

EVOBODY

New Principles of Unbound Embodied Evolution

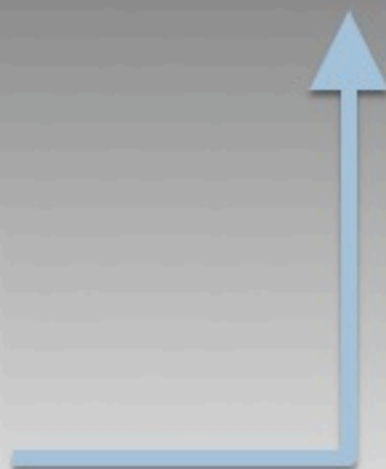

"to organise consultations of multi-disciplinary communities to formulate novel and widely supported FET research topics, initiatives and modalities in support of foundational research that could open up radically new avenues for future ICT."

FIRST:
Unbound
Embodied
Evolution

*Photographically reduced from Diagrams of the natural size (except that of the Gibbon, which was twice as large as nature)
Drawn by Mr. Waterhouse Hawkins from specimens in the Museum of the Royal College of Surgeons.*

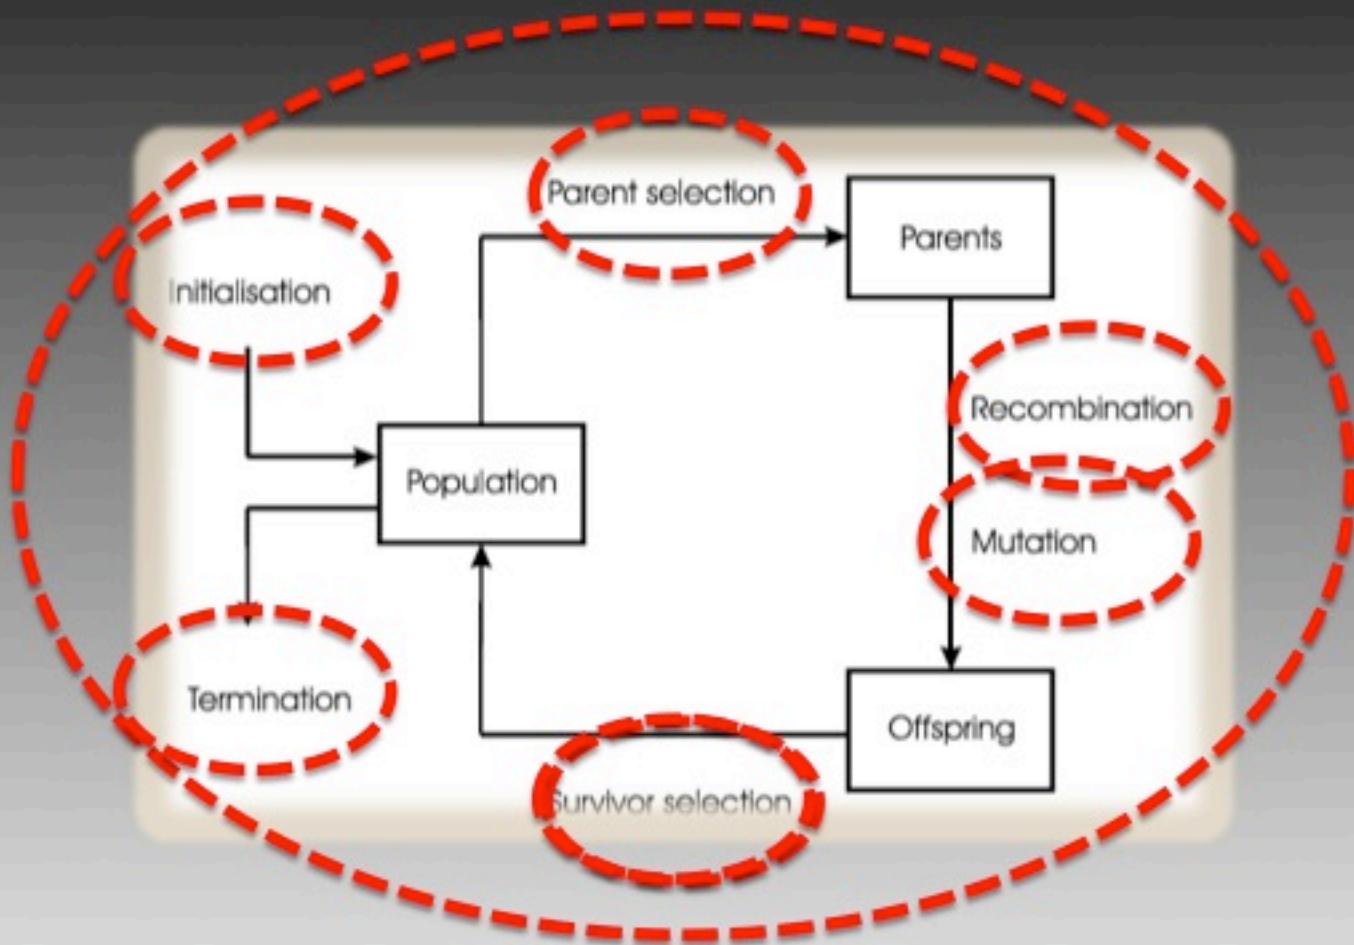

?

2 perspectives

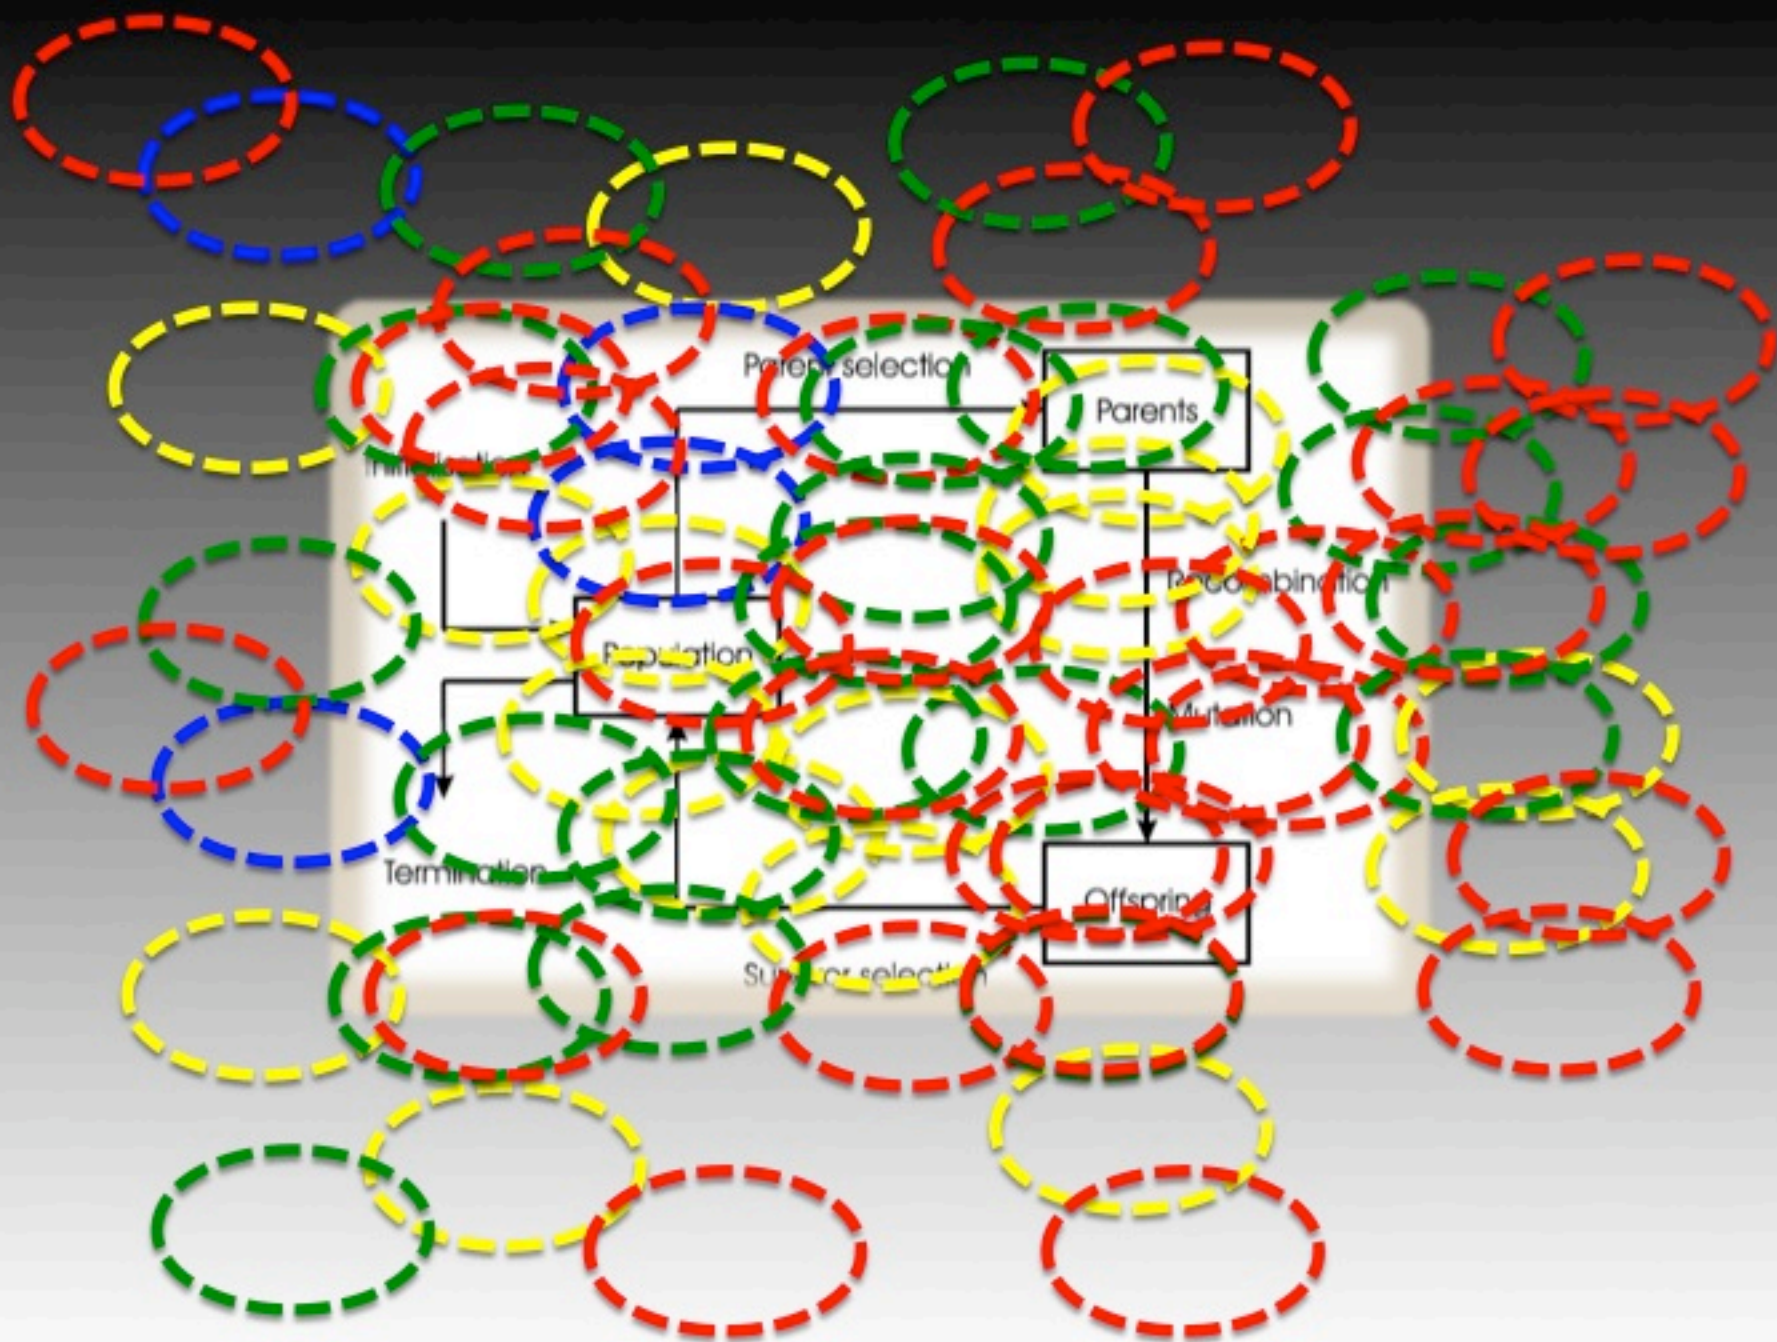

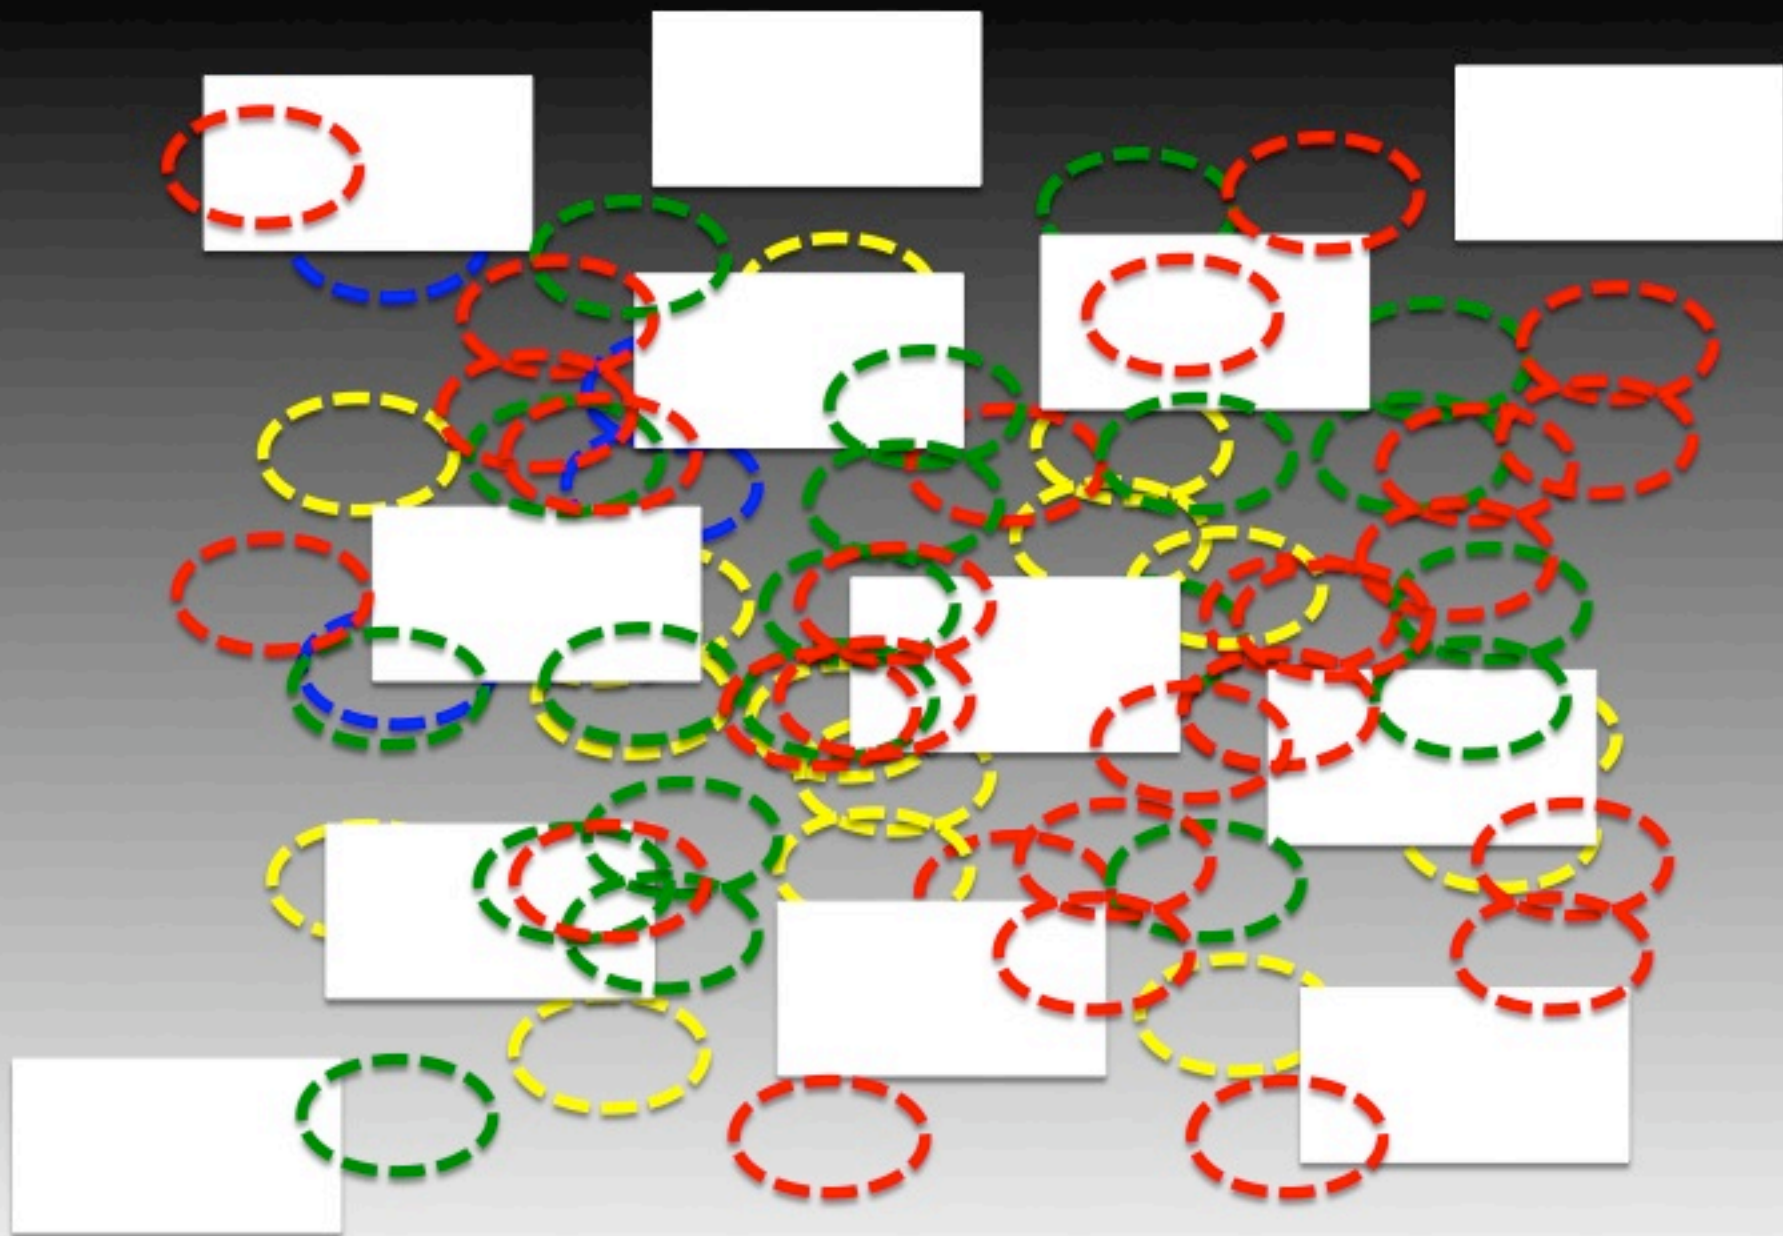

- 
- New computing paradigm
 - New experimental medium
for biologists

Autonomous and asynchronous

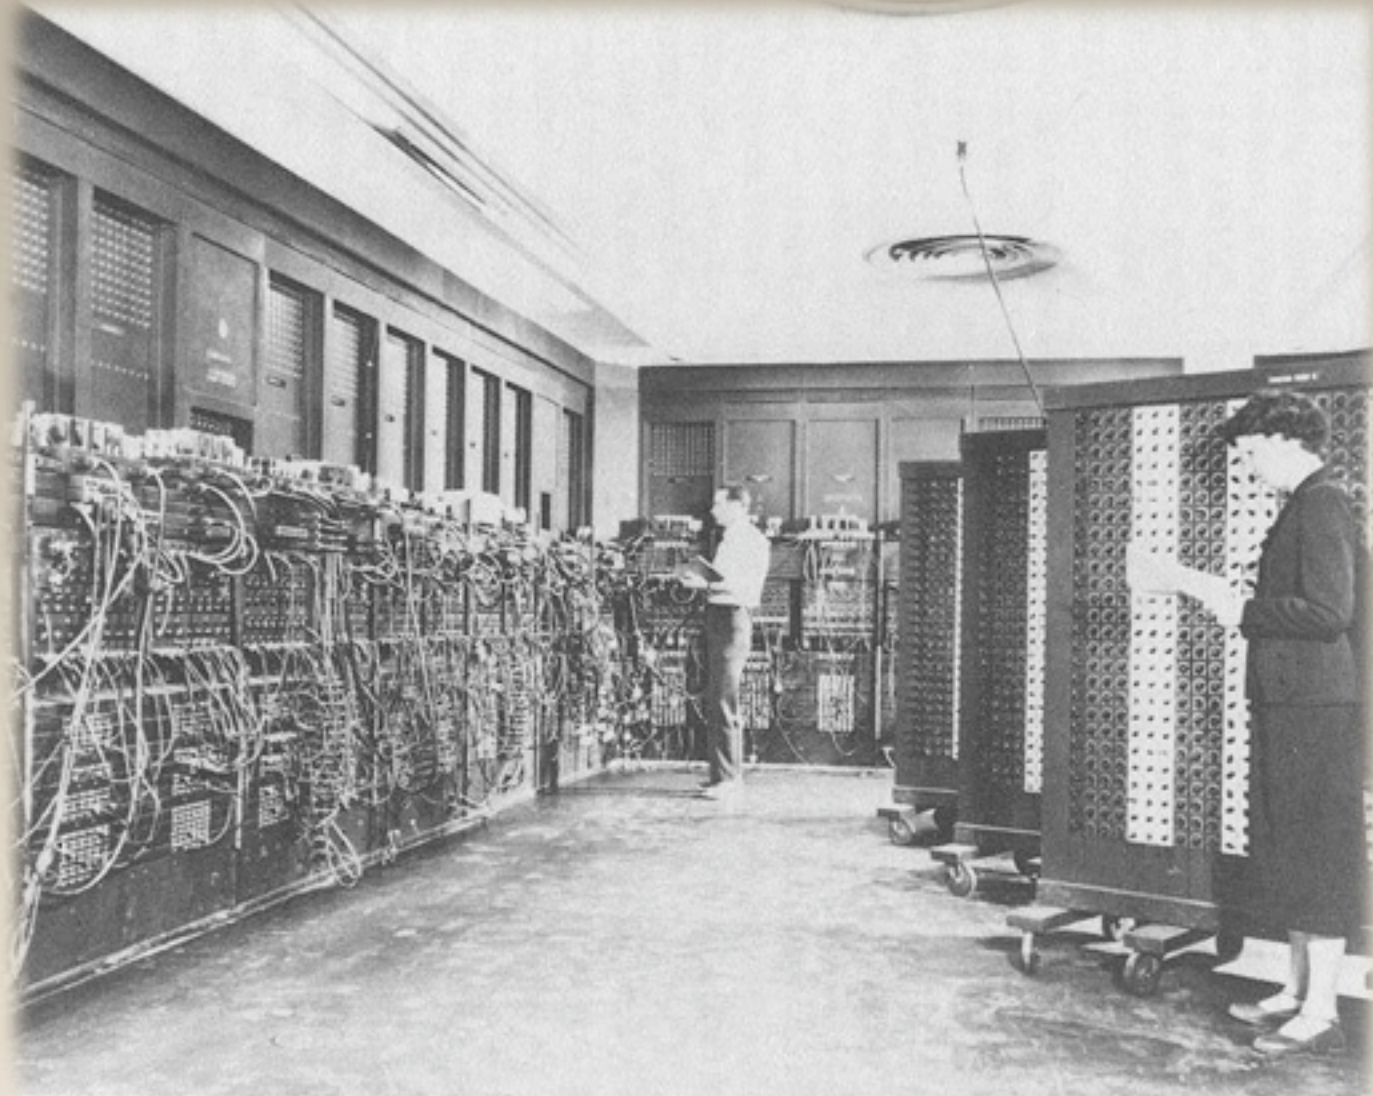

Ubiquitous computing

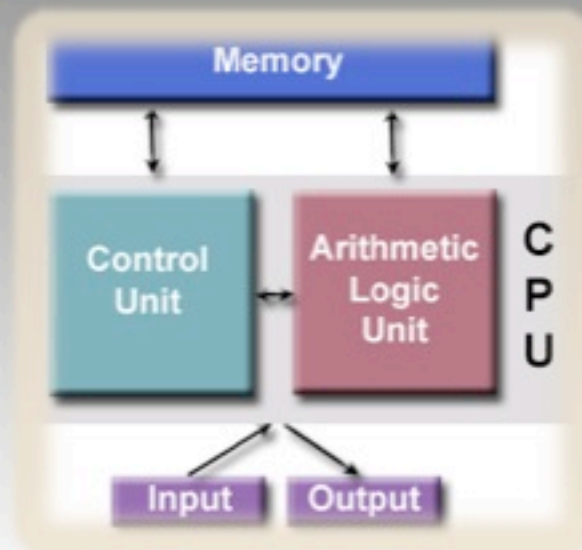

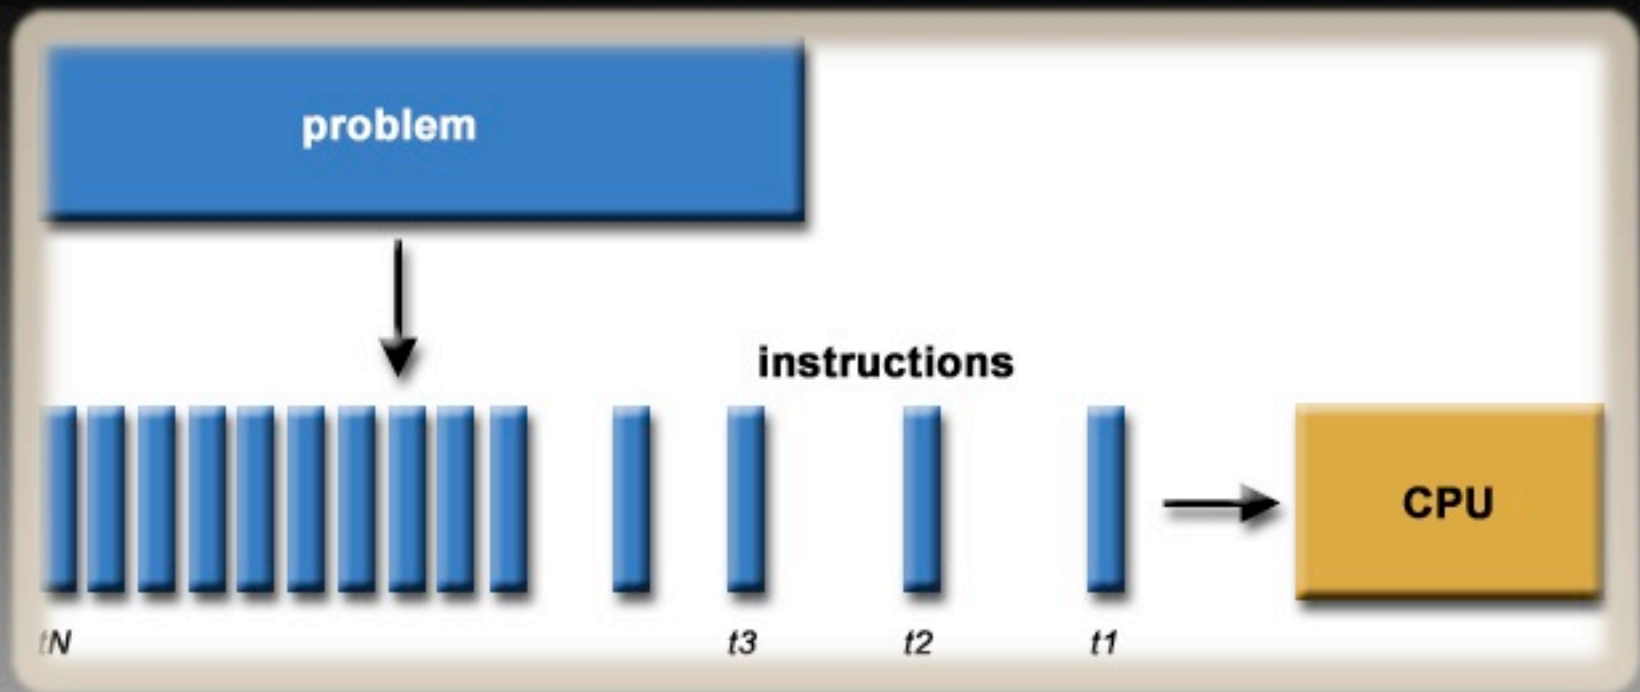

- ◆ Artificial evolutionary systems for information processing (computing):
- ◆ the units (individuals, agents) are physical objects, not just pieces of code in a computer
- ◆ asynchronous and autonomous selection and reproduction executed by the units themselves, without central control
- ◆ reproduction creates new objects, rather than replaces existing ones
- ◆ survivor selection terminates objects so that they really cease to exist
- ◆ selection is geared towards
 - ◆ survival in general as well as
 - ◆ user preferences that represent a given computing task
- ◆ open ended evolution (survival in general) biased towards improving computing capabilities

Long term vision

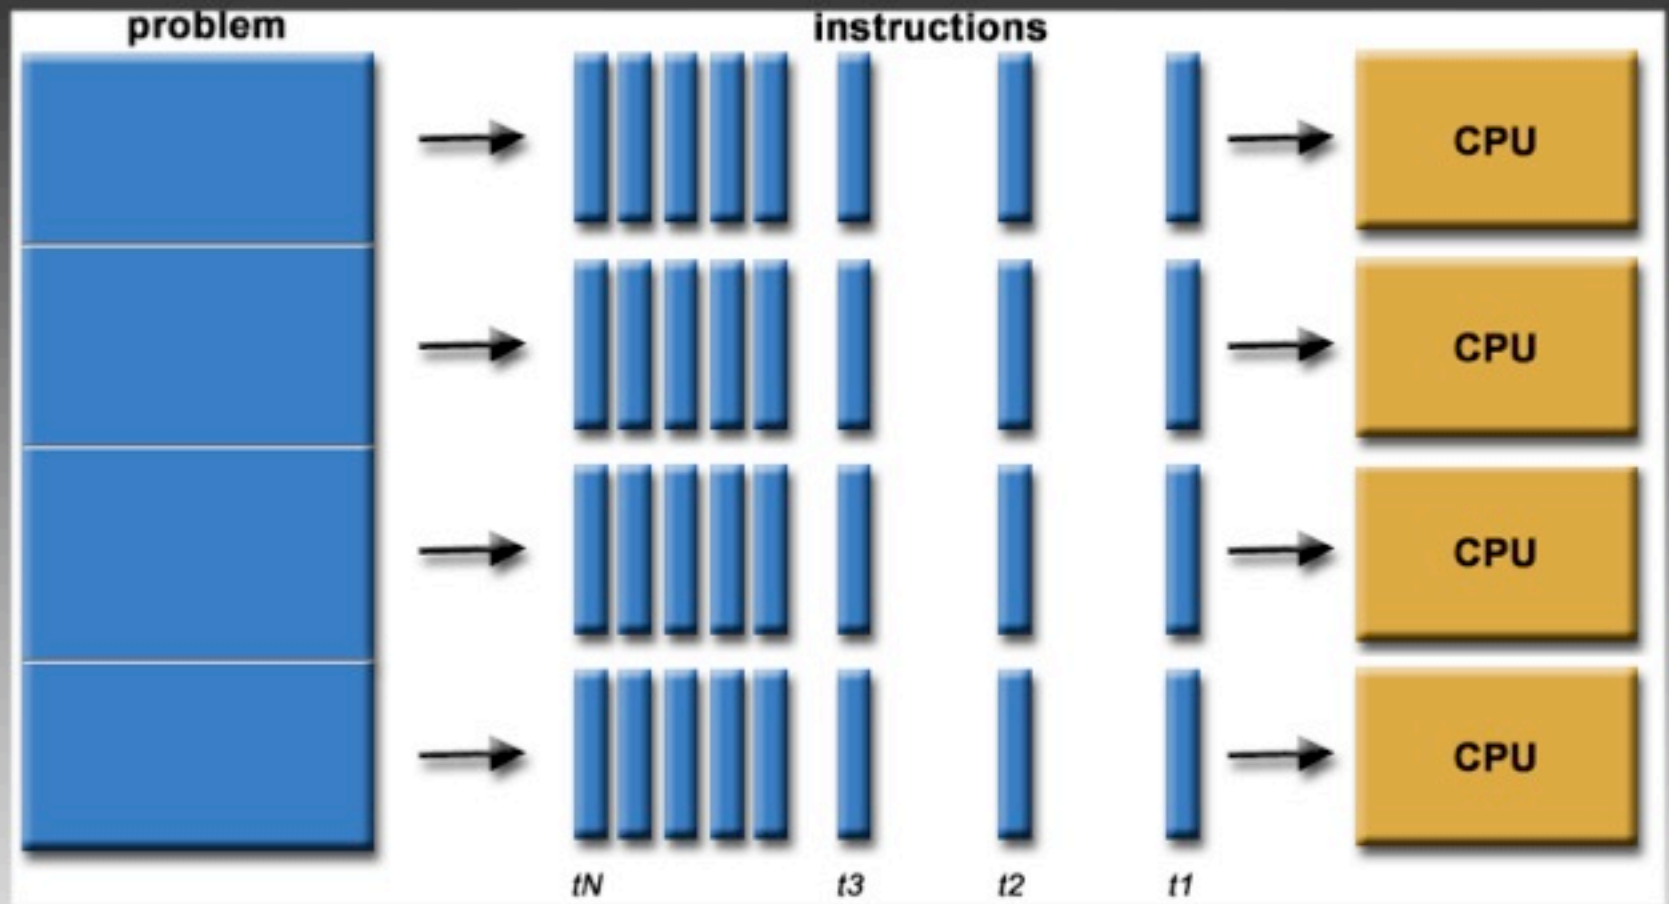

The ENIAC.

Smithsonian Institution Photo No. 53192

- ◆ regulate available computing power through adjusting the population size to the requirements of the moment
- ◆ optimise energy and material consumption by producing units when needed and terminating units when they are not necessary anymore ("feasibility formula" = ...)
- ◆ continuously improve their computing capabilities through evolution
- ◆ solve various user defined problems (of what kind?)

New non von-Neumannian computing

- ◆ designing and manufacturing the physical units (that can be electro-mechanical, bio-chemical, hybrid of these two, or what else is possible???)
- ◆ equipping the units with computing capabilities of their own and make the population one big computational entity that is more than the sum of its parts
- ◆ inventing reproduction and inheritance mechanisms
- ◆ managing the population size to prevent explosion and implosion (selection)
- ◆ interfacing the user's computational task to the evolutionary system
- ◆ striking a good balance between general and task dependent fitness, i.e., between the driving forces towards general survival (improving computing capabilities) and task dependent qualities

Major S/T challenges

The background of the slide features a collection of Polaroid photographs scattered across the left and center. Each photo shows a person, likely a woman, wearing traditional clothing and holding a large, ornate fan. The photos are in various orientations, some upright and some tilted. The overall aesthetic is that of a physical photo album or a project showcasing cultural imagery.

REPORT : FET FLAGSHIP INFODAY

22 January 2010 – Brussels

Future & Emerging Technologies Unit
<http://cordis.europa.eu/fet>

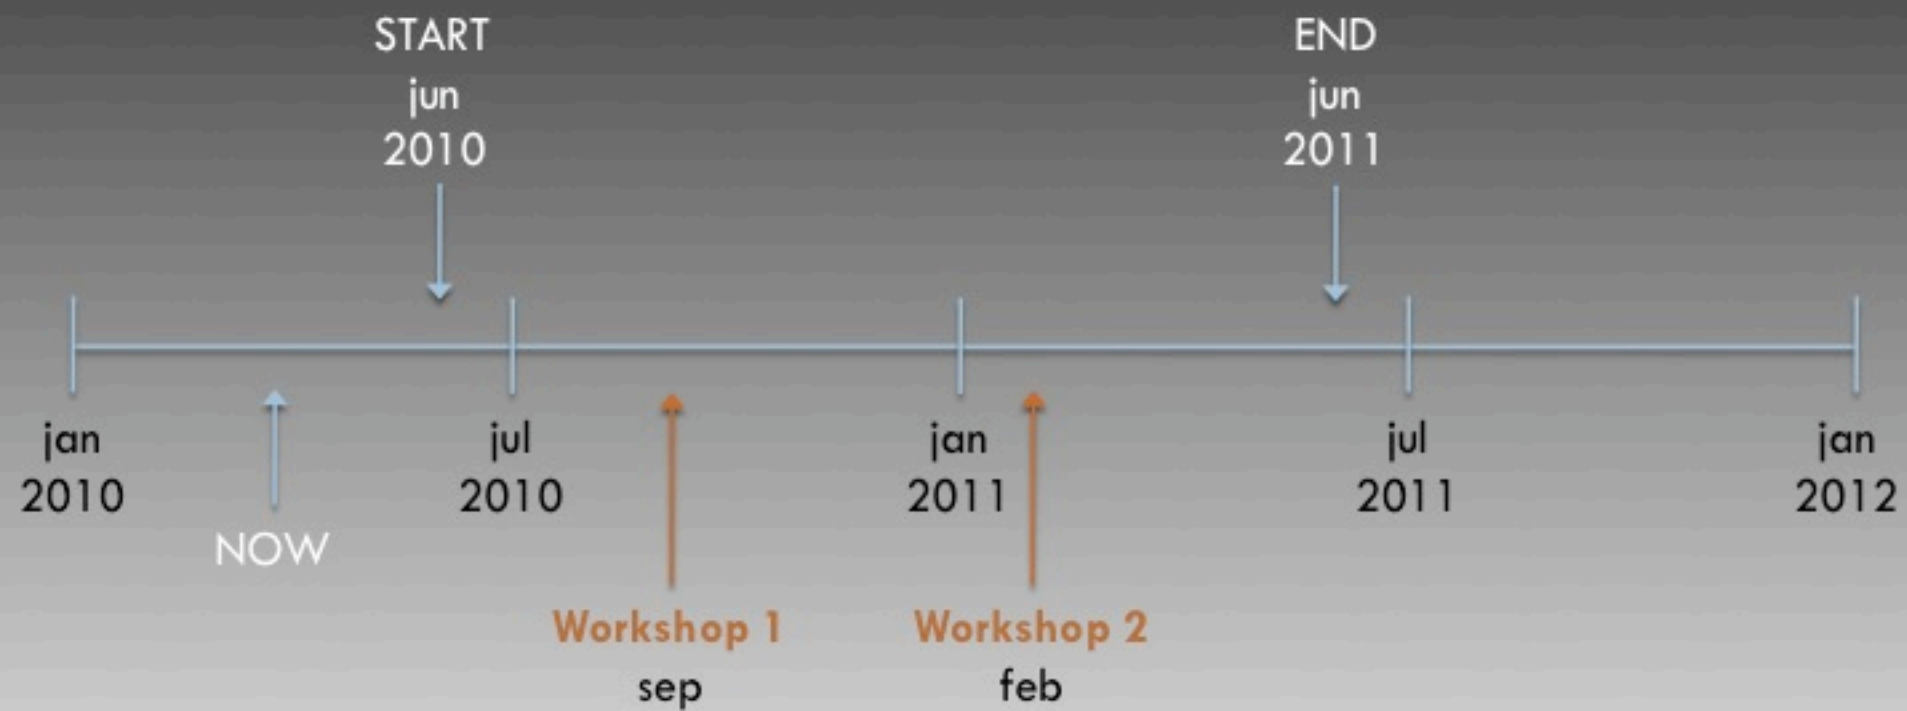

European Commission
Information Society and Media

The background of the slide features seven Polaroid photographs arranged in a circular pattern. Each photo shows a person wearing a white shirt and a red tie, holding a large yellow balloon. The person is also holding a large, colorful, circular object that resembles a fan or a large balloon. The photos are slightly tilted and overlap each other, creating a sense of movement and repetition.

Evolvable and Bio-
inspired Hardware

We'll have
web-enabled
discussions

You'll see us at
conferences
and workshops

End product:
EU report

FINALLY: Discussion

- ◆ strategic
 - ◆ real-world adaptive systems
 - ◆ meso- and nano-scale bio-molecular systems
- ◆ technological
 - ◆ processing computing systems
- ◆ social
 - ◆ conceptualisation of subject matter

Expected impact

About

Collectivae.net is an international and interdisciplinary conversation about collective systems. We have the goal to establish a collaborative forum in order to foster research and industrial efforts on the development of these systems (see below for an elaboration of what we consider what these are). On this website, we gather recent news and articles [from the web](#) (from news headlines, blog posts and various RSS and Atom feeds), chapter and conference [calls](#), as well as gradually create an overview of [books](#), [conferences](#), scientific [journals](#) and [organisations](#) (research institutes, university labs, companies) emerging area of interest. Additionally, we ourselves also publish and write [articles](#) related to collective systems*.

You can contact us at info@collectivae.net and follow us on twitter [@collectivae](#).

But what are collective systems anyway? There are three main dimensions along which we can look at such systems. Firstly, from an organizational point of view, organizations are considered in which we are involved with in every day life (from company to government). The main challenge to think about is how to make these organizations flexible and scalable, and keep them manageable at the same time. A practical example of this is the flexible-work model where employees get to make up their mind more themselves, while keeping the business a profitable one. Secondly, the technical perspective looks at how to design large artificial systems (computer networks, unmanned aerial vehicles, robotic systems). The challenge here is to look at Nature and society to find inspiration for developing such systems. An example of this is the maintenance of large distributed computer networks based on the principles of every-day gossiping. Finally, there is the personal or individual level. With the upcoming of Web 2.0, the internet becomes the platform for new kinds of collaborative interaction; but little is yet known how to use these novelties effectively. An
