 20526 provides symbolic (although numeric) names for signals. If a process is terminated by a signal,  
 20527 its exit status indicates the signal that killed it, but the exact values are not specified. The *kill -l*  
 20528 option, however, can be used to map decimal signal numbers and exit status values into the  
 20529 name of a signal. The following example reports the status of a terminated job:

```
20530 job
20531 stat=$?
20532 if [$stat -eq 0]
20533 then
20534 echo job completed successfully.
20535 elif [$stat -gt 128]
20536 then
20537 echo job terminated by signal SIG$(kill -l $stat).
20538 else
20539 echo job terminated with error code $stat.
20540 fi
```

20541 To send the default signal to a process group (say 123), an application should use a command  
 20542 similar to one of the following:

```
20543 kill -TERM -123
20544 kill -- -123
```

#### 20545 RATIONALE

20546 The *-l* option originated from the C shell, and is also implemented in the KornShell. The C shell  
 20547 output can consist of multiple output lines because the signal names do not always fit on a  
 20548 single line on some terminal screens. The KornShell output also included the implementation-  
 20549 defined signal numbers and was considered by the standard developers to be too difficult for  
 20550 scripts to parse conveniently. The specified output format is intended not only to accommodate  
 20551 the historical C shell output, but also to permit an entirely vertical or entirely horizontal listing  
 20552 on systems for which this is appropriate.

20553 An early proposal invented the name SIGNULL as a *signal\_name* for signal 0 (used by the System  
 20554 Interfaces volume of IEEE Std 1003.1-2001 to test for the existence of a process without sending it  
 20555 a signal). Since the *signal\_name* 0 can be used in this case unambiguously, SIGNULL has been  
 20556 removed.

20557 An early proposal also required symbolic *signal\_names* to be recognized with or without the **SIG**  
 20558 prefix. Historical versions of *kill* have not written the **SIG** prefix for the *-l* option and have not  
 20559 recognized the **SIG** prefix on *signal\_names*. Since neither applications portability nor ease-of-use  
 20560 would be improved by requiring this extension, it is no longer required.

20561 To avoid an ambiguity of an initial negative number argument specifying either a signal number  
 20562 or a process group, IEEE Std 1003.1-2001 mandates that it is always considered the former by  
 20563 implementations that support the XSI option. It also requires that conforming applications  
 20564 always use the "--" options terminator argument when specifying a process group, unless an  
 20565 option is also specified.

20566 The *-s* option was added in response to international interest in providing some form of *kill* that  
 20567 meets the Utility Syntax Guidelines.

20568           The job control job ID notation is not required to work as expected when *kill* is operating in its  
20569           own utility execution environment. In either of the following examples:

```
20570 nohup kill %1 &
20571 system("kill %1");
```

20572           the *kill* operates in a different environment and does not understand how the shell has managed  
20573           its job numbers.

#### 20574 **FUTURE DIRECTIONS**

20575           None.

#### 20576 **SEE ALSO**

20577           Chapter 2 (on page 29), *ps*, *wait*, the System Interfaces volume of IEEE Std 1003.1-2001, *kill*( ), the  
20578           Base Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>

#### 20579 **CHANGE HISTORY**

20580           First released in Issue 2.

#### 20581 **Issue 6**

20582           The obsolescent versions of the SYNOPSIS are turned into non-obsolescent features of the XSI  
20583           option, corresponding to a similar change in the *trap* special built-in.

20584 **NAME**20585       lex — generate programs for lexical tasks (**DEVELOPMENT**)20586 **SYNOPSIS**20587 CD       lex [-t] [-n|-v] [*file* ...]

20588

20589 **DESCRIPTION**

20590       The *lex* utility shall generate C programs to be used in lexical processing of character input, and  
 20591       that can be used as an interface to *yacc*. The C programs shall be generated from *lex* source code  
 20592       and conform to the ISO C standard. Usually, the *lex* utility shall write the program it generates to  
 20593       the file **lex.yy.c**; the state of this file is unspecified if *lex* exits with a non-zero exit status. See the  
 20594       EXTENDED DESCRIPTION section for a complete description of the *lex* input language.

20595 **OPTIONS**

20596       The *lex* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 20597       Utility Syntax Guidelines.

20598       The following options shall be supported:

20599       **-n**           Suppress the summary of statistics usually written with the **-v** option. If no table  
 20600       sizes are specified in the *lex* source code and the **-v** option is not specified, then **-n**  
 20601       is implied.

20602       **-t**           Write the resulting program to standard output instead of **lex.yy.c**.

20603       **-v**           Write a summary of *lex* statistics to the standard output. (See the discussion of *lex*  
 20604       table sizes in **Definitions in lex** (on page 537).) If the **-t** option is specified and **-n**  
 20605       is not specified, this report shall be written to standard error. If table sizes are  
 20606       specified in the *lex* source code, and if the **-n** option is not specified, the **-v** option  
 20607       may be enabled.

20608 **OPERANDS**

20609       The following operand shall be supported:

20610       *file*        A pathname of an input file. If more than one such *file* is specified, all files shall be  
 20611       concatenated to produce a single *lex* program. If no *file* operands are specified, or if  
 20612       a *file* operand is '-', the standard input shall be used.

20613 **STDIN**

20614       The standard input shall be used if no *file* operands are specified, or if a *file* operand is '-'. See  
 20615       INPUT FILES.

20616 **INPUT FILES**

20617       The input files shall be text files containing *lex* source code, as described in the EXTENDED  
 20618       DESCRIPTION section.

20619 **ENVIRONMENT VARIABLES**

20620       The following environment variables shall affect the execution of *lex*:

20621       **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 20622       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 20623       Internationalization Variables for the precedence of internationalization variables  
 20624       used to determine the values of locale categories.)

20625       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 20626       internationalization variables.

20627       **LC\_COLLATE**

20628       Determine the locale for the behavior of ranges, equivalence classes, and multi-

20629 character collating elements within regular expressions. If this variable is not set to  
20630 the POSIX locale, the results are unspecified.

20631 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
20632 characters (for example, single-byte as opposed to multi-byte characters in  
20633 arguments and input files), and the behavior of character classes within regular  
20634 expressions. If this variable is not set to the POSIX locale, the results are  
20635 unspecified.

20636 **LC\_MESSAGES**  
20637 Determine the locale that should be used to affect the format and contents of  
20638 diagnostic messages written to standard error.

20639 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 20640 ASYNCHRONOUS EVENTS

20641 Default.

## 20642 STDOUT

20643 If the **-t** option is specified, the text file of C source code output of *lex* shall be written to  
20644 standard output.

20645 If the **-t** option is not specified:

- 20646 • Implementation-defined informational, error, and warning messages concerning the contents  
20647 of *lex* source code input shall be written to either the standard output or standard error.
- 20648 • If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be  
20649 written to either the standard output or standard error, in an implementation-defined format.  
20650 These statistics may also be generated if table sizes are specified with a '%' operator in the  
20651 *Definitions* section, as long as the **-n** option is not specified.

## 20652 STDERR

20653 If the **-t** option is specified, implementation-defined informational, error, and warning messages  
20654 concerning the contents of *lex* source code input shall be written to the standard error.

20655 If the **-t** option is not specified:

- 20656 1. Implementation-defined informational, error, and warning messages concerning the  
20657 contents of *lex* source code input shall be written to either the standard output or standard  
20658 error.
- 20659 2. If the **-v** option is specified and the **-n** option is not specified, *lex* statistics shall also be  
20660 written to either the standard output or standard error, in an implementation-defined  
20661 format. These statistics may also be generated if table sizes are specified with a '%'   
20662 operator in the *Definitions* section, as long as the **-n** option is not specified.

## 20663 OUTPUT FILES

20664 A text file containing C source code shall be written to **lex.yy.c**, or to the standard output if the  
20665 **-t** option is present.

## 20666 EXTENDED DESCRIPTION

20667 Each input file shall contain *lex* source code, which is a table of regular expressions with  
20668 corresponding actions in the form of C program fragments.

20669 When **lex.yy.c** is compiled and linked with the *lex* library (using the **-ll** operand with *c99*), the  
20670 resulting program shall read character input from the standard input and shall partition it into  
20671 strings that match the given expressions.

20672 When an expression is matched, these actions shall occur:

- 20673 • The input string that was matched shall be left in *ytext* as a null-terminated string; *ytext*  
20674 shall either be an external character array or a pointer to a character string. As explained in  
20675 **Definitions in lex**, the type can be explicitly selected using the **%array** or **%pointer**  
20676 declarations, but the default is implementation-defined.
- 20677 • The external **int** *yyleng* shall be set to the length of the matching string.
- 20678 • The expression's corresponding program fragment, or action, shall be executed.

20679 During pattern matching, *lex* shall search the set of patterns for the single longest possible  
20680 match. Among rules that match the same number of characters, the rule given first shall be  
20681 chosen.

20682 The general format of *lex* source shall be:

```
20683 Definitions
20684 %%
20685 Rules
20686 %%
20687 UserSubroutines
```

20688 The first "%%" is required to mark the beginning of the rules (regular expressions and actions);  
20689 the second "%%" is required only if user subroutines follow.

20690 Any line in the *Definitions* section beginning with a <blank> shall be assumed to be a C program  
20691 fragment and shall be copied to the external definition area of the **lex.yy.c** file. Similarly,  
20692 anything in the *Definitions* section included between delimiter lines containing only "%{" and  
20693 "%}" shall also be copied unchanged to the external definition area of the **lex.yy.c** file.

20694 Any such input (beginning with a <blank> or within "%{" and "%}" delimiter lines) appearing  
20695 at the beginning of the *Rules* section before any rules are specified shall be written to **lex.yy.c**  
20696 after the declarations of variables for the *yylex()* function and before the first line of code in  
20697 *yylex()*. Thus, user variables local to *yylex()* can be declared here, as well as application code to  
20698 execute upon entry to *yylex()*.

20699 The action taken by *lex* when encountering any input beginning with a <blank> or within "%{"  
20700 and "%}" delimiter lines appearing in the *Rules* section but coming after one or more rules is  
20701 undefined. The presence of such input may result in an erroneous definition of the *yylex()*  
20702 function.

## 20703 **Definitions in lex**

20704 *Definitions* appear before the first "%%" delimiter. Any line in this section not contained between  
20705 "%{" and "%}" lines and not beginning with a <blank> shall be assumed to define a *lex*  
20706 substitution string. The format of these lines shall be:

```
20707 name substitute
```

20708 If a *name* does not meet the requirements for identifiers in the ISO C standard, the result is  
20709 undefined. The string *substitute* shall replace the string {*name*} when it is used in a rule. The *name*  
20710 string shall be recognized in this context only when the braces are provided and when it does  
20711 not appear within a bracket expression or within double-quotes.

20712 In the *Definitions* section, any line beginning with a '%' (percent sign) character and followed by  
20713 an alphanumeric word beginning with either 's' or 'S' shall define a set of start conditions.  
20714 Any line beginning with a '%' followed by a word beginning with either 'x' or 'X' shall define  
20715 a set of exclusive start conditions. When the generated scanner is in a %s state, patterns with no

state specified shall be also active; in a %x state, such patterns shall not be active. The rest of the line, after the first word, shall be considered to be one or more <blank>-separated names of start conditions. Start condition names shall be constructed in the same way as definition names. Start conditions can be used to restrict the matching of regular expressions to one or more states as described in **Regular Expressions in lex** (on page 539).

Implementations shall accept either of the following two mutually-exclusive declarations in the *Definitions* section:

**%array**      Declare the type of *yytext* to be a null-terminated character array.

**%pointer**    Declare the type of *yytext* to be a pointer to a null-terminated character string.

The default type of *yytext* is implementation-defined. If an application refers to *yytext* outside of the scanner source file (that is, via an **extern**), the application shall include the appropriate **%array** or **%pointer** declaration in the scanner source file.

Implementations shall accept declarations in the *Definitions* section for setting certain internal table sizes. The declarations are shown in the following table.

**Table 4-9** Table Size Declarations in *lex*

| Declaration        | Description                        | Minimum Value |
|--------------------|------------------------------------|---------------|
| <b>%p</b> <i>n</i> | Number of positions                | 2 500         |
| <b>%n</b> <i>n</i> | Number of states                   | 500           |
| <b>%a</b> <i>n</i> | Number of transitions              | 2 000         |
| <b>%e</b> <i>n</i> | Number of parse tree nodes         | 1 000         |
| <b>%k</b> <i>n</i> | Number of packed character classes | 1 000         |
| <b>%o</b> <i>n</i> | Size of the output array           | 3 000         |

In the table, *n* represents a positive decimal integer, preceded by one or more <blank>s. The exact meaning of these table size numbers is implementation-defined. The implementation shall document how these numbers affect the *lex* utility and how they are related to any output that may be generated by the implementation should limitations be encountered during the execution of *lex*. It shall be possible to determine from this output which of the table size values needs to be modified to permit *lex* to successfully generate tables for the input language. The values in the column Minimum Value represent the lowest values conforming implementations shall provide.

### Rules in *lex*

The rules in *lex* source files are a table in which the left column contains regular expressions and the right column contains actions (C program fragments) to be executed when the expressions are recognized.

*ERE action*

*ERE action*

...

The extended regular expression (ERE) portion of a row shall be separated from *action* by one or more <blank>s. A regular expression containing <blank>s shall be recognized under one of the following conditions:

- The entire expression appears within double-quotes.
- The <blank>s appear within double-quotes or square brackets.

- Each <blank> is preceded by a backslash character.

## 20759 User Subroutines in lex

20760 Anything in the user subroutines section shall be copied to **lex.yy.c** following `yylex()`.

## 20761 Regular Expressions in lex

20762 The *lex* utility shall support the set of extended regular expressions (see the Base Definitions  
20763 volume of IEEE Std 1003.1-2001, Section 9.4, Extended Regular Expressions), with the following  
20764 additions and exceptions to the syntax:

20765 " . . . " Any string enclosed in double-quotes shall represent the characters within the  
20766 double-quotes as themselves, except that backslash escapes (which appear in the  
20767 following table) shall be recognized. Any backslash-escape sequence shall be  
20768 terminated by the closing quote. For example, "\01""1" represents a single  
20769 string: the octal value 1 followed by the character '1'.

20770 <state>*r*, <state1, state2, . . .>*r*

20771 The regular expression *r* shall be matched only when the program is in one of the  
20772 start conditions indicated by *state*, *state1*, and so on; see **Actions in lex** (on page  
20773 541). (As an exception to the typographical conventions of the rest of this volume  
20774 of IEEE Std 1003.1-2001, in this case <state> does not represent a metavariable, but  
20775 the literal angle-bracket characters surrounding a symbol.) The start condition  
20776 shall be recognized as such only at the beginning of a regular expression.

20777 *r*/*x* The regular expression *r* shall be matched only if it is followed by an occurrence of  
20778 regular expression *x* (*x* is the instance of trailing context, further defined below).  
20779 The token returned in *yytext* shall only match *r*. If the trailing portion of *r* matches  
20780 the beginning of *x*, the result is unspecified. The *r* expression cannot include  
20781 further trailing context or the '\$' (match-end-of-line) operator; *x* cannot include  
20782 the '^' (match-beginning-of-line) operator, nor trailing context, nor the '\$'  
20783 operator. That is, only one occurrence of trailing context is allowed in a *lex* regular  
20784 expression, and the '^' operator only can be used at the beginning of such an  
20785 expression.

20786 {*name*} When *name* is one of the substitution symbols from the *Definitions* section, the  
20787 string, including the enclosing braces, shall be replaced by the *substitute* value. The  
20788 *substitute* value shall be treated in the extended regular expression as if it were  
20789 enclosed in parentheses. No substitution shall occur if {*name*} occurs within a  
20790 bracket expression or within double-quotes.

20791 Within an ERE, a backslash character shall be considered to begin an escape sequence as  
20792 specified in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File  
20793 Format Notation ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape  
20794 sequences in the following table shall be recognized.

20795 A literal <newline> cannot occur within an ERE; the escape sequence '\n' can be used to  
20796 represent a <newline>. A <newline> shall not be matched by a period operator.

|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>\digits</code>  | A backslash character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.                                                                                                                                 | The character whose encoding is represented by the one, two, or three-digit octal integer. If the size of a byte on the system is greater than nine bits, the valid escape sequence used to represent a byte is implementation-defined. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading <code>'\'</code> for each byte. |
| <code>\xdigits</code> | A backslash character followed by the longest sequence of hexadecimal-digit characters (01234567abcdefABCDEF). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.                                                                                                                                  | The character whose encoding is represented by the hexadecimal integer.                                                                                                                                                                                                                                                                                                           |
| <code>\c</code>       | A backslash character followed by any character not described in this table or in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation ( <code>'\'</code> , <code>'\a'</code> , <code>'\b'</code> , <code>'\f'</code> , <code>'\n'</code> , <code>'\r'</code> , <code>'\t'</code> , <code>'\v'</code> ). | The character <code>'c'</code> , unchanged.                                                                                                                                                                                                                                                                                                                                       |

20828

20829

20830

**Note:** If a `'\x'` sequence needs to be immediately followed by a hexadecimal digit character, a sequence such as `"\x1"1"` can be used, which represents a character containing the value 1, followed by the character `'1'`.

20831

20832

20833

20834

The order of precedence given to extended regular expressions for *lex* differs from that specified in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.4, Extended Regular Expressions. The order of precedence for *lex* shall be as shown in the following table, from high to low.

20835

20836

20837

20838

20839

**Note:** The escaped characters entry is not meant to imply that these are operators, but they are included in the table to show their relationships to the true operators. The start condition, trailing context, and anchoring notations have been omitted from the table because of the placement restrictions described in this section; they can only appear at the beginning or ending of an ERE.

Table 4-11 ERE Precedence in *lex*

| Extended Regular Expression       | Precedence            |
|-----------------------------------|-----------------------|
| collation-related bracket symbols | [ = ] [ : : ] [ . . ] |
| escaped characters                | \<special character>  |
| bracket expression                | [ ]                   |
| quoting                           | " . . . "             |
| grouping                          | ( )                   |
| definition                        | { name }              |
| single-character RE duplication   | * + ?                 |
| concatenation                     |                       |
| interval expression               | { m , n }             |
| alternation                       |                       |

The ERE anchoring operators '**^**' and '**\$**' do not appear in the table. With *lex* regular expressions, these operators are restricted in their use: the '**^**' operator can only be used at the beginning of an entire regular expression, and the '**\$**' operator only at the end. The operators apply to the entire regular expression. Thus, for example, the pattern "**(^abc) | (def\$)**" is undefined; it can instead be written as two separate rules, one with the regular expression "**^abc**" and one with "**def\$**", which share a common action via the special '**|**' action (see below). If the pattern were written "**^abc|def\$**", it would match either "abc" or "def" on a line by itself.

Unlike the general ERE rules, embedded anchoring is not allowed by most historical *lex* implementations. An example of embedded anchoring would be for patterns such as "**(^| )foo( |\$)**" to match "foo" when it exists as a complete word. This functionality can be obtained using existing *lex* features:

```
^foo/[\n] |
" foo"/[\n] /* Found foo as a separate word. */
```

Note also that '**\$**' is a form of trailing context (it is equivalent to "**/\n**") and as such cannot be used with regular expressions containing another instance of the operator (see the preceding discussion of trailing context).

The additional regular expressions trailing-context operator '**/'**' can be used as an ordinary character if presented within double-quotes, "**/**"; preceded by a backslash, "**\/**"; or within a bracket expression, "**[/]**". The start-condition '**<**' and '**>**' operators shall be special only in a start condition at the beginning of a regular expression; elsewhere in the regular expression they shall be treated as ordinary characters.

### Actions in *lex*

The action to be taken when an ERE is matched can be a C program fragment or the special actions described below; the program fragment can contain one or more C statements, and can also include special actions. The empty C statement '**;**' shall be a valid action; any string in the **lex.yy.c** input that matches the pattern portion of such a rule is effectively ignored or skipped. However, the absence of an action shall not be valid, and the action *lex* takes in such a condition is undefined.

The specification for an action, including C statements and special actions, can extend across several lines if enclosed in braces:

```
ERE <one or more blanks> { program statement
 program statement }
```

20885 The default action when a string in the input to a **lex.yy.c** program is not matched by any  
 20886 expression shall be to copy the string to the output. Because the default behavior of a program  
 20887 generated by *lex* is to read the input and copy it to the output, a minimal *lex* source program that  
 20888 has just "%%" shall generate a C program that simply copies the input to the output unchanged.

20889 Four special actions shall be available:

20890 | ECHO; REJECT; BEGIN

20891 | The action ' | ' means that the action for the next rule is the action for this rule.  
 20892 Unlike the other three actions, ' | ' cannot be enclosed in braces or be semicolon-  
 20893 terminated; the application shall ensure that it is specified alone, with no other  
 20894 actions.

20895 **ECHO;** Write the contents of the string *yytext* on the output.

20896 **REJECT;** Usually only a single expression is matched by a given string in the input. **REJECT**  
 20897 means "continue to the next expression that matches the current input", and shall  
 20898 cause whatever rule was the second choice after the current rule to be executed for  
 20899 the same input. Thus, multiple rules can be matched and executed for one input  
 20900 string or overlapping input strings. For example, given the regular expressions  
 20901 "xyz" and "xy" and the input "xyz", usually only the regular expression "xyz"  
 20902 would match. The next attempted match would start after **z**. If the last action in the  
 20903 "xyz" rule is **REJECT**, both this rule and the "xy" rule would be executed. The  
 20904 **REJECT** action may be implemented in such a fashion that flow of control does not  
 20905 continue after it, as if it were equivalent to a **goto** to another part of *yylex()*. The  
 20906 use of **REJECT** may result in somewhat larger and slower scanners.

20907 **BEGIN** The action:

20908 BEGIN *newstate*;

20909 switches the state (start condition) to *newstate*. If the string *newstate* has not been  
 20910 declared previously as a start condition in the *Definitions* section, the results are  
 20911 unspecified. The initial state is indicated by the digit '0' or the token **INITIAL**.

20912 The functions or macros described below are accessible to user code included in the *lex* input. It  
 20913 is unspecified whether they appear in the C code output of *lex*, or are accessible only through the  
 20914 **-ll** operand to *c99* (the *lex* library).

20915 **int yylex(void)**  
 20916 Performs lexical analysis on the input; this is the primary function generated by the *lex*  
 20917 utility. The function shall return zero when the end of input is reached; otherwise, it shall  
 20918 return non-zero values (tokens) determined by the actions that are selected.

20919 **int yymore(void)**  
 20920 When called, indicates that when the next input string is recognized, it is to be appended to  
 20921 the current value of *yytext* rather than replacing it; the value in *yyleng* shall be adjusted  
 20922 accordingly.

20923 **int yyless(int n)**  
 20924 Retains *n* initial characters in *yytext*, NUL-terminated, and treats the remaining characters  
 20925 as if they had not been read; the value in *yyleng* shall be adjusted accordingly.

20926 **int input(void)**  
 20927 Returns the next character from the input, or zero on end-of-file. It shall obtain input from  
 20928 the stream pointer *yyin*, although possibly via an intermediate buffer. Thus, once scanning  
 20929 has begun, the effect of altering the value of *yyin* is undefined. The character read shall be  
 20930 removed from the input stream of the scanner without any processing by the scanner.

20931 **int unput(int c)**  
 20932 Returns the character 'c' to the input; *yytext* and *yylen* are undefined until the next  
 20933 expression is matched. The result of using *unput()* for more characters than have been input  
 20934 is unspecified.

20935 The following functions shall appear only in the *lex* library accessible through the **-ll** operand;  
 20936 they can therefore be redefined by a conforming application:

20937 **int yywrap(void)**  
 20938 Called by *yylex()* at end-of-file; the default *yywrap()* shall always return 1. If the application  
 20939 requires *yylex()* to continue processing with another source of input, then the application  
 20940 can include a function *yywrap()*, which associates another file with the external variable  
 20941 **FILE \*yyin** and shall return a value of zero.

20942 **int main(int argc, char \*argv[ ])**  
 20943 Calls *yylex()* to perform lexical analysis, then exits. The user code can contain *main()* to  
 20944 perform application-specific operations, calling *yylex()* as applicable.

20945 Except for *input()*, *unput()*, and *main()*, all external and static names generated by *lex* shall begin  
 20946 with the prefix **yy** or **YY**.

#### 20947 EXIT STATUS

20948 The following exit values shall be returned:

20949 0 Successful completion.

20950 >0 An error occurred.

#### 20951 CONSEQUENCES OF ERRORS

20952 Default.

#### 20953 APPLICATION USAGE

20954 Conforming applications are warned that in the *Rules* section, an ERE without an action is not  
 20955 acceptable, but need not be detected as erroneous by *lex*. This may result in compilation or  
 20956 runtime errors.

20957 The purpose of *input()* is to take characters off the input stream and discard them as far as the  
 20958 lexical analysis is concerned. A common use is to discard the body of a comment once the  
 20959 beginning of a comment is recognized.

20960 The *lex* utility is not fully internationalized in its treatment of regular expressions in the *lex*  
 20961 source code or generated lexical analyzer. It would seem desirable to have the lexical analyzer  
 20962 interpret the regular expressions given in the *lex* source according to the environment specified  
 20963 when the lexical analyzer is executed, but this is not possible with the current *lex* technology.  
 20964 Furthermore, the very nature of the lexical analyzers produced by *lex* must be closely tied to the  
 20965 lexical requirements of the input language being described, which is frequently locale-specific  
 20966 anyway. (For example, writing an analyzer that is used for French text is not automatically  
 20967 useful for processing other languages.)

#### 20968 EXAMPLES

20969 The following is an example of a *lex* program that implements a rudimentary scanner for a  
 20970 Pascal-like syntax:

```
20971 %{
20972 /* Need this for the call to atof() below. */
20973 #include <math.h>
20974 /* Need this for printf(), fopen(), and stdin below. */
20975 #include <stdio.h>
20976 %}
```

```

20977 DIGIT [0-9]
20978 ID [a-z] [a-z0-9]*
20979
20980 %%
20981
20982 {DIGIT}+ {
20983 printf("An integer: %s (%d)\n", yytext,
20984 atoi(yytext));
20985 }
20986
20987 {DIGIT}+"."{DIGIT}* {
20988 printf("A float: %s (%g)\n", yytext,
20989 atof(yytext));
20990 }
20991
20992 if|then|begin|end|procedure|function {
20993 printf("A keyword: %s\n", yytext);
20994 }
20995
20996 {ID} printf("An identifier: %s\n", yytext);
20997
20998 "+"|"-"|"*"|"/" printf("An operator: %s\n", yytext);
20999
21000 "{"[^}\n]*}" /* Eat up one-line comments. */
21001
21002 [\t\n]+ /* Eat up white space. */
21003
21004 . printf("Unrecognized character: %s\n", yytext);
21005
21006 %%
21007
21008 int main(int argc, char *argv[])
21009 {
21010 ++argv, --argc; /* Skip over program name. */
21011 if (argc > 0)
21012 yyin = fopen(argv[0], "r");
21013 else
21014 yyin = stdin;
21015
21016 yylex();
21017 }

```

## 21006 RATIONALE

21007 Even though the `-c` option and references to the C language are retained in this description, *lex*  
 21008 may be generalized to other languages, as was done at one time for EFL, the Extended  
 21009 FORTRAN Language. Since the *lex* input specification is essentially language-independent,  
 21010 versions of this utility could be written to produce Ada, Modula-2, or Pascal code, and there are  
 21011 known historical implementations that do so.

21012 The current description of *lex* bypasses the issue of dealing with internationalized EREs in the *lex*  
 21013 source code or generated lexical analyzer. If it follows the model used by *awk* (the source code is  
 21014 assumed to be presented in the POSIX locale, but input and output are in the locale specified by  
 21015 the environment variables), then the tables in the lexical analyzer produced by *lex* would  
 21016 interpret EREs specified in the *lex* source in terms of the environment variables specified when  
 21017 *lex* was executed. The desired effect would be to have the lexical analyzer interpret the EREs  
 21018 given in the *lex* source according to the environment specified when the lexical analyzer is  
 21019 executed, but this is not possible with the current *lex* technology.

21020 The description of octal and hexadecimal-digit escape sequences agrees with the ISO C standard  
 21021 use of escape sequences. See the RATIONALE for *ed* for a discussion of bytes larger than 9 bits

21022 being represented by octal values. Hexadecimal values can represent larger bytes and multi-byte  
21023 characters directly, using as many digits as required.

21024 There is no detailed output format specification. The observed behavior of *lex* under four  
21025 different historical implementations was that none of these implementations consistently  
21026 reported the line numbers for error and warning messages. Furthermore, there was a desire that  
21027 *lex* be allowed to output additional diagnostic messages. Leaving message formats unspecified  
21028 avoids these formatting questions and problems with internationalization.

21029 Although the `%x` specifier for *exclusive* start conditions is not historical practice, it is believed to  
21030 be a minor change to historical implementations and greatly enhances the usability of *lex*  
21031 programs since it permits an application to obtain the expected functionality with fewer  
21032 statements.

21033 The `%array` and `%pointer` declarations were added as a compromise between historical systems.  
21034 The System V-based *lex* copies the matched text to a *yytext* array. The *flex* program, supported in  
21035 BSD and GNU systems, uses a pointer. In the latter case, significant performance improvements  
21036 are available for some scanners. Most historical programs should require no change in porting  
21037 from one system to another because the string being referenced is null-terminated in both cases.  
21038 (The method used by *flex* in its case is to null-terminate the token in place by remembering the  
21039 character that used to come right after the token and replacing it before continuing on to the next  
21040 scan.) Multi-file programs with external references to *yytext* outside the scanner source file  
21041 should continue to operate on their historical systems, but would require one of the new  
21042 declarations to be considered strictly portable.

21043 The description of EREs avoids unnecessary duplication of ERE details because their meanings  
21044 within a *lex* ERE are the same as that for the ERE in this volume of IEEE Std 1003.1-2001.

21045 The reason for the undefined condition associated with text beginning with a <blank> or within  
21046 "`%{`" and "`%}`" delimiter lines appearing in the *Rules* section is historical practice. Both the BSD  
21047 and System V *lex* copy the indented (or enclosed) input in the *Rules* section (except at the  
21048 beginning) to unreachable areas of the *yylex()* function (the code is written directly after a *break*  
21049 statement). In some cases, the System V *lex* generates an error message or a syntax error,  
21050 depending on the form of indented input.

21051 The intention in breaking the list of functions into those that may appear in **lex.yy.c** versus those  
21052 that only appear in **libl.a** is that only those functions in **libl.a** can be reliably redefined by a  
21053 conforming application.

21054 The descriptions of standard output and standard error are somewhat complicated because  
21055 historical *lex* implementations chose to issue diagnostic messages to standard output (unless `-t`  
21056 was given). IEEE Std 1003.1-2001 allows this behavior, but leaves an opening for the more  
21057 expected behavior of using standard error for diagnostics. Also, the System V behavior of  
21058 writing the statistics when any table sizes are given is allowed, while BSD-derived systems can  
21059 avoid it. The programmer can always precisely obtain the desired results by using either the `-t`  
21060 or `-n` options.

21061 The OPERANDS section does not mention the use of `-` as a synonym for standard input; not all  
21062 historical implementations support such usage for any of the *file* operands.

21063 A description of the *translation table* was deleted from early proposals because of its relatively  
21064 low usage in historical applications.

21065 The change to the definition of the *input()* function that allows buffering of input presents the  
21066 opportunity for major performance gains in some applications.

21067 The following examples clarify the differences between *lex* regular expressions and regular  
21068 expressions appearing elsewhere in this volume of IEEE Std 1003.1-2001. For regular expressions

21069 of the form " $r/x$ ", the string matching  $r$  is always returned; confusion may arise when the  
21070 beginning of  $x$  matches the trailing portion of  $r$ . For example, given the regular expression  
21071 " $a*b/cc$ " and the input "aaabcc", *yytext* would contain the string "aaab" on this match. But  
21072 given the regular expression " $x*/xy$ " and the input "xxxxy", the token **xxx**, not **xx**, is returned  
21073 by some implementations because **xxx** matches " $x*$ ".

21074 In the rule " $ab*/bc$ ", the " $b*$ " at the end of  $r$  extends  $r$ 's match into the beginning of the  
21075 trailing context, so the result is unspecified. If this rule were " $ab/bc$ ", however, the rule  
21076 matches the text "ab" when it is followed by the text "bc". In this latter case, the matching of  $r$   
21077 cannot extend into the beginning of  $x$ , so the result is specified.

#### 21078 **FUTURE DIRECTIONS**

21079 None.

#### 21082 **CHANGE HISTORY**

21083 First released in Issue 2.

#### 21084 **Issue 6**

21085 This utility is marked as part of the C-Language Development Utilities option.

21086 The obsolescent **-c** option is withdrawn in this issue.

21087 The normative text is reworded to avoid use of the term "must" for application requirements.

21088 **NAME**21089 link — call *link()* function21090 **SYNOPSIS**21091 xSI link *file1 file2*

21092

21093 **DESCRIPTION**21094 The *link* utility shall perform the function call:21095 link(*file1*, *file2*);21096 A user may need appropriate privilege to invoke the *link* utility.21097 **OPTIONS**

21098 None.

21099 **OPERANDS**

21100 The following operands shall be supported:

21101 *file1* The pathname of an existing file.21102 *file2* The pathname of the new directory entry to be created.21103 **STDIN**

21104 Not used.

21105 **INPUT FILES**

21106 Not used.

21107 **ENVIRONMENT VARIABLES**21108 The following environment variables shall affect the execution of *link*:

21109 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 21110 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21111 Internationalization Variables for the precedence of internationalization variables  
 21112 used to determine the values of locale categories.)

21113 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 21114 internationalization variables.

21115 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 21116 characters (for example, single-byte as opposed to multi-byte characters in  
 21117 arguments).

21118 *LC\_MESSAGES*

21119 Determine the locale that should be used to affect the format and contents of  
 21120 diagnostic messages written to standard error.

21121 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.21122 **ASYNCHRONOUS EVENTS**

21123 Default.

21124 **STDOUT**

21125 None.

21126 **STDERR**

21127 The standard error shall be used only for diagnostic messages.

21128 **OUTPUT FILES**

21129 None.

21130 **EXTENDED DESCRIPTION**

21131 None.

21132 **EXIT STATUS**

21133 The following exit values shall be returned:

21134 0 Successful completion.

21135 &gt;0 An error occurred.

21136 **CONSEQUENCES OF ERRORS**

21137 Default.

21138 **APPLICATION USAGE**

21139 None.

21145 None.

21146 **SEE ALSO**21147 *ln*, *unlink*, the System Interfaces volume of IEEE Std 1003.1-2001, *link()*21148 **CHANGE HISTORY**

21149 First released in Issue 5.

21150 **NAME**

21151       ln — link files

21152 **SYNOPSIS**21153       ln [-fs] *source\_file target\_file*21154       ln [-fs] *source\_file ... target\_dir*21155 **DESCRIPTION**

21156       In the first synopsis form, the *ln* utility shall create a new directory entry (link) at the destination  
 21157       path specified by the *target\_file* operand. If the **-s** option is specified, a symbolic link shall be  
 21158       created for the file specified by the *source\_file* operand. This first synopsis form shall be assumed  
 21159       when the final operand does not name an existing directory; if more than two operands are  
 21160       specified and the final is not an existing directory, an error shall result.

21161       In the second synopsis form, the *ln* utility shall create a new directory entry (link), or if the **-s**  
 21162       option is specified a symbolic link, for each file specified by a *source\_file* operand, at a destination  
 21163       path in the existing directory named by *target\_dir*.

21164       If the last operand specifies an existing file of a type not specified by the System Interfaces  
 21165       volume of IEEE Std 1003.1-2001, the behavior is implementation-defined.

21166       The corresponding destination path for each *source\_file* shall be the concatenation of the target  
 21167       directory pathname, a slash character, and the last pathname component of the *source\_file*. The  
 21168       second synopsis form shall be assumed when the final operand names an existing directory.

21169       For each *source\_file*:

- 21170       1. If the destination path exists:
  - 21171           a. If the **-f** option is not specified, *ln* shall write a diagnostic message to standard error,  
 21172           do nothing more with the current *source\_file*, and go on to any remaining *source\_files*.
  - 21173           b. Actions shall be performed equivalent to the *unlink()* function defined in the System  
 21174           Interfaces volume of IEEE Std 1003.1-2001, called using *destination* as the *path*  
 21175           argument. If this fails for any reason, *ln* shall write a diagnostic message to standard  
 21176           error, do nothing more with the current *source\_file*, and go on to any remaining  
 21177           *source\_files*.
- 21178       2. If the **-s** option is specified, *ln* shall create a symbolic link named by the destination path  
 21179       and containing as its pathname *source\_file*. The *ln* utility shall do nothing more with  
 21180       *source\_file* and shall go on to any remaining files.
- 21181       3. If *source\_file* is a symbolic link, actions shall be performed equivalent to the *link()* function  
 21182       using the object that *source\_file* references as the *path1* argument and the destination path  
 21183       as the *path2* argument. The *ln* utility shall do nothing more with *source\_file* and shall go on  
 21184       to any remaining files.
- 21185       4. Actions shall be performed equivalent to the *link()* function defined in the System  
 21186       Interfaces volume of IEEE Std 1003.1-2001 using *source\_file* as the *path1* argument, and the  
 21187       destination path as the *path2* argument.

21188 **OPTIONS**

21189       The *ln* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 21190       Utility Syntax Guidelines.

21191       The following option shall be supported:

21192       **-f**           Force existing destination pathnames to be removed to allow the link.

21193            **-s**            Create symbolic links instead of hard links.

#### 21194 **OPERANDS**

21195            The following operands shall be supported:

21196            *source\_file*      A pathname of a file to be linked. If the **-s** option is specified, no restrictions on the  
21197                                   type of file or on its existence shall be made. If the **-s** option is not specified,  
21198                                   whether a directory can be linked is implementation-defined.

21199            *target\_file*        The pathname of the new directory entry to be created.

21200            *target\_dir*          A pathname of an existing directory in which the new directory entries are created.

#### 21201 **STDIN**

21202            Not used.

#### 21203 **INPUT FILES**

21204            None.

#### 21205 **ENVIRONMENT VARIABLES**

21206            The following environment variables shall affect the execution of *ln*:

21207            *LANG*                Provide a default value for the internationalization variables that are unset or null.  
21208                                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
21209                                   Internationalization Variables for the precedence of internationalization variables  
21210                                   used to determine the values of locale categories.)

21211            *LC\_ALL*              If set to a non-empty string value, override the values of all the other  
21212                                   internationalization variables.

21213            *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
21214                                   characters (for example, single-byte as opposed to multi-byte characters in  
21215                                   arguments).

21216            *LC\_MESSAGES*

21217                                   Determine the locale that should be used to affect the format and contents of  
21218                                   diagnostic messages written to standard error.

21219 xSI        *NLSPATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 21220 **ASYNCHRONOUS EVENTS**

21221            Default.

#### 21222 **STDOUT**

21223            Not used.

#### 21224 **STDERR**

21225            The standard error shall be used only for diagnostic messages.

#### 21226 **OUTPUT FILES**

21227            None.

#### 21228 **EXTENDED DESCRIPTION**

21229            None.

#### 21230 **EXIT STATUS**

21231            The following exit values shall be returned:

21232            0    All the specified files were linked successfully.

21233            >0   An error occurred.

21234 **CONSEQUENCES OF ERRORS**

21235 Default.

21236 **APPLICATION USAGE**

21237 None.

21238 **EXAMPLES**

21239 None.

21240 **RATIONALE**

21241 Some historic versions of *ln* (including the one specified by the SVID) unlink the destination file,  
 21242 if it exists, by default. If the mode does not permit writing, these versions prompt for  
 21243 confirmation before attempting the unlink. In these versions the **-f** option causes *ln* not to  
 21244 attempt to prompt for confirmation.

21245 This allows *ln* to succeed in creating links when the target file already exists, even if the file itself  
 21246 is not writable (although the directory must be). Early proposals specified this functionality.

21247 This volume of IEEE Std 1003.1-2001 does not allow the *ln* utility to unlink existing destination  
 21248 paths by default for the following reasons:

- 21249 • The *ln* utility has historically been used to provide locking for shell applications, a usage that  
 21250 is incompatible with *ln* unlinking the destination path by default. There was no  
 21251 corresponding technical advantage to adding this functionality.
- 21252 • This functionality gave *ln* the ability to destroy the link structure of files, which changes the  
 21253 historical behavior of *ln*.
- 21254 • This functionality is easily replicated with a combination of *rm* and *ln*.
- 21255 • It is not historical practice in many systems; BSD and BSD-derived systems do not support  
 21256 this behavior. Unfortunately, whichever behavior is selected can cause scripts written  
 21257 expecting the other behavior to fail.
- 21258 • It is preferable that *ln* perform in the same manner as the *link()* function, which does not  
 21259 permit the target to exist already.

21260 This volume of IEEE Std 1003.1-2001 retains the **-f** option to provide support for shell scripts  
 21261 depending on the SVID semantics. It seems likely that shell scripts would not be written to  
 21262 handle prompting by *ln* and would therefore have specified the **-f** option.

21263 The **-f** option is an undocumented feature of many historical versions of the *ln* utility, allowing  
 21264 linking to directories. These versions require modification.

21265 Early proposals of this volume of IEEE Std 1003.1-2001 also required a **-i** option, which behaved  
 21266 like the **-i** options in *cp* and *mv*, prompting for confirmation before unlinking existing files. This  
 21267 was not historical practice for the *ln* utility and has been omitted.

21268 **FUTURE DIRECTIONS**

21269 None.

21270 **SEE ALSO**21271 *chmod*, *find*, *pax*, *rm*, the System Interfaces volume of IEEE Std 1003.1-2001, *link()*, *unlink()*21272 **CHANGE HISTORY**

21273 First released in Issue 2.

21274 **Issue 6**

21275 The *ln* utility is updated to include symbolic link processing as defined in the IEEE P1003.2b  
21276 draft standard.

21277 **NAME**

21278           locale — get locale-specific information

21279 **SYNOPSIS**

21280           locale [-a | -m]

21281           locale [-ck] *name*...21282 **DESCRIPTION**

21283           The *locale* utility shall write information about the current locale environment, or all public  
 21284           locales, to the standard output. For the purposes of this section, a *public locale* is one provided by  
 21285           the implementation that is accessible to the application.

21286           When *locale* is invoked without any arguments, it shall summarize the current locale  
 21287           environment for each locale category as determined by the settings of the environment variables  
 21288           defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21289           When invoked with operands, it shall write values that have been assigned to the keywords in  
 21290           the locale categories, as follows:

- 21291           • Specifying a keyword name shall select the named keyword and the category containing that  
 21292           keyword.
- 21293           • Specifying a category name shall select the named category and all keywords in that  
 21294           category.

21295 **OPTIONS**

21296           The *locale* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 21297           12.2, Utility Syntax Guidelines.

21298           The following options shall be supported:

- 21299           **-a**           Write information about all available public locales. The available locales shall  
 21300           include **POSIX**, representing the POSIX locale. The manner in which the  
 21301           implementation determines what other locales are available is implementation-  
 21302           defined.
- 21303           **-c**           Write the names of selected locale categories; see the STDOUT section. The **-c**  
 21304           option increases readability when more than one category is selected (for example,  
 21305           via more than one keyword name or via a category name). It is valid both with  
 21306           and without the **-k** option.
- 21307           **-k**           Write the names and values of selected keywords. The implementation may omit  
 21308           values for some keywords; see the OPERANDS section.
- 21309           **-m**           Write names of available charmaps; see the Base Definitions volume of  
 21310           IEEE Std 1003.1-2001, Section 6.1, Portable Character Set.

21311 **OPERANDS**

21312           The following operand shall be supported:

- 21313           *name*       The name of a locale category as defined in the Base Definitions volume of  
 21314           IEEE Std 1003.1-2001, Chapter 7, Locale, the name of a keyword in a locale  
 21315           category, or the reserved name **charmap**. The named category or keyword shall be  
 21316           selected for output. If a single *name* represents both a locale category name and a  
 21317           keyword name in the current locale, the results are unspecified. Otherwise, both  
 21318           category and keyword names can be specified as *name* operands, in any sequence.  
 21319           It is implementation-defined whether any keyword values are written for the  
 21320           categories *LC\_CTYPE* and *LC\_COLLATE*.

21321 **STDIN**

21322 Not used.

21323 **INPUT FILES**

21324 None.

21325 **ENVIRONMENT VARIABLES**21326 The following environment variables shall affect the execution of *locale*:

21327 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 21328 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21329 Internationalization Variables for the precedence of internationalization variables  
 21330 used to determine the values of locale categories.)

21331 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 21332 internationalization variables.

21333 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 21334 characters (for example, single-byte as opposed to multi-byte characters in  
 21335 arguments and input files).

21336 *LC\_MESSAGES*

21337 Determine the locale that should be used to affect the format and contents of  
 21338 diagnostic messages written to standard error.

21339 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

21340 XSI The application shall ensure that the *LANG*, *LC\_\**, and *NLSPATH* environment variables specify  
 21341 the current locale environment to be written out; they shall be used if the *-a* option is not  
 21342 specified.

21343 **ASYNCHRONOUS EVENTS**

21344 Default.

21345 **STDOUT**

21346 If *locale* is invoked without any options or operands, the names and values of the *LANG* and  
 21347 *LC\_\** environment variables described in this volume of IEEE Std 1003.1-2001 shall be written to  
 21348 the standard output, one variable per line, with *LANG* first, and each line using the following  
 21349 format. Only those variables set in the environment and not overridden by *LC\_ALL* shall be  
 21350 written using this format:

21351 "%s=%s\n", &lt;variable\_name&gt;, &lt;value&gt;

21352 The names of those *LC\_\** variables associated with locale categories defined in this volume of  
 21353 IEEE Std 1003.1-2001 that are not set in the environment or are overridden by *LC\_ALL* shall be  
 21354 written in the following format:

21355 "%s=\"%s\"\n", &lt;variable\_name&gt;, &lt;implied value&gt;

21356 The <implied value> shall be the name of the locale that has been selected for that category by the  
 21357 implementation, based on the values in *LANG* and *LC\_ALL*, as described in the Base Definitions  
 21358 volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

21359 The <value> and <implied value> shown above shall be properly quoted for possible later reentry  
 21360 to the shell. The <value> shall not be quoted using double-quotes (so that it can be distinguished  
 21361 by the user from the <implied value> case, which always requires double-quotes).

21362 The *LC\_ALL* variable shall be written last, using the first format shown above. If it is not set, it  
 21363 shall be written as:

21364 "LC\_ALL=\n"

21365 If any arguments are specified:

21366 1. If the **-a** option is specified, the names of all the public locales shall be written, each in the  
21367 following format:

21368 "%s\n", <locale name>

21369 2. If the **-c** option is specified, the names of all selected categories shall be written, each in the  
21370 following format:

21371 "%s\n", <category name>

21372 If keywords are also selected for writing (see following items), the category name output  
21373 shall precede the keyword output for that category.

21374 If the **-c** option is not specified, the names of the categories shall not be written; only the  
21375 keywords, as selected by the <name> operand, shall be written.

21376 3. If the **-k** option is specified, the names and values of selected keywords shall be written. If  
21377 a value is non-numeric, it shall be written in the following format:

21378 "%s=\"%s\"\\n", <keyword name>, <keyword value>

21379 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
21380 *localedef* **-f** option when the locale was created shall be written, with the word **charmap** as  
21381 <keyword name>.

21382 If a value is numeric, it shall be written in one of the following formats:

21383 "%s=%d\n", <keyword name>, <keyword value>

21384 "%s=%c%o\n", <keyword name>, <escape character>, <keyword value>

21385 "%s=%cx%x\n", <keyword name>, <escape character>, <keyword value>

21386 where the <escape character> is that identified by the **escape\_char** keyword in the current  
21387 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3, Locale  
21388 Definition.

21389 Compound keyword values (list entries) shall be separated in the output by semicolons.  
21390 When included in keyword values, the semicolon, the double-quote, the backslash, and  
21391 any control character shall be preceded (escaped) with the escape character.

21392 4. If the **-k** option is not specified, selected keyword values shall be written, each in the  
21393 following format:

21394 "%s\n", <keyword value>

21395 If the keyword was **charmap**, the name of the charmap (if any) that was specified via the  
21396 *localedef* **-f** option when the locale was created shall be written.

21397 5. If the **-m** option is specified, then a list of all available charmaps shall be written, each in  
21398 the format:

21399 "%s\n", <charmap>

21400 where <charmap> is in a format suitable for use as the option-argument to the *localedef* **-f**  
21401 option.

21402 **STDERR**

21403       The standard error shall be used only for diagnostic messages.

21404 **OUTPUT FILES**

21405       None.

21406 **EXTENDED DESCRIPTION**

21407       None.

21408 **EXIT STATUS**

21409       The following exit values shall be returned:

21410       0   All the requested information was found and output successfully.

21411       >0   An error occurred.

21412 **CONSEQUENCES OF ERRORS**

21413       Default.

21414 **APPLICATION USAGE**

21415       If the *LANG* environment variable is not set or set to an empty value, or one of the *LC\_\**  
21416       environment variables is set to an unrecognized value, the actual locales assumed (if any) are  
21417       implementation-defined as described in the Base Definitions volume of IEEE Std 1003.1-2001,  
21418       Chapter 8, Environment Variables.

21419       Implementations are not required to write out the actual values for keywords in the categories  
21420       *LC\_CTYPE* and *LC\_COLLATE*; however, they must write out the categories (allowing an  
21421       application to determine, for example, which character classes are available).

21422 **EXAMPLES**

21423       In the following examples, the assumption is that locale environment variables are set as  
21424       follows:

21425       LANG=locale\_x  
21426       LC\_COLLATE=locale\_y

21427       The command *locale* would result in the following output:

21428       LANG=locale\_x  
21429       LC\_CTYPE="locale\_x"  
21430       LC\_COLLATE=locale\_y  
21431       LC\_TIME="locale\_x"  
21432       LC\_NUMERIC="locale\_x"  
21433       LC\_MONETARY="locale\_x"  
21434       LC\_MESSAGES="locale\_x"  
21435       LC\_ALL=

21436       The order of presentation of the categories is not specified by this volume of  
21437       IEEE Std 1003.1-2001.

21438       The command:

21439       LC\_ALL=POSIX locale -ck decimal\_point

21440       would produce:

21441       LC\_NUMERIC  
21442       decimal\_point="."

21443       The following command shows an application of *locale* to determine whether a user-supplied  
21444       response is affirmative:

```

21445 if printf "%s\n" "$response" | grep -Eq "$(locale yesexpr) "
21446 then
21447 affirmative processing goes here
21448 else
21449 non-affirmative processing goes here
21450 fi

```

#### 21451 **RATIONALE**

21452 The output for categories *LC\_CTYPE* and *LC\_COLLATE* has been made implementation-defined  
 21453 because there is a questionable value in having a shell script receive an entire array of characters.  
 21454 It is also difficult to return a logical collation description, short of returning a complete *localedef*  
 21455 source.

21456 The **-m** option was included to allow applications to query for the existence of charmaps. The  
 21457 output is a list of the charmaps (implementation-supplied and user-supplied, if any) on the  
 21458 system.

21459 The **-c** option was included for readability when more than one category is selected (for  
 21460 example, via more than one keyword name or via a category name). It is valid both with and  
 21461 without the **-k** option.

21462 The **charmap** keyword, which returns the name of the charmap (if any) that was used when the  
 21463 current locale was created, was included to allow applications needing the information to  
 21464 retrieve it.

#### 21465 **FUTURE DIRECTIONS**

21466 None.

#### 21469 **CHANGE HISTORY**

21470 First released in Issue 4.

#### 21471 **Issue 5**

21472 The FUTURE DIRECTIONS section is added.

#### 21473 **Issue 6**

21474 The normative text is reworded to avoid use of the term “must” for application requirements.

21475 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/30 is applied, correcting an editorial error |  
 21476 in the STDOUT section. |

21477 **NAME**

21478 localedef — define locale environment

21479 **SYNOPSIS**

21480 localedef [-c] [-f *charmap*] [-i *sourcefile*] [-u *code\_set\_name*] *name*

21481 **DESCRIPTION**

21482 The *localedef* utility shall convert source definitions for locale categories into a format usable by  
 21483 the functions and utilities whose operational behavior is determined by the setting of the locale  
 21484 environment variables defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter  
 21485 7, Locale. It is implementation-defined whether users have the capability to create new locales,  
 21486 in addition to those supplied by the implementation. If the symbolic constant  
 21487 XSI POSIX2\_LOCALEDEF is defined, the system supports the creation of new locales. On XSI-  
 21488 conformant systems, the symbolic constant POSIX2\_LOCALEDEF shall be defined.

21489 The utility shall read source definitions for one or more locale categories belonging to the same  
 21490 locale from the file named in the -i option (if specified) or from standard input.

21491 The *name* operand identifies the target locale. The utility shall support the creation of *public*, or  
 21492 generally accessible locales, as well as *private*, or restricted-access locales. Implementations may  
 21493 restrict the capability to create or modify public locales to users with the appropriate privileges.

21494 Each category source definition shall be identified by the corresponding environment variable  
 21495 name and terminated by an **END** *category-name* statement. The following categories shall be  
 21496 supported. In addition, the input may contain source for implementation-defined categories.

21497 *LC\_CTYPE* Defines character classification and case conversion.

21498 *LC\_COLLATE*  
 21499 Defines collation rules.

21500 *LC\_MONETARY*  
 21501 Defines the format and symbols used in formatting of monetary information.

21502 *LC\_NUMERIC*  
 21503 Defines the decimal delimiter, grouping, and grouping symbol for non-monetary  
 21504 numeric editing.

21505 *LC\_TIME* Defines the format and content of date and time information.

21506 *LC\_MESSAGES*  
 21507 Defines the format and values of affirmative and negative responses.

21508 **OPTIONS**

21509 The *localedef* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 21510 12.2, Utility Syntax Guidelines.

21511 The following options shall be supported:

21512 -c Create permanent output even if warning messages have been issued.

21513 -f *charmap* Specify the pathname of a file containing a mapping of character symbols and  
 21514 collating element symbols to actual character encodings. The format of the  
 21515 *charmap* is described in the Base Definitions volume of IEEE Std 1003.1-2001,  
 21516 Section 6.4, Character Set Description File. The application shall ensure that this  
 21517 option is specified if symbolic names (other than collating symbols defined in a  
 21518 **collating-symbol** keyword) are used. If the -f option is not present, an  
 21519 implementation-defined character mapping shall be used.

21520        **-i** *inputfile*   The pathname of a file containing the source definitions. If this option is not  
 21521                           present, source definitions shall be read from standard input. The format of the  
 21522                           *inputfile* is described in the Base Definitions volume of IEEE Std 1003.1-2001,  
 21523                           Section 7.3, Locale Definition.

21524        **-u** *code\_set\_name*       Specify the name of a codeset used as the target mapping of character symbols and  
 21525                           collating element symbols whose encoding values are defined in terms of the  
 21526                           ISO/IEC 10646-1:2000 standard position constant values.  
 21527

## 21528 OPERANDS

21529        The following operand shall be supported:

21530        *name*           Identifies the locale; see the Base Definitions volume of IEEE Std 1003.1-2001,  
 21531                           Chapter 7, Locale for a description of the use of this name. If the name contains one  
 21532                           or more slash characters, *name* shall be interpreted as a pathname where the  
 21533                           created locale definitions shall be stored. If *name* does not contain any slash  
 21534                           characters, the interpretation of the name is implementation-defined and the locale  
 21535                           shall be public. This capability may be restricted to users with appropriate  
 21536                           privileges. (As a consequence of specifying one *name*, although several categories  
 21537                           can be processed in one execution, only categories belonging to the same locale can  
 21538                           be processed.)

## 21539 STDIN

21540        Unless the **-i** option is specified, the standard input shall be a text file containing one or more  
 21541        locale category source definitions, as described in the Base Definitions volume of  
 21542        IEEE Std 1003.1-2001, Section 7.3, Locale Definition. When lines are continued using the escape  
 21543        character mechanism, there is no limit to the length of the accumulated continued line.

## 21544 INPUT FILES

21545        The character set mapping file specified as the *charmap* option-argument is described in the Base  
 21546        Definitions volume of IEEE Std 1003.1-2001, Section 6.4, Character Set Description File. If a locale  
 21547        category source definition contains a **copy** statement, as defined in the Base Definitions volume  
 21548        of IEEE Std 1003.1-2001, Chapter 7, Locale, and the **copy** statement names a valid, existing locale,  
 21549        then *localedef* shall behave as if the source definition had contained a valid category source  
 21550        definition for the named locale.

## 21551 ENVIRONMENT VARIABLES

21552        The following environment variables shall affect the execution of *localedef*:

21553        **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 21554                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21555                           Internationalization Variables for the precedence of internationalization variables  
 21556                           used to determine the values of locale categories.)

21557        **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
 21558                           internationalization variables.

21559        **LC\_COLLATE**        (This variable has no affect on *localedef*; the POSIX locale is used for this category.)  
 21560

21561        **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 21562                           characters (for example, single-byte as opposed to multi-byte characters in  
 21563                           arguments and input files). This variable has no affect on the processing of *localedef*  
 21564                           input data; the POSIX locale is used for this purpose, regardless of the value of this  
 21565                           variable.

21566 *LC\_MESSAGES*

21567 Determine the locale that should be used to affect the format and contents of  
21568 diagnostic messages written to standard error.

21569 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 21570 ASYNCHRONOUS EVENTS

21571 Default.

## 21572 STDOUT

21573 The utility shall report all categories successfully processed, in an unspecified format.

## 21574 STDERR

21575 The standard error shall be used only for diagnostic messages.

## 21576 OUTPUT FILES

21577 The format of the created output is unspecified. If the *name* operand does not contain a slash, the  
21578 existence of an output file for the locale is unspecified.

## 21579 EXTENDED DESCRIPTION

21580 When the *-u* option is used, the *code\_set\_name* option-argument shall be interpreted as an  
21581 implementation-defined name of a codeset to which the ISO/IEC 10646-1:2000 standard  
21582 position constant values shall be converted via an implementation-defined method. Both the  
21583 ISO/IEC 10646-1:2000 standard position constant values and other formats (decimal,  
21584 hexadecimal, or octal) shall be valid as encoding values within the *charmap* file. The codeset  
21585 represented by the implementation-defined name can be any codeset that is supported by the  
21586 implementation.

21587 When conflicts occur between the *charmap* specification of *<code\_set\_name>*, *<mb\_cur\_max>*, or  
21588 *<mb\_cur\_min>* and the implementation-defined interpretation of these respective items for the  
21589 codeset represented by the *-u* option-argument *code\_set\_name*, the result is unspecified.

21590 When conflicts occur between the *charmap* encoding values specified for symbolic names of  
21591 characters of the portable character set and the implementation-defined assignment of character  
21592 encoding values, the result is unspecified.

21593 If a non-printable character in the *charmap* has a width specified that is not *-1*, *localedef* shall  
21594 generate a warning.

## 21595 EXIT STATUS

21596 The following exit values shall be returned:

- 21597 0 No errors occurred and the locales were successfully created.
- 21598 1 Warnings occurred and the locales were successfully created.
- 21599 2 The locale specification exceeded implementation limits or the coded character set or sets  
21600 used were not supported by the implementation, and no locale was created.
- 21601 3 The capability to create new locales is not supported by the implementation.
- 21602 >3 Warnings or errors occurred and no output was created.

## 21603 CONSEQUENCES OF ERRORS

21604 If an error is detected, no permanent output shall be created.

21605 If warnings occur, permanent output shall be created if the *-c* option was specified. The  
21606 following conditions shall cause warning messages to be issued:

- 21607 • If a symbolic name not found in the *charmap* file is used for the descriptions of the *LC\_CTYPE*  
21608 or *LC\_COLLATE* categories (for other categories, this shall be an error condition).

- 21609           • If the number of operands to the **order** keyword exceeds the {COLL\_WEIGHTS\_MAX} limit.
- 21610           • If optional keywords not supported by the implementation are present in the source.
- 21611           • If a non-printable character has a width specified other than -1.
- 21612           Other implementation-defined conditions may also cause warnings.

#### 21613 **APPLICATION USAGE**

21614           The *charmap* definition is optional, and is contained outside the locale definition. This allows  
21615           both completely self-defined source files, and generic sources (applicable to more than one  
21616           codeset). To aid portability, all *charmap* definitions must use the same symbolic names for the  
21617           portable character set. As explained in the Base Definitions volume of IEEE Std 1003.1-2001,  
21618           Section 6.4, Character Set Description File, it is implementation-defined whether or not users or  
21619           applications can provide additional character set description files. Therefore, the **-f** option might  
21620           be operable only when an implementation-defined *charmap* is named.

#### 21621 **EXAMPLES**

21622           None.

#### 21623 **RATIONALE**

21624           The output produced by the *localedef* utility is implementation-defined. The *name* operand is  
21625           used to identify the specific locale. (As a consequence, although several categories can be  
21626           processed in one execution, only categories belonging to the same locale can be processed.)

#### 21627 **FUTURE DIRECTIONS**

21628           None.

#### 21629 **SEE ALSO**

21630           *locale*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3, Locale Definition

#### 21631 **CHANGE HISTORY**

21632           First released in Issue 4.

#### 21633 **Issue 6**

21634           The **-u** option is added, as specified in the IEEE P1003.2b draft standard.

21635           The normative text is reworded to avoid use of the term “must” for application requirements.

21636 **NAME**

21637           logger — log messages

21638 **SYNOPSIS**21639           logger *string* ...21640 **DESCRIPTION**

21641           The *logger* utility saves a message, in an unspecified manner and format, containing the *string*  
 21642           operands provided by the user. The messages are expected to be evaluated later by personnel  
 21643           performing system administration tasks.

21644           It is implementation-defined whether messages written in locales other than the POSIX locale  
 21645           are effective.

21646 **OPTIONS**

21647           None.

21648 **OPERANDS**

21649           The following operand shall be supported:

21650           *string*       One of the string arguments whose contents are concatenated together, in the  
 21651                           order specified, separated by single <space>s.

21652 **STDIN**

21653           Not used.

21654 **INPUT FILES**

21655           None.

21656 **ENVIRONMENT VARIABLES**21657           The following environment variables shall affect the execution of *logger*:

21658           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 21659                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21660                           Internationalization Variables for the precedence of internationalization variables  
 21661                           used to determine the values of locale categories.)

21662           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 21663                           internationalization variables.

21664           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 21665                           characters (for example, single-byte as opposed to multi-byte characters in  
 21666                           arguments).

21667           *LC\_MESSAGES*

21668                           Determine the locale that should be used to affect the format and contents of  
 21669                           diagnostic messages written to standard error. (This means diagnostics from *logger*  
 21670                           to the user or application, not diagnostic messages that the user is sending to the  
 21671                           system administrator.)

21672 *XSI*       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

21673 **ASYNCHRONOUS EVENTS**

21674           Default.

21675 **STDOUT**

21676           Not used.

21677 **STDERR**

21678           The standard error shall be used only for diagnostic messages.

21679 **OUTPUT FILES**

21680           Unspecified.

21681 **EXTENDED DESCRIPTION**

21682           None.

21683 **EXIT STATUS**

21684           The following exit values shall be returned:

21685           0   Successful completion.

21686           >0  An error occurred.

21687 **CONSEQUENCES OF ERRORS**

21688           Default.

21689 **APPLICATION USAGE**

21690           This utility allows logging of information for later use by a system administrator or programmer  
21691           in determining why non-interactive utilities have failed. The locations of the saved messages,  
21692           their format, and retention period are all unspecified. There is no method for a conforming  
21693           application to read messages, once written.

21694 **EXAMPLES**

21695           A batch application, running non-interactively, tries to read a configuration file and fails; it may  
21696           attempt to notify the system administrator with:

21697           logger myname: unable to read file foo. [timestamp]

21698 **RATIONALE**

21699           The standard developers believed strongly that some method of alerting administrators to errors  
21700           was necessary. The obvious example is a batch utility, running non-interactively, that is unable  
21701           to read its configuration files or that is unable to create or write its results file. However, the  
21702           standard developers did not wish to define the format or delivery mechanisms as they have  
21703           historically been (and will probably continue to be) very system-specific, as well as involving  
21704           functionality clearly outside the scope of this volume of IEEE Std 1003.1-2001.

21705           The text with *LC\_MESSAGES* about diagnostic messages means diagnostics from *logger* to the  
21706           user or application, not diagnostic messages that the user is sending to the system administrator.

21707           Multiple *string* arguments are allowed, similar to *echo*, for ease-of-use.

21708           Like the utilities *mailx* and *lp*, *logger* is admittedly difficult to test. This was not deemed sufficient  
21709           justification to exclude these utilities from this volume of IEEE Std 1003.1-2001. It is also  
21710           arguable that they are, in fact, testable, but that the tests themselves are not portable.

21711 **FUTURE DIRECTIONS**

21712           None.

21713 **SEE ALSO**

21714           *lp*, *mailx*, *write*

21715 **CHANGE HISTORY**

21716           First released in Issue 4.

21717 **NAME**

21718 logname — return the user's login name

21719 **SYNOPSIS**

21720 logname

21721 **DESCRIPTION**

21722 The *logname* utility shall write the user's login name to standard output. The login name shall be  
 21723 the string that would be returned by the *getlogin()* function defined in the System Interfaces  
 21724 volume of IEEE Std 1003.1-2001. Under the conditions where the *getlogin()* function would fail,  
 21725 the *logname* utility shall write a diagnostic message to standard error and exit with a non-zero  
 21726 exit status.

21727 **OPTIONS**

21728 None.

21729 **OPERANDS**

21730 None.

21731 **STDIN**

21732 Not used.

21733 **INPUT FILES**

21734 None.

21735 **ENVIRONMENT VARIABLES**21736 The following environment variables shall affect the execution of *logname*:

21737 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 21738 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21739 Internationalization Variables for the precedence of internationalization variables  
 21740 used to determine the values of locale categories.)

21741 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 21742 internationalization variables.

21743 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 21744 characters (for example, single-byte as opposed to multi-byte characters in  
 21745 arguments).

21746 *LC\_MESSAGES*

21747 Determine the locale that should be used to affect the format and contents of  
 21748 diagnostic messages written to standard error.

21749 *XS1* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

21750 **ASYNCHRONOUS EVENTS**

21751 Default.

21752 **STDOUT**21753 The *logname* utility output shall be a single line consisting of the user's login name:

21754 "%s\n", &lt;login name&gt;

21755 **STDERR**

21756 The standard error shall be used only for diagnostic messages.

21757 **OUTPUT FILES**

21758           None.

21759 **EXTENDED DESCRIPTION**

21760           None.

21761 **EXIT STATUS**

21762           The following exit values shall be returned:

21763           0   Successful completion.

21764           &gt;0  An error occurred.

21765 **CONSEQUENCES OF ERRORS**

21766           Default.

21767 **APPLICATION USAGE**21768           The *logname* utility explicitly ignores the *LOGNAME* environment variable because environment changes could produce erroneous results.21770 **EXAMPLES**

21771           None.

21772 **RATIONALE**21773           The **passwd** file is not listed as required because the implementation may have other means of mapping login names.21775 **FUTURE DIRECTIONS**

21776           None.

21777 **SEE ALSO**21778           *id*, *who*, the System Interfaces volume of IEEE Std 1003.1-2001, *getlogin()*21779 **CHANGE HISTORY**

21780           First released in Issue 2.

21781 **NAME**

21782       lp — send files to a printer

21783 **SYNOPSIS**21784       lp [-c] [-d *dest*] [-n *copies*] [-msw] [-o *option*]... [-t *title*] [*file*...]21785 **DESCRIPTION**

21786       The *lp* utility shall copy the input files to an output destination in an unspecified manner. The  
 21787       default output destination should be to a hardcopy device, such as a printer or microfilm  
 21788       recorder, that produces non-volatile, human-readable documents. If such a device is not  
 21789       available to the application, or if the system provides no such device, the *lp* utility shall exit with  
 21790       a non-zero exit status.

21791       The actual writing to the output device may occur some time after the *lp* utility successfully  
 21792       exits. During the portion of the writing that corresponds to each input file, the implementation  
 21793       shall guarantee exclusive access to the device.

21794       The *lp* utility shall associate a unique *request ID* with each request.

21795       Normally, a banner page is produced to separate and identify each print job. This page may be  
 21796       suppressed by implementation-defined conditions, such as an operator command or one of the  
 21797       -o *option* values.

21798 **OPTIONS**

21799       The *lp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 21800       Utility Syntax Guidelines.

21801       The following options shall be supported:

21802       -c       Exit only after further access to any of the input files is no longer required. The  
 21803       application can then safely delete or modify the files without affecting the output  
 21804       operation. Normally, files are not copied, but are linked whenever possible. If the  
 21805       -c option is not given, then the user should be careful not to remove any of the  
 21806       files before the request has been printed in its entirety. It should also be noted that  
 21807       in the absence of the -c option, any changes made to the named files after the  
 21808       request is made but before it is printed may be reflected in the printed output. On  
 21809       some implementations, -c may be on by default.

21810       -d *dest*   Specify a string that names the destination (*dest*). If *dest* is a printer, the request  
 21811       shall be printed only on that specific printer. If *dest* is a class of printers, the request  
 21812       shall be printed on the first available printer that is a member of the class. Under  
 21813       certain conditions (printer unavailability, file space limitation, and so on), requests  
 21814       for specific destinations need not be accepted. Destination names vary between  
 21815       systems.

21816       If -d is not specified, and neither the *LPDEST* nor *PRINTER* environment variable  
 21817       is set, an unspecified destination is used. The -d *dest* option shall take precedence  
 21818       over *LPDEST*, which in turn shall take precedence over *PRINTER*. Results are  
 21819       undefined when *dest* contains a value that is not a valid destination name.

21820       -m       Send mail (see *mailx*) after the files have been printed. By default, no mail is sent  
 21821       upon normal completion of the print request.

21822       -n *copies*   Write *copies* number of copies of the files, where *copies* is a positive decimal integer.  
 21823       The methods for producing multiple copies and for arranging the multiple copies  
 21824       when multiple *file* operands are used are unspecified, except that each file shall be  
 21825       output as an integral whole, not interleaved with portions of other files.

21826        **-o option**        Specify printer-dependent or class-dependent *options*. Several such *options* may be  
 21827                                collected by specifying the **-o** option more than once.

21828        **-s**                Suppress messages from *lp*.

21829        **-t title**        Write *title* on the banner page of the output.

21830        **-w**                Write a message on the user's terminal after the files have been printed. If the user  
 21831                                is not logged in, then mail shall be sent instead.

## 21832 OPERANDS

21833        The following operand shall be supported:

21834        *file*              A pathname of a file to be output. If no *file* operands are specified, or if a *file*  
 21835                                operand is '-', the standard input shall be used. If a *file* operand is used, but the  
 21836                                **-c** option is not specified, the process performing the writing to the output device  
 21837                                may have user and group permissions that differ from that of the process invoking  
 21838                                *lp*.

## 21839 STDIN

21840        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 21841        See the INPUT FILES section.

## 21842 INPUT FILES

21843        The input files shall be text files.

## 21844 ENVIRONMENT VARIABLES

21845        The following environment variables shall affect the execution of *lp*:

21846        *LANG*              Provide a default value for the internationalization variables that are unset or null.  
 21847                                (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 21848                                Internationalization Variables for the precedence of internationalization variables  
 21849                                used to determine the values of locale categories.)

21850        *LC\_ALL*            If set to a non-empty string value, override the values of all the other  
 21851                                internationalization variables.

21852        *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 21853                                characters (for example, single-byte as opposed to multi-byte characters in  
 21854                                arguments and input files).

### 21855 LC\_MESSAGES

21856                                Determine the locale that should be used to affect the format and contents of  
 21857                                diagnostic messages written to standard error and informative messages written to  
 21858                                standard output.

21859        *LC\_TIME*        Determine the format and contents of date and time strings displayed in the *lp*  
 21860                                banner page, if any.

21861        *LPDEST*            Determine the destination. If the *LPDEST* environment variable is not set, the  
 21862                                *PRINTER* environment variable shall be used. The **-d dest** option takes precedence  
 21863                                over *LPDEST*. Results are undefined when **-d** is not specified and *LPDEST*  
 21864                                contains a value that is not a valid destination name.

21865 xSI        *NLS\_PATH*        Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

21866        *PRINTER*        Determine the output device or destination. If the *LPDEST* and *PRINTER*  
 21867                                environment variables are not set, an unspecified output device is used. The **-d**  
 21868                                *dest* option and the *LPDEST* environment variable shall take precedence over  
 21869                                *PRINTER*. Results are undefined when **-d** is not specified, *LPDEST* is unset, and

21870 *PRINTER* contains a value that is not a valid device or destination name.

21871 *TZ* Determine the timezone used to calculate date and time strings displayed in the *lp*  
 21872 banner page, if any. If *TZ* is unset or null, an unspecified default timezone shall be  
 21873 used.

#### 21874 **ASYNCHRONOUS EVENTS**

21875 Default.

#### 21876 **STDOUT**

21877 The *lp* utility shall write a *request ID* to the standard output, unless **-s** is specified. The format of  
 21878 the message is unspecified. The request ID can be used on systems supporting the historical  
 21879 *cancel* and *lpstat* utilities.

#### 21880 **STDERR**

21881 The standard error shall be used only for diagnostic messages.

#### 21882 **OUTPUT FILES**

21883 None.

#### 21884 **EXTENDED DESCRIPTION**

21885 None.

#### 21886 **EXIT STATUS**

21887 The following exit values shall be returned:

- 21888 0 All input files were processed successfully.
- 21889 >0 No output device was available, or an error occurred.

#### 21890 **CONSEQUENCES OF ERRORS**

21891 Default.

#### 21892 **APPLICATION USAGE**

21893 The *pr* and *fold* utilities can be used to achieve reasonable formatting for the implementation's  
 21894 default page size.

21895 A conforming application can use one of the *file* operands only with the **-c** option or if the file is  
 21896 publicly readable and guaranteed to be available at the time of printing. This is because  
 21897 IEEE Std 1003.1-2001 gives the implementation the freedom to queue up the request for printing  
 21898 at some later time by a different process that might not be able to access the file.

#### 21899 **EXAMPLES**

- 21900 1. To print file *file*:  
 21901 `lp -c file`
- 21902 2. To print multiple files with headers:  
 21903 `pr file1 file2 | lp`

#### 21904 **RATIONALE**

21905 The *lp* utility was designed to be a basic version of a utility that is already available in many  
 21906 historical implementations. The standard developers considered that it should be implementable  
 21907 simply as:

21908 `cat "$@" > /dev/lp`

21909 after appropriate processing of options, if that is how the implementation chose to do it and if  
 21910 exclusive access could be granted (so that two users did not write to the device simultaneously).  
 21911 Although in the future the standard developers may add other options to this utility, it should

21912 always be able to execute with no options or operands and send the standard input to an  
 21913 unspecified output device.

21914 This volume of IEEE Std 1003.1-2001 makes no representations concerning the format of the  
 21915 printed output, except that it must be “human-readable” and “non-volatile”. Thus, writing by  
 21916 default to a disk or tape drive or a display terminal would not qualify. (Such destinations are not  
 21917 prohibited when `-d dest`, `LPDEST`, or `PRINTER` are used, however.)

21918 This volume of IEEE Std 1003.1-2001 is worded such that a “print job” consisting of multiple  
 21919 input files, possibly in multiple copies, is guaranteed to print so that any one file is not  
 21920 intermixed with another, but there is no statement that all the files or copies have to print out  
 21921 together.

21922 The `-c` option may imply a spooling operation, but this is not required. The utility can be  
 21923 implemented to wait until the printer is ready and then wait until it is finished. Because of that,  
 21924 there is no attempt to define a queuing mechanism (priorities, classes of output, and so on).

21925 On some historical systems, the request ID reported on the STDOUT can be used to later cancel  
 21926 or find the status of a request using utilities not defined in this volume of IEEE Std 1003.1-2001.

21927 Although the historical System V `lp` and BSD `lpr` utilities have provided similar functionality,  
 21928 they used different names for the environment variable specifying the destination printer. Since  
 21929 the name of the utility here is `lp`, `LPDEST` (used by the System V `lp` utility) was given precedence  
 21930 over `PRINTER` (used by the BSD `lpr` utility). Since environments of users frequently contain one  
 21931 or the other environment variable, the `lp` utility is required to recognize both. If this was not  
 21932 done, many applications would send output to unexpected output devices when users moved  
 21933 from system to system.

21934 Some have commented that `lp` has far too little functionality to make it worthwhile. Requests  
 21935 have proposed additional options or operands or both that added functionality. The requests  
 21936 included:

- 21937 • Wording *requiring* the output to be “hardcopy”
- 21938 • A requirement for multiple printers
- 21939 • Options for supporting various page-description languages

21940 Given that a compliant system is not required to even have a printer, placing further restrictions  
 21941 upon the behavior of the printer is not useful. Since hardcopy format is so application-  
 21942 dependent, it is difficult, if not impossible, to select a reasonable subset of functionality that  
 21943 should be required on all compliant systems.

21944 The term *unspecified* is used in this section in lieu of *implementation-defined* as most known  
 21945 implementations would not be able to make definitive statements in their conformance  
 21946 documents; the existence and usage of printers is very dependent on how the system  
 21947 administrator configures each individual system.

21948 Since the default destination, device type, queuing mechanisms, and acceptable forms of input  
 21949 are all unspecified, usage guidelines for what a conforming application can do are as follows:

- 21950 • Use the command in a pipeline, or with `-c`, so that there are no permission problems and the  
 21951 files can be safely deleted or modified.
- 21952 • Limit output to text files of reasonable line lengths and printable characters and include no  
 21953 device-specific formatting information, such as a page description language. The meaning of  
 21954 “reasonable” in this context can only be answered as a quality-of-implementation issue, but  
 21955 it should be apparent from historical usage patterns in the industry and the locale. The `pr` and  
 21956 `fold` utilities can be used to achieve reasonable formatting for the default page size of the

21957 implementation.

21958 Alternatively, the application can arrange its installation in such a way that it requires the  
21959 system administrator or operator to provide the appropriate information on *lp* options and  
21960 environment variable values.

21961 At a minimum, having this utility in this volume of IEEE Std 1003.1-2001 tells the industry that  
21962 conforming applications require a means to print output and provides at least a command name  
21963 and *LPDEST* routing mechanism that can be used for discussions between vendors, application  
21964 writers, and users. The use of “should” in the DESCRIPTION of *lp* clearly shows the intent of  
21965 the standard developers, even if they cannot mandate that all systems (such as laptops) have  
21966 printers.

21967 This volume of IEEE Std 1003.1-2001 does not specify what the ownership of the process  
21968 performing the writing to the output device may be. If *-c* is not used, it is unspecified whether  
21969 the process performing the writing to the output device has permission to read *file* if there are  
21970 any restrictions in place on who may read *file* until after it is printed. Also, if *-c* is not used, the  
21971 results of deleting *file* before it is printed are unspecified.

## 21972 FUTURE DIRECTIONS

21973 None.

## 21974 SEE ALSO

21975 *mailx*

## 21976 CHANGE HISTORY

21977 First released in Issue 2.

## 21978 Issue 6

21979 The following new requirements on POSIX implementations derive from alignment with the  
21980 Single UNIX Specification:

- 21981 • In the DESCRIPTION, the requirement to associate a unique request ID, and the normal  
21982 generation of a banner page is added.
- 21983 • In the OPTIONS section:
  - 21984 — The *-d dest* description is expanded, but references to *lpstat* are removed.
  - 21985 — The *-m*, *-o*, *-s*, *-t*, and *-w* options are added.
- 21986 • In the ENVIRONMENT VARIABLES section, *LC\_TIME* may now affect the execution.
- 21987 • The STDOUT section is added.

21988 The normative text is reworded to avoid use of the term “must” for application requirements.

21989 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

21990 **NAME**

21991       ls — list directory contents

21992 **SYNOPSIS**

21993 xsi       ls [-CFRacdilqrtl] [-H | -L ] [-fgmnopsx] [file...]

21994 **DESCRIPTION**

21995       For each operand that names a file of a type other than directory or symbolic link to a directory,  
 21996       *ls* shall write the name of the file as well as any requested, associated information. For each  
 21997       operand that names a file of type directory, *ls* shall write the names of files contained within the  
 21998       directory as well as any requested, associated information. If one of the **-d**, **-F**, or **-l** options are  
 21999       specified, and one of the **-H** or **-L** options are not specified, for each operand that names a file of  
 22000       type symbolic link to a directory, *ls* shall write the name of the file as well as any requested,  
 22001       associated information. If none of the **-d**, **-F**, or **-l** options are specified, or the **-H** or **-L** options  
 22002       are specified, for each operand that names a file of type symbolic link to a directory, *ls* shall write  
 22003       the names of files contained within the directory as well as any requested, associated  
 22004       information.

22005       If no operands are specified, *ls* shall write the contents of the current directory. If more than one  
 22006       operand is specified, *ls* shall write non-directory operands first; it shall sort directory and non-  
 22007       directory operands separately according to the collating sequence in the current locale.

22008       The *ls* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 22009       ancestor of the last file encountered. When it detects an infinite loop, *ls* shall write a diagnostic  
 22010       message to standard error and shall either recover its position in the hierarchy or terminate.

22011 **OPTIONS**

22012       The *ls* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 22013       Utility Syntax Guidelines.

22014       The following options shall be supported:

22015       **-C**       Write multi-text-column output with entries sorted down the columns, according  
 22016       to the collating sequence. The number of text columns and the column separator  
 22017       characters are unspecified, but should be adapted to the nature of the output  
 22018       device.

22019       **-F**       Do not follow symbolic links named as operands unless the **-H** or **-L** options are  
 22020       specified. Write a slash ( '/' ) immediately after each pathname that is a directory,  
 22021       an asterisk ( '\*' ) after each that is executable, a vertical bar ( '|' ) after each that is  
 22022       a FIFO, and an at sign ( '@' ) after each that is a symbolic link. For other file types,  
 22023       other symbols may be written.

22024       **-H**       If a symbolic link referencing a file of type directory is specified on the command  
 22025       line, *ls* shall evaluate the file information and file type to be those of the file  
 22026       referenced by the link, and not the link itself; however, *ls* shall write the name of  
 22027       the link itself and not the file referenced by the link.

22028       **-L**       Evaluate the file information and file type for all symbolic links (whether named  
 22029       on the command line or encountered in a file hierarchy) to be those of the file  
 22030       referenced by the link, and not the link itself; however, *ls* shall write the name of  
 22031       the link itself and not the file referenced by the link. When **-L** is used with **-l**, write  
 22032       the contents of symbolic links in the long format (see the STDOUT section).

22033       **-R**       Recursively list subdirectories encountered.

22034       **-a**       Write out all directory entries, including those whose names begin with a period  
 22035       ( '.' ). Entries beginning with a period shall not be written out unless explicitly

|           |           |                                                                                                                                                                                                                                                                                                                                                                               |
|-----------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 22036     |           | referenced, the <b>-a</b> option is supplied, or an implementation-defined condition shall cause them to be written.                                                                                                                                                                                                                                                          |
| 22037     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22038     | <b>-c</b> | Use time of last modification of the file status information (see < <b>sys/stat.h</b> > in the System Interfaces volume of IEEE Std 1003.1-2001) instead of last modification of the file itself for sorting ( <b>-t</b> ) or writing ( <b>-l</b> ).                                                                                                                          |
| 22039     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22040     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22041     | <b>-d</b> | Do not follow symbolic links named as operands unless the <b>-H</b> or <b>-L</b> options are specified. Do not treat directories differently than other types of files. The use of <b>-d</b> with <b>-R</b> produces unspecified results.                                                                                                                                     |
| 22042     |           |                                                                                                                                                                                                                                                                                                                                                                               |

| 22044 XSI | <b>-f</b> | Force each argument to be interpreted as a directory and list the name found in each slot. This option shall turn off <b>-l</b> , <b>-t</b> , <b>-s</b> , and <b>-r</b> , and shall turn on <b>-a</b> ; the order is the order in which entries appear in the directory.                                                                                                      |
| 22045     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22046     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22047 XSI | <b>-g</b> | The same as <b>-l</b> , except that the owner shall not be written.                                                                                                                                                                                                                                                                                                           |
| 22048     | <b>-i</b> | For each file, write the file's file serial number (see <i>stat()</i> in the System Interfaces volume of IEEE Std 1003.1-2001).                                                                                                                                                                                                                                               |
| 22049     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22050     | <b>-l</b> | (The letter ell.) Do not follow symbolic links named as operands unless the <b>-H</b> or <b>-L</b> options are specified. Write out in long format (see the STDOUT section). When <b>-l</b> (ell) is specified, <b>-1</b> (one) shall be assumed.                                                                                                                             |
| 22051     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22052     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22053 XSI | <b>-m</b> | Stream output format; list files across the page, separated by commas.                                                                                                                                                                                                                                                                                                        |
| 22054 XSI | <b>-n</b> | The same as <b>-l</b> , except that the owner's UID and GID numbers shall be written, rather than the associated character strings.                                                                                                                                                                                                                                           |
| 22055     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22056 XSI | <b>-o</b> | The same as <b>-l</b> , except that the group shall not be written.                                                                                                                                                                                                                                                                                                           |
| 22057 XSI | <b>-p</b> | Write a slash ( <b>/</b> ) after each filename if that file is a directory.                                                                                                                                                                                                                                                                                                   |
| 22058     | <b>-q</b> | Force each instance of non-printable filename characters and <tab>s to be written as the question-mark ( <b>?</b> ) character. Implementations may provide this option by default if the output is to a terminal device.                                                                                                                                                      |
| 22059     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22060     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22061     | <b>-r</b> | Reverse the order of the sort to get reverse collating sequence or oldest first.                                                                                                                                                                                                                                                                                              |
| 22062 XSI | <b>-s</b> | Indicate the total number of file system blocks consumed by each file displayed. The block size is implementation-defined.                                                                                                                                                                                                                                                    |
| 22063     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22064     | <b>-t</b> | Sort with the primary key being time modified (most recently modified first) and the secondary key being filename in the collating sequence.                                                                                                                                                                                                                                  |
| 22065     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22066     | <b>-u</b> | Use time of last access (see < <b>sys/stat.h</b> >) instead of last modification of the file for sorting ( <b>-t</b> ) or writing ( <b>-l</b> ).                                                                                                                                                                                                                              |
| 22067     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22068 XSI | <b>-x</b> | The same as <b>-C</b> , except that the multi-text-column output is produced with entries sorted across, rather than down, the columns.                                                                                                                                                                                                                                       |
| 22069     |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22070     | <b>-1</b> | (The numeric digit one.) Force output to be one entry per line.                                                                                                                                                                                                                                                                                                               |
| 22071     |           | Specifying more than one of the options in the following mutually-exclusive pairs shall not be considered an error: <b>-C</b> and <b>-l</b> (ell), <b>-m</b> and <b>-l</b> (ell), <b>-x</b> and <b>-l</b> (ell), <b>-C</b> and <b>-1</b> (one), <b>-H</b> and <b>-L</b> , <b>-c</b> and <b>-u</b> . The last option specified in each pair shall determine the output format. |
| 22072 XSI |           |                                                                                                                                                                                                                                                                                                                                                                               |
| 22073     |           |                                                                                                                                                                                                                                                                                                                                                                               |

## 22074 OPERANDS

22075 The following operand shall be supported:

|       |             |                                                                                                                                 |
|-------|-------------|---------------------------------------------------------------------------------------------------------------------------------|
| 22076 | <i>file</i> | A pathname of a file to be written. If the file specified is not found, a diagnostic message shall be output on standard error. |
| 22077 |             |                                                                                                                                 |

22078 **STDIN**

22079 Not used.

22080 **INPUT FILES**

22081 None.

22082 **ENVIRONMENT VARIABLES**22083 The following environment variables shall affect the execution of *ls*:

22084 **COLUMNS** Determine the user's preferred column position width for writing multiple text-column output. If this variable contains a string representing a decimal integer, the  
 22085 *ls* utility shall calculate how many pathname text columns to write (see **-C**) based  
 22086 on the width provided. If **COLUMNS** is not set or invalid, an implementation-  
 22087 defined number of column positions shall be assumed, based on the  
 22088 implementation's knowledge of the output device. The column width chosen to  
 22089 write the names of files in any given directory shall be constant. Filenames shall  
 22090 not be truncated to fit into the multiple text-column output.  
 22091

22092 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 22093 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 22094 Internationalization Variables for the precedence of internationalization variables  
 22095 used to determine the values of locale categories.)

22096 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 22097 internationalization variables.

22098 **LC\_COLLATE**  
 22099 Determine the locale for character collation information in determining the  
 22100 pathname collation sequence.

22101 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 22102 characters (for example, single-byte as opposed to multi-byte characters in  
 22103 arguments) and which characters are defined as printable (character class **print**).

22104 **LC\_MESSAGES**  
 22105 Determine the locale that should be used to affect the format and contents of  
 22106 diagnostic messages written to standard error.

22107 **LC\_TIME** Determine the format and contents for date and time strings written by *ls*.

22108 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

22109 **TZ** Determine the timezone for date and time strings written by *ls*. If **TZ** is unset or  
 22110 null, an unspecified default timezone shall be used.

22111 **ASYNCHRONOUS EVENTS**

22112 Default.

22113 **STDOUT**

22114 The default format shall be to list one entry per line to standard output; the exceptions are to  
 22115 XSI terminals or when one of the **-C**, **-m**, or **-x** options is specified. If the output is to a terminal, the  
 22116 format is implementation-defined.

22117 XSI When **-m** is specified, the format used shall be:

22118 "%s, %s, ... \n", <filename1>, <filename2>

22119 where the largest number of filenames shall be written without exceeding the length of the line.

22120 If the **-i** option is specified, the file's file serial number (see <sys/stat.h>) shall be written in the  
 22121 following format before any other output for the corresponding entry:

22122        %u ", <file serial number>

22123        If the **-l** option is specified without **-L**, the following information shall be written:

22124        "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
 22125                <owner name>, <group name>, <number of bytes in the file>,  
 22126                <date and time>, <pathname>

22127        If the file is a symbolic link, this information shall be about the link itself and the <pathname>  
 22128        field shall be of the form:

22129        "%s -> %s", <pathname of link>, <contents of link>

22130        If both **-l** and **-L** are specified, the following information shall be written:

22131        "%s %u %s %s %u %s %s\n", <file mode>, <number of links>,  
 22132                <owner name>, <group name>, <number of bytes in the file>,  
 22133                <date and time>, <pathname of link>

22134        where all fields except <pathname of link> shall be for the file resolved from the symbolic link.

22135 xSI        The **-g**, **-n**, and **-o** options use the same format as **-l**, but with omitted items and their  
 22136        associated <blank>s. See the OPTIONS section.

22137 xSI        In both the preceding **-l** forms, if <owner name> or <group name> cannot be determined, or if **-n**  
 22138        is given, they shall be replaced with their associated numeric values using the format %u.

22139        The <date and time> field shall contain the appropriate date and timestamp of when the file was  
 22140        last modified. In the POSIX locale, the field shall be the equivalent of the output of the following  
 22141        *date* command:

22142        date "+%b %e %H:%M"

22143        if the file has been modified in the last six months, or:

22144        date "+%b %e %Y"

22145        (where two <space>s are used between %e and %Y) if the file has not been modified in the last six  
 22146        months or if the modification date is in the future, except that, in both cases, the final <newline>  
 22147        produced by *date* shall not be included and the output shall be as if the *date* command were  
 22148        executed at the time of the last modification date of the file rather than the current time. When  
 22149        the *LC\_TIME* locale category is not set to the POSIX locale, a different format and order of  
 22150        presentation of this field may be used.

22151        If the file is a character special or block special file, the size of the file may be replaced with  
 22152        implementation-defined information associated with the device in question.

22153        If the pathname was specified as a *file* operand, it shall be written as specified.

22154 xSI        The file mode written under the **-l**, **-g**, **-n**, and **-o** options shall consist of the following format:

22155        "%c%s%s%s%c", <entry type>, <owner permissions>,  
 22156                <group permissions>, <other permissions>,  
 22157                <optional alternate access method flag>

22158        The <optional alternate access method flag> shall be a single <space> if there is no alternate or  
 22159        additional access control method associated with the file; otherwise, a printable character shall  
 22160        be used.

22161        The <entry type> character shall describe the type of file, as follows:

22162        d        Directory.

|           |                                                                                                                                                   |                                                                                            |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| 22163     | b                                                                                                                                                 | Block special file.                                                                        |
| 22164     | c                                                                                                                                                 | Character special file.                                                                    |
| 22165     | l (ell)                                                                                                                                           | Symbolic link.                                                                             |
| 22166     | p                                                                                                                                                 | FIFO.                                                                                      |
| 22167     | –                                                                                                                                                 | Regular file.                                                                              |
| 22168     | Implementations may add other characters to this list to represent other implementation-defined                                                   |                                                                                            |
| 22169     | file types.                                                                                                                                       |                                                                                            |
| 22170     | The next three fields shall be three characters each:                                                                                             |                                                                                            |
| 22171     | <owner permissions>                                                                                                                               |                                                                                            |
| 22172     | Permissions for the file owner class (see the Base Definitions volume of                                                                          |                                                                                            |
| 22173     | IEEE Std 1003.1-2001, Section 4.4, File Access Permissions).                                                                                      |                                                                                            |
| 22174     | <group permissions>                                                                                                                               |                                                                                            |
| 22175     | Permissions for the file group class.                                                                                                             |                                                                                            |
| 22176     | <other permissions>                                                                                                                               |                                                                                            |
| 22177     | Permissions for the file other class.                                                                                                             |                                                                                            |
| 22178     | Each field shall have three character positions:                                                                                                  |                                                                                            |
| 22179     | 1.                                                                                                                                                | If 'r', the file is readable; if '–', the file is not readable.                            |
| 22180     | 2.                                                                                                                                                | If 'w', the file is writable; if '–', the file is not writable.                            |
| 22181     | 3.                                                                                                                                                | The first of the following that applies:                                                   |
| 22182     | S                                                                                                                                                 | If in <owner permissions>, the file is not executable and set-user-ID mode is set. If in   |
| 22183     |                                                                                                                                                   | <group permissions>, the file is not executable and set-group-ID mode is set.              |
| 22184     | s                                                                                                                                                 | If in <owner permissions>, the file is executable and set-user-ID mode is set. If in       |
| 22185     |                                                                                                                                                   | <group permissions>, the file is executable and set-group-ID mode is set.                  |
| 22186 XSI | T                                                                                                                                                 | If in <other permissions> and the file is a directory, search permission is not granted to |

| 22188 XSI | t                                                                                                                                                 | If in <other permissions> and the file is a directory, search permission is granted to     |
| 22189     |                                                                                                                                                   | others, and the restricted deletion flag is set.                                           |
| 22190     | x                                                                                                                                                 | The file is executable or the directory is searchable.                                     |
| 22191     | –                                                                                                                                                 | None of the attributes of 'S', 's', 'T', 't', or 'x' applies.                              |
| 22192     | Implementations may add other characters to this list for the third character position. Such                                                      |                                                                                            |
| 22193     | additions shall, however, be written in lowercase if the file is executable or searchable, and                                                    |                                                                                            |
| 22194     | in uppercase if it is not.                                                                                                                        |                                                                                            |
| 22195 XSI | If any of the <b>–l</b> , <b>–g</b> , <b>–n</b> , <b>–o</b> , or <b>–s</b> options is specified, each list of files within the directory shall be |                                                                                            |
| 22196     | preceded by a status line indicating the number of file system blocks occupied by files in the                                                    |                                                                                            |
| 22197     | directory in 512-byte units, rounded up to the next integral number of units, if necessary. In the                                                |                                                                                            |
| 22198     | POSIX locale, the format shall be:                                                                                                                |                                                                                            |
| 22199     | <code>"total %u\n", &lt;number of units in the directory&gt;</code>                                                                               |                                                                                            |
| 22200     | If more than one directory, or a combination of non-directory files and directories are written,                                                  |                                                                                            |
| 22201     | either as a result of specifying multiple operands, or the <b>–R</b> option, each list of files within a                                          |                                                                                            |
| 22202     | directory shall be preceded by:                                                                                                                   |                                                                                            |

22203        "`\n%s:\n`", *<directory name>*

22204        If this string is the first thing to be written, the first *<newline>* shall not be written. This output  
22205        shall precede the number of units in the directory.

22206 xSI      If the `-s` option is given, each file shall be written with the number of blocks used by the file.  
22207        Along with `-C`, `-l`, `-m`, or `-x`, the number and a *<space>* shall precede the filename; with `-g`, `-l`,  
22208        `-n`, or `-o`, they shall precede each line describing a file.

## 22209 **STDERR**

22210        The standard error shall be used only for diagnostic messages.

## 22211 **OUTPUT FILES**

22212        None.

## 22213 **EXTENDED DESCRIPTION**

22214        None.

## 22215 **EXIT STATUS**

22216        The following exit values shall be returned:

22217            0   Successful completion.

22218            >0   An error occurred.

## 22219 **CONSEQUENCES OF ERRORS**

22220        Default.

## 22221 **APPLICATION USAGE**

22222        Many implementations use the equal sign (`'='`) to denote sockets bound to the file system for  
22223        the `-F` option. Similarly, many historical implementations use the `'s'` character to denote  
22224        sockets as the entry type characters for the `-l` option.

22225        It is difficult for an application to use every part of the file modes field of `ls -l` in a portable  
22226        manner. Certain file types and executable bits are not guaranteed to be exactly as shown, as  
22227        implementations may have extensions. Applications can use this field to pass directly to a user  
22228        printout or prompt, but actions based on its contents should generally be deferred, instead, to  
22229        the *test* utility.

22230        The output of *ls* (with the `-l` and related options) contains information that logically could be  
22231        used by utilities such as *chmod* and *touch* to restore files to a known state. However, this  
22232        information is presented in a format that cannot be used directly by those utilities or be easily  
22233        translated into a format that can be used. A character has been added to the end of the  
22234        permissions string so that applications at least have an indication that they may be working in  
22235        an area they do not understand instead of assuming that they can translate the permissions  
22236        string into something that can be used. Future issues or related documents may define one or  
22237        more specific characters to be used based on different standard additional or alternative access  
22238        control mechanisms.

22239        As with many of the utilities that deal with filenames, the output of *ls* for multiple files or in one  
22240        of the long listing formats must be used carefully on systems where filenames can contain  
22241        embedded white space. Systems and system administrators should institute policies and user  
22242        training to limit the use of such filenames.

22243        The number of disk blocks occupied by the file that it reports varies depending on underlying  
22244        file system type, block size units reported, and the method of calculating the number of blocks.  
22245        On some file system types, the number is the actual number of blocks occupied by the file  
22246        (counting indirect blocks and ignoring holes in the file); on others it is calculated based on the  
22247        file size (usually making an allowance for indirect blocks, but ignoring holes).

22248 **EXAMPLES**

22249 An example of a small directory tree being fully listed with *ls -laRF a* in the POSIX locale:

```

22250 total 11
22251 drwxr-xr-x 3 hlj prog 64 Jul 4 12:07 ./
22252 drwxrwxrwx 4 hlj prog 3264 Jul 4 12:09 ../
22253 drwxr-xr-x 2 hlj prog 48 Jul 4 12:07 b/
22254 -rwxr--r-- 1 hlj prog 572 Jul 4 12:07 foo*

22255 a/b:
22256 total 4
22257 drwxr-xr-x 2 hlj prog 48 Jul 4 12:07 ./
22258 drwxr-xr-x 3 hlj prog 64 Jul 4 12:07 ../
22259 -rw-r--r-- 1 hlj prog 700 Jul 4 12:07 bar

```

22260 **RATIONALE**

22261 Some historical implementations of the *ls* utility show all entries in a directory except dot and  
 22262 dot-dot when a superuser invokes *ls* without specifying the **-a** option. When “normal” users  
 22263 invoke *ls* without specifying **-a**, they should not see information about any files with names  
 22264 beginning with a period unless they were named as *file* operands.

22265 Implementations are expected to traverse arbitrary depths when processing the **-R** option. The  
 22266 only limitation on depth should be based on running out of physical storage for keeping track of  
 22267 untraversed directories.

22268 The **-1** (one) option was historically found in BSD and BSD-derived implementations only. It is  
 22269 required in this volume of IEEE Std 1003.1-2001 so that conforming applications might ensure  
 22270 that output is one entry per line, even if the output is to a terminal.

22271 Generally, this volume of IEEE Std 1003.1-2001 is silent about what happens when options are  
 22272 given multiple times. In the cases of **-C**, **-l**, and **-1**, however, it does specify the results of these  
 22273 overlapping options. Since *ls* is one of the most aliased commands, it is important that the  
 22274 implementation perform intuitively. For example, if the alias were:

```
22275 alias ls="ls -C"
```

22276 and the user typed *ls -1*, single-text-column output should result, not an error.

22277 The BSD *ls* provides a **-A** option (like **-a**, but dot and dot-dot are not written out). The small  
 22278 difference from **-a** did not seem important enough to require both.

22279 Implementations may make **-q** the default for terminals to prevent trojan horse attacks on  
 22280 terminals with special escape sequences. This is not required because:

- 22281 • Some control characters may be useful on some terminals; for example, a system might write  
 22282 them as "\001" or "^A".
- 22283 • Special behavior for terminals is not relevant to applications portability.

22284 An early proposal specified that the optional alternate access method flag had to be '+' if there  
 22285 was an alternate access method used on the file or <space> if there was not. This was changed to  
 22286 be <space> if there is not and a single printable character if there is. This was done for three  
 22287 reasons:

- 22288 1. There are historical implementations using characters other than '+'.
- 22289 2. There are implementations that vary this character used in that position to distinguish  
 22290 between various alternate access methods in use.

- 22291 3. The standard developers did not want to preclude future specifications that might need a  
22292 way to specify more than one alternate access method.
- 22293 Nonetheless, implementations providing a single alternate access method are encouraged to use  
22294 ' + '.
- 22295 In an early proposal, the units used to specify the number of blocks occupied by files in a  
22296 directory in an *ls -l* listing were implementation-defined. This was because BSD systems have  
22297 historically used 1024-byte units and System V systems have historically used 512-byte units. It  
22298 was pointed out by BSD developers that their system has used 512-byte units in some places and  
22299 1024-byte units in other places. (System V has consistently used 512.) Therefore, this volume of  
22300 IEEE Std 1003.1-2001 usually specifies 512. Future releases of BSD are expected to consistently  
22301 provide 512 bytes as a default with a way of specifying 1024-byte units where appropriate.
- 22302 The *<date and time>* field in the *-l* format is specified only for the POSIX locale. As noted, the  
22303 format can be different in other locales. No mechanism for defining this is present in this volume  
22304 of IEEE Std 1003.1-2001, as the appropriate vehicle is a messaging system; that is, the format  
22305 should be specified as a “message”.
- 22306 **FUTURE DIRECTIONS**
- 22307 The *-s* uses implementation-defined units and cannot be used portably; it may be withdrawn in  
22308 a future version.
- 22309 **SEE ALSO**
- 22310 *chmod*, *find*, the System Interfaces volume of IEEE Std 1003.1-2001, *stat()*, the Base Definitions  
22311 volume of IEEE Std 1003.1-2001, **<sys/stat.h>**
- 22312 **CHANGE HISTORY**
- 22313 First released in Issue 2.
- 22314 **Issue 5**
- 22315 A second FUTURE DIRECTION is added.
- 22316 **Issue 6**
- 22317 The following new requirements on POSIX implementations derive from alignment with the  
22318 Single UNIX Specification:
- 22319 • In the *-F* option, other symbols are allowed for other file types.
- 22320 Treatment of symbolic links is added, as defined in the IEEE P1003.2b draft standard.
- 22321 The Open Group Base Resolution bwg2001-010 is applied, adding the *T* and *t* fields as an XSI  
22322 extension.

22323 **NAME**22324           m4 — macro processor (**DEVELOPMENT**)22325 **SYNOPSIS**22326 xSI        m4 [-s] [-D *name*[=*val*]] ... [-U *name*] ... *file*...

22327

22328 **DESCRIPTION**

22329       The *m4* utility is a macro processor that shall read one or more text files, process them according  
 22330       to their included macro statements, and write the results to standard output.

22331 **OPTIONS**

22332       The *m4* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 22333       Utility Syntax Guidelines, except that the order of the **-D** and **-U** options shall be significant.

22334       The following options shall be supported:

22335       **-s**           Enable line synchronization output for the c99 preprocessor phase (that is, **#line**  
 22336       directives).

22337       **-D *name*[=*val*]**   Define *name* to *val* or to null if *=val* is omitted.  
 22338

22339       **-U *name***       Undefine *name*.

22340 **OPERANDS**

22341       The following operand shall be supported:

22342       *file*           A pathname of a text file to be processed. If no *file* is given, or if it is '-', the  
 22343       standard input shall be read.

22344 **STDIN**

22345       The standard input shall be a text file that is used if no *file* operand is given, or if it is '-'.

22346 **INPUT FILES**

22347       The input file named by the *file* operand shall be a text file.

22348 **ENVIRONMENT VARIABLES**

22349       The following environment variables shall affect the execution of *m4*:

22350       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 22351       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 22352       Internationalization Variables for the precedence of internationalization variables  
 22353       used to determine the values of locale categories.)

22354       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 22355       internationalization variables.

22356       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 22357       characters (for example, single-byte as opposed to multi-byte characters in  
 22358       arguments and input files).

22359       **LC\_MESSAGES**   Determine the locale that should be used to affect the format and contents of  
 22360       diagnostic messages written to standard error.  
 22361

22362       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

22363 **ASYNCHRONOUS EVENTS**

22364 Default.

22365 **STDOUT**

22366 The standard output shall be the same as the input files, after being processed for macro  
 22367 expansion.

22368 **STDERR**

22369 The standard error shall be used to display strings with the **errprint** macro, macro tracing  
 22370 enabled by the **traceon** macro, the defined text for macros written by the **dumpdef** macro, or for  
 22371 diagnostic messages.

22372 **OUTPUT FILES**

22373 None.

22374 **EXTENDED DESCRIPTION**

22375 The *m4* utility shall compare each token from the input against the set of built-in and user-  
 22376 defined macros. If the token matches the name of a macro, then the token shall be replaced by  
 22377 the macro's defining text, if any, and rescanned for matching macro names. Once no portion of  
 22378 the token matches the name of a macro, it shall be written to standard output. Macros may have  
 22379 arguments, in which case the arguments shall be substituted into the defining text before it is  
 22380 rescanned.

22381 Macro calls have the form:

22382 *name(arg1, arg2, ..., argn)*

22383 Macro names shall consist of letters, digits, and underscores, where the first character is not a  
 22384 digit. Tokens not of this form shall not be treated as macros.

22385 The application shall ensure that the left parenthesis immediately follows the name of the  
 22386 macro. If a token matching the name of a macro is not followed by a left parenthesis, it is  
 22387 handled as a use of that macro without arguments.

22388 If a macro name is followed by a left parenthesis, its arguments are the comma-separated tokens  
 22389 between the left parenthesis and the matching right parenthesis. Unquoted <blank>s and  
 22390 <newline>s preceding each argument shall be ignored. All other characters, including trailing  
 22391 <blank>s and <newline>s, are retained. Commas enclosed between left and right parenthesis  
 22392 characters do not delimit arguments.

22393 Arguments are positionally defined and referenced. The string "\$1" in the defining text shall be  
 22394 replaced by the first argument. Systems shall support at least nine arguments; only the first nine  
 22395 can be referenced, using the strings "\$1" to "\$9", inclusive. The string "\$0" is replaced with  
 22396 the name of the macro. The string "\$#" is replaced by the number of arguments as a string. The  
 22397 string "\$\*" is replaced by a list of all of the arguments, separated by commas. The string "\$@"  
 22398 is replaced by a list of all of the arguments separated by commas, and each argument is quoted  
 22399 using the current left and right quoting strings.

22400 If fewer arguments are supplied than are in the macro definition, the omitted arguments are  
 22401 taken to be null. It is not an error if more arguments are supplied than are in the macro  
 22402 definition.

22403 No special meaning is given to any characters enclosed between matching left and right quoting  
 22404 strings, but the quoting strings are themselves discarded. By default, the left quoting string  
 22405 consists of a grave accent ('`') and the right quoting string consists of an acute accent ('`');  
 22406 see also the **changequote** macro.

22407 Comments are written but not scanned for matching macro names; by default, the begin-  
 22408 comment string consists of the number sign character and the end-comment string consists of a

|       |                    |                                                                                                                                              |
|-------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 22409 |                    | <newline>. See also the <b>changecom</b> and <b>dnl</b> macros.                                                                              |
| 22410 |                    | The <i>m4</i> utility shall make available the following built-in macros. They can be redefined, but                                         |
| 22411 |                    | once this is done the original meaning is lost. Their values shall be null unless otherwise stated.                                          |
| 22412 |                    | In the descriptions below, the term <i>defining text</i> refers to the value of the macro: the second                                        |
| 22413 |                    | argument to the <b>define</b> macro, among other things. Except for the first argument to the <b>eval</b>                                    |
| 22414 |                    | macro, all numeric arguments to built-in macros shall be interpreted as decimal values. The                                                  |
| 22415 |                    | string values produced as the defining text of the <b>decr</b> , <b>divnum</b> , <b>incr</b> , <b>index</b> , <b>len</b> , and <b>sysval</b> |
| 22416 |                    | built-in macros shall be in the form of a decimal-constant as defined in the C language.                                                     |
| 22417 | <b>changecom</b>   | The <b>changecom</b> macro shall set the begin-comment and end-comment strings.                                                              |
| 22418 |                    | With no arguments, the comment mechanism shall be disabled. With a single                                                                    |
| 22419 |                    | argument, that argument shall become the begin-comment string and the                                                                        |
| 22420 |                    | <newline> shall become the end-comment string. With two arguments, the first                                                                 |
| 22421 |                    | argument shall become the begin-comment string and the second argument shall                                                                 |
| 22422 |                    | become the end-comment string. Systems shall support comment strings of at least                                                             |
| 22423 |                    | five characters.                                                                                                                             |
| 22424 | <b>changequote</b> | The <b>changequote</b> macro shall set the begin-quote and end-quote strings. With no                                                        |
| 22425 |                    | arguments, the quote strings shall be set to the default values (that is, ' '). With a                                                       |
| 22426 |                    | single argument, that argument shall become the begin-quote string and the                                                                   |
| 22427 |                    | <newline> shall become the end-quote string. With two arguments, the first                                                                   |
| 22428 |                    | argument shall become the begin-quote string and the second argument shall                                                                   |
| 22429 |                    | become the end-quote string. Systems shall support quote strings of at least five                                                            |
| 22430 |                    | characters.                                                                                                                                  |
| 22431 | <b>decr</b>        | The defining text of the <b>decr</b> macro shall be its first argument decremented by 1. It                                                  |
| 22432 |                    | shall be an error to specify an argument containing any non-numeric characters.                                                              |
| 22433 | <b>define</b>      | The second argument shall become the defining text of the macro whose name is                                                                |
| 22434 |                    | the first argument.                                                                                                                          |
| 22435 | <b>defn</b>        | The defining text of the <b>defn</b> macro shall be the quoted definition (using the                                                         |
| 22436 |                    | current quoting strings) of its arguments.                                                                                                   |
| 22437 | <b>divert</b>      | The <i>m4</i> utility maintains nine temporary buffers, numbered 1 to 9, inclusive. When                                                     |
| 22438 |                    | the last of the input has been processed, any output that has been placed in these                                                           |
| 22439 |                    | buffers shall be written to standard output in buffer-numerical order. The <b>divert</b>                                                     |
| 22440 |                    | macro shall divert future output to the buffer specified by its argument. Specifying                                                         |
| 22441 |                    | no argument or an argument of 0 shall resume the normal output process. Output                                                               |
| 22442 |                    | diverted to a stream other than 0 to 9 shall be discarded. It shall be an error to                                                           |
| 22443 |                    | specify an argument containing any non-numeric characters.                                                                                   |
| 22444 | <b>divnum</b>      | The defining text of the <b>divnum</b> macro shall be the number of the current output                                                       |
| 22445 |                    | stream as a string.                                                                                                                          |
| 22446 | <b>dnl</b>         | The <b>dnl</b> macro shall cause <i>m4</i> to discard all input characters up to and including                                               |
| 22447 |                    | the next <newline>.                                                                                                                          |
| 22448 | <b>dumpdef</b>     | The <b>dumpdef</b> macro shall write the defined text to standard error for each of the                                                      |
| 22449 |                    | macros specified as arguments, or, if no arguments are specified, for all macros.                                                            |
| 22450 | <b>errprint</b>    | The <b>errprint</b> macro shall write its arguments to standard error.                                                                       |
| 22451 | <b>eval</b>        | The <b>eval</b> macro shall evaluate its first argument as an arithmetic expression, using                                                   |
| 22452 |                    | 32-bit signed integer arithmetic. All of the C-language operators shall be                                                                   |
| 22453 |                    | supported, except for:                                                                                                                       |

|       |                 |                                                                                               |
|-------|-----------------|-----------------------------------------------------------------------------------------------|
| 22454 |                 | [                                                                                             |

| 22461 |                 | ,                                                                                             |
| 22462 |                 | .                                                                                             |
| 22463 |                 | ?:                                                                                            |
| 22464 |                 | unary &                                                                                       |
| 22465 |                 | and all assignment operators. It shall be an error to specify any of these operators.         |
| 22466 |                 | Precedence and associativity shall be as in the ISO C standard. Systems shall                 |
| 22467 |                 | support octal and hexadecimal numbers as in the ISO C standard. The second                    |
| 22468 |                 | argument, if specified, shall set the radix for the result; the default is 10. The third      |
| 22469 |                 | argument, if specified, sets the minimum number of digits in the result. It shall be          |
| 22470 |                 | an error to specify the second or third argument containing any non-numeric                   |
| 22471 |                 | characters.                                                                                   |
| 22472 | <b>ifdef</b>    | If the first argument to the <b>ifdef</b> macro is defined, the defining text shall be the    |
| 22473 |                 | second argument. Otherwise, the defining text shall be the third argument, if                 |
| 22474 |                 | specified, or the null string, if not.                                                        |
| 22475 | <b>ifelse</b>   | The <b>ifelse</b> macro takes three or more arguments. If the first two arguments             |
| 22476 |                 | compare as equal strings (after macro expansion of both arguments), the defining              |
| 22477 |                 | text shall be the third argument. If the first two arguments do not compare as                |
| 22478 |                 | equal strings and there are three arguments, the defining text shall be null. If the          |
| 22479 |                 | first two arguments do not compare as equal strings and there are four or five                |
| 22480 |                 | arguments, the defining text shall be the fourth argument. If the first two                   |
| 22481 |                 | arguments do not compare as equal strings and there are six or more arguments,                |
| 22482 |                 | the first three arguments shall be discarded and processing shall restart with the            |
| 22483 |                 | remaining arguments.                                                                          |
| 22484 | <b>include</b>  | The defining text for the <b>include</b> macro shall be the contents of the file named by     |
| 22485 |                 | the first argument. It shall be an error if the file cannot be read.                          |
| 22486 | <b>incr</b>     | The defining text of the <b>incr</b> macro shall be its first argument incremented by 1. It   |
| 22487 |                 | shall be an error to specify an argument containing any non-numeric characters.               |
| 22488 | <b>index</b>    | The defining text of the <b>index</b> macro shall be the first character position (as a       |
| 22489 |                 | string) in the first argument where a string matching the second argument begins              |
| 22490 |                 | (zero origin), or -1 if the second argument does not occur.                                   |
| 22491 | <b>len</b>      | The defining text of the <b>len</b> macro shall be the length (as a string) of the first      |
| 22492 |                 | argument.                                                                                     |
| 22493 | <b>m4exit</b>   | Exit from the <i>m4</i> utility. If the first argument is specified, it is the exit code. The |
| 22494 |                 | default is zero. It shall be an error to specify an argument containing any non-              |
| 22495 |                 | numeric characters.                                                                           |
| 22496 | <b>m4wrap</b>   | The first argument shall be processed when EOF is reached. If the <b>m4wrap</b> macro         |
| 22497 |                 | is used multiple times, the arguments specified shall be processed in the order in            |
| 22498 |                 | which the <b>m4wrap</b> macros were processed.                                                |
| 22499 | <b>maketemp</b> | The defining text shall be the first argument, with any trailing 'X' characters               |
| 22500 |                 | replaced with the current process ID as a string.                                             |

|       |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 22501 | <b>popdef</b>      | The <b>popdef</b> macro shall delete the current definition of its arguments, replacing that definition with the previous one. If there is no previous definition, the macro is undefined.                                                                                                                                                                                                                                                                                                                                                                                                              |
| 22502 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 22503 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 22504 | <b>pushdef</b>     | The <b>pushdef</b> macro shall be equivalent to the <b>define</b> macro with the exception that it shall preserve any current definition for future retrieval using the <b>popdef</b> macro.                                                                                                                                                                                                                                                                                                                                                                                                            |

| 22510 | <b>substr</b>      | The defining text for the <b>substr</b> macro shall be the substring of the first argument beginning at the zero-offset character position specified by the second argument. The third argument, if specified, shall be the number of characters to select; if not specified, the characters from the starting point to the end of the first argument shall become the defining text. It shall not be an error to specify a starting point beyond the end of the first argument and the defining text shall be null. It shall be an error to specify an argument containing any non-numeric characters. |

22543 **CONSEQUENCES OF ERRORS**

22544 Default.

22545 **APPLICATION USAGE**22546 The **defn** macro is useful for renaming macros, especially built-ins.22547 **EXAMPLES**22548 If the file **m4src** contains the lines:

```

22549 The value of 'VER' is "VER".
22550 ifdef('VER', ``VER'' is defined to be VER., VER is not defined.)
22551 ifelse(VER, 1, ``VER'' is 'VER'.)
22552 ifelse(VER, 2, ``VER'' is 'VER'., ``VER'' is not 2.)
22553 end

```

22554 then the command

22555 `m4 m4src`

22556 or the command:

22557 `m4 -U VER m4src`

22558 produces the output:

```

22559 The value of VER is "VER".
22560 VER is not defined.

22561 VER is not 2.
22562 end

```

22563 The command:

22564 `m4 -D VER m4src`

22565 produces the output:

```

22566 The value of VER is ".
22567 VER is defined to be .

22568 VER is not 2.
22569 end

```

22570 The command:

22571 `m4 -D VER=1 m4src`

22572 produces the output:

```

22573 The value of VER is "1".
22574 VER is defined to be 1.
22575 VER is 1.
22576 VER is not 2.
22577 end

```

22578 The command:

22579 `m4 -D VER=2 m4src`

22580 produces the output:

```

22581 The value of VER is "2".
22582 VER is defined to be 2.

```

22583 VER is 2.  
22584 end

22585 **RATIONALE**

22586 None.

22587 **FUTURE DIRECTIONS**

22588 None.

22589 **SEE ALSO**

22590 c99

22591 **CHANGE HISTORY**

22592 First released in Issue 2.

22593 **Issue 5**

22594 The phrase “the defined text for macros written by the **dumpdef** macro” is added to the  
22595 description of STDERR, and the description of **dumpdef** is updated to indicate that output is  
22596 written to standard error. The description of **eval** is updated to indicate that the list of excluded  
22597 C operators excludes unary ‘&’ and ‘.’. In the description of **ifdef**, the phrase “and it is not  
22598 defined to be zero” is deleted.

22599 **Issue 6**

22600 In the EXTENDED DESCRIPTION, the **eval** text is updated to include a ‘&’ character in the  
22601 excepted list.

22602 The EXTENDED DESCRIPTION of **divert** is updated to clarify that there are only nine diversion  
22603 buffers.

22604 The normative text is reworded to avoid use of the term “must” for application requirements.

22605 The Open Group Base Resolution bwg2000-006 is applied.

22606 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/31 is applied, replacing the EXAMPLES  
22607 section.

22608 **NAME**

22609 mailx — process messages

22610 **SYNOPSIS**22611 **Send Mode**22612 mailx [-s *subject*] *address...*22613 **Receive Mode**

22614 mailx -e

22615 mailx [-HiNn] [-F] [-u *user*]22616 mailx -f [-HiNn] [-F] [*file*]22617 **DESCRIPTION**

22618 The *mailx* utility provides a message sending and receiving facility. It has two major modes,  
 22619 selected by the options used: Send Mode and Receive Mode.

22620 On systems that do not support the User Portability Utilities option, an application using *mailx*  
 22621 shall have the ability to send messages in an unspecified manner (Send Mode). Unless the first  
 22622 character of one or more lines is tilde ('~'), all characters in the input message shall appear in  
 22623 the delivered message, but additional characters may be inserted in the message before it is  
 22624 retrieved.

22625 On systems supporting the User Portability Utilities option, mail-receiving capabilities and other  
 22626 interactive features, Receive Mode, described below, also shall be enabled.

22627 **Send Mode**

22628 Send Mode can be used by applications or users to send messages from the text in standard  
 22629 input.

22630 **Receive Mode**

22631 Receive Mode is more oriented towards interactive users. Mail can be read and sent in this  
 22632 interactive mode.

22633 When reading mail, *mailx* provides commands to facilitate saving, deleting, and responding to  
 22634 messages. When sending mail, *mailx* allows editing, reviewing, and other modification of the  
 22635 message as it is entered.

22636 Incoming mail shall be stored in one or more unspecified locations for each user, collectively  
 22637 called the system *mailbox* for that user. When *mailx* is invoked in Receive Mode, the system  
 22638 mailbox shall be the default place to find new mail. As messages are read, they shall be marked  
 22639 to be moved to a secondary file for storage, unless specific action is taken. This secondary file is  
 22640 called the **mbox** and is normally located in the directory referred to by the *HOME* environment  
 22641 variable (see *MBOX* in the ENVIRONMENT VARIABLES section for a description of this file).  
 22642 Messages shall remain in this file until explicitly removed. When the **-f** option is used to read  
 22643 mail messages from secondary files, messages shall be retained in those files unless specifically  
 22644 removed. All three of these locations—system mailbox, **mbox**, and secondary file—are referred  
 22645 to in this section as simply “mailboxes”, unless more specific identification is required.

22646 **OPTIONS**

22647 The *mailx* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
22648 12.2, Utility Syntax Guidelines.

22649 The following options shall be supported. (Only the **–s** *subject* option shall be required on all  
22650 systems. The other options are required only on systems supporting the User Portability Utilities  
22651 option.)

22652 **–e** Test for the presence of mail in the system mailbox. The *mailx* utility shall write  
22653 nothing and exit with a successful return code if there is mail to read.

22654 **–f** Read messages from the file named by the *file* operand instead of the system  
22655 mailbox. (See also **folder**.) If no *file* operand is specified, read messages from **mbox**  
22656 instead of the system mailbox.

22657 **–F** Record the message in a file named after the first recipient. The name is the login-  
22658 name portion of the address found first on the **To:** line in the mail header.  
22659 Overrides the **record** variable, if set (see **Internal Variables in mailx** (on page  
22660 593).)

22661 **–H** Write a header summary only.

22662 **–i** Ignore interrupts. (See also **ignore**.)

22663 **–n** Do not initialize from the system default start-up file. See the EXTENDED  
22664 DESCRIPTION section.

22665 **–N** Do not write an initial header summary.

22666 **–s** *subject* Set the **Subject** header field to *subject*. All characters in the *subject* string shall  
22667 appear in the delivered message. The results are unspecified if *subject* is longer  
22668 than {LINE\_MAX} – 10 bytes or contains a <newline>.

22669 **–u** *user* Read the system mailbox of the login name *user*. This shall only be successful if  
22670 the invoking user has the appropriate privileges to read the system mailbox of that  
22671 user.

22672 **OPERANDS**

22673 The following operands shall be supported:

22674 *address* Addressee of message. When **–n** is specified and no user start-up files are accessed  
22675 (see the EXTENDED DESCRIPTION section), the user or application shall ensure  
22676 this is an address to pass to the mail delivery system. Any system or user start-up  
22677 files may enable aliases (see **alias** under **Commands in mailx** (on page 596)) that  
22678 may modify the form of *address* before it is passed to the mail delivery system.

22679 *file* A pathname of a file to be read instead of the system mailbox when **–f** is specified.  
22680 The meaning of the *file* option-argument shall be affected by the contents of the  
22681 **folder** internal variable; see **Internal Variables in mailx** (on page 593).

22682 **STDIN**

22683 When *mailx* is invoked in Send Mode (the first synopsis line), standard input shall be the  
22684 message to be delivered to the specified addresses. When in Receive Mode, user commands shall  
22685 be accepted from *stdin*. If the User Portability Utilities option is not supported, standard input  
22686 lines beginning with a tilde (‘~’) character produce unspecified results.

22687 If the User Portability Utilities option is supported, then in both Send and Receive Modes,  
22688 standard input lines beginning with the escape character (usually tilde (‘~’)) shall affect  
22689 processing as described in **Command Escapes in mailx** (on page 604).

22690 **INPUT FILES**

22691 When *mailx* is used as described by this volume of IEEE Std 1003.1-2001, the *file* option-  
 22692 argument (see the **-f** option) and the **mbox** shall be text files containing mail messages,  
 22693 formatted as described in the OUTPUT FILES section. The nature of the system mailbox is  
 22694 unspecified; it need not be a file.

22695 **ENVIRONMENT VARIABLES**

22696 The following environment variables shall affect the execution of *mailx*:

22697 **DEAD** Determine the pathname of the file in which to save partial messages in case of  
 22698 interrupts or delivery errors. The default shall be **dead.letter** in the directory  
 22699 named by the *HOME* variable. The behavior of *mailx* in saving partial messages is  
 22700 unspecified if the User Portability Utilities option is not supported and *DEAD* is  
 22701 not defined with the value **/dev/null**.

22702 **EDITOR** Determine the name of a utility to invoke when the **edit** (see **Commands in mailx**  
 22703 (on page 596)) or **~e** (see **Command Escapes in mailx** (on page 604)) command is  
 22704 XSI used. The default editor is unspecified. On XSI-conformant systems it is *ed*. The  
 22705 effects of this variable are unspecified if the User Portability Utilities option is not  
 22706 supported.

22707 **HOME** Determine the pathname of the user's home directory.

22708 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 22709 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 22710 Internationalization Variables for the precedence of internationalization variables  
 22711 used to determine the values of locale categories.)

22712 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 22713 internationalization variables.

22714 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 22715 characters (for example, single-byte as opposed to multi-byte characters in  
 22716 arguments and input files) and the handling of case-insensitive address and  
 22717 header-field comparisons.

22718 **LC\_TIME** Determine the format and contents of the date and time strings written by *mailx*.

22719 **LC\_MESSAGES**

22720 Determine the locale that should be used to affect the format and contents of  
 22721 diagnostic messages written to standard error and informative messages written to  
 22722 standard output.

22723 **LISTER** Determine a string representing the command for writing the contents of the  
 22724 **folder** directory to standard output when the **folders** command is given (see  
 22725 **folders** in **Commands in mailx** (on page 596)). Any string acceptable as a  
 22726 *command\_string* operand to the *sh -c* command shall be valid. If this variable is null  
 22727 or not set, the output command shall be *ls*. The effects of this variable are  
 22728 unspecified if the User Portability Utilities option is not supported.

22729 **MAILRC** Determine the pathname of the start-up file. The default shall be **.mailrc** in the  
 22730 directory referred to by the *HOME* environment variable. The behavior of *mailx* is  
 22731 unspecified if the User Portability Utilities option is not supported and *MAILRC* is  
 22732 not defined with the value **/dev/null**.

22733 **MBOX** Determine a pathname of the file to save messages from the system mailbox that  
 22734 have been read. The **exit** command shall override this function, as shall saving the  
 22735 message explicitly in another file. The default shall be **mbox** in the directory

|       |                            |                                                                                                          |
|-------|----------------------------|----------------------------------------------------------------------------------------------------------|
| 22736 |                            | named by the <i>HOME</i> variable. The effects of this variable are unspecified if the                   |
| 22737 |                            | User Portability Utilities option is not supported.                                                      |
| 22738 | XSI                        | <b>NLSPATH</b> Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .     |
| 22739 |                            |                                                                                                          |
| 22740 | <b>PAGER</b>               | Determine a string representing an output filtering or pagination command for                            |
| 22741 |                            | writing the output to the terminal. Any string acceptable as a <i>command_string</i>                     |
| 22742 |                            | operand to the <i>sh -c</i> command shall be valid. When standard output is a terminal                   |
| 22743 |                            | device, the message output shall be piped through the command if the <i>mailx</i>                        |
| 22744 |                            | internal variable <b>crt</b> is set to a value less the number of lines in the message; see              |
| 22745 |                            | <b>Internal Variables in mailx</b> (on page 593). If the <i>PAGER</i> variable is null or not set,       |
| 22746 |                            | the paginator shall be either <i>more</i> or another paginator utility documented in the                 |
| 22747 |                            | system documentation. The effects of this variable are unspecified if the User                           |
|       |                            | Portability Utilities option is not supported.                                                           |
| 22748 |                            |                                                                                                          |
| 22749 | <b>SHELL</b>               | Determine the name of a preferred command interpreter. The default shall be <i>sh</i> .                  |
| 22750 |                            | The effects of this variable are unspecified if the User Portability Utilities option is                 |
|       |                            | not supported.                                                                                           |
| 22751 |                            |                                                                                                          |
| 22752 | <b>TERM</b>                | If the internal variable <b>screen</b> is not specified, determine the name of the terminal              |
| 22753 |                            | type to indicate in an unspecified manner the number of lines in a screenful of                          |
| 22754 |                            | headers. If <i>TERM</i> is not set or is set to null, an unspecified default terminal type               |
| 22755 |                            | shall be used and the value of a screenful is unspecified. The effects of this variable                  |
|       |                            | are unspecified if the User Portability Utilities option is not supported.                               |
| 22756 |                            |                                                                                                          |
| 22757 | <b>TZ</b>                  | This variable may determine the timezone used to calculate date and time strings                         |
| 22758 |                            | written by <i>mailx</i> . If <i>TZ</i> is unset or null, an unspecified default timezone shall be        |
|       |                            | used.                                                                                                    |
| 22759 |                            |                                                                                                          |
| 22760 | <b>VISUAL</b>              | Determine a pathname of a utility to invoke when the <b>visual</b> command (see                          |
| 22761 |                            | <b>Commands in mailx</b> (on page 596)) or <b>~v</b> command-escape (see <b>Command</b>                  |
| 22762 |                            | <b>Escapes in mailx</b> (on page 604)) is used. If this variable is null or not set, the full-           |
| 22763 |                            | screen editor shall be <i>vi</i> . The effects of this variable are unspecified if the User              |
|       |                            | Portability Utilities option is not supported.                                                           |
| 22764 | <b>ASYNCHRONOUS EVENTS</b> |                                                                                                          |
| 22765 |                            | When <i>mailx</i> is in Send Mode and standard input is not a terminal, it shall take the standard       |
| 22766 |                            | action for all signals.                                                                                  |
| 22767 |                            | In Receive Mode, or in Send Mode when standard input is a terminal, if a SIGINT signal is                |
| 22768 |                            | received:                                                                                                |
| 22769 |                            | 1. If in command mode, the current command, if there is one, shall be aborted, and a                     |
| 22770 |                            | command-mode prompt shall be written.                                                                    |
| 22771 |                            | 2. If in input mode:                                                                                     |
| 22772 |                            | a. If <b>ignore</b> is set, <i>mailx</i> shall write "@\n", discard the current input line, and continue |
| 22773 |                            | processing, bypassing the message-abort mechanism described in item 2b.                                  |
| 22774 |                            | b. If the interrupt was received while sending mail, either when in Receive Mode or in                   |
| 22775 |                            | Send Mode, a message shall be written, and another subsequent interrupt, with no                         |
| 22776 |                            | other intervening characters typed, shall be required to abort the mail message. If in                   |
| 22777 |                            | Receive Mode and another interrupt is received, a command-mode prompt shall be                           |
| 22778 |                            | written. If in Send Mode and another interrupt is received, <i>mailx</i> shall terminate with            |
| 22779 |                            | a non-zero status.                                                                                       |
| 22780 |                            | In both cases listed in item b, if the message is not empty:                                             |

22781                   i. If **save** is enabled and the file named by *DEAD* can be created, the message  
 22782 shall be written to the file named by *DEAD*. If the file exists, the message shall  
 22783 be written to replace the contents of the file.

22784                   ii. If **save** is not enabled, or the file named by *DEAD* cannot be created, the  
 22785 message shall not be saved.

22786           The *mailx* utility shall take the standard action for all other signals.

## 22787 **STDOUT**

22788           In command and input modes, all output, including prompts and messages, shall be written to  
 22789 standard output.

## 22790 **STDERR**

22791           The standard error shall be used only for diagnostic messages.

## 22792 **OUTPUT FILES**

22793           Various *mailx* commands and command escapes can create or add to files, including the **mbox**,  
 22794 the dead-letter file, and secondary mailboxes. When *mailx* is used as described in this volume of  
 22795 IEEE Std 1003.1-2001, these files shall be text files, formatted as follows:

22796           line beginning with **From**<space>  
 22797           [one or more *header-lines*; see **Commands in mailx** (on page 596)]  
 22798           empty line  
 22799           [zero or more *body lines*  
 22800           empty line]  
 22801           [line beginning with **From**<space>...]

22802           where each message begins with the **From** <space> line shown, preceded by the beginning of  
 22803 the file or an empty line. (The **From** <space> line is considered to be part of the message header,  
 22804 but not one of the header-lines referred to in **Commands in mailx** (on page 596); thus, it shall not  
 22805 be affected by the **discard**, **ignore**, or **retain** commands.) The formats of the remainder of the  
 22806 **From** <space> line and any additional header lines are unspecified, except that none shall be  
 22807 empty. The format of a message body line is also unspecified, except that no line following an  
 22808 empty line shall start with **From** <space>; *mailx* shall modify any such user-entered message  
 22809 body lines (following an empty line and beginning with **From** <space>) by adding one or more  
 22810 characters to precede the 'F'; it may add these characters to **From** <space> lines that are not  
 22811 preceded by an empty line.

22812           When a message from the system mailbox or entered by the user is not a text file, it is  
 22813 implementation-defined how such a message is stored in files written by *mailx*.

## 22814 **EXTENDED DESCRIPTION**

22815           The entire EXTENDED DESCRIPTION section shall apply only to implementations supporting  
 22816 the User Portability Utilities option.

22817           The *mailx* utility cannot guarantee support for all character encodings in all circumstances. For  
 22818 example, inter-system mail may be restricted to 7-bit data by the underlying network, 8-bit data  
 22819 need not be portable to non-internationalized systems, and so on. Under these circumstances, it  
 22820 is recommended that only characters defined in the ISO/IEC 646:1991 standard International  
 22821 Reference Version (equivalent to ASCII) 7-bit range of characters be used.

22822           When *mailx* is invoked using one of the Receive Mode synopsis forms, it shall write a page of  
 22823 header-summary lines (if **-N** was not specified and there are messages, see below), followed by  
 22824 a prompt indicating that *mailx* can accept regular commands (see **Commands in mailx** (on page  
 22825 596)); this is termed *command mode*. The page of header-summary lines shall contain the first  
 22826 new message if there are new messages, or the first unread message if there are unread  
 22827 messages, or the first message. When *mailx* is invoked using the Send Mode synopsis and

standard input is a terminal, if no subject is specified on the command line and the **asksub** variable is set, a prompt for the subject shall be written. At this point, *mailx* shall be in input mode. This input mode shall also be entered when using one of the Receive Mode synopsis forms and a reply or new message is composed using the **reply**, **Reply**, **followup**, **Followup**, or **mail** commands and standard input is a terminal. When the message is typed and the end of the message is encountered, the message shall be passed to the mail delivery software. Commands can be entered by beginning a line with the escape character (by default, tilde ('~')) followed by a single command letter and optional arguments. See **Commands in mailx** (on page 596) for a summary of these commands. It is unspecified what effect these commands will have if standard input is not a terminal when a message is entered using either the Send Mode synopsis, or the Read Mode commands **reply**, **Reply**, **followup**, **Followup**, or **mail**.

**Note:** For notational convenience, this section uses the default escape character, tilde, in all references and examples.

At any time, the behavior of *mailx* shall be governed by a set of environmental and internal variables. These are flags and valued parameters that can be set and cleared via the *mailx* **set** and **unset** commands.

Regular commands are of the form:

[*command*] [*msglist*] [*argument ...*]

If no *command* is specified in command mode, **next** shall be assumed. In input mode, commands shall be recognized by the escape character, and lines not treated as commands shall be taken as input for the message.

In command mode, each message shall be assigned a sequential number, starting with 1.

All messages have a state that shall affect how they are displayed in the header summary and how they are retained or deleted upon termination of *mailx*. There is at any time the notion of a *current* message, which shall be marked by a '>' at the beginning of a line in the header summary. When *mailx* is invoked using one of the Receive Mode synopsis forms, the current message shall be the first new message, if there is a new message, or the first unread message if there is an unread message, or the first message if there are any messages, or unspecified if there are no messages in the mailbox. Each command that takes an optional list of messages (*msglist*) or an optional single message (*message*) on which to operate shall leave the current message set to the highest-numbered message of the messages specified, unless the command deletes messages, in which case the current message shall be set to the first undeleted message (that is, a message not in the deleted state) after the highest-numbered message deleted by the command, if one exists, or the first undeleted message before the highest-numbered message deleted by the command, if one exists, or to an unspecified value if there are no remaining undeleted messages. All messages shall be in one of the following states:

*new* The message is present in the system mailbox and has not been viewed by the user or moved to any other state. Messages in state *new* when *mailx* quits shall be retained in the system mailbox.

*unread* The message has been present in the system mailbox for more than one invocation of *mailx* and has not been viewed by the user or moved to any other state. Messages in state *unread* when *mailx* quits shall be retained in the system mailbox.

*read* The message has been processed by one of the following commands: **~f**, **~m**, **~F**, **~M**, **copy**, **mbox**, **next**, **pipe**, **print**, **Print**, **top**, **type**, **Type**, **undelete**. The **delete**, **dp**, and **dt** commands may also cause the next message to be marked as *read*, depending on the value of the **autoprint** variable. Messages that are in the system mailbox and in state *read* when *mailx* quits shall be saved in the **mbox**, unless the internal variable **hold** was set. Messages that are in the **mbox** or in a secondary mailbox and in state

|       |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 22876 |                  | <i>read</i> when <i>mailx</i> quits shall be retained in their current location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 22877 | <i>deleted</i>   | The message has been processed by one of the following commands: <b>delete</b> , <b>dp</b> , <b>dt</b> . Messages in state <i>deleted</i> when <i>mailx</i> quits shall be deleted. Deleted messages shall be ignored until <i>mailx</i> quits or changes mailboxes or they are specified to the undelete command; for example, the message specification <i>/string</i> shall only search the subject lines of messages that have not yet been deleted, unless the command operating on the list of messages is <b>undelete</b> . No deleted message or deleted message header shall be displayed by any <i>mailx</i> command other than <b>undelete</b> . |
| 22878 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 22879 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 22880 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 22881 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 22882 |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 22887 | <i>saved</i>     | The message has been processed by one of the following commands: <b>save</b> or <b>write</b> . If the current mailbox is the system mailbox, and the internal variable <b>keepsave</b> is set, messages in the state <i>saved</i> shall be saved to the file designated by the <i>MBOX</i> variable (see the ENVIRONMENT VARIABLES section). If the current mailbox is the system mailbox, messages in the state <i>saved</i> shall be deleted from the current mailbox, when the <b>quit</b> or <b>file</b> command is used to exit the current mailbox.                                                                                                   |

| 22914 | <i>r</i>         | Read messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 22915 | <i>u</i>         | Unread messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Other commands take an optional message (*message*) on which to operate, which defaults to the current message. All of the forms allowed for *msglist* are also allowed for *message*, but if more than one message is specified, only the first shall be operated on.

Other arguments are usually arbitrary strings whose usage depends on the command involved.

## Start-Up in mailx

At start-up time, *mailx* shall take the following steps in sequence:

1. Establish all variables at their stated default values.
2. Process command line options, overriding corresponding default values.
3. Import any of the *DEAD*, *EDITOR*, *MBOX*, *LISTER*, *PAGER*, *SHELL*, or *VISUAL* variables that are present in the environment, overriding the corresponding default values.
4. Read *mailx* commands from an unspecified system start-up file, unless the **-n** option is given, to initialize any internal *mailx* variables and aliases.
5. Process the start-up file of *mailx* commands named in the user *MAILRC* variable.

Most regular *mailx* commands are valid inside start-up files, the most common use being to set up initial display options and alias lists. The following commands shall be invalid in the start-up file: **!**, **edit**, **hold**, **mail**, **preserve**, **reply**, **Reply**, **shell**, **visual**, **Copy**, **followup**, and **Followup**. Any errors in the start-up file shall either cause *mailx* to terminate with a diagnostic message and a non-zero status or to continue after writing a diagnostic message, ignoring the remainder of the lines in the start-up file.

A blank line in a start-up file shall be ignored.

## Internal Variables in mailx

The following variables are internal *mailx* variables. Each internal variable can be set via the *mailx* **set** command at any time. The **unset** and **set no name** commands can be used to erase variables.

In the following list, variables shown as:

variable

represent Boolean values. Variables shown as:

variable=value

shall be assigned string or numeric values. For string values, the rules in **Commands in mailx** (on page 596) concerning filenames and quoting shall also apply.

The defaults specified here may be changed by the implementation-defined system start-up file unless the user specifies the **-n** option.

**allnet** All network names whose login name components match shall be treated as identical. This shall cause the *msglist* message specifications to behave similarly. The default shall be **noallnet**. See also the **alternates** command and the **metoo** variable.

**append** Append messages to the end of the **mbox** file upon termination instead of placing them at the beginning. The default shall be **noappend**. This variable shall not affect the **save** command when saving to **mbox**.

**ask, asksub** Prompt for a subject line on outgoing mail if one is not specified on the command line with the **-s** option. The **ask** and **asksub** forms are synonyms; the system shall

|           |                         |                                                                                                             |
|-----------|-------------------------|-------------------------------------------------------------------------------------------------------------|
| 22957     |                         | refer to <b>asksub</b> and <b>noasksub</b> in its messages, but shall accept <b>ask</b> and <b>noask</b> as |
| 22958     |                         | user input to mean <b>asksub</b> and <b>noasksub</b> . It shall not be possible to set both <b>ask</b>      |
| 22959     |                         | and <b>noasksub</b> , or <b>noask</b> and <b>asksub</b> . The default shall be <b>asksub</b> , but no       |
| 22960     |                         | prompting shall be done if standard input is not a terminal.                                                |
| 22961     | <b>askbcc</b>           | Prompt for the blind copy list. The default shall be <b>noaskbcc</b> .                                      |
| 22962     | <b>askcc</b>            | Prompt for the copy list. The default shall be <b>noaskcc</b> .                                             |
| 22963     | <b>autoprint</b>        | Enable automatic writing of messages after <b>delete</b> and <b>undelete</b> commands. The                  |
| 22964     |                         | default shall be <b>noautoprint</b> .                                                                       |
| 22965     | <b>bang</b>             | Enable the special-case treatment of exclamation marks ('!') in escape command                              |
| 22966     |                         | lines; see the <b>escape</b> command and <b>Command Escapes in mailx</b> (on page 604).                     |
| 22967     |                         | The default shall be <b>nobang</b> , disabling the expansion of '!' in the <i>command</i>                   |
| 22968     |                         | argument to the ~! command and the ~<!command escape.                                                       |
| 22969     | <b>cmd=command</b>      |                                                                                                             |
| 22970     |                         | Set the default command to be invoked by the <b>pipe</b> command. The default shall be                      |
| 22971     |                         | <b>nocmd</b> .                                                                                              |
| 22972     | <b>crt=number</b>       | Pipe messages having more than <i>number</i> lines through the command specified by                         |
| 22973     |                         | the value of the <i>PAGER</i> variable. The default shall be <b>nocrt</b> . If it is set to null, the       |
| 22974     |                         | value used is implementation-defined.                                                                       |
| 22975 XSI | <b>debug</b>            | Enable verbose diagnostics for debugging. Messages are not delivered. The                                   |
| 22976     |                         | default shall be <b>nodebug</b> .                                                                           |
| 22977     | <b>dot</b>              | When <b>dot</b> is set, a period on a line by itself during message input from a terminal                   |
| 22978     |                         | shall also signify end-of-file (in addition to normal end-of-file). The default shall be                    |
| 22979     |                         | <b>nodot</b> . If <b>ignoreeof</b> is set (see below), a setting of <b>nodot</b> shall be ignored and the   |
| 22980     |                         | period is the only method to terminate input mode.                                                          |
| 22981     | <b>escape=c</b>         | Set the command escape character to be the character 'c'. By default, the                                   |
| 22982     |                         | command escape character shall be tilde. If <b>escape</b> is unset, tilde shall be used; if it              |
| 22983     |                         | is set to null, command escaping shall be disabled.                                                         |
| 22984     | <b>flipr</b>            | Reverse the meanings of the <b>R</b> and <b>r</b> commands. The default shall be <b>noflipr</b> .           |
| 22985     | <b>folder=directory</b> |                                                                                                             |
| 22986     |                         | The default directory for saving mail files. User-specified filenames beginning with                        |
| 22987     |                         | a plus sign ('+') shall be expanded by preceding the filename with this directory                           |
| 22988     |                         | name to obtain the real pathname. If <i>directory</i> does not start with a slash ('/'), the                |
| 22989     |                         | contents of <i>HOME</i> shall be prefixed to it. The default shall be <b>nofolder</b> . If <b>folder</b> is |
| 22990     |                         | unset or set to null, user-specified filenames beginning with '+' shall refer to files                      |
| 22991     |                         | in the current directory that begin with the literal '+' character. See also <b>outfolder</b>               |
| 22992     |                         | below. The <b>folder</b> value need not affect the processing of the files named in <i>MBOX</i>             |
| 22993     |                         | and <i>DEAD</i> .                                                                                           |
| 22994     | <b>header</b>           | Enable writing of the header summary when entering <i>mailx</i> in Receive Mode. The                        |
| 22995     |                         | default shall be <b>header</b> .                                                                            |
| 22996     | <b>hold</b>             | Preserve all messages that are read in the system mailbox instead of putting them                           |
| 22997     |                         | in the <b>mbox</b> save file. The default shall be <b>nohold</b> .                                          |
| 22998     | <b>ignore</b>           | Ignore interrupts while entering messages. The default shall be <b>noignore</b> .                           |
| 22999     | <b>ignoreeof</b>        | Ignore normal end-of-file during message input. Input can be terminated only by                             |
| 23000     |                         | entering a period ('.') on a line by itself or by the ~. command escape. The default                        |
| 23001     |                         | shall be <b>noignoreeof</b> . See also <b>dot</b> above.                                                    |

|           |                            |                                                                                                            |
|-----------|----------------------------|------------------------------------------------------------------------------------------------------------|
| 23002     | <b>indentprefix=string</b> |                                                                                                            |
| 23003     |                            | A string that shall be added as a prefix to each line that is inserted into the message                    |
| 23004     |                            | by the <b>~m</b> command escape. This variable shall default to one <tab>.                                 |
| 23005     | <b>keep</b>                | When a system mailbox, secondary mailbox, or <b>mbox</b> is empty, truncate it to zero                     |
| 23006     |                            | length instead of removing it. The default shall be <b>nokeep</b> .                                        |
| 23007     | <b>keepsave</b>            | Keep the messages that have been saved from the system mailbox into other files                            |
| 23008     |                            | in the file designated by the variable <i>MBOX</i> , instead of deleting them. The default                 |
| 23009     |                            | shall be <b>nokeepsave</b> .                                                                               |
| 23010     | <b>metoo</b>               | Suppress the deletion of the login name of the user from the recipient list when                           |
| 23011     |                            | replying to a message or sending to a group. The default shall be <b>nometoo</b> .                         |
| 23012 XSI | <b>onehop</b>              | When responding to a message that was originally sent to several recipients, the                           |
| 23013     |                            | other recipient addresses are normally forced to be relative to the originating                            |
| 23014     |                            | author's machine for the response. This flag disables alteration of the recipients'                        |
| 23015     |                            | addresses, improving efficiency in a network where all machines can send directly                          |
| 23016     |                            | to all other machines (that is, one hop away). The default shall be <b>noonehop</b> .                      |
| 23017     | <b>outfolder</b>           | Cause the files used to record outgoing messages to be located in the directory                            |
| 23018     |                            | specified by the <b>folder</b> variable unless the pathname is absolute. The default shall                 |
| 23019     |                            | be <b>nooutfolder</b> . See the <b>record</b> variable.                                                    |
| 23020     | <b>page</b>                | Insert a <form-feed> after each message sent through the pipe created by the <b>pipe</b>                   |
| 23021     |                            | command. The default shall be <b>nopage</b> .                                                              |
| 23022     | <b>prompt=string</b>       |                                                                                                            |
| 23023     |                            | Set the command-mode prompt to <i>string</i> . If <i>string</i> is null or if <b>noprompt</b> is set, no   |
| 23024     |                            | prompting shall occur. The default shall be to prompt with the string " ? ".                               |
| 23025     | <b>quiet</b>               | Refrain from writing the opening message and version when entering <i>mailx</i> . The                      |
| 23026     |                            | default shall be <b>noquiet</b> .                                                                          |
| 23027     | <b>record=file</b>         | Record all outgoing mail in the file with the pathname <i>file</i> . The default shall be                  |
| 23028     |                            | <b>no record</b> . See also <b>outfolder</b> above.                                                        |
| 23029     | <b>save</b>                | Enable saving of messages in the dead-letter file on interrupt or delivery error. See                      |
| 23030     |                            | the variable <i>DEAD</i> for the location of the dead-letter file. The default shall be <b>save</b> .      |
| 23031     | <b>screen=number</b>       |                                                                                                            |
| 23032     |                            | Set the number of lines in a screenful of headers for the <b>headers</b> and <b>z</b> commands.            |
| 23033     |                            | If <b>screen</b> is not specified, a value based on the terminal type identified by the                    |
| 23034     |                            | <i>TERM</i> environment variable, the window size, the baud rate, or some combination                      |
| 23035     |                            | of these shall be used.                                                                                    |
| 23036     | <b>sendwait</b>            | Wait for the background mailer to finish before returning. The default shall be                            |
| 23037     |                            | <b>nosendwait</b> .                                                                                        |
| 23038     | <b>showto</b>              | When the sender of the message was the user who is invoking <i>mailx</i> , write the                       |
| 23039     |                            | information from the <b>To:</b> line instead of the <b>From:</b> line in the header summary.               |
| 23040     |                            | The default shall be <b>noshowto</b> .                                                                     |
| 23041     | <b>sign=string</b>         | Set the variable inserted into the text of a message when the <b>~a</b> command escape is                  |
| 23042     |                            | given. The default shall be <b>no sign</b> . The character sequences ' <b>\t</b> ' and ' <b>\n</b> ' shall |
| 23043     |                            | be recognized in the variable as <tab>s and <newline>s, respectively. (See also <b>~i</b> in               |
| 23044     |                            | <b>Command Escapes in mailx</b> (on page 604).)                                                            |
| 23045     | <b>Sign=string</b>         | Set the variable inserted into the text of a message when the <b>~A</b> command escape is                  |
| 23046     |                            | given. The default shall be <b>no Sign</b> . The character sequences ' <b>\t</b> ' and ' <b>\n</b> ' shall |

23047 be recognized in the variable as <tab>s and <newline>s, respectively.

23048 **toplines**=*number*

23049 Set the number of lines of the message to write with the **top** command. The default  
23050 shall be 5.

## 23051 **Commands in mailx**

23052 The following *mailx* commands shall be provided. In the following list, header refers to lines  
23053 from the message header, as shown in the OUTPUT FILES section. Header-line refers to lines  
23054 within the header that begin with one or more non-white-space characters, immediately  
23055 followed by a colon and white space and continuing until the next line beginning with a non-  
23056 white-space character or an empty line. Header-field refers to the portion of a header line prior  
23057 to the first colon in that line.

23058 For each of the commands listed below, the command can be entered as the abbreviation (those  
23059 characters in the Synopsis command word preceding the ' [ ' ), the full command (all characters  
23060 shown for the command word, omitting the ' [ ' and ' ] ' ), or any truncation of the full  
23061 command down to the abbreviation. For example, the **exit** command (shown as **ex[it]** in the  
23062 Synopsis) can be entered as **ex**, **exi**, or **exit**.

23063 The arguments to commands can be quoted, using the following methods:

- 23064 • An argument can be enclosed between paired double-quotes ( " ") or single-quotes ( ' '); any  
23065 white space, shell word expansion, or backslash characters within the quotes shall be treated  
23066 literally as part of the argument. A double-quote shall be treated literally within single-  
23067 quotes and *vice versa*. These special properties of the quote marks shall occur only when they  
23068 are paired at the beginning and end of the argument.
- 23069 • A backslash outside of the enclosing quotes shall be discarded and the following character  
23070 treated literally as part of the argument.
- 23071 • An unquoted backslash at the end of a command line shall be discarded and the next line  
23072 shall continue the command.

23073 Filenames, where expected, shall be subjected to the following transformations, in sequence:

- 23074 • If the filename begins with an unquoted plus sign, and the **folder** variable is defined (see the  
23075 **folder** variable), the plus sign shall be replaced by the value of the **folder** variable followed  
23076 by a slash. If the **folder** variable is unset or is set to null, the filename shall be unchanged.
- 23077 • Shell word expansions shall be applied to the filename (see Section 2.6 (on page 36)). If more  
23078 than a single pathname results from this expansion and the command is expecting one file,  
23079 the effects are unspecified.

## 23080 **Declare Aliases**

23081 *Synopsis:*     a[lias] [alias [address...]]

23082               g[roup] [alias [address...]]

23083 Add the given addresses to the alias specified by *alias*. The names shall be substituted when  
23084 *alias* is used as a recipient address specified by the user in an outgoing message (that is, other  
23085 recipients addressed indirectly through the **reply** command shall not be substituted in this  
23086 manner). Mail address alias substitution shall apply only when the alias string is used as a full  
23087 address; for example, when **hlj** is an alias, *hlj@posix.com* does not trigger the alias substitution. If  
23088 no arguments are given, write a listing of the current aliases to standard output. If only an *alias*  
23089 argument is given, write a listing of the specified alias to standard output. These listings need  
23090 not reflect the same order of addresses that were entered.

23091 **Declare Alternatives**23092 *Synopsis:*     alt[ernates] *name...*

23093 (See also the **metoo** command.) Declare a list of alternative names for the user's login. When  
 23094 responding to a message, these names shall be removed from the list of recipients for the  
 23095 response. The comparison of names shall be in a case-insensitive manner. With no arguments,  
 23096 **alternates** shall write the current list of alternative names.

23097 **Change Current Directory**

23098 *Synopsis:*     cd [*directory*]  
 23099                 ch[dir] [*directory*]

23100 Change directory. If *directory* is not specified, the contents of *HOME* shall be used.

23101 **Copy Messages**

23102 *Synopsis:*     c[opy] [*file*]  
 23103                 c[opy] [*msglist*] *file*  
 23104                 C[opy] [*msglist*]

23105 Copy messages to the file named by the pathname *file* without marking the messages as saved.  
 23106 Otherwise, it shall be equivalent to the **save** command.

23107 In the capitalized form, save the specified messages in a file whose name is derived from the  
 23108 author of the message to be saved, without marking the messages as saved. Otherwise, it shall  
 23109 be equivalent to the **Save** command.

23110 **Delete Messages**23111 *Synopsis:*     d[ele]te [*msglist*]

23112 Mark messages for deletion from the mailbox. The deletions shall not occur until *mailx* quits (see  
 23113 the **quit** command) or changes mailboxes (see the **folder** command). If **autoprint** is set and there  
 23114 are messages remaining after the **delete** command, the current message shall be written as  
 23115 described for the **print** command (see the **print** command); otherwise, the *mailx* prompt shall be  
 23116 written.

23117 **Discard Header Fields**

23118 *Synopsis:*     di[scard] [*header-field...*]  
 23119                 ig[nore] [*header-field...*]

23120 Suppress the specified header fields when writing messages. Specified *header-fields* shall be  
 23121 added to the list of suppressed header fields. Examples of header fields to ignore are **status** and  
 23122 **cc**. The fields shall be included when the message is saved. The **Print** and **Type** commands shall  
 23123 override this command. The comparison of header fields shall be in a case-insensitive manner. If  
 23124 no arguments are specified, write a list of the currently suppressed header fields to standard  
 23125 output; the listing need not reflect the same order of header fields that were entered.

23126 If both **retain** and **discard** commands are given, **discard** commands shall be ignored.

## 23127 Delete Messages and Display

23128 Synopsis: dp [msglist]  
 23129 dt [msglist]

23130 Delete the specified messages as described for the **delete** command, except that the **autoprint**  
 23131 variable shall have no effect, and the current message shall be written only if it was set to a  
 23132 message after the last message deleted by the command. Otherwise, an informational message  
 23133 to the effect that there are no further messages in the mailbox shall be written, followed by the  
 23134 *mailx* prompt.

## 23135 Echo a String

23136 Synopsis: ec[ho] string ...

23137 Echo the given strings, equivalent to the shell *echo* utility.

## 23138 Edit Messages

23139 Synopsis: e[dit] [msglist]

23140 Edit the given messages. The messages shall be placed in a temporary file and the utility named  
 23141 by the *EDITOR* variable is invoked to edit each file in sequence. The default *EDITOR* is  
 23142 unspecified.

23143 The **edit** command does not modify the contents of those messages in the mailbox.

## 23144 Exit

23145 Synopsis: ex[it]  
 23146 x[it]

23147 Exit from *mailx* without changing the mailbox. No messages shall be saved in the **mbox** (see also  
 23148 **quit**).

## 23149 Change Folder

23150 Synopsis: fi[le] [file]  
 23151 fold[er] [file]

23152 Quit (see the **quit** command) from the current file of messages and read in the file named by the  
 23153 pathname *file*. If no argument is given, the name and status of the current mailbox shall be  
 23154 written.

23155 Several unquoted special characters shall be recognized when used as *file* names, with the  
 23156 following substitutions:

23157 % The system mailbox for the invoking user.

23158 %*user* The system mailbox for *user*.

23159 # The previous file.

23160 & The current **mbox**.

23161 +*file* The named file in the **folder** directory. (See the **folder** variable.)

23162 The default file shall be the current mailbox.

## 23163 **Display List of Folders**

23164 *Synopsis:*     *folders*

23165 Write the names of the files in the directory set by the **folder** variable. The command specified by  
23166 the *LISTER* environment variable shall be used (see the ENVIRONMENT VARIABLES section).

## 23167 **Follow Up Specified Messages**

23168 *Synopsis:*     *fo[llowup] [message]*

23169               *F[ollowup] [msglist]*

23170 In the lowercase form, respond to a message, recording the response in a file whose name is  
23171 derived from the author of the message. See also the **save** and **copy** commands and **outfolder**.

23172 In the capitalized form, respond to the first message in the *msglist*, sending the message to the  
23173 author of each message in the *msglist*. The subject line shall be taken from the first message and  
23174 the response shall be recorded in a file whose name is derived from the author of the first  
23175 message. See also the **Save** and **Copy** commands and **outfolder**.

23176 Both forms shall override the **record** variable, if set.

## 23177 **Display Header Summary for Specified Messages**

23178 *Synopsis:*     *f[rom] [msglist]*

23179 Write the header summary for the specified messages.

## 23180 **Display Header Summary**

23181 *Synopsis:*     *h[eaders] [message]*

23182 Write the page of headers that includes the message specified. If the *message* argument is not  
23183 specified, the current message shall not change. However, if the *message* argument is specified,  
23184 the current message shall become the message that appears at the top of the page of headers that  
23185 includes the message specified. The **screen** variable sets the number of headers per page. See  
23186 also the **z** command.

## 23187 **Help**

23188 *Synopsis:*     *hel[p]*

23189               ?

23190 Write a summary of commands.

## 23191 **Hold Messages**

23192 *Synopsis:*     *ho[ld] [msglist]*

23193               *pre[serve] [msglist]*

23194 Mark the messages in *msglist* to be retained in the mailbox when *mailx* terminates. This shall  
23195 override any commands that might previously have marked the messages to be deleted. During  
23196 the current invocation of *mailx*, only the **delete**, **dp**, or **dt** commands shall remove the *preserve*  
23197 marking of a message.

**Execute Commands Conditionally**

Synopsis:    i[f] s|r  
               mail-commands  
               el[se]  
               mail-commands  
               en[dif]

Execute commands conditionally, where **if s** executes the following *mail-commands*, up to an **else** or **endif**, if the program is in Send Mode, and **if r** shall cause the *mail-commands* to be executed only in Receive Mode.

**List Available Commands**

Synopsis:    l[ist]

Write a list of all commands available. No explanation shall be given.

**Mail a Message**

Synopsis:    m[ail] address...

Mail a message to the specified addresses or aliases.

**Direct Messages to mbox**

Synopsis:    mb[ox] [msglist]

Arrange for the given messages to end up in the **mbox** save file when *mailx* terminates normally. See *MBOX*. See also the **exit** and **quit** commands.

**Process Next Specified Message**

Synopsis:    n[ext] [message]

If the current message has not been written (for example, by the **print** command) since *mailx* started or since any other message was the current message, behave as if the **print** command was entered. Otherwise, if there is an undeleted message after the current message, make it the current message and behave as if the **print** command was entered. Otherwise, an informational message to the effect that there are no further messages in the mailbox shall be written, followed by the *mailx* prompt.

**Pipe Message**

Synopsis:    pi[pe] [[msglist] command]  
               | [[msglist] command]

Pipe the messages through the given *command* by invoking the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) The application shall ensure that the command is given as a single argument. Quoting, described previously, can be used to accomplish this. If no arguments are given, the current message shall be piped through the command specified by the value of the **cmd** variable. If the **page** variable is set, a <form-feed> shall be inserted after each message.

### 23234 **Display Message with Headers**

23235 *Synopsis:*   P[rint] [msglist]  
 23236           T[ype] [msglist]

23237 Write the specified messages, including all header lines, to standard output. Override  
 23238 suppression of lines by the **discard**, **ignore**, and **retain** commands. If **crt** is set, the messages  
 23239 longer than the number of lines specified by the **crt** variable shall be paged through the  
 23240 command specified by the *PAGER* environment variable.

### 23241 **Display Message**

23242 *Synopsis:*   p[rint] [msglist]  
 23243           t[ype] [msglist]

23244 Write the specified messages to standard output. If **crt** is set, the messages longer than the  
 23245 number of lines specified by the **crt** variable shall be paged through the command specified by  
 23246 the *PAGER* environment variable.

### 23247 **Quit**

23248 *Synopsis:*   q[uit]  
 23249           end-of-file

23250 Terminate *mailx*, storing messages that were read in **mbox** (if the current mailbox is the system  
 23251 mailbox and unless **hold** is set), deleting messages that have been explicitly saved (unless  
 23252 **keepsave** is set), discarding messages that have been deleted, and saving all remaining messages  
 23253 in the mailbox.

### 23254 **Reply to a Message List**

23255 *Synopsis:*   R[eply] [msglist]  
 23256           R[espond] [msglist]

23257 Mail a reply message to the sender of each message in the *msglist*. The subject line shall be  
 23258 formed by concatenating **Re:**<space> (unless it already begins with that string) and the subject  
 23259 from the first message. If **record** is set to a filename, the response shall be saved at the end of that  
 23260 file.

23261 See also the **flipr** variable.

### 23262 **Reply to a Message**

23263 *Synopsis:*   r[eply] [message]  
 23264           r[espond] [message]

23265 Mail a reply message to all recipients included in the header of the message. The subject line  
 23266 shall be formed by concatenating **Re:**<space> (unless it already begins with that string) and the  
 23267 subject from the message. If **record** is set to a filename, the response shall be saved at the end of  
 23268 that file.

23269 See also the **flipr** variable.

**Retain Header Fields**

Synopsis: `ret[ain] [header-field...]`

Retain the specified header fields when writing messages. This command shall override all **discard** and **ignore** commands. The comparison of header fields shall be in a case-insensitive manner. If no arguments are specified, write a list of the currently retained header fields to standard output; the listing need not reflect the same order of header fields that were entered.

**Save Messages**

Synopsis: `s[ave] [file]`  
`s[ave] [msglist] file`  
`S[ave] [msglist]`

Save the specified messages in the file named by the pathname *file*, or the **mbox** if the *file* argument is omitted. The file shall be created if it does not exist; otherwise, the messages shall be appended to the file. The message shall be put in the state *saved*, and shall behave as specified in the description of the *saved* state when the current mailbox is exited by the **quit** or **file** command.

In the capitalized form, save the specified messages in a file whose name is derived from the author of the first message. The name of the file shall be taken to be the author's name with all network addressing stripped off. See also the **Copy**, **followup**, and **Followup** commands and **outfolder** variable.

**Set Variables**

Synopsis: `se[t] [name=[string]] ... [name=number ...] [noname ...]`

Define one or more variables called *name*. The variable can be given a null, string, or numeric value. Quoting and backslash escapes can occur anywhere in *string*, as described previously, as if the *string* portion of the argument were the entire argument. The forms *name* and *name=* shall be equivalent to *name=""* for variables that take string values. The **set** command without arguments shall write a list of all defined variables and their values. The **no name** form shall be equivalent to **unset name**.

**Invoke a Shell**

Synopsis: `sh[ell]`

Invoke an interactive command interpreter (see also *SHELL*).

**Display Message Size**

Synopsis: `si[ze] [msglist]`

Write the size in bytes of each of the specified messages.

**Read mailx Commands From a File**

Synopsis: `so[urce] file`

Read and execute commands from the file named by the pathname *file* and return to command mode.

### 23307 **Display Beginning of Messages**

23308 *Synopsis:*    to[p] [msglist]

23309 Write the top few lines of each of the specified messages. If the **toplines** variable is set, it is taken  
23310 as the number of lines to write. The default shall be 5.

### 23311 **Touch Messages**

23312 *Synopsis:*    tou[ch] [msglist]

23313 Touch the specified messages. If any message in *msglist* is not specifically deleted nor saved in a  
23314 file, it shall be placed in the **mbx** upon normal termination. See **exit** and **quit**.

### 23315 **Delete Aliases**

23316 *Synopsis:*    una[lias] [alias]...

23317 Delete the specified alias names. If a specified alias does not exist, the results are unspecified.

### 23318 **Undelete Messages**

23319 *Synopsis:*    u[ndelete] [msglist]

23320 Change the state of the specified messages from deleted to read. If **autoprint** is set, the last  
23321 message of those restored shall be written. If *msglist* is not specified, the message shall be  
23322 selected as follows:

- 23323       • If there are any deleted messages that follow the current message, the first of these shall be  
23324       chosen.
- 23325       • Otherwise, the last deleted message that also precedes the current message shall be chosen.

### 23326 **Unset Variables**

23327 *Synopsis:*    uns[et] name...

23328 Cause the specified variables to be erased.

### 23329 **Edit Message with Full-Screen Editor**

23330 *Synopsis:*    v[isual] [msglist]

23331 Edit the given messages with a screen editor. Each message shall be placed in a temporary file,  
23332 and the utility named by the *VISUAL* variable shall be invoked to edit each file in sequence. The  
23333 default editor shall be *vi*.

23334 The **visual** command does not modify the contents of those messages in the mailbox.

### 23335 **Write Messages to a File**

23336 *Synopsis:*    w[rite] [msglist] file

23337 Write the given messages to the file specified by the pathname *file*, minus the message header.  
23338 Otherwise, it shall be equivalent to the **save** command.

**Scroll Header Display**

Synopsis:     z [+|-]

Scroll the header display forward (if '+' is specified or if no option is specified) or backward (if '-' is specified) one screenful. The number of headers written shall be set by the **screen** variable.

**Invoke Shell Command**

Synopsis:     ! *command*

Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*. (See also *sh -c*.) If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

**Null Command**

Synopsis:     # *comment*

This null command (comment) shall be ignored by *mailx*.

**Display Current Message Number**

Synopsis:     =

Write the current message number.

**Command Escapes in mailx**

The following commands can be entered only from input mode, by beginning a line with the escape character (by default, tilde ('~')). See the **escape** variable description for changing this special character. The format for the commands shall be:

<escape-character><command-char><separator> [<arguments>]

where the <separator> can be zero or more <blank>s.

In the following descriptions, the application shall ensure that the argument *command* (but not *mailx-command*) is a shell command string. Any string acceptable to the command interpreter specified by the *SHELL* variable when it is invoked as *SHELL -c command\_string* shall be valid. The command can be presented as multiple arguments (that is, quoting is not required).

Command escapes that are listed with *msglist* or *mailx-command* arguments are invalid in Send Mode and produce unspecified results.

~! *command*   Invoke the command interpreter specified by *SHELL* with two arguments: **-c** and *command*; and then return to input mode. If the **bang** variable is set, each unescaped occurrence of '!' in *command* shall be replaced with the command executed by the previous ! command or ~! command escape.

~.            Simulate end-of-file (terminate message input).

~: *mailx-command*, ~\_ *mailx-command*  
Perform the command-level request.

~?           Write a summary of command escapes.

~A           This shall be equivalent to ~i **Sign**.

~a           This shall be equivalent to ~i **sign**.

|       |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |

If the argument begins with an exclamation mark ('!'), the rest of the string shall be taken as an arbitrary system command; the command interpreter specified by <i>SHELL</i> shall be invoked with two arguments: <b>-c</b> and <i>command</i> . The standard output of <i>command</i> shall be inserted into the message. |
| 23409 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23410 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23411 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23412 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23413 | <b>~s</b> <i>string</i>                                                                                     | Set the subject line to <i>string</i> .                                                                                                                                                                                                                                                                                                                                               |
| 23414 | <b>~t</b> <i>name...</i>                                                                                    | Add the given <i>names</i> to the <b>To</b> list.                                                                                                                                                                                                                                                                                                                                     |
| 23415 | <b>~v</b>                                                                                                   | Invoke the full-screen editor, as specified by the <i>VISUAL</i> environment variable, on the partial message.                                                                                                                                                                                                                                                                        |
| 23416 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23417 | <b>~w</b> <i>file</i>                                                                                       | Write the partial message, without the header, onto the file named by the pathname <i>file</i> . The file shall be created or the message shall be appended to it if the file exists.                                                                                                                                                                                                 |
| 23418 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |
| 23419 |                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                       |

23420       ~x           Exit as with ~q, except the message shall not be saved in the dead-letter file.

23421       ~| *command* Pipe the body of the message through the given *command* by invoking the  
 23422           command interpreter specified by *SHELL* with two arguments: -c and *command*.  
 23423           If the *command* returns a successful exit status, the standard output of the  
 23424           command shall replace the message. Otherwise, the message shall remain  
 23425           unchanged. If the *command* fails, an error message giving the exit status shall be  
 23426           written.

#### 23427 **EXIT STATUS**

23428       When the -e option is specified, the following exit values are returned:

23429       0   Mail was found.

23430       >0   Mail was not found or an error occurred.

23431       Otherwise, the following exit values are returned:

23432       0   Successful completion; note that this status implies that all messages were *sent*, but it gives  
 23433           no assurances that any of them were actually *delivered*.

23434       >0   An error occurred.

#### 23435 **CONSEQUENCES OF ERRORS**

23436       When in input mode (Receive Mode) or Send Mode:

23437       • If an error is encountered processing a command escape (see **Command Escapes in mailx**  
 23438         (on page 604)), a diagnostic message shall be written to standard error, and the message  
 23439         being composed may be modified, but this condition shall not prevent the message from  
 23440         being sent.

23441       • Other errors shall prevent the sending of the message.

23442       When in command mode:

23443       • Default.

#### 23444 **APPLICATION USAGE**

23445       Delivery of messages to remote systems requires the existence of communication paths to such  
 23446       systems. These need not exist.

23447       Input lines are limited to {LINE\_MAX} bytes, but mailers between systems may impose more  
 23448       severe line-length restrictions. This volume of IEEE Std 1003.1-2001 does not place any  
 23449       restrictions on the length of messages handled by *mailx*, and for delivery of local messages the  
 23450       only limitations should be the normal problems of available disk space for the target mail file.  
 23451       When sending messages to external machines, applications are advised to limit messages to less  
 23452       than 100 000 bytes because some mail gateways impose message-length restrictions.

23453       The format of the system mailbox is intentionally unspecified. Not all systems implement  
 23454       system mailboxes as flat files, particularly with the advent of multimedia mail messages. Some  
 23455       system mailboxes may be multiple files, others records in a database. The internal format of the  
 23456       messages themselves is specified with the historical format from Version 7, but only after the  
 23457       messages have been saved in some file other than the system mailbox. This was done so that  
 23458       many historical applications expecting text-file mailboxes are not broken.

23459       Some new formats for messages can be expected in the future, probably including binary data,  
 23460       bit maps, and various multimedia objects. As described here, *mailx* is not prohibited from  
 23461       handling such messages, but it must store them as text files in secondary mailboxes (unless  
 23462       some extension, such as a variable or command line option, is used to change the stored format).  
 23463       Its method of doing so is implementation-defined and might include translating the data into

23464 text file-compatible or readable form or omitting certain portions of the message from the stored  
23465 output.

23466 The **discard** and **ignore** commands are not inverses of the **retain** command. The **retain**  
23467 command discards all header-fields except those explicitly retained. The **discard** command  
23468 keeps all header-fields except those explicitly discarded. If headers exist on the retained header  
23469 list, **discard** and **ignore** commands are ignored.

#### 23470 EXAMPLES

23471 None.

#### 23472 RATIONALE

23473 The standard developers felt strongly that a method for applications to send messages to  
23474 specific users was necessary. The obvious example is a batch utility, running non-interactively,  
23475 that wishes to communicate errors or results to a user. However, the actual format, delivery  
23476 mechanism, and method of reading the message are clearly beyond the scope of this volume of  
23477 IEEE Std 1003.1-2001.

23478 The intent of this command is to provide a simple, portable interface for sending messages non-  
23479 interactively. It merely defines a “front-end” to the historical mail system. It is suggested that  
23480 implementations explicitly denote the sender and recipient in the body of the delivered message.  
23481 Further specification of formats for either the message envelope or the message itself were  
23482 deliberately not made, as the industry is in the midst of changing from the current standards to a  
23483 more internationalized standard and it is probably incorrect, at this time, to require either one.

23484 Implementations are encouraged to conform to the various delivery mechanisms described in  
23485 the CCITT X.400 standards or to the equivalent Internet standards, described in Internet Request  
23486 for Comment (RFC) documents RFC 819, RFC 822, RFC 920, RFC 921, and RFC 1123.

23487 Many historical systems modified each body line that started with **From** by prefixing the ‘F’  
23488 with ‘>’. It is unnecessary, but allowed, to do that when the string does not follow a blank line  
23489 because it cannot be confused with the next header.

23490 The **edit** and **visual** commands merely edit the specified messages in a temporary file. They do  
23491 not modify the contents of those messages in the mailbox; such a capability could be added as an  
23492 extension, such as by using different command names.

23493 The restriction on a subject line being {LINE\_MAX}–10 bytes is based on the historical format  
23494 that consumes 10 bytes for **Subject:** and the trailing <newline>. Many historical mailers that a  
23495 message may encounter on other systems are not able to handle lines that long, however.

23496 Like the utilities *logger* and *lp*, *mailx* admittedly is difficult to test. This was not deemed sufficient  
23497 justification to exclude this utility from this volume of IEEE Std 1003.1-2001. It is also arguable  
23498 that it is, in fact, testable, but that the tests themselves are not portable.

23499 When *mailx* is being used by an application that wishes to receive the results as if none of the  
23500 User Portability Utilities option features were supported, the *DEAD* environment variable must  
23501 be set to **/dev/null**. Otherwise, it may be subject to the file creations described in *mailx*  
23502 ASYNCHRONOUS EVENTS. Similarly, if the *MAILRC* environment variable is not set to  
23503 **/dev/null**, historical versions of *mailx* and *Mail* read initialization commands from a file before  
23504 processing begins. Since the initialization that a user specifies could alter the contents of  
23505 messages an application is trying to send, such applications must set *MAILRC* to **/dev/null**.

23506 The description of *LC\_TIME* uses “may affect” because many historical implementations do not  
23507 or cannot manipulate the date and time strings in the incoming mail headers. Some headers  
23508 found in incoming mail do not have enough information to determine the timezone in which the  
23509 mail originated, and, therefore, *mailx* cannot convert the date and time strings into the internal  
23510 form that then is parsed by routines like *strftime()* that can take *LC\_TIME* settings into account.

23511 Changing all these times to a user-specified format is allowed, but not required.

23512 The paginator selected when *PAGER* is null or unset is partially unspecified to allow the System  
23513 V historical practice of using *pg* as the default. Bypassing the pagination function, such as by  
23514 declaring that *cat* is the paginator, would not meet with the intended meaning of this  
23515 description. However, any “portable user” would have to set *PAGER* explicitly to get his or her  
23516 preferred paginator on all systems. The paginator choice was made partially unspecified, unlike  
23517 the *VISUAL* editor choice (mandated to be *vi*) because most historical pagers follow a common  
23518 theme of user input, whereas editors differ dramatically.

23519 Options to specify addresses as **cc** (carbon copy) or **bcc** (blind carbon copy) were considered to  
23520 be format details and were omitted.

23521 A zero exit status implies that all messages were *sent*, but it gives no assurances that any of them  
23522 were actually *delivered*. The reliability of the delivery mechanism is unspecified and is an  
23523 appropriate marketing distinction between systems.

23524 In order to conform to the Utility Syntax Guidelines, a solution was required to the optional *file*  
23525 option-argument to **-f**. By making *file* an operand, the guidelines are satisfied and users remain  
23526 portable. However, it does force implementations to support usage such as:

23527 `mailx -fin mymail.box`

23528 The **no name** method of unsetting variables is not present in all historical systems, but it is in  
23529 System V and provides a logical set of commands corresponding to the format of the display of  
23530 options from the *mailx set* command without arguments.

23531 The **ask** and **asksub** variables are the names selected by BSD and System V, respectively, for the  
23532 same feature. They are synonyms in this volume of IEEE Std 1003.1-2001.

23533 The *mailx echo* command was not documented in the BSD version and has been omitted here  
23534 because it is not obviously useful for interactive users.

23535 The default prompt on the System V *mailx* is a question mark, on BSD *Mail* an ampersand. Since  
23536 this volume of IEEE Std 1003.1-2001 chose the *mailx* name, it kept the System V default,  
23537 assuming that BSD users would not have difficulty with this minor incompatibility (that they  
23538 can override).

23539 The meanings of **r** and **R** are reversed between System V *mailx* and SunOS *Mail*. Once again,  
23540 since this volume of IEEE Std 1003.1-2001 chose the *mailx* name, it kept the System V default, but  
23541 allows the SunOS user to achieve the desired results using **flipr**, an internal variable in System V  
23542 *mailx*, although it has not been documented in the SVID.

23543 The **indentprefix** variable, the **retain** and **unalias** commands, and the **~F** and **~M** command  
23544 escapes were adopted from 4.3 BSD *Mail*.

23545 The **version** command was not included because no sufficiently general specification of the  
23546 version information could be devised that would still be useful to a portable user. This  
23547 command name should be used by suppliers who wish to provide version information about the  
23548 *mailx* command.

23549 The “implementation-specific (unspecified) system start-up file” historically has been named  
23550 **/etc/mailx.rc**, but this specific name and location are not required.

23551 The intent of the wording for the **next** command is that if any command has already displayed  
23552 the current message it should display a following message, but, otherwise, it should display the  
23553 current message. Consider the command sequence:

23554 `next 3`  
23555 `delete 3`

|       |                                                                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 23556 | next                                                                                                                                            |
| 23557 | where the <b>autoprint</b> option was not set. The normative text specifies that the second <b>next</b>                                         |
| 23558 | command should display a message following the third message, because even though the                                                           |
| 23559 | current message has not been displayed since it was set by the <b>delete</b> command, it has been                                               |
| 23560 | displayed since the current message was anything other than message number 3. This does not                                                     |
| 23561 | always match historical practice in some implementations, where the command file address                                                        |
| 23562 | followed by <b>next</b> (or the default command) would skip the message for which the user had                                                  |
| 23563 | searched.                                                                                                                                       |
| 23564 | <b>FUTURE DIRECTIONS</b>                                                                                                                        |
| 23565 | None.                                                                                                                                           |

| 23567 | Chapter 2 (on page 29), <i>ed</i> , <i>ls</i> , <i>more</i> , <i>vi</i>                                                                         |
| 23568 | <b>CHANGE HISTORY</b>                                                                                                                           |
| 23569 | First released in Issue 2.                                                                                                                      |
| 23570 | <b>Issue 5</b>                                                                                                                                  |
| 23571 | The description of the <i>EDITOR</i> environment variable is changed to indicate that <i>ed</i> is the default                                  |
| 23572 | editor if this variable is not set. In previous issues, this default was not stated explicitly at this                                          |
| 23573 | point but was implied further down in the text.                                                                                                 |
| 23574 | The FUTURE DIRECTIONS section is added.                                                                                                         |
| 23575 | <b>Issue 6</b>                                                                                                                                  |
| 23576 | The following new requirements on POSIX implementations derive from alignment with the                                                          |
| 23577 | Single UNIX Specification:                                                                                                                      |
| 23578 | <ul style="list-style-type: none"> <li>• The <b>-F</b> option is added.</li> </ul>                                                              |
| 23579 | <ul style="list-style-type: none"> <li>• The <b>allnet</b>, <b>debug</b>, and <b>sendwait</b> internal variables are added.</li> </ul>          |
| 23580 | <ul style="list-style-type: none"> <li>• The <b>C</b>, <b>ec</b>, <b>fo</b>, <b>F</b>, and <b>S</b> <i>mailx</i> commands are added.</li> </ul> |
| 23581 | In the DESCRIPTION and ENVIRONMENT VARIABLES sections, text stating “ <i>HOME</i>                                                               |
| 23582 | directory” is replaced by “directory referred to by the <i>HOME</i> environment variable”.                                                      |
| 23583 | The <i>mailx</i> utility is aligned with the IEEE P1003.2b draft standard, which includes various                                               |
| 23584 | clarifications to resolve IEEE PASC Interpretations submitted for the ISO POSIX-2:1993                                                          |
| 23585 | standard. In particular, the changes here address IEEE PASC Interpretations 1003.2 #10, #11,                                                    |
| 23586 | #103, #106, #108, #114, #115, #122, and #129.                                                                                                   |
| 23587 | The normative text is reworded to avoid use of the term “must” for application requirements.                                                    |
| 23588 | The <i>TZ</i> entry is added to the ENVIRONMENT VARIABLES section.                                                                              |
| 23589 | IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/32 is applied, applying a change to the                                                        |
| 23590 | EXTENDED DESCRIPTION, raised by IEEE PASC Interpretation 1003.2 #122, which was                                                                 |
| 23591 | overlooked in the first version of IEEE Std 1003.1-2001.                                                                                        |

23592 **NAME**23593       make — maintain, update, and regenerate groups of programs (**DEVELOPMENT**)23594 **SYNOPSIS**

```
23595 sd make [-einpqrst] [-f makefile] ... [-k | -S] [macro=value] ...
23596 [target_name...]
```

23597

23598 **DESCRIPTION**

23599       The *make* utility shall update files that are derived from other files. A typical case is one where  
 23600       object files are derived from the corresponding source files. The *make* utility examines time  
 23601       relationships and shall update those derived files (called targets) that have modified times  
 23602       earlier than the modified times of the files (called prerequisites) from which they are derived. A  
 23603       description file (makefile) contains a description of the relationships between files, and the  
 23604       commands that need to be executed to update the targets to reflect changes in their  
 23605       prerequisites. Each specification, or rule, shall consist of a target, optional prerequisites, and  
 23606       optional commands to be executed when a prerequisite is newer than the target. There are two  
 23607       types of rule:

23608           1. *Inference rules*, which have one target name with at least one period ( '.' ) and no slash  
 23609           (' / ')

23610           2. *Target rules*, which can have more than one target name

23611       In addition, *make* shall have a collection of built-in macros and inference rules that infer  
 23612       prerequisite relationships to simplify maintenance of programs.

23613       To receive exactly the behavior described in this section, the user shall ensure that a portable  
 23614       makefile shall:

- 23615       • Include the special target **.POSIX**
- 23616       • Omit any special target reserved for implementations (a leading period followed by  
 23617       uppercase letters) that has not been specified by this section

23618       The behavior of *make* is unspecified if either or both of these conditions are not met.

23619 **OPTIONS**

23620       The *make* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 23621       12.2, Utility Syntax Guidelines.

23622       The following options shall be supported:

23623       **-e**           Cause environment variables, including those with null values, to override macro  
 23624       assignments within makefiles.

23625       **-f *makefile***   Specify a different makefile. The argument *makefile* is a pathname of a description  
 23626       file, which is also referred to as the *makefile*. A pathname of '-' shall denote the  
 23627       standard input. There can be multiple instances of this option, and they shall be  
 23628       processed in the order specified. The effect of specifying the same option-  
 23629       argument more than once is unspecified.

23630       **-i**           Ignore error codes returned by invoked commands. This mode is the same as if the  
 23631       special target **.IGNORE** were specified without prerequisites.

23632       **-k**           Continue to update other targets that do not depend on the current target if a non-  
 23633       ignored error occurs while executing the commands to bring a target up-to-date.

23634       **-n**           Write commands that would be executed on standard output, but do not execute  
 23635       them. However, lines with a plus sign ( '+' ) prefix shall be executed. In this mode,

lines with an at sign ('@') character prefix shall be written to standard output.

**-p** Write to standard output the complete set of macro definitions and target descriptions. The output format is unspecified.

**-q** Return a zero exit value if the target file is up-to-date; otherwise, return an exit value of 1. Targets shall not be updated if this option is specified. However, a makefile command line (associated with the targets) with a plus sign ('+') prefix shall be executed.

**-r** Clear the suffix list and do not use the built-in rules.

**-S** Terminate *make* if an error occurs while executing the commands to bring a target up-to-date. This shall be the default and the opposite of **-k**.

**-s** Do not write makefile command lines or touch messages (see **-t**) to standard output before executing. This mode shall be the same as if the special target **.SILENT** were specified without prerequisites.

**-t** Update the modification time of each target as though a *touch target* had been executed. Targets that have prerequisites but no commands (see **Target Rules** (on page 614)), or that are already up-to-date, shall not be touched in this manner. Write messages to standard output for each target file indicating the name of the file and that it was touched. Normally, the *makefile* command lines associated with each target are not executed. However, a command line with a plus sign ('+') prefix shall be executed.

Any options specified in the *MAKEFLAGS* environment variable shall be evaluated before any options specified on the *make* utility command line. If the **-k** and **-S** options are both specified on the *make* utility command line or by the *MAKEFLAGS* environment variable, the last option specified shall take precedence. If the **-f** or **-p** options appear in the *MAKEFLAGS* environment variable, the result is undefined.

## 23661 OPERANDS

The following operands shall be supported:

*target\_name* Target names, as defined in the EXTENDED DESCRIPTION section. If no target is specified, while *make* is processing the makefiles, the first target that *make* encounters that is not a special target or an inference rule shall be used.

*macro=value* Macro definitions, as defined in **Macros** (on page 616).

If the *target\_name* and *macro=value* operands are intermixed on the *make* utility command line, the results are unspecified.

## 23669 STDIN

The standard input shall be used only if the *makefile* option-argument is '-'. See the INPUT FILES section.

## 23672 INPUT FILES

The input file, otherwise known as the makefile, is a text file containing rules, macro definitions, and comments. See the EXTENDED DESCRIPTION section.

## 23675 ENVIRONMENT VARIABLES

The following environment variables shall affect the execution of *make*:

*LANG* Provide a default value for the internationalization variables that are unset or null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables for the precedence of internationalization variables used to determine the values of locale categories.)

|       |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 23681 | <i>LC_ALL</i>              | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 23693 |                            | • The characters are option letters without the leading hyphens or <blank> separation used on a <i>make</i> utility command line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 23694 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 23695 |                            | • The characters are formatted in a manner similar to a portion of the <i>make</i> utility command line: options are preceded by hyphens and <blank>-separated as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines. The <i>macro=value</i> macro definition operands can also be included. The difference between the contents of <i>MAKEFLAGS</i> and the <i>make</i> utility command line is that the contents of the variable shall not be subjected to the word expansions (see Section 2.6 (on page 36)) associated with parsing the command line values. |

| 23705 |                            | Provide a directory to be used to search for SCCS files not found in the current directory. In all of the following cases, the search for SCCS files is made in the directory <b>SCCS</b> in the identified directory. If the value of <i>PROJECTDIR</i> begins with a slash, it shall be considered an absolute pathname; otherwise, the value of <i>PROJECTDIR</i> is treated as a user name and that user's initial working directory shall be examined for a subdirectory <b>src</b> or <b>source</b> . If such a directory is found, it shall be used. Otherwise, the value is used as a relative pathname.        |

| 23723 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 23724 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 23725 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 23726 |                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

23727 **STDOUT**

23728 The *make* utility shall write all commands to be executed to standard output unless the **-s** option  
 23729 was specified, the command is prefixed with an at sign, or the special target **.SILENT** has either  
 23730 the current target as a prerequisite or has no prerequisites. If *make* is invoked without any work  
 23731 needing to be done, it shall write a message to standard output indicating that no action was  
 23732 taken. If the **-t** option is present and a file is touched, *make* shall write to standard output a  
 23733 message of unspecified format indicating that the file was touched, including the filename of the  
 23734 file.

23735 **STDERR**

23736 The standard error shall be used only for diagnostic messages.

23737 **OUTPUT FILES**

23738 Files can be created when the **-t** option is present. Additional files can also be created by the  
 23739 utilities invoked by *make*.

23740 **EXTENDED DESCRIPTION**

23741 The *make* utility attempts to perform the actions required to ensure that the specified targets are  
 23742 up-to-date. A target is considered out-of-date if it is older than any of its prerequisites or if it  
 23743 does not exist. The *make* utility shall treat all prerequisites as targets themselves and recursively  
 23744 ensure that they are up-to-date, processing them in the order in which they appear in the rule.  
 23745 The *make* utility shall use the modification times of files to determine whether the corresponding  
 23746 targets are out-of-date.

23747 After *make* has ensured that all of the prerequisites of a target are up-to-date and if the target is  
 23748 out-of-date, the commands associated with the target entry shall be executed. If there are no  
 23749 commands listed for the target, the target shall be treated as up-to-date.

23750 **Makefile Syntax**

23751 A makefile can contain rules, macro definitions (see **Macros** (on page 616)), and comments.  
 23752 There are two kinds of rules: *inference rules* and *target rules*. The *make* utility shall contain a set of  
 23753 built-in inference rules. If the **-r** option is present, the built-in rules shall not be used and the  
 23754 suffix list shall be cleared. Additional rules of both types can be specified in a makefile. If a rule  
 23755 is defined more than once, the value of the rule shall be that of the last one specified. Macros can  
 23756 also be defined more than once, and the value of the macro is specified in **Macros** (on page 616).  
 23757 Comments start with a number sign ('#') and continue until an unescaped <newline> is  
 23758 reached.

23759 By default, the following files shall be tried in sequence: **./makefile** and **./Makefile**. If neither  
 23760 XSI **./makefile** or **./Makefile** are found, other implementation-defined files may also be tried. On  
 23761 XSI-conformant systems, the additional files **./s.makefile**, **SCCS/s.makefile**, **./s.Makefile**, and  
 23762 **SCCS/s.Makefile** shall also be tried.

23763 The **-f** option shall direct *make* to ignore any of these default files and use the specified argument  
 23764 as a makefile instead. If the **-** argument is specified, standard input shall be used.

23765 The term *makefile* is used to refer to any rules provided by the user, whether in **./makefile** or its  
 23766 variants, or specified by the **-f** option.

23767 The rules in makefiles shall consist of the following types of lines: target rules, including special  
 23768 targets (see **Target Rules** (on page 614)), inference rules (see **Inference Rules** (on page 617)),  
 23769 macro definitions (see **Macros** (on page 616)), empty lines, and comments.

23770 When an escaped <newline> (one preceded by a backslash) is found anywhere in the makefile  
 23771 except in a command line, it shall be replaced, along with any leading white space on the  
 23772 following line, with a single <space>. When an escaped <newline> is found in a command line

23773 in a makefile, the command line shall contain the backslash, the <newline>, and the next line,  
 23774 except that the first character of the next line shall not be included if it is a <tab>.

## 23775 **Makefile Execution**

23776 Makefile command lines shall be processed one at a time by writing the makefile command line  
 23777 to the standard output (unless one of the conditions listed under '@' suppresses the writing)  
 23778 and executing the command(s) in the line. A <tab> may precede the command to standard  
 23779 output. Command execution shall be as if the makefile command line were the argument to the  
 23780 *system()* function. The environment for the command being executed shall contain all of the  
 23781 variables in the environment of *make*.

23782 By default, when *make* receives a non-zero status from the execution of a command, it shall  
 23783 terminate with an error message to standard error.

23784 Makefile command lines can have one or more of the following prefixes: a hyphen ('-'), an at  
 23785 sign ('@'), or a plus sign ('+'). These shall modify the way in which *make* processes the  
 23786 command. When a command is written to standard output, the prefix shall not be included in  
 23787 the output.

23788 – If the command prefix contains a hyphen, or the **-i** option is present, or the special target  
 23789 **.IGNORE** has either the current target as a prerequisite or has no prerequisites, any error  
 23790 found while executing the command shall be ignored.

23791 @ If the command prefix contains an at sign and the *make* utility command line **-n** option is  
 23792 not specified, or the **-s** option is present, or the special target **.SILENT** has either the current  
 23793 target as a prerequisite or has no prerequisites, the command shall not be written to  
 23794 standard output before it is executed.

23795 + If the command prefix contains a plus sign, this indicates a makefile command line that  
 23796 shall be executed even if **-n**, **-q**, or **-t** is specified.

## 23797 **Target Rules**

23798 Target rules are formatted as follows:

```
23799 target [target...]: [prerequisite...] [;command]
23800 [

```

23803 *line that does not begin with <tab>*

23804 Target entries are specified by a <blank>-separated, non-null list of targets, then a colon, then a  
 23805 <blank>-separated, possibly empty list of prerequisites. Text following a semicolon, if any, and  
 23806 all following lines that begin with a <tab>, are makefile command lines to be executed to update  
 23807 the target. The first non-empty line that does not begin with a <tab> or '#' shall begin a new  
 23808 entry. An empty or blank line, or a line beginning with '#', may begin a new entry.

23809 Applications shall select target names from the set of characters consisting solely of periods,  
 23810 underscores, digits, and alphabetic characters from the portable character set (see the Base Definitions  
 23811 volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set). Implementations may allow  
 23812 other characters in target names as extensions. The interpretation of targets containing the  
 23813 characters '%' and '"' is implementation-defined.

23814 A target that has prerequisites, but does not have any commands, can be used to add to the  
 23815 prerequisite list for that target. Only one target rule for any given target can contain commands.

23816 Lines that begin with one of the following are called *special targets* and control the operation of  
 23817 *make*:

23818 **.DEFAULT** If the makefile uses this special target, the application shall ensure that it is  
 23819 specified with commands, but without prerequisites. The commands shall be used  
 23820 by *make* if there are no other rules available to build a target.

23821 **.IGNORE** Prerequisites of this special target are targets themselves; this shall cause errors  
 23822 from commands associated with them to be ignored in the same manner as  
 23823 specified by the **-i** option. Subsequent occurrences of **.IGNORE** shall add to the  
 23824 list of targets ignoring command errors. If no prerequisites are specified, *make* shall  
 23825 behave as if the **-i** option had been specified and errors from all commands  
 23826 associated with all targets shall be ignored.

23827 **.POSIX** The application shall ensure that this special target is specified without  
 23828 prerequisites or commands. If it appears as the first non-comment line in the  
 23829 makefile, *make* shall process the makefile as specified by this section; otherwise, the  
 23830 behavior of *make* is unspecified.

23831 **.PRECIOUS** Prerequisites of this special target shall not be removed if *make* receives one of the  
 23832 asynchronous events explicitly described in the ASYNCHRONOUS EVENTS  
 23833 section. Subsequent occurrences of **.PRECIOUS** shall add to the list of precious  
 23834 files. If no prerequisites are specified, all targets in the makefile shall be treated as  
 23835 if specified with **.PRECIOUS**.

23836 XSI **.SCCS\_GET** The application shall ensure that this special target is specified without  
 23837 prerequisites. If this special target is included in a makefile, the commands  
 23838 specified with this target shall replace the default commands associated with this  
 23839 special target (see **Default Rules** (on page 620)). The commands specified with  
 23840 this target are used to get all SCCS files that are not found in the current directory.

23841 When source files are named in a dependency list, *make* shall treat them just like  
 23842 any other target. Because the source file is presumed to be present in the directory,  
 23843 there is no need to add an entry for it to the makefile. When a target has no  
 23844 dependencies, but is present in the directory, *make* shall assume that that file is up-  
 23845 to-date. If, however, an SCCS file named **SCCS/s.source\_file** is found for a target  
 23846 *source\_file*, *make* compares the timestamp of the target file with that of the  
 23847 **SCCS/s.source\_file** to ensure the target is up-to-date. If the target is missing, or if  
 23848 the SCCS file is newer, *make* shall automatically issue the commands specified for  
 23849 the **.SCCS\_GET** special target to retrieve the most recent version. However, if the  
 23850 target is writable by anyone, *make* shall not retrieve a new version.

23851 **.SILENT** Prerequisites of this special target are targets themselves; this shall cause  
 23852 commands associated with them not to be written to the standard output before  
 23853 they are executed. Subsequent occurrences of **.SILENT** shall add to the list of  
 23854 targets with silent commands. If no prerequisites are specified, *make* shall behave  
 23855 as if the **-s** option had been specified and no commands or touch messages  
 23856 associated with any target shall be written to standard output.

23857 **.SUFFIXES** Prerequisites of **.SUFFIXES** shall be appended to the list of known suffixes and are  
 23858 used in conjunction with the inference rules (see **Inference Rules** (on page 617)). If  
 23859 **.SUFFIXES** does not have any prerequisites, the list of known suffixes shall be  
 23860 cleared.

23861 The special targets **.IGNORE**, **.POSIX**, **.PRECIOUS**, **.SILENT**, and **.SUFFIXES** shall be specified  
 23862 without commands.

23863 Targets with names consisting of a leading period followed by the uppercase letters "POSIX"  
 23864 and then any other characters are reserved for future standardization. Targets with names  
 23865 consisting of a leading period followed by one or more uppercase letters are reserved for  
 23866 implementation extensions.

## 23867 **Macros**

23868 Macro definitions are in the form:

23869 *string1* = [*string2*]

23870 The macro named *string1* is defined as having the value of *string2*, where *string2* is defined as all  
 23871 characters, if any, after the equal sign, up to a comment character ('#') or an unescaped  
 23872 <newline>. Any <blank>s immediately before or after the equal sign shall be ignored.

23873 Applications shall select macro names from the set of characters consisting solely of periods,  
 23874 underscores, digits, and alphabets from the portable character set (see the Base Definitions  
 23875 volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set). A macro name shall not  
 23876 contain an equals sign. Implementations may allow other characters in macro names as  
 23877 extensions.

23878 Macros can appear anywhere in the makefile. Macro expansions using the forms  $\$(string1)$  or  
 23879  $\${string1}$  shall be replaced by *string2*, as follows:

- 23880 • Macros in target lines shall be evaluated when the target line is read.
- 23881 • Macros in makefile command lines shall be evaluated when the command is executed.
- 23882 • Macros in the string before the equals sign in a macro definition shall be evaluated when the  
 23883 macro assignment is made.
- 23884 • Macros after the equals sign in a macro definition shall not be evaluated until the defined  
 23885 macro is used in a rule or command, or before the equals sign in a macro definition.

23886 The parentheses or braces are optional if *string1* is a single character. The macro  $\$\$$  shall be  
 23887 replaced by the single character '\$'. If *string1* in a macro expansion contains a macro  
 23888 expansion, the results are unspecified.

23889 Macro expansions using the forms  $\$(string1[:subst1=[subst2]])$  or  $\${string1[:subst1=[subst2]]}$  can  
 23890 be used to replace all occurrences of *subst1* with *subst2* when the macro substitution is  
 23891 performed. The *subst1* to be replaced shall be recognized when it is a suffix at the end of a word  
 23892 in *string1* (where a *word*, in this context, is defined to be a string delimited by the beginning of  
 23893 the line, a <blank>, or a <newline>). If *string1* in a macro expansion contains a macro expansion,  
 23894 the results are unspecified.

23895 Macro expansions in *string1* of macro definition lines shall be evaluated when read. Macro  
 23896 expansions in *string2* of macro definition lines shall be performed when the macro identified by  
 23897 *string1* is expanded in a rule or command.

23898 Macro definitions shall be taken from the following sources, in the following logical order,  
 23899 before the makefile(s) are read.

- 23900 1. Macros specified on the *make* utility command line, in the order specified on the command  
 23901 line. It is unspecified whether the internal macros defined in **Internal Macros** (on page 619)  
 23902 are accepted from this source.
- 23903 2. Macros defined by the *MAKEFLAGS* environment variable, in the order specified in the  
 23904 environment variable. It is unspecified whether the internal macros defined in **Internal**  
 23905 **Macros** (on page 619) are accepted from this source.

3. The contents of the environment, excluding the *MAKEFLAGS* and *SHELL* variables and including the variables with null values.
4. Macros defined in the inference rules built into *make*.

Macro definitions from these sources shall not override macro definitions from a lower-numbered source. Macro definitions from a single source (for example, the *make* utility command line, the *MAKEFLAGS* environment variable, or the other environment variables) shall override previous macro definitions from the same source.

Macros defined in the makefile(s) shall override macro definitions that occur before them in the makefile(s) and macro definitions from source 4. If the *-e* option is not specified, macros defined in the makefile(s) shall override macro definitions from source 3. Macros defined in the makefile(s) shall not override macro definitions from source 1 or source 2.

Before the makefile(s) are read, all of the *make* utility command line options (except *-f* and *-p*) and *make* utility command line macro definitions (except any for the *MAKEFLAGS* macro), not already included in the *MAKEFLAGS* macro, shall be added to the *MAKEFLAGS* macro, quoted in an implementation-defined manner such that when *MAKEFLAGS* is read by another instance of the *make* command, the original macro's value is recovered. Other implementation-defined options and macros may also be added to the *MAKEFLAGS* macro. If this modifies the value of the *MAKEFLAGS* macro, or, if the *MAKEFLAGS* macro is modified at any subsequent time, the *MAKEFLAGS* environment variable shall be modified to match the new value of the *MAKEFLAGS* macro. The result of setting *MAKEFLAGS* in the Makefile is unspecified.

Before the makefile(s) are read, all of the *make* utility command line macro definitions (except the *MAKEFLAGS* macro or the *SHELL* macro) shall be added to the environment of *make*. Other implementation-defined variables may also be added to the environment of *make*.

The **SHELL** macro shall be treated specially. It shall be provided by *make* and set to the pathname of the shell command language interpreter (see *sh*). The *SHELL* environment variable shall not affect the value of the **SHELL** macro. If **SHELL** is defined in the makefile or is specified on the command line, it shall replace the original value of the **SHELL** macro, but shall not affect the *SHELL* environment variable. Other effects of defining **SHELL** in the makefile or on the command line are implementation-defined.

## Inference Rules

Inference rules are formatted as follows:

```
target:
<tab>command
[<tab>command]
...
line that does not begin with <tab> or #
```

The application shall ensure that the *target* portion is a valid target name (see **Target Rules** (on page 614)) of the form *.s2* or *.s1.s2* (where *.s1* and *.s2* are suffixes that have been given as prerequisites of the **.SUFFIXES** special target and *s1* and *s2* do not contain any slashes or periods.) If there is only one period in the target, it is a single-suffix inference rule. Targets with two periods are double-suffix inference rules. Inference rules can have only one target before the colon.

The application shall ensure that the makefile does not specify prerequisites for inference rules; no characters other than white space shall follow the colon in the first line, except when creating the *empty rule*, described below. Prerequisites are inferred, as described below.

23951 Inference rules can be redefined. A target that matches an existing inference rule shall overwrite  
 23952 the old inference rule. An empty rule can be created with a command consisting of simply a  
 23953 semicolon (that is, the rule still exists and is found during inference rule search, but since it is  
 23954 empty, execution has no effect). The empty rule can also be formatted as follows:

23955 `rule: ;`

23956 where zero or more <blank>s separate the colon and semicolon.

23957 The *make* utility uses the suffixes of targets and their prerequisites to infer how a target can be  
 23958 made up-to-date. A list of inference rules defines the commands to be executed. By default, *make*  
 23959 contains a built-in set of inference rules. Additional rules can be specified in the makefile.

23960 The special target **.SUFFIXES** contains as its prerequisites a list of suffixes that shall be used by  
 23961 the inference rules. The order in which the suffixes are specified defines the order in which the  
 23962 inference rules for the suffixes are used. New suffixes shall be appended to the current list by  
 23963 specifying a **.SUFFIXES** special target in the makefile. A **.SUFFIXES** target with no prerequisites  
 23964 shall clear the list of suffixes. An empty **.SUFFIXES** target followed by a new **.SUFFIXES** list is  
 23965 required to change the order of the suffixes.

23966 Normally, the user would provide an inference rule for each suffix. The inference rule to update  
 23967 a target with a suffix **.s1** from a prerequisite with a suffix **.s2** is specified as a target **.s2.s1**. The  
 23968 internal macros provide the means to specify general inference rules (see **Internal Macros** (on  
 23969 page 619)).

23970 When no target rule is found to update a target, the inference rules shall be checked. The suffix  
 23971 of the target (**.s1**) to be built is compared to the list of suffixes specified by the **.SUFFIXES** special  
 23972 targets. If the **.s1** suffix is found in **.SUFFIXES**, the inference rules shall be searched in the order  
 23973 defined for the first **.s2.s1** rule whose prerequisite file (**\$.s2**) exists. If the target is out-of-date  
 23974 with respect to this prerequisite, the commands for that inference rule shall be executed.

23975 If the target to be built does not contain a suffix and there is no rule for the target, the single  
 23976 suffix inference rules shall be checked. The single-suffix inference rules define how to build a  
 23977 target if a file is found with a name that matches the target name with one of the single suffixes  
 23978 appended. A rule with one suffix **.s2** is the definition of how to build *target* from **target.s2**. The  
 23979 other suffix (**.s1**) is treated as null.

23980 XSI A tilde ('~') in the above rules refers to an SCCS file in the current directory. Thus, the rule **.c~.o**  
 23981 would transform an SCCS C-language source file into an object file (**.o**). Because the **s.** of the  
 23982 SCCS files is a prefix, it is incompatible with *make*'s suffix point of view. Hence, the '~' is a way  
 23983 of changing any file reference into an SCCS file reference.

## 23984 Libraries

23985 If a target or prerequisite contains parentheses, it shall be treated as a member of an archive  
 23986 library. For the *lib(member.o)* expression *lib* refers to the name of the archive library and *member.o*  
 23987 to the member name. The application shall ensure that the member is an object file with the **.o**  
 23988 suffix. The modification time of the expression is the modification time for the member as kept  
 23989 in the archive library; see *ar*. The **.a** suffix shall refer to an archive library. The **.s2.a** rule shall be  
 23990 used to update a member in the library from a file with a suffix **.s2**.

23991      **Internal Macros**

23992      The *make* utility shall maintain five internal macros that can be used in target and inference rules.  
 23993      In order to clearly define the meaning of these macros, some clarification of the terms *target rule*,  
 23994      *inference rule*, *target*, and *prerequisite* is necessary.

23995      Target rules are specified by the user in a makefile for a particular target. Inference rules are  
 23996      user-specified or *make*-specified rules for a particular class of target name. Explicit prerequisites  
 23997      are those prerequisites specified in a makefile on target lines. Implicit prerequisites are those  
 23998      prerequisites that are generated when inference rules are used. Inference rules are applied to  
 23999      implicit prerequisites or to explicit prerequisites that do not have target rules defined for them in  
 24000      the makefile. Target rules are applied to targets specified in the makefile.

24001      Before any target in the makefile is updated, each of its prerequisites (both explicit and implicit)  
 24002      shall be updated. This shall be accomplished by recursively processing each prerequisite. Upon  
 24003      recursion, each prerequisite shall become a target itself. Its prerequisites in turn shall be  
 24004      processed recursively until a target is found that has no prerequisites, at which point the  
 24005      recursion stops. The recursion shall then back up, updating each target as it goes.

24006      In the definitions that follow, the word *target* refers to one of:

- 24007      • A target specified in the makefile
- 24008      • An explicit prerequisite specified in the makefile that becomes the target when *make*  
 24009      processes it during recursion
- 24010      • An implicit prerequisite that becomes a target when *make* processes it during recursion

24011      In the definitions that follow, the word *prerequisite* refers to one of the following:

- 24012      • An explicit prerequisite specified in the makefile for a particular target
- 24013      • An implicit prerequisite generated as a result of locating an appropriate inference rule and  
 24014      corresponding file that matches the suffix of the target

24015      The five internal macros are:

24016      **\$@**      The **\$@** shall evaluate to the full target name of the current target, or the archive  
 24017      filename part of a library archive target. It shall be evaluated for both target and  
 24018      inference rules.

24019      For example, in the **.c.a** inference rule, **\$@** represents the out-of-date **.a** file to be built.  
 24020      Similarly, in a makefile target rule to build **lib.a** from **file.c**, **\$@** represents the out-of-  
 24021      date **lib.a**.

24022      **\$%**      The **\$%** macro shall be evaluated only when the current target is an archive library  
 24023      member of the form *libname(member.o)*. In these cases, **\$@** shall evaluate to *libname* and  
 24024      **\$%** shall evaluate to *member.o*. The **\$%** macro shall be evaluated for both target and  
 24025      inference rules.

24026      For example, in a makefile target rule to build **lib.a(file.o)**, **\$%** represents **file.o**, as  
 24027      opposed to **\$@**, which represents **lib.a**.

24028      **\$?**      The **\$?** macro shall evaluate to the list of prerequisites that are newer than the current  
 24029      target. It shall be evaluated for both target and inference rules.

24030      For example, in a makefile target rule to build *prog* from **file1.o**, **file2.o**, and **file3.o**, and  
 24031      where *prog* is not out-of-date with respect to **file1.o**, but is out-of-date with respect to  
 24032      **file2.o** and **file3.o**, **\$?** represents **file2.o** and **file3.o**.

24033       \$<       In an inference rule, the \$< macro shall evaluate to the filename whose existence  
 24034       allowed the inference rule to be chosen for the target. In the **.DEFAULT** rule, the \$<  
 24035       macro shall evaluate to the current target name. The meaning of the \$< macro shall be  
 24036       otherwise unspecified.

24037       For example, in the **.c.a** inference rule, \$< represents the prerequisite **.c** file.

24038       \$\*       The \$\* macro shall evaluate to the current target name with its suffix deleted. It shall be  
 24039       evaluated at least for inference rules.

24040       For example, in the **.c.a** inference rule, \$\*.o represents the out-of-date **.o** file that  
 24041       corresponds to the prerequisite **.c** file.

24042       Each of the internal macros has an alternative form. When an uppercase 'D' or 'F' is appended  
 24043       to any of the macros, the meaning shall be changed to the *directory part* for 'D' and *filename part*  
 24044       for 'F'. The directory part is the path prefix of the file without a trailing slash; for the current  
 24045       directory, the directory part is '.'. When the \$? macro contains more than one prerequisite  
 24046       filename, the \$(?D) and \$(?F) (or \${?D} and \${?F}) macros expand to a list of directory name parts  
 24047       and filename parts respectively.

24048       For the target *lib(member.o)* and the **s2.a** rule, the internal macros shall be defined as:

24049       \$<       *member.s2*

24050       \$\*       *member*

24051       \$@       *lib*

24052       \$?       *member.s2*

24053       \$%       *member.o*

## 24054       **Default Rules**

24055       The default rules for *make* shall achieve results that are the same as if the following were used.  
 24056       Implementations that do not support the C-Language Development Utilities option may omit  
 24057       **CC**, **CFLAGS**, **YACC**, **YFLAGS**, **LEX**, **LFLAGS**, **LDFLAGS**, and the **.c**, **.y**, and **.l** inference rules.  
 24058       Implementations that do not support FORTRAN may omit **FC**, **FFLAGS**, and the **.f** inference  
 24059       rules. Implementations may provide additional macros and rules.

## 24060       *SPECIAL TARGETS*

24061 xSI       .SCCS\_GET: sccs \$(SCCSFLAGS) get \$(SCCSGETFLAGS) \$@

24062

24063 xSI       .SUFFIXES: .o .c .y .l .a .sh .f .c~ .y~ .l~ .sh~ .f~

## 24064       **MACROS**

24065       MAKE=make

24066       AR=ar

24067       ARFLAGS=-rv

24068       YACC=yacc

24069       YFLAGS=

24070       LEX=lex

24071       LFLAGS=

24072       LDFLAGS=

24073       CC=c99

24074       CFLAGS=-O

24075       FC=fort77

```

24076 FFLAGS=-O 1
24077 xSI GET=get
24078 GFLAGS=
24079 SCCSFLAGS=
24080 SCCSGETFLAGS=-s
24081

```

#### 24082 *SINGLE SUFFIX RULES*

```

24083 .c:
24084 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $<
24085
24086 .f:
24087 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $<
24088
24089 .sh:
24090 cp $< $@
24091 chmod a+x $@
24092

```

```

24090 xSI .c~:
24091 $(GET) $(GFLAGS) -p $< > $*.c
24092 $(CC) $(CFLAGS) $(LDFLAGS) -o $@ $*.c
24093

```

```

24093 .f~:
24094 $(GET) $(GFLAGS) -p $< > $*.f
24095 $(FC) $(FFLAGS) $(LDFLAGS) -o $@ $*.f
24096

```

```

24096 .sh~:
24097 $(GET) $(GFLAGS) -p $< > $*.sh
24098 cp $*.sh $@
24099 chmod a+x $@
24100

```

#### 24101 *DOUBLE SUFFIX RULES*

```

24102 .c.o:
24103 $(CC) $(CFLAGS) -c $<
24104

```

```

24104 .f.o:
24105 $(FC) $(FFLAGS) -c $<
24106

```

```

24106 .y.o:
24107 $(YACC) $(YFLAGS) $<
24108 $(CC) $(CFLAGS) -c y.tab.c
24109 rm -f y.tab.c
24110 mv y.tab.o $@
24111

```

```

24111 .l.o:
24112 $(LEX) $(LFLAGS) $<
24113 $(CC) $(CFLAGS) -c lex.yy.c
24114 rm -f lex.yy.c
24115 mv lex.yy.o $@
24116

```

```

24116 .y.c:
24117 $(YACC) $(YFLAGS) $<
24118 mv y.tab.c $@
24119

```

```

24119 .l.c:
24120 $(LEX) $(LFLAGS) $<

```

```

24121 mv lex.yy.c $@
24122 xsi .c~.o:
24123 $(GET) $(GFLAGS) -p $< > $*.c
24124 $(CC) $(CFLAGS) -c $*.c
24125
24126 .f~.o:
24127 $(GET) $(GFLAGS) -p $< > $*.f
24128 $(FC) $(FFLAGS) -c $*.f
24129
24128 .y~.o:
24129 $(GET) $(GFLAGS) -p $< > $*.y
24130 $(YACC) $(YFLAGS) $*.y
24131 $(CC) $(CFLAGS) -c y.tab.c
24132 rm -f y.tab.c
24133 mv y.tab.o $@
24134
24134 .l~.o:
24135 $(GET) $(GFLAGS) -p $< > $*.l
24136 $(LEX) $(LFLAGS) $*.l
24137 $(CC) $(CFLAGS) -c lex.yy.c
24138 rm -f lex.yy.c
24139 mv lex.yy.o $@
24140
24140 .y~.c:
24141 $(GET) $(GFLAGS) -p $< > $*.y
24142 $(YACC) $(YFLAGS) $*.y
24143 mv y.tab.c $@
24144
24144 .l~.c:
24145 $(GET) $(GFLAGS) -p $< > $*.l

24156 rm -f $*.o
24157 EXIT STATUS
24158 When the -q option is specified, the make utility shall exit with one of the following values:
24159
24159 0 Successful completion.
24160
24160 1 The target was not up-to-date.
24161
24161 >1 An error occurred.
24162
24162 When the -q option is not specified, the make utility shall exit with one of the following values:
24163
24163 0 Successful completion.
24164
24164 >0 An error occurred.

```

24165 **CONSEQUENCES OF ERRORS**

24166 Default.

24167 **APPLICATION USAGE**

24168 If there is a source file (such as *./source.c*) and there are two SCCS files corresponding to it  
 24169 (*./s.source.c* and *./SCCS/s.source.c*), on XSI-conformant systems *make* uses the SCCS file in the  
 24170 current directory. However, users are advised to use the underlying SCCS utilities (*admin*, *delta*,  
 24171 *get*, and so on) or the *sccs* utility for all source files in a given directory. If both forms are used for  
 24172 a given source file, future developers are very likely to be confused.

24173 It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to  
 24174 guarantee that they are not affected by local extensions.

24175 The **-k** and **-S** options are both present so that the relationship between the command line, the  
 24176 *MAKEFLAGS* variable, and the makefile can be controlled precisely. If the **k** flag is passed in  
 24177 *MAKEFLAGS* and a command is of the form:

24178 `$ (MAKE) -S foo`24179 then the default behavior is restored for the child *make*.

24180 When the **-n** option is specified, it is always added to *MAKEFLAGS*. This allows a recursive  
 24181 *make -n target* to be used to see all of the action that would be taken to update *target*.

24182 Because of widespread historical practice, interpreting a '#' number sign inside a variable as  
 24183 the start of a comment has the unfortunate side effect of making it impossible to place a number  
 24184 sign in a variable, thus forbidding something like:

24185 `CFLAGS = "-D COMMENT_CHAR='#'"`

24186 Many historical *make* utilities stop chaining together inference rules when an intermediate target  
 24187 is nonexistent. For example, it might be possible for a *make* to determine that both **.y.c** and **.c.o**  
 24188 could be used to convert a **.y** to a **.o**. Instead, in this case, *make* requires the use of a **.y.o** rule.

24189 The best way to provide portable makefiles is to include all of the rules needed in the makefile  
 24190 itself. The rules provided use only features provided by other parts of this volume of  
 24191 IEEE Std 1003.1-2001. The default rules include rules for optional commands in this volume of  
 24192 IEEE Std 1003.1-2001. Only rules pertaining to commands that are provided are needed in an  
 24193 implementation's default set.

24194 Macros used within other macros are evaluated when the new macro is used rather than when  
 24195 the new macro is defined. Therefore:

```
24196 MACRO = value1
24197 NEW = $(MACRO)
24198 MACRO = value2
```

```
24199 target:
24200 echo $(NEW)
```

24201 would produce *value2* and not *value1* since **NEW** was not expanded until it was needed in the  
 24202 *echo* command line.

24203 Some historical applications have been known to intermix *target\_name* and *macro=name* operands  
 24204 on the command line, expecting that all of the macros are processed before any of the targets are  
 24205 dealt with. Conforming applications do not do this, although some backwards-compatibility  
 24206 support may be included in some implementations.

24207 The following characters in filenames may give trouble: '=', ':', '\', '\'', and '@'. For  
 24208 inference rules, the description of \$< and \$? seem similar. However, an example shows the

24209 minor difference. In a makefile containing:

24210 `foo.o: foo.h`

24211 if **foo.h** is newer than **foo.o**, yet **foo.c** is older than **foo.o**, the built-in rule to make **foo.o** from  
 24212 **foo.c** is used, with \$< equal to **foo.c** and \$? equal to **foo.h**. If **foo.c** is also newer than **foo.o**, \$< is  
 24213 equal to **foo.c** and \$? is equal to **foo.h foo.c**.

#### 24214 EXAMPLES

24215 1. The following command:

24216 `make`

24217 makes the first target found in the makefile.

24218 2. The following command:

24219 `make junk`

24220 makes the target **junk**.

24221 3. The following makefile says that **pgm** depends on two files, **a.o** and **b.o**, and that they in  
 24222 turn depend on their corresponding source files (**a.c** and **b.c**), and a common file **incl.h**:

24223 `pgm: a.o b.o`

24224 `c99 a.o b.o -o pgm`

24225 `a.o: incl.h a.c`

24226 `c99 -c a.c`

24227 `b.o: incl.h b.c`

24228 `c99 -c b.c`

24229 4. An example for making optimized **.o** files from **.c** files is:

24230 `.c.o:`

24231 `c99 -c -O $*.c`

24232 or:

24233 `.c.o:`

24234 `c99 -c -O $<`

24235 5. The most common use of the archive interface follows. Here, it is assumed that the source  
 24236 files are all C-language source:

24237 `lib: lib(file1.o) lib(file2.o) lib(file3.o)`

24238 `@echo lib is now up-to-date`

24239 The **.c.a** rule is used to make **file1.o**, **file2.o**, and **file3.o** and insert them into **lib**.

24240 The treatment of escaped <newline>s throughout the makefile is historical practice. For  
 24241 example, the inference rule:

24242 `.c.o\`

24243 `:`

24244 works, and the macro:

24245 `f= bar baz\`

24246 `biz`

24247 `a:`

24248 `echo ==$f==`

```

24249 echoes "==bar baz biz==".
24250 If $? were:
24251 /usr/include/stdio.h /usr/include/unistd.h foo.h
24252 then $(?D) would be:
24253 /usr/include /usr/include .
24254 and $(?F) would be:
24255 stdio.h unistd.h foo.h
24256 6. The contents of the built-in rules can be viewed by running:
24257 make -p -f /dev/null 2>/dev/null

```

#### 24258 RATIONALE

24259 The *make* utility described in this volume of IEEE Std 1003.1-2001 is intended to provide the  
 24260 means for changing portable source code into executables that can be run on an  
 24261 IEEE Std 1003.1-2001-conforming system. It reflects the most common features present in  
 24262 System V and BSD *makes*.

24263 Historically, the *make* utility has been an especially fertile ground for vendor and research  
 24264 organization-specific syntax modifications and extensions. Examples include:

- 24265 • Syntax supporting parallel execution (such as from various multi-processor vendors, GNU,  
 24266 and others)
- 24267 • Additional “operators” separating targets and their prerequisites (System V, BSD, and  
 24268 others)
- 24269 • Specifying that command lines containing the strings “\${MAKE}” and “\$(MAKE)” are  
 24270 executed when the `-n` option is specified (GNU and System V)
- 24271 • Modifications of the meaning of internal macros when referencing libraries (BSD and others)
- 24272 • Using a single instance of the shell for all of the command lines of the target (BSD and others)
- 24273 • Allowing spaces as well as tabs to delimit command lines (BSD)
- 24274 • Adding C preprocessor-style “include” and “ifdef” constructs (System V, GNU, BSD, and  
 24275 others)
- 24276 • Remote execution of command lines (Sprite and others)
- 24277 • Specifying additional special targets (BSD, System V, and most others)

24278 Additionally, many vendors and research organizations have rethought the basic concepts of  
 24279 *make*, creating vastly extended, as well as completely new, syntaxes. Each of these versions of  
 24280 *make* fulfills the needs of a different community of users; it is unreasonable for this volume of  
 24281 IEEE Std 1003.1-2001 to require behavior that would be incompatible (and probably inferior) to  
 24282 historical practice for such a community.

24283 In similar circumstances, when the industry has enough sufficiently incompatible formats as to  
 24284 make them irreconcilable, this volume of IEEE Std 1003.1-2001 has followed one or both of two  
 24285 courses of action. Commands have been renamed (*cksum*, *echo*, and *pax*) and/or command line  
 24286 options have been provided to select the desired behavior (*grep*, *od*, and *pax*).

24287 Because the syntax specified for the *make* utility is, by and large, a subset of the syntaxes  
 24288 accepted by almost all versions of *make*, it was decided that it would be counter-productive to  
 24289 change the name. And since the makefile itself is a basic unit of portability, it would not be

completely effective to reserve a new option letter, such as *make -P*, to achieve the portable behavior. Therefore, the special target **.POSIX** was added to the makefile, allowing users to specify “standard” behavior. This special target does not preclude extensions in the *make* utility, nor does it preclude such extensions being used by the makefile specifying the target; it does, however, preclude any extensions from being applied that could alter the behavior of previously valid syntax; such extensions must be controlled via command line options or new special targets. It is incumbent upon portable makefiles to specify the **.POSIX** special target in order to guarantee that they are not affected by local extensions.

The portable version of *make* described in this reference page is not intended to be the state-of-the-art software generation tool and, as such, some newer and more leading-edge features have not been included. An attempt has been made to describe the portable makefile in a manner that does not preclude such extensions as long as they do not disturb the portable behavior described here.

When the **-n** option is specified, it is always added to **MAKEFLAGS**. This allows a recursive *make -n target* to be used to see all of the action that would be taken to update *target*.

The definition of **MAKEFLAGS** allows both the System V letter string and the BSD command line formats. The two formats are sufficiently different to allow implementations to support both without ambiguity.

Early proposals stated that an “unquoted” number sign was treated as the start of a comment. The *make* utility does not pay any attention to quotes. A number sign starts a comment regardless of its surroundings.

The text about “other implementation-defined pathnames may also be tried” in addition to **./makefile** and **./Makefile** is to allow such extensions as **SCCS/s.Makefile** and other variations. It was made an implementation-defined requirement (as opposed to unspecified behavior) to highlight surprising implementations that might select something unexpected like **/etc/Makefile**. XSI-conformant systems also try **./s.makefile**, **SCCS/s.makefile**, **./s.Makefile**, and **SCCS/s.Makefile**.

Early proposals contained the macro **NPROC** as a means of specifying that *make* should use *n* processes to do the work required. While this feature is a valuable extension for many systems, it is not common usage and could require other non-trivial extensions to makefile syntax. This extension is not required by this volume of IEEE Std 1003.1-2001, but could be provided as a compatible extension. The macro **PARALLEL** is used by some historical systems with essentially the same meaning (but without using a name that is a common system limit value). It is suggested that implementors recognize the existing use of **NPROC** and/or **PARALLEL** as extensions to *make*.

The default rules are based on System V. The default **CC=** value is *c99* instead of *cc* because this volume of IEEE Std 1003.1-2001 does not standardize the utility named *cc*. Thus, every conforming application would be required to define **CC=c99** to expect to run. There is no advantage conferred by the hope that the makefile might hit the “preferred” compiler because this cannot be guaranteed to work. Also, since the portable makescript can only use the *c99* options, no advantage is conferred in terms of what the script can do. It is a quality-of-implementation issue as to whether *c99* is as valuable as *cc*.

The **-d** option to *make* is frequently used to produce debugging information, but is too implementation-defined to add to this volume of IEEE Std 1003.1-2001.

The **-p** option is not passed in **MAKEFLAGS** on most historical implementations and to change this would cause many implementations to break without sufficiently increased portability.

Commands that begin with a plus sign ('+') are executed even if the **-n** option is present. Based on the GNU version of *make*, the behavior of **-n** when the plus-sign prefix is encountered has been extended to apply to **-q** and **-t** as well. However, the System V convention of forcing command execution with **-n** when the command line of a target contains either of the strings "\$ (MAKE)" or "\${MAKE}" has not been adopted. This functionality appeared in early proposals, but the danger of this approach was pointed out with the following example of a portion of a makefile:

```
subdir:
 cd subdir; rm all_the_files; $(MAKE)
```

The loss of the System V behavior in this case is well-balanced by the safety afforded to other makefiles that were not aware of this situation. In any event, the command line plus-sign prefix can provide the desired functionality.

The double colon in the target rule format is supported in BSD systems to allow more than one target line containing the same target name to have commands associated with it. Since this is not functionality described in the SVID or XPG3 it has been allowed as an extension, but not mandated.

The default rules are provided with text specifying that the built-in rules shall be the same as if the listed set were used. The intent is that implementations should be able to use the rules without change, but will be allowed to alter them in ways that do not affect the primary behavior.

The best way to provide portable makefiles is to include all of the rules needed in the makefile itself. The rules provided use only features provided by other portions of this volume of IEEE Std 1003.1-2001. The default rules include rules for optional commands in this volume of IEEE Std 1003.1-2001. Only rules pertaining to commands that are provided are needed in the default set of an implementation.

One point of discussion was whether to drop the default rules list from this volume of IEEE Std 1003.1-2001. They provide convenience, but do not enhance portability of applications. The prime benefit is in portability of users who wish to type *make command* and have the command build from a **command.c** file.

The historical *MAKESHELL* feature was omitted. In some implementations it is used to let a user override the shell to be used to run *make* commands. This was confusing; for a portable *make*, the shell should be chosen by the makefile writer or specified on the *make* command line and not by a user running *make*.

The *make* utilities in most historical implementations process the prerequisites of a target in left-to-right order, and the makefile format requires this. It supports the standard idiom used in many makefiles that produce yacc programs; for example:

```
foo: y.tab.o lex.o main.o
 $(CC) $(CFLAGS) -o $@ t.tab.o lex.o main.o
```

In this example, if *make* chose any arbitrary order, the **lex.o** might not be made with the correct **y.tab.h**. Although there may be better ways to express this relationship, it is widely used historically. Implementations that desire to update prerequisites in parallel should require an explicit extension to *make* or the makefile format to accomplish it, as described previously.

The algorithm for determining a new entry for target rules is partially unspecified. Some historical *makes* allow blank, empty, or comment lines within the collection of commands marked by leading <tab>s. A conforming makefile must ensure that each command starts with a <tab>, but implementations are free to ignore blank, empty, and comment lines without triggering the start of a new entry.

The ASYNCHRONOUS EVENTS section includes having SIGTERM and SIGHUP, along with the more traditional SIGINT and SIGQUIT, remove the current target unless directed not to do so. SIGTERM and SIGHUP were added to parallel other utilities that have historically cleaned up their work as a result of these signals. When *make* receives any signal other than SIGQUIT, it is required to resend itself the signal it received so that it exits with a status that reflects the signal. The results from SIGQUIT are partially unspecified because, on systems that create **core** files upon receipt of SIGQUIT, the **core** from *make* would conflict with a **core** file from the command that was running when the SIGQUIT arrived. The main concern was to prevent damaged files from appearing up-to-date when *make* is rerun.

The **.PRECIOUS** special target was extended to affect all targets globally (by specifying no prerequisites). The **.IGNORE** and **.SILENT** special targets were extended to allow prerequisites; it was judged to be more useful in some cases to be able to turn off errors or echoing for a list of targets than for the entire makefile. These extensions to *make* in System V were made to match historical practice from the BSD *make*.

Macros are not exported to the environment of commands to be run. This was never the case in any historical *make* and would have serious consequences. The environment is the same as the environment to *make* except that **MAKEFLAGS** and macros defined on the *make* command line are added.

Some implementations do not use *system()* for all command lines, as required by the portable makefile format; as a performance enhancement, they select lines without shell metacharacters for direct execution by *execve()*. There is no requirement that *system()* be used specifically, but merely that the same results be achieved. The metacharacters typically used to bypass the direct *execve()* execution have been any of:

= | ^ ( ) ; & < > \* ? [ ] : \$ \ ' " \ \n

The default in some advanced versions of *make* is to group all the command lines for a target and execute them using a single shell invocation; the System V method is to pass each line individually to a separate shell. The single-shell method has the advantages in performance and the lack of a requirement for many continued lines. However, converting to this newer method has caused portability problems with many historical makefiles, so the behavior with the POSIX makefile is specified to be the same as that of System V. It is suggested that the special target **.ONESHELL** be used as an implementation extension to achieve the single-shell grouping for a target or group of targets.

Novice users of *make* have had difficulty with the historical need to start commands with a <tab>. Since it is often difficult to discern differences between <tab>s and <space>s on terminals or printed listings, confusing bugs can arise. In early proposals, an attempt was made to correct this problem by allowing leading <blank>s instead of <tab>s. However, implementors reported many makefiles that failed in subtle ways following this change, and it is difficult to implement a *make* that unambiguously can differentiate between macro and command lines. There is extensive historical practice of allowing leading spaces before macro definitions. Forcing macro lines into column 1 would be a significant backwards-compatibility problem for some makefiles. Therefore, historical practice was restored.

The System V INCLUDE feature was considered, but not included. This would treat a line that began in the first column and contained INCLUDE <filename> as an indication to read <filename> at that point in the makefile. This is difficult to use in a portable way, and it raises concerns about nesting levels and diagnostics. System V, BSD, GNU, and others have used different methods for including files.

The System V dynamic dependency feature was not included. It would support:

24430 cat: \$\$@.c

24431 that would expand to;

24432 cat: cat.c

24433 This feature exists only in the new version of System V *make* and, while useful, is not in wide  
24434 usage. This means that macros are expanded twice for prerequisites: once at makefile parse time  
24435 and once at target update time.

24436 Consideration was given to adding metarules to the POSIX *make*. This would make **%o: %c** the  
24437 same as **.c.o:**. This is quite useful and available from some vendors, but it would cause too many  
24438 changes to this *make* to support. It would have introduced rule chaining and new substitution  
24439 rules. However, the rules for target names have been set to reserve the '%' and '"' characters.  
24440 These are traditionally used to implement metarules and quoting of target names, respectively.  
24441 Implementors are strongly encouraged to use these characters only for these purposes.

24442 A request was made to extend the suffix delimiter character from a period to any character. The  
24443 metarules feature in newer *makes* solves this problem in a more general way. This volume of  
24444 IEEE Std 1003.1-2001 is staying with the more conservative historical definition.

24445 The standard output format for the **-p** option is not described because it is primarily a  
24446 debugging option and because the format is not generally useful to programs. In historical  
24447 implementations the output is not suitable for use in generating makefiles. The **-p** format has  
24448 been variable across historical implementations. Therefore, the definition of **-p** was only to  
24449 provide a consistently named option for obtaining *make* script debugging information.

24450 Some historical implementations have not cleared the suffix list with **-r**.

24451 Implementations should be aware that some historical applications have intermixed *target\_name*  
24452 and *macro=value* operands on the command line, expecting that all of the macros are processed  
24453 before any of the targets are dealt with. Conforming applications do not do this, but some  
24454 backwards-compatibility support may be warranted.

24455 Empty inference rules are specified with a semicolon command rather than omitting all  
24456 commands, as described in an early proposal. The latter case has no traditional meaning and is  
24457 reserved for implementation extensions, such as in GNU *make*.

## 24458 FUTURE DIRECTIONS

24459 None.

## 24463 CHANGE HISTORY

24464 First released in Issue 2.

### 24465 Issue 5

24466 The FUTURE DIRECTIONS section is added.

### 24467 Issue 6

24468 This utility is marked as part of the Software Development Utilities option.

24469 The Open Group Corrigendum U029/1 is applied, correcting a typographical error in the  
24470 SPECIAL TARGETS section.

24471 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
24472 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
24473 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

- 24474 It is specified whether the command line is related to the makefile or to the *make* command, and  
24475 the macro processing rules are updated to align with the IEEE P1003.2b draft standard.
- 24476 The normative text is reworded to avoid use of the term “must” for application requirements.
- 24477 PASC Interpretation 1003.2 #193 is applied.

24478 **NAME**

24479           man — display system documentation

24480 **SYNOPSIS**24481           man [-k] *name*...24482 **DESCRIPTION**

24483           The *man* utility shall write information about each of the *name* operands. If *name* is the name of a  
 24484           standard utility, *man* at a minimum shall write a message describing the syntax used by the  
 24485           standard utility, its options, and operands. If more information is available, the *man* utility shall  
 24486           provide it in an implementation-defined manner.

24487           An implementation may provide information for values of *name* other than the standard utilities.  
 24488           Standard utilities that are listed as optional and that are not supported by the implementation  
 24489           either shall cause a brief message indicating that fact to be displayed or shall cause a full display  
 24490           of information as described previously.

24491 **OPTIONS**

24492           The *man* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 24493           12.2, Utility Syntax Guidelines.

24494           The following option shall be supported:

24495           **-k**       Interpret *name* operands as keywords to be used in searching a utilities summary  
 24496                       database that contains a brief purpose entry for each standard utility and write lines  
 24497                       from the summary database that match any of the keywords. The keyword search shall  
 24498                       produce results that are the equivalent of the output of the following command:

```
24499 grep -Ei '
24500 name
24501 name
24502 ...
24503 ' summary-database
```

24504           This assumes that the *summary-database* is a text file with a single entry per line; this  
 24505           organization is not required and the example using *grep -Ei* is merely illustrative of the  
 24506           type of search intended. The purpose entry to be included in the database shall consist  
 24507           of a terse description of the purpose of the utility.

24508 **OPERANDS**

24509           The following operand shall be supported:

24510           *name*       A keyword or the name of a standard utility. When **-k** is not specified and *name*  
 24511                       does not represent one of the standard utilities, the results are unspecified.

24512 **STDIN**

24513           Not used.

24514 **INPUT FILES**

24515           None.

24516 **ENVIRONMENT VARIABLES**24517           The following environment variables shall affect the execution of *man*:

24518           **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 24519                       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 24520                       Internationalization Variables for the precedence of internationalization variables  
 24521                       used to determine the values of locale categories.)

24522 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 24523 internationalization variables.

24524 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 24525 characters (for example, single-byte as opposed to multi-byte characters in  
 24526 arguments and in the summary database). The value of *LC\_CTYPE* need not affect  
 24527 the format of the information written about the *name* operands.

24528 *LC\_MESSAGES*  
 24529 Determine the locale that should be used to affect the format and contents of  
 24530 diagnostic messages written to standard error and informative messages written to  
 24531 standard output.

24532 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

24533 *PAGER* Determine an output filtering command for writing the output to a terminal. Any  
 24534 string acceptable as a *command\_string* operand to the *sh -c* command shall be valid.  
 24535 When standard output is a terminal device, the reference page output shall be  
 24536 piped through the command. If the *PAGER* variable is null or not set, the  
 24537 command shall be either *more* or another paginator utility documented in the  
 24538 system documentation.

24539 **ASYNCHRONOUS EVENTS**

24540 Default.

24541 **STDOUT**  
 24542 The *man* utility shall write text describing the syntax of the utility *name*, its options and its  
 24543 operands, or, when *-k* is specified, lines from the summary database. The format of this text is  
 24544 implementation-defined.

24545 **STDERR**  
 24546 The standard error shall be used only for diagnostic messages.

24547 **OUTPUT FILES**  
 24548 None.

24549 **EXTENDED DESCRIPTION**  
 24550 None.

24551 **EXIT STATUS**  
 24552 The following exit values shall be returned:  
 24553 0 Successful completion.  
 24554 >0 An error occurred.

24555 **CONSEQUENCES OF ERRORS**  
 24556 Default.

24557 **APPLICATION USAGE**  
 24558 None.

24559 **EXAMPLES**  
 24560 None.

24561 **RATIONALE**  
 24562 It is recognized that the *man* utility is only of minimal usefulness as specified. The opinion of the  
 24563 standard developers was strongly divided as to how much or how little information *man* should  
 24564 be required to provide. They considered, however, that the provision of some portable way of  
 24565 accessing documentation would aid user portability. The arguments against a fuller

24566 specification were:

- 24567 • Large quantities of documentation should not be required on a system that does not have
- 24568 excess disk space.
- 24569 • The current manual system does not present information in a manner that greatly aids user
- 24570 portability.
- 24571 • A “better help system” is currently an area in which vendors feel that they can add value to
- 24572 their POSIX implementations.

24573 The **-f** option was considered, but due to implementation differences, it was not included in this

24574 volume of IEEE Std 1003.1-2001.

24575 The description was changed to be more specific about what has to be displayed for a utility.

24576 The standard developers considered it insufficient to allow a display of only the synopsis

24577 without giving a short description of what each option and operand does.

24578 The “purpose” entry to be included in the database can be similar to the section title (less the

24579 numeric prefix) from this volume of IEEE Std 1003.1-2001 for each utility. These titles are similar

24580 to those used in historical systems for this purpose.

24581 See *mailx* for rationale concerning the default paginator.

24582 The caveat in the *LC\_CTYPE* description was added because it is not a requirement that an

24583 implementation provide reference pages for all of its supported locales on each system;

24584 changing *LC\_CTYPE* does not necessarily translate the reference page into another language.

24585 This is equivalent to the current state of *LC\_MESSAGES* in IEEE Std 1003.1-2001—locale-specific

24586 messages are not yet a requirement.

24587 The historical *MANPATH* variable is not included in POSIX because no attempt is made to

24588 specify naming conventions for reference page files, nor even to mandate that they are files at

24589 all. On some implementations they could be a true database, a hypertext file, or even fixed

24590 strings within the *man* executable. The standard developers considered the portability of

24591 reference pages to be outside their scope of work. However, users should be aware that

24592 *MANPATH* is implemented on a number of historical systems and that it can be used to tailor

24593 the search pattern for reference pages from the various categories (utilities, functions, file

24594 formats, and so on) when the system administrator reveals the location and conventions for

24595 reference pages on the system.

24596 The keyword search can rely on at least the text of the section titles from these utility

24597 descriptions, and the implementation may add more keywords. The term “section titles” refers

24598 to the strings such as:

24599 *man* — Display system documentation

24600 *ps* — Report process status

24601 **FUTURE DIRECTIONS**

24602 None.

24603 **SEE ALSO**

24604 *more*

24605 **CHANGE HISTORY**

24606 First released in Issue 4.

24607 **Issue 5**

24608 The FUTURE DIRECTIONS section is added.

24609 **NAME**

24610           mesg — permit or deny messages

24611 **SYNOPSIS**

24612 UP       mesg [y|n]

24613

24614 **DESCRIPTION**

24615       The *mesg* utility shall control whether other users are allowed to send messages via *write*, *talk*, or  
 24616       other utilities to a terminal device. The terminal device affected shall be determined by searching  
 24617       for the first terminal in the sequence of devices associated with standard input, standard output,  
 24618       and standard error, respectively. With no arguments, *mesg* shall report the current state without  
 24619       changing it. Processes with appropriate privileges may be able to send messages to the terminal  
 24620       independent of the current state.

24621 **OPTIONS**

24622       None.

24623 **OPERANDS**

24624       The following operands shall be supported in the POSIX locale:

24625       y           Grant permission to other users to send messages to the terminal device.

24626       n           Deny permission to other users to send messages to the terminal device.

24627 **STDIN**

24628       Not used.

24629 **INPUT FILES**

24630       None.

24631 **ENVIRONMENT VARIABLES**24632       The following environment variables shall affect the execution of *mesg*:

24633       LANG       Provide a default value for the internationalization variables that are unset or null.  
 24634       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 24635       Internationalization Variables for the precedence of internationalization variables  
 24636       used to determine the values of locale categories.)

24637       LC\_ALL     If set to a non-empty string value, override the values of all the other  
 24638       internationalization variables.

24639       LC\_CTYPE   Determine the locale for the interpretation of sequences of bytes of text data as  
 24640       characters (for example, single-byte as opposed to multi-byte characters in  
 24641       arguments).

24642       LC\_MESSAGES

24643       Determine the locale that should be used to affect the format and contents of  
 24644       diagnostic messages written (by *mesg*) to standard error.

24645 XSI       NLSPATH   Determine the location of message catalogs for the processing of LC\_MESSAGES.

24646 **ASYNCHRONOUS EVENTS**

24647       Default.

24648 **STDOUT**24649       If no operand is specified, *mesg* shall display the current terminal state in an unspecified format.

24650 **STDERR**

24651           The standard error shall be used only for diagnostic messages.

24652 **OUTPUT FILES**

24653           None.

24654 **EXTENDED DESCRIPTION**

24655           None.

24656 **EXIT STATUS**

24657           The following exit values shall be returned:

24658           0   Receiving messages is allowed.

24659           1   Receiving messages is not allowed.

24660           >1  An error occurred.

24661 **CONSEQUENCES OF ERRORS**

24662           Default.

24663 **APPLICATION USAGE**

24664           The mechanism by which the message status of the terminal is changed is unspecified.  
24665           Therefore, unspecified actions may cause the status of the terminal to change after *mesg* has  
24666           successfully completed. These actions may include, but are not limited to: another invocation of  
24667           the *mesg* utility, login procedures; invocation of the *stty* utility, invocation of the *chmod* utility or  
24668           *chmod()* function, and so on.

24669 **EXAMPLES**

24670           None.

24671 **RATIONALE**

24672           The terminal changed by *mesg* is that associated with the standard input, output, or error, rather  
24673           than the controlling terminal for the session. This is because users logged in more than once  
24674           should be able to change any of their login terminals without having to stop the job running in  
24675           those sessions. This is not a security problem involving the terminals of other users because  
24676           appropriate privileges would be required to affect the terminal of another user.

24677           The method of checking each of the first three file descriptors in sequence until a terminal is  
24678           found was adopted from System V.

24679           The file */dev/tty* is not specified for the terminal device because it was thought to be too  
24680           restrictive. Typical environment changes for the *n* operand are that write permissions are  
24681           removed for *others* and *group* from the appropriate device. It was decided to leave the actual  
24682           description of what is done as unspecified because of potential differences between  
24683           implementations.

24684           The format for standard output is unspecified because of differences between historical  
24685           implementations. This output is generally not useful to shell scripts (they can use the exit  
24686           status), so exact parsing of the output is unnecessary.

24687 **FUTURE DIRECTIONS**

24688           None.

24689 **SEE ALSO**

24690           *talk*, *write*

24691 **CHANGE HISTORY**

24692 First released in Issue 2.

24693 **Issue 6**

24694 This utility is marked as part of the User Portability Utilities option.

24695 **NAME**

24696       mkdir — make directories

24697 **SYNOPSIS**

24698       mkdir [-p] [-m *mode*] *dir*...

24699 **DESCRIPTION**

24700       The *mkdir* utility shall create the directories specified by the operands, in the order specified.

24701       For each *dir* operand, the *mkdir* utility shall perform actions equivalent to the *mkdir()* function  
24702       defined in the System Interfaces volume of IEEE Std 1003.1-2001, called with the following  
24703       arguments:

- 24704       1. The *dir* operand is used as the *path* argument.
- 24705       2. The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO is used as  
24706       the *mode* argument. (If the **-m** option is specified, the *mode* option-argument overrides this  
24707       default.)

24708 **OPTIONS**

24709       The *mkdir* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
24710       12.2, Utility Syntax Guidelines.

24711       The following options shall be supported:

24712       **-m** *mode*       Set the file permission bits of the newly-created directory to the specified *mode*  
24713       value. The *mode* option-argument shall be the same as the *mode* operand defined  
24714       for the *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-'  
24715       shall be interpreted relative to an assumed initial mode of *a=rwx*; '+' shall add  
24716       permissions to the default mode, '-' shall delete permissions from the default  
24717       mode.

24718       **-p**               Create any missing intermediate pathname components.  
24719       For each *dir* operand that does not name an existing directory, effects equivalent to  
24720       those caused by the following command shall occur:

24721       mkdir -p -m \$(umask -S),u+wx \$(dirname *dir*) &&  
24722       mkdir [-m *mode*] *dir*

24723       where the **-m** *mode* option represents that option supplied to the original  
24724       invocation of *mkdir*, if any.

24725       Each *dir* operand that names an existing directory shall be ignored without error.

24726 **OPERANDS**

24727       The following operand shall be supported:

24728       *dir*             A pathname of a directory to be created.

24729 **STDIN**

24730       Not used.

24731 **INPUT FILES**

24732       None.

24733 **ENVIRONMENT VARIABLES**

24734       The following environment variables shall affect the execution of *mkdir*:

24735       *LANG*            Provide a default value for the internationalization variables that are unset or null.  
24736       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
24737       Internationalization Variables for the precedence of internationalization variables

|       |                               |                                                                                                       |
|-------|-------------------------------|-------------------------------------------------------------------------------------------------------|
| 24738 |                               | used to determine the values of locale categories.)                                                   |
| 24739 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other                              |
| 24740 |                               | internationalization variables.                                                                       |
| 24741 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as                     |
| 24742 |                               | characters (for example, single-byte as opposed to multi-byte characters in                           |
| 24743 |                               | arguments).                                                                                           |
| 24744 | <i>LC_MESSAGES</i>            |                                                                                                       |
| 24745 |                               | Determine the locale that should be used to affect the format and contents of                         |
| 24746 |                               | diagnostic messages written to standard error.                                                        |
| 24747 | XSI <i>NLSPATH</i>            | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                 |
| 24748 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                       |
| 24749 |                               | Default.                                                                                              |
| 24750 | <b>STDOUT</b>                 |                                                                                                       |
| 24751 |                               | Not used.                                                                                             |
| 24752 | <b>STDERR</b>                 |                                                                                                       |
| 24753 |                               | The standard error shall be used only for diagnostic messages.                                        |
| 24754 | <b>OUTPUT FILES</b>           |                                                                                                       |
| 24755 |                               | None.                                                                                                 |
| 24756 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                       |
| 24757 |                               | None.                                                                                                 |
| 24758 | <b>EXIT STATUS</b>            |                                                                                                       |
| 24759 |                               | The following exit values shall be returned:                                                          |
| 24760 | 0                             | All the specified directories were created successfully or the <b>-p</b> option was specified and all |
| 24761 |                               | the specified directories now exist.                                                                  |
| 24762 | >0                            | An error occurred.                                                                                    |
| 24763 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                       |
| 24764 |                               | Default.                                                                                              |
| 24765 | <b>APPLICATION USAGE</b>      |                                                                                                       |
| 24766 |                               | The default file mode for directories is <i>a=rwx</i> (777 on most systems) with selected permissions |
| 24767 |                               | removed in accordance with the file mode creation mask. For intermediate pathname                     |
| 24768 |                               | components created by <i>mkdir</i> , the mode is the default modified by <i>u+wx</i> so that the      |
| 24769 |                               | subdirectories can always be created regardless of the file mode creation mask; if different          |
| 24770 |                               | ultimate permissions are desired for the intermediate directories, they can be changed                |
| 24771 |                               | afterwards with <i>chmod</i> .                                                                        |
| 24772 |                               | Note that some of the requested directories may have been created even if an error occurs.            |
| 24773 | <b>EXAMPLES</b>               |                                                                                                       |
| 24774 |                               | None.                                                                                                 |
| 24775 | <b>RATIONALE</b>              |                                                                                                       |
| 24776 |                               | The System V <b>-m</b> option was included to control the file mode.                                  |
| 24777 |                               | The System V <b>-p</b> option was included to create any needed intermediate directories and to       |
| 24778 |                               | complement the functionality provided by <i>rmdir</i> for removing directories in the path prefix as  |
| 24779 |                               | they become empty. Because no error is produced if any path component already exists, the <b>-p</b>   |
| 24780 |                               | option is also useful to ensure that a particular directory exists.                                   |

24781           The functionality of *mkdir* is described substantially through a reference to the *mkdir()* function  
24782           in the System Interfaces volume of IEEE Std 1003.1-2001. For example, by default, the mode of  
24783           the directory is affected by the file mode creation mask in accordance with the specified  
24784           behavior of the *mkdir()* function. In this way, there is less duplication of effort required for  
24785           describing details of the directory creation.

24786 **FUTURE DIRECTIONS**

24787           None.

24788 **SEE ALSO**

24789           *chmod*, *rm*, *rmdir*, *umask*, the System Interfaces volume of IEEE Std 1003.1-2001, *mkdir()*

24790 **CHANGE HISTORY**

24791           First released in Issue 2.

24792 **Issue 5**

24793           The FUTURE DIRECTIONS section is added.

24794 **NAME**

24795 mkfifo — make FIFO special files

24796 **SYNOPSIS**24797 mkfifo [-m *mode*] *file*...24798 **DESCRIPTION**24799 The *mkfifo* utility shall create the FIFO special files specified by the operands, in the order  
24800 specified.24801 For each *file* operand, the *mkfifo* utility shall perform actions equivalent to the *mkfifo()* function  
24802 defined in the System Interfaces volume of IEEE Std 1003.1-2001, called with the following  
24803 arguments:

- 24804 1. The *file* operand is used as the *path* argument.
- 24805 2. The value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP, S\_IWGRP,  
24806 S\_IROTH, and S\_IWOTH is used as the *mode* argument. (If the **-m** option is specified, the  
24807 value of the *mkfifo()* *mode* argument is unspecified, but the FIFO shall at no time have  
24808 permissions less restrictive than the **-m mode** option-argument.)

24809 **OPTIONS**24810 The *mkfifo* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
24811 12.2, Utility Syntax Guidelines.

24812 The following option shall be supported:

24813 **-m mode** Set the file permission bits of the newly-created FIFO to the specified *mode* value.  
 24814 The *mode* option-argument shall be the same as the *mode* operand defined for the  
 24815 *chmod* utility. In the *symbolic\_mode* strings, the *op* characters '+' and '-' shall be  
 24816 interpreted relative to an assumed initial mode of *a=rw*.

24817 **OPERANDS**

24818 The following operand shall be supported:

24819 *file* A pathname of the FIFO special file to be created.24820 **STDIN**

24821 Not used.

24822 **INPUT FILES**

24823 None.

24824 **ENVIRONMENT VARIABLES**24825 The following environment variables shall affect the execution of *mkfifo*:

24826 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 24827 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 24828 Internationalization Variables for the precedence of internationalization variables  
 24829 used to determine the values of locale categories.)

24830 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 24831 internationalization variables.

24832 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 24833 characters (for example, single-byte as opposed to multi-byte characters in  
 24834 arguments).

24835 **LC\_MESSAGES**

24836 Determine the locale that should be used to affect the format and contents of  
 24837 diagnostic messages written to standard error.

24838 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 24839 ASYNCHRONOUS EVENTS

24840 Default.

## 24841 STDOUT

24842 Not used.

## 24843 STDERR

24844 The standard error shall be used only for diagnostic messages.

## 24845 OUTPUT FILES

24846 None.

## 24847 EXTENDED DESCRIPTION

24848 None.

## 24849 EXIT STATUS

24850 The following exit values shall be returned:

24851 0 All the specified FIFO special files were created successfully.

24852 >0 An error occurred.

## 24853 CONSEQUENCES OF ERRORS

24854 Default.

## 24855 APPLICATION USAGE

24856 None.

## 24857 EXAMPLES

24858 None.

## 24859 RATIONALE

24860 This utility was added to permit shell applications to create FIFO special files.

24861 The **-m** option was added to control the file mode, for consistency with the similar functionality  
24862 provided by the *mkdir* utility.

24863 Early proposals included a **-p** option similar to the *mkdir -p* option that created intermediate  
24864 directories leading up to the FIFO specified by the final component. This was removed because  
24865 it is not commonly needed and is not common practice with similar utilities.

24866 The functionality of *mkfifo* is described substantially through a reference to the *mkfifo()* function  
24867 in the System Interfaces volume of IEEE Std 1003.1-2001. For example, by default, the mode of  
24868 the FIFO file is affected by the file mode creation mask in accordance with the specified behavior  
24869 of the *mkfifo()* function. In this way, there is less duplication of effort required for describing  
24870 details of the file creation.

## 24871 FUTURE DIRECTIONS

24872 None.

## 24873 SEE ALSO

24874 *chmod*, *umask*, the System Interfaces volume of IEEE Std 1003.1-2001, *mkfifo()*

## 24875 CHANGE HISTORY

24876 First released in Issue 3.

24877 **NAME**24878        *more* — display files on a page-by-page basis24879 **SYNOPSIS**24880 UP        *more* [-ceisu] [-n *number*] [-p *command*] [-t *tagstring*] [*file* ...]

24881

24882 **DESCRIPTION**

24883        The *more* utility shall read files and either write them to the terminal on a page-by-page basis or  
 24884        filter them to standard output. If standard output is not a terminal device, all input files shall be  
 24885        copied to standard output in their entirety, without modification, except as specified for the **-s**  
 24886        option. If standard output is a terminal device, the files shall be written a number of lines (one  
 24887        screenful) at a time under the control of user commands. See the EXTENDED DESCRIPTION  
 24888        section.

24889        Certain block-mode terminals do not have all the capabilities necessary to support the complete  
 24890        *more* definition; they are incapable of accepting commands that are not terminated with a  
 24891        <newline>. Implementations that support such terminals shall provide an operating mode to  
 24892        *more* in which all commands can be terminated with a <newline> on those terminals. This mode:

- 24893        • Shall be documented in the system documentation
- 24894        • Shall, at invocation, inform the user of the terminal deficiency that requires the <newline>  
 24895        usage and provide instructions on how this warning can be suppressed in future invocations
- 24896        • Shall not be required for implementations supporting only fully capable terminals
- 24897        • Shall not affect commands already requiring <newline>s
- 24898        • Shall not affect users on the capable terminals from using *more* as described in this volume of  
 24899        IEEE Std 1003.1-2001

24900 **OPTIONS**

24901        The *more* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 24902        12.2, Utility Syntax Guidelines.

24903        The following options shall be supported:

- 24904        **-c**        If a screen is to be written that has no lines in common with the current screen, or  
 24905        *more* is writing its first screen, *more* shall not scroll the screen, but instead shall  
 24906        redraw each line of the screen in turn, from the top of the screen to the bottom. In  
 24907        addition, if *more* is writing its first screen, the screen shall be cleared. This option  
 24908        may be silently ignored on devices with insufficient terminal capabilities.
- 24909        **-e**        By default, *more* shall exit immediately after writing the last line of the last file in  
 24910        the argument list. If the **-e** option is specified:
  - 24911            1. If there is only a single file in the argument list and that file was completely  
 24912            displayed on a single screen, *more* shall exit immediately after writing the last  
 24913            line of that file.
  - 24914            2. Otherwise, *more* shall exit only after reaching end-of-file on the last file in the  
 24915            argument list twice without an intervening operation. See the EXTENDED  
 24916            DESCRIPTION section.
- 24917        **-i**        Perform pattern matching in searches without regard to case; see the Base  
 24918        Definitions volume of IEEE Std 1003.1-2001, Section 9.2, Regular Expression  
 24919        General Requirements.

24920       **-n number**   Specify the number of lines per screenful. The *number* argument is a positive  
 24921                   decimal integer. The **-n** option shall override any values obtained from any other  
 24922                   source.

24923       **-p command** Each time a screen from a new file is displayed or redisplayed (including as a  
 24924                   result of *more* commands; for example, **:p**), execute the *more* command(s) in the  
 24925                   command arguments in the order specified, as if entered by the user after the first  
 24926                   screen has been displayed. No intermediate results shall be displayed (that is, if the  
 24927                   command is a movement to a screen different from the normal first screen, only  
 24928                   the screen resulting from the command shall be displayed.) If any of the  
 24929                   commands fail for any reason, an informational message to this effect shall be  
 24930                   written, and no further commands specified using the **-p** option shall be executed  
 24931                   for this file.

24932       **-s**               Behave as if consecutive empty lines were a single empty line.

24933       **-t tagstring** Write the screenful of the file containing the tag named by the *tagstring* argument.  
 24934                   See the *ctags* utility. The tags feature represented by **-t tagstring** and the **:t**  
 24935                   command is optional. It shall be provided on any system that also provides a  
 24936                   conforming implementation of *ctags*; otherwise, the use of **-t** produces undefined  
 24937                   results.

24938                   The filename resulting from the **-t** option shall be logically added as a prefix to the  
 24939                   list of command line files, as if specified by the user. If the tag named by the  
 24940                   *tagstring* argument is not found, it shall be an error, and *more* shall take no further  
 24941                   action.

24942                   If the tag specifies a line number, the first line of the display shall contain the  
 24943                   beginning of that line. If the tag specifies a pattern, the first line of the display shall  
 24944                   contain the beginning of the matching text from the first line of the file that  
 24945                   contains that pattern. If the line does not exist in the file or matching text is not  
 24946                   found, an informational message to this effect shall be displayed, and *more* shall  
 24947                   display the default screen as if **-t** had not been specified.

24948                   If both the **-t tagstring** and **-p command** options are given, the **-t tagstring** shall be  
 24949                   processed first; that is, the file and starting line for the display shall be as specified  
 24950                   by **-t**, and then the **-p more** command shall be executed. If the line (matching text)  
 24951                   specified by the **-t** command does not exist (is not found), no **-p more** command  
 24952                   shall be executed for this file at any time.

24953       **-u**               Treat a <backspace> as a printable control character, displayed as an  
 24954                   implementation-defined character sequence (see the EXTENDED DESCRIPTION  
 24955                   section), suppressing backspacing and the special handling that produces  
 24956                   underlined or standout mode text on some terminal types. Also, do not ignore a  
 24957                   <carriage-return> at the end of a line.

## 24958 OPERANDS

24959       The following operand shall be supported:

24960       *file*            A pathname of an input file. If no *file* operands are specified, the standard input  
 24961                   shall be used. If a *file* is '-', the standard input shall be read at that point in the  
 24962                   sequence.

## 24963 STDIN

24964       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.

24965 **INPUT FILES**

24966 The input files being examined shall be text files. If standard output is a terminal, standard error  
 24967 shall be used to read commands from the user. If standard output is a terminal, standard error is  
 24968 not readable, and command input is needed, *more* may attempt to obtain user commands from  
 24969 the controlling terminal (for example, */dev/tty*); otherwise, *more* shall terminate with an error  
 24970 indicating that it was unable to read user commands. If standard output is not a terminal, no  
 24971 error shall result if standard error cannot be opened for reading.

24972 **ENVIRONMENT VARIABLES**

24973 The following environment variables shall affect the execution of *more*:

24974 **COLUMNS** Override the system-selected horizontal display line size. See the Base Definitions  
 24975 volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables for valid values  
 24976 and results when it is unset or null.

24977 **EDITOR** Used by the **v** command to select an editor. See the EXTENDED DESCRIPTION  
 24978 section.

24979 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 24980 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 24981 Internationalization Variables for the precedence of internationalization variables  
 24982 used to determine the values of locale categories.)

24983 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 24984 internationalization variables.

24985 **LC\_COLLATE**  
 24986 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 24987 character collating elements within regular expressions.

24988 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 24989 characters (for example, single-byte as opposed to multi-byte characters in  
 24990 arguments and input files) and the behavior of character classes within regular  
 24991 expressions.

24992 **LC\_MESSAGES**  
 24993 Determine the locale that should be used to affect the format and contents of  
 24994 diagnostic messages written to standard error and informative messages written to  
 24995 standard output.

24996 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

24997 **LINES** Override the system-selected vertical screen size, used as the number of lines in a  
 24998 screenful. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8,  
 24999 Environment Variables for valid values and results when it is unset or null. The **-n**  
 25000 option shall take precedence over the **LINES** variable for determining the number  
 25001 of lines in a screenful.

25002 **MORE** Determine a string containing options described in the OPTIONS section preceded  
 25003 with hyphens and <blank>-separated as on the command line. Any command line  
 25004 options shall be processed after those in the **MORE** variable, as if the command  
 25005 line were:

25006 *more \$MORE options operands*

25007 The **MORE** variable shall take precedence over the **TERM** and **LINES** variables for  
 25008 determining the number of lines in a screenful.

25009           **TERM**           Determine the name of the terminal type. If this variable is unset or null, an  
25010                               unspecified default terminal type is used.

## 25011 **ASYNCHRONOUS EVENTS**

25012           Default.

## 25013 **STDOUT**

25014           The standard output shall be used to write the contents of the input files.

## 25015 **STDERR**

25016           The standard error shall be used for diagnostic messages and user commands (see the INPUT  
25017           FILES section), and, if standard output is a terminal device, to write a prompting string. The  
25018           prompting string shall appear on the screen line below the last line of the file displayed in the  
25019           current screenful. The prompt shall contain the name of the file currently being examined and  
25020           shall contain an end-of-file indication and the name of the next file, if any, when prompting at  
25021           the end-of-file. If an error or informational message is displayed, it is unspecified whether it is  
25022           contained in the prompt. If it is not contained in the prompt, it shall be displayed and then the  
25023           user shall be prompted for a continuation character, at which point another message or the user  
25024           prompt may be displayed. The prompt is otherwise unspecified. It is unspecified whether  
25025           informational messages are written for other user commands.

## 25026 **OUTPUT FILES**

25027           None.

## 25028 **EXTENDED DESCRIPTION**

25029           The following section describes the behavior of *more* when the standard output is a terminal  
25030           device. If the standard output is not a terminal device, no options other than **-s** shall have any  
25031           effect, and all input files shall be copied to standard output otherwise unmodified, at which time  
25032           *more* shall exit without further action.

25033           The number of lines available per screen shall be determined by the **-n** option, if present, or by  
25034           examining values in the environment (see the ENVIRONMENT VARIABLES section). If neither  
25035           method yields a number, an unspecified number of lines shall be used.

25036           The maximum number of lines written shall be one less than this number, because the screen  
25037           line after the last line written shall be used to write a user prompt and user input. If the number  
25038           of lines in the screen is less than two, the results are undefined. It is unspecified whether user  
25039           input is permitted to be longer than the remainder of the single line where the prompt has been  
25040           written.

25041           The number of columns available per line shall be determined by examining values in the  
25042           environment (see the ENVIRONMENT VARIABLES section), with a default value as described  
25043           in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

25044           Lines that are longer than the display shall be folded; the length at which folding occurs is  
25045           unspecified, but should be appropriate for the output device. Folding may occur between glyphs  
25046           of single characters that take up multiple display columns.

25047           When standard output is a terminal and **-u** is not specified, *more* shall treat <backspace>s and  
25048           <carriage-return>s specially:

- 25049           • A character, followed first by a sequence of *n* <backspace>s (where *n* is the same as the  
25050           number of column positions that the character occupies), then by *n* underscore characters  
25051           (' \_ '), shall cause that character to be written as underlined text, if the terminal type  
25052           supports that. The *n* underscore characters, followed first by *n* <backspace>s, then any  
25053           character with *n* column positions, shall also cause that character to be written as underlined  
25054           text, if the terminal type supports that.

- A sequence of *n* <backspace>s (where *n* is the same as the number of column positions that the previous character occupies) that appears between two identical printable characters shall cause the first of those two characters to be written as emboldened text (that is, visually brighter, standout mode, or inverse-video mode), if the terminal type supports that, and the second to be discarded. Immediately subsequent occurrences of <backspace> /character pairs for that same character shall also be discarded. (For example, the sequence "a\ba\ba\ba" is interpreted as a single emboldened 'a'.)
- The *more* utility shall logically discard all other <backspace>s from the line as well as the character which precedes them, if any.
- A <carriage-return> at the end of a line shall be ignored, rather than being written as a non-printable character, as described in the next paragraph.

It is implementation-defined how other non-printable characters are written. Implementations should use the same format that they use for the *ex print* command; see the OPTIONS section within the *ed* utility. It is unspecified whether a multi-column character shall be separated if it crosses a display line boundary; it shall not be discarded. The behavior is unspecified if the number of columns on the display is less than the number of columns any single character in the line being displayed would occupy.

When each new file is displayed (or redisplayed), *more* shall write the first screen of the file. Once the initial screen has been written, *more* shall prompt for a user command. If the execution of the user command results in a screen that has lines in common with the current screen, and the device has sufficient terminal capabilities, *more* shall scroll the screen; otherwise, it is unspecified whether the screen is scrolled or redrawn.

For all files but the last (including standard input if no file was specified, and for the last file as well, if the *-e* option was not specified), when *more* has written the last line in the file, *more* shall prompt for a user command. This prompt shall contain the name of the next file as well as an indication that *more* has reached end-of-file. If the user command is **f**, <control>-F, <space>, **j**, <newline>, **d**, <control>-D, or **s**, *more* shall display the next file. Otherwise, if displaying the last file, *more* shall exit. Otherwise, *more* shall execute the user command specified.

Several of the commands described in this section display a previous screen from the input stream. In the case that text is being taken from a non-rewindable stream, such as a pipe, it is implementation-defined how much backwards motion is supported. If a command cannot be executed because of a limitation on backwards motion, an error message to this effect shall be displayed, the current screen shall not change, and the user shall be prompted for another command.

If a command cannot be performed because there are insufficient lines to display, *more* shall alert the terminal. If a command cannot be performed because there are insufficient lines to display or a / command fails: if the input is the standard input, the last screen in the file may be displayed; otherwise, the current file and screen shall not change, and the user shall be prompted for another command.

The interactive commands in the following sections shall be supported. Some commands can be preceded by a decimal integer, called *count* in the following descriptions. If not specified with the command, *count* shall default to 1. In the following descriptions, *pattern* is a basic regular expression, as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions. The term “examine” is historical usage meaning “open the file for viewing”; for example, *more foo* would be expressed as examining file **foo**.

In the following descriptions, unless otherwise specified, *line* is a line in the *more* display, not a line from the file being examined.

25102 In the following descriptions, the *current position* refers to two things:

- 25103 1. The position of the current line on the screen
- 25104 2. The line number (in the file) of the current line on the screen

25105 Usually, the line on the screen corresponding to the current position is the third line on the  
 25106 screen. If this is not possible (there are fewer than three lines to display or this is the first page of  
 25107 the file, or it is the last page of the file), then the current position is either the first or last line on  
 25108 the screen as described later.

## 25109 **Help**

25110 *Synopsis:*     h

25111 Write a summary of these commands and other implementation-defined commands. The  
 25112 behavior shall be as if the *more* utility were executed with the **-e** option on a file that contained  
 25113 the summary information. The user shall be prompted as described earlier in this section when  
 25114 end-of-file is reached. If the user command is one of those specified to continue to the next file,  
 25115 *more* shall return to the file and screen state from which the **h** command was executed.

## 25116 **Scroll Forward One Screenful**

25117 *Synopsis:*     [count] f  
 25118                 [count] <control>-F

25119 Scroll forward *count* lines, with a default of one screenful. If *count* is more than the screen size,  
 25120 only the final screenful shall be written.

## 25121 **Scroll Backward One Screenful**

25122 *Synopsis:*     [count] b  
 25123                 [count] <control>-B

25124 Scroll backward *count* lines, with a default of one screenful (see the **-n** option). If *count* is more  
 25125 than the screen size, only the final screenful shall be written.

## 25126 **Scroll Forward One Line**

25127 *Synopsis:*     [count] <space>  
 25128                 [count] j  
 25129                 [count] <newline>

25130 Scroll forward *count* lines. The default *count* for the <space> shall be one screenful; for **j** and  
 25131 <newline>, one line. The entire *count* lines shall be written, even if *count* is more than the screen  
 25132 size.

## 25133 **Scroll Backward One Line**

25134 *Synopsis:*     [count] k

25135 Scroll backward *count* lines. The entire *count* lines shall be written, even if *count* is more than the  
 25136 screen size.

### 25137 **Scroll Forward One Half Screenful**

25138 *Synopsis:*     [*count*] d  
 25139                   [*count*] <control>-D

25140 Scroll forward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 25141 shall become the new default for subsequent **d**, <control>-D, and **u** commands.

### 25142 **Skip Forward One Line**

25143 *Synopsis:*     [*count*] s

25144 Display the screenful beginning with the line *count* lines after the last line on the current screen.  
 25145 If *count* would cause the current position to be such that less than one screenful would be  
 25146 written, the last screenful in the file shall be written.

### 25147 **Scroll Backward One Half Screenful**

25148 *Synopsis:*     [*count*] u  
 25149                   [*count*] <control>-U

25150 Scroll backward *count* lines, with a default of one half of the screen size. If *count* is specified, it  
 25151 shall become the new default for subsequent **d**, <control>-D, **u**, and <control>-U commands.  
 25152 The entire *count* lines shall be written, even if *count* is more than the screen size.

### 25153 **Go to Beginning of File**

25154 *Synopsis:*     [*count*] g

25155 Display the screenful beginning with line *count*.

### 25156 **Go to End-of-File**

25157 *Synopsis:*     [*count*] G

25158 If *count* is specified, display the screenful beginning with the line *count*. Otherwise, display the  
 25159 last screenful of the file.

### 25160 **Refresh the Screen**

25161 *Synopsis:*     r  
 25162                   <control>-L

25163 Refresh the screen.

### 25164 **Discard and Refresh**

25165 *Synopsis:*     R

25166 Refresh the screen, discarding any buffered input. If the current file is non-seekable, buffered  
 25167 input shall not be discarded and the **R** command shall be equivalent to the **r** command.

25168 **Mark Position**25169 *Synopsis:*     *mletter*

25170 Mark the current position with the letter named by *letter*, where *letter* represents the name of one  
 25171 of the lowercase letters of the portable character set. When a new file is examined, all marks may  
 25172 be lost.

25173 **Return to Mark**25174 *Synopsis:*     '*letter*

25175 Return to the position that was previously marked with the letter named by *letter*, making that  
 25176 line the current position.

25177 **Return to Previous Position**25178 *Synopsis:*     ''

25179 Return to the position from which the last large movement command was executed (where a  
 25180 “large movement” is defined as any movement of more than a screenful of lines). If no such  
 25181 movements have been made, return to the beginning of the file.

25182 **Search Forward for Pattern**25183 *Synopsis:*     [*count*] / [!] *pattern* <newline>

25184 Display the screenful beginning with the *count*th line containing the pattern. The search shall  
 25185 start after the first line currently displayed. The null regular expression ('/' followed by a  
 25186 <newline>) shall repeat the search using the previous regular expression, with a default *count*. If  
 25187 the character '!' is included, the matching lines shall be those that do not contain the *pattern*. If  
 25188 no match is found for the *pattern*, a message to that effect shall be displayed.

25189 **Search Backward for Pattern**25190 *Synopsis:*     [*count*] ? [!] *pattern* <newline>

25191 Display the screenful beginning with the *count*th previous line containing the pattern. The  
 25192 search shall start on the last line before the first line currently displayed. The null regular  
 25193 expression ('?' followed by a <newline>) shall repeat the search using the previous regular  
 25194 expression, with a default *count*. If the character '!' is included, matching lines shall be those  
 25195 that do not contain the *pattern*. If no match is found for the *pattern*, a message to that effect shall  
 25196 be displayed.

25197 **Repeat Search**25198 *Synopsis:*     [*count*] n

25199 Repeat the previous search for *count*th line containing the last *pattern* (or not containing the last  
 25200 *pattern*, if the previous search was "/" or "?").

## 25201 **Repeat Search in Reverse**

25202 *Synopsis:*     [*count*]N

25203 Repeat the search in the opposite direction of the previous search for the *count*th line containing  
25204 the last *pattern* (or not containing the last *pattern*, if the previous search was `/! "` or `?! "`).

## 25205 **Examine New File**

25206 *Synopsis:*     :e [*filename*]<newline>

25207 Examine a new file. If the *filename* argument is not specified, the current file (see the **:n** and **:p**  
25208 commands below) shall be re-examined. The *filename* shall be subjected to the process of shell  
25209 word expansions (see Section 2.6 (on page 36)); if more than a single pathname results, the  
25210 effects are unspecified. If *filename* is a number sign (`'#'`), the previously examined file shall be  
25211 re-examined. If *filename* is not accessible for any reason (including that it is a non-seekable file),  
25212 an error message to this effect shall be displayed and the current file and screen shall not change.

## 25213 **Examine Next File**

25214 *Synopsis:*     [*count*] :n

25215 Examine the next file. If a number *count* is specified, the *count*th next file shall be examined. If  
25216 *filename* refers to a non-seekable file, the results are unspecified.

## 25217 **Examine Previous File**

25218 *Synopsis:*     [*count*] :p

25219 Examine the previous file. If a number *count* is specified, the *count*th previous file shall be  
25220 examined. If *filename* refers to a non-seekable file, the results are unspecified.

## 25221 **Go to Tag**

25222 *Synopsis:*     :t *tagstring*<newline>

25223 If the file containing the tag named by the *tagstring* argument is not the current file, examine the  
25224 file, as if the **:e** command was executed with that file as the argument. Otherwise, or in addition,  
25225 display the screenful beginning with the tag, as described for the **-t** option (see the OPTIONS  
25226 section). If the *ctags* utility is not supported by the system, the use of **:t** produces undefined  
25227 results.

## 25228 **Invoke Editor**

25229 *Synopsis:*     v

25230 Invoke an editor to edit the current file being examined. If standard input is being examined, the  
25231 results are unspecified. The name of the editor shall be taken from the environment variable  
25232 *EDITOR*, or shall default to *vi*. If the last pathname component in *EDITOR* is either *vi* or *ex*, the  
25233 editor shall be invoked with a **-c** *linenumber* command line argument, where *linenumber* is the  
25234 line number of the file line containing the display line currently displayed as the first line of the  
25235 screen. It is implementation-defined whether line-setting options are passed to editors other  
25236 than *vi* and *ex*.

25237 When the editor exits, *more* shall resume with the same file and screen as when the editor was  
25238 invoked.

**Display Position**

Synopsis:       =

                  <control>-G

Write a message for which the information references the first byte of the line after the last line of the file on the screen. This message shall include the name of the file currently being examined, its number relative to the total number of files there are to examine, the line number in the file, the byte number and the total bytes in the file, and what percentage of the file precedes the current position. If *more* is reading from standard input, or the file is shorter than a single screen, the line number, the byte number, the total bytes, and the percentage need not be written.

**Quit**

Synopsis:       q

                  :q

                  ZZ

Exit *more*.

**EXIT STATUS**

The following exit values shall be returned:

- 0   Successful completion.
- >0   An error occurred.

**CONSEQUENCES OF ERRORS**

If an error is encountered accessing a file when using the **:n** command, *more* shall attempt to examine the next file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:p** command, *more* shall attempt to examine the previous file in the argument list, but the final exit status shall be affected. If an error is encountered accessing a file via the **:e** command, *more* shall remain in the current file and the final exit status shall not be affected.

**APPLICATION USAGE**

When the standard output is not a terminal, only the **-s** filter-modification option is effective. This is based on historical practice. For example, a typical implementation of *man* pipes its output through *more -s* to squeeze excess white space for terminal users. When *man* is piped to *lp*, however, it is undesirable for this squeezing to happen.

**EXAMPLES**

The **-p** allows arbitrary commands to be executed at the start of each file. Examples are:

*more -p G file1 file2*

Examine each file starting with its last screenful.

*more -p 100 file1 file2*

Examine each file starting with line 100 in the current position (usually the third line, so line 98 would be the first line written).

*more -p /100 file1 file2*

Examine each file starting with the first line containing the string "100" in the current position

**RATIONALE**

The *more* utility, available in BSD and BSD-derived systems, was chosen as the prototype for the POSIX file display program since it is more widely available than either the public-domain program *less* or than *pg*, a pager provided in System V. The 4.4 BSD *more* is the model for the

25283 features selected; it is almost fully upwards-compatible from the 4.3 BSD version in wide use  
 25284 and has become more amenable for *vi* users. Several features originally derived from various file  
 25285 editors, found in both *less* and *pg*, have been added to this volume of IEEE Std 1003.1-2001 as  
 25286 they have proved extremely popular with users.

25287 There are inconsistencies between *more* and *vi* that result from historical practice. For example,  
 25288 the single-character commands **h**, **f**, **b**, and <space> are screen movers in *more*, but cursor  
 25289 movers in *vi*. These inconsistencies were maintained because the cursor movements are not  
 25290 applicable to *more* and the powerful functionality achieved without the use of the control key  
 25291 justifies the differences.

25292 The tags interface has been included in a program that is not a text editor because it promotes  
 25293 another degree of consistent operation with *vi*. It is conceivable that the paging environment of  
 25294 *more* would be superior for browsing source code files in some circumstances.

25295 The operating mode referred to for block-mode terminals effectively adds a <newline> to each  
 25296 Synopsis line that currently has none. So, for example, **d**<newline> would page one screenful.  
 25297 The mode could be triggered by a command line option, environment variable, or some other  
 25298 method. The details are not imposed by this volume of IEEE Std 1003.1-2001 because there are so  
 25299 few systems known to support such terminals. Nevertheless, it was considered that all systems  
 25300 should be able to support *more* given the exception cited for this small community of terminals  
 25301 because, in comparison to *vi*, the cursor movements are few and the command set relatively  
 25302 amenable to the optional <newline>s.

25303 Some versions of *more* provide a shell escaping mechanism similar to the *ex* ! command. The  
 25304 standard developers did not consider that this was necessary in a paginator, particularly given  
 25305 the wide acceptance of multiple window terminals and job control features. (They chose to  
 25306 retain such features in the editors and *mailx* because the shell interaction also gives an  
 25307 opportunity to modify the editing buffer, which is not applicable to *more*.)

25308 The **-p** (position) option replaces the **+** command because of the Utility Syntax Guidelines. In  
 25309 early proposals, it took a *pattern* argument, but historical *less* provided the *more* general facility of  
 25310 a command. It would have been desirable to use the same **-c** as *ex* and *vi*, but the letter was  
 25311 already in use.

25312 The text stating “from a non-rewindable stream ... implementations may limit the amount of  
 25313 backwards motion supported” would allow an implementation that permitted no backwards  
 25314 motion beyond text already on the screen. It was not possible to require a minimum amount of  
 25315 backwards motion that would be effective for all conceivable device types. The implementation  
 25316 should allow the user to back up as far as possible, within device and reasonable memory  
 25317 allocation constraints.

25318 Historically, non-printable characters were displayed using the ARPA standard mappings,  
 25319 which are as follows:

- 25320 1. Printable characters are left alone.
- 25321 2. Control characters less than \177 are represented as followed by the character offset from  
 25322 the '@' character in the ASCII map; for example, \007 is represented as 'G'.
- 25323 3. \177 is represented as followed by ' ? '.

25324 The display of characters having their eighth bit set was less standard. Existing implementations  
 25325 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed characters with their  
 25326 eighth bit set as the two characters "M-", followed by the seven-bit display as described  
 25327 previously.) The latter probably has the best claim to historical practice because it was used with  
 25328 the **-v** option of 4 BSD and 4 BSD-derived versions of the *cat* utility since 1980.

25329 No specific display format is required by IEEE Std 1003.1-2001. Implementations are encouraged  
25330 to conform to historic practice in the absence of any strong reason to diverge.

25331 **FUTURE DIRECTIONS**

25332 None.

25335 **CHANGE HISTORY**

25336 First released in Issue 4.

25337 **Issue 5**

25338 The FUTURE DIRECTIONS section is added.

25339 **Issue 6**

25340 This utility is marked as part of the User Portability Utilities option.

25341 The obsolescent SYNOPSIS is removed.

25342 The utility has been extensively reworked for alignment with the IEEE P1003.2b draft standard:

- 25343 • Changes have been made as a result of IEEE PASC Interpretations 1003.2 #37 and #109.
- 25344 • The *more* utility should be able to handle underlined and emboldened displays of characters
- 25345 that are wider than a single column position.

25346 **NAME**

25347 mv — move files

25348 **SYNOPSIS**25349 mv [-fi] *source\_file target\_file*25350 mv [-fi] *source\_file... target\_file*25351 **DESCRIPTION**

25352 In the first synopsis form, the *mv* utility shall move the file named by the *source\_file* operand to  
 25353 the destination specified by the *target\_file*. This first synopsis form is assumed when the final  
 25354 operand does not name an existing directory and is not a symbolic link referring to an existing  
 25355 directory.

25356 In the second synopsis form, *mv* shall move each file named by a *source\_file* operand to a  
 25357 destination file in the existing directory named by the *target\_dir* operand, or referenced if  
 25358 *target\_dir* is a symbolic link referring to an existing directory. The destination path for each  
 25359 *source\_file* shall be the concatenation of the target directory, a single slash character, and the last  
 25360 pathname component of the *source\_file*. This second form is assumed when the final operand  
 25361 names an existing directory.

25362 If any operand specifies an existing file of a type not specified by the System Interfaces volume  
 25363 of IEEE Std 1003.1-2001, the behavior is implementation-defined.

25364 For each *source\_file* the following steps shall be taken:

25365 1. If the destination path exists, the **-f** option is not specified, and either of the following  
 25366 conditions is true:

25367 a. The permissions of the destination path do not permit writing and the standard input  
 25368 is a terminal.

25369 b. The **-i** option is specified.

25370 the *mv* utility shall write a prompt to standard error and read a line from standard input. If  
 25371 the response is not affirmative, *mv* shall do nothing more with the current *source\_file* and  
 25372 go on to any remaining *source\_files*.

25373 2. The *mv* utility shall perform actions equivalent to the *rename()* function defined in the  
 25374 System Interfaces volume of IEEE Std 1003.1-2001, called with the following arguments:

25375 a. The *source\_file* operand is used as the *old* argument.

25376 b. The destination path is used as the *new* argument.

25377 If this succeeds, *mv* shall do nothing more with the current *source\_file* and go on to any  
 25378 remaining *source\_files*. If this fails for any reasons other than those described for the *errno*  
 25379 [EXDEV] in the System Interfaces volume of IEEE Std 1003.1-2001, *mv* shall write a  
 25380 diagnostic message to standard error, do nothing more with the current *source\_file*, and go  
 25381 on to any remaining *source\_files*.

25382 3. If the destination path exists, and it is a file of type directory and *source\_file* is not a file of  
 25383 type directory, or it is a file not of type directory and *source\_file* is a file of type directory,  
 25384 *mv* shall write a diagnostic message to standard error, do nothing more with the current  
 25385 *source\_file*, and go on to any remaining *source\_files*.

25386 4. If the destination path exists, *mv* shall attempt to remove it. If this fails for any reason, *mv*  
 25387 shall write a diagnostic message to standard error, do nothing more with the current  
 25388 *source\_file*, and go on to any remaining *source\_files*.

- 25389 5. The file hierarchy rooted in *source\_file* shall be duplicated as a file hierarchy rooted in the  
 25390 destination path. If *source\_file* or any of the files below it in the hierarchy are symbolic  
 25391 links, the links themselves shall be duplicated, including their contents, rather than any  
 25392 files to which they refer. The following characteristics of each file in the file hierarchy shall  
 25393 be duplicated:
- 25394 • The time of last data modification and time of last access
  - 25395 • The user ID and group ID
  - 25396 • The file mode
- 25397 If the user ID, group ID, or file mode of a regular file cannot be duplicated, the file mode  
 25398 bits S\_ISUID and S\_ISGID shall not be duplicated.
- 25399 When files are duplicated to another file system, the implementation may require that the  
 25400 process invoking *mv* has read access to each file being duplicated.
- 25401 If the duplication of the file hierarchy fails for any reason, *mv* shall write a diagnostic  
 25402 message to standard error, do nothing more with the current *source\_file*, and go on to any  
 25403 remaining *source\_files*.
- 25404 If the duplication of the file characteristics fails for any reason, *mv* shall write a diagnostic  
 25405 message to standard error, but this failure shall not cause *mv* to modify its exit status.
- 25406 6. The file hierarchy rooted in *source\_file* shall be removed. If this fails for any reason, *mv* shall  
 25407 write a diagnostic message to the standard error, do nothing more with the current  
 25408 *source\_file*, and go on to any remaining *source\_files*.

#### 25409 OPTIONS

- 25410 The *mv* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 25411 Utility Syntax Guidelines.
- 25412 The following options shall be supported:
- 25413 **-f** Do not prompt for confirmation if the destination path exists. Any previous  
 25414 occurrence of the **-i** option is ignored.
  - 25415 **-i** Prompt for confirmation if the destination path exists. Any previous occurrence of  
 25416 the **-f** option is ignored.
- 25417 Specifying more than one of the **-f** or **-i** options shall not be considered an error. The last option  
 25418 specified shall determine the behavior of *mv*.

#### 25419 OPERANDS

- 25420 The following operands shall be supported:
- 25421 *source\_file* A pathname of a file or directory to be moved.
  - 25422 *target\_file* A new pathname for the file or directory being moved.
  - 25423 *target\_dir* A pathname of an existing directory into which to move the input files.

#### 25424 STDIN

- 25425 The standard input shall be used to read an input line in response to each prompt specified in  
 25426 the STDERR section. Otherwise, the standard input shall not be used.

#### 25427 INPUT FILES

- 25428 The input files specified by each *source\_file* operand can be of any file type.

25429 **ENVIRONMENT VARIABLES**

25430 The following environment variables shall affect the execution of *mv*:

25431 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 25432 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 25433 Internationalization Variables for the precedence of internationalization variables  
 25434 used to determine the values of locale categories.)

25435 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 25436 internationalization variables.

25437 **LC\_COLLATE**  
 25438 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 25439 character collating elements used in the extended regular expression defined for  
 25440 the **yesexpr** locale keyword in the **LC\_MESSAGES** category.

25441 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 25442 characters (for example, single-byte as opposed to multi-byte characters in  
 25443 arguments and input files), the behavior of character classes used in the extended  
 25444 regular expression defined for the **yesexpr** locale keyword in the **LC\_MESSAGES**  
 25445 category.

25446 **LC\_MESSAGES**  
 25447 Determine the locale for the processing of affirmative responses that should be  
 25448 used to affect the format and contents of diagnostic messages written to standard  
 25449 error.

25450 **XSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

25451 **ASYNCHRONOUS EVENTS**

25452 Default.

25453 **STDOUT**

25454 Not used.

25455 **STDERR**

25456 Prompts shall be written to the standard error under the conditions specified in the  
 25457 **DESCRIPTION** section. The prompts shall contain the destination pathname, but their format is  
 25458 otherwise unspecified. Otherwise, the standard error shall be used only for diagnostic messages.

25459 **OUTPUT FILES**

25460 The output files may be of any file type.

25461 **EXTENDED DESCRIPTION**

25462 None.

25463 **EXIT STATUS**

25464 The following exit values shall be returned:

25465 0 All input files were moved successfully.

25466 >0 An error occurred.

25467 **CONSEQUENCES OF ERRORS**

25468 If the copying or removal of *source\_file* is prematurely terminated by a signal or error, *mv* may  
 25469 leave a partial copy of *source\_file* at the source or destination. The *mv* utility shall not modify  
 25470 both *source\_file* and the destination path simultaneously; termination at any point shall leave  
 25471 either *source\_file* or the destination path complete.

25472 **APPLICATION USAGE**

25473 Some implementations mark for update the *st\_ctime* field of renamed files and some do not.  
 25474 Applications which make use of the *st\_ctime* field may behave differently with respect to  
 25475 renamed files unless they are designed to allow for either behavior.

25476 **EXAMPLES**

25477 If the current directory contains only files **a** (of any type defined by the System Interfaces  
 25478 volume of IEEE Std 1003.1-2001), **b** (also of any type), and a directory **c**:

25479 `mv a b c`  
 25480 `mv c d`

25481 results with the original files **a** and **b** residing in the directory **d** in the current directory.

25482 **RATIONALE**

25483 Early proposals diverged from the SVID and BSD historical practice in that they required that  
 25484 when the destination path exists, the **-f** option is not specified, and input is not a terminal, *mv*  
 25485 fails. This was done for compatibility with *cp*. The current text returns to historical practice. It  
 25486 should be noted that this is consistent with the *rename()* function defined in the System  
 25487 Interfaces volume of IEEE Std 1003.1-2001, which does not require write permission on the  
 25488 target.

25489 For absolute clarity, paragraph (1), describing the behavior of *mv* when prompting for  
 25490 confirmation, should be interpreted in the following manner:

25491 `if (exists AND (NOT f_option) AND`  
 25492 `((not_writable AND input_is_terminal) OR i_option))`

25493 The **-i** option exists on BSD systems, giving applications and users a way to avoid accidentally  
 25494 unlinking files when moving others. When the standard input is not a terminal, the 4.3 BSD *mv*  
 25495 deletes all existing destination paths without prompting, even when **-i** is specified; this is  
 25496 inconsistent with the behavior of the 4.3 BSD *cp* utility, which always generates an error when  
 25497 the file is unwritable and the standard input is not a terminal. The standard developers decided  
 25498 that use of **-i** is a request for interaction, so when the destination path exists, the utility takes  
 25499 instructions from whatever responds to standard input.

25500 The *rename()* function is able to move directories within the same file system. Some historical  
 25501 versions of *mv* have been able to move directories, but not to a different file system. The  
 25502 standard developers considered that this was an annoying inconsistency, so this volume of  
 25503 IEEE Std 1003.1-2001 requires directories to be able to be moved even across file systems. There  
 25504 is no **-R** option to confirm that moving a directory is actually intended, since such an option was  
 25505 not required for moving directories in historical practice. Requiring the application to specify it  
 25506 sometimes, depending on the destination, seemed just as inconsistent. The semantics of the  
 25507 *rename()* function were preserved as much as possible. For example, *mv* is not permitted to  
 25508 “rename” files to or from directories, even though they might be empty and removable.

25509 Historic implementations of *mv* did not exit with a non-zero exit status if they were unable to  
 25510 duplicate any file characteristics when moving a file across file systems, nor did they write a  
 25511 diagnostic message for the user. The former behavior has been preserved to prevent scripts from  
 25512 breaking; a diagnostic message is now required, however, so that users are alerted that the file  
 25513 characteristics have changed.

25514 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 25515 contents of prompts are specified because implementations may desire more descriptive  
 25516 prompts than those used on historical implementations. Therefore, an application not using the  
 25517 **-f** option or using the **-i** option relies on the system to provide the most suitable dialog directly  
 25518 with the user, based on the behavior specified.

25519 When *mv* is dealing with a single file system and *source\_file* is a symbolic link, the link itself is  
25520 moved as a consequence of the dependence on the *rename()* functionality, per the  
25521 DESCRIPTION. Across file systems, this has to be made explicit.

25522 **FUTURE DIRECTIONS**

25523 None.

25524 **SEE ALSO**

25525 *cp*, *ln*, the System Interfaces volume of IEEE Std 1003.1-2001, *rename()*

25526 **CHANGE HISTORY**

25527 First released in Issue 2.

25528 **Issue 6**

25529 The *mv* utility is changed to describe processing of symbolic links as specified in the  
25530 IEEE P1003.2b draft standard.

25531 The APPLICATION USAGE section is added.

25532 **NAME**

25533 newgrp — change to a new group

25534 **SYNOPSIS**

25535 UP newgrp [-l] [group]

25536

25537 **DESCRIPTION**

25538 The *newgrp* utility shall create a new shell execution environment with a new real and effective  
 25539 group identification. Of the attributes listed in Section 2.12 (on page 61), the new shell execution  
 25540 environment shall retain the working directory, file creation mask, and exported variables from  
 25541 the previous environment (that is, open files, traps, unexported variables, alias definitions, shell  
 25542 functions, and *set* options may be lost). All other aspects of the process environment that are  
 25543 preserved by the *exec* family of functions defined in the System Interfaces volume of  
 25544 IEEE Std 1003.1-2001 shall also be preserved by *newgrp*; whether other aspects are preserved is  
 25545 unspecified.

25546 A failure to assign the new group identifications (for example, for security or password-related  
 25547 reasons) shall not prevent the new shell execution environment from being created.

25548 The *newgrp* utility shall affect the supplemental groups for the process as follows:

- 25549 • On systems where the effective group ID is normally in the supplementary group list (or  
 25550 whenever the old effective group ID actually is in the supplementary group list):
  - 25551 — If the new effective group ID is also in the supplementary group list, *newgrp* shall change  
 25552 the effective group ID.
  - 25553 — If the new effective group ID is not in the supplementary group list, *newgrp* shall add the  
 25554 new effective group ID to the list, if there is room to add it.
- 25555 • On systems where the effective group ID is not normally in the supplementary group list (or  
 25556 whenever the old effective group ID is not in the supplementary group list):
  - 25557 — If the new effective group ID is in the supplementary group list, *newgrp* shall delete it.
  - 25558 — If the old effective group ID is not in the supplementary list, *newgrp* shall add it if there is  
 25559 room.

25560 **Note:** The System Interfaces volume of IEEE Std 1003.1-2001 does not specify whether the effective  
 25561 group ID of a process is included in its supplementary group list.

25562 With no operands, *newgrp* shall change the effective group back to the groups identified in the  
 25563 user's user entry, and shall set the list of supplementary groups to that set in the user's group  
 25564 database entries.

25565 If a password is required for the specified group, and the user is not listed as a member of that  
 25566 group in the group database, the user shall be prompted to enter the correct password for that  
 25567 group. If the user is listed as a member of that group, no password shall be requested. If no  
 25568 password is required for the specified group, it is implementation-defined whether users not  
 25569 listed as members of that group can change to that group. Whether or not a password is  
 25570 required, implementation-defined system accounting or security mechanisms may impose  
 25571 additional authorization restrictions that may cause *newgrp* to write a diagnostic message and  
 25572 suppress the changing of the group identification.

25573 **OPTIONS**

25574 The *newgrp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 25575 12.2, Utility Syntax Guidelines.

25576 The following option shall be supported:

25577 **-l** (The letter ell.) Change the environment to what would be expected if the user  
25578 actually logged in again.

#### 25579 **OPERANDS**

25580 The following operand shall be supported:

25581 *group* A group name from the group database or a non-negative numeric group ID.  
25582 Specifies the group ID to which the real and effective group IDs shall be set. If  
25583 *group* is a non-negative numeric string and exists in the group database as a group  
25584 name (see *getgrnam()*), the numeric group ID associated with that group name  
25585 shall be used as the group ID.

#### 25586 **STDIN**

25587 Not used.

#### 25588 **INPUT FILES**

25589 The file */dev/tty* shall be used to read a single line of text for password checking, when one is  
25590 required.

#### 25591 **ENVIRONMENT VARIABLES**

25592 The following environment variables shall affect the execution of *newgrp*:

25593 *LANG* Provide a default value for the internationalization variables that are unset or null.  
25594 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
25595 Internationalization Variables for the precedence of internationalization variables  
25596 used to determine the values of locale categories.)

25597 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
25598 internationalization variables.

25599 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
25600 characters (for example, single-byte as opposed to multi-byte characters in  
25601 arguments).

25602 *LC\_MESSAGES*

25603 Determine the locale that should be used to affect the format and contents of  
25604 diagnostic messages written to standard error.

25605 *XS* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 25606 **ASYNCHRONOUS EVENTS**

25607 Default.

#### 25608 **STDOUT**

25609 Not used.

#### 25610 **STDERR**

25611 The standard error shall be used for diagnostic messages and a prompt string for a password, if  
25612 one is required. Diagnostic messages may be written in cases where the exit status is not  
25613 available. See the EXIT STATUS section.

#### 25614 **OUTPUT FILES**

25615 None.

#### 25616 **EXTENDED DESCRIPTION**

25617 None.

25618 **EXIT STATUS**

25619 If *newgrp* succeeds in creating a new shell execution environment, whether or not the group  
25620 identification was changed successfully, the exit status shall be the exit status of the shell.  
25621 Otherwise, the following exit value shall be returned:

25622 >0 An error occurred.

25623 **CONSEQUENCES OF ERRORS**

25624 The invoking shell may terminate.

25625 **APPLICATION USAGE**

25626 There is no convenient way to enter a password into the group database. Use of group  
25627 passwords is not encouraged, because by their very nature they encourage poor security  
25628 practices. Group passwords may disappear in the future.

25629 A common implementation of *newgrp* is that the current shell uses *exec* to overlay itself with  
25630 *newgrp*, which in turn overlays itself with a new shell after changing group. On some  
25631 implementations, however, this may not occur and *newgrp* may be invoked as a subprocess.

25632 The *newgrp* command is intended only for use from an interactive terminal. It does not offer a  
25633 useful interface for the support of applications.

25634 The exit status of *newgrp* is generally inapplicable. If *newgrp* is used in a script, in most cases it  
25635 successfully invokes a new shell and the rest of the original shell script is bypassed when the  
25636 new shell exits. Used interactively, *newgrp* displays diagnostic messages to indicate problems.  
25637 But usage such as:

25638 newgrp foo  
25639 echo \$?

25640 is not useful because the new shell might not have access to any status *newgrp* may have  
25641 generated (and most historical systems do not provide this status). A zero status echoed here  
25642 does not necessarily indicate that the user has changed to the new group successfully. Following  
25643 *newgrp* with the *id* command provides a portable means of determining whether the group  
25644 change was successful or not.

25645 **EXAMPLES**

25646 None.

25647 **RATIONALE**

25648 Most historical implementations use one of the *exec* functions to implement the behavior of  
25649 *newgrp*. Errors detected before the *exec* leave the environment unchanged, while errors detected  
25650 after the *exec* leave the user in a changed environment. While it would be useful to have *newgrp*  
25651 issue a diagnostic message to tell the user that the environment changed, it would be  
25652 inappropriate to require this change to some historical implementations.

25653 The password mechanism is allowed in the group database, but how this would be  
25654 implemented is not specified.

25655 The *newgrp* utility was retained in this volume of IEEE Std 1003.1-2001, even given the existence  
25656 of the multiple group permissions feature in the System Interfaces volume of  
25657 IEEE Std 1003.1-2001, for several reasons. First, in some implementations, the group ownership  
25658 of a newly created file is determined by the group of the directory in which the file is created, as  
25659 allowed by the System Interfaces volume of IEEE Std 1003.1-2001; on other implementations, the  
25660 group ownership of a newly created file is determined by the effective group ID. On  
25661 implementations of the latter type, *newgrp* allows files to be created with a specific group  
25662 ownership. Finally, many implementations use the real group ID in accounting, and on such  
25663 systems, *newgrp* allows the accounting identity of the user to be changed.

25664 **FUTURE DIRECTIONS**

25665           None.

25666 **SEE ALSO**

25667           Chapter 2 (on page 29), *sh*, the System Interfaces volume of IEEE Std 1003.1-2001, *exec*,  
25668           *getgrnam()*

25669 **CHANGE HISTORY**

25670           First released in Issue 2.

25671 **Issue 6**

25672           This utility is marked as part of the User Portability Utilities option.

25673           The obsolescent SYNOPSIS is removed.

25674           The text describing supplemental groups is no longer conditional on {NGROUPS\_MAX} being  
25675           greater than 1. This is because {NGROUPS\_MAX} now has a minimum value of 8. This is a FIPS  
25676           requirement.

25677 **NAME**

25678       *nice* — invoke a utility with an altered nice value

25679 **SYNOPSIS**

25680 UP       *nice* [-n *increment*] *utility* [*argument...*]

25681

25682 **DESCRIPTION**

25683       The *nice* utility shall invoke a utility, requesting that it be run with a different nice value (see the  
25684       Base Definitions volume of IEEE Std 1003.1-2001, Section 3.239, Nice Value). With no options  
25685       and only if the user has appropriate privileges, the executed utility shall be run with a nice value  
25686       that is some implementation-defined quantity less than or equal to the nice value of the current  
25687       process. If the user lacks appropriate privileges to affect the nice value in the requested manner,  
25688       the *nice* utility shall not affect the nice value; in this case, a warning message may be written to  
25689       standard error, but this shall not prevent the invocation of *utility* or affect the exit status.

25690 **OPTIONS**

25691       The *nice* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
25692       12.2, Utility Syntax Guidelines.

25693       The following option is supported:

25694       -n *increment*   A positive or negative decimal integer which shall have the same effect on the  
25695       execution of the utility as if the utility had called the *nice*() function with the  
25696       numeric value of the *increment* option-argument.

25697 **OPERANDS**

25698       The following operands shall be supported:

25699       *utility*        The name of a utility that is to be invoked. If the *utility* operand names any of the  
25700       special built-in utilities in Section 2.14 (on page 64), the results are undefined.

25701       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
25702       *utility* operand.

25703 **STDIN**

25704       Not used.

25705 **INPUT FILES**

25706       None.

25707 **ENVIRONMENT VARIABLES**

25708       The following environment variables shall affect the execution of *nice*:

25709       *LANG*        Provide a default value for the internationalization variables that are unset or null.  
25710       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
25711       Internationalization Variables for the precedence of internationalization variables  
25712       used to determine the values of locale categories.)

25713       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
25714       internationalization variables.

25715       *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
25716       characters (for example, single-byte as opposed to multi-byte characters in  
25717       arguments).

25718       *LC\_MESSAGES*

25719       Determine the locale that should be used to affect the format and contents of  
25720       diagnostic messages written to standard error.

|       |     |                                                 |                                                                                                                                                     |
|-------|-----|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 25721 | XSI | <b>NLSPATH</b>                                  | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                               |
| 25722 |     | <b>PATH</b>                                     | Determine the search path used to locate the utility to be invoked. See the Base                                                                    |
| 25723 |     |                                                 | Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.                                                                       |
| 25724 |     | <b>ASYNCHRONOUS EVENTS</b>                      |                                                                                                                                                     |
| 25725 |     |                                                 | Default.                                                                                                                                            |

| 25748 |     |                                                 | On some implementations they have no discernible effect on the invoked utility and on some                                                          |
| 25749 |     |                                                 | others they are exactly equivalent.                                                                                                                 |
| 25750 |     |                                                 | Historical systems have frequently supported the <i>&lt;positive integer&gt;</i> up to 20. Since there is no                                        |
| 25751 |     |                                                 | error penalty associated with guessing a number that is too high, users without access to the                                                       |
| 25752 |     |                                                 | system conformance document (to see what limits are actually in place) could use the historical                                                     |
| 25753 |     |                                                 | 1 to 20 range or attempt to use very large numbers if the job should be truly low priority.                                                         |
| 25754 |     |                                                 | The nice value of a process can be displayed using the command:                                                                                     |
| 25755 |     | <i>ps -o nice</i>                               |                                                                                                                                                     |
| 25756 |     |                                                 | The <i>command</i> , <i>env</i> , <i>nice</i> , <i>nohup</i> , <i>time</i> , and <i>xargs</i> utilities have been specified to use exit code 127 if |
| 25757 |     |                                                 | an error occurs so that applications can distinguish “failure to find a utility” from “invoked                                                      |
| 25758 |     |                                                 | utility exited with an error indication”. The value 127 was chosen because it is not commonly                                                       |
| 25759 |     |                                                 | used for other meanings; most utilities use small values for “normal error conditions” and the                                                      |
| 25760 |     |                                                 | values above 128 can be confused with termination due to receipt of a signal. The value 126 was                                                     |
| 25761 |     |                                                 | chosen in a similar manner to indicate that the utility could be found, but not invoked. Some                                                       |
| 25762 |     |                                                 | scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction                                                    |
| 25763 |     |                                                 | between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to                                                    |

25764 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
25765 any other reason.

#### 25766 **EXAMPLES**

25767 None.

#### 25768 **RATIONALE**

25769 Due to the text about the limits of the *nice* value being implementation-defined, *nice* is not  
25770 actually required to change the *nice* value of the executed command; the limits could be zero  
25771 differences from the system default, although the implementor is required to document this fact  
25772 in the conformance document.

25773 The 4.3 BSD version of *nice* does not check whether *increment* is a valid decimal integer. The  
25774 command *nice -x utility*, for example, would be treated the same as the command *nice --1*  
25775 *utility*. If the user does not have appropriate privileges, this results in a “permission denied”  
25776 error. This is considered a bug.

25777 When a user without appropriate privileges gives a negative *increment*, System V treats it like  
25778 the command *nice -0 utility*, while 4.3 BSD writes a “permission denied” message and does not  
25779 run the utility. Neither was considered clearly superior, so the behavior was left unspecified.

25780 The C shell has a built-in version of *nice* that has a different interface from the one described in  
25781 this volume of IEEE Std 1003.1-2001.

25782 The term “utility” is used, rather than “command”, to highlight the fact that shell compound  
25783 commands, pipelines, and so on, cannot be used. Special built-ins also cannot be used.  
25784 However, “utility” includes user application programs and shell scripts, not just utilities defined  
25785 in this volume of IEEE Std 1003.1-2001.

25786 Historical implementations of *nice* provide a *nice* value range of 40 or 41 discrete steps, with the  
25787 default *nice* value being the midpoint of that range. By default, they lower the *nice* value of the  
25788 executed utility by 10.

25789 Some historical documentation states that the *increment* value must be within a fixed range. This  
25790 is misleading; the valid *increment* values on any invocation are determined by the current  
25791 process *nice* value, which is not always the default.

25792 The definition of *nice* value is not intended to suggest that all processes in a system have  
25793 priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
25794 System Interfaces volume of IEEE Std 1003.1-2001 make the notion of a single underlying  
25795 priority for all scheduling policies problematic. Some implementations may implement the *nice*-  
25796 related features to affect all processes on the system, others to affect just the general time-  
25797 sharing activities implied by this volume of IEEE Std 1003.1-2001, and others may have no effect  
25798 at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of  
25799 implementation strategies are possible.

#### 25804 **CHANGE HISTORY**

25805 First released in Issue 4.

25806 **Issue 6**

25807 This utility is marked as part of the User Portability Utilities option.

25808 The obsolescent SYNOPSIS is removed.

25809 **NAME**

25810 nl — line numbering filter

25811 **SYNOPSIS**

```
25812 xsi nl [-p] [-b type] [-d delim] [-f type] [-h type] [-i incr] [-l num] [-n format]
25813 [-s sep] [-v startnum] [-w width] [file]
```

25814

25815 **DESCRIPTION**

25816 The *nl* utility shall read lines from the named *file* or the standard input if no *file* is named and  
 25817 shall reproduce the lines to standard output. Lines shall be numbered on the left. Additional  
 25818 functionality may be provided in accordance with the command options in effect.

25819 The *nl* utility views the text it reads in terms of logical pages. Line numbering shall be reset at  
 25820 the start of each logical page. A logical page consists of a header, a body, and a footer section.  
 25821 Empty sections are valid. Different line numbering options are independently available for  
 25822 header, body, and footer (for example, no numbering of header and footer lines while  
 25823 numbering blank lines only in the body).

25824 The starts of logical page sections shall be signaled by input lines containing nothing but the  
 25825 following delimiter characters:

25826

25827

25828

25829

| Line     | Start of |
|----------|----------|
| \: \: \: | Header   |
| \: \:    | Body     |
| \:       | Footer   |

25830 Unless otherwise specified, *nl* shall assume the text being read is in a single logical page body.

25831 **OPTIONS**

25832 The *nl* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 25833 Utility Syntax Guidelines. Only one file can be named.

25834 The following options shall be supported:

25835 **-b type** Specify which logical page body lines shall be numbered. Recognized *types* and  
 25836 their meaning are:

25837 **a** Number all lines.

25838 **t** Number only non-empty lines.

25839 **n** No line numbering.

25840 **pstring** Number only lines that contain the basic regular expression specified in  
 25841 *string*.

25842 The default *type* for logical page body shall be **t** (text lines numbered).

25843 **-d delim** Specify the delimiter characters that indicate the start of a logical page section.  
 25844 These can be changed from the default characters "\:" to two user-specified  
 25845 characters. If only one character is entered, the second character shall remain the  
 25846 default character ' : '.

25847 **-f type** Specify the same as **b type** except for footer. The default for logical page footer  
 25848 shall be **n** (no lines numbered).

25849 **-h type** Specify the same as **b type** except for header. The default *type* for logical page  
 25850 header shall be **n** (no lines numbered).

|       |                    |                                                                                                                                                                                                                                                                                         |
|-------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 25851 | <b>-i incr</b>     | Specify the increment value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                  |
| 25852 |                    |                                                                                                                                                                                                                                                                                         |
| 25853 | <b>-l num</b>      | Specify the number of blank lines to be considered as one. For example, <b>-l 2</b> results in only the second adjacent blank line being numbered (if the appropriate <b>-h a</b> , <b>-b a</b> , or <b>-f a</b> option is set). The default shall be 1.                                |
| 25854 |                    |                                                                                                                                                                                                                                                                                         |
| 25855 |                    |                                                                                                                                                                                                                                                                                         |
| 25856 | <b>-n format</b>   | Specify the line numbering format. Recognized values are: <b>ln</b> , left justified, leading zeros suppressed; <b>rn</b> , right justified, leading zeros suppressed; <b>rz</b> , right justified, leading zeros kept. The default <i>format</i> shall be <b>rn</b> (right justified). |
| 25857 |                    |                                                                                                                                                                                                                                                                                         |
| 25858 |                    |                                                                                                                                                                                                                                                                                         |
| 25859 | <b>-p</b>          | Specify that numbering should not be restarted at logical page delimiters.                                                                                                                                                                                                              |
| 25860 | <b>-s sep</b>      | Specify the characters used in separating the line number and the corresponding text line. The default <i>sep</i> shall be a <tab>.                                                                                                                                                     |
| 25861 |                    |                                                                                                                                                                                                                                                                                         |
| 25862 | <b>-v startnum</b> | Specify the initial value used to number logical page lines. The default shall be 1.                                                                                                                                                                                                    |
| 25863 | <b>-w width</b>    | Specify the number of characters to be used for the line number. The default <i>width</i> shall be 6.                                                                                                                                                                                   |
| 25864 |                    |                                                                                                                                                                                                                                                                                         |

## 25865 OPERANDS

25866 The following operand shall be supported:

25867 *file* A pathname of a text file to be line-numbered.

## 25868 STDIN

25869 The standard input is a text file that is used if no *file* operand is given.

## 25870 INPUT FILES

25871 The input file named by the *file* operand is a text file.

## 25872 ENVIRONMENT VARIABLES

25873 The following environment variables shall affect the execution of *nl*:

25874 **LANG** Provide a default value for the internationalization variables that are unset or null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables for the precedence of internationalization variables used to determine the values of locale categories.)

25878 **LC\_ALL** If set to a non-empty string value, override the values of all the other internationalization variables.

25880 **LC\_COLLATE** Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions.

25883 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, and for deciding which characters are in character class **graph** (for the **-b t**, **-f t**, and **-h t** options).

25888 **LC\_MESSAGES** Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

25891 **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

25892 **ASYNCHRONOUS EVENTS**

25893 Default.

25894 **STDOUT**

25895 The standard output shall be a text file in the following format:

25896 "%s%s%s", &lt;line number&gt;, &lt;separator&gt;, &lt;input line&gt;

25897 where &lt;line number&gt; is one of the following numeric formats:

25898 %6d When the **rn** format is used (the default; see **-n**).25899 %06d When the **rz** format is used.25900 %-6d When the **ln** format is used.25901 <empty> When line numbers are suppressed for a portion of the page; the <separator> is also  
25902 suppressed.25903 In the preceding list, the number 6 is the default width; the **-w** option can change this value.25904 **STDERR**

25905 The standard error shall be used only for diagnostic messages.

25906 **OUTPUT FILES**

25907 None.

25908 **EXTENDED DESCRIPTION**

25909 None.

25910 **EXIT STATUS**

25911 The following exit values shall be returned:

25912 0 Successful completion.

25913 &gt;0 An error occurred.

25914 **CONSEQUENCES OF ERRORS**

25915 Default.

25916 **APPLICATION USAGE**25917 In using the **-d delim** option, care should be taken to escape characters that have special meaning  
25918 to the command interpreter.25919 **EXAMPLES**

25920 The command:

25921 nl -v 10 -i 10 -d \!+ file1

25922 numbers *file1* starting at line number 10 with an increment of 10. The logical page delimiter is  
25923 " !+ ". Note that the ' ! ' has to be escaped when using *csh* as a command interpreter because of  
25924 its history substitution syntax. For *ksh* and *sh* the escape is not necessary, but does not do any  
25925 harm.25926 **RATIONALE**

25927 None.

25928 **FUTURE DIRECTIONS**

25929 None.

25930 **SEE ALSO**25931 *pr*25932 **CHANGE HISTORY**

25933 First released in Issue 2.

25934 **Issue 5**

25935 The option [**-f type**] is added to the SYNOPSIS. The option descriptions are presented in  
25936 alphabetic order. The description of **-bt** is changed to “Number only non-empty lines”.

25937 **Issue 6**

25938 The obsolescent behavior allowing the options to be intermingled with the optional *file* operand  
25939 is removed.

25940 **NAME**25941 nm — write the name list of an object file (**DEVELOPMENT**)25942 **SYNOPSIS**25943 UP SD XSI nm [-APv] [-efox] [ -g | -u ] [-t *format*] *file*...

25944

25945 **DESCRIPTION**

25946 This utility shall be provided on systems that support both the User Portability Utilities option  
 25947 and the Software Development Utilities option. On other systems it is optional. Certain options  
 25948 are only available on XSI-conformant systems.

25949 The *nm* utility shall display symbolic information appearing in the object file, executable file, or  
 25950 object-file library named by *file*. If no symbolic information is available for a valid input file, the  
 25951 *nm* utility shall report that fact, but not consider it an error condition.

25952 XSI The default base used when numeric values are written is unspecified. On XSI-conformant  
 25953 systems, it shall be decimal.

25954 **OPTIONS**

25955 The *nm* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 25956 12.2, Utility Syntax Guidelines.

25957 The following options shall be supported:

25958 **-A** Write the full pathname or library name of an object on each line.

25959 XSI **-e** Write only external (global) and static symbol information.

25960 XSI **-f** Produce full output. Write redundant symbols (**.text**, **.data**, and **.bss**), normally  
 25961 suppressed.

25962 **-g** Write only external (global) symbol information.

25963 XSI **-o** Write numeric values in octal (equivalent to **-t o**).

25964 **-P** Write information in a portable output format, as specified in the STDOUT section.

25965 **-t *format*** Write each numeric value in the specified format. The format shall be dependent  
 25966 on the single character used as the *format* option-argument:

25967 XSI d The offset is written in decimal (default).

25968 o The offset is written in octal.

25969 x The offset is written in hexadecimal.

25970 **-u** Write only undefined symbols.

25971 **-v** Sort output by value instead of alphabetically.

25972 XSI **-x** Write numeric values in hexadecimal (equivalent to **-t x**).

25973 **OPERANDS**

25974 The following operand shall be supported:

25975 *file* A pathname of an object file, executable file, or object-file library.

25976 **STDIN**

25977 See the INPUT FILES section.

25978 **INPUT FILES**

25979       The input file shall be an object file, an object-file library whose format is the same as those  
 25980       produced by the *ar* utility for link editing, or an executable file. The *nm* utility may accept  
 25981       additional implementation-defined object library formats for the input file.

25982 **ENVIRONMENT VARIABLES**

25983       The following environment variables shall affect the execution of *nm*:

25984       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 25985       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 25986       Internationalization Variables for the precedence of internationalization variables  
 25987       used to determine the values of locale categories.)

25988       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 25989       internationalization variables.

25990       *LC\_COLLATE*   Determine the locale for character collation information for the symbol-name and  
 25991       symbol-value collation sequences.  
 25992

25993       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 25994       characters (for example, single-byte as opposed to multi-byte characters in  
 25995       arguments).

25996       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
 25997       diagnostic messages written to standard error.  
 25998

25999 xSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26000 **ASYNCHRONOUS EVENTS**

26001       Default.

26002 **STDOUT**

26003       If symbolic information is present in the input files, then for each file or for each member of an  
 26004       archive, the *nm* utility shall write the following information to standard output. By default, the  
 26005       format is unspecified, but the output shall be sorted alphabetically by symbol name:

- 26006       • Library or object name, if **-A** is specified
- 26007       • Symbol name
- 26008       • Symbol type, which shall either be one of the following single characters or an  
 26009       implementation-defined type represented by a single character:
- 26010       A   Global absolute symbol.
- 26011       a   Local absolute symbol.
- 26012       B   Global “bss” (that is, uninitialized data space) symbol.
- 26013       b   Local bss symbol.
- 26014       D   Global data symbol.
- 26015       d   Local data symbol.
- 26016       T   Global text symbol.
- 26017       t   Local text symbol.
- 26018       U   Undefined symbol.

26019           • Value of the symbol

26020           • The size associated with the symbol, if applicable

26021       This information may be supplemented by additional information specific to the  
26022       implementation.

26023       If the **-P** option is specified, the previous information shall be displayed using the following  
26024       portable format. The three versions differ depending on whether **-t d**, **-t o**, or **-t x** was specified,  
26025       respectively:

26026       "*%s%s %s %d %d\n*", *<library/object name>*, *<name>*, *<type>*,  
26027       *<value>*, *<size>*

26028       "*%s%s %s %o %o\n*", *<library/object name>*, *<name>*, *<type>*,  
26029       *<value>*, *<size>*

26030       "*%s%s %s %x %x\n*", *<library/object name>*, *<name>*, *<type>*,  
26031       *<value>*, *<size>*

26032       where *<library/object name>* shall be formatted as follows:

26033           • If **-A** is not specified, *<library/object name>* shall be an empty string.

26034           • If **-A** is specified and the corresponding *file* operand does not name a library:

26035           *%s: "*, *<file>*

26036           • If **-A** is specified and the corresponding *file* operand names a library. In this case, *<object file>*  
26037           shall name the object file in the library containing the symbol being described:

26038           *%s[%s]: "*, *<file>*, *<object file>*

26039       If **-A** is not specified, then if more than one *file* operand is specified or if only one *file* operand is  
26040       specified and it names a library, *nm* shall write a line identifying the object containing the  
26041       following symbols before the lines containing those symbols, in the form:

26042           • If the corresponding *file* operand does not name a library:

26043           *%s:\n*, *<file>*

26044           • If the corresponding *file* operand names a library; in this case, *<object file>* shall be the name  
26045           of the file in the library containing the following symbols:

26046           *%s[%s]:\n*, *<file>*, *<object file>*

26047       If **-P** is specified, but **-t** is not, the format shall be as if **-t x** had been specified.

26048   **STDERR**

26049       The standard error shall be used only for diagnostic messages.

26050   **OUTPUT FILES**

26051       None.

26052   **EXTENDED DESCRIPTION**

26053       None.

26054   **EXIT STATUS**

26055       The following exit values shall be returned:

26056       0   Successful completion.

26057       >0   An error occurred.

26058 **CONSEQUENCES OF ERRORS**

26059 Default.

26060 **APPLICATION USAGE**

26061 Mechanisms for dynamic linking make this utility less meaningful when applied to an  
26062 executable file because a dynamically linked executable may omit numerous library routines  
26063 that would be found in a statically linked executable.

26064 **EXAMPLES**

26065 None.

26066 **RATIONALE**

26067 Historical implementations of *nm* have used different bases for numeric output and supplied  
26068 different default types of symbols that were reported. The **-t format** option, similar to that used  
26069 in *od* and *strings*, can be used to specify the numeric base; **-g** and **-u** can be used to restrict the  
26070 amount of output or the types of symbols included in the output.

26071 The compromise of using **-t format** versus using **-d**, **-o**, and other similar options was necessary  
26072 because of differences in the meaning of **-o** between implementations. The **-o** option from BSD  
26073 has been provided here as **-A** to avoid confusion with the **-o** from System V (which has been  
26074 provided here as **-t** and as **-o** on XSI-conformant systems).

26075 The option list was significantly reduced from that provided by historical implementations.

26076 The *nm* description is a subset of both the System V and BSD *nm* utilities with no specified  
26077 default output.

26078 It was recognized that mechanisms for dynamic linking make this utility less meaningful when  
26079 applied to an executable file (because a dynamically linked executable file may omit numerous  
26080 library routines that would be found in a statically linked executable file), but the value of *nm*  
26081 during software development was judged to outweigh other limitations.

26082 The default output format of *nm* is not specified because of differences in historical  
26083 implementations. The **-P** option was added to allow some type of portable output format. After  
26084 a comparison of the different formats used in SunOS, BSD, SVR3, and SVR4, it was decided to  
26085 create one that did not match the current format of any of these four systems. The format  
26086 devised is easy to parse by humans, easy to parse in shell scripts, and does not need to vary  
26087 depending on locale (because no English descriptions are included). All of the systems currently  
26088 have the information available to use this format.

26089 The format given in *nm* STDOUT uses spaces between the fields, which may be any number of  
26090 <blank>s required to align the columns. The single-character types were selected to match  
26091 historical practice, and the requirement that implementation additions also be single characters  
26092 made parsing the information easier for shell scripts.

26093 **FUTURE DIRECTIONS**

26094 None.

26095 **SEE ALSO**26096 *ar*, *c99*26097 **CHANGE HISTORY**

26098 First released in Issue 2.

26099 **Issue 6**

26100 This utility is marked as supported when both the User Portability Utilities option and the  
26101 Software Development Utilities option are supported.

## 26102 NAME

26103           nohup — invoke a utility immune to hangups

## 26104 SYNOPSIS

26105           nohup *utility* [*argument...*]

## 26106 DESCRIPTION

26107           The *nohup* utility shall invoke the utility named by the *utility* operand with arguments supplied  
26108           as the *argument* operands. At the time the named *utility* is invoked, the SIGHUP signal shall be  
26109           set to be ignored.

26110           If the standard output is a terminal, all output written by the named *utility* to its standard output  
26111           shall be appended to the end of the file **nohup.out** in the current directory. If **nohup.out** cannot  
26112           be created or opened for appending, the output shall be appended to the end of the file  
26113           **nohup.out** in the directory specified by the *HOME* environment variable. If neither file can be  
26114           created or opened for appending, *utility* shall not be invoked. If a file is created, the file's  
26115           permission bits shall be set to S\_IRUSR | S\_IWUSR.

26116           If the standard error is a terminal, all output written by the named *utility* to its standard error  
26117           shall be redirected to the same file descriptor as the standard output.

## 26118 OPTIONS

26119           None.

## 26120 OPERANDS

26121           The following operands shall be supported:

26122           *utility*           The name of a utility that is to be invoked. If the *utility* operand names any of the  
26123           special built-in utilities in Section 2.14 (on page 64), the results are undefined.

26124           *argument*       Any string to be supplied as an argument when invoking the utility named by the  
26125           *utility* operand.

## 26126 STDIN

26127           Not used.

## 26128 INPUT FILES

26129           None.

## 26130 ENVIRONMENT VARIABLES

26131           The following environment variables shall affect the execution of *nohup*:

26132           *HOME*           Determine the pathname of the user's home directory: if the output file **nohup.out**  
26133           cannot be created in the current directory, the *nohup* utility shall use the directory  
26134           named by *HOME* to create the file.

26135           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
26136           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
26137           Internationalization Variables for the precedence of internationalization variables  
26138           used to determine the values of locale categories.)

26139           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
26140           internationalization variables.

26141           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
26142           characters (for example, single-byte as opposed to multi-byte characters in  
26143           arguments).

26144           *LC\_MESSAGES*

26145           Determine the locale that should be used to affect the format and contents of

26146 diagnostic messages written to standard error.

26147 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26148 **PATH** Determine the search path that is used to locate the utility to be invoked. See the  
 26149 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment  
 26150 Variables.

26151 **ASYNCHRONOUS EVENTS**

26152 The *nohup* utility shall take the standard action for all signals except that SIGHUP shall be  
 26153 ignored.

26154 **STDOUT**

26155 If the standard output is not a terminal, the standard output of *nohup* shall be the standard  
 26156 output generated by the execution of the *utility* specified by the operands. Otherwise, nothing  
 26157 shall be written to the standard output.

26158 **STDERR**

26159 If the standard output is a terminal, a message shall be written to the standard error, indicating  
 26160 the name of the file to which the output is being appended. The name of the file shall be either  
 26161 **nohup.out** or **\$HOME/nohup.out**.

26162 **OUTPUT FILES**

26163 If the standard output is a terminal, all output written by the named *utility* to the standard  
 26164 output and standard error is appended to the file **nohup.out**, which is created if it does not  
 26165 already exist.

26166 **EXTENDED DESCRIPTION**

26167 None.

26168 **EXIT STATUS**

26169 The following exit values shall be returned:

26170 126 The utility specified by *utility* was found but could not be invoked.

26171 127 An error occurred in the *nohup* utility or the utility specified by *utility* could not be  
 26172 found.

26173 Otherwise, the exit status of *nohup* shall be that of the utility specified by the *utility* operand.

26174 **CONSEQUENCES OF ERRORS**

26175 Default.

26176 **APPLICATION USAGE**

26177 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 26178 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 26179 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 26180 used for other meanings; most utilities use small values for “normal error conditions” and the  
 26181 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 26182 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 26183 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 26184 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 26185 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 26186 any other reason.

26187 **EXAMPLES**

26188 It is frequently desirable to apply *nohup* to pipelines or lists of commands. This can be done by  
 26189 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
 26190 the *nohup* applies to everything in the file.

26191 Alternatively, the following command can be used to apply *nohup* to a complex command:

26192 `nohup sh -c 'complex-command-line'`

26193 **RATIONALE**

26194 The 4.3 BSD version ignores SIGTERM and SIGHUP, and if **./nohup.out** cannot be used, it fails  
26195 instead of trying to use **\$HOME/nohup.out**.

26196 The *cs*h utility has a built-in version of *nohup* that acts differently from the *nohup* defined in this  
26197 volume of IEEE Std 1003.1-2001.

26198 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
26199 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*  
26200 includes user application programs and shell scripts, not just the standard utilities.

26201 Historical versions of the *nohup* utility use default file creation semantics. Some more recent  
26202 versions use the permissions specified here as an added security precaution.

26203 Some historical implementations ignore SIGQUIT in addition to SIGHUP; others ignore  
26204 SIGTERM. An early proposal allowed, but did not require, SIGQUIT to be ignored. Several  
26205 reviewers objected that *nohup* should only modify the handling of SIGHUP as required by this  
26206 volume of IEEE Std 1003.1-2001.

26207 **FUTURE DIRECTIONS**

26208 None.

26209 **SEE ALSO**

26210 Chapter 2 (on page 29), *sh*, the System Interfaces volume of IEEE Std 1003.1-2001, *signal()*

26211 **CHANGE HISTORY**

26212 First released in Issue 2.

26213 **NAME**

26214           od — dump files in various formats

26215 **SYNOPSIS**

26216           od [-v] [-A *address\_base*] [-j *skip*] [-N *count*] [-t *type\_string*] ...  
 26217           [*file*...]

26218 xSI       od [-bcdosx] [*file*] [[+] *offset* [.] [b]]

26219

26220 **DESCRIPTION**

26221       The *od* utility shall write the contents of its input files to standard output in a user-specified  
 26222       format.

26223 **OPTIONS**

26224       The *od* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 26225 xSI       Utility Syntax Guidelines, except that the order of presentation of the **-t** options and the  
 26226       **-bcdosx** options is significant.

26227       The following options shall be supported:

26228       **-A** *address\_base*

26229           Specify the input offset base. See the EXTENDED DESCRIPTION section. The  
 26230           application shall ensure that the *address\_base* option-argument is a character. The  
 26231           characters 'd', 'o', and 'x' specify that the offset base shall be written in  
 26232           decimal, octal, or hexadecimal, respectively. The character 'n' specifies that the  
 26233           offset shall not be written.

26234 xSI       **-b**       Interpret bytes in octal. This shall be equivalent to **-t o1**.

26235 xSI       **-c**       Interpret bytes as characters specified by the current setting of the *LC\_CTYPE*  
 26236           category. Certain non-graphic characters appear as C escapes: "NUL=\0",  
 26237           "BS=\b", "FF=\f", "NL=\n", "CR=\r", "HT=\t"; others appear as 3-digit octal  
 26238           numbers.

26239 xSI       **-d**       Interpret *words* (two-byte units) in unsigned decimal. This shall be equivalent to  
 26240           **-t u2**.

26241       **-j** *skip*       Jump over *skip* bytes from the beginning of the input. The *od* utility shall read or  
 26242           seek past the first *skip* bytes in the concatenated input files. If the combined input  
 26243           is not at least *skip* bytes long, the *od* utility shall write a diagnostic message to  
 26244           standard error and exit with a non-zero exit status.

26245           By default, the *skip* option-argument shall be interpreted as a decimal number.  
 26246           With a leading 0x or 0X, the offset shall be interpreted as a hexadecimal number;  
 26247           otherwise, with a leading '0', the offset shall be interpreted as an octal number.  
 26248           Appending the character 'b', 'k', or 'm' to offset shall cause it to be interpreted  
 26249           as a multiple of 512, 1024, or 1048576 bytes, respectively. If the *skip* number is  
 26250           hexadecimal, any appended 'b' shall be considered to be the final hexadecimal  
 26251           digit.

26252       **-N** *count*      Format no more than *count* bytes of input. By default, *count* shall be interpreted as  
 26253           a decimal number. With a leading 0x or 0X, *count* shall be interpreted as a  
 26254           hexadecimal number; otherwise, with a leading '0', it shall be interpreted as an  
 26255           octal number. If *count* bytes of input (after successfully skipping, if **-j** *skip* is  
 26256           specified) are not available, it shall not be considered an error; the *od* utility shall  
 26257           format the input that is available.

|       |     |                        |                                                                                                                 |
|-------|-----|------------------------|-----------------------------------------------------------------------------------------------------------------|
| 26258 | XSI | <b>-o</b>              | Interpret <i>words</i> (two-byte units) in octal. This shall be equivalent to <b>-t o2</b> .                    |
| 26259 | XSI | <b>-s</b>              | Interpret <i>words</i> (two-byte units) in signed decimal. This shall be equivalent to                          |
| 26260 |     | <b>-t d2</b> .         |                                                                                                                 |
| 26261 |     | <b>-t type_string</b>  |                                                                                                                 |
| 26262 |     |                        | Specify one or more output types. See the EXTENDED DESCRIPTION section. The                                     |
| 26263 |     |                        | application shall ensure that the <i>type_string</i> option-argument is a string specifying                     |
| 26264 |     |                        | the types to be used when writing the input data. The string shall consist of the                               |
| 26265 |     |                        | type specification characters a, c, d, f, o, u, and x, specifying named character,                              |
| 26266 |     |                        | character, signed decimal, floating point, octal, unsigned decimal, and                                         |
| 26267 |     |                        | hexadecimal, respectively. The type specification characters d, f, o, u, and x can be                           |
| 26268 |     |                        | followed by an optional unsigned decimal integer that specifies the number of                                   |
| 26269 |     |                        | bytes to be transformed by each instance of the output type. The type specification                             |
| 26270 |     |                        | character f can be followed by an optional F, D, or L indicating that the conversion                            |
| 26271 |     |                        | should be applied to an item of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively.       |
| 26272 |     |                        | The type specification characters d, o, u, and x can be followed by an optional C, S,                           |
| 26273 |     |                        | I, or L indicating that the conversion should be applied to an item of type <b>char</b> ,                       |
| 26274 |     |                        | <b>short</b> , <b>int</b> , or <b>long</b> , respectively. Multiple types can be concatenated within the        |
| 26275 |     |                        | same <i>type_string</i> and multiple <b>-t</b> options can be specified. Output lines shall be                  |
| 26276 |     |                        | written for each type specified in the order in which the type specification                                    |
| 26277 |     |                        | characters are specified.                                                                                       |
| 26278 |     | <b>-v</b>              | Write all input data. Without the <b>-v</b> option, any number of groups of output lines,                       |
| 26279 |     |                        | which would be identical to the immediately preceding group of output lines                                     |
| 26280 |     |                        | (except for the byte offsets), shall be replaced with a line containing only an                                 |
| 26281 |     |                        | asterisk (' * ').                                                                                               |
| 26282 | XSI | <b>-x</b>              | Interpret <i>words</i> (two-byte units) in hexadecimal. This shall be equivalent to <b>-t x2</b> .              |
| 26283 | XSI |                        | Multiple types can be specified by using multiple <b>-bcdostx</b> options. Output lines are written for         |
| 26284 |     |                        | each type specified in the order in which the types are specified.                                              |
| 26285 |     | <b>OPERANDS</b>        |                                                                                                                 |
| 26286 |     |                        | The following operands shall be supported:                                                                      |
| 26287 |     | <i>file</i>            | A pathname of a file to be read. If no <i>file</i> operands are specified, the standard input                   |
| 26288 |     |                        | shall be used.                                                                                                  |
| 26289 |     |                        | If there are no more than two operands, none of the <b>-A</b> , <b>-j</b> , <b>-N</b> , or <b>-t</b> options is |
| 26290 |     |                        | specified, and either of the following is true: the first character of the last operand                         |
| 26291 |     |                        | is a plus sign (' + '), or there are two operands and the first character of the last                           |
| 26292 | XSI |                        | operand is numeric; the last operand shall be interpreted as an offset operand on                               |
| 26293 |     |                        | XSI-conformant systems. Under these conditions, the results are unspecified on                                  |
| 26294 |     |                        | systems that are not XSI-conformant systems.                                                                    |
| 26295 | XSI | <b>[+]offset[.][b]</b> | The <i>offset</i> operand specifies the offset in the file where dumping is to commence.                        |
| 26296 |     |                        | This operand is normally interpreted as octal bytes. If ' . ' is appended, the offset                           |
| 26297 |     |                        | shall be interpreted in decimal. If ' b ' is appended, the offset shall be interpreted                          |
| 26298 |     |                        | in units of 512 bytes.                                                                                          |
| 26299 |     | <b>STDIN</b>           |                                                                                                                 |
| 26300 |     |                        | The standard input shall be used only if no <i>file</i> operands are specified. See the INPUT FILES             |
| 26301 |     |                        | section.                                                                                                        |

26302 **INPUT FILES**

26303       The input files can be any file type.

26304 **ENVIRONMENT VARIABLES**

26305       The following environment variables shall affect the execution of *od*:

26306       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 26307                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 26308                   Internationalization Variables for the precedence of internationalization variables  
 26309                   used to determine the values of locale categories.)

26310       **LC\_ALL**     If set to a non-empty string value, override the values of all the other  
 26311                   internationalization variables.

26312       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 26313                   characters (for example, single-byte as opposed to multi-byte characters in  
 26314                   arguments and input files).

26315       **LC\_MESSAGES**  
 26316                   Determine the locale that should be used to affect the format and contents of  
 26317                   diagnostic messages written to standard error.

26318       **LC\_NUMERIC**  
 26319                   Determine the locale for selecting the radix character used when writing floating-  
 26320                   point formatted output.

26321 xSI     **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26322 **ASYNCHRONOUS EVENTS**

26323       Default.

26324 **STDOUT**

26325       See the EXTENDED DESCRIPTION section.

26326 **STDERR**

26327       The standard error shall be used only for diagnostic messages.

26328 **OUTPUT FILES**

26329       None.

26330 **EXTENDED DESCRIPTION**

26331       The *od* utility shall copy sequentially each input file to standard output, transforming the input  
 26332 xSI       data according to the output types specified by the **-t** option or the **-bcdosx** options. If no  
 26333       output type is specified, the default output shall be as if **-t oS** had been specified.

26334       The number of bytes transformed by the output type specifier *c* may be variable depending on  
 26335       the *LC\_CTYPE* category.

26336       The default number of bytes transformed by output type specifiers *d*, *f*, *o*, *u*, and *x* corresponds  
 26337       to the various C-language types as follows. If the *c99* compiler is present on the system, these  
 26338       specifiers shall correspond to the sizes used by default in that compiler. Otherwise, these sizes  
 26339       may vary among systems that conform to IEEE Std 1003.1-2001.

- 26340       • For the type specifier characters *d*, *o*, *u*, and *x*, the default number of bytes shall correspond
- 26341       to the size of the underlying implementation's basic integer type. For these specifier
- 26342       characters, the implementation shall support values of the optional number of bytes to be
- 26343       converted corresponding to the number of bytes in the C-language types **char**, **short**, **int**, and
- 26344       **long**. These numbers can also be specified by an application as the characters '*C*', '*S*', '*I*',
- 26345       and '*L*', respectively. The implementation shall also support the values 1, 2, 4, and 8, even if
- 26346       it provides no C-Language types of those sizes. The implementation shall support the

decimal value corresponding to the C-language type **long long**. The byte order used when interpreting numeric values is implementation-defined, but shall correspond to the order in which a constant of the corresponding type is stored in memory on the system.

- For the type specifier character **f**, the default number of bytes shall correspond to the number of bytes in the underlying implementation's basic double precision floating-point data type. The implementation shall support values of the optional number of bytes to be converted corresponding to the number of bytes in the C-language types **float**, **double**, and **long double**. These numbers can also be specified by an application as the characters '**F**', '**D**', and '**L**', respectively.

The type specifier character **a** specifies that bytes shall be interpreted as named characters from the International Reference Version (IRV) of the ISO/IEC 646:1991 standard. Only the least significant seven bits of each byte shall be used for this type specification. Bytes with the values listed in the following table shall be written using the corresponding names for those characters.

**Table 4-12** Named Characters in *od*

| Value | Name       | Value | Name       | Value | Name                     | Value | Name       |
|-------|------------|-------|------------|-------|--------------------------|-------|------------|
| \000  | <b>nul</b> | \001  | <b>soh</b> | \002  | <b>stx</b>               | \003  | <b>etx</b> |
| \004  | <b>eot</b> | \005  | <b>enq</b> | \006  | <b>ack</b>               | \007  | <b>bel</b> |
| \010  | <b>bs</b>  | \011  | <b>ht</b>  | \012  | <b>lf</b> or <b>nl</b> * | \013  | <b>vt</b>  |
| \014  | <b>ff</b>  | \015  | <b>cr</b>  | \016  | <b>so</b>                | \017  | <b>si</b>  |
| \020  | <b>dle</b> | \021  | <b>dc1</b> | \022  | <b>dc2</b>               | \023  | <b>dc3</b> |
| \024  | <b>dc4</b> | \025  | <b>nak</b> | \026  | <b>syn</b>               | \027  | <b>etb</b> |
| \030  | <b>can</b> | \031  | <b>em</b>  | \032  | <b>sub</b>               | \033  | <b>esc</b> |
| \034  | <b>fs</b>  | \035  | <b>gs</b>  | \036  | <b>rs</b>                | \037  | <b>us</b>  |
| \040  | <b>sp</b>  | \177  | <b>del</b> |       |                          |       |            |

**Note:** The "\012" value may be written either as **lf** or **nl**.

The type specifier character **c** specifies that bytes shall be interpreted as characters specified by the current setting of the *LC\_CTYPE* locale category. Characters listed in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v') shall be written as the corresponding escape sequences, except that backslash shall be written as a single backslash and a NUL shall be written as '\0'. Other non-printable characters shall be written as one three-digit octal number for each byte in the character. If the size of a byte on the system is greater than nine bits, the format used for non-printable characters is implementation-defined. Printable multi-byte characters shall be written in the area corresponding to the first byte of the character; the two-character sequence "\*\*\*" shall be written in the area corresponding to each remaining byte in the character, as an indication that the character is continued. When either the **-j skip** or **-N count** option is specified along with the **c** type specifier, and this results in an attempt to start or finish in the middle of a multi-byte character, the result is implementation-defined.

The input data shall be manipulated in blocks, where a block is defined as a multiple of the least common multiple of the number of bytes transformed by the specified output types. If the least common multiple is greater than 16, the results are unspecified. Each input block shall be written as transformed by each output type, one per written line, in the order that the output types were specified. If the input block size is larger than the number of bytes transformed by the output type, the output type shall sequentially transform the parts of the input block, and the output from each of the transformations shall be separated by one or more <blank>s.

26393 If, as a result of the specification of the **-N** option or end-of-file being reached on the last input  
 26394 file, input data only partially satisfies an output type, the input shall be extended sufficiently  
 26395 with null bytes to write the last byte of the input.

26396 Unless **-A n** is specified, the first output line produced for each input block shall be preceded by  
 26397 the input offset, cumulative across input files, of the next byte to be written. The format of the  
 26398 input offset is unspecified; however, it shall not contain any <blank>s, shall start at the first  
 26399 character of the output line, and shall be followed by one or more <blank>s. In addition, the  
 26400 offset of the byte following the last byte written shall be written after all the input data has been  
 26401 processed, but shall not be followed by any <blank>s.

26402 If no **-A** option is specified, the input offset base is unspecified.

## 26403 EXIT STATUS

26404 The following exit values shall be returned:

26405 0 All input files were processed successfully.

26406 >0 An error occurred.

## 26407 CONSEQUENCES OF ERRORS

26408 Default.

## 26409 APPLICATION USAGE

26410 XSI-conformant applications are warned not to use filenames starting with '+' or a first  
 26411 operand starting with a numeric character so that the old functionality can be maintained by  
 26412 implementations, unless they specify one of the **-A**, **-j**, or **-N** options. To guarantee that one of  
 26413 these filenames is always interpreted as a filename, an application could always specify the  
 26414 address base format with the **-A** option.

## 26415 EXAMPLES

26416 If a file containing 128 bytes with decimal values zero to 127, in increasing order, is supplied as  
 26417 standard input to the command:

26418 `od -A d -t a`

26419 on an implementation using an input block size of 16 bytes, the standard output, independent of  
 26420 the current locale setting, would be similar to:

```
26421 00000000 nul soh stx etx eot enq ack bel bs ht nl vt ff cr so si
26422 0000016 dle dc1 dc2 dc3 dc4 nak syn etb can em sub esc fs gs rs us
26423 0000032 sp ! " # $ % & ' () * + , - . /
26424 0000048 0 1 2 3 4 5 6 7 8 9 : ; < = > ?
26425 0000064 @ A B C D E F G H I J K L M N O
26426 0000080 P Q R S T U V W X Y Z [\] ^ _
26427 0000096 ` a b c d e f g h i j k l m n o
26428 0000112 p q r s t u v w x y z { | } ~ del
26429 0000128
```

26430 Note that this volume of IEEE Std 1003.1-2001 allows **nl** or **lf** to be used as the name for the  
 26431 ISO/IEC 646:1991 standard IRV character with decimal value 10. The IRV names this character  
 26432 **lf** (line feed), but traditional implementations have referred to this character as newline (**nl**) and  
 26433 the POSIX locale character set symbolic name for the corresponding character is a <newline>.

26434 The command:

26435 `od -A o -t o2x2x -N 18`

26436 on a system with 32-bit words and an implementation using an input block size of 16 bytes  
 26437 could write 18 bytes in approximately the following format:

```

26438 00000000 032056 031440 041123 042040 052516 044530 020043 031464
26439 342e 3320 4253 4420 554e 4958 2023 3334
26440 342e3320 42534420 554e4958 20233334
26441 00000020 032472
26442 353a
26443 353a0000
26444 00000022

```

26445 The command:

```
26446 od -A d -t f -t o4 -t x4 -N 24 -j 0x15
```

26447 on a system with 64-bit doubles (for example, IEEE Std 754-1985 double precision floating-point  
 26448 format) would skip 21 bytes of input data and then write 24 bytes in approximately the  
 26449 following format:

```

26450 00000000 1.0000000000000000e+00 1.5735000000000000e+01
26451 07774000000 000000000000 10013674121 35341217270
26452 3ff00000 00000000 402f3851 eb851eb8
26453 00000016 1.4066823000000000e+02
26454 10030312542 04370303230
26455 40619562 23e18698
26456 00000024

```

#### 26457 RATIONALE

26458 The *od* utility went through several names in early proposals, including *hd*, *xd*, and most recently  
 26459 *hexdump*. There were several objections to all of these based on the following reasons:

- 26460 • The *hd* and *xd* names conflicted with historical utilities that behaved differently.
- 26461 • The *hexdump* description was much more complex than needed for a simple dump utility.
- 26462 • The *od* utility has been available on all historical implementations and there was no need to  
 26463 create a new name for a utility so similar to the historical *od* utility.

26464 The original reasons for not standardizing historical *od* were also fairly widespread. Those  
 26465 reasons are given below along with rationale explaining why the standard developers believe  
 26466 that this version does not suffer from the indicated problem:

- 26467 • The BSD and System V versions of *od* have diverged, and the intersection of features  
 26468 provided by both does not meet the needs of the user community. In fact, the System V  
 26469 version only provides a mechanism for dumping octal bytes and **shorts**, signed and unsigned  
 26470 decimal **shorts**, hexadecimal **shorts**, and ASCII characters. BSD added the ability to dump  
 26471 **floats**, **doubles**, named ASCII characters, and octal, signed decimal, unsigned decimal, and  
 26472 hexadecimal **longs**. The version presented here provides more normalized forms for  
 26473 dumping bytes, **shorts**, **ints**, and **longs** in octal, signed decimal, unsigned decimal, and  
 26474 hexadecimal; **float**, **double**, and **long double**; and named ASCII as well as current locale  
 26475 characters.
- 26476 • It would not be possible to come up with a compatible superset of the BSD and System V  
 26477 flags that met the requirements of the standard developers. The historical default *od* output is  
 26478 the specified default output of this utility. None of the option letters chosen for this version  
 26479 of *od* conflict with any of the options to historical versions of *od*.
- 26480 • On systems with different sizes for **short**, **int**, and **long**, there was no way to ask for dumps  
 26481 of **ints**, even in the BSD version. Because of the way options are named, the name space  
 26482 could not be extended to solve these problems. This is why the **-t** option was added (with  
 26483 type specifiers more closely matched to the *printf()* formats used in the rest of this volume of

IEEE Std 1003.1-2001) and the optional field sizes were added to the `d`, `f`, `o`, `u`, and `x` type specifiers. It is also one of the reasons why the historical practice was not mandated as a required obsolescent form of `od`. (Although the old versions of `od` are not listed as an obsolescent form, implementations are urged to continue to recognize the older forms for several more years.) The `a`, `c`, `f`, `o`, and `x` types match the meaning of the corresponding format characters in the historical implementations of `od` except for the default sizes of the fields converted. The `d` format is signed in this volume of IEEE Std 1003.1-2001 to match the `printf()` notation. (Historical versions of `od` used `d` as a synonym for `u` in this version. The System V implementation uses `s` for signed decimal; BSD uses `i` for signed decimal and `s` for null-terminated strings.) Other than `d` and `u`, all of the type specifiers match format characters in the historical BSD version of `od`.

The sizes of the C-language types **char**, **short**, **int**, **long**, **float**, **double**, and **long double** are used even though it is recognized that there may be zero or more than one compiler for the C language on an implementation and that they may use different sizes for some of these types. (For example, one compiler might use 2 bytes **shorts**, 2 bytes **ints**, and 4 bytes **longs**, while another compiler (or an option to the same compiler) uses 2 bytes **shorts**, 4 bytes **ints**, and 4 bytes **longs**.) Nonetheless, there has to be a basic size known by the implementation for these types, corresponding to the values reported by invocations of the `getconf` utility when called with `system_var` operands {`UCHAR_MAX`}, {`USHORT_MAX`}, {`UINT_MAX`}, and {`ULONG_MAX`} for the types **char**, **short**, **int**, and **long**, respectively. There are similar constants required by the ISO C standard, but not required by the System Interfaces volume of IEEE Std 1003.1-2001 or this volume of IEEE Std 1003.1-2001. They are {`FLT_MANT_DIG`}, {`DBL_MANT_DIG`}, and {`LDBL_MANT_DIG`} for the types **float**, **double**, and **long double**, respectively. If the optional `c99` utility is provided by the implementation and used as specified by this volume of IEEE Std 1003.1-2001, these are the sizes that would be provided. If an option is used that specifies different sizes for these types, there is no guarantee that the `od` utility is able to interpret binary data output by such a program correctly.

This volume of IEEE Std 1003.1-2001 requires that the numeric values of these lengths be recognized by the `od` utility and that symbolic forms also be recognized. Thus, a conforming application can always look at an array of **unsigned long** data elements using `od -t uL`.

- The method of specifying the format for the address field based on specifying a starting offset in a file unnecessarily tied the two together. The `-A` option now specifies the address base and the `-S` option specifies a starting offset.
- It would be difficult to break the dependence on U.S. ASCII to achieve an internationalized utility. It does not seem to be any harder for `od` to dump characters in the current locale than it is for the `ed` or `sed` **I** commands. The `c` type specifier does this without difficulty and is completely compatible with the historical implementations of the `c` format character when the current locale uses a superset of the ISO/IEC 646:1991 standard as a codeset. The `a` type specifier (from the BSD `a` format character) was left as a portable means to dump ASCII (or more correctly ISO/IEC 646:1991 standard (IRV)) so that headers produced by `pax` could be deciphered even on systems that do not use the ISO/IEC 646:1991 standard as a subset of their base codeset.

The use of `"**"` as an indication of continuation of a multi-byte character in `c` specifier output was chosen based on seeing an implementation that uses this method. The continuation bytes have to be marked in a way that is not ambiguous with another single-byte or multi-byte character.

An early proposal used `-S` and `-n`, respectively, for the `-j` and `-N` options eventually selected. These were changed to avoid conflicts with historical implementations.

26532 The original standard specified **-t o2** as the default when no output type was given. This was  
 26533 changed to **-t oS** (the length of a **short**) to accommodate a supercomputer implementation that  
 26534 historically used 64 bits as its default (and that defined shorts as 64 bits). This change should not  
 26535 affect conforming applications. The requirement to support lengths of 1, 2, and 4 was added at  
 26536 the same time to address an historical implementation that had no two-byte data types in its C  
 26537 compiler.

26538 The use of a basic integer data type is intended to allow the implementation to choose a word  
 26539 size commonly used by applications on that architecture.

#### 26540 **FUTURE DIRECTIONS**

26541 All option and operand interfaces marked as extensions may be withdrawn in a future version.

#### 26542 **SEE ALSO**

26543 *c99, sed*

#### 26544 **CHANGE HISTORY**

26545 First released in Issue 2.

#### 26546 **Issue 5**

26547 In the description of the **-c** option, the phrase “This is equivalent to **-t c.**” is deleted.

26548 The FUTURE DIRECTIONS section is modified.

#### 26549 **Issue 6**

26550 The *od* utility is changed to remove the assumption that **short** was a two-byte entity, as per the  
 26551 revisions in the IEEE P1003.2b draft standard.

26552 The normative text is reworded to avoid use of the term “must” for application requirements.

26553 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/33 is applied, correcting the examples |  
 26554 which used an undefined **-n** option, which should have been **-N**. |

26555 **NAME**

26556           paste — merge corresponding or subsequent lines of files

26557 **SYNOPSIS**26558           paste [-s] [-d *list*] *file...*26559 **DESCRIPTION**26560           The *paste* utility shall concatenate the corresponding lines of the given input files, and write the  
26561           resulting lines to standard output.26562           The default operation of *paste* shall concatenate the corresponding lines of the input files. The  
26563           <newline> of every line except the line from the last input file shall be replaced with a <tab>.26564           If an end-of-file condition is detected on one or more input files, but not all input files, *paste* shall  
26565           behave as though empty lines were read from the files on which end-of-file was detected, unless  
26566           the **-s** option is specified.26567 **OPTIONS**26568           The *paste* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
26569           12.2, Utility Syntax Guidelines.

26570           The following options shall be supported:

26571           **-d list**       Unless a backslash character appears in *list*, each character in *list* is an element  
26572                           specifying a delimiter character. If a backslash character appears in *list*, the  
26573                           backslash character and one or more characters following it are an element  
26574                           specifying a delimiter character as described below. These elements specify one or  
26575                           more delimiters to use, instead of the default <tab>, to replace the <newline> of  
26576                           the input lines. The elements in *list* shall be used circularly; that is, when the list is  
26577                           exhausted the first element from the list is reused. When the **-s** option is specified:

- 26578
- The last <newline> in a file shall not be modified.
  - The delimiter shall be reset to the first element of *list* after each *file* operand is  
26579                           processed.
  - 26580

26581           When the **-s** option is not specified:

- 26582
- The <newline>s in the file specified by the last *file* operand shall not be  
26583                           modified.
  - The delimiter shall be reset to the first element of *list* each time a line is  
26584                           processed from each file.
  - 26585

26586           If a backslash character appears in *list*, it and the character following it shall be  
26587           used to represent the following delimiter characters:26588           \ *n*   <newline>.26589           \ *t*   <tab>.

26590           \\   Backslash character.

26591           \0   Empty string (not a null character). If '*\0*' is immediately followed by the  
26592                   character '*x*', the character '*X*', or any character defined by the *LC\_CTYPE*  
26593                   **digit** keyword (see the Base Definitions volume of IEEE Std 1003.1-2001,  
26594                   Chapter 7, Locale), the results are unspecified.

26595           If any other characters follow the backslash, the results are unspecified.

26596           **-s**           Concatenate all of the lines of each separate input file in command line order. The  
26597                   <newline> of every line except the last line in each input file shall be replaced with

26598 the <tab>, unless otherwise specified by the **-d** option.

## 26599 OPERANDS

26600 The following operand shall be supported:

26601 *file* A pathname of an input file. If '-' is specified for one or more of the *files*, the  
 26602 standard input shall be used; the standard input shall be read one line at a time,  
 26603 circularly, for each instance of '-'. Implementations shall support pasting of at  
 26604 least 12 *file* operands.

## 26605 STDIN

26606 The standard input shall be used only if one or more *file* operands is '-'. See the INPUT FILES  
 26607 section.

## 26608 INPUT FILES

26609 The input files shall be text files, except that line lengths shall be unlimited.

## 26610 ENVIRONMENT VARIABLES

26611 The following environment variables shall affect the execution of *paste*:

26612 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 26613 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 26614 Internationalization Variables for the precedence of internationalization variables  
 26615 used to determine the values of locale categories.)

26616 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 26617 internationalization variables.

26618 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 26619 characters (for example, single-byte as opposed to multi-byte characters in  
 26620 arguments and input files).

26621 *LC\_MESSAGES*  
 26622 Determine the locale that should be used to affect the format and contents of  
 26623 diagnostic messages written to standard error.

26624 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 26625 ASYNCHRONOUS EVENTS

26626 Default.

## 26627 STDOUT

26628 Concatenated lines of input files shall be separated by the <tab> (or other characters under the  
 26629 control of the **-d** option) and terminated by a <newline>.

## 26630 STDERR

26631 The standard error shall be used only for diagnostic messages.

## 26632 OUTPUT FILES

26633 None.

## 26634 EXTENDED DESCRIPTION

26635 None.

## 26636 EXIT STATUS

26637 The following exit values shall be returned:

26638 0 Successful completion.

26639 >0 An error occurred.

26640 **CONSEQUENCES OF ERRORS**

26641 If one or more input files cannot be opened when the **-s** option is not specified, a diagnostic  
 26642 message shall be written to standard error, but no output is written to standard output. If the **-s**  
 26643 option is specified, the *paste* utility shall provide the default behavior described in Section 1.11  
 26644 (on page 20).

26645 **APPLICATION USAGE**

26646 When the escape sequences of the *list* option-argument are used in a shell script, they must be  
 26647 quoted; otherwise, the shell treats the `'\'` as a special character.

26648 Conforming applications should only use the specific backslash escaped delimiters presented in  
 26649 this volume of IEEE Std 1003.1-2001. Historical implementations treat `'\x'`, where `'x'` is not in  
 26650 this list, as `'x'`, but future implementations are free to expand this list to recognize other  
 26651 common escapes similar to those accepted by *printf* and other standard utilities.

26652 Most of the standard utilities work on text files. The *cut* utility can be used to turn files with  
 26653 arbitrary line lengths into a set of text files containing the same data. The *paste* utility can be used  
 26654 to create (or recreate) files with arbitrary line lengths. For example, if *file* contains long lines:

```
26655 cut -b 1-500 -n file > file1
26656 cut -b 501- -n file > file2
```

26657 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
 26658 contains the remainder of the data from *file*. Note that **file2** is not a text file if there are lines in  
 26659 *file* that are longer than 500 + {LINE\_MAX} bytes. The original file can be recreated from **file1**  
 26660 and **file2** using the command:

```
26661 paste -d "\0" file1 file2 > file
```

26662 The commands:

```
26663 paste -d "\0" ...
26664 paste -d "" ...
```

26665 are not necessarily equivalent; the latter is not specified by this volume of IEEE Std 1003.1-2001  
 26666 and may result in an error. The construct `'\0'` is used to mean “no separator” because  
 26667 historical versions of *paste* did not follow the syntax guidelines, and the command:

```
26668 paste -d "" ...
```

26669 could not be handled properly by *getopt()*.

26670 **EXAMPLES**

26671 1. Write out a directory in four columns:

```
26672 ls | paste - - - -
```

26673 2. Combine pairs of lines from a file into single lines:

```
26674 paste -s -d "\t\n" file
```

26675 **RATIONALE**

26676 None.

26677 **FUTURE DIRECTIONS**

26678 None.

26679 **SEE ALSO**26680           Section 1.11 (on page 20), *cut*, *grep*, *pr*26681 **CHANGE HISTORY**

26682           First released in Issue 2.

26683 **Issue 6**

26684           The normative text is reworded to avoid use of the term “must” for application requirements.

26685 **NAME**

26686 patch — apply changes to files

26687 **SYNOPSIS**

```
26688 UP patch [-blNR] [-c | -e | -n] [-d dir] [-D define] [-i patchfile]
26689 [-o outfile] [-p num] [-r rejectfile] [file]
```

26690

26691 **DESCRIPTION**

26692 The *patch* utility shall read a source (patch) file containing any of the three forms of difference  
 26693 (diff) listings produced by the *diff* utility (normal, context, or in the style of *ed*) and apply those  
 26694 differences to a file. By default, *patch* shall read from the standard input.

26695 The *patch* utility shall attempt to determine the type of the *diff* listing, unless overruled by a **-c**,  
 26696 **-e**, or **-n** option.

26697 If the patch file contains more than one patch, *patch* shall attempt to apply each of them as if they  
 26698 came from separate patch files. (In this case, the application shall ensure that the name of the  
 26699 patch file is determinable for each *diff* listing.)

26700 **OPTIONS**

26701 The *patch* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 26702 12.2, Utility Syntax Guidelines.

26703 The following options shall be supported:

26704 **-b** Save a copy of the original contents of each modified file, before the differences are  
 26705 applied, in a file of the same name with the suffix **.orig** appended to it. If the file  
 26706 already exists, it shall be overwritten; if multiple patches are applied to the same  
 26707 file, the **.orig** file shall be written only for the first patch. When the **-o outfile** option  
 26708 is also specified, *file.orig* shall not be created but, if *outfile* already exists,  
 26709 *outfile.orig* shall be created.

26710 **-c** Interpret the patch file as a context difference (the output of the utility *diff* when  
 26711 the **-c** or **-C** options are specified).

26712 **-d dir** Change the current directory to *dir* before processing as described in the  
 26713 EXTENDED DESCRIPTION section.

26714 **-D define** Mark changes with one of the following C preprocessor constructs:

```
26715 #ifdef define
26716 ...
26717 #endif
```

```
26718 #ifndef define
26719 ...
26720 #endif
```

26721 optionally combined with the C preprocessor construct **#else**. If the patched file is  
 26722 processed with the C preprocessor, where the macro *define* is defined, the output  
 26723 shall contain the changes from the patch file; otherwise, the output shall not  
 26724 contain the patches specified in the patch file.

26725 **-e** Interpret the patch file as an *ed* script, rather than a *diff* script.

26726 **-i patchfile** Read the patch information from the file named by the pathname *patchfile*, rather  
 26727 than the standard input.

|       |                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 26728 | <b>-l</b>                   | (The letter ell.) Cause any sequence of <blank>s in the difference script to match any sequence of <blank>s in the input file. Other characters shall be matched exactly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 26731 | <b>-n</b>                   | Interpret the script as a normal difference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 26732 | <b>-N</b>                   | Ignore patches where the differences have already been applied to the file; by default, already-applied patches shall be rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 26734 | <b>-o <i>outfile</i></b>    | Instead of modifying the files (specified by the <i>file</i> operand or the difference listings) directly, write a copy of the file referenced by each patch, with the appropriate differences applied, to <i>outfile</i> . Multiple patches for a single file shall be applied to the intermediate versions of the file created by any previous patches, and shall result in multiple, concatenated versions of the file being written to <i>outfile</i> .                                                                                                                                                                                                                    |
| 26740 | <b>-p <i>num</i></b>        | For all pathnames in the patch file that indicate the names of files to be patched, delete <i>num</i> pathname components from the beginning of each pathname. If the pathname in the patch file is absolute, any leading slashes shall be considered the first component (that is, <b>-p 1</b> shall remove the leading slashes). Specifying <b>-p 0</b> shall cause the full pathname to be used. If <b>-p</b> is not specified, only the basename (the final pathname component) shall be used.                                                                                                                                                                             |
| 26746 | <b>-R</b>                   | Reverse the sense of the patch script; that is, assume that the difference script was created from the new version to the old version. The <b>-R</b> option cannot be used with <i>ed</i> scripts. The <i>patch</i> utility shall attempt to reverse each portion of the script before applying it. Rejected differences shall be saved in swapped format. If this option is not specified, and until a portion of the patch file is successfully applied, <i>patch</i> attempts to apply each portion in its reversed sense as well as in its normal sense. If the attempt is successful, the user shall be prompted to determine whether the <b>-R</b> option should be set. |
| 26754 | <b>-r <i>rejectfile</i></b> | Override the default reject filename. In the default case, the reject file shall have the same name as the output file, with the suffix <b>.rej</b> appended to it; see <b>Patch Application</b> (on page 694).                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 26757 OPERANDS

26758 The following operand shall be supported:

26759 *file* A pathname of a file to patch.

## 26760 STDIN

26761 See the INPUT FILES section.

## 26762 INPUT FILES

26763 Input files shall be text files.

## 26764 ENVIRONMENT VARIABLES

26765 The following environment variables shall affect the execution of *patch*:

26766 *LANG* Provide a default value for the internationalization variables that are unset or null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables for the precedence of internationalization variables used to determine the values of locale categories.)

26770 *LC\_ALL* If set to a non-empty string value, override the values of all the other internationalization variables.

26772        **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 26773                   characters (for example, single-byte as opposed to multi-byte characters in  
 26774                   arguments and input files).

26775        **LC\_MESSAGES**  
 26776                   Determine the locale that should be used to affect the format and contents of  
 26777                   diagnostic messages written to standard error and informative messages written to  
 26778                   standard output.

26779 xSI        **NLSPATH**    Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

26780        **LC\_TIME**    Determine the locale for recognizing the format of file timestamps written by the  
 26781                   *diff* utility in a context-difference input file.

26782 **ASYNCHRONOUS EVENTS**  
 26783        Default.

26784 **STDOUT**  
 26785        Not used.

26786 **STDERR**  
 26787        The standard error shall be used for diagnostic and informational messages.

26788 **OUTPUT FILES**  
 26789        The output of the *patch* utility, the save files (**.orig** suffixes), and the reject files (**.rej** suffixes)  
 26790        shall be text files.

26791 **EXTENDED DESCRIPTION**  
 26792        A patch file may contain patching instructions for more than one file; filenames shall be  
 26793        determined as specified in **Filename Determination** (on page 694). When the **-b** option is  
 26794        specified, for each patched file, the original shall be saved in a file of the same name with the  
 26795        suffix **.orig** appended to it.

26796        For each patched file, a reject file may also be created as noted in **Patch Application** (on page  
 26797        694). In the absence of a **-r** option, the name of this file shall be formed by appending the suffix  
 26798        **.rej** to the original filename.

26799        **Patch File Format**

26800        The patch file shall contain zero or more lines of header information followed by one or more  
 26801        patches. Each patch shall contain zero or more lines of filename identification in the format  
 26802        produced by *diff -c*, and one or more sets of *diff* output, which are customarily called *hunks*.

26803        The *patch* utility shall recognize the following expression in the header information:

26804        **Index:** *pathname*  
 26805                   The file to be patched is named *pathname*.

26806        If all lines (including headers) within a patch begin with the same leading sequence of <blank>s,  
 26807        the *patch* utility shall remove this sequence before proceeding. Within each patch, if the type of  
 26808        difference is context, the *patch* utility shall recognize the following expressions:

26809        \*\*\* *filename timestamp*  
 26810                   The patches arose from *filename*.

26811        --- *filename timestamp*  
 26812                   The patches should be applied to *filename*.

26813        Each hunk within a patch shall be the *diff* output to change a line range within the original file.  
 26814        The line numbers for successive hunks within a patch shall occur in ascending order.

**Filename Determination**

If no *file* operand is specified, *patch* shall perform the following steps to determine the filename to use:

1. If the type of *diff* is context, the *patch* utility shall delete pathname components (as specified by the **-p** option) from the filename on the line beginning with "\*\*\*\*", then test for the existence of this file relative to the current directory (or the directory specified with the **-d** option). If the file exists, the *patch* utility shall use this filename.
2. If the type of *diff* is context, the *patch* utility shall delete the pathname components (as specified by the **-p** option) from the filename on the line beginning with "---", then test for the existence of this file relative to the current directory (or the directory specified with the **-d** option). If the file exists, the *patch* utility shall use this filename.
3. If the header information contains a line beginning with the string **Index:**, the *patch* utility shall delete pathname components (as specified by the **-p** option) from this line, then test for the existence of this file relative to the current directory (or the directory specified with the **-d** option). If the file exists, the *patch* utility shall use this filename.
4. If an **SCCS** directory exists in the current directory, *patch* shall attempt to perform a **get -e SCCS/s.filename** command to retrieve an editable version of the file. If the file exists, the *patch* utility shall use this filename.
5. The *patch* utility shall write a prompt to standard output and request a filename interactively from the controlling terminal (for example, **/dev/tty**).

**Patch Application**

If the **-c**, **-e**, or **-n** option is present, the *patch* utility shall interpret information within each hunk as a context difference, an *ed* difference, or a normal difference, respectively. In the absence of any of these options, the *patch* utility shall determine the type of difference based on the format of information within the hunk.

For each hunk, the *patch* utility shall begin to search for the place to apply the patch at the line number at the beginning of the hunk, plus or minus any offset used in applying the previous hunk. If lines matching the hunk context are not found, *patch* shall scan both forwards and backwards at least 1 000 bytes for a set of lines that match the hunk context.

If no such place is found and it is a context difference, then another scan shall take place, ignoring the first and last line of context. If that fails, the first two and last two lines of context shall be ignored and another scan shall be made. Implementations may search more extensively for installation locations.

If no location can be found, the *patch* utility shall append the hunk to the reject file. The rejected hunk shall be written in context-difference format regardless of the format of the patch file. If the input was a normal or *ed*-style difference, the reject file may contain differences with zero lines of context. The line numbers on the hunks in the reject file may be different from the line numbers in the patch file since they shall reflect the approximate locations for the failed hunks in the new file rather than the old one.

If the type of patch is an *ed* diff, the implementation may accomplish the patching by invoking the *ed* utility.

**EXIT STATUS**

The following exit values shall be returned:

- 0 Successful completion.

26859           1   One or more lines were written to a reject file.

26860           >1   An error occurred.

## 26861 CONSEQUENCES OF ERRORS

26862           Patches that cannot be correctly placed in the file shall be written to a reject file.

## 26863 APPLICATION USAGE

26864           The **-R** option does not work with *ed* scripts because there is too little information to reconstruct the reverse operation.

26866           The **-p** option makes it possible to customize a patch file to local user directory structures without manually editing the patch file. For example, if the filename in the patch file was:

26868           /*curds/whey/src/blurfl/blurfl.c*

26869           Setting **-p 0** gives the entire pathname unmodified; **-p 1** gives:

26870           *curds/whey/src/blurfl/blurfl.c*

26871           without the leading slash, **-p 4** gives:

26872           *blurfl/blurfl.c*

26873           and not specifying **-p** at all gives:

26874           *blurfl.c* .

## 26875 EXAMPLES

26876           None.

## 26877 RATIONALE

26878           Some of the functionality in historical *patch* implementations was not specified. The following documents those features present in historical implementations that have not been specified.

26880           A deleted piece of functionality was the '+' pseudo-option allowing an additional set of options and a patch file operand to be given. This was seen as being insufficiently useful to standardize.

26882           In historical implementations, if the string "Prereq:" appeared in the header, the *patch* utility would search for the corresponding version information (the string specified in the header, delimited by <blank>s or the beginning or end of a line or the file) anywhere in the original file. This was deleted as too simplistic and insufficiently trustworthy a mechanism to standardize. For example, if:

26887           Prereq: 1.2

26888           were in the header, the presence of a delimited 1.2 anywhere in the file would satisfy the prerequisite.

26890           The following options were dropped from historical implementations of *patch* as insufficiently useful to standardize:

26892           **-b**           The **-b** option historically provided a method for changing the name extension of the backup file from the default **.orig**. This option has been modified and retained in this volume of IEEE Std 1003.1-2001.

26895           **-F**           The **-F** option specified the number of lines of a context diff to ignore when searching for a place to install a patch.

26897           **-f**           The **-f** option historically caused *patch* not to request additional information from the user.

|       |                          |                                                                                                                                   |
|-------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| 26899 | <b>-r</b>                | The <b>-r</b> option historically provided a method of overriding the extension of the reject file from the default <b>.rej</b> . |
| 26900 |                          |                                                                                                                                   |
| 26901 | <b>-s</b>                | The <b>-s</b> option historically caused <i>patch</i> to work silently unless an error occurred.                                  |
| 26902 | <b>-x</b>                | The <b>-x</b> option historically set internal debugging flags.                                                                   |
| 26903 |                          | In some file system implementations, the saving of a <b>.orig</b> file may produce unwanted results. In                           |
| 26904 |                          | the case of 12, 13, or 14-character filenames (on file systems supporting 14-character maximum                                    |
| 26905 |                          | filenames), the <b>.orig</b> file overwrites the new file. The reject file may also exceed this filename                          |
| 26906 |                          | limit. It was suggested, due to some historical practice, that a tilde ('~') suffix be used instead                               |
| 26907 |                          | of <b>.orig</b> and some other character instead of the <b>.rej</b> suffix. This was rejected because it is not                   |
| 26908 |                          | obvious to the user which file is which. The suffixes <b>.orig</b> and <b>.rej</b> are clearer and more                           |
| 26909 |                          | understandable.                                                                                                                   |
| 26910 |                          | The <b>-b</b> option has the opposite sense in some historical implementations—do not save the <b>.orig</b>                       |
| 26911 |                          | file. The default case here is not to save the files, making <i>patch</i> behave more consistently with the                       |
| 26912 |                          | other standard utilities.                                                                                                         |
| 26913 |                          | The <b>-w</b> option in early proposals was changed to <b>-I</b> to match historical practice.                                    |
| 26914 |                          | The <b>-N</b> option was included because without it, a non-interactive application cannot reject                                 |
| 26915 |                          | previously applied patches. For example, if a user is piping the output of <i>diff</i> into the <i>patch</i>                      |
| 26916 |                          | utility, and the user only wants to patch a file to a newer version non-interactively, the <b>-N</b>                              |
| 26917 |                          | option is required.                                                                                                               |
| 26918 |                          | Changes to the <b>-I</b> option description were proposed to allow matching across <newline>s in                                  |
| 26919 |                          | addition to just <blank>s. Since this is not historical practice, and since some ambiguities could                                |
| 26920 |                          | result, it is suggested that future developments in this area utilize another option letter, such as                              |
| 26921 |                          | <b>-L</b> .                                                                                                                       |
| 26922 | <b>FUTURE DIRECTIONS</b> |                                                                                                                                   |
| 26923 |                          | None.                                                                                                                             |
| 26924 | <b>SEE ALSO</b>          |                                                                                                                                   |
| 26925 |                          | <i>ed</i> , <i>diff</i>                                                                                                           |
| 26926 | <b>CHANGE HISTORY</b>    |                                                                                                                                   |
| 26927 |                          | First released in Issue 4.                                                                                                        |
| 26928 | <b>Issue 5</b>           |                                                                                                                                   |
| 26929 |                          | The FUTURE DIRECTIONS section is added.                                                                                           |
| 26930 | <b>Issue 6</b>           |                                                                                                                                   |
| 26931 |                          | This utility is marked as part of the User Portability Utilities option.                                                          |
| 26932 |                          | The description of the <b>-D</b> option and the steps in <b>Filename Determination</b> (on page 694) are                          |
| 26933 |                          | changed to match historical practice as defined in the IEEE P1003.2b draft standard.                                              |
| 26934 |                          | The normative text is reworded to avoid use of the term “must” for application requirements.                                      |
| 26935 |                          | IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/34 is applied, clarifying the way that the                                       |
| 26936 |                          | <i>patch</i> utility performs <b>ifdef</b> selection for the <b>-D</b> option.                                                    |

26937 **NAME**

26938 pathchk — check pathnames

26939 **SYNOPSIS**26940 pathchk [-p] *pathname...*26941 **DESCRIPTION**

26942 The *pathchk* utility shall check that one or more pathnames are valid (that is, they could be used  
 26943 to access or create a file without causing syntax errors) and portable (that is, no filename  
 26944 truncation results). More extensive portability checks are provided by the **-p** option.

26945 By default, the *pathchk* utility shall check each component of each *pathname* operand based on the  
 26946 underlying file system. A diagnostic shall be written for each *pathname* operand that:

- 26947 • Is longer than {PATH\_MAX} bytes (see **Pathname Variable Values** in the Base Definitions  
 26948 volume of IEEE Std 1003.1-2001, Chapter 13, Headers, <limits.h>)
- 26949 • Contains any component longer than {NAME\_MAX} bytes in its containing directory
- 26950 • Contains any component in a directory that is not searchable
- 26951 • Contains any character in any component that is not valid in its containing directory

26952 The format of the diagnostic message is not specified, but shall indicate the error detected and  
 26953 the corresponding *pathname* operand.

26954 It shall not be considered an error if one or more components of a *pathname* operand do not exist  
 26955 as long as a file matching the pathname specified by the missing components could be created  
 26956 that does not violate any of the checks specified above.

26957 **OPTIONS**

26958 The *pathchk* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 26959 12.2, Utility Syntax Guidelines.

26960 The following option shall be supported:

- 26961 **-p** Instead of performing checks based on the underlying file system, write a  
 26962 diagnostic for each *pathname* operand that:
  - 26963 • Is longer than {\_POSIX\_PATH\_MAX} bytes (see **Minimum Values** in the Base  
 26964 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers, <limits.h>)
  - 26965 • Contains any component longer than {\_POSIX\_NAME\_MAX} bytes
  - 26966 • Contains any character in any component that is not in the portable filename  
 26967 character set

26968 **OPERANDS**

26969 The following operand shall be supported:

26970 *pathname* A pathname to be checked.

26971 **STDIN**

26972 Not used.

26973 **INPUT FILES**

26974 None.

26975 **ENVIRONMENT VARIABLES**

26976 The following environment variables shall affect the execution of *pathchk*:

26977 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 26978 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,

26979 Internationalization Variables for the precedence of internationalization variables  
 26980 used to determine the values of locale categories.)

26981 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 26982 internationalization variables.

26983 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 26984 characters (for example, single-byte as opposed to multi-byte characters in  
 26985 arguments).

26986 *LC\_MESSAGES*  
 26987 Determine the locale that should be used to affect the format and contents of  
 26988 diagnostic messages written to standard error.

26989 *XS1* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

26990 **ASYNCHRONOUS EVENTS**  
 26991 Default.

26992 **STDOUT**  
 26993 Not used.

26994 **STDERR**  
 26995 The standard error shall be used only for diagnostic messages.

26996 **OUTPUT FILES**  
 26997 None.

26998 **EXTENDED DESCRIPTION**  
 26999 None.

27000 **EXIT STATUS**  
 27001 The following exit values shall be returned:  
 27002 0 All *pathname* operands passed all of the checks.  
 27003 >0 An error occurred.

27004 **CONSEQUENCES OF ERRORS**  
 27005 Default.

27006 **APPLICATION USAGE**  
 27007 The *test* utility can be used to determine whether a given *pathname* names an existing file; it  
 27008 does not, however, give any indication of whether or not any component of the *pathname* was  
 27009 truncated in a directory where the *\_POSIX\_NO\_TRUNC* feature is not in effect. The *pathchk*  
 27010 utility does not check for file existence; it performs checks to determine whether a *pathname*  
 27011 does exist or could be created with no *pathname* component truncation.

27012 The *noclobber* option in the shell (see the *set* special built-in) can be used to atomically create a  
 27013 file. As with all file creation semantics in the System Interfaces volume of IEEE Std 1003.1-2001,  
 27014 it guarantees atomic creation, but still depends on applications to agree on conventions and  
 27015 cooperate on the use of files after they have been created.

27016 **EXAMPLES**  
 27017 To verify that all *pathnames* in an imported data interchange archive are legitimate and  
 27018 unambiguous on the current system:  
 27019 

```
pax -f archive | sed -e '/' == './s///' | xargs pathchk
```

  
 27020 

```
if [$? -eq 0]
```

  
 27021 

```
then
```

  
 27022 

```
 pax -r -f archive
```

```

27023 else
27024 echo Investigate problems before importing files.
27025 exit 1
27026 fi

27027 To verify that all files in the current directory hierarchy could be moved to any system
27028 conforming to the System Interfaces volume of IEEE Std 1003.1-2001 that also supports the pax
27029 utility:

27030 find . -print | xargs pathchk -p
27031 if [$? -eq 0]
27032 then
27033 pax -w -f archive .
27034 else
27035 echo Portable archive cannot be created.
27036 exit 1
27037 fi

27038 To verify that a user-supplied pathname names a readable file and that the application can create
27039 a file extending the given path without truncation and without overwriting any existing file:

27040 case $- in
27041 *C*) reset="";;
27042 *) reset="set +C"
27043 set -C;;
27044 esac
27045 test -r "$path" && pathchk "$path.out" &&
27046 rm "$path.out" > "$path.out"
27047 if [$? -ne 0]; then
27048 printf "%s: %s not found or %s.out fails \
27049 creation checks.\n" $0 "$path" "$path"
27050 $reset # Reset the noclobber option in case a trap
27051 # on EXIT depends on it.
27052 exit 1
27053 fi
27054 $reset
27055 PROCESSING < "$path" > "$path.out"

27056 The following assumptions are made in this example:

27057 1. PROCESSING represents the code that is used by the application to use $path once it is
27058 verified that $path.out works as intended.

27059 2. The state of the noclobber option is unknown when this code is invoked and should be set
27060 on exit to the state it was in when this code was invoked. (The reset variable is used in this
27061 example to restore the initial state.)

27062 3. Note the usage of:

27063 rm "$path.out" > "$path.out"

27064 a. The pathchk command has already verified, at this point, that $path.out is not
27065 truncated.

27066 b. With the noclobber option set, the shell verifies that $path.out does not already exist
27067 before invoking rm.

```

27068 c. If the shell succeeded in creating **\$path.out**, *rm* removes it so that the application can  
 27069 create the file again in the **PROCESSING** step.

27070 d. If the **PROCESSING** step wants the file to exist already when it is invoked, the:

27071 `rm "$path.out" > "$path.out"`

27072 should be replaced with:

27073 `> "$path.out"`

27074 which verifies that the file did not already exist, but leaves **\$path.out** in place for use  
 27075 by **PROCESSING**.

#### 27076 RATIONALE

27077 The *pathchk* utility was new for the ISO POSIX-2:1993 standard. It, along with the *set*  
 27078 **-C(noclobber)** option added to the shell, replaces the *mktemp*, *validfnam*, and *create* utilities that  
 27079 appeared in early proposals. All of these utilities were attempts to solve several common  
 27080 problems:

- 27081 • Verify the validity (for several different definitions of “valid”) of a pathname supplied by a  
 27082 user, generated by an application, or imported from an external source.
- 27083 • Atomically create a file.
- 27084 • Perform various string handling functions to generate a temporary filename.

27085 The *create* utility, included in an early proposal, provided checking and atomic creation in a  
 27086 single invocation of the utility; these are orthogonal issues and need not be grouped into a single  
 27087 utility. Note that the *noclobber* option also provides a way of creating a lock for process  
 27088 synchronization; since it provides an atomic *create*, there is no race between a test for existence  
 27089 and the following creation if it did not exist.

27090 Having a function like *tmpnam()* in the ISO C standard is important in many high-level  
 27091 languages. The shell programming language, however, has built-in string manipulation  
 27092 facilities, making it very easy to construct temporary filenames. The names needed obviously  
 27093 depend on the application, but are frequently of a form similar to:

27094 `$TMPDIR/application_abbreviation$.suffix`

27095 In cases where there is likely to be contention for a given suffix, a simple shell **for** or **while** loop  
 27096 can be used with the shell *noclobber* option to create a file without risk of collisions, as long as  
 27097 applications trying to use the same filename name space are cooperating on the use of files after  
 27098 they have been created.

#### 27099 FUTURE DIRECTIONS

27100 None.

#### 27103 CHANGE HISTORY

27104 First released in Issue 4.

27105 **NAME**

27106       pax — portable archive interchange

27107 **SYNOPSIS**27108       pax [-cdnv] [-H|-L] [-f *archive*] [-s *replstr*]... [*pattern*...]27109       pax -r[-cdiknuv] [-H|-L] [-f *archive*] [-o *options*]... [-p *string*]...  
27110       [-s *replstr*]... [*pattern*...]27111       pax -w[-dituvX] [-H|-L] [-b *blocksize*] [[-a] [-f *archive*] [-o *options*]...  
27112       [-s *replstr*]... [-x *format*] [*file*...]27113       pax -r -w[-diklntuvX] [-H|-L] [-p *string*]... [-s *replstr*]...  
27114       [*file*...] *directory*27115 **DESCRIPTION**27116       The *pax* utility shall read, write, and write lists of the members of archive files and copy  
27117       directory hierarchies. A variety of archive formats shall be supported; see the **-x** *format* option.27118       The action to be taken depends on the presence of the **-r** and **-w** options. The four combinations  
27119       of **-r** and **-w** are referred to as the four modes of operation: **list**, **read**, **write**, and **copy** modes,  
27120       corresponding respectively to the four forms shown in the SYNOPSIS section.27121       **list**       In **list** mode (when neither **-r** nor **-w** are specified), *pax* shall write the names of  
27122       the members of the archive file read from the standard input, with pathnames  
27123       matching the specified patterns, to standard output. If a named file is of type  
27124       directory, the file hierarchy rooted at that file shall be listed as well.27125       **read**       In **read** mode (when **-r** is specified, but **-w** is not), *pax* shall extract the members of  
27126       the archive file read from the standard input, with pathnames matching the  
27127       specified patterns. If an extracted file is of type directory, the file hierarchy rooted  
27128       at that file shall be extracted as well. The extracted files shall be created performing  
27129       pathname resolution with the directory in which *pax* was invoked as the current  
27130       working directory.27131       If an attempt is made to extract a directory when the directory already exists, this  
27132       shall not be considered an error. If an attempt is made to extract a FIFO when the  
27133       FIFO already exists, this shall not be considered an error.27134       The ownership, access, and modification times, and file mode of the restored files  
27135       are discussed under the **-p** option.27136       **write**       In **write** mode (when **-w** is specified, but **-r** is not), *pax* shall write the contents of  
27137       the *file* operands to the standard output in an archive format. If no *file* operands are  
27138       specified, a list of files to copy, one per line, shall be read from the standard input.  
27139       A file of type directory shall include all of the files in the file hierarchy rooted at the  
27140       file.27141       **copy**       In **copy** mode (when both **-r** and **-w** are specified), *pax* shall copy the *file* operands  
27142       to the destination directory.27143       If no *file* operands are specified, a list of files to copy, one per line, shall be read  
27144       from the standard input. A file of type directory shall include all of the files in the  
27145       file hierarchy rooted at the file.27146       The effect of the **copy** shall be as if the copied files were written to an archive file  
27147       and then subsequently extracted, except that there may be hard links between the  
27148       original and the copied files. If the destination directory is a subdirectory of one of  
27149       the files to be copied, the results are unspecified. If the destination directory is a

27150 file of a type not defined by the System Interfaces volume of IEEE Std 1003.1-2001,  
 27151 the results are implementation-defined; otherwise, it shall be an error for the file  
 27152 named by the *directory* operand not to exist, not be writable by the user, or not be a  
 27153 file of type directory.

27154 In **read** or **copy** modes, if intermediate directories are necessary to extract an archive member,  
 27155 *pax* shall perform actions equivalent to the *mkdir()* function defined in the System Interfaces  
 27156 volume of IEEE Std 1003.1-2001, called with the following arguments:

- 27157 • The intermediate directory used as the *path* argument
- 27158 • The value of the bitwise-inclusive OR of S\_IRWXU, S\_IRWXG, and S\_IRWXO as the *mode*  
 27159 argument

27160 If any specified *pattern* or *file* operands are not matched by at least one file or archive member,  
 27161 *pax* shall write a diagnostic message to standard error for each one that did not match and exit  
 27162 with a non-zero exit status.

27163 The archive formats described in the EXTENDED DESCRIPTION section shall be automatically  
 27164 detected on input. The default output archive format shall be implementation-defined.

27165 A single archive can span multiple files. The *pax* utility shall determine, in an implementation-  
 27166 defined manner, what file to read or write as the next file.

27167 If the selected archive format supports the specification of linked files, it shall be an error if these  
 27168 files cannot be linked when the archive is extracted. For archive formats that do not store file  
 27169 contents with each name that causes a hard link, if the file that contains the data is not extracted  
 27170 during this *pax* session, either the data shall be restored from the original file, or a diagnostic  
 27171 message shall be displayed with the name of a file that can be used to extract the data. In  
 27172 traversing directories, *pax* shall detect infinite loops; that is, entering a previously visited  
 27173 directory that is an ancestor of the last file visited. When it detects an infinite loop, *pax* shall  
 27174 write a diagnostic message to standard error and shall terminate.

## 27175 OPTIONS

27176 The *pax* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 27177 12.2, Utility Syntax Guidelines, except that the order of presentation of the **-o**, **-p**, and **-s** options  
 27178 is significant.

27179 The following options shall be supported:

- 27180 **-r** Read an archive file from standard input.
- 27181 **-w** Write files to the standard output in the specified archive format.
- 27182 **-a** Append files to the end of the archive. It is implementation-defined which devices  
 27183 on the system support appending. Additional file formats unspecified by this  
 27184 volume of IEEE Std 1003.1-2001 may impose restrictions on appending.
- 27185 **-b** *blocksize* Block the output at a positive decimal integer number of bytes per write to the  
 27186 archive file. Devices and archive formats may impose restrictions on blocking.  
 27187 Blocking shall be automatically determined on input. Conforming applications  
 27188 shall not specify a *blocksize* value larger than 32 256. Default blocking when  
 27189 creating archives depends on the archive format. (See the **-x** option below.)
- 27190 **-c** Match all file or archive members except those specified by the *pattern* or *file*  
 27191 operands.
- 27192 **-d** Cause files of type directory being copied or archived or archive members of type  
 27193 directory being extracted or listed to match only the file or archive member itself  
 27194 and not the file hierarchy rooted at the file.

|       |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 27195 | <b>-f</b> <i>archive</i> | Specify the pathname of the input or output archive, overriding the default standard input (in <b>list</b> or <b>read</b> modes) or standard output ( <b>write</b> mode).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 27204 | <b>-i</b>                | Interactively rename files or archive members. For each archive member matching a <i>pattern</i> operand or file matching a <i>file</i> operand, a prompt shall be written to the file <b>/dev/tty</b> . The prompt shall contain the name of the file or archive member, but the format is otherwise unspecified. A line shall then be read from <b>/dev/tty</b> . If this line is blank, the file or archive member shall be skipped. If this line consists of a single period, the file or archive member shall be processed with no modification to its name. Otherwise, its name shall be replaced with the contents of the line. The <i>pax</i> utility shall immediately exit with a non-zero exit status if end-of-file is encountered when reading a response or if <b>/dev/tty</b> cannot be opened for reading and writing. |

| 27223 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 27224 | <b>-L</b>                | If a symbolic link referencing a file of type directory is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file hierarchy rooted in the file referenced by the link, using the name of the link as the root of the file hierarchy. Otherwise, if a symbolic link referencing a file of any other file type which <i>pax</i> can normally archive is specified on the command line or encountered during the traversal of a file hierarchy, <i>pax</i> shall archive the file referenced by the link, using the name of the link. The default behavior shall be to archive the symbolic link itself.                                                                                                                                                                |

| 27235 | <b>-o</b> <i>options</i> | Provide information to the implementation to modify the algorithm for extracting or writing files. The value of <i>options</i> shall consist of one or more comma-separated keywords of the form:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27236 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 27237 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 27238 |                          | <i>keyword</i> [[:]= <i>value</i> ] [, <i>keyword</i> [[:]= <i>value</i> ] , ...]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 27239 |                          | Some keywords apply only to certain file formats, as indicated with each description. Use of keywords that are inapplicable to the file format being processed produces undefined results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 27240 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 27241 |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Keywords in the *options* argument shall be a string that would be a valid portable filename as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.276, Portable Filename Character Set.

**Note:** Keywords are not expected to be filenames, merely to follow the same character composition rules as portable filenames.

Keywords can be preceded with white space. The *value* field shall consist of zero or more characters; within *value*, the application shall precede any literal comma with a backslash, which shall be ignored, but preserves the comma as part of *value*. A comma as the final character, or a comma followed solely by white space as the final characters, in *options* shall be ignored. Multiple **-o** options can be specified; if keywords given to these multiple **-o** options conflict, the keywords and values appearing later in command line sequence shall take precedence and the earlier shall be silently ignored. The following keyword values of *options* shall be supported for the file formats as indicated:

**delete=pattern**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax* shall omit from extended header records that it produces any keywords matching the string pattern. When used in **read** or **list** mode, *pax* shall ignore any keywords matching the string pattern in the extended header records. In both cases, matching shall be performed using the pattern matching notation described in Section 2.13.1 (on page 62) and Section 2.13.2 (on page 63). For example:

**-o delete=security.\***

would suppress security-related information. See **pax Extended Header** (on page 714) for extended header record keyword usage.

**exthdr.name=string**

(Applicable only to the **-x pax** format.) This keyword allows user control over the name that is written into the **ustar** header blocks for the extended header produced under the circumstances described in **pax Header Block** (on page 713). The name shall be the contents of *string*, after the following character substitutions have been made:

| <i>string</i><br><b>Includes:</b> | <b>Replaced By:</b>                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| %d                                | The directory name of the file, equivalent to the result of the <i>dirname</i> utility on the translated pathname. |
| %f                                | The filename of the file, equivalent to the result of the <i>basename</i> utility on the translated pathname.      |
| %p                                | The process ID of the <i>pax</i> process.                                                                          |
| %%                                | A '%' character.                                                                                                   |

Any other '%' characters in *string* produce undefined results.

If no **-o exthdr.name=string** is specified, *pax* shall use the following default value:

%d/PaxHeaders.%p/%f

**globexthdr.name=string**

(Applicable only to the **-x pax** format.) When used in **write** or **copy** mode with the appropriate options, *pax* shall create global extended header records

with **ustar** header blocks that will be treated as regular files by previous versions of *pax*. This keyword allows user control over the name that is written into the **ustar** header blocks for global extended header records. The name shall be the contents of string, after the following character substitutions have been made:

| <i>string</i><br><b>Includes:</b> | <b>Replaced By:</b>                                                                                                |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------|
| %n                                | An integer that represents the sequence number of the global extended header record in the archive, starting at 1. |
| %p                                | The process ID of the <i>pax</i> process.                                                                          |
| %%                                | A ' % ' character.                                                                                                 |

Any other ' % ' characters in *string* produce undefined results.

If no **-o globexthdr.name=string** is specified, *pax* shall use the following default value:

\$TMPDIR/GlobalHead.%p.%n

where *\$TMPDIR* represents the value of the *TMPDIR* environment variable. If *TMPDIR* is not set, *pax* shall use **/tmp**.

#### **invalid=action**

(Applicable only to the **-x pax** format.) This keyword allows user control over the action *pax* takes upon encountering values in an extended header record that, in **read** or **copy** mode, are invalid in the destination hierarchy or, in **list** mode, cannot be written in the codeset and current locale of the implementation. The following are invalid values that shall be recognized by *pax*:

- In **read** or **copy** mode, a filename or link name that contains character encodings invalid in the destination hierarchy. (For example, the name may contain embedded NULs.)
- In **read** or **copy** mode, a filename or link name that is longer than the maximum allowed in the destination hierarchy (for either a pathname component or the entire pathname).
- In **list** mode, any character string value (filename, link name, user name, and so on) that cannot be written in the codeset and current locale of the implementation.

The following mutually-exclusive values of the *action* argument are supported:

- bypass** In **read** or **copy** mode, *pax* shall bypass the file, causing no change to the destination hierarchy. In **list** mode, *pax* shall write all requested valid values for the file, but its method for writing invalid values is unspecified.
- rename** In **read** or **copy** mode, *pax* shall act as if the **-i** option were in effect for each file with invalid filename or link name values, allowing the user to provide a replacement name interactively. In **list** mode, *pax* shall behave identically to the **bypass** action.
- UTF-8** When used in **read**, **copy**, or **list** mode and a filename, link name, owner name, or any other field in an extended header

27333 record cannot be translated from the **pax** UTF-8 codeset format  
 27334 to the codeset and current locale of the implementation, *pax*  
 27335 shall use the actual UTF-8 encoding for the name.

27336 **write** In **read** or **copy** mode, *pax* shall write the file, translating or  
 27337 truncating the name, regardless of whether this may overwrite  
 27338 an existing file with a valid name. In **list** mode, *pax* shall behave  
 27339 identically to the **bypass** action.

27340 If no **-o invalid=** option is specified, *pax* shall act as if **-o invalid=bypass** were  
 27341 specified. Any overwriting of existing files that may be allowed by the  
 27342 **-o invalid=** actions shall be subject to permission (**-p**) and modification time  
 27343 (**-u**) restrictions, and shall be suppressed if the **-k** option is also specified.

27344 **linkdata**  
 27345 (Applicable only to the **-x pax** format.) In **write** mode, *pax* shall write the  
 27346 contents of a file to the archive even when that file is merely a hard link to a  
 27347 file whose contents have already been written to the archive.

27348 **listopt=format**  
 27349 This keyword specifies the output format of the table of contents produced  
 27350 when the **-v** option is specified in **list** mode. See **List Mode Format**  
 27351 **Specifications** (on page 709). To avoid ambiguity, the **listopt=format** shall be  
 27352 the only or final **keyword=value** pair in a **-o** option-argument; all characters in  
 27353 the remainder of the option-argument shall be considered part of the format  
 27354 string. When multiple **-olistopt=format** options are specified, the format  
 27355 strings shall be considered a single, concatenated string, evaluated in  
 27356 command line order.

27357 **times**  
 27358 (Applicable only to the **-x pax** format.) When used in **write** or **copy** mode, *pax* |  
 27359 shall include **atime**, **ctime**, and **mtime** extended header records for each file.  
 27360 See **pax Extended Header File Times** (on page 717).

27361 In addition to these keywords, if the **-x pax** format is specified, any of the |  
 27362 keywords and values defined in **pax Extended Header** (on page 714), including  
 27363 implementation extensions, can be used in **-o** option-arguments, in either of two  
 27364 modes:

27365 **keyword=value**  
 27366 When used in **write** or **copy** mode, these keyword/value pairs shall be  
 27367 included at the beginning of the archive as **typeflag g** global extended header  
 27368 records. When used in **read** or **list** mode, these keyword/value pairs shall act  
 27369 as if they had been at the beginning of the archive as **typeflag g** global  
 27370 extended header records.

27371 **keyword:=value**  
 27372 When used in **write** or **copy** mode, these keyword/value pairs shall be  
 27373 included as records at the beginning of a **typeflag x** extended header for each  
 27374 file. (This shall be equivalent to the equal-sign form except that it creates no  
 27375 **typeflag g** global extended header records.) When used in **read** or **list** mode,  
 27376 these keyword/value pairs shall act as if they were included as records at the  
 27377 end of each extended header; thus, they shall override any global or file-  
 27378 specific extended header record keywords of the same names. For example, in  
 27379 the command:

```

27380 pax -r -o "
27381 gname:=mygroup,
27382 " <archive

```

27383 the group name will be forced to a new value for all files read from the  
 27384 archive.

27385 The precedence of **-o** keywords over various fields in the archive is described in  
 27386 **pax Extended Header Keyword Precedence** (on page 717).

27387 **-p *string*** Specify one or more file characteristic options (privileges). The *string* option-  
 27388 argument shall be a string specifying file characteristics to be retained or discarded  
 27389 on extraction. The string shall consist of the specification characters a, e, m, o, and  
 27390 p. Other implementation-defined characters can be included. Multiple  
 27391 characteristics can be concatenated within the same string and multiple **-p** options  
 27392 can be specified. The meaning of the specification characters are as follows:

- 27393 a Do not preserve file access times.
- 27394 e Preserve the user ID, group ID, file mode bits (see the Base Definitions volume  
 27395 of IEEE Std 1003.1-2001, Section 3.168, File Mode Bits), access time,  
 27396 modification time, and any other implementation-defined file characteristics.
- 27397 m Do not preserve file modification times.
- 27398 o Preserve the user ID and group ID.
- 27399 p Preserve the file mode bits. Other implementation-defined file mode attributes  
 27400 may be preserved.

27401 In the preceding list, “preserve” indicates that an attribute stored in the archive  
 27402 shall be given to the extracted file, subject to the permissions of the invoking  
 27403 process. The access and modification times of the file shall be preserved unless  
 27404 otherwise specified with the **-p** option or not stored in the archive. All attributes  
 27405 that are not preserved shall be determined as part of the normal file creation action  
 27406 (see Section 1.7.1.4 (on page 4)).

27407 If neither the e nor the o specification character is specified, or the user ID and  
 27408 group ID are not preserved for any reason, *pax* shall not set the S\_ISUID and  
 27409 S\_ISGID bits of the file mode.

27410 If the preservation of any of these items fails for any reason, *pax* shall write a  
 27411 diagnostic message to standard error. Failure to preserve these items shall affect  
 27412 the final exit status, but shall not cause the extracted file to be deleted.

27413 If file characteristic letters in any of the *string* option-arguments are duplicated or  
 27414 conflict with each other, the ones given last shall take precedence. For example, if  
 27415 **-p eme** is specified, file modification times are preserved.

27416 **-s *replstr*** Modify file or archive member names named by *pattern* or *file* operands according  
 27417 to the substitution expression *replstr*, using the syntax of the *ed* utility. The  
 27418 concepts of “address” and “line” are meaningless in the context of the *pax* utility,  
 27419 and shall not be supplied. The format shall be:

```

27420 -s /old/new/ [gp]

```

27421 where as in *ed*, *old* is a basic regular expression and *new* can contain an ampersand,  
 27422 ‘\n’ (where *n* is a digit) backreferences, or subexpression matching. The *old* string  
 27423 shall also be permitted to contain <newline>s.

|       |                  |                                                                                                           |
|-------|------------------|-----------------------------------------------------------------------------------------------------------|
| 27424 |                  | Any non-null character can be used as a delimiter ('/' shown here). Multiple <b>-s</b>                    |
| 27425 |                  | expressions can be specified; the expressions shall be applied in the order                               |
| 27426 |                  | specified, terminating with the first successful substitution. The optional trailing                      |
| 27427 |                  | 'g' is as defined in the <i>ed</i> utility. The optional trailing 'p' shall cause successful              |
| 27428 |                  | substitutions to be written to standard error. File or archive member names that                          |
| 27429 |                  | substitute to the empty string shall be ignored when reading and writing archives.                        |
| 27430 | <b>-t</b>        | When reading files from the file system, and if the user has the permissions                              |
| 27431 |                  | required by <i>utime()</i> to do so, set the access time of each file read to the access time             |
| 27432 |                  | that it had before being read by <i>pax</i> .                                                             |
| 27433 | <b>-u</b>        | Ignore files that are older (having a less recent file modification time) than a pre-                     |
| 27434 |                  | existing file or archive member with the same name. In <b>read</b> mode, an archive                       |
| 27435 |                  | member with the same name as a file in the file system shall be extracted if the                          |
| 27436 |                  | archive member is newer than the file. In <b>write</b> mode, an archive file member with                  |
| 27437 |                  | the same name as a file in the file system shall be superseded if the file is newer                       |
| 27438 |                  | than the archive member. If <b>-a</b> is also specified, this is accomplished by appending                |
| 27439 |                  | to the archive; otherwise, it is unspecified whether this is accomplished by actual                       |
| 27440 |                  | replacement in the archive or by appending to the archive. In <b>copy</b> mode, the file in               |
| 27441 |                  | the destination hierarchy shall be replaced by the file in the source hierarchy or by                     |
| 27442 |                  | a link to the file in the source hierarchy if the file in the source hierarchy is newer.                  |
| 27443 | <b>-v</b>        | In <b>list</b> mode, produce a verbose table of contents (see the STDOUT section).                        |
| 27444 |                  | Otherwise, write archive member pathnames to standard error (see the STDERR                               |
| 27445 |                  | section).                                                                                                 |
| 27446 | <b>-x format</b> | Specify the output archive format. The <i>pax</i> utility shall support the following                     |
| 27447 |                  | formats:                                                                                                  |
| 27448 | <b>cpio</b>      | The <b>cpio</b> interchange format; see the EXTENDED DESCRIPTION                                          |
| 27449 |                  | section. The default <i>blocksize</i> for this format for character special                               |
| 27450 |                  | archive files shall be 5120. Implementations shall support all                                            |
| 27451 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                           |
| 27452 | <b>pax</b>       | The <b>pax</b> interchange format; see the EXTENDED DESCRIPTION                                           |
| 27453 |                  | section. The default <i>blocksize</i> for this format for character special                               |
| 27454 |                  | archive files shall be 5120. Implementations shall support all                                            |
| 27455 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                           |
| 27456 | <b>ustar</b>     | The <b>tar</b> interchange format; see the EXTENDED DESCRIPTION                                           |
| 27457 |                  | section. The default <i>blocksize</i> for this format for character special                               |
| 27458 |                  | archive files shall be 10 240. Implementations shall support all                                          |
| 27459 |                  | <i>blocksize</i> values less than or equal to 32 256 that are multiples of 512.                           |
| 27460 |                  | Implementation-defined formats shall specify a default block size as well as any                          |
| 27461 |                  | other block sizes supported for character special archive files.                                          |
| 27462 |                  | Any attempt to append to an archive file in a format different from the existing                          |
| 27463 |                  | archive format shall cause <i>pax</i> to exit immediately with a non-zero exit status.                    |
| 27464 |                  | In <b>copy</b> mode, if no <b>-x</b> format is specified, <i>pax</i> shall behave as if <b>-xpax</b> were |
| 27465 |                  | specified.                                                                                                |
| 27466 | <b>-X</b>        | When traversing the file hierarchy specified by a pathname, <i>pax</i> shall not descend                  |
| 27467 |                  | into directories that have a different device ID ( <i>st_dev</i> ; see the System Interfaces              |
| 27468 |                  | volume of IEEE Std 1003.1-2001, <i>stat()</i> ).                                                          |

27469 The options that operate on the names of files or archive members (**-c**, **-i**, **-n**, **-s**, **-u**, and **-v**)  
 27470 shall interact as follows. In **read** mode, the archive members shall be selected based on the user-  
 27471 specified *pattern* operands as modified by the **-c**, **-n**, and **-u** options. Then, any **-s** and **-i** options  
 27472 shall modify, in that order, the names of the selected files. The **-v** option shall write names  
 27473 resulting from these modifications.

27474 In **write** mode, the files shall be selected based on the user-specified pathnames as modified by  
 27475 the **-n** and **-u** options. Then, any **-s** and **-i** options shall modify, in that order, the names of  
 27476 these selected files. The **-v** option shall write names resulting from these modifications.

27477 If both the **-u** and **-n** options are specified, *pax* shall not consider a file selected unless it is newer  
 27478 than the file to which it is compared.

## 27479 List Mode Format Specifications

27480 In **list** mode with the **-o listopt=format** option, the *format* argument shall be applied for each  
 27481 selected file. The *pax* utility shall append a <newline> to the **listopt** output for each selected file.  
 27482 The *format* argument shall be used as the *format* string described in the Base Definitions volume  
 27483 of IEEE Std 1003.1-2001, Chapter 5, File Format Notation, with the exceptions 1. through 5.  
 27484 defined in the EXTENDED DESCRIPTION section of *printf*, plus the following exceptions:

27485 6. The sequence (*keyword*) can occur before a format conversion specifier. The conversion  
 27486 argument is defined by the value of *keyword*. The implementation shall support the  
 27487 following keywords:

27488 — Any of the Field Name entries in Table 4-13 (on page 718) and Table 4-15 (on page 721).  
 27489 The implementation may support the *cpio* keywords without the leading **c\_** in addition  
 27490 to the form required by Table 4-16 (on page 722).

27491 — Any keyword defined for the extended header in **pax Extended Header** (on page 714).

27492 — Any keyword provided as an implementation-defined extension within the extended  
 27493 header defined in **pax Extended Header** (on page 714).

27494 For example, the sequence "%(charset)s" is the string value of the name of the character  
 27495 set in the extended header.

27496 The result of the keyword conversion argument shall be the value from the applicable  
 27497 header field or extended header, without any trailing NULs.

27498 All keyword values used as conversion arguments shall be translated from the UTF-8  
 27499 encoding to the character set appropriate for the local file system, user database, and so on,  
 27500 as applicable.

27501 7. An additional conversion specifier character, T, shall be used to specify time formats. The T  
 27502 conversion specifier character can be preceded by the sequence (*keyword=subformat*), where  
 27503 *subformat* is a date format as defined by *date* operands. The default *keyword* shall be **mtime**  
 27504 and the default subformat shall be:

27505 %b %e %H:%M %Y

27506 8. An additional conversion specifier character, M, shall be used to specify the file mode string  
 27507 as defined in *ls* Standard Output. If (*keyword*) is omitted, the **mode** keyword shall be used.  
 27508 For example, % . 1M writes the single character corresponding to the <entry type> field of the  
 27509 *ls -l* command.

27510 9. An additional conversion specifier character, D, shall be used to specify the device for block  
 27511 or special files, if applicable, in an implementation-defined format. If not applicable, and  
 27512 (*keyword*) is specified, then this conversion shall be equivalent to % (*keyword*) u. If not

- 27513 applicable, and (*keyword*) is omitted, then this conversion shall be equivalent to <space>.
- 27514 10. An additional conversion specifier character, F, shall be used to specify a pathname. The F  
27515 conversion character can be preceded by a sequence of comma-separated keywords:
- 27516 (*keyword* [, *keyword*] . . . )
- 27517 The values for all the keywords that are non-null shall be concatenated together, each  
27518 separated by a '/'. The default shall be (**path**) if the keyword **path** is defined; otherwise,  
27519 the default shall be (**prefix,name**).
- 27520 11. An additional conversion specifier character, L, shall be used to specify a symbolic line  
27521 expansion. If the current file is a symbolic link, then %L shall expand to:
- 27522 "%s -> %s", <value of keyword>, <contents of link>
- 27523 Otherwise, the %L conversion specification shall be the equivalent of %F.

## 27524 OPERANDS

27525 The following operands shall be supported:

- 27526 *directory* The destination directory pathname for **copy** mode.
- 27527 *file* A pathname of a file to be copied or archived.
- 27528 *pattern* A pattern matching one or more pathnames of archive members. A pattern must  
27529 be given in the name-generating notation of the pattern matching notation in  
27530 Section 2.13 (on page 62), including the filename expansion rules in Section 2.13.3  
27531 (on page 63). The default, if no *pattern* is specified, is to select all members in the  
27532 archive.

## 27533 STDIN

- 27534 In **write** mode, the standard input shall be used only if no *file* operands are specified. It shall be a  
27535 text file containing a list of pathnames, one per line, without leading or trailing <blank>s.
- 27536 In **list** and **read** modes, if **-f** is not specified, the standard input shall be an archive file.
- 27537 Otherwise, the standard input shall not be used.

## 27538 INPUT FILES

- 27539 The input file named by the *archive* option-argument, or standard input when the archive is read  
27540 from there, shall be a file formatted according to one of the specifications in the EXTENDED  
27541 DESCRIPTION section or some other implementation-defined format.
- 27542 The file **/dev/tty** shall be used to write prompts and read responses.

## 27543 ENVIRONMENT VARIABLES

- 27544 The following environment variables shall affect the execution of *pax*:
- 27545 *LANG* Provide a default value for the internationalization variables that are unset or null.  
27546 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
27547 Internationalization Variables for the precedence of internationalization variables  
27548 used to determine the values of locale categories.)
- 27549 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
27550 internationalization variables.
- 27551 *LC\_COLLATE*  
27552 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
27553 character collating elements used in the pattern matching expressions for the  
27554 *pattern* operand, the basic regular expression for the **-s** option, and the extended  
27555 regular expression defined for the **yesexpr** locale keyword in the *LC\_MESSAGES*

27556 category.

27557 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 27558 characters (for example, single-byte as opposed to multi-byte characters in  
 27559 arguments and input files), the behavior of character classes used in the extended  
 27560 regular expression defined for the **yesexpr** locale keyword in the **LC\_MESSAGES**  
 27561 category, and pattern matching.

27562 **LC\_MESSAGES**  
 27563 Determine the locale for the processing of affirmative responses that should be  
 27564 used to affect the format and contents of diagnostic messages written to standard  
 27565 error.

27566 **LC\_TIME** Determine the format and contents of date and time strings when the **-v** option is  
 27567 specified.

27568 xsi **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

27569 **TMPDIR** Determine the pathname that provides part of the default global extended header  
 27570 record file, as described for the **-o globexthdr=** keyword in the **OPTIONS** section.

27571 **TZ** Determine the timezone used to calculate date and time strings when the **-v** option  
 27572 is specified. If **TZ** is unset or null, an unspecified default timezone shall be used.

27573 **ASYNCHRONOUS EVENTS**

27574 Default.

27575 **STDOUT**

27576 In **write** mode, if **-f** is not specified, the standard output shall be the archive formatted  
 27577 according to one of the specifications in the **EXTENDED DESCRIPTION** section, or some other  
 27578 implementation-defined format (see **-x format**).

27579 In **list** mode, when the **-olistopt=format** has been specified, the selected archive members shall  
 27580 be written to standard output using the format described under **List Mode Format**  
 27581 **Specifications** (on page 709). In **list** mode without the **-olistopt=format** option, the table of  
 27582 contents of the selected archive members shall be written to standard output using the following  
 27583 format:

27584 "%s\n", <pathname>

27585 If the **-v** option is specified in **list** mode, the table of contents of the selected archive members  
 27586 shall be written to standard output using the following formats.

27587 For pathnames representing hard links to previous members of the archive:

27588 "%sΔ=Δ%s\n", <ls -l listing>, <linkname>

27589 For all other pathnames:

27590 "%s\n", <ls -l listing>

27591 where <ls -l listing> shall be the format specified by the **ls** utility with the **-l** option. When  
 27592 writing pathnames in this format, it is unspecified what is written for fields for which the  
 27593 underlying archive format does not have the correct information, although the correct number of  
 27594 <blank>-separated fields shall be written.

27595 In **list** mode, standard output shall not be buffered more than a line at a time.

27596 **STDERR**

27597 If **-v** is specified in **read**, **write**, or **copy** modes, *pax* shall write the pathnames it processes to the  
 27598 standard error output using the following format:

27599 "%s\n", <pathname>

27600 These pathnames shall be written as soon as processing is begun on the file or archive member,  
 27601 and shall be flushed to standard error. The trailing <newline>, which shall not be buffered, is  
 27602 written when the file has been read or written.

27603 If the **-s** option is specified, and the replacement string has a trailing 'p', substitutions shall be  
 27604 written to standard error in the following format:

27605 "%sΔ>>Δ%s\n", <original pathname>, <new pathname>

27606 In all operating modes of *pax*, optional messages of unspecified format concerning the input  
 27607 archive format and volume number, the number of files, blocks, volumes, and media parts as  
 27608 well as other diagnostic messages may be written to standard error.

27609 In all formats, for both standard output and standard error, it is unspecified how non-printable  
 27610 characters in pathnames or link names are written.

27611 When *pax* is in **read** mode or **list** mode, using the **-xpax** archive format, and a filename, link  
 27612 name, owner name, or any other field in an extended header record cannot be translated from  
 27613 the **pax** UTF-8 codeset format to the codeset and current locale of the implementation, *pax* shall  
 27614 write a diagnostic message to standard error, shall process the file as described for the **-o**  
 27615 **invalid=**option, and then shall process the next file in the archive.

27616 **OUTPUT FILES**

27617 In **read** mode, the extracted output files shall be of the archived file type. In **copy** mode, the  
 27618 copied output files shall be the type of the file being copied. In either mode, existing files in the  
 27619 destination hierarchy shall be overwritten only when all permission (**-p**), modification time (**-u**),  
 27620 and invalid-value (**-oinvalid=**) tests allow it.

27621 In **write** mode, the output file named by the **-f** option-argument shall be a file formatted  
 27622 according to one of the specifications in the EXTENDED DESCRIPTION section, or some other  
 27623 implementation-defined format.

27624 **EXTENDED DESCRIPTION**27625 **pax Interchange Format**

27626 A *pax* archive tape or file produced in the **-xpax** format shall contain a series of blocks. The  
 27627 physical layout of the archive shall be identical to the **ustar** format described in **ustar**  
 27628 **Interchange Format** (on page 717). Each file archived shall be represented by the following  
 27629 sequence:

- 27630 • An optional header block with extended header records. This header block is of the form  
 27631 described in **pax Header Block** (on page 713), with a *typeflag* value of **x** or **g**. The extended  
 27632 header records, described in **pax Extended Header** (on page 714), shall be included as the  
 27633 data for this header block.
- 27634 • A header block that describes the file. Any fields in the preceding optional extended header  
 27635 shall override the associated fields in this header block for this file.
- 27636 • Zero or more blocks that contain the contents of the file.

27637 At the end of the archive file there shall be two 512-byte blocks filled with binary zeros,  
 27638 interpreted as an end-of-archive indicator.

27639 A schematic of an example archive with global extended header records and two actual files is  
 27640 shown in Figure 4-1. In the example, the second file in the archive has no extended header  
 27641 preceding it, presumably because it has no need for extended attributes.

27642

27643

**Figure 4-1** pax Format Archive Example

27644

### **pax Header Block**

27645 The **pax** header block shall be identical to the **ustar** header block described in **ustar Interchange**  
 27646 **Format** (on page 717), except that two additional *typeflag* values are defined:

27647 x Represents extended header records for the following file in the archive (which shall have  
 27648 its own **ustar** header block). The format of these extended header records shall be as  
 27649 described in **pax Extended Header** (on page 714).

27650 g Represents global extended header records for the following files in the archive. The format  
 27651 of these extended header records shall be as described in **pax Extended Header** (on page  
 27652 714). Each value shall affect all subsequent files that do not override that value in their own  
 27653 extended header record and until another global extended header record is reached that  
 27654 provides another value for the same field. The *typeflag g* global headers should not be used  
 27655 with interchange media that could suffer partial data loss in transporting the archive.

27656 For both of these types, the *size* field shall be the size of the extended header records in octets.  
 27657 The other fields in the header block are not meaningful to this version of the *pax* utility.  
 27658 However, if this archive is read by a *pax* utility conforming to the ISO POSIX-2: 1993 standard,  
 27659 the header block fields are used to create a regular file that contains the extended header records  
 27660 as data. Therefore, header block field values should be selected to provide reasonable file access  
 27661 to this regular file.

27662 A further difference from the **ustar** header block is that data blocks for files of *typeflag* 1 (the digit  
 27663 one) (hard link) may be included, which means that the size field may be greater than zero.  
 27664 Archives created by *pax -o linkdata* shall include these data blocks with the hard links.

## 27665 **pax Extended Header**

27666 A **pax** extended header contains values that are inappropriate for the **ustar** header block because  
 27667 of limitations in that format: fields requiring a character encoding other than that described in  
 27668 the ISO/IEC 646:1991 standard, fields representing file attributes not described in the **ustar**  
 27669 header, and fields whose format or length do not fit the requirements of the **ustar** header. The  
 27670 values in an extended header add attributes to the following file (or files; see the description of  
 27671 the *typeflag g* header block) or override values in the following header block(s), as indicated in  
 27672 the following list of keywords.

27673 An extended header shall consist of one or more records, each constructed as follows:

27674 "%d %s=%s\n", <length>, <keyword>, <value>

27675 The extended header records shall be encoded according to the ISO/IEC 10646-1:2000 standard  
 27676 (UTF-8). The <length> field, <blank>, equals sign, and <newline> shown shall be limited to the  
 27677 portable character set, as encoded in UTF-8. The <keyword> and <value> fields can be any UTF-8  
 27678 characters. The <length> field shall be the decimal length of the extended header record in octets,  
 27679 including the trailing <newline>.

27680 The <keyword> field shall be one of the entries from the following list or a keyword provided as  
 27681 an implementation extension. Keywords consisting entirely of lowercase letters, digits, and  
 27682 periods are reserved for future standardization. A keyword shall not include an equals sign. (In  
 27683 the following list, the notations “file(s)” or “block(s)” is used to acknowledge that a keyword  
 27684 affects the following single file after a *typeflag x* extended header, but possibly multiple files after  
 27685 *typeflag g*. Any requirements in the list for *pax* to include a record when in **write** or **copy** mode  
 27686 shall apply only when such a record has not already been provided through the use of the **-o**  
 27687 option. When used in **copy** mode, *pax* shall behave as if an archive had been created with  
 27688 applicable extended header records and then extracted.)

27689 **atime** The file access time for the following file(s), equivalent to the value of the *st\_atime*  
 27690 member of the **stat** structure for a file, as described by the *stat()* function. The  
 27691 access time shall be restored if the process has the appropriate privilege required  
 27692 to do so. The format of the <value> shall be as described in **pax Extended Header**  
 27693 **File Times** (on page 717).

27694 **charset** The name of the character set used to encode the data in the following file(s). The  
 27695 entries in the following table are defined to refer to known standards; additional  
 27696 names may be agreed on between the originator and recipient.

| ISO-IRΔ8859Δ14Δ1998     | ISO / IEC 8859-14: 1998         |
| ISO-IRΔ8859Δ15Δ1999     | ISO / IEC 8859-15: 1999         |
| ISO-IRΔ10646Δ2000       | ISO / IEC 10646: 2000           |
| ISO-IRΔ10646Δ2000ΔUTF-8 | ISO / IEC 10646, UTF-8 encoding |
| BINARY                  | None.                           |

27716  
27717  
27718

The encoding is included in an extended header for information only; when *pax* is used as described in IEEE Std 1003.1-2001, it shall not translate the file data into any other encoding. The **BINARY** entry indicates unencoded binary data.

27719  
27720

When used in **write** or **copy** mode, it is implementation-defined whether *pax* includes a **charset** extended header record for a file.

27721 **comment**  
27722

A series of characters used as a comment. All characters in the <value> field shall be ignored by *pax*.

27723 **ctime**  
27724  
27725  
27726  
27727

The file creation time for the following file(s), equivalent to the value of the *st\_ctime* member of the **stat** structure for a file, as described by the *stat()* function. The creation time shall be restored if the process has the appropriate privilege required to do so. The format of the <value> shall be as described in **pax Extended Header File Times** (on page 717).

27728 **gid**  
27729  
27730  
27731  
27732

The group ID of the group that owns the file, expressed as a decimal number using digits from the ISO / IEC 646: 1991 standard. This record shall override the *gid* field in the following header block(s). When used in **write** or **copy** mode, *pax* shall include a *gid* extended header record for each file whose group ID is greater than 2 097 151 (octal 7 777 777).

27733 **gname**  
27734  
27735  
27736  
27737  
27738  
27739  
27740  
27741  
27742

The group of the file(s), formatted as a group name in the group database. This record shall override the *gid* and *gname* fields in the following header block(s), and any *gid* extended header record. When used in **read**, **copy**, or **list** mode, *pax* shall translate the name from the UTF-8 encoding in the header record to the character set appropriate for the group database on the receiving system. If any of the UTF-8 characters cannot be translated, and if the **-oinvalid=UTF-8** option is not specified, the results are implementation-defined. When used in **write** or **copy** mode, *pax* shall include a **gname** extended header record for each file whose group name cannot be represented entirely with the letters and digits of the portable character set.

27743 **linkpath**  
27744  
27745

The pathname of a link being created to another file, of any type, previously archived. This record shall override the *linkname* field in the following **ustar** header block(s). The following **ustar** header block shall determine the type of link created.

|       |                     |                                                                                                                     |
|-------|---------------------|---------------------------------------------------------------------------------------------------------------------|
| 27746 |                     | If <i>typeflag</i> of the following header block is 1, it shall be a hard link. If <i>typeflag</i> is 2, it         |
| 27747 |                     | shall be a symbolic link and the <b>linkpath</b> value shall be the contents of the                                 |
| 27748 |                     | symbolic link. The <i>pax</i> utility shall translate the name of the link (contents of the                         |
| 27749 |                     | symbolic link) from the UTF-8 encoding to the character set appropriate for the                                     |
| 27750 |                     | local file system. When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <b>linkpath</b>        |
| 27751 |                     | extended header record for each link whose pathname cannot be represented                                           |
| 27752 |                     | entirely with the members of the portable character set other than NUL.                                             |
| 27753 | <b>mtime</b>        | The file modification time of the following file(s), equivalent to the value of the                                 |
| 27754 |                     | <i>st_mtime</i> member of the <b>stat</b> structure for a file, as described in the <i>stat()</i> function.         |
| 27755 |                     | This record shall override the <i>mtime</i> field in the following header block(s). The                             |
| 27756 |                     | modification time shall be restored if the process has the appropriate privilege                                    |
| 27757 |                     | required to do so. The format of the <value> shall be as described in <b>pax Extended</b>                           |
| 27758 |                     | <b>Header File Times</b> (on page 717).                                                                             |
| 27759 | <b>path</b>         | The pathname of the following file(s). This record shall override the <i>name</i> and                               |
| 27760 |                     | <i>prefix</i> fields in the following header block(s). The <i>pax</i> utility shall translate the                   |
| 27761 |                     | pathname of the file from the UTF-8 encoding to the character set appropriate for                                   |
| 27762 |                     | the local file system.                                                                                              |
| 27763 |                     | When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a <i>path</i> extended header record        |
| 27764 |                     | for each file whose pathname cannot be represented entirely with the members of                                     |
| 27765 |                     | the portable character set other than NUL.                                                                          |
| 27766 | <b>realtime.any</b> | The keywords prefixed by “realtime.” are reserved for future standardization.                                       |
| 27767 | <b>security.any</b> | The keywords prefixed by “security.” are reserved for future standardization.                                       |
| 27768 | <b>size</b>         | The size of the file in octets, expressed as a decimal number using digits from the                                 |
| 27769 |                     | ISO/IEC 646:1991 standard. This record shall override the <i>size</i> field in the                                  |
| 27770 |                     | following header block(s). When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a                |
| 27771 |                     | <i>size</i> extended header record for each file with a size value greater than 8 589 934 591                       |
| 27772 |                     | (octal 77 777 777 777).                                                                                             |
| 27773 | <b>uid</b>          | The user ID of the file owner, expressed as a decimal number using digits from the                                  |
| 27774 |                     | ISO/IEC 646:1991 standard. This record shall override the <i>uid</i> field in the                                   |
| 27775 |                     | following header block(s). When used in <b>write</b> or <b>copy</b> mode, <i>pax</i> shall include a                |
| 27776 |                     | <i>uid</i> extended header record for each file whose owner ID is greater than 2 097 151                            |
| 27777 |                     | (octal 7 777 777).                                                                                                  |
| 27778 | <b>uname</b>        | The owner of the following file(s), formatted as a user name in the user database.                                  |
| 27779 |                     | This record shall override the <i>uid</i> and <i>uname</i> fields in the following header block(s),                 |
| 27780 |                     | and any <i>uid</i> extended header record. When used in <b>read</b> , <b>copy</b> , or <b>list</b> mode, <i>pax</i> |
| 27781 |                     | shall translate the name from the UTF-8 encoding in the header record to the                                        |
| 27782 |                     | character set appropriate for the user database on the receiving system. If any of                                  |
| 27783 |                     | the UTF-8 characters cannot be translated, and if the <b>-oinvalid=</b> UTF-8 option is                             |
| 27784 |                     | not specified, the results are implementation-defined. When used in <b>write</b> or <b>copy</b>                     |
| 27785 |                     | mode, <i>pax</i> shall include a <b>uname</b> extended header record for each file whose user                       |
| 27786 |                     | name cannot be represented entirely with the letters and digits of the portable                                     |
| 27787 |                     | character set.                                                                                                      |
| 27788 |                     | If the <value> field is zero length, it shall delete any header block field, previously entered                     |
| 27789 |                     | extended header value, or global extended header value of the same name.                                            |
| 27790 |                     | If a keyword in an extended header record (or in a <b>-o</b> option-argument) overrides or deletes a                |
| 27791 |                     | corresponding field in the <b>ustar</b> header block, <i>pax</i> shall ignore the contents of that header block     |
| 27792 |                     | field.                                                                                                              |

27793 Unlike the **ustar** header block fields, NULs shall not delimit *<value>*s; all characters within the  
 27794 *<value>* field shall be considered data for the field. None of the length limitations of the **ustar**  
 27795 header block fields in Table 4-13 (on page 718) shall apply to the extended header records.

#### 27796 **pax Extended Header Keyword Precedence**

27797 This section describes the precedence in which the various header records and fields and  
 27798 command line options are selected to apply to a file in the archive. When *pax* is used in **read** or  
 27799 **list** modes, it shall determine a file attribute in the following sequence:

- 27800 1. If **-odelete=keyword-prefix** is used, the affected attributes shall be determined from step 7.,  
 27801 if applicable, or ignored otherwise.
- 27802 2. If **-okeyword:=** is used, the affected attributes shall be ignored.
- 27803 3. If **-okeyword:=value** is used, the affected attribute shall be assigned the value.
- 27804 4. If there is a *typeflag* **x** extended header record, the affected attribute shall be assigned the  
 27805 *<value>*. When extended header records conflict, the last one given in the header shall take  
 27806 precedence.
- 27807 5. If **-okeyword=value** is used, the affected attribute shall be assigned the value.
- 27808 6. If there is a *typeflag* **g** global extended header record, the affected attribute shall be  
 27809 assigned the *<value>*. When global extended header records conflict, the last one given in  
 27810 the global header shall take precedence.
- 27811 7. Otherwise, the attribute shall be determined from the **ustar** header block.

#### 27812 **pax Extended Header File Times**

27813 The *pax* utility shall write an **mtime** record for each file in **write** or **copy** modes if the file's  
 27814 modification time cannot be represented exactly in the **ustar** header logical record described in  
 27815 **ustar Interchange Format**. This can occur if the time is out of **ustar** range, or if the file system of  
 27816 the underlying implementation supports non-integer time granularities and the time is not an  
 27817 integer. All of these time records shall be formatted as a decimal representation of the time in  
 27818 seconds since the Epoch. If a period ( ' . ' ) decimal point character is present, the digits to the  
 27819 right of the point shall represent the units of a subsecond timing granularity, where the first digit  
 27820 is tenths of a second and each subsequent digit is a tenth of the previous digit. In **read** or **copy**  
 27821 mode, the *pax* utility shall truncate the time of a file to the greatest value that is not greater than  
 27822 the input header file time. In **write** or **copy** mode, the *pax* utility shall output a time exactly if it  
 27823 can be represented exactly as a decimal number, and otherwise shall generate only enough digits  
 27824 so that the same time shall be recovered if the file is extracted on a system whose underlying  
 27825 implementation supports the same time granularity.

#### 27826 **ustar Interchange Format**

27827 A **ustar** archive tape or file shall contain a series of logical records. Each logical record shall be a  
 27828 fixed-size logical record of 512 octets (see below). Although this format may be thought of as  
 27829 being stored on 9-track industry-standard 12.7 mm (0.5 in) magnetic tape, other types of  
 27830 transportable media are not excluded. Each file archived shall be represented by a header logical  
 27831 record that describes the file, followed by zero or more logical records that give the contents of  
 27832 the file. At the end of the archive file there shall be two 512-octet logical records filled with  
 27833 binary zeros, interpreted as an end-of-archive indicator.

27834 The logical records may be grouped for physical I/O operations, as described under the  
 27835 **-bblocksize** and **-x ustar** options. Each group of logical records may be written with a single  
 27836 operation equivalent to the *write()* function. On magnetic tape, the result of this write shall be a

single tape physical block. The last physical block shall always be the full size, so logical records after the two zero logical records may contain undefined data.

The header logical record shall be structured as shown in the following table. All lengths and offsets are in decimal.

**Table 4-13** ustar Header Block

| Field Name      | Octet Offset | Length (in Octets) |
|-----------------|--------------|--------------------|
| <i>name</i>     | 0            | 100                |
| <i>mode</i>     | 100          | 8                  |
| <i>uid</i>      | 108          | 8                  |
| <i>gid</i>      | 116          | 8                  |
| <i>size</i>     | 124          | 12                 |
| <i>mtime</i>    | 136          | 12                 |
| <i>chksum</i>   | 148          | 8                  |
| <i>typeflag</i> | 156          | 1                  |
| <i>linkname</i> | 157          | 100                |
| <i>magic</i>    | 257          | 6                  |
| <i>version</i>  | 263          | 2                  |
| <i>uname</i>    | 265          | 32                 |
| <i>gname</i>    | 297          | 32                 |
| <i>devmajor</i> | 329          | 8                  |
| <i>devminor</i> | 337          | 8                  |
| <i>prefix</i>   | 345          | 155                |

All characters in the header logical record shall be represented in the coded character set of the ISO/IEC 646:1991 standard. For maximum portability between implementations, names should be selected from characters represented by the portable filename character set as octets with the most significant bit zero. If an implementation supports the use of characters outside of slash and the portable filename character set in names for files, users, and groups, one or more implementation-defined encodings of these characters shall be provided for interchange purposes.

However, the *pax* utility shall never create filenames on the local system that cannot be accessed via the procedures described in IEEE Std 1003.1-2001. If a filename is found on the medium that would create an invalid filename, it is implementation-defined whether the data from the file is stored on the file hierarchy and under what name it is stored. The *pax* utility may choose to ignore these files as long as it produces an error indicating that the file is being ignored.

Each field within the header logical record is contiguous; that is, there is no padding used. Each character on the archive medium shall be stored contiguously.

The fields *magic*, *uname*, and *gname* are character strings each terminated by a NUL character. The fields *name*, *linkname*, and *prefix* are NUL-terminated character strings except when all characters in the array contain non-NUL characters including the last character. The *version* field is two octets containing the characters "00" (zero-zero). The *typeflag* contains a single character. All other fields are leading zero-filled octal numbers using digits from the ISO/IEC 646:1991 standard IRV. Each numeric field is terminated by one or more <space> or NUL characters.

The *name* and the *prefix* fields shall produce the pathname of the file. A new pathname shall be formed, if *prefix* is not an empty string (its first character is not NUL), by concatenating *prefix* (up to the first NUL character), a slash character, and *name*; otherwise, *name* is used alone. In either case, *name* is terminated at the first NUL character. If *prefix* begins with a NUL character, it shall be ignored. In this manner, pathnames of at most 256 characters can be supported. If a pathname

27884 does not fit in the space provided, *pax* shall notify the user of the error, and shall not store any  
27885 part of the file—header or data—on the medium.

27886 The *linkname* field, described below, shall not use the *prefix* to produce a pathname. As such, a  
27887 *linkname* is limited to 100 characters. If the name does not fit in the space provided, *pax* shall  
27888 notify the user of the error, and shall not attempt to store the link on the medium.

27889 The *mode* field provides 12 bits encoded in the ISO/IEC 646:1991 standard octal digit  
27890 representation. The encoded bits shall represent the following values:

27891 **Table 4-14** *ustar mode* Field

| 27892 | Bit Value | IEEE Std 1003.1-2001 Bit | Description                                     |
|-------|-----------|--------------------------|-------------------------------------------------|
| 27893 | 04 000    | S_ISUID                  | Set UID on execution.                           |
| 27894 | 02 000    | S_ISGID                  | Set GID on execution.                           |
| 27895 | 01 000    | <reserved>               | Reserved for future standardization.            |
| 27896 | 00 400    | S_IRUSR                  | Read permission for file owner class.           |
| 27897 | 00 200    | S_IWUSR                  | Write permission for file owner class.          |
| 27898 | 00 100    | S_IXUSR                  | Execute/search permission for file owner class. |
| 27899 | 00 040    | S_IRGRP                  | Read permission for file group class.           |
| 27900 | 00 020    | S_IWGRP                  | Write permission for file group class.          |
| 27901 | 00 010    | S_IXGRP                  | Execute/search permission for file group class. |
| 27902 | 00 004    | S_IROTH                  | Read permission for file other class.           |
| 27903 | 00 002    | S_IWOTH                  | Write permission for file other class.          |
| 27904 | 00 001    | S_IXOTH                  | Execute/search permission for file other class. |

27905 When appropriate privilege is required to set one of these mode bits, and the user restoring the  
27906 files from the archive does not have the appropriate privilege, the mode bits for which the user  
27907 does not have appropriate privilege shall be ignored. Some of the mode bits in the archive  
27908 format are not mentioned elsewhere in this volume of IEEE Std 1003.1-2001. If the  
27909 implementation does not support those bits, they may be ignored.

27910 The *uid* and *gid* fields are the user and group ID of the owner and group of the file, respectively.

27911 The *size* field is the size of the file in octets. If the *typeflag* field is set to specify a file to be of type  
27912 1 (a link) or 2 (a symbolic link), the *size* field shall be specified as zero. If the *typeflag* field is set to  
27913 specify a file of type 5 (directory), the *size* field shall be interpreted as described under the  
27914 definition of that record type. No data logical records are stored for types 1, 2, or 5. If the *typeflag*  
27915 field is set to 3 (character special file), 4 (block special file), or 6 (FIFO), the meaning of the *size*  
27916 field is unspecified by this volume of IEEE Std 1003.1-2001, and no data logical records shall be  
27917 stored on the medium. Additionally, for type 6, the *size* field shall be ignored when reading. If  
27918 the *typeflag* field is set to any other value, the number of logical records written following the  
27919 header shall be  $(size+511)/512$ , ignoring any fraction in the result of the division.

27920 The *mtime* field shall be the modification time of the file at the time it was archived. It is the  
27921 ISO/IEC 646:1991 standard representation of the octal value of the modification time obtained  
27922 from the *stat()* function.

27923 The *chksum* field shall be the ISO/IEC 646:1991 standard IRV representation of the octal value of  
27924 the simple sum of all octets in the header logical record. Each octet in the header shall be treated  
27925 as an unsigned value. These values shall be added to an unsigned integer, initialized to zero, the  
27926 precision of which is not less than 17 bits. When calculating the checksum, the *chksum* field is  
27927 treated as if it were all spaces.

27928 The *typeflag* field specifies the type of file archived. If a particular implementation does not  
27929 recognize the type, or the user does not have appropriate privilege to create that type, the file

|       |       |                                                                                                                      |
|-------|-------|----------------------------------------------------------------------------------------------------------------------|
| 27930 |       | shall be extracted as if it were a regular file if the file type is defined to have a meaning for the                |
| 27931 |       | <i>size</i> field that could cause data logical records to be written on the medium (see the previous                |
| 27932 |       | description for <i>size</i> ). If conversion to a regular file occurs, the <i>pax</i> utility shall produce an error |
| 27933 |       | indicating that the conversion took place. All of the <i>typeflag</i> fields shall be coded in the                   |
| 27934 |       | ISO / IEC 646: 1991 standard IRV:                                                                                    |
| 27935 | 0     | Represents a regular file. For backwards-compatibility, a <i>typeflag</i> value of binary zero                       |
| 27936 |       | (' \0 ') should be recognized as meaning a regular file when extracting files from the                               |
| 27937 |       | archive. Archives written with this version of the archive file format create regular files                          |
| 27938 |       | with a <i>typeflag</i> value of the ISO / IEC 646: 1991 standard IRV ' 0 '.                                          |
| 27939 | 1     | Represents a file linked to another file, of any type, previously archived. Such files are                           |
| 27940 |       | identified by each file having the same device and file serial number. The linked-to                                 |
| 27941 |       | name is specified in the <i>linkname</i> field with a NUL-character terminator if it is less than                    |
| 27942 |       | 100 octets in length.                                                                                                |
| 27943 | 2     | Represents a symbolic link. The contents of the symbolic link shall be stored in the                                 |
| 27944 |       | <i>linkname</i> field.                                                                                               |
| 27945 | 3 , 4 | Represent character special files and block special files respectively. In this case the                             |
| 27946 |       | <i>devmajor</i> and <i>devminor</i> fields shall contain information defining the device, the format                 |
| 27947 |       | of which is unspecified by this volume of IEEE Std 1003.1-2001. Implementations may                                  |
| 27948 |       | map the device specifications to their own local specification or may ignore the entry.                              |
| 27949 | 5     | Specifies a directory or subdirectory. On systems where disk allocation is performed on                              |
| 27950 |       | a directory basis, the <i>size</i> field shall contain the maximum number of octets (which may                       |
| 27951 |       | be rounded to the nearest disk block allocation unit) that the directory may hold. A <i>size</i>                     |
| 27952 |       | field of zero indicates no such limiting. Systems that do not support limiting in this                               |
| 27953 |       | manner should ignore the <i>size</i> field.                                                                          |
| 27954 | 6     | Specifies a FIFO special file. Note that the archiving of a FIFO file archives the existence                         |
| 27955 |       | of this file and not its contents.                                                                                   |
| 27956 | 7     | Reserved to represent a file to which an implementation has associated some high-                                    |
| 27957 |       | performance attribute. Implementations without such extensions should treat this file                                |
| 27958 |       | as a regular file (type 0).                                                                                          |
| 27959 | A - Z | The letters ' A ' to ' Z ', inclusive, are reserved for custom implementations. All other                            |
| 27960 |       | values are reserved for future versions of IEEE Std 1003.1-2001.                                                     |
| 27961 |       | Attempts to archive a socket using <b>ustar</b> interchange format shall produce a diagnostic message.               |
| 27962 |       | Handling of other file types is implementation-defined.                                                              |
| 27963 |       | The <i>magic</i> field is the specification that this archive was output in this archive format. If this field       |
| 27964 |       | contains <b>ustar</b> (the five characters from the ISO / IEC 646: 1991 standard IRV shown followed by               |
| 27965 |       | NUL), the <i>uname</i> and <i>gname</i> fields shall contain the ISO / IEC 646: 1991 standard IRV                    |
| 27966 |       | representation of the owner and group of the file, respectively (truncated to fit, if necessary).                    |
| 27967 |       | When the file is restored by a privileged, protection-preserving version of the utility, the user                    |
| 27968 |       | and group databases shall be scanned for these names. If found, the user and group IDs                               |
| 27969 |       | contained within these files shall be used rather than the values contained within the <i>uid</i> and <i>gid</i>     |
| 27970 |       | fields.                                                                                                              |

**cpio Interchange Format**

The octet-oriented **cpio** archive format shall be a series of entries, each comprising a header that describes the file, the name of the file, and then the contents of the file.

An archive may be recorded as a series of fixed-size blocks of octets. This blocking shall be used only to make physical I/O more efficient. The last group of blocks shall always be at the full size.

For the octet-oriented **cpio** archive format, the individual entry information shall be in the order indicated and described by the following table; see also the **<cpio.h>** header.

**Table 4-15** Octet-Oriented cpio Archive Entry

| Header Field Name    | Length (in Octets) | Interpreted as  |
|----------------------|--------------------|-----------------|
| <i>c_magic</i>       | 6                  | Octal number    |
| <i>c_dev</i>         | 6                  | Octal number    |
| <i>c_ino</i>         | 6                  | Octal number    |
| <i>c_mode</i>        | 6                  | Octal number    |
| <i>c_uid</i>         | 6                  | Octal number    |
| <i>c_gid</i>         | 6                  | Octal number    |
| <i>c_nlink</i>       | 6                  | Octal number    |
| <i>c_rdev</i>        | 6                  | Octal number    |
| <i>c_mtime</i>       | 11                 | Octal number    |
| <i>c_namesize</i>    | 6                  | Octal number    |
| <i>c_filesize</i>    | 11                 | Octal number    |
| Filename Field Name  | Length             | Interpreted as  |
| <i>c_name</i>        | <i>c_namesize</i>  | Pathname string |
| File Data Field Name | Length             | Interpreted as  |
| <i>c_filedata</i>    | <i>c_filesize</i>  | Data            |

**cpio Header**

For each file in the archive, a header as defined previously shall be written. The information in the header fields is written as streams of the ISO/IEC 646:1991 standard characters interpreted as octal numbers. The octal numbers shall be extended to the necessary length by appending the ISO/IEC 646:1991 standard IRV zeros at the most-significant-digit end of the number; the result is written to the most-significant digit of the stream of octets first. The fields shall be interpreted as follows:

*c\_magic* Identify the archive as being a transportable archive by containing the identifying value "070707".

*c\_dev, c\_ino* Contains values that uniquely identify the file within the archive (that is, no files contain the same pair of *c\_dev* and *c\_ino* values unless they are links to the same file). The values shall be determined in an unspecified manner.

*c\_mode* Contains the file type and access permissions as defined in the following table.

28033

28034

28035

28036

Directories, FIFOs, symbolic links, and regular files shall be supported on a system conforming to this volume of IEEE Std 1003.1-2001; additional values defined previously are reserved for compatibility with existing systems. Additional file types may be supported; however, such files should not be written to archives intended to be transported to other systems.

28037

*c\_uid*

Contains the user ID of the owner.

28038

*c\_gid*

Contains the group ID of the group.

28039

*c\_nlink*

Contains the number of links referencing the file at the time the archive was created.

28040

28041

*c\_rdev*

Contains implementation-defined information for character or block special files.

28042

*c\_mtime*

Contains the latest time of modification of the file at the time the archive was created.

28043

28044

*c\_namesize*

Contains the length of the pathname, including the terminating NUL character.

28045

*c\_filesize*

Contains the length of the file in octets. This shall be the length of the data section following the header structure.

28046

28047 **cpio Filename**

28048 The *c\_name* field shall contain the pathname of the file. The length of this field in octets is the  
 28049 value of *c\_namesize*.

28050 If a filename is found on the medium that would create an invalid pathname, it is  
 28051 implementation-defined whether the data from the file is stored on the file hierarchy and under  
 28052 what name it is stored.

28053 All characters shall be represented in the ISO/IEC 646:1991 standard IRV. For maximum  
 28054 portability between implementations, names should be selected from characters represented by  
 28055 the portable filename character set as octets with the most significant bit zero. If an  
 28056 implementation supports the use of characters outside the portable filename character set in  
 28057 names for files, users, and groups, one or more implementation-defined encodings of these  
 28058 characters shall be provided for interchange purposes. However, the *pax* utility shall never  
 28059 create filenames on the local system that cannot be accessed via the procedures described  
 28060 previously in this volume of IEEE Std 1003.1-2001. If a filename is found on the medium that  
 28061 would create an invalid filename, it is implementation-defined whether the data from the file is  
 28062 stored on the local file system and under what name it is stored. The *pax* utility may choose to  
 28063 ignore these files as long as it produces an error indicating that the file is being ignored.

28064 **cpio File Data**

28065 Following *c\_name*, there shall be *c\_filesize* octets of data. Interpretation of such data occurs in a  
 28066 manner dependent on the file. If *c\_filesize* is zero, no data shall be contained in *c\_filedata*.

28067 When restoring from an archive:

- 28068 • If the user does not have the appropriate privilege to create a file of the specified type, *pax*  
 28069 shall ignore the entry and write an error message to standard error.
- 28070 • Only regular files have data to be restored. Presuming a regular file meets any selection  
 28071 criteria that might be imposed on the format-reading utility by the user, such data shall be  
 28072 restored.
- 28073 • If a user does not have appropriate privilege to set a particular mode flag, the flag shall be  
 28074 ignored. Some of the mode flags in the archive format are not mentioned elsewhere in this  
 28075 volume of IEEE Std 1003.1-2001. If the implementation does not support those flags, they  
 28076 may be ignored.

28077 **cpio Special Entries**

28078 FIFO special files, directories, and the trailer shall be recorded with *c\_filesize* equal to zero. For  
 28079 other special files, *c\_filesize* is unspecified by this volume of IEEE Std 1003.1-2001. The header for  
 28080 the next file entry in the archive shall be written directly after the last octet of the file entry  
 28081 preceding it. A header denoting the filename **TRAILER!!!** shall indicate the end of the archive;  
 28082 the contents of octets in the last block of the archive following such a header are undefined.

28083 **EXIT STATUS**

28084 The following exit values shall be returned:

- 28085 0 All files were processed successfully.
- 28086 >0 An error occurred.

28087 **CONSEQUENCES OF ERRORS**

28088 If *pax* cannot create a file or a link when reading an archive or cannot find a file when writing an  
 28089 archive, or cannot preserve the user ID, group ID, or file mode when the **-p** option is specified, a  
 28090 diagnostic message shall be written to standard error and a non-zero exit status shall be  
 28091 returned, but processing shall continue. In the case where *pax* cannot create a link to a file, *pax*  
 28092 shall not, by default, create a second copy of the file.

28093 If the extraction of a file from an archive is prematurely terminated by a signal or error, *pax* may  
 28094 have only partially extracted the file or (if the **-n** option was not specified) may have extracted a  
 28095 file of the same name as that specified by the user, but which is not the file the user wanted.  
 28096 Additionally, the file modes of extracted directories may have additional bits from the S\_IRWXU  
 28097 mask set as well as incorrect modification and access times.

28098 **APPLICATION USAGE**

28099 The **-p** (privileges) option was invented to reconcile differences between historical *tar* and *cpio*  
 28100 implementations. In particular, the two utilities use **-m** in diametrically opposed ways. The **-p**  
 28101 option also provides a consistent means of extending the ways in which future file attributes can  
 28102 be addressed, such as for enhanced security systems or high-performance files. Although it may  
 28103 seem complex, there are really two modes that are most commonly used:

28104 **-p e** “Preserve everything”. This would be used by the historical superuser, someone with  
 28105 all the appropriate privileges, to preserve all aspects of the files as they are recorded in  
 28106 the archive. The **e** flag is the sum of **o** and **p**, and other implementation-defined  
 28107 attributes.

28108 **-p p** “Preserve” the file mode bits. This would be used by the user with regular privileges  
 28109 who wished to preserve aspects of the file other than the ownership. The file times are  
 28110 preserved by default, but two other flags are offered to disable these and use the time  
 28111 of extraction.

28112 The one pathname per line format of standard input precludes pathnames containing  
 28113 <newline>s. Although such pathnames violate the portable filename guidelines, they may exist  
 28114 and their presence may inhibit usage of *pax* within shell scripts. This problem is inherited from  
 28115 historical archive programs. The problem can be avoided by listing filename arguments on the  
 28116 command line instead of on standard input.

28117 It is almost certain that appropriate privileges are required for *pax* to accomplish parts of this  
 28118 volume of IEEE Std 1003.1-2001. Specifically, creating files of type block special or character  
 28119 special, restoring file access times unless the files are owned by the user (the **-t** option), or  
 28120 preserving file owner, group, and mode (the **-p** option) all probably require appropriate  
 28121 privileges.

28122 In **read** mode, implementations are permitted to overwrite files when the archive has multiple  
 28123 members with the same name. This may fail if permissions on the first version of the file do not  
 28124 permit it to be overwritten.

28125 The **cpio** and **ustar** formats can only support files up to 8 589 934 592 bytes ( $8 * 2^{30}$ ) in size.

28126 **EXAMPLES**

28127 The following command:

28128 `pax -w -f /dev/rmt/1m .`

28129 copies the contents of the current directory to tape drive 1, medium density (assuming historical  
 28130 System V device naming procedures—the historical BSD device name would be **/dev/rmt9**).

28131 The following commands:

```

28132 mkdir newdir
28133 pax -rw olddir newdir
28134 copy the olddir directory hierarchy to newdir.
28135 pax -r -s ',^/*usr/*,, ' -f a.pax
28136 reads the archive a.pax, with all files rooted in /usr in the archive extracted relative to the current
28137 directory.
28138 Using the option:
28139 -o listopt="%M %(atime)T %(size)D %(name)s"
28140 overrides the default output description in Standard Output and instead writes:
28141 -rw-rw--- Jan 12 15:53 1492 /usr/foo/bar
28142 Using the options:
28143 -o listopt='%L\t%(size)D\n%.7' \
28144 -o listopt='(name)s\n%(ctime)T\n%T'
28145 overrides the default output description in Standard Output and instead writes:
28146 /usr/foo/bar -> /tmp 1492
28147 /usr/fo
28148 Jan 12 1991
28149 Jan 31 15:53
28150 RATIONALE
28151 The pax utility was new for the ISO POSIX-2:1993 standard. It represents a peaceful compromise
28152 between advocates of the historical tar and cpio utilities.
28153 A fundamental difference between cpio and tar was in the way directories were treated. The cpio
28154 utility did not treat directories differently from other files, and to select a directory and its
28155 contents required that each file in the hierarchy be explicitly specified. For tar, a directory
28156 matched every file in the file hierarchy it rooted.
28157 The pax utility offers both interfaces; by default, directories map into the file hierarchy they root.
28158 The -d option causes pax to skip any file not explicitly referenced, as cpio historically did. The tar
28159 -style behavior was chosen as the default because it was believed that this was the more
28160 common usage and because tar is the more commonly available interface, as it was historically
28161 provided on both System V and BSD implementations.
28162 The data interchange format specification in this volume of IEEE Std 1003.1-2001 requires that
28163 processes with “appropriate privileges” shall always restore the ownership and permissions of
28164 extracted files exactly as archived. If viewed from the historic equivalence between superuser
28165 and “appropriate privileges”, there are two problems with this requirement. First, users running
28166 as superusers may unknowingly set dangerous permissions on extracted files. Second, it is
28167 needlessly limiting, in that superusers cannot extract files and own them as superuser unless the
28168 archive was created by the superuser. (It should be noted that restoration of ownerships and
28169 permissions for the superuser, by default, is historical practice in cpio, but not in tar.) In order to
28170 avoid these two problems, the pax specification has an additional “privilege” mechanism, the -p
28171 option. Only a pax invocation with the privileges needed, and which has the -p option set using
28172 the e specification character, has the “appropriate privilege” to restore full ownership and
28173 permission information.
28174 Note also that this volume of IEEE Std 1003.1-2001 requires that the file ownership and access
28175 permissions shall be set, on extraction, in the same fashion as the creat() function when provided

```

28176 with the mode stored in the archive. This means that the file creation mask of the user is applied  
28177 to the file permissions.

28178 Users should note that directories may be created by *pax* while extracting files with permissions  
28179 that are different from those that existed at the time the archive was created. When extracting  
28180 sensitive information into a directory hierarchy that no longer exists, users are encouraged to set  
28181 their file creation mask appropriately to protect these files during extraction.

28182 The table of contents output is written to standard output to facilitate pipeline processing.

28183 An early proposal had hard links displaying for all pathnames. This was removed because it  
28184 complicates the output of the case where **-v** is not specified and does not match historical *cpio*  
28185 usage. The hard-link information is available in the **-v** display.

28186 The description of the **-l** option allows implementations to make hard links to symbolic links.  
28187 IEEE Std 1003.1-2001 does not specify any way to create a hard link to a symbolic link, but many  
28188 implementations provide this capability as an extension. If there are hard links to symbolic links  
28189 when an archive is created, the implementation is required to archive the hard link in the archive  
28190 (unless **-H** or **-L** is specified). When in **read** mode and in **copy** mode, implementations  
28191 supporting hard links to symbolic links should use them when appropriate.

28192 The archive formats inherited from the POSIX.1-1990 standard have certain restrictions that  
28193 have been brought along from historical usage. For example, there are restrictions on the length  
28194 of pathnames stored in the archive. When *pax* is used in **copy(-rw)** mode (copying directory  
28195 hierarchies), the ability to use extensions from the **-xpax** format overcomes these restrictions.

28196 The default *blocksize* value of 5 120 bytes for *cpio* was selected because it is one of the standard  
28197 block-size values for *cpio*, set when the **-B** option is specified. (The other default block-size value  
28198 for *cpio* is 512 bytes, and this was considered to be too small.) The default block value of 10 240  
28199 bytes for *tar* was selected because that is the standard block-size value for BSD *tar*. The  
28200 maximum block size of 32 256 bytes ( $2^{15}$ –512 bytes) is the largest multiple of 512 bytes that fits  
28201 into a signed 16-bit tape controller transfer register. There are known limitations in some  
28202 historical systems that would prevent larger blocks from being accepted. Historical values were  
28203 chosen to improve compatibility with historical scripts using *dd* or similar utilities to manipulate  
28204 archives. Also, default block sizes for any file type other than character special file has been  
28205 deleted from this volume of IEEE Std 1003.1-2001 as unimportant and not likely to affect the  
28206 structure of the resulting archive.

28207 Implementations are permitted to modify the block-size value based on the archive format or  
28208 the device to which the archive is being written. This is to provide implementations with the  
28209 opportunity to take advantage of special types of devices, and it should not be used without a  
28210 great deal of consideration as it almost certainly decreases archive portability.

28211 The intended use of the **-n** option was to permit extraction of one or more files from the archive  
28212 without processing the entire archive. This was viewed by the standard developers as offering  
28213 significant performance advantages over historical implementations. The **-n** option in early  
28214 proposals had three effects; the first was to cause special characters in patterns to not be treated  
28215 specially. The second was to cause only the first file that matched a pattern to be extracted. The  
28216 third was to cause *pax* to write a diagnostic message to standard error when no file was found  
28217 matching a specified pattern. Only the second behavior is retained by this volume of  
28218 IEEE Std 1003.1-2001, for many reasons. First, it is in general not acceptable for a single option to  
28219 have multiple effects. Second, the ability to make pattern matching characters act as normal  
28220 characters is useful for parts of *pax* other than file extraction. Third, a finer degree of control over  
28221 the special characters is useful because users may wish to normalize only a single special  
28222 character in a single filename. Fourth, given a more general escape mechanism, the previous  
28223 behavior of the **-n** option can be easily obtained using the **-s** option or a *sed* script. Finally,

28224 writing a diagnostic message when a pattern specified by the user is unmatched by any file is  
28225 useful behavior in all cases.

28226 In this version, the **-n** was removed from the **copy** mode synopsis of *pax*; it is inapplicable  
28227 because there are no pattern operands specified in this mode.

28228 There is another method than *pax* for copying subtrees in IEEE Std 1003.1-2001 described as part  
28229 of the *cp* utility. Both methods are historical practice: *cp* provides a simpler, more intuitive  
28230 interface, while *pax* offers a finer granularity of control. Each provides additional functionality to  
28231 the other; in particular, *pax* maintains the hard-link structure of the hierarchy while *cp* does not.  
28232 It is the intention of the standard developers that the results be similar (using appropriate option  
28233 combinations in both utilities). The results are not required to be identical; there seemed  
28234 insufficient gain to applications to balance the difficulty of implementations having to guarantee  
28235 that the results would be exactly identical.

28236 A single archive may span more than one file. It is suggested that implementations provide  
28237 informative messages to the user on standard error whenever the archive file is changed.

28238 The **-d** option (do not create intermediate directories not listed in the archive) found in early  
28239 proposals was originally provided as a complement to the historic **-d** option of *cpio*. It has been  
28240 deleted.

28241 The **-s** option in early proposals specified a subset of the substitution command from the *ed*  
28242 utility. As there was no reason for only a subset to be supported, the **-s** option is now  
28243 compatible with the current *ed* specification. Since the delimiter can be any non-null character,  
28244 the following usage with single spaces is valid:

28245 `pax -s " foo bar " ...`

28246 The **-t** description is worded so as to note that this may cause the access time update caused by  
28247 some other activity (which occurs while the file is being read) to be overwritten.

28248 The default behavior of *pax* with regard to file modification times is the same as historical  
28249 implementations of *tar*. It is not the historical behavior of *cpio*.

28250 Because the **-i** option uses **/dev/tty**, utilities without a controlling terminal are not able to use  
28251 this option.

28252 The **-y** option, found in early proposals, has been deleted because a line containing a single  
28253 period for the **-i** option has equivalent functionality. The special lines for the **-i** option (a single  
28254 period and the empty line) are historical practice in *cpio*.

28255 In early drafts, a **-echarmap** option was included to increase portability of files between systems  
28256 using different coded character sets. This option was omitted because it was apparent that  
28257 consensus could not be formed for it. In this version, the use of UTF-8 should be an adequate  
28258 substitute.

28259 The **-k** option was added to address international concerns about the dangers involved in the  
28260 character set transformations of **-e** (if the target character set were different from the source, the  
28261 filenames might be transformed into names matching existing files) and also was made more  
28262 general to protect files transferred between file systems with different {NAME\_MAX} values  
28263 (truncating a filename on a smaller system might also inadvertently overwrite existing files). As  
28264 stated, it prevents any overwriting, even if the target file is older than the source. This version  
28265 adds more granularity of options to solve this problem by introducing the **-oinvalid=** option—  
28266 specifically the UTF-8 action. (Note that an existing file that is named with a UTF-8 encoding is  
28267 still subject to overwriting in this case. The **-k** option closes that loophole.)

28268 Some of the file characteristics referenced in this volume of IEEE Std 1003.1-2001 might not be  
28269 supported by some archive formats. For example, neither the **tar** nor **cpio** formats contain the

28270 file access time. For this reason, the `e` specification character has been provided, intended to  
 28271 cause all file characteristics specified in the archive to be retained.

28272 It is required that extracted directories, by default, have their access and modification times and  
 28273 permissions set to the values specified in the archive. This has obvious problems in that the  
 28274 directories are almost certainly modified after being extracted and that directory permissions  
 28275 may not permit file creation. One possible solution is to create directories with the mode  
 28276 specified in the archive, as modified by the `umask` of the user, with sufficient permissions to  
 28277 allow file creation. After all files have been extracted, *pax* would then reset the access and  
 28278 modification times and permissions as necessary.

28279 The list-mode formatting description borrows heavily from the one defined by the *printf* utility.  
 28280 However, since there is no separate operand list to get conversion arguments, the format was  
 28281 extended to allow specifying the name of the conversion argument as part of the conversion  
 28282 specification.

28283 The `T` conversion specifier allows time fields to be displayed in any of the date formats. Unlike  
 28284 the *ls* utility, *pax* does not adjust the format when the date is less than six months in the past.  
 28285 This makes parsing the output more predictable.

28286 The `D` conversion specifier handles the ability to display the major/minor or file size, as with *ls*,  
 28287 by using `%-8 (size)D`.

28288 The `L` conversion specifier handles the *ls* display for symbolic links.

28289 Conversion specifiers were added to generate existing known types used for *ls*.

## 28290 **pax Interchange Format**

28291 The new POSIX data interchange format was developed primarily to satisfy international  
 28292 concerns that the **ustar** and **cpio** formats did not provide for file, user, and group names encoded  
 28293 in characters outside a subset of the ISO/IEC 646:1991 standard. The standard developers  
 28294 realized that this new POSIX data interchange format should be very extensible because there  
 28295 were other requirements they foresaw in the near future:

- 28296 • Support international character encodings and locale information
- 28297 • Support security information (ACLs, and so on)
- 28298 • Support future file types, such as realtime or contiguous files
- 28299 • Include data areas for implementation use
- 28300 • Support systems with words larger than 32 bits and timers with subsecond granularity

28301 The following were not goals for this format because these are better handled by separate  
 28302 utilities or are inappropriate for a portable format:

- 28303 • Encryption
- 28304 • Compression
- 28305 • Data translation between locales and codesets
- 28306 • *inode* storage

28307 The format chosen to support the goals is an extension of the **ustar** format. Of the two formats  
 28308 previously available, only the **ustar** format was selected for extensions because:

- 28309 • It was easier to extend in an upwards-compatible way. It offered version flags and header  
 28310 block type fields with room for future standardization. The **cpio** format, while possessing a  
 28311 more flexible file naming methodology, could not be extended without breaking some

28312           theoretical implementation or using a dummy filename that could be a legitimate filename.

28313           • Industry experience since the original “*tar wars*” fought in developing the ISO POSIX-1  
28314           standard has clearly been in favor of the **ustar** format, which is generally the default output  
28315           format selected for *pax* implementations on new systems.

28316           The new format was designed with one additional goal in mind: reasonable behavior when an  
28317           older *tar* or *pax* utility happened to read an archive. Since the POSIX.1-1990 standard mandated  
28318           that a “format-reading utility” had to treat unrecognized *typeflag* values as regular files, this  
28319           allowed the format to include all the extended information in a pseudo-regular file that preceded  
28320           each real file. An option is given that allows the archive creator to set up reasonable names for  
28321           these files on the older systems. Also, the normative text suggests that reasonable file access  
28322           values be used for this **ustar** header block. Making these header files inaccessible for convenient  
28323           reading and deleting would not be reasonable. File permissions of 600 or 700 are suggested.

28324           The **ustar** *typeflag* field was used to accommodate the additional functionality of the new format  
28325           rather than magic or version because the POSIX.1-1990 standard (and, by reference, the previous  
28326           version of *pax*), mandated the behavior of the format-reading utility when it encountered an  
28327           unknown *typeflag*, but was silent about the other two fields.

28328           Early proposals of the first revision to IEEE Std 1003.1-2001 contained a proposed archive format  
28329           that was based on compatibility with the standard for tape files (ISO 1001, similar to the format  
28330           used historically on many mainframes and minicomputers). This format was overly complex  
28331           and required considerable overhead in volume and header records. Furthermore, the standard  
28332           developers felt that it would not be acceptable to the community of POSIX developers, so it was  
28333           later changed to be a format more closely related to historical practice on POSIX systems.

28334           The prefix and name split of pathnames in **ustar** was replaced by the single path extended  
28335           header record for simplicity.

28336           The concept of a global extended header (*typeflag g*) was controversial. If this were applied to an  
28337           archive being recorded on magnetic tape, a few unreadable blocks at the beginning of the tape  
28338           could be a serious problem; a utility attempting to extract as many files as possible from a  
28339           damaged archive could lose a large percentage of file header information in this case. However,  
28340           if the archive were on a reliable medium, such as a CD-ROM, the global extended header offers  
28341           considerable potential size reductions by eliminating redundant information. Thus, the text  
28342           warns against using the global method for unreliable media and provides a method for  
28343           implanting global information in the extended header for each file, rather than in the *typeflag g*  
28344           records.

28345           No facility for data translation or filtering on a per-file basis is included because the standard  
28346           developers could not invent an interface that would allow this in an efficient manner. If a filter,  
28347           such as encryption or compression, is to be applied to all the files, it is more efficient to apply the  
28348           filter to the entire archive as a single file. The standard developers considered interfaces that  
28349           would invoke a shell script for each file going into or out of the archive, but the system overhead  
28350           in this approach was considered to be too high.

28351           One such approach would be to have **filter=** records that give a pathname for an executable.  
28352           When the program is invoked, the file and archive would be open for standard input/output  
28353           and all the header fields would be available as environment variables or command-line  
28354           arguments. The standard developers did discuss such schemes, but they were omitted from  
28355           IEEE Std 1003.1-2001 due to concerns about excessive overhead. Also, the program itself would  
28356           need to be in the archive if it were to be used portably.

28357           There is currently no portable means of identifying the character set(s) used for a file in the file  
28358           system. Therefore, *pax* has not been given a mechanism to generate charset records  
28359           automatically. The only portable means of doing this is for the user to write the archive using the

28360 **-ocharset=string** command line option. This assumes that all of the files in the archive use the  
 28361 same encoding. The “implementation-defined” text is included to allow for a system that can  
 28362 identify the encodings used for each of its files.

28363 The table of standards that accompanies the charset record description is acknowledged to be  
 28364 very limited. Only a limited number of character set standards is reasonable for maximal  
 28365 interchange. Any character set is, of course, possible by prior agreement. It was suggested that  
 28366 EBCDIC be listed, but it was omitted because it is not defined by a formal standard. Formal  
 28367 standards, and then only those with reasonably large followings, can be included here, simply as  
 28368 a matter of practicality. The <value>s represent names of officially registered character sets in the  
 28369 format required by the ISO 2375:1985 standard.

28370 The normal comma or <blank>-separated list rules are not followed in the case of keyword  
 28371 options to allow ease of argument parsing for *getopts*.

28372 Further information on character encodings is in **pax Archive Character Set Encoding/Decoding**  
 28373 (on page 732).

28374 The standard developers have reserved keyword name space for vendor extensions. It is  
 28375 suggested that the format to be used is:

28376 *VENDOR.keyword*

28377 where *VENDOR* is the name of the vendor or organization in all uppercase letters. It is further  
 28378 suggested that the keyword following the period be named differently than any of the standard  
 28379 keywords so that it could be used for future standardization, if appropriate, by omitting the  
 28380 *VENDOR* prefix.

28381 The <length> field in the extended header record was included to make it simpler to step  
 28382 through the records, even if a record contains an unknown format (to a particular *pax*) with  
 28383 complex interactions of special characters. It also provides a minor integrity checkpoint within  
 28384 the records to aid a program attempting to recover files from a damaged archive.

28385 There are no extended header versions of the *devmajor* and *devminor* fields because the  
 28386 unspecified format **ustar** header field should be sufficient. If they are not, vendor-specific  
 28387 extended keywords (such as *VENDOR.devmajor*) should be used.

28388 Device and *i*-number labeling of files was not adopted from *cpio*; files are interchanged strictly  
 28389 on a symbolic name basis, as in **ustar**.

28390 Just as with the **ustar** format descriptions, the new format makes no special arrangements for  
 28391 multi-volume archives. Each of the *pax* archive types is assumed to be inside a single POSIX file  
 28392 and splitting that file over multiple volumes (diskettes, tape cartridges, and so on), processing  
 28393 their labels, and mounting each in the proper sequence are considered to be implementation  
 28394 details that cannot be described portably.

28395 The **pax** format is intended for interchange, not only for backup on a single (family of) systems.  
 28396 It is not as densely packed as might be possible for backup:

- 28397 • It contains information as coded characters that could be coded in binary.
- 28398 • It identifies extended records with name fields that could be omitted in favor of a fixed-field  
 28399 layout.
- 28400 • It translates names into a portable character set and identifies locale-related information,  
 28401 both of which are probably unnecessary for backup.

28402 The requirements on restoring from an archive are slightly different from the historical wording,  
 28403 allowing for non-monolithic privilege to bring forward as much as possible. In particular,  
 28404 attributes such as “high performance file” might be broadly but not universally granted while

28405 set-user-ID or *chown()* might be much more restricted. There is no implication in  
28406 IEEE Std 1003.1-2001 that the security information be honored after it is restored to the file  
28407 hierarchy, in spite of what might be improperly inferred by the silence on that topic. That is a  
28408 topic for another standard.

28409 Links are recorded in the fashion described here because a link can be to any file type. It is  
28410 desirable in general to be able to restore part of an archive selectively and restore all of those  
28411 files completely. If the data is not associated with each link, it is not possible to do this.  
28412 However, the data associated with a file can be large, and when selective restoration is not  
28413 needed, this can be a significant burden. The archive is structured so that files that have no  
28414 associated data can always be restored by the name of any link name of any link, and the user  
28415 may choose whether data is recorded with each instance of a file that contains data. The format  
28416 permits mixing of both types of links in a single archive; this can be done for special needs, and  
28417 *pax* is expected to interpret such archives on input properly, despite the fact that there is no *pax*  
28418 option that would force this mixed case on output. (When **-o linkdata** is used, the output must  
28419 contain the duplicate data, but the implementation is free to include it or omit it when **-o**  
28420 **linkdata** is not used.)

28421 The time values are included as extended header records for those implementations needing  
28422 more than the eleven octal digits allowed by the **ustar** format. Portable file timestamps cannot be  
28423 negative. If *pax* encounters a file with a negative timestamp in **copy** or **write** mode, it can reject  
28424 the file, substitute a non-negative timestamp, or generate a non-portable timestamp with a  
28425 leading '-'. Even though some implementations can support finer file-time granularities than  
28426 seconds, the normative text requires support only for seconds since the Epoch because the  
28427 ISO POSIX-1 standard states them that way. The **ustar** format includes only *mtime*; the new  
28428 format adds *atime* and *ctime* for symmetry. The *atime* access time restored to the file system will  
28429 be affected by the **-p a** and **-p e** options. The *ctime* creation time (actually *inode* modification  
28430 time) is described with “appropriate privilege” so that it can be ignored when writing to the file  
28431 system. POSIX does not provide a portable means to change file creation time. Nothing is  
28432 intended to prevent a non-portable implementation of *pax* from restoring the value.

28433 The *gid*, *size*, and *uid* extended header records were included to allow expansion beyond the  
28434 sizes specified in the regular *tar* header. New file system architectures are emerging that will  
28435 exhaust the 12-digit size field. There are probably not many systems requiring more than 8 digits  
28436 for user and group IDs, but the extended header values were included for completeness,  
28437 allowing overrides for all of the decimal values in the *tar* header.

28438 The standard developers intended to describe the effective results of *pax* with regard to file  
28439 ownerships and permissions; implementations are not restricted in timing or sequencing the  
28440 restoration of such, provided the results are as specified.

28441 Much of the text describing the extended headers refers to use in “**write** or **copy** modes”. The  
28442 **copy** mode references are due to the normative text: “The effect of the copy shall be as if the  
28443 copied files were written to an archive file and then subsequently extracted ...”. There is  
28444 certainly no way to test whether *pax* is actually generating the extended headers in **copy** mode,  
28445 but the effects must be as if it had.

**pax Archive Character Set Encoding/Decoding**

There is a need to exchange archives of files between systems of different native codesets. Filenames, group names, and user names must be preserved to the fullest extent possible when an archive is read on the receiving platform. Translation of the contents of files is not within the scope of the *pax* utility.

There will also be the need to represent characters that are not available on the receiving platform. These unsupported characters cannot be automatically folded to the local set of characters due to the chance of collisions. This could result in overwriting previous extracted files from the archive or pre-existing files on the system.

For these reasons, the codeset used to represent characters within the extended header records of the *pax* archive must be sufficiently rich to handle all commonly used character sets. The fields requiring translation include, at a minimum, filenames, user names, group names, and link pathnames. Implementations may wish to have localized extended keywords that use non-portable characters.

The standard developers considered the following options:

- The archive creator specifies the well-defined name of the source codeset. The receiver must then recognize the codeset name and perform the appropriate translations to the destination codeset.
- The archive creator includes within the archive the character mapping table for the source codeset used to encode extended header records. The receiver must then read the character mapping table and perform the appropriate translations to the destination codeset.
- The archive creator translates the extended header records in the source codeset into a canonical form. The receiver must then perform the appropriate translations to the destination codeset.

The approach that incorporates the name of the source codeset poses the problem of codeset name registration, and makes the archive useless to *pax* archive decoders that do not recognize that codeset.

Because parts of an archive may be corrupted, the standard developers felt that including the character map of the source codeset was too fragile. The loss of this one key component could result in making the entire archive useless. (The difference between this and the global extended header decision was that the latter has a workaround—duplicating extended header records on unreliable media—but this would be too burdensome for large character set maps.)

Both of the above approaches also put an undue burden on the *pax* archive receiver to handle the cross-product of all source and destination codesets.

To simplify the translation from the source codeset to the canonical form and from the canonical form to the destination codeset, the standard developers decided that the internal representation should be a stateless encoding. A stateless encoding is one where each codepoint has the same meaning, without regard to the decoder being in a specific state. An example of a stateful encoding would be the Japanese Shift-JIS; an example of a stateless encoding would be the ISO/IEC 646:1991 standard (equivalent to 7-bit ASCII).

For these reasons, the standard developers decided to adopt a canonical format for the representation of file information strings. The obvious, well-endorsed candidate is the ISO/IEC 10646-1:2000 standard (based in part on Unicode), which can be used to represent the characters of virtually all standardized character sets. The standard developers initially agreed upon using UCS2 (16-bit Unicode) as the internal representation. This repertoire of characters provides a sufficiently rich set to represent all commonly-used codesets.

However, the standard developers found that the 16-bit Unicode representation had some problems. It forced the issue of standardizing byte ordering. The 2-byte length of each character made the extended header records twice as long for the case of strings coded entirely from historical 7-bit ASCII. For these reasons, the standard developers chose the UTF-8 defined in the ISO/IEC 10646-1:2000 standard. This multi-byte representation encodes UCS2 or UCS4 characters reliably and deterministically, eliminating the need for a canonical byte ordering. In addition, NUL octets and other characters possibly confusing to POSIX file systems do not appear, except to represent themselves. It was realized that certain national codesets take up more space after the encoding, due to their placement within the UCS range; it was felt that the usefulness of the encoding of the names outweighs the disadvantage of size increase for file, user, and group names.

The encoding of UTF-8 is as follows:

| UCS4 Hex Encoding | UTF-8 Binary Encoding                                 |
|-------------------|-------------------------------------------------------|
| 00000000-0000007F | 0xxxxxxx                                              |
| 00000080-000007FF | 110xxxxx 10xxxxxx                                     |
| 00000800-0000FFFF | 1110xxxx 10xxxxxx 10xxxxxx                            |
| 00010000-001FFFFF | 11110xxx 10xxxxxx 10xxxxxx 10xxxxxx                   |
| 00200000-03FFFFFF | 111110xx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx          |
| 04000000-7FFFFFFF | 1111110x 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx 10xxxxxx |

where each 'x' represents a bit value from the character being translated.

### ustar Interchange Format

The description of the **ustar** format reflects numerous enhancements over pre-1988 versions of the historical *tar* utility. The goal of these changes was not only to provide the functional enhancements desired, but also to retain compatibility between new and old versions. This compatibility has been retained. Archives written using the old archive format are compatible with the new format.

Implementors should be aware that the previous file format did not include a mechanism to archive directory type files. For this reason, the convention of using a filename ending with slash was adopted to specify a directory on the archive.

The total size of the *name* and *prefix* fields have been set to meet the minimum requirements for {PATH\_MAX}. If a pathname will fit within the *name* field, it is recommended that the pathname be stored there without the use of the *prefix* field. Although the name field is known to be too small to contain {PATH\_MAX} characters, the value was not changed in this version of the archive file format to retain backwards-compatibility, and instead the prefix was introduced. Also, because of the earlier version of the format, there is no way to remove the restriction on the *linkname* field being limited in size to just that of the *name* field.

The *size* field is required to be meaningful in all implementation extensions, although it could be zero. This is required so that the data blocks can always be properly counted.

It is suggested that if device special files need to be represented that cannot be represented in the standard format, that one of the extension types (**A-Z**) be used, and that the additional information for the special file be represented as data and be reflected in the *size* field.

Attempting to restore a special file type, where it is converted to ordinary data and conflicts with an existing filename, need not be specially detected by the utility. If run as an ordinary user, *pax* should not be able to overwrite the entries in, for example, */dev* in any case (whether the file is converted to another type or not). If run as a privileged user, it should be able to do so, and it would be considered a bug if it did not. The same is true of ordinary data files and similarly

named special files; it is impossible to anticipate the needs of the user (who could really intend to overwrite the file), so the behavior should be predictable (and thus regular) and rely on the protection system as required.

The value 7 in the *typeflag* field is intended to define how contiguous files can be stored in a **ustar** archive. IEEE Std 1003.1-2001 does not require the contiguous file extension, but does define a standard way of archiving such files so that all conforming systems can interpret these file types in a meaningful and consistent manner. On a system that does not support extended file types, the *pax* utility should do the best it can with the file and go on to the next.

The file protection modes are those conventionally used by the *ls* utility. This is extended beyond the usage in the ISO POSIX-2 standard to support the “shared text” or “sticky” bit. It is intended that the conformance document should not document anything beyond the existence of and support of such a mode. Further extensions are expected to these bits, particularly with overloading the set-user-ID and set-group-ID flags.

### 28551 **cpio Interchange Format**

The reference to appropriate privilege in the **cpio** format refers to an error on standard output; the **ustar** format does not make comparable statements.

The model for this format was the historical System V *cpio-c* data interchange format. This model documents the portable version of the **cpio** format and not the binary version. It has the flexibility to transfer data of any type described within IEEE Std 1003.1-2001, yet is extensible to transfer data types specific to extensions beyond IEEE Std 1003.1-2001 (for example, contiguous files). Because it describes existing practice, there is no question of maintaining upwards-compatibility.

### 28560 **cpio Header**

There has been some concern that the size of the *c\_ino* field of the header is too small to handle those systems that have very large *inode* numbers. However, the *c\_ino* field in the header is used strictly as a hard-link resolution mechanism for archives. It is not necessarily the same value as the *inode* number of the file in the location from which that file is extracted.

The name *c\_magic* is based on historical usage.

### 28566 **cpio Filename**

For most historical implementations of the *cpio* utility, {PATH\_MAX} octets can be used to describe the pathname without the addition of any other header fields (the NUL character would be included in this count). {PATH\_MAX} is the minimum value for pathname size, documented as 256 bytes. However, an implementation may use *c\_namesize* to determine the exact length of the pathname. With the current description of the **<cpio.h>** header, this pathname size can be as large as a number that is described in six octal digits.

Two values are documented under the *c\_mode* field values to provide for extensibility for known file types:

**0110 000**      Reserved for contiguous files. The implementation may treat the rest of the information for this archive like a regular file. If this file type is undefined, the implementation may create the file as a regular file.

This provides for extensibility of the **cpio** format while allowing for the ability to read old archives. Files of an unknown type may be read as “regular files” on some implementations. On a system that does not support extended file types, the *pax* utility should do the best it can with the file and go on to the next.

28582 **FUTURE DIRECTIONS**

28585 Chapter 2 (on page 29), *cp*, *ed*, *getopts*, *ls*, *printf*, the Base Definitions volume of  
 28586 IEEE Std 1003.1-2001, <**cpio.h**>, the System Interfaces volume of IEEE Std 1003.1-2001, *chown()*,  
 28587 *creat()*, *mkdir()*, *mkfifo()*, *stat()*, *utime()*, *write()*

28588 **CHANGE HISTORY**

28589 First released in Issue 4.

28590 **Issue 5**

28591 A note is added to the APPLICATION USAGE indicating that the **cpio** and **tar** formats can only  
 28592 support files up to 8 gigabytes in size.

28593 **Issue 6**28594 The *pax* utility is aligned with the IEEE P1003.2b draft standard:

- 28595 • Support has been added for symbolic links in the options and interchange formats.
- 28596 • A new format has been devised, based on extensions to **ustar**.
- 28597 • References to the “extended” **tar** and **cpio** formats derived from the POSIX.1-1990 standard  
 28598 have been changed to remove the “extended” adjective because this could cause confusion  
 28599 with the extended *tar* header added in this revision. (All references to *tar* are actually to  
 28600 **ustar**.)

28601 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

28602 IEEE PASC Interpretation 1003.2 #168 is applied, clarifying that *mkdir()* and *mkfifo()* calls can  
 28603 ignore an [EEXIST] error when extracting an archive.

28604 IEEE PASC Interpretation 1003.2 #180 is applied, clarifying how extracted files are created when  
 28605 in **read** mode.

28606 IEEE PASC Interpretation 1003.2 #181 is applied, clarifying the description of the **-t** option.

28607 IEEE PASC Interpretation 1003.2 #195 is applied.

28608 IEEE PASC Interpretation 1003.2 #206 is applied, clarifying the handling of links for the **-H**, **-L**,  
 28609 and **-I** options.

28610 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/35 is applied, adding the process ID of  
 28611 the *pax* process into certain fields. This change provides a method for the implementation to  
 28612 ensure that different instances of *pax* extracting a file named **/a/b/foo** will not collide when  
 28613 processing the extended header information associated with **foo**.

28614 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/36 is applied, changing **-x B** to **-x pax** in  
 28615 the OPTIONS section.

28616 **NAME**

28617 pr — print files

28618 **SYNOPSIS**

28619 pr [+page] [-column] [-adFmrt] [-e[*char*] [*gap*]] [-h *header*] [-i[*char*] [*gap*]]  
 28620 xSI [-l *lines*] [-n[*char*] [*width*]] [-o *offset*] [-s[*char*]] [-w *width*] [-fp]  
 28621 [*file...*]

28622 **DESCRIPTION**

28623 The *pr* utility is a printing and pagination filter. If multiple input files are specified, each shall be  
 28624 read, formatted, and written to standard output. By default, the input shall be separated into 66-  
 28625 line pages, each with:

- 28626 • A 5-line header that includes the page number, date, time, and the pathname of the file
- 28627 • A 5-line trailer consisting of blank lines

28628 If standard output is associated with a terminal, diagnostic messages shall be deferred until the  
 28629 *pr* utility has completed processing.

28630 When options specifying multi-column output are specified, output text columns shall be of  
 28631 equal width; input lines that do not fit into a text column shall be truncated. By default, text  
 28632 columns shall be separated with at least one <blank>.

28633 **OPTIONS**

28634 The *pr* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 28635 Utility Syntax Guidelines, except that: the *page* option has a '+' delimiter; *page* and *column* can  
 28636 be multi-digit numbers; some of the option-arguments are optional; and some of the option-  
 28637 arguments cannot be specified as separate arguments from the preceding option letter. In  
 28638 particular, the *-s* option does not allow the option letter to be separated from its argument, and  
 28639 the options *-e*, *-i*, and *-n* require that both arguments, if present, not be separated from the  
 28640 option letter.

28641 The following options shall be supported. In the following option descriptions, *column*, *lines*,  
 28642 *offset*, *page*, and *width* are positive decimal integers; *gap* is a non-negative decimal integer.

28643 *+page* Begin output at page number *page* of the formatted input.

28644 *-column* Produce multi-column output that is arranged in *column* columns (the default shall  
 28645 be 1) and is written down each column in the order in which the text is received  
 28646 from the input file. This option should not be used with *-m*. The options *-e* and *-i*  
 28647 shall be assumed for multiple text-column output. Whether or not text columns  
 28648 are produced with identical vertical lengths is unspecified, but a text column shall  
 28649 never exceed the length of the page (see the *-l* option). When used with *-t*, use the  
 28650 minimum number of lines to write the output.

28651 *-a* Modify the effect of the *-column* option so that the columns are filled across the  
 28652 page in a round-robin order (for example, when *column* is 2, the first input line  
 28653 heads column 1, the second heads column 2, the third is the second line in column  
 28654 1, and so on).

28655 *-d* Produce output that is double-spaced; append an extra <newline> following every  
 28656 <newline> found in the input.

28657 *-e[*char*][*gap*]*

28658 Expand each input <tab> to the next greater column position specified by the  
 28659 formula  $n*gap+1$ , where *n* is an integer > 0. If *gap* is zero or is omitted, it shall  
 28660 default to 8. All <tab>s in the input shall be expanded into the appropriate number  
 28661 of <space>s. If any non-digit character, *char*, is specified, it shall be used as the

|           |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 28662     |                                      | input <tab>.                                                                                                                                                                                                                                                                                                                                                                                    |
| 28663 XSI | <b>-f</b>                            | Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline>s. Pause before beginning the first page if the standard output is associated with a terminal.                                                                                                                                                                                                |
| 28664     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28665     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28666     | <b>-F</b>                            | Use a <form-feed> for new pages, instead of the default behavior that uses a sequence of <newline>s.                                                                                                                                                                                                                                                                                            |
| 28667     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28668     | <b>-h header</b>                     | Use the string <i>header</i> to replace the contents of the <i>file</i> operand in the page header.                                                                                                                                                                                                                                                                                             |
| 28669     | <b>-i[<i>char</i>][<i>gap</i>]</b>   | In output, replace multiple <space>s with <tab>s wherever two or more adjacent <space>s reach column positions <i>gap</i> +1, 2* <i>gap</i> +1, 3* <i>gap</i> +1, and so on. If <i>gap</i> is zero or is omitted, default tab settings at every eighth column position shall be assumed. If any non-digit character, <i>char</i> , is specified, it shall be used as the output <tab>.          |
| 28670     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28671     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28672     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28673     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28674     | <b>-l lines</b>                      | Override the 66-line default and reset the page length to <i>lines</i> . If <i>lines</i> is not greater than the sum of both the header and trailer depths (in lines), the <i>pr</i> utility shall suppress both the header and trailer, as if the <b>-t</b> option were in effect.                                                                                                             |
| 28675     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28676     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28677     | <b>-m</b>                            | Merge files. Standard output shall be formatted so the <i>pr</i> utility writes one line from each file specified by a <i>file</i> operand, side by side into text columns of equal fixed widths, in terms of the number of column positions. Implementations shall support merging of at least nine <i>file</i> operands.                                                                      |

| 28693     | <b>-r</b>                            | Write no diagnostic reports on failure to open files.                                                                                                                                                                                                                                                                                                                                           |
| 28694     | <b>-s[<i>char</i>]</b>               | Separate text columns by the single character <i>char</i> instead of by the appropriate number of <space>s (default for <i>char</i> shall be <tab>).                                                                                                                                                                                                                                            |
| 28695     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28696     | <b>-t</b>                            | Write neither the five-line identifying header nor the five-line trailer usually supplied for each page. Quit writing after the last line of each file without spacing to the end of the page.                                                                                                                                                                                                  |
| 28697     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28698     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28699     | <b>-w width</b>                      | Set the width of the line to <i>width</i> column positions for multiple text-column output only. If the <b>-w</b> option is not specified and the <b>-s</b> option is not specified, the default width shall be 72. If the <b>-w</b> option is not specified and the <b>-s</b> option is specified, the default width shall be 512.                                                             |
| 28700     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28701     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28702     |                                      |                                                                                                                                                                                                                                                                                                                                                                                                 |
| 28703     |                                      | For single column output, input lines shall not be truncated.                                                                                                                                                                                                                                                                                                                                   |

28704 **OPERANDS**

28705 The following operand shall be supported:

28706 *file* A pathname of a file to be written. If no *file* operands are specified, or if a *file*  
 28707 operand is '-', the standard input shall be used.

28708 **STDIN**

28709 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 28710 See the INPUT FILES section.

28711 **INPUT FILES**

28712 The input files shall be text files.

28713 The file **/dev/tty** shall be used to read responses required by the **-p** option.

28714 **ENVIRONMENT VARIABLES**

28715 The following environment variables shall affect the execution of *pr*:

28716 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 28717 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 28718 Internationalization Variables for the precedence of internationalization variables  
 28719 used to determine the values of locale categories.)

28720 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 28721 internationalization variables.

28722 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 28723 characters (for example, single-byte as opposed to multi-byte characters in  
 28724 arguments and input files) and which characters are defined as printable (character  
 28725 class **print**). Non-printable characters are still written to standard output, but are  
 28726 not counted for the purpose for column-width and line-length calculations.

28727 *LC\_MESSAGES*  
 28728 Determine the locale that should be used to affect the format and contents of  
 28729 diagnostic messages written to standard error.

28730 *LC\_TIME* Determine the format of the date and time for use in writing header lines.

28731 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

28732 *TZ* Determine the timezone used to calculate date and time strings written in header  
 28733 lines. If *TZ* is unset or null, an unspecified default timezone shall be used.

28734 **ASYNCHRONOUS EVENTS**

28735 If *pr* receives an interrupt while writing to a terminal, it shall flush all accumulated error  
 28736 messages to the screen before terminating.

28737 **STDOUT**

28738 The *pr* utility output shall be a paginated version of the original file (or files). This pagination  
 28739 shall be accomplished using either <form-feed>s or a sequence of <newline>s, as controlled by  
 28740 XSI the **-F** or **-f** option. Page headers shall be generated unless the **-t** option is specified. The page  
 28741 headers shall be of the form:

28742 "\n\n%s %s Page %d\n\n\n", <output of date>, <file>, <page number>

28743 In the POSIX locale, the <output of date> field, representing the date and time of last modification  
 28744 of the input file (or the current date and time if the input file is standard input), shall be  
 28745 equivalent to the output of the following command as it would appear if executed at the given  
 28746 time:

28747           date "+%b %e %H:%M %Y"

28748           without the trailing <newline>, if the page being written is from standard input. If the page  
28749           being written is not from standard input, in the POSIX locale, the same format shall be used, but  
28750           the time used shall be the modification time of the file corresponding to *file* instead of the current  
28751           time. When the *LC\_TIME* locale category is not set to the POSIX locale, a different format and  
28752           order of presentation of this field may be used.

28753           If the standard input is used instead of a *file* operand, the <*file*> field shall be replaced by a null  
28754           string.

28755           If the **-h** option is specified, the <*file*> field shall be replaced by the *header* argument.

#### 28756 **STDERR**

28757           The standard error shall be used for diagnostic messages and for alerting the terminal when **-p**  
28758           is specified.

#### 28759 **OUTPUT FILES**

28760           None.

#### 28761 **EXTENDED DESCRIPTION**

28762           None.

#### 28763 **EXIT STATUS**

28764           The following exit values shall be returned:

28765           0   Successful completion.

28766           >0   An error occurred.

#### 28767 **CONSEQUENCES OF ERRORS**

28768           Default.

#### 28769 **APPLICATION USAGE**

28770           None.

#### 28771 **EXAMPLES**

28772           1.   Print a numbered list of all files in the current directory:

28773                ls -a | pr -n -h "Files in \$(pwd) ."

28774           2.   Print **file1** and **file2** as a double-spaced, three-column listing headed by “file list”:

28775                pr -3d -h "file list" file1 file2

28776           3.   Write **file1** on **file2**, expanding tabs to columns 10, 19, 28, ...:

28777                pr -e9 -t <file1 >file2

#### 28778 **RATIONALE**

28779           This utility is one of those that does not follow the Utility Syntax Guidelines because of its  
28780           historical origins. The standard developers could have added new options that obeyed the  
28781           guidelines (and marked the old options obsolescent) or devised an entirely new utility; there are  
28782           examples of both actions in this volume of IEEE Std 1003.1-2001. Because of its widespread use  
28783           by historical applications, the standard developers decided to exempt this version of *pr* from  
28784           many of the guidelines.

28785           Implementations are required to accept option-arguments to the **-h**, **-l**, **-o**, and **-w** options  
28786           whether presented as part of the same argument or as a separate argument to *pr*, as suggested by  
28787           the Utility Syntax Guidelines. The **-n** and **-s** options, however, are specified as in historical  
28788           practice because they are frequently specified without their optional arguments. If a <blank>

28789 were allowed before the option-argument in these cases, a *file* operand could mistakenly be  
28790 interpreted as an option-argument in historical applications.

28791 The text about the minimum number of lines in multi-column output was included to ensure  
28792 that a best effort is made in balancing the length of the columns. There are known historical  
28793 implementations in which, for example, 60-line files are listed by *pr -2* as one column of 56 lines  
28794 and a second of 4. Although this is not a problem when a full page with headers and trailers is  
28795 produced, it would be relatively useless when used with *-t*.

28796 Historical implementations of the *pr* utility have differed in the action taken for the *-f* option.  
28797 BSD uses it as described here for the *-F* option; System V uses it to change trailing <newline>s  
28798 on each page to a <form-feed> and, if standard output is a TTY device, sends an <alert> to  
28799 standard error and reads a line from */dev/tty* before the first page. There were strong arguments  
28800 from both sides of this issue concerning historical practice and as a result the *-F* option was  
28801 added. XSI-conformant systems support the System V historical actions for the *-f* option.

28802 The <output of date> field in the *-I* format is specified only for the POSIX locale. As noted, the  
28803 format can be different in other locales. No mechanism for defining this is present in this volume  
28804 of IEEE Std 1003.1-2001, as the appropriate vehicle is a message catalog; that is, the format  
28805 should be specified as a “message”.

#### 28806 **FUTURE DIRECTIONS**

28807 None.

#### 28808 **SEE ALSO**

28809 *expand*, *lp*

#### 28810 **CHANGE HISTORY**

28811 First released in Issue 2.

#### 28812 **Issue 6**

28813 The following new requirements on POSIX implementations derive from alignment with the  
28814 Single UNIX Specification:

- 28815 • The *-p* option is added.

28816 The normative text is reworded to avoid use of the term “must” for application requirements.

28817 **NAME**

28818           printf — write formatted output

28819 **SYNOPSIS**28820           printf *format* [*argument...*]28821 **DESCRIPTION**

28822           The *printf* utility shall write formatted operands to the standard output. The *argument* operands  
 28823           shall be formatted under control of the *format* operand.

28824 **OPTIONS**

28825           None.

28826 **OPERANDS**

28827           The following operands shall be supported:

28828           *format*           A string describing the format to use to write the remaining operands. See the  
 28829           EXTENDED DESCRIPTION section.

28830           *argument*       The strings to be written to standard output, under the control of *format*. See the  
 28831           EXTENDED DESCRIPTION section.

28832 **STDIN**

28833           Not used.

28834 **INPUT FILES**

28835           None.

28836 **ENVIRONMENT VARIABLES**28837           The following environment variables shall affect the execution of *printf*:

28838           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 28839           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 28840           Internationalization Variables for the precedence of internationalization variables  
 28841           used to determine the values of locale categories.)

28842           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 28843           internationalization variables.

28844           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 28845           characters (for example, single-byte as opposed to multi-byte characters in  
 28846           arguments).

28847           *LC\_MESSAGES*

28848                           Determine the locale that should be used to affect the format and contents of  
 28849           diagnostic messages written to standard error.

28850           *LC\_NUMERIC*

28851                           Determine the locale for numeric formatting. It shall affect the format of numbers  
 28852           written using the e, E, f, g, and G conversion specifier characters (if supported).

28853 *XSI*           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.28854 **ASYNCHRONOUS EVENTS**

28855           Default.

28856 **STDOUT**

28857           See the EXTENDED DESCRIPTION section.

28858 **STDERR**

28859 The standard error shall be used only for diagnostic messages.

28860 **OUTPUT FILES**

28861 None.

28862 **EXTENDED DESCRIPTION**

28863 The *format* operand shall be used as the *format* string described in the Base Definitions volume of  
 28864 IEEE Std 1003.1-2001, Chapter 5, File Format Notation with the following exceptions:

- 28865 1. A <space> in the format string, in any context other than a flag of a conversion  
 28866 specification, shall be treated as an ordinary character that is copied to the output.
- 28867 2. A 'Δ' character in the format string shall be treated as a 'Δ' character, not as a <space>.
- 28868 3. In addition to the escape sequences shown in the Base Definitions volume of  
 28869 IEEE Std 1003.1-2001, Chapter 5, File Format Notation ('\\', '\a', '\b', '\f', '\n',  
 28870 '\r', '\t', '\v'), "\ddd", where *ddd* is a one, two, or three-digit octal number, shall be  
 28871 written as a byte with the numeric value specified by the octal number.
- 28872 4. The implementation shall not precede or follow output from the *d* or *u* conversion  
 28873 specifiers with <blank>s not specified by the *format* operand.
- 28874 5. The implementation shall not precede output from the *o* conversion specifier with zeros  
 28875 not specified by the *format* operand.
- 28876 6. The *e*, *E*, *f*, *g*, and *G* conversion specifiers need not be supported.
- 28877 7. An additional conversion specifier character, *b*, shall be supported as follows. The  
 28878 argument shall be taken to be a string that may contain backslash-escape sequences. The  
 28879 following backslash-escape sequences shall be supported:
  - 28880 — The escape sequences listed in the Base Definitions volume of IEEE Std 1003.1-2001,  
 28881 Chapter 5, File Format Notation ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'),  
 28882 which shall be converted to the characters they represent
  - 28883 — "\0ddd", where *ddd* is a zero, one, two, or three-digit octal number that shall be  
 28884 converted to a byte with the numeric value specified by the octal number
  - 28885 — '\c', which shall not be written and shall cause *printf* to ignore any remaining  
 28886 characters in the string operand containing it, any remaining string operands, and any  
 28887 additional characters in the *format* operand
- 28888 The interpretation of a backslash followed by any other sequence of characters is  
 28889 unspecified.
- 28890 Bytes from the converted string shall be written until the end of the string or the number of  
 28891 bytes indicated by the precision specification is reached. If the precision is omitted, it shall  
 28892 be taken to be infinite, so all bytes up to the end of the converted string shall be written.
- 28893 8. For each conversion specification that consumes an argument, the next argument operand  
 28894 shall be evaluated and converted to the appropriate type for the conversion as specified  
 28895 below.
- 28896 9. The *format* operand shall be reused as often as necessary to satisfy the argument operands.  
 28897 Any extra *c* or *s* conversion specifiers shall be evaluated as if a null string argument were  
 28898 supplied; other extra conversion specifications shall be evaluated as if a zero argument  
 28899 were supplied. If the *format* operand contains no conversion specifications and *argument*  
 28900 operands are present, the results are unspecified.

28901 10. If a character sequence in the *format* operand begins with a '%' character, but does not  
28902 form a valid conversion specification, the behavior is unspecified.

28903 The *argument* operands shall be treated as strings if the corresponding conversion specifier is b,  
28904 c, or s; otherwise, it shall be evaluated as a C constant, as described by the ISO C standard, with  
28905 the following extensions:

- 28906 • A leading plus or minus sign shall be allowed.
- 28907 • If the leading character is a single-quote or double-quote, the value shall be the numeric  
28908 value in the underlying codeset of the character following the single-quote or double-quote.

28909 If an argument operand cannot be completely converted into an internal value appropriate to  
28910 the corresponding conversion specification, a diagnostic message shall be written to standard  
28911 error and the utility shall not exit with a zero exit status, but shall continue processing any  
28912 remaining operands and shall write the value accumulated at the time the error was detected to  
28913 standard output.

28914 It is not considered an error if an argument operand is not completely used for a c or s  
28915 conversion or if a string operand's first or second character is used to get the numeric value of a  
28916 character.

#### 28917 EXIT STATUS

28918 The following exit values shall be returned:

- 28919 0 Successful completion.
- 28920 >0 An error occurred.

#### 28921 CONSEQUENCES OF ERRORS

28922 Default.

#### 28923 APPLICATION USAGE

28924 The floating-point formatting conversion specifications of *printf()* are not required because all  
28925 arithmetic in the shell is integer arithmetic. The *awk* utility performs floating-point calculations  
28926 and provides its own **printf** function. The *bc* utility can perform arbitrary-precision floating-  
28927 point arithmetic, but does not provide extensive formatting capabilities. (This *printf* utility  
28928 cannot really be used to format *bc* output; it does not support arbitrary precision.)  
28929 Implementations are encouraged to support the floating-point conversions as an extension.

28930 Note that this *printf* utility, like the *printf()* function defined in the System Interfaces volume of  
28931 IEEE Std 1003.1-2001 on which it is based, makes no special provision for dealing with multi-  
28932 byte characters when using the %c conversion specification or when a precision is specified in a  
28933 %b or %s conversion specification. Applications should be extremely cautious using either of  
28934 these features when there are multi-byte characters in the character set.

28935 No provision is made in this volume of IEEE Std 1003.1-2001 which allows field widths and  
28936 precisions to be specified as '\*' since the '\*' can be replaced directly in the *format* operand  
28937 using shell variable substitution. Implementations can also provide this feature as an extension  
28938 if they so choose.

28939 Hexadecimal character constants as defined in the ISO C standard are not recognized in the  
28940 *format* operand because there is no consistent way to detect the end of the constant. Octal  
28941 character constants are limited to, at most, three octal digits, but hexadecimal character  
28942 constants are only terminated by a non-hex-digit character. In the ISO C standard, the "##"  
28943 concatenation operator can be used to terminate a constant and follow it with a hexadecimal  
28944 character to be written. In the shell, concatenation occurs before the *printf* utility has a chance to  
28945 parse the end of the hexadecimal constant.

The %b conversion specification is not part of the ISO C standard; it has been added here as a portable way to process backslash escapes expanded in string operands as provided by the *echo* utility. See also the APPLICATION USAGE section of *echo* (on page 333) for ways to use *printf* as a replacement for all of the traditional versions of the *echo* utility.

If an argument cannot be parsed correctly for the corresponding conversion specification, the *printf* utility is required to report an error. Thus, overflow and extraneous characters at the end of an argument being used for a numeric conversion shall be reported as errors.

#### EXAMPLES

To alert the user and then print and read a series of prompts:

```
printf "\aPlease fill in the following: \nName: "
read name
printf "Phone number: "
read phone
```

To read out a list of right and wrong answers from a file, calculate the percentage correctly, and print them out. The numbers are right-justified and separated by a single <tab>. The percentage is written to one decimal place of accuracy:

```
while read right wrong ; do
 percent=$(echo "scale=1; ($right*100)/($right+$wrong)" | bc)
 printf "%2d right\t%2d wrong\t(%%s%%)\n" \
 $right $wrong $percent
done < database_file
```

The command:

```
printf "%5d%4d\n" 1 21 321 4321 54321
```

produces:

```
 1 21
 3214321
54321 0
```

Note that the *format* operand is used three times to print all of the given strings and that a '0' was supplied by *printf* to satisfy the last %4d conversion specification.

The *printf* utility is required to notify the user when conversion errors are detected while producing numeric output; thus, the following results would be expected on an implementation with 32-bit twos-complement integers when %d is specified as the *format* operand:

| Argument    | Standard Output | Diagnostic Output                         |
|-------------|-----------------|-------------------------------------------|
| 5a          | 5               | printf: "5a" not completely converted     |
| 9999999999  | 2147483647      | printf: "9999999999" arithmetic overflow  |
| -9999999999 | -2147483648     | printf: "-9999999999" arithmetic overflow |
| ABC         | 0               | printf: "ABC" expected numeric value      |

The diagnostic message format is not specified, but these examples convey the type of information that should be reported. Note that the value shown on standard output is what would be expected as the return value from the *strtol()* function as defined in the System Interfaces volume of IEEE Std 1003.1-2001. A similar correspondence exists between %u and *strtoul()* and %e, %f, and %g (if the implementation supports floating-point conversions) and *strtod()*.

28990 In a locale using the ISO / IEC 646: 1991 standard as the underlying codeset, the command:

28991 `printf "%d\n" 3 +3 -3 \'3 \"+3 \"'-3"`

28992 produces:

28993 3 Numeric value of constant 3

28994 3 Numeric value of constant 3

28995 -3 Numeric value of constant -3

28996 51 Numeric value of the character '3' in the ISO / IEC 646: 1991 standard codeset

28997 43 Numeric value of the character '+' in the ISO / IEC 646: 1991 standard codeset

28998 45 Numeric value of the character '-' in the ISO / IEC 646: 1991 standard codeset

28999 Note that in a locale with multi-byte characters, the value of a character is intended to be the  
29000 value of the equivalent of the **wchar\_t** representation of the character as described in the System  
29001 Interfaces volume of IEEE Std 1003.1-2001.

#### 29002 **RATIONALE**

29003 The *printf* utility was added to provide functionality that has historically been provided by *echo*.  
29004 However, due to irreconcilable differences in the various versions of *echo* extant, the version has  
29005 few special features, leaving those to this new *printf* utility, which is based on one in the Ninth  
29006 Edition system.

29007 The EXTENDED DESCRIPTION section almost exactly matches the *printf()* function in the  
29008 ISO C standard, although it is described in terms of the file format notation in the Base  
29009 Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation.

#### 29010 **FUTURE DIRECTIONS**

29011 None.

#### 29012 **SEE ALSO**

29013 *awk*, *bc*, *echo*, the System Interfaces volume of IEEE Std 1003.1-2001, *printf()*

#### 29014 **CHANGE HISTORY**

29015 First released in Issue 4.

29016 **NAME**29017        *prs* — print an SCCS file (**DEVELOPMENT**)29018 **SYNOPSIS**29019 xSI        *prs* [-a] [-d *dataspec*] [-r[*SID*]] *file...*29020 xSI        *prs* [ -e | -l ] -c *cutoff* [-d *dataspec*] *file...*29021 xSI        *prs* [ -e | -l ] -r[*SID*] [-d *dataspec*] *file...*29022 **DESCRIPTION**29023        The *prs* utility shall write to standard output parts or all of an SCCS file in a user-supplied  
29024        format.29025 **OPTIONS**29026        The *prs* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
29027        Utility Syntax Guidelines, except that the **-r** option has an optional option-argument. This  
29028        optional option-argument cannot be presented as a separate argument. The following options  
29029        shall be supported:29030        **-d** *dataspec*    Specify the output data specification. The *dataspec* shall be a string consisting of  
29031        SCCS file *data keywords* (see **Data Keywords** (on page 747)) interspersed with  
29032        optional user-supplied text.29033        **-r**[*SID*]        Specify the SCCS identification string (SID) of a delta for which information is  
29034        desired. If no *SID* option-argument is specified, the SID of the most recently  
29035        created delta shall be assumed.29036        **-e**                Request information for all deltas created earlier than and including the delta  
29037        designated via the **-r** option or the date-time given by the **-c** option.29038        **-l**                Request information for all deltas created later than and including the delta  
29039        designated via the **-r** option or the date-time given by the **-c** option.29040        **-c** *cutoff*        Indicate the *cutoff* date-time, in the form:29041        *YY*[*MM*][*DD*][*HH*][*MM*][*SS*]]]]29042        For the *YY* component, values in the range [69,99] shall refer to years 1969 to 1999  
29043        inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.29044        **Note:**        It is expected that in a future version of IEEE Std 1003.1-2001 the default  
29045        century inferred from a 2-digit year will change. (This would apply to all  
29046        commands accepting a 2-digit year as input.)29047        No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
29048        date-time shall be included in the output. Units omitted from the date-time default  
29049        to their maximum possible values; for example, **-c 7502** is equivalent to  
29050        **-c 750228235959**.29051        **-a**                Request writing of information for both removed—that is, *delta type=R* (see  
29052        *rmDEL*)—and existing—that is, *delta type=D*,—deltas. If the **-a** option is not  
29053        specified, information for existing deltas only shall be provided.29054 **OPERANDS**

29055        The following operand shall be supported:

29056        *file*            A pathname of an existing SCCS file or a directory. If *file* is a directory, the *prs*  
29057        utility shall behave as though each file in the directory were specified as a named  
29058        file, except that non-SCCS files (last component of the pathname does not begin  
29059        with **s.**) and unreadable files shall be silently ignored.

29060 If exactly one *file* operand appears, and it is '*-*', the standard input shall be read;  
 29061 each line of the standard input shall be taken to be the name of an SCCS file to be  
 29062 processed. Non-SCCS files and unreadable files shall be silently ignored.

#### 29063 **STDIN**

29064 The standard input shall be a text file used only when the *file* operand is specified as '*-*'. Each  
 29065 line of the text file shall be interpreted as an SCCS pathname.

#### 29066 **INPUT FILES**

29067 Any SCCS files displayed are files of an unspecified format.

#### 29068 **ENVIRONMENT VARIABLES**

29069 The following environment variables shall affect the execution of *prs*:

29070 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 29071 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 29072 Internationalization Variables for the precedence of internationalization variables  
 29073 used to determine the values of locale categories.)

29074 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 29075 internationalization variables.

29076 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 29077 characters (for example, single-byte as opposed to multi-byte characters in  
 29078 arguments and input files).

29079 *LC\_MESSAGES*

29080 Determine the locale that should be used to affect the format and contents of  
 29081 diagnostic messages written to standard error.

29082 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 29083 **ASYNCHRONOUS EVENTS**

29084 Default.

#### 29085 **STDOUT**

29086 The standard output shall be a text file whose format is dependent on the data keywords  
 29087 specified with the *-d* option.

#### 29088 **Data Keywords**

29089 Data keywords specify which parts of an SCCS file shall be retrieved and output. All parts of an  
 29090 SCCS file have an associated data keyword. A data keyword may appear in a *dataspec* multiple  
 29091 times.

29092 The information written by *prs* shall consist of:

- 29093 1. The user-supplied text
- 29094 2. Appropriate values (extracted from the SCCS file) substituted for the recognized data  
 29095 keywords in the order of appearance in the *dataspec*

29096 The format of a data keyword value shall either be simple ('*S*'), in which keyword substitution  
 29097 is direct, or multi-line ('*M*').

29098 User-supplied text shall be any text other than recognized data keywords. A <tab> shall be  
 29099 specified by '\t' and <newline> by '\n'. When the *-r* option is not specified, the default  
 29100 *dataspec* shall be:

29101 :PN: :\n\n

29102 and the following *dataspec* shall be used for each selected delta:

29103 :Dt:\t:DL:\nMRs:\n:MR:COMMENTS:\n:C:

29164

\* **:Dt::DT: :I: :D: :T: :P: :DS: :DP:**

29165

\*\* **:R::L::B::S:** if the delta is a branch delta (**:BF:=yes**)

29166

**:R::L:** if the delta is not a branch delta (**:BF:=no**)

29167

\*\*\* The line statistics are capped at 99999. For example, if 100 000 lines were unchanged in a certain revision, **:Lu:** shall produce the value 99999.

29168

**29169 STDERR**

29170

The standard error shall be used only for diagnostic messages.

**29171 OUTPUT FILES**

29172

None.

**29173 EXTENDED DESCRIPTION**

29174

None.

**29175 EXIT STATUS**

29176

The following exit values shall be returned:

29177

0 Successful completion.

29178

&gt;0 An error occurred.

**29179 CONSEQUENCES OF ERRORS**

29180

Default.

**29181 APPLICATION USAGE**

29182

None.

**29183 EXAMPLES**

29184

1. The following example:

29185

`prs -d "User Names for :F: are:\n:UN:" s.file`

29186

might write to standard output:

29187

User Names for s.file are:

29188

xyz

29189

131

29190

abc

29191

2. The following example:

```

29192 prs -d "Delta for pgm :M:: :I: - :D: By :P:" -r s.file
29193 might write to standard output:
29194 Delta for pgm main.c: 3.7 - 77/12/01 By cas
29195 3. As a special case:
29196 prs s.file
29197 might write to standard output:
29198 s.file:
29199 <blank line>
29200 D 1.1 77/12/01 00:00:00 cas 1 000000/00000/00000
29201 MRs:
29202 b178-12345
29203 b179-54321
29204 COMMENTS:
29205 this is the comment line for s.file initial delta
29206 <blank line>
29207 for each delta table entry of the D type. The only option allowed to be used with this
29208 special case is the -a option.

29209 RATIONALE
29210 None.

29211 FUTURE DIRECTIONS
29212 None.

29215 CHANGE HISTORY
29216 First released in Issue 2.

29217 Issue 5
29218 The phrase “in which keyword substitution is followed by a <newline>” is deleted from the end
29219 of the second paragraph of Data Keywords (on page 747).
29220 The interpretation of the YY component of the -c cutoff argument is noted.

29221 Issue 6
29222 The normative text is reworded to emphasize the term “shall” for implementation requirements.
29223 The Open Group Base Resolution bwg2001-007 is applied, updating the table in STDOUT with a
29224 note that line statistics are capped at 99 999 for the :Li:, :Ld:, :Lu:, and :DL: keywords.
29225 The Open Group Interpretation PIN4C.00009 is applied.

```

29226 **NAME**

29227       ps — report process status

29228 **SYNOPSIS**29229 UP XSI   ps [-aA] [-defl] [-G *grouplist*] [-o *format*]...[-p *proclist*] [-t *termlist*]29230       [-U *userlist*] [-g *grouplist*] [-n *namelist*] [-u *userlist*]

29231

29232 **DESCRIPTION**29233       The *ps* utility shall write information about processes, subject to having the appropriate  
29234       privileges to obtain information about those processes.29235       By default, *ps* shall select all processes with the same effective user ID as the current user and the  
29236       same controlling terminal as the invoker.29237 **OPTIONS**29238       The *ps* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
29239       Utility Syntax Guidelines.

29240       The following options shall be supported:

29241       **-a**       Write information for all processes associated with terminals. Implementations  
29242       may omit session leaders from this list.29243       **-A**       Write information for all processes.29244 XSI       **-d**       Write information for all processes, except session leaders.29245 XSI       **-e**       Write information for all processes. (Equivalent to **-A**.)29246 XSI       **-f**       Generate a **full** listing. (See the STDOUT section for the contents of a **full** listing.)29247 XSI       **-g *grouplist*** Write information for processes whose session leaders are given in *grouplist*. The  
29248       application shall ensure that the *grouplist* is a single argument in the form of a  
29249       <blank> or comma-separated list.29250       **-G *grouplist*** Write information for processes whose real group ID numbers are given in  
29251       *grouplist*. The application shall ensure that the *grouplist* is a single argument in the  
29252       form of a <blank> or comma-separated list.29253 XSI       **-l**       Generate a **long** listing. (See STDOUT for the contents of a **long** listing.)29254 XSI       **-n *namelist*** Specify the name of an alternative system *namelist* file in place of the default. The  
29255       name of the default file and the format of a *namelist* file are unspecified.29256       **-o *format***   Write information according to the format specification given in *format*. This is  
29257       fully described in the STDOUT section. Multiple **-o** options can be specified; the  
29258       format specification shall be interpreted as the <space>-separated concatenation of  
29259       all the *format* option-arguments.29260       **-p *proclist*** Write information for processes whose process ID numbers are given in *proclist*.  
29261       The application shall ensure that the *proclist* is a single argument in the form of a  
29262       <blank> or comma-separated list.29263       **-t *termlist*** Write information for processes associated with terminals given in *termlist*. The  
29264       application shall ensure that the *termlist* is a single argument in the form of a  
29265       <blank> or comma-separated list. Terminal identifiers shall be given in an  
29266 XSI       implementation-defined format. On XSI-conformant systems, they shall be given  
29267       in one of two forms: the device's filename (for example, **tty04**) or, if the device's  
29268       filename starts with **tty**, just the identifier following the characters **tty** (for

|           |                              |                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 29269     |                              | example, "04").                                                                                                                                                                                                                                                                                                                                                             |
| 29270 XSI | <b>-u</b> <i>userlist</i>    | Write information for processes whose user ID numbers or login names are given in <i>userlist</i> . The application shall ensure that the <i>userlist</i> is a single argument in the form of a <blank> or comma-separated list. In the listing, the numerical user ID shall be written unless the <b>-f</b> option is used, in which case the login name shall be written. |
| 29271     |                              |                                                                                                                                                                                                                                                                                                                                                                             |
| 29272     |                              |                                                                                                                                                                                                                                                                                                                                                                             |

| 29306     | <b>LC_TIME</b>               | Determine the format and contents of the date and time strings displayed.                                                                                                                                                                                                                                                                                                   |
| 29307 XSI | <b>NLSPATH</b>               | Determine the location of message catalogs for the processing of <b>LC_MESSAGES</b> .                                                                                                                                                                                                                                                                                       |
| 29308     | <b>TZ</b>                    | Determine the timezone used to calculate date and time strings displayed. If <b>TZ</b> is unset or null, an unspecified default timezone shall be used.                                                                                                                                                                                                                     |
| 29309     |                              |                                                                                                                                                                                                                                                                                                                                                                             |

29310 **ASYNCHRONOUS EVENTS**

29311 Default.

29312 **STDOUT**29313 When the **-o** option is not specified, the standard output format is unspecified.

29314 XSI On XSI-conformant systems, the output format shall be as follows. The column headings and descriptions of the columns in a *ps* listing are given below. The precise meanings of these fields are implementation-defined. The letters 'f' and 'l' (below) indicate the option (**full** or **long**) that shall cause the corresponding heading to appear; **all** means that the heading always appears. Note that these two options determine only what information is provided for a process; they do not determine which processes are listed.

|       |              |       |                                                                                                   |
|-------|--------------|-------|---------------------------------------------------------------------------------------------------|
| 29320 | <b>F</b>     | (l)   | Flags (octal and additive) associated with the process.                                           |
| 29321 | <b>S</b>     | (l)   | The state of the process.                                                                         |
| 29322 | <b>UID</b>   | (f,l) | The user ID number of the process owner; the login name is printed under the <b>-f</b> option.    |
| 29323 |              |       |                                                                                                   |
| 29324 | <b>PID</b>   | (all) | The process ID of the process; it is possible to kill a process if this datum is known.           |
| 29325 |              |       |                                                                                                   |
| 29326 | <b>PPID</b>  | (f,l) | The process ID of the parent process.                                                             |
| 29327 | <b>C</b>     | (f,l) | Processor utilization for scheduling.                                                             |
| 29328 | <b>PRI</b>   | (l)   | The priority of the process; higher numbers mean lower priority.                                  |
| 29329 | <b>NI</b>    | (l)   | Nice value; used in priority computation.                                                         |
| 29330 | <b>ADDR</b>  | (l)   | The address of the process.                                                                       |
| 29331 | <b>SZ</b>    | (l)   | The size in blocks of the core image of the process.                                              |
| 29332 | <b>WCHAN</b> | (l)   | The event for which the process is waiting or sleeping; if blank, the process is running.         |
| 29333 |              |       |                                                                                                   |
| 29334 | <b>STIME</b> | (f)   | Starting time of the process.                                                                     |
| 29335 | <b>TTY</b>   | (all) | The controlling terminal for the process.                                                         |
| 29336 | <b>TIME</b>  | (all) | The cumulative execution time for the process.                                                    |
| 29337 | <b>CMD</b>   | (all) | The command name; the full command name and its arguments are written under the <b>-f</b> option. |
| 29338 |              |       |                                                                                                   |

29339 A process that has exited and has a parent, but has not yet been waited for by the parent, shall be marked **defunct**.

29341 Under the option **-f**, *ps* tries to determine the command name and arguments given when the process was created by examining memory or the swap area. Failing this, the command name, as it would appear without the option **-f**, is written in square brackets.

29344 The **-o** option allows the output format to be specified under user control.

29345 The application shall ensure that the format specification is a list of names presented as a single argument, <blank> or comma-separated. Each variable has a default header. The default header can be overridden by appending an equals sign and the new text of the header. The rest of the characters in the argument shall be used as the header text. The fields specified shall be written in the order specified on the command line, and should be arranged in columns in the output. The field widths shall be selected by the system to be at least as wide as the header text (default or overridden value). If the header text is null, such as **-o user=**, the field width shall be at least as wide as the default header text. If all header text fields are null, no header line shall be written.

29354 The following names are recognized in the POSIX locale:

|       |                                                                                                  |                                                                                                                   |
|-------|--------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 29355 | <b>ruser</b>                                                                                     | The real user ID of the process. This shall be the textual user ID, if it can be obtained                         |
| 29356 |                                                                                                  | and the field width permits, or a decimal representation otherwise.                                               |
| 29357 | <b>user</b>                                                                                      | The effective user ID of the process. This shall be the textual user ID, if it can be                             |
| 29358 |                                                                                                  | obtained and the field width permits, or a decimal representation otherwise.                                      |
| 29359 | <b>rgroup</b>                                                                                    | The real group ID of the process. This shall be the textual group ID, if it can be obtained                       |
| 29360 |                                                                                                  | and the field width permits, or a decimal representation otherwise.                                               |
| 29361 | <b>group</b>                                                                                     | The effective group ID of the process. This shall be the textual group ID, if it can be                           |
| 29362 |                                                                                                  | obtained and the field width permits, or a decimal representation otherwise.                                      |
| 29363 | <b>pid</b>                                                                                       | The decimal value of the process ID.                                                                              |
| 29364 | <b>ppid</b>                                                                                      | The decimal value of the parent process ID.                                                                       |
| 29365 | <b>pgid</b>                                                                                      | The decimal value of the process group ID.                                                                        |
| 29366 | <b>pcpu</b>                                                                                      | The ratio of CPU time used recently to CPU time available in the same period,                                     |
| 29367 |                                                                                                  | expressed as a percentage. The meaning of “recently” in this context is unspecified. The                          |
| 29368 |                                                                                                  | CPU time available is determined in an unspecified manner.                                                        |
| 29369 | <b>vsz</b>                                                                                       | The size of the process in (virtual) memory in 1 024 byte units as a decimal integer.                             |
| 29370 | <b>nice</b>                                                                                      | The decimal value of the nice value of the process; see <i>nice</i> .                                             |
| 29371 | <b>etime</b>                                                                                     | In the POSIX locale, the elapsed time since the process was started, in the form:                                 |
| 29372 |                                                                                                  | [ [ <i>dd</i> –] <i>hh</i> : ] <i>mm</i> : <i>ss</i>                                                              |
| 29373 |                                                                                                  | where <i>dd</i> shall represent the number of days, <i>hh</i> the number of hours, <i>mm</i> the number           |
| 29374 |                                                                                                  | of minutes, and <i>ss</i> the number of seconds. The <i>dd</i> field shall be a decimal integer. The              |
| 29375 |                                                                                                  | <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be two-digit decimal integers padded on the left with zeros.   |
| 29376 | <b>time</b>                                                                                      | In the POSIX locale, the cumulative CPU time of the process in the form:                                          |
| 29377 |                                                                                                  | [ [ <i>dd</i> –] <i>hh</i> : <i>mm</i> : <i>ss</i>                                                                |
| 29378 |                                                                                                  | The <i>dd</i> , <i>hh</i> , <i>mm</i> , and <i>ss</i> fields shall be as described in the <b>etime</b> specifier. |
| 29379 | <b>tty</b>                                                                                       | The name of the controlling terminal of the process (if any) in the same format used by                           |
| 29380 |                                                                                                  | the <i>who</i> utility.                                                                                           |
| 29381 | <b>comm</b>                                                                                      | The name of the command being executed ( <i>argv</i> [0] value) as a string.                                      |
| 29382 | <b>args</b>                                                                                      | The command with all its arguments as a string. The implementation may truncate this                              |
| 29383 |                                                                                                  | value to the field width; it is implementation-defined whether any further truncation                             |
| 29384 |                                                                                                  | occurs. It is unspecified whether the string represented is a version of the argument list                        |
| 29385 |                                                                                                  | as it was passed to the command when it started, or is a version of the arguments as                              |
| 29386 |                                                                                                  | they may have been modified by the application. Applications cannot depend on being                               |
| 29387 |                                                                                                  | able to modify their argument list and having that modification be reflected in the                               |
| 29388 |                                                                                                  | output of <i>ps</i> .                                                                                             |
| 29389 | Any field need not be meaningful in all implementations. In such a case a hyphen (‘–’) should    |                                                                                                                   |
| 29390 | be output in place of the field value.                                                           |                                                                                                                   |
| 29391 | Only <b>comm</b> and <b>args</b> shall be allowed to contain <blank>s; all others shall not. Any |                                                                                                                   |
| 29392 | implementation-defined variables shall be specified in the system documentation along with the   |                                                                                                                   |
| 29393 | default header and indicating whether the field may contain <blank>s.                            |                                                                                                                   |
| 29394 | The following table specifies the default header to be used in the POSIX locale corresponding to |                                                                                                                   |
| 29395 | each format specifier.                                                                           |                                                                                                                   |

Table 4-17 Variable Names and Default Headers in *ps*

| Format Specifier | Default Header | Format Specifier | Default Header |
|------------------|----------------|------------------|----------------|
| <b>args</b>      | <b>COMMAND</b> | <b>ppid</b>      | <b>PPID</b>    |
| <b>comm</b>      | <b>COMMAND</b> | <b>rgroup</b>    | <b>RGROUP</b>  |
| <b>etime</b>     | <b>ELAPSED</b> | <b>ruser</b>     | <b>RUSER</b>   |
| <b>group</b>     | <b>GROUP</b>   | <b>time</b>      | <b>TIME</b>    |
| <b>nice</b>      | <b>NI</b>      | <b>tty</b>       | <b>TT</b>      |
| <b>pcpu</b>      | <b>%CPU</b>    | <b>user</b>      | <b>USER</b>    |
| <b>pgid</b>      | <b>PGID</b>    | <b>vsz</b>       | <b>VSZ</b>     |
| <b>pid</b>       | <b>PID</b>     |                  |                |

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

None.

**EXIT STATUS**

The following exit values shall be returned:

0 Successful completion.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

Things can change while *ps* is running; the snapshot it gives is only true for an instant, and might not be accurate by the time it is displayed.

The **args** format specifier is allowed to produce a truncated version of the command arguments. In some implementations, this information is no longer available when the *ps* utility is executed.

If the field width is too narrow to display a textual ID, the system may use a numeric version. Normally, the system would be expected to choose large enough field widths, but if a large number of fields were selected to write, it might squeeze fields to their minimum sizes to fit on one line. One way to ensure adequate width for the textual IDs is to override the default header for a field to make it larger than most or all user or group names.

There is no special quoting mechanism for header text. The header text is the rest of the argument. If multiple header changes are needed, multiple **-o** options can be used, such as:

```
ps -o "user=User Name" -o pid=Process\ ID
```

On some implementations, especially multi-level secure systems, *ps* may be severely restricted and produce information only about child processes owned by the user.

**EXAMPLES**

The command:

```
ps -o user,pid,ppid=MOM -o args
```

writes at least the following in the POSIX locale:

```
USER PID MOM COMMAND
helene 34 12 ps -o uid,pid,ppid=MOM -o args
```

29439 The contents of the **COMMAND** field need not be the same in all implementations, due to  
29440 possible truncation.

#### 29441 **RATIONALE**

29442 There is very little commonality between BSD and System V implementations of *ps*. Many  
29443 options conflict or have subtly different usages. The standard developers attempted to select a  
29444 set of options for the base standard that were useful on a wide range of systems and selected  
29445 options that either can be implemented on both BSD and System V-based systems without  
29446 breaking the current implementations or where the options are sufficiently similar that any  
29447 changes would not be unduly problematic for users or implementors.

29448 It is recognized that on some implementations, especially multi-level secure systems, *ps* may be  
29449 nearly useless. The default output has therefore been chosen such that it does not break  
29450 historical implementations and also is likely to provide at least some useful information on most  
29451 systems.

29452 The major change is the addition of the format specification capability. The motivation for this  
29453 invention is to provide a mechanism for users to access a wider range of system information, if  
29454 the system permits it, in a portable manner. The fields chosen to appear in this volume of  
29455 IEEE Std 1003.1-2001 were arrived at after considering what concepts were likely to be both  
29456 reasonably useful to the “average” user and had a reasonable chance of being implemented on a  
29457 wide range of systems. Again it is recognized that not all systems are able to provide all the  
29458 information and, conversely, some may wish to provide more. It is hoped that the approach  
29459 adopted will be sufficiently flexible and extensible to accommodate most systems.  
29460 Implementations may be expected to introduce new format specifiers.

29461 The default output should consist of a short listing containing the process ID, terminal name,  
29462 cumulative execution time, and command name of each process.

29463 The preference of the standard developers would have been to make the format specification an  
29464 operand of the *ps* command. Unfortunately, BSD usage precluded this.

29465 At one time a format was included to display the environment array of the process. This was  
29466 deleted because there is no portable way to display it.

29467 The **-A** option is equivalent to the BSD **-g** and the SVID **-e**. Because the two systems differed, a  
29468 mnemonic compromise was selected.

29469 The **-a** option is described with some optional behavior because the SVID omits session leaders,  
29470 but BSD does not.

29471 In an early proposal, format specifiers appeared for priority and start time. The former was not  
29472 defined adequately in this volume of IEEE Std 1003.1-2001 and was removed in deference to the  
29473 defined nice value; the latter because elapsed time was considered to be more useful.

29474 In a new BSD version of *ps*, a **-O** option can be used to write all of the default information,  
29475 followed by additional format specifiers. This was not adopted because the default output is  
29476 implementation-defined. Nevertheless, this is a useful option that should be reserved for that  
29477 purpose. In the **-o** option for the POSIX Shell and Utilities *ps*, the format is the concatenation of  
29478 each **-o**. Therefore, the user can have an alias or function that defines the beginning of their  
29479 desired format and add more fields to the end of the output in certain cases where that would be  
29480 useful.

29481 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
29482 require that they all use the same format.

29483 The **pcpu** field indicates that the CPU time available is determined in an unspecified manner.  
29484 This is because it is difficult to express an algorithm that is useful across all possible machine

29485 architectures. Historical counterparts to this value have attempted to show percentage of use in  
29486 the recent past, such as the preceding minute. Frequently, these values for all processes did not  
29487 add up to 100%. Implementations are encouraged to provide data in this field to users that will  
29488 help them identify processes currently affecting the performance of the system.

29489 **FUTURE DIRECTIONS**

29490 None.

29491 **SEE ALSO**

29492 *kill, nice, renice*

29493 **CHANGE HISTORY**

29494 First released in Issue 2.

29495 **Issue 6**

29496 This utility is marked as part of the User Portability Utilities option.

29497 The normative text is reworded to avoid use of the term “must” for application requirements.

29498 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

29499 **NAME**

29500           pwd — return working directory name

29501 **SYNOPSIS**

29502           pwd [-L | -P ]

29503 **DESCRIPTION**

29504           The *pwd* utility shall write to standard output an absolute pathname of the current working  
 29505           directory, which does not contain the filenames dot or dot-dot.

29506 **OPTIONS**

29507           The *pwd* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 29508           12.2, Utility Syntax Guidelines.

29509           The following options shall be supported by the implementation:

29510           **-L**           If the *PWD* environment variable contains an absolute pathname of the current  
 29511                            directory that does not contain the filenames dot or dot-dot, *pwd* shall write this  
 29512                            pathname to standard output. Otherwise, the **-L** option shall behave as the **-P**  
 29513                            option.

29514           **-P**           The absolute pathname written shall not contain filenames that, in the context of  
 29515                            the pathname, refer to files of type symbolic link.

29516           If both **-L** and **-P** are specified, the last one shall apply. If neither **-L** nor **-P** is specified, the *pwd*  
 29517           utility shall behave as if **-L** had been specified.

29518 **OPERANDS**

29519           None.

29520 **STDIN**

29521           Not used.

29522 **INPUT FILES**

29523           None.

29524 **ENVIRONMENT VARIABLES**

29525           The following environment variables shall affect the execution of *pwd*:

29526           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 29527                            (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 29528                            Internationalization Variables for the precedence of internationalization variables  
 29529                            used to determine the values of locale categories.)

29530           **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 29531                            internationalization variables.

29532           **LC\_MESSAGES**

29533                           Determine the locale that should be used to affect the format and contents of  
 29534                            diagnostic messages written to standard error.

29535 **XS1**           **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

29536           **PWD**           If the **-P** option is in effect, this variable shall be set to an absolute pathname of the  
 29537                            current working directory that does not contain any components that specify  
 29538                            symbolic links, does not contain any components that are dot, and does not  
 29539                            contain any components that are dot-dot. If an application sets or unsets the value  
 29540                            of *PWD*, the behavior of *pwd* is unspecified.

29541 **ASYNCHRONOUS EVENTS**

29542 Default.

29543 **STDOUT**29544 The *pwd* utility output is an absolute pathname of the current working directory:

29545 "%s\n", &lt;directory pathname&gt;

29546 **STDERR**

29547 The standard error shall be used only for diagnostic messages.

29548 **OUTPUT FILES**

29549 None.

29550 **EXTENDED DESCRIPTION**

29551 None.

29552 **EXIT STATUS**

29553 The following exit values shall be returned:

29554 0 Successful completion.

29555 &gt;0 An error occurred.

29556 **CONSEQUENCES OF ERRORS**29557 If an error is detected, output shall not be written to standard output, a diagnostic message shall  
29558 be written to standard error, and the exit status is not zero.29559 **APPLICATION USAGE**

29560 None.

29561 **EXAMPLES**

29562 None.

29563 **RATIONALE**29564 Some implementations have historically provided *pwd* as a shell special built-in command.

29565 In most utilities, if an error occurs, partial output may be written to standard output. This does  
29566 not happen in historical implementations of *pwd*. Because *pwd* is frequently used in historical  
29567 shell scripts without checking the exit status, it is important that the historical behavior is  
29568 required here; therefore, the CONSEQUENCES OF ERRORS section specifically disallows any  
29569 partial output being written to standard output.

29570 **FUTURE DIRECTIONS**

29571 None.

29572 **SEE ALSO**29573 *cd*, the System Interfaces volume of IEEE Std 1003.1-2001, *getcwd()*29574 **CHANGE HISTORY**

29575 First released in Issue 2.

29576 **Issue 6**

29577 The **-P** and **-L** options are added to describe actions relating to symbolic links as specified in the  
29578 IEEE P1003.2b draft standard.

29579 **NAME**

29580 qalter — alter batch job

29581 **SYNOPSIS**

```
29582 BE qalter [-a date_time] [-A account_string] [-c interval] [-e path_name]
29583 [-h hold_list] [-j join_list] [-k keep_list] [-l resource_list]
29584 [-m mail_options] [-M mail_list] [-N name] [-o path_name]
29585 [-p priority] [-r y|n] [-S path_name_list] [-u user_list]
29586 job_identifier ...
29587
```

29588 **DESCRIPTION**

29589 The attributes of a batch job are altered by a request to the batch server that manages the batch  
 29590 job. The *qalter* utility is a user-accessible batch client that requests the alteration of the attributes  
 29591 of one or more batch jobs.

29592 The *qalter* utility shall alter the attributes of those batch jobs, and only those batch jobs, for which  
 29593 a batch *job\_identifier* is presented to the utility.

29594 The *qalter* utility shall alter the attributes of batch jobs in the order in which the batch  
 29595 *job\_identifiers* are presented to the utility.

29596 If the *qalter* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 29597 process the remaining batch *job\_identifiers*, if any.

29598 For each batch *job\_identifier* for which the *qalter* utility succeeds, each attribute of the identified  
 29599 batch job shall be altered as indicated by all the options presented to the utility.

29600 For each identified batch job for which the *qalter* utility fails, the utility shall not alter any  
 29601 attribute of the batch job.

29602 For each batch job that the *qalter* utility processes, the utility shall not modify any attribute other  
 29603 than those required by the options and option-arguments presented to the utility.

29604 The *qalter* utility shall alter batch jobs by sending a *Modify Job Request* to the batch server that  
 29605 manages each batch job. At the time the *qalter* utility exits, it shall have modified the batch job  
 29606 corresponding to each successfully processed batch *job\_identifier*. An attempt to alter the  
 29607 attributes of a batch job in the RUNNING state is implementation-defined.

29608 **OPTIONS**

29609 The *qalter* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 29610 12.2, Utility Syntax Guidelines.

29611 The following options shall be supported by the implementation:

29612 **-a date\_time** Redefine the time at which the batch job becomes eligible for execution.

29613 The *date\_time* argument shall be in the same form and represent the same time as  
 29614 for the *touch* utility. The time so represented shall be set into the *Execution\_Time*  
 29615 attribute of the batch job. If the time specified is earlier than the current time, the  
 29616 **-a** option shall have no effect.

29617 **-A account\_string**

29618 Redefine the account to which the resource consumption of the batch job should be  
 29619 charged.

29620 The syntax of the *account\_string* option-argument is unspecified.

29621 The *qalter* utility shall set the *Account\_Name* attribute of the batch job to the value  
 29622 of the *account\_string* option-argument.

29623       **-c interval**     Redefine whether the batch job should be checkpointed, and if so, how often.

29624                     The *qalter* utility shall accept a value for the interval option-argument that is one of

29625                     the following:

29626               n             No checkpointing is to be performed on the batch job

29627                     (NO\_CHECKPOINT).

29628               s             Checkpointing is to be performed only when the batch server is shut

29629                     down (CHECKPOINT\_AT\_SHUTDOWN).

29630               c             Automatic periodic checkpointing is to be performed at the

29631                     *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU

29632                     minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

29633               c=*minutes*   Automatic periodic checkpointing is to be performed every *minutes*

29634                     of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is

29635                     greater. The *minutes* argument shall conform to the syntax for

29636                     unsigned integers and shall be greater than zero.

29637                     An implementation may define other checkpoint intervals. The conformance

29638                     document for an implementation shall describe any alternative checkpoint

29639                     intervals, how they are specified, their internal behavior, and how they affect the

29640                     behavior of the utility.

29641                     The *qalter* utility shall set the *Checkpoint* attribute of the batch job to the value of the

29642                     *interval* option-argument.

29643       **-e path\_name**       Redefine the path to be used for the standard error stream of the batch job. |

29644                     The *qalter* utility shall accept a *path\_name* option-argument that conforms to the |

29645                     syntax of the *path\_name* element defined in the System Interfaces volume of

29646                     IEEE Std 1003.1-2001, which can be preceded by a host name element of the form

29647                     *hostname*::.

29648                     If the *path\_name* option-argument constitutes an absolute pathname, the *qalter*

29649                     utility shall set the *Error\_Path* attribute of the batch job to the value of the

29650                     *path\_name* option-argument, including the host name element, if present.

29651                     If the *path\_name* option-argument constitutes a relative pathname and no host

29652                     name element is specified, the *qalter* utility shall set the *Error\_Path* attribute of the

29653                     batch job to the value of the absolute pathname derived by expanding the

29654                     *path\_name* option-argument relative to the current directory of the process that

29655                     executes the *qalter* utility.

29656                     If the *path\_name* option-argument constitutes a relative pathname and a host name

29657                     element is specified, the *qalter* utility shall set the *Error\_Path* attribute of the batch

29658                     job to the value of the option-argument without expansion.

29659                     If the *path\_name* option-argument does not include a host name element, the *qalter*

29660                     utility shall prefix the pathname in the *Error\_Path* attribute with *hostname*::, where

29661                     *hostname* is the name of the host upon which the *qalter* utility is being executed.

29662                     29663       **-h hold\_list**     Redefine the types of holds, if any, on the batch job. The *qalter* **-h** option shall

29664                     accept a value for the *hold\_list* option-argument that is a string of alphanumeric

29665                     characters in the portable character set.

29666                     The *qalter* utility shall accept a value for the *hold\_list* option-argument that is a

29667                     string of one or more of the characters 'u', 's', or 'o', or the single character

29668 'n'. For each unique character in the *hold\_list* option-argument, the *qalter* utility  
 29669 shall add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 29670 representing a different hold type:

29671 u USER  
 29672 s SYSTEM  
 29673 o OPERATOR

29674 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 29675 duplicates shall be ignored. An existing *Hold\_Types* attribute can be cleared by the  
 29676 hold type:

29677 n NO\_HOLD

29678 The *qalter* utility shall consider it an error if any hold type other than 'n' is  
 29679 combined with hold type 'n'. Strictly conforming applications shall not repeat  
 29680 any of the characters 'u', 's', 'o', or 'n' within the *hold\_list* option-argument.  
 29681 The *qalter* utility shall permit the repetition of characters, but shall not assign  
 29682 additional meaning to the repeated characters. An implementation may define  
 29683 other hold types. The conformance document for an implementation shall describe  
 29684 any additional hold types, how they are specified, their internal behavior, and how  
 29685 they affect the behavior of the utility.

29686 **-j join\_list** Redefine which streams of the batch job are to be merged. The *qalter* **-j** option shall  
 29687 accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 29688 characters in the portable character set.

29689 The *qalter* utility shall accept a *join\_list* option-argument that consists of one or  
 29690 more of the characters 'e' and 'o', or the single character 'n'.

29691 All of the other batch job output streams specified shall be merged into the output  
 29692 stream represented by the character listed first in the *join\_list* option-argument.

29693 For each unique character in the *join\_list* option-argument, the *qalter* utility shall  
 29694 add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 29695 a different batch job stream to join:

29696 e The standard error of the batch job (JOIN\_STD\_ERROR).  
 29697 o The standard output of the batch job (JOIN\_STD\_OUTPUT).

29698 An existing *Join\_Path* attribute can be cleared by the join type:

29699 n NO\_JOIN

29700 If 'n' is specified, then no files are joined. The *qalter* utility shall consider it an  
 29701 error if any join type other than 'n' is combined with join type 'n'.

29702 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 29703 'n' within the *join\_list* option-argument. The *qalter* utility shall permit the  
 29704 repetition of characters, but shall not assign additional meaning to the repeated  
 29705 characters.

29706 An implementation may define other join types. The conformance document for an  
 29707 implementation shall describe any additional batch job streams, how they are  
 29708 specified, their internal behavior, and how they affect the behavior of the utility.

29709 **-k keep\_list** Redefine which output of the batch job to retain on the execution host.

29710 The *qalter* **-k** option shall accept a value for the *keep\_list* option-argument that is a  
 29711 string of alphanumeric characters in the portable character set.

29712 The *qalter* utility shall accept a *keep\_list* option-argument that consists of one or  
 29713 more of the characters 'e' and 'o', or the single character 'n'.

29714 For each unique character in the *keep\_list* option-argument, the *qalter* utility shall  
 29715 add a value to the *Keep\_Files* attribute of the batch job as follows, each representing  
 29716 a different batch job stream to keep:

- 29717 e The standard error of the batch job (KEEP\_STD\_ERROR).
- 29718 o The standard output of the batch job (KEEP\_STD\_OUTPUT).

29719 If both 'e' and 'o' are specified, then both files are retained. An existing  
 29720 *Keep\_Files* attribute can be cleared by the keep type:

29721 n NO\_KEEP

29722 If 'n' is specified, then no files are retained. The *qalter* utility shall consider it an  
 29723 error if any keep type other than 'n' is combined with keep type 'n'.

29724 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 29725 'n' within the *keep\_list* option-argument. The *qalter* utility shall permit the  
 29726 repetition of characters, but shall not assign additional meaning to the repeated  
 29727 characters. An implementation may define other keep types. The conformance  
 29728 document for an implementation shall describe any additional keep types, how  
 29729 they are specified, their internal behavior, and how they affect the behavior of the  
 29730 utility.

29731 **-l resource\_list**

29732 Redefine the resources that are allowed or required by the batch job.

29733 The *qalter* utility shall accept a *resource\_list* option-argument that conforms to the  
 29734 following syntax:

29735 resource=value[, , resource=value, , ...]

29736 The *qalter* utility shall set one entry in the value of the *Resource\_List* attribute of the  
 29737 batch job for each resource listed in the *resource\_list* option-argument.

29738 Because the list of supported resource names might vary by batch server, the *qalter*  
 29739 utility shall rely on the batch server to validate the resource names and associated  
 29740 values. See Section 3.3.3 (on page 123) for a means of removing *keyword=value* (and  
 29741 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

29742 **-m mail\_options**

29743 Redefine the points in the execution of the batch job at which the batch server is to  
 29744 send mail about a change in the state of the batch job.

29745 The *qalter* **-m** option shall accept a value for the *mail\_options* option-argument that  
 29746 is a string of alphanumeric characters in the portable character set.

29747 The *qalter* utility shall accept a value for the *mail\_options* option-argument that is a  
 29748 string of one or more of the characters 'e', 'b', and 'a', or the single character  
 29749 'n'. For each unique character in the *mail\_options* option-argument, the *qalter*  
 29750 utility shall add a value to the *Mail\_Users* attribute of the batch job as follows, each  
 29751 representing a different time during the life of a batch job at which to send mail:

- 29752 e MAIL\_AT\_EXIT

|       |           |                  |                                                                                                        |
|-------|-----------|------------------|--------------------------------------------------------------------------------------------------------|
| 29753 |           | b                | MAIL_AT_BEGINNING                                                                                      |
| 29754 |           | a                | MAIL_AT_ABORT                                                                                          |
| 29755 |           |                  | If any of these characters are duplicated in the <i>mail_options</i> option-argument, the              |
| 29756 |           |                  | duplicates shall be ignored.                                                                           |
| 29757 |           |                  | An existing <i>Mail_Points</i> attribute can be cleared by the mail type:                              |
| 29758 |           | n                | NO_MAIL                                                                                                |
| 29759 |           |                  | If 'n' is specified, then mail is not sent. The <i>qalter</i> utility shall consider it an error       |
| 29760 |           |                  | if any mail type other than 'n' is combined with mail type 'n'. Strictly                               |
| 29761 |           |                  | conforming applications shall not repeat any of the characters 'e', 'b', 'a', or                       |
| 29762 |           |                  | 'n' within the <i>mail_options</i> option-argument. The <i>qalter</i> utility shall permit the         |
| 29763 |           |                  | repetition of characters but shall not assign additional meaning to the repeated                       |
| 29764 |           |                  | characters.                                                                                            |
| 29765 |           |                  | An implementation may define other mail types. The conformance document for                            |
| 29766 |           |                  | an implementation shall describe any additional mail types, how they are                               |
| 29767 |           |                  | specified, their internal behavior, and how they affect the behavior of the utility.                   |
| 29768 | <b>-M</b> | <i>mail_list</i> | Redefine the list of users to which the batch server that executes the batch job is to                 |
| 29769 |           |                  | send mail, if the batch server sends mail about the batch job.                                         |
| 29770 |           |                  | The syntax of the <i>mail_list</i> option-argument is unspecified. If the implementation               |
| 29771 |           |                  | of the <i>qalter</i> utility uses a name service to locate users, the utility shall accept the         |
| 29772 |           |                  | syntax used by the name service.                                                                       |
| 29773 |           |                  | If the implementation of the <i>qalter</i> utility does not use a name service to locate               |
| 29774 |           |                  | users, the implementation shall accept the following syntax for user names:                            |
| 29775 |           |                  | <i>mail_address</i> [, , <i>mail_address</i> , , ...]                                                  |
| 29776 |           |                  | The interpretation of <i>mail_address</i> is implementation-defined.                                   |
| 29777 |           |                  | The <i>qalter</i> utility shall set the <i>Mail_Users</i> attribute of the batch job to the value of   |
| 29778 |           |                  | the <i>mail_list</i> option-argument.                                                                  |
| 29779 | <b>-N</b> | <i>name</i>      | Redefine the name of the batch job.                                                                    |
| 29780 |           |                  | The <i>qalter</i> <b>-N</b> option shall accept a value for the <i>name</i> option-argument that is a  |
| 29781 |           |                  | string of up to 15 alphanumeric characters in the portable character set where the                     |
| 29782 |           |                  | first character is alphabetic.                                                                         |
| 29783 |           |                  | The syntax of the <i>name</i> option-argument is unspecified.                                          |
| 29784 |           |                  | The <i>qalter</i> utility shall set the <i>Job_Name</i> attribute of the batch job to the value of the |
| 29785 |           |                  | <i>name</i> option-argument.                                                                           |
| 29786 | <b>-o</b> | <i>path_name</i> |                                                                                                        |
| 29787 |           |                  | Redefine the path for the standard output of the batch job.                                            |
| 29788 |           |                  | The <i>qalter</i> utility shall accept a <i>path_name</i> option-argument that conforms to the         |
| 29789 |           |                  | syntax of the <i>path_name</i> element defined in the System Interfaces volume of                      |
| 29790 |           |                  | IEEE Std 1003.1-2001, which can be preceded by a host name element of the form                         |
| 29791 |           |                  | <i>hostname</i> ::.                                                                                    |
| 29792 |           |                  | If the <i>path_name</i> option-argument constitutes an absolute pathname, the <i>qalter</i>            |
| 29793 |           |                  | utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the                |
| 29794 |           |                  | <i>path_name</i> option-argument.                                                                      |

|       |                          |                                                                                                         |
|-------|--------------------------|---------------------------------------------------------------------------------------------------------|
| 29795 |                          | If the <i>path_name</i> option-argument constitutes a relative pathname and no host                     |
| 29796 |                          | name element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the  |
| 29797 |                          | batch job to the absolute pathname derived by expanding the <i>path_name</i> option-                    |
| 29798 |                          | argument relative to the current directory of the process that executes the <i>qalter</i>               |
| 29799 |                          | utility.                                                                                                |
| 29800 |                          | If the <i>path_name</i> option-argument constitutes a relative pathname and a host name                 |
| 29801 |                          | element is specified, the <i>qalter</i> utility shall set the <i>Output_Path</i> attribute of the batch |
| 29802 |                          | job to the value of the <i>path_name</i> option-argument without any expansion of the                   |
| 29803 |                          | pathname.                                                                                               |
| 29804 |                          | If the <i>path_name</i> option-argument does not include a host name element, the <i>qalter</i>         |
| 29805 |                          | utility shall prefix the pathname in the <i>Output_Path</i> attribute with <i>hostname</i> :, where     |
| 29806 |                          | <i>hostname</i> is the name of the host upon which the <i>qalter</i> utility is being executed.         |
| 29807 | <b>-p priority</b>       | Redefine the priority of the batch job.                                                                 |
| 29808 |                          | The <i>qalter</i> utility shall accept a value for the priority option-argument that                    |
| 29809 |                          | conforms to the syntax for signed decimal integers, and which is not less than                          |
| 29810 |                          | -1 024 and not greater than 1 023.                                                                      |
| 29811 |                          | The <i>qalter</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the  |
| 29812 |                          | <i>priority</i> option-argument.                                                                        |
| 29813 | <b>-r y   n</b>          | Redefine whether the batch job is rerunnable.                                                           |
| 29814 |                          | If the value of the option-argument is 'y', the <i>qalter</i> utility shall set the <i>Rerunable</i>    |
| 29815 |                          | attribute of the batch job to TRUE.                                                                     |
| 29816 |                          | If the value of the option-argument is 'n', the <i>qalter</i> utility shall set the <i>Rerunable</i>    |
| 29817 |                          | attribute of the batch job to FALSE.                                                                    |
| 29818 |                          | The <i>qalter</i> utility shall consider it an error if any character other than 'y' or 'n' is          |
| 29819 |                          | specified in the option-argument.                                                                       |
| 29820 | <b>-S path_name_list</b> |                                                                                                         |
| 29821 |                          | Redefine the shell that interprets the script at the destination system.                                |
| 29822 |                          | The <i>qalter</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to         |
| 29823 |                          | the following syntax:                                                                                   |
| 29824 |                          | pathname[@host] [, pathname[@host] , ...]                                                               |
| 29825 |                          | The <i>qalter</i> utility shall accept only one pathname that is missing a corresponding                |
| 29826 |                          | host name. The <i>qalter</i> utility shall allow only one pathname per named host.                      |
| 29827 |                          | The <i>qalter</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job    |
| 29828 |                          | for each entry in the <i>path_name_list</i> option-argument. See Section 3.3.3 (on page                 |
| 29829 |                          | 123) for a means of removing <i>keyword=value</i> (and <i>value@keyword</i> ) pairs and other           |
| 29830 |                          | general rules for list-oriented batch job attributes.                                                   |
| 29831 | <b>-u user_list</b>      | Redefine the user name under which the batch job is to run at the destination                           |
| 29832 |                          | system.                                                                                                 |
| 29833 |                          | The <i>qalter</i> utility shall accept a <i>user_list</i> option-argument that conforms to the          |
| 29834 |                          | following syntax:                                                                                       |
| 29835 |                          | username[@host] [, , username[@host] , , ...]                                                           |
| 29836 |                          | The <i>qalter</i> utility shall accept only one user name that is missing a corresponding               |
| 29837 |                          | host name. The <i>qalter</i> utility shall accept only one user name per named host.                    |

29838 The *qalter* utility shall add a value to the *User\_List* attribute of the batch job for each  
 29839 entry in the *user\_list* option-argument. See Section 3.3.3 (on page 123) for a means  
 29840 of removing *keyword=value* (and *value@keyword*) pairs and other general rules for  
 29841 list-oriented batch job attributes.

#### 29842 OPERANDS

29843 The *qalter* utility shall accept one or more operands that conform to the syntax for a batch  
 29844 *job\_identifier* (see Section 3.3.1 (on page 122)).

#### 29845 STDIN

29846 Not used.

#### 29847 INPUT FILES

29848 None.

#### 29849 ENVIRONMENT VARIABLES

29850 The following environment variables shall affect the execution of *qalter*:

29851 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 29852 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 29853 Internationalization Variables for the precedence of internationalization variables  
 29854 used to determine the values of locale categories.)

29855 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 29856 internationalization variables.

29857 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 29858 characters (for example, single-byte as opposed to multi-byte characters in  
 29859 arguments).

#### 29860 LC\_MESSAGES

29861 Determine the locale that should be used to affect the format and contents of  
 29862 diagnostic messages written to standard error.

29863 *LOGNAME* Determine the login name of the user.

29864 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
 29865 unset or null, an unspecified default timezone shall be used.

#### 29866 ASYNCHRONOUS EVENTS

29867 Default.

#### 29868 STDOUT

29869 None.

#### 29870 STDERR

29871 The standard error shall be used only for diagnostic messages.

#### 29872 OUTPUT FILES

29873 None.

#### 29874 EXTENDED DESCRIPTION

29875 None.

#### 29876 EXIT STATUS

29877 The following exit values shall be returned:

29878 0 Successful completion.

29879 >0 An error occurred.

29880 **CONSEQUENCES OF ERRORS**

29881 In addition to the default behavior, the *qalter* utility shall not be required to write a diagnostic  
 29882 message to standard error when the error reply received from a batch server indicates that the  
 29883 batch *job\_identifier* does not exist on the server. Whether or not the *qalter* utility attempts to  
 29884 locate the batch job on other batch servers is implementation-defined.

29885 **APPLICATION USAGE**

29886 None.

29887 **EXAMPLES**

29888 None.

29889 **RATIONALE**

29890 The *qalter* utility allows users to change the attributes of a batch job.

29891 As a means of altering a queued job, the *qalter* utility is superior to deleting and requeuing the  
 29892 batch job insofar as an altered job retains its place in the queue with some traditional selection  
 29893 algorithms. In addition, the *qalter* utility is both shorter and simpler than a sequence of *qdel* and  
 29894 *qsub* utilities.

29895 The result of an attempt on the part of a user to alter a batch job in a RUNNING state is  
 29896 implementation-defined because a batch job in the RUNNING state will already have opened its  
 29897 output files and otherwise performed any actions indicated by the options in effect at the time  
 29898 the batch job began execution.

29899 The options processed by the *qalter* utility are identical to those of the *qsub* utility, with a few  
 29900 exceptions: **-V**, **-v**, and **-q**. The **-V** and **-v** are inappropriate for the *qalter* utility, since they  
 29901 capture potentially transient environment information from the submitting process. The **-q**  
 29902 option would specify a new queue, which would largely negate the previously stated advantage  
 29903 of using *qalter*; furthermore, the *qmove* utility provides a superior means of moving jobs.

29904 Each of the following paragraphs provides the rationale for a *qalter* option.

29905 Additional rationale concerning these options can be found in the rationale for the *qsub* utility.

29906 The **-a** option allows users to alter the date and time at which a batch job becomes eligible to  
 29907 run.

29908 The **-A** option allows users to change the account that will be charged for the resources  
 29909 consumed by the batch job. Support for the **-A** option is mandatory for conforming  
 29910 implementations of *qalter*, even though support of accounting is optional for servers. Whether or  
 29911 not to support accounting is left to the implementor of the server, but mandatory support of the  
 29912 **-A** option assures users of a consistent interface and allows them to control accounting on  
 29913 servers that support accounting.

29914 The **-c** option allows users to alter the checkpointing interval of a batch job. A checkpointing  
 29915 system, which is not defined by IEEE Std 1003.1-2001, allows recovery of a batch job at the most  
 29916 recent checkpoint in the event of a crash. Checkpointing is typically used for jobs that consume  
 29917 expensive computing time or must meet a critical schedule. Users should be allowed to make  
 29918 the tradeoff between the overhead of checkpointing and the risk to the timely completion of the  
 29919 batch job; therefore, this volume of IEEE Std 1003.1-2001 provides the checkpointing interval  
 29920 option. Support for checkpointing is optional for servers.

29921 The **-e** option allows users to alter the name and location of the standard error stream written by  
 29922 a batch job. However, the path of the standard error stream is meaningless if the value of the  
 29923 *Join\_Path* attribute of the batch job is TRUE.

29924 The **-h** option allows users to set the hold type in the *Hold\_Types* attribute of a batch job. The  
 29925 *qhold* and *qrls* utilities add or remove hold types to the *Hold\_Types* attribute, respectively. The **-h**

- 29926 option has been modified to allow for implementation-defined hold types.
- 29927 The **-j** option allows users to alter the decision to join (merge) the standard error stream of the  
29928 batch job with the standard output stream of the batch job.
- 29929 The **-l** option allows users to change the resource limits imposed on a batch job.
- 29930 The **-m** option allows users to modify the list of points in the life of a batch job at which the  
29931 designated users will receive mail notification.
- 29932 The **-M** option allows users to alter the list of users who will receive notification about events in  
29933 the life of a batch job.
- 29934 The **-N** option allows users to change the name of a batch job.
- 29935 The **-o** option allows users to alter the name and path to which the standard output stream of  
29936 the batch job will be written.
- 29937 The **-P** option allows users to modify the priority of a batch job. Support for priority is optional  
29938 for batch servers.
- 29939 The **-r** option allows users to alter the rerunability status of a batch job.
- 29940 The **-S** option allows users to change the name and location of the shell image that will be  
29941 invoked to interpret the script of the batch job. This option has been modified to allow a list of  
29942 shell name and locations associated with different hosts.
- 29943 The **-u** option allows users to change the user identifier under which the batch job will execute.
- 29944 The *job\_identifier* operand syntax is provided so that the user can differentiate between the  
29945 originating and destination (or executing) batch server. These may or may not be the same. The  
29946 *.server\_name* portion identifies the originating batch server, while the *@server* portion identifies  
29947 the destination batch server.
- 29948 Historically, the *qalter* utility has been a component of the Network Queuing System (NQS), the  
29949 existing practice from which this utility has been derived.

- 29958 IEEE PASC Interpretation 1003.2 #182 is applied, clarifying the description of the **-a** option.

29959 **NAME**

29960 qdel — delete batch jobs

29961 **SYNOPSIS**29962 BE qdel *job\_identifier* ...

29963

29964 **DESCRIPTION**

29965 A batch job is deleted by sending a request to the batch server that manages the batch job. A  
 29966 batch job that has been deleted is no longer subject to management by batch services.

29967 The *qdel* utility is a user-accessible client of batch services that requests the deletion of one or  
 29968 more batch jobs.

29969 The *qdel* utility shall request a batch server to delete those batch jobs for which a batch  
 29970 *job\_identifier* is presented to the utility.

29971 The *qdel* utility shall delete batch jobs in the order in which their batch *job\_identifiers* are  
 29972 presented to the utility.

29973 If the *qdel* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 29974 process the remaining batch *job\_identifiers*, if any.

29975 The *qdel* utility shall delete each batch job by sending a *Delete Job Request* to the batch server that  
 29976 manages the batch job.

29977 The *qdel* utility shall not exit until the batch job corresponding to each successfully processed  
 29978 batch *job\_identifier* has been deleted.

29979 **OPTIONS**

29980 None.

29981 **OPERANDS**

29982 The *qdel* utility shall accept one or more operands that conform to the syntax for a batch  
 29983 *job\_identifier* (see Section 3.3.1 (on page 122)).

29984 **STDIN**

29985 Not used.

29986 **INPUT FILES**

29987 None.

29988 **ENVIRONMENT VARIABLES**29989 The following environment variables shall affect the execution of *qdel*:

29990 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 29991 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 29992 Internationalization Variables for the precedence of internationalization variables  
 29993 used to determine the values of locale categories.)

29994 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 29995 internationalization variables.

29996 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 29997 characters (for example, single-byte as opposed to multi-byte characters in  
 29998 arguments).

29999 *LC\_MESSAGES*

30000 Determine the locale that should be used to affect the format and contents of  
 30001 diagnostic messages written to standard error.

30002            *LOGNAME*   Determine the login name of the user.

30003 **ASYNCHRONOUS EVENTS**

30004            Default.

30005 **STDOUT**

30006            An implementation of the *qdel* utility may write informative messages to standard output.

30007 **STDERR**

30008            The standard error shall be used only for diagnostic messages.

30009 **OUTPUT FILES**

30010            None.

30011 **EXTENDED DESCRIPTION**

30012            None.

30013 **EXIT STATUS**

30014            The following exit values shall be returned:

30015            0   Successful completion.

30016            >0   An error occurred.

30017 **CONSEQUENCES OF ERRORS**

30018            In addition to the default behavior, the *qdel* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qdel* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

30023 **APPLICATION USAGE**

30024            None.

30025 **EXAMPLES**

30026            None.

30027 **RATIONALE**

30028            The *qdel* utility allows users and administrators to delete jobs.

30029            The *qdel* utility provides functionality that is not otherwise available. For example, the *kill* utility of the operating system does not suffice. First, to use the *kill* utility, the user might have to log in on a remote node, because the *kill* utility does not operate across the network. Second, unlike *qdel*, *kill* cannot remove jobs from queues. Lastly, the arguments of the *qdel* utility are job identifiers rather than process identifiers, and so this utility can be passed the output of the *qselect* utility, thus providing users with a means of deleting a list of jobs.

30035            Because a set of jobs can be selected using the *qselect* utility, the *qdel* utility has not been complicated with options that provide for selection of jobs. Instead, the batch jobs to be deleted are identified individually by their job identifiers.

30038            Historically, the *qdel* utility has been a component of NQS, the existing practice on which it is based. However, the *qdel* utility defined in this volume of IEEE Std 1003.1-2001 does not provide an option for specifying a signal number to send to the batch job prior to the killing of the process; that capability has been subsumed by the *qsig* utility.

30042            A discussion was held about the delays of networking and the possibility that the batch server may never respond, due to a down router, down batch server, or other network mishap. The DESCRIPTION records this under the words “fails to process any job identifier”. In the broad sense, the network problem is also an error, which causes the failure to process the batch job

30046 identifier.

30047 **FUTURE DIRECTIONS**

30048 None.

30049 **SEE ALSO**

30050 Chapter 3 (on page 101), *kill*, *qselect*, *qsig*

30051 **CHANGE HISTORY**

30052 Derived from IEEE Std 1003.2d-1994.

30053 **Issue 6**

30054 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30055 **NAME**

30056 qhold — hold batch jobs

30057 **SYNOPSIS**30058 BE qhold [-h *hold\_list*] *job\_identifier* ...

30059

30060 **DESCRIPTION**

30061 A hold is placed on a batch job by a request to the batch server that manages the batch job. A  
 30062 batch job that has one or more holds is not eligible for execution. The *qhold* utility is a user-  
 30063 accessible client of batch services that requests one or more types of hold to be placed on one or  
 30064 more batch jobs.

30065 The *qhold* utility shall place holds on those batch jobs for which a batch *job\_identifier* is presented  
 30066 to the utility.

30067 The *qhold* utility shall place holds on batch jobs in the order in which their batch *job\_identifiers*  
 30068 are presented to the utility. If the *qhold* utility fails to process any batch *job\_identifier* successfully,  
 30069 the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

30070 The *qhold* utility shall place holds on each batch job by sending a *Hold Job Request* to the batch  
 30071 server that manages the batch job.

30072 The *qhold* utility shall not exit until holds have been placed on the batch job corresponding to  
 30073 each successfully processed batch *job\_identifier*.

30074 **OPTIONS**

30075 The *qhold* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 30076 12.2, Utility Syntax Guidelines.

30077 The following option shall be supported by the implementation:

30078 **-h *hold\_list*** Define the types of holds to be placed on the batch job.

30079 The *qhold -h* option shall accept a value for the *hold\_list* option-argument that is a  
 30080 string of alphanumeric characters in the portable character set (see the Base  
 30081 Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

30082 The *qhold* utility shall accept a value for the *hold\_list* option-argument that is a  
 30083 string of one or more of the characters 'u', 's', or 'o', or the single character  
 30084 'n'.

30085 For each unique character in the *hold\_list* option-argument, the *qhold* utility shall  
 30086 add a value to the *Hold\_Types* attribute of the batch job as follows, each  
 30087 representing a different hold type:

30088 u USER

30089 s SYSTEM

30090 o OPERATOR

30091 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 30092 duplicates shall be ignored.

30093 An existing *Hold\_Types* attribute can be cleared by the following hold type:

30094 n NO\_HOLD

30095 The *qhold* utility shall consider it an error if any hold type other than 'n' is  
 30096 combined with hold type 'n'.

30097 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 30098 'o', or 'n' within the *hold\_list* option-argument. The *qhold* utility shall permit the  
 30099 repetition of characters, but shall not assign additional meaning to the repeated  
 30100 characters.

30101 An implementation may define other hold types. The conformance document for  
 30102 an implementation shall describe any additional hold types, how they are  
 30103 specified, their internal behavior, and how they affect the behavior of the utility.

30104 If the **-h** option is not presented to the *qhold* utility, the implementation shall set  
 30105 the *Hold\_Types* attribute to USER.

#### 30106 **OPERANDS**

30107 The *qhold* utility shall accept one or more operands that conform to the syntax for a batch  
 30108 *job\_identifier* (see Section 3.3.1 (on page 122)).

#### 30109 **STDIN**

30110 Not used.

#### 30111 **INPUT FILES**

30112 None.

#### 30113 **ENVIRONMENT VARIABLES**

30114 The following environment variables shall affect the execution of *qhold*:

30115 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30116 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30117 Internationalization Variables for the precedence of internationalization variables  
 30118 used to determine the values of locale categories.)

30119 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30120 internationalization variables.

30121 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30122 characters (for example, single-byte as opposed to multi-byte characters in  
 30123 arguments).

30124 *LC\_MESSAGES*

30125 Determine the locale that should be used to affect the format and contents of  
 30126 diagnostic messages written to standard error.

30127 *LOGNAME* Determine the login name of the user.

#### 30128 **ASYNCHRONOUS EVENTS**

30129 Default.

#### 30130 **STDOUT**

30131 None.

#### 30132 **STDERR**

30133 The standard error shall be used only for diagnostic messages.

#### 30134 **OUTPUT FILES**

30135 None.

#### 30136 **EXTENDED DESCRIPTION**

30137 None.

**30138 EXIT STATUS**

30139 The following exit values shall be returned:

30140 0 Successful completion.

30141 >0 An error occurred.

**30142 CONSEQUENCES OF ERRORS**

30143 In addition to the default behavior, the *qhold* utility shall not be required to write a diagnostic  
30144 message to standard error when the error reply received from a batch server indicates that the  
30145 batch *job\_identifier* does not exist on the server. Whether or not the *qhold* utility waits to output  
30146 the diagnostic message while attempting to locate the job on other servers is implementation-  
30147 defined.

**30148 APPLICATION USAGE**

30149 None.

**30150 EXAMPLES**

30151 None.

**30152 RATIONALE**

30153 The *qhold* utility allows users to place a hold on one or more jobs. A hold makes a batch job  
30154 ineligible for execution.

30155 The *qhold* utility has options that allow the user to specify the type of hold. Should the user wish  
30156 to place a hold on a set of jobs that meet a selection criteria, such a list of jobs can be acquired  
30157 using the *qselect* utility.

30158 The **-h** option allows the user to specify the type of hold that is to be placed on the job. This  
30159 option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The  
30160 USER and OPERATOR holds are distinct. The batch server that manages the batch job will verify  
30161 that the user is authorized to set the specified hold for the batch job.

30162 Mail is not required on hold because the administrator has the tools and libraries to build this  
30163 option if he or she wishes.

30164 Historically, the *qhold* utility has been a part of some existing batch systems, although it has not  
30165 traditionally been a part of the NQS.

**30166 FUTURE DIRECTIONS**

30167 None.

**30168 SEE ALSO**

30169 Chapter 3 (on page 101), *qselect*

**30170 CHANGE HISTORY**

30171 Derived from IEEE Std 1003.2d-1994.

**30172 Issue 6**

30173 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30174 **NAME**

30175           qmove — move batch jobs

30176 **SYNOPSIS**30177 BE       *qmove destination job\_identifier ...*

30178

30179 **DESCRIPTION**

30180       To move a batch job is to remove the batch job from the batch queue in which it resides and  
 30181       instantiate the batch job in another batch queue. A batch job is moved by a request to the batch  
 30182       server that manages the batch job. The *qmove* utility is a user-accessible batch client that requests  
 30183       the movement of one or more batch jobs.

30184       The *qmove* utility shall move those batch jobs, and only those batch jobs, for which a batch  
 30185       *job\_identifier* is presented to the utility.

30186       The *qmove* utility shall move batch jobs in the order in which the corresponding batch  
 30187       *job\_identifiers* are presented to the utility.

30188       If the *qmove* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 30189       process the remaining batch *job\_identifiers*, if any.

30190       The *qmove* utility shall move batch jobs by sending a *Move Job Request* to the batch server that  
 30191       manages each batch job. The *qmove* utility shall not exit before the batch jobs corresponding to all  
 30192       successfully processed batch *job\_identifiers* have been moved.

30193 **OPTIONS**

30194           None.

30195 **OPERANDS**

30196       The *qmove* utility shall accept one operand that conforms to the syntax for a destination (see  
 30197       Section 3.3.2 (on page 123)).

30198       The *qmove* utility shall accept one or more operands that conform to the syntax for a batch  
 30199       *job\_identifier* (see Section 3.3.1 (on page 122)).

30200 **STDIN**

30201           Not used.

30202 **INPUT FILES**

30203           None.

30204 **ENVIRONMENT VARIABLES**30205       The following environment variables shall affect the execution of *qmove*:

30206       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 30207       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30208       Internationalization Variables for the precedence of internationalization variables  
 30209       used to determine the values of locale categories.)

30210       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 30211       internationalization variables.

30212       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 30213       characters (for example, single-byte as opposed to multi-byte characters in  
 30214       arguments).

30215       *LC\_MESSAGES*

30216       Determine the locale that should be used to affect the format and contents of  
 30217       diagnostic messages written to standard error.

30218 *LOGNAME* Determine the login name of the user.

30219 **ASYNCHRONOUS EVENTS**

30220 Default.

30221 **STDOUT**

30222 None.

30223 **STDERR**

30224 The standard error shall be used only for diagnostic messages.

30225 **OUTPUT FILES**

30226 None.

30227 **EXTENDED DESCRIPTION**

30228 None.

30229 **EXIT STATUS**

30230 The following exit values shall be returned:

30231 0 Successful completion.

30232 >0 An error occurred.

30233 **CONSEQUENCES OF ERRORS**

30234 In addition to the default behavior, the *qmove* utility shall not be required to write a diagnostic  
30235 message to standard error when the error reply received from a batch server indicates that the  
30236 batch *job\_identifier* does not exist on the server. Whether or not the *qmove* utility waits to output  
30237 the diagnostic message while attempting to locate the job on other servers is implementation-  
30238 defined.

30239 **APPLICATION USAGE**

30240 None.

30241 **EXAMPLES**

30242 None.

30243 **RATIONALE**

30244 The *qmove* utility allows users to move jobs between queues.

30245 The alternative to using the *qmove* utility—deleting the batch job and requeuing it—entails  
30246 considerably more typing.

30247 Since the means of selecting jobs based on attributes has been encapsulated in the *qselect* utility,  
30248 the only option of the *qmove* utility concerns authorization. The **-u** option provides the user with  
30249 the convenience of changing the user identifier under which the batch job will execute.  
30250 Minimalism and consistency have taken precedence over convenience; the **-u** option has been  
30251 deleted because the equivalent capability exists with the **-u** option of the *qalter* utility.

30252 **FUTURE DIRECTIONS**

30253 None.

30254 **SEE ALSO**

30255 Chapter 3 (on page 101), *qalter*, *qselect*

30256 **CHANGE HISTORY**

30257 Derived from IEEE Std 1003.2d-1994.

30258 **Issue 6**

30259 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30260 **NAME**

30261 qmsg — send message to batch jobs

30262 **SYNOPSIS**30263 BE qmsg [-E] [-O] *message\_string* *job\_identifier* ...

30264

30265 **DESCRIPTION**

30266 To send a message to a batch job is to request that a server write a message string into one or  
 30267 more output files of the batch job. A message is sent to a batch job by a request to the batch  
 30268 server that manages the batch job. The *qmsg* utility is a user-accessible batch client that requests  
 30269 the sending of messages to one or more batch jobs.

30270 The *qmsg* utility shall write messages into the files of batch jobs by sending a *Job Message Request*  
 30271 to the batch server that manages the batch job. The *qmsg* utility shall not directly write the  
 30272 message into the files of the batch job.

30273 The *qmsg* utility shall send a *Job Message Request* for those batch jobs, and only those batch jobs,  
 30274 for which a batch *job\_identifier* is presented to the utility.

30275 The *qmsg* utility shall send *Job Message Requests* for batch jobs in the order in which their batch  
 30276 *job\_identifiers* are presented to the utility.

30277 If the *qmsg* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed to  
 30278 process the remaining batch *job\_identifiers*, if any.

30279 The *qmsg* utility shall not exit before a *Job Message Request* has been sent to the server that  
 30280 manages the batch job that corresponds to each successfully processed batch *job\_identifier*.

30281 **OPTIONS**

30282 The *qmsg* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 30283 12.2, Utility Syntax Guidelines.

30284 The following options shall be supported by the implementation:

30285 **-E** Specify that the message is written to the standard error of each batch job.

30286 The *qmsg* utility shall write the message into the standard error of the batch job.

30287 **-O** Specify that the message is written to the standard output of each batch job.

30288 The *qmsg* utility shall write the message into the standard output of the batch job.

30289 If neither the **-O** nor the **-E** option is presented to the *qmsg* utility, the utility shall write the  
 30290 message into an implementation-defined file. The conformance document for the  
 30291 implementation shall describe the name and location of the implementation-defined file. If both  
 30292 the **-O** and the **-E** options are presented to the *qmsg* utility, then the utility shall write the  
 30293 messages to both standard output and standard error.

30294 **OPERANDS**

30295 The *qmsg* utility shall accept a minimum of two operands, *message\_string* and one or more batch  
 30296 *job\_identifiers*.

30297 The *message\_string* operand shall be the string to be written to one or more output files of the  
 30298 batch job followed by a <newline>. If the string contains <blank>s, then the application shall  
 30299 ensure that the string is quoted. The *message\_string* shall be encoded in the portable character set  
 30300 (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

30301 All remaining operands are batch *job\_identifiers* that conform to the syntax for a batch  
 30302 *job\_identifier* (see Section 3.3.1 (on page 122)).

30303 **STDIN**

30304 Not used.

30305 **INPUT FILES**

30306 None.

30307 **ENVIRONMENT VARIABLES**30308 The following environment variables shall affect the execution of *qmsg*:

30309 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30310 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30311 Internationalization Variables for the precedence of internationalization variables  
 30312 used to determine the values of locale categories.)

30313 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30314 internationalization variables.

30315 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30316 characters (for example, single-byte as opposed to multi-byte characters in  
 30317 arguments).

30318 *LC\_MESSAGES*

30319 Determine the locale that should be used to affect the format and contents of  
 30320 diagnostic messages written to standard error.

30321 *LOGNAME* Determine the login name of the user.30322 **ASYNCHRONOUS EVENTS**

30323 Default.

30324 **STDOUT**

30325 None.

30326 **STDERR**

30327 The standard error shall be used only for diagnostic messages.

30328 **OUTPUT FILES**

30329 None.

30330 **EXTENDED DESCRIPTION**

30331 None.

30332 **EXIT STATUS**

30333 The following exit values shall be returned:

30334 0 Successful completion.

30335 &gt;0 An error occurred.

30336 **CONSEQUENCES OF ERRORS**

30337 In addition to the default behavior, the *qmsg* utility shall not be required to write a diagnostic  
 30338 message to standard error when the error reply received from a batch server indicates that the  
 30339 batch *job\_identifier* does not exist on the server. Whether or not the *qmsg* utility waits to output  
 30340 the diagnostic message while attempting to locate the job on other servers is implementation-  
 30341 defined.

**30342 APPLICATION USAGE**

30343 None.

**30344 EXAMPLES**

30345 None.

**30346 RATIONALE**

30347 The *qmsg* utility allows users to write messages into the output files of running jobs. Users,  
30348 including operators and administrators, have a number of occasions when they want to place  
30349 messages in the output files of a batch job. For example, if a disk that is being used by a batch job  
30350 is showing errors, the operator might note this in the standard error stream of the batch job.

30351 The options of the *qmsg* utility provide users with the means of placing the message in the  
30352 output stream of their choice. The default output stream for the message—if the user does not  
30353 designate an output stream—is implementation-defined, since many implementations will  
30354 provide, as an extension to this volume of IEEE Std 1003.1-2001, a log file that shows the history  
30355 of utility execution.

30356 If users wish to send a message to a set of jobs that meet a selection criteria, the *qselect* utility can  
30357 be used to acquire the appropriate list of job identifiers.

30358 The **-E** option allows users to place the message in the standard error stream of the batch job.

30359 The **-O** option allows users to place the message in the standard output stream of the batch job.

30360 Historically, the *qmsg* utility is an existing practice in the offerings of one or more implementors  
30361 of an NQS-derived batch system. The utility has been found to be useful enough that it deserves  
30362 to be included in this volume of IEEE Std 1003.1-2001.

**30363 FUTURE DIRECTIONS**

30364 None.

**30365 SEE ALSO**

30366 Chapter 3 (on page 101), *qselect*

**30367 CHANGE HISTORY**

30368 Derived from IEEE Std 1003.2d-1994.

**30369 Issue 6**

30370 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30371 **NAME**

30372 qrerun — rerun batch jobs

30373 **SYNOPSIS**30374 BE qrerun *job\_identifier* ...

30375

30376 **DESCRIPTION**

30377 To rerun a batch job is to terminate the session leader of the batch job, delete any associated  
 30378 checkpoint files, and return the batch job to the batch queued state. A batch job is rerun by a  
 30379 request to the batch server that manages the batch job. The *qrerun* utility is a user-accessible  
 30380 batch client that requests the rerunning of one or more batch jobs.

30381 The *qrerun* utility shall rerun those batch jobs for which a batch *job\_identifier* is presented to the  
 30382 utility.

30383 The *qrerun* utility shall rerun batch jobs in the order in which their batch *job\_identifiers* are  
 30384 presented to the utility.

30385 If the *qrerun* utility fails to process any batch *job\_identifier* successfully, the utility shall proceed  
 30386 to process the remaining batch *job\_identifiers*, if any.

30387 The *qrerun* utility shall rerun batch jobs by sending a *Rerun Job Request* to the batch server that  
 30388 manages each batch job.

30389 For each successfully processed batch *job\_identifier*, the *qrerun* utility shall have rerun the  
 30390 corresponding batch job at the time the utility exits.

30391 **OPTIONS**

30392 None.

30393 **OPERANDS**

30394 The *qrerun* utility shall accept one or more operands that conform to the syntax for a batch  
 30395 *job\_identifier* (see Section 3.3.1 (on page 122)).

30396 **STDIN**

30397 Not used.

30398 **INPUT FILES**

30399 None.

30400 **ENVIRONMENT VARIABLES**30401 The following environment variables shall affect the execution of *qrerun*:

30402 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30403 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30404 Internationalization Variables for the precedence of internationalization variables  
 30405 used to determine the values of locale categories.)

30406 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30407 internationalization variables.

30408 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30409 characters (for example, single-byte as opposed to multi-byte characters in  
 30410 arguments).

30411 *LC\_MESSAGES*

30412 Determine the locale that should be used to affect the format and contents of  
 30413 diagnostic messages written to standard error.

30414 *LOGNAME* Determine the login name of the user.

30415 **ASYNCHRONOUS EVENTS**

30416 Default.

30417 **STDOUT**

30418 None.

30419 **STDERR**

30420 The standard error shall be used only for diagnostic messages.

30421 **OUTPUT FILES**

30422 None.

30423 **EXTENDED DESCRIPTION**

30424 None.

30425 **EXIT STATUS**

30426 The following exit values shall be returned:

30427 0 Successful completion.

30428 >0 An error occurred.

30429 **CONSEQUENCES OF ERRORS**

30430 In addition to the default behavior, the *qrerun* utility shall not be required to write a diagnostic  
30431 message to standard error when the error reply received from a batch server indicates that the  
30432 batch *job\_identifier* does not exist on the server. Whether or not the *qrerun* utility waits to output  
30433 the diagnostic message while attempting to locate the job on other servers is implementation-  
30434 defined.

30435 **APPLICATION USAGE**

30436 None.

30437 **EXAMPLES**

30438 None.

30439 **RATIONALE**

30440 The *qrerun* utility allows users to cause jobs in the running state to exit and rerun.

30441 The *qrerun* utility is a new utility, *vis-a-vis* existing practice, that has been defined in this volume  
30442 of IEEE Std 1003.1-2001 to correct user-perceived deficiencies in the existing practice.

30443 **FUTURE DIRECTIONS**

30444 None.

30445 **SEE ALSO**

30446 Chapter 3 (on page 101)

30447 **CHANGE HISTORY**

30448 Derived from IEEE Std 1003.2d-1994.

30449 **Issue 6**

30450 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30451 **NAME**

30452 qrln — release batch jobs

30453 **SYNOPSIS**30454 BE qrln [-h *hold\_list*] *job\_identifier* ...

30455

30456 **DESCRIPTION**

30457 A batch job might have one or more holds, which prevent the batch job from executing. A batch  
 30458 job from which all the holds have been removed becomes eligible for execution and is said to  
 30459 have been released. A batch job hold is removed by sending a request to the batch server that  
 30460 manages the batch job. The *qrln* utility is a user-accessible client of batch services that requests  
 30461 holds be removed from one or more batch jobs.

30462 The *qrln* utility shall remove one or more holds from those batch jobs for which a batch  
 30463 *job\_identifier* is presented to the utility.

30464 The *qrln* utility shall remove holds from batch jobs in the order in which their batch *job\_identifiers*  
 30465 are presented to the utility.

30466 If the *qrln* utility fails to process a batch *job\_identifier* successfully, the utility shall proceed to  
 30467 process the remaining batch *job\_identifiers*, if any.

30468 The *qrln* utility shall remove holds on each batch job by sending a *Release Job Request* to the batch  
 30469 server that manages the batch job.

30470 The *qrln* utility shall not exit until the holds have been removed from the batch job  
 30471 corresponding to each successfully processed batch *job\_identifier*.

30472 **OPTIONS**

30473 The *qrln* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 30474 12.2, Utility Syntax Guidelines.

30475 The following option shall be supported by the implementation:

30476 **-h *hold\_list*** Define the types of holds to be removed from the batch job.

30477 The *qrln* **-h** option shall accept a value for the *hold\_list* option-argument that is a  
 30478 string of alphanumeric characters in the portable character set (see the Base  
 30479 Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

30480 The *qrln* utility shall accept a value for the *hold\_list* option-argument that is a string  
 30481 of one or more of the characters 'u', 's', or 'o', or the single character 'n'.

30482 For each unique character in the *hold\_list* option-argument, the *qrln* utility shall add  
 30483 a value to the *Hold\_Types* attribute of the batch job as follows, each representing a  
 30484 different hold type:

30485 u USER

30486 s SYSTEM

30487 o OPERATOR

30488 If any of these characters are duplicated in the *hold\_list* option-argument, the  
 30489 duplicates shall be ignored.

30490 An existing *Hold\_Types* attribute can be cleared by the following hold type:

30491 n NO\_HOLD

30492 The *qrls* utility shall consider it an error if any hold type other than 'n' is  
 30493 combined with hold type 'n'.

30494 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 30495 'o', or 'n' within the *hold\_list* option-argument. The *qrls* utility shall permit the  
 30496 repetition of characters, but shall not assign additional meaning to the repeated  
 30497 characters.

30498 An implementation may define other hold types. The conformance document for  
 30499 an implementation shall describe any additional hold types, how they are  
 30500 specified, their internal behavior, and how they affect the behavior of the utility.

30501 If the **-h** option is not presented to the *qrls* utility, the implementation shall remove  
 30502 the USER hold in the *Hold\_Types* attribute.

#### 30503 OPERANDS

30504 The *qrls* utility shall accept one or more operands that conform to the syntax for a batch  
 30505 *job\_identifier* (see Section 3.3.1 (on page 122)).

#### 30506 STDIN

30507 Not used.

#### 30508 INPUT FILES

30509 None.

#### 30510 ENVIRONMENT VARIABLES

30511 The following environment variables shall affect the execution of *qrls*:

30512 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30513 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30514 Internationalization Variables for the precedence of internationalization variables  
 30515 used to determine the values of locale categories.)

30516 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30517 internationalization variables.

30518 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30519 characters (for example, single-byte as opposed to multi-byte characters in  
 30520 arguments).

30521 *LC\_MESSAGES*

30522 Determine the locale that should be used to affect the format and contents of  
 30523 diagnostic messages written to standard error.

30524 *LOGNAME* Determine the login name of the user.

#### 30525 ASYNCHRONOUS EVENTS

30526 Default.

#### 30527 STDOUT

30528 None.

#### 30529 STDERR

30530 The standard error shall be used only for diagnostic messages.

#### 30531 OUTPUT FILES

30532 None.

**30533 EXTENDED DESCRIPTION**

30534 None.

**30535 EXIT STATUS**

30536 The following exit values shall be returned:

30537 0 Successful completion.

30538 >0 An error occurred.

**30539 CONSEQUENCES OF ERRORS**

30540 In addition to the default behavior, the *qrIs* utility shall not be required to write a diagnostic message to standard error when the error reply received from a batch server indicates that the batch *job\_identifier* does not exist on the server. Whether or not the *qrIs* utility waits to output the diagnostic message while attempting to locate the job on other servers is implementation-defined.

**30545 APPLICATION USAGE**

30546 None.

**30547 EXAMPLES**

30548 None.

**30549 RATIONALE**

30550 The *qrIs* utility allows users, operators, and administrators to remove holds from jobs.

30551 The *qrIs* utility does not support any job selection options or wildcard arguments. Users may acquire a list of jobs selected by attributes using the *qselect* utility. For example, a user could select all of their held jobs.

30552 The **-h** option allows the user to specify the type of hold that is to be removed. This option allows for USER, SYSTEM, OPERATOR, and implementation-defined hold types. The batch server that manages the batch job will verify whether the user is authorized to remove the specified hold for the batch job. If more than one type of hold has been placed on the batch job, a user may wish to remove only some of them.

30553 Mail is not required on release because the administrator has the tools and libraries to build this option if required.

30554 The *qrIs* utility is a new utility *vis-a-vis* existing practice; it has been defined in this volume of IEEE Std 1003.1-2001 as the natural complement to the *qhold* utility.

**30563 FUTURE DIRECTIONS**

30564 None.

**30565 SEE ALSO**

30566 Chapter 3 (on page 101), *qhold*, *qselect*

**30567 CHANGE HISTORY**

30568 Derived from IEEE Std 1003.2d-1994.

**30569 Issue 6**

30570 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

30571 **NAME**

30572 qselect — select batch jobs

30573 **SYNOPSIS**

```
30574 BE qselect [-a [op]date_time] [-A account_string] [-c [op]interval]
30575 [-h hold_list] [-l resource_list] [-N name] [-p [op]priority]
30576 [-q destination] [-r y|n] [-s states] [-u user_list]
30577
```

30578 **DESCRIPTION**

30579 To select a set of batch jobs is to return the batch *job\_identifiers* for each batch job that meets a list  
 30580 of selection criteria. A set of batch jobs is selected by a request to a batch server. The *qselect*  
 30581 utility is a user-accessible batch client that requests the selection of batch jobs.

30582 Upon successful completion, the *qselect* utility shall have returned a list of zero or more batch  
 30583 *job\_identifiers* that meet the criteria specified by the options and option-arguments presented to  
 30584 the utility.

30585 The *qselect* utility shall select batch jobs by sending a *Select Jobs Request* to a batch server. The  
 30586 *qselect* utility shall not exit until the server replies to each request generated.

30587 For each option presented to the *qselect* utility, the utility shall restrict the set of selected batch  
 30588 jobs as described in the OPTIONS section.

30589 The *qselect* utility shall not restrict selection of batch jobs except by authorization and as required  
 30590 by the options presented to the utility.

30591 When an option is specified with a mandatory or optional *op* component to the option-  
 30592 argument, then *op* shall specify a relation between the value of a certain batch job attribute and  
 30593 the *value* component of the option-argument. If an *op* is allowable on an option, then the  
 30594 description of the option letter indicates the *op* as either mandatory or optional. Acceptable  
 30595 strings for the *op* component, and the relation the string indicates, are shown in the following  
 30596 list:

- |                |      |                                                                                                                                   |
|----------------|------|-----------------------------------------------------------------------------------------------------------------------------------|
| 30597<br>30598 | .eq. | The value represented by the attribute of the batch job is equal to the value represented by the option-argument.                 |
| 30599<br>30600 | .ge. | The value represented by the attribute of the batch job is greater than or equal to the value represented by the option-argument. |
| 30601<br>30602 | .gt. | The value represented by the attribute of the batch job is greater than the value represented by the option-argument.             |
| 30603<br>30604 | .lt. | The value represented by the attribute of the batch job is less than the value represented by the option-argument.                |
| 30605<br>30606 | .le. | The value represented by the attribute of the batch job is less than or equal to the value represented by the option-argument.    |
| 30607<br>30608 | .ne. | The value represented by the attribute of the batch job is not equal to the value represented by the option-argument.             |

30609 **OPTIONS**

30610 The *qselect* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 30611 12.2, Utility Syntax Guidelines.

30612 The following options shall be supported by the implementation:

- |                |                  |                                                             |
|----------------|------------------|-------------------------------------------------------------|
| 30613<br>30614 | -a [op]date_time | Restrict selection to a specific time, or a range of times. |
|----------------|------------------|-------------------------------------------------------------|

30615 The *qselect* utility shall select only batch jobs for which the value of the  
 30616 *Execution\_Time* attribute is related to the Epoch equivalent of the local time  
 30617 expressed by the value of the *date\_time* component of the option-argument in the  
 30618 manner indicated by the value of the *op* component of the option-argument.

30619 The *qselect* utility shall accept a *date\_time* component of the option-argument that  
 30620 conforms to the syntax of the *time* operand of the *touch* utility.

30621 If the *op* component of the option-argument is not presented to the *qselect* utility,  
 30622 the utility shall select batch jobs for which the *Execution\_Time* attribute is equal to  
 30623 the *date\_time* component of the option-argument.

30624 When comparing times, the *qselect* utility shall use the following definitions for the  
 30625 *op* component of the option-argument:

30626 .eq. The time represented by value of the *Execution\_Time* attribute of the batch  
 30627 job is equal to the time represented by the *date\_time* component of the  
 30628 option-argument.

30629 .ge. The time represented by value of the *Execution\_Time* attribute of the batch  
 30630 job is after or equal to the time represented by the *date\_time* component of  
 30631 the option-argument.

30632 .gt. The time represented by value of the *Execution\_Time* attribute of the batch  
 30633 job is after the time represented by the *date\_time* component of the  
 30634 option-argument.

30635 .lt. The time represented by value of the *Execution\_Time* attribute of the batch  
 30636 job is before the time represented by the *date\_time* component of the  
 30637 option-argument.

30638 .le. The time represented by value of the *Execution\_Time* attribute of the batch  
 30639 job is before or equal to the time represented by the *date\_time* component  
 30640 of the option-argument.

30641 .ne. The time represented by value of the *Execution\_Time* attribute of the batch  
 30642 job is not equal to the time represented by the *date\_time* component of the  
 30643 option-argument.

30644 The *qselect* utility shall accept the defined character strings for the *op* component of  
 30645 the option-argument.

30646 **-A** *account\_string*  
 30647 Restrict selection to the batch jobs charging a specified account.

30648 The *qselect* utility shall select only batch jobs for which the value of the  
 30649 *Account\_Name* attribute of the batch job matches the value of the *account\_string*  
 30650 option-argument.

30651 The syntax of the *account\_string* option-argument is unspecified.

30652 **-c** [*op*]*interval*  
 30653 Restrict selection to batch jobs within a range of checkpoint intervals.

30654 The *qselect* utility shall select only batch jobs for which the value of the *Checkpoint*  
 30655 attribute relates to the value of the *interval* component of the option-argument in  
 30656 the manner indicated by the value of the *op* component of the option-argument.

30657 If the *op* component of the option-argument is omitted, the *qselect* utility shall  
 30658 select batch jobs for which the value of the *Checkpoint* attribute is equal to the value

30659 of the *interval* component of the option-argument.

30660 When comparing checkpoint intervals, the *qselect* utility shall use the following

30661 definitions for the *op* component of the option-argument:

30662 .eq. The value of the *Checkpoint* attribute of the batch job equals the value of

30663 the *interval* component of the option-argument.

30664 .ge. The value of the *Checkpoint* attribute of the batch job is greater than or

30665 equal to the value of the *interval* component option-argument.

30666 .gt. The value of the *Checkpoint* attribute of the batch job is greater than the

30667 value of the *interval* component option-argument.

30668 .lt. The value of the *Checkpoint* attribute of the batch job is less than the value

30669 of the *interval* component option-argument.

30670 .le. The value of the *Checkpoint* attribute of the batch job is less than or equal

30671 to the value of the *interval* component option-argument.

30672 .ne. The value of the *Checkpoint* attribute of the batch job does not equal the

30673 value of the *interval* component option-argument.

30674 The *qselect* utility shall accept the defined character strings for the *op* component of

30675 the option-argument.

30676 The ordering relationship for the values of the interval option-argument is defined

30677 to be:

30678 'n' .gt. 's' .gt. 'c=minutes' .ge. 'c'

30679 When comparing *Checkpoint* attributes with an interval having the value of the

30680 single character 'u', only equality or inequality are valid comparisons.

30681 **-h hold\_list** Restrict selection to batch jobs that have a specific type of hold.

30682 The *qselect* utility shall select only batch jobs for which the value of the *Hold\_Types*

30683 attribute matches the value of the *hold\_list* option-argument.

30684 The *qselect* **-h** option shall accept a value for the *hold\_list* option-argument that is a

30685 string of alphanumeric characters in the portable character set (see the Base

30686 Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

30687 The *qselect* utility shall accept a value for the *hold\_list* option-argument that is a

30688 string of one or more of the characters 'u', 's', or 'o', or the single character

30689 'n'.

30690 Each unique character in the *hold\_list* option-argument of the *qselect* utility is

30691 defined as follows, each representing a different hold type:

30692 u USER

30693 s SYSTEM

30694 o OPERATOR

30695 If any of these characters are duplicated in the *hold\_list* option-argument, the

30696 duplicates shall be ignored.

30697 The *qselect* utility shall consider it an error if any hold type other than 'n' is

30698 combined with hold type 'n'.

30699 Strictly conforming applications shall not repeat any of the characters 'u', 's',  
 30700 'o', or 'n' within the *hold\_list* option-argument. The *qselect* utility shall permit  
 30701 the repetition of characters, but shall not assign additional meaning to the repeated  
 30702 characters.

30703 An implementation may define other hold types. The conformance document for  
 30704 an implementation shall describe any additional hold types, how they are  
 30705 specified, their internal behavior, and how they affect the behavior of the utility.

30706 **-I *resource\_list***  
 30707 Restrict selection to batch jobs with specified resource limits and attributes.

30708 The *qselect* utility shall accept a *resource\_list* option-argument with the following  
 30709 syntax:

30710 *resource\_name op value [, , resource\_name op value, , ...]*

30711 When comparing resource values, the *qselect* utility shall use the following  
 30712 definitions for the *op* component of the option-argument:

30713 .eq. The value of the resource of the same name in the *Resource\_List* attribute  
 30714 of the batch job equals the value of the value component of the option-  
 30715 argument.

30716 .ge. The value of the resource of the same name in the *Resource\_List* attribute  
 30717 of the batch job is greater than or equal to the value of the value  
 30718 component of the option-argument.

30719 .gt. The value of the resource of the same name in the *Resource\_List* attribute  
 30720 of the batch job is greater than the value of the value component of the  
 30721 option-argument.

30722 .lt. The value of the resource of the same name in the *Resource\_List* attribute  
 30723 of the batch job is less than the value of the value component of the  
 30724 option-argument.

30725 .ne. The value of the resource of the same name in the *Resource\_List* attribute  
 30726 of the batch job does not equal the value of the value component of the  
 30727 option-argument.

30728 .le. The value of the resource of the same name in the *Resource\_List* attribute  
 30729 of the batch job is less than or equal to the value of the value component  
 30730 of the option-argument.

30731 When comparing the limit of a *Resource\_List* attribute with the *value* component of  
 30732 the option-argument, if the limit, the value, or both are non-numeric, only equality  
 30733 or inequality are valid comparisons.

30734 The *qselect* utility shall select only batch jobs for which the values of the  
 30735 *resource\_names* listed in the *resource\_list* option-argument match the corresponding  
 30736 limits of the *Resource\_List* attribute of the batch job.

30737 Limits of *resource\_names* present in the *Resource\_List* attribute of the batch job that  
 30738 have no corresponding values in the *resource\_list* option-argument shall not be  
 30739 considered when selecting batch jobs.

30740 **-N *name*** Restrict selection to batch jobs with a specified name.

30741 The *qselect* utility shall select only batch jobs for which the value of the *Job\_Name*  
 30742 attribute matches the value of the *name* option-argument. The string specified in

30743 the *name* option-argument shall be passed, uninterpreted, to the server. This allows  
 30744 an implementation to match “wildcard” patterns against batch job names.

30745 An implementation shall describe in the conformance document the format it  
 30746 supports for matching against the *Job\_Name* attribute.

30747 **-p [op]priority**

30748 Restrict selection to batch jobs of the specified priority or range of priorities.

30749 The *qselect* utility shall select only batch jobs for which the value of the *Priority*  
 30750 attribute of the batch job relates to the value of the *priority* component of the  
 30751 option-argument in the manner indicated by the value of the *op* component of the  
 30752 option-argument.

30753 If the *op* component of the option-argument is omitted, the *qselect* utility shall  
 30754 select batch jobs for which the value of the *Priority* attribute of the batch job is  
 30755 equal to the value of the *priority* component of the option-argument.

30756 When comparing priority values, the *qselect* utility shall use the following  
 30757 definitions for the *op* component of the option-argument:

30758 .eq. The value of the *Priority* attribute of the batch job equals the value of the  
 30759 *priority* component of the option-argument.

30760 .ge. The value of the *Priority* attribute of the batch job is greater than or equal  
 30761 to the value of the *priority* component option-argument.

30762 .gt. The value of the *Priority* attribute of the batch job is greater than the value  
 30763 of the *priority* component option-argument.

30764 .lt. The value of the *Priority* attribute of the batch job is less than the value of  
 30765 the *priority* component option-argument.

30766 .lte. The value of the *Priority* attribute of the batch job is less than or equal to  
 30767 the value of the *priority* component option-argument.

30768 .ne. The value of the *Priority* attribute of the batch job does not equal the value  
 30769 of the *priority* component option-argument.

30770 **-q destination**

30771 Restrict selection to the specified batch queue or server, or both.

30772 The *qselect* utility shall select only batch jobs that are located at the destination  
 30773 indicated by the value of the *destination* option-argument.

30774 The destination defines a batch queue, a server, or a batch queue at a server.

30775 The *qselect* utility shall accept an option-argument for the **-q** option that conforms  
 30776 to the syntax for a destination. If the **-q** option is not presented to the *qselect* utility,  
 30777 the utility shall select batch jobs from all batch queues at the default batch server.

30778 If the option-argument describes only a batch queue, the *qselect* utility shall select  
 30779 only batch jobs from the batch queue of the specified name at the default batch  
 30780 server. The means by which *qselect* determines the default server is  
 30781 implementation-defined.

30782 If the option-argument describes only a batch server, the *qselect* utility shall select  
 30783 batch jobs from all the batch queues at that batch server.

30784 If the option-argument describes both a batch queue and a batch server, the *qselect*  
 30785 utility shall select only batch jobs from the specified batch queue at the specified

|       |                     |                                                                                                        |
|-------|---------------------|--------------------------------------------------------------------------------------------------------|
| 30786 |                     | server.                                                                                                |
| 30787 | <b>-r y n</b>       | Restrict selection to batch jobs with the specified rerunability status.                               |
| 30788 |                     | The <i>qselect</i> utility shall select only batch jobs for which the value of the <i>Rerunable</i>    |
| 30789 |                     | attribute of the batch job matches the value of the option-argument.                                   |
| 30790 |                     | The <i>qselect</i> utility shall accept a value for the option-argument that consists of               |
| 30791 |                     | either the single character 'y' or the single character 'n'. The character 'y'                         |
| 30792 |                     | represents the value TRUE, and the character 'n' represents the value FALSE.                           |
| 30793 | <b>-s states</b>    | Restrict selection to batch jobs in the specified states.                                              |
| 30794 |                     | The <i>qselect</i> utility shall accept an option-argument that consists of any combination            |
| 30795 |                     | of the characters 'e', 'q', 'r', 'w', 'h', and 't'.                                                    |
| 30796 |                     | Conforming applications shall not repeat any character in the option-argument.                         |
| 30797 |                     | The <i>qselect</i> utility shall permit the repetition of characters in the option-argument,           |
| 30798 |                     | but shall not assign additional meaning to repeated characters.                                        |
| 30799 |                     | The <i>qselect</i> utility shall interpret the characters in the <i>states</i> option-argument as      |
| 30800 |                     | follows:                                                                                               |
| 30801 |                     | e Represents the EXITING state.                                                                        |
| 30802 |                     | q Represents the QUEUED state.                                                                         |
| 30803 |                     | r Represents the RUNNING state.                                                                        |
| 30804 |                     | t Represents the TRANSITING state.                                                                     |
| 30805 |                     | h Represents the HELD state.                                                                           |
| 30806 |                     | w Represents the WAITING state.                                                                        |
| 30807 |                     | For each character in the <i>states</i> option-argument, the <i>qselect</i> utility shall select batch |
| 30808 |                     | jobs in the corresponding state.                                                                       |
| 30809 | <b>-u user_list</b> | Restrict selection to batch jobs owned by the specified user names.                                    |
| 30810 |                     | The <i>qselect</i> utility shall select only the batch jobs of those users specified in the            |
| 30811 |                     | <i>user_list</i> option-argument.                                                                      |
| 30812 |                     | The <i>qselect</i> utility shall accept a <i>user_list</i> option-argument that conforms to the        |
| 30813 |                     | following syntax:                                                                                      |
| 30814 |                     | <i>username</i> [@ <i>host</i> ] [, , <i>username</i> [@ <i>host</i> ] , , . . .]                      |
| 30815 |                     | The <i>qselect</i> utility shall accept only one user name that is missing a corresponding             |
| 30816 |                     | host name. The <i>qselect</i> utility shall accept only one user name per named host.                  |
| 30817 | <b>OPERANDS</b>     |                                                                                                        |
| 30818 |                     | None.                                                                                                  |
| 30819 | <b>STDIN</b>        |                                                                                                        |
| 30820 |                     | Not used.                                                                                              |
| 30821 | <b>INPUT FILES</b>  |                                                                                                        |
| 30822 |                     | None.                                                                                                  |

30823 **ENVIRONMENT VARIABLES**

30824 The following environment variables shall affect the execution of *qselect*:

30825 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30826 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30827 Internationalization Variables for the precedence of internationalization variables  
 30828 used to determine the values of locale categories.)

30829 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30830 internationalization variables.

30831 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30832 characters (for example, single-byte as opposed to multi-byte characters in  
 30833 arguments).

30834 *LC\_MESSAGES*  
 30835 Determine the locale that should be used to affect the format and contents of  
 30836 diagnostic messages written to standard error.

30837 *LOGNAME* Determine the login name of the user.

30838 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
 30839 unset or null, an unspecified default timezone shall be used.

30840 **ASYNCHRONOUS EVENTS**

30841 Default.

30842 **STDOUT**

30843 The *qselect* utility shall write zero or more batch *job\_identifiers* to standard output.

30844 The *qselect* utility shall separate the batch *job\_identifiers* written to standard output by white  
 30845 space.

30846 The *qselect* utility shall write batch *job\_identifiers* in the following format:

30847 *sequence\_number.server\_name@server*

30848 **STDERR**

30849 The standard error shall be used only for diagnostic messages.

30850 **OUTPUT FILES**

30851 None.

30852 **EXTENDED DESCRIPTION**

30853 None.

30854 **EXIT STATUS**

30855 The following exit values shall be returned:

30856 0 Successful completion.

30857 >0 An error occurred.

30858 **CONSEQUENCES OF ERRORS**

30859 Default.

30860 **APPLICATION USAGE**

30861       None.

30862 **EXAMPLES**

30863       The following example shows how a user might use the *qselect* utility in conjunction with the  
 30864       *qdel* utility to delete all of his or her jobs in the queued state without affecting any jobs that are  
 30865       already running:

30866       `qdel $(qselect -s q)`

30867       or:

30868       `qselect -s q || xargs qdel`30869 **RATIONALE**

30870       The *qselect* utility allows users to acquire a list of job identifiers that match user-specified  
 30871       selection criteria. The list of identifiers returned by the *qselect* utility conforms to the syntax of  
 30872       the batch job identifier list processed by a utility such as *qmove*, *qdel*, and *qrls*. The *qselect* utility is  
 30873       thus a powerful tool for causing another batch system utility to act upon a set of jobs that match  
 30874       a list of selection criteria.

30875       The options of the *qselect* utility let the user apply a number of useful filters for selecting jobs.  
 30876       Each option further restricts the selection of jobs. Many of the selection options allow the  
 30877       specification of a relational operator. The FORTRAN-like syntax of the operator—that is,  
 30878       "*.lt.*"—was chosen rather than the C-like "*<=*" meta-characters.

30879       The **-a** option allows users to restrict the selected jobs to those that have been submitted (or  
 30880       altered) to wait until a particular time. The time period is determined by the argument of this  
 30881       option, which includes both a time and an operator—it is thus possible to select jobs waiting  
 30882       until a specific time, jobs waiting until after a certain time, or those waiting for a time before the  
 30883       specified time.

30884       The **-A** option allows users to restrict the selected jobs to those that have been submitted (or  
 30885       altered) to charge a particular account.

30886       The **-c** option allows users to restrict the selected jobs to those whose checkpointing interval  
 30887       falls within the specified range.

30888       The **-l** option allows users to select those jobs whose resource limits fall within the range  
 30889       indicated by the value of the option. For example, a user could select those jobs for which the  
 30890       CPU time limit is greater than two hours.

30891       The **-N** option allows users to select jobs by job name. For instance, all the parts of a task that  
 30892       have been divided in parallel jobs might be given the same name, and thus manipulated as a  
 30893       group by means of this option.

30894       The **-q** option allows users to select jobs in a specified queue.

30895       The **-r** option allows users to select only those jobs with a specified rerun criteria. For instance, a  
 30896       user might select only those jobs that can be rerun for use with the *qrerun* utility.

30897       The **-s** option allows users to select only those jobs that are in a certain state.

30898       The **-u** option allows users to select jobs that have been submitted to execute under a particular  
 30899       account.

30900       The selection criteria provided by the options of the *qselect* utility allow users to select jobs based  
 30901       on all the appropriate attributes that can be assigned to jobs by the *qsub* utility.

30902       Historically, the *qselect* utility has not been a part of existing practice; it is an improvement that  
 30903       has been introduced in this volume of IEEE Std 1003.1-2001.

30904 **FUTURE DIRECTIONS**

30905           None.

30906 **SEE ALSO**30907           *qdel*, *qrerun*, *qrls*, *qselect*, *qsub*, *touch*, Chapter 3 (on page 101)30908 **CHANGE HISTORY**

30909           Derived from IEEE Std 1003.2d-1994.

30910 **NAME**

30911           qsig — signal batch jobs

30912 **SYNOPSIS**30913 BE       qsig [-s *signal*] *job\_identifier* ...

30914

30915 **DESCRIPTION**

30916       To signal a batch job is to send a signal to the session leader of the batch job. A batch job is  
 30917       signaled by sending a request to the batch server that manages the batch job. The *qsig* utility is a  
 30918       user-accessible batch client that requests the signaling of a batch job.

30919       The *qsig* utility shall signal those batch jobs for which a batch *job\_identifier* is presented to the  
 30920       utility. The *qsig* utility shall not signal any batch jobs whose batch *job\_identifiers* are not  
 30921       presented to the utility.

30922       The *qsig* utility shall signal batch jobs in the order in which the corresponding batch  
 30923       *job\_identifiers* are presented to the utility. If the *qsig* utility fails to process a batch *job\_identifier*  
 30924       successfully, the utility shall proceed to process the remaining batch *job\_identifiers*, if any.

30925       The *qsig* utility shall signal batch jobs by sending a *Signal Job Request* to the batch server that  
 30926       manages the batch job.

30927       For each successfully processed batch *job\_identifier*, the *qsig* utility shall have received a  
 30928       completion reply to each *Signal Job Request* sent to a batch server at the time the utility exits.

30929 **OPTIONS**

30930       The *qsig* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 30931       12.2, Utility Syntax Guidelines.

30932       The following option shall be supported by the implementation:

30933       -s *signal*     Define the signal to be sent to the batch job.

30934       The *qsig* utility shall accept a *signal* option-argument that is either a symbolic  
 30935       signal name or an unsigned integer signal number (see the POSIX.1-1990 standard,  
 30936       Section 3.3.1.1). The *qsig* utility shall accept signal names for which the SIG prefix  
 30937       has been omitted.

30938       If the *signal* option-argument is a signal name, the *qsig* utility shall send that name.

30939       If the *signal* option-argument is a number, the *qsig* utility shall send the signal  
 30940       value represented by the number.

30941       If the -s option is not presented to the *qsig* utility, the utility shall send the signal  
 30942       SIGTERM to each signaled batch job.

30943 **OPERANDS**

30944       The *qsig* utility shall accept one or more operands that conform to the syntax for a batch  
 30945       *job\_identifier* (see Section 3.3.1 (on page 122)).

30946 **STDIN**

30947       Not used.

30948 **INPUT FILES**

30949       None.

## 30950 ENVIRONMENT VARIABLES

30951 The following environment variables shall affect the execution of *qsig*:

30952 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 30953 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 30954 Internationalization Variables for the precedence of internationalization variables  
 30955 used to determine the values of locale categories.)

30956 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 30957 internationalization variables.

30958 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 30959 characters (for example, single-byte as opposed to multi-byte characters in  
 30960 arguments).

30961 *LC\_MESSAGES*  
 30962 Determine the locale that should be used to affect the format and contents of  
 30963 diagnostic messages written to standard error.

30964 *LOGNAME* Determine the login name of the user.

## 30965 ASYNCHRONOUS EVENTS

30966 Default.

## 30967 STDOUT

30968 An implementation of the *qsig* utility may write informative messages to standard output.

## 30969 STDERR

30970 The standard error shall be used only for diagnostic messages.

## 30971 OUTPUT FILES

30972 None.

## 30973 EXTENDED DESCRIPTION

30974 None.

## 30975 EXIT STATUS

30976 The following exit values shall be returned:

30977 0 Successful completion.

30978 >0 An error occurred.

## 30979 CONSEQUENCES OF ERRORS

30980 In addition to the default behavior, the *qsig* utility shall not be required to write a diagnostic  
 30981 message to standard error when the error reply received from a batch server indicates that the  
 30982 batch *job\_identifier* does not exist on the server. Whether or not the *qsig* utility waits to output the  
 30983 diagnostic message while attempting to locate the batch job on other servers is implementation-  
 30984 defined.

## 30985 APPLICATION USAGE

30986 None.

## 30987 EXAMPLES

30988 None.

## 30989 RATIONALE

30990 The *qsig* utility allows users to signal batch jobs.

30991 A user may be unable to signal a batch job with the *kill* utility of the operating system for a  
 30992 number of reasons. First, the process ID of the batch job may be unknown to the user. Second,

- 30993 the processes of the batch job may be on a remote node. However, by virtue of communication  
30994 between batch nodes, the *qsig* utility can arrange for the signaling of a process.
- 30995 Because a batch job that is not running cannot be signaled, and because the signal may not  
30996 terminate the batch job, the *qsig* utility is not a substitute for the *qdel* utility.
- 30997 The options of the *qsig* utility allow the user to specify the signal that is to be sent to the batch  
30998 job.
- 30999 The **-s** option allows users to specify a signal by name or by number, and thus override the  
31000 default signal. The POSIX.1-1990 standard defines signals by both name and number.
- 31001 The *qsig* utility is a new utility, *vis-a-vis* existing practice; it has been defined in this volume of  
31002 IEEE Std 1003.1-2001 in response to user-perceived shortcomings in existing practice.
- 31003 **FUTURE DIRECTIONS**
- 31004 None.
- 31005 **SEE ALSO**
- 31006 Chapter 3 (on page 101), *kill*, *qdel*
- 31007 **CHANGE HISTORY**
- 31008 Derived from IEEE Std 1003.2d-1994.
- 31009 **Issue 6**
- 31010 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

31011 **NAME**

31012 qstat — show status of batch jobs

31013 **SYNOPSIS**31014 BE qstat [-f] *job\_identifier* ...31015 qstat -Q [-f] *destination* ...31016 qstat -B [-f] *server\_name* ...

31017

31018 **DESCRIPTION**

31019 The status of a batch job, batch queue, or batch server is obtained by a request to the server. The  
 31020 *qstat* utility is a user-accessible batch client that requests the status of one or more batch jobs,  
 31021 batch queues, or servers, and writes the status information to standard output.

31022 For each successfully processed batch *job\_identifier*, the *qstat* utility shall display information  
 31023 about the corresponding batch job.

31024 For each successfully processed destination, the *qstat* utility shall display information about the  
 31025 corresponding batch queue.

31026 For each successfully processed server name, the *qstat* utility shall display information about the  
 31027 corresponding server.

31028 The *qstat* utility shall acquire batch job status information by sending a *Job Status Request* to a  
 31029 batch server. The *qstat* utility shall acquire batch queue status information by sending a *Queue*  
 31030 *Status Request* to a batch server. The *qstat* utility shall acquire server status information by  
 31031 sending a *Server Status Request* to a batch server.

31032 **OPTIONS**

31033 The *qstat* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 31034 12.2, Utility Syntax Guidelines.

31035 The following options shall be supported by the implementation:

31036 **-f** Specify that a full display is produced.

31037 The minimum contents of a full display are specified in the STDOUT section.

31038 Additional contents and format of a full display are implementation-defined.

31039 **-Q** Specify that the operand is a destination.

31040 The *qstat* utility shall display information about each batch queue at each  
 31041 destination identified as an operand.

31042 **-B** Specify that the operand is a server name.

31043 The *qstat* utility shall display information about each server identified as an  
 31044 operand.

31045 **OPERANDS**

31046 If the **-Q** option is presented to the *qstat* utility, the utility shall accept one or more operands that  
 31047 conform to the syntax for a destination (see Section 3.3.2 (on page 123)).

31048 If the **-B** option is presented to the *qstat* utility, the utility shall accept one or more *server\_name*  
 31049 operands.

31050 If neither the **-B** nor the **-Q** option is presented to the *qstat* utility, the utility shall accept one or  
 31051 more operands that conform to the syntax for a batch *job\_identifier* (see Section 3.3.1 (on page  
 31052 122)).

31053 **STDIN**

31054 Not used.

31055 **INPUT FILES**

31056 None.

31057 **ENVIRONMENT VARIABLES**31058 The following environment variables shall affect the execution of *qstat*:31059 *HOME* Determine the pathname of the user's home directory.

31060 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31061 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 31062 Internationalization Variables for the precedence of internationalization variables  
 31063 used to determine the values of locale categories.)

31064 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31065 internationalization variables.

31066 *LC\_COLLATE*

31067 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 31068 character collating elements within regular expressions.

31069 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31070 characters (for example, single-byte as opposed to multi-byte characters in  
 31071 arguments).

31072 *LC\_MESSAGES*

31073 Determine the locale that should be used to affect the format and contents of  
 31074 diagnostic messages written to standard error.

31075 *LC\_NUMERIC*

31076 Determine the locale for selecting the radix character used when writing floating-  
 31077 point formatted output.

31078 **ASYNCHRONOUS EVENTS**

31079 Default.

31080 **STDOUT**

31081 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the **-f** option is not  
 31082 specified, the *qstat* utility shall display the following items on a single line, in the stated order,  
 31083 with white space between each item, for each successfully processed operand:

- 31084 • The batch *job\_identifier*
- 31085 • The batch job name
- 31086 • The *Job\_Owner* attribute
- 31087 • The CPU time used by the batch job
- 31088 • The batch job state
- 31089 • The batch job location

31090 If an operand presented to the *qstat* utility is a batch *job\_identifier* and the **-f** option is specified,  
 31091 the *qstat* utility shall display the following items for each success fully processed operand:

- 31092 • The batch *job\_identifier*
- 31093 • The batch job name

- 31094 • The *Job\_Owner* attribute
  - 31095 • The execution user ID
  - 31096 • The CPU time used by the batch job
  - 31097 • The batch job state
  - 31098 • The batch job location
  - 31099 • Additional implementation-defined information, if any, about the batch job or batch queue
- 31100 If an operand presented to the *qstat* utility is a destination, the **-Q** option is specified, and the **-f**  
 31101 option is not specified, the *qstat* utility shall display the following items on a single line, in the  
 31102 stated order, with white space between each item, for each successfully processed operand:
- 31103 • The batch queue name
  - 31104 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 31105 • The total number of batch jobs in the batch queue
  - 31106 • The status of the batch queue
  - 31107 • For each state, the number of batch jobs in that state in the batch queue and the name of the  
 31108 state
  - 31109 • The type of batch queue (execution or routing)
- 31110 If the operands presented to the *qstat* utility are destinations, the **-Q** option is specified, and the  
 31111 **-f** option is specified, the *qstat* utility shall display the following items for each successfully  
 31112 processed operand:
- 31113 • The batch queue name
  - 31114 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 31115 • The total number of batch jobs in the batch queue
  - 31116 • The status of the batch queue
  - 31117 • For each state, the number of batch jobs in that state in the batch queue and the name of the  
 31118 state
  - 31119 • The type of batch queue (execution or routing)
  - 31120 • Additional implementation-defined information, if any, about the batch queue
- 31121 If the operands presented to the *qstat* utility are batch server names, the **-B** option is specified,  
 31122 and the **-f** option is not specified, the *qstat* utility shall display the following items on a single  
 31123 line, in the stated order, with white space between each item, for each successfully processed  
 31124 operand:
- 31125 • The batch server name
  - 31126 • The maximum number of batch jobs that shall be run in the batch queue concurrently
  - 31127 • The total number of batch jobs managed by the batch server
  - 31128 • The status of the batch server
  - 31129 • For each state, the number of batch jobs in that state and the name of the state
- 31130 If the operands presented to the *qstat* utility are server names, the **-B** option is specified, and the  
 31131 **-f** option is specified, the *qstat* utility shall display the following items for each successfully  
 31132 processed operand:

- 31133
  - The server name
- 31134
  - The maximum number of batch jobs that shall be run in the batch queue concurrently
- 31135
  - The total number of batch jobs managed by the server
- 31136
  - The status of the server
- 31137
  - For each state, the number of batch jobs in that state and the name of the state
- 31138
  - Additional implementation-defined information, if any, about the server
- 31139 **STDERR**
- 31140 The standard error shall be used only for diagnostic messages.
- 31141 **OUTPUT FILES**
- 31142 None.
- 31143 **EXTENDED DESCRIPTION**
- 31144 None.
- 31145 **EXIT STATUS**
- 31146 The following exit values shall be returned:
- 31147 0 Successful completion.
- 31148 >0 An error occurred.
- 31149 **CONSEQUENCES OF ERRORS**
- 31150 In addition to the default behavior, the *qstat* utility shall not be required to write a diagnostic
- 31151 message to standard error when the error reply received from a batch server indicates that the
- 31152 batch *job\_identifier* does not exist on the server. Whether or not the *qstat* utility waits to output
- 31153 the diagnostic message while attempting to locate the batch job on other servers is
- 31154 implementation-defined.
- 31155 **APPLICATION USAGE**
- 31156 None.
- 31157 **EXAMPLES**
- 31158 None.
- 31159 **RATIONALE**
- 31160 The *qstat* utility allows users to display the status of jobs and list the batch jobs in queues.
- 31161 The operands of the *qstat* utility may be either job identifiers, queues (specified as destination
- 31162 identifiers), or batch server names. The **-Q** and **-B** options, or absence thereof, indicate the
- 31163 nature of the operands.
- 31164 The other options of the *qstat* utility allow the user to control the amount of information
- 31165 displayed and the format in which it is displayed. Should a user wish to display the status of a
- 31166 set of jobs that match a selection criteria, the *qselect* utility may be used to acquire such a list.
- 31167 The **-f** option allows users to request a “full” display in an implementation-defined format.
- 31168 Historically, the *qstat* utility has been a part of the NQS and its derivatives, the existing practice
- 31169 on which it is based.
- 31170 **FUTURE DIRECTIONS**
- 31171 None.

31172 **SEE ALSO**31173 Chapter 3 (on page 101), *qselect*31174 **CHANGE HISTORY**

31175 Derived from IEEE Std 1003.2d-1994.

31176 **Issue 6**31177 IEEE PASC Interpretation 1003.2 #191 is applied, removing the following ENVIRONMENT  
31178 VARIABLES listed as affecting *qstat*: *COLUMNS*, *LINES*, *LOGNAME*, *TERM*, and *TZ*.31179 The *LC\_TIME* entry is also removed from the ENVIRONMENT VARIABLES section.

31180 **NAME**

31181           qsub — submit a script

31182 **SYNOPSIS**

```

31183 BE qsub [-a date_time] [-A account_string] [-c interval]
31184 [-C directive_prefix] [-e path_name] [-h] [-j join_list] [-k keep_list]
31185 [-m mail_options] [-M mail_list] [-N name]
31186 [-o path_name] [-p priority] [-q destination] [-r y|n]
31187 [-S path_name_list] [-u user_list] [-v variable_list] [-V]
31188 [-z] [script]
31189

```

31190 **DESCRIPTION**

31191       To submit a script is to create a batch job that executes the script. A script is submitted by a  
 31192       request to a batch server. The *qsub* utility is a user-accessible batch client that submits a script.

31193       Upon successful completion, the *qsub* utility shall have created a batch job that will execute the  
 31194       submitted script.

31195       The *qsub* utility shall submit a script by sending a *Queue Job Request* to a batch server.

31196       The *qsub* utility shall place the value of the following environment variables in the *Variable\_List*  
 31197       attribute of the batch job: *HOME*, *LANG*, *LOGNAME*, *PATH*, *MAIL*, *SHELL*, and *TZ*. The name  
 31198       of the environment variable shall be the current name prefixed with the string *PBS\_O\_*.

31199       **Note:**     If the current value of the *HOME* variable in the environment space of the *qsub* utility is  
 31200       */aa/bb/cc*, then *qsub* shall place *PBS\_O\_HOME=/aa/bb/cc* in the *Variable\_List* attribute of the  
 31201       batch job.

31202       In addition to the variables described above, the *qsub* utility shall add the following variables  
 31203       with the indicated values to the variable list:

31204       *PBS\_O\_WORKDIR*     The absolute path of the current working directory of the *qsub* utility  
 31205       process.

31206       *PBS\_O\_HOST*        The name of the host on which the *qsub* utility is running.

31207 **OPTIONS**

31208       The *qsub* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 31209       12.2, Utility Syntax Guidelines.

31210       The following options shall be supported by the implementation:

31211       **-a *date\_time***    Define the time at which a batch job becomes eligible for execution.

31212       The *qsub* utility shall accept an option-argument that conforms to the syntax of the  
 31213       *time* operand of the *touch* utility.

**Table 4-18** Environment Variable Values (Utilities)

| Variable Name        | Value at qsub Time        |
|----------------------|---------------------------|
| <i>PBS_O_HOME</i>    | <i>HOME</i>               |
| <i>PBS_O_HOST</i>    | Client host name          |
| <i>PBS_O_LANG</i>    | <i>LANG</i>               |
| <i>PBS_O_LOGNAME</i> | <i>LOGNAME</i>            |
| <i>PBS_O_PATH</i>    | <i>PATH</i>               |
| <i>PBS_O_MAIL</i>    | <i>MAIL</i>               |
| <i>PBS_O_SHELL</i>   | <i>SHELL</i>              |
| <i>PBS_O_TZ</i>      | <i>TZ</i>                 |
| <i>PBS_O_WORKDIR</i> | Current working directory |

**Note:** The server that initiates execution of the batch job will add other variables to the batch job's environment; see Section 3.2.2.1 (on page 106).

The *qsub* utility shall set the *Execution\_Time* attribute of the batch job to the number of seconds since the Epoch that is equivalent to the local time expressed by the value of the *date\_time* option-argument. The Epoch is defined in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.149, Epoch.

If the **-a** option is not presented to the *qsub* utility, the utility shall set the *Execution\_Time* attribute of the batch job to a time (number of seconds since the Epoch) that is earlier than the time at which the utility exits.

**-A** *account\_string*

Define the account to which the resource consumption of the batch job should be charged.

The syntax of the *account\_string* option-argument is unspecified.

The *qsub* utility shall set the *Account\_Name* attribute of the batch job to the value of the *account\_string* option-argument.

If the **-A** option is not presented to the *qsub* utility, the utility shall omit the *Account\_Name* attribute from the attributes of the batch job.

**-c** *interval*

Define whether the batch job should be checkpointed, and if so, how often.

The *qsub* utility shall accept a value for the interval option-argument that is one of the following:

**n** No checkpointing shall be performed on the batch job (NO\_CHECKPOINT).

**s** Checkpointing shall be performed only when the batch server is shut down (CHECKPOINT\_AT\_SHUTDOWN).

**c** Automatic periodic checkpointing shall be performed at the *Minimum\_Cpu\_Interval* attribute of the batch queue, in units of CPU minutes (CHECKPOINT\_AT\_MIN\_CPU\_INTERVAL).

**c=minutes** Automatic periodic checkpointing shall be performed every *minutes* of CPU time, or every *Minimum\_Cpu\_Interval* minutes, whichever is greater. The *minutes* argument shall conform to the syntax for unsigned integers and shall be greater than zero.

The *qsub* utility shall set the *Checkpoint* attribute of the batch job to the value of the *interval* option-argument.

31258 If the **-c** option is not presented to the *qsub* utility, the utility shall set the  
 31259 *Checkpoint* attribute of the batch job to the single character 'u'  
 31260 (*CHECKPOINT\_UNSPECIFIED*).

31261 **-C directive\_prefix**  
 31262 Define the prefix that declares a directive to the *qsub* utility within the script.

31263 The *directive\_prefix* is not a batch job attribute; it affects the behavior of the *qsub*  
 31264 utility.

31265 If the **-C** option is presented to the *qsub* utility, and the value of the *directive\_prefix*  
 31266 option-argument is the null string, the utility shall not scan the script file for  
 31267 directives. If the **-C** option is not presented to the *qsub* utility, then the value of the  
 31268 *PBS\_DPREFIX* environment variable is used. If the environment variable is not  
 31269 defined, then #PBS encoded in the portable character set is the default.

31270 **-e path\_name**  
 31271 Define the path to be used for the standard error stream of the batch job.

31272 The *qsub* utility shall accept a *path\_name* option-argument which can be preceded  
 31273 by a host name element of the form *hostname*:.  
 31274 If the *path\_name* option-argument constitutes an absolute pathname, the *qsub*  
 31275 utility shall set the *Error\_Path* attribute of the batch job to the value of the  
 31276 *path\_name* option-argument.

31277 If the *path\_name* option-argument constitutes a relative pathname and no host  
 31278 name element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the  
 31279 batch job to the value of the absolute pathname derived by expanding the  
 31280 *path\_name* option-argument relative to the current directory of the process  
 31281 executing *qsub*.

31282 If the *path\_name* option-argument constitutes a relative pathname and a host name  
 31283 element is specified, the *qsub* utility shall set the *Error\_Path* attribute of the batch  
 31284 job to the value of the *path\_name* option-argument without expansion. The host  
 31285 name element shall be included.

31286 If the *path\_name* option-argument does not include a host name element, the *qsub*  
 31287 utility shall prefix the pathname with *hostname*:, where *hostname* is the name of the  
 31288 host upon which the *qsub* utility is being executed.

31289 If the **-e** option is not presented to the *qsub* utility, the utility shall set the  
 31290 *Error\_Path* attribute of the batch job to the host name and path of the current  
 31291 directory of the submitting process and the default filename.

31292 The default filename for standard error has the following format:  
 31293 *job\_name.esquence\_number*

31294 **-h** Specify that a USER hold is applied to the batch job.

31295 The *qsub* utility shall set the value of the *Hold\_Types* attribute of the batch job to the  
 31296 value USER.

31297 If the **-h** option is not presented to the *qsub* utility, the utility shall set the  
 31298 *Hold\_Types* attribute of the batch job to the value NO\_HOLD.

31299 **-j join\_list** Define which streams of the batch job are to be merged. The *qsub* **-j** option shall  
 31300 accept a value for the *join\_list* option-argument that is a string of alphanumeric  
 31301 characters in the portable character set (see the Base Definitions volume of

31302 IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

31303 The *qsub* utility shall accept a *join\_list* option-argument that consists of one or  
 31304 more of the characters 'e' and 'o', or the single character 'n'.

31305 All of the other batch job output streams specified will be merged into the output  
 31306 stream represented by the character listed first in the *join\_list* option-argument.

31307 For each unique character in the *join\_list* option-argument, the *qsub* utility shall  
 31308 add a value to the *Join\_Path* attribute of the batch job as follows, each representing  
 31309 a different batch job stream to join:

- 31310 e The standard error of the batch job (JOIN\_STD\_ERROR).
- 31311 o The standard output of the batch job (JOIN\_STD\_OUTPUT).

31312 An existing *Join\_Path* attribute can be cleared by the following join type:

31313 n NO\_JOIN

31314 If 'n' is specified, then no files are joined. The *qsub* utility shall consider it an error  
 31315 if any join type other than 'n' is combined with join type 'n'.

31316 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 31317 'n' within the *join\_list* option-argument. The *qsub* utility shall permit the  
 31318 repetition of characters, but shall not assign additional meaning to the repeated  
 31319 characters.

31320 An implementation may define other join types. The conformance document for an  
 31321 implementation shall describe any additional batch job streams, how they are  
 31322 specified, their internal behavior, and how they affect the behavior of the utility.

31323 If the **-j** option is not presented to the *qsub* utility, the utility shall set the value of  
 31324 the *Join\_Path* attribute of the batch job to NO\_JOIN.

31325 **-k keep\_list** Define which output of the batch job to retain on the execution host.

31326 The *qsub* **-k** option shall accept a value for the *keep\_list* option-argument that is a  
 31327 string of alphanumeric characters in the portable character set (see the Base  
 31328 Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

31329 The *qsub* utility shall accept a *keep\_list* option-argument that consists of one or  
 31330 more of the characters 'e' and 'o', or the single character 'n'.

31331 For each unique character in the *keep\_list* option-argument, the *qsub* utility shall  
 31332 add a value to the *Keep\_Files* attribute of the batch job as follows, each representing  
 31333 a different batch job stream to keep:

- 31334 e The standard error of the batch job (KEEP\_STD\_ERROR).
- 31335 o The standard output of the batch job (KEEP\_STD\_OUTPUT).

31336 If both 'e' and 'o' are specified, then both files are retained. An existing  
 31337 *Keep\_Files* attribute can be cleared by the following keep type:

31338 n NO\_KEEP

31339 If 'n' is specified, then no files are retained. The *qsub* utility shall consider it an  
 31340 error if any keep type other than 'n' is combined with keep type 'n'.

31341 Strictly conforming applications shall not repeat any of the characters 'e', 'o', or  
 31342 'n' within the *keep\_list* option-argument. The *qsub* utility shall permit the  
 31343 repetition of characters, but shall not assign additional meaning to the repeated

31344 characters.

31345 An implementation may define other keep types. The conformance document for  
 31346 an implementation shall describe any additional keep types, how they are  
 31347 specified, their internal behavior, and how they affect the behavior of the utility. If  
 31348 the **-k** option is not presented to the *qsub* utility, the utility shall set the *Keep\_Files*  
 31349 attribute of the batch job to the value NO\_KEEP.

31350 **-m mail\_options**

31351 Define the points in the execution of the batch job at which the batch server that  
 31352 manages the batch job shall send mail about a change in the state of the batch job.

31353 The *qsub -m* option shall accept a value for the *mail\_options* option-argument that  
 31354 is a string of alphanumeric characters in the portable character set (see the Base  
 31355 Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set).

31356 The *qsub* utility shall accept a value for the *mail\_options* option-argument that is a  
 31357 string of one or more of the characters 'e', 'b', and 'a', or the single character  
 31358 'n'.

31359 For each unique character in the *mail\_options* option-argument, the *qsub* utility shall  
 31360 add a value to the *Mail\_Users* attribute of the batch job as follows, each  
 31361 representing a different time during the life of a batch job at which to send mail:

31362 e MAIL\_AT\_EXIT

31363 b MAIL\_AT\_BEGINNING

31364 a MAIL\_AT\_ABORT

31365 If any of these characters are duplicated in the *mail\_options* option-argument, the  
 31366 duplicates shall be ignored.

31367 An existing *Mail\_Points* attribute can be cleared by the following mail type:

31368 n NO\_MAIL

31369 If 'n' is specified, then mail is not sent. The *qsub* utility shall consider it an error if  
 31370 any mail type other than 'n' is combined with mail type 'n'.

31371 Strictly conforming applications shall not repeat any of the characters 'e', 'b',  
 31372 'a', or 'n' within the *mail\_options* option-argument.

31373 The *qsub* utility shall permit the repetition of characters, but shall not assign  
 31374 additional meaning to the repeated characters. An implementation may define  
 31375 other mail types. The conformance document for an implementation shall describe  
 31376 any additional mail types, how they are specified, their internal behavior, and how  
 31377 they affect the behavior of the utility.

31378 If the **-m** option is not presented to the *qsub* utility, the utility shall set the  
 31379 *Mail\_Points* attribute to the value MAIL\_AT\_ABORT.

31380 **-M mail\_list** Define the list of users to which a batch server that executes the batch job shall  
 31381 send mail, if the server sends mail about the batch job.

31382 The syntax of the *mail\_list* option-argument is unspecified.

31383 If the implementation of the *qsub* utility uses a name service to locate users, the  
 31384 utility should accept the syntax used by the name service.

31385 If the implementation of the *qsub* utility does not use a name service to locate  
 31386 users, the implementation should accept the following syntax for user names:

|       |                     |                                                                                                        |
|-------|---------------------|--------------------------------------------------------------------------------------------------------|
| 31387 |                     | <i>mail_address</i> [,, <i>mail_address</i> ,, ...]                                                    |
| 31388 |                     | The interpretation of <i>mail_address</i> is implementation-defined.                                   |
| 31389 |                     | The <i>qsub</i> utility shall set the <i>Mail_Users</i> attribute of the batch job to the value of the |
| 31390 |                     | <i>mail_list</i> option-argument.                                                                      |
| 31391 |                     | If the <b>-M</b> option is not presented to the <i>qsub</i> utility, the utility shall place only the  |
| 31392 |                     | user name and host name for the current process in the <i>Mail_Users</i> attribute of the              |
| 31393 |                     | batch job.                                                                                             |
| 31394 | <b>-N name</b>      | Define the name of the batch job.                                                                      |
| 31395 |                     | The <i>qsub</i> <b>-N</b> option shall accept a value for the <i>name</i> option-argument that is a    |
| 31396 |                     | string of up to 15 alphanumeric characters in the portable character set (see the                      |
| 31397 |                     | Base Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character                       |
| 31398 |                     | Set) where the first character is alphabetic.                                                          |
| 31399 |                     | The <i>qsub</i> utility shall set the value of the <i>Job_Name</i> attribute of the batch job to the   |
| 31400 |                     | value of the <i>name</i> option-argument.                                                              |
| 31401 |                     | If the <b>-N</b> option is not presented to the <i>qsub</i> utility, the utility shall set the         |
| 31402 |                     | <i>Job_Name</i> attribute of the batch job to the name of the <i>script</i> argument from which        |
| 31403 |                     | the directory specification if any, has been removed.                                                  |
| 31404 |                     | If the <b>-N</b> option is not presented to the <i>qsub</i> utility, and the script is read from       |
| 31405 |                     | standard input, the utility shall set the <i>Job_Name</i> attribute of the batch job to the            |
| 31406 |                     | value STDIN.                                                                                           |
| 31407 | <b>-o path_name</b> |                                                                                                        |
| 31408 |                     | Define the path for the standard output of the batch job.                                              |
| 31409 |                     | The <i>qsub</i> utility shall accept a <i>path_name</i> option-argument that conforms to the           |
| 31410 |                     | syntax of the <i>path_name</i> element defined in the System Interfaces volume of                      |
| 31411 |                     | IEEE Std 1003.1-2001, which can be preceded by a host name element of the form                         |
| 31412 |                     | <i>hostname</i> ..                                                                                     |
| 31413 |                     | If the <i>path_name</i> option-argument constitutes an absolute pathname, the <i>qsub</i>              |
| 31414 |                     | utility shall set the <i>Output_Path</i> attribute of the batch job to the value of the                |
| 31415 |                     | <i>path_name</i> option-argument without expansion.                                                    |
| 31416 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and no host                    |
| 31417 |                     | name element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the   |
| 31418 |                     | batch job to the pathname derived by expanding the value of the <i>path_name</i>                       |
| 31419 |                     | option-argument relative to the current directory of the process executing the <i>qsub</i> .           |
| 31420 |                     | If the <i>path_name</i> option-argument constitutes a relative pathname and a host name                |
| 31421 |                     | element is specified, the <i>qsub</i> utility shall set the <i>Output_Path</i> attribute of the batch  |
| 31422 |                     | job to the value of the <i>path_name</i> option-argument without expansion.                            |
| 31423 |                     | If the <i>path_name</i> option-argument does not specify a host name element, the <i>qsub</i>          |
| 31424 |                     | utility shall prefix the pathname with <i>hostname</i> ., where <i>hostname</i> is the name of the     |
| 31425 |                     | host upon which the <i>qsub</i> utility is executing.                                                  |
| 31426 |                     | If the <b>-o</b> option is not presented to the <i>qsub</i> utility, the utility shall set the         |
| 31427 |                     | <i>Output_Path</i> attribute of the batch job to the host name and path of the current                 |
| 31428 |                     | directory of the submitting process and the default filename.                                          |
| 31429 |                     | The default filename for standard output has the following format:                                     |

|       |                                 |                                                                                                                                                                                                                                      |
|-------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31430 |                                 | <i>job_name.osequence_number</i>                                                                                                                                                                                                     |
| 31431 | <b>-p</b> <i>priority</i>       | Define the priority the batch job should have relative to other batch jobs owned by the batch server.                                                                                                                                |
| 31432 |                                 |                                                                                                                                                                                                                                      |
| 31433 |                                 | The <i>qsub</i> utility shall set the <i>Priority</i> attribute of the batch job to the value of the <i>priority</i> option-argument.                                                                                                |
| 31434 |                                 |                                                                                                                                                                                                                                      |
| 31435 |                                 | If the <b>-p</b> option is not presented to the <i>qsub</i> utility, the value of the <i>Priority</i> attribute is implementation-defined.                                                                                           |
| 31436 |                                 |                                                                                                                                                                                                                                      |
| 31437 |                                 | The <i>qsub</i> utility shall accept a value for the <i>priority</i> option-argument that conforms to the syntax for signed decimal integers, and which is not less than -1 024 and not greater than 1 023.                          |
| 31438 |                                 |                                                                                                                                                                                                                                      |
| 31439 |                                 |                                                                                                                                                                                                                                      |
| 31440 | <b>-q</b> <i>destination</i>    |                                                                                                                                                                                                                                      |
| 31441 |                                 | Define the destination of the batch job.                                                                                                                                                                                             |
| 31442 |                                 | The destination is not a batch job attribute; it determines the batch server, and possibly the batch queue, to which the <i>qsub</i> utility batch queues the batch job.                                                             |
| 31443 |                                 |                                                                                                                                                                                                                                      |
| 31444 |                                 | The <i>qsub</i> utility shall submit the script to the batch server named by the <i>destination</i> option-argument or the server that owns the batch queue named in the <i>destination</i> option-argument.                         |
| 31445 |                                 |                                                                                                                                                                                                                                      |
| 31446 |                                 |                                                                                                                                                                                                                                      |
| 31447 |                                 | The <i>qsub</i> utility shall accept an option-argument for the <b>-q</b> option that conforms to the syntax for a destination (see Section 3.3.2 (on page 123)).                                                                    |
| 31448 |                                 |                                                                                                                                                                                                                                      |
| 31449 |                                 | If the <b>-q</b> option is not presented to the <i>qsub</i> utility, the <i>qsub</i> utility shall submit the batch job to the default destination. The mechanism for determining the default destination is implementation-defined. |
| 31450 |                                 |                                                                                                                                                                                                                                      |
| 31451 |                                 |                                                                                                                                                                                                                                      |
| 31452 | <b>-r</b> <i>y   n</i>          | Define whether the batch job is rerunnable.                                                                                                                                                                                          |
| 31453 |                                 | If the value of the option-argument is <i>y</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                         |
| 31454 |                                 |                                                                                                                                                                                                                                      |
| 31455 |                                 | If the value of the option-argument is <i>n</i> , the <i>qsub</i> utility shall set the <i>Rerunable</i> attribute of the batch job to FALSE.                                                                                        |
| 31456 |                                 |                                                                                                                                                                                                                                      |
| 31457 |                                 | If the <b>-r</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Rerunable</i> attribute of the batch job to TRUE.                                                                                  |
| 31458 |                                 |                                                                                                                                                                                                                                      |
| 31459 | <b>-S</b> <i>path_name_list</i> |                                                                                                                                                                                                                                      |
| 31460 |                                 | Define the pathname to the shell under which the batch job is to execute.                                                                                                                                                            |
| 31461 |                                 | The <i>qsub</i> utility shall accept a <i>path_name_list</i> option-argument that conforms to the following syntax:                                                                                                                  |
| 31462 |                                 |                                                                                                                                                                                                                                      |
| 31463 |                                 | <i>pathname</i> [@ <i>host</i> ] [, , <i>pathname</i> [@ <i>host</i> ] , , . . .]                                                                                                                                                    |
| 31464 |                                 | The <i>qsub</i> utility shall allow only one pathname for a given host name. The <i>qsub</i> utility shall allow only one pathname that is missing a corresponding host name.                                                        |
| 31465 |                                 |                                                                                                                                                                                                                                      |
| 31466 |                                 | The <i>qsub</i> utility shall add a value to the <i>Shell_Path_List</i> attribute of the batch job for each entry in the <i>path_name_list</i> option-argument.                                                                      |
| 31467 |                                 |                                                                                                                                                                                                                                      |
| 31468 |                                 | If the <b>-S</b> option is not presented to the <i>qsub</i> utility, the utility shall set the <i>Shell_Path_List</i> attribute of the batch job to the null string.                                                                 |
| 31469 |                                 |                                                                                                                                                                                                                                      |
| 31470 |                                 | The conformance document for an implementation shall describe the mechanism used to set the default shell and determine the current value of the default shell.                                                                      |
| 31471 |                                 |                                                                                                                                                                                                                                      |

31472 An implementation shall provide a means for the installation to set the default  
 31473 shell to the login shell of the user under which the batch job is to execute. See  
 31474 Section 3.3.3 (on page 123) for a means of removing *keyword=value* (and  
 31475 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

31476     **-u *user\_list*** Define the user name under which the batch job is to execute.

31477 The *qsub* utility shall accept a *user\_list* option-argument that conforms to the  
 31478 following syntax:

31479     *username*[@*host*] [, , *username*[@*host*] , , ...]

31480 The *qsub* utility shall accept only one user name that is missing a corresponding  
 31481 host name. The *qsub* utility shall accept only one user name per named host.

31482 The *qsub* utility shall add a value to the *User\_List* attribute of the batch job for each  
 31483 entry in the *user\_list* option-argument.

31484 If the **-u** option is not presented to the *qsub* utility, the utility shall set the *User\_List*  
 31485 attribute of the batch job to the user name from which the utility is executing. See  
 31486 Section 3.3.3 (on page 123) for a means of removing *keyword=value* (and  
 31487 *value@keyword*) pairs and other general rules for list-oriented batch job attributes.

31488     **-v *variable\_list***

31489 Add to the list of variables that are exported to the session leader of the batch job.

31490 A *variable\_list* is a set of strings of either the form <*variable*> or <*variable=value*>,  
 31491 delimited by commas.

31492 If the **-v** option is presented to the *qsub* utility, the utility shall also add, to the  
 31493 environment *Variable\_List* attribute of the batch job, every variable named in the  
 31494 environment *variable\_list* option-argument and, optionally, values of specified  
 31495 variables.

31496 If a value is not provided on the command line, the *qsub* utility shall set the value  
 31497 of each variable in the environment *Variable\_List* attribute of the batch job to the  
 31498 value of the corresponding environment variable for the process in which the  
 31499 utility is executing; see Table 4-18 (on page 804).

31500 A conforming application shall not repeat a variable in the environment  
 31501 *variable\_list* option-argument.

31502 The *qsub* utility shall not repeat a variable in the environment *Variable\_List*  
 31503 attribute of the batch job. See Section 3.3.3 (on page 123) for a means of removing  
 31504 *keyword=value* (and *value@keyword*) pairs and other general rules for list-oriented  
 31505 batch job attributes.

31506     **-V**

31507 Specify that all of the environment variables of the process are exported to the  
 context of the batch job.

31508 The *qsub* utility shall place every environment variable in the process in which the  
 31509 utility is executing in the list and shall set the value of each variable in the attribute  
 31510 to the value of that variable in the process.

31511     **-z**

31512 Specify that the utility does not write the batch *job\_identifier* of the created batch  
 job to standard output.

31513 If the **-z** option is presented to the *qsub* utility, the utility shall not write the batch  
 31514 *job\_identifier* of the created batch job to standard output.

31515 If the **-z** option is not presented to the *qsub* utility, the utility shall write the  
 31516 identifier of the created batch job to standard output.

### 31517 OPERANDS

31518 The *qsub* utility shall accept a *script* operand that indicates the path to the script of the batch job.

31519 If the *script* operand is not presented to the *qsub* utility, or if the operand is the single-character  
 31520 string ' - ', the utility shall read the script from standard input.

31521 If the script represents a partial path, the *qsub* utility shall expand the path relative to the current  
 31522 directory of the process executing the utility.

### 31523 STDIN

31524 The *qsub* utility reads the script of the batch job from standard input if the script operand is  
 31525 omitted or is the single character ' - '.

### 31526 INPUT FILES

31527 In addition to binding the file indicated by the *script* operand to the batch job, the *qsub* utility  
 31528 reads the script file and acts on directives in the script.

### 31529 ENVIRONMENT VARIABLES

31530 The following environment variables shall affect the execution of *qsub*:

31531 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31532 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 31533 Internationalization Variables for the precedence of internationalization variables  
 31534 used to determine the values of locale categories.)

31535 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31536 internationalization variables.

31537 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31538 characters (for example, single-byte as opposed to multi-byte characters in  
 31539 arguments).

31540 *LC\_MESSAGES*

31541 Determine the locale that should be used to affect the format and contents of  
 31542 diagnostic messages written to standard error.

31543 *LOGNAME* Determine the login name of the user.

31544 *PBS\_DPREFIX*

31545 Determine the default prefix for directives within the script.

31546 *SHELL* Determine the pathname of the preferred command language interpreter of the  
 31547 user.

31548 *TZ* Determine the timezone used to interpret the *date-time* option-argument. If *TZ* is  
 31549 unset or null, an unspecified default timezone shall be used.

### 31550 ASYNCHRONOUS EVENTS

31551 Once created, a batch job exists until it exits, aborts, or is deleted.

31552 After a batch job is created by the *qsub* utility, batch servers might route, execute, modify, or  
 31553 delete the batch job.

### 31554 STDOUT

31555 The *qsub* utility writes the batch *job\_identifier* assigned to the batch job to standard output, unless  
 31556 the **-z** option is specified.

31557 **STDERR**

31558           The standard error shall be used only for diagnostic messages.

31559 **OUTPUT FILES**

31560           None.

31561 **EXTENDED DESCRIPTION**31562           **Script Preservation**

31563           The *qsub* utility shall make the script available to the server executing the batch job in such a way  
31564           that the server executes the script as it exists at the time of submission.

31565           The *qsub* utility can send a copy of the script to the server with the *Queue Job Request* or store a  
31566           temporary copy of the script in a location specified to the server.

31567           **Option Specification**

31568           A script can contain directives to the *qsub* utility.

31569           The *qsub* utility shall scan the lines of the script for directives, skipping blank lines, until the first  
31570           line that begins with a string other than the directive string; if directives occur on subsequent  
31571           lines, the utility shall ignore those directives.

31572           Lines are separated by a <newline>. If the first line of the script begins with "#!" or a colon  
31573           (' : '), then it is skipped. The *qsub* utility shall process a line in the script as a directive if and  
31574           only if the string of characters from the first non-white-space character on the line until the first  
31575           <space> or <tab> on the line match the directive prefix. If a line in the script contains a directive  
31576           and the final characters of the line are backslash (' \ ') and <newline>, then the next line shall be  
31577           interpreted as a continuation of that directive.

31578           The *qsub* utility shall process the options and option-arguments contained on the directive prefix  
31579           line using the same syntax as if the options were input on the *qsub* utility.

31580           The *qsub* utility shall continue to process a directive prefix line until after a <newline> is  
31581           encountered. An implementation may ignore lines which, according to the syntax of the shell  
31582           that will interpret the script, are comments. An implementation shall describe in the  
31583           conformance document the format of any shell comments that it will recognize.

31584           If an option is present in both a directive and the arguments to the *qsub* utility, the utility shall  
31585           ignore the option and the corresponding option-argument, if any, in the directive.

31586           If an option that is present in the directive is not present in the arguments to the *qsub* utility, the  
31587           utility shall process the option and the option-argument, if any.

31588           In order of preference, the *qsub* utility shall select the directive prefix from one of the following  
31589           sources:

- 31590           • If the **-C** option is presented to the utility, the value of the *directive\_prefix* option-argument
- 31591           • If the environment variable *PBS\_DPREFIX* is defined, the value of that variable
- 31592           • The four-character string "#PBS" encoded in the portable character set

31593           If the **-C** option is present in the script file it shall be ignored.

31594 **EXIT STATUS**

31595           The following exit values shall be returned:

31596           0   Successful completion.

31597 >0 An error occurred.

31598 **CONSEQUENCES OF ERRORS**

31599 Default.

31600 **APPLICATION USAGE**

31601 None.

31602 **EXAMPLES**

31603 None.

31604 **RATIONALE**

31605 The *qsub* utility allows users to create a batch job that will process the script specified as the  
31606 operand of the utility.

31607 The options of the *qsub* utility allow users to control many aspects of the queuing and execution  
31608 of a batch job.

31609 The **-a** option allows users to designate the time after which the batch job will become eligible to  
31610 run. By specifying an execution time, users can take advantage of resources at off-peak hours,  
31611 synchronize jobs with chronologically predictable events, and perhaps take advantage of off-  
31612 peak pricing of computing time. For these reasons and others, a timing option is existing practice  
31613 on the part of almost every batch system, including NQS.

31614 The **-A** option allows users to specify the account that will be charged for the batch job. Support  
31615 for account is not mandatory for conforming batch servers.

31616 The **-C** option allows users to prescribe the prefix for directives within the script file. The default  
31617 prefix "#PBS" may be inappropriate if the script will be interpreted with an alternate shell, as  
31618 specified by the **-S** option.

31619 The **-c** option allows users to establish the checkpointing interval for their jobs. A checkpointing  
31620 system, which is not defined by this volume of IEEE Std 1003.1-2001, allows recovery of a batch  
31621 job at the most recent checkpoint in the event of a crash. Checkpointing is typically used for jobs  
31622 that consume expensive computing time or must meet a critical schedule. Users should be  
31623 allowed to make the tradeoff between the overhead of checkpointing and the risk to the timely  
31624 completion of the batch job; therefore, this volume of IEEE Std 1003.1-2001 provides the  
31625 checkpointing interval option. Support for checkpointing is optional for batch servers.

31626 The **-e** option allows users to redirect the standard error streams of their jobs to a non-default  
31627 path. For example, if the submitted script generally produces a great deal of useless error output,  
31628 a user might redirect the standard error output to the null device. Or, if the file system holding  
31629 the default location (the home directory of the user) has too little free space, the user might  
31630 redirect the standard error stream to a file in another file system.

31631 The **-h** option allows users to create a batch job that is held until explicitly released. The ability  
31632 to create a held job is useful when some external event must complete before the batch job can  
31633 execute. For example, the user might submit a held job and release it when the system load has  
31634 dropped.

31635 The **-j** option allows users to merge the standard error of a batch job into its standard output  
31636 stream, which has the advantage of showing the sequential relationship between output and  
31637 error messages.

31638 The **-m** option allows users to designate those points in the execution of a batch job at which  
31639 mail will be sent to the submitting user, or to the account(s) indicated by the **-M** option. By  
31640 requesting mail notification at points of interest in the life of a job, the submitting user, or other  
31641 designated users, can track the progress of a batch job.

31642 The **-N** option allows users to associate a name with the batch job. The job name in no way  
31643 affects the processing of the batch job, but rather serves as a mnemonic handle for users. For  
31644 example, the batch job name can help the user distinguish between multiple jobs listed by the  
31645 *qstat* utility.

31646 The **-o** option allows users to redirect the standard output stream. A user might, for example,  
31647 wish to redirect to the null device the standard output stream of a job that produces copious yet  
31648 superfluous output.

31649 The **-P** option allows users to designate the relative priority of a batch job for selection from a  
31650 queue.

31651 The **-q** option allows users to specify an initial queue for the batch job. If the user specifies a  
31652 routing queue, the batch server routes the batch job to another queue for execution or further  
31653 routing. If the user specifies a non-routing queue, the batch server of the queue eventually  
31654 executes the batch job.

31655 The **-r** option allows users to control whether the submitted job will be rerun if the controlling  
31656 batch node fails during execution of the batch job. The **-r** option likewise allows users to  
31657 indicate whether or not the batch job is eligible to be rerun by the *qrerun* utility. Some jobs cannot  
31658 be correctly rerun because of changes they make in the state of databases or other aspects of  
31659 their environment. This volume of IEEE Std 1003.1-2001 specifies that the default, if the **-r**  
31660 option is not presented to the utility, will be that the batch job cannot be rerun, since the result of  
31661 rerunning a non-runnable job might be catastrophic.

31662 The **-S** option allows users to specify the program (usually a shell) that will be invoked to  
31663 process the script of the batch job. This option has been modified to allow a list of shell names  
31664 and locations associated with different hosts.

31665 The **-u** option is useful when the submitting user is authorized to use more than one account on  
31666 a given host, in which case the **-u** option allows the user to select from among those accounts.  
31667 The option-argument is a list of user-host pairs, so that the submitting user can provide different  
31668 user identifiers for different nodes in the event the batch job is routed. The **-u** option provides a  
31669 lot of flexibility to accommodate sites with complex account structures. Users that have the  
31670 same user identifier on all the hosts they are authorized to use will not need to use the **-u** option.

31671 The **-V** option allows users to export all their current environment variables, as of the time the  
31672 batch job is submitted, to the context of the processes of the batch job.

31673 The **-v** option allows users to export specific environment variables from their current process  
31674 to the processes of the batch job.

31675 The **-z** option allows users to suppress the writing of the batch job identifier to standard output.  
31676 The **-z** option is an existing NQS practice that has been standardized.

31677 Historically, the *qsub* utility has served the batch job-submission function in the NQS system, the  
31678 existing practice on which it is based. Some changes and additions have been made to the *qsub*  
31679 utility in this volume of IEEE Std 1003.1-2001, *vis-a-vis* NQS, as a result of the growing pool of  
31680 experience with distributed batch systems.

31681 The set of features of the *qsub* utility as defined in this volume of IEEE Std 1003.1-2001 appears to  
31682 incorporate all the common existing practice on potentially conforming platforms.

#### 31683 **FUTURE DIRECTIONS**

31684 None.

31685 **SEE ALSO**31686 Chapter 3 (on page 101), *qrerun*, *qstat*, *touch*31687 **CHANGE HISTORY**

31688 Derived from IEEE Std 1003.2d-1994.

31689 **Issue 6**31690 The **-I** option has been removed as there is no portable description of the resources that are  
31691 allowed or required by the batch job.

31692 **NAME**

31693           read — read a line from standard input

31694 **SYNOPSIS**

31695           read [-r] var...

31696 **DESCRIPTION**31697           The *read* utility shall read a single line from standard input.

31698           By default, unless the **-r** option is specified, backslash ('\**\**') shall act as an escape character, as  
 31699           described in Section 2.2.1 (on page 30). If standard input is a terminal device and the invoking  
 31700           shell is interactive, *read* shall prompt for a continuation line when:

- 31701           • The shell reads an input line ending with a backslash, unless the **-r** option is specified.
- 31702           • A here-document is not terminated after a <newline> is entered.

31703           The line shall be split into fields as in the shell (see Section 2.6.5 (on page 42)); the first field shall  
 31704           be assigned to the first variable *var*, the second field to the second variable *var*, and so on. If  
 31705           there are fewer *var* operands specified than there are fields, the leftover fields and their  
 31706           intervening separators shall be assigned to the last *var*. If there are fewer fields than *vars*, the  
 31707           remaining *vars* shall be set to empty strings.

31708           The setting of variables specified by the *var* operands shall affect the current shell execution  
 31709           environment; see Section 2.12 (on page 61). If it is called in a subshell or separate utility  
 31710           execution environment, such as one of the following:

```
31711 (read foo)
31712 nohup read ...
31713 find . -exec read ... \;
```

31714           it shall not affect the shell variables in the caller's environment.

31715 **OPTIONS**

31716           The *read* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 31717           12.2, Utility Syntax Guidelines.

31718           The following option is supported:

31719           **-r**           Do not treat a backslash character in any special way. Consider each backslash to  
 31720           be part of the input line.

31721 **OPERANDS**

31722           The following operand shall be supported:

31723           *var*           The name of an existing or nonexisting shell variable.

31724 **STDIN**

31725           The standard input shall be a text file.

31726 **INPUT FILES**

31727           None.

31728 **ENVIRONMENT VARIABLES**31729           The following environment variables shall affect the execution of *read*:

31730           **IFS**           Determine the internal field separators used to delimit fields; see Section 2.5.3 (on  
 31731           page 34).

31732           **LANG**          Provide a default value for the internationalization variables that are unset or null.  
 31733           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 31734           Internationalization Variables for the precedence of internationalization variables)

31735 used to determine the values of locale categories.)

31736 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
31737 internationalization variables.

31738 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
31739 characters (for example, single-byte as opposed to multi-byte characters in  
31740 arguments).

31741 **LC\_MESSAGES**  
31742 Determine the locale that should be used to affect the format and contents of  
31743 diagnostic messages written to standard error.

31744 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

31745 **PS2** Provide the prompt string that an interactive shell shall write to standard error  
31746 when a line ending with a backslash is read and the **-r** option was not specified, or  
31747 if a here-document is not terminated after a <newline> is entered.

31748 **ASYNCHRONOUS EVENTS**  
31749 Default.

31750 **STDOUT**  
31751 Not used.

31752 **STDERR**  
31753 The standard error shall be used for diagnostic messages and prompts for continued input.

31754 **OUTPUT FILES**  
31755 None.

31756 **EXTENDED DESCRIPTION**  
31757 None.

31758 **EXIT STATUS**  
31759 The following exit values shall be returned:  
31760 0 Successful completion.  
31761 >0 End-of-file was detected or an error occurred.

31762 **CONSEQUENCES OF ERRORS**  
31763 Default.

31764 **APPLICATION USAGE**  
31765 The **-r** option is included to enable *read* to subsume the purpose of the *line* utility, which is not  
31766 included in IEEE Std 1003.1-2001.  
31767 The results are undefined if an end-of-file is detected following a backslash at the end of a line  
31768 when **-r** is not specified.

31769 **EXAMPLES**  
31770 The following command:  
31771 while read -r xx yy  
31772 do  
31773 printf "%s %s\n" "\$yy" "\$xx"  
31774 done < *input\_file*  
31775 prints a file with the first field of each line moved to the end of the line.

31776 **RATIONALE**

31777       The *read* utility historically has been a shell built-in. It was separated off into its own utility to  
31778       take advantage of the richer description of functionality introduced by this volume of  
31779       IEEE Std 1003.1-2001.

31780       Since *read* affects the current shell execution environment, it is generally provided as a shell  
31781       regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
31782       of the following:

31783        (read foo)  
31784        nohup read ...  
31785        find . -exec read ... \;

31786       it does not affect the shell variables in the environment of the caller.

31787 **FUTURE DIRECTIONS**

31788       None.

31789 **SEE ALSO**

31790       Chapter 2 (on page 29)

31791 **CHANGE HISTORY**

31792       First released in Issue 2.

31793 **NAME**

31794           renice — set nice values of running processes

31795 **SYNOPSIS**31796 UP        renice -n *increment* [-g | -p | -u] *ID* ...

31797

31798 **DESCRIPTION**

31799       The *renice* utility shall request that the nice values (see the Base Definitions volume of  
 31800 IEEE Std 1003.1-2001, Section 3.239, Nice Value) of one or more running processes be changed.  
 31801 By default, the applicable processes are specified by their process IDs. When a process group is  
 31802 specified (see -g), the request shall apply to all processes in the process group.

31803       The nice value shall be bounded in an implementation-defined manner. If the requested  
 31804 *increment* would raise or lower the nice value of the executed utility beyond implementation-  
 31805 defined limits, then the limit whose value was exceeded shall be used.

31806       When a user is *reniced*, the request applies to all processes whose saved set-user-ID matches the  
 31807 user ID corresponding to the user.

31808       Regardless of which options are supplied or any other factor, *renice* shall not alter the nice values  
 31809 of any process unless the user requesting such a change has appropriate privileges to do so for  
 31810 the specified process. If the user lacks appropriate privileges to perform the requested action, the  
 31811 utility shall return an error status.

31812       The saved set-user-ID of the user's process shall be checked instead of its effective user ID when  
 31813 *renice* attempts to determine the user ID of the process in order to determine whether the user  
 31814 has appropriate privileges.

31815 **OPTIONS**

31816       The *renice* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 31817 12.2, Utility Syntax Guidelines.

31818       The following options shall be supported:

31819       -g           Interpret all operands as unsigned decimal integer process group IDs.

31820       -n *increment* Specify how the nice value of the specified process or processes is to be adjusted.  
 31821       The *increment* option-argument is a positive or negative decimal integer that shall  
 31822       be used to modify the nice value of the specified process or processes.

31823       Positive *increment* values shall cause a lower nice value. Negative *increment* values  
 31824       may require appropriate privileges and shall cause a higher nice value.

31825       -p           Interpret all operands as unsigned decimal integer process IDs. The -p option is  
 31826       the default if no options are specified.

31827       -u           Interpret all operands as users. If a user exists with a user name equal to the  
 31828       operand, then the user ID of that user is used in further processing. Otherwise, if  
 31829       the operand represents an unsigned decimal integer, it shall be used as the numeric  
 31830       user ID of the user.

31831 **OPERANDS**

31832       The following operands shall be supported:

31833       *ID*           A process ID, process group ID, or user name/user ID, depending on the option  
 31834       selected.

31835 **STDIN**

31836 Not used.

31837 **INPUT FILES**

31838 None.

31839 **ENVIRONMENT VARIABLES**31840 The following environment variables shall affect the execution of *renice*:

31841 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 31842 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 31843 Internationalization Variables for the precedence of internationalization variables  
 31844 used to determine the values of locale categories.)

31845 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 31846 internationalization variables.

31847 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 31848 characters (for example, single-byte as opposed to multi-byte characters in  
 31849 arguments).

31850 *LC\_MESSAGES*

31851 Determine the locale that should be used to affect the format and contents of  
 31852 diagnostic messages written to standard error.

31853 *NSI* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

31854 **ASYNCHRONOUS EVENTS**

31855 Default.

31856 **STDOUT**

31857 Not used.

31858 **STDERR**

31859 The standard error shall be used only for diagnostic messages.

31860 **OUTPUT FILES**

31861 None.

31862 **EXTENDED DESCRIPTION**

31863 None.

31864 **EXIT STATUS**

31865 The following exit values shall be returned:

31866 0 Successful completion.

31867 &gt;0 An error occurred.

31868 **CONSEQUENCES OF ERRORS**

31869 Default.

31870 **APPLICATION USAGE**

31871       None.

31872 **EXAMPLES**

31873       1. Adjust the nice value so that process IDs 987 and 32 would have a lower nice value:

31874       `renice -n 5 -p 987 32`31875       2. Adjust the nice value so that group IDs 324 and 76 would have a higher nice value, if the  
31876       user has the appropriate privileges to do so:31877       `renice -n -4 -g 324 76`31878       3. Adjust the nice value so that numeric user ID 8 and user **sas** would have a lower nice  
31879       value:31880       `renice -n 4 -u 8 sas`31881       Useful nice value increments on historical systems include 19 or 20 (the affected processes run  
31882       only when nothing else in the system attempts to run) and any negative number (to make  
31883       processes run faster).31884 **RATIONALE**31885       The *gid*, *pid*, and *user* specifications do not fit either the definition of operand or option-  
31886       argument. However, for clarity, they have been included in the OPTIONS section, rather than  
31887       the OPERANDS section.31888       The definition of nice value is not intended to suggest that all processes in a system have  
31889       priorities that are comparable. Scheduling policy extensions such as the realtime priorities in the  
31890       System Interfaces volume of IEEE Std 1003.1-2001 make the notion of a single underlying  
31891       priority for all scheduling policies problematic. Some implementations may implement the *nice*-  
31892       related features to affect all processes on the system, others to affect just the general time-  
31893       sharing activities implied by this volume of IEEE Std 1003.1-2001, and others may have no effect  
31894       at all. Because of the use of “implementation-defined” in *nice* and *renice*, a wide range of  
31895       implementation strategies are possible.31896       Originally, this utility was written in the historical manner, using the term “nice value”. This  
31897       was always a point of concern with users because it was never intuitively obvious what this  
31898       meant. With a newer version of *renice*, which used the term “system scheduling priority”, it was  
31899       hoped that novice users could better understand what this utility was meant to do. Also, it  
31900       would be easier to document what the utility was meant to do. Unfortunately, the addition of  
31901       the POSIX realtime scheduling capabilities introduced the concepts of process and thread  
31902       scheduling priorities that were totally unaffected by the *nice/renice* utilities or the  
31903       *nice()/setpriority()* functions. Continuing to use the term “system scheduling priority” would  
31904       have incorrectly suggested that these utilities and functions were indeed affecting these realtime  
31905       priorities. It was decided to revert to the historical term “nice value” to reference this unrelated  
31906       process attribute.31907       Although this utility has use by system administrators (and in fact appears in the system  
31908       administration portion of the BSD documentation), the standard developers considered that it  
31909       was very useful for individual end users to control their own processes.31910 **FUTURE DIRECTIONS**

31911       None.

31912 **SEE ALSO**31913 *nice*31914 **CHANGE HISTORY**

31915 First released in Issue 4.

31916 **Issue 5**31917 In the SYNOPSIS, an ellipsis is added to the **-u** option in all three obsolescent forms.31918 **Issue 6**

31919 This utility is marked as part of the User Portability Utilities option.

31920 The APPLICATION USAGE section is added.

31921 The obsolescent forms of the SYNOPSIS are removed.

31922 Text previously conditional on POSIX\_SAVED\_IDS is mandatory in this issue. This is a FIPS  
31923 requirement.

31924 **NAME**

31925           rm — remove directory entries

31926 **SYNOPSIS**31927           rm [-fiRr] *file...*31928 **DESCRIPTION**31929           The *rm* utility shall remove the directory entry specified by each *file* argument.

31930           If either of the files dot or dot-dot are specified as the basename portion of an operand (that is,  
 31931           the final pathname component), *rm* shall write a diagnostic message to standard error and do  
 31932           nothing more with such operands.

31933           For each *file* the following steps shall be taken:

- 31934           1. If the *file* does not exist:
    - 31935               a. If the **-f** option is not specified, *rm* shall write a diagnostic message to standard error.
    - 31936               b. Go on to any remaining *files*.
  - 31937           2. If *file* is of type directory, the following steps shall be taken:
    - 31938               a. If neither the **-R** option nor the **-r** option is specified, *rm* shall write a diagnostic  
 31939               message to standard error, do nothing more with *file*, and go on to any remaining  
 31940               files.
    - 31941               b. If the **-f** option is not specified, and either the permissions of *file* do not permit  
 31942               writing and the standard input is a terminal or the **-i** option is specified, *rm* shall  
 31943               write a prompt to standard error and read a line from the standard input. If the  
 31944               response is not affirmative, *rm* shall do nothing more with the current file and go on  
 31945               to any remaining files.
    - 31946               c. For each entry contained in *file*, other than dot or dot-dot, the four steps listed here (1  
 31947               to 4) shall be taken with the entry as if it were a *file* operand. The *rm* utility shall not  
 31948               traverse directories by following symbolic links into other parts of the hierarchy, but  
 31949               shall remove the links themselves.
    - 31950               d. If the **-i** option is specified, *rm* shall write a prompt to standard error and read a line  
 31951               from the standard input. If the response is not affirmative, *rm* shall do nothing more  
 31952               with the current file, and go on to any remaining files.
  - 31953           3. If *file* is not of type directory, the **-f** option is not specified, and either the permissions of  
 31954           *file* do not permit writing and the standard input is a terminal or the **-i** option is specified,  
 31955           *rm* shall write a prompt to the standard error and read a line from the standard input. If the  
 31956           response is not affirmative, *rm* shall do nothing more with the current file and go on to any  
 31957           remaining files.
  - 31958           4. If the current file is a directory, *rm* shall perform actions equivalent to the *rmdir()* function  
 31959           defined in the System Interfaces volume of IEEE Std 1003.1-2001 called with a pathname of  
 31960           the current file used as the *path* argument. If the current file is not a directory, *rm* shall  
 31961           perform actions equivalent to the *unlink()* function defined in the System Interfaces  
 31962           volume of IEEE Std 1003.1-2001 called with a pathname of the current file used as the *path*  
 31963           argument.
- 31964           If this fails for any reason, *rm* shall write a diagnostic message to standard error, do  
 31965           nothing more with the current file, and go on to any remaining files.
- 31966           The *rm* utility shall be able to descend to arbitrary depths in a file hierarchy, and shall not fail  
 31967           due to path length limitations (unless an operand specified by the user exceeds system

31968 limitations).

### 31969 OPTIONS

31970 The *rm* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
31971 Utility Syntax Guidelines.

31972 The following options shall be supported:

31973 **-f** Do not prompt for confirmation. Do not write diagnostic messages or modify the  
31974 exit status in the case of nonexistent operands. Any previous occurrences of the **-i**  
31975 option shall be ignored.

31976 **-i** Prompt for confirmation as described previously. Any previous occurrences of the  
31977 **-f** option shall be ignored.

31978 **-R** Remove file hierarchies. See the DESCRIPTION.

31979 **-r** Equivalent to **-R**.

### 31980 OPERANDS

31981 The following operand shall be supported:

31982 *file* A pathname of a directory entry to be removed.

### 31983 STDIN

31984 The standard input shall be used to read an input line in response to each prompt specified in  
31985 the STDOUT section. Otherwise, the standard input shall not be used.

### 31986 INPUT FILES

31987 None.

### 31988 ENVIRONMENT VARIABLES

31989 The following environment variables shall affect the execution of *rm*:

31990 **LANG** Provide a default value for the internationalization variables that are unset or null.  
31991 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
31992 Internationalization Variables for the precedence of internationalization variables  
31993 used to determine the values of locale categories.)

31994 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
31995 internationalization variables.

31996 **LC\_COLLATE**  
31997 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
31998 character collating elements used in the extended regular expression defined for  
31999 the **yesexpr** locale keyword in the *LC\_MESSAGES* category.

32000 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
32001 characters (for example, single-byte as opposed to multi-byte characters in  
32002 arguments) and the behavior of character classes within regular expressions used  
32003 in the extended regular expression defined for the **yesexpr** locale keyword in the  
32004 *LC\_MESSAGES* category.

32005 **LC\_MESSAGES**  
32006 Determine the locale for the processing of affirmative responses that should be  
32007 used to affect the format and contents of diagnostic messages written to standard  
32008 error.

32009 **NSI** **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

32010 **ASYNCHRONOUS EVENTS**

32011 Default.

32012 **STDOUT**

32013 Not used.

32014 **STDERR**

32015 Prompts shall be written to standard error under the conditions specified in the DESCRIPTION  
 32016 and OPTIONS sections. The prompts shall contain the *file* pathname, but their format is  
 32017 otherwise unspecified. The standard error also shall be used for diagnostic messages.

32018 **OUTPUT FILES**

32019 None.

32020 **EXTENDED DESCRIPTION**

32021 None.

32022 **EXIT STATUS**

32023 The following exit values shall be returned:

32024 0 All of the named directory entries for which *rm* performed actions equivalent to the *rmdir()*  
 32025 or *unlink()* functions were removed.

32026 &gt;0 An error occurred.

32027 **CONSEQUENCES OF ERRORS**

32028 Default.

32029 **APPLICATION USAGE**

32030 The *rm* utility is forbidden to remove the names dot and dot-dot in order to avoid the  
 32031 consequences of inadvertently doing something like:

32032 `rm -r .*`

32033 Some implementations do not permit the removal of the last link to an executable binary file that  
 32034 is being executed; see the [EBUSY] error in the *unlink()* function defined in the System Interfaces  
 32035 volume of IEEE Std 1003.1-2001. Thus, the *rm* utility can fail to remove such files.

32036 The *-i* option causes *rm* to prompt and read the standard input even if the standard input is not  
 32037 a terminal, but in the absence of *-i* the mode prompting is not done when the standard input is  
 32038 not a terminal.

32039 **EXAMPLES**

32040 1. The following command:

32041 `rm a.out core`32042 removes the directory entries: **a.out** and **core**.

32043 2. The following command:

32044 `rm -Rf junk`32045 removes the directory **junk** and all its contents, without prompting.32046 **RATIONALE**

32047 For absolute clarity, paragraphs (2b) and (3) in the DESCRIPTION of *rm* describing the behavior  
 32048 when prompting for confirmation, should be interpreted in the following manner:

32049 `if ((NOT f_option) AND`  
 32050 `((not_writable AND input_is_terminal) OR i_option))`

32051 The exact format of the interactive prompts is unspecified. Only the general nature of the  
32052 contents of prompts are specified because implementations may desire more descriptive  
32053 prompts than those used on historical implementations. Therefore, an application not using the  
32054 `-f` option, or using the `-i` option, relies on the system to provide the most suitable dialog directly  
32055 with the user, based on the behavior specified.

32056 The `-r` option is historical practice on all known systems. The synonym `-R` option is provided  
32057 for consistency with the other utilities in this volume of IEEE Std 1003.1-2001 that provide  
32058 options requesting recursive descent through the file hierarchy.

32059 The behavior of the `-f` option in historical versions of *rm* is inconsistent. In general, along with  
32060 “forcing” the unlink without prompting for permission, it always causes diagnostic messages to  
32061 be suppressed and the exit status to be unmodified for nonexistent operands and files that  
32062 cannot be unlinked. In some versions, however, the `-f` option suppresses usage messages and  
32063 system errors as well. Suppressing such messages is not a service to either shell scripts or users.

32064 It is less clear that error messages regarding files that cannot be unlinked (removed) should be  
32065 suppressed. Although this is historical practice, this volume of IEEE Std 1003.1-2001 does not  
32066 permit the `-f` option to suppress such messages.

32067 When given the `-r` and `-i` options, historical versions of *rm* prompt the user twice for each  
32068 directory, once before removing its contents and once before actually attempting to delete the  
32069 directory entry that names it. This allows the user to “prune” the file hierarchy walk. Historical  
32070 versions of *rm* were inconsistent in that some did not do the former prompt for directories  
32071 named on the command line and others had obscure prompting behavior when the `-i` option  
32072 was specified and the permissions of the file did not permit writing. The POSIX Shell and  
32073 Utilities *rm* differs little from historic practice, but does require that prompts be consistent.  
32074 Historical versions of *rm* were also inconsistent in that prompts were done to both standard  
32075 output and standard error. This volume of IEEE Std 1003.1-2001 requires that prompts be done  
32076 to standard error, for consistency with *cp* and *mv*, and to allow historical extensions to *rm* that  
32077 provide an option to list deleted files on standard output.

32078 The *rm* utility is required to descend to arbitrary depths so that any file hierarchy may be  
32079 deleted. This means, for example, that the *rm* utility cannot run out of file descriptors during its  
32080 descent (that is, if the number of file descriptors is limited, *rm* cannot be implemented in the  
32081 historical fashion where one file descriptor is used per directory level). Also, *rm* is not permitted  
32082 to fail because of path length restrictions, unless an operand specified by the user is longer than  
32083 {PATH\_MAX}.

32084 The *rm* utility removes symbolic links themselves, not the files they refer to, as a consequence of  
32085 the dependence on the *unlink()* functionality, per the DESCRIPTION. When removing  
32086 hierarchies with `-r` or `-R`, the prohibition on following symbolic links has to be made explicit.

#### 32087 FUTURE DIRECTIONS

32088 None.

32090 *rmdir*, the System Interfaces volume of IEEE Std 1003.1-2001, *remove()*, *rmdir()*, *unlink()*

#### 32091 CHANGE HISTORY

32092 First released in Issue 2.

#### 32093 Issue 5

32094 The FUTURE DIRECTIONS section is added.

32095 **Issue 6**

32096 Text is added to clarify actions relating to symbolic links as specified in the IEEE P1003.2b draft  
32097 standard.

32098 **NAME**32099           rm~~del~~ — remove a delta from an SCCS file (**DEVELOPMENT**)32100 **SYNOPSIS**32101 xSI       rm~~del~~ -r *SID file...*

32102

32103 **DESCRIPTION**

32104       The *rm~~del~~* utility shall remove the delta specified by the *SID* from each named SCCS file. The  
 32105       delta to be removed shall be the most recent delta in its branch in the delta chain of each named  
 32106       SCCS file. In addition, the application shall ensure that the *SID* specified is not that of a version  
 32107       being edited for the purpose of making a delta; that is, if a *p-file* (see *get*) exists for the named  
 32108       SCCS file, the *SID* specified shall not appear in any entry of the *p-file*.

32109       Removal of a delta shall be restricted to:

- 32110           1. The user who made the delta
- 32111           2. The owner of the SCCS file
- 32112           3. The owner of the directory containing the SCCS file

32113 **OPTIONS**

32114       The *rm~~del~~* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 32115       12.2, Utility Syntax Guidelines.

32116       The following option shall be supported:

32117       -r *SID*       Specify the SCCS identification string (*SID*) of the delta to be deleted.32118 **OPERANDS**

32119       The following operand shall be supported:

32120       *file*           A pathname of an existing SCCS file or a directory. If *file* is a directory, the *rm~~del~~*  
 32121       utility shall behave as though each file in the directory were specified as a named  
 32122       file, except that non-SCCS files (last component of the pathname does not begin  
 32123       with **s**.) and unreadable files shall be silently ignored.

32124                       If exactly one *file* operand appears, and it is '-', the standard input shall be read;  
 32125       each line of the standard input is taken to be the name of an SCCS file to be  
 32126       processed. Non-SCCS files and unreadable files shall be silently ignored.

32127 **STDIN**

32128       The standard input shall be a text file used only when the *file* operand is specified as '-'. Each  
 32129       line of the text file shall be interpreted as an SCCS pathname.

32130 **INPUT FILES**

32131       The SCCS files shall be files of unspecified format.

32132 **ENVIRONMENT VARIABLES**32133       The following environment variables shall affect the execution of *rm~~del~~*:

32134       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 32135       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 32136       Internationalization Variables for the precedence of internationalization variables  
 32137       used to determine the values of locale categories.)

32138       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 32139       internationalization variables.

|       |                               |                                                                                                                                                                                                                                                                     |
|-------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 32140 | <b>LC_CTYPE</b>               | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                                           |

| 32178 |                               | The normative text is reworded to avoid use of the term “must” for application requirements.                                                                                                                                                                        |

32179 **NAME**

32180           rmdir — remove directories

32181 **SYNOPSIS**32182           rmdir [-p] *dir*...32183 **DESCRIPTION**32184           The *rmdir* utility shall remove the directory entry specified by each *dir* operand.32185           For each *dir* operand, the *rmdir* utility shall perform actions equivalent to the *rmdir()* function  
32186           called with the *dir* operand as its only argument.32187           Directories shall be processed in the order specified. If a directory and a subdirectory of that  
32188           directory are specified in a single invocation of the *rmdir* utility, the application shall specify the  
32189           subdirectory before the parent directory so that the parent directory will be empty when the  
32190           *rmdir* utility tries to remove it.32191 **OPTIONS**32192           The *rmdir* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
32193           12.2, Utility Syntax Guidelines.

32194           The following option shall be supported:

32195           **-p**           Remove all directories in a pathname. For each *dir* operand:

- 32196                           1. The directory entry it names shall be removed.
- 
- 32197                           2. If the
- dir*
- operand includes more than one pathname component, effects
- 
- 32198                           equivalent to the following command shall occur:

32199                                 rmdir -p \$(dirname *dir*)32200 **OPERANDS**

32201           The following operand shall be supported:

32202           *dir*           A pathname of an empty directory to be removed.32203 **STDIN**

32204           Not used.

32205 **INPUT FILES**

32206           None.

32207 **ENVIRONMENT VARIABLES**32208           The following environment variables shall affect the execution of *rmdir*:32209           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
32210                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
32211                           Internationalization Variables for the precedence of internationalization variables  
32212                           used to determine the values of locale categories.)32213           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
32214                           internationalization variables.32215           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
32216                           characters (for example, single-byte as opposed to multi-byte characters in  
32217                           arguments).32218           **LC\_MESSAGES**32219                           Determine the locale that should be used to affect the format and contents of  
32220                           diagnostic messages written to standard error.

32221 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 32222 ASYNCHRONOUS EVENTS

32223 Default.

## 32224 STDOUT

32225 Not used.

## 32226 STDERR

32227 The standard error shall be used only for diagnostic messages.

## 32228 OUTPUT FILES

32229 None.

## 32230 EXTENDED DESCRIPTION

32231 None.

## 32232 EXIT STATUS

32233 The following exit values shall be returned:

32234 0 Each directory entry specified by a *dir* operand was removed successfully.

32235 >0 An error occurred.

## 32236 CONSEQUENCES OF ERRORS

32237 Default.

## 32238 APPLICATION USAGE

32239 The definition of an empty directory is one that contains, at most, directory entries for dot and dot-dot.

## 32241 EXAMPLES

32242 If a directory **a** in the current directory is empty except it contains a directory **b** and **a/b** is empty  
32243 except it contains a directory **c**:

32244 `rmdir -p a/b/c`

32245 removes all three directories.

## 32246 RATIONALE

32247 On historical System V systems, the **-p** option also caused a message to be written to the  
32248 standard output. The message indicated whether the whole path was removed or whether part  
32249 of the path remained for some reason. The STDERR section requires this diagnostic when the  
32250 entire path specified by a *dir* operand is not removed, but does not allow the status message  
32251 reporting success to be written as a diagnostic.

32252 The *rmdir* utility on System V also included a **-s** option that suppressed the informational  
32253 message output by the **-p** option. This option has been omitted because the informational  
32254 message is not specified by this volume of IEEE Std 1003.1-2001.

## 32255 FUTURE DIRECTIONS

32256 None.

## 32257 SEE ALSO

32258 *rm*, the System Interfaces volume of IEEE Std 1003.1-2001, *remove()*, *rmdir()*, *unlink()*

## 32259 CHANGE HISTORY

32260 First released in Issue 2.

32261 **Issue 6**

32262 The normative text is reworded to avoid use of the term “must” for application requirements.

32263 **NAME**32264           sact — print current SCCS file-editing activity (**DEVELOPMENT**)32265 **SYNOPSIS**32266 xSI       sact *file...*

32267

32268 **DESCRIPTION**

32269       The *sact* utility shall inform the user of any impending deltas to a named SCCS file by writing a  
 32270       list to standard output. This situation occurs when *get -e* has been executed previously without  
 32271       a subsequent execution of *delta*, *unget*, or *sccs unedit*.

32272 **OPTIONS**

32273           None.

32274 **OPERANDS**

32275       The following operand shall be supported:

32276       *file*       A pathname of an existing SCCS file or a directory. If *file* is a directory, the *sact*  
 32277       utility shall behave as though each file in the directory were specified as a named  
 32278       file, except that non-SCCS files (last component of the pathname does not begin  
 32279       with **s.**) and unreadable files shall be silently ignored.

32280       If exactly one *file* operand appears, and it is *'-'*, the standard input shall be read;  
 32281       each line of the standard input shall be taken to be the name of an SCCS file to be  
 32282       processed. Non-SCCS files and unreadable files shall be silently ignored.

32283 **STDIN**

32284       The standard input shall be a text file used only when the *file* operand is specified as *'-'*. Each  
 32285       line of the text file shall be interpreted as an SCCS pathname.

32286 **INPUT FILES**

32287       Any SCCS files interrogated are files of an unspecified format.

32288 **ENVIRONMENT VARIABLES**32289       The following environment variables shall affect the execution of *sact*:

32290       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 32291       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 32292       Internationalization Variables for the precedence of internationalization variables  
 32293       used to determine the values of locale categories.)

32294       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 32295       internationalization variables.

32296       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 32297       characters (for example, single-byte as opposed to multi-byte characters in  
 32298       arguments and input files).

32299       *LC\_MESSAGES*

32300       Determine the locale that should be used to affect the format and contents of  
 32301       diagnostic messages written to standard error.

32302       *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

32303 **ASYNCHRONOUS EVENTS**

32304       Default.

**32305 STDOUT**

32306 The output for each named file shall consist of a line in the following format:

32307 "%sΔ%sΔ%sΔ%sΔ\n", <SID>, <new SID>, <login>, <date>, <time>

32308 <SID> Specifies the SID of a delta that currently exists in the SCCS file to which changes  
32309 are made to make the new delta.

32310 <new SID> Specifies the SID for the new delta to be created.

32311 <login> Contains the login name of the user who makes the delta (that is, who executed a  
32312 *get* for editing).

32313 <date> Contains the date that *get -e* was executed, in the format used by the *prs :D:* data  
32314 keyword.

32315 <time> Contains the time that *get -e* was executed, in the format used by the *prs :T:* data  
32316 keyword.

32317 If there is more than one named file or if a directory or standard input is named, each pathname  
32318 shall be written before each of the preceding lines:

32319 "\n%s:\n", <pathname>

**32320 STDERR**

32321 The standard error shall be used only for optional informative messages concerning SCCS files  
32322 with no impending deltas, and for diagnostic messages.

**32323 OUTPUT FILES**

32324 None.

**32325 EXTENDED DESCRIPTION**

32326 None.

**32327 EXIT STATUS**

32328 The following exit values shall be returned:

32329 0 Successful completion.

32330 >0 An error occurred.

**32331 CONSEQUENCES OF ERRORS**

32332 Default.

**32333 APPLICATION USAGE**

32334 None.

**32335 EXAMPLES**

32336 None.

**32337 RATIONALE**

32338 None.

**32339 FUTURE DIRECTIONS**

32340 None.

**32341 SEE ALSO**

32342 *delta*, *get*, *sccs*, *unget*

32343 **CHANGE HISTORY**

32344 First released in Issue 2.

32345 **NAME**32346        *sccs* — front end for the SCCS subsystem (**DEVELOPMENT**)32347 **SYNOPSIS**32348 xSI        *sccs* [-r] [-d *path*] [-p *path*] *command* [*options...*] [*operands...*]

32349

32350 **DESCRIPTION**32351        The *sccs* utility is a front end to the SCCS programs. It also includes the capability to run set-  
32352        user-id to another user to provide additional protection.32353        The *sccs* utility shall invoke the specified *command* with the specified *options* and *operands*. By  
32354        default, each of the *operands* shall be modified by prefixing it with the string "SCCS/s. ".32355        The *command* can be the name of one of the SCCS utilities in this volume of IEEE Std 1003.1-2001  
32356        (*admin*, *delta*, *get*, *prs*, *rmdel*, *sact*, *unget*, *val*, or *what*) or one of the pseudo-utilities listed in the  
32357        EXTENDED DESCRIPTION section.32358 **OPTIONS**32359        The *sccs* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
32360        12.2, Utility Syntax Guidelines, except that *options* operands are actually options to be passed to  
32361        the utility named by *command*. When the portion of the command:32362        *command* [*options ...*] [*operands ...*]32363        is considered, all of the pseudo-utilities used as *command* shall support the Utility Syntax  
32364        Guidelines. Any of the other SCCS utilities that can be invoked in this manner support the  
32365        Guidelines to the extent indicated by their individual OPTIONS sections.32366        The following options shall be supported preceding the *command* operand:32367        **-d path**        A pathname of a directory to be used as a root directory for the SCCS files. The  
32368        default shall be the current directory. The **-d** option shall take precedence over the  
32369        *PROJECTDIR* variable. See **-p**.32370        **-p path**        A pathname of a directory in which the SCCS files are located. The default shall be  
32371        the **SCCS** directory.32372        The **-p** option differs from the **-d** option in that the **-d** option-argument shall be  
32373        prefixed to the entire pathname and the **-p** option-argument shall be inserted  
32374        before the final component of the pathname. For example:32375        *sccs -d /x -p y get a/b*

32376        converts to:

32377        *get /x/a/y/s.b*

32378        This allows the creation of aliases such as:

32379        *alias syssccs="sccs -d /usr/src"*

32380        which is used as:

32381        *syssccs get cmd/who.c*32382        **-r**            Invoke *command* with the real user ID of the process, not any effective user ID that  
32383        the *sccs* utility is set to. Certain commands (*admin*, **check**, **clean**, **diffs**, **info**, *rmdel*,  
32384        and **tell**) cannot be run set-user-ID by all users, since this would allow anyone to  
32385        change the authorizations. These commands are always run as the real user.

32386 **OPERANDS**

32387 The following operands shall be supported:

32388 *command* An SCCS utility name or the name of one of the pseudo-utilities listed in the  
 32389 EXTENDED DESCRIPTION section.

32390 *options* An option or option-argument to be passed to *command*.

32391 *operands* An operand to be passed to *command*.

32392 **STDIN**32393 See the utility description for the specified *command*.32394 **INPUT FILES**32395 See the utility description for the specified *command*.32396 **ENVIRONMENT VARIABLES**32397 The following environment variables shall affect the execution of *sccs*:

32398 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 32399 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 32400 Internationalization Variables for the precedence of internationalization variables  
 32401 used to determine the values of locale categories.)

32402 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 32403 internationalization variables.

32404 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 32405 characters (for example, single-byte as opposed to multi-byte characters in  
 32406 arguments and input files).

32407 *LC\_MESSAGES*

32408 Determine the locale that should be used to affect the format and contents of  
 32409 diagnostic messages written to standard error.

32410 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

32411 *PROJECTDIR*

32412 Provide a default value for the *-d path* option. If the value of *PROJECTDIR* begins  
 32413 with a slash, it shall be considered an absolute pathname; otherwise, the value of  
 32414 *PROJECTDIR* is treated as a user name and that user's initial working directory  
 32415 shall be examined for a subdirectory **src** or **source**. If such a directory is found, it  
 32416 shall be used. Otherwise, the value shall be used as a relative pathname.

32417 Additional environment variable effects may be found in the utility description for the specified  
 32418 *command*.

32419 **ASYNCHRONOUS EVENTS**

32420 Default.

32421 **STDOUT**32422 See the utility description for the specified *command*.32423 **STDERR**32424 See the utility description for the specified *command*.32425 **OUTPUT FILES**32426 See the utility description for the specified *command*.

## 32427 EXTENDED DESCRIPTION

32428 The following pseudo-utilities shall be supported as *command* operands. All options referred to  
 32429 in the following list are values given in the *options* operands following *command*.

32430 **check** Equivalent to **info**, except that nothing shall be printed if nothing is being edited, and a  
 32431 non-zero exit status shall be returned if anything is being edited. The intent is to have  
 32432 this included in an “install” entry in a makefile to ensure that everything is included  
 32433 into the SCCS file before a version is installed.

32434 **clean** Remove everything from the current directory that can be recreated from SCCS files,  
 32435 but do not remove any files being edited. If the **-b** option is given, branches shall be  
 32436 ignored in the determination of whether they are being edited; this is dangerous if  
 32437 branches are kept in the same directory.

32438 **create** Create an SCCS file, taking the initial contents from the file of the same name. Any  
 32439 options to *admin* are accepted. If the creation is successful, the original files shall be  
 32440 renamed by prefixing the basenames with a comma. These renamed files should be  
 32441 removed after it has been verified that the SCCS files have been created successfully.

32442 **delget** Perform a *delta* on the named files and then *get* new versions. The new versions shall  
 32443 have ID keywords expanded and shall not be editable. Any **-m**, **-p**, **-r**, **-s**, and **-y**  
 32444 options shall be passed to *delta*, and any **-b**, **-c**, **-e**, **-i**, **-k**, **-l**, **-s**, and **-x** options shall be  
 32445 passed to *get*.

32446 **deledit** Equivalent to **delget**, except that the *get* phase shall include the **-e** option. This option  
 32447 is useful for making a checkpoint of the current editing phase. The same options shall  
 32448 be passed to *delta* as described above, and all the options listed for *get* above except **-e**  
 32449 shall be passed to **edit**.

32450 **diffs** Write a difference listing between the current version of the files checked out for  
 32451 editing and the versions in SCCS format. Any **-r**, **-c**, **-i**, **-x**, and **-t** options shall be  
 32452 passed to *get*; any **-l**, **-s**, **-e**, **-f**, **-h**, and **-b** options shall be passed to *diff*. A **-C** option  
 32453 shall be passed to *diff* as **-c**.

32454 **edit** Equivalent to *get -e*.

32455 **fix** Remove the named delta, but leave a copy of the delta with the changes that were in it.  
 32456 It is useful for fixing small compiler bugs, and so on. The application shall ensure that it  
 32457 is followed by a **-r SID** option. Since **fix** does not leave audit trails, it should be used  
 32458 carefully.

32459 **info** Write a listing of all files being edited. If the **-b** option is given, branches (that is, SIDs  
 32460 with two or fewer components) shall be ignored. If a **-u user** option is given, then only  
 32461 files being edited by the named user shall be listed. A **-U** option shall be equivalent to  
 32462 **-u<current user>**.

32463 **print** Write out verbose information about the named files, equivalent to *scs prs*.

32464 **tell** Write a <newline>-separated list of the files being edited to standard output. Takes the  
 32465 **-b**, **-u**, and **-U** options like **info** and **check**.

32466 **unedit** This is the opposite of an **edit** or a *get -e*. It should be used with caution, since any  
 32467 changes made since the *get* are lost.

## 32468 EXIT STATUS

32469 The following exit values shall be returned:

32470 0 Successful completion.

32471 >0 An error occurred.

## 32472 CONSEQUENCES OF ERRORS

32473 Default.

## 32474 APPLICATION USAGE

32475 Many of the SCCS utilities take directory names as operands as well as specific filenames. The  
 32476 pseudo-utilities supported by *sccs* are not described as having this capability, but are not  
 32477 prohibited from doing so.

## 32478 EXAMPLES

32479 1. To get a file for editing, edit it and produce a new delta:

32480 `sccs get -e file.c`

32481 `ex file.c`

32482 `sccs delta file.c`

32483 2. To get a file from another directory:

32484 `sccs -p /usr/src/sccs/s. get cc.c`

32485 or:

32486 `sccs get /usr/src/sccs/s.cc.c`

32487 3. To make a delta of a large number of files in the current directory:

32488 `sccs delta *.c`

32489 4. To get a list of files being edited that are not on branches:

32490 `sccs info -b`

32491 5. To delta everything being edited by the current user:

32492 `sccs delta $(sccs tell -U)`

32493 6. In a makefile, to get source files from an SCCS file if it does not already exist:

32494 `SRCS = <list of source files>`

32495 `$(SRCS) :`

32496 `sccs get $(REL) $@`

## 32497 RATIONALE

32498 SCCS and its associated utilities are part of the XSI Development Utilities option within the XSI  
 32499 extension.

32500 SCCS is an abbreviation for Source Code Control System. It is a maintenance and enhancement  
 32501 tracking tool. When a file is put under SCCS, the source code control system maintains the file  
 32502 and, when changes are made, identifies and stores them in the file with the original source code  
 32503 and/or documentation. As other changes are made, they too are identified and retained in the  
 32504 file.

32505 Retrieval of the original and any set of changes is possible. Any version of the file as it develops  
 32506 can be reconstructed for inspection or additional modification. History data can be stored with  
 32507 each version, documenting why the changes were made, who made them, and when they were  
 32508 made.

32509 **FUTURE DIRECTIONS**

32510 None.

32511 **SEE ALSO**32512 *admin, delta, get, make, prs, rmdel, sact, unget, val, what*32513 **CHANGE HISTORY**

32514 First released in Issue 4.

32515 **Issue 6**

32516 In the ENVIRONMENT VARIABLES section, the *PROJECTDIR* description is updated from  
32517 “otherwise, the home directory of a user of that name is examined” to “otherwise, the value of  
32518 *PROJECTDIR* is treated as a user name and that user’s initial working directory is examined”.

32519 The normative text is reworded to avoid use of the term “must” for application requirements.

32520 **NAME**

32521           sed — stream editor

32522 **SYNOPSIS**32523           sed [-n] *script*[*file...*]32524           sed [-n] [-e *script*]...[-f *script\_file*]...[*file...*]32525 **DESCRIPTION**

32526           The *sed* utility is a stream editor that shall read one or more text files, make editing changes  
 32527           according to a script of editing commands, and write the results to standard output. The script  
 32528           shall be obtained from either the *script* operand string or a combination of the option-arguments  
 32529           from the **-e** *script* and **-f** *script\_file* options.

32530 **OPTIONS**

32531           The *sed* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 32532           Utility Syntax Guidelines, except that the order of presentation of the **-e** and **-f** options is  
 32533           significant.

32534           The following options shall be supported:

32535           **-e** *script*     Add the editing commands specified by the *script* option-argument to the end of  
 32536                           the script of editing commands. The *script* option-argument shall have the same  
 32537                           properties as the *script* operand, described in the OPERANDS section.

32538           **-f** *script\_file* Add the editing commands in the file *script\_file* to the end of the script.

32539           **-n**           Suppress the default output (in which each line, after it is examined for editing, is  
 32540                           written to standard output). Only lines explicitly selected for output are written.

32541           Multiple **-e** and **-f** options may be specified. All commands shall be added to the script in the  
 32542           order specified, regardless of their origin.

32543 **OPERANDS**

32544           The following operands shall be supported:

32545           *file*           A pathname of a file whose contents are read and edited. If multiple *file* operands  
 32546                           are specified, the named files shall be read in the order specified and the  
 32547                           concatenation shall be edited. If no *file* operands are specified, the standard input  
 32548                           shall be used.

32549           *script*        A string to be used as the script of editing commands. The application shall not  
 32550                           present a *script* that violates the restrictions of a text file except that the final  
 32551                           character need not be a <newline>.

32552 **STDIN**

32553           The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 32554           section.

32555 **INPUT FILES**

32556           The input files shall be text files. The *script\_files* named by the **-f** option shall consist of editing  
 32557           commands.

32558 **ENVIRONMENT VARIABLES**32559           The following environment variables shall affect the execution of *sed*:

32560           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 32561                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 32562                           Internationalization Variables for the precedence of internationalization variables  
 32563                           used to determine the values of locale categories.)

32564 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 32565 internationalization variables.

32566 *LC\_COLLATE*  
 32567 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 32568 character collating elements within regular expressions.

32569 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 32570 characters (for example, single-byte as opposed to multi-byte characters in  
 32571 arguments and input files), and the behavior of character classes within regular  
 32572 expressions.

32573 *LC\_MESSAGES*  
 32574 Determine the locale that should be used to affect the format and contents of  
 32575 diagnostic messages written to standard error.

32576 xsi *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

32577 **ASYNCHRONOUS EVENTS**  
 32578 Default.

32579 **STDOUT**  
 32580 The input files shall be written to standard output, with the editing commands specified in the  
 32581 script applied. If the **-n** option is specified, only those input lines selected by the script shall be  
 32582 written to standard output.

32583 **STDERR**  
 32584 The standard error shall be used only for diagnostic messages.

32585 **OUTPUT FILES**  
 32586 The output files shall be text files whose formats are dependent on the editing commands given.

32587 **EXTENDED DESCRIPTION**  
 32588 The *script* shall consist of editing commands of the following form:  
 32589 *[address [, address] ] function*  
 32590 where *function* represents a single-character command verb from the list in **Editing Commands**  
 32591 **in sed** (on page 843), followed by any applicable arguments.  
 32592 The command can be preceded by <blank>s and/or semicolons. The function can be preceded  
 32593 by <blank>s. These optional characters shall have no effect.

32594 In default operation, *sed* cyclically shall append a line of input, less its terminating <newline>,  
 32595 into the pattern space. Normally the pattern space will be empty, unless a **D** command  
 32596 terminated the last cycle. The *sed* utility shall then apply in sequence all commands whose  
 32597 addresses select that pattern space, and at the end of the script copy the pattern space to  
 32598 standard output (except when **-n** is specified) and delete the pattern space. Whenever the  
 32599 pattern space is written to standard output or a named file, *sed* shall immediately follow it with a  
 32600 <newline>.

32601 Some of the editing commands use a hold space to save all or part of the pattern space for  
 32602 subsequent retrieval. The pattern and hold spaces shall each be able to hold at least 8 192 bytes.

**Addresses in sed**

An address is either a decimal number that counts input lines cumulatively across files, a ' '\$ ' character that addresses the last line of input, or a context address (which consists of a BRE, as described in **Regular Expressions in sed**, preceded and followed by a delimiter, usually a slash).

An editing command with no addresses shall select every pattern space.

An editing command with one address shall select each pattern space that matches the address.

An editing command with two addresses shall select the inclusive range from the first pattern space that matches the first address through the next pattern space that matches the second. (If the second address is a number less than or equal to the line number first selected, only one line shall be selected.) Starting at the first line following the selected range, *sed* shall look again for the first address. Thereafter, the process shall be repeated. Omitting either or both of the address components in the following form produces undefined results:

`[address [, address] ]`

**Regular Expressions in sed**

The *sed* utility shall support the BREs described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions, with the following additions:

- In a context address, the construction "`\cBREc`", where *c* is any character other than backslash or <newline>, shall be identical to "`/BRE/`". If the character designated by *c* appears following a backslash, then it shall be considered to be that literal character, which shall not terminate the BRE. For example, in the context address "`\xabc\xdefx`", the second *x* stands for itself, so that the BRE is "`abcxdef`".
- The escape sequence '`\n`' shall match a <newline> embedded in the pattern space. A literal <newline> shall not be used in the BRE of a context address or in the substitute function.
- If an RE is empty (that is, no pattern is specified) *sed* shall behave as if the last RE used in the last command applied (either as an address or as part of a substitute command) was specified.

**Editing Commands in sed**

In the following list of editing commands, the maximum number of permissible addresses for each function is indicated by `[0addr]`, `[1addr]`, or `[2addr]`, representing zero, one, or two addresses.

The argument *text* shall consist of one or more lines. Each embedded <newline> in the text shall be preceded by a backslash. Other backslashes in text shall be removed, and the following character shall be treated literally.

The **r** and **w** command verbs, and the **w** flag to the **s** command, take an optional *rfile* (or *wfile*) parameter, separated from the command verb letter or flag by one or more <blank>s; implementations may allow zero separation as an extension.

The argument *rfile* or the argument *wfile* shall terminate the editing command. Each *wfile* shall be created before processing begins. Implementations shall support at least ten *wfile* arguments in the script; the actual number (greater than or equal to 10) that is supported by the implementation is unspecified. The use of the *wfile* parameter shall cause that file to be initially created, if it does not exist, or shall replace the contents of an existing file.

The **b**, **r**, **s**, **t**, **w**, **y**, and **:** command verbs shall accept additional arguments. The following synopses indicate which arguments shall be separated from the command verbs by a single

|       |                                                                                                                                                                          |                                                                                                         |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| 32646 | <space>.                                                                                                                                                                 |                                                                                                         |
| 32647 | The <b>a</b> and <b>r</b> commands schedule text for later output. The text specified for the <b>a</b> command, and                                                      |                                                                                                         |
| 32648 | the contents of the file specified for the <b>r</b> command, shall be written to standard output just                                                                    |                                                                                                         |
| 32649 | before the next attempt to fetch a line of input when executing the <b>N</b> or <b>n</b> commands, or when                                                               |                                                                                                         |
| 32650 | reaching the end of the script. If written when reaching the end of the script, and the <b>-n</b> option                                                                 |                                                                                                         |
| 32651 | was not specified, the text shall be written after copying the pattern space to standard output.                                                                         |                                                                                                         |
| 32652 | The contents of the file specified for the <b>r</b> command shall be as of the time the output is written,                                                               |                                                                                                         |
| 32653 | not the time the <b>r</b> command is applied. The text shall be output in the order in which the <b>a</b> and <b>r</b>                                                   |                                                                                                         |
| 32654 | commands were applied to the input.                                                                                                                                      |                                                                                                         |
| 32655 | Command verbs other than { <b>a</b> , <b>b</b> , <b>c</b> , <b>i</b> , <b>r</b> , <b>t</b> , <b>w</b> , <b>:</b> , and <b>#</b> can be followed by a semicolon, optional |                                                                                                         |
| 32656 | <blank>s, and another command verb. However, when the <b>s</b> command verb is used with the <b>w</b>                                                                    |                                                                                                         |
| 32657 | flag, following it with another command in this manner produces undefined results.                                                                                       |                                                                                                         |
| 32658 | A function can be preceded by one or more '!' characters, in which case the function shall be                                                                            |                                                                                                         |
| 32659 | applied if the addresses do not select the pattern space. Zero or more <blank>s shall be accepted                                                                        |                                                                                                         |
| 32660 | before the first '!' character. It is unspecified whether <blank>s can follow a '!' character, and                                                                       |                                                                                                         |
| 32661 | conforming applications shall not follow a '!' character with <blank>s.                                                                                                  |                                                                                                         |

| 32692 | <i>text</i>                           | Write <i>text</i> to standard output.                                                              |
| 32693 | <b>[2addr]l</b>                       | (The letter ell.) Write the pattern space to standard output in a visually                         |
| 32694 |                                       | unambiguous form. The characters listed in the Base Definitions volume of                          |
| 32695 |                                       | IEEE Std 1003.1-2001, Table 5-1, Escape Sequences and Associated Actions ('\\',                    |
| 32696 |                                       | '\a', '\b', '\f', '\r', '\t', '\v') shall be written as the corresponding                          |
| 32697 |                                       | escape sequence; the '\n' in that table is not applicable. Non-printable characters                |
| 32698 |                                       | not in that table shall be written as one three-digit octal number (with a preceding               |
| 32699 |                                       | backslash) for each byte in the character (most significant byte first). If the size of a          |
| 32700 |                                       | byte on the system is greater than 9 bits, the format used for non-printable                       |
| 32701 |                                       | characters is implementation-defined.                                                              |
| 32702 |                                       | Long lines shall be folded, with the point of folding indicated by writing a                       |
| 32703 |                                       | backslash followed by a <newline>; the length at which folding occurs is                           |
| 32704 |                                       | unspecified, but should be appropriate for the output device. The end of each line                 |
| 32705 |                                       | shall be marked with a '\$'.                                                                       |
| 32706 | <b>[2addr]n</b>                       | Write the pattern space to standard output if the default output has not been                      |
| 32707 |                                       | suppressed, and replace the pattern space with the next line of input, less its                    |
| 32708 |                                       | terminating <newline>.                                                                             |
| 32709 |                                       | If no next line of input is available, the <b>n</b> command verb shall branch to the end of        |
| 32710 |                                       | the script and quit without starting a new cycle.                                                  |
| 32711 | <b>[2addr]N</b>                       | Append the next line of input, less its terminating <newline>, to the pattern space,               |
| 32712 |                                       | using an embedded <newline> to separate the appended material from the original                    |
| 32713 |                                       | material. Note that the current line number changes.                                               |
| 32714 |                                       | If no next line of input is available, the <b>N</b> command verb shall branch to the end of        |
| 32715 |                                       | the script and quit without starting a new cycle or copying the pattern space to                   |
| 32716 |                                       | standard output.                                                                                   |
| 32717 | <b>[2addr]p</b>                       | Write the pattern space to standard output.                                                        |
| 32718 | <b>[2addr]P</b>                       | Write the pattern space, up to the first <newline>, to standard output.                            |
| 32719 | <b>[1addr]q</b>                       | Branch to the end of the script and quit without starting a new cycle.                             |
| 32720 | <b>[1addr]r rfile</b>                 | Copy the contents of <i>rfile</i> to standard output as described previously. If <i>rfile</i> does |
| 32721 |                                       | not exist or cannot be read, it shall be treated as if it were an empty file, causing no           |
| 32722 |                                       | error condition.                                                                                   |
| 32723 | <b>[2addr]s/BRE/replacement/flags</b> |                                                                                                    |
| 32724 |                                       | Substitute the replacement string for instances of the BRE in the pattern space. Any               |
| 32725 |                                       | character other than backslash or <newline> can be used instead of a slash to                      |
| 32726 |                                       | delimit the BRE and the replacement. Within the BRE and the replacement, the                       |
| 32727 |                                       | BRE delimiter itself can be used as a literal character if it is preceded by a                     |
| 32728 |                                       | backslash.                                                                                         |
| 32729 |                                       | The replacement string shall be scanned from beginning to end. An ampersand                        |
| 32730 |                                       | (' & ') appearing in the replacement shall be replaced by the string matching the                  |
| 32731 |                                       | BRE. The special meaning of ' & ' in this context can be suppressed by preceding it                |
| 32732 |                                       | by a backslash. The characters "\n", where <i>n</i> is a digit, shall be replaced by the           |
| 32733 |                                       | text matched by the corresponding backreference expression. The special meaning                    |
| 32734 |                                       | of "\n" where <i>n</i> is a digit in this context, can be suppressed by preceding it by a          |
| 32735 |                                       | backslash. For each other backslash ('\') encountered, the following character                     |
| 32736 |                                       | shall lose its special meaning (if any). The meaning of a '\ ' immediately followed                |

|       |                                                     |                                                                                                                  |
|-------|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 32737 |                                                     | by any character other than '&', '\', a digit, or the delimiter character used for                               |
| 32738 |                                                     | this command, is unspecified.                                                                                    |
| 32739 |                                                     | A line can be split by substituting a <newline> into it. The application shall escape                            |
| 32740 |                                                     | the <newline> in the replacement by preceding it by a backslash. A substitution                                  |
| 32741 |                                                     | shall be considered to have been performed even if the replacement string is                                     |
| 32742 |                                                     | identical to the string that it replaces. Any backslash used to alter the default                                |
| 32743 |                                                     | meaning of a subsequent character shall be discarded from the BRE or the                                         |
| 32744 |                                                     | replacement before evaluating the BRE or using the replacement.                                                  |
| 32745 |                                                     | The value of <i>flags</i> shall be zero or more of:                                                              |
| 32746 | <i>n</i>                                            | Substitute for the <i>n</i> th occurrence only of the BRE found within the                                       |
| 32747 |                                                     | pattern space.                                                                                                   |
| 32748 | <b>g</b>                                            | Globally substitute for all non-overlapping instances of the BRE                                                 |
| 32749 |                                                     | rather than just the first one. If both <b>g</b> and <i>n</i> are specified, the results                         |
| 32750 |                                                     | are unspecified.                                                                                                 |
| 32751 | <b>p</b>                                            | Write the pattern space to standard output if a replacement was                                                  |
| 32752 |                                                     | made.                                                                                                            |
| 32753 | <b>w</b> <i>wfile</i>                               | Write. Append the pattern space to <i>wfile</i> if a replacement was made.                                       |
| 32754 |                                                     | A conforming application shall precede the <i>wfile</i> argument with one                                        |
| 32755 |                                                     | or more <blank>s. If the <b>w</b> flag is not the last flag value given in a                                     |
| 32756 |                                                     | concatenation of multiple flag values, the results are undefined.                                                |
| 32757 | <b>[2addr]t</b> [ <i>label</i> ]                    |                                                                                                                  |
| 32758 |                                                     | Test. Branch to the : command verb bearing the <i>label</i> if any substitutions have been                       |
| 32759 |                                                     | made since the most recent reading of an input line or execution of a <b>t</b> . If <i>label</i> is              |
| 32760 |                                                     | not specified, branch to the end of the script.                                                                  |
| 32761 | <b>[2addr]w</b> <i>wfile</i>                        |                                                                                                                  |
| 32762 |                                                     | Append (write) the pattern space to <i>wfile</i> .                                                               |
| 32763 | <b>[2addr]x</b>                                     | Exchange the contents of the pattern and hold spaces.                                                            |
| 32764 | <b>[2addr]y</b> / <i>string1</i> / <i>string2</i> / |                                                                                                                  |
| 32765 |                                                     | Replace all occurrences of characters in <i>string1</i> with the corresponding characters                        |
| 32766 |                                                     | in <i>string2</i> . If a backslash followed by an 'n' appear in <i>string1</i> or <i>string2</i> , the two       |
| 32767 |                                                     | characters shall be handled as a single <newline>. If the number of characters in                                |
| 32768 |                                                     | <i>string1</i> and <i>string2</i> are not equal, or if any of the characters in <i>string1</i> appear more       |
| 32769 |                                                     | than once, the results are undefined. Any character other than backslash or                                      |
| 32770 |                                                     | <newline> can be used instead of slash to delimit the strings. If the delimiter is not                           |
| 32771 |                                                     | <i>n</i> , within <i>string1</i> and <i>string2</i> , the delimiter itself can be used as a literal character if |
| 32772 |                                                     | it is preceded by a backslash. If a backslash character is immediately followed by a                             |
| 32773 |                                                     | backslash character in <i>string1</i> or <i>string2</i> , the two backslash characters shall be                  |
| 32774 |                                                     | counted as a single literal backslash character. The meaning of a backslash                                      |
| 32775 |                                                     | followed by any character that is not 'n', a backslash, or the delimiter character is                            |
| 32776 |                                                     | undefined.                                                                                                       |
| 32777 | <b>[0addr]:label</b>                                | Do nothing. This command bears a <i>label</i> to which the <b>b</b> and <b>t</b> commands branch.                |
| 32778 | <b>[1addr]=</b>                                     | Write the following to standard output:                                                                          |
| 32779 |                                                     | "%d\n", <current line number>                                                                                    |
| 32780 | <b>[0addr]</b>                                      | Ignore this empty command.                                                                                       |

32781           **[0addr]#**     Ignore the '#' and the remainder of the line (treat them as a comment), with the  
 32782                           single exception that if the first two characters in the script are "#n", the default  
 32783                           output shall be suppressed; this shall be the equivalent of specifying **-n** on the  
 32784                           command line.

#### 32785 **EXIT STATUS**

32786           The following exit values shall be returned:

32787           0   Successful completion.

32788           >0   An error occurred.

#### 32789 **CONSEQUENCES OF ERRORS**

32790           Default.

#### 32791 **APPLICATION USAGE**

32792           Regular expressions match entire strings, not just individual lines, but a <newline> is matched  
 32793           by '\n' in a *sed* RE; a <newline> is not allowed by the general definition of regular expression in  
 32794           IEEE Std 1003.1-2001. Also note that '\n' cannot be used to match a <newline> at the end of an  
 32795           arbitrary input line; <newline>s appear in the pattern space as a result of the **N** editing  
 32796           command.

#### 32797 **EXAMPLES**

32798           This *sed* script simulates the BSD *cat -s* command, squeezing excess blank lines from standard  
 32799           input.

```
32800 sed -n '
32801 # Write non-empty lines.
32802 ./ {
32803 p
32804 d
32805 }
32806 # Write a single empty line, then look for more empty lines.
32807 /^$/ p
32808 # Get next line, discard the held <newline> (empty line),
32809 # and look for more empty lines.
32810 :Empty
32811 /^$/ {
32812 N
32813 s/./ /
32814 b Empty
32815 }
32816 # Write the non-empty line before going back to search
32817 # for the first in a set of empty lines.
32818 p
32819 '
```

#### 32820 **RATIONALE**

32821           This volume of IEEE Std 1003.1-2001 requires implementations to support at least ten distinct  
 32822           *wfiles*, matching historical practice on many implementations. Implementations are encouraged  
 32823           to support more, but conforming applications should not exceed this limit.

32824           The exit status codes specified here are different from those in System V. System V returns 2 for  
 32825           garbled *sed* commands, but returns zero with its usage message or if the input file could not be  
 32826           opened. The standard developers considered this to be a bug.

32827 The manner in which the **I** command writes non-printable characters was changed to avoid the  
 32828 historical backspace-overstrike method, and other requirements to achieve unambiguous output  
 32829 were added. See the RATIONALE for *ed* for details of the format chosen, which is the same as  
 32830 that chosen for *sed*.

32831 This volume of IEEE Std 1003.1-2001 requires implementations to provide pattern and hold  
 32832 spaces of at least 8192 bytes, larger than the 4000 bytes spaces used by some historical  
 32833 implementations, but less than the 20480 bytes limit used in an early proposal. Implementations  
 32834 are encouraged to allocate dynamically larger pattern and hold spaces as needed.

32835 The requirements for acceptance of <blank>s and <space>s in command lines has been made  
 32836 more explicit than in early proposals to describe clearly the historical practice and to remove  
 32837 confusion about the phrase “protect initial blanks [sic] and tabs from the stripping that is done  
 32838 on every script line” that appears in much of the historical documentation of the *sed* utility  
 32839 description of text. (Not all implementations are known to have stripped <blank>s from text  
 32840 lines, although they all have allowed leading <blank>s preceding the address on a command  
 32841 line.)

32842 The treatment of ‘#’ comments differs from the SVID which only allows a comment as the first  
 32843 line of the script, but matches BSD-derived implementations. The comment character is treated  
 32844 as a command, and it has the same properties in terms of being accepted with leading <blank>s;  
 32845 the BSD implementation has historically supported this.

32846 Early proposals required that a *script\_file* have at least one non-comment line. Some historical  
 32847 implementations have behaved in unexpected ways if this were not the case. The standard  
 32848 developers considered that this was incorrect behavior and that application developers should  
 32849 not have to avoid this feature. A correct implementation of this volume of IEEE Std 1003.1-2001  
 32850 shall permit *script\_files* that consist only of comment lines.

32851 Early proposals indicated that if **-e** and **-f** options were intermixed, all **-e** options were  
 32852 processed before any **-f** options. This has been changed to process them in the order presented  
 32853 because it matches historical practice and is more intuitive.

32854 The treatment of the **p** flag to the **s** command differs between System V and BSD-based systems  
 32855 when the default output is suppressed. In the two examples:

```
32856 echo a | sed 's/a/A/p'
```

```
32857 echo a | sed -n 's/a/A/p'
```

32858 this volume of IEEE Std 1003.1-2001, BSD, System V documentation, and the SVID indicate that  
 32859 the first example should write two lines with **A**, whereas the second should write one. Some  
 32860 System V systems write the **A** only once in both examples because the **p** flag is ignored if the **-n**  
 32861 option is not specified.

32862 This is a case of a diametrical difference between systems that could not be reconciled through  
 32863 the compromise of declaring the behavior to be unspecified. The SVID/BSD/System V  
 32864 documentation behavior was adopted for this volume of IEEE Std 1003.1-2001 because:

- 32865 • No known documentation for any historic system describes the interaction between the **p**  
 32866 flag and the **-n** option.
- 32867 • The selected behavior is more correct as there is no technical justification for any interaction  
 32868 between the **p** flag and the **-n** option. A relationship between **-n** and the **p** flag might imply  
 32869 that they are only used together, but this ignores valid scripts that interrupt the cyclical  
 32870 nature of the processing through the use of the **D**, **d**, **q**, or branching commands. Such scripts  
 32871 rely on the **p** suffix to write the pattern space because they do not make use of the default  
 32872 output at the “bottom” of the script.

32873       • Because the **-n** option makes the **p** flag unnecessary, any interaction would only be useful if  
 32874 *sed* scripts were written to run both with and without the **-n** option. This is believed to be  
 32875 unlikely. It is even more unlikely that programmers have coded the **p** flag expecting it to be  
 32876 unnecessary. Because the interaction was not documented, the likelihood of a programmer  
 32877 discovering the interaction and depending on it is further decreased.

32878       • Finally, scripts that break under the specified behavior produce too much output instead of  
 32879 too little, which is easier to diagnose and correct.

32880       The form of the substitute command that uses the **n** suffix was limited to the first 512 matches in  
 32881 an early proposal. This limit has been removed because there is no reason an editor processing  
 32882 lines of {LINE\_MAX} length should have this restriction. The command **s/a/A/2047** should be  
 32883 able to substitute the 2047th occurrence of **a** on a line.

32884       The **b**, **t**, and **:** commands are documented to ignore leading white space, but no mention is  
 32885 made of trailing white space. Historical implementations of *sed* assigned different locations to  
 32886 the labels '**x**' and "**x**". This is not useful, and leads to subtle programming errors, but it is  
 32887 historical practice, and changing it could theoretically break working scripts. Implementors are  
 32888 encouraged to provide warning messages about labels that are never used or jumps to labels  
 32889 that do not exist.

32890       Historically, the *sed* **!** and **}** editing commands did not permit multiple commands on a single  
 32891 line using a semicolon as a command delimiter. Implementations are permitted, but not  
 32892 required, to support this extension.

#### 32893 **FUTURE DIRECTIONS**

32894       None.

#### 32895 **SEE ALSO**

32896       *awk*, *ed*, *grep*

#### 32897 **CHANGE HISTORY**

32898       First released in Issue 2.

#### 32899 **Issue 5**

32900       The FUTURE DIRECTIONS section is added.

#### 32901 **Issue 6**

32902       The following new requirements on POSIX implementations derive from alignment with the  
 32903 Single UNIX Specification:

32904       • Implementations are required to support at least ten *wfile* arguments in an editing command.

32905       The EXTENDED DESCRIPTION is changed to align with the IEEE P1003.2b draft standard.

32906       IEEE PASC Interpretation 1003.2 #190 is applied.

32907       IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the meaning of the backslash escape  
 32908 sequences in a replacement string for a BRE.

32909 **NAME**

32910 sh — shell, the standard command language interpreter

32911 **SYNOPSIS**32912 sh [-abCefhimnuvx] [-o *option*] [+abCefhimnuvx] [+o *option*]  
32913 [*command\_file* [*argument...*]]32914 sh -c [-abCefhimnuvx] [-o *option*] [+abCefhimnuvx] [+o *option*] *command\_string*  
32915 [*command\_name* [*argument...*]]32916 sh -s [-abCefhimnuvx] [-o *option*] [+abCefhimnuvx] [+o *option*] [*argument*]32917 **DESCRIPTION**32918 The *sh* utility is a command language interpreter that shall execute commands read from a  
32919 command line string, the standard input, or a specified file. The application shall ensure that the  
32920 commands to be executed are expressed in the language described in Chapter 2 (on page 29).

32921 Pathname expansion shall not fail due to the size of a file.

32922 Shell input and output redirections have an implementation-defined offset maximum that is  
32923 established in the open file description.32924 **OPTIONS**32925 The *sh* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
32926 Utility Syntax Guidelines, with an extension for support of a leading plus sign ('+') as noted  
32927 below.32928 The **-a**, **-b**, **-C**, **-e**, **-f**, **-m**, **-n**, **-o option**, **-u**, **-v**, and **-x** options are described as part of the *set*  
32929 utility in Section 2.14 (on page 64). The option letters derived from the *set* special built-in shall  
32930 also be accepted with a leading plus sign ('+') instead of a leading hyphen (meaning the reverse  
32931 case of the option as described in this volume of IEEE Std 1003.1-2001).

32932 The following additional options shall be supported:

32933 **-c** Read commands from the *command\_string* operand. Set the value of special  
32934 parameter 0 (see Section 2.5.2 (on page 34)) from the value of the *command\_name*  
32935 operand and the positional parameters (\$1, \$2, and so on) in sequence from the  
32936 remaining *argument* operands. No commands shall be read from the standard  
32937 input.32938 **-i** Specify that the shell is *interactive*; see below. An implementation may treat  
32939 specifying the **-i** option as an error if the real user ID of the calling process does  
32940 not equal the effective user ID or if the real group ID does not equal the effective  
32941 group ID.32942 **-s** Read commands from the standard input.32943 If there are no operands and the **-c** option is not specified, the **-s** option shall be assumed.32944 If the **-i** option is present, or if there are no operands and the shell's standard input and standard  
32945 error are attached to a terminal, the shell is considered to be *interactive*.32946 **OPERANDS**

32947 The following operands shall be supported:

32948 **-** A single hyphen shall be treated as the first operand and then ignored. If both '-'  
32949 and "--" are given as arguments, or if other operands precede the single hyphen,  
32950 the results are undefined.32951 *argument* The positional parameters (\$1, \$2, and so on) shall be set to *arguments*, if any.

32952 *command\_file* The pathname of a file containing commands. If the pathname contains one or  
 32953 more slash characters, the implementation attempts to read that file; the file need  
 32954 not be executable. If the pathname does not contain a slash character:

32955       • The implementation shall attempt to read that file from the current working  
 32956 directory; the file need not be executable.

32957       • If the file is not in the current working directory, the implementation may  
 32958 perform a search for an executable file using the value of *PATH*, as described in  
 32959 Section 2.9.1.1 (on page 48).

32960 Special parameter 0 (see Section 2.5.2 (on page 34)) shall be set to the value of  
 32961 *command\_file*. If *sh* is called using a synopsis form that omits *command\_file*, special  
 32962 parameter 0 shall be set to the value of the first argument passed to *sh* from its  
 32963 parent (for example, *argv*[0] for a C program), which is normally a pathname used  
 32964 to execute the *sh* utility.

32965 *command\_name*  
 32966 A string assigned to special parameter 0 when executing the commands in  
 32967 *command\_string*. If *command\_name* is not specified, special parameter 0 shall be set  
 32968 to the value of the first argument passed to *sh* from its parent (for example, *argv*[0]  
 32969 for a C program), which is normally a pathname used to execute the *sh* utility.

32970 *command\_string*  
 32971 A string that shall be interpreted by the shell as one or more commands, as if the  
 32972 string were the argument to the *system()* function defined in the System Interfaces  
 32973 volume of IEEE Std 1003.1-2001. If the *command\_string* operand is an empty string,  
 32974 *sh* shall exit with a zero exit status.

## 32975 **STDIN**

32976 The standard input shall be used only if one of the following is true:

- 32977       • The *-s* option is specified.
- 32978       • The *-c* option is not specified and no operands are specified.
- 32979       • The script executes one or more commands that require input from standard input (such as a  
 32980 *read* command that does not redirect its input).

32981 See the INPUT FILES section.

32982 When the shell is using standard input and it invokes a command that also uses standard input,  
 32983 the shell shall ensure that the standard input file pointer points directly after the command it has  
 32984 read when the command begins execution. It shall not read ahead in such a manner that any  
 32985 characters intended to be read by the invoked command are consumed by the shell (whether  
 32986 interpreted by the shell or not) or that characters that are not read by the invoked command are  
 32987 not seen by the shell. When the command expecting to read standard input is started  
 32988 asynchronously by an interactive shell, it is unspecified whether characters are read by the  
 32989 command or interpreted by the shell.

32990 If the standard input to *sh* is a FIFO or terminal device and is set to non-blocking reads, then *sh*  
 32991 shall enable blocking reads on standard input. This shall remain in effect when the command  
 32992 completes.

## 32993 **INPUT FILES**

32994 The input file shall be a text file, except that line lengths shall be unlimited. If the input file is  
 32995 empty or consists solely of blank lines or comments, or both, *sh* shall exit with a zero exit status.

32996 **ENVIRONMENT VARIABLES**32997 The following environment variables shall affect the execution of *sh*:

- 32998       *ENV*           This variable, when and only when an interactive shell is invoked, shall be  
32999                   subjected to parameter expansion (see Section 2.6.2 (on page 37)) by the shell, and  
33000                   the resulting value shall be used as a pathname of a file containing shell  
33001                   commands to execute in the current environment. The file need not be executable.  
33002                   If the expanded value of *ENV* is not an absolute pathname, the results are  
33003                   unspecified. *ENV* shall be ignored if the real and effective user IDs or real and  
33004                   effective group IDs of the process are different.
- 33005       *FCEDIT*       This variable, when expanded by the shell, shall determine the default value for  
33006                   the **-e** *editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
33007                   used as the editor. This volume of IEEE Std 1003.1-2001 specifies the effects of this  
33008                   variable only for systems supporting the User Portability Utilities option.
- 33009       *HISTFILE*      Determine a pathname naming a command history file. If the *HISTFILE* variable is  
33010                   not set, the shell may attempt to access or create a file **.sh\_history** in the directory  
33011                   referred to by the *HOME* environment variable. If the shell cannot obtain both read  
33012                   and write access to, or create, the history file, it shall use an unspecified  
33013                   mechanism that allows the history to operate properly. (References to history  
33014                   “file” in this section shall be understood to mean this unspecified mechanism in  
33015                   such cases.) An implementation may choose to access this variable only when  
33016                   initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
33017                   to retrieve entries from, or add entries to, the file, as the result of commands issued  
33018                   by the user, the file named by the *ENV* variable, or implementation-defined system  
33019                   start-up files. Implementations may choose to disable the history list mechanism  
33020                   for users with appropriate privileges who do not set *HISTFILE*; the specific  
33021                   circumstances under which this occurs are implementation-defined. If more than  
33022                   one instance of the shell is using the same history file, it is unspecified how  
33023                   updates to the history file from those shells interact. As entries are deleted from  
33024                   the history file, they shall be deleted oldest first. It is unspecified when history file  
33025                   entries are physically removed from the history file. This volume of  
33026                   IEEE Std 1003.1-2001 specifies the effects of this variable only for systems  
33027                   supporting the User Portability Utilities option.
- 33028       *HISTSIZE*      Determine a decimal number representing the limit to the number of previous  
33029                   commands that are accessible. If this variable is unset, an unspecified default  
33030                   greater than or equal to 128 shall be used. The maximum number of commands in  
33031                   the history list is unspecified, but shall be at least 128. An implementation may  
33032                   choose to access this variable only when initializing the history file, as described  
33033                   under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
33034                   after the history file has been initialized are effective.
- 33035       *HOME*          Determine the pathname of the user's home directory. The contents of *HOME* are  
33036                   used in tilde expansion as described in Section 2.6.1 (on page 37). This volume of  
33037                   IEEE Std 1003.1-2001 specifies the effects of this variable only for systems  
33038                   supporting the User Portability Utilities option.
- 33039       *IFS*           (Input Field Separators.) A string treated as a list of characters that shall be used  
33040                   for field splitting and to split lines into words with the *read* command. See Section  
33041                   2.6.5 (on page 42). If *IFS* is not set, the shell shall behave as if the value of *IFS* were  
33042                   <space>, <tab>, and <newline>. Implementations may ignore the value of *IFS* in  
33043                   the environment at the time *sh* is invoked, treating *IFS* as if it were not set.

|       |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 33059 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 33060 | <i>MAIL</i>        | Determine a pathname of the user's mailbox file for purposes of incoming mail notification. If this variable is set, the shell shall inform the user if the file named by the variable is created or if its modification time has changed. Informing the user shall be accomplished by writing a string of unspecified format to standard error prior to the writing of the next primary prompt string. Such check shall be performed only after the completion of the interval defined by the <i>MAILCHECK</i> variable after the last such check. The user shall be informed only if <i>MAIL</i> is set and <i>MAILPATH</i> is not set. This volume of IEEE Std 1003.1-2001 specifies the effects of this variable only for systems supporting the User Portability Utilities option. |

| 33070 |                    | Establish a decimal integer value that specifies how often (in seconds) the shell shall check for the arrival of mail in the files specified by the <i>MAILPATH</i> or <i>MAIL</i> variables. The default value shall be 600 seconds. If set to zero, the shell shall check before issuing each primary prompt. This volume of IEEE Std 1003.1-2001 specifies the effects of this variable only for systems supporting the User Portability Utilities option.                                                                                                                                                                                                                                                                                                                           |
| 33071 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| 33075 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 33076 | <i>MAILPATH</i>    | Provide a list of pathnames and optional messages separated by colons. If this variable is set, the shell shall inform the user if any of the files named by the variable are created or if any of their modification times change. (See the preceding entry for <i>MAIL</i> for descriptions of mail arrival and user informing.) Each pathname can be followed by ' <i>%</i> ' and a string that shall be subjected to parameter expansion and written to standard error when the modification time changes. If a ' <i>%</i> ' character in the pathname is preceded by a backslash, it shall be treated as a literal ' <i>%</i> ' in the pathname. The default message is unspecified.                                                                                               |

| 33084 |                    | The <i>MAILPATH</i> environment variable takes precedence over the <i>MAIL</i> variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 33085 |                    | This volume of IEEE Std 1003.1-2001 specifies the effects of this variable only for systems supporting the User Portability Utilities option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 33086 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 33087 | <i>NLSPATH</i>     | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 33088 | <i>PATH</i>        | Establish a string formatted as described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables, used to effect command interpretation; see Section 2.9.1.1 (on page 48).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 33089 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 33090 |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

33091        *PWD*        This variable shall represent an absolute pathname of the current working  
33092        directory. Assignments to this variable may be ignored unless the value is an  
33093        absolute pathname of the current working directory and there are no filename  
33094        components of dot or dot-dot.

### 33095 **ASYNCHRONOUS EVENTS**

33096        Default.

### 33097 **STDOUT**

33098        See the STDERR section.

### 33099 **STDERR**

33100        Except as otherwise stated (by the descriptions of any invoked utilities or in interactive mode),  
33101        standard error shall be used only for diagnostic messages.

### 33102 **OUTPUT FILES**

33103        None.

### 33104 **EXTENDED DESCRIPTION**

33105        See Chapter 2. The following additional capabilities are supported on systems supporting the  
33106        User Portability Utilities option.

#### 33107        **Command History List**

33108        When the *sh* utility is being used interactively, it shall maintain a list of commands previously  
33109        entered from the terminal in the file named by the *HISTFILE* environment variable. The type,  
33110        size, and internal format of this file are unspecified. Multiple *sh* processes can share access to the  
33111        file for a user, if file access permissions allow this; see the description of the *HISTFILE*  
33112        environment variable.

#### 33113        **Command Line Editing**

33114        When *sh* is being used interactively from a terminal, the current command and the command  
33115        history (see *fc*) can be edited using *vi*-mode command line editing. This mode uses commands,  
33116        described below, similar to a subset of those described in the *vi* utility. Implementations may  
33117        offer other command line editing modes corresponding to other editing utilities.

33118        The command *set -o vi* shall enable *vi*-mode editing and place *sh* into *vi* insert mode (see  
33119        **Command Line Editing (vi-mode)** (on page 855)). This command also shall disable any other  
33120        editing mode that the implementation may provide. The command *set +o vi* disables *vi*-mode  
33121        editing.

33122        Certain block-mode terminals may be unable to support shell command line editing. If a  
33123        terminal is unable to provide either edit mode, it need not be possible to *set -o vi* when using the  
33124        shell on this terminal.

33125        In the following sections, the characters *erase*, *interrupt*, *kill*, and *end-of-file* are those set by the  
33126        *stty* utility.

## 33127 **Command Line Editing (vi-mode)**

33128 In *vi* editing mode, there shall be a distinguished line, the edit line. All the editing operations  
33129 which modify a line affect the edit line. The edit line is always the newest line in the command  
33130 history buffer.

33131 With *vi*-mode enabled, *sh* can be switched between insert mode and command mode.

33132 When in insert mode, an entered character shall be inserted into the command line, except as  
33133 noted in **vi Line Editing Insert Mode**. Upon entering *sh* and after termination of the previous  
33134 command, *sh* shall be in insert mode.

33135 Typing an escape character shall switch *sh* into command mode (see **vi Line Editing Command**  
33136 **Mode** (on page 856)). In command mode, an entered character shall either invoke a defined  
33137 operation, be used as part of a multi-character operation, or be treated as an error. A character  
33138 that is not recognized as part of an editing command shall terminate any specific editing  
33139 command and shall alert the terminal. Typing the *interrupt* character in command mode shall  
33140 cause *sh* to terminate command line editing on the current command line, reissue the prompt on  
33141 the next line of the terminal, and reset the command history (see *fc*) so that the most recently  
33142 executed command is the previous command (that is, the command that was being edited when  
33143 it was interrupted is not reentered into the history).

33144 In the following sections, the phrase “move the cursor to the beginning of the word” shall mean  
33145 “move the cursor to the first character of the current word” and the phrase “move the cursor to  
33146 the end of the word” shall mean “move the cursor to the last character of the current word”. The  
33147 phrase “beginning of the command line” indicates the point between the end of the prompt  
33148 string issued by the shell (or the beginning of the terminal line, if there is no prompt string) and  
33149 the first character of the command text.

## 33150 **vi Line Editing Insert Mode**

33151 While in insert mode, any character typed shall be inserted in the current command line, unless  
33152 it is from the following set.

33153 <newline> Execute the current command line. If the current command line is not empty, this  
33154 line shall be entered into the command history (see *fc*).

33155 *erase* Delete the character previous to the current cursor position and move the current  
33156 cursor position back one character. In insert mode, characters shall be erased from  
33157 both the screen and the buffer when backspacing.

33158 *interrupt* Terminate command line editing with the same effects as described for  
33159 interrupting command mode; see **Command Line Editing (vi-mode)**.

33160 *kill* Clear all the characters from the input line.

33161 <control>-V Insert the next character input, even if the character is otherwise a special insert  
33162 mode character.

33163 <control>-W Delete the characters from the one preceding the cursor to the preceding word  
33164 boundary. The word boundary in this case is the closer to the cursor of either the  
33165 beginning of the line or a character that is in neither the **blank** nor **punct** character  
33166 classification of the current locale.

33167 *end-of-file* Interpreted as the end of input in *sh*. This interpretation shall occur only at the  
33168 beginning of an input line. If *end-of-file* is entered other than at the beginning of the  
33169 line, the results are unspecified.

33170 <ESC> Place *sh* into command mode.

### 33171 **vi Line Editing Command Mode**

33172 In command mode for the command line editing feature, decimal digits not beginning with 0  
33173 that precede a command letter shall be remembered. Some commands use these decimal digits  
33174 as a count number that affects the operation.

33175 The term *motion command* represents one of the commands:

33176 <space> 0 b F l W ^ \$ ; E f T w | , B e h t

33177 If the current line is not the edit line, any command that modifies the current line shall cause the  
33178 content of the current line to replace the content of the edit line, and the current line shall  
33179 become the edit line. This replacement cannot be undone (see the **u** and **U** commands below).  
33180 The modification requested shall then be performed to the edit line. When the current line is the  
33181 edit line, the modification shall be done directly to the edit line.

33182 Any command that is preceded by *count* shall take a count (the numeric value of any preceding  
33183 decimal digits). Unless otherwise noted, this count shall cause the specified operation to repeat  
33184 by the number of times specified by the count. Also unless otherwise noted, a *count* that is out of  
33185 range is considered an error condition and shall alert the terminal, but neither the cursor  
33186 position, nor the command line, shall change.

33187 The terms *word* and *bigword* are used as defined in the *vi* description. The term *save buffer*  
33188 corresponds to the term *unnamed buffer* in *vi*.

33189 The following commands shall be recognized in command mode:

33190 <newline> Execute the current command line. If the current command line is not empty, this  
33191 line shall be entered into the command history (see *fc*).

33192 <control>-L Redraw the current command line. Position the cursor at the same location on the  
33193 redrawn line.

33194 **#** Insert the character '**#**' at the beginning of the current command line and treat the  
33195 resulting edit line as a comment. This line shall be entered into the command  
33196 history; see *fc*.

33197 **=** Display the possible shell word expansions (see Section 2.6 (on page 36)) of the  
33198 bigword at the current command line position.

33199 **Note:** This does not modify the content of the current line, and therefore does not  
33200 cause the current line to become the edit line.

33201 These expansions shall be displayed on subsequent terminal lines. If the bigword  
33202 contains none of the characters '?', '\*', or '[', an asterisk ('\*') shall be  
33203 implicitly assumed at the end. If any directories are matched, these expansions  
33204 shall have a '/' character appended. After the expansion, the line shall be  
33205 redrawn, the cursor repositioned at the current cursor position, and *sh* shall be  
33206 placed in command mode.

33207 **\** Perform pathname expansion (see Section 2.6.6 (on page 42)) on the current  
33208 bigword, up to the largest set of characters that can be matched uniquely. If the  
33209 bigword contains none of the characters '?', '\*', or '[', an asterisk ('\*') shall  
33210 be implicitly assumed at the end. This maximal expansion then shall replace the  
33211 original bigword in the command line, and the cursor shall be placed after this  
33212 expansion. If the resulting bigword completely and uniquely matches a directory, a  
33213 '/' character shall be inserted directly after the bigword. If some other file is  
33214 completely matched, a single <space> shall be inserted after the bigword. After

|       |                             |                                                                                                        |
|-------|-----------------------------|--------------------------------------------------------------------------------------------------------|
| 33215 |                             | this operation, <i>sh</i> shall be placed in insert mode.                                              |
| 33216 | <b>*</b>                    | Perform pathname expansion on the current bigword and insert all expansions                            |
| 33217 |                             | into the command to replace the current bigword, with each expansion separated                         |
| 33218 |                             | by a single <space>. If at the end of the line, the current cursor position shall be                   |
| 33219 |                             | moved to the first column position following the expansions and <i>sh</i> shall be placed              |
| 33220 |                             | in insert mode. Otherwise, the current cursor position shall be the last column                        |
| 33221 |                             | position of the first character after the expansions and <i>sh</i> shall be placed in insert           |
| 33222 |                             | mode. If the current bigword contains none of the characters '?', '*', or '[',                         |
| 33223 |                             | before the operation, an asterisk shall be implicitly assumed at the end.                              |
| 33224 | <b>@letter</b>              | Insert the value of the alias named <i>_letter</i> . The symbol <i>letter</i> represents a single      |
| 33225 |                             | alphabetic character from the portable character set; implementations may support                      |
| 33226 |                             | additional characters as an extension. If the alias <i>_letter</i> contains other editing              |
| 33227 |                             | commands, these commands shall be performed as part of the insertion. If no alias                      |
| 33228 |                             | <i>_letter</i> is enabled, this command shall have no effect.                                          |
| 33229 | <b>[count]~</b>             | Convert, if the current character is a lowercase letter, to the equivalent uppercase                   |
| 33230 |                             | letter and <i>vice versa</i> , as prescribed by the current locale. The current cursor position        |
| 33231 |                             | then shall be advanced by one character. If the cursor was positioned on the last                      |
| 33232 |                             | character of the line, the case conversion shall occur, but the cursor shall not                       |
| 33233 |                             | advance. If the '~' command is preceded by a <i>count</i> , that number of characters                  |
| 33234 |                             | shall be converted, and the cursor shall be advanced to the character position after                   |
| 33235 |                             | the last character converted. If the <i>count</i> is larger than the number of characters              |
| 33236 |                             | after the cursor, this shall not be considered an error; the cursor shall advance to                   |
| 33237 |                             | the last character on the line.                                                                        |
| 33238 | <b>[count].</b>             | Repeat the most recent non-motion command, even if it was executed on an earlier                       |
| 33239 |                             | command line. If the previous command was preceded by a <i>count</i> , and no count is                 |
| 33240 |                             | given on the '.' command, the count from the previous command shall be                                 |
| 33241 |                             | included as part of the repeated command. If the '.' command is preceded by a                          |
| 33242 |                             | <i>count</i> , this shall override any <i>count</i> argument to the previous command. The <i>count</i> |
| 33243 |                             | specified in the '.' command shall become the count for subsequent '.'                                 |
| 33244 |                             | commands issued without a count.                                                                       |
| 33245 | <b>[number]v</b>            | Invoke the <i>vi</i> editor to edit the current command line in a temporary file. When the             |
| 33246 |                             | editor exits, the commands in the temporary file shall be executed and placed in                       |
| 33247 |                             | the command history. If a <i>number</i> is included, it specifies the command number in                |
| 33248 |                             | the command history to be edited, rather than the current command line.                                |
| 33249 | <b>[count]l</b> (ell)       |                                                                                                        |
| 33250 | <b>[count]&lt;space&gt;</b> |                                                                                                        |
| 33251 |                             | Move the current cursor position to the next character position. If the cursor was                     |
| 33252 |                             | positioned on the last character of the line, the terminal shall be alerted and the                    |
| 33253 |                             | cursor shall not be advanced. If the <i>count</i> is larger than the number of characters              |
| 33254 |                             | after the cursor, this shall not be considered an error; the cursor shall advance to                   |
| 33255 |                             | the last character on the line.                                                                        |
| 33256 | <b>[count]h</b>             | Move the current cursor position to the <i>count</i> th (default 1) previous character                 |
| 33257 |                             | position. If the cursor was positioned on the first character of the line, the terminal                |
| 33258 |                             | shall be alerted and the cursor shall not be moved. If the count is larger than the                    |
| 33259 |                             | number of characters before the cursor, this shall not be considered an error; the                     |
| 33260 |                             | cursor shall move to the first character on the line.                                                  |
| 33261 | <b>[count]w</b>             | Move to the start of the next word. If the cursor was positioned on the last                           |
| 33262 |                             | character of the line, the terminal shall be alerted and the cursor shall not be                       |

|       |                  |                                                                                               |
|-------|------------------|-----------------------------------------------------------------------------------------------|
| 33263 |                  | advanced. If the <i>count</i> is larger than the number of words after the cursor, this shall |
| 33264 |                  | not be considered an error; the cursor shall advance to the last character on the             |
| 33265 |                  | line.                                                                                         |
| 33266 | <b>[count]W</b>  | Move to the start of the next bigword. If the cursor was positioned on the last               |
| 33267 |                  | character of the line, the terminal shall be alerted and the cursor shall not be              |
| 33268 |                  | advanced. If the <i>count</i> is larger than the number of bigwords after the cursor, this    |
| 33269 |                  | shall not be considered an error; the cursor shall advance to the last character on           |
| 33270 |                  | the line.                                                                                     |
| 33271 | <b>[count]e</b>  | Move to the end of the current word. If at the end of a word, move to the end of the          |
| 33272 |                  | next word. If the cursor was positioned on the last character of the line, the                |
| 33273 |                  | terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> is larger |
| 33274 |                  | than the number of words after the cursor, this shall not be considered an error; the         |
| 33275 |                  | cursor shall advance to the last character on the line.                                       |
| 33276 | <b>[count]E</b>  | Move to the end of the current bigword. If at the end of a bigword, move to the               |
| 33277 |                  | end of the next bigword. If the cursor was positioned on the last character of the            |
| 33278 |                  | line, the terminal shall be alerted and the cursor shall not be advanced. If the <i>count</i> |
| 33279 |                  | is larger than the number of bigwords after the cursor, this shall not be considered          |
| 33280 |                  | an error; the cursor shall advance to the last character on the line.                         |
| 33281 | <b>[count]b</b>  | Move to the beginning of the current word. If at the beginning of a word, move to             |
| 33282 |                  | the beginning of the previous word. If the cursor was positioned on the first                 |
| 33283 |                  | character of the line, the terminal shall be alerted and the cursor shall not be              |
| 33284 |                  | moved. If the <i>count</i> is larger than the number of words preceding the cursor, this      |
| 33285 |                  | shall not be considered an error; the cursor shall return to the first character on the       |
| 33286 |                  | line.                                                                                         |
| 33287 | <b>[count]B</b>  | Move to the beginning of the current bigword. If at the beginning of a bigword,               |
| 33288 |                  | move to the beginning of the previous bigword. If the cursor was positioned on the            |
| 33289 |                  | first character of the line, the terminal shall be alerted and the cursor shall not be        |
| 33290 |                  | moved. If the <i>count</i> is larger than the number of bigwords preceding the cursor,        |
| 33291 |                  | this shall not be considered an error; the cursor shall return to the first character on      |
| 33292 |                  | the line.                                                                                     |
| 33293 | <b>^</b>         | Move the current cursor position to the first character on the input line that is not a       |
| 33294 |                  | <blank>.                                                                                      |
| 33295 | <b>\$</b>        | Move to the last character position on the current command line.                              |
| 33296 | <b>0</b>         | (Zero.) Move to the first character position on the current command line.                     |
| 33297 | <b>[count]  </b> | Move to the <i>count</i> th character position on the current command line. If no number      |
| 33298 |                  | is specified, move to the first position. The first character position shall be               |
| 33299 |                  | numbered 1. If the count is larger than the number of characters on the line, this            |
| 33300 |                  | shall not be considered an error; the cursor shall be placed on the last character on         |
| 33301 |                  | the line.                                                                                     |
| 33302 | <b>[count]fc</b> | Move to the first occurrence of the character 'c' that occurs after the current               |
| 33303 |                  | cursor position. If the cursor was positioned on the last character of the line, the          |
| 33304 |                  | terminal shall be alerted and the cursor shall not be advanced. If the character 'c'          |
| 33305 |                  | does not occur in the line after the current cursor position, the terminal shall be           |
| 33306 |                  | alerted and the cursor shall not be moved.                                                    |
| 33307 | <b>[count]Fc</b> | Move to the first occurrence of the character 'c' that occurs before the current              |
| 33308 |                  | cursor position. If the cursor was positioned on the first character of the line, the         |
| 33309 |                  | terminal shall be alerted and the cursor shall not be moved. If the character 'c'             |

|       |                       |                                                                                                          |
|-------|-----------------------|----------------------------------------------------------------------------------------------------------|
| 33310 |                       | does not occur in the line before the current cursor position, the terminal shall be                     |
| 33311 |                       | alerted and the cursor shall not be moved.                                                               |
| 33312 | <b>[count]tc</b>      | Move to the character before the first occurrence of the character 'c' that occurs                       |
| 33313 |                       | after the current cursor position. If the cursor was positioned on the last character                    |
| 33314 |                       | of the line, the terminal shall be alerted and the cursor shall not be advanced. If the                  |
| 33315 |                       | character 'c' does not occur in the line after the current cursor position, the                          |
| 33316 |                       | terminal shall be alerted and the cursor shall not be moved.                                             |
| 33317 | <b>[count]Tc</b>      | Move to the character after the first occurrence of the character 'c' that occurs                        |
| 33318 |                       | before the current cursor position. If the cursor was positioned on the first                            |
| 33319 |                       | character of the line, the terminal shall be alerted and the cursor shall not be                         |
| 33320 |                       | moved. If the character 'c' does not occur in the line before the current cursor                         |
| 33321 |                       | position, the terminal shall be alerted and the cursor shall not be moved.                               |
| 33322 | <b>[count];</b>       | Repeat the most recent <b>f</b> , <b>F</b> , <b>t</b> , or <b>T</b> command. Any number argument on that |
| 33323 |                       | previous command shall be ignored. Errors are those described for the repeated                           |
| 33324 |                       | command.                                                                                                 |
| 33325 | <b>[count],</b>       | Repeat the most recent <b>f</b> , <b>F</b> , <b>t</b> , or <b>T</b> command. Any number argument on that |
| 33326 |                       | previous command shall be ignored. However, reverse the direction of that                                |
| 33327 |                       | command.                                                                                                 |
| 33328 | <b>a</b>              | Enter insert mode after the current cursor position. Characters that are entered                         |
| 33329 |                       | shall be inserted before the next character.                                                             |
| 33330 | <b>A</b>              | Enter insert mode after the end of the current command line.                                             |
| 33331 | <b>i</b>              | Enter insert mode at the current cursor position. Characters that are entered shall                      |
| 33332 |                       | be inserted before the current character.                                                                |
| 33333 | <b>I</b>              | Enter insert mode at the beginning of the current command line.                                          |
| 33334 | <b>R</b>              | Enter insert mode, replacing characters from the command line beginning at the                           |
| 33335 |                       | current cursor position.                                                                                 |
| 33336 | <b>[count]cmotion</b> |                                                                                                          |
| 33337 |                       | Delete the characters between the current cursor position and the cursor position                        |
| 33338 |                       | that would result from the specified motion command. Then enter insert mode                              |
| 33339 |                       | before the first character following any deleted characters. If <i>count</i> is specified, it            |
| 33340 |                       | shall be applied to the motion command. A <i>count</i> shall be ignored for the following                |
| 33341 |                       | motion commands:                                                                                         |
| 33342 |                       | 0      ^      \$      c                                                                                  |
| 33343 |                       | If the motion command is the character 'c', the current command line shall be                            |
| 33344 |                       | cleared and insert mode shall be entered. If the motion command would move the                           |
| 33345 |                       | current cursor position toward the beginning of the command line, the character                          |
| 33346 |                       | under the current cursor position shall not be deleted. If the motion command                            |
| 33347 |                       | would move the current cursor position toward the end of the command line, the                           |
| 33348 |                       | character under the current cursor position shall be deleted. If the <i>count</i> is larger              |
| 33349 |                       | than the number of characters between the current cursor position and the end of                         |
| 33350 |                       | the command line toward which the motion command would move the cursor,                                  |
| 33351 |                       | this shall not be considered an error; all of the remaining characters in the                            |
| 33352 |                       | mentioned range shall be deleted and insert mode shall be entered. If the                                |
| 33353 |                       | motion command is invalid, the terminal shall be alerted, the cursor shall not be                        |
| 33354 |                       | moved, and no text shall be deleted.                                                                     |

|       |                       |                                                                                              |
|-------|-----------------------|----------------------------------------------------------------------------------------------|
| 33355 | <b>C</b>              | Delete from the current character to the end of the line and enter insert mode at the        |
| 33356 |                       | new end-of-line.                                                                             |
| 33357 | <b>S</b>              | Clear the entire edit line and enter insert mode.                                            |
| 33358 | <b>[count]rc</b>      | Replace the current character with the character 'c'. With a number <i>count</i> ,           |
| 33359 |                       | replace the current and the following <i>count</i> −1 characters. After this command, the    |
| 33360 |                       | current cursor position shall be on the last character that was changed. If the <i>count</i> |
| 33361 |                       | is larger than the number of characters after the cursor, this shall not be considered       |
| 33362 |                       | an error; all of the remaining characters shall be changed.                                  |
| 33363 | <b>[count]_</b>       | Append a <space> after the current character position and then append the last               |
| 33364 |                       | bigword in the previous input line after the <space>. Then enter insert mode after           |
| 33365 |                       | the last character just appended. With a number <i>count</i> , append the <i>count</i> th    |
| 33366 |                       | bigword in the previous line.                                                                |
| 33367 | <b>[count]x</b>       | Delete the character at the current cursor position and place the deleted characters         |
| 33368 |                       | in the save buffer. If the cursor was positioned on the last character of the line, the      |
| 33369 |                       | character shall be deleted and the cursor position shall be moved to the previous            |
| 33370 |                       | character (the new last character). If the <i>count</i> is larger than the number of         |
| 33371 |                       | characters after the cursor, this shall not be considered an error; all the characters       |
| 33372 |                       | from the cursor to the end of the line shall be deleted.                                     |
| 33373 | <b>[count]X</b>       | Delete the character before the current cursor position and place the deleted                |
| 33374 |                       | characters in the save buffer. The character under the current cursor position shall         |
| 33375 |                       | not change. If the cursor was positioned on the first character of the line, the             |
| 33376 |                       | terminal shall be alerted, and the <b>X</b> command shall have no effect. If the line        |
| 33377 |                       | contained a single character, the <b>X</b> command shall have no effect. If the line         |
| 33378 |                       | contained no characters, the terminal shall be alerted and the cursor shall not be           |
| 33379 |                       | moved. If the <i>count</i> is larger than the number of characters before the cursor, this   |
| 33380 |                       | shall not be considered an error; all the characters from before the cursor to the           |
| 33381 |                       | beginning of the line shall be deleted.                                                      |
| 33382 | <b>[count]dmotion</b> |                                                                                              |
| 33383 |                       | Delete the characters between the current cursor position and the character                  |
| 33384 |                       | position that would result from the motion command. A number <i>count</i> repeats the        |
| 33385 |                       | motion command <i>count</i> times. If the motion command would move toward the               |
| 33386 |                       | beginning of the command line, the character under the current cursor position               |
| 33387 |                       | shall not be deleted. If the motion command is <b>d</b> , the entire current command line    |
| 33388 |                       | shall be cleared. If the <i>count</i> is larger than the number of characters between the    |
| 33389 |                       | current cursor position and the end of the command line toward which the motion              |
| 33390 |                       | command would move the cursor, this shall not be considered an error; all of the             |
| 33391 |                       | remaining characters in the aforementioned range shall be deleted. The deleted               |
| 33392 |                       | characters shall be placed in the save buffer.                                               |
| 33393 | <b>D</b>              | Delete all characters from the current cursor position to the end of the line. The           |
| 33394 |                       | deleted characters shall be placed in the save buffer.                                       |
| 33395 | <b>[count]ymotion</b> |                                                                                              |
| 33396 |                       | Yank (that is, copy) the characters from the current cursor position to the position         |
| 33397 |                       | resulting from the motion command into the save buffer. A number <i>count</i> shall be       |
| 33398 |                       | applied to the motion command. If the motion command would move toward the                   |
| 33399 |                       | beginning of the command line, the character under the current cursor position               |
| 33400 |                       | shall not be included in the set of yanked characters. If the motion command is <b>y</b> ,   |
| 33401 |                       | the entire current command line shall be yanked into the save buffer. The current            |
| 33402 |                       | cursor position shall be unchanged. If the <i>count</i> is larger than the number of         |

|       |                                |                                                                                                             |
|-------|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| 33403 |                                | characters between the current cursor position and the end of the command line                              |
| 33404 |                                | toward which the motion command would move the cursor, this shall not be                                    |
| 33405 |                                | considered an error; all of the remaining characters in the aforementioned range                            |
| 33406 |                                | shall be yanked.                                                                                            |
| 33407 | <b>Y</b>                       | Yank the characters from the current cursor position to the end of the line into the                        |
| 33408 |                                | save buffer. The current character position shall be unchanged.                                             |
| 33409 | <b>[count]p</b>                | Put a copy of the current contents of the save buffer after the current cursor                              |
| 33410 |                                | position. The current cursor position shall be advanced to the last character put                           |
| 33411 |                                | from the save buffer. A <i>count</i> shall indicate how many copies of the save buffer                      |
| 33412 |                                | shall be put.                                                                                               |
| 33413 | <b>[count]P</b>                | Put a copy of the current contents of the save buffer before the current cursor                             |
| 33414 |                                | position. The current cursor position shall be moved to the last character put from                         |
| 33415 |                                | the save buffer. A <i>count</i> shall indicate how many copies of the save buffer shall be                  |
| 33416 |                                | put.                                                                                                        |
| 33417 | <b>u</b>                       | Undo the last command that changed the edit line. This operation shall not undo                             |
| 33418 |                                | the copy of any command line to the edit line.                                                              |
| 33419 | <b>U</b>                       | Undo all changes made to the edit line. This operation shall not undo the copy of                           |
| 33420 |                                | any command line to the edit line.                                                                          |
| 33421 | <b>[count]k</b>                |                                                                                                             |
| 33422 | <b>[count]–</b>                | Set the current command line to be the <i>count</i> th previous command line in the shell                   |
| 33423 |                                | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be               |
| 33424 |                                | positioned on the first character of the new command. If a <b>k</b> or <b>–</b> command would               |
| 33425 |                                | retreat past the maximum number of commands in effect for this shell (affected by                           |
| 33426 |                                | the <i>HISTSIZE</i> environment variable), the terminal shall be alerted, and the                           |
| 33427 |                                | command shall have no effect.                                                                               |
| 33428 | <b>[count]j</b>                |                                                                                                             |
| 33429 | <b>[count]+</b>                | Set the current command line to be the <i>count</i> th next command line in the shell                       |
| 33430 |                                | command history. If <i>count</i> is not specified, it shall default to 1. The cursor shall be               |
| 33431 |                                | positioned on the first character of the new command. If a <b>j</b> or <b>+</b> command                     |
| 33432 |                                | advances past the edit line, the current command line shall be restored to the edit                         |
| 33433 |                                | line and the terminal shall be alerted.                                                                     |
| 33434 | <b>[number]G</b>               | Set the current command line to be the oldest command line stored in the shell                              |
| 33435 |                                | command history. With a number <i>number</i> , set the current command line to be the                       |
| 33436 |                                | command line <i>number</i> in the history. If command line <i>number</i> does not exist, the                |
| 33437 |                                | terminal shall be alerted and the command line shall not be changed.                                        |
| 33438 | <b>/pattern&lt;newline&gt;</b> |                                                                                                             |
| 33439 |                                | Move backwards through the command history, searching for the specified                                     |
| 33440 |                                | pattern, beginning with the previous command line. Patterns use the pattern                                 |
| 33441 |                                | matching notation described in Section 2.13 (on page 62), except that the <b>'^'</b>                        |
| 33442 |                                | character shall have special meaning when it appears as the first character of                              |
| 33443 |                                | <i>pattern</i> . In this case, the <b>'^'</b> is discarded and the characters after the <b>'^'</b> shall be |
| 33444 |                                | matched only at the beginning of a line. Commands in the command history shall                              |
| 33445 |                                | be treated as strings, not as filenames. If the pattern is not found, the current                           |
| 33446 |                                | command line shall be unchanged and the terminal is alerted. If it is found in a                            |
| 33447 |                                | previous line, the current command line shall be set to that line and the cursor                            |
| 33448 |                                | shall be set to the first character of the new command line.                                                |

33449 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 33450 there is no previous non-empty pattern, the terminal shall be alerted and the  
 33451 current command line shall remain unchanged.

33452 ?*pattern*<newline>

33453 Move forwards through the command history, searching for the specified pattern,  
 33454 beginning with the next command line. Patterns use the pattern matching notation  
 33455 described in Section 2.13 (on page 62), except that the '^' character shall have  
 33456 special meaning when it appears as the first character of *pattern*. In this case, the  
 33457 '^' is discarded and the characters after the '^' shall be matched only at the  
 33458 beginning of a line. Commands in the command history shall be treated as strings,  
 33459 not as filenames. If the pattern is not found, the current command line shall be  
 33460 unchanged and the terminal alerted. If it is found in a following line, the current  
 33461 command line shall be set to that line and the cursor shall be set to the first  
 33462 character of the new command line.

33463 If *pattern* is empty, the last non-empty pattern provided to / or ? shall be used. If  
 33464 there is no previous non-empty pattern, the terminal shall be alerted and the  
 33465 current command line shall remain unchanged.

33466 **n** Repeat the most recent / or ? command. If there is no previous / or ?, the terminal  
 33467 shall be alerted and the current command line shall remain unchanged.

33468 **N** Repeat the most recent / or ? command, reversing the direction of the search. If  
 33469 there is no previous / or ?, the terminal shall be alerted and the current command  
 33470 line shall remain unchanged.

#### 33471 EXIT STATUS

33472 The following exit values shall be returned:

33473 0 The script to be executed consisted solely of zero or more blank lines or comments, or  
 33474 both.

33475 1-125 A non-interactive shell detected a syntax, redirection, or variable assignment error.

33476 127 A specified *command\_file* could not be found by a non-interactive shell.

33477 Otherwise, the shell shall return the exit status of the last command it invoked or attempted to  
 33478 invoke (see also the *exit* utility in Section 2.14 (on page 64)).

#### 33479 CONSEQUENCES OF ERRORS

33480 See Section 2.8.1 (on page 46).

#### 33481 APPLICATION USAGE

33482 Standard input and standard error are the files that determine whether a shell is interactive  
 33483 when -i is not specified. For example:

33484 sh > file

33485 and:

33486 sh 2> file

33487 create interactive and non-interactive shells, respectively. Although both accept terminal input,  
 33488 the results of error conditions are different, as described in Section 2.8.1 (on page 46); in the  
 33489 second example a redirection error encountered by a special built-in utility aborts the shell.

33490 A conforming application must protect its first operand, if it starts with a plus sign, by preceding  
 33491 it with the "--" argument that denotes the end of the options.

33492 Applications should note that the standard *PATH* to the shell cannot be assumed to be either  
 33493 **/bin/sh** or **/usr/bin/sh**, and should be determined by interrogation of the *PATH* returned by  
 33494 *getconf PATH*, ensuring that the returned pathname is an absolute pathname and not a shell  
 33495 built-in.

33496 For example, to determine the location of the standard *sh* utility:

33497 `command -v sh`

33498 On some implementations this might return:

33499 `/usr/xpg4/bin/sh`

33500 Furthermore, on systems that support executable scripts (the "#!" construct), it is  
 33501 recommended that applications using executable scripts install them using *getconf -v* to  
 33502 determine the shell pathname and update the "#!" script appropriately as it is being installed  
 33503 (for example, with *sed*). For example:

```

33504 #
33505 # Installation time script to install correct POSIX shell pathname
33506 #
33507 # Get list of paths to check
33508 #
33509 Sifs=$IFS
33510 IFS=:
33511 set $(getconf PATH)
33512 IFS=$Sifs
33513 #
33514 # Check each path for 'sh'
33515 #
33516 for i in $@
33517 do
33518 if [-f ${i}/sh];
33519 then
33520 Pshell=${i}/sh
33521 fi
33522 done
33523 #
33524 # This is the list of scripts to update. They should be of the
33525 # form '${name}.source' and will be transformed to '${name}'.
33526 # Each script should begin:
33527 #
33528 # !INSTALLSHELLPATH -p
33529 #
33530 scripts="a b c"
33531 #
33532 # Transform each script
33533 #
33534 for i in ${scripts}
33535 do
33536 sed -e "s|INSTALLSHELLPATH|${Pshell}|" < ${i}.source > ${i}
33537 done

```

33538 **EXAMPLES**

- 33539           1. Execute a shell command from a string:
- 33540            sh -c "cat myfile"
- 33541           2. Execute a shell script from a file in the current directory:
- 33542            sh my\_shell\_cmds

33543 **RATIONALE**

33544           The *sh* utility and the *set* special built-in utility share a common set of options.

33545           The KornShell ignores the contents of *IFS* upon entry to the script. A conforming application cannot rely on importing *IFS*. One justification for this, beyond security considerations, is to assist possible future shell compilers. Allowing *IFS* to be imported from the environment prevents many optimizations that might otherwise be performed via dataflow analysis of the script itself.

33550           The text in the STDIN section about non-blocking reads concerns an instance of *sh* that has been invoked, probably by a C-language program, with standard input that has been opened using the *O\_NONBLOCK* flag; see *open()* in the System Interfaces volume of IEEE Std 1003.1-2001. If the shell did not reset this flag, it would immediately terminate because no input data would be available yet and that would be considered the same as end-of-file.

33555           The options associated with a *restricted shell* (command name *rsh* and the *-r* option) were excluded because the standard developers considered that the implied level of security could not be achieved and they did not want to raise false expectations.

33558           On systems that support set-user-ID scripts, a historical trapdoor has been to link a script to the name *-i*. When it is called by a sequence such as:

33560           sh -

33561           or by:

33562           #! usr/bin/sh -

33563           the historical systems have assumed that no option letters follow. Thus, this volume of IEEE Std 1003.1-2001 allows the single hyphen to mark the end of the options, in addition to the use of the regular *"--"* argument, because it was considered that the older practice was so pervasive. An alternative approach is taken by the KornShell, where real and effective user/group IDs must match for an interactive shell; this behavior is specifically allowed by this volume of IEEE Std 1003.1-2001.

33569           **Note:**     There are other problems with set-user-ID scripts that the two approaches described here do not resolve.

33571           The initialization process for the history file can be dependent on the system start-up files, in that they may contain commands that effectively preempt the user's settings of *HISTFILE* and *HISTSIZE*. For example, function definition commands are recorded in the history file, unless the *set -o nolog* option is set. If the system administrator includes function definitions in some system start-up file called before the *ENV* file, the history file is initialized before the user gets a chance to influence its characteristics. In some historical shells, the history file is initialized just after the *ENV* file has been processed. Therefore, it is implementation-defined whether changes made to *HISTFILE* after the history file has been initialized are effective.

33579           The default messages for the various *MAIL*-related messages are unspecified because they vary across implementations. Typical messages are:

33580

33581 "you have mail\n"

33582 or:

33583 "you have new mail\n"

33584 It is important that the descriptions of command line editing refer to the same shell as that in  
33585 IEEE Std 1003.1-2001 so that interactive users can also be application programmers without  
33586 having to deal with programmatic differences in their two environments. It is also essential that  
33587 the utility name *sh* be specified because this explicit utility name is too firmly rooted in historical  
33588 practice of application programs for it to change.

33589 Consideration was given to mandating a diagnostic message when attempting to set *vi*-mode on  
33590 terminals that do not support command line editing. However, it is not historical practice for the  
33591 shell to be cognizant of all terminal types and thus be able to detect inappropriate terminals in  
33592 all cases. Implementations are encouraged to supply diagnostics in this case whenever possible,  
33593 rather than leaving the user in a state where editing commands work incorrectly.

33594 In early proposals, the KornShell-derived *emacs* mode of command line editing was included,  
33595 even though the *emacs* editor itself was not. The community of *emacs* proponents was adamant  
33596 that the full *emacs* editor not be standardized because they were concerned that an attempt to  
33597 standardize this very powerful environment would encourage vendors to ship strictly  
33598 conforming versions lacking the extensibility required by the community. The author of the  
33599 original *emacs* program also expressed his desire to omit the program. Furthermore, there were a  
33600 number of historical systems that did not include *emacs*, or included it without supporting it, but  
33601 there were very few that did not include and support *vi*. The shell *emacs* command line editing  
33602 mode was finally omitted because it became apparent that the KornShell version and the editor  
33603 being distributed with the GNU system had diverged in some respects. The author of *emacs*  
33604 requested that the POSIX *emacs* mode either be deleted or have a significant number of  
33605 unspecified conditions. Although the KornShell author agreed to consider changes to bring the  
33606 shell into alignment, the standard developers decided to defer specification at that time. At the  
33607 time, it was assumed that convergence on an acceptable definition would occur for a subsequent  
33608 draft, but that has not happened, and there appears to be no impetus to do so. In any case,  
33609 implementations are free to offer additional command line editing modes based on the exact  
33610 models of editors their users are most comfortable with.

33611 Early proposals had the following list entry in **vi Line Editing Insert Mode** (on page 855):

33612 \ If followed by the *erase* or *kill* character, that character shall be inserted into the input line.  
33613 Otherwise, the backslash itself shall be inserted into the input line.

33614 However, this is not actually a feature of *sh* command line editing insert mode, but one of some  
33615 historical terminal line drivers. Some conforming implementations continue to do this when the  
33616 *stty ixtextn* flag is set.

#### 33617 FUTURE DIRECTIONS

33618 None.

#### 33619 SEE ALSO

33620 Chapter 2 (on page 29), *cd*, *echo*, *exit*, *fc*, *pwd*, *read*, *set*, *stty*, *test*, *umask*, *vi*, the System Interfaces  
33621 volume of IEEE Std 1003.1-2001, *dup()*, *exec*, *exit()*, *fork()*, *open()*, *pipe()*, *signal()*, *system()*,  
33622 *ulimit()*, *umask()*, *wait()*

#### 33623 CHANGE HISTORY

33624 First released in Issue 2.

33625 **Issue 5**

33626 The FUTURE DIRECTIONS section is added.

33627 Text is added to the DESCRIPTION for the Large File Summit proposal.

33628 **Issue 6**

33629 The Open Group Corrigendum U029/2 is applied, correcting the second SYNOPSIS.

33630 The Open Group Corrigendum U027/3 is applied, correcting a typographical error.

33631 The following new requirements on POSIX implementations derive from alignment with the  
33632 Single UNIX Specification:

33633 • The option letters derived from the *set* special built-in are also accepted with a leading plus  
33634 sign ('+').

33635 • Large file extensions are added:

33636 — Pathname expansion does not fail due to the size of a file.

33637 — Shell input and output redirections have an implementation-defined offset maximum  
33638 that is established in the open file description.

33639 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
33640 “directory referred to by the *HOME* environment variable”.

33641 Descriptions for the *ENV* and *PWD* environment variables are included to align with the  
33642 IEEE P1003.2b draft standard.

33643 The normative text is reworded to avoid use of the term “must” for application requirements.

33644 **NAME**

33645           sleep — suspend execution for an interval

33646 **SYNOPSIS**33647           sleep *time*33648 **DESCRIPTION**33649           The *sleep* utility shall suspend execution for at least the integral number of seconds specified by  
33650           the *time* operand.33651 **OPTIONS**

33652           None.

33653 **OPERANDS**

33654           The following operand shall be supported:

33655           *time*           A non-negative decimal integer specifying the number of seconds for which to  
33656                               suspend execution.33657 **STDIN**

33658           Not used.

33659 **INPUT FILES**

33660           None.

33661 **ENVIRONMENT VARIABLES**33662           The following environment variables shall affect the execution of *sleep*:33663           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
33664                               (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
33665                               Internationalization Variables for the precedence of internationalization variables  
33666                               used to determine the values of locale categories.)33667           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
33668                               internationalization variables.33669           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
33670                               characters (for example, single-byte as opposed to multi-byte characters in  
33671                               arguments).33672           *LC\_MESSAGES*33673                               Determine the locale that should be used to affect the format and contents of  
33674                               diagnostic messages written to standard error.33675 *XS1*           *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.33676 **ASYNCHRONOUS EVENTS**33677           If the *sleep* utility receives a SIGALRM signal, one of the following actions shall be taken:

- 33678           1. Terminate normally with a zero exit status.
- 
- 33679           2. Effectively ignore the signal.
- 
- 33680           3. Provide the default behavior for signals described in the ASYNCHRONOUS EVENTS
- 
- 33681               section of Section 1.11 (on page 20). This could include terminating with a non-zero exit
- 
- 33682               status.

33683           The *sleep* utility shall take the standard action for all other signals.

33684 **STDOUT**

33685 Not used.

33686 **STDERR**

33687 The standard error shall be used only for diagnostic messages.

33688 **OUTPUT FILES**

33689 None.

33690 **EXTENDED DESCRIPTION**

33691 None.

33692 **EXIT STATUS**

33693 The following exit values shall be returned:

33694 0 The execution was successfully suspended for at least *time* seconds, or a SIGALRM signal  
33695 was received. See the ASYNCHRONOUS EVENTS section.

33696 &gt;0 An error occurred.

33697 **CONSEQUENCES OF ERRORS**

33698 Default.

33699 **APPLICATION USAGE**

33700 None.

33701 **EXAMPLES**33702 The *sleep* utility can be used to execute a command after a certain amount of time, as in:33703 (sleep 105; *command*) &

33704 or to execute a command every so often, as in:

33705 while true

33706 do

33707 *command*

33708 sleep 37

33709 done

33710 **RATIONALE**

33711 The exit status is allowed to be zero when *sleep* is interrupted by the SIGALRM signal because  
33712 most implementations of this utility rely on the arrival of that signal to notify them that the  
33713 requested finishing time has been successfully attained. Such implementations thus do not  
33714 distinguish this situation from the successful completion case. Other implementations are  
33715 allowed to catch the signal and go back to sleep until the requested time expires or to provide  
33716 the normal signal termination procedures.

33717 As with all other utilities that take integral operands and do not specify subranges of allowed  
33718 values, *sleep* is required by this volume of IEEE Std 1003.1-2001 to deal with *time* requests of up  
33719 to 2 147 483 647 seconds. This may mean that some implementations have to make multiple calls  
33720 to the delay mechanism of the underlying operating system if its argument range is less than  
33721 this.

33722 **FUTURE DIRECTIONS**

33723 None.

33724 **SEE ALSO**33725 *wait*, the System Interfaces volume of IEEE Std 1003.1-2001, *alarm()*, *sleep()*

33726 **CHANGE HISTORY**

33727 First released in Issue 2.

33728 **NAME**

33729           sort — sort, merge, or sequence check text files

33730 **SYNOPSIS**33731           sort [-m] [-o *output*] [-bdfinru] [-t *char*] [-k *keydef*]... [*file*...]33732           sort -c [-bdfinru] [-t *char*] [-k *keydef*] [*file*]33733 **DESCRIPTION**33734           The *sort* utility shall perform one of the following functions:

- 33735           1. Sort lines of all the named files together and write the result to the specified output.
- 33736           2. Merge lines of all the named (presorted) files together and write the result to the specified  
33737           output.
- 33738           3. Check that a single input file is correctly presorted.

33739           Comparisons shall be based on one or more sort keys extracted from each line of input (or, if no  
33740           sort keys are specified, the entire line up to, but not including, the terminating <newline>), and  
33741           shall be performed using the collating sequence of the current locale.

33742 **OPTIONS**

33743           The *sort* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
33744           12.2, Utility Syntax Guidelines, and the **-k** *keydef* option should follow the **-b**, **-d**, **-f**, **-i**, **-n**, and  
33745           **-r** options.

33746           The following options shall be supported:

- 33747           **-c**           Check that the single input file is ordered as specified by the arguments and the  
33748           collating sequence of the current locale. No output shall be produced; only the exit  
33749           code shall be affected.
- 33750           **-m**           Merge only; the input file shall be assumed to be already sorted.
- 33751           **-o** *output*   Specify the name of an output file to be used instead of the standard output. This  
33752           file can be the same as one of the input *files*.
- 33753           **-u**           Unique: suppress all but one in each set of lines having equal keys. If used with  
33754           the **-c** option, check that there are no lines with duplicate keys, in addition to  
33755           checking that the input file is sorted.

33756           The following options shall override the default ordering rules. When ordering options appear  
33757           independent of any key field specifications, the requested field ordering rules shall be applied  
33758           globally to all sort keys. When attached to a specific key (see **-k**), the specified ordering options  
33759           shall override all global ordering options for that key.

- 33760           **-d**           Specify that only <blank>s and alphanumeric characters, according to the current  
33761           setting of *LC\_CTYPE*, shall be significant in comparisons. The behavior is  
33762           undefined for a sort key to which **-i** or **-n** also applies.
- 33763           **-f**           Consider all lowercase characters that have uppercase equivalents, according to  
33764           the current setting of *LC\_CTYPE*, to be the uppercase equivalent for the purposes  
33765           of comparison.
- 33766           **-i**           Ignore all characters that are non-printable, according to the current setting of  
33767           *LC\_CTYPE*.
- 33768           **-n**           Restrict the sort key to an initial numeric string, consisting of optional <blank>s,  
33769           optional minus sign, and zero or more digits with an optional radix character and  
33770           thousands separators (as defined in the current locale), which shall be sorted by

33771 arithmetic value. An empty digit string shall be treated as zero. Leading zeros and  
 33772 signs on zeros shall not affect ordering.

33773 **-r** Reverse the sense of comparisons.

33774 The treatment of field separators can be altered using the options:

33775 **-b** Ignore leading <blank>s when determining the starting and ending positions of a  
 33776 restricted sort key. If the **-b** option is specified before the first **-k** option, it shall be  
 33777 applied to all **-k** options. Otherwise, the **-b** option can be attached independently  
 33778 to each **-k** *field\_start* or *field\_end* option-argument (see below).

33779 **-t char** Use *char* as the field separator character; *char* shall not be considered to be part of a  
 33780 field (although it can be included in a sort key). Each occurrence of *char* shall be  
 33781 significant (for example, <*char*><*char*> delimits an empty field). If **-t** is not  
 33782 specified, <blank>s shall be used as default field separators; each maximal non-  
 33783 empty sequence of <blank>s that follows a non-<blank> shall be a field separator.

33784 Sort keys can be specified using the options:

33785 **-k keydef** The *keydef* argument is a restricted sort key field definition. The format of this  
 33786 definition is:

33787 *field\_start*[*type*] [, *field\_end*[*type*]]

33788 where *field\_start* and *field\_end* define a key field restricted to a portion of the line  
 33789 (see the EXTENDED DESCRIPTION section), and *type* is a modifier from the list of  
 33790 characters 'b', 'd', 'f', 'i', 'n', 'r'. The 'b' modifier shall behave like the  
 33791 **-b** option, but shall apply only to the *field\_start* or *field\_end* to which it is attached.  
 33792 The other modifiers shall behave like the corresponding options, but shall apply  
 33793 only to the key field to which they are attached; they shall have this effect if  
 33794 specified with *field\_start*, *field\_end*, or both. If any modifier is attached to a  
 33795 *field\_start* or to a *field\_end*, no option shall apply to either. Implementations shall  
 33796 support at least nine occurrences of the **-k** option, which shall be significant in  
 33797 command line order. If no **-k** option is specified, a default sort key of the entire  
 33798 line shall be used.

33799 When there are multiple key fields, later keys shall be compared only after all  
 33800 earlier keys compare equal. Except when the **-u** option is specified, lines that  
 33801 otherwise compare equal shall be ordered as if none of the options **-d**, **-f**, **-i**, **-n**, or  
 33802 **-k** were present (but with **-r** still in effect, if it was specified) and with all bytes in  
 33803 the lines significant to the comparison. The order in which lines that still compare  
 33804 equal are written is unspecified.

## 33805 OPERANDS

33806 The following operand shall be supported:

33807 *file* A pathname of a file to be sorted, merged, or checked. If no *file* operands are  
 33808 specified, or if a *file* operand is '-', the standard input shall be used.

## 33809 STDIN

33810 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
 33811 See the INPUT FILES section.

## 33812 INPUT FILES

33813 The input files shall be text files, except that the *sort* utility shall add a <newline> to the end of a  
 33814 file ending with an incomplete last line.

33815 **ENVIRONMENT VARIABLES**

33816 The following environment variables shall affect the execution of *sort*:

33817 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 33818 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 33819 Internationalization Variables for the precedence of internationalization variables  
 33820 used to determine the values of locale categories.)

33821 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 33822 internationalization variables.

33823 *LC\_COLLATE*  
 33824 Determine the locale for ordering rules.

33825 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 33826 characters (for example, single-byte as opposed to multi-byte characters in  
 33827 arguments and input files) and the behavior of character classification for the *-b*,  
 33828 *-d*, *-f*, *-i*, and *-n* options.

33829 *LC\_MESSAGES*  
 33830 Determine the locale that should be used to affect the format and contents of  
 33831 diagnostic messages written to standard error.

33832 *LC\_NUMERIC*  
 33833 Determine the locale for the definition of the radix character and thousands  
 33834 separator for the *-n* option.

33835 *XS* *NLS\_PATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

33836 **ASYNCHRONOUS EVENTS**

33837 Default.

33838 **STDOUT**

33839 Unless the *-o* or *-c* options are in effect, the standard output shall contain the sorted input.

33840 **STDERR**

33841 The standard error shall be used for diagnostic messages. A warning message about correcting  
 33842 an incomplete last line of an input file may be generated, but need not affect the final exit status.

33843 **OUTPUT FILES**

33844 If the *-o* option is in effect, the sorted input shall be written to the file *output*.

33845 **EXTENDED DESCRIPTION**

33846 The notation:

33847 *-k field\_start[type] [,field\_end[type]]*

33848 shall define a key field that begins at *field\_start* and ends at *field\_end* inclusive, unless *field\_start*  
 33849 falls beyond the end of the line or after *field\_end*, in which case the key field is empty. A missing  
 33850 *field\_end* shall mean the last character of the line.

33851 A field comprises a maximal sequence of non-separating characters and, in the absence of option  
 33852 *-t*, any preceding field separator.

33853 The *field\_start* portion of the *keydef* option-argument shall have the form:

33854 *field\_number[.first\_character]*

33855 Fields and characters within fields shall be numbered starting with 1. The *field\_number* and  
 33856 *first\_character* pieces, interpreted as positive decimal integers, shall specify the first character to  
 33857 be used as part of a sort key. If *.first\_character* is omitted, it shall refer to the first character of the

33858 field.

33859 The *field\_end* portion of the *keydef* option-argument shall have the form:

33860 *field\_number*[.*last\_character*]

33861 The *field\_number* shall be as described above for *field\_start*. The *last\_character* piece, interpreted  
 33862 as a non-negative decimal integer, shall specify the last character to be used as part of the sort  
 33863 key. If *last\_character* evaluates to zero or *.last\_character* is omitted, it shall refer to the last  
 33864 character of the field specified by *field\_number*.

33865 If the **-b** option or **b** type modifier is in effect, characters within a field shall be counted from the  
 33866 first non-*<blank>* in the field. (This shall apply separately to *first\_character* and *last\_character*.)

### 33867 EXIT STATUS

33868 The following exit values shall be returned:

33869 0 All input files were output successfully, or **-c** was specified and the input file was correctly  
 33870 sorted.

33871 1 Under the **-c** option, the file was not ordered as specified, or if the **-c** and **-u** options were  
 33872 both specified, two input lines were found with equal keys.

33873 >1 An error occurred.

### 33874 CONSEQUENCES OF ERRORS

33875 Default.

### 33876 APPLICATION USAGE

33877 The default value for **-t**, *<blank>*, has different properties from, for example, **-t**"*<space>*". If a  
 33878 line contains:

33879 *<space><space>foo*

33880 the following treatment would occur with default separation as opposed to specifically selecting  
 33881 a *<space>*:

| Field | Default                              | <b>-t</b> " <i>&lt;space&gt;</i> " |
|-------|--------------------------------------|------------------------------------|
| 1     | <i>&lt;space&gt;&lt;space&gt;foo</i> | <i>empty</i>                       |
| 2     | <i>empty</i>                         | <i>empty</i>                       |
| 3     | <i>empty</i>                         | <i>foo</i>                         |

33886 The leading field separator itself is included in a field when **-t** is not used. For example, this  
 33887 command returns an exit status of zero, meaning the input was already sorted:

33888 `sort -c -k 2 <<eof`  
 33889 `y<tab>b`  
 33890 `x<space>a`  
 33891 `eof`

33892 (assuming that a *<tab>* precedes the *<space>* in the current collating sequence). The field  
 33893 separator is not included in a field when it is explicitly set via **-t**. This is historical practice and  
 33894 allows usage such as:

33895 `sort -t "|" -k 2n <<eof`  
 33896 `Atlanta|425022|Georgia`  
 33897 `Birmingham|284413|Alabama`  
 33898 `Columbia|100385|South Carolina`  
 33899 `eof`

33900 where the second field can be correctly sorted numerically without regard to the non-numeric  
33901 field separator.

33902 The wording in the OPTIONS section clarifies that the **-b**, **-d**, **-f**, **-i**, **-n**, and **-r** options have to  
33903 come before the first sort key specified if they are intended to apply to all specified keys. The  
33904 way it is described in this volume of IEEE Std 1003.1-2001 matches historical practice, not  
33905 historical documentation. The results are unspecified if these options are specified after a **-k**  
33906 option.

33907 The **-f** option might not work as expected in locales where there is not a one-to-one mapping  
33908 between an uppercase and a lowercase letter.

#### 33909 EXAMPLES

33910 1. The following command sorts the contents of **infile** with the second field as the sort key:

```
33911 sort -k 2,2 infile
```

33912 2. The following command sorts, in reverse order, the contents of **infile1** and **infile2**, placing  
33913 the output in **outfile** and using the second character of the second field as the sort key  
33914 (assuming that the first character of the second field is the field separator):

```
33915 sort -r -o outfile -k 2.2,2.2 infile1 infile2
```

33916 3. The following command sorts the contents of **infile1** and **infile2** using the second non-  
33917 <blank> of the second field as the sort key:

```
33918 sort -k 2.2b,2.2b infile1 infile2
```

33919 4. The following command prints the System V password file (user database) sorted by the  
33920 numeric user ID (the third colon-separated field):

```
33921 sort -t : -k 3,3n /etc/passwd
```

33922 5. The following command prints the lines of the already sorted file **infile**, suppressing all  
33923 but one occurrence of lines having the same third field:

```
33924 sort -um -k 3.1,3.0 infile
```

#### 33925 RATIONALE

33926 Examples in some historical documentation state that options **-um** with one input file keep the  
33927 first in each set of lines with equal keys. This behavior was deemed to be an implementation  
33928 artifact and was not standardized.

33929 The **-z** option was omitted; it is not standard practice on most systems and is inconsistent with  
33930 using *sort* to sort several files individually and then merge them together. The text concerning **-z**  
33931 in historical documentation appeared to require implementations to determine the proper buffer  
33932 length during the sort phase of operation, but not during the merge.

33933 The **-y** option was omitted because of non-portability. The **-M** option, present in System V, was  
33934 omitted because of non-portability in international usage.

33935 An undocumented **-T** option exists in some implementations. It is used to specify a directory for  
33936 intermediate files. Implementations are encouraged to support the use of the *TMPDIR*  
33937 environment variable instead of adding an option to support this functionality.

33938 The **-k** option was added to satisfy two objections. First, the zero-based counting used by *sort* is  
33939 not consistent with other utility conventions. Second, it did not meet syntax guideline  
33940 requirements.

33941 Historical documentation indicates that “setting **-n** implies **-b**”. The description of **-n** already  
33942 states that optional leading <blank>s are tolerated in doing the comparison. If **-b** is enabled,

33943 rather than implied, by **-n**, this has unusual side effects. When a character offset is used in a  
33944 column of numbers (for example, to sort modulo 100), that offset is measured relative to the  
33945 most significant digit, not to the column. Based upon a recommendation from the author of the  
33946 original *sort* utility, the **-b** implication has been omitted from this volume of  
33947 IEEE Std 1003.1-2001, and an application wishing to achieve the previously mentioned side  
33948 effects has to code the **-b** flag explicitly.

33949 **FUTURE DIRECTIONS**

33950 None.

33951 **SEE ALSO**

33952 *comm, join, uniq*, the System Interfaces volume of IEEE Std 1003.1-2001, *toupper()*

33953 **CHANGE HISTORY**

33954 First released in Issue 2.

33955 **Issue 6**

33956 IEEE PASC Interpretation 1003.2 #174 is applied, updating the DESCRIPTION of comparisons.

33957 IEEE PASC Interpretation 1003.2 #168 is applied.

33958 **NAME**

33959           split — split files into pieces

33960 **SYNOPSIS**33961 UP       split [-l *line\_count*] [-a *suffix\_length*] [*file* [*name*]]33962           split -b *n*[*k*|*m*] [-a *suffix\_length*] [*file* [*name*]]

33963

33964 **DESCRIPTION**

33965       The *split* utility shall read an input file and write one or more output files. The default size of  
 33966       each output file shall be 1 000 lines. The size of the output files can be modified by specification  
 33967       of the **-b** or **-l** options. Each output file shall be created with a unique suffix. The suffix shall  
 33968       consist of exactly *suffix\_length* lowercase letters from the POSIX locale. The letters of the suffix  
 33969       shall be used as if they were a base-26 digit system, with the first suffix to be created consisting  
 33970       of all 'a' characters, the second with a 'b' replacing the last 'a', and so on, until a name of all  
 33971       'z' characters is created. By default, the names of the output files shall be 'x', followed by a  
 33972       two-character suffix from the character set as described above, starting with "aa", "ab", "ac",  
 33973       and so on, and continuing until the suffix "zz", for a maximum of 676 files.

33974       If the number of files required exceeds the maximum allowed by the suffix length provided,  
 33975       such that the last allowable file would be larger than the requested size, the *split* utility shall fail  
 33976       after creating the last file with a valid suffix; *split* shall not delete the files it created with valid  
 33977       suffixes. If the file limit is not exceeded, the last file created shall contain the remainder of the  
 33978       input file, and may be smaller than the requested size.

33979 **OPTIONS**

33980       The *split* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 33981       12.2, Utility Syntax Guidelines.

33982       The following options shall be supported:

33983       **-a *suffix\_length***

33984           Use *suffix\_length* letters to form the suffix portion of the filenames of the split file.  
 33985           If **-a** is not specified, the default suffix length shall be two. If the sum of the *name*  
 33986           operand and the *suffix\_length* option-argument would create a filename exceeding  
 33987           {NAME\_MAX} bytes, an error shall result; *split* shall exit with a diagnostic  
 33988           message and no files shall be created.

33989       **-b *n***           Split a file into pieces *n* bytes in size.

33990       **-b *nk***           Split a file into pieces *n*\*1 024 bytes in size.

33991       **-b *nm***           Split a file into pieces *n*\*1 048 576 bytes in size.

33992       **-l *line\_count***   Specify the number of lines in each resulting file piece. The *line\_count* argument is  
 33993       an unsigned decimal integer. The default is 1 000. If the input does not end with a  
 33994       <newline>, the partial line shall be included in the last output file.

33995 **OPERANDS**

33996       The following operands shall be supported:

33997       *file*           The pathname of the ordinary file to be split. If no input file is given or *file* is '-',  
 33998       the standard input shall be used.

33999       *name*           The prefix to be used for each of the files resulting from the split operation. If no  
 34000       *name* argument is given, 'x' shall be used as the prefix of the output files. The  
 34001       combined length of the basename of *prefix* and *suffix\_length* cannot exceed  
 34002       {NAME\_MAX} bytes. See the OPTIONS section.

34003 **STDIN**

34004 See the INPUT FILES section.

34005 **INPUT FILES**

34006 Any file can be used as input.

34007 **ENVIRONMENT VARIABLES**34008 The following environment variables shall affect the execution of *split*:

34009 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 34010 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34011 Internationalization Variables for the precedence of internationalization variables  
 34012 used to determine the values of locale categories.)

34013 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 34014 internationalization variables.

34015 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 34016 characters (for example, single-byte as opposed to multi-byte characters in  
 34017 arguments and input files).

34018 *LC\_MESSAGES*

34019 Determine the locale that should be used to affect the format and contents of  
 34020 diagnostic messages written to standard error.

34021 *XS* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34022 **ASYNCHRONOUS EVENTS**

34023 Default.

34024 **STDOUT**

34025 Not used.

34026 **STDERR**

34027 The standard error shall be used only for diagnostic messages.

34028 **OUTPUT FILES**

34029 The output files contain portions of the original input file; otherwise, unchanged.

34030 **EXTENDED DESCRIPTION**

34031 None.

34032 **EXIT STATUS**

34033 The following exit values shall be returned:

34034 0 Successful completion.

34035 &gt;0 An error occurred.

34036 **CONSEQUENCES OF ERRORS**

34037 Default.

34038 **APPLICATION USAGE**

34039 None.

34040 **EXAMPLES**34041 In the following examples **foo** is a text file that contains 5 000 lines.34042 1. Create five files, **xaa**, **xab**, **xac**, **xad**, and **xae**:34043 `split foo`34044 2. Create five files, but the suffixed portion of the created files consists of three letters, **xaaa**,  
34045 **xaab**, **xaac**, **xaad**, and **xaae**:34046 `split -a 3 foo`34047 3. Create three files with four-letter suffixes and a supplied prefix, **bar\_aaaa**, **bar\_aaab**, and  
34048 **bar\_aaac**:34049 `split -a 4 -l 2000 foo bar_`34050 4. Create as many files as are necessary to contain at most 20\*1 024 bytes, each with the  
34051 default prefix of **x** and a five-letter suffix:34052 `split -a 5 -b 20k foo`34053 **RATIONALE**34054 The **-b** option was added to provide a mechanism for splitting files other than by lines. While  
34055 most uses of the **-b** option are for transmitting files over networks, some believed it would have  
34056 additional uses.34057 The **-a** option was added to overcome the limitation of being able to create only 676 files.34058 Consideration was given to deleting this utility, using the rationale that the functionality  
34059 provided by this utility is available via the *csplit* utility (see *csplit*). Upon reconsideration of the  
34060 purpose of the User Portability Extension, it was decided to retain both this utility and the *csplit*  
34061 utility because users use both utilities and have historical expectations of their behavior.  
34062 Furthermore, the splitting on byte boundaries in *split* cannot be duplicated with the historical  
34063 *csplit*.34064 The text “*split* shall not delete the files it created with valid suffixes” would normally be  
34065 assumed, but since the related utility, *csplit*, does delete files under some circumstances, the  
34066 historical behavior of *split* is made explicit to avoid misinterpretation.34067 **FUTURE DIRECTIONS**

34068 None.

34069 **SEE ALSO**34070 *csplit*34071 **CHANGE HISTORY**

34072 First released in Issue 2.

34073 **Issue 6**

34074 This utility is marked as part of the User Portability Utilities option.

34075 The APPLICATION USAGE section is added.

34076 The obsolescent SYNOPSIS is removed.

34077 **NAME**

34078 strings — find printable strings in files

34079 **SYNOPSIS**34080 UP strings [-a] [-t *format*] [-n *number*] [*file...*]

34081

34082 **DESCRIPTION**

34083 The *strings* utility shall look for printable strings in regular files and shall write those strings to  
 34084 standard output. A printable string is any sequence of four (by default) or more printable  
 34085 characters terminated by a <newline> or NUL character. Additional implementation-defined  
 34086 strings may be written; see *localedef*.

34087 **OPTIONS**

34088 The *strings* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 34089 12.2, Utility Syntax Guidelines.

34090 The following options shall be supported:

34091 **-a** Scan files in their entirety. If **-a** is not specified, it is implementation-defined what  
 34092 portion of each file is scanned for strings.

34093 **-n *number*** Specify the minimum string length, where the *number* argument is a positive  
 34094 decimal integer. The default shall be 4.

34095 **-t *format*** Write each string preceded by its byte offset from the start of the file. The format  
 34096 shall be dependent on the single character used as the *format* option-argument:

34097     d   The offset shall be written in decimal.

34098     o   The offset shall be written in octal.

34099     x   The offset shall be written in hexadecimal.

34100 **OPERANDS**

34101 The following operand shall be supported:

34102 *file*       A pathname of a regular file to be used as input. If no *file* operand is specified, the  
 34103 *strings* utility shall read from the standard input.

34104 **STDIN**

34105 See the INPUT FILES section.

34106 **INPUT FILES**

34107 The input files named by the utility arguments or the standard input shall be regular files of any  
 34108 format.

34109 **ENVIRONMENT VARIABLES**34110 The following environment variables shall affect the execution of *strings*:

34111 **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 34112 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34113 Internationalization Variables for the precedence of internationalization variables  
 34114 used to determine the values of locale categories.)

34115 **LC\_ALL**      If set to a non-empty string value, override the values of all the other  
 34116 internationalization variables.

34117 **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 34118 characters (for example, single-byte as opposed to multi-byte characters in  
 34119 arguments and input files) and to identify printable strings.

34120 *LC\_MESSAGES*

34121 Determine the locale that should be used to affect the format and contents of  
34122 diagnostic messages written to standard error.

34123 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

### 34124 ASYNCHRONOUS EVENTS

34125 Default.

### 34126 STDOUT

34127 Strings found shall be written to the standard output, one per line.

34128 When the **-t** option is not specified, the format of the output shall be:

34129 "%s", <string>

34130 With the **-t o** option, the format of the output shall be:

34131 "%o %s", <byte offset>, <string>

34132 With the **-t x** option, the format of the output shall be:

34133 "%x %s", <byte offset>, <string>

34134 With the **-t d** option, the format of the output shall be:

34135 "%d %s", <byte offset>, <string>

### 34136 STDERR

34137 The standard error shall be used only for diagnostic messages.

### 34138 OUTPUT FILES

34139 None.

### 34140 EXTENDED DESCRIPTION

34141 None.

### 34142 EXIT STATUS

34143 The following exit values shall be returned:

34144 0 Successful completion.

34145 >0 An error occurred.

### 34146 CONSEQUENCES OF ERRORS

34147 Default.

### 34148 APPLICATION USAGE

34149 By default the data area (as opposed to the text, “bss”, or header areas) of a binary executable  
34150 file is scanned. Implementations document which areas are scanned.

34151 Some historical implementations do not require NUL or <newline> terminators for strings to  
34152 permit those languages that do not use NUL as a string terminator to have their strings written.

### 34153 EXAMPLES

34154 None.

### 34155 RATIONALE

34156 Apart from rationalizing the option syntax and slight difficulties with object and executable  
34157 binary files, *strings* is specified to match historical practice closely. The **-a** and **-n** options were  
34158 introduced to replace the non-conforming **-** and *-number* options.

34159 The **-o** option historically means different things on different implementations. Some use it to  
34160 mean “*offset* in decimal”, while others use it as “*offset* in octal”. Instead of trying to decide which

34161 way would be least objectionable, the **-t** option was added. It was originally named **-O** to mean  
34162 “offset”, but was changed to **-t** to be consistent with *od*.

34163 The ISO C standard function *isprint()* is restricted to a domain of **unsigned char**. This volume of  
34164 IEEE Std 1003.1-2001 requires implementations to write strings as defined by the current locale.

34165 **FUTURE DIRECTIONS**

34166 None.

34167 **SEE ALSO**

34168 *localedef, nm*

34169 **CHANGE HISTORY**

34170 First released in Issue 4.

34171 **Issue 6**

34172 This utility is marked as part of the User Portability Utilities option.

34173 The obsolescent SYNOPSIS is removed.

34174 The normative text is reworded to avoid use of the term “must” for application requirements.

34175 **NAME**

34176 strip — remove unnecessary information from executable files (**DEVELOPMENT**)

34177 **SYNOPSIS**

34178 SD strip *file...*

34179

34180 **DESCRIPTION**

34181 The *strip* utility shall remove from executable files named by the *file* operands any information  
 34182 the implementor deems unnecessary for execution of those files. The nature of that information  
 34183 is unspecified. The effect of *strip* shall be similar to the use of the **-s** option to *c99* or *fort77*.

34184 **OPTIONS**

34185 None.

34186 **OPERANDS**

34187 The following operand shall be supported:

34188 *file* A pathname referring to an executable file.

34189 **STDIN**

34190 Not used.

34191 **INPUT FILES**

34192 The input files shall be in the form of executable files successfully produced by any compiler  
 34193 defined by this volume of IEEE Std 1003.1-2001.

34194 **ENVIRONMENT VARIABLES**

34195 The following environment variables shall affect the execution of *strip*:

34196 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 34197 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34198 Internationalization Variables for the precedence of internationalization variables  
 34199 used to determine the values of locale categories.)

34200 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 34201 internationalization variables.

34202 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 34203 characters (for example, single-byte as opposed to multi-byte characters in  
 34204 arguments).

34205 *LC\_MESSAGES*

34206 Determine the locale that should be used to affect the format and contents of  
 34207 diagnostic messages written to standard error.

34208 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34209 **ASYNCHRONOUS EVENTS**

34210 Default.

34211 **STDOUT**

34212 Not used.

34213 **STDERR**

34214 The standard error shall be used only for diagnostic messages.

34215 **OUTPUT FILES**

34216           The *strip* utility shall produce executable files of unspecified format.

34217 **EXTENDED DESCRIPTION**

34218           None.

34219 **EXIT STATUS**

34220           The following exit values shall be returned:

34221           0   Successful completion.

34222           >0  An error occurred.

34223 **CONSEQUENCES OF ERRORS**

34224           Default.

34225 **APPLICATION USAGE**

34226           None.

34227 **EXAMPLES**

34228           None.

34229 **RATIONALE**

34230           Historically, this utility has been used to remove the symbol table from an executable file. It was  
34231           included since it is known that the amount of symbolic information can amount to several  
34232           megabytes; the ability to remove it in a portable manner was deemed important, especially for  
34233           smaller systems.

34234           The behavior of *strip* is said to be the same as the **-s** option to a compiler. While the end result is  
34235           essentially the same, it is not required to be identical.

34236 **FUTURE DIRECTIONS**

34237           None.

34238 **SEE ALSO**

34239           *ar*, *c99*, *fort77*

34240 **CHANGE HISTORY**

34241           First released in Issue 2.

34242 **Issue 6**

34243           This utility is marked as part of the Software Development Utilities option.

34244 **NAME**

34245           stty — set the options for a terminal

34246 **SYNOPSIS**

34247           stty [ -a | -g ]

34248           stty *operands*34249 **DESCRIPTION**

34250       The *stty* utility shall set or report on terminal I/O characteristics for the device that is its  
 34251       standard input. Without options or operands specified, it shall report the settings of certain  
 34252       characteristics, usually those that differ from implementation-defined defaults. Otherwise, it  
 34253       shall modify the terminal state according to the specified operands. Detailed information about  
 34254       the modes listed in the first five groups below are described in the Base Definitions volume of  
 34255       IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface. Operands in the Combination  
 34256       Modes group (see **Combination Modes** (on page 889)) are implemented using operands in the  
 34257       previous groups. Some combinations of operands are mutually-exclusive on some terminal  
 34258       types; the results of using such combinations are unspecified.

34259       Typical implementations of this utility require a communications line configured to use the  
 34260       **termios** interface defined in the System Interfaces volume of IEEE Std 1003.1-2001. On systems  
 34261       where none of these lines are available, and on lines not currently configured to support the  
 34262       **termios** interface, some of the operands need not affect terminal characteristics.

34263 **OPTIONS**

34264       The *stty* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 34265       12.2, Utility Syntax Guidelines.

34266       The following options shall be supported:

34267       **-a**           Write to standard output all the current settings for the terminal.

34268       **-g**           Write to standard output all the current settings in an unspecified form that can be  
 34269       used as arguments to another invocation of the *stty* utility on the same system. The  
 34270       form used shall not contain any characters that would require quoting to avoid  
 34271       word expansion by the shell; see Section 2.6 (on page 36).

34272 **OPERANDS**

34273       The following operands shall be supported to set the terminal characteristics.

34274       **Control Modes**

34275       **parenb** (**-parenb**) Enable (disable) parity generation and detection. This shall have the effect of  
 34276       setting (not setting) PARENB in the **termios** *c\_flag* field, as defined in the  
 34277       Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General  
 34278       Terminal Interface.

34279       **parodd** (**-parodd**)  
 34280       Select odd (even) parity. This shall have the effect of setting (not setting)  
 34281       PARODD in the **termios** *c\_flag* field, as defined in the Base Definitions  
 34282       volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface.

34283       **cs5 cs6 cs7 cs8** Select character size, if possible. This shall have the effect of setting CS5, CS6,  
 34284       CS7, and CS8, respectively, in the **termios** *c\_flag* field, as defined in the Base  
 34285       Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal  
 34286       Interface.

34287       *number*       Set terminal baud rate to the number given, if possible. If the baud rate is set  
 34288       to zero, the modem control lines shall no longer be asserted. This shall have

|       |                                                                                                        |                                                                                                 |
|-------|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| 34289 |                                                                                                        | the effect of setting the input and output <b>termios</b> baud rate values as defined           |
| 34290 |                                                                                                        | in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General                     |
| 34291 |                                                                                                        | Terminal Interface.                                                                             |
| 34292 | <b>ispeed</b> <i>number</i>                                                                            | Set terminal input baud rate to the number given, if possible. If the input baud                |
| 34293 |                                                                                                        | rate is set to zero, the input baud rate shall be specified by the value of the                 |
| 34294 |                                                                                                        | output baud rate. This shall have the effect of setting the input <b>termios</b> baud           |
| 34295 |                                                                                                        | rate values as defined in the Base Definitions volume of IEEE Std 1003.1-2001,                  |
| 34296 |                                                                                                        | Chapter 11, General Terminal Interface.                                                         |
| 34297 | <b>ospeed</b> <i>number</i>                                                                            | Set terminal output baud rate to the number given, if possible. If the output                   |
| 34298 |                                                                                                        | baud rate is set to zero, the modem control lines shall no longer be asserted.                  |
| 34299 |                                                                                                        | This shall have the effect of setting the output <b>termios</b> baud rate values as             |
| 34300 |                                                                                                        | defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11,                     |
| 34301 |                                                                                                        | General Terminal Interface.                                                                     |
| 34302 | <b>hupcl</b> ( <b>-hupcl</b> )                                                                         | Stop asserting modem control lines (do not stop asserting modem control                         |
| 34303 |                                                                                                        | lines) on last close. This shall have the effect of setting (not setting) HUPCL in              |
| 34304 |                                                                                                        | the <b>termios</b> <i>c_cflag</i> field, as defined in the Base Definitions volume of           |
| 34305 |                                                                                                        | IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface.                                   |
| 34306 | <b>hup</b> ( <b>-hup</b> )                                                                             | Equivalent to <b>hupcl</b> ( <b>-hupcl</b> ).                                                   |

| 34456 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |
| 34457 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |
| 34458 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |
| 34459 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                             |

**Table 4-19** Control Character Names in *stty*

| Control Character | c_cc Subscript | Description     |
|-------------------|----------------|-----------------|
| <b>eof</b>        | VEOF           | EOF character   |
| <b>eol</b>        | VEOL           | EOL character   |
| <b>erase</b>      | VERASE         | ERASE character |
| <b>intr</b>       | VINTR          | INTR character  |
| <b>kill</b>       | VKILL          | KILL character  |
| <b>quit</b>       | VQUIT          | QUIT character  |
| <b>susp</b>       | VSUSP          | SUSP character  |
| <b>start</b>      | VSTART         | START character |
| <b>stop</b>       | VSTOP          | STOP character  |

If *string* is a single character, the control character shall be set to that character. If *string* is the two-character sequence "^-" or the string *undef*, the control character shall be set to `_POSIX_VDISABLE`, if it is in effect for the device; if `_POSIX_VDISABLE` is not in effect for the device, it shall be treated as an error. In the POSIX locale, if *string* is a two-character sequence beginning with circumflex ('^'), and the second character is one of those listed in the "^c" column of the following table, the control character shall be set to the corresponding character value in the Value column of the table.

**Table 4-20** Circumflex Control Characters in *stty*

| ^c   | Value | ^c   | Value | ^c   | Value |
|------|-------|------|-------|------|-------|
| a, A | <SOH> | l, L | <FF>  | w, W | <ETB> |
| b, B | <STX> | m, M | <CR>  | x, X | <CAN> |
| c, C | <ETX> | n, N | <SO>  | y, Y | <EM>  |
| d, D | <EOT> | o, O | <SI>  | z, Z | <SUB> |
| e, E | <ENQ> | p, P | <DLE> | [    | <ESC> |
| f, F | <ACK> | q, Q | <DC1> | \    | <FS>  |
| g, G | <BEL> | r, R | <DC2> | ]    | <GS>  |
| h, H | <BS>  | s, S | <DC3> | ^    | <RS>  |
| i, I | <HT>  | t, T | <DC4> | _    | <US>  |
| j, J | <LF>  | u, U | <NAK> | ?    | <DEL> |
| k, K | <VT>  | v, V | <SYN> |      |       |

**min** *number*

Set the value of MIN to *number*. MIN is used in non-canonical mode input processing (**icanon**).

**time** *number*

Set the value of TIME to *number*. TIME is used in non-canonical mode input processing (**icanon**).

**Combination Modes***saved settings*

Set the current terminal characteristics to the saved settings produced by the **-g** option.

**evenp** or **parity**

Enable **parenb** and **cs7**; disable **parodd**.

**oddp**

Enable **parenb**, **cs7**, and **parodd**.

34504       **–parity, –evenp, or –oddp**  
 34505           Disable **parenb**, and set **cs8**.

34506 xSI   **raw (–raw or cooked)**  
 34507           Enable (disable) raw input and output. Raw mode shall be equivalent to setting:

34508           stty cs8 erase ^- kill ^- intr ^- \  
 34509           quit ^- eof ^- eol ^- –post –inpck

34510       **nl (–nl)**  
 34511           Disable (enable) **icrnl**. In addition, **–nl** unsets **inlcr** and **igncr**.

34512       **ek**   Reset ERASE and KILL characters back to system defaults.

34513       **sane**  
 34514           Reset all modes to some reasonable, unspecified, values.

34515   **STDIN**  
 34516           Although no input is read from standard input, standard input shall be used to get the current  
 34517           terminal I/O characteristics and to set new terminal I/O characteristics.

34518   **INPUT FILES**  
 34519           None.

34520   **ENVIRONMENT VARIABLES**  
 34521           The following environment variables shall affect the execution of *stty*:

34522       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 34523                      (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34524                      Internationalization Variables for the precedence of internationalization variables  
 34525                      used to determine the values of locale categories.)

34526       **LC\_ALL**     If set to a non-empty string value, override the values of all the other  
 34527                      internationalization variables.

34528       **LC\_CTYPE**   This variable determines the locale for the interpretation of sequences of bytes of  
 34529                      text data as characters (for example, single-byte as opposed to multi-byte  
 34530                      characters in arguments) and which characters are in the class **print**.

34531       **LC\_MESSAGES**  
 34532                      Determine the locale that should be used to affect the format and contents of  
 34533                      diagnostic messages written to standard error.

34534 xSI   **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34535   **ASYNCHRONOUS EVENTS**  
 34536           Default.

34537   **STDOUT**  
 34538           If operands are specified, no output shall be produced.

34539           If the **–g** option is specified, *stty* shall write to standard output the current settings in a form that  
 34540           can be used as arguments to another instance of *stty* on the same system.

34541           If the **–a** option is specified, all of the information as described in the OPERANDS section shall  
 34542           be written to standard output. Unless otherwise specified, this information shall be written as  
 34543           <space>-separated tokens in an unspecified format, on one or more lines, with an unspecified  
 34544           number of tokens per line. Additional information may be written.

34545           If no options or operands are specified, an unspecified subset of the information written for the  
 34546           **–a** option shall be written.

34547 If speed information is written as part of the default output, or if the **-a** option is specified and if  
 34548 the terminal input speed and output speed are the same, the speed information shall be written  
 34549 as follows:

34550 "speed %d baud;", <speed>

34551 Otherwise, speeds shall be written as:

34552 "ispeed %d baud; ospeed %d baud;", <ispeed>, <ospeed>

34553 In locales other than the POSIX locale, the word **baud** may be changed to something more  
 34554 appropriate in those locales.

34555 If control characters are written as part of the default output, or if the **-a** option is specified,  
 34556 control characters shall be written as:

34557 "%s = %s;", <control-character name>, <value>

34558 where <value> is either the character, or some visual representation of the character if it is non-  
 34559 printable, or the string *undef* if the character is disabled.

#### 34560 **STDERR**

34561 The standard error shall be used only for diagnostic messages.

#### 34562 **OUTPUT FILES**

34563 None.

#### 34564 **EXTENDED DESCRIPTION**

34565 None.

#### 34566 **EXIT STATUS**

34567 The following exit values shall be returned:

34568 0 The terminal options were read or set successfully.

34569 >0 An error occurred.

#### 34570 **CONSEQUENCES OF ERRORS**

34571 Default.

#### 34572 **APPLICATION USAGE**

34573 The **-g** flag is designed to facilitate the saving and restoring of terminal state from the shell level.  
 34574 For example, a program may:

```
34575 saveterm="$(stty -g)" # save terminal state
34576 stty (new settings) # set new state
34577 ... # ...
34578 stty $saveterm # restore terminal state
```

34579 Since the format is unspecified, the saved value is not portable across systems.

34580 Since the **-a** format is so loosely specified, scripts that save and restore terminal settings should  
 34581 use the **-g** option.

#### 34582 **EXAMPLES**

34583 None.

#### 34584 **RATIONALE**

34585 The original *stty* description was taken directly from System V and reflected the System V  
 34586 terminal driver **termio**. It has been modified to correspond to the terminal driver **termios**.

34587 Output modes are specified only for XSI-conformant systems. All implementations are expected  
 34588 to provide *stty* operands corresponding to all of the output modes they support.

34589 The *stty* utility is primarily used to tailor the user interface of the terminal, such as selecting the  
 34590 preferred ERASE and KILL characters. As an application programming utility, *stty* can be used  
 34591 within shell scripts to alter the terminal settings for the duration of the script.

34592 The **termios** section states that individual disabling of control characters is possible through the  
 34593 option `_POSIX_VDISABLE`. If enabled, two conventions currently exist for specifying this:  
 34594 System V uses `^_`, and BSD uses *undef*. Both are accepted by *stty* in this volume of  
 34595 IEEE Std 1003.1-2001. The other BSD convention of using the letter `'u'` was rejected because it  
 34596 conflicts with the actual letter `'u'`, which is an acceptable value for a control character.

34597 Early proposals did not specify the mapping of `^c` to control characters because the control  
 34598 characters were not specified in the POSIX locale character set description file requirements. The  
 34599 control character set is now specified in the Base Definitions volume of IEEE Std 1003.1-2001,  
 34600 Chapter 3, Definitions so the historical mapping is specified. Note that although the mapping  
 34601 corresponds to control-character key assignments on many terminals that use the  
 34602 ISO/IEC 646:1991 standard (or ASCII) character encodings, the mapping specified here is to the  
 34603 control characters, not their keyboard encodings.

34604 Since **termios** supports separate speeds for input and output, two new options were added to  
 34605 specify each distinctly.

34606 Some historical implementations use standard input to get and set terminal characteristics;  
 34607 others use standard output. Since input from a login TTY is usually restricted to the owner while  
 34608 output to a TTY is frequently open to anyone, using standard input provides fewer chances of  
 34609 accidentally (or maliciously) altering the terminal settings of other users. Using standard input  
 34610 also allows *stty -a* and *stty -g* output to be redirected for later use. Therefore, usage of standard  
 34611 input is required by this volume of IEEE Std 1003.1-2001.

#### 34612 **FUTURE DIRECTIONS**

34613 None.

#### 34614 **SEE ALSO**

34615 Chapter 2 (on page 29), the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11,  
 34616 General Terminal Interface, **<termios.h>**

#### 34617 **CHANGE HISTORY**

34618 First released in Issue 2.

#### 34619 **Issue 5**

34620 The description of **tabs** is clarified.

34621 The FUTURE DIRECTIONS section is added.

#### 34622 **Issue 6**

34623 The legacy items **iucl**(**-iucl**), **xcas**, **olcu**(**-olcu**), **lcas**(**-lcas**), and **LCASE**(**-LCASE**) are  
 34624 removed.

34625 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/37 is applied, applying IEEE PASC  
 34626 Interpretation 1003.2 #133, fixing an error in the OPERANDS section for the Combination Modes  
 34627 **nl**(**-nl**).

34628 **NAME**34629            `tabs` — set terminal tabs34630 **SYNOPSIS**34631 UP XSI    `tabs [ -n | -a | -a2 | -c | -c2 | -c3 | -f | -p | -s | -u ] [+m[n]] [-T type]`34632            `tabs [-T type] [ +[n]] n1[,n2,...]`

34633

34634 **DESCRIPTION**

34635            The `tabs` utility shall display a series of characters that first clears the hardware terminal tab  
 34636 XSI        settings and then initializes the tab stops at the specified positions and optionally adjusts the  
 34637            margin.

34638            The phrase “tab-stop position *N*” shall be taken to mean that, from the start of a line of output,  
 34639            tabbing to position *N* shall cause the next character output to be in the (*N*+1)th column position  
 34640            on that line. The maximum number of tab stops allowed is terminal-dependent.

34641            It need not be possible to implement `tabs` on certain terminals. If the terminal type obtained from  
 34642            the `TERM` environment variable or `-T` option represents such a terminal, an appropriate  
 34643            diagnostic message shall be written to standard error and `tabs` shall exit with a status greater  
 34644            than zero.

34645 **OPTIONS**

34646            The `tabs` utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 34647 XSI        12.2, Utility Syntax Guidelines, except for various extensions: the options `-a2`, `-c2`, and `-c3` are  
 34648            multi-character.

34649            The following options shall be supported:

34650            `-n`            Specify repetitive tab stops separated by a uniform number of column positions, *n*,  
 34651            where *n* is a single-digit decimal number. The default usage of `tabs` with no  
 34652            arguments shall be equivalent to `tabs-8`. When `-0` is used, the tab stops shall be  
 34653            cleared and no new ones set.

34654 XSI        `-a`            1,10,16,36,72  
 34655            Assembler, applicable to some mainframes.

34656 XSI        `-a2`            1,10,16,40,72  
 34657            Assembler, applicable to some mainframes.

34658 XSI        `-c`            1,8,12,16,20,55  
 34659            COBOL, normal format.

34660 XSI        `-c2`            1,6,10,14,49  
 34661            COBOL, compact format (columns 1 to 6 omitted).

34662 XSI        `-c3`            1,6,10,14,18,22,26,30,34,38,42,46,50,54,58,62,67  
 34663            COBOL compact format (columns 1 to 6 omitted), with more tabs than `-c2`.

34664 XSI        `-f`            1,7,11,15,19,23  
 34665            FORTRAN

34666 XSI        `-p`            1,5,9,13,17,21,25,29,33,37,41,45,49,53,57,61  
 34667            PL / 1

34668 XSI        `-s`            1,10,55  
 34669            SNOBOL

34670 XSI        `-u`            1,12,20,44  
 34671            Assembler, applicable to some mainframes.

34672        **-T type**       Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
34673                           is unset or null, an unspecified default terminal type shall be used. The setting of  
34674                           *type* shall take precedence over the value in *TERM*.

#### 34675 **OPERANDS**

34676        The following operand shall be supported:

34677        **n1[,n2,...]**     A single command line argument that consists of tab-stop values separated using  
34678                           either commas or <blank>s. The application shall ensure that the tab-stop values  
34679                           are positive decimal integers in strictly ascending order. If any number (except the  
34680                           first one) is preceded by a plus sign, it is taken as an increment to be added to the  
34681                           previous value. For example, the tab lists 1,10,20,30 and 1,10,+10,+10 are  
34682                           considered to be identical.

#### 34683 **STDIN**

34684        Not used.

#### 34685 **INPUT FILES**

34686        None.

#### 34687 **ENVIRONMENT VARIABLES**

34688        The following environment variables shall affect the execution of *tabs*:

34689        **LANG**           Provide a default value for the internationalization variables that are unset or null.  
34690                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
34691                           Internationalization Variables for the precedence of internationalization variables  
34692                           used to determine the values of locale categories.)

34693        **LC\_ALL**        If set to a non-empty string value, override the values of all the other  
34694                           internationalization variables.

34695        **LC\_CTYPE**     Determine the locale for the interpretation of sequences of bytes of text data as  
34696                           characters (for example, single-byte as opposed to multi-byte characters in  
34697                           arguments).

34698        **LC\_MESSAGES**

34699                           Determine the locale that should be used to affect the format and contents of  
34700                           diagnostic messages written to standard error.

34701 xSI     **NLSPATH**     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34702        **TERM**           Determine the terminal type. If this variable is unset or null, and if the **-T** option is  
34703                           not specified, an unspecified default terminal type shall be used.

#### 34704 **ASYNCHRONOUS EVENTS**

34705        Default.

#### 34706 **STDOUT**

34707        If standard output is a terminal, the appropriate sequence to clear and set the tab stops may be  
34708        written to standard output in an unspecified format. If standard output is not a terminal,  
34709        undefined results occur.

#### 34710 **STDERR**

34711        The standard error shall be used only for diagnostic messages.

#### 34712 **OUTPUT FILES**

34713        None.

34714 **EXTENDED DESCRIPTION**

34715 None.

34716 **EXIT STATUS**

34717 The following exit values shall be returned:

34718 0 Successful completion.

34719 &gt;0 An error occurred.

34720 **CONSEQUENCES OF ERRORS**

34721 Default.

34722 **APPLICATION USAGE**34723 This utility makes use of the terminal's hardware tabs and the *stty tabs* option.

34724 This utility is not recommended for application use.

34725 Some integrated display units might not have escape sequences to set tab stops, but may be set  
 34726 by internal system calls. On these terminals, *tabs* works if standard output is directed to the  
 34727 terminal; if output is directed to another file, however, *tabs* fails.

34728 **EXAMPLES**

34729 None.

34730 **RATIONALE**

34731 Consideration was given to having the *tput* utility handle all of the functions described in *tabs*.  
 34732 However, the separate *tabs* utility was retained because it seems more intuitive to use a  
 34733 command named *tabs* than *tput* with a new option. The *tput* utility does not support setting or  
 34734 clearing tabs, and no known historical version of *tabs* supports the capability of setting arbitrary  
 34735 tab stops.

34736 The System V *tabs* interface is very complex; the version in this volume of IEEE Std 1003.1-2001  
 34737 has a reduced feature list, but many of the features omitted were restored as XSI extensions even  
 34738 though the supported languages and coding styles are primarily historical.

34739 There was considerable sentiment for specifying only a means of resetting the tabs back to a  
 34740 known state—presumably the “standard” of tabs every eight positions. The following features  
 34741 were omitted:

- 34742 • Setting tab stops via the first line in a file, using *--file*. Since even the SVID has no complete  
 34743 explanation of this feature, it is doubtful that it is in widespread use.

34744 In an early proposal, a *-t tablist* option was added for consistency with *expand*; this was later  
 34745 removed when inconsistencies with the historical list of tabs were identified.

34746 Consideration was given to adding a *-p* option that would output the current tab settings so  
 34747 that they could be saved and then later restored. This was not accepted because querying the tab  
 34748 stops of the terminal is not a capability in historical *terminfo* or *termcap* facilities and might not be  
 34749 supported on a wide range of terminals.

34750 **FUTURE DIRECTIONS**

34751 None.

34752 **SEE ALSO**34753 *expand*, *stty*, *tput*, *unexpand*

34754 **CHANGE HISTORY**

34755 First released in Issue 2.

34756 **Issue 6**

34757 This utility is marked as part of the User Portability Utilities option.

34758 The normative text is reworded to avoid use of the term “must” for application requirements.

34759 **NAME**34760 `tail` — copy the last part of a file34761 **SYNOPSIS**34762 `tail [-f] [ -c number | -n number] [file]`34763 **DESCRIPTION**34764 The *tail* utility shall copy its input file to the standard output beginning at a designated place.

34765 Copying shall begin at the point in the file indicated by the `-c number` or `-n number` options. The  
 34766 option-argument *number* shall be counted in units of lines or bytes, according to the options `-n`  
 34767 and `-c`. Both line and byte counts start from 1.

34768 Tails relative to the end of the file may be saved in an internal buffer, and thus may be limited in  
 34769 length. Such a buffer, if any, shall be no smaller than {LINE\_MAX}\*10 bytes.

34770 **OPTIONS**

34771 The *tail* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 34772 12.2, Utility Syntax Guidelines.

34773 The following options shall be supported:

34774 `-c number` The application shall ensure that the *number* option-argument is a decimal integer  
 34775 whose sign affects the location in the file, measured in bytes, to begin the copying:

34776

34777

34778

34779

| Sign        | Copying Starts                         |
|-------------|----------------------------------------|
| +           | Relative to the beginning of the file. |
| -           | Relative to the end of the file.       |
| <i>none</i> | Relative to the end of the file.       |

34780 The origin for counting shall be 1; that is, `-c +1` represents the first byte of the file,  
 34781 `-c -1` the last.

34782 `-f` If the input file is a regular file or if the *file* operand specifies a FIFO, do not  
 34783 terminate after the last line of the input file has been copied, but read and copy  
 34784 further bytes from the input file when they become available. If no *file* operand is  
 34785 specified and standard input is a pipe, the `-f` option shall be ignored. If the input  
 34786 file is not a FIFO, pipe, or regular file, it is unspecified whether or not the `-f` option  
 34787 shall be ignored.

34788 `-n number` This option shall be equivalent to `-c number`, except the starting location in the file  
 34789 shall be measured in lines instead of bytes. The origin for counting shall be 1; that  
 34790 is, `-n +1` represents the first line of the file, `-n -1` the last.

34791 If neither `-c` nor `-n` is specified, `-n 10` shall be assumed.34792 **OPERANDS**

34793 The following operand shall be supported:

34794 *file* A pathname of an input file. If no *file* operands are specified, the standard input  
 34795 shall be used.

34796 **STDIN**

34797 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 34798 section.

34799 **INPUT FILES**

34800 If the **-c** option is specified, the input file can contain arbitrary data; otherwise, the input file  
 34801 shall be a text file.

34802 **ENVIRONMENT VARIABLES**

34803 The following environment variables shall affect the execution of *tail*:

34804 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 34805 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34806 Internationalization Variables for the precedence of internationalization variables  
 34807 used to determine the values of locale categories.)

34808 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 34809 internationalization variables.

34810 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 34811 characters (for example, single-byte as opposed to multi-byte characters in  
 34812 arguments and input files).

34813 **LC\_MESSAGES**  
 34814 Determine the locale that should be used to affect the format and contents of  
 34815 diagnostic messages written to standard error.

34816 **XS** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

34817 **ASYNCHRONOUS EVENTS**

34818 Default.

34819 **STDOUT**

34820 The designated portion of the input file shall be written to standard output.

34821 **STDERR**

34822 The standard error shall be used only for diagnostic messages.

34823 **OUTPUT FILES**

34824 None.

34825 **EXTENDED DESCRIPTION**

34826 None.

34827 **EXIT STATUS**

34828 The following exit values shall be returned:

34829 0 Successful completion.

34830 >0 An error occurred.

34831 **CONSEQUENCES OF ERRORS**

34832 Default.

34833 **APPLICATION USAGE**

34834 The **-c** option should be used with caution when the input is a text file containing multi-byte  
 34835 characters; it may produce output that does not start on a character boundary.

34836 Although the input file to *tail* can be any type, the results might not be what would be expected  
 34837 on some character special device files or on file types not described by the System Interfaces  
 34838 volume of IEEE Std 1003.1-2001. Since this volume of IEEE Std 1003.1-2001 does not specify the  
 34839 block size used when doing input, *tail* need not read all of the data from devices that only  
 34840 perform block transfers.

34841 **EXAMPLES**

34842       The **-f** option can be used to monitor the growth of a file that is being written by some other  
34843       process. For example, the command:

34844       tail -f fred

34845       prints the last ten lines of the file **fred**, followed by any lines that are appended to **fred** between  
34846       the time *tail* is initiated and killed. As another example, the command:

34847       tail -f -c 15 fred

34848       prints the last 15 bytes of the file **fred**, followed by any bytes that are appended to **fred** between  
34849       the time *tail* is initiated and killed.

34850 **RATIONALE**

34851       This version of *tail* was created to allow conformance to the Utility Syntax Guidelines. The  
34852       historical **-b** option was omitted because of the general non-portability of block-sized units of  
34853       text. The **-c** option historically meant “characters”, but this volume of IEEE Std 1003.1-2001  
34854       indicates that it means “bytes”. This was selected to allow reasonable implementations when  
34855       multi-byte characters are possible; it was not named **-b** to avoid confusion with the historical  
34856       **-b**.

34857       The origin of counting both lines and bytes is 1, matching all widespread historical  
34858       implementations.

34859       The restriction on the internal buffer is a compromise between the historical System V  
34860       implementation of 4 096 bytes and the BSD 32 768 bytes.

34861       The **-f** option has been implemented as a loop that sleeps for 1 second and copies any bytes that  
34862       are available. This is sufficient, but if more efficient methods of determining when new data are  
34863       available are developed, implementations are encouraged to use them.

34864       Historical documentation indicates that *tail* ignores the **-f** option if the input file is a pipe (pipe  
34865       and FIFO on systems that support FIFOs). On BSD-based systems, this has been true; on System  
34866       V-based systems, this was true when input was taken from standard input, but it did not ignore  
34867       the **-f** flag if a FIFO was named as the *file* operand. Since the **-f** option is not useful on pipes and  
34868       all historical implementations ignore **-f** if no *file* operand is specified and standard input is a  
34869       pipe, this volume of IEEE Std 1003.1-2001 requires this behavior. However, since the **-f** option is  
34870       useful on a FIFO, this volume of IEEE Std 1003.1-2001 also requires that if standard input is a  
34871       FIFO or a FIFO is named, the **-f** option shall not be ignored. Although historical behavior does  
34872       not ignore the **-f** option for other file types, this is unspecified so that implementations are  
34873       allowed to ignore the **-f** option if it is known that the file cannot be extended.

34874       This was changed to the current form based on comments noting that **-c** was almost never used  
34875       without specifying a number and that there was no need to specify **-l** if **-n number** was given.

34876 **FUTURE DIRECTIONS**

34877       None.

34878 **SEE ALSO**

34879       *head*

34880 **CHANGE HISTORY**

34881       First released in Issue 2.

34882 **Issue 6**

34883       The obsolescent SYNOPSIS lines and associated text are removed.

34884       The normative text is reworded to avoid use of the term “must” for application requirements.

34885 **NAME**

34886           talk — talk to another user

34887 **SYNOPSIS**34888 UP        talk *address* [*terminal*]

34889

34890 **DESCRIPTION**34891       The *talk* utility is a two-way, screen-oriented communication program.34892       When first invoked, *talk* shall send a message similar to:34893       Message from <*unspecified string*>34894       talk: connection requested by *your\_address*34895       talk: respond with: talk *your\_address*34896       to the specified *address*. At this point, the recipient of the message can reply by typing:34897       talk *your\_address*

34898       Once communication is established, the two parties can type simultaneously, with their output displayed in separate regions of the screen. Characters shall be processed as follows:

- 34900       • Typing the alert character shall alert the recipient's terminal.
- 34901       • Typing <control>-L shall cause the sender's screen regions to be refreshed.
- 34902       • Typing the erase and kill characters shall affect the sender's terminal in the manner described
- 34903       by the **termios** interface in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11,
- 34904       General Terminal Interface.
- 34905       • Typing the interrupt or end-of-file characters shall terminate the local *talk* utility. Once the
- 34906       *talk* session has been terminated on one side, the other side of the *talk* session shall be notified
- 34907       that the *talk* session has been terminated and shall be able to do nothing except exit.
- 34908       • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those characters
- 34909       to be sent to the recipient's terminal.
- 34910       • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of
- 34911       additional special control characters and multi-byte or single-byte functions shall be
- 34912       implementation-defined.
- 34913       • Typing other non-printable characters shall cause implementation-defined sequences of
- 34914       printable characters to be sent to the recipient's terminal.

34915       Permission to be a recipient of a *talk* message can be denied or granted by use of the *mesg* utility.

34916       However, a user's privilege may further constrain the domain of accessibility of other users'

34917       terminals. The *talk* utility shall fail when the user lacks the appropriate privileges to perform the

34918       requested action.

34919       Certain block-mode terminals do not have all the capabilities necessary to support the

34920       simultaneous exchange of messages required for *talk*. When this type of exchange cannot be

34921       supported on such terminals, the implementation may support an exchange with reduced levels

34922       of simultaneous interaction or it may report an error describing the terminal-related deficiency.

34923 **OPTIONS**

34924       None.

34925 **OPERANDS**

34926 The following operands shall be supported:

34927 *address* The recipient of the *talk* session. One form of *address* is the <*user name*>, as returned  
 34928 by the *who* utility. Other address formats and how they are handled are  
 34929 unspecified.

34930 *terminal* If the recipient is logged in more than once, the *terminal* argument can be used to  
 34931 indicate the appropriate terminal name. If *terminal* is not specified, the *talk* message  
 34932 shall be displayed on one or more accessible terminals in use by the recipient. The  
 34933 format of *terminal* shall be the same as that returned by the *who* utility.

34934 **STDIN**

34935 Characters read from standard input shall be copied to the recipient's terminal in an unspecified  
 34936 manner. If standard input is not a terminal, *talk* shall write a diagnostic message and exit with a  
 34937 non-zero status.

34938 **INPUT FILES**

34939 None.

34940 **ENVIRONMENT VARIABLES**34941 The following environment variables shall affect the execution of *talk*:

34942 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 34943 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 34944 Internationalization Variables for the precedence of internationalization variables  
 34945 used to determine the values of locale categories.)

34946 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 34947 internationalization variables.

34948 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 34949 characters (for example, single-byte as opposed to multi-byte characters in  
 34950 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 34951 equivalent to the sender's, the results are undefined.

34952 *LC\_MESSAGES*

34953 Determine the locale that should be used to affect the format and contents of  
 34954 diagnostic messages written to standard error and informative messages written to  
 34955 standard output.

34956 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

34957 *TERM* Determine the name of the invoker's terminal type. If this variable is unset or null,  
 34958 an unspecified default terminal type shall be used.

34959 **ASYNCHRONOUS EVENTS**

34960 When the *talk* utility receives a SIGINT signal, the utility shall terminate and exit with a zero  
 34961 status. It shall take the standard action for all other signals.

34962 **STDOUT**

34963 If standard output is a terminal, characters copied from the recipient's standard input may be  
 34964 written to standard output. Standard output also may be used for diagnostic messages. If  
 34965 standard output is not a terminal, *talk* shall exit with a non-zero status.

34966 **STDERR**

34967 None.

34968 **OUTPUT FILES**

34969 None.

34970 **EXTENDED DESCRIPTION**

34971 None.

34972 **EXIT STATUS**

34973 The following exit values shall be returned:

34974 0 Successful completion.

34975 >0 An error occurred or *talk* was invoked on a terminal incapable of supporting it.34976 **CONSEQUENCES OF ERRORS**

34977 Default.

34978 **APPLICATION USAGE**

34979 Because the handling of non-printable, non-`<space>s` is tied to the *stty* description of **ixtext**,  
 34980 implementation extensions within the terminal driver can be accessed. For example, some  
 34981 implementations provide line editing functions with certain control character sequences.

34982 **EXAMPLES**

34983 None.

34984 **RATIONALE**

34985 The *write* utility was included in this volume of IEEE Std 1003.1-2001 since it can be  
 34986 implemented on all terminal types. The *talk* utility, which cannot be implemented on certain  
 34987 terminals, was considered to be a “better” communications interface. Both of these programs are  
 34988 in widespread use on historical implementations. Therefore, both utilities have been specified.

34989 All references to networking abilities (*talking* to a user on another system) were removed as  
 34990 being outside the scope of this volume of IEEE Std 1003.1-2001.

34991 Historical BSD and System V versions of *talk* terminate both of the conversations when either  
 34992 user breaks out of the session. This can lead to adverse consequences if a user unwittingly  
 34993 continues to enter text that is interpreted by the shell when the other terminates the session.  
 34994 Therefore, the version of *talk* specified by this volume of IEEE Std 1003.1-2001 requires both  
 34995 users to terminate their end of the session explicitly.

34996 Only messages sent to the terminal of the invoking user can be internationalized in any way:

- 34997 • The original “Message from *<unspecified string>* ...” message sent to the terminal of the  
 34998 recipient cannot be internationalized because the environment of the recipient is as yet  
 34999 inaccessible to the *talk* utility. The environment of the invoking party is irrelevant.
- 35000 • Subsequent communication between the two parties cannot be internationalized because the  
 35001 two parties may specify different languages in their environment (and non-portable  
 35002 characters cannot be mapped from one language to another).
- 35003 • Neither party can be required to communicate in a language other than C and/or the one  
 35004 specified by their environment because unavailable terminal hardware support (for example,  
 35005 fonts) may be required.

35006 The text in the STDOUT section reflects the usage of the verb “display” in this section; some *talk*  
 35007 implementations actually use standard output to write to the terminal, but this volume of  
 35008 IEEE Std 1003.1-2001 does not require that to be the case.

35009 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
 35010 require that they all use or accept the same format.

35011 The handling of non-printable characters is partially implementation-defined because the details  
35012 of mapping them to printable sequences is not needed by the user. Historical implementations,  
35013 for security reasons, disallow the transmission of non-printable characters that may send  
35014 commands to the other terminal.

35015 **FUTURE DIRECTIONS**

35016 None.

35019 Terminal Interface

35020 **CHANGE HISTORY**

35021 First released in Issue 4.

35022 **Issue 6**

35023 This utility is marked as part of the User Portability Utilities option.

35024 **NAME**

35025           tee — duplicate standard input

35026 **SYNOPSIS**35027           tee [-ai] [*file...*]35028 **DESCRIPTION**35029           The *tee* utility shall copy standard input to standard output, making a copy in zero or more files.35030           The *tee* utility shall not buffer output.35031           If the **-a** option is not specified, output files shall be written (see Section 1.7.1.4 (on page 4)).35032 **OPTIONS**35033           The *tee* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
35034           Utility Syntax Guidelines.

35035           The following options shall be supported:

35036           **-a**           Append the output to the files.35037           **-i**           Ignore the SIGINT signal.35038 **OPERANDS**

35039           The following operands shall be supported:

35040           *file*           A pathname of an output file. Processing of at least 13 *file* operands shall be  
35041           supported.35042 **STDIN**

35043           The standard input can be of any type.

35044 **INPUT FILES**

35045           None.

35046 **ENVIRONMENT VARIABLES**35047           The following environment variables shall affect the execution of *tee*:35048           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
35049           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
35050           Internationalization Variables for the precedence of internationalization variables  
35051           used to determine the values of locale categories.)35052           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
35053           internationalization variables.35054           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
35055           characters (for example, single-byte as opposed to multi-byte characters in  
35056           arguments).35057           **LC\_MESSAGES**35058                               Determine the locale that should be used to affect the format and contents of  
35059           diagnostic messages written to standard error.35060 **XSI**           **NLSPATH**   Determine the location of message catalogs for the processing of **LC\_MESSAGES**.35061 **ASYNCHRONOUS EVENTS**35062           Default, except that if the **-i** option was specified, SIGINT shall be ignored.

**35063 STDOUT**

35064 The standard output shall be a copy of the standard input.

**35065 STDERR**

35066 The standard error shall be used only for diagnostic messages.

**35067 OUTPUT FILES**

35068 If any *file* operands are specified, the standard input shall be copied to each named file.

**35069 EXTENDED DESCRIPTION**

35070 None.

**35071 EXIT STATUS**

35072 The following exit values shall be returned:

35073 0 The standard input was successfully copied to all output files.

35074 >0 An error occurred.

**35075 CONSEQUENCES OF ERRORS**

35076 If a write to any successfully opened *file* operand fails, writes to other successfully opened *file*  
35077 operands and standard output shall continue, but the exit status shall be non-zero. Otherwise,  
35078 the default actions specified in Section 1.11 (on page 20) apply.

**35079 APPLICATION USAGE**

35080 The *tee* utility is usually used in a pipeline, to make a copy of the output of some utility.

35081 The *file* operand is technically optional, but *tee* is no more useful than *cat* when none is specified.

**35082 EXAMPLES**

35083 Save an unsorted intermediate form of the data in a pipeline:

35084 ... | tee unsorted | sort > sorted

**35085 RATIONALE**

35086 The buffering requirement means that *tee* is not allowed to use ISO C standard fully buffered or  
35087 line-buffered writes. It does not mean that *tee* has to do 1-byte reads followed by 1-byte writes.

35088 It should be noted that early versions of BSD ignore any invalid options and accept a single '-'  
35089 as an alternative to -i. They also print a message if unable to open a file:

35090 "tee: cannot access %s\n", <pathname>

35091 Historical implementations ignore write errors. This is explicitly not permitted by this volume of  
35092 IEEE Std 1003.1-2001.

35093 Some historical implementations use O\_APPEND when providing append mode; others use the  
35094 *lseek()* function to seek to the end-of-file after opening the file without O\_APPEND. This volume  
35095 of IEEE Std 1003.1-2001 requires functionality equivalent to using O\_APPEND; see Section  
35096 1.7.1.4 (on page 4).

**35097 FUTURE DIRECTIONS**

35098 None.

**35099 SEE ALSO**

35100 Chapter 1 (on page 1), *cat*, the System Interfaces volume of IEEE Std 1003.1-2001, *lseek()*

**35101 CHANGE HISTORY**

35102 First released in Issue 2.

35103 **Issue 6**

35104 IEEE PASC Interpretation 1003.2 #168 is applied.

35105 **NAME**

35106           test — evaluate expression

35107 **SYNOPSIS**35108           test [*expression*]35109           [ [*expression*] ]35110 **DESCRIPTION**

35111           The *test* utility shall evaluate the *expression* and indicate the result of the evaluation by its exit  
 35112           status. An exit status of zero indicates that the expression evaluated as true and an exit status of  
 35113           1 indicates that the expression evaluated as false.

35114           In the second form of the utility, which uses "[]" rather than *test*, the application shall ensure  
 35115           that the square brackets are separate arguments.

35116 **OPTIONS**

35117           The *test* utility shall not recognize the "--" argument in the manner specified by guideline 10 in  
 35118           the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines.

35119           No options shall be supported.

35120 **OPERANDS**

35121           The application shall ensure that all operators and elements of primaries are presented as  
 35122           separate arguments to the *test* utility.

35123           The following primaries can be used to construct *expression*:35124           **-b file**           True if *file* exists and is a block special file.35125           **-c file**           True if *file* exists and is a character special file.35126           **-d file**           True if *file* exists and is a directory.35127           **-e file**           True if *file* exists.35128           **-f file**           True if *file* exists and is a regular file.35129           **-g file**           True if *file* exists and its set-group-ID flag is set.35130           **-h file**           True if *file* exists and is a symbolic link.35131           **-L file**           True if *file* exists and is a symbolic link.35132           **-n string**       True if the length of *string* is non-zero.35133           **-p file**           True if *file* is a FIFO.

35134           **-r file**           True if *file* exists and is readable. True shall indicate that permission to read from  
 35135           *file* will be granted, as defined in Section 1.7.1.4 (on page 4).

35136           **-S file**           True if *file* exists and is a socket.35137           **-s file**           True if *file* exists and has a size greater than zero.35138           **-t file\_descriptor**

35139           True if the file whose file descriptor number is *file\_descriptor* is open and is  
 35140           associated with a terminal.

35141           **-u file**           True if *file* exists and its set-user-ID flag is set.

35142           **-w file**           True if *file* exists and is writable. True shall indicate that permission to write from  
 35143           *file* will be granted, as defined in Section 1.7.1.4 (on page 4).

35144 **-x file** True if *file* exists and is executable. True shall indicate that permission to execute  
 35145 *file* will be granted, as defined in Section 1.7.1.4 (on page 4). If *file* is a directory,  
 35146 true shall indicate that permission to search *file* will be granted.

35147 **-z string** True if the length of string *string* is zero.

35148 *string* True if the string *string* is not the null string.

35149 *s1 = s2* True if the strings *s1* and *s2* are identical.

35150 *s1 != s2* True if the strings *s1* and *s2* are not identical.

35151 *n1 -eq n2* True if the integers *n1* and *n2* are algebraically equal.

35152 *n1 -ne n2* True if the integers *n1* and *n2* are not algebraically equal.

35153 *n1 -gt n2* True if the integer *n1* is algebraically greater than the integer *n2*.

35154 *n1 -ge n2* True if the integer *n1* is algebraically greater than or equal to the integer *n2*.

35155 *n1 -lt n2* True if the integer *n1* is algebraically less than the integer *n2*.

35156 *n1 -le n2* True if the integer *n1* is algebraically less than or equal to the integer *n2*.

35157 xSI *expression1 -a expression2*  
 35158 True if both *expression1* and *expression2* are true. The **-a** binary primary is left  
 35159 associative. It has a higher precedence than **-o**.

35160 xSI *expression1 -o expression2*  
 35161 True if either *expression1* or *expression2* is true. The **-o** binary primary is left  
 35162 associative.

35163 With the exception of the **-h file** and **-L file** primaries, if a *file* argument is a symbolic link, *test*  
 35164 shall evaluate the expression by resolving the symbolic link and using the file referenced by the  
 35165 link.

35166 These primaries can be combined with the following operators:

35167 **! expression** True if *expression* is false.

35168 xSI **( expression )** True if *expression* is true. The parentheses can be used to alter the normal  
 35169 precedence and associativity.

35170 The primaries with two elements of the form:

35171 *-primary\_operator primary\_operand*

35172 are known as *unary primaries*. The primaries with three elements in either of the two forms:

35173 *primary\_operand -primary\_operator primary\_operand*

35174 *primary\_operand primary\_operator primary\_operand*

35175 are known as *binary primaries*. Additional implementation-defined operators and  
 35176 *primary\_operators* may be provided by implementations. They shall be of the form *-operator*  
 35177 where the first character of *operator* is not a digit.

35178 The algorithm for determining the precedence of the operators and the return value that shall be  
 35179 generated is based on the number of arguments presented to *test*. (However, when using the  
 35180 "[ . . . ]" form, the right-bracket final argument shall not be counted in this algorithm.)

35181 In the following list, \$1, \$2, \$3, and \$4 represent the arguments presented to *test*:

35182 0 arguments: Exit false (1).

|           |                              |                                                                                                                                                       |
|-----------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 35183     | 1 argument:                  | Exit true (0) if \$1 is not null; otherwise, exit false.                                                                                              |
| 35184     | 2 arguments:                 | <ul style="list-style-type: none"> <li>• If \$1 is ' ! ', exit true if \$2 is null, false if \$2 is not null.</li> </ul>                              |
| 35185     |                              | <ul style="list-style-type: none"> <li>• If \$1 is a unary primary, exit true if the unary test is true, false if the unary test is false.</li> </ul> |
| 35186     |                              |                                                                                                                                                       |
| 35187     |                              | <ul style="list-style-type: none"> <li>• Otherwise, produce unspecified results.</li> </ul>                                                           |
| 35188     | 3 arguments:                 | <ul style="list-style-type: none"> <li>• If \$2 is a binary primary, perform the binary test of \$1 and \$3.</li> </ul>                               |
| 35189     |                              | <ul style="list-style-type: none"> <li>• If \$1 is ' ! ', negate the two-argument test of \$2 and \$3.</li> </ul>                                     |
| 35190 XSI |                              | <ul style="list-style-type: none"> <li>• If \$1 is ' ( ' and \$3 is ' ) ', perform the unary test of \$2.</li> </ul>                                  |
| 35191     |                              | <ul style="list-style-type: none"> <li>• Otherwise, produce unspecified results.</li> </ul>                                                           |
| 35192     | 4 arguments:                 | <ul style="list-style-type: none"> <li>• If \$1 is ' ! ', negate the three-argument test of \$2, \$3, and \$4.</li> </ul>                             |
| 35193 XSI |                              | <ul style="list-style-type: none"> <li>• If \$1 is ' ( ' and \$4 is ' ) ', perform the two-argument test of \$2 and \$3.</li> </ul>                   |
| 35194     |                              | <ul style="list-style-type: none"> <li>• Otherwise, the results are unspecified.</li> </ul>                                                           |
| 35195     | >4 arguments:                | The results are unspecified.                                                                                                                          |
| 35196 XSI |                              | On XSI-conformant systems, combinations of primaries and operators shall be                                                                           |
| 35197     |                              | evaluated using the precedence and associativity rules described previously.                                                                          |
| 35198     |                              | In addition, the string comparison binary primaries ' =' and " != " shall have                                                                        |
| 35199     |                              | a higher precedence than any unary primary.                                                                                                           |
| 35200     | <b>STDIN</b>                 |                                                                                                                                                       |
| 35201     |                              | Not used.                                                                                                                                             |
| 35202     | <b>INPUT FILES</b>           |                                                                                                                                                       |
| 35203     |                              | None.                                                                                                                                                 |
| 35204     | <b>ENVIRONMENT VARIABLES</b> |                                                                                                                                                       |
| 35205     |                              | The following environment variables shall affect the execution of <i>test</i> :                                                                       |
| 35206     | <i>LANG</i>                  | Provide a default value for the internationalization variables that are unset or null.                                                                |
| 35207     |                              | (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,                                                                                |
| 35208     |                              | Internationalization Variables for the precedence of internationalization variables                                                                   |
| 35209     |                              | used to determine the values of locale categories.)                                                                                                   |
| 35210     | <i>LC_ALL</i>                | If set to a non-empty string value, override the values of all the other                                                                              |

| 35213     |                              | characters (for example, single-byte as opposed to multi-byte characters in                                                                           |
| 35214     |                              | arguments).                                                                                                                                           |
| 35215     | <i>LC_MESSAGES</i>           |                                                                                                                                                       |
| 35216     |                              | Determine the locale that should be used to affect the format and contents of                                                                         |
| 35217     |                              | diagnostic messages written to standard error.                                                                                                        |
| 35218 XSI | <i>NLSPATH</i>               | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                 |
| 35219     | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                                                                       |
| 35220     |                              | Default.                                                                                                                                              |

35221 **STDOUT**

35222 Not used.

35223 **STDERR**

35224 The standard error shall be used only for diagnostic messages.

35225 **OUTPUT FILES**

35226 None.

35227 **EXTENDED DESCRIPTION**

35228 None.

35229 **EXIT STATUS**

35230 The following exit values shall be returned:

35231 0 *expression* evaluated to true.35232 1 *expression* evaluated to false or *expression* was missing.

35233 &gt;1 An error occurred.

35234 **CONSEQUENCES OF ERRORS**

35235 Default.

35236 **APPLICATION USAGE**

35237 Scripts should be careful when dealing with user-supplied input that could be confused with  
 35238 primaries and operators. Unless the application writer knows all the cases that produce input to  
 35239 the script, invocations like:

35240 `test "$1" -a "$2"`

35241 should be written as:

35242 `test "$1" && test "$2"`

35243 to avoid problems if a user supplied values such as \$1 set to '!' and \$2 set to the null string.  
 35244 That is, in cases where maximal portability is of concern, replace:

35245 `test expr1 -a expr2`

35246 with:

35247 `test expr1 && test expr2`

35248 and replace:

35249 `test expr1 -o expr2`

35250 with:

35251 `test expr1 || test expr2`

35252 but note that, in *test*, **-a** has higher precedence than **-o** while **"&&"** and **"||"** have equal  
 35253 precedence in the shell.

35254 Parentheses or braces can be used in the shell command language to effect grouping.

35255 Parentheses must be escaped when using *sh*; for example:35256 `test \( expr1 -a expr2 \) -o expr3`

35257 This command is not always portable outside XSI-conformant systems. The following form can  
 35258 be used instead:

```
35259 (test expr1 && test expr2) || test expr3
```

```
35260 The two commands:
```

```
35261 test "$1"
```

```
35262 test ! "$1"
```

```
35263 could not be used reliably on some historical systems. Unexpected results would occur if such a
35264 string expression were used and $1 expanded to '!', '(', or a known unary primary. Better
35265 constructs are:
```

```
35266 test -n "$1"
```

```
35267 test -z "$1"
```

```
35268 respectively.
```

```
35269 Historical systems have also been unreliable given the common construct:
```

```
35270 test "$response" = "expected string"
```

```
35271 One of the following is a more reliable form:
```

```
35272 test "X$response" = "Xexpected string"
```

```
35273 test "expected string" = "$response"
```

```
35274 Note that the second form assumes that expected string could not be confused with any unary
35275 primary. If expected string starts with '-', '(', '!', or even '=', the first form should be used
35276 instead. Using the preceding rules without the XSI marked extensions, any of the three
35277 comparison forms is reliable, given any input. (However, note that the strings are quoted in all
35278 cases.)
```

```
35279 Because the string comparison binary primaries, '=' and '!=', have a higher precedence than
35280 any unary primary in the greater than 4 argument case, unexpected results can occur if
35281 arguments are not properly prepared. For example, in:
```

```
35282 test -d $1 -o -d $2
```

```
35283 If $1 evaluates to a possible directory name of '=', the first three arguments are considered a
35284 string comparison, which shall cause a syntax error when the second -d is encountered. One of
35285 the following forms prevents this; the second is preferred:
```

```
35286 test \(-d "$1" \) -o \(-d "$2" \)
```

```
35287 test -d "$1" || test -d "$2"
```

```
35288 Also in the greater than 4 argument case:
```

```
35289 test "$1" = "bat" -a "$2" = "ball"
```

```
35290 syntax errors occur if $1 evaluates to '(' or '!'. One of the following forms prevents this; the
35291 third is preferred:
```

```
35292 test "X$1" = "Xbat" -a "X$2" = "Xball"
```

```
35293 test "$1" = "bat" && test "$2" = "ball"
```

```
35294 test "X$1" = "Xbat" && test "X$2" = "Xball"
```

## 35295 EXAMPLES

```
35296 1. Exit if there are not two or three arguments (two variations):
```

```
35297 if [$# -ne 2 -a $# -ne 3]; then exit 1; fi
```

```
35298 if [$# -lt 2 -o $# -gt 3]; then exit 1; fi
```

```

35299 2. Perform a mkdir if a directory does not exist:
35300 test ! -d tempdir && mkdir tempdir
35301
35302 3. Wait for a file to become non-readable:
35303 while test -r thefile
35304 do
35305 sleep 30
35306 done
35307 echo '"thefile" is no longer readable'
35308
35309 4. Perform a command if the argument is one of three strings (two variations):
35310 if ["$1" = "pear"] || ["$1" = "grape"] || ["$1" = "apple"]
35311 then
35312 command
35313 fi
35314
35315 case "$1" in
35316 pear|grape|apple) command ;;
35317 esac

```

#### 35315 RATIONALE

35316 The KornShell-derived conditional command (double bracket **[[ ]]**) was removed from the shell  
 35317 command language description in an early proposal. Objections were raised that the real  
 35318 problem is misuse of the *test* command (**I**), and putting it into the shell is the wrong way to fix  
 35319 the problem. Instead, proper documentation and a new shell reserved word (**!**) are sufficient.

35320 Tests that require multiple *test* operations can be done at the shell level using individual  
 35321 invocations of the *test* command and shell logicals, rather than using the error-prone **-o** flag of  
 35322 *test*.

35323 XSI-conformant systems support more than four arguments.

35324 XSI-conformant systems support the combining of primaries with the following constructs:

35325 *expression1* **-a** *expression2*

35326 True if both *expression1* and *expression2* are true.

35327 *expression1* **-o** *expression2*

35328 True if at least one of *expression1* and *expression2* are true.

35329 **(** *expression* **)**

35330 True if *expression* is true.

35331 In evaluating these more complex combined expressions, the following precedence rules are  
 35332 used:

- 35333 • The unary primaries have higher precedence than the algebraic binary primaries.
- 35334 • The unary primaries have lower precedence than the string binary primaries.
- 35335 • The unary and binary primaries have higher precedence than the unary *string* primary.
- 35336 • The **!** operator has higher precedence than the **-a** operator, and the **-a** operator has higher  
 35337 precedence than the **-o** operator.
- 35338 • The **-a** and **-o** operators are left associative.
- 35339 • The parentheses can be used to alter the normal precedence and associativity.

35340 The BSD and System V versions of **-f** are not the same. The BSD definition was:

35341 **-f file** True if *file* exists and is not a directory.

35342 The SVID version (true if the file exists and is a regular file) was chosen for this volume of  
 35343 IEEE Std 1003.1-2001 because its use is consistent with the **-b**, **-c**, **-d**, and **-p** operands (*file* exists  
 35344 and is a specific file type).

35345 The **-e** primary, possessing similar functionality to that provided by the C shell, was added  
 35346 because it provides the only way for a shell script to find out if a file exists without trying to  
 35347 open the file. Since implementations are allowed to add additional file types, a portable script  
 35348 cannot use:

35349 `test -b foo -o -c foo -o -d foo -o -f foo -o -p foo`

35350 to find out if **foo** is an existing file. On historical BSD systems, the existence of a file could be  
 35351 determined by:

35352 `test -f foo -o -d foo`

35353 but there was no easy way to determine that an existing file was a regular file. An early proposal  
 35354 used the KornShell **-a** primary (with the same meaning), but this was changed to **-e** because  
 35355 there were concerns about the high probability of humans confusing the **-a** primary with the **-a**  
 35356 binary operator.

35357 The following options were not included in this volume of IEEE Std 1003.1-2001, although they  
 35358 are provided by some implementations. These operands should not be used by new  
 35359 implementations for other purposes:

35360 **-k file** True if *file* exists and its sticky bit is set.

35361 **-C file** True if *file* is a contiguous file.

35362 **-V file** True if *file* is a version file.

35363 The following option was not included because it was undocumented in most implementations,  
 35364 has been removed from some implementations (including System V), and the functionality is  
 35365 provided by the shell (see Section 2.6.2 (on page 37)).

35366 **-l string** The length of the string *string*.

35367 The **-b**, **-c**, **-g**, **-p**, **-u**, and **-x** operands are derived from the SVID; historical BSD does not  
 35368 provide them. The **-k** operand is derived from System V; historical BSD does not provide it.

35369 On historical BSD systems, `test -w directory` always returned false because `test` tried to open the  
 35370 directory for writing, which always fails.

35371 Some additional primaries newly invented or from the KornShell appeared in an early proposal  
 35372 as part of the conditional command (**[I I]**): `s1 > s2`, `s1 < s2`, `str = pattern`, `str != pattern`, `f1 -nt f2`, `f1`  
 35373 `-ot f2`, and `f1 -ef f2`. They were not carried forward into the `test` utility when the conditional  
 35374 command was removed from the shell because they have not been included in the `test` utility  
 35375 built into historical implementations of the `sh` utility.

35376 The **-t file\_descriptor** primary is shown with a mandatory argument because the grammar is  
 35377 ambiguous if it can be omitted. Historical implementations have allowed it to be omitted,  
 35378 providing a default of 1.

35379 **FUTURE DIRECTIONS**

35380 None.

35381 **SEE ALSO**35382           Section 1.7.1.4 (on page 4), *find*35383 **CHANGE HISTORY**

35384           First released in Issue 2.

35385 **Issue 5**

35386           The FUTURE DIRECTIONS section is added.

35387 **Issue 6**35388           The **-h** operand is added for symbolic links, and access permission requirements are clarified for  
35389           the **-r**, **-w**, and **-x** operands to align with the IEEE P1003.2b draft standard.

35390           The normative text is reworded to avoid use of the term “must” for application requirements.

35391           The **-L** and **-S** operands are added for symbolic links and sockets.35392           IEEE Std 1003.1-2001 / Cor 1-2002, item XCU / TC1 / D6 / 38 is applied, adding XSI margin marking |  
35393           and shading to a line in the OPERANDS section referring to the use of parentheses as arguments |  
35394           to the *test* utility. |

35395 **NAME**

35396           time — time a simple command

35397 **SYNOPSIS**35398 UP       time [-p] *utility* [*argument...*]

35399

35400 **DESCRIPTION**

35401       The *time* utility shall invoke the utility named by the *utility* operand with arguments supplied as  
 35402       the *argument* operands and write a message to standard error that lists timing statistics for the  
 35403       utility. The message shall include the following information:

- 35404           • The elapsed (real) time between invocation of *utility* and its termination.
- 35405           • The User CPU time, equivalent to the sum of the *tms\_utime* and *tms\_cutime* fields returned by  
 35406           the *times()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 for the  
 35407           process in which *utility* is executed.
- 35408           • The System CPU time, equivalent to the sum of the *tms\_stime* and *tms\_cstime* fields returned  
 35409           by the *times()* function for the process in which *utility* is executed.

35410       The precision of the timing shall be no less than the granularity defined for the size of the clock  
 35411       tick unit on the system, but the results shall be reported in terms of standard time units (for  
 35412       example, 0.02 seconds, 00:00:00.02, 1m33.75s, 365.21 seconds), not numbers of clock ticks.

35413       When *time* is used as part of a pipeline, the times reported are unspecified, except when it is the  
 35414       sole command within a grouping command (see Section 2.9.4.1 (on page 52)) in that pipeline. For  
 35415       example, the commands on the left are unspecified; those on the right report on utilities **a** and **c**,  
 35416       respectively:

```
35417 time a | b | c { time a } | b | c
35418 a | b | time c a | b | (time c)
```

35419 **OPTIONS**

35420       The *time* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 35421       12.2, Utility Syntax Guidelines.

35422       The following option shall be supported:

35423       **-p**           Write the timing output to standard error in the format shown in the STDERR  
 35424       section.

35425 **OPERANDS**

35426       The following operands shall be supported:

35427       *utility*       The name of a utility that is to be invoked. If the *utility* operand names any of the  
 35428       special built-in utilities in Section 2.14 (on page 64), the results are undefined.

35429       *argument*     Any string to be supplied as an argument when invoking the utility named by the  
 35430       *utility* operand.

35431 **STDIN**

35432       Not used.

35433 **INPUT FILES**

35434       None.

35435 **ENVIRONMENT VARIABLES**

35436 The following environment variables shall affect the execution of *time*:

35437 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 35438 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 35439 Internationalization Variables for the precedence of internationalization variables  
 35440 used to determine the values of locale categories.)

35441 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 35442 internationalization variables.

35443 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 35444 characters (for example, single-byte as opposed to multi-byte characters in  
 35445 arguments).

35446 **LC\_MESSAGES**  
 35447 Determine the locale that should be used to affect the format and contents of  
 35448 diagnostic and informative messages written to standard error.

35449 **LC\_NUMERIC**  
 35450 Determine the locale for numeric formatting.

35451 **NSI** **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

35452 **PATH** Determine the search path that shall be used to locate the utility to be invoked; see  
 35453 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment  
 35454 Variables.

35455 **ASYNCHRONOUS EVENTS**

35456 Default.

35457 **STDOUT**

35458 Not used.

35459 **STDERR**

35460 The standard error shall be used to write the timing statistics. If **-p** is specified, the following  
 35461 format shall be used in the POSIX locale:

35462 "real %f\nuser %f\nsys %f\n", <real seconds>, <user seconds>,  
 35463 <system seconds>

35464 where each floating-point number shall be expressed in seconds. The precision used may be less  
 35465 than the default six digits of %f, but shall be sufficiently precise to accommodate the size of the  
 35466 clock tick on the system (for example, if there were 60 clock ticks per second, at least two digits  
 35467 shall follow the radix character). The number of digits following the radix character shall be no  
 35468 less than one, even if this always results in a trailing zero. The implementation may append  
 35469 white space and additional information following the format shown here.

35470 **OUTPUT FILES**

35471 None.

35472 **EXTENDED DESCRIPTION**

35473 None.

35474 **EXIT STATUS**

35475 If the *utility* utility is invoked, the exit status of *time* shall be the exit status of *utility*; otherwise,  
 35476 the *time* utility shall exit with one of the following values:

35477 1-125 An error occurred in the *time* utility.

35478 126 The utility specified by *utility* was found but could not be invoked.

35479 127 The utility specified by *utility* could not be found.

## 35480 CONSEQUENCES OF ERRORS

35481 Default.

## 35482 APPLICATION USAGE

35483 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 35484 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 35485 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 35486 used for other meanings; most utilities use small values for “normal error conditions” and the  
 35487 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 35488 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 35489 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 35490 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 35491 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 35492 any other reason.

## 35493 EXAMPLES

35494 It is frequently desirable to apply *time* to pipelines or lists of commands. This can be done by  
 35495 placing pipelines and command lists in a single file; this file can then be invoked as a utility, and  
 35496 the *time* applies to everything in the file.

35497 Alternatively, the following command can be used to apply *time* to a complex command:

35498 `time sh -c 'complex-command-line'`

## 35499 RATIONALE

35500 When the *time* utility was originally proposed to be included in the ISO POSIX-2: 1993 standard,  
 35501 questions were raised about its suitability for inclusion on the grounds that it was not useful for  
 35502 conforming applications, specifically:

- 35503 • The underlying CPU definitions from the System Interfaces volume of IEEE Std 1003.1-2001  
 35504 are vague, so the numeric output could not be compared accurately between systems or even  
 35505 between invocations.
- 35506 • The creation of portable benchmark programs was outside the scope this volume of  
 35507 IEEE Std 1003.1-2001.

35508 However, *time* does fit in the scope of user portability. Human judgement can be applied to the  
 35509 analysis of the output, and it could be very useful in hands-on debugging of applications or in  
 35510 providing subjective measures of system performance. Hence it has been included in this  
 35511 volume of IEEE Std 1003.1-2001.

35512 The default output format has been left unspecified because historical implementations differ  
 35513 greatly in their style of depicting this numeric output. The **-p** option was invented to provide  
 35514 scripts with a common means of obtaining this information.

35515 In the KornShell, *time* is a shell reserved word that can be used to time an entire pipeline, rather  
 35516 than just a simple command. The POSIX definition has been worded to allow this  
 35517 implementation. Consideration was given to invalidating this approach because of the historical  
 35518 model from the C shell and System V shell. However, since the System V *time* utility historically  
 35519 has not produced accurate results in pipeline timing (because the constituent processes are not  
 35520 all owned by the same parent process, as allowed by POSIX), it did not seem worthwhile to  
 35521 break historical KornShell usage.

35522 The term *utility* is used, rather than *command*, to highlight the fact that shell compound  
 35523 commands, pipelines, special built-ins, and so on, cannot be used directly. However, *utility*

35524 includes user application programs and shell scripts, not just the standard utilities.

35525 **FUTURE DIRECTIONS**

35526 None.

35527 **SEE ALSO**

35528 Chapter 2 (on page 29), *sh*, the System Interfaces volume of IEEE Std 1003.1-2001, *times()*

35529 **CHANGE HISTORY**

35530 First released in Issue 2.

35531 **Issue 6**

35532 This utility is marked as part of the User Portability Utilities option.

35533 **NAME**

35534 touch — change file access and modification times

35535 **SYNOPSIS**35536 touch [-acm] [ -r *ref\_file* | -t *time*] *file*...35537 **DESCRIPTION**

35538 The *touch* utility shall change the modification times, access times, or both of files. The  
 35539 modification time shall be equivalent to the value of the *st\_mtime* member of the **stat** structure  
 35540 for a file, as described in the System Interfaces volume of IEEE Std 1003.1-2001; the access time  
 35541 shall be equivalent to the value of *st\_atime*.

35542 The time used can be specified by the **-t** *time* option-argument, the corresponding time fields of  
 35543 the file referenced by the **-r** *ref\_file* option-argument, or the *date\_time* operand, as specified in the  
 35544 following sections. If none of these are specified, *touch* shall use the current time (the value  
 35545 returned by the equivalent of the *time()* function defined in the System Interfaces volume of  
 35546 IEEE Std 1003.1-2001).

35547 For each *file* operand, *touch* shall perform actions equivalent to the following functions defined  
 35548 in the System Interfaces volume of IEEE Std 1003.1-2001:

- 35549 1. If *file* does not exist, a *creat()* function call is made with the *file* operand used as the *path*  
 35550 argument and the value of the bitwise-inclusive OR of S\_IRUSR, S\_IWUSR, S\_IRGRP,  
 35551 S\_IWGRP, S\_IROTH, and S\_IWOTH used as the *mode* argument.
- 35552 2. The *utime()* function is called with the following arguments:
  - 35553 a. The *file* operand is used as the *path* argument.
  - 35554 b. The **utimbuf** structure members *actime* and *modtime* are determined as described in  
 35555 the OPTIONS section.

35556 **OPTIONS**

35557 The *touch* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 35558 12.2, Utility Syntax Guidelines.

35559 The following options shall be supported:

- |       |                           |                                                                                                 |
|-------|---------------------------|-------------------------------------------------------------------------------------------------|
| 35560 | <b>-a</b>                 | Change the access time of <i>file</i> . Do not change the modification time unless <b>-m</b> is |
| 35561 |                           | also specified.                                                                                 |
| 35562 | <b>-c</b>                 | Do not create a specified <i>file</i> if it does not exist. Do not write any diagnostic         |
| 35563 |                           | messages concerning this condition.                                                             |
| 35564 | <b>-m</b>                 | Change the modification time of <i>file</i> . Do not change the access time unless <b>-a</b> is |
| 35565 |                           | also specified.                                                                                 |
| 35566 | <b>-r</b> <i>ref_file</i> | Use the corresponding time of the file named by the pathname <i>ref_file</i> instead of         |
| 35567 |                           | the current time.                                                                               |
| 35568 | <b>-t</b> <i>time</i>     | Use the specified <i>time</i> instead of the current time. The option-argument shall be a       |
| 35569 |                           | decimal number of the form:                                                                     |

35570 [ [CC] YY] MMDDhhmm [ . SS]

35571 where each two digits represents the following:

- |       |           |                                |
|-------|-----------|--------------------------------|
| 35572 | <i>MM</i> | The month of the year [01,12]. |
| 35573 | <i>DD</i> | The day of the month [01,31].  |

35574            *hh*        The hour of the day [00,23].

35575            *mm*        The minute of the hour [00,59].

35576            *CC*        The first two digits of the year (the century).

35577            *YY*        The second two digits of the year.

35578            *SS*        The second of the minute [00,60].

35579            Both *CC* and *YY* shall be optional. If neither is given, the current year shall be  
 35580            assumed. If *YY* is specified, but *CC* is not, *CC* shall be derived as follows:

|       |                         |                           |
|-------|-------------------------|---------------------------|
| 35581 | <b>If <i>YY</i> is:</b> | <b><i>CC</i> becomes:</b> |
| 35582 | [69,99]                 | 19                        |
| 35583 | [00,68]                 | 20                        |

35584            **Note:**        It is expected that in a future version of IEEE Std 1003.1-2001 the default  
 35585            century inferred from a 2-digit year will change. (This would apply to all  
 35586            commands accepting a 2-digit year as input.)

35587            The resulting time shall be affected by the value of the *TZ* environment variable. If  
 35588            the resulting time value precedes the Epoch, *touch* shall exit immediately with an  
 35589            error status. The range of valid times past the Epoch is implementation-defined,  
 35590            but it shall extend to at least the time 0 hours, 0 minutes, 0 seconds, January 1,  
 35591            2038, Coordinated Universal Time. Some implementations may not be able to  
 35592            represent dates beyond January 18, 2038, because they use **signed int** as a time  
 35593            holder.

35594            The range for *SS* is [00,60] rather than [00,59] because of leap seconds. If *SS* is 60,  
 35595            and the resulting time, as affected by the *TZ* environment variable, does not refer  
 35596            to a leap second, the resulting time shall be one second after a time where *SS* is 59.  
 35597            If *SS* is not given a value, it is assumed to be zero.

35598            If neither the **-a** nor **-m** options were specified, *touch* shall behave as if both the **-a** and **-m**  
 35599            options were specified.

## 35600 OPERANDS

35601            The following operands shall be supported:

35602            *file*            A pathname of a file whose times shall be modified.

## 35603 STDIN

35604            Not used.

## 35605 INPUT FILES

35606            None.

## 35607 ENVIRONMENT VARIABLES

35608            The following environment variables shall affect the execution of *touch*:

35609            *LANG*            Provide a default value for the internationalization variables that are unset or null.  
 35610            (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 35611            Internationalization Variables for the precedence of internationalization variables  
 35612            used to determine the values of locale categories.)

35613            *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 35614            internationalization variables.

35615            *LC\_CTYPE*        Determine the locale for the interpretation of sequences of bytes of text data as  
 35616            characters (for example, single-byte as opposed to multi-byte characters in

arguments).

**LC\_MESSAGES**  
Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.

**NLSPATH** XSI Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

**TZ**  
Determine the timezone to be used for interpreting the *time* option-argument. If *TZ* is unset or null, an unspecified default timezone shall be used.

**ASYNCHRONOUS EVENTS**  
Default.

**STDOUT**  
Not used.

**STDERR**  
The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**  
None.

**EXTENDED DESCRIPTION**  
None.

**EXIT STATUS**  
The following exit values shall be returned:

0 The utility executed successfully and all requested changes were made.

>0 An error occurred.

**CONSEQUENCES OF ERRORS**  
Default.

**APPLICATION USAGE**  
The interpretation of time is taken to be *seconds since the Epoch* (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch). It should be noted that implementations conforming to the System Interfaces volume of IEEE Std 1003.1-2001 do not take leap seconds into account when computing seconds since the Epoch. When *SS=60* is used, the resulting time always refers to 1 plus *seconds since the Epoch* for a time when *SS=59*.

Although the **-t time** option-argument specifies values in 1969, the access time and modification time fields are defined in terms of seconds since the Epoch (00:00:00 on 1 January 1970 UTC). Therefore, depending on the value of *TZ* when *touch* is run, there is never more than a few valid hours in 1969 and there need not be any valid times in 1969.

One ambiguous situation occurs if **-t time** is not specified, **-r ref\_file** is not specified, and the first operand is an eight or ten-digit decimal number. A portable script can avoid this problem by using:

```
touch -- file
```

or:

```
touch ./file
```

in this case.

35657 **EXAMPLES**

35658           None.

35659 **RATIONALE**

35660           The functionality of *touch* is described almost entirely through references to functions in the  
 35661           System Interfaces volume of IEEE Std 1003.1-2001. In this way, there is no duplication of effort  
 35662           required for describing such side effects as the relationship of user IDs to the user database,  
 35663           permissions, and so on.

35664           There are some significant differences between the *touch* utility in this volume of  
 35665           IEEE Std 1003.1-2001 and those in System V and BSD systems. They are upwards-compatible for  
 35666           historical applications from both implementations:

35667           1. In System V, an ambiguity exists when a pathname that is a decimal number leads the  
 35668           operands; it is treated as a time value. In BSD, no *time* value is allowed; files may only be  
 35669           *touched* to the current time. The **-t** *time* construct solves these problems for future  
 35670           conforming applications (note that the **-t** option is not historical practice).

35671           2. The inclusion of the century digits, *CC*, is also new. Note that a ten-digit *time* value is  
 35672           treated as if *YY*, and not *CC*, were specified. The caveat about the range of dates following  
 35673           the Epoch was included as recognition that some implementations are not able to  
 35674           represent dates beyond 18 January 2038 because they use **signed int** as a time holder.

35675           The **-r** option was added because several comments requested this capability. This option was  
 35676           named **-f** in an early proposal, but was changed because the **-f** option is used in the BSD version  
 35677           of *touch* with a different meaning.

35678           At least one historical implementation of *touch* incremented the exit code if **-c** was specified and  
 35679           the file did not exist. This volume of IEEE Std 1003.1-2001 requires exit status zero if no errors  
 35680           occur.

35681 **FUTURE DIRECTIONS**35682           Applications should use the **-r** or **-t** options.35683 **SEE ALSO**

35684           *date*, the System Interfaces volume of IEEE Std 1003.1-2001, *creat()*, *time()*, *utime()*, the Base  
 35685           Definitions volume of IEEE Std 1003.1-2001, **<sys/stat.h>**

35686 **CHANGE HISTORY**

35687           First released in Issue 2.

35688 **Issue 6**35689           The obsolescent *date\_time* operand is removed.

35690           The Open Group Corrigendum U027/1 is applied. This extends the range of valid time past the  
 35691           Epoch to at least the time 0 hours, 0 minutes, 0 seconds, January 1, 2038, Coordinated Universal  
 35692           Time. This is a new requirement on POSIX implementations.

35693           The range for seconds is changed from [00,61] to [00,60] to align with the ISO/IEC 9899:1999  
 35694           standard, and to allow for positive leap seconds.

35695 **NAME**

35696           tput — change terminal characteristics

35697 **SYNOPSIS**35698 UP       tput [-T *type*] *operand...*

35699

35700 **DESCRIPTION**

35701       The *tput* utility shall display terminal-dependent information. The manner in which this  
 35702       information is retrieved is unspecified. The information displayed shall clear the terminal screen,  
 35703       initialize the user's terminal, or reset the user's terminal, depending on the operand given. The  
 35704       exact consequences of displaying this information are unspecified.

35705 **OPTIONS**

35706       The *tput* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 35707       12.2, Utility Syntax Guidelines.

35708       The following option shall be supported:

35709       **-T *type***     Indicate the type of terminal. If this option is not supplied and the *TERM* variable  
 35710       is unset or null, an unspecified default terminal type shall be used. The setting of  
 35711       *type* shall take precedence over the value in *TERM*.

35712 **OPERANDS**

35713       The following strings shall be supported as operands by the implementation in the POSIX locale:

35714       **clear**       Display the clear-screen sequence.

35715       **init**        Display the sequence that initializes the user's terminal in an implementation-  
 35716       defined manner.

35717       **reset**       Display the sequence that resets the user's terminal in an implementation-defined  
 35718       manner.

35719       If a terminal does not support any of the operations described by these operands, this shall not  
 35720       be considered an error condition.

35721 **STDIN**

35722       Not used.

35723 **INPUT FILES**

35724       None.

35725 **ENVIRONMENT VARIABLES**

35726       The following environment variables shall affect the execution of *tput*:

35727       **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 35728       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 35729       Internationalization Variables for the precedence of internationalization variables  
 35730       used to determine the values of locale categories.)

35731       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 35732       internationalization variables.

35733       **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 35734       characters (for example, single-byte as opposed to multi-byte characters in  
 35735       arguments).

35736       **LC\_MESSAGES**

35737       Determine the locale that should be used to affect the format and contents of  
 35738       diagnostic messages written to standard error.

35739 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

35740 **TERM** Determine the terminal type. If this variable is unset or null, and if the **-T** option is  
35741 not specified, an unspecified default terminal type shall be used.

35742 **ASYNCHRONOUS EVENTS**

35743 Default.

35744 **STDOUT**

35745 If standard output is a terminal device, it may be used for writing the appropriate sequence to  
35746 clear the screen or reset or initialize the terminal. If standard output is not a terminal device,  
35747 undefined results occur.

35748 **STDERR**

35749 The standard error shall be used only for diagnostic messages.

35750 **OUTPUT FILES**

35751 None.

35752 **EXTENDED DESCRIPTION**

35753 None.

35754 **EXIT STATUS**

35755 The following exit values shall be returned:

35756 0 The requested string was written successfully.

35757 1 Unspecified.

35758 2 Usage error.

35759 3 No information is available about the specified terminal type.

35760 4 The specified operand is invalid.

35761 >4 An error occurred.

35762 **CONSEQUENCES OF ERRORS**

35763 If one of the operands is not available for the terminal, *tput* continues processing the remaining  
35764 operands.

35765 **APPLICATION USAGE**

35766 The difference between resetting and initializing a terminal is left unspecified, as they vary  
35767 greatly based on hardware types. In general, resetting is a more severe action.

35768 Some terminals use control characters to perform the stated functions, and on such terminals it  
35769 might make sense to use *tput* to store the initialization strings in a file or environment variable  
35770 for later use. However, because other terminals might rely on system calls to do this work, the  
35771 standard output cannot be used in a portable manner, such as the following non-portable  
35772 constructs:

35773 ClearVar='tput clear'  
35774 tput reset | mailx -s "Wake Up" ddg

35775 **EXAMPLES**

35776 1. Initialize the terminal according to the type of terminal in the environmental variable  
35777 *TERM*. This command can be included in a **.profile** file.

35778 tput init

35779 2. Reset a 450 terminal.

35780                   tput -T 450 reset

35781 **RATIONALE**

35782                   The list of operands was reduced to a minimum for the following reasons:

- 35783                   • The only features chosen were those that were likely to be used by human users interacting  
35784                   with a terminal.
- 35785                   • Specifying the full *terminfo* set was not considered desirable, but the standard developers did  
35786                   not want to select among operands.
- 35787                   • This volume of IEEE Std 1003.1-2001 does not attempt to provide applications with  
35788                   sophisticated terminal handling capabilities, as that falls outside of its assigned scope and  
35789                   intersects with the responsibilities of other standards bodies.

35790                   The difference between resetting and initializing a terminal is left unspecified as this varies  
35791                   greatly based on hardware types. In general, resetting is a more severe action.

35792                   The exit status of 1 is historically reserved for finding out if a Boolean operand is not set.  
35793                   Although the operands were reduced to a minimum, the exit status of 1 should still be reserved  
35794                   for the Boolean operands, for those sites that wish to support them.

35795 **FUTURE DIRECTIONS**

35796                   None.

35799 **CHANGE HISTORY**

35800                   First released in Issue 4.

35801 **Issue 6**

35802                   This utility is marked as part of the User Portability Utilities option.

35803 **NAME**

35804 tr — translate characters

35805 **SYNOPSIS**35806 tr [-c | -C] [-s] *string1 string2*35807 tr -s [-c | -C] *string1*35808 tr -d [-c | -C] *string1*35809 tr -ds [-c | -C] *string1 string2*35810 **DESCRIPTION**

35811 The *tr* utility shall copy the standard input to the standard output with substitution or deletion  
 35812 of selected characters. The options specified and the *string1* and *string2* operands shall control  
 35813 translations that occur while copying characters and single-character collating elements.

35814 **OPTIONS**

35815 The *tr* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 35816 Utility Syntax Guidelines.

35817 The following options shall be supported:

35818 **-c** Complement the set of values specified by *string1*. See the EXTENDED  
 35819 DESCRIPTION section.

35820 **-C** Complement the set of characters specified by *string1*. See the EXTENDED  
 35821 DESCRIPTION section.

35822 **-d** Delete all occurrences of input characters that are specified by *string1*.

35823 **-s** Replace instances of repeated characters with a single character, as described in the  
 35824 EXTENDED DESCRIPTION section.

35825 **OPERANDS**

35826 The following operands shall be supported:

35827 *string1, string2*

35828 Translation control strings. Each string shall represent a set of characters to be  
 35829 converted into an array of characters used for the translation. For a detailed  
 35830 description of how the strings are interpreted, see the EXTENDED DESCRIPTION  
 35831 section.

35832 **STDIN**

35833 The standard input can be any type of file.

35834 **INPUT FILES**

35835 None.

35836 **ENVIRONMENT VARIABLES**35837 The following environment variables shall affect the execution of *tr*:

35838 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 35839 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 35840 Internationalization Variables for the precedence of internationalization variables  
 35841 used to determine the values of locale categories.)

35842 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 35843 internationalization variables.

35844 **LC\_COLLATE**

35845 Determine the locale for the behavior of range expressions and equivalence classes.

| 35862 |                             | The operands <i>string1</i> and <i>string2</i> (if specified) define two arrays of characters. The constructs in the following list can be used to specify characters or single-character collating elements. If any of the constructs result in multi-character collating elements, <i>tr</i> shall exclude, without a diagnostic, those multi-character elements from the resulting array.                                                                                                                                                                                                                                                            |

| 35867 | <i>\octal</i>               | Octal sequences can be used to represent characters with specific coded values. An octal sequence shall consist of a backslash followed by the longest sequence of one, two, or three-octal-digit characters (01234567). The sequence shall cause the value whose encoding is represented by the one, two, or three-digit octal integer to be placed into the array. If the size of a byte on the system is greater than nine bits, the valid escape sequence used to represent a byte is implementation-defined. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading ' <i>\</i> ' for each byte. |

| 35880 | <i>c-c</i>                  | In the POSIX locale, this construct shall represent the range of collating elements between the range endpoints (as long as neither endpoint is an octal sequence of the form <i>\octal</i> ), inclusive, as defined by the collation sequence. The characters or collating elements in the range shall be placed in the array in ascending collation sequence. If the second endpoint precedes the starting endpoint in the collation sequence, it is unspecified whether the range of collating elements is empty, or this construct is treated as invalid. In locales other than the POSIX locale, this construct has unspecified behavior.          |

| 35899 |                        | When both the <code>-d</code> and <code>-s</code> options are specified, any of the character class names shall be accepted in <i>string2</i> . Otherwise, only character class names <b>lower</b> or <b>upper</b> are valid in <i>string2</i> and then only if the corresponding character class ( <b>upper</b> and <b>lower</b> , respectively) is specified in the same relative position in <i>string1</i> . Such a specification shall be interpreted as a request for case conversion. When <code>[:lower:]</code> appears in <i>string1</i> and <code>[:upper:]</code> appears in <i>string2</i> , the arrays shall contain the characters from the <b>toupper</b> mapping in the <code>LC_CTYPE</code> category of the current locale. When <code>[:upper:]</code> appears in <i>string1</i> and <code>[:lower:]</code> appears in <i>string2</i> , the arrays shall contain the characters from the <b>tolower</b> mapping in the <code>LC_CTYPE</code> category of the current locale. The first character from each mapping pair shall be in the array for <i>string1</i> and the second character from each mapping pair shall be in the array for <i>string2</i> in the same relative position. |

| 35921 | <code>[x*n]</code>     | Represents <i>n</i> repeated occurrences of the character <i>x</i> . Because this expression is used to map multiple characters to one, it is only valid when it occurs in <i>string2</i> . If <i>n</i> is omitted or is zero, it shall be interpreted as large enough to extend the <i>string2</i> -based sequence to the length of the <i>string1</i> -based sequence. If <i>n</i> has a leading zero, it shall be interpreted as an octal value. Otherwise, it shall be interpreted as a decimal value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 35933 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 35934 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 35935 |                        | • If the <code>-c</code> option is specified, the complement of the values specified by <i>string1</i> shall be placed in the array in ascending order by binary value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 35936 |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

35937 • Because the order in which characters specified by character class expressions or equivalence  
 35938 class expressions is undefined, such expressions should only be used if the intent is to map  
 35939 several characters into one. An exception is case conversion, as described previously.

35940 When the **-d** option is specified:

- 35941 • Input characters found in the array specified by *string1* shall be deleted.
- 35942 • When the **-C** option is specified with **-d**, all characters except those specified by *string1* shall  
 35943 be deleted. The contents of *string2* are ignored, unless the **-s** option is also specified.
- 35944 • When the **-c** option is specified with **-d**, all values except those specified by *string1* shall be  
 35945 deleted. The contents of *string2* shall be ignored, unless the **-s** option is also specified.
- 35946 • The same string cannot be used for both the **-d** and the **-s** option; when both options are  
 35947 specified, both *string1* (used for deletion) and *string2* (used for squeezing) shall be required.

35948 When the **-s** option is specified, after any deletions or translations have taken place, repeated  
 35949 sequences of the same character shall be replaced by one occurrence of the same character, if the  
 35950 character is found in the array specified by the last operand. If the last operand contains a  
 35951 character class, such as the following example:

35952 `tr -s '[:space:]'`

35953 the last operand's array shall contain all of the characters in that character class. However, in a  
 35954 case conversion, as described previously, such as:

35955 `tr -s '[:upper:]' '[:lower:]'`

35956 the last operand's array shall contain only those characters defined as the second characters in  
 35957 each of the **toupper** or **tolower** character pairs, as appropriate.

35958 An empty string used for *string1* or *string2* produces undefined results.

#### 35959 EXIT STATUS

35960 The following exit values shall be returned:

35961 0 All input was processed successfully.

35962 >0 An error occurred.

#### 35963 CONSEQUENCES OF ERRORS

35964 Default.

#### 35965 APPLICATION USAGE

35966 If necessary, *string1* and *string2* can be quoted to avoid pattern matching by the shell.

35967 If an ordinary digit (representing itself) is to follow an octal sequence, the octal sequence must  
 35968 use the full three digits to avoid ambiguity.

35969 When *string2* is shorter than *string1*, a difference results between historical System V and BSD  
 35970 systems. A BSD system pads *string2* with the last character found in *string2*. Thus, it is possible  
 35971 to do the following:

35972 `tr 0123456789 d`

35973 which would translate all digits to the letter 'd'. Since this area is specifically unspecified in  
 35974 this volume of IEEE Std 1003.1-2001, both the BSD and System V behaviors are allowed, but a  
 35975 conforming application cannot rely on the BSD behavior. It would have to code the example in  
 35976 the following way:

35977 `tr 0123456789 '[d*]'`

35978 It should be noted that, despite similarities in appearance, the string operands used by *tr* are not  
35979 regular expressions.

35980 Unlike some historical implementations, this definition of the *tr* utility correctly processes NUL  
35981 characters in its input stream. NUL characters can be stripped by using:

35982 `tr -d '\000'`

### 35983 EXAMPLES

35984 1. The following example creates a list of all words in **file1** one per line in **file2**, where a word  
35985 is taken to be a maximal string of letters.

35986 `tr -cs "[:alpha:]" "[\n*]" <file1 >file2`

35987 2. The next example translates all lowercase characters in **file1** to uppercase and writes the  
35988 results to standard output.

35989 `tr "[:lower:]" "[:upper:]" <file1`

35990 3. This example uses an equivalence class to identify accented variants of the base character  
35991 'e' in **file1**, which are stripped of diacritical marks and written to **file2**.

35992 `tr "[=e=]" e <file1 >file2`

### 35993 RATIONALE

35994 In some early proposals, an explicit option **-n** was added to disable the historical behavior of  
35995 stripping NUL characters from the input. It was considered that automatically stripping NUL  
35996 characters from the input was not correct functionality. However, the removal of **-n** in a later  
35997 proposal does not remove the requirement that *tr* correctly process NUL characters in its input  
35998 stream. NUL characters can be stripped by using `tr -d '\000'`.

35999 Historical implementations of *tr* differ widely in syntax and behavior. For example, the BSD  
36000 version has not needed the bracket characters for the repetition sequence. The *tr* utility syntax is  
36001 based more closely on the System V and XPG3 model while attempting to accommodate  
36002 historical BSD implementations. In the case of the short *string2* padding, the decision was to  
36003 unspecify the behavior and preserve System V and XPG3 scripts, which might find difficulty  
36004 with the BSD method. The assumption was made that BSD users of *tr* have to make  
36005 accommodations to meet the syntax defined here. Since it is possible to use the repetition  
36006 sequence to duplicate the desired behavior, whereas there is no simple way to achieve the  
36007 System V method, this was the correct, if not desirable, approach.

36008 The use of octal values to specify control characters, while having historical precedents, is not  
36009 portable. The introduction of escape sequences for control characters should provide the  
36010 necessary portability. It is recognized that this may cause some historical scripts to break.

36011 An early proposal included support for multi-character collating elements. It was pointed out  
36012 that, while *tr* does employ some syntactical elements from REs, the aim of *tr* is quite different;  
36013 ranges, for example, do not have a similar meaning ("any of the chars in the range matches",  
36014 *versus* "translate each character in the range to the output counterpart"). As a result, the  
36015 previously included support for multi-character collating elements has been removed. What  
36016 remains are ranges in current collation order (to support, for example, accented characters),  
36017 character classes, and equivalence classes.

36018 In XPG3 the `[:class:]` and `[equiv=]` conventions are shown with double brackets, as in RE syntax.  
36019 However, *tr* does not implement RE principles; it just borrows part of the syntax. Consequently,  
36020 `[:class:]` and `[equiv=]` should be regarded as syntactical elements on a par with `[x*n]`, which is  
36021 not an RE bracket expression.

36022 The standard developers will consider changes to *tr* that allow it to translate characters between  
 36023 different character encodings, or they will consider providing a new utility to accomplish this.

36024 On historical System V systems, a range expression requires enclosing square-brackets, such as:

36025 `tr '[a-z]' '[A-Z]'`

36026 However, BSD-based systems did not require the brackets, and this convention is used here to  
 36027 avoid breaking large numbers of BSD scripts:

36028 `tr a-z A-Z`

36029 The preceding System V script will continue to work because the brackets, treated as regular  
 36030 characters, are translated to themselves. However, any System V script that relied on "a-z"  
 36031 representing the three characters 'a', '-', and 'z' have to be rewritten as "az-".

36032 The ISO POSIX-2: 1993 standard had a `-c` option that behaved similarly to the `-C` option, but did  
 36033 not supply functionality equivalent to the `-c` option specified in IEEE Std 1003.1-2001. This  
 36034 meant that historical practice of being able to specify `tr -d\200-\377` (which would delete all  
 36035 bytes with the top bit set) would have no effect because, in the C locale, bytes with the values  
 36036 octal 200 to octal 377 are not characters.

36037 The earlier version also said that octal sequences referred to collating elements and could be  
 36038 placed adjacent to each other to specify multi-byte characters. However, it was noted that this  
 36039 caused ambiguities because *tr* would not be able to tell whether adjacent octal sequences were  
 36040 intending to specify multi-byte characters or multiple single byte characters.  
 36041 IEEE Std 1003.1-2001 specifies that octal sequences always refer to single byte binary values.

#### 36042 **FUTURE DIRECTIONS**

36043 None.

#### 36044 **SEE ALSO**

36045 *sed*

#### 36046 **CHANGE HISTORY**

36047 First released in Issue 2.

#### 36048 **Issue 6**

36049 The `-C` operand is added, and the description of the `-c` operand is changed to align with the  
 36050 IEEE P1003.2b draft standard.

36051 The normative text is reworded to avoid use of the term “must” for application requirements.

36052 **NAME**

36053           true — return true value

36054 **SYNOPSIS**

36055           true

36056 **DESCRIPTION**36057           The *true* utility shall return with exit code zero.36058 **OPTIONS**

36059           None.

36060 **OPERANDS**

36061           None.

36062 **STDIN**

36063           Not used.

36064 **INPUT FILES**

36065           None.

36066 **ENVIRONMENT VARIABLES**

36067           None.

36068 **ASYNCHRONOUS EVENTS**

36069           Default.

36070 **STDOUT**

36071           Not used.

36072 **STDERR**

36073           Not used. |

36074 **OUTPUT FILES**

36075           None.

36076 **EXTENDED DESCRIPTION**

36077           None.

36078 **EXIT STATUS**

36079           Zero. |

36080 **CONSEQUENCES OF ERRORS**

36081           None.

36082 **APPLICATION USAGE**

36083           This utility is typically used in shell scripts, as shown in the EXAMPLES section. The special  
 36084           built-in utility `:` is sometimes more efficient than *true*.

36085 **EXAMPLES**

36086           This command is executed forever:

```
36087 while true
36088 do
36089 command
36090 done
```

36091 **RATIONALE**

36092           The *true* utility has been retained in this volume of IEEE Std 1003.1-2001, even though the shell  
36093           special built-in : provides similar functionality, because *true* is widely used in historical scripts  
36094           and is less cryptic to novice script readers.

36095 **FUTURE DIRECTIONS**

36096           None.

36097 **SEE ALSO**

36098           *false*, Section 2.9 (on page 47)

36099 **CHANGE HISTORY**

36100           First released in Issue 2.

36101 **Issue 6**

36102           IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/39 is applied, replacing the terms “None”  
36103           and “Default” from the STDERR and EXIT STATUS sections, respectively, with terms as defined  
36104           in Section 1.11 (on page 20).

36105 **NAME**

36106           tsort — topological sort

36107 **SYNOPSIS**36108 xSI       tsort [*file*]

36109

36110 **DESCRIPTION**36111           The *tsort* utility shall write to standard output a totally ordered list of items consistent with a  
36112           partial ordering of items contained in the input.36113           The application shall ensure that the input consists of pairs of items (non-empty strings)  
36114           separated by <blank>s. Pairs of different items indicate ordering. Pairs of identical items  
36115           indicate presence, but not ordering.36116 **OPTIONS**

36117           None.

36118 **OPERANDS**

36119           The following operand shall be supported:

36120           *file*           A pathname of a text file to order. If no *file* operand is given, the standard input  
36121           shall be used.36122 **STDIN**36123           The standard input shall be a text file that is used if no *file* operand is given.36124 **INPUT FILES**36125           The input file named by the *file* operand is a text file.36126 **ENVIRONMENT VARIABLES**36127           The following environment variables shall affect the execution of *tsort*:36128           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
36129                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
36130                           Internationalization Variables for the precedence of internationalization variables  
36131                           used to determine the values of locale categories.)36132           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
36133           internationalization variables.36134           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
36135           characters (for example, single-byte as opposed to multi-byte characters in  
36136           arguments and input files).36137           *LC\_MESSAGES*36138                           Determine the locale that should be used to affect the format and contents of  
36139           diagnostic messages written to standard error.36140           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.36141 **ASYNCHRONOUS EVENTS**

36142           Default.

36143 **STDOUT**36144           The standard output shall be a text file consisting of the order list produced from the partially  
36145           ordered input.

**36146 STDERR**

36147 The standard error shall be used only for diagnostic messages.

**36148 OUTPUT FILES**

36149 None.

**36150 EXTENDED DESCRIPTION**

36151 None.

**36152 EXIT STATUS**

36153 The following exit values shall be returned:

36154 0 Successful completion.

36155 >0 An error occurred.

**36156 CONSEQUENCES OF ERRORS**

36157 Default.

**36158 APPLICATION USAGE**

36159 The *LC\_COLLATE* variable need not affect the actions of *tsort*. The output ordering is not  
36160 lexicographic, but depends on the pairs of items given as input.

**36161 EXAMPLES**

36162 The command:

```
36163 tsort <<EOF
36164 a b c c d e
36165 g g
36166 f g e f
36167 h h
36168 EOF
```

36169 produces the output:

```
36170 a
36171 b
36172 c
36173 d
36174 e
36175 f
36176 g
36177 h
```

**36178 RATIONALE**

36179 None.

**36180 FUTURE DIRECTIONS**

36181 None.

**36182 SEE ALSO**

36183 None.

**36184 CHANGE HISTORY**

36185 First released in Issue 2.

**36186 Issue 6**

36187 The normative text is reworded to avoid use of the term “must” for application requirements.

36188 **NAME**

36189           tty — return user's terminal name

36190 **SYNOPSIS**

36191           tty

36192 **DESCRIPTION**

36193           The *tty* utility shall write to the standard output the name of the terminal that is open as  
 36194           standard input. The name that is used shall be equivalent to the string that would be returned by  
 36195           the *ttyname()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001.

36196 **OPTIONS**

36197           The *tty* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 36198           Utility Syntax Guidelines.

36199 **OPERANDS**

36200           None.

36201 **STDIN**

36202           While no input is read from standard input, standard input shall be examined to determine  
 36203           whether or not it is a terminal, and, if so, to determine the name of the terminal.

36204 **INPUT FILES**

36205           None.

36206 **ENVIRONMENT VARIABLES**36207           The following environment variables shall affect the execution of *tty*:

36208           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 36209                        (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36210                        Internationalization Variables for the precedence of internationalization variables  
 36211                        used to determine the values of locale categories.)

36212           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 36213                        internationalization variables.

36214           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 36215                        characters (for example, single-byte as opposed to multi-byte characters in  
 36216                        arguments).

36217           *LC\_MESSAGES*

36218                        Determine the locale that should be used to affect the format and contents of  
 36219                        diagnostic messages written to standard error and informative messages written to  
 36220                        standard output.

36221 xSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36222 **ASYNCHRONOUS EVENTS**

36223           Default.

36224 **STDOUT**

36225           If standard input is a terminal device, a pathname of the terminal as specified by the *ttyname()*  
 36226           function defined in the System Interfaces volume of IEEE Std 1003.1-2001 shall be written in the  
 36227           following format:

36228           "%s\n", &lt;terminal name&gt;

36229           Otherwise, a message shall be written indicating that standard input is not connected to a  
 36230           terminal. In the POSIX locale, the *tty* utility shall use the format:

36231 "not a tty\n"

36232 **STDERR**

36233 The standard error shall be used only for diagnostic messages.

36234 **OUTPUT FILES**

36235 None.

36236 **EXTENDED DESCRIPTION**

36237 None.

36238 **EXIT STATUS**

36239 The following exit values shall be returned:

36240 0 Standard input is a terminal.

36241 1 Standard input is not a terminal.

36242 >1 An error occurred.

36243 **CONSEQUENCES OF ERRORS**

36244 Default.

36245 **APPLICATION USAGE**

36246 This utility checks the status of the file open as standard input against that of an  
36247 implementation-defined set of files. It is possible that no match can be found, or that the match  
36248 found need not be the same file as that which was opened for standard input (although they are  
36249 the same device).

36250 **EXAMPLES**

36251 None.

36252 **RATIONALE**

36253 None.

36254 **FUTURE DIRECTIONS**

36255 None.

36256 **SEE ALSO**

36257 The System Interfaces volume of IEEE Std 1003.1-2001, *isatty()*, *ttyname()*

36258 **CHANGE HISTORY**

36259 First released in Issue 2.

36260 **Issue 5**

36261 The SYNOPSIS is changed to indicate two forms of the command, with the second form marked  
36262 as obsolete. This is a clarification and does not change the functionality published in previous  
36263 issues.

36264 **Issue 6**

36265 The obsolescent **-s** option is removed.

36266 **NAME**

36267           type — write a description of command type

36268 **SYNOPSIS**

36269 xSI       type name...

36270

36271 **DESCRIPTION**36272       The *type* utility shall indicate how each argument would be interpreted if used as a command  
36273       name.36274 **OPTIONS**

36275       None.

36276 **OPERANDS**

36277       The following operand shall be supported:

36278       *name*           A name to be interpreted.36279 **STDIN**

36280       Not used.

36281 **INPUT FILES**

36282       None.

36283 **ENVIRONMENT VARIABLES**36284       The following environment variables shall affect the execution of *type*:36285       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
36286                       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
36287                       Internationalization Variables for the precedence of internationalization variables  
36288                       used to determine the values of locale categories.)36289       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
36290       internationalization variables.36291       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
36292       characters (for example, single-byte as opposed to multi-byte characters in  
36293       arguments).36294       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
36295       diagnostic messages written to standard error.  
3629636297       *NLSPATH*       Determine the location of message catalogs for the processing of *LC\_MESSAGES*.36298       *PATH*           Determine the location of *name*, as described in the Base Definitions volume of  
36299       IEEE Std 1003.1-2001, Chapter 8, Environment Variables.36300 **ASYNCHRONOUS EVENTS**

36301       Default.

36302 **STDOUT**36303       The standard output of *type* contains information about each operand in an unspecified format.  
36304       The information provided typically identifies the operand as a shell built-in, function, alias, or  
36305       keyword, and where applicable, may display the operand's pathname.

36306 **STDERR**

36307           The standard error shall be used only for diagnostic messages.

36308 **OUTPUT FILES**

36309           None.

36310 **EXTENDED DESCRIPTION**

36311           None.

36312 **EXIT STATUS**

36313           The following exit values shall be returned:

36314           0   Successful completion.

36315           >0  An error occurred.

36316 **CONSEQUENCES OF ERRORS**

36317           Default.

36318 **APPLICATION USAGE**

36319           Since *type* must be aware of the contents of the current shell execution environment (such as the  
36320           lists of commands, functions, and built-ins processed by *hash*), it is always provided as a shell  
36321           regular built-in. If it is called in a separate utility execution environment, such as one of the  
36322           following:

36323           nohup *type* writer

36324           find . -type f | xargs *type*

36325           it might not produce accurate results.

36326 **EXAMPLES**

36327           None.

36328 **RATIONALE**

36329           None.

36330 **FUTURE DIRECTIONS**

36331           None.

36332 **SEE ALSO**

36333           *command*, *hash*

36334 **CHANGE HISTORY**

36335           First released in Issue 2.

36336 **NAME**

36337           ulimit — set or report file size limit

36338 **SYNOPSIS**36339 xSI       ulimit [-f] [*blocks*]

36340

36341 **DESCRIPTION**

36342       The *ulimit* utility shall set or report the file-size writing limit imposed on files written by the  
 36343       shell and its child processes (files of any size may be read). Only a process with appropriate  
 36344       privileges can increase the limit.

36345 **OPTIONS**

36346       The *ulimit* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 36347       12.2, Utility Syntax Guidelines.

36348       The following option shall be supported:

36349       **-f**           Set (or report, if no *blocks* operand is present), the file size limit in blocks. The **-f**  
 36350       option shall also be the default case.

36351 **OPERANDS**

36352       The following operand shall be supported:

36353       *blocks*       The number of 512-byte blocks to use as the new file size limit.

36354 **STDIN**

36355       Not used.

36356 **INPUT FILES**

36357       None.

36358 **ENVIRONMENT VARIABLES**

36359       The following environment variables shall affect the execution of *ulimit*:

36360       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 36361       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36362       Internationalization Variables for the precedence of internationalization variables  
 36363       used to determine the values of locale categories.)

36364       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 36365       internationalization variables.

36366       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 36367       characters (for example, single-byte as opposed to multi-byte characters in  
 36368       arguments).

36369       *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
 36370       diagnostic messages written to standard error.  
 36371

36372       *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36373 **ASYNCHRONOUS EVENTS**

36374       Default.

36375 **STDOUT**

36376       The standard output shall be used when no *blocks* operand is present. If the current number of  
 36377       blocks is limited, the number of blocks in the current limit shall be written in the following  
 36378       format:

36379 "%d\n", <number of 512-byte blocks>

36380 If there is no current limit on the number of blocks, in the POSIX locale the following format  
36381 shall be used:

36382 "unlimited\n"

#### 36383 **STDERR**

36384 The standard error shall be used only for diagnostic messages.

#### 36385 **OUTPUT FILES**

36386 None.

#### 36387 **EXTENDED DESCRIPTION**

36388 None.

#### 36389 **EXIT STATUS**

36390 The following exit values shall be returned:

36391 0 Successful completion.

36392 >0 A request for a higher limit was rejected or an error occurred.

#### 36393 **CONSEQUENCES OF ERRORS**

36394 Default.

#### 36395 **APPLICATION USAGE**

36396 Since *ulimit* affects the current shell execution environment, it is always provided as a shell  
36397 regular built-in. If it is called in a separate utility execution environment, such as one of the  
36398 following:

36399 nohup ulimit -f 10000

36400 env ulimit 10000

36401 it does not affect the file size limit of the caller's environment.

36402 Once a limit has been decreased by a process, it cannot be increased (unless appropriate  
36403 privileges are involved), even back to the original system limit.

#### 36404 **EXAMPLES**

36405 Set the file size limit to 51 200 bytes:

36406 ulimit -f 100

#### 36407 **RATIONALE**

36408 None.

#### 36409 **FUTURE DIRECTIONS**

36410 None.

#### 36411 **SEE ALSO**

36412 The System Interfaces volume of IEEE Std 1003.1-2001, *ulimit()*

#### 36413 **CHANGE HISTORY**

36414 First released in Issue 2.

36415 **NAME**

36416           umask — get or set the file mode creation mask

36417 **SYNOPSIS**36418           umask [-S] [*mask*]36419 **DESCRIPTION**

36420           The *umask* utility shall set the file mode creation mask of the current shell execution  
 36421           environment (see Section 2.12 (on page 61)) to the value specified by the *mask* operand. This  
 36422           mask shall affect the initial value of the file permission bits of subsequently created files. If *umask*  
 36423           is called in a subshell or separate utility execution environment, such as one of the following:

36424           (*umask* 002)  
 36425           nohup *umask* ...  
 36426           find . -exec *umask* ... \;

36427           it shall not affect the file mode creation mask of the caller's environment.

36428           If the *mask* operand is not specified, the *umask* utility shall write to standard output the value of  
 36429           the invoking process' file mode creation mask.

36430 **OPTIONS**

36431           The *umask* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 36432           12.2, Utility Syntax Guidelines.

36433           The following option shall be supported:

36434           -S           Produce symbolic output.

36435           The default output style is unspecified, but shall be recognized on a subsequent invocation of  
 36436           *umask* on the same system as a *mask* operand to restore the previous file mode creation mask.

36437 **OPERANDS**

36438           The following operand shall be supported:

36439           *mask*           A string specifying the new file mode creation mask. The string is treated in the  
 36440           same way as the *mode* operand described in the EXTENDED DESCRIPTION  
 36441           section for *chmod*.

36442           For a *symbolic\_mode* value, the new value of the file mode creation mask shall be  
 36443           the logical complement of the file permission bits portion of the file mode specified  
 36444           by the *symbolic\_mode* string.

36445           In a *symbolic\_mode* value, the permissions *op* characters '+' and '-' shall be  
 36446           interpreted relative to the current file mode creation mask; '+' shall cause the bits  
 36447           for the indicated permissions to be cleared in the mask; '-' shall cause the bits for  
 36448           the indicated permissions to be set in the mask.

36449           The interpretation of *mode* values that specify file mode bits other than the file  
 36450           permission bits is unspecified.

36451           In the octal integer form of *mode*, the specified bits are set in the file mode creation  
 36452           mask.

36453           The file mode creation mask shall be set to the resulting numeric value.

36454           The default output of a prior invocation of *umask* on the same system with no  
 36455           operand also shall be recognized as a *mask* operand.

36456 **STDIN**

36457 Not used.

36458 **INPUT FILES**

36459 None.

36460 **ENVIRONMENT VARIABLES**36461 The following environment variables shall affect the execution of *umask*:

36462 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 36463 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36464 Internationalization Variables for the precedence of internationalization variables  
 36465 used to determine the values of locale categories.)

36466 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 36467 internationalization variables.

36468 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 36469 characters (for example, single-byte as opposed to multi-byte characters in  
 36470 arguments).

36471 *LC\_MESSAGES*

36472 Determine the locale that should be used to affect the format and contents of  
 36473 diagnostic messages written to standard error.

36474 *XS* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36475 **ASYNCHRONOUS EVENTS**

36476 Default.

36477 **STDOUT**

36478 When the *mask* operand is not specified, the *umask* utility shall write a message to standard  
 36479 output that can later be used as a *umask mask* operand.

36480 If *-S* is specified, the message shall be in the following format:

36481 "u=%s,g=%s,o=%s\n", <owner permissions>, <group permissions>,  
 36482 <other permissions>

36483 where the three values shall be combinations of letters from the set {r, w, x}; the presence of a  
 36484 letter shall indicate that the corresponding bit is clear in the file mode creation mask.

36485 If a *mask* operand is specified, there shall be no output written to standard output.36486 **STDERR**

36487 The standard error shall be used only for diagnostic messages.

36488 **OUTPUT FILES**

36489 None.

36490 **EXTENDED DESCRIPTION**

36491 None.

36492 **EXIT STATUS**

36493 The following exit values shall be returned:

36494 0 The file mode creation mask was successfully changed, or no *mask* operand was supplied.

36495 &gt;0 An error occurred.

36496 **CONSEQUENCES OF ERRORS**

36497 Default.

36498 **APPLICATION USAGE**

36499 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 36500 regular built-in.

36501 In contrast to the negative permission logic provided by the file mode creation mask and the  
 36502 octal number form of the *mask* argument, the symbolic form of the *mask* argument specifies those  
 36503 permissions that are left alone.

36504 **EXAMPLES**

36505 Either of the commands:

36506 `umask a=rx,ug+w`36507 `umask 002`

36508 sets the mode mask so that subsequently created files have their S\_IWOTH bit cleared.

36509 After setting the mode mask with either of the above commands, the *umask* command can be  
 36510 used to write out the current value of the mode mask:

36511 `$ umask`36512 `0002`

36513 (The output format is unspecified, but historical implementations use the octal integer mode  
 36514 format.)

36515 `$ umask -S`36516 `u=rwx,g=rwx,o=rx`

36517 Either of these outputs can be used as the mask operand to a subsequent invocation of the *umask*  
 36518 utility.

36519 Assuming the mode mask is set as above, the command:

36520 `umask g-w`

36521 sets the mode mask so that subsequently created files have their S\_IWGRP and S\_IWOTH bits  
 36522 cleared.

36523 The command:

36524 `umask -- -w`

36525 sets the mode mask so that subsequently created files have all their write bits cleared. Note that  
 36526 *mask* operands `-r`, `-w`, `-x` or anything beginning with a hyphen, must be preceded by `--` to  
 36527 keep it from being interpreted as an option.

36528 **RATIONALE**

36529 Since *umask* affects the current shell execution environment, it is generally provided as a shell  
 36530 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 36531 of the following:

36532 `(umask 002)`36533 `nohup umask ...`36534 `find . -exec umask ... \;`

36535 it does not affect the file mode creation mask of the environment of the caller.

36536 The description of the historical utility was modified to allow it to use the symbolic modes of  
 36537 *chmod*. The `-s` option used in early proposals was changed to `-S` because `-s` could be confused

36538 with a *symbolic\_mode* form of mask referring to the S\_ISUID and S\_ISGID bits.

36539 The default output style is implementation-defined to permit implementors to provide  
36540 migration to the new symbolic style at the time most appropriate to their users. A **-o** flag to  
36541 force octal mode output was omitted because the octal mode may not be sufficient to specify all  
36542 of the information that may be present in the file mode creation mask when more secure file  
36543 access permission checks are implemented.

36544 It has been suggested that trusted systems developers might appreciate ameliorating the  
36545 requirement that the mode mask “affects” the file access permissions, since it seems access  
36546 control lists might replace the mode mask to some degree. The wording has been changed to say  
36547 that it affects the file permission bits, and it leaves the details of the behavior of how they affect  
36548 the file access permissions to the description in the System Interfaces volume of  
36549 IEEE Std 1003.1-2001.

36550 **FUTURE DIRECTIONS**

36551 None.

36552 **SEE ALSO**

36553 Chapter 2 (on page 29), *chmod*, the System Interfaces volume of IEEE Std 1003.1-2001, *umask()*

36554 **CHANGE HISTORY**

36555 First released in Issue 2.

36556 **Issue 6**

36557 The following new requirements on POSIX implementations derive from alignment with the  
36558 Single UNIX Specification:

- 36559
- The octal mode is supported.

36560 **NAME**

36561 unalias — remove alias definitions

36562 **SYNOPSIS**36563 UP unalias *alias-name*...

36564 unalias -a

36565

36566 **DESCRIPTION**

36567 The *unalias* utility shall remove the definition for each alias name specified. See Section 2.3.1 (on  
 36568 page 32). The aliases shall be removed from the current shell execution environment; see Section  
 36569 2.12 (on page 61).

36570 **OPTIONS**

36571 The *unalias* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 36572 12.2, Utility Syntax Guidelines.

36573 The following option shall be supported:

36574 **-a** Remove all alias definitions from the current shell execution environment.

36575 **OPERANDS**

36576 The following operand shall be supported:

36577 *alias-name* The name of an alias to be removed.

36578 **STDIN**

36579 Not used.

36580 **INPUT FILES**

36581 None.

36582 **ENVIRONMENT VARIABLES**

36583 The following environment variables shall affect the execution of *unalias*:

36584 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 36585 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36586 Internationalization Variables for the precedence of internationalization variables  
 36587 used to determine the values of locale categories.)

36588 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 36589 internationalization variables.

36590 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 36591 characters (for example, single-byte as opposed to multi-byte characters in  
 36592 arguments).

36593 **LC\_MESSAGES**

36594 Determine the locale that should be used to affect the format and contents of  
 36595 diagnostic messages written to standard error.

36596 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36597 **ASYNCHRONOUS EVENTS**

36598 Default.

36599 **STDOUT**

36600 Not used.

36601 **STDERR**

36602           The standard error shall be used only for diagnostic messages.

36603 **OUTPUT FILES**

36604           None.

36605 **EXTENDED DESCRIPTION**

36606           None.

36607 **EXIT STATUS**

36608           The following exit values shall be returned:

36609           0   Successful completion.

36610           >0   One of the *alias-name* operands specified did not represent a valid alias definition, or an  
36611           error occurred.

36612 **CONSEQUENCES OF ERRORS**

36613           Default.

36614 **APPLICATION USAGE**

36615           Since *unalias* affects the current shell execution environment, it is generally provided as a shell  
36616           regular built-in.

36617 **EXAMPLES**

36618           None.

36619 **RATIONALE**

36620           The *unalias* description is based on that from historical KornShell implementations. Known  
36621           differences exist between that and the C shell. The KornShell version was adopted to be  
36622           consistent with all the other KornShell features in this volume of IEEE Std 1003.1-2001, such as  
36623           command line editing.

36624           The *-a* option is the equivalent of the *unalias \** form of the C shell and is provided to address  
36625           security concerns about unknown aliases entering the environment of a user (or application)  
36626           through the allowable implementation-defined predefined alias route or as a result of an *ENV*  
36627           file. (Although *unalias* could be used to simplify the “secure” shell script shown in the *command*  
36628           rationale, it does not obviate the need to quote all command names. An initial call to *unalias -a*  
36629           would have to be quoted in case there was an alias for *unalias*.)

36630 **FUTURE DIRECTIONS**

36631           None.

36632 **SEE ALSO**

36633           Chapter 2 (on page 29), *alias*

36634 **CHANGE HISTORY**

36635           First released in Issue 4.

36636 **Issue 6**

36637           This utility is marked as part of the User Portability Utilities option.

36638 **NAME**

36639            uname — return system name

36640 **SYNOPSIS**

36641            uname [-snrvma]

36642 **DESCRIPTION**

36643            By default, the *uname* utility shall write the operating system name to standard output. When  
 36644            options are specified, symbols representing one or more system characteristics shall be written  
 36645            to the standard output. The format and contents of the symbols are implementation-defined. On  
 36646            systems conforming to the System Interfaces volume of IEEE Std 1003.1-2001, the symbols  
 36647            written shall be those supported by the *uname()* function as defined in the System Interfaces  
 36648            volume of IEEE Std 1003.1-2001.

36649 **OPTIONS**

36650            The *uname* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 36651            12.2, Utility Syntax Guidelines.

36652            The following options shall be supported:

- 36653            **-a**            Behave as though all of the options **-mnrsv** were specified.
- 36654            **-m**            Write the name of the hardware type on which the system is running to standard  
 36655            output.
- 36656            **-n**            Write the name of this node within an implementation-defined communications  
 36657            network.
- 36658            **-r**            Write the current release level of the operating system implementation.
- 36659            **-s**            Write the name of the implementation of the operating system.
- 36660            **-v**            Write the current version level of this release of the operating system  
 36661            implementation.
- 36662            If no options are specified, the *uname* utility shall write the operating system name, as if the **-s**  
 36663            option had been specified.

36664 **OPERANDS**

36665            None.

36666 **STDIN**

36667            Not used.

36668 **INPUT FILES**

36669            None.

36670 **ENVIRONMENT VARIABLES**36671            The following environment variables shall affect the execution of *uname*:

- 36672            **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 36673            (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36674            Internationalization Variables for the precedence of internationalization variables  
 36675            used to determine the values of locale categories.)
- 36676            **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 36677            internationalization variables.
- 36678            **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 36679            characters (for example, single-byte as opposed to multi-byte characters in  
 36680            arguments).

36681 **LC\_MESSAGES**  
 36682 Determine the locale that should be used to affect the format and contents of  
 36683 diagnostic messages written to standard error.

36684 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

36685 **ASYNCHRONOUS EVENTS**  
 36686 Default.

36687 **STDOUT**  
 36688 By default, the output shall be a single line of the following form:  
 36689 "%s\n", <sysname>  
 36690 If the **-a** option is specified, the output shall be a single line of the following form:  
 36691 "%s %s %s %s %s\n", <sysname>, <nodename>, <release>,  
 36692 <version>, <machine>  
 36693 Additional implementation-defined symbols may be written; all such symbols shall be written at  
 36694 the end of the line of output before the <newline>.  
 36695 If options are specified to select different combinations of the symbols, only those symbols shall  
 36696 be written, in the order shown above for the **-a** option. If a symbol is not selected for writing, its  
 36697 corresponding trailing <blank>s also shall not be written.

36698 **STDERR**  
 36699 The standard error shall be used only for diagnostic messages.

36700 **OUTPUT FILES**  
 36701 None.

36702 **EXTENDED DESCRIPTION**  
 36703 None.

36704 **EXIT STATUS**  
 36705 The following exit values shall be returned:  
 36706 0 The requested information was successfully written.  
 36707 >0 An error occurred.

36708 **CONSEQUENCES OF ERRORS**  
 36709 Default.

36710 **APPLICATION USAGE**  
 36711 Note that any of the symbols could include embedded <space>s, which may affect parsing  
 36712 algorithms if multiple options are selected for output.  
 36713 The node name is typically a name that the system uses to identify itself for inter-system  
 36714 communication addressing.

36715 **EXAMPLES**  
 36716 The following command:  
 36717 `uname -sr`  
 36718 writes the operating system name and release level, separated by one or more <blank>s.

36719 **RATIONALE**

36720 It was suggested that this utility cannot be used portably since the format of the symbols is  
36721 implementation-defined. The POSIX.1 working group could not achieve consensus on defining  
36722 these formats in the underlying *uname()* function, and there was no expectation that this volume  
36723 of IEEE Std 1003.1-2001 would be any more successful. Some applications may still find this  
36724 historical utility of value. For example, the symbols could be used for system log entries or for  
36725 comparison with operator or user input.

36726 **FUTURE DIRECTIONS**

36727 None.

36728 **SEE ALSO**

36729 The System Interfaces volume of IEEE Std 1003.1-2001, *uname()*

36730 **CHANGE HISTORY**

36731 First released in Issue 2.

36732 **NAME**

36733 uncompress — expand compressed data

36734 **SYNOPSIS**36735 xSI uncompress [-cfv] [*file...*]

36736

36737 **DESCRIPTION**

36738 The *uncompress* utility shall restore files to their original state after they have been compressed  
 36739 using the *compress* utility. If no files are specified, the standard input shall be uncompressed to  
 36740 the standard output. If the invoking process has appropriate privileges, the ownership, modes,  
 36741 access time, and modification time of the original file shall be preserved.

36742 This utility shall support the uncompressing of any files produced by the *compress* utility on the  
 36743 same implementation. For files produced by *compress* on other systems, *uncompress* supports 9 to  
 36744 14-bit compression (see *compress*, **-b**); it is implementation-defined whether values of **-b** greater  
 36745 than 14 are supported.

36746 **OPTIONS**

36747 The *uncompress* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
 36748 Section 12.2, Utility Syntax Guidelines.

36749 The following options shall be supported:

- 36750 **-c** Write to standard output; no files are changed.
- 36751 **-f** Do not prompt for overwriting files. Except when run in the background, if **-f** is  
 36752 not given the user shall be prompted as to whether an existing file should be  
 36753 overwritten. If the standard input is not a terminal and **-f** is not given, *uncompress*  
 36754 shall write a diagnostic message to standard error and exit with a status greater  
 36755 than zero.
- 36756 **-v** Write messages to standard error concerning the expansion of each file.

36757 **OPERANDS**

36758 The following operand shall be supported:

- 36759 *file* A pathname of a file. If *file* already has the **.Z** suffix specified, it shall be used as the  
 36760 input file and the output file shall be named **file** with the **.Z** suffix removed.  
 36761 Otherwise, *file* shall be used as the name of the output file and **file** with the **.Z**  
 36762 suffix appended shall be used as the input file.

36763 **STDIN**

36764 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is ' - '.

36765 **INPUT FILES**

36766 Input files shall be in the format produced by the *compress* utility.

36767 **ENVIRONMENT VARIABLES**

36768 The following environment variables shall affect the execution of *uncompress*:

- 36769 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 36770 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36771 Internationalization Variables for the precedence of internationalization variables  
 36772 used to determine the values of locale categories.)
- 36773 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 36774 internationalization variables.

36775        *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
36776                   characters (for example, single-byte as opposed to multi-byte characters in  
36777                   arguments).

36778        *LC\_MESSAGES*  
36779                   Determine the locale that should be used to affect the format and contents of  
36780                   diagnostic messages written to standard error.

36781        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36782 **ASYNCHRONOUS EVENTS**

36783        Default.

36784 **STDOUT**

36785        When there are no *file* operands or the **-c** option is specified, the uncompressed output is written  
36786        to standard output.

36787 **STDERR**

36788        Prompts shall be written to the standard error output under the conditions specified in the  
36789        DESCRIPTION and OPTIONS sections. The prompts shall contain the *file* pathname, but their  
36790        format is otherwise unspecified. Otherwise, the standard error output shall be used only for  
36791        diagnostic messages.

36792 **OUTPUT FILES**

36793        Output files are the same as the respective input files to *compress*.

36794 **EXTENDED DESCRIPTION**

36795        None.

36796 **EXIT STATUS**

36797        The following exit values shall be returned:

36798        0   Successful completion.

36799        >0   An error occurred.

36800 **CONSEQUENCES OF ERRORS**

36801        The input file remains unmodified.

36802 **APPLICATION USAGE**

36803        The limit of 14 on the *compress -b bits* argument is to achieve portability to all systems (within  
36804        the restrictions imposed by the lack of an explicit published file format). Some implementations  
36805        based on 16-bit architectures cannot support 15 or 16-bit uncompression.

36806 **EXAMPLES**

36807        None.

36808 **RATIONALE**

36809        None.

36810 **FUTURE DIRECTIONS**

36811        None.

36812 **SEE ALSO**

36813        *compress*, *zcat*

36814 **CHANGE HISTORY**

36815        First released in Issue 4.

36816 **Issue 6**

36817 The normative text is reworded to avoid use of the term “must” for application requirements.

36818 **NAME**

36819 unexpand — convert spaces to tabs

36820 **SYNOPSIS**36821 UP unexpand [ -a | -t *tablist*] [*file...*]

36822

36823 **DESCRIPTION**

36824 The *unexpand* utility shall copy files or standard input to standard output, converting <blank>s  
 36825 at the beginning of each line into the maximum number of <tab>s followed by the minimum  
 36826 number of <space>s needed to fill the same column positions originally filled by the translated  
 36827 <blank>s. By default, tabstops shall be set at every eighth column position. Each <backspace>  
 36828 shall be copied to the output, and shall cause the column position count for tab calculations to be  
 36829 decremented; the count shall never be decremented to a value less than one.

36830 **OPTIONS**

36831 The *unexpand* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
 36832 Section 12.2, Utility Syntax Guidelines.

36833 The following options shall be supported:

36834 **-a** In addition to translating <blank>s at the beginning of each line, translate all  
 36835 sequences of two or more <blank>s immediately preceding a tab stop to the  
 36836 maximum number of <tab>s followed by the minimum number of <space>s  
 36837 needed to fill the same column positions originally filled by the translated  
 36838 <blank>s.

36839 **-t *tablist*** Specify the tab stops. The application shall ensure that the *tablist* option-argument  
 36840 is a single argument consisting of a single positive decimal integer or multiple  
 36841 positive decimal integers, separated by <blank>s or commas, in ascending order. If  
 36842 a single number is given, tabs shall be set *tablist* column positions apart instead of  
 36843 the default 8. If multiple numbers are given, the tabs shall be set at those specific  
 36844 column positions.

36845 The application shall ensure that each tab-stop position *N* is an integer value  
 36846 greater than zero, and the list shall be in strictly ascending order. This is taken to  
 36847 mean that, from the start of a line of output, tabbing to position *N* shall cause the  
 36848 next character output to be in the (*N*+1)th column position on that line. When the  
 36849 **-t** option is not specified, the default shall be the equivalent of specifying **-t 8**  
 36850 (except for the interaction with **-a**, described below).

36851 No <space>-to-<tab> conversions shall occur for characters at positions beyond  
 36852 the last of those specified in a multiple tab-stop list.

36853 When **-t** is specified, the presence or absence of the **-a** option shall be ignored;  
 36854 conversion shall not be limited to the processing of leading <blank>s.

36855 **OPERANDS**

36856 The following operand shall be supported:

36857 *file* A pathname of a text file to be used as input.

36858 **STDIN**

36859 See the INPUT FILES section.

36860 **INPUT FILES**

36861 The input files shall be text files.

36862 **ENVIRONMENT VARIABLES**36863 The following environment variables shall affect the execution of *unexpand*:

36864 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 36865 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 36866 Internationalization Variables for the precedence of internationalization variables  
 36867 used to determine the values of locale categories.)

36868 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 36869 internationalization variables.

36870 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 36871 characters (for example, single-byte as opposed to multi-byte characters in  
 36872 arguments and input files), the processing of <tab>s and <space>s, and for the  
 36873 determination of the width in column positions each character would occupy on  
 36874 an output device.

36875 *LC\_MESSAGES*  
 36876 Determine the locale that should be used to affect the format and contents of  
 36877 diagnostic messages written to standard error.

36878 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36879 **ASYNCHRONOUS EVENTS**

36880 Default.

36881 **STDOUT**

36882 The standard output shall be equivalent to the input files with the specified <space>-to-<tab>  
 36883 conversions.

36884 **STDERR**

36885 The standard error shall be used only for diagnostic messages.

36886 **OUTPUT FILES**

36887 None.

36888 **EXTENDED DESCRIPTION**

36889 None.

36890 **EXIT STATUS**

36891 The following exit values shall be returned:

36892 0 Successful completion.

36893 &gt;0 An error occurred.

36894 **CONSEQUENCES OF ERRORS**

36895 Default.

**36896 APPLICATION USAGE**

36897 One non-intuitive aspect of *unexpand* is its restriction to leading spaces when neither **-a** nor **-t** is  
36898 specified. Users who always want to convert all spaces in a file can easily alias *unexpand* to use  
36899 the **-a** or **-t 8** option.

**36900 EXAMPLES**

36901 None.

**36902 RATIONALE**

36903 On several occasions, consideration was given to adding a **-t** option to the *unexpand* utility to  
36904 complement the **-t** in *expand* (see *expand*). The historical intent of *unexpand* was to translate  
36905 multiple <blank>s into tab stops, where tab stops were a multiple of eight column positions on  
36906 most UNIX systems. An early proposal omitted **-t** because it seemed outside the scope of the  
36907 User Portability Utilities option; it was not described in any of the base documents. However,  
36908 hard-coding tab stops every eight columns was not suitable for the international community and  
36909 broke historical precedents for some vendors in the FORTRAN community, so **-t** was restored  
36910 in conjunction with the list of valid extension categories considered by the standard developers.  
36911 Thus, *unexpand* is now the logical converse of *expand*.

**36912 FUTURE DIRECTIONS**

36913 None.

**36914 SEE ALSO**

36915 *expand*, *tabs*

**36916 CHANGE HISTORY**

36917 First released in Issue 4.

**36918 Issue 6**

36919 This utility is marked as part of the User Portability Utilities option.

36920 The definition of the *LC\_CTYPE* environment variable is changed to align with the  
36921 IEEE P1003.2b draft standard.

36922 The normative text is reworded to avoid use of the term “must” for application requirements.

36923 **NAME**36924 unget — undo a previous get of an SCCS file (**DEVELOPMENT**)36925 **SYNOPSIS**36926 xSI unget [-ns] [-r *SID*] *file...*

36927

36928 **DESCRIPTION**36929 The *unget* utility shall reverse the effect of a *get -e* done prior to creating the intended new delta.36930 **OPTIONS**36931 The *unget* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
36932 12.2, Utility Syntax Guidelines.

36933 The following options shall be supported:

36934 **-r *SID*** Uniquely identify which delta is no longer intended. (This would have been  
36935 specified by *get* as the new delta.) The use of this option is necessary only if two or  
36936 more outstanding *get* commands for editing on the same SCCS file were done by  
36937 the same person (login name).36938 **-s** Suppress the writing to standard output of the intended delta's *SID*.36939 **-n** Retain the file that was obtained by *get*, which would normally be removed from  
36940 the current directory.36941 **OPERANDS**

36942 The following operands shall be supported:

36943 ***file*** A pathname of an existing SCCS file or a directory. If *file* is a directory, the *unget*  
36944 utility shall behave as though each file in the directory were specified as a named  
36945 file, except that non-SCCS files (last component of the pathname does not begin  
36946 with **s**.) and unreadable files shall be silently ignored.36947 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
36948 each line of the standard input shall be taken to be the name of an SCCS file to be  
36949 processed. Non-SCCS files and unreadable files shall be silently ignored.36950 **STDIN**36951 The standard input shall be a text file used only when the *file* operand is specified as **'-'**. Each  
36952 line of the text file shall be interpreted as an SCCS pathname.36953 **INPUT FILES**

36954 Any SCCS files processed shall be files of an unspecified format.

36955 **ENVIRONMENT VARIABLES**36956 The following environment variables shall affect the execution of *unget*:36957 ***LANG*** Provide a default value for the internationalization variables that are unset or null.  
36958 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
36959 Internationalization Variables for the precedence of internationalization variables  
36960 used to determine the values of locale categories.)36961 ***LC\_ALL*** If set to a non-empty string value, override the values of all the other  
36962 internationalization variables.36963 ***LC\_CTYPE*** Determine the locale for the interpretation of sequences of bytes of text data as  
36964 characters (for example, single-byte as opposed to multi-byte characters in  
36965 arguments and input files).

36966 **LC\_MESSAGES**

36967 Determine the locale that should be used to affect the format and contents of  
36968 diagnostic messages written to standard error.

36969 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

36970 **ASYNCHRONOUS EVENTS**

36971 Default.

36972 **STDOUT**

36973 The standard output shall consist of a line for each file, in the following format:

36974 "%s\n", <*SID removed from file*>

36975 If there is more than one named file or if a directory or standard input is named, each pathname  
36976 shall be written before each of the preceding lines:

36977 "\n%s:\n", <*pathname*>

36978 **STDERR**

36979 The standard error shall be used only for diagnostic messages.

36980 **OUTPUT FILES**

36981 Any SCCS files updated shall be files of an unspecified format. During processing of a *file*, a  
36982 locking *z-file*, as described in *get*, and a *q-file* (a working copy of the *p-file*), may be created and  
36983 deleted. The *p-file* and *g-file*, as described in *get*, shall be deleted.

36984 **EXTENDED DESCRIPTION**

36985 None.

36986 **EXIT STATUS**

36987 The following exit values shall be returned:

36988 0 Successful completion.

36989 >0 An error occurred.

36990 **CONSEQUENCES OF ERRORS**

36991 Default.

36992 **APPLICATION USAGE**

36993 None.

36994 **EXAMPLES**

36995 None.

36996 **RATIONALE**

36997 None.

36998 **FUTURE DIRECTIONS**

36999 None.

37000 **SEE ALSO**

37001 *delta*, *get*, *sact*

37002 **CHANGE HISTORY**

37003 First released in Issue 2.

37004 **Issue 6**

37005 The normative text is reworded to avoid use of the term “must” for application requirements.

37006 **NAME**37007            `uniq` — report or filter out repeated lines in a file37008 **SYNOPSIS**37009            `uniq [-c|-d|-u] [-f fields] [-s char] [input_file [output_file]]`37010 **DESCRIPTION**

37011        The *uniq* utility shall read an input file comparing adjacent lines, and write one copy of each  
 37012        input line on the output. The second and succeeding copies of repeated adjacent input lines shall  
 37013        not be written.

37014        Repeated lines in the input shall not be detected if they are not adjacent.

37015 **OPTIONS**

37016        The *uniq* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 37017        12.2, Utility Syntax Guidelines.

37018        The following options shall be supported:

37019        **-c**            Precede each output line with a count of the number of times the line occurred in  
 37020                        the input.

37021        **-d**            Suppress the writing of lines that are not repeated in the input.

37022        **-f *fields***    Ignore the first *fields* fields on each input line when doing comparisons, where  
 37023                        *fields* is a positive decimal integer. A field is the maximal string matched by the  
 37024                        basic regular expression:

37025                        `[[:blank:]]* [^[[:blank:]]]*`

37026                        If the *fields* option-argument specifies more fields than appear on an input line, a  
 37027                        null string shall be used for comparison.

37028        **-s *chars***    Ignore the first *chars* characters when doing comparisons, where *chars* shall be a  
 37029                        positive decimal integer. If specified in conjunction with the **-f** option, the first  
 37030                        *chars* characters after the first *fields* fields shall be ignored. If the *chars* option-  
 37031                        argument specifies more characters than remain on an input line, a null string shall  
 37032                        be used for comparison.

37033        **-u**            Suppress the writing of lines that are repeated in the input.

37034 **OPERANDS**

37035        The following operands shall be supported:

37036        *input\_file*    A pathname of the input file. If the *input\_file* operand is not specified, or if the  
 37037                        *input\_file* is `'-'`, the standard input shall be used.

37038        *output\_file*    A pathname of the output file. If the *output\_file* operand is not specified, the  
 37039                        standard output shall be used. The results are unspecified if the file named by  
 37040                        *output\_file* is the file named by *input\_file*.

37041 **STDIN**

37042        The standard input shall be used only if no *input\_file* operand is specified or if *input\_file* is `'-'`.  
 37043        See the INPUT FILES section.

37044 **INPUT FILES**

37045        The input file shall be a text file.

## 37046 ENVIRONMENT VARIABLES

37047 The following environment variables shall affect the execution of *uniq*:

37048 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 37049 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 37050 Internationalization Variables for the precedence of internationalization variables  
 37051 used to determine the values of locale categories.)

37052 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 37053 internationalization variables.

37054 **LC\_COLLATE** Determine the locale for ordering rules. |  
 37055

37056 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 37057 characters (for example, single-byte as opposed to multi-byte characters in  
 37058 arguments and input files) and which characters constitute a <blank> in the  
 37059 current locale.

37060 **LC\_MESSAGES**  
 37061 Determine the locale that should be used to affect the format and contents of  
 37062 diagnostic messages written to standard error.

37063 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 37064 ASYNCHRONOUS EVENTS

37065 Default.

## 37066 STDOUT

37067 The standard output shall be used only if no *output\_file* operand is specified. See the OUTPUT  
 37068 FILES section.

## 37069 STDERR

37070 The standard error shall be used only for diagnostic messages.

## 37071 OUTPUT FILES

37072 If the **-c** option is specified, the output file shall be empty or each line shall be of the form: |

37073 "%d %s", <number of duplicates>, <line>

37074 otherwise, the output file shall be empty or each line shall be of the form: |

37075 "%s", <line>

## 37076 EXTENDED DESCRIPTION

37077 None.

## 37078 EXIT STATUS

37079 The following exit values shall be returned:

37080 0 The utility executed successfully.

37081 >0 An error occurred.

## 37082 CONSEQUENCES OF ERRORS

37083 Default.

37084 **APPLICATION USAGE**

37085       The *sort* utility can be used to cause repeated lines to be adjacent in the input file.

37086 **EXAMPLES**

37087       The following input file data (but flushed left) was used for a test series on *uniq*:

```
37088 #01 foo0 bar0 foo1 bar1
37089 #02 bar0 foo1 bar1 foo1
37090 #03 foo0 bar0 foo1 bar1
37091 #04
37092 #05 foo0 bar0 foo1 bar1
37093 #06 foo0 bar0 foo1 bar1
37094 #07 bar0 foo1 bar1 foo0
```

37095       What follows is a series of test invocations of the *uniq* utility that use a mixture of *uniq* options  
 37096       against the input file data. These tests verify the meaning of *adjacent*. The *uniq* utility views the  
 37097       input data as a sequence of strings delimited by '`\n`'. Accordingly, for the *fieldsth* member of  
 37098       the sequence, *uniq* interprets unique or repeated adjacent lines strictly relative to the *fields+1*th  
 37099       member.

- 37100       1. This first example tests the line counting option, comparing each line of the input file data  
 37101       starting from the second field:

```
37102 uniq -c -f 1 uniq_0I.t
37103 1 #01 foo0 bar0 foo1 bar1
37104 1 #02 bar0 foo1 bar1 foo0
37105 1 #03 foo0 bar0 foo1 bar1
37106 1 #04
37107 2 #05 foo0 bar0 foo1 bar1
37108 1 #07 bar0 foo1 bar1 foo0
```

37109       The number '2', prefixing the fifth line of output, signifies that the *uniq* utility detected a  
 37110       pair of repeated lines. Given the input data, this can only be true when *uniq* is run using  
 37111       the **-f 1** option (which shall cause *uniq* to ignore the first field on each input line).

- 37112       2. The second example tests the option to suppress unique lines, comparing each line of the  
 37113       input file data starting from the second field:

```
37114 uniq -d -f 1 uniq_0I.t
37115 #05 foo0 bar0 foo1 bar1
```

- 37116       3. This test suppresses repeated lines, comparing each line of the input file data starting from  
 37117       the second field:

```
37118 uniq -u -f 1 uniq_0I.t
37119 #01 foo0 bar0 foo1 bar1
37120 #02 bar0 foo1 bar1 foo1
37121 #03 foo0 bar0 foo1 bar1
37122 #04
37123 #07 bar0 foo1 bar1 foo0
```

- 37124       4. This suppresses unique lines, comparing each line of the input file data starting from the  
 37125       third character:

```
37126 uniq -d -s 2 uniq_0I.t
```

37127       In the last example, the *uniq* utility found no input matching the above criteria.

37128 **RATIONALE**

37129           Some historical implementations have limited lines to be 1 080 bytes in length, which does not  
37130           meet the implied {LINE\_MAX} limit.

37131 **FUTURE DIRECTIONS**

37132           None.

37133 **SEE ALSO**

37134           *comm, sort*

37135 **CHANGE HISTORY**

37136           First released in Issue 2.

37137 **Issue 6**

37138           The obsolescent SYNOPSIS and associated text are removed.

37139           The normative text is reworded to avoid use of the term “must” for application requirements.

37140           IEEE Std 1003.1-2001 / Cor 1-2002, item XCU / TC1 / D6 / 40 is applied, adding *LC\_COLLATE* to the  
37141           ENVIRONMENT VARIABLES section, and changing “the application shall ensure that” in the  
37142           OUTPUT FILES section.

37143 **NAME**37144           unlink — call the *unlink()* function37145 **SYNOPSIS**37146 xSI        unlink *file*

37147

37148 **DESCRIPTION**37149           The *unlink* utility shall perform the function call:37150           unlink(*file*);37151           A user may need appropriate privilege to invoke the *unlink* utility.37152 **OPTIONS**

37153           None.

37154 **OPERANDS**

37155           The following operands shall be supported:

37156           *file*           The pathname of an existing file.37157 **STDIN**

37158           Not used.

37159 **INPUT FILES**

37160           Not used.

37161 **ENVIRONMENT VARIABLES**37162           The following environment variables shall affect the execution of *unlink*:

37163           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 37164                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 37165           Internationalization Variables for the precedence of internationalization variables  
 37166           used to determine the values of locale categories.)

37167           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 37168           internationalization variables.

37169           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 37170           characters (for example, single-byte as opposed to multi-byte characters in  
 37171           arguments).

37172           *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
 37173           diagnostic messages written to standard error.  
 37174

37175           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37176 **ASYNCHRONOUS EVENTS**

37177           Default.

37178 **STDOUT**

37179           None.

37180 **STDERR**

37181           The standard error shall be used only for diagnostic messages.

37182 **OUTPUT FILES**

37183           None.

37184 **EXTENDED DESCRIPTION**

37185           None.

37186 **EXIT STATUS**

37187           The following exit values shall be returned:

37188           0   Successful completion.

37189           >0  An error occurred.

37190 **CONSEQUENCES OF ERRORS**

37191           Default.

37192 **APPLICATION USAGE**

37193           None.

37194 **EXAMPLES**

37195           None.

37196 **RATIONALE**

37197           None.

37198 **FUTURE DIRECTIONS**

37199           None.

37200 **SEE ALSO**

37201           *link*, *rm*, the System Interfaces volume of IEEE Std 1003.1-2001, *unlink()*

37202 **CHANGE HISTORY**

37203           First released in Issue 5.

37204 **NAME**

37205           uucp — system-to-system copy

37206 **SYNOPSIS**37207 xsl       uucp [-cCdfjmr] [-n user] *source-file*... *destination-file*

37208

37209 **DESCRIPTION**37210       The *uucp* utility shall copy files named by the *source-file* argument to the *destination-file*  
37211       argument. The files named can be on local or remote systems.37212       The *uucp* utility cannot guarantee support for all character encodings in all circumstances. For  
37213       example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and  
37214       filenames need not be portable to non-internationalized systems, and so on. Under these  
37215       circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
37216       standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used,  
37217       and that only characters defined in the portable filename character set be used for naming files.  
37218       The protocol for transfer of files is unspecified by IEEE Std 1003.1-2001.37219       Typical implementations of this utility require a communications line configured to use the Base  
37220       Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, but other  
37221       communications means may be used. On systems where there are no available communications  
37222       means (either temporarily or permanently), this utility shall write an error message describing  
37223       the problem and exit with a non-zero exit status.37224 **OPTIONS**37225       The *uucp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
37226       12.2, Utility Syntax Guidelines.

37227       The following options shall be supported:

37228       **-c**           Do not copy local file to the spool directory for transfer to the remote machine  
37229       (default).37230       **-C**           Force the copy of local files to the spool directory for transfer.37231       **-d**           Make all necessary directories for the file copy (default).37232       **-f**           Do not make intermediate directories for the file copy.37233       **-j**           Write the job identification string to standard output. This job identification can be  
37234       used by *uustat* to obtain the status or terminate a job.37235       **-m**           Send mail to the requester when the copy is completed.37236       **-n user**       Notify *user* on the remote system that a file was sent.37237       **-r**           Do not start the file transfer; just queue the job.37238 **OPERANDS**

37239       The following operands shall be supported:

37240       *destination-file*, *source-file*37241           A pathname of a file to be copied to, or from, respectively. Either name can be a  
37242           pathname on the local machine, or can have the form:37243           *system-name*!*pathname*37244           where *system-name* is taken from a list of system names that *uucp* knows about.  
37245           The destination *system-name* can also be a list of names such as:

37246 *system-name!system-name!...!system-name!pathname*

37247 in which case, an attempt is made to send the file via the specified route to the

37248 destination. Care should be taken to ensure that intermediate nodes in the route

37249 are willing to forward information.

37250 The shell pattern matching notation characters '?', '\*', and "[...]" appearing

37251 in *pathname* shall be expanded on the appropriate system.

37252 Pathnames can be one of:

37253 1. An absolute pathname.

37254 2. A pathname preceded by *~user* where *user* is a login name on the specified

37255 system and is replaced by that user's login directory. Note that if an invalid

37256 login is specified, the default is to the public directory (called *PUBDIR*; the

37257 actual location of *PUBDIR* is implementation-defined).

37258 3. A pathname preceded by *~/destination* where *destination* is appended to

37259 *PUBDIR*.

37260 **Note:** This destination is treated as a filename unless more than one file is being

37261 transferred by this request or the destination is already a directory. To

37262 ensure that it is a directory, follow the destination with a '/'. For

37263 example, *~/dan/* as the destination makes the directory **PUBDIR/dan** if it

37264 does not exist and puts the requested files in that directory.

37265 4. Anything else shall be prefixed by the current directory.

37266 If the result is an erroneous pathname for the remote system, the copy shall fail. If

37267 the *destination-file* is a directory, the last part of the *source-file* name shall be used.

37268 The read, write, and execute permissions given by *uucp* are implementation-

37269 defined.

37270 **STDIN**

37271 Not used.

37272 **INPUT FILES**

37273 The files to be copied are regular files.

37274 **ENVIRONMENT VARIABLES**

37275 The following environment variables shall affect the execution of *uucp*:

37276 *LANG* Provide a default value for the internationalization variables that are unset or null.

37277 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,

37278 Internationalization Variables for the precedence of internationalization variables

37279 used to determine the values of locale categories.)

37280 *LC\_ALL* If set to a non-empty string value, override the values of all the other

37281 internationalization variables.

37282 *LC\_COLLATE*

37283 Determine the locale for the behavior of ranges, equivalence classes, and multi-

37284 character collating elements within bracketed filename patterns.

37285 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as

37286 characters (for example, single-byte as opposed to multi-byte characters in

37287 arguments and input files) and the behavior of character classes within bracketed

37288 filename patterns (for example, "'[:lower:])\*'").

37289 **LC\_MESSAGES**

37290 Determine the locale that should be used to affect the format and contents of  
37291 diagnostic messages written to standard error, and informative messages written  
37292 to standard output.

37293 **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37294 **ASYNCHRONOUS EVENTS**

37295 Default.

37296 **STDOUT**

37297 Not used.

37298 **STDERR**

37299 The standard error shall be used only for diagnostic messages.

37300 **OUTPUT FILES**

37301 The output files (which may be on other systems) are copies of the input files.

37302 If **-m** is used, mail files are modified.

37303 **EXTENDED DESCRIPTION**

37304 None.

37305 **EXIT STATUS**

37306 The following exit values shall be returned:

37307 0 Successful completion.

37308 >0 An error occurred.

37309 **CONSEQUENCES OF ERRORS**

37310 Default.

37311 **APPLICATION USAGE**

37312 The domain of remotely accessible files can (and for obvious security reasons usually should) be  
37313 severely restricted.

37314 Note that the **'!'** character in addresses has to be escaped when using *cs***h** as a command  
37315 interpreter because of its history substitution syntax. For *ks***h** and *sh* the escape is not necessary,  
37316 but may be used.

37317 As noted above, shell metacharacters appearing in pathnames are expanded on the appropriate  
37318 system. On an internationalized system, this is done under the control of local settings of  
37319 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
37320 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
37321 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
37322 need not be supported on non-internationalized systems.

37323 **EXAMPLES**

37324 None.

37325 **RATIONALE**

37326 None.

37327 **FUTURE DIRECTIONS**

37328 None.

37329 **SEE ALSO**

37330 *mailx, uuencode, uustat, uux*

37331 **CHANGE HISTORY**

37332 First released in Issue 2.

37333 **Issue 6**

37334 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

37335 The UN margin codes and associated shading are removed from the **-C**, **-f**, **-j**, **-n**, and **-r**  
37336 options in response to The Open Group Base Resolution bwg2001-003.

37337 **NAME**

37338           uudecode — decode a binary file

37339 **SYNOPSIS**37340 UP       uudecode [-o *outfile*] [*file*]

37341

37342 **DESCRIPTION**

37343       The *uudecode* utility shall read a file, or standard input if no file is specified, that includes data  
 37344       created by the *uuencode* utility. The *uudecode* utility shall scan the input file, searching for data  
 37345       compatible with one of the formats specified in *uuencode*, and attempt to create or overwrite the  
 37346       file described by the data (or overridden by the **-o** option). The pathname shall be contained in  
 37347       the data or specified by the **-o** option. The file access permission bits and contents for the file to  
 37348       be produced shall be contained in that data. The mode bits of the created file (other than  
 37349       standard output) shall be set from the file access permission bits contained in the data; that is,  
 37350       other attributes of the mode, including the file mode creation mask (see *umask*), shall not affect  
 37351       the file being produced.

37352       If the pathname of the file to be produced exists, and the user does not have write permission on  
 37353       that file, *uudecode* shall terminate with an error. If the pathname of the file to be produced exists,  
 37354       and the user has write permission on that file, the existing file shall be overwritten.

37355       If the input data was produced by *uuencode* on a system with a different number of bits per byte  
 37356       than on the target system, the results of *uudecode* are unspecified.

37357 **OPTIONS**

37358       The *uudecode* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
 37359       Section 12.2, Utility Syntax Guidelines.

37360       The following option shall be supported by the implementation:

37361       **-o *outfile***    A pathname of a file that shall be used instead of any pathname contained in the  
 37362       input data. Specifying an *outfile* option-argument of **/dev/stdout** shall indicate  
 37363       standard output.

37364 **OPERANDS**

37365       The following operand shall be supported:

37366       *file*           The pathname of a file containing the output of *uuencode*.

37367 **STDIN**

37368       See the INPUT FILES section.

37369 **INPUT FILES**

37370       The input files shall be files containing the output of *uuencode*.

37371 **ENVIRONMENT VARIABLES**

37372       The following environment variables shall affect the execution of *uudecode*:

37373       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 37374       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 37375       Internationalization Variables for the precedence of internationalization variables  
 37376       used to determine the values of locale categories.)

37377       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 37378       internationalization variables.

37379       **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 37380       characters (for example, single-byte as opposed to multi-byte characters in  
 37381       arguments and input files).

37382 **LC\_MESSAGES**

37383 Determine the locale that should be used to affect the format and contents of  
37384 diagnostic messages written to standard error.

37385 xSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

37386 **ASYNCHRONOUS EVENTS**

37387 Default.

37388 **STDOUT**

37389 If the file data header encoded by *uencode* is **-** or **/dev/stdout**, or the **-o /dev/stdout** option  
37390 overrides the file data, the standard output shall be in the same format as the file originally  
37391 encoded by *uencode*. Otherwise, the standard output shall not be used.

37392 **STDERR**

37393 The standard error shall be used only for diagnostic messages.

37394 **OUTPUT FILES**

37395 The output file shall be in the same format as the file originally encoded by *uencode*.

37396 **EXTENDED DESCRIPTION**

37397 None.

37398 **EXIT STATUS**

37399 The following exit values shall be returned:

37400 0 Successful completion.

37401 >0 An error occurred.

37402 **CONSEQUENCES OF ERRORS**

37403 Default.

37404 **APPLICATION USAGE**

37405 The user who is invoking *uudecode* must have write permission on any file being created.

37406 The output of *uencode* is essentially an encoded bit stream that is not cognizant of byte  
37407 boundaries. It is possible that a 9-bit byte target machine can process input from an 8-bit source,  
37408 if it is aware of the requirement, but the reverse is unlikely to be satisfying. Of course, the only  
37409 data that is meaningful for such a transfer between architectures is generally character data.

37410 **EXAMPLES**

37411 None.

37412 **RATIONALE**

37413 Input files are not necessarily text files, as stated by an early proposal. Although the *uencode*  
37414 output is a text file, that output could have been wrapped within another file or mail message  
37415 that is not a text file.

37416 The **-o** option is not historical practice, but was added at the request of WG15 so that the user  
37417 could override the target pathname without having to edit the input data itself.

37418 In early drafts, the **[-o outfile]** option-argument allowed the use of **-** to mean standard output.  
37419 The symbol **-** has only been used previously in IEEE Std 1003.1-2001 as a standard input  
37420 indicator. The developers of the standard did not wish to overload the meaning of **-** in this  
37421 manner. The **/dev/stdout** concept exists on most modern systems. The **/dev/stdout** syntax does  
37422 not refer to a new special file. It is just a magic cookie to specify standard output.

37423 **FUTURE DIRECTIONS**

37424           None.

37425 **SEE ALSO**37426           *umask, uuencode*37427 **CHANGE HISTORY**

37428           First released in Issue 4.

37429 **Issue 6**

37430           This utility is marked as part of the User Portability Utilities option.

37431           The **-o** *outfile* option is added, as specified in the IEEE P1003.2b draft standard.

37432           The normative text is reworded to avoid use of the term “must” for application requirements.

37433 **NAME**

37434 uuencode — encode a binary file

37435 **SYNOPSIS**37436 UP uuencode [-m] [*file*] *decode\_pathname*

37437

37438 **DESCRIPTION**

37439 The *uuencode* utility shall write an encoded version of the named input file, or standard input if  
 37440 no *file* is specified, to standard output. The output shall be encoded using one of the algorithms  
 37441 described in the STDOUT section and shall include the file access permission bits (in *chmod* octal  
 37442 or symbolic notation) of the input file and the *decode\_pathname*, for re-creation of the file on  
 37443 another system that conforms to this volume of IEEE Std 1003.1-2001.

37444 **OPTIONS**

37445 The *uuencode* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
 37446 Section 12.2, Utility Syntax Guidelines.

37447 The following option shall be supported by the implementation:

37448 **-m** Encode the output using the MIME Base64 algorithm described in STDOUT. If **-m**  
 37449 is not specified, the historical algorithm described in STDOUT shall be used.

37450 **OPERANDS**

37451 The following operands shall be supported:

37452 *decode\_pathname*

37453 The pathname of the file into which the *uudecode* utility shall place the decoded  
 37454 file. Specifying a *decode\_pathname* operand of **/dev/stdout** shall indicate that  
 37455 *uudecode* is to use standard output. If there are characters in *decode\_pathname* that  
 37456 are not in the portable filename character set the results are unspecified.

37457 *file* A pathname of the file to be encoded.

37458 **STDIN**

37459 See the INPUT FILES section.

37460 **INPUT FILES**

37461 Input files can be files of any type.

37462 **ENVIRONMENT VARIABLES**

37463 The following environment variables shall affect the execution of *uuencode*:

37464 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 37465 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 37466 Internationalization Variables for the precedence of internationalization variables  
 37467 used to determine the values of locale categories.)

37468 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 37469 internationalization variables.

37470 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 37471 characters (for example, single-byte as opposed to multi-byte characters in  
 37472 arguments and input files).

37473 **LC\_MESSAGES**

37474 Determine the locale that should be used to affect the format and contents of  
 37475 diagnostic messages written to standard error.

37476 xSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 37477 ASYNCHRONOUS EVENTS

37478 Default.

## 37479 STDOUT

### 37480 uuencode Base64 Algorithm

37481 The standard output shall be a text file (encoded in the character set of the current locale) that  
37482 begins with the line:

37483 "begin-base64 $\Delta$ %s $\Delta$ %s\n", <mode>, <decode\_pathname>

37484 and ends with the line:

37485 "====\n"

37486 In both cases, the lines shall have no preceding or trailing <blank>s.

37487 The encoding process represents 24-bit groups of input bits as output strings of four encoded  
37488 characters. Proceeding from left to right, a 24-bit input group shall be formed by concatenating  
37489 three 8-bit input groups. Each 24-bit input group then shall be treated as four concatenated 6-bit  
37490 groups, each of which shall be translated into a single digit in the Base64 alphabet. When  
37491 encoding a bit stream via the Base64 encoding, the bit stream shall be presumed to be ordered  
37492 with the most-significant bit first. That is, the first bit in the stream shall be the high-order bit in  
37493 the first byte, and the eighth bit shall be the low-order bit in the first byte, and so on. Each 6-bit  
37494 group is used as an index into an array of 64 printable characters, as shown in Table 4-21.

37495 **Table 4-21** uuencode Base64 Values

| Value | Encoding | Value | Encoding | Value | Encoding | Value | Encoding |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 0     | A        | 17    | R        | 34    | i        | 51    | z        |
| 1     | B        | 18    | S        | 35    | j        | 52    | 0        |
| 2     | C        | 19    | T        | 36    | k        | 53    | 1        |
| 3     | D        | 20    | U        | 37    | l        | 54    | 2        |
| 4     | E        | 21    | V        | 38    | m        | 55    | 3        |
| 5     | F        | 22    | W        | 39    | n        | 56    | 4        |
| 6     | G        | 23    | X        | 40    | o        | 57    | 5        |
| 7     | H        | 24    | Y        | 41    | p        | 58    | 6        |
| 8     | I        | 25    | Z        | 42    | q        | 59    | 7        |
| 9     | J        | 26    | a        | 43    | r        | 60    | 8        |
| 10    | K        | 27    | b        | 44    | s        | 61    | 9        |
| 11    | L        | 28    | c        | 45    | t        | 62    | +        |
| 12    | M        | 29    | d        | 46    | u        | 63    | /        |
| 13    | N        | 30    | e        | 47    | v        | (pad) | =        |
| 14    | O        | 31    | f        | 48    | w        |       |          |
| 15    | P        | 32    | g        | 49    | x        |       |          |
| 16    | Q        | 33    | h        | 50    | y        |       |          |

37514 The character referenced by the index shall be placed in the output string.

37515 The output stream (encoded bytes) shall be represented in lines of no more than 76 characters  
37516 each. All line breaks or other characters not found in the table shall be ignored by decoding  
37517 software (see *uudecode*).

37518 Special processing shall be performed if fewer than 24 bits are available at the end of a message  
37519 or encapsulated part of a message. A full encoding quantum shall always be completed at the

37520 end of a message. When fewer than 24 input bits are available in an input group, zero bits shall  
 37521 be added (on the right) to form an integral number of 6-bit groups. Output character positions  
 37522 that are not required to represent actual input data shall be set to the character '='. Since all  
 37523 Base64 input is an integral number of octets, only the following cases can arise:

- 37524 1. The final quantum of encoding input is an integral multiple of 24 bits; here, the final unit of  
 37525 encoded output shall be an integral multiple of 4 characters with no '=' padding.
- 37526 2. The final quantum of encoding input is exactly 16 bits; here, the final unit of encoded  
 37527 output shall be three characters followed by one '=' padding character.
- 37528 3. The final quantum of encoding input is exactly 8 bits; here, the final unit of encoded output  
 37529 shall be two characters followed by two '=' padding characters.

37530 A terminating "====" evaluates to nothing and denotes the end of the encoded data.

### 37531 uuencode Historical Algorithm

37532 The standard output shall be a text file (encoded in the character set of the current locale) that  
 37533 begins with the line:

37534 "beginΔsΔs\n" <mode>, <decode\_pathname>

37535 and ends with the line:

37536 "end\n"

37537 In both cases, the lines shall have no preceding or trailing <blank>s.

37538 The algorithm that shall be used for lines in between **begin** and **end** takes three octets as input  
 37539 and writes four characters of output by splitting the input at six-bit intervals into four octets,  
 37540 containing data in the lower six bits only. These octets shall be converted to characters by adding  
 37541 a value of 0x20 to each octet, so that each octet is in the range [0x20,0x5f], and then it shall be  
 37542 assumed to represent a printable character in the ISO/IEC 646:1991 standard encoded character  
 37543 set. It then shall be translated into the corresponding character codes for the codeset in use in the  
 37544 current locale. (For example, the octet 0x41, representing 'A', would be translated to 'A' in the  
 37545 current codeset, such as 0xc1 if it were EBCDIC.)

37546 Where the bits of two octets are combined, the least significant bits of the first octet shall be  
 37547 shifted left and combined with the most significant bits of the second octet shifted right. Thus  
 37548 the three octets A, B, C shall be converted into the four octets:

```
37549 0x20 + ((A >> 2) & 0x3F)
37550 0x20 + (((A << 4) | ((B >> 4) & 0xF)) & 0x3F)
37551 0x20 + (((B << 2) | ((C >> 6) & 0x3)) & 0x3F)
37552 0x20 + ((C) & 0x3F)
```

37553 These octets then shall be translated into the local character set.

37554 Each encoded line contains a length character, equal to the number of characters to be decoded  
 37555 plus 0x20 translated to the local character set as described above, followed by the encoded  
 37556 characters. The maximum number of octets to be encoded on each line shall be 45.

### 37557 STDERR

37558 The standard error shall be used only for diagnostic messages.

### 37559 OUTPUT FILES

37560 None.

37561 **EXTENDED DESCRIPTION**

37562       None.

37563 **EXIT STATUS**

37564       The following exit values shall be returned:

37565       0   Successful completion.

37566       &gt;0   An error occurred.

37567 **CONSEQUENCES OF ERRORS**

37568       Default.

37569 **APPLICATION USAGE**

37570       The file is expanded by 35 percent (each three octets become four, plus control information)  
37571       causing it to take longer to transmit.

37572       Since this utility is intended to create files to be used for data interchange between systems with  
37573       possibly different codesets, and to represent binary data as a text file, the ISO/IEC 646:1991  
37574       standard was chosen for a midpoint in the algorithm as a known reference point. The output  
37575       from *uuencode* is a text file on the local system. If the output were in the ISO/IEC 646:1991  
37576       standard codeset, it might not be a text file (at least because the <newline>s might not match),  
37577       and the goal of creating a text file would be defeated. If this text file was then carried to another  
37578       machine with the same codeset, it would be perfectly compatible with that system's *uudecode*. If  
37579       it was transmitted over a mail system or sent to a machine with a different codeset, it is assumed  
37580       that, as for every other text file, some translation mechanism would convert it (by the time it  
37581       reached a user on the other system) into an appropriate codeset. This translation only makes  
37582       sense from the local codeset, not if the file has been put into a ISO/IEC 646:1991 standard  
37583       representation first. Similarly, files processed by *uuencode* can be placed in *pax* archives,  
37584       intermixed with other text files in the same codeset.

37585 **EXAMPLES**

37586       None.

37587 **RATIONALE**

37588       A new algorithm was added at the request of the international community to parallel work in  
37589       RFC 2045 (MIME). As with the historical *uuencode* format, the Base64 Content-Transfer-Encoding  
37590       is designed to represent arbitrary sequences of octets in a form that is not humanly readable. A  
37591       65-character subset of the ISO/IEC 646:1991 standard is used, enabling 6 bits to be represented  
37592       per printable character. (The extra 65th character, '=', is used to signify a special processing  
37593       function.)

37594       This subset has the important property that it is represented identically in all versions of the  
37595       ISO/IEC 646:1991 standard, including US ASCII, and all characters in the subset are also  
37596       represented identically in all versions of EBCDIC. The historical *uuencode* algorithm does not  
37597       share this property, which is the reason that a second algorithm was added to the ISO POSIX-2  
37598       standard.

37599       The string "====" was used for the termination instead of the end used in the original format  
37600       because the latter is a string that could be valid encoded input.

37601       In an early draft, the **-m** option was named **-b** (for Base64), but it was renamed to reflect its  
37602       relationship to the RFC 2045. A **-u** was also present to invoke the default algorithm, but since  
37603       this was not historical practice, it was omitted as being unnecessary.

37604       See the RATIONALE section in *uudecode* for the derivation of the **/dev/stdout** symbol.

37605 **FUTURE DIRECTIONS**

37606           None.

37607 **SEE ALSO**37608           *chmod, mailx, uudecode*37609 **CHANGE HISTORY**

37610           First released in Issue 4.

37611 **Issue 6**

37612           This utility is marked as part of the User Portability Utilities option.

37613           The Base64 algorithm and the ability to output to **/dev/stdout** are added as specified in the  
37614           IEEE P1003.2b draft standard.

37615 **NAME**

37616           uustat — uucp status inquiry and job control

37617 **SYNOPSIS**37618 xSI       uustat [ -q | -k *jobid* | -r *jobid* ]37619           uustat [-s *system*] [-u *user*]

37620

37621 **DESCRIPTION**37622           The *uustat* utility shall display the status of, or cancel, previously specified *uucp* requests, or  
37623           provide general status on *uucp* connections to other systems.37624           When no options are given, *uustat* shall write to standard output the status of all *uucp* requests  
37625           issued by the current user.37626           Typical implementations of this utility require a communications line configured to use the Base  
37627           Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, but other  
37628           communications means may be used. On systems where there are no available communications  
37629           means (either temporarily or permanently), this utility shall write an error message describing  
37630           the problem and exit with a non-zero exit status.37631 **OPTIONS**37632           The *uustat* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
37633           12.2, Utility Syntax Guidelines.

37634           The following options shall be supported:

37635           **-q**           Write the jobs queued for each machine.37636           **-k** *jobid*       Kill the *uucp* request whose job identification is *jobid*. The application shall ensure  
37637           that the killed *uucp* request belongs to the person invoking *uustat* unless that user  
37638           has appropriate privileges.37639           **-r** *jobid*       Rejuvenate *jobid*. The files associated with *jobid* are touched so that their  
37640           modification time is set to the current time. This prevents the cleanup program  
37641           from deleting the job until the jobs modification time reaches the limit imposed by  
37642           the program.37643           **-s** *system*       Write the status of all *uucp* requests for remote system *system*.37644           **-u** *user*       Write the status of all *uucp* requests issued by *user*.37645 **OPERANDS**

37646           None.

37647 **STDIN**

37648           Not used.

37649 **INPUT FILES**

37650           None.

37651 **ENVIRONMENT VARIABLES**37652           The following environment variables shall affect the execution of *uustat*:37653           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
37654           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
37655           Internationalization Variables for the precedence of internationalization variables  
37656           used to determine the values of locale categories.)

37657 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
37658 internationalization variables.

37659 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
37660 characters (for example, single-byte as opposed to multi-byte characters in  
37661 arguments).

37662 *LC\_MESSAGES*  
37663 Determine the locale that should be used to affect the format and contents of  
37664 diagnostic messages written to standard error, and informative messages written  
37665 to standard output.

37666 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37667 **ASYNCHRONOUS EVENTS**  
37668 Default.

37669 **STDOUT**  
37670 The standard output shall consist of information about each job selected, in an unspecified  
37671 format. The information shall include at least the job ID, the user ID or name, and the remote  
37672 system name.

37673 **STDERR**  
37674 The standard error shall be used only for diagnostic messages.

37675 **OUTPUT FILES**  
37676 None.

37677 **EXTENDED DESCRIPTION**  
37678 None.

37679 **EXIT STATUS**  
37680 The following exit values shall be returned:  
37681 0 Successful completion.  
37682 >0 An error occurred.

37683 **CONSEQUENCES OF ERRORS**  
37684 Default.

37685 **APPLICATION USAGE**  
37686 None.

37687 **EXAMPLES**  
37688 None.

37689 **RATIONALE**  
37690 None.

37691 **FUTURE DIRECTIONS**  
37692 None.

37693 **SEE ALSO**  
37694 *uucp*

37695 **CHANGE HISTORY**  
37696 First released in Issue 2.

37697 **Issue 6**

37698 The normative text is reworded to avoid use of the term “must” for application requirements.

37699 The *LC\_TIME* and *TZ* entries are removed from the ENVIRONMENT VARIABLES section.

37700 The UN margin code and associated shading are removed from the **-q** option in response to The  
37701 Open Group Base Resolution bwg2001-003.

37702 **NAME**

37703       uux — remote command execution

37704 **SYNOPSIS**37705 xsi       uux [-np] *command-string*37706       uux [-jnp] *command-string*

37707

37708 **DESCRIPTION**

37709       The *uux* utility shall gather zero or more files from various systems, execute a shell pipeline (see  
 37710       Section 2.9 (on page 47)) on a specified system, and then send the standard output of the  
 37711       command to a file on a specified system. Only the first command of a pipeline can have a  
 37712       *system-name!* prefix. All other commands in the pipeline shall be executed on the system of the  
 37713       first command.

37714       The following restrictions are applicable to the shell pipeline processed by *uux*:

- 37715       • In gathering files from different systems, pathname expansion shall not be performed by *uux*.  
 37716       Thus, a request such as:

37717       uux "c99 remsys!~/\*.c"

37718       would attempt to copy the file named literally *\*.c* to the local system.

- 37719       • The redirection operators ">>", "<<", ">|", and ">&" shall not be accepted. Any use of  
 37720       these redirection operators shall cause this utility to write an error message describing the  
 37721       problem and exit with a non-zero exit status.

- 37722       • The reserved word *!* cannot be used at the head of the pipeline to modify the exit status. (See  
 37723       the *command-string* operand description below.)

- 37724       • Alias substitution shall not be performed.

37725       A filename can be specified as for *uucp*; it can be an absolute pathname, a pathname preceded by  
 37726       ~*name* (which is replaced by the corresponding login directory), a pathname specified as ~/ *dest*  
 37727       (*dest* is prefixed by the public directory called *PUBDIR*; the actual location of *PUBDIR* is  
 37728       implementation-defined), or a simple filename (which is prefixed by *uux* with the current  
 37729       directory). See *uucp* for the details.

37730       The execution of commands on remote systems shall take place in an execution directory known  
 37731       to the *uucp* system. All files required for the execution shall be put into this directory unless they  
 37732       already reside on that machine. Therefore, the application shall ensure that non-local filenames  
 37733       (without path or machine reference) are unique within the *uux* request.

37734       The *uux* utility shall attempt to get all files to the execution system. For files that are output files,  
 37735       the application shall ensure that the filename is escaped using parentheses.

37736       The remote system shall notify the user by mail if the requested command on the remote system  
 37737       was disallowed or the files were not accessible. This notification can be turned off by the **-n**  
 37738       option.

37739       Typical implementations of this utility require a communications line configured to use the Base  
 37740       Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, but other  
 37741       communications means may be used. On systems where there are no available communications  
 37742       means (either temporarily or permanently), this utility shall write an error message describing  
 37743       the problem and exit with a non-zero exit status.

37744       The *uux* utility cannot guarantee support for all character encodings in all circumstances. For  
 37745       example, transmission data may be restricted to 7 bits by the underlying network, 8-bit data and

37746 filenames need not be portable to non-internationalized systems, and so on. Under these  
 37747 circumstances, it is recommended that only characters defined in the ISO/IEC 646:1991  
 37748 standard International Reference Version (equivalent to ASCII) 7-bit range of characters be used  
 37749 and that only characters defined in the portable filename character set be used for naming files.

### 37750 OPTIONS

37751 The *uux* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 37752 12.2, Utility Syntax Guidelines.

37753 The following options shall be supported:

- 37754 **-p** Make the standard input to *uux* the standard input to the *command-string*.
- 37755 **-j** Write the job identification string to standard output. This job identification can be  
 37756 used by *uustat* to obtain the status or terminate a job.
- 37757 **-n** Do not notify the user if the command fails.

### 37758 OPERANDS

37759 The following operand shall be supported:

- 37760 *command-string*  
 37761 A string made up of one or more arguments that are similar to normal command  
 37762 arguments, except that the command and any filenames can be prefixed by  
 37763 *system-name*!. A null *system-name* shall be interpreted as the local system.

### 37764 STDIN

37765 The standard input shall not be used unless the **'-'** or **-p** option is specified; in those cases, the  
 37766 standard input shall be made the standard input of the *command-string*.

### 37767 INPUT FILES

37768 Input files shall be selected according to the contents of *command-string*.

### 37769 ENVIRONMENT VARIABLES

37770 The following environment variables shall affect the execution of *uux*:

- 37771 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 37772 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 37773 Internationalization Variables for the precedence of internationalization variables  
 37774 used to determine the values of locale categories.)
- 37775 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 37776 internationalization variables.
- 37777 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 37778 characters (for example, single-byte as opposed to multi-byte characters in  
 37779 arguments).
- 37780 **LC\_MESSAGES**  
 37781 Determine the locale that should be used to affect the format and contents of  
 37782 diagnostic messages written to standard error.
- 37783 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

### 37784 ASYNCHRONOUS EVENTS

37785 Default.

37786 **STDOUT**

37787 The standard output shall not be used unless the **-j** option is specified; in that case, the job  
 37788 identification string shall be written to standard output in the following format:

37789 "%s\n", <*jobid*>

37790 **STDERR**

37791 The standard error shall be used only for diagnostic messages.

37792 **OUTPUT FILES**

37793 Output files shall be created or written, or both, according to the contents of *command-string*.

37794 If **-n** is not used, mail files shall be modified following any command or file-access failures on  
 37795 the remote system.

37796 **EXTENDED DESCRIPTION**

37797 None.

37798 **EXIT STATUS**

37799 The following exit values shall be returned:

37800 0 Successful completion.

37801 >0 An error occurred.

37802 **CONSEQUENCES OF ERRORS**

37803 Default.

37804 **APPLICATION USAGE**

37805 Note that, for security reasons, many installations limit the list of commands executable on  
 37806 behalf of an incoming request from *uux*. Many sites permit little more than the receipt of mail  
 37807 via *uux*.

37808 Any characters special to the command interpreter should be quoted either by quoting the entire  
 37809 *command-string* or quoting the special characters as individual arguments.

37810 As noted in *uucp*, shell pattern matching notation characters appearing in pathnames are  
 37811 expanded on the appropriate local system. This is done under the control of local settings of  
 37812 *LC\_COLLATE* and *LC\_CTYPE*. Thus, care should be taken when using bracketed filename  
 37813 patterns, as collation and typing rules may vary from one system to another. Also be aware that  
 37814 certain types of expression (that is, equivalence classes, character classes, and collating symbols)  
 37815 need not be supported on non-internationalized systems.

37816 **EXAMPLES**

37817 1. The following command gets **file1** from system **a** and **file2** from system **b**, executes *diff* on  
 37818 the local system, and puts the results in **file.diff** in the local *PUBDIR* directory. (*PUBDIR* is  
 37819 the *uucp* public directory on the local system.)

37820 `uux "!diff a!/usr/file1 b!/a4/file2 >!/~/file.diff"`

37821 2. The following command fails because *uux* places all files copied to a system in the same  
 37822 working directory. Although the files **xyz** are from two different systems, their filenames  
 37823 are the same and conflict.

37824 `uux "!diff a!/usr1/xyz b!/usr2/xyz >!/~/xyz.diff"`

37825 3. The following command succeeds (assuming *diff* is permitted on system **a**) because the file  
 37826 local to system **a** is not copied to the working directory, and hence does not conflict with  
 37827 the file from system **c**.

37828                   uux "a!diff a!/usr/xyz c!/usr/xyz >!~/xyz.diff"

37829 **RATIONALE**

37830                   None.

37831 **FUTURE DIRECTIONS**

37832                   None.

37833 **SEE ALSO**

37834                   Chapter 2 (on page 29), *uucp*, *uuencode*, *uustat*

37835 **CHANGE HISTORY**

37836                   First released in Issue 2.

37837 **Issue 6**

37838                   The obsolescent SYNOPSIS is removed.

37839                   The normative text is reworded to avoid use of the term “must” for application requirements.

37840                   The UN margin code and associated shading are removed from the **-j** option in response to The  
37841                   Open Group Base Resolution bwg2001-003.

37842 **NAME**37843       val — validate SCCS files (**DEVELOPMENT**)37844 **SYNOPSIS**

37845 xSI       val -

37846       val [-s] [-m *name*] [-r *SID*] [-y *type*] *file*...

37847

37848 **DESCRIPTION**37849       The *val* utility shall determine whether the specified *file* is an SCCS file meeting the  
37850       characteristics specified by the options.37851 **OPTIONS**37852       The *val* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
37853       Utility Syntax Guidelines, except that the usage of the '-' operand is not strictly as intended by  
37854       the guidelines (that is, reading options and operands from standard input).

37855       The following options shall be supported:

37856       -m *name*       Specify a *name*, which is compared with the SCCS %M% keyword in *file*; see *get*.37857       -r *SID*       Specify a *SID* (SCCS Identification String), an SCCS delta number. A check shall be  
37858       made to determine whether the *SID* is ambiguous (for example, -r 1 is ambiguous  
37859       because it physically does not exist but implies 1.1, 1.2, and so on, which may  
37860       exist) or invalid (for example, -r 1.0 or -r 1.1.0 are invalid because neither case can  
37861       exist as a valid delta number). If the *SID* is valid and not ambiguous, a check shall  
37862       be made to determine whether it actually exists.37863       -s           Silence the diagnostic message normally written to standard output for any error  
37864       that is detected while processing each named file on a given command line.37865       -y *type*       Specify a *type*, which shall be compared with the SCCS %Y% keyword in *file*; see  
37866       *get*.37867 **OPERANDS**

37868       The following operands shall be supported:

37869       *file*       A pathname of an existing SCCS file. If exactly one *file* operand appears, and it is  
37870       '-', the standard input shall be read: each line shall be independently processed  
37871       as if it were a command line argument list. (However, the line is not subjected to  
37872       any of the shell word expansions, such as parameter expansion or quote removal.)37873 **STDIN**37874       The standard input shall be a text file used only when the *file* operand is specified as '-'.37875 **INPUT FILES**

37876       Any SCCS files processed shall be files of an unspecified format.

37877 **ENVIRONMENT VARIABLES**37878       The following environment variables shall affect the execution of *val*:37879       LANG       Provide a default value for the internationalization variables that are unset or null.  
37880       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
37881       Internationalization Variables for the precedence of internationalization variables  
37882       used to determine the values of locale categories.)37883       LC\_ALL       If set to a non-empty string value, override the values of all the other  
37884       internationalization variables.

37885        **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 37886                   characters (for example, single-byte as opposed to multi-byte characters in  
 37887                   arguments and input files).

37888        **LC\_MESSAGES**  
 37889                   Determine the locale that should be used to affect the format and contents of  
 37890                   diagnostic messages written to standard error, and informative messages written  
 37891                   to standard output.

37892        **NLSPATH**    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

37893 **ASYNCHRONOUS EVENTS**  
 37894        Default.

37895 **STDOUT**  
 37896        The standard output shall consist of informative messages about either:

37897        1. Each file processed

37898        2. Each command line read from standard input

37899        If the standard input is not used, for each *file* operand yielding a discrepancy, the output line  
 37900        shall have the following format:

37901        "%s: %s\n", <pathname>, <unspecified string>

37902        If standard input is used, a line of input shall be written before each of the preceding lines for  
 37903        files containing discrepancies:

37904        "%s:\n", <input line>

37905 **STDERR**  
 37906        Not used.

37907 **OUTPUT FILES**  
 37908        None.

37909 **EXTENDED DESCRIPTION**  
 37910        None.

37911 **EXIT STATUS**  
 37912        The 8-bit code returned by *val* shall be a disjunction of the possible errors; that is, it can be  
 37913        interpreted as a bit string where set bits are interpreted as follows:

37914        0x80    =    Missing file argument.

37915        0x40    =    Unknown or duplicate option.

37916        0x20    =    Corrupted SCCS file.

37917        0x10    =    Cannot open file or file not SCCS.

37918        0x08    =    *SID* is invalid or ambiguous.

37919        0x04    =    *SID* does not exist.

37920        0x02    =    %Y%, -y mismatch.

37921        0x01    =    %M%, -m mismatch.

37922        Note that *val* can process two or more files on a given command line and can process multiple  
 37923        command lines (when reading the standard input). In these cases an aggregate code shall be  
 37924        returned: a logical OR of the codes generated for each command line and file processed.

37925 **CONSEQUENCES OF ERRORS**

37926 Default.

37927 **APPLICATION USAGE**

37928 Since the *val* exit status sets the 0x80 bit, shell applications checking "\$?" cannot tell if it  
37929 terminated due to a missing file argument or receipt of a signal.

37930 **EXAMPLES**

37931 In a directory with three SCCS files—**s.x** (of **t** type “text”), **s.y**, and **s.z** (a corrupted file)—the  
37932 following command could produce the output shown:

37933 `val - <<EOF`37934 `-y source s.x`37935 `-m y s.y`37936 `s.z`37937 `EOF`37938 `-y source s.x`37939 `s.x: %Y%, -y mismatch`37940 `s.z`37941 `s.z: corrupted SCCS file`37942 **RATIONALE**

37943 None.

37944 **FUTURE DIRECTIONS**

37945 None.

37946 **SEE ALSO**37947 *admin, delta, get, prs*37948 **CHANGE HISTORY**

37949 First released in Issue 2.

37950 **Issue 6**

37951 The Open Group Corrigendum U025/4 is applied, correcting a typographical error in the EXIT  
37952 STATUS.

37953 **NAME**37954 `vi` — screen-oriented (visual) display editor37955 **SYNOPSIS**37956 UP `vi [-rR] [-c command] [-t tagstring] [-w size] [file ...]`

37957

37958 **DESCRIPTION**37959 This utility shall be provided on systems that both support the User Portability Utilities option  
37960 and define the POSIX2\_CHAR\_TERM symbol. On other systems it is optional.37961 The *vi* (visual) utility is a screen-oriented text editor. Only the open and visual modes of the  
37962 editor are described in IEEE Std 1003.1-2001; see the line editor *ex* for additional editing  
37963 capabilities used in *vi*. The user can switch back and forth between *vi* and *ex* and execute *ex*  
37964 commands from within *vi*.37965 This reference page uses the term *edit buffer* to describe the current working text. No specific  
37966 implementation is implied by this term. All editing changes are performed on the edit buffer,  
37967 and no changes to it shall affect any file until an editor command writes the file.37968 When using *vi*, the terminal screen acts as a window into the editing buffer. Changes made to  
37969 the editing buffer shall be reflected in the screen display; the position of the cursor on the screen  
37970 shall indicate the position within the editing buffer.37971 Certain terminals do not have all the capabilities necessary to support the complete *vi* definition.  
37972 When these commands cannot be supported on such terminals, this condition shall not produce  
37973 an error message such as “not an editor command” or report a syntax error. The implementation  
37974 may either accept the commands and produce results on the screen that are the result of an  
37975 unsuccessful attempt to meet the requirements of this volume of IEEE Std 1003.1-2001 or report  
37976 an error describing the terminal-related deficiency.37977 **OPTIONS**37978 The *vi* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
37979 Utility Syntax Guidelines.

37980 The following options shall be supported:

37981 `-c command` See the *ex* command description of the `-c` option.37982 `-r` See the *ex* command description of the `-r` option.37983 `-R` See the *ex* command description of the `-R` option.37984 `-t tagstring` See the *ex* command description of the `-t` option.37985 `-w size` See the *ex* command description of the `-w` option.37986 **OPERANDS**37987 See the OPERANDS section of the *ex* command for a description of the operands supported by  
37988 the *vi* command.37989 **STDIN**37990 If standard input is not a terminal device, the results are undefined. The standard input consists  
37991 of a series of commands and input text, as described in the EXTENDED DESCRIPTION section.37992 If a read from the standard input returns an error, or if the editor detects an end-of-file condition  
37993 from the standard input, it shall be equivalent to a SIGHUP asynchronous event.

37994 **INPUT FILES**

37995 See the INPUT FILES section of the *ex* command for a description of the input files supported by  
 37996 the *vi* command.

37997 **ENVIRONMENT VARIABLES**

37998 See the ENVIRONMENT VARIABLES section of the *ex* command for the environment variables  
 37999 that affect the execution of the *vi* command.

38000 **ASYNCHRONOUS EVENTS**

38001 See the ASYNCHRONOUS EVENTS section of the *ex* for the asynchronous events that affect the  
 38002 execution of the *vi* command.

38003 **STDOUT**

38004 If standard output is not a terminal device, undefined results occur.

38005 Standard output may be used for writing prompts to the user, for informational messages, and  
 38006 for writing lines from the file.

38007 **STDERR**

38008 If standard output is not a terminal device, undefined results occur.

38009 The standard error shall be used only for diagnostic messages.

38010 **OUTPUT FILES**

38011 See the OUTPUT FILES section of the *ex* command for a description of the output files  
 38012 supported by the *vi* command.

38013 **EXTENDED DESCRIPTION**

38014 If the terminal does not have the capabilities necessary to support an unspecified portion of the  
 38015 *vi* definition, implementations shall start initially in *ex* mode or open mode. Otherwise, after  
 38016 initialization, *vi* shall be in command mode; text input mode can be entered by one of several  
 38017 commands used to insert or change text. In text input mode, <ESC> can be used to return to  
 38018 command mode; other uses of <ESC> are described later in this section; see **Terminate**  
 38019 **Command or Input Mode** (on page 996).

38020 **Initialization in *ex* and *vi***

38021 See **Initialization in *ex* and *vi*** (on page 358) for a description of *ex* and *vi* initialization for the *vi*  
 38022 utility.

38023 **Command Descriptions in *vi***

38024 The following symbols are used in this reference page to represent arguments to commands.

38025 *buffer* See the description of *buffer* in the EXTENDED DESCRIPTION section of the *ex* utility;  
 38026 see **Command Descriptions in *ex*** (on page 368).

38027 In open and visual mode, when a command synopsis shows both [*buffer*] and [*count*]  
 38028 preceding the command name, they can be specified in either order.

38029 *count* A positive integer used as an optional argument to most commands, either to give a  
 38030 repeat count or as a size. This argument is optional and shall default to 1 unless  
 38031 otherwise specified.

38032 The Synopsis lines for the *vi* commands <control>-G, <control>-L, <control>-R,  
 38033 <control>-], %, &, ^, **D**, **m**, **M**, **Q**, **u**, **U**, and **ZZ** do not have *count* as an optional  
 38034 argument. Regardless, it shall not be an error to specify a *count* to these commands, and  
 38035 any specified *count* shall be ignored.

38036 *motion* An optional trailing argument used by the **!**, **<**, **>**, **c**, **d**, and **y** commands, which is used  
 38037 to indicate the region of text that shall be affected by the command. The motion can be  
 38038 either one of the command characters repeated or one of several other *vi* commands  
 38039 (listed in the following table). Each of the applicable commands specifies the region of  
 38040 text matched by repeating the command; each command that can be used as a motion  
 38041 command specifies the region of text it affects.

38042 Commands that take *motion* arguments operate on either lines or characters, depending  
 38043 on the circumstances. When operating on lines, all lines that fall partially or wholly  
 38044 within the text region specified for the command shall be affected. When operating on  
 38045 characters, only the exact characters in the specified text region shall be affected. Each  
 38046 motion command specifies this individually.

38047 When commands that may be motion commands are not used as motion commands,  
 38048 they shall set the current position to the current line and column as specified.

38049 The following commands shall be valid cursor motion commands:

|       |                   |    |    |   |   |
|-------|-------------------|----|----|---|---|
| 38050 | <apostrophe>      | (  | -  | j | H |
| 38051 | <carriage-return> | )  | \$ | k | L |
| 38052 | <comma>           | [  | %  | l | M |
| 38053 | <control>-H       | ]] | _  | n | N |
| 38054 | <control>-N       | {  | ;  | t | T |
| 38055 | <control>-P       | }  | ?  | w | W |
| 38056 | <grave accent>    | ^  | b  | B |   |
| 38057 | <newline>         | +  | e  | E |   |
| 38058 | <space>           |    | f  | F |   |
| 38059 | <zero>            | /  | h  | G |   |

38060 Any *count* that is specified to a command that has an associated motion command shall  
 38061 be applied to the motion command. If a *count* is applied to both the command and its  
 38062 associated motion command, the effect shall be multiplicative.

38063 The following symbols are used in this section to specify locations in the edit buffer:

38064 *current character*

38065 The character that is currently indicated by the cursor.

38066 *end of a line*

38067 The point located between the last non-<newline> (if any) and the terminating  
 38068 <newline> of a line. For an empty line, this location coincides with the beginning of the  
 38069 line.

38070 *end of the edit buffer*

38071 The location corresponding to the end of the last line in the edit buffer.

38072 The following symbols are used in this section to specify command actions:

38073 *bigword* In the POSIX locale, *vi* shall recognize four kinds of *bigwords*:

- 38074 1. A maximal sequence of non-<blank>s preceded and followed by <blank>s or the  
 38075 beginning or end of a line or the edit buffer
- 38076 2. One or more sequential blank lines
- 38077 3. The first character in the edit buffer
- 38078 4. The last non-<newline> in the edit buffer

- 38079        *word*        In the POSIX locale, *vi* shall recognize five kinds of words:
- 38080                1. A maximal sequence of letters, digits, and underscores, delimited at both ends by:
- 38081                    — Characters other than letters, digits, or underscores
- 38082                    — The beginning or end of a line
- 38083                    — The beginning or end of the edit buffer
- 38084                2. A maximal sequence of characters other than letters, digits, underscores, or
- 38085                    <blank>s, delimited at both ends by:
- 38086                    — A letter, digit, underscore
- 38087                    — <blank>s
- 38088                    — The beginning or end of a line
- 38089                    — The beginning or end of the edit buffer
- 38090                3. One or more sequential blank lines
- 38091                4. The first character in the edit buffer
- 38092                5. The last non-<newline> in the edit buffer
- 38093        *section boundary*
- 38094                A *section boundary* is one of the following:
- 38095                    1. A line whose first character is a <form-feed>
- 38096                    2. A line whose first character is an open curly brace ( ' { ' )
- 38097                    3. A line whose first character is a period and whose second and third characters
- 38098                    match a two-character pair in the **sections** edit option (see *ed*)
- 38099                    4. A line whose first character is a period and whose only other character matches
- 38100                    the first character of a two-character pair in the **sections** edit option, where the
- 38101                    second character of the two-character pair is a <space>
- 38102                    5. The first line of the edit buffer
- 38103                    6. The last line of the edit buffer if the last line of the edit buffer is empty or if it is a
- 38104                    **]]** or **}** command; otherwise, the last non-<newline> of the last line of the edit
- 38105                    buffer
- 38106        *paragraph boundary*
- 38107                A *paragraph boundary* is one of the following:
- 38108                    1. A section boundary
- 38109                    2. A line whose first character is a period and whose second and third characters
- 38110                    match a two-character pair in the **paragraphs** edit option (see *ed*)
- 38111                    3. A line whose first character is a period and whose only other character matches
- 38112                    the first character of a two-character pair in the *paragraphs* edit option, where the
- 38113                    second character of the two-character pair is a <space>
- 38114                    4. One or more sequential blank lines
- 38115        *remembered search direction*
- 38116                See the description of *remembered search direction* in *ed*.

38117 *sentence boundary*

38118 A *sentence boundary* is one of the following:

- 38119 1. A paragraph boundary
- 38120 2. The first non-`<blank>` that occurs after a paragraph boundary
- 38121 3. The first non-`<blank>` that occurs after a period (`' . '`), exclamation mark (`' ! '`),  
38122 or question mark (`' ? '`), followed by two `<space>`s or the end of a line; any  
38123 number of closing parenthesis (`' ) '`), closing brackets (`' ] '`), double quote (`' \" '`),  
38124 or single quote (`' ' '`) characters can appear between the punctuation mark and  
38125 the two `<space>`s or end-of-line

38126 In the remainder of the description of the *vi* utility, the term “buffer line” refers to a line in the  
38127 edit buffer and the term “display line” refers to the line or lines on the display screen used to  
38128 display one buffer line. The term “current line” refers to a specific “buffer line”.

38129 If there are display lines on the screen for which there are no corresponding buffer lines because  
38130 they correspond to lines that would be after the end of the file, they shall be displayed as a single  
38131 tilde (`' ~ '`) character, plus the terminating `<newline>`.

38132 The last line of the screen shall be used to report errors or display informational messages. It  
38133 shall also be used to display the input for “line-oriented commands” (`/`, `?`, `:`, and `!`). When a line-  
38134 oriented command is executed, the editor shall enter text input mode on the last line on the  
38135 screen, using the respective command characters as prompt characters. (In the case of the `!`  
38136 command, the associated motion shall be entered by the user before the editor enters text input  
38137 mode.) The line entered by the user shall be terminated by a `<newline>`, a non-`<control>`-V-  
38138 escaped `<carriage-return>`, or unescaped `<ESC>`. It is unspecified if more characters than  
38139 require a display width minus one column number of screen columns can be entered.

38140 If any command is executed that overwrites a portion of the screen other than the last line of the  
38141 screen (for example, the *ex* **suspend** or `!` commands), other than the *ex* **shell** command, the user  
38142 shall be prompted for a character before the screen is refreshed and the edit session continued.

38143 `<tab>`s shall take up the number of columns on the screen set by the **tabstop** edit option (see *ed*),  
38144 unless there are less than that number of columns before the display margin that will cause the  
38145 displayed line to be folded; in this case, they shall only take up the number of columns up to that  
38146 boundary.

38147 The cursor shall be placed on the current line and relative to the current column as specified by  
38148 each command described in the following sections.

38149 In open mode, if the current line is not already displayed, then it shall be displayed.

38150 In visual mode, if the current line is not displayed, then the lines that are displayed shall be  
38151 expanded, scrolled, or redrawn to cause an unspecified portion of the current line to be  
38152 displayed. If the screen is redrawn, no more than the number of display lines specified by the  
38153 value of the **window** edit option shall be displayed (unless the current line cannot be completely  
38154 displayed in the number of display lines specified by the **window** edit option) and the current  
38155 line shall be positioned as close to the center of the displayed lines as possible (within the  
38156 constraints imposed by the distance of the line from the beginning or end of the edit buffer). If  
38157 the current line is before the first line in the display and the screen is scrolled, an unspecified  
38158 portion of the current line shall be placed on the first line of the display. If the current line is after  
38159 the last line in the display and the screen is scrolled, an unspecified portion of the current line  
38160 shall be placed on the last line of the display.

38161 In visual mode, if a line from the edit buffer (other than the current line) does not entirely fit into  
38162 the lines at the bottom of the display that are available for its presentation, the editor may

38163 choose not to display any portion of the line. The lines of the display that do not contain text  
 38164 from the edit buffer for this reason shall each consist of a single '@' character.

38165 In visual mode, the editor may choose for unspecified reasons to not update lines in the display  
 38166 to correspond to the underlying edit buffer text. The lines of the display that do not correctly  
 38167 correspond to text from the edit buffer for this reason shall consist of a single '@' character  
 38168 (plus the terminating <newline>), and the <control>-R command shall cause the editor to  
 38169 update the screen to correctly represent the edit buffer.

38170 Open and visual mode commands that set the current column set it to a column position in the  
 38171 display, and not a character position in the line. In this case, however, the column position in the  
 38172 display shall be calculated for an infinite width display; for example, the column related to a  
 38173 character that is part of a line that has been folded onto additional screen lines will be offset from  
 38174 the display line column where the buffer line begins, not from the beginning of a particular  
 38175 display line.

38176 The display cursor column in the display is based on the value of the current column, as follows,  
 38177 with each rule applied in turn:

- 38178 1. If the current column is after the last display line column used by the displayed line, the  
 38179 display cursor column shall be set to the last display line column occupied by the last non-  
 38180 <newline> in the current line; otherwise, the display cursor column shall be set to the  
 38181 current column.
- 38182 2. If the character of which some portion is displayed in the display line column specified by  
 38183 the display cursor column requires more than a single display line column:
  - 38184 a. If in text input mode, the display cursor column shall be adjusted to the first display  
 38185 line column in which any portion of that character is displayed.
  - 38186 b. Otherwise, the display cursor column shall be adjusted to the last display line  
 38187 column in which any portion of that character is displayed.

38188 The current column shall not be changed by these adjustments to the display cursor column.

38189 If an error occurs during the parsing or execution of a vi command:

- 38190 • The terminal shall be alerted. Execution of the vi command shall stop, and the cursor (for  
 38191 example, the current line and column) shall not be further modified.
- 38192 • Unless otherwise specified by the following command sections, it is unspecified whether an  
 38193 informational message shall be displayed.
- 38194 • Any partially entered vi command shall be discarded.
- 38195 • If the vi command resulted from a **map** expansion, all characters from that **map** expansion  
 38196 shall be discarded, except as otherwise specified by the **map** command (see *ed*).
- 38197 • If the vi command resulted from the execution of a buffer, no further commands caused by  
 38198 the execution of the buffer shall be executed.

**Page Backwards**

*Synopsis:*     [*count*] <control>-B

If in open mode, the <control>-B command shall behave identically to the **z** command. Otherwise, if the current line is the first line of the edit buffer, it shall be an error.

If the **window** edit option is less than 3, display a screen where the last line of the display shall be some portion of:

(*current first line*) -1

otherwise, display a screen where the first line of the display shall be some portion of:

(*current first line*) - *count* x ((window edit option) -2)

If this calculation would result in a line that is before the first line of the edit buffer, the first line of the display shall display some portion of the first line of the edit buffer.

*Current line:* If no lines from the previous display remain on the screen, set to the last line of the display; otherwise, set to (*line* - the number of new lines displayed on this screen).

*Current column:* Set to non-<blank>.

**Scroll Forward**

*Synopsis:*     [*count*] <control>-D

If the current line is the last line of the edit buffer, it shall be an error.

If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D or <control>-U command. If there was no previous <control>-D or <control>-U command, *count* shall default to the value of the **scroll** edit option.

If in open mode, write lines starting with the line after the current line, until *count* lines or the last line of the file have been written.

*Current line:* If the current line + *count* is past the last line of the edit buffer, set to the last line of the edit buffer; otherwise, set to the current line + *count*.

*Current column:* Set to non-<blank>.

**Scroll Forward by Line**

*Synopsis:*     [*count*] <control>-E

Display the line *count* lines after the last line currently displayed.

If the last line of the edit buffer is displayed, it shall be an error. If there is no line *count* lines after the last line currently displayed, the last line of the display shall display some portion of the last line of the edit buffer.

*Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first line displayed.

*Current column:* Unchanged.

**Page Forward**

*Synopsis:*     [*count*] <control>-F

If in open mode, the <control>-F command shall behave identically to the **z** command. Otherwise, if the current line is the last line of the edit buffer, it shall be an error.

If the **window** edit option is less than 3, display a screen where the first line of the display shall be some portion of:

*(current last line) +1*

otherwise, display a screen where the first line of the display shall be some portion of:

*(current first line) + count x ((window edit option) -2)*

If this calculation would result in a line that is after the last line of the edit buffer, the last line of the display shall display some portion of the last line of the edit buffer.

*Current line:* If no lines from the previous display remain on the screen, set to the first line of the display; otherwise, set to *(line + the number of new lines displayed on this screen)*.

*Current column:* Set to non-<blank>.

**Display Information**

*Synopsis:*     <control>-G

This command shall be equivalent to the **ex file** command.

**Move Cursor Backwards**

*Synopsis:*     [*count*] <control>-H

              [*count*] h

              the current erase character (see stty)

If there are no characters before the current character on the current line, it shall be an error. If there are less than *count* previous characters on the current line, *count* shall be adjusted to the number of previous characters on the line.

If used as a motion command:

1. The text region shall be from the character before the starting cursor up to and including the *count*th character before the starting cursor.
2. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to *(column - the number of columns occupied by count characters ending with the previous current column)*.

**Move Down**

*Synopsis:*     [*count*] <newline>  
                  [*count*] <control>-J  
                  [*count*] <control>-M  
                  [*count*] <control>-N  
                  [*count*] j  
                  [*count*] <carriage-return>  
                  [*count*] +

If there are less than *count* lines after the current line in the edit buffer, it shall be an error.

If used as a motion command:

1. The text region shall include the starting line and the next *count* – 1 lines.
2. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to *current line* + *count*.

*Current column:* Set to non-<blank> for the <carriage-return>, <control>-M, and + commands; otherwise, unchanged.

**Clear and Redisplay**

*Synopsis:*     <control>-L

If in open mode, clear the screen and redisplay the current line. Otherwise, clear and redisplay the screen.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Move Up**

*Synopsis:*     [*count*] <control>-P  
                  [*count*] k  
                  [*count*] –

If there are less than *count* lines before the current line in the edit buffer, it shall be an error.

If used as a motion command:

1. The text region shall include the starting line and the previous *count* lines.
2. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

*Current line:* Set to *current line* – *count*.

*Current column:* Set to non-<blank> for the – command; otherwise, unchanged.

**Redraw Screen**

*Synopsis:*     <control>-R

If any lines have been deleted from the display screen and flagged as deleted on the terminal using the @ convention (see the beginning of the EXTENDED DESCRIPTION section), they shall be redisplayed to match the contents of the edit buffer.

It is unspecified whether lines flagged with @ because they do not fit on the terminal display shall be affected.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Scroll Backward**

*Synopsis:*     [count] <control>-U

If the current line is the first line of the edit buffer, it shall be an error.

If no *count* is specified, *count* shall default to the *count* associated with the previous <control>-D or <control>-U command. If there was no previous <control>-D or <control>-U command, *count* shall default to the value of the **scroll** edit option.

*Current line:* If *count* is greater than the current line, set to 1; otherwise, set to the current line – *count*.

*Current column:* Set to non-<blank>.

**Scroll Backward by Line**

*Synopsis:*     [count] <control>-Y

Display the line *count* lines before the first line currently displayed.

If the current line is the first line of the edit buffer, it shall be an error. If this calculation would result in a line that is before the first line of the edit buffer, the first line of the display shall display some portion of the first line of the edit buffer.

*Current line:* Unchanged if the previous current character is displayed; otherwise, set to the first line displayed.

*Current column:* Unchanged.

**Edit the Alternate File**

*Synopsis:*     <control>-^

This command shall be equivalent to the *ex* **edit** command, with the alternate pathname as its argument.

**Terminate Command or Input Mode**

*Synopsis:*     <ESC>

If a partial *vi* command (as defined by at least one, non-*count* character) has been entered, discard the *count* and the command character(s).

Otherwise, if no command characters have been entered, and the <ESC> was the result of a map expansion, the terminal shall be alerted and the <ESC> character shall be discarded, but it shall not be an error.

38336 Otherwise, it shall be an error.

38337 *Current line*: Unchanged.

38338 *Current column*: Unchanged.

### 38339 **Search for tagstring**

38340 *Synopsis*:     <control>-]

38341 If the current character is not a word or <blank>, it shall be an error.

38342 This command shall be equivalent to the *ex* **tag** command, with the argument to that command  
38343 defined as follows.

38344 If the current character is a <blank>:

- 38345     1. Skip all <blank>s after the cursor up to the end of the line.
- 38346     2. If the end of the line is reached, it shall be an error.

38347 Then, the argument to the *ex* **tag** command shall be the current character and all subsequent  
38348 characters, up to the first non-word character or the end of the line.

### 38349 **Move Cursor Forward**

38350 *Synopsis*:     [*count*] <space>  
38351               [*count*] 1 (ell)

38352 If there are less than *count* non-<newline>s after the cursor on the current line, *count* shall be  
38353 adjusted to the number of non-<newline>s after the cursor on the line.

38354 If used as a motion command:

- 38355     1. If the current or *count*th character after the cursor is the last non-<newline> in the line, the  
38356       text region shall be comprised of the current character up to and including the last non-  
38357       <newline> in the line. Otherwise, the text region shall be from the current character up to,  
38358       but not including, the *count*th character after the cursor.
- 38359     2. Any text copied to a buffer shall be in character mode.

38360 If not used as a motion command:

38361 If there are no non-<newline>s after the current character on the current line, it shall be an error.

38362 *Current line*: Unchanged.

38363 *Current column*: Set to the last column that displays any portion of the *count*th character after the  
38364 current character.

### 38365 **Replace Text with Results from Shell Command**

38366 *Synopsis*:     [*count*] ! *motion shell-commands* <newline>

38367 If the motion command is the ! command repeated:

- 38368     1. If the edit buffer is empty and no *count* was supplied, the command shall be the equivalent  
38369       of the *ex* **:read !** command, with the text input, and no text shall be copied to any buffer.
- 38370     2. Otherwise:
  - 38371       a. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be  
38372       an error.

38373                   b. The text region shall be from the current line up to and including the next *count* –1  
38374                   lines.

38375                   Otherwise, the text region shall be the lines in which any character of the text region specified by  
38376                   the motion command appear.

38377                   Any text copied to a buffer shall be in line mode.

38378                   This command shall be equivalent to the *ex !* command for the specified lines.

### 38379                   **Move Cursor to End-of-Line**

38380                   Synopsis:       [*count*] \$

38381                   It shall be an error if there are less than (*count* –1) lines after the current line in the edit buffer.

38382                   If used as a motion command:

- 38383                   1. If *count* is 1:
  - 38384                   a. It shall be an error if the line is empty.
  - 38385                   b. Otherwise, the text region shall consist of all characters from the starting cursor to  
38386                   the last non-<newline> in the line, inclusive, and any text copied to a buffer shall be  
38387                   in character mode.
- 38388                   2. Otherwise, if the starting cursor position is at or before the first non-<blank> in the line,  
38389                   the text region shall consist of the current and the next *count* –1 lines, and any text saved to  
38390                   a buffer shall be in line mode.
- 38391                   3. Otherwise, the text region shall consist of all characters from the starting cursor to the last  
38392                   non-<newline> in the line that is *count* –1 lines forward from the current line, and any text  
38393                   copied to a buffer shall be in character mode.

38394                   If not used as a motion command:

38395                   *Current line*: Set to the *current line* + *count* –1.

38396                   *Current column*: The current column is set to the last display line column of the last non-  
38397                   <newline> in the line, or column position 1 if the line is empty.

38398                   The current column shall be adjusted to be on the last display line column of the last non-  
38399                   <newline> of the current line as subsequent commands change the current line, until a  
38400                   command changes the current column.

### 38401                   **Move to Matching Character**

38402                   Synopsis:       %

38403                   If the character at the current position is not a parenthesis, bracket, or curly brace, search  
38404                   forward in the line to the first one of those characters. If no such character is found, it shall be an  
38405                   error.

38406                   The matching character shall be the parenthesis, bracket, or curly brace matching the  
38407                   parenthesis, bracket, or curly brace, respectively, that was at the current position or that was  
38408                   found on the current line.

38409                   Matching shall be determined as follows, for an open parenthesis:

- 38410                   1. Set a counter to 1.
- 38411                   2. Search forwards until a parenthesis is found or the end of the edit buffer is reached.

- 38412           3. If the end of the edit buffer is reached, it shall be an error.
- 38413           4. If an open parenthesis is found, increment the counter by 1.
- 38414           5. If a close parenthesis is found, decrement the counter by 1.
- 38415           6. If the counter is zero, the current character is the matching character.
- 38416       Matching for a close parenthesis shall be equivalent, except that the search shall be backwards,  
38417       from the starting character to the beginning of the buffer, a close parenthesis shall increment the  
38418       counter by 1, and an open parenthesis shall decrement the counter by 1.
- 38419       Matching for brackets and curly braces shall be equivalent, except that searching shall be done  
38420       for open and close brackets or open and close curly braces. It is implementation-defined whether  
38421       other characters are searched for and matched as well.
- 38422       If used as a motion command:
- 38423           1. If the matching cursor was after the starting cursor in the edit buffer, and the starting  
38424           cursor position was at or before the first non-`<blank>` non-`<newline>` in the starting line,  
38425           and the matching cursor position was at or after the last non-`<blank>` non-`<newline>` in  
38426           the matching line, the text region shall consist of the current line to the matching line,  
38427           inclusive, and any text copied to a buffer shall be in line mode.
- 38428           2. If the matching cursor was before the starting cursor in the edit buffer, and the starting  
38429           cursor position was at or after the last non-`<blank>` non-`<newline>` in the starting line, and  
38430           the matching cursor position was at or before the first non-`<blank>` non-`<newline>` in the  
38431           matching line, the text region shall consist of the current line to the matching line,  
38432           inclusive, and any text copied to a buffer shall be in line mode.
- 38433           3. Otherwise, the text region shall consist of the starting character to the matching character,  
38434           inclusive, and any text copied to a buffer shall be in character mode.
- 38435       If not used as a motion command:
- 38436       *Current line*: Set to the line where the matching character is located.
- 38437       *Current column*: Set to the last column where any portion of the matching character is displayed.
- 38438       **Repeat Substitution**
- 38439       Synopsis:       &
- 38440       Repeat the previous substitution command. This command shall be equivalent to the *ex* **&**  
38441       command with the current line as its addresses, and without *options*, *count*, or *flags*.
- 38442       **Return to Previous Context at Beginning of Line**
- 38443       Synopsis:       ' *character*
- 38444       It shall be an error if there is no line in the edit buffer marked by *character*.
- 38445       If used as a motion command:
- 38446           1. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
38447           and the marked cursor in the edit buffer shall be logically swapped.
- 38448           2. The text region shall consist of the starting line up to and including the marked line, and  
38449           any text copied to a buffer shall be in line mode.
- 38450       If not used as a motion command:

38451 *Current line*: Set to the line referenced by the mark.

38452 *Current column*: Set to non-<blank>.

### 38453 **Return to Previous Context**

38454 *Synopsis*:     \ *character*

38455 It shall be an error if the marked line is no longer in the edit buffer. If the marked line no longer  
38456 contains a character in the saved numbered character position, it shall be as if the marked  
38457 position is the first non-<blank>.

38458 If used as a motion command:

- 38459     1. It shall be an error if the marked cursor references the same character in the edit buffer as  
38460       the starting cursor.
- 38461     2. If the starting cursor is after the marked cursor, then the locations of the starting cursor  
38462       and the marked cursor in the edit buffer shall be logically swapped.
- 38463     3. If the starting line is empty or the starting cursor is at or before the first non-<blank> non-  
38464       <newline> of the starting line, and the marked cursor line is empty or the marked cursor  
38465       references the first character of the marked cursor line, the text region shall consist of all  
38466       lines containing characters from the starting cursor to the line before the marked cursor  
38467       line, inclusive, and any text copied to a buffer shall be in line mode.
- 38468     4. Otherwise, if the marked cursor line is empty or the marked cursor references a character  
38469       at or before the first non-<blank> non-<newline> of the marked cursor line, the region of  
38470       text shall be from the starting cursor to the last non-<newline> of the line before the  
38471       marked cursor line, inclusive, and any text copied to a buffer shall be in character mode.
- 38472     5. Otherwise, the region of text shall be from the starting cursor (inclusive), to the marked  
38473       cursor (exclusive), and any text copied to a buffer shall be in character mode.

38474 If not used as a motion command:

38475 *Current line*: Set to the line referenced by the mark.

38476 *Current column*: Set to the last column in which any portion of the character referenced by the  
38477 mark is displayed.

### 38478 **Return to Previous Section**

38479 *Synopsis*:     [*count*] [ [

38480 Move the cursor backward through the edit buffer to the first character of the previous section  
38481 boundary, *count* times.

38482 If used as a motion command:

- 38483     1. If the starting cursor was at the first character of the starting line or the starting line was  
38484       empty, and the first character of the boundary was the first character of the boundary line,  
38485       the text region shall consist of the current line up to and including the line where the  
38486       *count*th next boundary starts, and any text copied to a buffer shall be in line mode.
- 38487     2. If the boundary was the last line of the edit buffer or the last non-<newline> of the last line  
38488       of the edit buffer, the text region shall consist of the last character in the edit buffer up to  
38489       and including the starting character, and any text saved to a buffer shall be in character  
38490       mode.

38491 3. Otherwise, the text region shall consist of the starting character up to but not including the  
 38492 first character in the *countth* next boundary, and any text copied to a buffer shall be in  
 38493 character mode.

38494 If not used as a motion command:

38495 *Current line*: Set to the line where the *countth* next boundary in the edit buffer starts.

38496 *Current column*: Set to the last column in which any portion of the first character of the *countth*  
 38497 next boundary is displayed, or column position 1 if the line is empty.

### 38498 **Move to Next Section**

38499 *Synopsis*: [ *count* ] ]

38500 Move the cursor forward through the edit buffer to the first character of the next section  
 38501 boundary, *count* times.

38502 If used as a motion command:

- 38503 1. If the starting cursor was at the first character of the starting line or the starting line was  
 38504 empty, and the first character of the boundary was the first character of the boundary line,  
 38505 the text region shall consist of the current line up to and including the line where the  
 38506 *countth* previous boundary starts, and any text copied to a buffer shall be in line mode.
- 38507 2. If the boundary was the first line of the edit buffer, the text region shall consist of the first  
 38508 character in the edit buffer up to but not including the starting character, and any text  
 38509 copied to a buffer shall be in character mode.
- 38510 3. Otherwise, the text region shall consist of the first character in the *countth* previous section  
 38511 boundary up to but not including the starting character, and any text copied to a buffer  
 38512 shall be in character mode.

38513 If not used as a motion command:

38514 *Current line*: Set to the line where the *countth* previous boundary in the edit buffer starts.

38515 *Current column*: Set to the last column in which any portion of the first character of the *countth*  
 38516 previous boundary is displayed, or column position 1 if the line is empty.

### 38517 **Move to First Non-<blank> Position on Current Line**

38518 *Synopsis*: ^

38519 If used as a motion command:

- 38520 1. If the line has no non-<blank> non-<newline>s, or if the cursor is at the first non-<blank>  
 38521 non-<newline> of the line, it shall be an error.
- 38522 2. If the cursor is before the first non-<blank> non-<newline> of the line, the text region shall  
 38523 be comprised of the current character, up to, but not including, the first non-<blank> non-  
 38524 <newline> of the line.
- 38525 3. If the cursor is after the first non-<blank> non-<newline> of the line, the text region shall  
 38526 be from the character before the starting cursor up to and including the first non-<blank>  
 38527 non-<newline> of the line.
- 38528 4. Any text copied to a buffer shall be in character mode.

38529 If not used as a motion command:

38530 *Current line*: Unchanged.

38531 *Current column*: Set to non-<blank>.

### 38532 **Current and Line Above**

38533 *Synopsis*:     [*count*] \_

38534 If there are less than *count* − 1 lines after the current line in the edit buffer, it shall be an error.

38535 If used as a motion command:

- 38536     1. If *count* is less than 2, the text region shall be the current line.
- 38537     2. Otherwise, the text region shall include the starting line and the next *count* − 1 lines.
- 38538     3. Any text copied to a buffer shall be in line mode.

38539 If not used as a motion command:

38540 *Current line*: Set to current line + *count* − 1.

38541 *Current column*: Set to non-<blank>.

### 38542 **Move Back to Beginning of Sentence**

38543 *Synopsis*:     [*count*] (

38544 Move backward to the beginning of a sentence. This command shall be equivalent to the **[[**  
38545 command, with the exception that sentence boundaries shall be used instead of section  
38546 boundaries.

### 38547 **Move Forward to Beginning of Sentence**

38548 *Synopsis*:     [*count*] )

38549 Move forward to the beginning of a sentence. This command shall be equivalent to the **]]**  
38550 command, with the exception that sentence boundaries shall be used instead of section  
38551 boundaries.

### 38552 **Move Back to Preceding Paragraph**

38553 *Synopsis*:     [*count*] {

38554 Move back to the beginning of the preceding paragraph. This command shall be equivalent to  
38555 the **[[** command, with the exception that paragraph boundaries shall be used instead of section  
38556 boundaries.

### 38557 **Move Forward to Next Paragraph**

38558 *Synopsis*:     [*count*] }

38559 Move forward to the beginning of the next paragraph. This command shall be equivalent to the  
38560 **]]** command, with the exception that paragraph boundaries shall be used instead of section  
38561 boundaries.

**Move to Specific Column Position**

*Synopsis:*     [*count*] |

For the purposes of this command, lines that are too long for the current display and that have been folded shall be treated as having a single, 1-based, number of columns.

If there are less than *count* columns in which characters from the current line are displayed on the screen, *count* shall be adjusted to be the last column in which any portion of the line is displayed on the screen.

If used as a motion command:

1. If the line is empty, or the cursor character is the same as the character on the *count*th column of the line, it shall be an error.
2. If the cursor is before the *count*th column of the line, the text region shall be comprised of the current character, up to but not including the character on the *count*th column of the line.
3. If the cursor is after the *count*th column of the line, the text region shall be from the character before the starting cursor up to and including the character on the *count*th column of the line.
4. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

*Current line:* Unchanged.

*Current column:* Set to the last column in which any portion of the character that is displayed in the *count* column of the line is displayed.

**Reverse Find Character**

*Synopsis:*     [*count*] ,

If the last **F**, **f**, **T**, or **t** command was **F**, **f**, **T**, or **t**, this command shall be equivalent to an **f**, **F**, **t**, or **T** command, respectively, with the specified *count* and the same search character.

If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

**Repeat**

*Synopsis:*     [*count*] .

Repeat the last **!**, **<**, **>**, **A**, **C**, **D**, **I**, **J**, **O**, **P**, **R**, **S**, **X**, **Y**, **a**, **c**, **d**, **i**, **o**, **p**, **r**, **s**, **x**, **y**, or **~** command. It shall be an error if none of these commands have been executed. Commands (other than commands that enter text input mode) executed as a result of map expansions, shall not change the value of the last repeatable command.

Repeated commands with associated motion commands shall repeat the motion command as well; however, any specified *count* shall replace the *count*(s) that were originally specified to the repeated command or its associated motion command.

If the motion component of the repeated command is **f**, **F**, **t**, or **T**, the repeated command shall not set the remembered search character for the **;** and **,** commands.

If the repeated command is **p** or **P**, and the buffer associated with that command was a numeric buffer named with a number less than 9, the buffer associated with the repeated command shall be set to be the buffer named by the name of the previous buffer logically incremented by 1.

38602 If the repeated character is a text input command, the input text associated with that command  
 38603 is repeated literally:

- 38604 • Input characters are neither macro or abbreviation-expanded.
- 38605 • Input characters are not interpreted in any special way with the exception that <newline>,  
 38606 <carriage-return>, and <control>-T behave as described in **Input Mode Commands in vi** (on  
 38607 page 1022).

38608 *Current line*: Set as described for the repeated command.

38609 *Current column*: Set as described for the repeated command.

## 38610 **Find Regular Expression**

38611 *Synopsis*:        /

38612 If the input line contains no non-<newline>s, it shall be equivalent to a line containing only the  
 38613 last regular expression encountered. The enhanced regular expressions supported by vi are  
 38614 described in **Regular Expressions in ex** (on page 391).

38615 Otherwise, the line shall be interpreted as one or more regular expressions, optionally followed  
 38616 by an address offset or a vi **z** command.

38617 If the regular expression is not the last regular expression on the line, or if a line offset or **z**  
 38618 command is specified, the regular expression shall be terminated by an unescaped '/'  
 38619 character, which shall not be used as part of the regular expression. If the regular expression is  
 38620 not the first regular expression on the line, it shall be preceded by zero or more <blank>s, a  
 38621 semicolon, zero or more <blank>s, and a leading '/' character, which shall not be interpreted as  
 38622 part of the regular expression. It shall be an error to precede any regular expression with any  
 38623 characters other than these.

38624 Each search shall begin from the character after the first character of the last match (or, if it is the  
 38625 first search, after the cursor). If the **wrapsan** edit option is set, the search shall continue to the  
 38626 character before the starting cursor character; otherwise, to the end of the edit buffer. It shall be  
 38627 an error if any search fails to find a match, and an informational message to this effect shall be  
 38628 displayed.

38629 An optional address offset (see **Addressing in ex** (on page 361)) can be specified after the last  
 38630 regular expression by including a trailing '/' character after the regular expression and  
 38631 specifying the address offset. This offset will be from the line containing the match for the last  
 38632 regular expression specified. It shall be an error if the line offset would indicate a line address  
 38633 less than 1 or greater than the last line in the edit buffer. An address offset of zero shall be  
 38634 supported. It shall be an error to follow the address offset with any other characters than  
 38635 <blank>s.

38636 If not used as a motion command, an optional **z** command (see **Redraw Window** (on page 1021))  
 38637 can be specified after the last regular expression by including a trailing '/' character after the  
 38638 regular expression, zero or more <blank>s, a 'z', zero or more <blank>s, an optional new  
 38639 **window** edit option value, zero or more <blank>s, and a location character. The effect shall be as  
 38640 if the **z** command was executed after the / command. It shall be an error to follow the **z**  
 38641 command with any other characters than <blank>s.

38642 The remembered search direction shall be set to forward.

38643 If used as a motion command:

- 38644 1. It shall be an error if the last match references the same character in the edit buffer as the  
 38645 starting cursor.

- 38646 2. If any address offset is specified, the last match shall be adjusted by the specified offset as  
38647 described previously.
- 38648 3. If the starting cursor is after the last match, then the locations of the starting cursor and the  
38649 last match in the edit buffer shall be logically swapped.
- 38650 4. If any address offset is specified, the text region shall consist of all lines containing  
38651 characters from the starting cursor to the last match line, inclusive, and any text copied to a  
38652 buffer shall be in line mode.
- 38653 5. Otherwise, if the starting line is empty or the starting cursor is at or before the first non-  
38654 <blank> non-<newline> of the starting line, and the last match line is empty or the last  
38655 match starts at the first character of the last match line, the text region shall consist of all  
38656 lines containing characters from the starting cursor to the line before the last match line,  
38657 inclusive, and any text copied to a buffer shall be in line mode.
- 38658 6. Otherwise, if the last match line is empty or the last match begins at a character at or  
38659 before the first non-<blank> non-<newline> of the last match line, the region of text shall  
38660 be from the current cursor to the last non-<newline> of the line before the last match line,  
38661 inclusive, and any text copied to a buffer shall be in character mode.
- 38662 7. Otherwise, the region of text shall be from the current cursor (inclusive), to the first  
38663 character of the last match (exclusive), and any text copied to a buffer shall be in character  
38664 mode.

38665 If not used as a motion command:

38666 *Current line:* If a match is found, set to the last matched line plus the address offset, if any;  
38667 otherwise, unchanged.

38668 *Current column:* Set to the last column on which any portion of the first character in the last  
38669 matched string is displayed, if a match is found; otherwise, unchanged.

## 38670 **Move to First Character in Line**

38671 *Synopsis:*     0    (zero)

38672 Move to the first character on the current line. The character '0' shall not be interpreted as a  
38673 command if it is immediately preceded by a digit.

38674 If used as a motion command:

- 38675 1. If the cursor character is the first character in the line, it shall be an error.
- 38676 2. The text region shall be from the character before the cursor character up to and including  
38677 the first character in the line.
- 38678 3. Any text copied to a buffer shall be in character mode.

38679 If not used as a motion command:

38680 *Current line:* Unchanged.

38681 *Current column:* The last column in which any portion of the first character in the line is  
38682 displayed, or if the line is empty, unchanged.

**Execute an ex Command**

*Synopsis:*       :

Execute one or more *ex* commands.

If any portion of the screen other than the last line of the screen was overwritten by any *ex* command (except **shell**), *vi* shall display a message indicating that it is waiting for an input from the user, and shall then read a character. This action may also be taken for other, unspecified reasons.

If the next character entered is a ' : ', another *ex* command shall be accepted and executed. Any other character shall cause the screen to be refreshed and *vi* shall return to command mode.

*Current line:* As specified for the *ex* command.

*Current column:* As specified for the *ex* command.

**Repeat Find**

*Synopsis:*       [*count*] ;

This command shall be equivalent to the last **F**, **f**, **T**, or **t** command, with the specified *count*, and with the same search character used for the last **F**, **f**, **T**, or **t** command. If there was no previous **F**, **f**, **T**, or **t** command, it shall be an error.

**Shift Left**

*Synopsis:*       [*count*] < *motion*

If the motion command is the < command repeated:

1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.
2. The text region shall be from the current line, up to and including the next *count* -1 lines.

Shift any line in the text region specified by the *count* and motion command one shiftwidth (see the *ex* **shiftwidth** option) toward the start of the line, as described by the *ex* < command. The unshifted lines shall be copied to the unnamed buffer in line mode.

*Current line:* If the motion was from the current cursor position toward the end of the edit buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region specified by the motion command.

*Current column:* Set to non-<blank>.

**Shift Right**

*Synopsis:*       [*count*] > *motion*

If the motion command is the > command repeated:

1. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.
2. The text region shall be from the current line, up to and including the next *count* -1 lines.

Shift any line with characters in the text region specified by the *count* and motion command one shiftwidth (see the *ex* **shiftwidth** option) away from the start of the line, as described by the *ex* > command. The unshifted lines shall be copied into the unnamed buffer in line mode.

38721 *Current line:* If the motion was from the current cursor position toward the end of the edit  
 38722 buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region  
 38723 specified by the motion command.

38724 *Current column:* Set to non-<blank>.

## 38725 **Scan Backwards for Regular Expression**

38726 *Synopsis:*     ?

38727 Scan backwards; the ? command shall be equivalent to the / command (see **Find Regular**  
 38728 **Expression** (on page 1004)) with the following exceptions:

- 38729     1. The input prompt shall be a ' ? '.
- 38730     2. Each search shall begin from the character before the first character of the last match (or, if  
 38731 it is the first search, the character before the cursor character).
- 38732     3. The search direction shall be from the cursor toward the beginning of the edit buffer, and  
 38733 the **wrapsan** edit option shall affect whether the search wraps to the end of the edit buffer  
 38734 and continues.
- 38735     4. The remembered search direction shall be set to backward.

## 38736 **Execute**

38737 *Synopsis:*     @*buffer*

38738 If the *buffer* is specified as @, the last buffer executed shall be used. If no previous buffer has been  
 38739 executed, it shall be an error.

38740 Behave as if the contents of the named buffer were entered as standard input. After each line of a  
 38741 line-mode buffer, and all but the last line of a character mode buffer, behave as if a <newline>  
 38742 were entered as standard input.

38743 If an error occurs during this process, an error message shall be written, and no more characters  
 38744 resulting from the execution of this command shall be processed.

38745 If a *count* is specified, behave as if that count were entered as user input before the characters  
 38746 from the @ buffer were entered.

38747 *Current line:* As specified for the individual commands.

38748 *Current column:* As specified for the individual commands.

## 38749 **Reverse Case**

38750 *Synopsis:*     [*count*] ~

38751 Reverse the case of the current character and the next *count* –1 characters, such that lowercase  
 38752 characters that have uppercase counterparts shall be changed to uppercase characters, and  
 38753 uppercase characters that have lowercase counterparts shall be changed to lowercase characters,  
 38754 as prescribed by the current locale. No other characters shall be affected by this command.

38755 If there are less than *count* –1 characters after the cursor in the edit buffer, *count* shall be adjusted  
 38756 to the number of characters after the cursor in the edit buffer minus 1.

38757 For the purposes of this command, the next character after the last non-<newline> on the line  
 38758 shall be the next character in the edit buffer.

38759 *Current line:* Set to the line including the (*count*–1)th character after the cursor.

38760 *Current column*: Set to the last column in which any portion of the (*count*–1)th character after the  
 38761 cursor is displayed.

## 38762 **Append**

38763 *Synopsis*:     [*count*] a

38764 Enter text input mode after the current cursor position. No characters already in the edit buffer  
 38765 shall be affected by this command. A *count* shall cause the input text to be appended *count* –1  
 38766 more times to the end of the input.

38767 *Current line/column*: As specified for the text input commands (see **Input Mode Commands in vi**  
 38768 (on page 1022)).

## 38769 **Append at End-of-Line**

38770 *Synopsis*:     [*count*] A

38771 This command shall be equivalent to the *vi* command:

38772 \$ [ *count* ] a

38773 (see **Append**).

## 38774 **Move Backward to Preceding Word**

38775 *Synopsis*:     [*count*] b

38776 With the exception that words are used as the delimiter instead of bigwords, this command shall  
 38777 be equivalent to the **B** command.

## 38778 **Move Backward to Preceding Bigword**

38779 *Synopsis*:     [*count*] B

38780 If the edit buffer is empty or the cursor is on the first character of the edit buffer, it shall be an  
 38781 error. If less than *count* bigwords begin between the cursor and the start of the edit buffer, *count*  
 38782 shall be adjusted to the number of bigword beginnings between the cursor and the start of the  
 38783 edit buffer.

38784 If used as a motion command:

- 38785     1. The text region shall be from the first character of the *count*th previous bigword beginning  
 38786       up to but not including the cursor character.
- 38787     2. Any text copied to a buffer shall be in character mode.

38788 If not used as a motion command:

38789 *Current line*: Set to the line containing the *current column*.

38790 *Current column*: Set to the last column upon which any part of the first character of the *count*th  
 38791 previous bigword is displayed.

**Change**

*Synopsis:*     [*buffer*] [*count*] *c motion*

If the motion command is the **c** command repeated:

1. The buffer text shall be in line mode.
2. If there are less than *count* - 1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* - 1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

The replaced text shall be copied into *buffer*, if specified, and into the unnamed buffer. If the text to be replaced contains characters from more than a single line, or the buffer text is in line mode, the replaced text shall be copied into the numeric buffers as well.

If the buffer text is in line mode:

1. Any lines that contain characters in the region shall be deleted, and the editor shall enter text input mode at the beginning of a new line which shall replace the first line deleted.
2. If the **autoindent** edit option is set, **autoindent** characters equal to the **autoindent** characters on the first line deleted shall be inserted as if entered by the user.

Otherwise, if characters from more than one line are in the region of text:

1. The text shall be deleted.
2. Any text remaining in the last line in the text region shall be appended to the first line in the region, and the last line in the region shall be deleted.
3. The editor shall enter text input mode after the last character not deleted from the first line in the text region, if any; otherwise, on the first column of the first line in the region.

Otherwise:

1. If the glyph for ' \$ ' is smaller than the region, the end of the region shall be marked with a ' \$ '.
2. The editor shall enter text input mode, overwriting the region of text.

*Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi** (on page 1022)).

**Change to End-of-Line**

*Synopsis:*     [*buffer*] [*count*] *C*

This command shall be equivalent to the *vi* command:

[*buffer*] [*count*] *c\$*

See the **c** command.

**Delete**

*Synopsis:*     [*buffer*] [*count*] d *motion*

If the motion command is the **d** command repeated:

1. The buffer text shall be in line mode.
2. If there are less than *count* -1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* -1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

If in open mode, and the current line is deleted, and the line remains on the display, an '@' character shall be displayed as the first glyph of that line.

Delete the region of text into *buffer*, if specified, and into the unnamed buffer. If the text to be deleted contains characters from more than a single line, or the buffer text is in line mode, the deleted text shall be copied into the numeric buffers, as well.

*Current line:* Set to the first text region line that appears in the edit buffer, unless that line has been deleted, in which case it shall be set to the last line in the edit buffer, or line 1 if the edit buffer is empty.

*Current column:*

1. If the line is empty, set to column position 1.
2. Otherwise, if the buffer text is in line mode or the motion was from the cursor toward the end of the edit buffer:
  - a. If a character from the current line is displayed in the current column, set to the last column that displays any portion of that character.
  - b. Otherwise, set to the last column in which any portion of any character in the line is displayed.
3. Otherwise, if a character is displayed in the column that began the text region, set to the last column that displays any portion of that character.
4. Otherwise, set to the last column in which any portion of any character in the line is displayed.

**Delete to End-of-Line**

*Synopsis:*     [*buffer*] D

Delete the text from the current position to the end of the current line; equivalent to the *vi* command:

[*buffer*] d\$

### 38858 **Move to End-of-Word**

38859 *Synopsis:*     [*count*] e

38860 With the exception that words are used instead of bigwords as the delimiter, this command shall  
38861 be equivalent to the **E** command.

### 38862 **Move to End-of-Bigword**

38863 *Synopsis:*     [*count*] E

38864 If the edit buffer is empty it shall be an error. If less than *count* bigwords end between the cursor  
38865 and the end of the edit buffer, *count* shall be adjusted to the number of bigword endings between  
38866 the cursor and the end of the edit buffer.

38867 If used as a motion command:

- 38868     1. The text region shall be from the last character of the *count*th next bigword up to and  
38869       including the cursor character.
- 38870     2. Any text copied to a buffer shall be in character mode.

38871 If not used as a motion command:

38872 *Current line:* Set to the line containing the current column.

38873 *Current column:* Set to the last column upon which any part of the last character of the *count*th  
38874 next bigword is displayed.

### 38875 **Find Character in Current Line (Forward)**

38876 *Synopsis:*     [*count*] f *character*

38877 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

38878 If used as a motion command:

- 38879     1. The text range shall be from the cursor character up to and including the *count*th  
38880       occurrence of the specified character after the cursor.
- 38881     2. Any text copied to a buffer shall be in character mode.

38882 If not used as a motion command:

38883 *Current line:* Unchanged.

38884 *Current column:* Set to the last column in which any portion of the *count*th occurrence of the  
38885 specified character after the cursor appears in the line.

### 38886 **Find Character in Current Line (Reverse)**

38887 *Synopsis:*     [*count*] F *character*

38888 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

38889 If used as a motion command:

- 38890     1. The text region shall be from the *count*th occurrence of the specified character before the  
38891       cursor, up to, but not including the cursor character.
- 38892     2. Any text copied to a buffer shall be in character mode.

38893 If not used as a motion command:

38894 *Current line*: Unchanged.

38895 *Current column*: Set to the last column in which any portion of the *count*th occurrence of the  
38896 specified character before the cursor appears in the line.

### 38897 **Move to Line**

38898 *Synopsis*:     [*count*] G

38899 If *count* is not specified, it shall default to the last line of the edit buffer. If *count* is greater than  
38900 the last line of the edit buffer, it shall be an error.

38901 If used as a motion command:

- 38902     1. The text region shall be from the cursor line up to and including the specified line.
- 38903     2. Any text copied to a buffer shall be in line mode.

38904 If not used as a motion command:

38905 *Current line*: Set to *count* if *count* is specified; otherwise, the last line.

38906 *Current column*: Set to non-<blank>.

### 38907 **Move to Top of Screen**

38908 *Synopsis*:     [*count*] H

38909 If the beginning of the line *count* greater than the first line of which any portion appears on the  
38910 display does not exist, it shall be an error.

38911 If used as a motion command:

- 38912     1. If in open mode, the text region shall be the current line.
- 38913     2. Otherwise, the text region shall be from the starting line up to and including (the first line  
38914       of the display + *count* - 1).
- 38915     3. Any text copied to a buffer shall be in line mode.

38916 If not used as a motion command:

38917 If in open mode, this command shall set the current column to non-<blank> and do nothing else.

38918 Otherwise, it shall set the current line and current column as follows.

38919 *Current line*: Set to (the first line of the display + *count* - 1).

38920 *Current column*: Set to non-<blank>.

### 38921 **Insert Before Cursor**

38922 *Synopsis*:     [*count*] i

38923 Enter text input mode before the current cursor position. No characters already in the edit buffer  
38924 shall be affected by this command. A *count* shall cause the input text to be appended *count* - 1  
38925 more times to the end of the input.

38926 *Current line/column*: As specified for the text input commands (see **Input Mode Commands in vi**  
38927 (on page 1022)).

**Insert at Beginning of Line**

*Synopsis:*     [*count*] I

This command shall be equivalent to the *vi* command `^[count]i`.

**Join**

*Synopsis:*     [*count*] J

If the current line is the last line in the edit buffer, it shall be an error.

This command shall be equivalent to the *ex* **join** command with no addresses, and an *ex* command *count* value of 1 if *count* was not specified or if a *count* of 1 was specified, and an *ex* command *count* value of *count* -1 for any other value of *count*, except that the current line and column shall be set as follows.

*Current line:* Unchanged.

*Current column:* The last column in which any portion of the character following the last character in the initial line is displayed, or the last non-<newline> in the line if no characters were appended.

**Move to Bottom of Screen**

*Synopsis:*     [*count*] L

If the beginning of the line *count* less than the last line of which any portion appears on the display does not exist, it shall be an error.

If used as a motion command:

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall include all lines from the starting cursor line to (the last line of the display -(*count* -1)).
3. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

1. If in open mode, this command shall set the current column to non-<blank> and do nothing else.
2. Otherwise, it shall set the current line and current column as follows.

*Current line:* Set to (the last line of the display -(*count* -1)).

*Current column:* Set to non-<blank>.

**Mark Position**

*Synopsis:*     m *letter*

This command shall be equivalent to the *ex* **mark** command with the specified character as an argument.

**Move to Middle of Screen**

*Synopsis:*     M

The middle line of the display shall be calculated as follows:

$(\text{the top line of the display}) + ((\text{number of lines displayed}) + 1) / 2) - 1$

If used as a motion command:

1. If in open mode, the text region shall be the current line.
2. Otherwise, the text region shall include all lines from the starting cursor line up to and including the middle line of the display.
3. Any text copied to a buffer shall be in line mode.

If not used as a motion command:

If in open mode, this command shall set the current column to non-<blank> and do nothing else.

Otherwise, it shall set the current line and current column as follows.

*Current line:* Set to the middle line of the display.

*Current column:* Set to non-<blank>.

**Repeat Regular Expression Find (Forward)**

*Synopsis:*     n

If the remembered search direction was forward, the **n** command shall be equivalent to the *vi* **/** command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi* **?** command with no characters entered by the user.

If the **n** command is used as a motion command for the **!** command, the editor shall not enter text input mode on the last line on the screen, and shall behave as if the user entered a single '!' character as the text input.

**Repeat Regular Expression Find (Reverse)**

*Synopsis:*     N

Scan for the next match of the last pattern given to **/** or **?**, but in the reverse direction; this is the reverse of **n**.

If the remembered search direction was forward, the **N** command shall be equivalent to the *vi* **?** command with no characters entered by the user. Otherwise, it shall be equivalent to the *vi* **/** command with no characters entered by the user. If the **N** command is used as a motion command for the **!** command, the editor shall not enter text input mode on the last line on the screen, and shall behave as if the user entered a single **!** character as the text input.

**Insert Empty Line Below**

*Synopsis:*     o

Enter text input mode in a new line appended after the current line. A *count* shall cause the input text to be appended *count* - 1 more times to the end of the already added text, each time starting on a new, appended line.

*Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi** (on page 1022)).

**Insert Empty Line Above**

*Synopsis:*     ○

Enter text input mode in a new line inserted before the current line. A *count* shall cause the input text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

*Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi** (on page 1022)).

**Put from Buffer Following**

*Synopsis:*     [*buffer*] p

If no *buffer* is specified, the unnamed buffer shall be used.

If the buffer text is in line mode, the text shall be appended below the current line, and each line of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

If the buffer text is in character mode, the text shall be appended into the current line after the cursor, and each line of the buffer other than the first and last shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the already added text, each time starting after the last added character.

*Current line:* If the buffer text is in line mode, set the line to line +1; otherwise, unchanged.

*Current column:* If the buffer text is in line mode:

1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any portion of the first non-<blank> in the line is displayed.
2. If there is no non-<blank> in the first line of the buffer, set to the last column on which any portion of the last non-<newline> in the first line of the buffer is displayed.

If the buffer text is in character mode:

1. If the text in the buffer is from more than a single line, then set to the last column on which any portion of the first character from the buffer is displayed.
2. Otherwise, if the buffer is the unnamed buffer, set to the last column on which any portion of the last character from the buffer is displayed.
3. Otherwise, set to the first column on which any portion of the first character from the buffer is displayed.

**Put from Buffer Before**

*Synopsis:*     [*buffer*] P

If no *buffer* is specified, the unnamed buffer shall be used.

If the buffer text is in line mode, the text shall be inserted above the current line, and each line of the buffer shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the already added text, each time starting on a new, appended line.

If the buffer text is in character mode, the text shall be inserted into the current line before the cursor, and each line of the buffer other than the first and last shall become a new line in the edit buffer. A *count* shall cause the buffer text to be appended *count* –1 more times to the end of the

39040 already added text, each time starting after the last added character.

39041 *Current line:* Unchanged.

39042 *Current column:* If the buffer text is in line mode:

39043 1. If there is a non-<blank> in the first line of the buffer, set to the last column on which any

39044 portion of that character is displayed.

39045 2. If there is no non-<blank> in the first line of the buffer, set to the last column on which any

39046 portion of the last non-<newline> in the first line of the buffer is displayed.

39047 If the buffer text is in character mode:

39048 1. If the buffer is the unnamed buffer, set to the last column on which any portion of the last

39049 character from the buffer is displayed.

39050 2. Otherwise, set to the first column on which any portion of the first character from the

39051 buffer is displayed.

39052 **Enter ex Mode**

39053 *Synopsis:*     Q

39054 Leave visual or open mode and enter *ex* command mode.

39055 *Current line:* Unchanged.

39056 *Current column:* Unchanged.

39057 **Replace Character**

39058 *Synopsis:*     [count] r character

39059 Replace the *count* characters at and after the cursor with the specified character. If there are less

39060 than *count* non-<newline>s at and after the cursor on the line, it shall be an error.

39061 If character is <control>-V, any next character other than the <newline> shall be stripped of any

39062 special meaning and used as a literal character.

39063 If character is <ESC>, no replacement shall be made and the current line and current column

39064 shall be unchanged.

39065 If character is <carriage-return> or <newline>, *count* new lines shall be appended to the current

39066 line. All but the last of these lines shall be empty. *count* characters at and after the cursor shall be

39067 discarded, and any remaining characters after the cursor in the current line shall be moved to the

39068 last of the new lines. If the **autoindent** edit option is set, they shall be preceded by the same

39069 number of **autoindent** characters found on the line from which the command was executed.

39070 *Current line:* Unchanged unless the replacement character is a <carriage-return> or <newline>,

39071 in which case it shall be set to line + *count*.

39072 *Current column:* Set to the last column position on which a portion of the last replaced character

39073 is displayed, or if the replacement character caused new lines to be created, set to non-<blank>.

39074 **Replace Characters**39075 *Synopsis:*     R

39076 Enter text input mode at the current cursor position possibly replacing text on the current line. A  
 39077 *count* shall cause the input text to be appended *count* – 1 more times to the end of the input.

39078 *Current line/column:* As specified for the text input commands (see **Input Mode Commands in vi**  
 39079 (on page 1022)).

39080 **Substitute Character**39081 *Synopsis:*     [*buffer*] [*count*] s

39082 This command shall be equivalent to the vi command:

39083 [*buffer*] [*count*] c<space>39084 **Substitute Lines**39085 *Synopsis:*     [*buffer*] [*count*] S

39086 This command shall be equivalent to the vi command:

39087 [*buffer*] [*count*] c\_39088 **Move Cursor to Before Character (Forward)**39089 *Synopsis:*     [*count*] t *character*39090 It shall be an error if *count* occurrences of the character do not occur after the cursor in the line.

39091 If used as a motion command:

39092     1. The text region shall be from the cursor up to but not including the *count*th occurrence of  
 39093       the specified character after the cursor.

39094     2. Any text copied to a buffer shall be in character mode.

39095 If not used as a motion command:

39096 *Current line:* Unchanged.

39097 *Current column:* Set to the last column in which any portion of the character before the *count*th  
 39098 occurrence of the specified character after the cursor appears in the line.

39099 **Move Cursor to After Character (Reverse)**39100 *Synopsis:*     [*count*] T *character*39101 It shall be an error if *count* occurrences of the character do not occur before the cursor in the line.

39102 If used as a motion command:

39103     1. If the character before the cursor is the specified character, it shall be an error.

39104     2. The text region shall be from the character before the cursor up to but not including the  
 39105       *count*th occurrence of the specified character before the cursor.

39106     3. Any text copied to a buffer shall be in character mode.

39107 If not used as a motion command:

39108 *Current line:* Unchanged.

39109 *Current column:* Set to the last column in which any portion of the character after the *count*th  
39110 occurrence of the specified character before the cursor appears in the line.

## 39111 **Undo**

39112 *Synopsis:*     u

39113 This command shall be equivalent to the *ex* **undo** command except that the current line and  
39114 current column shall be set as follows:

39115 *Current line:* Set to the first line added or changed if any; otherwise, move to the line preceding  
39116 any deleted text if one exists; otherwise, move to line 1.

39117 *Current column:* If undoing an *ex* command, set to the first non-<blank>.

39118 Otherwise, if undoing a text input command:

- 39119     1. If the command was a **C**, **c**, **O**, **o**, **R**, **S**, or **s** command, the current column shall be set to the  
39120 value it held when the text input command was entered.
- 39121     2. Otherwise, set to the last column in which any portion of the first character after the  
39122 deleted text is displayed, or, if no non-<newline>s follow the text deleted from this line, set  
39123 to the last column in which any portion of the last non-<newline> in the line is displayed,  
39124 or 1 if the line is empty.

39125 Otherwise, if a single line was modified (that is, not added or deleted) by the **u** command:

- 39126     1. If text was added or changed, set to the last column in which any portion of the first  
39127 character added or changed is displayed.
- 39128     2. If text was deleted, set to the last column in which any portion of the first character after  
39129 the deleted text is displayed, or, if no non-<newline>s follow the deleted text, set to the last  
39130 column in which any portion of the last non-<newline> in the line is displayed, or 1 if the  
39131 line is empty.

39132 Otherwise, set to non-<blank>.

## 39133 **Undo Current Line**

39134 *Synopsis:*     U

39135 Restore the current line to its state immediately before the most recent time that it became the  
39136 current line.

39137 *Current line:* Unchanged.

39138 *Current column:* Set to the first column in the line in which any portion of the first character in  
39139 the line is displayed.

## 39140 **Move to Beginning of Word**

39141 *Synopsis:*     [count] w

39142 With the exception that words are used as the delimiter instead of bigwords, this command shall  
39143 be equivalent to the **W** command.

**Move to Beginning of Bigword**

*Synopsis:*     [*count*] W

If the edit buffer is empty, it shall be an error. If there are less than *count* bigwords between the cursor and the end of the edit buffer, *count* shall be adjusted to move the cursor to the last bigword in the edit buffer.

If used as a motion command:

1. If the associated command is **c**, *count* is 1, and the cursor is on a <blank>, the region of text shall be the current character and no further action shall be taken.
2. If there are less than *count* bigwords between the cursor and the end of the edit buffer, then the command shall succeed, and the region of text shall include the last character of the edit buffer.
3. If there are <blank>s or an end-of-line that precede the *count*th bigword, and the associated command is **c**, the region of text shall be up to and including the last character before the preceding <blank>s or end-of-line.
4. If there are <blank>s or an end-of-line that precede the bigword, and the associated command is **d** or **y**, the region of text shall be up to and including the last <blank> before the start of the bigword or end-of-line.
5. Any text copied to a buffer shall be in character mode.

If not used as a motion command:

1. If the cursor is on the last character of the edit buffer, it shall be an error.

*Current line:* Set to the line containing the current column.

*Current column:* Set to the last column in which any part of the first character of the *count*th next bigword is displayed.

**Delete Character at Cursor**

*Synopsis:*     [*buffer*] [*count*] x

Delete the *count* characters at and after the current character into *buffer*, if specified, and into the unnamed buffer.

If the line is empty, it shall be an error. If there are less than *count* non-<newline>s at and after the cursor on the current line, *count* shall be adjusted to the number of non-<newline>s at and after the cursor.

*Current line:* Unchanged.

*Current column:* If the line is empty, set to column position 1. Otherwise, if there were *count* or less non-<newline>s at and after the cursor on the current line, set to the last column that displays any part of the last non-<newline> of the line. Otherwise, unchanged.

**Delete Character Before Cursor**

*Synopsis:*     [*buffer*] [*count*] X

Delete the *count* characters before the current character into *buffer*, if specified, and into the unnamed buffer.

If there are no characters before the current character on the current line, it shall be an error. If there are less than *count* previous characters on the current line, *count* shall be adjusted to the number of previous characters on the line.

*Current line:* Unchanged.

*Current column:* Set to (current column – the width of the deleted characters).

**Yank**

*Synopsis:*     [*buffer*] [*count*] y *motion*

Copy (yank) the region of text into *buffer*, if specified, and into the unnamed buffer.

If the motion command is the **y** command repeated:

1. The buffer shall be in line mode.
2. If there are less than *count* – 1 lines after the current line in the edit buffer, it shall be an error.
3. The text region shall be from the current line up to and including the next *count* – 1 lines.

Otherwise, the buffer text mode and text region shall be as specified by the motion command.

*Current line:* If the motion was from the current cursor position toward the end of the edit buffer, unchanged. Otherwise, set to the first line in the edit buffer that is part of the text region specified by the motion command.

*Current column:*

1. If the motion was from the current cursor position toward the end of the edit buffer, unchanged.
2. Otherwise, if the current line is empty, set to column position 1.
3. Otherwise, set to the last column that displays any part of the first character in the file that is part of the text region specified by the motion command.

**Yank Current Line**

*Synopsis:*     [*buffer*] [*count*] Y

This command shall be equivalent to the **vi** command:

[*buffer*] [*count*] y\_

39209 **Redraw Window**39210 If in open mode, the **z** command shall have the Synopsis:39211 *Synopsis:*     [*count*] **z**

39212 If *count* is not specified, it shall default to the **window** edit option -1. The **z** command shall be  
 39213 equivalent to the *ex z* command, with a type character of = and a *count* of *count* -2, except that  
 39214 the current line and current column shall be set as follows, and the **window** edit option shall not  
 39215 be affected. If the calculation for the *count* argument would result in a negative number, the  
 39216 *count* argument to the *ex z* command shall be zero. A blank line shall be written after the last line  
 39217 is written.

39218 *Current line:* Unchanged.39219 *Current column:* Unchanged.39220 If not in open mode, the **z** command shall have the following Synopsis:39221 *Synopsis:*     [*line*] **z** [*count*] *character*

39222 If *line* is not specified, it shall default to the current line. If *line* is specified, but is greater than the  
 39223 number of lines in the edit buffer, it shall default to the number of lines in the edit buffer.

39224 If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in the  
 39225 *ex window* command), and the screen shall be redrawn.

39226 *line* shall be placed as specified by the following characters:

39227 &lt;newline&gt;, &lt;carriage-return&gt;

39228     Place the beginning of the line on the first line of the display.

39229 .     Place the beginning of the line in the center of the display. The middle line of the display  
 39230 shall be calculated as described for the **M** command.

39231 -     Place an unspecified portion of the line on the last line of the display.

39232 +     If *line* was specified, equivalent to the <newline> case. If *line* was not specified, display a  
 39233 screen where the first line of the display shall be (current last line) +1. If there are no lines  
 39234 after the last line in the display, it shall be an error.

39235 ^     If *line* was specified, display a screen where the last line of the display shall contain an  
 39236 unspecified portion of the first line of a display that had an unspecified portion of the  
 39237 specified line on the last line of the display. If this calculation results in a line before the  
 39238 beginning of the edit buffer, display the first screen of the edit buffer.

39239 Otherwise, display a screen where the last line of the display shall contain an unspecified  
 39240 portion of (current first line -1). If this calculation results in a line before the beginning of  
 39241 the edit buffer, it shall be an error.

39242 *Current line:* If *line* and the ' ^ ' character were specified:

39243 1. If the first screen was displayed as a result of the command attempting to display lines  
 39244 before the beginning of the edit buffer: if the first screen was already displayed,  
 39245 unchanged; otherwise, set to (current first line -1).

39246 2. Otherwise, set to the last line of the display.

39247 If *line* and the ' + ' character were specified, set to the first line of the display.39248 Otherwise, if *line* was specified, set to *line*.

39249 Otherwise, unchanged.

39250 *Current column*: Set to non-<blank>.

## 39251 **Exit**

39252 *Synopsis*:      ZZ

39253 This command shall be equivalent to the *ex* **xit** command with no addresses, trailing **!**, or  
39254 filename (see the *ex* **xit** command).

## 39255 **Input Mode Commands in vi**

39256 In text input mode, the current line shall consist of zero or more of the following categories, plus  
39257 the terminating <newline>:

- 39258 1. Characters preceding the text input entry point

39259 Characters in this category shall not be modified during text input mode.

- 39260 2. **autoindent** characters

39261 **autoindent** characters shall be automatically inserted into each line that is created in text  
39262 input mode, either as a result of entering a <newline> or <carriage-return> while in text  
39263 input mode, or as an effect of the command itself; for example, **O** or **o** (see the *ex*  
39264 **autoindent** command), as if entered by the user.

39265 It shall be possible to erase **autoindent** characters with the <control>-D command; it is  
39266 unspecified whether they can be erased by <control>-H, <control>-U, and <control>-W  
39267 characters. Erasing any **autoindent** character turns the glyph into erase-columns and  
39268 deletes the character from the edit buffer, but does not change its representation on the  
39269 screen.

- 39270 3. Text input characters

39271 Text input characters are the characters entered by the user. Erasing any text input  
39272 character turns the glyph into erase-columns and deletes the character from the edit buffer,  
39273 but does not change its representation on the screen.

39274 Each text input character entered by the user (that does not have a special meaning) shall  
39275 be treated as follows:

- 39276 a. The text input character shall be appended to the last character in the edit buffer  
39277 from the first, second, or third categories.
- 39278 b. If there are no erase-columns on the screen, the text input command was the **R**  
39279 command, and characters in the fifth category from the original line follow the  
39280 cursor, the next such character shall be deleted from the edit buffer. If the **slowopen**  
39281 edit option is not set, the corresponding glyph on the screen shall become erase-  
39282 columns.
- 39283 c. If there are erase-columns on the screen, as many columns as they occupy, or as are  
39284 necessary, shall be overwritten to display the text input character. (If only part of a  
39285 multi-column glyph is overwritten, the remainder shall be left on the screen, and  
39286 continue to be treated as erase-columns; it is unspecified whether the remainder of  
39287 the glyph is modified in any way.)
- 39288 d. If additional display line columns are needed to display the text input character:
  - 39289 1. If the **slowopen** edit option is set, the text input characters shall be displayed  
39290 on subsequent display line columns, overwriting any characters displayed in

39291                   those columns.

39292                   2. Otherwise, any characters currently displayed on or after the column on the  
39293                   display line where the text input character is to be displayed shall be pushed  
39294                   ahead the number of display line columns necessary to display the rest of the  
39295                   text input character.

39296           4. Erase-columns

39297                   Erase-columns are not logically part of the edit buffer, appearing only on the screen, and  
39298                   may be overwritten on the screen by subsequent text input characters. When text input  
39299                   mode ends, all erase-columns shall no longer appear on the screen.

39300                   Erase-columns are initially the region of text specified by the **c** command (see **Change** (on  
39301                   page 1009)); however, erasing **autoindent** or text input characters causes the glyphs of the  
39302                   erased characters to be treated as erase-columns.

39303           5. Characters following the text region for the **c** command, or the text input entry point for all  
39304                   other commands

39305                   Characters in this category shall not be modified during text input mode, except as  
39306                   specified in category 3.b. for the **R** text input command, or as <blank>s deleted when a  
39307                   <newline> or <carriage-return> is entered.

39308                   It is unspecified whether it is an error to attempt to erase past the beginning of a line that was  
39309                   created by the entry of a <newline> or <carriage-return> during text input mode. If it is not an  
39310                   error, the editor shall behave as if the erasing character was entered immediately after the last  
39311                   text input character entered on the previous line, and all of the non-<newline>s on the current  
39312                   line shall be treated as erase-columns.

39313                   When text input mode is entered, or after a text input mode character is entered (except as  
39314                   specified for the special characters below), the cursor shall be positioned as follows:

- 39315                   1. On the first column that displays any part of the first erase-column, if one exists
- 39316                   2. Otherwise, if the **slowopen** edit option is set, on the first display line column after the last  
39317                   character in the first, second, or third categories, if one exists
- 39318                   3. Otherwise, the first column that displays any part of the first character in the fifth category,  
39319                   if one exists
- 39320                   4. Otherwise, the display line column after the last character in the first, second, or third  
39321                   categories, if one exists
- 39322                   5. Otherwise, on column position 1

39323                   The characters that are updated on the screen during text input mode are unspecified, other than  
39324                   that the last text input character shall always be updated, and, if the **slowopen** edit option is not  
39325                   set, the current cursor character shall always be updated.

39326                   The following specifications are for command characters entered during text input mode.

39327       **NUL**

39328       *Synopsis:*       NUL

39329       If the first character of the text input is a NUL, the most recently input text shall be input as if  
 39330       entered by the user, and then text input mode shall be exited. The text shall be input literally;  
 39331       that is, characters are neither macro or abbreviation expanded, nor are any characters interpreted  
 39332       in any special manner. It is unspecified whether implementations shall support more than 256  
 39333       bytes of remembered input text.

39334       **<control>-D**

39335       *Synopsis:*       <control>-D

39336       The <control>-D character shall have no special meaning when in text input mode for a line-  
 39337       oriented command (see **Command Descriptions in vi** (on page 988)).

39338       This command need not be supported on block-mode terminals.

39339       If the cursor does not follow an **autoindent** character, or an **autoindent** character and a '0' or  
 39340       '^' character:

- 39341           1. If the cursor is in column position 1, the <control>-D character shall be discarded and no  
 39342           further action taken.
- 39343           2. Otherwise, the <control>-D character shall have no special meaning.

39344       If the last input character was a '0', the cursor shall be moved to column position 1.

39345       Otherwise, if the last input character was a '^', the cursor shall be moved to column position 1.  
 39346       In addition, the **autoindent** level for the next input line shall be derived from the same line from  
 39347       which the **autoindent** level for the current input line was derived.

39348       Otherwise, the cursor shall be moved back to the column after the previous shiftwidth (see the  
 39349       ex **shiftwidth** command) boundary.

39350       All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 39351       cursor position shall become erase-columns as described in **Input Mode Commands in vi** (on  
 39352       page 1022).

39353       *Current line:* Unchanged.

39354       *Current column:* Set to 1 if the <control>-D was preceded by a '^' or '0'; otherwise, set to  
 39355       (column - 1) - ((column - 2) % **shiftwidth**).

39356       **<control>-H**

39357       *Synopsis:*       <control>-H

39358       If in text input mode for a line-oriented command, and there are no characters to erase, text  
 39359       input mode shall be terminated, no further action shall be done for this command, and the  
 39360       current line and column shall be unchanged.

39361       If there are characters other than **autoindent** characters that have been input on the current line  
 39362       before the cursor, the cursor shall move back one character.

39363       Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 39364       implementation-defined whether the <control>-H command is an error or if the cursor moves  
 39365       back one **autoindent** character.

39366       Otherwise, if the cursor is in column position 1 and there are previous lines that have been input,  
 39367       it is implementation-defined whether the <control>-H command is an error or if it is equivalent

39368 to entering <control>-H after the last input character on the previous input line.

39369 Otherwise, it shall be an error.

39370 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 39371 cursor position shall become erase-columns as described in **Input Mode Commands in vi** (on  
 39372 page 1022).

39373 The current erase character (see *stty*) shall cause an equivalent action to the <control>-H  
 39374 command, unless the previously inserted character was a backslash, in which case it shall be as  
 39375 if the literal current erase character had been inserted instead of the backslash.

39376 *Current line*: Unchanged, unless previously input lines are erased, in which case it shall be set to  
 39377 line -1.

39378 *Current column*: Set to the first column that displays any portion of the character backed up  
 39379 over.

39380 **<newline>**

39381 *Synopsis*:       <newline>  
 39382               <carriage-return>  
 39383               <control>-J  
 39384               <control>-M

39385 If input was part of a line-oriented command, text input mode shall be terminated and the  
 39386 command shall continue execution with the input provided.

39387 Otherwise, terminate the current line. If there are no characters other than **autoindent** characters  
 39388 on the line, all characters on the line shall be discarded. Otherwise, it is unspecified whether the  
 39389 **autoindent** characters in the line are modified by entering these characters.

39390 Continue text input mode on a new line appended after the current line. If the **slowopen** edit  
 39391 option is set, the lines on the screen below the current line shall not be pushed down, but the  
 39392 first of them shall be cleared and shall appear to be overwritten. Otherwise, the lines of the  
 39393 screen below the current line shall be pushed down.

39394 If the **autoindent** edit option is set, an appropriate number of **autoindent** characters shall be  
 39395 added as a prefix to the line as described by the *ex* **autoindent** edit option.

39396 All columns after the cursor that are erase-columns (as described in **Input Mode Commands in**  
 39397 **vi** (on page 1022)) shall be discarded.

39398 If the **autoindent** edit option is set, all <blank>s immediately following the cursor shall be  
 39399 discarded.

39400 All remaining characters after the cursor shall be transferred to the new line, positioned after any  
 39401 **autoindent** characters.

39402 *Current line*: Set to current line +1.

39403 *Current column*: Set to the first column that displays any portion of the first character after the  
 39404 **autoindent** characters on the new line, if any, or the first column position after the last  
 39405 **autoindent** character, if any, or column position 1.

**<control>-T**

*Synopsis:*      <control>-T

The <control>-T character shall have no special meaning when in text input mode for a line-oriented command (see **Command Descriptions in vi** (on page 988)).

This command need not be supported on block-mode terminals.

Behave as if the user entered the minimum number of <blank>s necessary to move the cursor forward to the column position after the next **shiftwidth** (see the *ex* **shiftwidth** command) boundary.

*Current line:* Unchanged.

*Current column:* Set to  $column + \text{shiftwidth} - ((column - 1) \% \text{shiftwidth})$ .

**<control>-U**

*Synopsis:*      <control>-U

If there are characters other than **autoindent** characters that have been input on the current line before the cursor, the cursor shall move to the first character input after the **autoindent** characters.

Otherwise, if there are **autoindent** characters on the current line before the cursor, it is implementation-defined whether the <control>-U command is an error or if the cursor moves to the first column position on the line.

Otherwise, if the cursor is in column position 1 and there are previous lines that have been input, it is implementation-defined whether the <control>-U command is an error or if it is equivalent to entering <control>-U after the last input character on the previous input line.

Otherwise, it shall be an error.

All of the glyphs on columns between the starting cursor position and (inclusively) the ending cursor position shall become erase-columns as described in **Input Mode Commands in vi** (on page 1022).

The current *kill* character (see *stty*) shall cause an equivalent action to the <control>-U command, unless the previously inserted character was a backslash, in which case it shall be as if the literal current *kill* character had been inserted instead of the backslash.

*Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to line -1.

*Current column:* Set to the first column that displays any portion of the last character backed up over.

**<control>-V**

*Synopsis:*      <control>-V  
                 <control>-Q

Allow the entry of any subsequent character, other than <control>-J or the <newline>, as a literal character, removing any special meaning that it may have to the editor in text input mode. If a <control>-V or <control>-Q is entered before a <control>-J or <newline>, the <control>-V or <control>-Q character shall be discarded, and the <control>-J or <newline> shall behave as described in the <newline> command character during input mode.

39446 For purposes of the display only, the editor shall behave as if a '^' character was entered, and  
 39447 the cursor shall be positioned as if overwriting the '^' character. When a subsequent character  
 39448 is entered, the editor shall behave as if that character was entered instead of the original  
 39449 <control>-V or <control>-Q character.

39450 *Current line:* Unchanged.

39451 *Current column:* Unchanged.

#### 39452 <control>-W

39453 *Synopsis:* <control>-W

39454 If there are characters other than **autoindent** characters that have been input on the current line  
 39455 before the cursor, the cursor shall move back over the last word preceding the cursor (including  
 39456 any <blank>s between the end of the last word and the current cursor); the cursor shall not  
 39457 move to before the first character after the end of any **autoindent** characters.

39458 Otherwise, if there are **autoindent** characters on the current line before the cursor, it is  
 39459 implementation-defined whether the <control>-W command is an error or if the cursor moves to  
 39460 the first column position on the line.

39461 Otherwise, if the cursor is in column position 1 and there are previous lines that have been input,  
 39462 it is implementation-defined whether the <control>-W command is an error or if it is equivalent  
 39463 to entering <control>-W after the last input character on the previous input line.

39464 Otherwise, it shall be an error.

39465 All of the glyphs on columns between the starting cursor position and (inclusively) the ending  
 39466 cursor position shall become erase-columns as described in **Input Mode Commands in vi** (on  
 39467 page 1022).

39468 *Current line:* Unchanged, unless previously input lines are erased, in which case it shall be set to  
 39469 line -1.

39470 *Current column:* Set to the first column that displays any portion of the last character backed up  
 39471 over.

#### 39472 <ESC>

39473 *Synopsis:* <ESC>

39474 If input was part of a line-oriented command:

- 39475 1. If *interrupt* was entered, text input mode shall be terminated and the editor shall return to  
 39476 command mode. The terminal shall be alerted.
- 39477 2. If <ESC> was entered, text input mode shall be terminated and the command shall  
 39478 continue execution with the input provided.

39479 Otherwise, terminate text input mode and return to command mode.

39480 Any **autoindent** characters entered on newly created lines that have no other non-<newline>s  
 39481 shall be deleted.

39482 Any leading **autoindent** and <blank>s on newly created lines shall be rewritten to be the  
 39483 minimum number of <blank>s possible.

39484 The screen shall be redisplayed as necessary to match the contents of the edit buffer.

39485 *Current line:* Unchanged.

39486 *Current column:*

- 39487 1. If there are text input characters on the current line, the column shall be set to the last  
39488 column where any portion of the last text input character is displayed.
- 39489 2. Otherwise, if a character is displayed in the current column, unchanged.
- 39490 3. Otherwise, set to column position 1.

#### 39491 **EXIT STATUS**

39492 The following exit values shall be returned:

- 39493 0 Successful completion.
- 39494 >0 An error occurred.

#### 39495 **CONSEQUENCES OF ERRORS**

39496 When any error is encountered and the standard input is not a terminal device file, *vi* shall not  
39497 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
39498 status.

39499 Otherwise, when an unrecoverable error is encountered it shall be equivalent to a SIGHUP  
39500 asynchronous event.

39501 Otherwise, when an error is encountered, the editor shall behave as specified in **Command**  
39502 **Descriptions in vi** (on page 988).

#### 39503 **APPLICATION USAGE**

39504 None.

#### 39505 **EXAMPLES**

39506 None.

#### 39507 **RATIONALE**

39508 See the RATIONALE for *ex* for more information on *vi*. Major portions of the *vi* utility  
39509 specification point to *ex* to avoid inadvertent divergence. While *ex* and *vi* have historically been  
39510 implemented as a single utility, this is not required by IEEE Std 1003.1-2001.

39511 It is recognized that portions of *vi* would be difficult, if not impossible, to implement  
39512 satisfactorily on a block-mode terminal, or a terminal without any form of cursor addressing,  
39513 thus it is not a mandatory requirement that such features should work on all terminals. It is the  
39514 intention, however, that a *vi* implementation should provide the full set of capabilities on all  
39515 terminals capable of supporting them.

39516 Historically, *vi* exited immediately if the standard input was not a terminal. IEEE Std 1003.1-2001  
39517 permits, but does not require, this behavior. An end-of-file condition is not equivalent to an  
39518 end-of-file character. A common end-of-file character, <control>-D, is historically a *vi* command.

39519 The text in the STDOUT section reflects the usage of the verb *display* in this section; some  
39520 implementations of *vi* use standard output to write to the terminal, but IEEE Std 1003.1-2001  
39521 does not require that to be the case.

39522 Historically, implementations reverted to open mode if the terminal was incapable of  
39523 supporting full visual mode. IEEE Std 1003.1-2001 requires this behavior. Historically, the open  
39524 mode of *vi* behaved roughly equivalently to the visual mode, with the exception that only a  
39525 single line from the edit buffer (one “buffer line”) was kept current at any time. This line was  
39526 normally displayed on the next-to-last line of a terminal with cursor addressing (and the last line  
39527 performed its normal visual functions for line-oriented commands and messages). In addition,  
39528 some few commands behaved differently in open mode than in visual mode.  
39529 IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, *ex* and *vi* implementations have expected text to proceed in the usual European/Latin order of left to right, top to bottom. There is no requirement in IEEE Std 1003.1-2001 that this be the case. The specification was deliberately written using words like “before”, “after”, “first”, and “last” in order to permit implementations to support the natural text order of the language.

Historically, lines past the end of the edit buffer were marked with single tilde ('~') characters; that is, if the one-based display was 20 lines in length, and the last line of the file was on line one, then lines 2-20 would contain only a single '~' character.

Historically, the *vi* editor attempted to display only complete lines at the bottom of the screen (it did display partial lines at the top of the screen). If a line was too long to fit in its entirety at the bottom of the screen, the screen lines where the line would have been displayed were displayed as single '@' characters, instead of displaying part of the line. IEEE Std 1003.1-2001 permits, but does not require, this behavior. Implementations are encouraged to attempt always to display a complete line at the bottom of the screen when doing scrolling or screen positioning by buffer lines.

Historically, lines marked with '@' were also used to minimize output to dumb terminals over slow lines; that is, changes local to the cursor were updated, but changes to lines on the screen that were not close to the cursor were simply marked with an '@' sign instead of being updated to match the current text. IEEE Std 1003.1-2001 permits, but does not require this feature because it is used ever less frequently as terminals become smarter and connections are faster.

### Initialization in *ex* and *vi*

Historically, *vi* always had a line in the edit buffer, even if the edit buffer was “empty”. For example:

1. The *ex* command = executed from visual mode wrote “1” when the buffer was empty.
2. Writes from visual mode of an empty edit buffer wrote files of a single character (<newline>), while writes from *ex* mode of an empty edit buffer wrote empty files.
3. Put and read commands into an empty edit buffer left an empty line at the top of the edit buffer.

For consistency, IEEE Std 1003.1-2001 does not permit any of these behaviors.

Historically, *vi* did not always return the terminal to its original modes; for example, ICRNL was modified if it was not originally set. IEEE Std 1003.1-2001 does not permit this behavior.

### Command Descriptions in *vi*

Motion commands are among the most complicated aspects of *vi* to describe. With some exceptions, the text region and buffer type effect of a motion command on a *vi* command are described on a case-by-case basis. The descriptions of text regions in IEEE Std 1003.1-2001 are not intended to imply direction; that is, an inclusive region from line *n* to line *n*+5 is identical to a region from line *n*+5 to line *n*. This is of more than academic interest—movements to marks can be in either direction, and, if the **wrapscan** option is set, so can movements to search points. Historically, lines are always stored into buffers in text order; that is, from the start of the edit buffer to the end. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, command counts were applied to any associated motion, and were multiplicative to any supplied motion count. For example, **2cw** is the same as **c2w**, and **2c3w** is the same as **c6w**. IEEE Std 1003.1-2001 requires this behavior. Historically, *vi* commands that used bigwords, words, paragraphs, and sentences as objects treated groups of empty lines, or lines that contained only <blank>s, inconsistently. Some commands treated them as a single entity, while

others treated each line separately. For example, the **w**, **W**, and **B** commands treated groups of empty lines as individual words; that is, the command would move the cursor to each new empty line. The **e** and **E** commands treated groups of empty lines as a single word; that is, the first use would move past the group of lines. The **b** command would just beep at the user, or if done from the start of the line as a motion command, fail in unexpected ways. If the lines contained only (or ended with) `<blank>s`, the **w** and **W** commands would just beep at the user, the **E** and **e** commands would treat the group as a single word, and the **B** and **b** commands would treat the lines as individual words. For consistency and simplicity of specification, IEEE Std 1003.1-2001 requires that all *vi* commands treat groups of empty or blank lines as a single entity, and that movement through lines ending with `<blank>s` be consistent with other movements.

Historically, *vi* documentation indicated that any number of double quotes were skipped after punctuation marks at sentence boundaries; however, implementations only skipped single quotes. IEEE Std 1003.1-2001 requires both to be skipped.

Historically, the first and last characters in the edit buffer were word boundaries. This historical practice is required by IEEE Std 1003.1-2001.

Historically, *vi* attempted to update the minimum number of columns on the screen possible, which could lead to misleading information being displayed. IEEE Std 1003.1-2001 makes no requirements other than that the current character being entered is displayed correctly, leaving all other decisions in this area up to the implementation.

Historically, lines were arbitrarily folded between columns of any characters that required multiple column positions on the screen, with the exception of tabs, which terminated at the right-hand margin. IEEE Std 1003.1-2001 permits the former and requires the latter. Implementations that do not arbitrarily break lines between columns of characters that occupy multiple column positions should not permit the cursor to rest on a column that does not contain any part of a character.

The historical *vi* had a problem in that all movements were by buffer lines, not by display or screen lines. This is often the right thing to do; for example, single line movements, such as **j** or **k**, should work on buffer lines. Commands like **dj**, or **j.**, where **.** is a change command, only make sense for buffer lines. It is not, however, the right thing to do for screen motion or scrolling commands like `<control>-D`, `<control>-F`, and **H**. If the window is fairly small, using buffer lines in these cases can result in completely random motion; for example, **1<control>-D** can result in a completely changed screen, without any overlap. This is clearly not what the user wanted. The problem is even worse in the case of the **H**, **L**, and **M** commands—as they position the cursor at the first non-`<blank>` of the line, they may all refer to the same location in large lines, and will result in no movement at all.

In addition, if the line is larger than the screen, using buffer lines can make it impossible to display parts of the line—there are not any commands that do not display the beginning of the line in historical *vi*, and if both the beginning and end of the line cannot be on the screen at the same time, the user suffers. Finally, the page and half-page scrolling commands historically moved to the first non-`<blank>` in the new line. If the line is approximately the same size as the screen, this is inadequate because the cursor before and after a `<control>-D` command will refer to the same location on the screen.

Implementations of *ex* and *vi* exist that do not have these problems because the relevant commands (`<control>-B`, `<control>-D`, `<control>-F`, `<control>-U`, `<control>-Y`, `<control>-E`, **H**, **L**, and **M**) operate on display (screen) lines, not (edit) buffer lines.

IEEE Std 1003.1-2001 does not permit this behavior by default because the standard developers believed that users would find it too confusing. However, historical practice has been relaxed.

For example, *ex* and *vi* historically attempted, albeit sometimes unsuccessfully, to never put part of a line on the last lines of a screen; for example, if a line would not fit in its entirety, no part of the line was displayed, and the screen lines corresponding to the line contained single '@' characters. This behavior is permitted, but not required by IEEE Std 1003.1-2001, so that it is possible for implementations to support long lines in small screens more reasonably without changing the commands to be oriented to the display (instead of oriented to the buffer). IEEE Std 1003.1-2001 also permits implementations to refuse to edit any edit buffer containing a line that will not fit on the screen in its entirety.

The display area (for example, the value of the **window** edit option) has historically been “grown”, or expanded, to display new text when local movements are done in displays where the number of lines displayed is less than the maximum possible. Expansion has historically been the first choice, when the target line is less than the maximum possible expansion value away. Scrolling has historically been the next choice, done when the target line is less than half a display away, and otherwise, the screen was redrawn. There were exceptions, however, in that *ex* commands generally always caused the screen to be redrawn. IEEE Std 1003.1-2001 does not specify a standard behavior because there may be external issues, such as connection speed, the number of characters necessary to redraw as opposed to scroll, or terminal capabilities that implementations will have to accommodate.

The current line in IEEE Std 1003.1-2001 maps one-to-one to a buffer line in the file. The current column does not. There are two different column values that are described by IEEE Std 1003.1-2001. The first is the current column value as set by many of the *vi* commands. This value is remembered for the lifetime of the editor. The second column value is the actual position on the screen where the cursor rests. The two are not always the same. For example, when the cursor is backed by a multi-column character, the actual cursor position on the screen has historically been the last column of the character in command mode, and the first column of the character in input mode.

Commands that set the current line, but that do not set the current cursor value (for example, **j** and **k**) attempt to get as close as possible to the remembered column position, so that the cursor tends to restrict itself to a vertical column as the user moves around in the edit buffer. IEEE Std 1003.1-2001 requires conformance to historical practice, requiring that the display location of the cursor on the display line be adjusted from the current column value as necessary to support this historical behavior.

Historically, only a single line (and for some terminals, a single line minus 1 column) of characters could be entered by the user for the line-oriented commands; that is, **:**, **!**, **/**, or **?**. IEEE Std 1003.1-2001 permits, but does not require, this limitation.

Historically, “soft” errors in *vi* caused the terminal to be alerted, but no error message was displayed. As a general rule, no error message was displayed for errors in command execution in *vi*, when the error resulted from the user attempting an invalid or impossible action, or when a searched-for object was not found. Examples of soft errors included **h** at the left margin, **<control>-B** or **[[** at the beginning of the file, **2G** at the end of the file, and so on. In addition, errors such as **%**, **[[**, **]**, **)**, **N**, **n**, **f**, **F**, **t**, and **T** failing to find the searched-for object were soft as well. Less consistently, **/** and **?** displayed an error message if the pattern was not found, **/**, **?**, **N**, and **n** displayed an error message if no previous regular expression had been specified, and **;** did not display an error message if no previous **f**, **F**, **t**, or **T** command had occurred. Also, behavior in this area might reasonably be based on a runtime evaluation of the speed of a network connection. Finally, some implementations have provided error messages for soft errors in order to assist naive users, based on the value of a verbose edit option. IEEE Std 1003.1-2001 does not list specific errors for which an error message shall be displayed. Implementations should conform to historical practice in the absence of any strong reason to diverge.

### Page Backwards

The <control>-B and <control>-F commands historically considered it an error to attempt to page past the beginning or end of the file, whereas the <control>-D and <control>-U commands simply moved to the beginning or end of the file. For consistency, IEEE Std 1003.1-2001 requires the latter behavior for all four commands. All four commands still consider it an error if the current line is at the beginning (<control>-B, <control>-U) or end (<control>-F, <control>-D) of the file. Historically, the <control>-B and <control>-F commands skip two lines in order to include overlapping lines when a single command is entered. This makes less sense in the presence of a *count*, as there will be, by definition, no overlapping lines. The actual calculation used by historical implementations of the *vi* editor for <control>-B was:

$$((\text{current first line}) - \text{count} \times (\text{window edit option})) + 2$$

and for <control>-F was:

$$((\text{current first line}) + \text{count} \times (\text{window edit option})) - 2$$

This calculation does not work well when intermixing commands with and without counts; for example, 3<control>-F is not equivalent to entering the <control>-F command three times, and is not reversible by entering the <control>-B command three times. For consistency with other *vi* commands that take counts, IEEE Std 1003.1-2001 requires a different calculation.

### Scroll Forward

The 4BSD and System V implementations of *vi* differed on the initial value used by the **scroll** command. 4BSD used:

$$((\text{window edit option}) + 1) / 2$$

while System V used the value of the **scroll** edit option. The System V version is specified by IEEE Std 1003.1-2001 because the standard developers believed that it was more intuitive and permitted the user a method of setting the scroll value initially without also setting the number of lines that are displayed.

### Scroll Forward by Line

Historically, the <control>-E and <control>-Y commands considered it an error if the last and first lines, respectively, were already on the screen. IEEE Std 1003.1-2001 requires conformance to historical practice. Historically, the <control>-E and <control>-Y commands had no effect in open mode. For simplicity and consistency of specification, IEEE Std 1003.1-2001 requires that they behave as usual, albeit with a single line screen.

### Clear and Redisplay

The historical <control>-L command refreshed the screen exactly as it was supposed to be currently displayed, replacing any '@' characters for lines that had been deleted but not updated on the screen with refreshed '@' characters. The intent of the <control>-L command is to refresh when the screen has been accidentally overwritten; for example, by a **write** command from another user, or modem noise.

### 39709 **Redraw Screen**

39710 The historical <control>-R command redisplayed only when necessary to update lines that had  
 39711 been deleted but not updated on the screen and that were flagged with '@' characters. There is  
 39712 no requirement that the screen be in any way refreshed if no lines of this form are currently  
 39713 displayed. IEEE Std 1003.1-2001 permits implementations to extend this command to refresh  
 39714 lines on the screen flagged with '@' characters because they are too long to be displayed in the  
 39715 current framework; however, the current line and column need not be modified.

### 39716 **Search for tagstring**

39717 Historically, the first non-<blank> at or after the cursor was the first character, and all  
 39718 subsequent characters that were word characters, up to the end of the line, were included. For  
 39719 example, with the cursor on the leading space or on the '#' character in the text "#bar@", the  
 39720 tag was "#bar". On the character 'b' it was "bar", and on the 'a' it was "ar".  
 39721 IEEE Std 1003.1-2001 requires this behavior.

### 39722 **Replace Text with Results from Shell Command**

39723 Historically, the <, >, and ! commands considered most cursor motions other than line-oriented  
 39724 motions an error; for example, the command >/foo<CR> succeeded, while the command >I  
 39725 failed, even though the text region described by the two commands might be identical. For  
 39726 consistency, all three commands only consider entire lines and not partial lines, and the region is  
 39727 defined as any line that contains a character that was specified by the motion.

### 39728 **Move to Matching Character**

39729 Other matching characters have been left implementation-defined in order to allow extensions  
 39730 such as matching '<' and '>' for searching HTML, or #ifdef, #else, and #endif for searching C  
 39731 source.

### 39732 **Repeat Substitution**

39733 IEEE Std 1003.1-2001 requires that any c and g flags specified to the previous substitute  
 39734 command be ignored; however, the r flag may still apply, if supported by the implementation.

### 39735 **Return to Previous (Context or Section)**

39736 The [[, ]], (, ), {, and } commands are all affected by “section boundaries”, but in some historical  
 39737 implementations not all of the commands recognize the same section boundaries. This is a bug,  
 39738 not a feature, and a unique section-boundary algorithm was not described for each command.  
 39739 One special case that is preserved is that the sentence command moves to the end of the last line  
 39740 of the edit buffer while the other commands go to the beginning, in order to preserve the  
 39741 traditional character cut semantics of the sentence command. Historically, vi section boundaries  
 39742 at the beginning and end of the edit buffer were the first non-<blank> on the first and last lines  
 39743 of the edit buffer if one exists; otherwise, the last character of the first and last lines of the edit  
 39744 buffer if one exists. To increase consistency with other section locations, this has been simplified  
 39745 by IEEE Std 1003.1-2001 to the first character of the first and last lines of the edit buffer, or the  
 39746 first and the last lines of the edit buffer if they are empty.

39747 Sentence boundaries were problematic in the historical vi. They were not only the boundaries as  
 39748 defined for the section and paragraph commands, but they were the first non-<blank> that  
 39749 occurred after those boundaries, as well. Historically, the vi section commands were  
 39750 documented as taking an optional window size as a count preceding the command. This was not  
 39751 implemented in historical versions, so IEEE Std 1003.1-2001 requires that the count repeat the  
 39752 command, for consistency with other vi commands.

**Repeat**

Historically, mapped commands other than text input commands could not be repeated using the **period** command. IEEE Std 1003.1-2001 requires conformance to historical practice.

The restrictions on the interpretation of special characters (for example, <control>-H) in the repetition of text input mode commands is intended to match historical practice. For example, given the input sequence:

```
iab<control>-H<control>-H<control>-Hdef<escape>
```

the user should be informed of an error when the sequence is first entered, but not during a command repetition. The character <control>-T is specifically exempted from this restriction. Historical implementations of *vi* ignored <control>-T characters that were input in the original command during command repetition. IEEE Std 1003.1-2001 prohibits this behavior.

**Find Regular Expression**

Historically, commands did not affect the line searched to or from if the motion command was a search (*/*, *?*, **N**, **n**) and the final position was the start/end of the line. There were some special cases and *vi* was not consistent. IEEE Std 1003.1-2001 does not permit this behavior, for consistency. Historical implementations permitted but were unable to handle searches as motion commands that wrapped (that is, due to the edit option **wrapsan**) to the original location. IEEE Std 1003.1-2001 requires that this behavior be treated as an error.

Historically, the syntax *"/RE/0"* was used to force the command to cut text in line mode. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, in open mode, a **z** specified to a search command redisplayed the current line instead of displaying the current screen with the current line highlighted. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

Historically, trailing **z** commands were permitted and ignored if entered as part of a search used as a motion command. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

**Execute an ex Command**

Historically, *vi* implementations restricted the commands that could be entered on the colon command line (for example, **append** and **change**), and some other commands were known to cause them to fail catastrophically. For consistency, IEEE Std 1003.1-2001 does not permit these restrictions. When executing an *ex* command by entering *:*, it is not possible to enter a <newline> as part of the command because it is considered the end of the command. A different approach is to enter *ex* command mode by using the *vi* **Q** command (and later resuming visual mode with the *ex* **vi** command). In *ex* command mode, the single-line limitation does not exist. So, for example, the following is valid:

```
Q
s/break here/break\
here/
vi
```

IEEE Std 1003.1-2001 requires that, if the *ex* command overwrites any part of the screen that would be erased by a refresh, *vi* pauses for a character from the user. Historically, this character could be any character; for example, a character input by the user before the message appeared, or even a mapped character. This is probably a bug, but implementations that have tried to be more rigorous by requiring that the user enter a specific character, or that the user enter a character after the message was displayed, have been forced by user indignation back into

39798 historical behavior. IEEE Std 1003.1-2001 requires conformance to historical practice.

#### 39799 **Shift Left (Right)**

39800 Refer to the Rationale for the **!** and **/** commands. Historically, the **<** and **>** commands sometimes  
39801 moved the cursor to the first non-**<blank>** (for example if the command was repeated or with **\_**  
39802 as the motion command), and sometimes left it unchanged. IEEE Std 1003.1-2001 does not  
39803 permit this inconsistency, requiring instead that the cursor always move to the first non-  
39804 **<blank>**. Historically, the **<** and **>** commands did not support buffer arguments, although some  
39805 implementations allow the specification of an optional buffer. This behavior is neither required  
39806 nor disallowed by IEEE Std 1003.1-2001.

#### 39807 **Execute**

39808 Historically, buffers could execute other buffers, and loops, infinite and otherwise, were  
39809 possible. IEEE Std 1003.1-2001 requires conformance to historical practice. The *\*buffer* syntax of  
39810 **ex** is not required in **vi**, because it is not historical practice and has been used in some **vi**  
39811 implementations to support additional scripting languages.

#### 39812 **Reverse Case**

39813 Historically, the **~** command ignored any associated *count*, and acted only on the characters in  
39814 the current line. For consistency with other **vi** commands, IEEE Std 1003.1-2001 requires that an  
39815 associated *count* act on the next *count* characters, and that the command move to subsequent  
39816 lines if warranted by *count*, to make it possible to modify large pieces of text in a reasonably  
39817 efficient manner. There exist **vi** implementations that optionally require an associated motion  
39818 command for the **~** command. Implementations supporting this functionality are encouraged to  
39819 base it on the **tildedop** edit option and handle the text regions and cursor positioning identically  
39820 to the **yank** command.

#### 39821 **Append**

39822 Historically, *counts* specified to the **A**, **a**, **I**, and **i** commands repeated the input of the first line  
39823 *count* times, and did not repeat the subsequent lines of the input text. IEEE Std 1003.1-2001  
39824 requires that the entire text input be repeated *count* times.

#### 39825 **Move Backward to Preceding Word**

39826 Historically, **vi** became confused if word commands were used as motion commands in empty  
39827 files. IEEE Std 1003.1-2001 requires that this be an error. Historical implementations of **vi** had a  
39828 large number of bugs in the word movement commands, and they varied greatly in behavior in  
39829 the presence of empty lines, “words” made up of a single character, and lines containing only  
39830 **<blank>**s. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit  
39831 this behavior.

#### 39832 **Change to End-of-Line**

39833 Some historical implementations of the **C** command did not behave as described by  
39834 IEEE Std 1003.1-2001 when the **\$** key was remapped because they were implemented by pushing  
39835 the **\$** key onto the input queue and reprocessing it. IEEE Std 1003.1-2001 does not permit this  
39836 behavior. Historically, the **C**, **S**, and **s** commands did not copy replaced text into the numeric  
39837 buffers. For consistency and simplicity of specification, IEEE Std 1003.1-2001 requires that they  
39838 behave like their respective **c** commands in all respects.

**Delete**

Historically, lines in open mode that were deleted were scrolled up, and an @ glyph written over the beginning of the line. In the case of terminals that are incapable of the necessary cursor motions, the editor erased the deleted line from the screen. IEEE Std 1003.1-2001 requires conformance to historical practice; that is, if the terminal cannot display the '@' character, the line cannot remain on the screen.

**Delete to End-of-Line**

Some historical implementations of the **D** command did not behave as described by IEEE Std 1003.1-2001 when the **\$** key was remapped because they were implemented by pushing the **\$** key onto the input queue and reprocessing it. IEEE Std 1003.1-2001 does not permit this behavior.

**Join**

An historical oddity of *vi* is that the commands **J**, **1J**, and **2J** are all equivalent. IEEE Std 1003.1-2001 requires conformance to historical practice. The *vi* **J** command is specified in terms of the *ex* **join** command with an *ex* command *count* value. The address correction for a *count* that is past the end of the edit buffer is necessary for historical compatibility for both *ex* and *vi*.

**Mark Position**

Historical practice is that only lowercase letters, plus '' and ''', could be used to mark a cursor position. IEEE Std 1003.1-2001 requires conformance to historical practice, but encourages implementations to support other characters as marks as well.

**Repeat Regular Expression Find (Forward and Reverse)**

Historically, the **N** and **n** commands could not be used as motion components for the **c** command. With the exception of the **cN** command, which worked if the search crossed a line boundary, the text region would be discarded, and the user would not be in text input mode. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

**Insert Empty Line (Below and Above)**

Historically, counts to the **O** and **o** commands were used as the number of physical lines to open, if the terminal was dumb and the **slowopen** option was not set. This was intended to minimize traffic over slow connections and repainting for dumb terminals. IEEE Std 1003.1-2001 does not permit this behavior, requiring that a *count* to the open command behave as for other text input commands. This change to historical practice was made for consistency, and because a superset of the functionality is provided by the **slowopen** edit option.

**Put from Buffer (Following and Before)**

Historically, *counts* to the **p** and **P** commands were ignored if the buffer was a line mode buffer, but were (mostly) implemented as described in IEEE Std 1003.1-2001 if the buffer was a character mode buffer. Because implementations exist that do not have this limitation, and because pasting lines multiple times is generally useful, IEEE Std 1003.1-2001 requires that *count* be supported for all **p** and **P** commands.

Historical implementations of *vi* were widely known to have major problems in the **p** and **P** commands, particularly when unusual regions of text were copied into the edit buffer. The standard developers viewed these as bugs, and they are not permitted for consistency and

39881 simplicity of specification.

39882 Historically, a **P** or **p** command (or an **ex put** command executed from open or visual mode)  
39883 executed in an empty file, left an empty line as the first line of the file. For consistency and  
39884 simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

#### 39885 **Replace Character**

39886 Historically, the **r** command did not correctly handle the *erase* and *word erase* characters as  
39887 arguments, nor did it handle an associated *count* greater than 1 with a <carriage-return>  
39888 argument, for which it replaced *count* characters with a single <newline>. IEEE Std 1003.1-2001  
39889 does not permit these inconsistencies.

39890 Historically, the **r** command permitted the <control>-V escaping of entered characters, such as  
39891 <ESC> and the <carriage-return>; however, it required two leading <control>-V characters  
39892 instead of one. IEEE Std 1003.1-2001 requires that this be changed for consistency with the other  
39893 text input commands of *vi*.

39894 Historically, it is an error to enter the **r** command if there are less than *count* characters at or after  
39895 the cursor in the line. While a reasonable and unambiguous extension would be to permit the **r**  
39896 command on empty lines, it would require that too large a *count* be adjusted to match the  
39897 number of characters at or after the cursor for consistency, which is sufficiently different from  
39898 historical practice to be avoided. IEEE Std 1003.1-2001 requires conformance to historical  
39899 practice.

#### 39900 **Replace Characters**

39901 Historically, if there were **autoindent** characters in the line on which the **R** command was run,  
39902 and **autoindent** was set, the first <newline> would be properly indented and no characters  
39903 would be replaced by the <newline>. Each additional <newline> would replace *n* characters,  
39904 where *n* was the number of characters that were needed to indent the rest of the line to the  
39905 proper indentation level. This behavior is a bug and is not permitted by IEEE Std 1003.1-2001.

#### 39906 **Undo**

39907 Historical practice for cursor positioning after undoing commands was mixed. In most cases,  
39908 when undoing commands that affected a single line, the cursor was moved to the start of added  
39909 or changed text, or immediately after deleted text. However, if the user had moved from the line  
39910 being changed, the column was either set to the first non-<blank>, returned to the origin of the  
39911 command, or remained unchanged. When undoing commands that affected multiple lines or  
39912 entire lines, the cursor was moved to the first character in the first line restored. As an example  
39913 of how inconsistent this was, a search, followed by an **o** text input command, followed by an  
39914 **undo** would return the cursor to the location where the **o** command was entered, but a **cw**  
39915 command followed by an **o** command followed by an **undo** would return the cursor to the first  
39916 non-<blank> of the line. IEEE Std 1003.1-2001 requires the most useful of these behaviors, and  
39917 discards the least useful, in the interest of consistency and simplicity of specification.

**Yank**

Historically, the **yank** command did not move to the end of the motion if the motion was in the forward direction. It moved to the end of the motion if the motion was in the backward direction, except for the **\_** command, or for the **G** and **'** commands when the end of the motion was on the current line. This was further complicated by the fact that for a number of motion commands, the **yank** command moved the cursor but did not update the screen; for example, a subsequent command would move the cursor from the end of the motion, even though the cursor on the screen had not reflected the cursor movement for the **yank** command. IEEE Std 1003.1-2001 requires that all **yank** commands associated with backward motions move the cursor to the end of the motion for consistency, and specifically, to make **'** commands as motions consistent with search patterns as motions.

**Yank Current Line**

Some historical implementations of the **Y** command did not behave as described by IEEE Std 1003.1-2001 when the **'\_'** key was remapped because they were implemented by pushing the **'\_'** key onto the input queue and reprocessing it. IEEE Std 1003.1-2001 does not permit this behavior.

**Redraw Window**

Historically, the **z** command always redrew the screen. This is permitted but not required by IEEE Std 1003.1-2001, because of the frequent use of the **z** command in macros such as **map n nz.** for screen positioning, instead of its use to change the screen size. The standard developers believed that expanding or scrolling the screen offered a better interface for users. The ability to redraw the screen is preserved if the optional new window size is specified, and in the **<control>-L** and **<control>-R** commands.

The semantics of **z^** are confusing at best. Historical practice is that the screen before the screen that ended with the specified line is displayed. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the **z** command would not display a partial line at the top or bottom of the screen. If the partial line would normally have been displayed at the bottom of the screen, the command worked, but the partial line was replaced with **'@'** characters. If the partial line would normally have been displayed at the top of the screen, the command would fail. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

Historically, the **z** command with a line specification of 1 ignored the command. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

Historically, the **z** command did not set the cursor column to the first non-**<blank>** for the character if the first screen was to be displayed, and was already displayed. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

**Input Mode Commands in vi**

Historical implementations of **vi** did not permit the user to erase more than a single line of input, or to use normal erase characters such as *line erase*, *worderase*, and *erase* to erase **autoindent** characters. As there exist implementations of **vi** that do not have these limitations, both behaviors are permitted, but only historical practice is required. In the case of these extensions, **vi** is required to pause at the **autoindent** and previous line boundaries.

Historical implementations of **vi** updated only the portion of the screen where the current cursor character was displayed. For example, consider the **vi** input keystrokes:

39962 iabcd<escape>0C<tab>

39963 Historically, the <tab> would overwrite the characters "abcd" when it was displayed. Other  
 39964 implementations replace only the 'a' character with the <tab>, and then push the rest of the  
 39965 characters ahead of the cursor. Both implementations have problems. The historical  
 39966 implementation is probably visually nicer for the above example; however, for the keystrokes:

39967 iabcd<ESC>0R<tab><ESC>

39968 the historical implementation results in the string "bcd" disappearing and then magically  
 39969 reappearing when the <ESC> character is entered. IEEE Std 1003.1-2001 requires the former  
 39970 behavior when overwriting erase-columns—that is, overwriting characters that are no longer  
 39971 logically part of the edit buffer—and the latter behavior otherwise.

39972 Historical implementations of *vi* discarded the <control>-D and <control>-T characters when  
 39973 they were entered at places where their command functionality was not appropriate.  
 39974 IEEE Std 1003.1-2001 requires that the <control>-T functionality always be available, and that  
 39975 <control>-D be treated as any other key when not operating on **autoindent** characters.

## 39976 NUL

39977 Some historical implementations of *vi* limited the number of characters entered using the NUL  
 39978 input character to 256 bytes. IEEE Std 1003.1-2001 permits this limitation; however,  
 39979 implementations are encouraged to remove this limit.

## 39980 <control>-D

39981 See also Rationale for the input mode command <newline>. The hidden assumptions in the  
 39982 <control>-D command (and in the *vi* **autoindent** specification in general) is that <space>s take  
 39983 up a single column on the screen and that <tab>s are comprised of an integral number of  
 39984 <space>s.

## 39985 <newline>

39986 Implementations are permitted to rewrite **autoindent** characters in the line when <newline>,  
 39987 <carriage-return>, <control>-D, and <control>-T are entered, or when the **shift** commands are  
 39988 used, because historical implementations have both done so and found it necessary to do so. For  
 39989 example, a <control>-D when the cursor is preceded by a single <tab>, with **tabstop** set to 8, and  
 39990 **shiftwidth** set to 3, will result in the <tab> being replaced by several <space>s.

## 39991 <control>-T

39992 See also the Rationale for the input mode command <newline>. Historically, <control>-T only  
 39993 worked if no non-<blank>s had yet been input in the current input line. In addition, the  
 39994 characters inserted by <control>-T were treated as **autoindent** characters, and could not be  
 39995 erased using normal user erase characters. Because implementations exist that do not have  
 39996 these limitations, and as moving to a column boundary is generally useful, IEEE Std 1003.1-2001  
 39997 requires that both limitations be removed.

|       |                                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------------------------|
| 39998 | <b>&lt;control&gt;-V</b>                                                                                            |
| 39999 | Historically, <i>vi</i> used <b>^V</b> , regardless of the value of the literal-next character of the terminal.     |
| 40000 | IEEE Std 1003.1-2001 requires conformance to historical practice.                                                   |
| 40001 | The uses described for <control>-V can also be accomplished with <control>-Q, which is useful                       |
| 40002 | on terminals that use <control>-V for the down-arrow function. However, most historical                             |
| 40003 | implementations use <control>-Q for the <i>termios</i> START character, so the editor will generally                |
| 40004 | not receive the <control>-Q unless <b>stty ixon</b> mode is set to off. (In addition, some historical               |
| 40005 | implementations of <i>vi</i> explicitly set <b>ixon</b> mode to on, so it was difficult for the user to set it to   |
| 40006 | off.) Any of the command characters described in IEEE Std 1003.1-2001 can be made ineffective                       |
| 40007 | by their selection as <i>termios</i> control characters, using the <i>stty</i> utility or other methods described   |
| 40008 | in the System Interfaces volume of IEEE Std 1003.1-2001.                                                            |
| 40009 | <b>&lt;ESC&gt;</b>                                                                                                  |
| 40010 | Historically, SIGINT alerted the terminal when used to end input mode. This behavior is                             |
| 40011 | permitted, but not required, by IEEE Std 1003.1-2001.                                                               |
| 40012 | <b>FUTURE DIRECTIONS</b>                                                                                            |
| 40013 | None.                                                                                                               |
| 40014 | <b>SEE ALSO</b>                                                                                                     |
| 40015 | <i>ed</i> , <i>ex</i> , <i>stty</i>                                                                                 |
| 40016 | <b>CHANGE HISTORY</b>                                                                                               |
| 40017 | First released in Issue 2.                                                                                          |
| 40018 | <b>Issue 5</b>                                                                                                      |
| 40019 | The FUTURE DIRECTIONS section is added.                                                                             |
| 40020 | <b>Issue 6</b>                                                                                                      |
| 40021 | This utility is marked as part of the User Portability Utilities option.                                            |
| 40022 | The APPLICATION USAGE section is added.                                                                             |
| 40023 | The obsolescent SYNOPSIS is removed.                                                                                |
| 40024 | The following new requirements on POSIX implementations derive from alignment with the                              |
| 40025 | Single UNIX Specification:                                                                                          |

40037 **NAME**

40038           wait — await process completion

40039 **SYNOPSIS**40040           wait [*pid*...]40041 **DESCRIPTION**

40042           When an asynchronous list (see Section 2.9.3.1 (on page 50)) is started by the shell, the process ID  
 40043           of the last command in each element of the asynchronous list shall become known in the current  
 40044           shell execution environment; see Section 2.12 (on page 61).

40045           If the *wait* utility is invoked with no operands, it shall wait until all process IDs known to the  
 40046           invoking shell have terminated and exit with a zero exit status.

40047           If one or more *pid* operands are specified that represent known process IDs, the *wait* utility shall  
 40048           wait until all of them have terminated. If one or more *pid* operands are specified that represent  
 40049           unknown process IDs, *wait* shall treat them as if they were known process IDs that exited with  
 40050           exit status 127. The exit status returned by the *wait* utility shall be the exit status of the process  
 40051           requested by the last *pid* operand.

40052           The known process IDs are applicable only for invocations of *wait* in the current shell execution  
 40053           environment.

40054 **OPTIONS**

40055           None.

40056 **OPERANDS**

40057           The following operand shall be supported:

40058           *pid*           One of the following:

- 40059                           1. The unsigned decimal integer process ID of a command, for which the utility  
 40060                           is to wait for the termination.
- 40061                           2. A job control job ID (see the Base Definitions volume of IEEE Std 1003.1-2001,  
 40062                           Section 3.203, Job Control Job ID) that identifies a background process group  
 40063                           to be waited for. The job control job ID notation is applicable only for  
 40064                           invocations of *wait* in the current shell execution environment; see Section  
 40065                           2.12 (on page 61). The exit status of *wait* shall be determined by the last  
 40066                           command in the pipeline.

40067                           **Note:**   The job control job ID type of *pid* is only available on systems supporting  
 40068                           the User Portability Utilities option.

40069 **STDIN**

40070           Not used.

40071 **INPUT FILES**

40072           None.

40073 **ENVIRONMENT VARIABLES**40074           The following environment variables shall affect the execution of *wait*:

40075           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 40076                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40077                           Internationalization Variables for the precedence of internationalization variables  
 40078                           used to determine the values of locale categories.)

40079           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 40080                           internationalization variables.

40081 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 40082 characters (for example, single-byte as opposed to multi-byte characters in  
 40083 arguments).

40084 **LC\_MESSAGES**  
 40085 Determine the locale that should be used to affect the format and contents of  
 40086 diagnostic messages written to standard error.

40087 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

40088 **ASYNCHRONOUS EVENTS**  
 40089 Default.

40090 **STDOUT**  
 40091 Not used.

40092 **STDERR**  
 40093 The standard error shall be used only for diagnostic messages.

40094 **OUTPUT FILES**  
 40095 None.

40096 **EXTENDED DESCRIPTION**  
 40097 None.

40098 **EXIT STATUS**  
 40099 If one or more operands were specified, all of them have terminated or were not known by the  
 40100 invoking shell, and the status of the last operand specified is known, then the exit status of *wait*  
 40101 shall be the exit status information of the command indicated by the last operand specified. If  
 40102 the process terminated abnormally due to the receipt of a signal, the exit status shall be greater  
 40103 than 128 and shall be distinct from the exit status generated by other signals, but the exact value  
 40104 is unspecified. (See the *kill -l* option.) Otherwise, the *wait* utility shall exit with one of the  
 40105 following values:

40106 0 The *wait* utility was invoked with no operands and all process IDs known by the  
 40107 invoking shell have terminated.

40108 1-126 The *wait* utility detected an error.

40109 127 The command identified by the last *pid* operand specified is unknown.

40110 **CONSEQUENCES OF ERRORS**  
 40111 Default.

40112 **APPLICATION USAGE**  
 40113 On most implementations, *wait* is a shell built-in. If it is called in a subshell or separate utility  
 40114 execution environment, such as one of the following:

40115 (wait)  
 40116 nohup wait ...  
 40117 find . -exec wait ... \;

40118 it returns immediately because there are no known process IDs to wait for in those  
 40119 environments.

40120 Historical implementations of interactive shells have discarded the exit status of terminated  
 40121 background processes before each shell prompt. Therefore, the status of background processes  
 40122 was usually lost unless it terminated while *wait* was waiting for it. This could be a serious  
 40123 problem when a job that was expected to run for a long time actually terminated quickly with a  
 40124 syntax or initialization error because the exit status returned was usually zero if the requested

process ID was not found. This volume of IEEE Std 1003.1-2001 requires the implementation to keep the status of terminated jobs available until the status is requested, so that scripts like:

```

40127 j1&
40128 p1=$!
40129 j2&
40130 wait $p1
40131 echo Job 1 exited with status $?
40132 wait $!
40133 echo Job 2 exited with status $?

```

work without losing status on any of the jobs. The shell is allowed to discard the status of any process if it determines that the application cannot get the process ID for that process from the shell. It is also required to remember only {CHILD\_MAX} number of processes in this way. Since the only way to get the process ID from the shell is by using the '!' shell parameter, the shell is allowed to discard the status of an asynchronous list if "\$!" was not referenced before another asynchronous list was started. (This means that the shell only has to keep the status of the last asynchronous list started if the application did not reference "\$!". If the implementation of the shell is smart enough to determine that a reference to "\$!" was not saved anywhere that the application can retrieve it later, it can use this information to trim the list of saved information. Note also that a successful call to *wait* with no operands discards the exit status of all asynchronous lists.)

If the exit status of *wait* is greater than 128, there is no way for the application to know if the waited-for process exited with that value or was killed by a signal. Since most utilities exit with small values, there is seldom any ambiguity. Even in the ambiguous cases, most applications just need to know that the asynchronous job failed; it does not matter whether it detected an error and failed or was killed and did not complete its job normally.

#### 40150 EXAMPLES

Although the exact value used when a process is terminated by a signal is unspecified, if it is known that a signal terminated a process, a script can still reliably determine which signal by using *kill* as shown by the following script:

```

40154 sleep 1000&
40155 pid=$!
40156 kill -kill $pid
40157 wait $pid
40158 echo $pid was terminated by a SIG$(kill -l $?) signal.

```

If the following sequence of commands is run in less than 31 seconds:

```

40160 sleep 257 | sleep 31 &
40161 jobs -l %%

```

either of the following commands returns the exit status of the second *sleep* in the pipeline:

```

40163 wait <pid of sleep 31>
40164 wait %%

```

#### 40165 RATIONALE

The description of *wait* does not refer to the *waitpid()* function from the System Interfaces volume of IEEE Std 1003.1-2001 because that would needlessly overspecify this interface. However, the wording means that *wait* is required to wait for an explicit process when it is given an argument so that the status information of other processes is not consumed. Historical implementations use the *wait()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 until *wait()* returns the requested process ID or finds that the requested

40172 process does not exist. Because this means that a shell script could not reliably get the status of  
40173 all background children if a second background job was ever started before the first job finished,  
40174 it is recommended that the *wait* utility use a method such as the functionality provided by the  
40175 *waitpid()* function.

40176 The ability to wait for multiple *pid* operands was adopted from the KornShell.

40177 This new functionality was added because it is needed to determine the exit status of any  
40178 asynchronous list accurately. The only compatibility problem that this change creates is for a  
40179 script like

```
40180 while sleep 60 do
40181 job& echo Job started $(date) as $! done
```

40182 which causes the shell to monitor all of the jobs started until the script terminates or runs out of  
40183 memory. This would not be a problem if the loop did not reference "\$!" or if the script would  
40184 occasionally *wait* for jobs it started.

#### 40185 **FUTURE DIRECTIONS**

40186 None.

#### 40187 **SEE ALSO**

#### 40190 **CHANGE HISTORY**

40191 First released in Issue 2.

40192 **NAME**

40193           wc — word, line, and byte or character count

40194 **SYNOPSIS**40195           wc [-c|-m] [-lw] [*file*...]40196 **DESCRIPTION**40197           The *wc* utility shall read one or more input files and, by default, write the number of <newline>s,  
40198           words, and bytes contained in each input file to the standard output.40199           The utility also shall write a total count for all named files, if more than one input file is  
40200           specified.40201           The *wc* utility shall consider a *word* to be a non-zero-length string of characters delimited by  
40202           white space.40203 **OPTIONS**40204           The *wc* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
40205           Utility Syntax Guidelines.

40206           The following options shall be supported:

40207           **-c**           Write to the standard output the number of bytes in each input file.40208           **-l**           Write to the standard output the number of <newline>s in each input file.40209           **-m**           Write to the standard output the number of characters in each input file.40210           **-w**           Write to the standard output the number of words in each input file.40211           When any option is specified, *wc* shall report only the information requested by the specified  
40212           options.40213 **OPERANDS**

40214           The following operand shall be supported:

40215           *file*           A pathname of an input file. If no *file* operands are specified, the standard input  
40216           shall be used.40217 **STDIN**40218           The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
40219           section.40220 **INPUT FILES**

40221           The input files may be of any type.

40222 **ENVIRONMENT VARIABLES**40223           The following environment variables shall affect the execution of *wc*:40224           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
40225           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
40226           Internationalization Variables for the precedence of internationalization variables  
40227           used to determine the values of locale categories.)40228           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
40229           internationalization variables.40230           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
40231           characters (for example, single-byte as opposed to multi-byte characters in  
40232           arguments and input files) and which characters are defined as white space  
40233           characters.

40234 **LC\_MESSAGES**

40235 Determine the locale that should be used to affect the format and contents of  
 40236 diagnostic messages written to standard error and informative messages written to  
 40237 standard output.

40238 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

40239 **ASYNCHRONOUS EVENTS**

40240 Default.

40241 **STDOUT**

40242 By default, the standard output shall contain an entry for each input file of the form:

40243 "%d %d %d %s\n", <newlines>, <words>, <bytes>, <file>

40244 If the **-m** option is specified, the number of characters shall replace the <bytes> field in this  
 40245 format.

40246 If any options are specified and the **-l** option is not specified, the number of <newline>s shall  
 40247 not be written.

40248 If any options are specified and the **-w** option is not specified, the number of words shall not be  
 40249 written.

40250 If any options are specified and neither **-c** nor **-m** is specified, the number of bytes or characters  
 40251 shall not be written.

40252 If no input *file* operands are specified, no name shall be written and no <blank>s preceding the  
 40253 pathname shall be written.

40254 If more than one input *file* operand is specified, an additional line shall be written, of the same  
 40255 format as the other lines, except that the word **total** (in the POSIX locale) shall be written instead  
 40256 of a pathname and the total of each column shall be written as appropriate. Such an additional  
 40257 line, if any, is written at the end of the output.

40258 **STDERR**

40259 The standard error shall be used only for diagnostic messages.

40260 **OUTPUT FILES**

40261 None.

40262 **EXTENDED DESCRIPTION**

40263 None.

40264 **EXIT STATUS**

40265 The following exit values shall be returned:

40266 0 Successful completion.

40267 >0 An error occurred.

40268 **CONSEQUENCES OF ERRORS**

40269 Default.

**40270 APPLICATION USAGE**

40271 The **-m** option is not a switch, but an option at the same level as **-c**. Thus, to produce the full  
40272 default output with character counts instead of bytes, the command required is:

40273 `wc -mlw`

**40274 EXAMPLES**

40275 None.

**40276 RATIONALE**

40277 The output file format pseudo-*printf()* string differs from the System V version of *wc*:

40278 `"%7d%7d%7d %s\n"`

40279 which produces possibly ambiguous and unparseable results for very large files, as it assumes no  
40280 number shall exceed six digits.

40281 Some historical implementations use only <space>, <tab>, and <newline> as word separators.  
40282 The equivalent of the ISO C standard *isspace()* function is more appropriate.

40283 The **-c** option stands for “character” count, even though it counts bytes. This stems from the  
40284 sometimes erroneous historical view that bytes and characters are the same size. Due to  
40285 international requirements, the **-m** option (reminiscent of “multi-byte”) was added to obtain  
40286 actual character counts.

40287 Early proposals only specified the results when input files were text files. The current  
40288 specification more closely matches historical practice. (Bytes, words, and <newline>s are  
40289 counted separately and the results are written when an end-of-file is detected.)

40290 Historical implementations of the *wc* utility only accepted one argument to specify the options  
40291 **-c**, **-l**, and **-w**. Some of them also had multiple occurrences of an option cause the  
40292 corresponding count to be written multiple times and had the order of specification of the  
40293 options affect the order of the fields on output, but did not document either of these. Because  
40294 common usage either specifies no options or only one option, and because none of this was  
40295 documented, the changes required by this volume of IEEE Std 1003.1-2001 should not break  
40296 many historical applications (and do not break any historical conforming applications).

**40297 FUTURE DIRECTIONS**

40298 None.

**40299 SEE ALSO**

40300 *cksum*

**40301 CHANGE HISTORY**

40302 First released in Issue 2.

40303 **NAME**40304           what — identify SCCS files (**DEVELOPMENT**)40305 **SYNOPSIS**40306 xSI        what [-s] *file...*

40307

40308 **DESCRIPTION**

40309       The *what* utility shall search the given files for all occurrences of the pattern that *get* (see *get*)  
 40310       substitutes for the %Z% keyword ("@(#) ") and shall write to standard output what follows  
 40311       until the first occurrence of one of the following:

40312           "    &gt;   newline   \    NUL

40313 **OPTIONS**

40314       The *what* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 40315       12.2, Utility Syntax Guidelines.

40316       The following option shall be supported:

40317       -s           Quit after finding the first occurrence of the pattern in each file.

40318 **OPERANDS**

40319       The following operands shall be supported:

40320       *file*           A pathname of a file to search.40321 **STDIN**

40322       Not used.

40323 **INPUT FILES**

40324       The input files shall be of any file type.

40325 **ENVIRONMENT VARIABLES**40326       The following environment variables shall affect the execution of *what*:

40327       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 40328                        (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40329       Internationalization Variables for the precedence of internationalization variables  
 40330       used to determine the values of locale categories.)

40331       *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 40332       internationalization variables.

40333       *LC\_CTYPE*     Determine the locale for the interpretation of sequences of bytes of text data as  
 40334       characters (for example, single-byte as opposed to multi-byte characters in  
 40335       arguments and input files).

40336       *LC\_MESSAGES*

40337                       Determine the locale that should be used to affect the format and contents of  
 40338       diagnostic messages written to standard error.

40339       *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.40340 **ASYNCHRONOUS EVENTS**

40341       Default.

40342 **STDOUT**40343       The standard output shall consist of the following for each *file* operand:

40344       "%s:\n\t%s\n", &lt;pathname&gt;, &lt;identification string&gt;

40345 **STDERR**

40346           The standard error shall be used only for diagnostic messages.

40347 **OUTPUT FILES**

40348           None.

40349 **EXTENDED DESCRIPTION**

40350           None.

40351 **EXIT STATUS**

40352           The following exit values shall be returned:

40353           0    Any matches were found.

40354           1    Otherwise.

40355 **CONSEQUENCES OF ERRORS**

40356           Default.

40357 **APPLICATION USAGE**

40358           The *what* utility is intended to be used in conjunction with the SCCS command *get*, which automatically inserts identifying information, but it can also be used where the information is inserted by any other means.

40361           When the string "@(#)" is included in a library routine in a shared library, it might not be found in an **a.out** file using that library routine.

40363 **EXAMPLES**

40364           If the C-language program in file **f.c** contains:

40365           char ident[] = "@(#)identification information";

40366           and **f.c** is compiled to yield **f.o** and **a.out**, then the command:

40367           what f.c f.o a.out

40368           writes:

40369           f.c:

40370               identification information

40371               ...

40372           f.o:

40373               identification information

40374               ...

40375           a.out:

40376               identification information

40377               ...

40378 **RATIONALE**

40379           None.

40380 **FUTURE DIRECTIONS**

40381           None.

40382 **SEE ALSO**

40383           *get*

40384 **CHANGE HISTORY**

40385           First released in Issue 2.

40386 **NAME**

40387       who — display who is on the system

40388 **SYNOPSIS**

40389 UP       who [-mTu]

40390 XSI       who [-mu]-s [-bHlprt] [*file*]40391       who [-mTu] [-abdHlprt] [*file*]40392       who -q [*file*]

40393       who am i

40394       who am I

40395

40396 **DESCRIPTION**40397       The *who* utility shall list various pieces of information about accessible users. The domain of  
40398 accessibility is implementation-defined.40399 XSI       Based on the options given, *who* can also list the user's name, terminal line, login time, elapsed  
40400 time since activity occurred on the line, and the process ID of the command interpreter for each  
40401 current system user.40402 **OPTIONS**40403       The *who* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
40404 12.2, Utility Syntax Guidelines.40405       The following options shall be supported. The metavariables, such as <*line*>, refer to fields  
40406 described in the STDOUT section.40407 XSI       **-a**       Process the implementation-defined database or named file with the **-b**, **-d**, **-l**, **-p**,  
40408 **-r**, **-t**, **-T** and **-u** options turned on.40409 XSI       **-b**       Write the time and date of the last reboot.40410 XSI       **-d**       Write a list of all processes that have expired and not been respawned by the *init*  
40411 system process. The <*exit*> field shall appear for dead processes and contain the  
40412 termination and exit values of the dead process. This can be useful in determining  
40413 why a process terminated.40414 XSI       **-H**       Write column headings above the regular output.40415 XSI       **-l**       (The letter ell.) List only those lines on which the system is waiting for someone to  
40416 login. The <*name*> field shall be **LOGIN** in such cases. Other fields shall be the  
40417 same as for user entries except that the <*state*> field does not exist.40418       **-m**       Output only information about the current terminal.40419 XSI       **-p**       List any other process that is currently active and has been previously spawned by  
40420 *init*.40421 XSI       **-q**       (Quick.) List only the names and the number of users currently logged on. When  
40422 this option is used, all other options shall be ignored.40423 XSI       **-r**       Write the current *run-level* of the *init* process.40424 XSI       **-s**       List only the <*name*>, <*line*>, and <*time*> fields. This is the default case.40425 XSI       **-t**       Indicate the last change to the system clock.

40426       **-T**       Show the state of each terminal, as described in the STDOUT section.

40427       **-u**       Write “idle time” for each displayed user in addition to any other information. The  
 40428       idle time is the time since any activity occurred on the user’s terminal. The method  
 40429 XSI       of determining this is unspecified. This option shall list only those users who are  
 40430       currently logged in. The *<name>* is the user’s login name. The *<line>* is the name of  
 40431       the line as found in the directory */dev*. The *<time>* is the time that the user logged  
 40432       in. The *<activity>* is the number of hours and minutes since activity last occurred  
 40433       on that particular line. A dot indicates that the terminal has seen activity in the last  
 40434       minute and is therefore “current”. If more than twenty-four hours have elapsed or  
 40435       the line has not been used since boot time, the entry shall be marked *<old>*. This  
 40436       field is useful when trying to determine whether a person is working at the  
 40437       terminal or not. The *<pid>* is the process ID of the user’s login process.

#### 40438 OPERANDS

40439 XSI       The following operands shall be supported:

40440       **am i, am I**   In the POSIX locale, limit the output to describing the invoking user, equivalent to  
 40441       the **-m** option. The **am** and **i** or **I** must be separate arguments.

40442       *file*       Specify a pathname of a file to substitute for the implementation-defined database  
 40443       of logged-on users that *who* uses by default.

#### 40444 STDIN

40445       Not used.

#### 40446 INPUT FILES

40447       None.

#### 40448 ENVIRONMENT VARIABLES

40449       The following environment variables shall affect the execution of *who*:

40450       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
 40451       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40452       Internationalization Variables for the precedence of internationalization variables  
 40453       used to determine the values of locale categories.)

40454       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 40455       internationalization variables.

40456       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 40457       characters (for example, single-byte as opposed to multi-byte characters in  
 40458       arguments).

40459       **LC\_MESSAGES**  
 40460       Determine the locale that should be used to affect the format and contents of  
 40461       diagnostic messages written to standard error.

40462       **LC\_TIME**     Determine the locale used for the format and contents of the date and time strings.

40463 XSI       **NLSPATH**   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

40464       **TZ**         Determine the timezone used when writing date and time information. If *TZ* is  
 40465       unset or null, an unspecified default timezone shall be used.

#### 40466 ASYNCHRONOUS EVENTS

40467       Default.

**40468 STDOUT**

40469 The *who* utility shall write its default format to the standard output in an implementation-  
 40470 defined format, subject only to the requirement of containing the information described above.

40471 XSI OF XSI-conformant systems shall write the default information to the standard output in the  
 40472 following general format:

40473 `<name>[<state>]<line><time>[<activity>] [<pid>] [<comment>] [<exit>]`

40474 The following format shall be used for the **-T** option:

40475 `"%s %c %s %s\n" <name>, <terminal state>, <terminal name>,  
 40476 <time of login>`

40477 where *<terminal state>* is one of the following characters:

- 40478 + The terminal allows write access to other users.
- 40479 - The terminal denies write access to other users.
- 40480 ? The terminal write-access state cannot be determined.

40481 In the POSIX locale, the *<time of login>* shall be equivalent in format to the output of:

40482 `date +"%b %e %H:%M"`

40483 If the **-u** option is used with **-T**, the idle time shall be added to the end of the previous format in  
 40484 an unspecified format.

**40485 STDERR**

40486 The standard error shall be used only for diagnostic messages.

**40487 OUTPUT FILES**

40488 None.

**40489 EXTENDED DESCRIPTION**

40490 None.

**40491 EXIT STATUS**

40492 The following exit values shall be returned:

- 40493 0 Successful completion.
- 40494 >0 An error occurred.

**40495 CONSEQUENCES OF ERRORS**

40496 Default.

**40497 APPLICATION USAGE**

40498 The name *init* used for the system process is the most commonly used on historical systems, but  
 40499 it may vary.

40500 The “domain of accessibility” referred to is a broad concept that permits interpretation either on  
 40501 a very secure basis or even to allow a network-wide implementation like the historical *rwho*.

**40502 EXAMPLES**

40503 None.

**40504 RATIONALE**

40505 Due to differences between historical implementations, the base options provided were a  
 40506 compromise to allow users to work with those functions. The standard developers also  
 40507 considered removing all the options, but felt that these options offered users valuable  
 40508 functionality. Additional options to match historical systems are available on XSI-conformant

- 40509 systems.
- 40510 It is recognized that the *who* command may be of limited usefulness, especially in a multi-level  
40511 secure environment. The standard developers considered, however, that having some standard  
40512 method of determining the “accessibility” of other users would aid user portability.
- 40513 No format was specified for the default *who* output for systems not supporting the XSI  
40514 Extension. In such a user-oriented command, designed only for human use, this was not  
40515 considered to be a deficiency.
- 40516 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, and *write* require  
40517 that they use the same format.
- 40518 It is acceptable for an implementation to produce no output for an invocation of *who* **mil**.
- 40519 **FUTURE DIRECTIONS**
- 40520 None.
- 40521 **SEE ALSO**
- 40522 *mesg*
- 40523 **CHANGE HISTORY**
- 40524 First released in Issue 2.
- 40525 **Issue 6**
- 40526 This utility is marked as part of the User Portability Utilities option.
- 40527 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

40528 **NAME**

40529 write — write to another user

40530 **SYNOPSIS**40531 UP write *user\_name* [*terminal*]

40532

40533 **DESCRIPTION**40534 The *write* utility shall read lines from the user's standard input and write them to the terminal of  
40535 another user. When first invoked, it shall write the message:40536 **Message from** *sender-login-id* (*sending-terminal*) [*date*] ...40537 to *user\_name*. When it has successfully completed the connection, the sender's terminal shall be  
40538 alerted twice to indicate that what the sender is typing is being written to the recipient's  
40539 terminal.

40540 If the recipient wants to reply, this can be accomplished by typing:

40541 write *sender-login-id* [*sending-terminal*]40542 upon receipt of the initial message. Whenever a line of input as delimited by an NL, EOF, or EOL  
40543 special character (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General  
40544 Terminal Interface) is accumulated while in canonical input mode, the accumulated data shall be  
40545 written on the other user's terminal. Characters shall be processed as follows:

- 40546 • Typing <alert> shall write the alert character to the recipient's terminal.
- 40547 • Typing the erase and kill characters shall affect the sender's terminal in the manner described  
40548 by the **termios** interface in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11,  
40549 General Terminal Interface.
- 40550 • Typing the interrupt or end-of-file characters shall cause *write* to write an appropriate  
40551 message ("EOT\n" in the POSIX locale) to the recipient's terminal and exit.
- 40552 • Typing characters from *LC\_CTYPE* classifications **print** or **space** shall cause those characters  
40553 to be sent to the recipient's terminal.
- 40554 • When and only when the *stty* **ixten** local mode is enabled, the existence and processing of  
40555 additional special control characters and multi-byte or single-byte functions is  
40556 implementation-defined.
- 40557 • Typing other non-printable characters shall cause implementation-defined sequences of  
40558 printable characters to be written to the recipient's terminal.

40559 To write to a user who is logged in more than once, the *terminal* argument can be used to indicate  
40560 which terminal to write to; otherwise, the recipient's terminal is selected in an implementation-  
40561 defined manner and an informational message is written to the sender's standard output,  
40562 indicating which terminal was chosen.40563 Permission to be a recipient of a *write* message can be denied or granted by use of the *mesg*  
40564 utility. However, a user's privilege may further constrain the domain of accessibility of other  
40565 users' terminals. The *write* utility shall fail when the user lacks the appropriate privileges to  
40566 perform the requested action.40567 **OPTIONS**

40568 None.

40569 **OPERANDS**

40570 The following operands shall be supported:

40571 *user\_name* Login name of the person to whom the message shall be written. The application  
 40572 shall ensure that this operand is of the form returned by the *who* utility.

40573 *terminal* Terminal identification in the same format provided by the *who* utility.

40574 **STDIN**

40575 Lines to be copied to the recipient's terminal are read from standard input.

40576 **INPUT FILES**

40577 None.

40578 **ENVIRONMENT VARIABLES**40579 The following environment variables shall affect the execution of *write*:

40580 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 40581 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40582 Internationalization Variables for the precedence of internationalization variables  
 40583 used to determine the values of locale categories.)

40584 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 40585 internationalization variables.

40586 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 40587 characters (for example, single-byte as opposed to multi-byte characters in  
 40588 arguments and input files). If the recipient's locale does not use an *LC\_CTYPE*  
 40589 equivalent to the sender's, the results are undefined.

40590 *LC\_MESSAGES*

40591 Determine the locale that should be used to affect the format and contents of  
 40592 diagnostic messages written to standard error and informative messages written to  
 40593 standard output.

40594 *XS1* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

40595 **ASYNCHRONOUS EVENTS**

40596 If an interrupt signal is received, *write* shall write an appropriate message on the recipient's  
 40597 terminal and exit with a status of zero. It shall take the standard action for all other signals.

40598 **STDOUT**

40599 An informational message shall be written to standard output if a recipient is logged in more  
 40600 than once.

40601 **STDERR**

40602 The standard error shall be used only for diagnostic messages.

40603 **OUTPUT FILES**

40604 The recipient's terminal is used for output.

40605 **EXTENDED DESCRIPTION**

40606 None.

40607 **EXIT STATUS**

40608 The following exit values shall be returned:

40609 0 Successful completion.

40610 &gt;0 The addressed user is not logged on or the addressed user denies permission.

**40611 CONSEQUENCES OF ERRORS**

40612 Default.

**40613 APPLICATION USAGE**

40614 The *talk* utility is considered by some users to be a more usable utility on full-screen terminals.

**40615 EXAMPLES**

40616 None.

**40617 RATIONALE**

40618 The *write* utility was included in this volume of IEEE Std 1003.1-2001 since it can be  
40619 implemented on all terminal types. The standard developers considered the *talk* utility, which  
40620 cannot be implemented on certain terminals, to be a “better” communications interface. Both of  
40621 these programs are in widespread use on historical implementations. Therefore, the standard  
40622 developers decided that both utilities should be specified.

40623 The format of the terminal name is unspecified, but the descriptions of *ps*, *talk*, *who*, and *write*  
40624 require that they all use or accept the same format.

**40625 FUTURE DIRECTIONS**

40626 None.

**40627 SEE ALSO**

40628 *mesg*, *talk*, *who*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General  
40629 Terminal Interface

**40630 CHANGE HISTORY**

40631 First released in Issue 2.

**40632 Issue 5**

40633 The FUTURE DIRECTIONS section is added.

**40634 Issue 6**

40635 This utility is marked as part of the User Portability Utilities option.

40636 The normative text is reworded to avoid use of the term “must” for application requirements.

40637 **NAME**

40638 xargs — construct argument lists and invoke utility

40639 **SYNOPSIS**

40640 xsi xargs [-t] [-p]] [-E *eofstr*] [-I *replstr*] [-L *number*] [-n *number* [-x]]  
 40641 [-s *size*] [*utility* [*argument...*]]

40642 **DESCRIPTION**

40643 The *xargs* utility shall construct a command line consisting of the *utility* and *argument* operands  
 40644 specified followed by as many arguments read in sequence from standard input as fit in length  
 40645 and number constraints specified by the options. The *xargs* utility shall then invoke the  
 40646 constructed command line and wait for its completion. This sequence shall be repeated until one  
 40647 of the following occurs:

- 40648 • An end-of-file condition is detected on standard input.
- 40649 • The logical end-of-file string (see the **-E** *eofstr* option) is found on standard input after  
 40650 double-quote processing, apostrophe processing, and backslash escape processing (see next  
 40651 paragraph).
- 40652 • An invocation of a constructed command line returns an exit status of 255.

40653 The application shall ensure that arguments in the standard input are separated by unquoted  
 40654 <blank>s, unescaped <blank>s, or <newline>s. A string of zero or more non-double-quote ( ' " ' )  
 40655 characters and non-<newline>s can be quoted by enclosing them in double-quotes. A string of  
 40656 zero or more non-apostrophe ( ' ' ' ) characters and non-<newline>s can be quoted by enclosing  
 40657 them in apostrophes. Any unquoted character can be escaped by preceding it with a backslash.  
 40658 The utility named by *utility* shall be executed one or more times until the end-of-file is reached  
 40659 or the logical end-of file string is found. The results are unspecified if the utility named by *utility*  
 40660 attempts to read from its standard input.

40661 The generated command line length shall be the sum of the size in bytes of the utility name and  
 40662 each argument treated as strings, including a null byte terminator for each of these strings. The  
 40663 *xargs* utility shall limit the command line length such that when the command line is invoked,  
 40664 the combined argument and environment lists (see the *exec* family of functions in the System  
 40665 Interfaces volume of IEEE Std 1003.1-2001) shall not exceed {ARG\_MAX}-2048 bytes. Within  
 40666 this constraint, if neither the **-n** nor the **-s** option is specified, the default command line length  
 40667 shall be at least {LINE\_MAX}.

40668 **OPTIONS**

40669 The *xargs* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 40670 12.2, Utility Syntax Guidelines.

40671 The following options shall be supported:

40672 **-E** *eofstr* Use *eofstr* as the logical end-of-file string. If **-E** is not specified, it is unspecified  
 40673 whether the logical end-of-file string is the underscore character ( ' \_ ' ) or the end-  
 40674 of-file string capability is disabled. When *eofstr* is the null string, the logical end-  
 40675 of-file string capability shall be disabled and underscore characters shall be taken  
 40676 literally.

40677 xsi **-I** *replstr* Insert mode: *utility* is executed for each line from standard input, taking the entire  
 40678 line as a single argument, inserting it in *arguments* for each occurrence of *replstr*. A  
 40679 maximum of five arguments in *arguments* can each contain one or more instances  
 40680 of *replstr*. Any <blank>s at the beginning of each line shall be ignored.  
 40681 Constructed arguments cannot grow larger than 255 bytes. Option **-x** shall be  
 40682 forced on.

|           |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 40683 XSI | <b>-L number</b> | The <i>utility</i> shall be executed for each non-empty <i>number</i> lines of arguments from standard input. The last invocation of <i>utility</i> shall be with fewer lines of arguments if fewer than <i>number</i> remain. A line is considered to end with the first <newline> unless the last character of the line is a <blank>; a trailing <blank> signals continuation to the next non-empty line, inclusive. The <b>-L</b> and <b>-n</b> options are mutually-exclusive; the last one specified shall take effect. |
| 40684     |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 40685     |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 40686     |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 40687     |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 40715 OPERANDS

40716 The following operands shall be supported:

|       |                 |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 40717 | <i>utility</i>  | The name of the utility to be invoked, found by search path using the <i>PATH</i> environment variable, described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables. If <i>utility</i> is omitted, the default shall be the <i>echo</i> utility. If the <i>utility</i> operand names any of the special built-in utilities in Section 2.14 (on page 64), the results are undefined. |
| 40718 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 40719 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 40720 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 40721 |                 |                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 40722 | <i>argument</i> | An initial option or operand for the invocation of <i>utility</i> .                                                                                                                                                                                                                                                                                                                                                        |

## 40723 STDIN

40724 The standard input shall be a text file. The results are unspecified if an end-of-file condition is detected immediately following an escaped <newline>.

40725

40726 **INPUT FILES**

40727 The file **/dev/tty** shall be used to read responses required by the **-p** option.

40728 **ENVIRONMENT VARIABLES**

40729 The following environment variables shall affect the execution of *xargs*:

40730 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 40731 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40732 Internationalization Variables for the precedence of internationalization variables  
 40733 used to determine the values of locale categories.)

40734 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 40735 internationalization variables.

40736 **LC\_COLLATE**  
 40737 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 40738 character collating elements used in the extended regular expression defined for  
 40739 the **yesexpr** locale keyword in the **LC\_MESSAGES** category.

40740 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 40741 characters (for example, single-byte as opposed to multi-byte characters in  
 40742 arguments and input files) and the behavior of character classes used in the  
 40743 extended regular expression defined for the **yesexpr** locale keyword in the  
 40744 **LC\_MESSAGES** category.

40745 **LC\_MESSAGES**  
 40746 Determine the locale for the processing of affirmative responses and that should be  
 40747 used to affect the format and contents of diagnostic messages written to standard  
 40748 error.

40749 **XSI** **NLS\_PATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

40750 **PATH** Determine the location of *utility*, as described in the Base Definitions volume of  
 40751 IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

40752 **ASYNCHRONOUS EVENTS**

40753 Default.

40754 **STDOUT**

40755 Not used.

40756 **STDERR**

40757 The standard error shall be used for diagnostic messages and the **-t** and **-p** options. If the **-t**  
 40758 option is specified, the *utility* and its constructed argument list shall be written to standard error,  
 40759 as it will be invoked, prior to invocation. If **-p** is specified, a prompt of the following format  
 40760 shall be written (in the POSIX locale):

40761 " ? . . . "

40762 at the end of the line of the output from **-t**.

40763 **OUTPUT FILES**

40764 None.

40765 **EXTENDED DESCRIPTION**

40766 None.

40767 **EXIT STATUS**

40768 The following exit values shall be returned:

- 40769           0     All invocations of *utility* returned exit status zero.
- 40770           1-125   A command line meeting the specified requirements could not be assembled, one or  
40771 more of the invocations of *utility* returned a non-zero exit status, or some other error  
40772 occurred.
- 40773           126    The utility specified by *utility* was found but could not be invoked.
- 40774           127    The utility specified by *utility* could not be found.

40775 **CONSEQUENCES OF ERRORS**

40776 If a command line meeting the specified requirements cannot be assembled, the utility cannot be  
40777 invoked, an invocation of the utility is terminated by a signal, or an invocation of the utility exits  
40778 with exit status 255, the *xargs* utility shall write a diagnostic message and exit without  
40779 processing any remaining input.

40780 **APPLICATION USAGE**

40781 The 255 exit status allows a utility being used by *xargs* to tell *xargs* to terminate if it knows no  
40782 further invocations using the current data stream will succeed. Thus, *utility* should explicitly *exit*  
40783 with an appropriate value to avoid accidentally returning with 255.

40784 Note that input is parsed as lines; <blank>s separate arguments. If *xargs* is used to bundle output  
40785 of commands like *find dir -print* or *ls* into commands to be executed, unexpected results are  
40786 likely if any filenames contain any <blank>s or <newline>s. This can be fixed by using *find* to  
40787 call a script that converts each file found into a quoted string that is then piped to *xargs*. Note  
40788 that the quoting rules used by *xargs* are not the same as in the shell. They were not made  
40789 consistent here because existing applications depend on the current rules and the shell syntax is  
40790 not fully compatible with it. An easy rule that can be used to transform any string into a quoted  
40791 form that *xargs* interprets correctly is to precede each character in the string with a backslash.

40792 On implementations with a large value for {ARG\_MAX}, *xargs* may produce command lines  
40793 longer than {LINE\_MAX}. For invocation of utilities, this is not a problem. If *xargs* is being used  
40794 to create a text file, users should explicitly set the maximum command line length with the *-s*  
40795 option.

40796 The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
40797 an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
40798 utility exited with an error indication”. The value 127 was chosen because it is not commonly  
40799 used for other meanings; most utilities use small values for “normal error conditions” and the  
40800 values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
40801 chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
40802 scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
40803 between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
40804 *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
40805 any other reason.

40806 **EXAMPLES**

- 40807           1. The following command combines the output of the parenthesised commands onto one  
40808 line, which is then written to the end-of-file **log**:
- 40809           (logname; date; printf "%s\n" "\$0 \$\*") | xargs >>log
- 40810           2. The following command invokes *diff* with successive pairs of arguments originally typed  
40811 as command line arguments (assuming there are no embedded <blank>s in the elements of  
40812 the original argument list):

```

40813 printf "%s\n" "$*" | xargs -n 2 -x diff
40814
40815 3. In the following commands, the user is asked which files in the current directory are to be
 archived. The files are archived into arch; a, one at a time, or b, many at a time.
40816
40817 a. ls | xargs -p -L 1 ar -r arch
40818
40819 b. ls | xargs -p -L 1 | xargs ar -r arch
40820
40821 4. The following executes with successive pairs of arguments originally typed as command
40822 line arguments:
40823
40824 echo $* | xargs -n 2 diff
40825
40826 5. On XSI-conformant systems, the following moves all files from directory $1 to directory $2,
40827 and echoes each move command just before doing it:
40828
40829 ls $1 | xargs -I {} -t mv $1/{} $2/{}

```

#### 40824 RATIONALE

40825 The *xargs* utility was usually found only in System V-based systems; BSD systems included an  
 40826 *apply* utility that provided functionality similar to *xargs -n number*. The SVID lists *xargs* as a  
 40827 software development extension. This volume of IEEE Std 1003.1-2001 does not share the view  
 40828 that it is used only for development, and therefore it is not optional.

40829 The classic application of the *xargs* utility is in conjunction with the *find* utility to reduce the  
 40830 number of processes launched by a simplistic use of the *find -exec* combination. The *xargs* utility  
 40831 is also used to enforce an upper limit on memory required to launch a process. With this basis in  
 40832 mind, this volume of IEEE Std 1003.1-2001 selected only the minimal features required.

40833 Although the 255 exit status is mostly an accident of historical implementations, it allows a  
 40834 utility being used by *xargs* to tell *xargs* to terminate if it knows no further invocations using the  
 40835 current data stream shall succeed. Any non-zero exit status from a utility falls into the 1-125  
 40836 range when *xargs* exits. There is no statement of how the various non-zero utility exit status  
 40837 codes are accumulated by *xargs*. The value could be the addition of all codes, their highest  
 40838 value, the last one received, or a single value such as 1. Since no algorithm is arguably better  
 40839 than the others, and since many of the standard utilities say little more (portably) than  
 40840 “pass/fail”, no new algorithm was invented.

40841 Several other *xargs* options were withdrawn because simple alternatives already exist within this  
 40842 volume of IEEE Std 1003.1-2001. For example, the *-i replstr* option can be just as efficiently  
 40843 performed using a shell **for** loop. Since *xargs* calls an *exec* function with each input line, the *-i*  
 40844 option does not usually exploit the grouping capabilities of *xargs*.

40845 The requirement that *xargs* never produces command lines such that invocation of *utility* is  
 40846 within 2048 bytes of hitting the POSIX *exec* {ARG\_MAX} limitations is intended to guarantee  
 40847 that the invoked utility has room to modify its environment variables and command line  
 40848 arguments and still be able to invoke another utility. Note that the minimum {ARG\_MAX}  
 40849 allowed by the System Interfaces volume of IEEE Std 1003.1-2001 is 4096 bytes and the  
 40850 minimum value allowed by this volume of IEEE Std 1003.1-2001 is 2048 bytes; therefore, the  
 40851 2048 bytes difference seems reasonable. Note, however, that *xargs* may never be able to invoke a  
 40852 utility if the environment passed in to *xargs* comes close to using {ARG\_MAX} bytes.

40853 The version of *xargs* required by this volume of IEEE Std 1003.1-2001 is required to wait for the  
 40854 completion of the invoked command before invoking another command. This was done because  
 40855 historical scripts using *xargs* assumed sequential execution. Implementations wanting to provide  
 40856 parallel operation of the invoked utilities are encouraged to add an option enabling parallel  
 40857 invocation, but should still wait for termination of all of the children before *xargs* terminates  
 40858 normally.

The **-e** option was omitted from the ISO POSIX-2:1993 standard in the belief that the *eofstr* option-argument was recognized only when it was on a line by itself and before quote and escape processing were performed, and that the logical end-of-file processing was only enabled if a **-e** option was specified. In that case, a simple *sed* script could be used to duplicate the **-e** functionality. Further investigation revealed that:

- The logical end-of-file string was checked for after quote and escape processing, making a *sed* script that provided equivalent functionality much more difficult to write.
- The default was to perform logical end-of-file processing with an underscore as the logical end-of-file string.

To correct this misunderstanding, the **-E eofstr** option was adopted from the X/Open Portability Guide. Users should note that the description of the **-E** option matches historical documentation of the **-e** option (which was not adopted because it did not support the Utility Syntax Guidelines), by saying that if *eofstr* is the null string, logical end-of-file processing is disabled. Historical implementations of *xargs* actually did not disable logical end-of-file processing; they treated a null argument found in the input as a logical end-of-file string. (A null *string* argument could be generated using single or double quotes ( ' ' or " "). Since this behavior was not documented historically, it is considered to be a bug.

#### **FUTURE DIRECTIONS**

None.

#### **SEE ALSO**

Chapter 2 (on page 29), *echo*, *find*, the System Interfaces volume of IEEE Std 1003.1-2001, *exec*

#### **CHANGE HISTORY**

First released in Issue 2.

#### **Issue 5**

A second FUTURE DIRECTION is added.

#### **Issue 6**

The obsolescent **-e**, **-i**, and **-l** options are removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The **-p** option is added.
- In the INPUT FILES section, the file **/dev/tty** is used to read responses required by the **-p** option.
- The STDERR section is updated to describe the **-p** option.

The description of the **-E** option is aligned with the ISO POSIX-2: 1993 standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

40894 **NAME**40895 yacc — yet another compiler compiler (**DEVELOPMENT**)40896 **SYNOPSIS**40897 CD yacc [-dltv] [-b *file\_prefix*] [-p *sym\_prefix*] *grammar*

40898

40899 **DESCRIPTION**

40900 The *yacc* utility shall read a description of a context-free grammar in *grammar* and write C source  
 40901 code, conforming to the ISO C standard, to a code file, and optionally header information into a  
 40902 header file, in the current directory. The C code shall define a function and related routines and  
 40903 macros for an automaton that executes a parsing algorithm meeting the requirements in  
 40904 **Algorithms** (on page 1074).

40905 The form and meaning of the grammar are described in the EXTENDED DESCRIPTION section.

40906 The C source code and header file shall be produced in a form suitable as input for the C  
 40907 compiler (see *c99*).

40908 **OPTIONS**

40909 The *yacc* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 40910 12.2, Utility Syntax Guidelines.

40911 The following options shall be supported:

40912 **-b** *file\_prefix* Use *file\_prefix* instead of **y** as the prefix for all output filenames. The code file  
 40913 **y.tab.c**, the header file **y.tab.h** (created when **-d** is specified), and the description  
 40914 file **y.output** (created when **-v** is specified), shall be changed to *file\_prefix.tab.c*,  
 40915 *file\_prefix.tab.h*, and *file\_prefix.output*, respectively.

40916 **-d** Write the header file; by default only the code file is written. The **#define**  
 40917 statements associate the token codes assigned by *yacc* with the user-declared token  
 40918 names. This allows source files other than **y.tab.c** to access the token codes.

40919 **-l** Produce a code file that does not contain any **#line** constructs. If this option is not  
 40920 present, it is unspecified whether the code file or header file contains **#line**  
 40921 directives. This should only be used after the grammar and the associated actions  
 40922 are fully debugged.

40923 **-p** *sym\_prefix* Use *sym\_prefix* instead of **yy** as the prefix for all external names produced by *yacc*.  
 40924 The names affected shall include the functions *yyparse()*, *yylex()*, and *yyerror()*,  
 40925 and the variables *yyval*, *yychar*, and *yydebug*. (In the remainder of this section, the  
 40926 six symbols cited are referenced using their default names only as a notational  
 40927 convenience.) Local names may also be affected by the **-p** option; however, the **-p**  
 40928 option shall not affect **#define** symbols generated by *yacc*.  
 40929

40930 **-t** Modify conditional compilation directives to permit compilation of debugging  
 40931 code in the code file. Runtime debugging statements shall always be contained in  
 40932 the code file, but by default conditional compilation directives prevent their  
 40933 compilation.

40934 **-v** Write a file containing a description of the parser and a report of conflicts  
 40935 generated by ambiguities in the grammar.

40936 **OPERANDS**

40937 The following operand is required:

40938 *grammar* A pathname of a file containing instructions, hereafter called *grammar*, for which a  
 40939 parser is to be created. The format for the grammar is described in the EXTENDED  
 40940 DESCRIPTION section.

40941 **STDIN**

40942 Not used.

40943 **INPUT FILES**

40944 The file *grammar* shall be a text file formatted as specified in the EXTENDED DESCRIPTION  
 40945 section.

40946 **ENVIRONMENT VARIABLES**40947 The following environment variables shall affect the execution of *yacc*:

40948 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 40949 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 40950 Internationalization Variables for the precedence of internationalization variables  
 40951 used to determine the values of locale categories.)

40952 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 40953 internationalization variables.

40954 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 40955 characters (for example, single-byte as opposed to multi-byte characters in  
 40956 arguments and input files).

40957 *LC\_MESSAGES*

40958 Determine the locale that should be used to affect the format and contents of  
 40959 diagnostic messages written to standard error.

40960 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

40961 The *LANG* and *LC\_\** variables affect the execution of the *yacc* utility as stated. The *main()*  
 40962 function defined in **Yacc Library** (on page 1074) shall call:

40963 `setlocale(LC_ALL, "")`

40964 and thus the program generated by *yacc* shall also be affected by the contents of these variables  
 40965 at runtime.

40966 **ASYNCHRONOUS EVENTS**

40967 Default.

40968 **STDOUT**

40969 Not used.

40970 **STDERR**

40971 If shift/reduce or reduce/reduce conflicts are detected in *grammar*, *yacc* shall write a report of  
 40972 those conflicts to the standard error in an unspecified format.

40973 Standard error shall also be used for diagnostic messages.

40974 **OUTPUT FILES**

40975 The code file, the header file, and the description file shall be text files. All are described in the  
 40976 following sections.

**40977 Code File**

40978 This file shall contain the C source code for the `yyparse()` function. It shall contain code for the  
40979 various semantic actions with macro substitution performed on them as described in the  
40980 EXTENDED DESCRIPTION section. It also shall contain a copy of the **#define** statements in the  
40981 header file. If a **%union** declaration is used, the declaration for YYSTYPE shall also be included  
40982 in this file.

**40983 Header File**

40984 The header file shall contain **#define** statements that associate the token numbers with the token  
40985 names. This allows source files other than the code file to access the token codes. If a **%union**  
40986 declaration is used, the declaration for YYSTYPE and an *extern YYSTYPE yylval* declaration shall  
40987 also be included in this file.

**40988 Description File**

40989 The description file shall be a text file containing a description of the state machine  
40990 corresponding to the parser, using an unspecified format. Limits for internal tables (see **Limits**  
40991 (on page 1075)) shall also be reported, in an implementation-defined manner. (Some  
40992 implementations may use dynamic allocation techniques and have no specific limit values to  
40993 report.)

**40994 EXTENDED DESCRIPTION**

40995 The `yacc` command accepts a language that is used to define a grammar for a target language to  
40996 be parsed by the tables and code generated by `yacc`. The language accepted by `yacc` as a  
40997 grammar for the target language is described below using the `yacc` input language itself.

40998 The input *grammar* includes rules describing the input structure of the target language and code  
40999 to be invoked when these rules are recognized to provide the associated semantic action. The  
41000 code to be executed shall appear as bodies of text that are intended to be C-language code. The  
41001 C-language inclusions are presumed to form a correct function when processed by `yacc` into its  
41002 output files. The code included in this way shall be executed during the recognition of the target  
41003 language.

41004 Given a grammar, the `yacc` utility generates the files described in the OUTPUT FILES section.  
41005 The code file can be compiled and linked using `c99`. If the declaration and programs sections of  
41006 the grammar file did not include definitions of `main()`, `yylex()`, and `yyerror()`, the compiled  
41007 output requires linking with externally supplied versions of those functions. Default versions of  
41008 `main()` and `yyerror()` are supplied in the `yacc` library and can be linked in by using the **-ly**  
41009 operand to `c99`. The `yacc` library interfaces need not support interfaces with other than the  
41010 default **yy** symbol prefix. The application provides the lexical analyzer function, `yylex()`; the *lex*  
41011 utility is specifically designed to generate such a routine.

**41012 Input Language**

41013 The application shall ensure that every specification file consists of three sections in order:  
41014 *declarations*, *grammar rules*, and *programs*, separated by double percent signs ("%"). The  
41015 declarations and programs sections can be empty. If the latter is empty, the preceding "%"   
41016 mark separating it from the rules section can be omitted.

41017 The input is free form text following the structure of the grammar defined below.

## Lexical Structure of the Grammar

The <blank>s, <newline>s, and <form-feed>s shall be ignored, except that the application shall ensure that they do not appear in names or multi-character reserved symbols. Comments shall be enclosed in `"/ * . . . */`, and can appear wherever a name is valid.

Names are of arbitrary length, made up of letters, periods (`'.'`), underscores (`'_'`), and non-initial digits. Uppercase and lowercase letters are distinct. Conforming applications shall not use names beginning in **yy** or **YY** since the *yacc* parser uses such names. Many of the names appear in the final output of *yacc*, and thus they should be chosen to conform with any additional rules created by the C compiler to be used. In particular they appear in **#define** statements.

A literal shall consist of a single character enclosed in single-quotes (`' '`). All of the escape sequences supported for character constants by the ISO C standard shall be supported by *yacc*.

The relationship with the lexical analyzer is discussed in detail below.

The application shall ensure that the NUL character is not used in grammar rules or literals.

## Declarations Section

The declarations section is used to define the symbols used to define the target language and their relationship with each other. In particular, much of the additional information required to resolve ambiguities in the context-free grammar for the target language is provided here.

Usually *yacc* assigns the relationship between the symbolic names it generates and their underlying numeric value. The declarations section makes it possible to control the assignment of these values.

It is also possible to keep semantic information associated with the tokens currently on the parse stack in a user-defined C-language **union**, if the members of the union are associated with the various names in the grammar. The declarations section provides for this as well.

The first group of declarators below all take a list of names as arguments. That list can optionally be preceded by the name of a C union member (called a *tag* below) appearing within `'<'` and `'>'`. (As an exception to the typographical conventions of the rest of this volume of IEEE Std 1003.1-2001, in this case `<tag>` does not represent a metavariable, but the literal angle bracket characters surrounding a symbol.) The use of *tag* specifies that the tokens named on this line shall be of the same C type as the union member referenced by *tag*. This is discussed in more detail below.

For lists used to define tokens, the first appearance of a given token can be followed by a positive integer (as a string of decimal digits). If this is done, the underlying value assigned to it for lexical purposes shall be taken to be that number.

The following declares *name* to be a token:

```
%token [<tag>] name [number] [name [number]] . . .
```

If *tag* is present, the C type for all tokens on this line shall be declared to be the type referenced by *tag*. If a positive integer, *number*, follows a *name*, that value shall be assigned to the token.

The following declares *name* to be a token, and assigns precedence to it:

```
%left [<tag>] name [number] [name [number]] . . .
```

```
%right [<tag>] name [number] [name [number]] . . .
```

One or more lines, each beginning with one of these symbols, can appear in this section. All tokens on the same line have the same precedence level and associativity; the lines are in order

41061 of increasing precedence or binding strength. **%left** denotes that the operators on that line are  
 41062 left associative, and **%right** similarly denotes right associative operators. If *tag* is present, it shall  
 41063 declare a C type for *names* as described for **%token**.

41064 The following declares *name* to be a token, and indicates that this cannot be used associatively:

41065 `%nonassoc [<tag>] name [number] [name [number]] ...`

41066 If the parser encounters associative use of this token it reports an error. If *tag* is present, it shall  
 41067 declare a C type for *names* as described for **%token**.

41068 The following declares that union member *names* are non-terminals, and thus it is required to  
 41069 have a *tag* field at its beginning:

41070 `%type <tag> name...`

41071 Because it deals with non-terminals only, assigning a token number or using a literal is also  
 41072 prohibited. If this construct is present, *yacc* shall perform type checking; if this construct is not  
 41073 present, the parse stack shall hold only the **int** type.

41074 Every name used in *grammar* not defined by a **%token**, **%left**, **%right**, or **%nonassoc** declaration  
 41075 is assumed to represent a non-terminal symbol. The *yacc* utility shall report an error for any  
 41076 non-terminal symbol that does not appear on the left side of at least one grammar rule.

41077 Once the type, precedence, or token number of a name is specified, it shall not be changed. If the  
 41078 first declaration of a token does not assign a token number, *yacc* shall assign a token number.  
 41079 Once this assignment is made, the token number shall not be changed by explicit assignment.

41080 The following declarators do not follow the previous pattern.

41081 The following declares the non-terminal *name* to be the *start symbol*, which represents the largest,  
 41082 most general structure described by the grammar rules:

41083 `%start name`

41084 By default, it is the left-hand side of the first grammar rule; this default can be overridden with  
 41085 this declaration.

41086 The following declares the *yacc* value stack to be a union of the various types of values desired:

41087 `%union { body of union (in C) }`

41088 By default, the values returned by actions (see below) and the lexical analyzer shall be of type  
 41089 **int**. The *yacc* utility keeps track of types, and it shall insert corresponding union member names  
 41090 in order to perform strict type checking of the resulting parser.

41091 Alternatively, given that at least one *<tag>* construct is used, the union can be declared in a  
 41092 header file (which shall be included in the declarations section by using a **#include** construct  
 41093 within **%{** and **%}**), and a **typedef** used to define the symbol YYSTYPE to represent this union.  
 41094 The effect of **%union** is to provide the declaration of YYSTYPE directly from the *yacc* input.

41095 C-language declarations and definitions can appear in the declarations section, enclosed by the  
 41096 following marks:

41097 `%{ ... %}`

41098 These statements shall be copied into the code file, and have global scope within it so that they  
 41099 can be used in the rules and program sections.

41100 The application shall ensure that the declarations section is terminated by the token **%%**.

41101 **Grammar Rules in yacc**

41102 The rules section defines the context-free grammar to be accepted by the function *yacc* generates,  
 41103 and associates with those rules C-language actions and additional precedence information. The  
 41104 grammar is described below, and a formal definition follows.

41105 The rules section is comprised of one or more grammar rules. A grammar rule has the form:

41106 **A** : BODY ;

41107 The symbol **A** represents a non-terminal name, and **BODY** represents a sequence of zero or  
 41108 more *names*, *literals*, and *semantic actions* that can then be followed by optional *precedence rules*.  
 41109 Only the names and literals participate in the formation of the grammar; the semantic actions  
 41110 and precedence rules are used in other ways. The colon and the semicolon are *yacc* punctuation.  
 41111 If there are several successive grammar rules with the same left-hand side, the vertical bar ' | '   
 41112 can be used to avoid rewriting the left-hand side; in this case the semicolon appears only after  
 41113 the last rule. The BODY part can be empty (or empty of names and literals) to indicate that the  
 41114 non-terminal symbol matches the empty string.

41115 The *yacc* utility assigns a unique number to each rule. Rules using the vertical bar notation are  
 41116 distinct rules. The number assigned to the rule appears in the description file.

41117 The elements comprising a BODY are:

41118 *name, literal* These form the rules of the grammar: *name* is either a *token* or a *non-terminal*; *literal*  
 41119 stands for itself (less the lexically required quotation marks).

41120 *semantic action*

41121 With each grammar rule, the user can associate actions to be performed each time  
 41122 the rule is recognized in the input process. (Note that the word "action" can also  
 41123 refer to the actions of the parser—shift, reduce, and so on.)

41124 These actions can return values and can obtain the values returned by previous  
 41125 actions. These values are kept in objects of type YYSTYPE (see **%union**). The  
 41126 result value of the action shall be kept on the parse stack with the left-hand side of  
 41127 the rule, to be accessed by other reductions as part of their right-hand side. By  
 41128 using the *<tag>* information provided in the declarations section, the code  
 41129 generated by *yacc* can be strictly type checked and contain arbitrary information. In  
 41130 addition, the lexical analyzer can provide the same kinds of values for tokens, if  
 41131 desired.

41132 An action is an arbitrary C statement and as such can do input or output, call  
 41133 subprograms, and alter external variables. An action is one or more C statements  
 41134 enclosed in curly braces ' { ' and ' } '.

41135 Certain pseudo-variables can be used in the action. These are macros for access to  
 41136 data structures known internally to *yacc*.

41137 **\$\$** The value of the action can be set by assigning it to **\$\$**. If type  
 41138 checking is enabled and the type of the value to be assigned cannot  
 41139 be determined, a diagnostic message may be generated.

41140 **\$number** This refers to the value returned by the component specified by the  
 41141 token *number* in the right side of a rule, reading from left to right;  
 41142 *number* can be zero or negative. If *number* is zero or negative, it refers  
 41143 to the data associated with the name on the parser's stack preceding  
 41144 the leftmost symbol of the current rule. (That is, "\$0" refers to the  
 41145 name immediately preceding the leftmost name in the current rule to  
 41146 be found on the parser's stack and "\$-1" refers to the symbol to *its*

|       |                                  |                                                                                                               |
|-------|----------------------------------|---------------------------------------------------------------------------------------------------------------|
| 41147 |                                  | left.) If <i>number</i> refers to an element past the current point in the rule,                              |
| 41148 |                                  | or beyond the bottom of the stack, the result is undefined. If type                                           |
| 41149 |                                  | checking is enabled and the type of the value to be assigned cannot                                           |
| 41150 |                                  | be determined, a diagnostic message may be generated.                                                         |
| 41151 | <code>\$&lt;tag&gt;number</code> |                                                                                                               |
| 41152 |                                  | These correspond exactly to the corresponding symbols without the                                             |
| 41153 |                                  | <i>tag</i> inclusion, but allow for strict type checking (and preclude                                        |
| 41154 |                                  | unwanted type conversions). The effect is that the macro is expanded                                          |
| 41155 |                                  | to use <i>tag</i> to select an element from the YYSTYPE union (using                                          |
| 41156 |                                  | <i>dataname.tag</i> ). This is particularly useful if <i>number</i> is not positive.                          |
| 41157 | <code>\$&lt;tag&gt;\$</code>     |                                                                                                               |
| 41158 |                                  | This imposes on the reference the type of the union member                                                    |
| 41159 |                                  | referenced by <i>tag</i> . This construction is applicable when a reference                                   |
| 41160 |                                  | to a left context value occurs in the grammar, and provides yacc with                                         |
|       |                                  | a means for selecting a type.                                                                                 |
| 41161 |                                  | Actions can occur anywhere in a rule (not just at the end); an action can access                              |
| 41162 |                                  | values returned by actions to its left, and in turn the value it returns can be                               |
| 41163 |                                  | accessed by actions to its right. An action appearing in the middle of a rule shall be                        |
| 41164 |                                  | equivalent to replacing the action with a new non-terminal symbol and adding an                               |
| 41165 |                                  | empty rule with that non-terminal symbol on the left-hand side. The semantic                                  |
| 41166 |                                  | action associated with the new rule shall be equivalent to the original action. The                           |
| 41167 |                                  | use of actions within rules might introduce conflicts that would not otherwise                                |
| 41168 |                                  | exist.                                                                                                        |
| 41169 |                                  | By default, the value of a rule shall be the value of the first element in it. If the first                   |
| 41170 |                                  | element does not have a type (particularly in the case of a literal) and type                                 |
| 41171 |                                  | checking is turned on by <b>%type</b> , an error message shall result.                                        |
| 41172 | <i>precedence</i>                |                                                                                                               |
| 41173 |                                  | The keyword <b>%prec</b> can be used to change the precedence level associated with a                         |
| 41174 |                                  | particular grammar rule. Examples of this are in cases where a unary and binary                               |
| 41175 |                                  | operator have the same symbolic representation, but need to be given different                                |
| 41176 |                                  | precedences, or where the handling of an ambiguous if-else construction is                                    |
| 41177 |                                  | necessary. The reserved symbol <b>%prec</b> can appear immediately after the body of                          |
| 41178 |                                  | the grammar rule and can be followed by a token name or a literal. It shall cause                             |
| 41179 |                                  | the precedence of the grammar rule to become that of the following token name or                              |
|       |                                  | literal. The action for the rule as a whole can follow <b>%prec</b> .                                         |
| 41180 |                                  | If a program section follows, the application shall ensure that the grammar rules are terminated              |
| 41181 |                                  | by <b>%%</b> .                                                                                                |
| 41182 | <b>Programs Section</b>          |                                                                                                               |
| 41183 |                                  | The <i>programs</i> section can include the definition of the lexical analyzer <i>yylex()</i> , and any other |
| 41184 |                                  | functions; for example, those used in the actions specified in the grammar rules. It is unspecified           |
| 41185 |                                  | whether the programs section precedes or follows the semantic actions in the output file;                     |
| 41186 |                                  | therefore, if the application contains any macro definitions and declarations intended to apply to            |
| 41187 |                                  | the code in the semantic actions, it shall place them within " <b>%{ . . . %}</b> " in the declarations       |
| 41188 |                                  | section.                                                                                                      |

41189 **Input Grammar**

41190 The following input to *yacc* yields a parser for the input to *yacc*. This formal syntax takes  
 41191 precedence over the preceding text syntax description.

41192 The lexical structure is defined less precisely; **Lexical Structure of the Grammar** (on page 1066)  
 41193 defines most terms. The correspondence between the previous terms and the tokens below is as  
 41194 follows.

41195 **IDENTIFIER** This corresponds to the concept of *name*, given previously. It also includes  
 41196 literals as defined previously.

41197 **C\_IDENTIFIER** This is a name, and additionally it is known to be followed by a colon. A literal  
 41198 cannot yield this token.

41199 **NUMBER** A string of digits (a non-negative decimal integer).

41200 **TYPE, LEFT, MARK, LCURL, RCURL**

41201 These correspond directly to **%type**, **%left**, **%%**, **%{**, and **%}**.

41202 **{...}** This indicates C-language source code, with the possible inclusion of '\$'  
 41203 macros as discussed previously.

```

41204 /* Grammar for the input to yacc. */
41205 /* Basic entries. */
41206 /* The following are recognized by the lexical analyzer. */

41207 %token IDENTIFIER /* Includes identifiers and literals */
41208 %token C_IDENTIFIER /* identifier (but not literal)
41209 followed by a :: */
41210 %token NUMBER /* [0-9][0-9]* */

41211 /* Reserved words : %type=>TYPE %left=>LEFT, and so on */
41212 %token LEFT RIGHT NONASSOC TOKEN PREC TYPE START UNION

41213 %token MARK /* The %% mark. */
41214 %token LCURL /* The %{ mark. */
41215 %token RCURL /* The %} mark. */

41216 /* 8-bit character literals stand for themselves; */
41217 /* tokens have to be defined for multi-byte characters. */
