14759 [EOVERFLOW] One of the values is too large to store into the structure pointed to by the *buf*
 14760 argument.

14761 **EXAMPLES**14762 **Obtaining File Status Information**

14763 The following example shows how to obtain file status information for a file named
 14764 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure. The
 14765 **/home/cnd/mod1** file is opened with read/write privileges and is passed to the open file
 14766 descriptor *fildes*.

```
14767 #include <sys/types.h>
14768 #include <sys/stat.h>
14769 #include <fcntl.h>

14770 struct stat buffer;
14771 int      status;
14772 ...
14773 fildes = open("/home/cnd/mod1", O_RDWR);
14774 status = fstat(fildes, &buffer);
```

14775 **APPLICATION USAGE**

14776 None.

14777 **RATIONALE**

14778 None.

14779 **FUTURE DIRECTIONS**

14780 None.

14781 **SEE ALSO**

14782 *lstat()*, *stat()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/stat.h>**, **<sys/types.h>**

14783 **CHANGE HISTORY**

14784 First released in Issue 1. Derived from Issue 1 of the SVID.

14785 **Issue 5**

14786 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

14787 Large File Summit extensions are added.

14788 **Issue 6**

14789 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

14790 The following new requirements on POSIX implementations derive from alignment with the
 14791 Single UNIX Specification:

- 14792 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 14793 required for conforming implementations of previous POSIX specifications, it was not
 14794 required for UNIX applications.
- 14795 • The [EIO] mandatory error condition is added.
- 14796 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
 14797 files.
- 14798 • The [EOVERFLOW] optional error condition is added.

14799 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 14800 shared memory object semantics apply to typed memory objects.

14801 **NAME**

14802 fstatvfs, statvfs — get file system information

14803 **SYNOPSIS**

14804 xSI #include <sys/statvfs.h>

14805 int fstatvfs(int *fildes*, struct statvfs **buf*);14806 int statvfs(const char *restrict *path*, struct statvfs *restrict *buf*);

14807

14808 **DESCRIPTION**14809 The *fstatvfs()* function shall obtain information about the file system containing the file
14810 referenced by *fildes*.14811 The *statvfs()* function shall obtain information about the file system containing the file named by
14812 *path*.14813 For both functions, the *buf* argument is a pointer to a **statvfs** structure that shall be filled. Read,
14814 write, or execute permission of the named file is not required.14815 The following flags can be returned in the *f_flag* member:

14816 ST_RDONLY Read-only file system.

14817 ST_NOSUID Setuid/setgid bits ignored by *exec*.14818 It is unspecified whether all members of the **statvfs** structure have meaningful values on all file
14819 systems.14820 **RETURN VALUE**14821 Upon successful completion, *statvfs()* shall return 0. Otherwise, it shall return -1 and set *errno* to
14822 indicate the error.14823 **ERRORS**14824 The *fstatvfs()* and *statvfs()* functions shall fail if:

14825 [EIO] An I/O error occurred while reading the file system.

14826 [EINTR] A signal was caught during execution of the function.

14827 [EOVERFLOW] One of the values to be returned cannot be represented correctly in the
14828 structure pointed to by *buf*.14829 The *fstatvfs()* function shall fail if:14830 [EBADF] The *fildes* argument is not an open file descriptor.14831 The *statvfs()* function shall fail if:

14832 [EACCES] Search permission is denied on a component of the path prefix.

14833 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
14834 argument.

14835 [ENAMETOOLONG]

14836 The length of a pathname exceeds {PATH_MAX} or a pathname component is
14837 longer than {NAME_MAX}.14838 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.14839 [ENOTDIR] A component of the path prefix of *path* is not a directory.

14840 The *statvfs()* function may fail if:

14841 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
14842 resolution of the *path* argument.

14843 [ENAMETOOLONG]

14844 Pathname resolution of a symbolic link produced an intermediate result
14845 whose length exceeds {PATH_MAX}.

14846 EXAMPLES

14847 Obtaining File System Information Using *fstatvfs()*

14848 The following example shows how to obtain file system information for the file system upon
14849 which the file named **/home/cnd/mod1** resides, using the *fstatvfs()* function. The
14850 **/home/cnd/mod1** file is opened with read/write privileges and the open file descriptor is passed
14851 to the *fstatvfs()* function.

```
14852 #include <statvfs.h>
```

```
14853 #include <fcntl.h>
```

```
14854 struct statvfs buffer;
```

```
14855 int status;
```

```
14856 ...
```

```
14857 fildes = open("/home/cnd/mod1", O_RDWR);
```

```
14858 status = fstatvfs(fildes, &buffer);
```

14859 Obtaining File System Information Using *statvfs()*

14860 The following example shows how to obtain file system information for the file system upon
14861 which the file named **/home/cnd/mod1** resides, using the *statvfs()* function.

```
14862 #include <statvfs.h>
```

```
14863 struct statvfs buffer;
```

```
14864 int status;
```

```
14865 ...
```

```
14866 status = statvfs("/home/cnd/mod1", &buffer);
```

14867 APPLICATION USAGE

14868 None.

14869 RATIONALE

14870 None.

14871 FUTURE DIRECTIONS

14872 None.

14873 SEE ALSO

14876 CHANGE HISTORY

14877 First released in Issue 4, Version 2.

14878 Issue 5

14879 Moved from X/OPEN UNIX extension to BASE.

14880 Large File Summit extensions are added.

14881 **Issue 6**

- 14882 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 14883 The **restrict** keyword is added to the *statvfs()* prototype for alignment with the
- 14884 ISO/IEC 9899:1999 standard.
- 14885 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
- 14886 [ELOOP] error condition is added.

14887 **NAME**

14888 fsync — synchronize changes to a file

14889 **SYNOPSIS**14890 FSC `#include <unistd.h>`14891 `int fsync(int fildes);`

14892

14893 **DESCRIPTION**

14894 The *fsync()* function shall request that all data for the open file descriptor named by *fil*des is to be
 14895 transferred to the storage device associated with the file described by *fil*des in an
 14896 implementation-defined manner. The *fsync()* function shall not return until the system has
 14897 completed that action or until an error is detected.

14898 SIO If `_POSIX_SYNCHRONIZED_IO` is defined, the *fsync()* function shall force all currently queued
 14899 I/O operations associated with the file indicated by file descriptor *fil*des to the synchronized I/O
 14900 completion state. All I/O operations shall be completed as defined for synchronized I/O file
 14901 integrity completion.

14902 **RETURN VALUE**

14903 Upon successful completion, *fsync()* shall return 0. Otherwise, `-1` shall be returned and *errno* set
 14904 to indicate the error. If the *fsync()* function fails, outstanding I/O operations are not guaranteed
 14905 to have been completed.

14906 **ERRORS**14907 The *fsync()* function shall fail if:14908 [EBADF] The *fil*des argument is not a valid descriptor.14909 [EINTR] The *fsync()* function was interrupted by a signal.14910 [EINVAL] The *fil*des argument does not refer to a file on which this operation is possible.

14911 [EIO] An I/O error occurred while reading from or writing to the file system.

14912 In the event that any of the queued I/O operations fail, *fsync()* shall return the error conditions
 14913 defined for *read()* and *write()*.

14914 **EXAMPLES**

14915 None.

14916 **APPLICATION USAGE**

14917 The *fsync()* function should be used by programs which require modifications to a file to be
 14918 completed before continuing; for example, a program which contains a simple transaction
 14919 facility might use it to ensure that all modifications to a file or files caused by a transaction are
 14920 recorded.

14921 **RATIONALE**

14922 The *fsync()* function is intended to force a physical write of data from the buffer cache, and to
 14923 assure that after a system crash or other failure that all data up to the time of the *fsync()* call is
 14924 recorded on the disk. Since the concepts of “buffer cache”, “system crash”, “physical write”, and
 14925 “non-volatile storage” are not defined here, the wording has to be more abstract.

14926 If `_POSIX_SYNCHRONIZED_IO` is not defined, the wording relies heavily on the conformance
 14927 document to tell the user what can be expected from the system. It is explicitly intended that a
 14928 null implementation is permitted. This could be valid in the case where the system cannot assure
 14929 non-volatile storage under any circumstances or when the system is highly fault-tolerant and the
 14930 functionality is not required. In the middle ground between these extremes, *fsync()* might or
 14931 might not actually cause data to be written where it is safe from a power failure. The

14932 conformance document should identify at least that one configuration exists (and how to obtain
14933 that configuration) where this can be assured for at least some files that the user can select to use
14934 for critical data. It is not intended that an exhaustive list is required, but rather sufficient
14935 information is provided so that if critical data needs to be saved, the user can determine how the
14936 system is to be configured to allow the data to be written to non-volatile storage.

14937 It is reasonable to assert that the key aspects of *fsync()* are unreasonable to test in a test suite.
14938 That does not make the function any less valuable, just more difficult to test. A formal
14939 conformance test should probably force a system crash (power shutdown) during the test for
14940 this condition, but it needs to be done in such a way that automated testing does not require this
14941 to be done except when a formal record of the results is being made. It would also not be
14942 unreasonable to omit testing for *fsync()*, allowing it to be treated as a quality-of-implementation
14943 issue.

14944 **FUTURE DIRECTIONS**

14945 None.

14946 **SEE ALSO**

14947 *sync()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

14948 **CHANGE HISTORY**

14949 First released in Issue 3.

14950 **Issue 5**

14951 Aligned with *fsync()* in the POSIX Realtime Extension. Specifically, the DESCRIPTION and
14952 RETURN VALUE sections are much expanded, and the ERRORS section is updated to indicate
14953 that *fsync()* can return the error conditions defined for *read()* and *write()*.

14954 **Issue 6**

14955 This function is marked as part of the File Synchronization option.

14956 The following new requirements on POSIX implementations derive from alignment with the
14957 Single UNIX Specification:

- 14958 • The [EINVAL] and [EIO] mandatory error conditions are added.

14959 **NAME**

14960 ftell, ftello — return a file offset in a stream

14961 **SYNOPSIS**

14962 #include <stdio.h>

14963 long ftell(FILE *stream);

14964 CX off_t ftello(FILE *stream);

14965

14966 **DESCRIPTION**

14967 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14968 conflict between the requirements described here and the ISO C standard is unintentional. This
 14969 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14970 The *ftell()* function shall obtain the current value of the file-position indicator for the stream
 14971 pointed to by *stream*.

14972 CX The *ftello()* function shall be equivalent to *ftell()*, except that the return value is of type **off_t**.

14973 **RETURN VALUE**

14974 CX Upon successful completion, *ftell()* and *ftello()* shall return the current value of the file-position
 14975 indicator for the stream measured in bytes from the beginning of the file.

14976 CX Otherwise, *ftell()* and *ftello()* shall return -1 , cast to **long** and **off_t** respectively, and set *errno* to
 14977 indicate the error.

14978 **ERRORS**

14979 CX The *ftell()* and *ftello()* functions shall fail if:

14980 CX [EBADF] The file descriptor underlying *stream* is not an open file descriptor.

14981 CX [EOVERFLOW] For *ftell()*, the current file offset cannot be represented correctly in an object of
 14982 type **long**.

14983 CX [EOVERFLOW] For *ftello()*, the current file offset cannot be represented correctly in an object
 14984 of type **off_t**.

14985 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

14986 The *ftell()* function may fail if:

14987 CX [ESPIPE] The file descriptor underlying *stream* is associated with a socket.

14988 **EXAMPLES**

14989 None.

14990 **APPLICATION USAGE**

14991 None.

14992 **RATIONALE**

14993 None.

14994 **FUTURE DIRECTIONS**

14995 None.

14996 **SEE ALSO**

14997 *fgetpos()*, *fopen()*, *fseek()*, *lseek()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

14998 **CHANGE HISTORY**

14999 First released in Issue 1. Derived from Issue 1 of the SVID.

15000 **Issue 5**

15001 Large File Summit extensions are added.

15002 **Issue 6**

15003 Extensions beyond the ISO C standard are marked.

15004 The following new requirements on POSIX implementations derive from alignment with the
15005 Single UNIX Specification:

- 15006 • The *ftello()* function is added.
- 15007 • The [EOVERFLOW] error conditions are added.

15008 An additional [ESPIPE] error condition is added for sockets.

15009 NAME

15010 ftime — get date and time (**LEGACY**)

15011 SYNOPSIS

15012 xSI `#include <sys/timeb.h>`

15013 `int ftime(struct timeb *tp);`

15014

15015 DESCRIPTION

15016 The *ftime()* function shall set the *time* and *millitm* members of the **timeb** structure pointed to by
15017 *tp* to contain the seconds and milliseconds portions, respectively, of the current time in seconds
15018 since the Epoch. The contents of the *timezone* and *dstflag* members of *tp* after a call to *ftime()* are
15019 unspecified.

15020 The system clock need not have millisecond granularity. Depending on any granularity
15021 (particularly a granularity of one) renders code non-portable.

15022 RETURN VALUE

15023 Upon successful completion, the *ftime()* function shall return 0; otherwise, -1 shall be returned.

15024 ERRORS

15025 No errors are defined.

15026 EXAMPLES

15027 Getting the Current Time and Date

15028 The following example shows how to get the current system time values using the *ftime()*
15029 function. The **timeb** structure pointed to by *tp* is filled with the current system time values for
15030 *time* and *millitm*.

15031 `#include <sys/timeb.h>`

15032 `struct timeb tp;`

15033 `int status;`

15034 `...`

15035 `status = ftime(&tp);`

15036 APPLICATION USAGE

15037 For applications portability, the *time()* function should be used to determine the current time
15038 instead of *ftime()*. Realtime applications should use *clock_gettime()* to determine the current
15039 time instead of *ftime()*.

15040 RATIONALE

15041 None.

15042 FUTURE DIRECTIONS

15043 This function may be withdrawn in a future version.

15044 SEE ALSO

15045 *clock_getres()*, *ctime()*, *gettimeofday()*, *time()*, the Base Definitions volume of
15046 IEEE Std 1003.1-2001, **<sys/timeb.h>**

15047 CHANGE HISTORY

15048 First released in Issue 4, Version 2.

15049 **Issue 5**

15050 Moved from X/OPEN UNIX extension to BASE.

15051 Normative text previously in the APPLICATION USAGE section is moved to the
15052 DESCRIPTION.

15053 **Issue 6**

15054 This function is marked LEGACY.

15055 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
15056 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
15057 functions.

15058 **NAME**

15059 ftok — generate an IPC key

15060 **SYNOPSIS**

15061 xSI #include <sys/ipc.h>

15062 key_t ftok(const char *path, int id);

15063

15064 **DESCRIPTION**

15065 The *ftok()* function shall return a key based on *path* and *id* that is usable in subsequent calls to
 15066 *msgget()*, *semget()*, and *shmget()*. The application shall ensure that the *path* argument is the
 15067 pathname of an existing file that the process is able to *stat()*.

15068 The *ftok()* function shall return the same key value for all paths that name the same file, when
 15069 called with the same *id* value, and return different key values when called with different *id*
 15070 values or with paths that name different files existing on the same file system at the same time. It
 15071 is unspecified whether *ftok()* shall return the same key value when called again after the file
 15072 named by *path* is removed and recreated with the same name.

15073 Only the low-order 8-bits of *id* are significant. The behavior of *ftok()* is unspecified if these bits
 15074 are 0.

15075 **RETURN VALUE**

15076 Upon successful completion, *ftok()* shall return a key. Otherwise, *ftok()* shall return **(key_t)−1**
 15077 and set *errno* to indicate the error.

15078 **ERRORS**15079 The *ftok()* function shall fail if:

15080 [EACCES] Search permission is denied for a component of the path prefix.

15081 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 15082 argument.

15083 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
 15084 component is longer than {NAME_MAX}.

15086 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

15087 [ENOTDIR] A component of the path prefix is not a directory.

15088 The *ftok()* function may fail if:

15089 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 15090 resolution of the *path* argument.

15091 [ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
 15092 whose length exceeds {PATH_MAX}.

15094 **EXAMPLES**15095 **Getting an IPC Key**

15096 The following example gets a unique key that can be used by the IPC functions *semget()*,
 15097 *msgget()*, and *shmget()*. The key returned by *ftok()* for this example is based on the ID value *S*
 15098 and the pathname */tmp*.

```
15099 #include <sys/ipc.h>
15100 ...
15101 key_t key;
15102 char *path = "/tmp";
15103 int id = 'S';
15104 key = ftok(path, id);
```

15105 **Saving an IPC Key**

15106 The following example gets a unique key based on the pathname */tmp* and the ID value *a*. It
 15107 also assigns the value of the resulting key to the *semkey* variable so that it will be available to a
 15108 later call to *semget()*, *msgget()*, or *shmget()*.

```
15109 #include <sys/ipc.h>
15110 ...
15111 key_t semkey;
15112 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
15113     perror("IPC error: ftok"); exit(1);
15114 }
```

15115 **APPLICATION USAGE**

15116 For maximum portability, *id* should be a single-byte character.

15117 **RATIONALE**

15118 None.

15119 **FUTURE DIRECTIONS**

15120 None.

15121 **SEE ALSO**

15122 *msgget()*, *semget()*, *shmget()*, the Base Definitions volume of IEEE Std 1003.1-2001, *<sys/ipc.h>*

15123 **CHANGE HISTORY**

15124 First released in Issue 4, Version 2.

15125 **Issue 5**

15126 Moved from X/OPEN UNIX extension to BASE.

15127 **Issue 6**

15128 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

15129 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 15130 [ELOOP] error condition is added.

15131 **NAME**

15132 ftruncate — truncate a file to a specified length

15133 **SYNOPSIS**

15134 #include <unistd.h>

15135 int ftruncate(int *fildes*, off_t *length*);15136 **DESCRIPTION**15137 If *fildes* is not a valid file descriptor open for writing, the *ftruncate()* function shall fail.

15138 If *fildes* refers to a regular file, the *ftruncate()* function shall cause the size of the file to be truncated to *length*. If the size of the file previously exceeded *length*, the extra data shall no longer be available to reads on the file. If the file previously was smaller than this size, *ftruncate()* shall either increase the size of the file or fail. XSI-conformant systems shall increase the size of the file. If the file size is increased, the extended area shall appear as if it were zero-filled. The value of the seek pointer shall not be modified by a call to *ftruncate()*.

15144 Upon successful completion, if *fildes* refers to a regular file, the *ftruncate()* function shall mark for update the *st_ctime* and *st_mtime* fields of the file and the S_ISUID and S_ISGID bits of the file mode may be cleared. If the *ftruncate()* function is unsuccessful, the file is unaffected.

15147 XSI If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

15149 If *fildes* refers to a directory, *ftruncate()* shall fail.15150 If *fildes* refers to any other file type, except a shared memory object, the result is unspecified.

15151 SHM If *fildes* refers to a shared memory object, *ftruncate()* shall set the size of the shared memory object to *length*.

15153 MF|SHM If the effect of *ftruncate()* is to decrease the size of a shared memory object or memory mapped file and whole pages beyond the new end were previously mapped, then the whole pages beyond the new end shall be discarded.

15156 MPR If the Memory Protection option is supported, references to discarded pages shall result in the generation of a SIGBUS signal; otherwise, the result of such references is undefined.

15158 MF|SHM If the effect of *ftruncate()* is to increase the size of a shared memory object, it is unspecified whether the contents of any mapped pages between the old end-of-file and the new are flushed to the underlying object.

15161 **RETURN VALUE**

15162 Upon successful completion, *ftruncate()* shall return 0; otherwise, -1 shall be returned and *errno* set to indicate the error.

15164 **ERRORS**15165 The *ftruncate()* function shall fail if:

15166 [EINTR] A signal was caught during execution.

15167 [EINVAL] The *length* argument was less than 0.

15168 [EFBIG] or [EINVAL]

15169 The *length* argument was greater than the maximum file size.

15170 XSI [EFBIG] The file is a regular file and *length* is greater than the offset maximum established in the open file description associated with *fildes*.

15172 [EIO] An I/O error occurred while reading from or writing to a file system.

15173 [EBADF] or [EINVAL]
 15174 The *filides* argument is not a file descriptor open for writing.
 15175 [EINVAL] The *filides* argument references a file that was opened without write
 15176 permission.
 15177 [EROFS] The named file resides on a read-only file system.

15178 EXAMPLES

15179 None.

15180 APPLICATION USAGE

15181 None.

15182 RATIONALE

15183 The *ftruncate()* function is part of IEEE Std 1003.1-2001 as it was deemed to be more useful than
 15184 *truncate()*. The *truncate()* function is provided as an XSI extension.

15185 FUTURE DIRECTIONS

15186 None.

15187 SEE ALSO

15188 *open()*, *truncate()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

15189 CHANGE HISTORY

15190 First released in Issue 4, Version 2.

15191 Issue 5

15192 Moved from X/OPEN UNIX extension to BASE and aligned with *ftruncate()* in the POSIX
 15193 Realtime Extension. Specifically, the DESCRIPTION is extensively reworded and [EROFS] is
 15194 added to the list of mandatory errors that can be returned by *ftruncate()*.

15195 Large File Summit extensions are added.

15196 Issue 6

15197 The *truncate()* function is split out into a separate reference page.

15198 The following new requirements on POSIX implementations derive from alignment with the
 15199 Single UNIX Specification:

- 15200 • The DESCRIPTION is changed to indicate that if the file size is changed, and if the file is a
 15201 regular file, the S_ISUID and S_ISGID bits in the file mode may be cleared.

15202 The following changes were made to align with the IEEE P1003.1a draft standard:

- 15203 • The DESCRIPTION text is updated.

15204 XSI-conformant systems are required to increase the size of the file if the file was previously
 15205 smaller than the size requested.

15206 **NAME**

15207 ftrylockfile — stdio locking functions

15208 **SYNOPSIS**

15209 TSF #include <stdio.h>

15210 int ftrylockfile(FILE *file);

15211

15212 **DESCRIPTION**

15213 Refer to *flockfile()*.

15214 **NAME**

15215 ftw — traverse (walk) a file tree

15216 **SYNOPSIS**15217 xSI `#include <ftw.h>`

```
15218 int ftw(const char *path, int (*fn)(const char *,
15219     const struct stat *ptr, int flag), int ndirs);
```

15220

15221 **DESCRIPTION**

15222 The *ftw()* function shall recursively descend the directory hierarchy rooted in *path*. For each
 15223 object in the hierarchy, *ftw()* shall call the function pointed to by *fn*, passing it a pointer to a
 15224 null-terminated character string containing the name of the object, a pointer to a **stat** structure
 15225 containing information about the object, and an integer. Possible values of the integer, defined
 15226 in the **<ftw.h>** header, are:

15227 FTW_D For a directory.

15228 FTW_DNR For a directory that cannot be read.

15229 FTW_F For a file.

15230 FTW_SL For a symbolic link (but see also FTW_NS below).

15231 FTW_NS For an object other than a symbolic link on which *stat()* could not successfully be
 15232 executed. If the object is a symbolic link and *stat()* failed, it is unspecified whether
 15233 *ftw()* passes FTW_SL or FTW_NS to the user-supplied function.

15234 If the integer is FTW_DNR, descendants of that directory shall not be processed. If the integer is
 15235 FTW_NS, the **stat** structure contains undefined values. An example of an object that would
 15236 cause FTW_NS to be passed to the function pointed to by *fn* would be a file in a directory with
 15237 read but without execute (search) permission.

15238 The *ftw()* function shall visit a directory before visiting any of its descendants.15239 The *ftw()* function shall use at most one file descriptor for each level in the tree.15240 The argument *ndirs* should be in the range [1,{OPEN_MAX}].

15241 The tree traversal shall continue until either the tree is exhausted, an invocation of *fn* returns a
 15242 non-zero value, or some error, other than [EACCES], is detected within *ftw()*.

15243 The *ndirs* argument shall specify the maximum number of directory streams or file descriptors
 15244 or both available for use by *ftw()* while traversing the tree. When *ftw()* returns it shall close any
 15245 directory streams and file descriptors it uses not counting any opened by the application-
 15246 supplied *fn* function.

15247 The results are unspecified if the application-supplied *fn* function does not preserve the current
 15248 working directory.

15249 The *ftw()* function need not be reentrant. A function that is not required to be reentrant is not
 15250 required to be thread-safe.

15251 **RETURN VALUE**

15252 If the tree is exhausted, *ftw()* shall return 0. If the function pointed to by *fn* returns a non-zero
 15253 value, *ftw()* shall stop its tree traversal and return whatever value was returned by the function
 15254 pointed to by *fn*. If *ftw()* detects an error, it shall return -1 and set *errno* to indicate the error.

15255 If *ftw()* encounters an error other than [EACCES] (see FTW_DNR and FTW_NS above), it shall
 15256 return -1 and set *errno* to indicate the error. The external variable *errno* may contain any error

15257 value that is possible when a directory is opened or when one of the *stat* functions is executed on
 15258 a directory or file.

15259 ERRORS

15260 The *ftw()* function shall fail if:

15261 [EACCES] Search permission is denied for any component of *path* or read permission is
 15262 denied for *path*.

15263 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 15264 argument.

15265 [ENAMETOOLONG]
 15266 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 15267 component is longer than {NAME_MAX}.

15268 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

15269 [ENOTDIR] A component of *path* is not a directory.

15270 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
 15271 programming environment for one or more files found in the file hierarchy.

15272 The *ftw()* function may fail if:

15273 [EINVAL] The value of the *ndirs* argument is invalid.

15274 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 15275 resolution of the *path* argument.

15276 [ENAMETOOLONG]
 15277 Pathname resolution of a symbolic link produced an intermediate result
 15278 whose length exceeds {PATH_MAX}.

15279 In addition, if the function pointed to by *fn* encounters system errors, *errno* may be set
 15280 accordingly.

15281 EXAMPLES

15282 Walking a Directory Structure

15283 The following example walks the current directory structure, calling the *fn* function for every
 15284 directory entry, using at most 10 file descriptors:

```
15285 #include <ftw.h>
15286 ...
15287 if (ftw(".", fn, 10) != 0) {
15288     perror("ftw"); exit(2);
15289 }
```

15290 APPLICATION USAGE

15291 The *ftw()* function may allocate dynamic storage during its operation. If *ftw()* is forcibly
 15292 terminated, such as by *longjmp()* or *siglongjmp()* being executed by the function pointed to by *fn*
 15293 or an interrupt routine, *ftw()* does not have a chance to free that storage, so it remains
 15294 permanently allocated. A safe way to handle interrupts is to store the fact that an interrupt has
 15295 occurred, and arrange to have the function pointed to by *fn* return a non-zero value at its next
 15296 invocation.

15297 **RATIONALE**

15298 None.

15299 **FUTURE DIRECTIONS**

15300 None.

15301 **SEE ALSO**

15302 *longjmp()*, *lstat()*, *malloc()*, *nftw()*, *opendir()*, *siglongjmp()*, *stat()*, the Base Definitions volume of
15303 IEEE Std 1003.1-2001, <**ftw.h**>, <**sys/stat.h**>

15304 **CHANGE HISTORY**

15305 First released in Issue 1. Derived from Issue 1 of the SVID.

15306 **Issue 5**

15307 UX codings in the DESCRIPTION, RETURN VALUE, and ERRORS sections are changed to EX.

15308 **Issue 6**

15309 The ERRORS section is updated as follows:

- 15310 • The wording of the mandatory [ELOOP] error condition is updated.
- 15311 • A second optional [ELOOP] error condition is added.
- 15312 • The [EOVERFLOW] mandatory error condition is added.

15313 Text is added to the DESCRIPTION to say that the *ftw()* function need not be reentrant and that
15314 the results are unspecified if the application-supplied *fn* function does not preserve the current
15315 working directory.

15316 NAME

15317 funlockfile — stdio locking functions

15318 SYNOPSIS

15319 TSF `#include <stdio.h>`

15320 `void funlockfile(FILE *file);`

15321

15322 DESCRIPTION

15323 Refer to *flockfile()*.

15324 **NAME**

15325 fwide — set stream orientation

15326 **SYNOPSIS**

15327 #include <stdio.h>

15328 #include <wchar.h>

15329 int fwide(FILE **stream*, int *mode*);15330 **DESCRIPTION**

15331 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 15332 conflict between the requirements described here and the ISO C standard is unintentional. This
 15333 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15334 The *fwide()* function shall determine the orientation of the stream pointed to by *stream*. If *mode* is
 15335 greater than zero, the function first attempts to make the stream wide-oriented. If *mode* is less
 15336 than zero, the function first attempts to make the stream byte-oriented. Otherwise, *mode* is zero
 15337 and the function does not alter the orientation of the stream.

15338 If the orientation of the stream has already been determined, *fwide()* shall not change it.

15339 CX Since no return value is reserved to indicate an error, an application wishing to check for error
 15340 situations should set *errno* to 0, then call *fwide()*, then check *errno*, and if it is non-zero, assume
 15341 an error has occurred.

15342 **RETURN VALUE**

15343 The *fwide()* function shall return a value greater than zero if, after the call, the stream has wide-
 15344 orientation, a value less than zero if the stream has byte-orientation, or zero if the stream has no
 15345 orientation.

15346 **ERRORS**15347 The *fwide()* function may fail if:

15348 CX [EBADF] The *stream* argument is not a valid stream.

15349 **EXAMPLES**

15350 None.

15351 **APPLICATION USAGE**

15352 A call to *fwide()* with *mode* set to zero can be used to determine the current orientation of a
 15353 stream.

15354 **RATIONALE**

15355 None.

15356 **FUTURE DIRECTIONS**

15357 None.

15358 **SEE ALSO**15359 The Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>15360 **CHANGE HISTORY**

15361 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 15362 (E).

15363 **Issue 6**

15364 Extensions beyond the ISO C standard are marked.

15365 **NAME**

15366 fwprintf, swprintf, wprintf — print formatted wide-character output

15367 **SYNOPSIS**

15368 #include <stdio.h>

15369 #include <wchar.h>

15370 int fwprintf(FILE *restrict *stream*, const wchar_t *restrict *format*, ...);15371 int swprintf(wchar_t *restrict *ws*, size_t *n*,15372 const wchar_t *restrict *format*, ...);15373 int wprintf(const wchar_t *restrict *format*, ...);15374 **DESCRIPTION**

15375 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 15376 conflict between the requirements described here and the ISO C standard is unintentional. This
 15377 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15378 The *fwprintf()* function shall place output on the named output *stream*. The *wprintf()* function
 15379 shall place output on the standard output stream *stdout*. The *swprintf()* function shall place
 15380 output followed by the null wide character in consecutive wide characters starting at **ws*; no
 15381 more than *n* wide characters shall be written, including a terminating null wide character, which
 15382 is always added (unless *n* is zero).

15383 Each of these functions shall convert, format, and print its arguments under control of the *format*
 15384 wide-character string. The *format* is composed of zero or more directives: *ordinary wide-*
 15385 *characters*, which are simply copied to the output stream, and *conversion specifications*, each of
 15386 which results in the fetching of zero or more arguments. The results are undefined if there are
 15387 insufficient arguments for the *format*. If the *format* is exhausted while arguments remain, the
 15388 excess arguments are evaluated but are otherwise ignored.

15389 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 15390 to the next unused argument. In this case, the conversion specifier wide character % (see below)
 15391 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}],
 15392 giving the position of the argument in the argument list. This feature provides for the definition
 15393 of *format* wide-character strings that select arguments in an order appropriate to specific
 15394 languages (see the EXAMPLES section).

15395 The *format* can contain either numbered argument specifications (that is, "%n\$" and "%m\$"), or
 15396 unnumbered argument conversion specifications (that is, % and *), but not both. The only
 15397 exception to this is that %% can be mixed with the "%n\$" form. The results of mixing numbered
 15398 and unnumbered argument specifications in a *format* wide-character string are undefined. When
 15399 numbered argument specifications are used, specifying the *N*th argument requires that all the
 15400 leading arguments, from the first to the (*N*−1)th, are specified in the *format* wide-character string.

15401 In *format* wide-character strings containing the "%n\$" form of conversion specification,
 15402 numbered arguments in the argument list can be referenced from the *format* wide-character
 15403 string as many times as required.

15404 In *format* wide-character strings containing the % form of conversion specification, each
 15405 argument in the argument list shall be used exactly once.

15406 CX All forms of the *fwprintf()* function allow for the insertion of a locale-dependent radix character
 15407 in the output string, output as a wide-character value. The radix character is defined in the
 15408 program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the radix
 15409 character is not defined, the radix character shall default to a period ('.').

15410 XSI Each conversion specification is introduced by the '%' wide character or by the wide-character
 15411 sequence "%n\$", after which the following appear in sequence:

- 15412 • Zero or more *flags* (in any order), which modify the meaning of the conversion specification.
- 15413 • An optional minimum *field width*. If the converted value has fewer wide characters than the
- 15414 field width, it shall be padded with spaces by default on the left; it shall be padded on the
- 15415 right, if the left-adjustment flag ('-'), described below, is given to the field width. The field
- 15416 width takes the form of an asterisk ('*'), described below, or a decimal integer.
- 15417 • An optional *precision* that gives the minimum number of digits to appear for the d, i, o, u, x,
- 15418 and X conversion specifiers; the number of digits to appear after the radix character for the a,
- 15419 A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g
- 15420 and G conversion specifiers; or the maximum number of wide characters to be printed from a
- 15421 string in the s conversion specifiers. The precision takes the form of a period ('.') followed
- 15422 either by an asterisk ('*'), described below, or an optional decimal digit string, where a null
- 15423 digit string is treated as 0. If a precision appears with any other conversion wide character,
- 15424 the behavior is undefined.
- 15425 • An optional length modifier that specifies the size of the argument.
- 15426 • A *conversion specifier* wide character that indicates the type of conversion to be applied.
- 15427 A field width, or precision, or both, may be indicated by an asterisk ('*'). In this case an
- 15428 argument of type **int** supplies the field width or precision. Applications shall ensure that
- 15429 arguments specifying field width, or precision, or both appear in that order before the argument,
- 15430 if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field
- 15431 XSI width. A negative precision is taken as if the precision were omitted. In *format* wide-character
- 15432 strings containing the "%n\$" form of a conversion specification, a field width or precision may
- 15433 be indicated by the sequence "%m\$", where *m* is a decimal integer in the range
- 15434 [1,{NL_ARGMAX}] giving the position in the argument list (after the *format* argument) of an
- 15435 integer argument containing the field width or precision, for example:
- 15436 `wprintf(L"%1$d:%2$.*3$d:%4$.*3$d\n", hour, min, precision, sec);`
- 15437 The flag wide characters and their meanings are:
- 15438 XSI ' The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G)
- 15439 shall be formatted with thousands' grouping wide characters. For other conversions,
- 15440 the behavior is undefined. The numeric grouping wide character is used.
- 15441 - The result of the conversion shall be left-justified within the field. The conversion shall
- 15442 be right-justified if this flag is not specified.
- 15443 + The result of a signed conversion shall always begin with a sign ('+' or '-'). The
- 15444 conversion shall begin with a sign only when a negative value is converted if this flag is
- 15445 not specified.
- 15446 <space> If the first wide character of a signed conversion is not a sign, or if a signed conversion
- 15447 results in no wide characters, a <space> shall be prefixed to the result. This means that
- 15448 if the <space> and '+' flags both appear, the <space> flag shall be ignored.
- 15449 # Specifies that the value is to be converted to an alternative form. For o conversion, it
- 15450 increases the precision (if necessary) to force the first digit of the result to be 0. For x or
- 15451 X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A, e,
- 15452 E, f, F, g, and G conversion specifiers, the result shall always contain a radix character,
- 15453 even if no digits follow it. Without this flag, a radix character appears in the result of
- 15454 these conversions only if a digit follows it. For g and G conversion specifiers, trailing
- 15455 zeros shall *not* be removed from the result as they normally are. For other conversion
- 15456 specifiers, the behavior is undefined.

15457 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
 15458 (following any indication of sign or base) are used to pad to the field width; no space
 15459 padding is performed. If the '0' and '-' flags both appear, the '0' flag shall be
 15460 ignored. For d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0'
 15461 flag shall be ignored. If the '0' and '-' flags both appear, the grouping wide
 15462 characters are inserted before zero padding. For other conversions, the behavior is
 15463 undefined.

15464 The length modifiers and their meanings are:

15465 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
 15466 or **unsigned char** argument (the argument will have been promoted according to the
 15467 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
 15468 before printing); or that a following n conversion specifier applies to a pointer to a
 15469 **signed char** argument.

15470 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
 15471 **unsigned short** argument (the argument will have been promoted according to the
 15472 integer promotions, but its value shall be converted to **short** or **unsigned short** before
 15473 printing); or that a following n conversion specifier applies to a pointer to a **short**
 15474 argument.

15475 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
 15476 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
 15477 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
 15478 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
 15479 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

15480 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long** or
 15481 **unsigned long long** argument; or that a following n conversion specifier applies to a
 15482 pointer to a **long long** argument.

15484 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
 15485 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
 15486 to an **intmax_t** argument.

15487 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
 15488 corresponding signed integer type argument; or that a following n conversion specifier
 15489 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

15490 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff_t** or
 15491 the corresponding **unsigned** type argument; or that a following n conversion specifier
 15492 applies to a pointer to a **ptrdiff_t** argument.

15493 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**
 15494 **double** argument.

15495 If a length modifier appears with any conversion specifier other than as specified above, the
 15496 behavior is undefined.

15497 The conversion specifiers and their meanings are:

15498 d, i The **int** argument shall be converted to a signed decimal in the style "[-] dddd". The
 15499 precision specifies the minimum number of digits to appear; if the value being
 15500 converted can be represented in fewer digits, it shall be expanded with leading zeros.
 15501 The default precision shall be 1. The result of converting zero with an explicit precision
 15502 of zero shall be no wide characters.

15503	o	The unsigned argument shall be converted to unsigned octal format in the style "dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
15504		
15505		
15506		
15507		
15508	u	The unsigned argument shall be converted to unsigned decimal format in the style "dddd". The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
15509		
15510		
15511		
15512		
15513	x	The unsigned argument shall be converted to unsigned hexadecimal format in the style "dddd"; the letters "abcdef" are used. The precision specifies the minimum number of digits to appear; if the value being converted can be represented in fewer digits, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting zero with an explicit precision of zero shall be no wide characters.
15514		
15515		
15516		
15517		
15518	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead of "abcdef".
15519		
15520	f, F	The double argument shall be converted to decimal notation in the style "[-] ddd.ddd", where the number of digits after the radix character shall be equal to the precision specification. If the precision is missing, it shall be taken as 6; if the precision is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix character appears, at least one digit shall appear before it. The value shall be rounded in an implementation-defined manner to the appropriate number of digits.
15521		
15522		
15523		
15524		
15525		
15526		A double argument representing an infinity shall be converted in one of the styles "[-]inf" or "[-]infinity"; which style is implementation-defined. A double argument representing a NaN shall be converted in one of the styles "[-]nan" or "[-]nan(<i>n-char-sequence</i>)"; which style, and the meaning of any <i>n-char-sequence</i> , is implementation-defined. The F conversion specifier produces "INF", "INFINITY", or "NAN" instead of "inf", "infinity", or "nan", respectively.
15527		
15528		
15529		
15530		
15531		
15532	e, E	The double argument shall be converted in the style "[-] d.ddde±dd", where there shall be one digit before the radix character (which is non-zero if the argument is non-zero) and the number of digits after it shall be equal to the precision; if the precision is missing, it shall be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall appear. The value shall be rounded in an implementation-defined manner to the appropriate number of digits. The E conversion wide character shall produce a number with 'E' instead of 'e' introducing the exponent. The exponent shall always contain at least two digits. If the value is zero, the exponent shall be zero.
15533		
15534		
15535		
15536		
15537		
15538		
15539		
15540		A double argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.
15541		
15542	g, G	The double argument shall be converted in the style f or e (or in the style F or E in the case of a G conversion specifier), with the precision specifying the number of significant digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on the value converted; style e (or E) shall be used only if the exponent resulting from such a conversion is less than -4 or greater than or equal to the precision. Trailing zeros shall be removed from the fractional portion of the result; a radix character shall appear only if it is followed by a digit.
15543		
15544		
15545		
15546		
15547		
15548		
15549		A double argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.
15550		

15551	a, A	A double argument representing a floating-point number shall be converted in the style "[-] 0xh.hhhhp±d", where there shall be one hexadecimal digit (which is non-zero if the argument is a normalized floating-point number and is otherwise unspecified) before the decimal-point wide character and the number of hexadecimal digits after it shall be equal to the precision; if the precision is missing and FLT_RADIX is a power of 2, then the precision shall be sufficient for an exact representation of the value; if the precision is missing and FLT_RADIX is not a power of 2, then the precision shall be sufficient to distinguish values of type double , except that trailing zeros may be omitted; if the precision is zero and the '#' flag is not specified, no decimal-point wide character shall appear. The letters "abcdef" are used for a conversion and the letters "ABCDEF" for A conversion. The A conversion specifier produces a number with 'X' and 'P' instead of 'x' and 'p'. The exponent shall always contain at least one digit, and only as many more digits as necessary to represent the decimal exponent of 2. If the value is zero, the exponent shall be zero.
15552		
15553		
15554		
15555		
15556		
15557		
15558		
15559		
15560		
15561		
15562		
15563		
15564		
15565		A double argument representing an infinity or NaN shall be converted in the style of an f or F conversion specifier.
15566		
15567	c	If no l (ell) qualifier is present, the int argument shall be converted to a wide character as if by calling the <i>btowc()</i> function and the resulting wide character shall be written. Otherwise, the wint_t argument shall be converted to wchar_t , and written.
15568		
15569		
15570	s	If no l (ell) qualifier is present, the application shall ensure that the argument is a pointer to a character array containing a character sequence beginning in the initial shift state. Characters from the array shall be converted as if by repeated calls to the <i>mbrtowc()</i> function, with the conversion state described by an mbstate_t object initialized to zero before the first character is converted, and written up to (but not including) the terminating null wide character. If the precision is specified, no more than that many wide characters shall be written. If the precision is not specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character.
15571		
15572		
15573		
15574		
15575		
15576		
15577		
15578		
15579		If an l (ell) qualifier is present, the application shall ensure that the argument is a pointer to an array of type wchar_t . Wide characters from the array shall be written up to (but not including) a terminating null wide character. If no precision is specified, or is greater than the size of the array, the application shall ensure that the array contains a null wide character. If a precision is specified, no more than that many wide characters shall be written.
15580		
15581		
15582		
15583		
15584		
15585	p	The application shall ensure that the argument is a pointer to void . The value of the pointer shall be converted to a sequence of printable wide characters in an implementation-defined manner.
15586		
15587		
15588	n	The application shall ensure that the argument is a pointer to an integer into which is written the number of wide characters written to the output so far by this call to one of the <i>fwprintf()</i> functions. No argument shall be converted, but one shall be consumed. If the conversion specification includes any flags, a field width, or a precision, the behavior is undefined.
15589		
15590		
15591		
15592		
15593	XSI C	Equivalent to lc.
15594	XSI S	Equivalent to ls.
15595	%	Output a '%' wide character; no argument shall be converted. The entire conversion specification shall be %%.
15596		

- 15597 If a conversion specification does not match one of the above forms, the behavior is undefined.
- 15598 In no case does a nonexistent or small field width cause truncation of a field; if the result of a
15599 conversion is wider than the field width, the field shall be expanded to contain the conversion
15600 result. Characters generated by *fwprintf()* and *wprintf()* shall be printed as if *fputwc()* had been
15601 called.
- 15602 For a and A conversions, if FLT_RADIX is not a power of 2 and the result is not exactly
15603 representable in the given precision, the result should be one of the two adjacent numbers in
15604 hexadecimal floating style with the given precision, with the extra stipulation that the error
15605 should have a correct sign for the current rounding direction.
- 15606 For e, E, f, F, g, and G conversion specifiers, if the number of significant decimal digits is at most
15607 DECIMAL_DIG, then the result should be correctly rounded. If the number of significant
15608 decimal digits is more than DECIMAL_DIG but the source value is exactly representable with
15609 DECIMAL_DIG digits, then the result should be an exact representation with trailing zeros.
15610 Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
15611 DECIMAL_DIG significant digits; the value of the resultant decimal string D should satisfy $L \leq$
15612 $D \leq U$, with the extra stipulation that the error should have a correct sign for the current
15613 rounding direction.
- 15614 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the call to a
15615 successful execution of *fwprintf()* or *wprintf()* and the next successful completion of a call to
15616 *fflush()* or *fclose()* on the same stream, or a call to *exit()* or *abort()*.
- 15617 **RETURN VALUE**
- 15618 Upon successful completion, these functions shall return the number of wide characters
15619 transmitted, excluding the terminating null wide character in the case of *swprintf()*, or a negative
15620 CX value if an output error was encountered, and set *errno* to indicate the error.
- 15621 If *n* or more wide characters were requested to be written, *swprintf()* shall return a negative
15622 CX value, and set *errno* to indicate the error.
- 15623 **ERRORS**
- 15624 For the conditions under which *fwprintf()* and *wprintf()* fail and may fail, refer to *fputwc()*.
- 15625 In addition, all forms of *fwprintf()* may fail if:
- 15626 XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been
15627 detected.
- 15628 XSI [EINVAL] There are insufficient arguments.
- 15629 In addition, *wprintf()* and *fwprintf()* may fail if:
- 15630 XSI [ENOMEM] Insufficient storage space is available.
- 15631 **EXAMPLES**
- 15632 To print the language-independent date and time format, the following statement could be used:
- 15633 `wprintf(format, weekday, month, day, hour, min);`
- 15634 For American usage, *format* could be a pointer to the wide-character string:
- 15635 `L"%s, %s %d, %d:%.2d\n"`
- 15636 producing the message:
- 15637 `Sunday, July 3, 10:02`
- 15638 whereas for German usage, *format* could be a pointer to the wide-character string:

15639 L"%1\$s, %3\$d. %2\$s, %4\$d:%5\$.2d\n"

15640 producing the message:

15641 Sonntag, 3. Juli, 10:02

15642 APPLICATION USAGE

15643 None.

15644 RATIONALE

15645 None.

15646 FUTURE DIRECTIONS

15647 None.

15648 SEE ALSO

15651 CHANGE HISTORY

15652 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
15653 (E).

15654 Issue 6

15655 The Open Group Corrigendum U040/1 is applied to the RETURN VALUE section, describing
15656 the case if *n* or more wide characters are requested to be written using *swprintf()*.

15657 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

15658 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 15659 • The prototypes for *fwprintf()*, *swprintf()*, and *wprintf()* are updated.
- 15660 • The DESCRIPTION is updated.
- 15661 • The hh, ll, j, t, and z length modifiers are added.
- 15662 • The a, A, and F conversion characters are added.
- 15663 • XSI shading is removed from the description of character string representations of infinity
15664 and NaN floating-point values.

15665 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
15666 specification” consistently.

15667 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

15668 **NAME**

15669 fwrite — binary output

15670 **SYNOPSIS**

15671 #include <stdio.h>

15672 size_t fwrite(const void *restrict ptr, size_t size, size_t nitems,
 15673 FILE *restrict stream);

15674 **DESCRIPTION**

15675 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 15676 conflict between the requirements described here and the ISO C standard is unintentional. This
 15677 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15678 The *fwrite()* function shall write, from the array pointed to by *ptr*, up to *nitems* elements whose
 15679 size is specified by *size*, to the stream pointed to by *stream*. For each object, *size* calls shall be
 15680 made to the *fputc()* function, taking the values (in order) from an array of **unsigned char** exactly
 15681 overlaying the object. The file-position indicator for the stream (if defined) shall be advanced by
 15682 the number of bytes successfully written. If an error occurs, the resulting value of the file-
 15683 position indicator for the stream is unspecified.

15684 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 15685 execution of *fwrite()* and the next successful completion of a call to *fflush()* or *fclose()* on the
 15686 same stream, or a call to *exit()* or *abort()*.

15687 **RETURN VALUE**

15688 The *fwrite()* function shall return the number of elements successfully written, which may be
 15689 less than *nitems* if a write error is encountered. If *size* or *nitems* is 0, *fwrite()* shall return 0 and the
 15690 state of the stream remains unchanged. Otherwise, if a write error occurs, the error indicator for
 15691 CX the stream shall be set, and *errno* shall be set to indicate the error.

15692 **ERRORS**15693 Refer to *fputc()*.15694 **EXAMPLES**

15695 None.

15696 **APPLICATION USAGE**

15697 Because of possible differences in element length and byte ordering, files written using *fwrite()*
 15698 are application-dependent, and possibly cannot be read using *fread()* by a different application
 15699 or by the same application on a different processor.

15700 **RATIONALE**

15701 None.

15702 **FUTURE DIRECTIONS**

15703 None.

15704 **SEE ALSO**

15705 *ferror()*, *fopen()*, *printf()*, *putc()*, *puts()*, *write()*, the Base Definitions volume of
 15706 IEEE Std 1003.1-2001, <**stdio.h**>

15707 **CHANGE HISTORY**

15708 First released in Issue 1. Derived from Issue 1 of the SVID.

15709 **Issue 6**

15710 Extensions beyond the ISO C standard are marked.

15711 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

15712

- The *fwrite()* prototype is updated.

15713

- The DESCRIPTION is updated to clarify how the data is written out using *fputc()*.

15714 **NAME**

15715 fwscanf, swscanf, wscanf — convert formatted wide-character input

15716 **SYNOPSIS**

15717 #include <stdio.h>

15718 #include <wchar.h>

15719 int fwscanf(FILE *restrict *stream*, const wchar_t *restrict *format*, ...);15720 int swscanf(const wchar_t *restrict *ws*,15721 const wchar_t *restrict *format*, ...);15722 int wscanf(const wchar_t *restrict *format*, ...);15723 **DESCRIPTION**

15724 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 15725 conflict between the requirements described here and the ISO C standard is unintentional. This
 15726 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

15727 The *fwscanf()* function shall read from the named input *stream*. The *wscanf()* function shall read
 15728 from the standard input stream *stdin*. The *swscanf()* function shall read from the wide-character
 15729 string *ws*. Each function reads wide characters, interprets them according to a format, and stores
 15730 the results in its arguments. Each expects, as arguments, a control wide-character string *format*
 15731 described below, and a set of *pointer* arguments indicating where the converted input should be
 15732 stored. The result is undefined if there are insufficient arguments for the format. If the *format* is
 15733 exhausted while arguments remain, the excess arguments are evaluated but are otherwise
 15734 ignored.

15735 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 15736 to the next unused argument. In this case, the conversion specifier wide character % (see below)
 15737 is replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}].
 15738 This feature provides for the definition of *format* wide-character strings that select arguments in
 15739 an order appropriate to specific languages. In *format* wide-character strings containing the
 15740 "%n\$" form of conversion specifications, it is unspecified whether numbered arguments in the
 15741 argument list can be referenced from the *format* wide-character string more than once.

15742 The *format* can contain either form of a conversion specification—that is, % or "%n\$" — but the
 15743 two forms cannot normally be mixed within a single *format* wide-character string. The only
 15744 exception to this is that %% or %* can be mixed with the "%n\$" form. When numbered
 15745 argument specifications are used, specifying the *N*th argument requires that all the leading
 15746 arguments, from the first to the (*N*−1)th, are pointers.

15747 CX The *fwscanf()* function in all its forms allows for detection of a language-dependent radix
 15748 character in the input string, encoded as a wide-character value. The radix character is defined in
 15749 the program's locale (category *LC_NUMERIC*). In the POSIX locale, or in a locale where the
 15750 radix character is not defined, the radix character shall default to a period (' . ').

15751 The *format* is a wide-character string composed of zero or more directives. Each directive is
 15752 composed of one of the following: one or more white-space wide characters (<space>s, <tab>s,
 15753 <newline>s, <vertical-tab>s, or <form-feed>s); an ordinary wide character (neither '%' nor a
 15754 white-space character); or a conversion specification. Each conversion specification is introduced
 15755 XSI by a '%' or the sequence "%n\$" after which the following appear in sequence:

- 15756 • An optional assignment-suppressing character ' * '.
- 15757 • An optional non-zero decimal integer that specifies the maximum field width.
- 15758 • An optional length modifier that specifies the size of the receiving object.

15759 • A conversion specifier wide character that specifies the type of conversion to be applied. The
15760 valid conversion specifiers are described below.

15761 The *fwscanf()* functions shall execute each directive of the format in turn. If a directive fails, as
15762 detailed below, the function shall return. Failures are described as input failures (due to the
15763 unavailability of input bytes) or matching failures (due to inappropriate input).

15764 A directive composed of one or more white-space wide characters is executed by reading input
15765 until no more valid input can be read, or up to the first wide character which is not a white-
15766 space wide character, which remains unread.

15767 A directive that is an ordinary wide character shall be executed as follows. The next wide
15768 character is read from the input and compared with the wide character that comprises the
15769 directive; if the comparison shows that they are not equivalent, the directive shall fail, and the
15770 differing and subsequent wide characters remain unread. Similarly, if end-of-file, an encoding
15771 error, or a read error prevents a wide character from being read, the directive shall fail.

15772 A directive that is a conversion specification defines a set of matching input sequences, as
15773 described below for each conversion wide character. A conversion specification is executed in
15774 the following steps.

15775 Input white-space wide characters (as specified by *iswspace()*) shall be skipped, unless the
15776 conversion specification includes a *[], c,* or *n* conversion specifier.

15777 An item shall be read from the input, unless the conversion specification includes an *n*
15778 conversion specifier wide character. An input item is defined as the longest sequence of input
15779 wide characters, not exceeding any specified field width, which is an initial subsequence of a
15780 matching sequence. The first wide character, if any, after the input item shall remain unread. If
15781 the length of the input item is zero, the execution of the conversion specification shall fail; this
15782 condition is a matching failure, unless end-of-file, an encoding error, or a read error prevented
15783 input from the stream, in which case it is an input failure.

15784 Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion
15785 specification, the count of input wide characters) shall be converted to a type appropriate to the
15786 conversion wide character. If the input item is not a matching sequence, the execution of the
15787 conversion specification shall fail; this condition is a matching failure. Unless assignment
15788 suppression was indicated by a *'*'*, the result of the conversion shall be placed in the object
15789 pointed to by the first argument following the *format* argument that has not already received a
15790 xsi conversion result if the conversion specification is introduced by *%*, or in the *n*th argument if
15791 introduced by the wide-character sequence *"%n\$"*. If this object does not have an appropriate
15792 type, or if the result of the conversion cannot be represented in the space provided, the behavior
15793 is undefined.

15794 The length modifiers and their meanings are:

15795 hh	Specifies that a following <i>d, i, o, u, x, X,</i> or <i>n</i> conversion specifier applies to an 15796 argument with type pointer to signed char or unsigned char .
15797 h	Specifies that a following <i>d, i, o, u, x, X,</i> or <i>n</i> conversion specifier applies to an 15798 argument with type pointer to short or unsigned short .
15799 l (ell)	Specifies that a following <i>d, i, o, u, x, X,</i> or <i>n</i> conversion specifier applies to an 15800 argument with type pointer to long or unsigned long ; that a following <i>a, A, e, E, f, F, g,</i> 15801 or <i>G</i> conversion specifier applies to an argument with type pointer to double ; or that a 15802 following <i>c, s,</i> or <i>[]</i> conversion specifier applies to an argument with type pointer to 15803 wchar_t .

15804	ll (ell-ell)	
15805		Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an
15806		argument with type pointer to long long or unsigned long long .
15807	j	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an
15808		argument with type pointer to intmax_t or uintmax_t .
15809	z	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an
15810		argument with type pointer to size_t or the corresponding signed integer type.
15811	t	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an
15812		argument with type pointer to ptrdiff_t or the corresponding unsigned type.
15813	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an
15814		argument with type pointer to long double .
15815		If a length modifier appears with any conversion specifier other than as specified above, the
15816		behavior is undefined.
15817		The following conversion specifier wide characters are valid:
15818	d	Matches an optionally signed decimal integer, whose format is the same as expected for
15819		the subject sequence of <i>wcstol()</i> with the value 10 for the <i>base</i> argument. In the absence
15820		of a size modifier, the application shall ensure that the corresponding argument is a
15821		pointer to int .
15822	i	Matches an optionally signed integer, whose format is the same as expected for the
15823		subject sequence of <i>wcstol()</i> with 0 for the <i>base</i> argument. In the absence of a size
15824		modifier, the application shall ensure that the corresponding argument is a pointer to
15825		int .
15826	o	Matches an optionally signed octal integer, whose format is the same as expected for
15827		the subject sequence of <i>wcstoul()</i> with the value 8 for the <i>base</i> argument. In the absence
15828		of a size modifier, the application shall ensure that the corresponding argument is a
15829		pointer to unsigned .
15830	u	Matches an optionally signed decimal integer, whose format is the same as expected for
15831		the subject sequence of <i>wcstoul()</i> with the value 10 for the <i>base</i> argument. In the absence
15832		of a size modifier, the application shall ensure that the corresponding argument is a
15833		pointer to unsigned .
15834	x	Matches an optionally signed hexadecimal integer, whose format is the same as
15835		expected for the subject sequence of <i>wcstoul()</i> with the value 16 for the <i>base</i> argument.
15836		In the absence of a size modifier, the application shall ensure that the corresponding
15837		argument is a pointer to unsigned .
15838	a, e, f, g	
15839		Matches an optionally signed floating-point number, infinity, or NaN whose format is
15840		the same as expected for the subject sequence of <i>wcstod()</i> . In the absence of a size
15841		modifier, the application shall ensure that the corresponding argument is a pointer to
15842		float .
15843		If the <i>fwprintf()</i> family of functions generates character string representations for
15844		infinity and NaN (a symbolic entity encoded in floating-point format) to support
15845		IEEE Std 754-1985, the <i>fwscanf()</i> family of functions shall recognize them as input.
15846	s	Matches a sequence of non white-space wide characters. If no l (ell) qualifier is present,
15847		characters from the input field shall be converted as if by repeated calls to the
15848		<i>wcrtomb()</i> function, with the conversion state described by an mbstate_t object

15849		initialized to zero before the first wide character is converted. The application shall
15850		ensure that the corresponding argument is a pointer to a character array large enough
15851		to accept the sequence and the terminating null character, which shall be added
15852		automatically.
15853		Otherwise, the application shall ensure that the corresponding argument is a pointer to
15854		an array of wchar_t large enough to accept the sequence and the terminating null wide
15855		character, which shall be added automatically.
15856	[	Matches a non-empty sequence of wide characters from a set of expected wide
15857		characters (the <i>scanset</i>). If no l (ell) qualifier is present, wide characters from the input
15858		field shall be converted as if by repeated calls to the <i>wrtomb()</i> function, with the
15859		conversion state described by an mbstate_t object initialized to zero before the first
15860		wide character is converted. The application shall ensure that the corresponding
15861		argument is a pointer to a character array large enough to accept the sequence and the
15862		terminating null character, which shall be added automatically.
15863		If an l (ell) qualifier is present, the application shall ensure that the corresponding
15864		argument is a pointer to an array of wchar_t large enough to accept the sequence and
15865		the terminating null wide character, which shall be added automatically.
15866		The conversion specification includes all subsequent wide characters in the <i>format</i>
15867		string up to and including the matching right square bracket (']'). The wide
15868		characters between the square brackets (the <i>scanlist</i>) comprise the scanset, unless the
15869		wide character after the left square bracket is a circumflex ('^'), in which case the
15870		scanset contains all wide characters that do not appear in the scanlist between the
15871		circumflex and the right square bracket. If the conversion specification begins with
15872		"[]" or "[^]", the right square bracket is included in the scanlist and the next right
15873		square bracket is the matching right square bracket that ends the conversion
15874		specification; otherwise, the first right square bracket is the one that ends the
15875		conversion specification. If a '-' is in the scanlist and is not the first wide character,
15876		nor the second where the first wide character is a '^', nor the last wide character, the
15877		behavior is implementation-defined.
15878	c	Matches a sequence of wide characters of exactly the number specified by the field
15879		width (1 if no field width is present in the conversion specification).
15880		If no l (ell) length modifier is present, characters from the input field shall be converted
15881		as if by repeated calls to the <i>wrtomb()</i> function, with the conversion state described by
15882		an mbstate_t object initialized to zero before the first wide character is converted. The
15883		corresponding argument shall be a pointer to the initial element of a character array
15884		large enough to accept the sequence. No null character is added.
15885		If an l (ell) length modifier is present, the corresponding argument shall be a pointer to
15886		the initial element of an array of wchar_t large enough to accept the sequence. No null
15887		wide character is added.
15888		Otherwise, the application shall ensure that the corresponding argument is a pointer to
15889		an array of wchar_t large enough to accept the sequence. No null wide character is
15890		added.
15891	p	Matches an implementation-defined set of sequences, which shall be the same as the set
15892		of sequences that is produced by the %p conversion specification of the corresponding
15893		<i>fwprintf()</i> functions. The application shall ensure that the corresponding argument is a
15894		pointer to a pointer to void . The interpretation of the input item is implementation-
15895		defined. If the input item is a value converted earlier during the same program
15896		execution, the pointer that results shall compare equal to that value; otherwise, the

15897		behavior of the %p conversion is undefined.
15898	n	No input is consumed. The application shall ensure that the corresponding argument is a pointer to the integer into which is to be written the number of wide characters read from the input so far by this call to the <i>fwscanf()</i> functions. Execution of a %n conversion specification shall not increment the assignment count returned at the completion of execution of the function. No argument shall be converted, but one shall be consumed. If the conversion specification includes an assignment-suppressing wide character or a field width, the behavior is undefined.
15899		
15900		
15901		
15902		
15903		
15904		
15905	XSI	C Equivalent to lc.
15906	XSI	S Equivalent to ls.
15907	%	Matches a single '%' wide character; no conversion or assignment shall occur. The complete conversion specification shall be %%.
15908		
15909		If a conversion specification is invalid, the behavior is undefined.
15910		The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to, respectively, a, e, f, g, and x.
15911		
15912		If end-of-file is encountered during input, conversion is terminated. If end-of-file occurs before any wide characters matching the current conversion specification (except for %n) have been read (other than leading white-space, where permitted), execution of the current conversion specification shall terminate with an input failure. Otherwise, unless execution of the current conversion specification is terminated with a matching failure, execution of the following conversion specification (if any) shall be terminated with an input failure.
15913		
15914		
15915		
15916		
15917		
15918		Reaching the end of the string in <i>swscanf()</i> shall be equivalent to encountering end-of-file for <i>fwscanf()</i> .
15919		
15920		If conversion terminates on a conflicting input, the offending input shall be left unread in the input. Any trailing white space (including <newline>) shall be left unread unless matched by a conversion specification. The success of literal matches and suppressed assignments is only directly determinable via the %n conversion specification.
15921		
15922		
15923		
15924		
15924	CX	The <i>fwscanf()</i> and <i>wscanf()</i> functions may mark the <i>st_atime</i> field of the file associated with <i>stream</i> for update. The <i>st_atime</i> field shall be marked for update by the first successful execution of <i>fgetc()</i> , <i>fgetwc()</i> , <i>fgets()</i> , <i>fgetws()</i> , <i>fread()</i> , <i>getc()</i> , <i>getwc()</i> , <i>getchar()</i> , <i>getwchar()</i> , <i>gets()</i> , <i>fscanf()</i> , or <i>fwscanf()</i> using <i>stream</i> that returns data not supplied by a prior call to <i>ungetc()</i> .
15925		
15926		
15927		
15928	RETURN VALUE	
15929		Upon successful completion, these functions shall return the number of successfully matched and assigned input items; this number can be zero in the event of an early matching failure. If the input ends before the first matching failure or conversion, EOF shall be returned. If a read error occurs, the error indicator for the stream is set, EOF shall be returned, and <i>errno</i> shall be set to indicate the error.
15930		
15931		
15932		
15932	CX	
15933		
15934	ERRORS	
15935		For the conditions under which the <i>fwscanf()</i> functions shall fail and may fail, refer to <i>fgetwc()</i> .
15936		In addition, <i>fwscanf()</i> may fail if:
15937	XSI	[EILSEQ] Input byte sequence does not form a valid character.
15938	XSI	[EINVAL] There are insufficient arguments.

15939 **EXAMPLES**

15940 The call:

```
15941 int i, n; float x; char name[50];
15942 n = wscanf(L"%d%f%s", &i, &x, name);
```

15943 with the input line:

15944 25 54.32E-1 Hamster

15945 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
 15946 "Hamster".

15947 The call:

```
15948 int i; float x; char name[50];
15949 (void) wscanf(L"%2d%f*d %[0123456789]", &i, &x, name);
```

15950 with input:

15951 56789 0123 56a72

15952 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to
 15953 *getchar()* shall return the character 'a'.

15954 **APPLICATION USAGE**

15955 In format strings containing the '%' form of conversion specifications, each argument in the
 15956 argument list is used exactly once.

15957 **RATIONALE**

15958 None.

15959 **FUTURE DIRECTIONS**

15960 None.

15961 **SEE ALSO**

15962 *getwc()*, *fwprintf()*, *setlocale()*, *wctod()*, *wctol()*, *wcstoul()*, *wcrtomb()*, the Base Definitions
 15963 volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <langinfo.h>, <stdio.h>, <wchar.h>

15964 **CHANGE HISTORY**

15965 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
 15966 (E).

15967 **Issue 6**

15968 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

15969 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 15970 • The prototypes for *fwscanf()* and *swscanf()* are updated.
- 15971 • The DESCRIPTION is updated.
- 15972 • The hh, ll, j, t, and z length modifiers are added.
- 15973 • The a, A, and F conversion characters are added.

15974 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
 15975 specification” consistently.

15976 **NAME**

15977 gai_strerror — address and name information error description

15978 **SYNOPSIS**

15979 #include <netdb.h>

15980 const char *gai_strerror(int *ecode*);15981 **DESCRIPTION**15982 The *gai_strerror()* function shall return a text string describing an error value for the *getaddrinfo()*
15983 and *getnameinfo()* functions listed in the <netdb.h> header.15984 When the *ecode* argument is one of the following values listed in the <netdb.h> header:

15985 [EAI_AGAIN]

15986 [EAI_BADFLAGS]

15987 [EAI_FAIL]

15988 [EAI_FAMILY]

15989 [EAI_MEMORY]

15990 [EAI_NONAME]

15991 [EAI_OVERFLOW]

15992 [EAI_SERVICE]

15993 [EAI_SOCKTYPE]

15994 [EAI_SYSTEM]

15995 the function return value shall point to a string describing the error. If the argument is not one
15996 of those values, the function shall return a pointer to a string whose contents indicate an
15997 unknown error.15998 **RETURN VALUE**15999 Upon successful completion, *gai_strerror()* shall return a pointer to an implementation-defined
16000 string.16001 **ERRORS**

16002 No errors are defined.

16003 **EXAMPLES**

16004 None.

16005 **APPLICATION USAGE**

16006 None.

16007 **RATIONALE**

16008 None.

16009 **FUTURE DIRECTIONS**

16014 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

16015 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type from
16016 **char *** to **const char ***. This is for coordination with the IPnG Working Group.16017 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/22 is applied, adding the
16018 [EAI_OVERFLOW] error code. |

16019 **NAME**16020 gcvt — convert a floating-point number to a string (**LEGACY**)16021 **SYNOPSIS**

16022 xSI #include <stdlib.h>

16023 char *gcvt(double value, int ndigit, char *buf);

16024

16025 **DESCRIPTION**16026 Refer to *ecvt()*.

16027 **NAME**

16028 getaddrinfo — get address information

16029 **SYNOPSIS**

16030 #include <sys/socket.h>

16031 #include <netdb.h>

```
16032       int getaddrinfo(const char *restrict nodename,  
16033                      const char *restrict servname,  
16034                      const struct addrinfo *restrict hints,  
16035                      struct addrinfo **restrict res);
```

16036 **DESCRIPTION**16037 Refer to *freeaddrinfo()*.

16038 **NAME**

16039 getc — get a byte from a stream

16040 **SYNOPSIS**

16041 #include <stdio.h>

16042 int getc(FILE *stream);

16043 **DESCRIPTION**

16044 cx The functionality described on this reference page is aligned with the ISO C standard. Any
16045 conflict between the requirements described here and the ISO C standard is unintentional. This
16046 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

16047 The *getc()* function shall be equivalent to *fgetc()*, except that if it is implemented as a macro it
16048 may evaluate *stream* more than once, so the argument should never be an expression with side
16049 effects.

16050 **RETURN VALUE**16051 Refer to *fgetc()*.16052 **ERRORS**16053 Refer to *fgetc()*.16054 **EXAMPLES**

16055 None.

16056 **APPLICATION USAGE**

16057 If the integer value returned by *getc()* is stored into a variable of type **char** and then compared
16058 against the integer constant EOF, the comparison may never succeed, because sign-extension of
16059 a variable of type **char** on widening to integer is implementation-defined.

16060 Since it may be implemented as a macro, *getc()* may treat incorrectly a *stream* argument with
16061 side effects. In particular, *getc(*f++)* does not necessarily work as expected. Therefore, use of this
16062 function should be preceded by "#undef getc" in such situations; *fgetc()* could also be used.

16063 **RATIONALE**

16064 None.

16065 **FUTURE DIRECTIONS**

16066 None.

16067 **SEE ALSO**16068 *fgetc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>16069 **CHANGE HISTORY**

16070 First released in Issue 1. Derived from Issue 1 of the SVID.

16071 **NAME**

16072 `getc_unlocked`, `getchar_unlocked`, `putc_unlocked`, `putchar_unlocked` — stdio with explicit client
 16073 locking

16074 **SYNOPSIS**

```
16075 TSF      #include <stdio.h>

16076      int getc_unlocked(FILE *stream);
16077      int getchar_unlocked(void);
16078      int putc_unlocked(int c, FILE *stream);
16079      int putchar_unlocked(int c);
16080
```

16081 **DESCRIPTION**

16082 Versions of the functions `getc()`, `getchar()`, `putc()`, and `putchar()` respectively named
 16083 `getc_unlocked()`, `getchar_unlocked()`, `putc_unlocked()`, and `putchar_unlocked()` shall be provided
 16084 which are functionally equivalent to the original versions, with the exception that they are not
 16085 required to be implemented in a thread-safe manner. They may only safely be used within a
 16086 scope protected by `flockfile()` (or `ftrylockfile()`) and `funlockfile()`. These functions may safely be
 16087 used in a multi-threaded program if and only if they are called while the invoking thread owns
 16088 the (**FILE ***) object, as is the case after a successful call to the `flockfile()` or `ftrylockfile()` functions.

16089 **RETURN VALUE**

16090 See `getc()`, `getchar()`, `putc()`, and `putchar()`.

16091 **ERRORS**

16092 See `getc()`, `getchar()`, `putc()`, and `putchar()`.

16093 **EXAMPLES**

16094 None.

16095 **APPLICATION USAGE**

16096 Since they may be implemented as macros, `getc_unlocked()` and `putc_unlocked()` may treat
 16097 incorrectly a *stream* argument with side effects. In particular, `getc_unlocked(*f++)` and
 16098 `putc_unlocked(*f++)` do not necessarily work as expected. Therefore, use of these functions in
 16099 such situations should be preceded by the following statement as appropriate:

```
16100      #undef getc_unlocked
16101      #undef putc_unlocked
```

16102 **RATIONALE**

16103 Some I/O functions are typically implemented as macros for performance reasons (for example,
 16104 `putc()` and `getc()`). For safety, they need to be synchronized, but it is often too expensive to
 16105 synchronize on every character. Nevertheless, it was felt that the safety concerns were more
 16106 important; consequently, the `getc()`, `getchar()`, `putc()`, and `putchar()` functions are required to be
 16107 thread-safe. However, unlocked versions are also provided with names that clearly indicate the
 16108 unsafe nature of their operation but can be used to exploit their higher performance. These
 16109 unlocked versions can be safely used only within explicitly locked program regions, using
 16110 exported locking primitives. In particular, a sequence such as:

```
16111      flockfile(fileptr);
16112      putc_unlocked('1', fileptr);
16113      putc_unlocked('\n', fileptr);
16114      fprintf(fileptr, "Line 2\n");
16115      funlockfile(fileptr);
```

16116 is permissible, and results in the text sequence:

16117 1
 16118 Line 2
 16119 being printed without being interspersed with output from other threads.

16120 It would be wrong to have the standard names such as *getc()*, *putc()*, and so on, map to the
 16121 “faster, but unsafe” rather than the “slower, but safe” versions. In either case, you would still
 16122 want to inspect all uses of *getc()*, *putc()*, and so on, by hand when converting existing code.
 16123 Choosing the safe bindings as the default, at least, results in correct code and maintains the
 16124 “atomicity at the function” invariant. To do otherwise would introduce gratuitous
 16125 synchronization errors into converted code. Other routines that modify the *stdio* (**FILE ***)
 16126 structures or buffers are also safely synchronized.

16127 Note that there is no need for functions of the form *getc_locked()*, *putc_locked()*, and so on, since
 16128 this is the functionality of *getc()*, *putc()*, *et al.* It would be inappropriate to use a feature test
 16129 macro to switch a macro definition of *getc()* between *getc_locked()* and *getc_unlocked()*, since the
 16130 ISO C standard requires an actual function to exist, a function whose behavior could not be
 16131 changed by the feature test macro. Also, providing both the *xxx_locked()* and *xxx_unlocked()*
 16132 forms leads to the confusion of whether the suffix describes the behavior of the function or the
 16133 circumstances under which it should be used.

16134 Three additional routines, *flockfile()*, *ftrylockfile()*, and *funlockfile()* (which may be macros), are
 16135 provided to allow the user to delineate a sequence of I/O statements that are executed
 16136 synchronously.

16137 The *ungetc()* function is infrequently called relative to the other functions/macros so no
 16138 unlocked variation is needed.

16139 **FUTURE DIRECTIONS**
 16140 None.

16141 **SEE ALSO**
 16142 *getc()*, *getchar()*, *putc()*, *putchar()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 16143 **<stdio.h>**

16144 **CHANGE HISTORY**
 16145 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

16146 **Issue 6**
 16147 These functions are marked as part of the Thread-Safe Functions option.

16148 The Open Group Corrigendum U030/2 is applied, adding APPLICATION USAGE describing
 16149 how applications should be written to avoid the case when the functions are implemented as
 16150 macros.

16151 **NAME**16152 `getchar` — get a byte from a stdin stream16153 **SYNOPSIS**16154 `#include <stdio.h>`16155 `int getchar(void);`16156 **DESCRIPTION**

16157 cx The functionality described on this reference page is aligned with the ISO C standard. Any
16158 conflict between the requirements described here and the ISO C standard is unintentional. This
16159 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

16160 The `getchar()` function shall be equivalent to `getc(stdin)`.16161 **RETURN VALUE**16162 Refer to `fgetc()`.16163 **ERRORS**16164 Refer to `fgetc()`.16165 **EXAMPLES**

16166 None.

16167 **APPLICATION USAGE**

16168 If the integer value returned by `getchar()` is stored into a variable of type **char** and then
16169 compared against the integer constant EOF, the comparison may never succeed, because sign-
16170 extension of a variable of type **char** on widening to integer is implementation-defined.

16171 **RATIONALE**

16172 None.

16173 **FUTURE DIRECTIONS**

16174 None.

16175 **SEE ALSO**16176 `getc()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdio.h>**16177 **CHANGE HISTORY**

16178 First released in Issue 1. Derived from Issue 1 of the SVID.

16179 **NAME**

16180 getchar_unlocked — stdio with explicit client locking

16181 **SYNOPSIS**

16182 TSF #include <stdio.h>

16183 int getchar_unlocked(void);

16184

16185 **DESCRIPTION**

16186 Refer to *getc_unlocked()*.

16187 **NAME**

16188 getcontext, setcontext — get and set current user context

16189 **SYNOPSIS**

16190 xSI #include <ucontext.h>

16191 int getcontext(ucontext_t *ucp);

16192 int setcontext(const ucontext_t *ucp);

16193

16194 **DESCRIPTION**

16195 The *getcontext()* function shall initialize the structure pointed to by *ucp* to the current user
 16196 context of the calling thread. The **ucontext_t** type that *ucp* points to defines the user context and
 16197 includes the contents of the calling thread's machine registers, the signal mask, and the current
 16198 execution stack.

16199 The *setcontext()* function shall restore the user context pointed to by *ucp*. A successful call to
 16200 *setcontext()* shall not return; program execution resumes at the point specified by the *ucp*
 16201 argument passed to *setcontext()*. The *ucp* argument should be created either by a prior call to
 16202 *getcontext()* or *makecontext()*, or by being passed as an argument to a signal handler. If the *ucp*
 16203 argument was created with *getcontext()*, program execution continues as if the corresponding
 16204 call of *getcontext()* had just returned. If the *ucp* argument was created with *makecontext()*,
 16205 program execution continues with the function passed to *makecontext()*. When that function
 16206 returns, the thread shall continue as if after a call to *setcontext()* with the *ucp* argument that was
 16207 input to *makecontext()*. If the *uc_link* member of the **ucontext_t** structure pointed to by the *ucp*
 16208 argument is equal to 0, then this context is the main context, and the thread shall exit when this
 16209 context returns. The effects of passing a *ucp* argument obtained from any other source are
 16210 unspecified.

16211 **RETURN VALUE**

16212 Upon successful completion, *setcontext()* shall not return and *getcontext()* shall return 0;
 16213 otherwise, a value of -1 shall be returned.

16214 **ERRORS**

16215 No errors are defined.

16216 **EXAMPLES**16217 Refer to *makecontext()*.16218 **APPLICATION USAGE**

16219 When a signal handler is executed, the current user context is saved and a new context is
 16220 created. If the thread leaves the signal handler via *longjmp()*, then it is unspecified whether the
 16221 context at the time of the corresponding *setjmp()* call is restored and thus whether future calls to
 16222 *getcontext()* provide an accurate representation of the current context, since the context restored
 16223 by *longjmp()* does not necessarily contain all the information that *setcontext()* requires. Signal
 16224 handlers should use *siglongjmp()* or *setcontext()* instead.

16225 Conforming applications should not modify or access the *uc_mcontext* member of **ucontext_t**. A
 16226 conforming application cannot assume that context includes any process-wide static data,
 16227 possibly including *errno*. Users manipulating contexts should take care to handle these
 16228 explicitly when required.

16229 Use of contexts to create alternate stacks is not defined by this volume of IEEE Std 1003.1-2001.

16230 **RATIONALE**

16231 None.

16232 **FUTURE DIRECTIONS**

16233 None.

16234 **SEE ALSO**16235 *bsd_signal()*, *makecontext()*, *setcontext()*, *setjmp()*, *sigaction()*, *sigaltstack()*, *siglongjmp()*,16236 *sigprocmask()*, *sigsetjmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<ucontext.h>**16237 **CHANGE HISTORY**

16238 First released in Issue 4, Version 2.

16239 **Issue 5**

16240 Moved from X/OPEN UNIX extension to BASE.

16241 The following sentence was removed from the DESCRIPTION: “If the *ucp* argument was passed
16242 to a signal handler, program execution continues with the program instruction following the
16243 instruction interrupted by the signal.”

16244 **NAME**

16245 getcwd — get the pathname of the current working directory

16246 **SYNOPSIS**

16247 #include <unistd.h>

16248 char *getcwd(char *buf, size_t size);

16249 **DESCRIPTION**

16250 The *getcwd()* function shall place an absolute pathname of the current working directory in the
 16251 array pointed to by *buf*, and return *buf*. The pathname copied to the array shall contain no
 16252 components that are symbolic links. The *size* argument is the size in bytes of the character array
 16253 pointed to by the *buf* argument. If *buf* is a null pointer, the behavior of *getcwd()* is unspecified.

16254 **RETURN VALUE**

16255 Upon successful completion, *getcwd()* shall return the *buf* argument. Otherwise, *getcwd()* shall
 16256 return a null pointer and set *errno* to indicate the error. The contents of the array pointed to by
 16257 *buf* are then undefined.

16258 **ERRORS**16259 The *getcwd()* function shall fail if:16260 [EINVAL] The *size* argument is 0.

16261 [ERANGE] The *size* argument is greater than 0, but is smaller than the length of the
 16262 pathname +1.

16263 The *getcwd()* function may fail if:

16264 [EACCES] Read or search permission was denied for a component of the pathname.

16265 [ENOMEM] Insufficient storage space is available.

16266 **EXAMPLES**16267 **Determining the Absolute Pathname of the Current Working Directory**

16268 The following example returns a pointer to an array that holds the absolute pathname of the
 16269 current working directory. The pointer is returned in the *ptr* variable, which points to the *buf*
 16270 array where the pathname is stored.

16271 #include <stdlib.h>

16272 #include <unistd.h>

16273 ...

16274 long size;

16275 char *buf;

16276 char *ptr;

16277 size = pathconf(".", _PC_PATH_MAX);

16278 if ((buf = (char *)malloc((size_t)size)) != NULL)

16279 ptr = getcwd(buf, (size_t)size);

16280 ...

16281 **APPLICATION USAGE**

16282 None.

16283 RATIONALE

16284 Since the maximum pathname length is arbitrary unless {PATH_MAX} is defined, an application
16285 generally cannot supply a *buf* with size {{PATH_MAX}+1}.

16286 Having *getcwd()* take no arguments and instead use the *malloc()* function to produce space for
16287 the returned argument was considered. The advantage is that *getcwd()* knows how big the
16288 working directory pathname is and can allocate an appropriate amount of space. But the
16289 programmer would have to use the *free()* function to free the resulting object, or each use of
16290 *getcwd()* would further reduce the available memory. Also, *malloc()* and *free()* are used nowhere
16291 else in this volume of IEEE Std 1003.1-2001. Finally, *getcwd()* is taken from the SVID where it has
16292 the two arguments used in this volume of IEEE Std 1003.1-2001.

16293 The older function *getwd()* was rejected for use in this context because it had only a buffer
16294 argument and no *size* argument, and thus had no way to prevent overwriting the buffer, except
16295 to depend on the programmer to provide a large enough buffer.

16296 On some implementations, if *buf* is a null pointer, *getcwd()* may obtain *size* bytes of memory
16297 using *malloc()*. In this case, the pointer returned by *getcwd()* may be used as the argument in a
16298 subsequent call to *free()*. Invoking *getcwd()* with *buf* as a null pointer is not recommended in
16299 conforming applications.

16300 If a program is operating in a directory where some (grand)parent directory does not permit
16301 reading, *getcwd()* may fail, as in most implementations it must read the directory to determine
16302 the name of the file. This can occur if search, but not read, permission is granted in an
16303 intermediate directory, or if the program is placed in that directory by some more privileged
16304 process (for example, login). Including the [EACCES] error condition makes the reporting of the
16305 error consistent and warns the application writer that *getcwd()* can fail for reasons beyond the
16306 control of the application writer or user. Some implementations can avoid this occurrence (for
16307 example, by implementing *getcwd()* using *pwd*, where *pwd* is a set-user-root process), thus the
16308 error was made optional. Since this volume of IEEE Std 1003.1-2001 permits the addition of other
16309 errors, this would be a common addition and yet one that applications could not be expected to
16310 deal with without this addition.

16311 FUTURE DIRECTIONS

16312 None.

16313 SEE ALSO

16315 CHANGE HISTORY

16316 First released in Issue 1. Derived from Issue 1 of the SVID.

16317 Issue 6

16318 The following new requirements on POSIX implementations derive from alignment with the
16319 Single UNIX Specification:

- 16320 • The [ENOMEM] optional error condition is added.

16321 **NAME**

16322 getdate — convert user format date and time

16323 **SYNOPSIS**16324 xSI `#include <time.h>`16325 `struct tm *getdate(const char *string);`

16326

16327 **DESCRIPTION**16328 The *getdate()* function shall convert a string representation of a date or time into a broken-down
16329 time.16330 The external variable or macro *getdate_err* is used by *getdate()* to return error values.16331 Templates are used to parse and interpret the input string. The templates are contained in a text
16332 file identified by the environment variable *DATMSK*. The *DATMSK* variable should be set to
16333 indicate the full pathname of the file that contains the templates. The first line in the template
16334 that matches the input specification is used for interpretation and conversion into the internal
16335 time format.

16336 The following conversion specifications shall be supported:

16337 %% Equivalent to %.

16338 %a Abbreviated weekday name.

16339 %A Full weekday name.

16340 %b Abbreviated month name.

16341 %B Full month name.

16342 %c Locale's appropriate date and time representation.

16343 %C Century number [00,99]; leading zeros are permitted but not required.

16344 %d Day of month [01,31]; the leading 0 is optional.

16345 %D Date as %m/%d/%y.

16346 %e Equivalent to %d.

16347 %h Abbreviated month name.

16348 %H Hour [00,23].

16349 %I Hour [01,12].

16350 %m Month number [01,12].

16351 %M Minute [00,59].

16352 %n Equivalent to <newline>.

16353 %p Locale's equivalent of either AM or PM.

16354 %r The locale's appropriate representation of time in AM and PM notation. In the POSIX
16355 locale, this shall be equivalent to %I:%M:%S %p.

16356 %R Time as %H:%M.

16357 %S Seconds [00,60]. The range goes to 60 (rather than stopping at 59) to allow positive leap
16358 seconds to be expressed. Since leap seconds cannot be predicted by any algorithm, leap
16359 second data must come from some external source.

16360	%t	Equivalent to <tab>.
16361	%T	Time as %H:%M:%S.
16362	%w	Weekday number (Sunday = [0,6]).
16363	%x	Locale's appropriate date representation.
16364	%X	Locale's appropriate time representation.
16365	%y	Year within century. When a century is not otherwise specified, values in the range
16366		[69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall
16367		refer to years 2000 to 2068 inclusive.
16368	Note:	It is expected that in a future version of IEEE Std 1003.1-2001 the default century
16369		inferred from a 2-digit year will change. (This would apply to all commands
16370		accepting a 2-digit year as input.)
16371	%Y	Year as "ccyy" (for example, 2001).
16372	%Z	Timezone name or no characters if no timezone exists. If the timezone supplied by %Z is
16373		not the timezone that <i>getdate()</i> expects, an invalid input specification error shall result.
16374		The <i>getdate()</i> function calculates an expected timezone based on information supplied
16375		to the function (such as the hour, day, and month).
16376	The match between the template and input specification performed by <i>getdate()</i> shall be case-	
16377	insensitive.	
16378	The month and weekday names can consist of any combination of upper and lowercase letters.	
16379	The process can request that the input date or time specification be in a specific language by	
16380	setting the <i>LC_TIME</i> category (see <i>setlocale()</i>).	
16381	Leading zeros are not necessary for the descriptors that allow leading zeros. However, at most	
16382	two digits are allowed for those descriptors, including leading zeros. Extra whitespace in either	
16383	the template file or in <i>string</i> shall be ignored.	
16384	The results are undefined if the conversion specifications %c, %x, and %X include unsupported	
16385	conversion specifications.	
16386	The following rules apply for converting the input specification into the internal format:	
16387	• If %Z is being scanned, then <i>getdate()</i> shall initialize the broken-down time to be the current	
16388	time in the scanned timezone. Otherwise, it shall initialize the broken-down time based on	
16389	the current local time as if <i>localtime()</i> had been called.	
16390	• If only the weekday is given, the day chosen shall be the day, starting with today and moving	
16391	into the future, which first matches the named day.	
16392	• If only the month (and no year) is given, the month chosen shall be the month, starting with	
16393	the current month and moving into the future, which first matches the named month. The	
16394	first day of the month shall be assumed if no day is given.	
16395	• If no hour, minute, and second are given, the current hour, minute, and second shall be	
16396	assumed.	
16397	• If no date is given, the hour chosen shall be the hour, starting with the current hour and	
16398	moving into the future, which first matches the named hour.	
16399	If a conversion specification in the <i>DATMSK</i> file does not correspond to one of the conversion	
16400	specifications above, the behavior is unspecified.	
16401	The <i>getdate()</i> function need not be reentrant. A function that is not required to be reentrant is not	
16402	required to be thread-safe.	

16403 **RETURN VALUE**

16404 Upon successful completion, *getdate()* shall return a pointer to a **struct tm**. Otherwise, it shall
 16405 return a null pointer and set *getdate_err* to indicate the error.

16406 **ERRORS**

16407 The *getdate()* function shall fail in the following cases, setting *getdate_err* to the value shown in
 16408 the list below. Any changes to *errno* are unspecified.

- 16409 1. The *DATETIME* environment variable is null or undefined.
- 16410 2. The template file cannot be opened for reading.
- 16411 3. Failed to get file status information.
- 16412 4. The template file is not a regular file.
- 16413 5. An I/O error is encountered while reading the template file.
- 16414 6. Memory allocation failed (not enough memory available).
- 16415 7. There is no line in the template that matches the input.
- 16416 8. Invalid input specification. For example, February 31; or a time is specified that cannot be
 16417 represented in a **time_t** (representing the time in seconds since the Epoch).

16418 **EXAMPLES**

- 16419 1. The following example shows the possible contents of a template:

```
16420       %m
16421       %A %B %d, %Y, %H:%M:%S
16422       %A
16423       %B
16424       %m/%d/%Y %I %p
16425       %d,%m,%Y %H:%M
16426       at %A the %dst of %B in %Y
16427       run job at %I %p,%B %dnd
16428       %A den %d. %B %Y %H.%M Uhr
```

- 16429 2. The following are examples of valid input specifications for the template in Example 1:

```
16430       getdate("10/1/87 4 PM");
16431       getdate("Friday");
16432       getdate("Friday September 18, 1987, 10:30:30");
16433       getdate("24,9,1986 10:30");
16434       getdate("at monday the 1st of december in 1986");
16435       getdate("run job at 3 PM, december 2nd");
```

16436 If the *LC_TIME* category is set to a German locale that includes *freitag* as a weekday name
 16437 and *oktober* as a month name, the following would be valid:

```
16438       getdate("freitag den 10. oktober 1986 10.30 Uhr");
```

- 16439 3. The following example shows how local date and time specification can be defined in the
 16440 template:

16441
16442
16443
16444
16445
16446

Invocation	Line in Template
getdate("11/27/86")	%m/%d/%y
getdate("27.11.86")	%d.%m.%y
getdate("86-11-27")	%y-%m-%d
getdate("Friday 12:00:00")	%A %H:%M:%S

16447
16448
16449
16450

4. The following examples help to illustrate the above rules assuming that the current date is Mon Sep 22 12:19:47 EDT 1986 and the *LC_TIME* category is set to the default C locale:

16451
16452
16453
16454
16455
16456
16457
16458
16459
16460
16461
16462
16463
16464

Input	Line in Template	Date
Mon	%a	Mon Sep 22 12:19:47 EDT 1986
Sun	%a	Sun Sep 28 12:19:47 EDT 1986
Fri	%a	Fri Sep 26 12:19:47 EDT 1986
September	%B	Mon Sep 1 12:19:47 EDT 1986
January	%B	Thu Jan 1 12:19:47 EST 1987
December	%B	Mon Dec 1 12:19:47 EST 1986
Sep Mon	%b %a	Mon Sep 1 12:19:47 EDT 1986
Jan Fri	%b %a	Fri Jan 2 12:19:47 EST 1987
Dec Mon	%b %a	Mon Dec 1 12:19:47 EST 1986
Jan Wed 1989	%b %a %Y	Wed Jan 4 12:19:47 EST 1989
Fri 9	%a %H	Fri Sep 26 09:00:00 EDT 1986
Feb 10:30	%b %H:%S	Sun Feb 1 10:00:30 EST 1987
10:30	%H:%M	Tue Sep 23 10:30:00 EDT 1986
13:30	%H:%M	Mon Sep 22 13:30:00 EDT 1986

16465 APPLICATION USAGE

16466 Although historical versions of *getdate()* did not require that **<time.h>** declare the external
16467 variable *getdate_err*, this volume of IEEE Std 1003.1-2001 does require it. The standard
16468 developers encourage applications to remove declarations of *getdate_err* and instead incorporate
16469 the declaration by including **<time.h>**.

16470 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

16471 RATIONALE

16472 In standard locales, the conversion specifications %c, %x, and %X do not include unsupported
16473 conversion specifiers and so the text regarding results being undefined is not a problem in that
16474 case.

16475 FUTURE DIRECTIONS

16476 None.

16477 SEE ALSO

16478 *ctime()*, *localtime()*, *setlocale()*, *strftime()*, *times()*, the Base Definitions volume of
16479 IEEE Std 1003.1-2001, **<time.h>**

16480 CHANGE HISTORY

16481 First released in Issue 4, Version 2.

16482 Issue 5

16483 Moved from X/OPEN UNIX extension to BASE.

16484 The last paragraph of the DESCRIPTION is added.

16485 The %C conversion specification is added, and the exact meaning of the %y conversion
16486 specification is clarified in the DESCRIPTION.

- 16487 A note indicating that this function need not be reentrant is added to the DESCRIPTION.
- 16488 The %R conversion specification is changed to follow historical practice.
- 16489 **Issue 6**
- 16490 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
- 16491 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
- 16492 functions.
- 16493 The description of %S is updated so that the valid range is [00,60] rather than [00,61].
- 16494 The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors
- 16495 for consistency with other functions.

16496 **NAME**

16497 getegid — get the effective group ID

16498 **SYNOPSIS**

16499 #include <unistd.h>

16500 gid_t getegid(void);

16501 **DESCRIPTION**

16502 The *getegid()* function shall return the effective group ID of the calling process.

16503 **RETURN VALUE**

16504 The *getegid()* function shall always be successful and no return value is reserved to indicate an
16505 error.

16506 **ERRORS**

16507 No errors are defined.

16508 **EXAMPLES**

16509 None.

16510 **APPLICATION USAGE**

16511 None.

16512 **RATIONALE**

16513 None.

16514 **FUTURE DIRECTIONS**

16515 None.

16516 **SEE ALSO**

16517 *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base
16518 Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

16519 **CHANGE HISTORY**

16520 First released in Issue 1. Derived from Issue 1 of the SVID.

16521 **Issue 6**

16522 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16523 The following new requirements on POSIX implementations derive from alignment with the
16524 Single UNIX Specification:

- 16525
 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
16526 required for conforming implementations of previous POSIX specifications, it was not
16527 required for UNIX applications.

16528 **NAME**

16529 getenv — get value of an environment variable

16530 **SYNOPSIS**

16531 #include <stdlib.h>

16532 char *getenv(const char *name);

16533 **DESCRIPTION**

16534 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 16535 conflict between the requirements described here and the ISO C standard is unintentional. This
 16536 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

16537 The *getenv()* function shall search the environment of the calling process (see the Base
 16538 Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables) for the
 16539 environment variable *name* if it exists and return a pointer to the value of the environment
 16540 variable. If the specified environment variable cannot be found, a null pointer shall be returned.
 16541 The application shall ensure that it does not modify the string pointed to by the *getenv()*
 16542 function.

16543 CX The string pointed to may be overwritten by a subsequent call to *getenv()*, *setenv()*, or *unsetenv()*,
 16544 but shall not be overwritten by a call to any other function in this volume of
 16545 IEEE Std 1003.1-2001.

16546 CX If the application modifies *environ* or the pointers to which it points, the behavior of *getenv()* is
 16547 undefined.

16548 The *getenv()* function need not be reentrant. A function that is not required to be reentrant is not
 16549 required to be thread-safe.

16550 **RETURN VALUE**

16551 Upon successful completion, *getenv()* shall return a pointer to a string containing the *value* for
 16552 the specified *name*. If the specified *name* cannot be found in the environment of the calling
 16553 process, a null pointer shall be returned.

16554 The return value from *getenv()* may point to static data which may be overwritten by
 16555 CX subsequent calls to *getenv()*, *setenv()*, or *unsetenv()*.

16556 XSI On XSI-conformant systems, the return value from *getenv()* may point to static data which may
 16557 also be overwritten by subsequent calls to *putenv()*.

16558 **ERRORS**

16559 No errors are defined.

16560 **EXAMPLES**16561 **Getting the Value of an Environment Variable**16562 The following example gets the value of the *HOME* environment variable.

16563 #include <stdlib.h>

16564 ...

16565 const char *name = "HOME";

16566 char *value;

16567 value = getenv(name);

16568 **APPLICATION USAGE**

16569 None.

16570 **RATIONALE**

16571 The *clearenv()* function was considered but rejected. The *putenv()* function has now been
16572 included for alignment with the Single UNIX Specification.

16573 The *getenv()* function is inherently not reentrant because it returns a value pointing to static
16574 data.

16575 Conforming applications are required not to modify *environ* directly, but to use only the
16576 functions described here to manipulate the process environment as an abstract object. Thus, the
16577 implementation of the environment access functions has complete control over the data
16578 structure used to represent the environment (subject to the requirement that *environ* be
16579 maintained as a list of strings with embedded equal signs for applications that wish to scan the
16580 environment). This constraint allows the implementation to properly manage the memory it
16581 allocates, either by using allocated storage for all variables (copying them on the first invocation
16582 of *setenv()* or *unsetenv()*), or keeping track of which strings are currently in allocated space and
16583 which are not, via a separate table or some other means. This enables the implementation to free
16584 any allocated space used by strings (and perhaps the pointers to them) stored in *environ* when
16585 *unsetenv()* is called. A C runtime start-up procedure (that which invokes *main()* and perhaps
16586 initializes *environ*) can also initialize a flag indicating that none of the environment has yet been
16587 copied to allocated storage, or that the separate table has not yet been initialized.

16588 In fact, for higher performance of *getenv()*, the implementation could also maintain a separate
16589 copy of the environment in a data structure that could be searched much more quickly (such as
16590 an indexed hash table, or a binary tree), and update both it and the linear list at *environ* when
16591 *setenv()* or *unsetenv()* is invoked.

16592 Performance of *getenv()* can be important for applications which have large numbers of
16593 environment variables. Typically, applications like this use the environment as a resource
16594 database of user-configurable parameters. The fact that these variables are in the user's shell
16595 environment usually means that any other program that uses environment variables (such as *ls*,
16596 which attempts to use *COLUMNS*), or really almost any utility (*LANG*, *LC_ALL*, and so on) is
16597 similarly slowed down by the linear search through the variables.

16598 An implementation that maintains separate data structures, or even one that manages the
16599 memory it consumes, is not currently required as it was thought it would reduce consensus
16600 among implementors who do not want to change their historical implementations.

16601 The POSIX Threads Extension states that multi-threaded applications must not modify *environ*
16602 directly, and that IEEE Std 1003.1-2001 is providing functions which such applications can use in
16603 the future to manipulate the environment in a thread-safe manner. Thus, moving away from
16604 application use of *environ* is desirable from that standpoint as well.

16605 **FUTURE DIRECTIONS**

16606 None.

16607 **SEE ALSO**

16608 *exec*, *putenv()*, *setenv()*, *unsetenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter
16609 8, Environment Variables, <**stdlib.h**>

16610 **CHANGE HISTORY**

16611 First released in Issue 1. Derived from Issue 1 of the SVID.

16612 Issue 5

16613 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
16614 VALUE section.

16615 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

16616 Issue 6

16617 The following changes were made to align with the IEEE P1003.1a draft standard:

- 16618 • References added to the new *setenv()* and *unsetenv()* functions.

16619 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

16620 **NAME**

16621 geteuid — get the effective user ID

16622 **SYNOPSIS**

16623 #include <unistd.h>

16624 uid_t geteuid(void);

16625 **DESCRIPTION**

16626 The *geteuid()* function shall return the effective user ID of the calling process.

16627 **RETURN VALUE**

16628 The *geteuid()* function shall always be successful and no return value is reserved to indicate an
16629 error.

16630 **ERRORS**

16631 No errors are defined.

16632 **EXAMPLES**

16633 None.

16634 **APPLICATION USAGE**

16635 None.

16636 **RATIONALE**

16637 None.

16638 **FUTURE DIRECTIONS**

16639 None.

16640 **SEE ALSO**

16641 *getegid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base
16642 Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

16643 **CHANGE HISTORY**

16644 First released in Issue 1. Derived from Issue 1 of the SVID.

16645 **Issue 6**

16646 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16647 The following new requirements on POSIX implementations derive from alignment with the
16648 Single UNIX Specification:

- 16649
 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
16650 required for conforming implementations of previous POSIX specifications, it was not
16651 required for UNIX applications.

16652 **NAME**

16653 getgid — get the real group ID

16654 **SYNOPSIS**

16655 #include <unistd.h>

16656 gid_t getgid(void);

16657 **DESCRIPTION**16658 The *getgid()* function shall return the real group ID of the calling process.16659 **RETURN VALUE**16660 The *getgid()* function shall always be successful and no return value is reserved to indicate an
16661 error.16662 **ERRORS**

16663 No errors are defined.

16664 **EXAMPLES**

16665 None.

16666 **APPLICATION USAGE**

16667 None.

16668 **RATIONALE**

16669 None.

16670 **FUTURE DIRECTIONS**

16671 None.

16672 **SEE ALSO**16673 *getegid()*, *geteuid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setregid()*, *setreuid()*, *setuid()*, the Base
16674 Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>16675 **CHANGE HISTORY**

16676 First released in Issue 1. Derived from Issue 1 of the SVID.

16677 **Issue 6**

16678 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

16679 The following new requirements on POSIX implementations derive from alignment with the
16680 Single UNIX Specification:

- 16681
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
16682 required for conforming implementations of previous POSIX specifications, it was not
16683 required for UNIX applications.

16684 **NAME**

16685 getgrent — get the group database entry

16686 **SYNOPSIS**

16687 XSI #include <grp.h>

16688 struct group *getgrent(void);

16689

16690 **DESCRIPTION**

16691 Refer to *endgrent()*.

16692 **NAME**

16693 getgrgid, getgrgid_r — get group database entry for a group ID

16694 **SYNOPSIS**

16695 #include <grp.h>

16696 struct group *getgrgid(gid_t gid);

16697 TSF int getgrgid_r(gid_t gid, struct group *grp, char *buffer,
16698 size_t bufsize, struct group **result);

16699

16700 **DESCRIPTION**16701 The *getgrgid()* function shall search the group database for an entry with a matching *gid*.16702 The *getgrgid()* function need not be reentrant. A function that is not required to be reentrant is
16703 not required to be thread-safe.16704 TSF The *getgrgid_r()* function shall update the **group** structure pointed to by *grp* and store a pointer
16705 to that structure at the location pointed to by *result*. The structure shall contain an entry from
16706 the group database with a matching *gid*. Storage referenced by the group structure is allocated
16707 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The
16708 maximum size needed for this buffer can be determined with the {_SC_GETGR_R_SIZE_MAX}
16709 sysconf() parameter. A NULL pointer shall be returned at the location pointed to by *result* on
16710 error or if the requested entry is not found.16711 **RETURN VALUE**16712 Upon successful completion, *getgrgid()* shall return a pointer to a **struct group** with the structure
16713 defined in <grp.h> with a matching entry if one is found. The *getgrgid()* function shall return a
16714 null pointer if either the requested entry was not found, or an error occurred. On error, *errno*
16715 shall be set to indicate the error.16716 The return value may point to a static area which is overwritten by a subsequent call to
16717 *getgrent()*, *getgrgid()*, or *getgrnam()*.16718 TSF If successful, the *getgrgid_r()* function shall return zero; otherwise, an error number shall be
16719 returned to indicate the error.16720 **ERRORS**16721 The *getgrgid()* and *getgrgid_r()* functions may fail if:

16722 [EIO] An I/O error has occurred.

16723 [EINTR] A signal was caught during *getgrgid()*.

16724 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

16725 [ENFILE] The maximum allowable number of files is currently open in the system.

16726 TSF The *getgrgid_r()* function may fail if:16727 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to
16728 be referenced by the resulting **group** structure.

16729 **EXAMPLES**16730 **Finding an Entry in the Group Database**

16731 The following example uses *getgrgid()* to search the group database for a group ID that was
 16732 previously stored in a **stat** structure, then prints out the group name if it is found. If the group is
 16733 not found, the program prints the numeric value of the group for the entry.

```
16734 #include <sys/types.h>
16735 #include <grp.h>
16736 #include <stdio.h>
16737 ...
16738 struct stat statbuf;
16739 struct group *grp;
16740 ...
16741 if ((grp = getgrgid(statbuf.st_gid)) != NULL)
16742     printf(" %-8.8s", grp->gr_name);
16743 else
16744     printf(" %-8d", statbuf.st_gid);
16745 ...
```

16746 **APPLICATION USAGE**

16747 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrgid()*.
 16748 If *errno* is set on return, an error occurred.

16749 The *getgrgid_r()* function is thread-safe and shall return values in a user-supplied buffer instead
 16750 of possibly using a static data area that may be overwritten by each call.

16751 **RATIONALE**

16752 None.

16753 **FUTURE DIRECTIONS**

16754 None.

16755 **SEE ALSO**

16756 *endgrent()*, *getgrnam()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<grp.h>**,
 16757 **<limits.h>**, **<sys/types.h>**

16758 **CHANGE HISTORY**

16759 First released in Issue 1. Derived from System V Release 2.0.

16760 **Issue 5**

16761 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 16762 VALUE section.

16763 The *getgrgid_r()* function is included for alignment with the POSIX Threads Extension.

16764 A note indicating that the *getgrgid()* function need not be reentrant is added to the
 16765 DESCRIPTION.

16766 **Issue 6**

16767 The *getgrgid_r()* function is marked as part of the Thread-Safe Functions option.

16768 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION
 16769 describing matching the *gid*.

16770 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

16771 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

- 16772 The following new requirements on POSIX implementations derive from alignment with the
16773 Single UNIX Specification:
- 16774 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16775 required for conforming implementations of previous POSIX specifications, it was not
16776 required for UNIX applications.
 - 16777 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
 - 16778 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.
- 16779 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
16780 its avoidance of possibly using a static data area.
- 16781 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
16782 buffer from *bufsize* characters to bytes.

16783 **NAME**

16784 getgrnam, getgrnam_r — search group database for a name

16785 **SYNOPSIS**

16786 #include <grp.h>

16787 struct group *getgrnam(const char *name);

16788 TSF int getgrnam_r(const char *name, struct group *grp, char *buffer,
16789 size_t bufsize, struct group **result);

16790

16791 **DESCRIPTION**16792 The *getgrnam()* function shall search the group database for an entry with a matching *name*.16793 The *getgrnam()* function need not be reentrant. A function that is not required to be reentrant is
16794 not required to be thread-safe.16795 TSF The *getgrnam_r()* function shall update the **group** structure pointed to by *grp* and store a pointer
16796 to that structure at the location pointed to by *result*. The structure shall contain an entry from
16797 the group database with a matching *gid* or *name*. Storage referenced by the **group** structure is
16798 allocated from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The
16799 maximum size needed for this buffer can be determined with the {_SC_GETGR_R_SIZE_MAX}
16800 sysconf() parameter. A NULL pointer is returned at the location pointed to by *result* on error or if
16801 the requested entry is not found.16802 **RETURN VALUE**16803 The *getgrnam()* function shall return a pointer to a **struct group** with the structure defined in
16804 <grp.h> with a matching entry if one is found. The *getgrnam()* function shall return a null
16805 pointer if either the requested entry was not found, or an error occurred. On error, *errno* shall be
16806 set to indicate the error.16807 The return value may point to a static area which is overwritten by a subsequent call to
16808 *getgrent()*, *getgrgid()*, or *getgrnam()*.16809 TSF If successful, the *getgrnam_r()* function shall return zero; otherwise, an error number shall be
16810 returned to indicate the error.16811 **ERRORS**16812 The *getgrnam()* and *getgrnam_r()* functions may fail if:

16813 [EIO] An I/O error has occurred.

16814 [EINTR] A signal was caught during *getgrnam()*.

16815 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

16816 [ENFILE] The maximum allowable number of files is currently open in the system.

16817 The *getgrnam_r()* function may fail if:16818 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to
16819 be referenced by the resulting **group** structure.

16820 **EXAMPLES**

16821 None.

16822 **APPLICATION USAGE**

16823 Applications wishing to check for error situations should set *errno* to 0 before calling *getgrnam()*.
16824 If *errno* is set on return, an error occurred.

16825 The *getgrnam_r()* function is thread-safe and shall return values in a user-supplied buffer instead
16826 of possibly using a static data area that may be overwritten by each call.

16827 **RATIONALE**

16828 None.

16829 **FUTURE DIRECTIONS**

16830 None.

16831 **SEE ALSO**

16832 *endgrent()*, *getgrgid()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<grp.h>**, **<limits.h>**,
16833 **<sys/types.h>**

16834 **CHANGE HISTORY**

16835 First released in Issue 1. Derived from System V Release 2.0.

16836 **Issue 5**

16837 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
16838 VALUE section.

16839 The *getgrnam_r()* function is included for alignment with the POSIX Threads Extension.

16840 A note indicating that the *getgrnam()* function need not be reentrant is added to the
16841 DESCRIPTION.

16842 **Issue 6**

16843 The *getgrnam_r()* function is marked as part of the Thread-Safe Functions option.

16844 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

16845 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

16846 The following new requirements on POSIX implementations derive from alignment with the
16847 Single UNIX Specification:

16848

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16849 required for conforming implementations of previous POSIX specifications, it was not
16850 required for UNIX applications.

16851

- In the RETURN VALUE section, the requirement to set *errno* on error is added.

16852

- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

16853 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
16854 its avoidance of possibly using a static data area.

16855 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
16856 buffer from *bufsize* characters to bytes.

16857 **NAME**

16858 getgroups — get supplementary group IDs

16859 **SYNOPSIS**

16860 #include <unistd.h>

16861 int getgroups(int *gidsetsize*, gid_t *grouplist*[]);16862 **DESCRIPTION**

16863 The *getgroups()* function shall fill in the array *grouplist* with the current supplementary group
 16864 IDs of the calling process. It is implementation-defined whether *getgroups()* also returns the
 16865 effective group ID in the *grouplist* array.

16866 The *gidsetsize* argument specifies the number of elements in the array *grouplist*. The actual
 16867 number of group IDs stored in the array shall be returned. The values of array entries with
 16868 indices greater than or equal to the value returned are undefined.

16869 If *gidsetsize* is 0, *getgroups()* shall return the number of group IDs that it would otherwise return
 16870 without modifying the array pointed to by *grouplist*.

16871 If the effective group ID of the process is returned with the supplementary group IDs, the value
 16872 returned shall always be greater than or equal to one and less than or equal to the value of
 16873 {NGROUPS_MAX}+1.

16874 **RETURN VALUE**

16875 Upon successful completion, the number of supplementary group IDs shall be returned. A
 16876 return value of -1 indicates failure and *errno* shall be set to indicate the error.

16877 **ERRORS**16878 The *getgroups()* function shall fail if:

16879 [EINVAL] The *gidsetsize* argument is non-zero and less than the number of group IDs
 16880 that would have been returned.

16881 **EXAMPLES**16882 **Getting the Supplementary Group IDs of the Calling Process**

16883 The following example places the current supplementary group IDs of the calling process into
 16884 the *group* array.

```
16885       #include <sys/types.h>
16886       #include <unistd.h>
16887       ...
16888       gid_t *group;
16889       int nogroups;
16890       long ngroups_max;

16891       ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
16892       group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));
16893       ngroups = getgroups(ngroups_max, group);
```

16894 **APPLICATION USAGE**

16895 None.

16896 **RATIONALE**

16897 The related function *setgroups()* is a privileged operation and therefore is not covered by this
 16898 volume of IEEE Std 1003.1-2001.

As implied by the definition of supplementary groups, the effective group ID may appear in the array returned by *getgroups()* or it may be returned only by *getegid()*. Duplication may exist, but the application needs to call *getegid()* to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of *getgroups()* to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of “set”). (The history of a process and its parents could affect the details of the result.)

Application writers should note that {NGROUPS_MAX} is not necessarily a constant on all implementations.

16908 **FUTURE DIRECTIONS**

16909 None.

16910 **SEE ALSO**

16911 *getegid()*, *setgid()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/types.h>**,
16912 **<unistd.h>**

16913 **CHANGE HISTORY**

16914 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

16915 **Issue 5**

16916 Normative text previously in the APPLICATION USAGE section is moved to the
16917 DESCRIPTION.

16918 **Issue 6**

16919 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

16920 The following new requirements on POSIX implementations derive from alignment with the
16921 Single UNIX Specification:

- 16922 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
16923 required for conforming implementations of previous POSIX specifications, it was not
16924 required for UNIX applications.
- 16925 • A return value of 0 is not permitted, because {NGROUPS_MAX} cannot be 0. This is a FIPS
16926 requirement.

16927 The following changes were made to align with the IEEE P1003.1a draft standard:

- 16928 • An explanation is added that the effective group ID may be included in the supplementary
16929 group list.

16930 **NAME**

16931 gethostbyaddr, gethostbyname — network host database functions

16932 **SYNOPSIS**

16933 #include <netdb.h>

```
16934 OB struct hostent *gethostbyaddr(const void *addr, socklen_t len,
16935 int type);
16936 struct hostent *gethostbyname(const char *name);
16937
```

16938 **DESCRIPTION**

16939 These functions shall retrieve information about hosts. This information is considered to be
 16940 stored in a database that can be accessed sequentially or randomly. Implementation of this
 16941 database is unspecified.

16942 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,
 16943 RFC 1035, and RFC 1886.

16944 Entries shall be returned in **hostent** structures.

16945 The *gethostbyaddr()* function shall return an entry containing addresses of address family *type* for
 16946 the host with address *addr*. The *len* argument contains the length of the address pointed to by
 16947 *addr*. The *gethostbyaddr()* function need not be reentrant. A function that is not required to be
 16948 reentrant is not required to be thread-safe.

16949 The *gethostbyname()* function shall return an entry containing addresses of address family
 16950 AF_INET for the host with name *name*. The *gethostbyname()* function need not be reentrant. A
 16951 function that is not required to be reentrant is not required to be thread-safe.

16952 The *addr* argument of *gethostbyaddr()* shall be an **in_addr** structure when *type* is AF_INET. It
 16953 contains a binary format (that is, not null-terminated) address in network byte order. The
 16954 *gethostbyaddr()* function is not guaranteed to return addresses of address families other than
 16955 AF_INET, even when such addresses exist in the database.

16956 If *gethostbyaddr()* returns successfully, then the *h_addrtype* field in the result shall be the same as
 16957 the *type* argument that was passed to the function, and the *h_addr_list* field shall list a single
 16958 address that is a copy of the *addr* argument that was passed to the function.

16959 The *name* argument of *gethostbyname()* shall be a node name; the behavior of *gethostbyname()*
 16960 when passed a numeric address string is unspecified. For IPv4, a numeric address string shall be
 16961 in the dotted-decimal notation described in *inet_addr()*.

16962 If *name* is not a numeric address string and is an alias for a valid host name, then *gethostbyname()*
 16963 shall return information about the host name to which the alias refers, and *name* shall be
 16964 included in the list of aliases returned.

16965 **RETURN VALUE**

16966 Upon successful completion, these functions shall return a pointer to a **hostent** structure if the
 16967 requested entry was found, and a null pointer if the end of the database was reached or the
 16968 requested entry was not found.

16969 Upon unsuccessful completion, *gethostbyaddr()* and *gethostbyname()* shall set *h_errno* to indicate
 16970 the error.

16971 **ERRORS**

16972 These functions shall fail in the following cases. The *gethostbyaddr()* and *gethostbyname()*
 16973 functions shall set *h_errno* to the value shown in the list below. Any changes to *errno* are
 16974 unspecified.

16975 [HOST_NOT_FOUND]
 16976 No such host is known.

16977 [NO_DATA] The server recognized the request and the name, but no address is available.
 16978 Another type of request to the name server for the domain might return an
 16979 answer.

16980 [NO_RECOVERY]
 16981 An unexpected server failure occurred which cannot be recovered.

16982 [TRY_AGAIN] A temporary and possibly transient error occurred, such as a failure of a
 16983 server to respond.

16984 **EXAMPLES**

16985 None.

16986 **APPLICATION USAGE**

16987 The *gethostbyaddr()* and *gethostbyname()* functions may return pointers to static data, which may
 16988 be overwritten by subsequent calls to any of these functions.

16989 The *getaddrinfo()* and *getnameinfo()* functions are preferred over the *gethostbyaddr()* and
 16990 *gethostbyname()* functions.

16991 **RATIONALE**

16992 None.

16993 **FUTURE DIRECTIONS**

16994 The *gethostbyaddr()* and *gethostbyname()* functions may be withdrawn in a future version.

16995 **SEE ALSO**

16996 *endhostent()*, *endservent()*, *gai_strerror()*, *getaddrinfo()*, *h_errno*, *inet_addr()*, the Base Definitions
 16997 volume of IEEE Std 1003.1-2001, **<netdb.h>**

16998 **CHANGE HISTORY**

16999 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17000 **NAME**

17001 gethostent — network host database functions

17002 **SYNOPSIS**

17003 #include <netdb.h>

17004 struct hostent *gethostent(void);

17005 **DESCRIPTION**

17006 Refer to *endhostent()*.

17007 **NAME**

17008 gethostid — get an identifier for the current host

17009 **SYNOPSIS**

17010 xSI #include <unistd.h>

17011 long gethostid(void);

17012

17013 **DESCRIPTION**

17014 The *gethostid()* function shall retrieve a 32-bit identifier for the current host.

17015 **RETURN VALUE**

17016 Upon successful completion, *gethostid()* shall return an identifier for the current host.

17017 **ERRORS**

17018 No errors are defined.

17019 **EXAMPLES**

17020 None.

17021 **APPLICATION USAGE**

17022 This volume of IEEE Std 1003.1-2001 does not define the domain in which the return value is
17023 unique.

17024 **RATIONALE**

17025 None.

17026 **FUTURE DIRECTIONS**

17031 First released in Issue 4, Version 2.

17032 **Issue 5**

17033 Moved from X/OPEN UNIX extension to BASE.

17034 **NAME**

17035 gethostname — get name of current host

17036 **SYNOPSIS**

17037 #include <unistd.h>

17038 int gethostname(char *name, size_t namelen);

17039 **DESCRIPTION**

17040 The *gethostname()* function shall return the standard host name for the current machine. The
17041 *namelen* argument shall specify the size of the array pointed to by the *name* argument. The
17042 returned name shall be null-terminated, except that if *namelen* is an insufficient length to hold
17043 the host name, then the returned name shall be truncated and it is unspecified whether the
17044 returned name is null-terminated.

17045 Host names are limited to {HOST_NAME_MAX} bytes.

17046 **RETURN VALUE**

17047 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned.

17048 **ERRORS**

17049 No errors are defined.

17050 **EXAMPLES**

17051 None.

17052 **APPLICATION USAGE**

17053 None.

17054 **RATIONALE**

17055 None.

17056 **FUTURE DIRECTIONS**

17057 None.

17058 **SEE ALSO**17059 *gethostid()*, *uname()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>17060 **CHANGE HISTORY**

17061 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17062 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter from
17063 **socklen_t** to **size_t**.

17064 **NAME**

17065 getitimer, setitimer — get and set value of interval timer

17066 **SYNOPSIS**

17067 XSI #include <sys/time.h>

17068 int getitimer(int which, struct itimerval *value);

17069 int setitimer(int which, const struct itimerval *restrict value,
17070 struct itimerval *restrict ovalue);

17071

17072 **DESCRIPTION**

17073 The *getitimer()* function shall store the current value of the timer specified by *which* into the
 17074 structure pointed to by *value*. The *setitimer()* function shall set the timer specified by *which* to
 17075 the value specified in the structure pointed to by *value*, and if *ovalue* is not a null pointer, store
 17076 the previous value of the timer in the structure pointed to by *ovalue*.

17077 A timer value is defined by the **itimerval** structure, specified in <sys/time.h>. If *it_value* is non-
 17078 zero, it shall indicate the time to the next timer expiration. If *it_interval* is non-zero, it shall
 17079 specify a value to be used in reloading *it_value* when the timer expires. Setting *it_value* to 0 shall
 17080 disable a timer, regardless of the value of *it_interval*. Setting *it_interval* to 0 shall disable a timer
 17081 after its next expiration (assuming *it_value* is non-zero).

17082 Implementations may place limitations on the granularity of timer values. For each interval
 17083 timer, if the requested timer value requires a finer granularity than the implementation supports,
 17084 the actual timer value shall be rounded up to the next supported value.

17085 An XSI-conforming implementation provides each process with at least three interval timers,
 17086 which are indicated by the *which* argument:

17087 ITIMER_REAL Decrements in real time. A SIGALRM signal is delivered when this timer
 17088 expires.

17089 ITIMER_VIRTUAL Decrements in process virtual time. It runs only when the process is
 17090 executing. A SIGVTALRM signal is delivered when it expires.

17091 ITIMER_PROF Decrements both in process virtual time and when the system is running
 17092 on behalf of the process. It is designed to be used by interpreters in
 17093 statistically profiling the execution of interpreted programs. Each time the
 17094 ITIMER_PROF timer expires, the SIGPROF signal is delivered.

17095 The interaction between *setitimer()* and any of *alarm()*, *sleep()*, or *usleep()* is unspecified.

17096 **RETURN VALUE**

17097 Upon successful completion, *getitimer()* or *setitimer()* shall return 0; otherwise, -1 shall be
 17098 returned and *errno* set to indicate the error.

17099 **ERRORS**

17100 The *setitimer()* function shall fail if:

17101 [EINVAL] The *value* argument is not in canonical form. (In canonical form, the number of
 17102 microseconds is a non-negative integer less than 1 000 000 and the number of
 17103 seconds is a non-negative integer.)

17104 The *getitimer()* and *setitimer()* functions may fail if:

17105 [EINVAL] The *which* argument is not recognized.

17106 **EXAMPLES**

17107 None.

17108 **APPLICATION USAGE**

17109 None.

17110 **RATIONALE**

17111 None.

17112 **FUTURE DIRECTIONS**

17113 None.

17114 **SEE ALSO**

17115 *alarm()*, *sleep()*, *timer_getoverrun()*, *ualarm()*, *usleep()*, the Base Definitions volume of
17116 IEEE Std 1003.1-2001, <**signal.h**>, <**sys/time.h**>

17117 **CHANGE HISTORY**

17118 First released in Issue 4, Version 2.

17119 **Issue 5**

17120 Moved from X/OPEN UNIX extension to BASE.

17121 **Issue 6**

17122 The **restrict** keyword is added to the *setitimer()* prototype for alignment with the
17123 ISO/IEC 9899:1999 standard.

17124 **NAME**

17125 getlogin, getlogin_r — get login name

17126 **SYNOPSIS**

17127 #include <unistd.h>

17128 char *getlogin(void);

17129 TSF int getlogin_r(char *name, size_t namesize);

17130

17131 **DESCRIPTION**

17132 The *getlogin()* function shall return a pointer to a string containing the user name associated by
 17133 the login activity with the controlling terminal of the current process. If *getlogin()* returns a non-
 17134 null pointer, then that pointer points to the name that the user logged in under, even if there are
 17135 several login names with the same user ID.

17136 The *getlogin()* function need not be reentrant. A function that is not required to be reentrant is
 17137 not required to be thread-safe.

17138 TSF The *getlogin_r()* function shall put the name associated by the login activity with the controlling
 17139 terminal of the current process in the character array pointed to by *name*. The array is *namesize*
 17140 characters long and should have space for the name and the terminating null character. The
 17141 maximum size of the login name is {LOGIN_NAME_MAX}.

17142 If *getlogin_r()* is successful, *name* points to the name the user used at login, even if there are
 17143 several login names with the same user ID.

17144 **RETURN VALUE**

17145 Upon successful completion, *getlogin()* shall return a pointer to the login name or a null pointer
 17146 if the user's login name cannot be found. Otherwise, it shall return a null pointer and set *errno* to
 17147 indicate the error.

17148 The return value from *getlogin()* may point to static data whose content is overwritten by each
 17149 call.

17150 TSF If successful, the *getlogin_r()* function shall return zero; otherwise, an error number shall be
 17151 returned to indicate the error.

17152 **ERRORS**17153 The *getlogin()* and *getlogin_r()* functions may fail if:

17154 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

17155 [ENFILE] The maximum allowable number of files is currently open in the system.

17156 [ENXIO] The calling process has no controlling terminal.

17157 The *getlogin_r()* function may fail if:

17158 TSF [ERANGE] The value of *namesize* is smaller than the length of the string to be returned
 17159 including the terminating null character.

17160 **EXAMPLES**17161 **Getting the User Login Name**

17162 The following example calls the *getlogin()* function to obtain the name of the user associated
 17163 with the calling process, and passes this information to the *getpwnam()* function to get the
 17164 associated user database information.

```

17165 #include <unistd.h>
17166 #include <sys/types.h>
17167 #include <pwd.h>
17168 #include <stdio.h>
17169 ...
17170 char *lgn;
17171 struct passwd *pw;
17172 ...
17173 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
17174     fprintf(stderr, "Get of user information failed.\n"); exit(1);
17175 }
```

17176 **APPLICATION USAGE**

17177 Three names associated with the current process can be determined: *getpwuid(geteuid())* shall
 17178 return the name associated with the effective user ID of the process; *getlogin()* shall return the
 17179 name associated with the current login activity; and *getpwuid(getuid())* shall return the name
 17180 associated with the real user ID of the process.

17181 The *getlogin_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 17182 possibly using a static data area that may be overwritten by each call.

17183 **RATIONALE**

17184 The *getlogin()* function returns a pointer to the user's login name. The same user ID may be
 17185 shared by several login names. If it is desired to get the user database entry that is used during
 17186 login, the result of *getlogin()* should be used to provide the argument to the *getpwnam()*
 17187 function. (This might be used to determine the user's login shell, particularly where a single user
 17188 has multiple login shells with distinct login names, but the same user ID.)

17189 The information provided by the *cuserid()* function, which was originally defined in the
 17190 POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
17191 getpwuid(geteuid())
```

17192 while the information provided by historical implementations of *cuserid()* can be obtained by:

```
17193 getpwuid(getuid())
```

17194 The thread-safe version of this function places the user name in a user-supplied buffer and
 17195 returns a non-zero value if it fails. The non-thread-safe version may return the name in a static
 17196 data area that may be overwritten by each call.

17197 **FUTURE DIRECTIONS**

17198 None.

17199 **SEE ALSO**

17200 *getpwnam()*, *getpwuid()*, *geteuid()*, *getuid()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 17201 **<limits.h>**, **<unistd.h>**

17202 **CHANGE HISTORY**

17203 First released in Issue 1. Derived from System V Release 2.0.

17204 **Issue 5**

17205 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
17206 VALUE section.

17207 The *getlogin_r()* function is included for alignment with the POSIX Threads Extension.

17208 A note indicating that the *getlogin()* function need not be reentrant is added to the
17209 DESCRIPTION.

17210 **Issue 6**

17211 The *getlogin_r()* function is marked as part of the Thread-Safe Functions option.

17212 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

17213 The following new requirements on POSIX implementations derive from alignment with the
17214 Single UNIX Specification:

17215 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

17216 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.

17217 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
17218 its avoidance of possibly using a static data area.

17219 **NAME**17220 getmsg, getpmsg — receive next message from a STREAMS file (**STREAMS**)17221 **SYNOPSIS**17222 XSR `#include <stropts.h>`

```
17223 int getmsg(int fildes, struct strbuf *restrict ctlptr,
17224           struct strbuf *restrict dataptr, int *restrict flagsp);
17225 int getpmsg(int fildes, struct strbuf *restrict ctlptr,
17226            struct strbuf *restrict dataptr, int *restrict bandp,
17227            int *restrict flagsp);
```

17229 **DESCRIPTION**

17230 The *getmsg()* function shall retrieve the contents of a message located at the head of the
 17231 STREAM head read queue associated with a STREAMS file and place the contents into one or
 17232 more buffers. The message contains either a data part, a control part, or both. The data and
 17233 control parts of the message shall be placed into separate buffers, as described below. The
 17234 semantics of each part are defined by the originator of the message.

17235 The *getpmsg()* function shall be equivalent to *getmsg()*, except that it provides finer control over
 17236 the priority of the messages received. Except where noted, all requirements on *getmsg()* also
 17237 pertain to *getpmsg()*.

17238 The *fildes* argument specifies a file descriptor referencing a STREAMS-based file.

17239 The *ctlptr* and *dataptr* arguments each point to a **strbuf** structure, in which the *buf* member points
 17240 to a buffer in which the data or control information is to be placed, and the *maxlen* member
 17241 indicates the maximum number of bytes this buffer can hold. On return, the *len* member shall
 17242 contain the number of bytes of data or control information actually received. The *len* member
 17243 shall be set to 0 if there is a zero-length control or data part and *len* shall be set to -1 if no data or
 17244 control information is present in the message.

17245 When *getmsg()* is called, *flagsp* should point to an integer that indicates the type of message the
 17246 process is able to receive. This is described further below.

17247 The *ctlptr* argument is used to hold the control part of the message, and *dataptr* is used to hold
 17248 the data part of the message. If *ctlptr* (or *dataptr*) is a null pointer or the *maxlen* member is -1, the
 17249 control (or data) part of the message shall not be processed and shall be left on the STREAM
 17250 head read queue, and if the *ctlptr* (or *dataptr*) is not a null pointer, *len* shall be set to -1. If the
 17251 *maxlen* member is set to 0 and there is a zero-length control (or data) part, that zero-length part
 17252 shall be removed from the read queue and *len* shall be set to 0. If the *maxlen* member is set to 0
 17253 and there are more than 0 bytes of control (or data) information, that information shall be left on
 17254 the read queue and *len* shall be set to 0. If the *maxlen* member in *ctlptr* (or *dataptr*) is less than the
 17255 control (or data) part of the message, *maxlen* bytes shall be retrieved. In this case, the remainder
 17256 of the message shall be left on the STREAM head read queue and a non-zero return value shall
 17257 be provided.

17258 By default, *getmsg()* shall process the first available message on the STREAM head read queue.
 17259 However, a process may choose to retrieve only high-priority messages by setting the integer
 17260 pointed to by *flagsp* to RS_HIPRI. In this case, *getmsg()* shall only process the next message if it is
 17261 a high-priority message. When the integer pointed to by *flagsp* is 0, any available message shall
 17262 be retrieved. In this case, on return, the integer pointed to by *flagsp* shall be set to RS_HIPRI if a
 17263 high-priority message was retrieved, or 0 otherwise.

17264 For *getpmsg()*, the flags are different. The *flagsp* argument points to a bitmask with the following
 17265 mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like *getmsg()*,

17266 *getpmsg()* shall process the first available message on the STREAM head read queue. A process
 17267 may choose to retrieve only high-priority messages by setting the integer pointed to by *flagsp* to
 17268 MSG_HIPRI and the integer pointed to by *bandp* to 0. In this case, *getpmsg()* shall only process
 17269 the next message if it is a high-priority message. In a similar manner, a process may choose to
 17270 retrieve a message from a particular priority band by setting the integer pointed to by *flagsp* to
 17271 MSG_BAND and the integer pointed to by *bandp* to the priority band of interest. In this case,
 17272 *getpmsg()* shall only process the next message if it is in a priority band equal to, or greater than,
 17273 the integer pointed to by *bandp*, or if it is a high-priority message. If a process wants to get the
 17274 first message off the queue, the integer pointed to by *flagsp* should be set to MSG_ANY and the
 17275 integer pointed to by *bandp* should be set to 0. On return, if the message retrieved was a high-
 17276 priority message, the integer pointed to by *flagsp* shall be set to MSG_HIPRI and the integer
 17277 pointed to by *bandp* shall be set to 0. Otherwise, the integer pointed to by *flagsp* shall be set to
 17278 MSG_BAND and the integer pointed to by *bandp* shall be set to the priority band of the message.

17279 If O_NONBLOCK is not set, *getmsg()* and *getpmsg()* shall block until a message of the type
 17280 specified by *flagsp* is available at the front of the STREAM head read queue. If O_NONBLOCK is
 17281 set and a message of the specified type is not present at the front of the read queue, *getmsg()* and
 17282 *getpmsg()* shall fail and set *errno* to [EAGAIN].

17283 If a hangup occurs on the STREAM from which messages are retrieved, *getmsg()* and *getpmsg()*
 17284 shall continue to operate normally, as described above, until the STREAM head read queue is
 17285 empty. Thereafter, they shall return 0 in the *len* members of *ctlptr* and *dataptr*.

17286 RETURN VALUE

17287 Upon successful completion, *getmsg()* and *getpmsg()* shall return a non-negative value. A value
 17288 of 0 indicates that a full message was read successfully. A return value of MORECTL indicates
 17289 that more control information is waiting for retrieval. A return value of MOREDATA indicates
 17290 that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL
 17291 and MOREDATA indicates that both types of information remain. Subsequent *getmsg()* and
 17292 *getpmsg()* calls shall retrieve the remainder of the message. However, if a message of higher
 17293 priority has come in on the STREAM head read queue, the next call to *getmsg()* or *getpmsg()*
 17294 shall retrieve that higher-priority message before retrieving the remainder of the previous
 17295 message.

17296 If the high priority control part of the message is consumed, the message shall be placed back on
 17297 the queue as a normal message of band 0. Subsequent *getmsg()* and *getpmsg()* calls shall retrieve
 17298 the remainder of the message. If, however, a priority message arrives or already exists on the
 17299 STREAM head, the subsequent call to *getmsg()* or *getpmsg()* shall retrieve the higher-priority
 17300 message before retrieving the remainder of the message that was put back.

17301 Upon failure, *getmsg()* and *getpmsg()* shall return -1 and set *errno* to indicate the error.

17302 ERRORS

17303 The *getmsg()* and *getpmsg()* functions shall fail if:

17304	[EAGAIN]	The O_NONBLOCK flag is set and no messages are available.
17305	[EBADF]	The <i>fildes</i> argument is not a valid file descriptor open for reading.
17306	[EBADMSG]	The queued message to be read is not valid for <i>getmsg()</i> or <i>getpmsg()</i> or a 17307 pending file descriptor is at the STREAM head.
17308	[EINTR]	A signal was caught during <i>getmsg()</i> or <i>getpmsg()</i> .
17309	[EINVAL]	An illegal value was specified by <i>flagsp</i> , or the STREAM or multiplexer 17310 referenced by <i>fildes</i> is linked (directly or indirectly) downstream from a 17311 multiplexer.

17312 [ENOSTR] A STREAM is not associated with *fildev*.

17313 In addition, *getmsg()* and *getpmsg()* shall fail if the STREAM head had processed an
17314 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
17315 *getmsg()* or *getpmsg()* but reflects the prior error.

17316 EXAMPLES

17317 Getting Any Message

17318 In the following example, the value of *fd* is assumed to refer to an open STREAMS file. The call
17319 to *getmsg()* retrieves any available message on the associated STREAM-head read queue,
17320 returning control and data information to the buffers pointed to by *ctrlbuf* and *databuf*,
17321 respectively.

```
17322 #include <stropts.h>
17323 ...
17324 int fd;
17325 char ctrlbuf[128];
17326 char databuf[512];
17327 struct strbuf ctrl;
17328 struct strbuf data;
17329 int flags = 0;
17330 int ret;

17331 ctrl.buf = ctrlbuf;
17332 ctrl.maxlen = sizeof(ctrlbuf);

17333 data.buf = databuf;
17334 data.maxlen = sizeof(databuf);

17335 ret = getmsg (fd, &ctrl, &data, &flags);
```

17336 Getting the First Message off the Queue

17337 In the following example, the call to *getpmsg()* retrieves the first available message on the
17338 associated STREAM-head read queue.

```
17339 #include <stropts.h>
17340 ...

17341 int fd;
17342 char ctrlbuf[128];
17343 char databuf[512];
17344 struct strbuf ctrl;
17345 struct strbuf data;
17346 int band = 0;
17347 int flags = MSG_ANY;
17348 int ret;

17349 ctrl.buf = ctrlbuf;
17350 ctrl.maxlen = sizeof(ctrlbuf);

17351 data.buf = databuf;
17352 data.maxlen = sizeof(databuf);

17353 ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```

17354 **APPLICATION USAGE**

17355 None.

17356 **RATIONALE**

17357 None.

17358 **FUTURE DIRECTIONS**

17359 None.

17360 **SEE ALSO**

17361 Section 2.6 (on page 38), *poll()*, *putmsg()*, *read()*, *write()*, the Base Definitions volume of
17362 IEEE Std 1003.1-2001, <**stropts.h**>

17363 **CHANGE HISTORY**

17364 First released in Issue 4, Version 2.

17365 **Issue 5**

17366 Moved from X/OPEN UNIX extension to BASE.

17367 A paragraph regarding “high-priority control parts of messages” is added to the RETURN
17368 VALUE section.

17369 **Issue 6**

17370 This function is marked as part of the XSI STREAMS Option Group.

17371 The **restrict** keyword is added to the *getmsg()* and *getpmsg()* prototypes for alignment with the
17372 ISO/IEC 9899:1999 standard.

17373 **NAME**

17374 getnameinfo — get name information

17375 **SYNOPSIS**

17376 #include <sys/socket.h>

17377 #include <netdb.h>

```
17378 int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
17379 char *restrict node, socklen_t nodelen, char *restrict service,
17380 socklen_t servicelen, int flags);
```

17381 **DESCRIPTION**

17382 The *getnameinfo()* function shall translate a socket address to a node name and service location,
 17383 all of which are defined as in *getaddrinfo()*.

17384 The *sa* argument points to a socket address structure to be translated.

17385 **IPv6** If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible
 17386 IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node
 17387 name for that IPv4 address.

17388 **Note:** The IPv6 unspecified address ("::") and the IPv6 loopback address "::1") are not IPv4-
 17389 compatible addresses. If the address is the IPv6 unspecified address ("::"), a lookup is not
 17390 performed, and the [EAI_NONAME] error is returned.

17391 If the *node* argument is non-NULL and the *nodelen* argument is non-zero, then the *node* argument
 17392 points to a buffer able to contain up to *nodelen* characters that receives the node name as a null-
 17393 terminated string. If the *node* argument is NULL or the *nodelen* argument is zero, the node name
 17394 shall not be returned. If the node's name cannot be located, the numeric form of the address
 17395 contained in the socket address structure pointed to by the *sa* argument is returned instead of its
 17396 name.

17397 If the *service* argument is non-NULL and the *servicelen* argument is non-zero, then the *service*
 17398 argument points to a buffer able to contain up to *servicelen* bytes that receives the service name
 17399 as a null-terminated string. If the *service* argument is NULL or the *servicelen* argument is zero,
 17400 the service name shall not be returned. If the service's name cannot be located, the numeric form
 17401 of the service address (for example, its port number) shall be returned instead of its name.

17402 The *flags* argument is a flag that changes the default actions of the function. By default the fully-
 17403 qualified domain name (FQDN) for the host shall be returned, but:

- 17404 • If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be returned
 17405 for local hosts.
- 17406 • If the flag bit NI_NUMERICHOST is set, the numeric form of the address contained in the
 17407 socket address structure pointed to by the *sa* argument shall be returned instead of its name,
 17408 under all circumstances.
- 17409 • If the flag bit NI_NAMEREQD is set, an error shall be returned if the host's name cannot be
 17410 located.
- 17411 • If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be
 17412 returned (for example, its port number) instead of its name, under all circumstances.
- 17413 • If the flag bit NI_NUMERICSERVICE is set, the numeric form of the scope identifier shall be
 17414 returned (for example, interface index) instead of its name. This flag shall be ignored if the *sa*
 17415 argument is not an IPv6 address.
- 17416 • If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
 17417 (SOCK_DGRAM). The default behavior shall assume that the service is a stream service

17418 (SOCK_STREAM).

17419 **Notes:**

- 17420 1. The two NI_NUMERICxxx flags are required to support the **-n** flag that many
- 17421 commands provide.
- 17422 2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for
- 17423 example, [512,514]) that represent different services for UDP and TCP.

17424 The *getnameinfo()* function shall be thread-safe.

17425 RETURN VALUE

17426 A zero return value for *getnameinfo()* indicates successful completion; a non-zero return value

17427 indicates failure. The possible values for the failures are listed in the ERRORS section.

17428 Upon successful completion, *getnameinfo()* shall return the *node* and *service* names, if requested,

17429 in the buffers provided. The returned names are always null-terminated strings.

17430 ERRORS

17431 The *getnameinfo()* function shall fail and return the corresponding value if:

17432 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

17433 [EAI_BADFLAGS]

17434 The *flags* had an invalid value.

17435 [EAI_FAIL] A non-recoverable error occurred.

17436 [EAI_FAMILY] The address family was not recognized or the address length was invalid for

17437 the specified family.

17438 [EAI_MEMORY] There was a memory allocation failure.

17439 [EAI_NONAME] The name does not resolve for the supplied parameters.

17440 NI_NAMEREQD is set and the host's name cannot be located, or both

17441 *nodename* and *servname* were null.

17442 [EAI_OVERFLOW]

17443 An argument buffer overflowed. The buffer pointed to by the *node* argument

17444 or the *service* argument was too small.

17445 [EAI_SYSTEM] A system error occurred. The error code can be found in *errno*.

17446 EXAMPLES

17447 None.

17448 APPLICATION USAGE

17449 If the returned values are to be used as part of any further name resolution (for example, passed

17450 to *getaddrinfo()*), applications should provide buffers large enough to store any result possible

17451 on the system.

17452 Given the IPv4-mapped IPv6 address "::

17453 lookup as if the socket address structure contains the IPv4 address "1.2.3.4".

17454 RATIONALE

17455 None.

17456 FUTURE DIRECTIONS

17457 None.

17461 **CHANGE HISTORY**

17462 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17463 The **restrict** keyword is added to the *getnameinfo()* prototype for alignment with the
17464 ISO/IEC 9899:1999 standard.

17465 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/23 is applied, making various changes in |
17466 the SYNOPSIS and DESCRIPTION for alignment with IPv6. |

17467 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/24 is applied, adding the |
17468 [EAI_OVERFLOW] error to the ERRORS section. |

17469 **NAME**

17470 getnetbyaddr, getnetbyname, getnetent — network database functions

17471 **SYNOPSIS**

17472 #include <netdb.h>

17473 struct netent *getnetbyaddr(uint32_t net, int type);

17474 struct netent *getnetbyname(const char *name);

17475 struct netent *getnetent(void);

17476 **DESCRIPTION**

17477 Refer to *endnetent()*.

17478 **NAME**

17479 getopt, optarg, opterr, optind, optopt — command option parsing

17480 **SYNOPSIS**

17481 #include <unistd.h>

17482 int getopt(int argc, char * const argv[], const char *optstring);

17483 extern char *optarg;

17484 extern int optind, opterr, optopt;

17485 **DESCRIPTION**

17486 The *getopt()* function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5,
 17487 6, 7, 9, and 10 in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax
 17488 Guidelines.

17489 The parameters *argc* and *argv* are the argument count and argument array as passed to *main()*
 17490 (see *exec*). The argument *optstring* is a string of recognized option characters; if a character is
 17491 followed by a colon, the option takes an argument. All option characters allowed by Utility
 17492 Syntax Guideline 3 are allowed in *optstring*. The implementation may accept other characters as
 17493 an extension.

17494 The variable *optind* is the index of the next element of the *argv[]* vector to be processed. It shall
 17495 be initialized to 1 by the system, and *getopt()* shall update it when it finishes with each element
 17496 of *argv[]*. When an element of *argv[]* contains multiple option characters, it is unspecified how
 17497 *getopt()* determines which options have already been processed.

17498 The *getopt()* function shall return the next option character (if one is found) from *argv* that
 17499 matches a character in *optstring*, if there is one that matches. If the option takes an argument,
 17500 *getopt()* shall set the variable *optarg* to point to the option-argument as follows:

- 17501 1. If the option was the last character in the string pointed to by an element of *argv*, then
 17502 *optarg* shall contain the next element of *argv*, and *optind* shall be incremented by 2. If the
 17503 resulting value of *optind* is greater than *argc*, this indicates a missing option-argument, and
 17504 *getopt()* shall return an error indication.
- 17505 2. Otherwise, *optarg* shall point to the string following the option character in that element of
 17506 *argv*, and *optind* shall be incremented by 1.

17507 If, when *getopt()* is called:

17508 *argv[optind]* is a null pointer
 17509 **argv[optind]* is not the character *-*
 17510 *argv[optind]* points to the string *--*

17511 *getopt()* shall return *-1* without changing *optind*. If:

17512 *argv[optind]* points to the string *--*

17513 *getopt()* shall return *-1* after incrementing *optind*.

17514 If *getopt()* encounters an option character that is not contained in *optstring*, it shall return the
 17515 question-mark (*' ? '*) character. If it detects a missing option-argument, it shall return the colon
 17516 character (*' : '*) if the first character of *optstring* was a colon, or a question-mark character (*' ? '*)
 17517 otherwise. In either case, *getopt()* shall set the variable *optopt* to the option character that caused
 17518 the error. If the application has not set the variable *opterr* to 0 and the first character of *optstring*
 17519 is not a colon, *getopt()* shall also print a diagnostic message to *stderr* in the format specified for
 17520 the *getopts* utility.

17521 The *getopt()* function need not be reentrant. A function that is not required to be reentrant is not
 17522 required to be thread-safe.

17523 **RETURN VALUE**

17524 The *getopt()* function shall return the next option character specified on the command line.

17525 A colon (':') shall be returned if *getopt()* detects a missing argument and the first character of
17526 *optstring* was a colon (':').

17527 A question mark ('?') shall be returned if *getopt()* encounters an option character not in
17528 *optstring* or detects a missing argument and the first character of *optstring* was not a colon (':').

17529 Otherwise, *getopt()* shall return -1 when all command line options are parsed.

17530 **ERRORS**

17531 No errors are defined.

17532 **EXAMPLES**17533 **Parsing Command Line Options**

17534 The following code fragment shows how you might process the arguments for a utility that can
17535 take the mutually-exclusive options *a* and *b* and the options *f* and *o*, both of which require
17536 arguments:

```
17537 #include <unistd.h>
17538
17539 int
17540 main(int argc, char *argv[ ])
17541 {
17542     int c;
17543     int bflg, aflag, errflag;
17544     char *ifile;
17545     char *ofile;
17546     extern char *optarg;
17547     extern int optind, optopt;
17548     . . .
17549     while ((c = getopt(argc, argv, ":abf:o:")) != -1) {
17550         switch(c) {
17551             case 'a':
17552                 if (bflg)
17553                     errflag++;
17554                 else
17555                     aflag++;
17556                 break;
17557             case 'b':
17558                 if (aflag)
17559                     errflag++;
17560                 else {
17561                     bflg++;
17562                     bproc();
17563                 }
17564                 break;
17565             case 'f':
17566                 ifile = optarg;
17567                 break;
17568             case 'o':
17569                 ofile = optarg;
17570                 break;
```

```

17570         case ':':          /* -f or -o without operand */
17571             fprintf(stderr,
17572                 "Option -%c requires an operand\n", optopt);
17573             errflg++;
17574             break;
17575         case '?':
17576             fprintf(stderr,
17577                 "Unrecognized option: -%c\n", optopt);
17578             errflg++;
17579     }
17580 }
17581 if (errflg) {
17582     fprintf(stderr, "usage: . . . ");
17583     exit(2);
17584 }
17585 for ( ; optind < argc; optind++) {
17586     if (access(argv[optind], R_OK)) {
17587         . . .
17588     }

```

17589 This code accepts any of the following as equivalent:

```

17590 cmd -ao arg path path
17591 cmd -a -o arg path path
17592 cmd -o arg -a path path
17593 cmd -a -o arg -- path path
17594 cmd -a -oarg path path
17595 cmd -aoarg path path

```

17596 **Checking Options and Arguments**

17597 The following example parses a set of command line options and prints messages to standard
 17598 output for each option and argument that it encounters.

```

17599 #include <unistd.h>
17600 #include <stdio.h>
17601 ...
17602 int c;
17603 char *filename;
17604 extern char *optarg;
17605 extern int optind, optopt, opterr;
17606 ...
17607 while ((c = getopt(argc, argv, ":abf:")) != -1) {
17608     switch(c) {
17609         case 'a':
17610             printf("a is set\n");
17611             break;
17612         case 'b':
17613             printf("b is set\n");
17614             break;
17615         case 'f':
17616             filename = optarg;
17617             printf("filename is %s\n", filename);
17618             break;

```

```

17619         case ':':
17620             printf("-%c without filename\n", optopt);
17621             break;
17622         case '?':
17623             printf("unknown arg %c\n", optopt);
17624             break;
17625     }
17626 }

```

17627 **Selecting Options from the Command Line**

17628 The following example selects the type of database routines the user wants to use based on the
 17629 *Options* argument.

```

17630 #include <unistd.h>
17631 #include <string.h>
17632 ...
17633 char *Options = "hdbtl";
17634 ...
17635 int dbtype, i;
17636 char c;
17637 char *st;
17638 ...
17639 dbtype = 0;
17640 while ((c = getopt(argc, argv, Options)) != -1) {
17641     if ((st = strchr(Options, c)) != NULL) {
17642         dbtype = st - Options;
17643         break;
17644     }
17645 }

```

17646 **APPLICATION USAGE**

17647 The *getopt()* function is only required to support option characters included in Utility Syntax
 17648 Guideline 3. Many historical implementations of *getopt()* support other characters as options.
 17649 This is an allowed extension, but applications that use extensions are not maximally portable.
 17650 Note that support for multi-byte option characters is only possible when such characters can be
 17651 represented as type **int**.

17652 **RATIONALE**

17653 The *optopt* variable represents historical practice and allows the application to obtain the identity
 17654 of the invalid option.

17655 The description has been written to make it clear that *getopt()*, like the *getopts* utility, deals with
 17656 option-arguments whether separated from the option by <blank>s or not. Note that the
 17657 requirements on *getopt()* and *getopts* are more stringent than the Utility Syntax Guidelines.

17658 The *getopt()* function shall return **-1**, rather than EOF, so that **<stdio.h>** is not required.

17659 The special significance of a colon as the first character of *optstring* makes *getopt()* consistent
 17660 with the *getopts* utility. It allows an application to make a distinction between a missing
 17661 argument and an incorrect option letter without having to examine the option letter. It is true
 17662 that a missing argument can only be detected in one case, but that is a case that has to be
 17663 considered.

17664 **FUTURE DIRECTIONS**

17665 None.

17666 **SEE ALSO**

17667 *exec*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>, the Shell and Utilities
17668 volume of IEEE Std 1003.1-2001

17669 **CHANGE HISTORY**

17670 First released in Issue 1. Derived from Issue 1 of the SVID.

17671 **Issue 5**17672 A note indicating that the *getopt()* function need not be reentrant is added to the DESCRIPTION.17673 **Issue 6**

17674 IEEE PASC Interpretation 1003.2 #150 is applied.

17675 **NAME**

17676 getpeername — get the name of the peer socket

17677 **SYNOPSIS**

17678 #include <sys/socket.h>

17679 int getpeername(int *socket*, struct sockaddr *restrict *address*,
17680 socklen_t *restrict *address_len*);

17681 **DESCRIPTION**

17682 The *getpeername()* function shall retrieve the peer address of the specified socket, store this
17683 address in the **sockaddr** structure pointed to by the *address* argument, and store the length of this
17684 address in the object pointed to by the *address_len* argument.

17685 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
17686 the stored address shall be truncated.

17687 If the protocol permits connections by unbound clients, and the peer is not bound, then the value
17688 stored in the object pointed to by *address* is unspecified.

17689 **RETURN VALUE**

17690 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
17691 indicate the error.

17692 **ERRORS**

17693 The *getpeername()* function shall fail if:

17694 [EBADF] The *socket* argument is not a valid file descriptor.

17695 [EINVAL] The socket has been shut down.

17696 [ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.

17697 [ENOTSOCK] The *socket* argument does not refer to a socket.

17698 [EOPNOTSUPP] The operation is not supported for the socket protocol.

17699 The *getpeername()* function may fail if:

17700 [ENOBUFS] Insufficient resources were available in the system to complete the call.

17701 **EXAMPLES**

17702 None.

17703 **APPLICATION USAGE**

17704 None.

17705 **RATIONALE**

17706 None.

17707 **FUTURE DIRECTIONS**

17708 None.

17709 **SEE ALSO**

17710 *accept()*, *bind()*, *getsockname()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,
17711 <sys/socket.h>

17712 **CHANGE HISTORY**

17713 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

17714 The **restrict** keyword is added to the *getpeername()* prototype for alignment with the
17715 ISO/IEC 9899:1999 standard.

17716 **NAME**

17717 getpgid — get the process group ID for a process

17718 **SYNOPSIS**

17719 xSI #include <unistd.h>

17720 pid_t getpgid(pid_t pid);

17721

17722 **DESCRIPTION**

17723 The *getpgid()* function shall return the process group ID of the process whose process ID is equal
 17724 to *pid*. If *pid* is equal to 0, *getpgid()* shall return the process group ID of the calling process.

17725 **RETURN VALUE**

17726 Upon successful completion, *getpgid()* shall return a process group ID. Otherwise, it shall return
 17727 (**pid_t**)−1 and set *errno* to indicate the error.

17728 **ERRORS**17729 The *getpgid()* function shall fail if:

17730 [EPERM] The process whose process ID is equal to *pid* is not in the same session as the
 17731 calling process, and the implementation does not allow access to the process
 17732 group ID of that process from the calling process.

17733 [ESRCH] There is no process with a process ID equal to *pid*.

17734 The *getpgid()* function may fail if:

17735 [EINVAL] The value of the *pid* argument is invalid.

17736 **EXAMPLES**

17737 None.

17738 **APPLICATION USAGE**

17739 None.

17740 **RATIONALE**

17741 None.

17742 **FUTURE DIRECTIONS**

17743 None.

17744 **SEE ALSO**

17745 *exec*, *fork()*, *getpgrp()*, *getpid()*, *getsid()*, *setpgid()*, *setsid()*, the Base Definitions volume of
 17746 IEEE Std 1003.1-2001, <**unistd.h**>

17747 **CHANGE HISTORY**

17748 First released in Issue 4, Version 2.

17749 **Issue 5**

17750 Moved from X/OPEN UNIX extension to BASE.

17751 **NAME**

17752 getpgrp — get the process group ID of the calling process

17753 **SYNOPSIS**

17754 #include <unistd.h>

17755 pid_t getpgrp(void);

17756 **DESCRIPTION**

17757 The *getpgrp()* function shall return the process group ID of the calling process.

17758 **RETURN VALUE**

17759 The *getpgrp()* function shall always be successful and no return value is reserved to indicate an error.

17761 **ERRORS**

17762 No errors are defined.

17763 **EXAMPLES**

17764 None.

17765 **APPLICATION USAGE**

17766 None.

17767 **RATIONALE**

17768 4.3 BSD provides a *getpgrp()* function that returns the process group ID for a specified process.
17769 Although this function supports job control, all known job control shells always specify the
17770 calling process with this function. Thus, the simpler System V *getpgrp()* suffices, and the added
17771 complexity of the 4.3 BSD *getpgrp()* is provided by the XSI extension *getpgid()*.

17772 **FUTURE DIRECTIONS**

17773 None.

17774 **SEE ALSO**

17775 *exec*, *fork()*, *getpgid()*, *getpid()*, *getppid()*, *kill()*, *setpgid()*, *setsid()*, the Base Definitions volume of
17776 IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

17777 **CHANGE HISTORY**

17778 First released in Issue 1. Derived from Issue 1 of the SVID.

17779 **Issue 6**

17780 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

17781 The following new requirements on POSIX implementations derive from alignment with the
17782 Single UNIX Specification:

- 17783
 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
17784 required for conforming implementations of previous POSIX specifications, it was not
17785 required for UNIX applications.

17786 **NAME**

17787 `getpid` — get the process ID

17788 **SYNOPSIS**

17789 `#include <unistd.h>`

17790 `pid_t getpid(void);`

17791 **DESCRIPTION**

17792 The `getpid()` function shall return the process ID of the calling process.

17793 **RETURN VALUE**

17794 The `getpid()` function shall always be successful and no return value is reserved to indicate an
17795 error.

17796 **ERRORS**

17797 No errors are defined.

17798 **EXAMPLES**

17799 None.

17800 **APPLICATION USAGE**

17801 None.

17802 **RATIONALE**

17803 None.

17804 **FUTURE DIRECTIONS**

17805 None.

17809 **CHANGE HISTORY**

17810 First released in Issue 1. Derived from Issue 1 of the SVID.

17811 **Issue 6**

17812 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

17813 The following new requirements on POSIX implementations derive from alignment with the
17814 Single UNIX Specification:

- 17815 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
17816 required for conforming implementations of previous POSIX specifications, it was not
17817 required for UNIX applications.

17818 **NAME**

17819 getpmsg — receive next message from a STREAMS file

17820 **SYNOPSIS**

17821 xSI #include <stropts.h>

```
17822       int getpmsg(int fildev, struct strbuf *restrict ctlptr,  
17823                struct strbuf *restrict dataptr, int *restrict bandp,  
17824                int *restrict flagsp);
```

17825

17826 **DESCRIPTION**17827 Refer to *getmsg()*.

17828 **NAME**

17829 getppid — get the parent process ID

17830 **SYNOPSIS**

17831 #include <unistd.h>

17832 pid_t getppid(void);

17833 **DESCRIPTION**

17834 The *getppid()* function shall return the parent process ID of the calling process.

17835 **RETURN VALUE**

17836 The *getppid()* function shall always be successful and no return value is reserved to indicate an
17837 error.

17838 **ERRORS**

17839 No errors are defined.

17840 **EXAMPLES**

17841 None.

17850 IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

17851 **CHANGE HISTORY**

17852 First released in Issue 1. Derived from Issue 1 of the SVID.

17853 **Issue 6**

17854 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

17855 The following new requirements on POSIX implementations derive from alignment with the
17856 Single UNIX Specification:

- 17857
 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
17858 required for conforming implementations of previous POSIX specifications, it was not
17859 required for UNIX applications.

17860 **NAME**

17861 getpriority, setpriority — get and set the nice value

17862 **SYNOPSIS**

17863 xSI #include <sys/resource.h>

17864 int getpriority(int which, id_t who);

17865 int setpriority(int which, id_t who, int value);

17866

17867 **DESCRIPTION**

17868 The *getpriority()* function shall obtain the nice value of a process, process group, or user. The
 17869 *setpriority()* function shall set the nice value of a process, process group, or user to
 17870 *value*+{NZERO}.

17871 Target processes are specified by the values of the *which* and *who* arguments. The *which*
 17872 argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER,
 17873 indicating that the *who* argument is to be interpreted as a process ID, a process group ID, or an
 17874 effective user ID, respectively. A 0 value for the *who* argument specifies the current process,
 17875 process group, or user.

17876 The nice value set with *setpriority()* shall be applied to the process. If the process is multi-
 17877 threaded, the nice value shall affect all system scope threads in the process.

17878 If more than one process is specified, *getpriority()* shall return value {NZERO} less than the
 17879 lowest nice value pertaining to any of the specified processes, and *setpriority()* shall set the nice
 17880 values of all of the specified processes to *value*+{NZERO}.

17881 The default nice value is {NZERO}; lower nice values shall cause more favorable scheduling.
 17882 While the range of valid nice values is [0,{NZERO}*2-1], implementations may enforce more
 17883 restrictive limits. If *value*+{NZERO} is less than the system's lowest supported nice value,
 17884 *setpriority()* shall set the nice value to the lowest supported value; if *value*+{NZERO} is greater
 17885 than the system's highest supported nice value, *setpriority()* shall set the nice value to the highest
 17886 supported value.

17887 Only a process with appropriate privileges can lower its nice value.

17888 PS|TPS Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to
 17889 *setpriority()*. This is not considered an error. A process which subsequently reverts to
 17890 SCHED_OTHER need not have its priority affected by such a *setpriority()* call.

17891 The effect of changing the nice value may vary depending on the process-scheduling algorithm
 17892 in effect.

17893 Since *getpriority()* can return the value -1 on successful completion, it is necessary to set *errno* to
 17894 0 prior to a call to *getpriority()*. If *getpriority()* returns the value -1, then *errno* can be checked to
 17895 see if an error occurred or if the value is a legitimate nice value.

17896 **RETURN VALUE**

17897 Upon successful completion, *getpriority()* shall return an integer in the range -{NZERO} to
 17898 {NZERO}-1. Otherwise, -1 shall be returned and *errno* set to indicate the error.

17899 Upon successful completion, *setpriority()* shall return 0; otherwise, -1 shall be returned and *errno*
 17900 set to indicate the error.

17901 **ERRORS**

17902 The *getpriority()* and *setpriority()* functions shall fail if:

17903 [ESRCH] No process could be located using the *which* and *who* argument values
 17904 specified.

17905 [EINVAL] The value of the *which* argument was not recognized, or the value of the *who*
 17906 argument is not a valid process ID, process group ID, or user ID.

17907 In addition, *setpriority()* may fail if:

17908 [EPERM] A process was located, but neither the real nor effective user ID of the
 17909 executing process match the effective user ID of the process whose nice value
 17910 is being changed.

17911 [EACCES] A request was made to change the nice value to a lower numeric value and
 17912 the current process does not have appropriate privileges.

17913 EXAMPLES

17914 Using *getpriority()*

17915 The following example returns the current scheduling priority for the process ID returned by the
 17916 call to *getpid()*.

```
17917 #include <sys/resource.h>
17918 ...
17919 int which = PRIO_PROCESS;
17920 id_t pid;
17921 int ret;

17922 pid = getpid();
17923 ret = getpriority(which, pid);
```

17924 Using *setpriority()*

17925 The following example sets the priority for the current process ID to -20.

```
17926 #include <sys/resource.h>
17927 ...
17928 int which = PRIO_PROCESS;
17929 id_t pid;
17930 int priority = -20;
17931 int ret;

17932 pid = getpid();
17933 ret = setpriority(which, pid, priority);
```

17934 APPLICATION USAGE

17935 The *getpriority()* and *setpriority()* functions work with an offset nice value (nice value
 17936 $-\{\text{NZERO}\}$). The nice value is in the range $[0, 2*\{\text{NZERO}\} - 1]$, while the return value for
 17937 *getpriority()* and the third parameter for *setpriority()* are in the range $[-\{\text{NZERO}\}, \{\text{NZERO}\} - 1]$.

17938 RATIONALE

17939 None.

17940 FUTURE DIRECTIONS

17941 None.

17942 SEE ALSO

17943 *nice()*, *sched_get_priority_max()*, *sched_setscheduler()*, the Base Definitions volume of
 17944 IEEE Std 1003.1-2001, **<sys/resource.h>**

17945 **CHANGE HISTORY**

17946 First released in Issue 4, Version 2.

17947 **Issue 5**

17948 Moved from X/OPEN UNIX extension to BASE.

17949 The DESCRIPTION is reworded in terms of the nice value rather than *priority* to avoid confusion
17950 with functionality in the POSIX Realtime Extension.

17951 NAME

17952 getprotobyname, getprotobynumber, getprotent — network protocol database functions

17953 SYNOPSIS

17954 #include <netdb.h>

17955 struct protoent *getprotobyname(const char *name);

17956 struct protoent *getprotobynumber(int proto);

17957 struct protoent *getprotoent(void);

17958 DESCRIPTION

17959 Refer to *endprotoent()*.

17960 **NAME**

17961 getpwent — get user database entry

17962 **SYNOPSIS**

17963 xSI #include <pwd.h>

17964 struct passwd *getpwent(void);

17965

17966 **DESCRIPTION**17967 Refer to *endpwent()*.

17968 **NAME**

17969 getpwnam, getpwnam_r — search user database for a name

17970 **SYNOPSIS**

17971 #include <pwd.h>

17972 struct passwd *getpwnam(const char *name);

17973 TSF int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,

17974 size_t bufsize, struct passwd **result);

17975

17976 **DESCRIPTION**17977 The *getpwnam()* function shall search the user database for an entry with a matching *name*.17978 The *getpwnam()* function need not be reentrant. A function that is not required to be reentrant is
17979 not required to be thread-safe.17980 Applications wishing to check for error situations should set *errno* to 0 before calling
17981 *getpwnam()*. If *getpwnam()* returns a null pointer and *errno* is non-zero, an error occurred.17982 TSF The *getpwnam_r()* function shall update the **passwd** structure pointed to by *pwd* and store a
17983 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
17984 from the user database with a matching *name*. Storage referenced by the structure is allocated
17985 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The
17986 maximum size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX}
17987 *sysconf()* parameter. A NULL pointer shall be returned at the location pointed to by *result* on
17988 error or if the requested entry is not found.17989 **RETURN VALUE**17990 The *getpwnam()* function shall return a pointer to a **struct passwd** with the structure as defined
17991 in <pwd.h> with a matching entry if found. A null pointer shall be returned if the requested
17992 entry is not found, or an error occurs. On error, *errno* shall be set to indicate the error.17993 The return value may point to a static area which is overwritten by a subsequent call to
17994 *getpwent()*, *getpwnam()*, or *getpwuid()*.17995 TSF If successful, the *getpwnam_r()* function shall return zero; otherwise, an error number shall be
17996 returned to indicate the error.17997 **ERRORS**17998 The *getpwnam()* and *getpwnam_r()* functions may fail if:

17999 [EIO] An I/O error has occurred.

18000 [EINTR] A signal was caught during *getpwnam()*.

18001 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

18002 [ENFILE] The maximum allowable number of files is currently open in the system.

18003 The *getpwnam_r()* function may fail if:18004 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to
18005 be referenced by the resulting **passwd** structure.

18006 **EXAMPLES**18007 **Getting an Entry for the Login Name**

18008 The following example uses the *getlogin()* function to return the name of the user who logged in;
 18009 this information is passed to the *getpwnam()* function to get the user database entry for that user.

```

18010 #include <sys/types.h>
18011 #include <pwd.h>
18012 #include <unistd.h>
18013 #include <stdio.h>
18014 #include <stdlib.h>
18015 ...
18016 char *lgn;
18017 struct passwd *pw;
18018 ...
18019 if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
18020     fprintf(stderr, "Get of user information failed.\n"); exit(1);
18021 }
18022 ...

```

18023 **APPLICATION USAGE**

18024 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns
 18025 the name associated with the effective user ID of the process; *getlogin()* returns the name
 18026 associated with the current login activity; and *getpwuid(getuid())* returns the name associated
 18027 with the real user ID of the process.

18028 The *getpwnam_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 18029 possibly using a static data area that may be overwritten by each call.

18030 **RATIONALE**

18031 None.

18032 **FUTURE DIRECTIONS**

18033 None.

18034 **SEE ALSO**

18035 *getpwuid()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<limits.h>**, **<pwd.h>**,
 18036 **<sys/types.h>**

18037 **CHANGE HISTORY**

18038 First released in Issue 1. Derived from System V Release 2.0.

18039 **Issue 5**

18040 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 18041 VALUE section.

18042 The *getpwnam_r()* function is included for alignment with the POSIX Threads Extension.

18043 A note indicating that the *getpwnam()* function need not be reentrant is added to the
 18044 DESCRIPTION.

18045 **Issue 6**

18046 The *getpwnam_r()* function is marked as part of the Thread-Safe Functions option.

18047 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION
 18048 describing matching the *name*.

- 18049 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.
- 18050 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
- 18051 The following new requirements on POSIX implementations derive from alignment with the
- 18052 Single UNIX Specification:
- 18053 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 - 18054 required for conforming implementations of previous POSIX specifications, it was not
 - 18055 required for UNIX applications.
 - 18056 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
 - 18057 • The [EMFILE], [ENFILE], and [ENXIO] optional error conditions are added.
- 18058 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
- 18059 its avoidance of possibly using a static data area.
- 18060 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
- 18061 buffer from *bufsize* characters to bytes.

18062 **NAME**

18063 getpwuid, getpwuid_r — search user database for a user ID

18064 **SYNOPSIS**

18065 #include <pwd.h>

18066 struct passwd *getpwuid(uid_t uid);

18067 TSF int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer,
18068 size_t bufsize, struct passwd **result);

18069

18070 **DESCRIPTION**18071 The *getpwuid()* function shall search the user database for an entry with a matching *uid*.18072 The *getpwuid()* function need not be reentrant. A function that is not required to be reentrant is
18073 not required to be thread-safe.18074 Applications wishing to check for error situations should set *errno* to 0 before calling *getpwuid()*.
18075 If *getpwuid()* returns a null pointer and *errno* is set to non-zero, an error occurred.18076 TSF The *getpwuid_r()* function shall update the **passwd** structure pointed to by *pwd* and store a
18077 pointer to that structure at the location pointed to by *result*. The structure shall contain an entry
18078 from the user database with a matching *uid*. Storage referenced by the structure is allocated
18079 from the memory provided with the *buffer* parameter, which is *bufsize* bytes in size. The
18080 maximum size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX}
18081 sysconf() parameter. A NULL pointer shall be returned at the location pointed to by *result* on
18082 error or if the requested entry is not found.18083 **RETURN VALUE**18084 The *getpwuid()* function shall return a pointer to a **struct passwd** with the structure as defined in
18085 <**pwd.h**> with a matching entry if found. A null pointer shall be returned if the requested entry
18086 is not found, or an error occurs. On error, *errno* shall be set to indicate the error.18087 The return value may point to a static area which is overwritten by a subsequent call to
18088 *getpwent()*, *getpwnam()*, or *getpwuid()*.18089 TSF If successful, the *getpwuid_r()* function shall return zero; otherwise, an error number shall be
18090 returned to indicate the error.18091 **ERRORS**18092 The *getpwuid()* and *getpwuid_r()* functions may fail if:

18093 [EIO] An I/O error has occurred.

18094 [EINTR] A signal was caught during *getpwuid()*.

18095 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

18096 [ENFILE] The maximum allowable number of files is currently open in the system.

18097 The *getpwuid_r()* function may fail if:18098 TSF [ERANGE] Insufficient storage was supplied via *buffer* and *bufsize* to contain the data to
18099 be referenced by the resulting **passwd** structure.

18100 **EXAMPLES**18101 **Getting an Entry for the Root User**

18102 The following example gets the user database entry for the user with user ID 0 (root).

```
18103 #include <sys/types.h>
18104 #include <pwd.h>
18105 ...
18106 uid_t id = 0;
18107 struct passwd *pwd;
18108 pwd = getpwuid(id);
```

18109 **Finding the Name for the Effective User ID**

18110 The following example defines *pws* as a pointer to a structure of type **passwd**, which is used to
 18111 store the structure pointer returned by the call to the *getpwuid()* function. The *geteuid()* function
 18112 shall return the effective user ID of the calling process; this is used as the search criteria for the
 18113 *getpwuid()* function. The call to *getpwuid()* shall return a pointer to the structure containing that
 18114 user ID value.

```
18115 #include <unistd.h>
18116 #include <sys/types.h>
18117 #include <pwd.h>
18118 ...
18119 struct passwd *pws;
18120 pws = getpwuid(geteuid());
```

18121 **Finding an Entry in the User Database**

18122 The following example uses *getpwuid()* to search the user database for a user ID that was
 18123 previously stored in a **stat** structure, then prints out the user name if it is found. If the user is not
 18124 found, the program prints the numeric value of the user ID for the entry.

```
18125 #include <sys/types.h>
18126 #include <pwd.h>
18127 #include <stdio.h>
18128 ...
18129 struct stat statbuf;
18130 struct passwd *pwd;
18131 ...
18132 if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
18133     printf(" %-8.8s", pwd->pw_name);
18134 else
18135     printf(" %-8d", statbuf.st_uid);
```

18136 **APPLICATION USAGE**

18137 Three names associated with the current process can be determined: *getpwuid(geteuid())* returns
 18138 the name associated with the effective user ID of the process; *getlogin()* returns the name
 18139 associated with the current login activity; and *getpwuid(getuid())* returns the name associated
 18140 with the real user ID of the process.

18141 The *getpwuid_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 18142 possibly using a static data area that may be overwritten by each call.

18143 **RATIONALE**

18144 None.

18145 **FUTURE DIRECTIONS**

18146 None.

18147 **SEE ALSO**

18148 *getpwnam()*, *geteuid()*, *getuid()*, *getlogin()*, the Base Definitions volume of IEEE Std 1003.1-2001,

18150 **CHANGE HISTORY**

18151 First released in Issue 1. Derived from System V Release 2.0.

18152 **Issue 5**

18153 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
 18154 VALUE section.

18155 The *getpwuid_r()* function is included for alignment with the POSIX Threads Extension.

18156 A note indicating that the *getpwuid()* function need not be reentrant is added to the
 18157 DESCRIPTION.

18158 **Issue 6**18159 The *getpwuid_r()* function is marked as part of the Thread-Safe Functions option.

18160 The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION
 18161 describing matching the *uid*.

18162 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

18163 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

18164 The following new requirements on POSIX implementations derive from alignment with the
 18165 Single UNIX Specification:

18166 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 18167 required for conforming implementations of previous POSIX specifications, it was not
 18168 required for UNIX applications.

18169 • In the RETURN VALUE section, the requirement to set *errno* on error is added.

18170 • The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.

18171 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 18172 its avoidance of possibly using a static data area.

18173 IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
 18174 buffer from *bufsize* characters to bytes.

18175 **NAME**

18176 getrlimit, setrlimit — control maximum resource consumption

18177 **SYNOPSIS**

18178 xSI #include <sys/resource.h>

18179 int getrlimit(int resource, struct rlimit *rlp);

18180 int setrlimit(int resource, const struct rlimit *rlp);

18181

18182 **DESCRIPTION**18183 The *getrlimit()* function shall get, and the *setrlimit()* function shall set, limits on the consumption
18184 of a variety of resources.

18185 Each call to either *getrlimit()* or *setrlimit()* identifies a specific resource to be operated upon as
18186 well as a resource limit. A resource limit is represented by an **rlimit** structure. The *rlim_cur*
18187 member specifies the current or soft limit and the *rlim_max* member specifies the maximum or
18188 hard limit. Soft limits may be changed by a process to any value that is less than or equal to the
18189 hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or
18190 equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both
18191 hard and soft limits can be changed in a single call to *setrlimit()* subject to the constraints
18192 described above.

18193 The value RLIM_INFINITY, defined in <sys/resource.h>, shall be considered to be larger than
18194 any other limit value. If a call to *getrlimit()* returns RLIM_INFINITY for a resource, it means the
18195 implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any
18196 resource limit value on a successful call to *setrlimit()* shall inhibit enforcement of that resource
18197 limit.

18198 The following resources are defined:

18199 RLIMIT_CORE This is the maximum size of a **core** file, in bytes, that may be created by a
18200 process. A limit of 0 shall prevent the creation of a **core** file. If this limit is
18201 exceeded, the writing of a **core** file shall terminate at this size.

18202 RLIMIT_CPU This is the maximum amount of CPU time, in seconds, used by a process.
18203 If this limit is exceeded, SIGXCPU shall be generated for the process. If
18204 the process is catching or ignoring SIGXCPU, or all threads belonging to
18205 that process are blocking SIGXCPU, the behavior is unspecified.

18206 RLIMIT_DATA This is the maximum size of a process' data segment, in bytes. If this limit
18207 is exceeded, the *malloc()* function shall fail with *errno* set to [ENOMEM].

18208 RLIMIT_FSIZE This is the maximum size of a file, in bytes, that may be created by a
18209 process. If a write or truncate operation would cause this limit to be
18210 exceeded, SIGXFSZ shall be generated for the thread. If the thread is
18211 blocking, or the process is catching or ignoring SIGXFSZ, continued
18212 attempts to increase the size of a file from end-of-file to beyond the limit
18213 shall fail with *errno* set to [EFBIG].

18214 RLIMIT_NOFILE This is a number one greater than the maximum value that the system
18215 may assign to a newly-created descriptor. If this limit is exceeded,
18216 functions that allocate a file descriptor shall fail with *errno* set to
18217 [EMFILE]. This limit constrains the number of file descriptors that a
18218 process may allocate.

18219 RLIMIT_STACK This is the maximum size of a process' stack, in bytes. The
18220 implementation does not automatically grow the stack beyond this limit.

18221		If this limit is exceeded, SIGSEGV shall be generated for the thread. If the
18222		thread is blocking SIGSEGV, or the process is ignoring or catching
18223		SIGSEGV and has not made arrangements to use an alternate stack, the
18224		disposition of SIGSEGV shall be set to SIG_DFL before it is generated.
18225	RLIMIT_AS	This is the maximum size of a process' total available memory, in bytes. If
18226		this limit is exceeded, the <i>malloc()</i> and <i>mmap()</i> functions shall fail with
18227		<i>errno</i> set to [ENOMEM]. In addition, the automatic stack growth fails
18228		with the effects outlined above.
18229		When using the <i>getrlimit()</i> function, if a resource limit can be represented correctly in an object
18230		of type rlim_t , then its representation is returned; otherwise, if the value of the resource limit is
18231		equal to that of the corresponding saved hard limit, the value returned shall be
18232		RLIM_SAVED_MAX; otherwise, the value returned shall be RLIM_SAVED_CUR.
18233		When using the <i>setrlimit()</i> function, if the requested new limit is RLIM_INFINITY, the new limit
18234		shall be “no limit”; otherwise, if the requested new limit is RLIM_SAVED_MAX, the new limit
18235		shall be the corresponding saved hard limit; otherwise, if the requested new limit is
18236		RLIM_SAVED_CUR, the new limit shall be the corresponding saved soft limit; otherwise, the
18237		new limit shall be the requested value. In addition, if the corresponding saved limit can be
18238		represented correctly in an object of type rlim_t then it shall be overwritten with the new limit.
18239		The result of setting a limit to RLIM_SAVED_MAX or RLIM_SAVED_CUR is unspecified unless
18240		a previous call to <i>getrlimit()</i> returned that value as the soft or hard limit for the corresponding
18241		resource limit.
18242		The determination of whether a limit can be correctly represented in an object of type rlim_t is
18243		implementation-defined. For example, some implementations permit a limit whose value is
18244		greater than RLIM_INFINITY and others do not.
18245		The <i>exec</i> family of functions shall cause resource limits to be saved.
18246	RETURN VALUE	
18247		Upon successful completion, <i>getrlimit()</i> and <i>setrlimit()</i> shall return 0. Otherwise, these functions
18248		shall return -1 and set <i>errno</i> to indicate the error.
18249	ERRORS	
18250		The <i>getrlimit()</i> and <i>setrlimit()</i> functions shall fail if:
18251	[EINVAL]	An invalid <i>resource</i> was specified; or in a <i>setrlimit()</i> call, the new <i>rlim_cur</i>
18252		exceeds the new <i>rlim_max</i> .
18253	[EPERM]	The limit specified to <i>setrlimit()</i> would have raised the maximum limit value,
18254		and the calling process does not have appropriate privileges.
18255		The <i>setrlimit()</i> function may fail if:
18256	[EINVAL]	The limit specified cannot be lowered because current usage is already higher
18257		than the limit.

18258 **EXAMPLES**

18259 None.

18260 **APPLICATION USAGE**

18261 If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value
 18262 of {_POSIX_OPEN_MAX} from <limits.h>, unexpected behavior may occur. |

18263 If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the
 18264 highest currently open file descriptor +1, unexpected behavior may occur. |

18265 **RATIONALE**

18266 None.

18267 **FUTURE DIRECTIONS**

18268 None.

18274 **Issue 5**

18275 Moved from X/OPEN UNIX extension to BASE.

18276 An APPLICATION USAGE section is added.

18277 Large File Summit extensions are added.

18278 **Issue 6**

18279 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for |
 18280 RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing |
 18281 with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of |
 18282 a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest |
 18283 currently open file descriptor +1. |

18284 **NAME**

18285 getrusage — get information about resource utilization

18286 **SYNOPSIS**

18287 xSI #include <sys/resource.h>

18288 int getrusage(int *who*, struct rusage **r_usage*);

18289

18290 **DESCRIPTION**

18291 The *getrusage()* function shall provide measures of the resources used by the current process or
 18292 its terminated and waited-for child processes. If the value of the *who* argument is
 18293 RUSAGE_SELF, information shall be returned about resources used by the current process. If the
 18294 value of the *who* argument is RUSAGE_CHILDREN, information shall be returned about
 18295 resources used by the terminated and waited-for children of the current process. If the child is
 18296 never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to
 18297 SIG_IGN), the resource information for the child process is discarded and not included in the
 18298 resource information provided by *getrusage()*.

18299 The *r_usage* argument is a pointer to an object of type **struct rusage** in which the returned
 18300 information is stored.

18301 **RETURN VALUE**

18302 Upon successful completion, *getrusage()* shall return 0; otherwise, -1 shall be returned and *errno*
 18303 set to indicate the error.

18304 **ERRORS**18305 The *getrusage()* function shall fail if:

18306 [EINVAL] The value of the *who* argument is not valid.

18307 **EXAMPLES**18308 **Using getrusage()**

18309 The following example returns information about the resources used by the current process.

```
18310       #include <sys/resource.h>
18311       ...
18312       int who = RUSAGE_SELF;
18313       struct rusage usage;
18314       int ret;

18315       ret = getrusage(who, &usage);
```

18316 **APPLICATION USAGE**

18317 None.

18318 **RATIONALE**

18319 None.

18320 **FUTURE DIRECTIONS**

18321 None.

18322 **SEE ALSO**

18323 *exit()*, *sigaction()*, *time()*, *times()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 18324 <sys/resource.h>

18325 **CHANGE HISTORY**

18326 First released in Issue 4, Version 2.

18327 **Issue 5**

18328 Moved from X/OPEN UNIX extension to BASE.

18329 **NAME**

18330 gets — get a string from a stdin stream

18331 **SYNOPSIS**

18332 #include <stdio.h>

18333 char *gets(char *s);

18334 **DESCRIPTION**

18335 CX The functionality described on this reference page is aligned with the ISO C standard. Any
18336 conflict between the requirements described here and the ISO C standard is unintentional. This
18337 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18338 The *gets()* function shall read bytes from the standard input stream, *stdin*, into the array pointed
18339 to by *s*, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall
18340 be discarded and a null byte shall be placed immediately after the last byte read into the array.

18341 CX The *gets()* function may mark the *st_atime* field of the file associated with *stream* for update. The
18342 *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
18343 *fread()*, *getc()*, *getchar()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that returns data not supplied by
18344 a prior call to *ungetc()*.

18345 **RETURN VALUE**

18346 Upon successful completion, *gets()* shall return *s*. If the stream is at end-of-file, the end-of-file
18347 indicator for the stream shall be set and *gets()* shall return a null pointer. If a read error occurs,
18348 CX the error indicator for the stream shall be set, *gets()* shall return a null pointer, and set *errno* to
18349 indicate the error.

18350 **ERRORS**18351 Refer to *fgetc()*.18352 **EXAMPLES**

18353 None.

18354 **APPLICATION USAGE**

18355 Reading a line that overflows the array pointed to by *s* results in undefined behavior. The use of
18356 *fgets()* is recommended.

18357 Since the user cannot specify the length of the buffer passed to *gets()*, use of this function is
18358 discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in
18359 such a way as to cause applications to fail, or possible system security violations.

18360 It is recommended that the *fgets()* function should be used to read input lines.

18361 **RATIONALE**

18362 None.

18363 **FUTURE DIRECTIONS**

18364 None.

18365 **SEE ALSO**18366 *feof()*, *ferror()*, *fgets()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>18367 **CHANGE HISTORY**

18368 First released in Issue 1. Derived from Issue 1 of the SVID.

18369 **Issue 6**

18370 Extensions beyond the ISO C standard are marked.

18371 NAME

18372 getservbyname, getservbyport, getservent — network services database functions

18373 SYNOPSIS

18374 #include <netdb.h>

18375 struct servent *getservbyname(const char *name, const char *proto);

18376 struct servent *getservbyport(int port, const char *proto);

18377 struct servent *getservent(void);

18378 DESCRIPTION

18379 Refer to *endservent()*.

18380 **NAME**18381 `getsid` — get the process group ID of a session leader18382 **SYNOPSIS**18383 XSI `#include <unistd.h>`18384 `pid_t getsid(pid_t pid);`

18385

18386 **DESCRIPTION**18387 The `getsid()` function shall obtain the process group ID of the process that is the session leader of
18388 the process specified by *pid*. If *pid* is **(pid_t)0**, it specifies the calling process.18389 **RETURN VALUE**18390 Upon successful completion, `getsid()` shall return the process group ID of the session leader of
18391 the specified process. Otherwise, it shall return **(pid_t)-1** and set *errno* to indicate the error.18392 **ERRORS**18393 The `getsid()` function shall fail if:18394 [EPERM] The process specified by *pid* is not in the same session as the calling process,
18395 and the implementation does not allow access to the process group ID of the
18396 session leader of that process from the calling process.18397 [ESRCH] There is no process with a process ID equal to *pid*.18398 **EXAMPLES**

18399 None.

18400 **APPLICATION USAGE**

18401 None.

18402 **RATIONALE**

18403 None.

18404 **FUTURE DIRECTIONS**

18405 None.

18406 **SEE ALSO**18407 *exec*, *fork()*, *getpid()*, *getpgid()*, *setpgid()*, *setsid()*, the Base Definitions volume of
18408 IEEE Std 1003.1-2001, **<unistd.h>**18409 **CHANGE HISTORY**

18410 First released in Issue 4, Version 2.

18411 **Issue 5**

18412 Moved from X/OPEN UNIX extension to BASE.

18413 **NAME**

18414 getsockname — get the socket name

18415 **SYNOPSIS**

18416 #include <sys/socket.h>

```
18417 int getsockname(int socket, struct sockaddr *restrict address,  
18418                 socklen_t *restrict address_len);
```

18419 **DESCRIPTION**

18420 The *getsockname()* function shall retrieve the locally-bound name of the specified socket, store
18421 this address in the **sockaddr** structure pointed to by the *address* argument, and store the length of
18422 this address in the object pointed to by the *address_len* argument.

18423 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
18424 the stored address shall be truncated.

18425 If the socket has not been bound to a local name, the value stored in the object pointed to by
18426 *address* is unspecified.

18427 **RETURN VALUE**

18428 Upon successful completion, 0 shall be returned, the *address* argument shall point to the address
18429 of the socket, and the *address_len* argument shall point to the length of the address. Otherwise, -1
18430 shall be returned and *errno* set to indicate the error.

18431 **ERRORS**18432 The *getsockname()* function shall fail if:18433 [EBADF] The *socket* argument is not a valid file descriptor.18434 [ENOTSOCK] The *socket* argument does not refer to a socket.

18435 [EOPNOTSUPP] The operation is not supported for this socket's protocol.

18436 The *getsockname()* function may fail if:

18437 [EINVAL] The socket has been shut down.

18438 [ENOBUFS] Insufficient resources were available in the system to complete the function.

18439 **EXAMPLES**

18440 None.

18441 **APPLICATION USAGE**

18442 None.

18443 **RATIONALE**

18444 None.

18445 **FUTURE DIRECTIONS**

18446 None.

18447 **SEE ALSO**

18448 *accept()*, *bind()*, *getpeername()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,
18449 <sys/socket.h>

18450 **CHANGE HISTORY**

18451 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

18452 The **restrict** keyword is added to the *getsockname()* prototype for alignment with the
18453 ISO/IEC 9899:1999 standard.

18454 **NAME**

18455 getsockopt — get the socket options

18456 **SYNOPSIS**

18457 #include <sys/socket.h>

```
18458 int getsockopt(int socket, int level, int option_name,
18459               void *restrict option_value, socklen_t *restrict option_len);
```

18460 **DESCRIPTION**18461 The *getsockopt()* function manipulates options associated with a socket.

18462 The *getsockopt()* function shall retrieve the value for the option specified by the *option_name*
 18463 argument for the socket specified by the *socket* argument. If the size of the option value is greater
 18464 than *option_len*, the value stored in the object pointed to by the *option_value* argument shall be
 18465 silently truncated. Otherwise, the object pointed to by the *option_len* argument shall be modified
 18466 to indicate the actual length of the value.

18467 The *level* argument specifies the protocol level at which the option resides. To retrieve options at
 18468 the socket level, specify the *level* argument as SOL_SOCKET. To retrieve options at other levels,
 18469 supply the appropriate level identifier for the protocol controlling the option. For example, to
 18470 indicate that an option is interpreted by the TCP (Transmission Control Protocol), set *level* to
 18471 IPPROTO_TCP as defined in the <netinet/in.h> header.

18472 The socket in use may require the process to have appropriate privileges to use the *getsockopt()*
 18473 function.

18474 The *option_name* argument specifies a single option to be retrieved. It can be one of the following
 18475 values defined in <sys/socket.h>:

18476 SO_DEBUG Reports whether debugging information is being recorded. This option
 18477 shall store an **int** value. This is a Boolean option.

18478 SO_ACCEPTCONN Reports whether socket listening is enabled. This option shall store an **int**
 18479 value. This is a Boolean option.

18480 SO_BROADCAST Reports whether transmission of broadcast messages is supported, if this
 18481 is supported by the protocol. This option shall store an **int** value. This is a
 18482 Boolean option.

18483 SO_REUSEADDR Reports whether the rules used in validating addresses supplied to *bind()*
 18484 should allow reuse of local addresses, if this is supported by the protocol.
 18485 This option shall store an **int** value. This is a Boolean option.

18486 SO_KEEPALIVE Reports whether connections are kept active with periodic transmission
 18487 of messages, if this is supported by the protocol.

18488 If the connected socket fails to respond to these messages, the connection
 18489 shall be broken and threads writing to that socket shall be notified with a
 18490 SIGPIPE signal. This option shall store an **int** value. This is a Boolean
 18491 option.

18492 SO_LINGER Reports whether the socket lingers on *close()* if data is present. If
 18493 SO_LINGER is set, the system blocks the process during *close()* until it
 18494 can transmit the data or until the end of the interval indicated by the
 18495 *l_linger* member, whichever comes first. If SO_LINGER is not specified,
 18496 and *close()* is issued, the system handles the call in a way that allows the
 18497 process to continue as quickly as possible. This option shall store a **linger**
 18498 structure.

18499	SO_OOBINLINE	Reports whether the socket leaves received out-of-band data (data marked urgent) inline. This option shall store an int value. This is a Boolean option.
18500		
18501		
18502	SO_SNDBUF	Reports send buffer size information. This option shall store an int value.
18503	SO_RCVBUF	Reports receive buffer size information. This option shall store an int value.
18504		
18505	SO_ERROR	Reports information about error status and clears it. This option shall store an int value.
18506		
18507	SO_TYPE	Reports the socket type. This option shall store an int value. Socket types are described in Section 2.10.6 (on page 59).
18508		
18509	SO_DONTROUTE	Reports whether outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option shall store an int value. This is a Boolean option.
18510		
18511		
18512		
18513		
18514		
18515	SO_RCVLOWAT	Reports the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option shall store an int value. Note that not all implementations allow this option to be retrieved.
18516		
18517		
18518		
18519		
18520		
18521		
18522		
18523		
18524	SO_RCVTIMEO	Reports the timeout value for input operations. This option shall store a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was received. The default for this option is zero, which indicates that a receive operation shall not time out. Note that not all implementations allow this option to be retrieved.
18525		
18526		
18527		
18528		
18529		
18530		
18531		
18532	SO_SNDLOWAT	Reports the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option shall store an int value. Note that not all implementations allow this option to be retrieved.
18533		
18534		
18535		
18536		
18537	SO_SNDTIMEO	Reports the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data was sent. The default for this option is zero, which indicates that a send operation shall not time out. The option shall store a timeval structure. Note that not all implementations allow this option to be retrieved.
18538		
18539		
18540		
18541		
18542		
18543		
18544		
18545		
		For Boolean options, a zero value indicates that the option is disabled and a non-zero value indicates that the option is enabled.

18546 **RETURN VALUE**

18547 Upon successful completion, *getsockopt()* shall return 0; otherwise, -1 shall be returned and *errno*
18548 set to indicate the error.

18549 **ERRORS**

18550 The *getsockopt()* function shall fail if:

18551 [EBADF] The *socket* argument is not a valid file descriptor.

18552 [EINVAL] The specified option is invalid at the specified socket level.

18553 [ENOPROTOOPT]

18554 The option is not supported by the protocol.

18555 [ENOTSOCK] The *socket* argument does not refer to a socket.

18556 The *getsockopt()* function may fail if:

18557 [EACCES] The calling process does not have the appropriate privileges.

18558 [EINVAL] The socket has been shut down.

18559 [ENOBUFS] Insufficient resources are available in the system to complete the function.

18560 **EXAMPLES**

18561 None.

18562 **APPLICATION USAGE**

18563 None.

18564 **RATIONALE**

18565 None.

18571 **CHANGE HISTORY**

18572 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

18573 The **restrict** keyword is added to the *getsockopt()* prototype for alignment with the
18574 ISO/IEC 9899:1999 standard.

18575 **NAME**

18576 getsubopt — parse suboption arguments from a string

18577 **SYNOPSIS**

18578 xSI #include <stdlib.h>

18579 int getsubopt(char **optionp, char * const *keylistp, char **valuep);

18580

18581 **DESCRIPTION**18582 The *getsubopt()* function shall parse suboption arguments in a flag argument. Such options often
18583 result from the use of *getopt()*.18584 The *getsubopt()* argument *optionp* is a pointer to a pointer to the option argument string. The
18585 suboption arguments shall be separated by commas and each may consist of either a single
18586 token, or a token-value pair separated by an equal sign.18587 The *keylistp* argument shall be a pointer to a vector of strings. The end of the vector is identified
18588 by a null pointer. Each entry in the vector is one of the possible tokens that might be found in
18589 **optionp*. Since commas delimit suboption arguments in *optionp*, they should not appear in any of
18590 the strings pointed to by *keylistp*. Similarly, because an equal sign separates a token from its
18591 value, the application should not include an equal sign in any of the strings pointed to by
18592 *keylistp*.18593 The *valuep* argument is the address of a value string pointer.18594 If a comma appears in *optionp*, it shall be interpreted as a suboption separator. After commas
18595 have been processed, if there are one or more equal signs in a suboption string, the first equal
18596 sign in any suboption string shall be interpreted as a separator between a token and a value.
18597 Subsequent equal signs in a suboption string shall be interpreted as part of the value.18598 If the string at **optionp* contains only one suboption argument (equivalently, no commas),
18599 *getsubopt()* shall update **optionp* to point to the null character at the end of the string. Otherwise,
18600 it shall isolate the suboption argument by replacing the comma separator with a null character,
18601 and shall update **optionp* to point to the start of the next suboption argument. If the suboption
18602 argument has an associated value (equivalently, contains an equal sign), *getsubopt()* shall update
18603 **valuep* to point to the value's first character. Otherwise, it shall set **valuep* to a null pointer. The
18604 calling application may use this information to determine whether the presence or absence of a
18605 value for the suboption is an error.18606 Additionally, when *getsubopt()* fails to match the suboption argument with a token in the *keylistp*
18607 array, the calling application should decide if this is an error, or if the unrecognized option
18608 should be processed in another way.18609 **RETURN VALUE**18610 The *getsubopt()* function shall return the index of the matched token string, or -1 if no token
18611 strings were matched.18612 **ERRORS**

18613 No errors are defined.

18614 **EXAMPLES**

```

18615     #include <stdio.h>
18616     #include <stdlib.h>

18617     int do_all;
18618     const char *type;
18619     int read_size;
18620     int write_size;
18621     int read_only;

18622     enum
18623     {
18624         RO_OPTION = 0,
18625         RW_OPTION,
18626         READ_SIZE_OPTION,
18627         WRITE_SIZE_OPTION
18628     };

18629     const char *mount_opts[] =
18630     {
18631         [RO_OPTION] = "ro",
18632         [RW_OPTION] = "rw",
18633         [READ_SIZE_OPTION] = "rsize",
18634         [WRITE_SIZE_OPTION] = "wsize",
18635         NULL
18636     };

18637     int
18638     main(int argc, char *argv[])
18639     {
18640         char *subopts, *value;
18641         int opt;

18642         while ((opt = getopt(argc, argv, "at:o:")) != -1)
18643             switch(opt)
18644             {
18645                 case 'a':
18646                     do_all = 1;
18647                     break;
18648                 case 't':
18649                     type = optarg;
18650                     break;
18651                 case 'o':
18652                     subopts = optarg;
18653                     while (*subopts != '\0')
18654                         switch(getsubopt(&subopts, mount_opts, &value))
18655                         {
18656                             case RO_OPTION:
18657                                 read_only = 1;
18658                                 break;
18659                             case RW_OPTION:
18660                                 read_only = 0;
18661                                 break;
18662                             case READ_SIZE_OPTION:

```

```

18663         if (value == NULL)
18664             abort();
18665         read_size = atoi(value);
18666         break;
18667     case WRITE_SIZE_OPTION:
18668         if (value == NULL)
18669             abort();
18670         write_size = atoi(value);
18671         break;
18672     default:
18673         /* Unknown suboption. */
18674         printf("Unknown suboption '%s'\n", value);
18675         break;
18676     }
18677     break;
18678 default:
18679     abort();
18680 }
18681
18681     /* Do the real work. */
18682     return 0;
18683 }

```

18684 Parsing Suboptions

18685 The following example uses the *getsubopt()* function to parse a *value* argument in the *optarg*
 18686 external variable returned by a call to *getopt()*.

```

18687 #include <stdlib.h>
18688 ...
18689 char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
18690 char *value;
18691 int opt, index;
18692
18692 while ((opt = getopt(argc, argv, "e:")) != -1) {
18693     switch(opt) {
18694     case 'e' :
18695         while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
18696             switch(index) {
18697             ...
18698             }
18699             break;
18700         ...
18701     }
18702 }
18703 ...

```

18719 **NAME**

18720 gettimeofday — get the date and time

18721 **SYNOPSIS**

18722 xSI #include <sys/time.h>

18723 int gettimeofday(struct timeval *restrict tp, void *restrict tzp);

18724

18725 **DESCRIPTION**

18726 The *gettimeofday()* function shall obtain the current time, expressed as seconds and
18727 microseconds since the Epoch, and store it in the **timeval** structure pointed to by *tp*. The
18728 resolution of the system clock is unspecified.

18729 If *tzp* is not a null pointer, the behavior is unspecified.

18730 **RETURN VALUE**

18731 The *gettimeofday()* function shall return 0 and no value shall be reserved to indicate an error.

18732 **ERRORS**

18733 No errors are defined.

18734 **EXAMPLES**

18735 None.

18736 **APPLICATION USAGE**

18737 None.

18738 **RATIONALE**

18739 None.

18740 **FUTURE DIRECTIONS**

18744 **CHANGE HISTORY**

18745 First released in Issue 4, Version 2.

18746 **Issue 5**

18747 Moved from X/OPEN UNIX extension to BASE.

18748 **Issue 6**

18749 The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since
18750 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other *time*
18751 functions.

18752 The **restrict** keyword is added to the *gettimeofday()* prototype for alignment with the
18753 ISO/IEC 9899:1999 standard.

18754 **NAME**

18755 getuid — get a real user ID

18756 **SYNOPSIS**

18757 #include <unistd.h>

18758 uid_t getuid(void);

18759 **DESCRIPTION**

18760 The *getuid()* function shall return the real user ID of the calling process.

18761 **RETURN VALUE**

18762 The *getuid()* function shall always be successful and no return value is reserved to indicate the error.

18764 **ERRORS**

18765 No errors are defined.

18766 **EXAMPLES**18767 **Setting the Effective User ID to the Real User ID**

18768 The following example sets the effective user ID and the real user ID of the current process to the real user ID of the caller.

```
18770           #include <unistd.h>
18771           #include <sys/types.h>
18772           ...
18773           setreuid(getuid(), getuid());
18774           ...
```

18775 **APPLICATION USAGE**

18776 None.

18777 **RATIONALE**

18778 None.

18779 **FUTURE DIRECTIONS**

18780 None.

18784 **CHANGE HISTORY**

18785 First released in Issue 1. Derived from Issue 1 of the SVID.

18786 **Issue 6**

18787 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

18788 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- 18790
 - The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- 18791
- 18792

18793 NAME

18794 getutxent, getutxid, getutxline — get user accounting database entries

18795 SYNOPSIS

18796 xSI #include <utmpx.h>

18797 struct utmpx *getutxent(void);

18798 struct utmpx *getutxid(const struct utmpx *id);

18799 struct utmpx *getutxline(const struct utmpx *line);

18800

18801 DESCRIPTION

18802 Refer to *endutxent()*.

18803 **NAME**

18804 getwc — get a wide character from a stream

18805 **SYNOPSIS**

18806 #include <stdio.h>

18807 #include <wchar.h>

18808 wint_t getwc(FILE **stream*);18809 **DESCRIPTION**

18810 cx The functionality described on this reference page is aligned with the ISO C standard. Any
18811 conflict between the requirements described here and the ISO C standard is unintentional. This
18812 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18813 The *getwc()* function shall be equivalent to *fgetwc()*, except that if it is implemented as a macro it
18814 may evaluate *stream* more than once, so the argument should never be an expression with side
18815 effects.

18816 **RETURN VALUE**18817 Refer to *fgetwc()*.18818 **ERRORS**18819 Refer to *fgetwc()*.18820 **EXAMPLES**

18821 None.

18822 **APPLICATION USAGE**

18823 Since it may be implemented as a macro, *getwc()* may treat incorrectly a *stream* argument with
18824 side effects. In particular, *getwc(*f++)* does not necessarily work as expected. Therefore, use of
18825 this function is not recommended; *fgetwc()* should be used instead.

18826 **RATIONALE**

18827 None.

18828 **FUTURE DIRECTIONS**

18829 None.

18830 **SEE ALSO**18831 *fgetwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>18832 **CHANGE HISTORY**

18833 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
18834 draft.

18835 **Issue 5**

18836 The Optional Header (OH) marking is removed from <stdio.h>.

18837 NAME

18838 getwchar — get a wide character from a stdin stream

18839 SYNOPSIS

18840 #include <wchar.h>

18841 wint_t getwchar(void);

18842 DESCRIPTION

18843 cx The functionality described on this reference page is aligned with the ISO C standard. Any
18844 conflict between the requirements described here and the ISO C standard is unintentional. This
18845 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

18846 The *getwchar()* function shall be equivalent to *getwc(stdin)*.

18847 RETURN VALUE

18848 Refer to *fgetwc()*.

18849 ERRORS

18850 Refer to *fgetwc()*.

18851 EXAMPLES

18852 None.

18853 APPLICATION USAGE

18854 If the **wint_t** value returned by *getwchar()* is stored into a variable of type **wchar_t** and then
18855 compared against the **wint_t** macro WEOF, the result may be incorrect. Only the **wint_t** type is
18856 guaranteed to be able to represent any wide character and WEOF.

18857 RATIONALE

18858 None.

18859 FUTURE DIRECTIONS

18860 None.

18861 SEE ALSO

18862 *fgetwc()*, *getwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>

18863 CHANGE HISTORY

18864 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
18865 draft.

18866 NAME

18867 getwd — get the current working directory pathname (**LEGACY**)

18868 SYNOPSIS

18869 xSI #include <unistd.h>

18870 char *getwd(char *path_name);

18871

18872 DESCRIPTION

18873 The *getwd()* function shall determine an absolute pathname of the current working directory of
18874 the calling process, and copy a string containing that pathname into the array pointed to by the
18875 *path_name* argument.

18876 If the length of the pathname of the current working directory is greater than ({PATH_MAX}+1)
18877 including the null byte, *getwd()* shall fail and return a null pointer.

18878 RETURN VALUE

18879 Upon successful completion, a pointer to the string containing the absolute pathname of the
18880 current working directory shall be returned. Otherwise, *getwd()* shall return a null pointer and
18881 the contents of the array pointed to by *path_name* are undefined.

18882 ERRORS

18883 No errors are defined.

18884 EXAMPLES

18885 None.

18886 APPLICATION USAGE

18887 For applications portability, the *getcwd()* function should be used to determine the current
18888 working directory instead of *getwd()*.

18889 RATIONALE

18890 Since the user cannot specify the length of the buffer passed to *getwd()*, use of this function is
18891 discouraged. The length of a pathname described in {PATH_MAX} is file system-dependent and
18892 may vary from one mount point to another, or might even be unlimited. It is possible to
18893 overflow this buffer in such a way as to cause applications to fail, or possible system security
18894 violations.

18895 It is recommended that the *getcwd()* function should be used to determine the current working
18896 directory.

18897 FUTURE DIRECTIONS

18898 This function may be withdrawn in a future version.

18899 SEE ALSO

18900 *getcwd()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

18901 CHANGE HISTORY

18902 First released in Issue 4, Version 2.

18903 Issue 5

18904 Moved from X/OPEN UNIX extension to BASE.

18905 Issue 6

18906 This function is marked LEGACY.

18907 **NAME**

18908 glob, globfree — generate pathnames matching a pattern

18909 **SYNOPSIS**

18910 #include <glob.h>

```
18911 int glob(const char *restrict pattern, int flags,
18912         int (*errfunc)(const char *epath, int eerrno),
18913         glob_t *restrict pglob);
18914 void globfree(glob_t *pglob);
```

18915 **DESCRIPTION**

18916 The *glob()* function is a pathname generator that shall implement the rules defined in the Shell
 18917 and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern Matching Notation, with
 18918 optional support for rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
 18919 2.13.3, Patterns Used for Filename Expansion.

18920 The structure type **glob_t** is defined in <glob.h> and includes at least the following members:

18921

18922

18923

18924

18925

Member Type	Member Name	Description
size_t	<i>gl_pathc</i>	Count of paths matched by <i>pattern</i> .
char **	<i>gl_pathv</i>	Pointer to a list of matched pathnames.
size_t	<i>gl_offs</i>	Slots to reserve at the beginning of <i>gl_pathv</i> .

18926 The argument *pattern* is a pointer to a pathname pattern to be expanded. The *glob()* function
 18927 shall match all accessible pathnames against this pattern and develop a list of all pathnames that
 18928 match. In order to have access to a pathname, *glob()* requires search permission on every
 18929 component of a path except the last, and read permission on each directory of any filename
 18930 component of *pattern* that contains any of the following special characters: '*', '?', and '['.

18931 The *glob()* function shall store the number of matched pathnames into *pglob->gl_pathc* and a
 18932 pointer to a list of pointers to pathnames into *pglob->gl_pathv*. The pathnames shall be in sort
 18933 order as defined by the current setting of the *LC_COLLATE* category; see the Base Definitions
 18934 volume of IEEE Std 1003.1-2001, Section 7.3.2, *LC_COLLATE*. The first pointer after the last
 18935 pathname shall be a null pointer. If the pattern does not match any pathnames, the returned
 18936 number of matched paths is set to 0, and the contents of *pglob->gl_pathv* are implementation-
 18937 defined.

18938 It is the caller's responsibility to create the structure pointed to by *pglob*. The *glob()* function shall
 18939 allocate other space as needed, including the memory pointed to by *gl_pathv*. The *globfree()*
 18940 function shall free any space associated with *pglob* from a previous call to *glob()*.

18941 The *flags* argument is used to control the behavior of *glob()*. The value of *flags* is a bitwise-
 18942 inclusive OR of zero or more of the following constants, which are defined in <glob.h>:

18943	GLOBAL_APPEND	Append pathnames generated to the ones from a previous call to <i>glob()</i> .
18944	GLOBAL_DOOFFS	Make use of <i>pglob->gl_offs</i> . If this flag is set, <i>pglob->gl_offs</i> is used to specify how many null pointers to add to the beginning of <i>pglob->gl_pathv</i> . In other words, <i>pglob->gl_pathv</i> shall point to <i>pglob->gl_offs</i> null pointers, followed by <i>pglob->gl_pathc</i> pathname pointers, followed by a null pointer.
18949	GLOBAL_ERR	Cause <i>glob()</i> to return when it encounters a directory that it cannot open or read. Ordinarily, <i>glob()</i> continues to find matches.

18950

18951	GLOB_MARK	Each pathname that is a directory that matches <i>pattern</i> shall have a slash appended.
18952		
18953	GLOB_NOCHECK	Supports rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13.3, Patterns Used for Filename Expansion. If <i>pattern</i> does not match any pathname, then <i>glob()</i> shall return a list consisting of only <i>pattern</i> , and the number of matched pathnames is 1.
18954		
18955		
18956		
18957	GLOB_NOESCAPE	Disable backslash escaping.
18958	GLOB_NOSORT	Ordinarily, <i>glob()</i> sorts the matching pathnames according to the current setting of the <i>LC_COLLATE</i> category; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, <i>LC_COLLATE</i> . When this flag is used, the order of pathnames returned is unspecified.
18959		
18960		
18961		
18962	The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a previous call to <i>glob()</i> . The following rules apply to applications when two or more calls to <i>glob()</i> are made with the same value of <i>pglob</i> and without intervening calls to <i>globfree()</i> :	
18963		
18964		
18965	1.	The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.
18966	2.	All the calls shall set GLOB_DOOFFS, or all shall not set it.
18967	3.	After the second call, <i>pglob->gl_pathv</i> points to a list containing the following:
18968	a.	Zero or more null pointers, as specified by GLOB_DOOFFS and <i>pglob->gl_offs</i> .
18969	b.	Pointers to the pathnames that were in the <i>pglob->gl_pathv</i> list before the call, in the same order as before.
18970		
18971	c.	Pointers to the new pathnames generated by the second call, in the specified order.
18972	4.	The count returned in <i>pglob->gl_pathc</i> shall be the total number of pathnames from the two calls.
18973		
18974	5.	The application can change any of the fields after a call to <i>glob()</i> . If it does, the application shall reset them to the original value before a subsequent call, using the same <i>pglob</i> value, to <i>globfree()</i> or <i>glob()</i> with the GLOB_APPEND flag.
18975		
18976		
18977	If, during the search, a directory is encountered that cannot be opened or read and <i>errfunc</i> is not a null pointer, <i>glob()</i> calls (<i>*errfunc()</i>) with two arguments:	
18978		
18979	1.	The <i>epath</i> argument is a pointer to the path that failed.
18980	2.	The <i>errno</i> argument is the value of <i>errno</i> from the failure, as set by <i>opendir()</i> , <i>readdir()</i> , or <i>stat()</i> . (Other values may be used to report other errors not explicitly documented for those functions.)
18981		
18982		
18983	If (<i>*errfunc()</i>) is called and returns non-zero, or if the GLOB_ERR flag is set in <i>flags</i> , <i>glob()</i> shall stop the scan and return GLOB_ABORTED after setting <i>gl_pathc</i> and <i>gl_pathv</i> in <i>pglob</i> to reflect the paths already scanned. If GLOB_ERR is not set and either <i>errfunc</i> is a null pointer or (<i>*errfunc()</i>) returns 0, the error shall be ignored.	
18984		
18985		
18986		
18987	The <i>glob()</i> function shall not fail because of large files.	
18988	RETURN VALUE	
18989	Upon successful completion, <i>glob()</i> shall return 0. The argument <i>pglob->gl_pathc</i> shall return the number of matched pathnames and the argument <i>pglob->gl_pathv</i> shall contain a pointer to a null-terminated list of matched and sorted pathnames. However, if <i>pglob->gl_pathc</i> is 0, the content of <i>pglob->gl_pathv</i> is undefined.	
18990		
18991		
18992		

18993 The *globfree()* function shall not return a value.

18994 If *glob()* terminates due to an error, it shall return one of the non-zero constants defined in
18995 **<glob.h>**. The arguments *pglob->gl_pathc* and *pglob->gl_pathv* are still set as defined above.

18996 **ERRORS**

18997 The *glob()* function shall fail and return the corresponding value if:

18998 GLOB_ABORTED The scan was stopped because GLOB_ERR was set or (**errfunc()*)
18999 returned non-zero.

19000 GLOB_NOMATCH The pattern does not match any existing pathname, and
19001 GLOB_NOCHECK was not set in flags.

19002 GLOB_NOSPACE An attempt to allocate memory failed.

19003 **EXAMPLES**

19004 One use of the GLOB_DOOFFS flag is by applications that build an argument list for use with
19005 *execv()*, *execve()*, or *execvp()*. Suppose, for example, that an application wants to do the
19006 equivalent of:

```
19007 ls -l *.c
```

19008 but for some reason:

```
19009 system("ls -l *.c")
```

19010 is not acceptable. The application could obtain approximately the same result using the
19011 sequence:

```
19012 globbuf.gl_offs = 2;  
19013 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
19014 globbuf.gl_pathv[0] = "ls";  
19015 globbuf.gl_pathv[1] = "-l";  
19016 execvp("ls", &globbuf.gl_pathv[0]);
```

19017 Using the same example:

```
19018 ls -l *.c *.h
```

19019 could be approximately simulated using GLOB_APPEND as follows:

```
19020 globbuf.gl_offs = 2;  
19021 glob("*.c", GLOB_DOOFFS, NULL, &globbuf);  
19022 glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);  
19023 ...
```

19024 **APPLICATION USAGE**

19025 This function is not provided for the purpose of enabling utilities to perform pathname
19026 expansion on their arguments, as this operation is performed by the shell, and utilities are
19027 explicitly not expected to redo this. Instead, it is provided for applications that need to do
19028 pathname expansion on strings obtained from other sources, such as a pattern typed by a user or
19029 read from a file.

19030 If a utility needs to see if a pathname matches a given pattern, it can use *fnmatch()*.

19031 Note that *gl_pathc* and *gl_pathv* have meaning even if *glob()* fails. This allows *glob()* to report
19032 partial results in the event of an error. However, if *gl_pathc* is 0, *gl_pathv* is unspecified even if
19033 *glob()* did not return an error.

19034 The GLOB_NOCHECK option could be used when an application wants to expand a pathname
19035 if wildcards are specified, but wants to treat the pattern as just a string otherwise. The *sh* utility

19036 might use this for option-arguments, for example.

19037 The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted
 19038 together with the previous pathnames. This mirrors the way that the shell handles pathname
 19039 expansion when multiple expansions are done on a command line.

19040 Applications that need tilde and parameter expansion should use *wordexp()*.

19041 RATIONALE

19042 It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```
19043 new = (char **)malloc((n + pglob->gl_pathc + 1)
19044                      * sizeof(char *));
19045 (void) memcpy(new+n, pglob->gl_pathv,
19046              pglob->gl_pathc * sizeof(char *));
19047 (void) memset(new, 0, n * sizeof(char *));
19048 free(pglob->gl_pathv);
19049 pglob->gl_pathv = new;
```

19050 However, this assumes that the memory pointed to by *gl_pathv* is a block that was separately
 19051 created using *malloc()*. This is not necessarily the case. An application should make no
 19052 assumptions about how the memory referenced by fields in *pglob* was allocated. It might have
 19053 been obtained from *malloc()* in a large chunk and then carved up within *glob()*, or it might have
 19054 been created using a different memory allocator. It is not the intent of the standard developers to
 19055 specify or imply how the memory used by *glob()* is managed.

19056 The GLOB_APPEND flag would be used when an application wants to expand several different
 19057 patterns into a single list.

19058 FUTURE DIRECTIONS

19059 None.

19063 CHANGE HISTORY

19064 First released in Issue 4. Derived from the ISO POSIX-2 standard.

19065 Issue 5

19066 Moved from POSIX2 C-language Binding to BASE.

19067 Issue 6

19068 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

19069 The **restrict** keyword is added to the *glob()* prototype for alignment with the ISO/IEC 9899:1999
 19070 standard.

19071 **NAME**

19072 gmtime, gmtime_r — convert a time value to a broken-down UTC time

19073 **SYNOPSIS**

19074 #include <time.h>

19075 struct tm *gmtime(const time_t *timer);

19076 TSF struct tm *gmtime_r(const time_t *restrict timer,

19077 struct tm *restrict result);

19078

19079 **DESCRIPTION**

19080 CX For *gmtime()*: The functionality described on this reference page is aligned with the ISO C
 19081 standard. Any conflict between the requirements described here and the ISO C standard is
 19082 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19083 The *gmtime()* function shall convert the time in seconds since the Epoch pointed to by *timer* into
 19084 a broken-down time, expressed as Coordinated Universal Time (UTC).

19085 CX The relationship between a time in seconds since the Epoch used as an argument to *gmtime()*
 19086 and the **tm** structure (defined in the <time.h> header) is that the result shall be as specified in the
 19087 expression given in the definition of seconds since the Epoch (see the Base Definitions volume of
 19088 IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch), where the names in the structure
 19089 and in the expression correspond.

19090 TSF The same relationship shall apply for *gmtime_r()*.

19091 CX The *gmtime()* function need not be reentrant. A function that is not required to be reentrant is not
 19092 required to be thread-safe.

19093 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 19094 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 19095 functions may overwrite the information returned in either of these objects by any of the other
 19096 functions.

19097 TSF The *gmtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 19098 into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down
 19099 time is stored in the structure referred to by *result*. The *gmtime_r()* function shall also return the
 19100 address of the same structure.

19101 **RETURN VALUE**

19102 Upon successful completion, the *gmtime()* function shall return a pointer to a **struct tm**. If an
 19103 CX error is detected, *gmtime()* shall return a null pointer and set *errno* to indicate the error.

19104 TSF Upon successful completion, *gmtime_r()* shall return the address of the structure pointed to by
 19105 the argument *result*. If an error is detected, *gmtime_r()* shall return a null pointer.

19106 **ERRORS**19107 The *gmtime()* function shall fail if:

19108 CX [EOverflow] The result cannot be represented.

19109 **EXAMPLES**

19110 None.

19111 **APPLICATION USAGE**

19112 The *gmtime_r()* function is thread-safe and returns values in a user-supplied buffer instead of
19113 possibly using a static data area that may be overwritten by each call.

19114 **RATIONALE**

19115 None.

19116 **FUTURE DIRECTIONS**

19117 None.

19118 **SEE ALSO**

19121 **CHANGE HISTORY**

19122 First released in Issue 1. Derived from Issue 1 of the SVID.

19123 **Issue 5**

19124 A note indicating that the *gmtime()* function need not be reentrant is added to the
19125 DESCRIPTION.

19126 The *gmtime_r()* function is included for alignment with the POSIX Threads Extension.19127 **Issue 6**19128 The *gmtime_r()* function is marked as part of the Thread-Safe Functions option.

19129 Extensions beyond the ISO C standard are marked.

19130 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
19131 its avoidance of possibly using a static data area.

19132 The **restrict** keyword is added to the *gmtime_r()* prototype for alignment with the
19133 ISO/IEC 9899:1999 standard.

19134 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/27 is applied, adding the [EOVERFLOW]
19135 error.

19136 **NAME**

19137 grantpt — grant access to the slave pseudo-terminal device

19138 **SYNOPSIS**

19139 xSI #include <stdlib.h>

19140 int grantpt(int *fildes*);

19141

19142 **DESCRIPTION**

19143 The *grantpt()* function shall change the mode and ownership of the slave pseudo-terminal
 19144 device associated with its master pseudo-terminal counterpart. The *fildes* argument is a file
 19145 descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to
 19146 the real UID of the calling process and the group ID shall be set to an unspecified group ID. The
 19147 permission mode of the slave pseudo-terminal shall be set to readable and writable by the
 19148 owner, and writable by the group.

19149 The behavior of the *grantpt()* function is unspecified if the application has installed a signal
 19150 handler to catch SIGCHLD signals.

19151 **RETURN VALUE**

19152 Upon successful completion, *grantpt()* shall return 0; otherwise, it shall return -1 and set *errno* to
 19153 indicate the error.

19154 **ERRORS**19155 The *grantpt()* function may fail if:

19156	[EBADF]	The <i>fildes</i> argument is not a valid open file descriptor.
19157	[EINVAL]	The <i>fildes</i> argument is not associated with a master pseudo-terminal device.
19158	[EACCES]	The corresponding slave pseudo-terminal device could not be accessed.

19159 **EXAMPLES**

19160 None.

19161 **APPLICATION USAGE**

19162 None.

19163 **RATIONALE**

19164 None.

19165 **FUTURE DIRECTIONS**

19166 None.

19170 First released in Issue 4, Version 2.

19171 **Issue 5**

19172 Moved from X/OPEN UNIX extension to BASE.

19173 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

19174 NAME

19175 h_errno — error return value for network database operations

19176 SYNOPSIS

19177 OB #include <netdb.h>

19178

19179 DESCRIPTION

19180 This method of returning errors is used only in connection with obsolescent functions.

19181 The <netdb.h> header provides a declaration of *h_errno* as a modifiable lvalue of type **int**.

19182 It is unspecified whether *h_errno* is a macro or an identifier declared with external linkage. If a
19183 macro definition is suppressed in order to access an actual object, or a program defines an
19184 identifier with the name *h_errno*, the behavior is undefined.

19185 RETURN VALUE

19186 None.

19187 ERRORS

19188 No errors are defined.

19189 EXAMPLES

19190 None.

19191 APPLICATION USAGE

19192 Applications should obtain the definition of *h_errno* by the inclusion of the <netdb.h> header.

19193 RATIONALE

19194 None.

19195 FUTURE DIRECTIONS

19196 *h_errno* may be withdrawn in a future version.

19197 SEE ALSO

19198 *endhostent()*, *errno*, the Base Definitions volume of IEEE Std 1003.1-2001, <netdb.h>

19199 CHANGE HISTORY

19200 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19201 **NAME**

19202 hcreate, hdestroy, hsearch — manage hash search table

19203 **SYNOPSIS**

```
19204 xSI      #include <search.h>
19205
19206      int hcreate(size_t nel);
19207      void hdestroy(void);
19208      ENTRY *hsearch(ENTRY item, ACTION action);
```

19209 **DESCRIPTION**19210 The *hcreate()*, *hdestroy()*, and *hsearch()* functions shall manage hash search tables.

19211 The *hcreate()* function shall allocate sufficient space for the table, and the application shall ensure it is called before *hsearch()* is used. The *nel* argument is an estimate of the maximum number of entries that the table shall contain. This number may be adjusted upward by the algorithm in order to obtain certain mathematically favorable circumstances.

19215 The *hdestroy()* function shall dispose of the search table, and may be followed by another call to *hcreate()*. After the call to *hdestroy()*, the data can no longer be considered accessible.

19217 The *hsearch()* function is a hash-table search routine. It shall return a pointer into a hash table indicating the location at which an entry can be found. The *item* argument is a structure of type **ENTRY** (defined in the *<search.h>* header) containing two pointers: *item.key* points to the comparison key (a **char ***), and *item.data* (a **void ***) points to any other data to be associated with that key. The comparison function used by *hsearch()* is *strcmp()*. The *action* argument is a member of an enumeration type **ACTION** indicating the disposition of the entry if it cannot be found in the table. **ENTER** indicates that the item should be inserted in the table at an appropriate point. **FIND** indicates that no entry should be made. Unsuccessful resolution is indicated by the return of a null pointer.

19226 These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

19228 **RETURN VALUE**

19229 The *hcreate()* function shall return 0 if it cannot allocate sufficient space for the table; otherwise, it shall return non-zero.

19231 The *hdestroy()* function shall not return a value.

19232 The *hsearch()* function shall return a null pointer if either the action is **FIND** and the item could not be found or the action is **ENTER** and the table is full.

19234 **ERRORS**19235 The *hcreate()* and *hsearch()* functions may fail if:

19236 [ENOMEM] Insufficient storage space is available.

19237 **EXAMPLES**

19238 The following example reads in strings followed by two numbers and stores them in a hash table, discarding duplicates. It then reads in strings and finds the matching entry in the hash table and prints it out.

```
19241      #include <stdio.h>
19242      #include <search.h>
19243      #include <string.h>
19244
19245      struct info {          /* This is the info stored in the table */
19246          int age, room;     /* other than the key. */
19247      };
```

```

19246     };
19247     #define NUM_EMPL    5000    /* # of elements in search table. */
19248     int main(void)
19249     {
19250         char string_space[NUM_EMPL*20];    /* Space to store strings. */
19251         struct info info_space[NUM_EMPL]; /* Space to store employee info. */
19252         char *str_ptr = string_space;      /* Next space in string_space. */
19253         struct info *info_ptr = info_space;
19254                                         /* Next space in info_space. */
19255         ENTRY item;
19256         ENTRY *found_item; /* Name to look for in table. */
19257         char name_to_find[30];
19258         int i = 0;
19259         /* Create table; no error checking is performed. */
19260         (void) hcreate(NUM_EMPL);
19261         while (scanf("%s%d%d", str_ptr, &info_ptr->age,
19262                     &info_ptr->room) != EOF && i++ < NUM_EMPL) {
19263             /* Put information in structure, and structure in item. */
19264             item.key = str_ptr;
19265             item.data = info_ptr;
19266             str_ptr += strlen(str_ptr) + 1;
19267             info_ptr++;
19268             /* Put item into table. */
19269             (void) hsearch(item, ENTER);
19270         }
19271         /* Access table. */
19272         item.key = name_to_find;
19273         while (scanf("%s", item.key) != EOF) {
19274             if ((found_item = hsearch(item, FIND)) != NULL) {
19275                 /* If item is in the table. */
19276                 (void)printf("found %s, age = %d, room = %d\n",
19277                             found_item->key,
19278                             ((struct info *)found_item->data)->age,
19279                             ((struct info *)found_item->data)->room);
19280             } else
19281                 (void)printf("no such employee %s\n", name_to_find);
19282         }
19283         return 0;
19284     }

```

19285 APPLICATION USAGE

19286 The *hcreate()* and *hsearch()* functions may use *malloc()* to allocate space.

19287 RATIONALE

19288 None.

19289 FUTURE DIRECTIONS

19290 None.

19294 CHANGE HISTORY

19295 First released in Issue 1. Derived from Issue 1 of the SVID.

19296 Issue 6

19297 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

19298 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

19299 **NAME**

19300 htonl, htons, ntohl, ntohs — convert values between host and network byte order

19301 **SYNOPSIS**

19302 #include <arpa/inet.h>

19303 uint32_t htonl(uint32_t *hostlong*);
19304 uint16_t htons(uint16_t *hostshort*);
19305 uint32_t ntohl(uint32_t *netlong*);
19306 uint16_t ntohs(uint16_t *netshort*);

19307 **DESCRIPTION**

19308 These functions shall convert 16-bit and 32-bit quantities between network byte order and host
19309 byte order.

19310 On some implementations, these functions are defined as macros.

19311 The **uint32_t** and **uint16_t** types are defined in <inttypes.h>.

19312 **RETURN VALUE**

19313 The *htonl()* and *htons()* functions shall return the argument value converted from host to
19314 network byte order.

19315 The *ntohl()* and *ntohs()* functions shall return the argument value converted from network to
19316 host byte order.

19317 **ERRORS**

19318 No errors are defined.

19319 **EXAMPLES**

19320 None.

19321 **APPLICATION USAGE**

19322 These functions are most often used in conjunction with IPv4 addresses and ports as returned by
19323 *gethostent()* and *getservent()*.

19324 **RATIONALE**

19325 None.

19326 **FUTURE DIRECTIONS**

19327 None.

19329 *endhostent()*, *endservent()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>,
19330 <arpa/inet.h>

19331 **CHANGE HISTORY**

19332 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19333 **NAME**

19334 hypot, hypotf, hypotl — Euclidean distance function

19335 **SYNOPSIS**

19336 #include <math.h>

19337 double hypot(double x, double y);

19338 float hypotf(float x, float y);

19339 long double hypotl(long double x, long double y);

19340 **DESCRIPTION**

19341 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19342 conflict between the requirements described here and the ISO C standard is unintentional. This
 19343 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19344 These functions shall compute the value of the square root of x^2+y^2 without undue overflow or
 19345 underflow.

19346 An application wishing to check for error situations should set *errno* to zero and call
 19347 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 19348 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 19349 zero, an error has occurred.

19350 **RETURN VALUE**

19351 Upon successful completion, these functions shall return the length of the hypotenuse of a
 19352 right-angled triangle with sides of length *x* and *y*.

19353 If the correct value would cause overflow, a range error shall occur and *hypot()*, *hypotf()*, and
 19354 *hypotl()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 19355 respectively.

19356 MX If *x* or *y* is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned (even if one of *x* or *y* is NaN).

19357 If *x* or *y* is NaN, and the other is not $\pm\text{Inf}$, a NaN shall be returned.

19358 If both arguments are subnormal and the correct result is subnormal, a range error may occur
 19359 and the correct result is returned.

19360 **ERRORS**

19361 These functions shall fail if:

19362 Range Error The result overflows.

19363 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 19364 then *errno* shall be set to [ERANGE]. If the integer expression
 19365 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 19366 floating-point exception shall be raised.

19367 These functions may fail if:

19368 MX Range Error The result underflows.

19369 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 19370 then *errno* shall be set to [ERANGE]. If the integer expression
 19371 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 19372 floating-point exception shall be raised.

19373 **EXAMPLES**

19374 None.

19375 **APPLICATION USAGE**19376 *hypot(x,y)*, *hypot(y,x)*, and *hypot(x, -y)* are equivalent.19377 *hypot(x, ±0)* is equivalent to *fabs(x)*.19378 Underflow only happens when both *x* and *y* are subnormal and the (inexact) result is also
19379 subnormal.19380 These functions take precautions against overflow during intermediate steps of the
19381 computation.19382 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
19383 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.19384 **RATIONALE**

19385 None.

19386 **FUTURE DIRECTIONS**

19387 None.

19388 **SEE ALSO**19389 *feclearexcept()*, *fetestexcept()*, *isnan()*, *sqrt()*, the Base Definitions volume of IEEE Std 1003.1-2001,
19390 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>19391 **CHANGE HISTORY**

19392 First released in Issue 1. Derived from Issue 1 of the SVID.

19393 **Issue 5**19394 The DESCRIPTION is updated to indicate how an application should check for an error. This
19395 text was previously published in the APPLICATION USAGE section.19396 **Issue 6**19397 The *hypot()* function is no longer marked as an extension.19398 The *hypotf()* and *hypotl()* functions are added for alignment with the ISO/IEC 9899:1999
19399 standard.19400 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
19401 revised to align with the ISO/IEC 9899:1999 standard.19402 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
19403 marked.

19404 **NAME**

19405 iconv — codeset conversion function

19406 **SYNOPSIS**19407 xSI `#include <iconv.h>`

```
19408     size_t iconv(iconv_t cd, char **restrict inbuf,
19409                 size_t *restrict inbytesleft, char **restrict outbuf,
19410                 size_t *restrict outbytesleft);
```

19411

19412 **DESCRIPTION**

19413 The *iconv()* function shall convert the sequence of characters from one codeset, in the array
 19414 specified by *inbuf*, into a sequence of corresponding characters in another codeset, in the array
 19415 specified by *outbuf*. The codesets are those specified in the *iconv_open()* call that returned the
 19416 conversion descriptor, *cd*. The *inbuf* argument points to a variable that points to the first
 19417 character in the input buffer and *inbytesleft* indicates the number of bytes to the end of the buffer
 19418 to be converted. The *outbuf* argument points to a variable that points to the first available byte in
 19419 the output buffer and *outbytesleft* indicates the number of the available bytes to the end of the
 19420 buffer.

19421 For state-dependent encodings, the conversion descriptor *cd* is placed into its initial shift state by
 19422 a call for which *inbuf* is a null pointer, or for which *inbuf* points to a null pointer. When *iconv()* is
 19423 called in this way, and if *outbuf* is not a null pointer or a pointer to a null pointer, and *outbytesleft*
 19424 points to a positive value, *iconv()* shall place, into the output buffer, the byte sequence to change
 19425 the output buffer to its initial shift state. If the output buffer is not large enough to hold the
 19426 entire reset sequence, *iconv()* shall fail and set *errno* to [E2BIG]. Subsequent calls with *inbuf* as
 19427 other than a null pointer or a pointer to a null pointer cause the conversion to take place from
 19428 the current state of the conversion descriptor.

19429 If a sequence of input bytes does not form a valid character in the specified codeset, conversion
 19430 shall stop after the previous successfully converted character. If the input buffer ends with an
 19431 incomplete character or shift sequence, conversion shall stop after the previous successfully
 19432 converted bytes. If the output buffer is not large enough to hold the entire converted input,
 19433 conversion shall stop just prior to the input bytes that would cause the output buffer to
 19434 overflow. The variable pointed to by *inbuf* shall be updated to point to the byte following the last
 19435 byte successfully used in the conversion. The value pointed to by *inbytesleft* shall be
 19436 decremented to reflect the number of bytes still not converted in the input buffer. The variable
 19437 pointed to by *outbuf* shall be updated to point to the byte following the last byte of converted
 19438 output data. The value pointed to by *outbytesleft* shall be decremented to reflect the number of
 19439 bytes still available in the output buffer. For state-dependent encodings, the conversion
 19440 descriptor shall be updated to reflect the shift state in effect at the end of the last successfully
 19441 converted byte sequence.

19442 If *iconv()* encounters a character in the input buffer that is valid, but for which an identical
 19443 character does not exist in the target codeset, *iconv()* shall perform an implementation-defined
 19444 conversion on this character.

19445 **RETURN VALUE**

19446 The *iconv()* function shall update the variables pointed to by the arguments to reflect the extent
 19447 of the conversion and return the number of non-identical conversions performed. If the entire
 19448 string in the input buffer is converted, the value pointed to by *inbytesleft* shall be 0. If the input
 19449 conversion is stopped due to any conditions mentioned above, the value pointed to by *inbytesleft*
 19450 shall be non-zero and *errno* shall be set to indicate the condition. If an error occurs, *iconv()* shall
 19451 return (**size_t**)-1 and set *errno* to indicate the error.

19452 **ERRORS**19453 The *iconv()* function shall fail if:

19454 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the
 19455 input codeset.

19456 [E2BIG] Input conversion stopped due to lack of space in the output buffer.

19457 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at
 19458 the end of the input buffer.

19459 The *iconv()* function may fail if:

19460 [EBADF] The *cd* argument is not a valid open conversion descriptor.

19461 **EXAMPLES**

19462 None.

19463 **APPLICATION USAGE**

19464 The *inbuf* argument indirectly points to the memory area which contains the conversion input
 19465 data. The *outbuf* argument indirectly points to the memory area which is to contain the result of
 19466 the conversion. The objects indirectly pointed to by *inbuf* and *outbuf* are not restricted to
 19467 containing data that is directly representable in the ISO C standard language **char** data type. The
 19468 type of *inbuf* and *outbuf*, **char ****, does not imply that the objects pointed to are interpreted as
 19469 null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that
 19470 represents a character in a given character set encoding scheme is done internally within the
 19471 codeset converters. For example, the area pointed to indirectly by *inbuf* and/or *outbuf* can
 19472 contain all zero octets that are not interpreted as string terminators but as coded character data
 19473 according to the respective codeset encoding scheme. The type of the data (**char**, **short**, **long**, and
 19474 so on) read or stored in the objects is not specified, but may be inferred for both the input and
 19475 output data by the converters determined by the *fromcode* and *toencode* arguments of *iconv_open()*.

19476 Regardless of the data type inferred by the converter, the size of the remaining space in both
 19477 input and output objects (the *inbytesleft* and *outbytesleft* arguments) is always measured in bytes.

19478 For implementations that support the conversion of state-dependent encodings, the conversion
 19479 descriptor must be able to accurately reflect the shift-state in effect at the end of the last
 19480 successful conversion. It is not required that the conversion descriptor itself be updated, which
 19481 would require it to be a pointer type. Thus, implementations are free to implement the
 19482 descriptor as a handle (other than a pointer type) by which the conversion information can be
 19483 accessed and updated.

19484 **RATIONALE**

19485 None.

19486 **FUTURE DIRECTIONS**

19487 None.

19488 **SEE ALSO**19489 *iconv_open()*, *iconv_close()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**iconv.h**>19490 **CHANGE HISTORY**

19491 First released in Issue 4. Derived from the HP-UX Manual.

19492 **Issue 6**19493 The SYNOPSIS has been corrected to align with the <**iconv.h**> reference page.

19494 The **restrict** keyword is added to the *iconv()* prototype for alignment with the
 19495 ISO/IEC 9899:1999 standard.

19496 **NAME**

19497 iconv_close — codeset conversion deallocation function

19498 **SYNOPSIS**

19499 xSI #include <iconv.h>

19500 int iconv_close(iconv_t *cd*);

19501

19502 **DESCRIPTION**19503 The *iconv_close()* function shall deallocate the conversion descriptor *cd* and all other associated
19504 resources allocated by *iconv_open()*.19505 If a file descriptor is used to implement the type **iconv_t**, that file descriptor shall be closed.19506 **RETURN VALUE**19507 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
19508 indicate the error.19509 **ERRORS**19510 The *iconv_close()* function may fail if:

19511 [EBADF] The conversion descriptor is invalid.

19512 **EXAMPLES**

19513 None.

19514 **APPLICATION USAGE**

19515 None.

19516 **RATIONALE**

19517 None.

19518 **FUTURE DIRECTIONS**

19519 None.

19520 **SEE ALSO**19521 *iconv()*, *iconv_open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**iconv.h**>19522 **CHANGE HISTORY**

19523 First released in Issue 4. Derived from the HP-UX Manual.

19524 **NAME**

19525 iconv_open — codeset conversion allocation function

19526 **SYNOPSIS**19527 xSI `#include <iconv.h>`19528 `iconv_t iconv_open(const char *tocode, const char *fromcode);`

19529

19530 **DESCRIPTION**

19531 The *iconv_open()* function shall return a conversion descriptor that describes a conversion from
 19532 the codeset specified by the string pointed to by the *fromcode* argument to the codeset specified
 19533 by the string pointed to by the *tocode* argument. For state-dependent encodings, the conversion
 19534 descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with
 19535 *iconv()*.

19536 Settings of *fromcode* and *tocode* and their permitted combinations are implementation-defined.

19537 A conversion descriptor shall remain valid until it is closed by *iconv_close()* or an implicit close.

19538 If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be
 19539 set; see <fcntl.h>.

19540 **RETURN VALUE**

19541 Upon successful completion, *iconv_open()* shall return a conversion descriptor for use on
 19542 subsequent calls to *iconv()*. Otherwise, *iconv_open()* shall return (**iconv_t**)-1 and set *errno* to
 19543 indicate the error.

19544 **ERRORS**

19545 The *iconv_open()* function may fail if:

19546 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

19547 [ENFILE] Too many files are currently open in the system.

19548 [ENOMEM] Insufficient storage space is available.

19549 [EINVAL] The conversion specified by *fromcode* and *tocode* is not supported by the
 19550 implementation.

19551 **EXAMPLES**

19552 None.

19553 **APPLICATION USAGE**

19554 Some implementations of *iconv_open()* use *malloc()* to allocate space for internal buffer areas.
 19555 The *iconv_open()* function may fail if there is insufficient storage space to accommodate these
 19556 buffers.

19557 Conforming applications must assume that conversion descriptors are not valid after a call to
 19558 one of the *exec* functions.

19559 Application developers should consult the system documentation to determine the supported
 19560 codesets and their naming schemes.

19561 **RATIONALE**

19562 None.

19563 **FUTURE DIRECTIONS**

19564 None.

19568 First released in Issue 4. Derived from the HP-UX Manual.

19569 NAME

19570 if_freenameindex — free memory allocated by if_nameindex

19571 SYNOPSIS

19572 #include <net/if.h>

19573 void if_freenameindex(struct if_nameindex *ptr);

19574 DESCRIPTION

19575 The *if_freenameindex()* function shall free the memory allocated by *if_nameindex()*. The *ptr*
19576 argument shall be a pointer that was returned by *if_nameindex()*. After *if_freenameindex()* has
19577 been called, the application shall not use the array of which *ptr* is the address.

19578 RETURN VALUE

19579 None.

19580 ERRORS

19581 No errors are defined.

19582 EXAMPLES

19583 None.

19584 APPLICATION USAGE

19585 None.

19593 CHANGE HISTORY

19594 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19595 **NAME**

19596 if_indextoname — map a network interface index to its corresponding name

19597 **SYNOPSIS**

19598 #include <net/if.h>

19599 char *if_indextoname(unsigned *ifindex*, char **ifname*);

19600 **DESCRIPTION**

19601 The *if_indextoname()* function shall map an interface index to its corresponding name.

19602 When this function is called, *ifname* shall point to a buffer of at least {IF_NAMESIZE} bytes. The
19603 function shall place in this buffer the name of the interface with index *ifindex*.

19604 **RETURN VALUE**

19605 If *ifindex* is an interface index, then the function shall return the value supplied in *ifname*, which
19606 points to a buffer now containing the interface name. Otherwise, the function shall return a
19607 NULL pointer and set *errno* to indicate the error.

19608 **ERRORS**

19609 The *if_indextoname()* function shall fail if:

19610 [ENXIO] The interface does not exist.

19611 **EXAMPLES**

19612 None.

19613 **APPLICATION USAGE**

19614 None.

19615 **RATIONALE**

19616 None.

19622 **CHANGE HISTORY**

19623 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19624 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing {IFNAMSIZ} to
19625 {IF_NAMESIZ} in the DESCRIPTION.

19626 **NAME**

19627 if_nameindex — return all network interface names and indexes

19628 **SYNOPSIS**

19629 #include <net/if.h>

19630 struct if_nameindex *if_nameindex(void);

19631 **DESCRIPTION**

19632 The *if_nameindex()* function shall return an array of *if_nameindex* structures, one structure per
19633 interface. The end of the array is indicated by a structure with an *if_index* field of zero and an
19634 *if_name* field of NULL.

19635 Applications should call *if_freenameindex()* to release the memory that may be dynamically
19636 allocated by this function, after they have finished using it.

19637 **RETURN VALUE**

19638 An array of structures identifying local interfaces. A NULL pointer is returned upon an error,
19639 with *errno* set to indicate the error.

19640 **ERRORS**

19641 The *if_nameindex()* function may fail if:

19642 [ENOBUFS] Insufficient resources are available to complete the function.

19643 **EXAMPLES**

19644 None.

19645 **APPLICATION USAGE**

19646 None.

19677 Definitions volume of IEEE Std 1003.1-2001, <net/if.h>

19678 CHANGE HISTORY

19679 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19680 **NAME**

19681 ilogb, ilogbf, ilogbl — return an unbiased exponent

19682 **SYNOPSIS**

19683 #include <math.h>

19684 int ilogb(double x);

19685 int ilogbf(float x);

19686 int ilogbl(long double x);

19687 **DESCRIPTION**

19688 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 19689 conflict between the requirements described here and the ISO C standard is unintentional. This
 19690 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19691 These functions shall return the exponent part of their argument *x*. Formally, the return value is
 19692 the integral part of $\log_r |x|$ as a signed integral value, for non-zero *x*, where *r* is the radix of the
 19693 machine's floating-point arithmetic, which is the value of FLT_RADIX defined in <float.h>.

19694 An application wishing to check for error situations should set *errno* to zero and call
 19695 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 19696 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 19697 zero, an error has occurred.

19698 **RETURN VALUE**

19699 Upon successful completion, these functions shall return the exponent part of *x* as a signed
 19700 integer value. They are equivalent to calling the corresponding *logb*() function and casting the
 19701 returned value to type **int**.

19702 XSI If *x* is 0, a domain error shall occur, and the value FP_ILOGB0 shall be returned.

19703 XSI If *x* is $\pm\text{Inf}$, a domain error shall occur, and the value {INT_MAX} shall be returned.

19704 XSI If *x* is a NaN, a domain error shall occur, and the value FP_ILOGBNAN shall be returned.

19705 XSI If the correct value is greater than {INT_MAX}, {INT_MAX} shall be returned and a domain error
 19706 shall occur.

19707 If the correct value is less than {INT_MIN}, {INT_MIN} shall be returned and a domain error
 19708 shall occur.

19709 **ERRORS**

19710 These functions shall fail if:

19711 XSI	Domain Error	The <i>x</i> argument is zero, NaN, or $\pm\text{Inf}$, or the correct value is not representable as an integer.

19713	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.
19714	
19715	
19716	

19717 **EXAMPLES**

19718 None.

19719 **APPLICATION USAGE**

19720 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
19721 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

19722 **RATIONALE**

19723 The errors come from taking the expected floating-point value and converting it to **int**, which is
19724 an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not
19725 representable in a type **int**), so should be a domain error.

19726 There are no known implementations that overflow. For overflow to happen, {INT_MAX} must
19727 be less than $\text{LDBL\_MAX\_EXP} * \log_2(\text{FLT\_RADIX})$ or {INT_MIN} must be greater than
19728 $\text{LDBL\_MIN\_EXP} * \log_2(\text{FLT\_RADIX})$ if subnormals are not supported, or {INT_MIN} must be
19729 greater than $(\text{LDBL\_MIN\_EXP} - \text{LDBL\_MANT\_DIG}) * \log_2(\text{FLT\_RADIX})$ if subnormals are
19730 supported.

19731 **FUTURE DIRECTIONS**

19732 None.

19736 **CHANGE HISTORY**

19737 First released in Issue 4, Version 2.

19738 **Issue 5**

19739 Moved from X/OPEN UNIX extension to BASE.

19740 **Issue 6**19741 The *ilogb()* function is no longer marked as an extension.

19742 The *ilogbf()* and *ilogbl()* functions are added for alignment with the ISO/IEC 9899:1999
19743 standard.

19744 The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

19745 XSI extensions are marked.

19746 **NAME**

19747 imaxabs — return absolute value

19748 **SYNOPSIS**

19749 #include <inttypes.h>

19750 intmax_t imaxabs(intmax_t j);

19751 **DESCRIPTION**

19752 cx The functionality described on this reference page is aligned with the ISO C standard. Any
19753 conflict between the requirements described here and the ISO C standard is unintentional. This
19754 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19755 The *imaxabs()* function shall compute the absolute value of an integer *j*. If the result cannot be
19756 represented, the behavior is undefined.

19757 **RETURN VALUE**19758 The *imaxabs()* function shall return the absolute value.19759 **ERRORS**

19760 No errors are defined.

19761 **EXAMPLES**

19762 None.

19763 **APPLICATION USAGE**

19764 The absolute value of the most negative number cannot be represented in two's complement.

19765 **RATIONALE**

19766 None.

19767 **FUTURE DIRECTIONS**

19768 None.

19769 **SEE ALSO**19770 *imaxdiv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>19771 **CHANGE HISTORY**

19773 **NAME**

19774 imaxdiv — return quotient and remainder

19775 **SYNOPSIS**

19776 #include <inttypes.h>

19777 imaxdiv_t imaxdiv(intmax_t *numer*, intmax_t *denom*);19778 **DESCRIPTION**

19779 CX The functionality described on this reference page is aligned with the ISO C standard. Any
19780 conflict between the requirements described here and the ISO C standard is unintentional. This
19781 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

19782 The *imaxdiv()* function shall compute *numer* / *denom* and *numer* % *denom* in a single operation.19783 **RETURN VALUE**

19784 The *imaxdiv()* function shall return a structure of type **imaxdiv_t**, comprising both the quotient
19785 and the remainder. The structure shall contain (in either order) the members *quot* (the quotient)
19786 and *rem* (the remainder), each of which has type **intmax_t**.

19787 If either part of the result cannot be represented, the behavior is undefined.

19788 **ERRORS**

19789 No errors are defined.

19790 **EXAMPLES**

19791 None.

19792 **APPLICATION USAGE**

19793 None.

19794 **RATIONALE**

19795 None.

19801 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

19802 **NAME**19803 index — character string operations (**LEGACY**)19804 **SYNOPSIS**

19805 xSI #include <strings.h>

19806 char *index(const char *s, int c);

19807

19808 **DESCRIPTION**19809 The *index()* function shall be equivalent to *strchr()*.19810 **RETURN VALUE**19811 See *strchr()*.19812 **ERRORS**19813 See *strchr()*.19814 **EXAMPLES**

19815 None.

19816 **APPLICATION USAGE**19817 The *strchr()* function is preferred over this function.19818 For maximum portability, it is recommended to replace the function call to *index()* as follows:

19819 #define index(a,b) strchr((a),(b))

19820 **RATIONALE**

19821 None.

19822 **FUTURE DIRECTIONS**

19823 This function may be withdrawn in a future version.

19824 **SEE ALSO**19825 *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>19826 **CHANGE HISTORY**

19827 First released in Issue 4, Version 2.

19828 **Issue 5**

19829 Moved from X/OPEN UNIX extension to BASE.

19830 **Issue 6**

19831 This function is marked LEGACY.

19832 **NAME**

19833 inet_addr, inet_ntoa — IPv4 address manipulation

19834 **SYNOPSIS**

19835 #include <arpa/inet.h>

19836 in_addr_t inet_addr(const char *cp);

19837 char *inet_ntoa(struct in_addr in);

19838 **DESCRIPTION**19839 The *inet_addr()* function shall convert the string pointed to by *cp*, in the standard IPv4 dotted decimal notation, to an integer value suitable for use as an Internet address.19841 The *inet_ntoa()* function shall convert the Internet host address specified by *in* to a string in the Internet standard dot notation.19843 The *inet_ntoa()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

19845 All Internet addresses shall be returned in network order (bytes ordered from left to right).

19846 Values specified using IPv4 dotted decimal notation take one of the following forms:

19847 a.b.c.d When four parts are specified, each shall be interpreted as a byte of data and
19848 assigned, from left to right, to the four bytes of an Internet address.19849 a.b.c When a three-part address is specified, the last part shall be interpreted as a 16-bit
19850 quantity and placed in the rightmost two bytes of the network address. This makes
19851 the three-part address format convenient for specifying Class B network addresses
19852 as "128.net.host".19853 a.b When a two-part address is supplied, the last part shall be interpreted as a 24-bit
19854 quantity and placed in the rightmost three bytes of the network address. This
19855 makes the two-part address format convenient for specifying Class A network
19856 addresses as "net.host".19857 a When only one part is given, the value shall be stored directly in the network
19858 address without any byte rearrangement.19859 All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or
19860 hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;
19861 otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).19862 **RETURN VALUE**19863 Upon successful completion, *inet_addr()* shall return the Internet address. Otherwise, it shall
19864 return (**in_addr_t**)(-1).19865 The *inet_ntoa()* function shall return a pointer to the network address in Internet standard dot
19866 notation.19867 **ERRORS**

19868 No errors are defined.

19869 **EXAMPLES**

19870 None.

19871 **APPLICATION USAGE**

19872 The return value of *inet_ntoa()* may point to static data that may be overwritten by subsequent
19873 calls to *inet_ntoa()*.

19874 **RATIONALE**

19875 None.

19876 **FUTURE DIRECTIONS**

19877 None.

19878 **SEE ALSO**19879 *endhostent()*, *endnetent()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**arpa/inet.h**>19880 **CHANGE HISTORY**

19881 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19882 **NAME**

19883 inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

19884 **SYNOPSIS**

19885 #include <arpa/inet.h>

```
19886       const char *inet_ntop(int af, const void *restrict src,
19887                              char *restrict dst, socklen_t size);
19888       int inet_pton(int af, const char *restrict src, void *restrict dst);
```

19889 **DESCRIPTION**

19890 The *inet_ntop()* function shall convert a numeric address into a text string suitable for
 19891 IP6 presentation. The *af* argument shall specify the family of the address. This can be AF_INET or
 19892 AF_INET6. The *src* argument points to a buffer holding an IPv4 address if the *af* argument is
 19893 IP6 AF_INET, or an IPv6 address if the *af* argument is AF_INET6; the address must be in network
 19894 byte order. The *dst* argument points to a buffer where the function stores the resulting text
 19895 string; it shall not be NULL. The *size* argument specifies the size of this buffer, which shall be
 19896 IP6 large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4,
 19897 INET6_ADDRSTRLEN characters for IPv6).

19898 The *inet_pton()* function shall convert an address in its standard text presentation form into its
 19899 IP6 numeric binary form. The *af* argument shall specify the family of the address. The AF_INET and
 19900 AF_INET6 address families shall be supported. The *src* argument points to the string being
 19901 passed in. The *dst* argument points to a buffer into which the function stores the numeric
 19902 IP6 address; this shall be large enough to hold the numeric address (32 bits for AF_INET, 128 bits for
 19903 AF_INET6).

19904 If the *af* argument of *inet_pton()* is AF_INET, the *src* string shall be in the standard IPv4 dotted-
 19905 decimal form:

19906 ddd.ddd.ddd.ddd

19907 where "ddd" is a one to three digit decimal number between 0 and 255 (see *inet_addr()*). The
 19908 *inet_pton()* function does not accept other formats (such as the octal numbers, hexadecimal
 19909 numbers, and fewer than four numbers that *inet_addr()* accepts).

19910 IP6 If the *af* argument of *inet_pton()* is AF_INET6, the *src* string shall be in one of the following
 19911 standard IPv6 text forms:

19912 1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values
 19913 of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted,
 19914 but there shall be at least one numeral in every field.

19915 2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::" can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may be represented simply as "::".

19918 3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is "x:x:x:x:x:x.d.d.d.d", where the 'x's are the hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

19923 **Note:** A more extensive description of the standard representations of IPv6 addresses can be found in
 19924 RFC 2373.

19925

19926 **RETURN VALUE**

19927 The *inet_ntop()* function shall return a pointer to the buffer containing the text string if the
 19928 conversion succeeds, and NULL otherwise, and set *errno* to indicate the error.

19929 The *inet_pton()* function shall return 1 if the conversion succeeds, with the address pointed to by
 19930 *IP6* *dst* in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or
 19931 a valid IPv6 address string, or -1 with *errno* set to [EAFNOSUPPORT] if the *af* argument is
 19932 unknown.

19933 **ERRORS**

19934 The *inet_ntop()* and *inet_pton()* functions shall fail if:

19935 [EAFNOSUPPORT]

19936 The *af* argument is invalid.

19937 [ENOSPC] The size of the *inet_ntop()* result buffer is inadequate.

19938 **EXAMPLES**

19939 None.

19940 **APPLICATION USAGE**

19941 None.

19942 **RATIONALE**

19943 None.

19944 **FUTURE DIRECTIONS**

19945 None.

19946 **SEE ALSO**

19947 The Base Definitions volume of IEEE Std 1003.1-2001, <**arpa/inet.h**>

19948 **CHANGE HISTORY**

19949 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

19950 IPv6 extensions are marked.

19951 The **restrict** keyword is added to the *inet_ntop()* and *inet_pton()* prototypes for alignment with
 19952 the ISO/IEC 9899:1999 standard.

19953 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must
 19954 be in network byte order” to the end of the fourth sentence of the first paragraph in the
 19955 DESCRIPTION.

19956 **NAME**

19957 initstate, random, setstate, srandom — pseudo-random number functions

19958 **SYNOPSIS**

```

19959 xSI      #include <stdlib.h>

19960          char *initstate(unsigned seed, char *state, size_t size);
19961          long random(void);
19962          char *setstate(const char *state);
19963          void srandom(unsigned seed);
19964

```

19965 **DESCRIPTION**

19966 The *random()* function shall use a non-linear additive feedback random-number generator
 19967 employing a default state array size of 31 **long** integers to return successive pseudo-random
 19968 numbers in the range from 0 to $2^{31}-1$. The period of this random-number generator is
 19969 approximately $16 \times (2^{31}-1)$. The size of the state array determines the period of the random-
 19970 number generator. Increasing the state array size shall increase the period.

19971 With 256 bytes of state information, the period of the random-number generator shall be greater
 19972 than 2^{69} .

19973 Like *rand()*, *random()* shall produce by default a sequence of numbers that can be duplicated by
 19974 calling *srandom()* with 1 as the seed.

19975 The *srandom()* function shall initialize the current state array using the value of *seed*.

19976 The *initstate()* and *setstate()* functions handle restarting and changing random-number
 19977 generators. The *initstate()* function allows a state array, pointed to by the *state* argument, to be
 19978 initialized for future use. The *size* argument, which specifies the size in bytes of the state array,
 19979 shall be used by *initstate()* to decide what type of random-number generator to use; the larger
 19980 the state array, the more random the numbers. Values for the amount of state information are 8,
 19981 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one
 19982 of these values. If *initstate()* is called with $8 \leq \text{size} < 32$, then *random()* shall use a simple linear
 19983 congruential random number generator. The *seed* argument specifies a starting point for the
 19984 random-number sequence and provides for restarting at the same point. The *initstate()* function
 19985 shall return a pointer to the previous state information array.

19986 If *initstate()* has not been called, then *random()* shall behave as though *initstate()* had been called
 19987 with *seed*=1 and *size*=128.

19988 Once a state has been initialized, *setstate()* allows switching between state arrays. The array
 19989 defined by the *state* argument shall be used for further random-number generation until
 19990 *initstate()* is called or *setstate()* is called again. The *setstate()* function shall return a pointer to the
 19991 previous state array.

19992 **RETURN VALUE**

19993 If *initstate()* is called with *size* less than 8, it shall return NULL.

19994 The *random()* function shall return the generated pseudo-random number.

19995 The *srandom()* function shall not return a value.

19996 Upon successful completion, *initstate()* and *setstate()* shall return a pointer to the previous state
 19997 array; otherwise, a null pointer shall be returned.

19998 **ERRORS**

19999 No errors are defined.

20000 **EXAMPLES**

20001 None.

20002 **APPLICATION USAGE**

20003 After initialization, a state array can be restarted at a different point in one of two ways:

- 20004 1. The *initstate()* function can be used, with the desired seed, state array, and size of the
20005 array.
- 20006 2. The *setstate()* function, with the desired state, can be used, followed by *srandom()* with the
20007 desired seed. The advantage of using both of these functions is that the size of the state
20008 array does not have to be saved once it is initialized.

20009 Although some implementations of *random()* have written messages to standard error, such
20010 implementations do not conform to IEEE Std 1003.1-2001.

20011 Issue 5 restored the historical behavior of this function.

20012 Threaded applications should use *erand48()*, *nrand48()*, or *jrand48()* instead of *random()* when
20013 an independent random number sequence in multiple threads is required.

20014 **RATIONALE**

20015 None.

20016 **FUTURE DIRECTIONS**

20017 None.

20018 **SEE ALSO**20019 *drand48()*, *rand()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>20020 **CHANGE HISTORY**

20021 First released in Issue 4, Version 2.

20022 **Issue 5**

20023 Moved from X/OPEN UNIX extension to BASE.

20024 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than
20025 or equal to 8, or less than 32”, “*size*<8” is replaced with “ $8 \leq \textit{size} < 32$ ”, and a new first paragraph
20026 is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE
20027 indicating that these changes restore the historical behavior of the function.

20028 **Issue 6**

20029 In the DESCRIPTION, duplicate text “For values greater than or equal to 8...” is removed.

20030 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing *rand_r()* from the
20031 list of suggested functions in the APPLICATION USAGE section.

20032 **NAME**

20033 insque, remque — insert or remove an element in a queue

20034 **SYNOPSIS**

```
20035 xsi      #include <search.h>

20036         void insque(void *element, void *pred);
20037         void remque(void *element);
20038
```

20039 **DESCRIPTION**

20040 The *insque()* and *remque()* functions shall manipulate queues built from doubly-linked lists. The
 20041 queue can be either circular or linear. An application using *insque()* or *remque()* shall ensure it
 20042 defines a structure in which the first two members of the structure are pointers to the same type
 20043 of structure, and any further members are application-specific. The first member of the structure
 20044 is a forward pointer to the next entry in the queue. The second member is a backward pointer to
 20045 the previous entry in the queue. If the queue is linear, the queue is terminated with null
 20046 pointers. The names of the structure and of the pointer members are not subject to any special
 20047 restriction.

20048 The *insque()* function shall insert the element pointed to by *element* into a queue immediately
 20049 after the element pointed to by *pred*.

20050 The *remque()* function shall remove the element pointed to by *element* from a queue.

20051 If the queue is to be used as a linear list, invoking *insque(&element, NULL)*, where *element* is the
 20052 initial element of the queue, shall initialize the forward and backward pointers of *element* to null
 20053 pointers.

20054 If the queue is to be used as a circular list, the application shall ensure it initializes the forward
 20055 pointer and the backward pointer of the initial element of the queue to the element's own
 20056 address.

20057 **RETURN VALUE**

20058 The *insque()* and *remque()* functions do not return a value.

20059 **ERRORS**

20060 No errors are defined.

20061 **EXAMPLES**20062 **Creating a Linear Linked List**

20063 The following example creates a linear linked list.

```
20064         #include <search.h>
20065         ...
20066         struct myque element1;
20067         struct myque element2;

20068         char *data1 = "DATA1";
20069         char *data2 = "DATA2";
20070         ...
20071         element1.data = data1;
20072         element2.data = data2;

20073         insque (&element1, NULL);
20074         insque (&element2, &element1);
```

Creating a Circular Linked List

The following example creates a circular linked list.

```
#include <search.h>
...
struct myque element1;
struct myque element2;

char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;

element1.fwd = &element1;
element1.bck = &element1;

insque (&element2, &element1);
```

Removing an Element

The following example removes the element pointed to by *element1*.

```
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type **struct qelem *** rather than as being of type **void *** as defined here. In those implementations, **struct qelem** was commonly defined in **<search.h>** as:

```
struct qelem {
    struct qelem  *q_forw;
    struct qelem  *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used **struct qelem** as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to **struct qelem** to avoid compilation warnings. By specifying **void *** as the argument type, applications do not need to change (unless they specifically referenced **struct qelem** and depended on it being defined in **<search.h>**).

20119 **RATIONALE**

20120 None.

20121 **FUTURE DIRECTIONS**

20122 None.

20123 **SEE ALSO**20124 The Base Definitions volume of IEEE Std 1003.1-2001, <**search.h**>20125 **CHANGE HISTORY**

20126 First released in Issue 4, Version 2.

20127 **Issue 5**

20128 Moved from X/OPEN UNIX extension to BASE.

20129 **Issue 6**

20130 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20131 **NAME**20132 **ioctl** — control a STREAMS device (**STREAMS**)20133 **SYNOPSIS**20134 **xsr** #include <stropts.h>20135 int ioctl(int *fildev*, int *request*, ... /* *arg* */);

20136

20137 **DESCRIPTION**

20138 The *ioctl()* function shall perform a variety of control functions on STREAMS devices. For non-
 20139 STREAMS devices, the functions performed by this call are unspecified. The *request* argument
 20140 and an optional third argument (with varying type) shall be passed to and interpreted by the
 20141 appropriate part of the STREAM associated with *fildev*.

20142 The *fildev* argument is an open file descriptor that refers to a device.

20143 The *request* argument selects the control function to be performed and shall depend on the
 20144 STREAMS device being addressed.

20145 The *arg* argument represents additional information that is needed by this specific STREAMS
 20146 device to perform the requested function. The type of *arg* depends upon the particular control
 20147 request, but it shall be either an integer or a pointer to a device-specific data structure.

20148 The *ioctl()* commands applicable to STREAMS, their arguments, and error conditions that apply
 20149 to each individual command are described below.

20150 The following *ioctl()* commands, with error values indicated, are applicable to all STREAMS
 20151 files:

20152 **I_PUSH** Pushes the module whose name is pointed to by *arg* onto the top of the
 20153 current STREAM, just below the STREAM head. It then calls the *open()*
 20154 function of the newly-pushed module.

20155 The *ioctl()* function with the **I_PUSH** command shall fail if:

20156 [EINVAL] Invalid module name.

20157 [ENXIO] Open function of new module failed.

20158 [ENXIO] Hangup received on *fildev*.

20159 **I_POP** Removes the module just below the STREAM head of the STREAM pointed to
 20160 by *fildev*. The *arg* argument should be 0 in an **I_POP** request.

20161 The *ioctl()* function with the **I_POP** command shall fail if:

20162 [EINVAL] No module present in the STREAM.

20163 [ENXIO] Hangup received on *fildev*.

20164 **I_LOOK** Retrieves the name of the module just below the STREAM head of the
 20165 STREAM pointed to by *fildev*, and places it in a character string pointed to by
 20166 *arg*. The buffer pointed to by *arg* should be at least FMNAMESZ+1 bytes long,
 20167 where FMNAMESZ is defined in <stropts.h>.

20168 The *ioctl()* function with the **I_LOOK** command shall fail if:

20169 [EINVAL] No module present in the STREAM.

20170 **I_FLUSH** Flushes read and/or write queues, depending on the value of *arg*. Valid *arg*
 20171 values are:

20172		FLUSHR	Flush all read queues.
20173		FLUSHW	Flush all write queues.
20174		FLUSHRW	Flush all read and all write queues.
20175		The <i>ioctl()</i> function with the <i>I_FLUSH</i> command shall fail if:	
20176		[EINVAL]	Invalid <i>arg</i> value.
20177		[EAGAIN] or [ENOSR]	Unable to allocate buffers for flush message.
20178			
20179		[ENXIO]	Hangup received on <i>fildev</i> .
20180	I_FLUSHBAND	Flushes a particular band of messages. The <i>arg</i> argument points to a bandinfo structure. The <i>bi_flag</i> member may be one of FLUSHR, FLUSHW, or FLUSHRW as described above. The <i>bi_pri</i> member determines the priority band to be flushed.	
20181			
20182			
20183			
20184	I_SETSIG	Requests that the STREAMS implementation send the SIGPOLL signal to the calling process when a particular event has occurred on the STREAM associated with <i>fildev</i> . I_SETSIG supports an asynchronous processing capability in STREAMS. The value of <i>arg</i> is a bitmask that specifies the events for which the process should be signaled. It is the bitwise-inclusive OR of any combination of the following constants:	
20185			
20186			
20187			
20188			
20189			
20190		S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
20191			
20192			
20193		S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
20194			
20195			
20196		S_INPUT	A message, other than a high-priority message, has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
20197			
20198			
20199		S_HIPRI	A high-priority message is present on a STREAM head read queue. A signal shall be generated even if the message is of zero length.
20200			
20201			
20202		S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
20203			
20204			
20205			
20206		S_WRNORM	Equivalent to S_OUTPUT.
20207		S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) priority data downstream.
20208			
20209			
20210			
20211		S_MSG	A STREAMS signal message that contains the SIGPOLL signal has reached the front of the STREAM head read queue.
20212			
20213			
20214		S_ERROR	Notification of an error condition has reached the STREAM head.
20215			

20216	S_HANGUP	Notification of a hangup has reached the STREAM head.
20217	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of SIGPOLL when a priority message reaches the front of the STREAM head read queue.
20218		
20219		
20220		If <i>arg</i> is 0, the calling process shall be unregistered and shall not receive further SIGPOLL signals for the stream associated with <i>fildev</i> .
20221		
20222		
20223		Processes that wish to receive SIGPOLL signals shall ensure that they explicitly register to receive them using I_SETSIG. If several processes register to receive this signal for the same event on the same STREAM, each process shall be signaled when the event occurs.
20224		
20225		
20226		The <i>ioctl()</i> function with the I_SETSIG command shall fail if:
20227	[EINVAL]	The value of <i>arg</i> is invalid.
20228	[EINVAL]	The value of <i>arg</i> is 0 and the calling process is not registered to receive the SIGPOLL signal.
20229		
20230	[EAGAIN]	There were insufficient resources to store the signal request.
20231	I_GETSIG	Returns the events for which the calling process is currently registered to be sent a SIGPOLL signal. The events are returned as a bitmask in an int pointed to by <i>arg</i> , where the events are those specified in the description of I_SETSIG above.
20232		
20233		
20234		
20235		The <i>ioctl()</i> function with the I_GETSIG command shall fail if:
20236	[EINVAL]	Process is not registered to receive the SIGPOLL signal.
20237	I_FIND	Compares the names of all modules currently present in the STREAM to the name pointed to by <i>arg</i> , and returns 1 if the named module is present in the STREAM, or returns 0 if the named module is not present.
20238		
20239		
20240		The <i>ioctl()</i> function with the I_FIND command shall fail if:
20241	[EINVAL]	<i>arg</i> does not contain a valid module name.
20242	I_PEEK	Retrieves the information in the first message on the STREAM head read queue without taking the message off the queue. It is analogous to <i>getmsg()</i> except that this command does not remove the message from the queue. The <i>arg</i> argument points to a strpeek structure.
20243		
20244		
20245		
20246		The application shall ensure that the <i>maxlen</i> member in the ctlbuf and databuf structures is set to the number of bytes of control information and/or data information, respectively, to retrieve. The <i>flags</i> member may be marked RS_HIPRI or 0, as described by <i>getmsg()</i> . If the process sets <i>flags</i> to RS_HIPRI, for example, I_PEEK shall only look for a high-priority message on the STREAM head read queue.
20247		
20248		
20249		
20250		
20251		
20252		I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was found on the STREAM head read queue, or if the RS_HIPRI flag was set in <i>flags</i> and a high-priority message was not present on the STREAM head read queue. It does not wait for a message to arrive. On return, ctlbuf specifies information in the control buffer, databuf specifies information in the data buffer, and <i>flags</i> contains the value RS_HIPRI or 0.
20253		
20254		
20255		
20256		
20257		
20258	I_SRDOPT	Sets the read mode using the value of the argument <i>arg</i> . Read modes are described in <i>read()</i> . Valid <i>arg</i> flags are:
20259		

20260		RNORM	Byte-stream mode, the default.
20261		RMSGD	Message-discard mode.
20262		RMSGN	Message-nondiscard mode.
20263		The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The	
20264		bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in	
20265		the other flag overriding RNORM which is the default.	
20266		In addition, treatment of control messages by the STREAM head may be	
20267		changed by setting any of the following flags in <i>arg</i> :	
20268		RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a
20269			control part is at the front of the STREAM head read queue.
20270		RPROTDAT	Deliver the control part of a message as data when a
20271			process issues a <i>read()</i> .
20272		RPROTDIS	Discard the control part of a message, delivering any data
20273			portion, when a process issues a <i>read()</i> .
20274		The <i>ioctl()</i> function with the I_SRDOPT command shall fail if:	
20275		[EINVAL]	The <i>arg</i> argument is not valid.
20276	I_GRDOPT	Returns the current read mode setting, as described above, in an int pointed to	
20277		by the argument <i>arg</i> . Read modes are described in <i>read()</i> .	
20278	I_NREAD	Counts the number of data bytes in the data part of the first message on the	
20279		STREAM head read queue and places this value in the int pointed to by <i>arg</i> .	
20280		The return value for the command shall be the number of messages on the	
20281		STREAM head read queue. For example, if 0 is returned in <i>arg</i> , but the <i>ioctl()</i>	
20282		return value is greater than 0, this indicates that a zero-length message is next	
20283		on the queue.	
20284	I_FDINSERT	Creates a message from specified buffer(s), adds information about another	
20285		STREAM, and sends the message downstream. The message contains a	
20286		control part and an optional data part. The data and control parts to be sent	
20287		are distinguished by placement in separate buffers, as described below. The	
20288		<i>arg</i> argument points to a strfdinsert structure.	
20289		The application shall ensure that the <i>len</i> member in the ctlbuf strbuf structure	
20290		is set to the size of a t_uscalar_t plus the number of bytes of control	
20291		information to be sent with the message. The <i>fildev</i> member specifies the file	
20292		descriptor of the other STREAM, and the <i>offset</i> member, which must be	
20293		suitably aligned for use as a t_uscalar_t , specifies the offset from the start of	
20294		the control buffer where I_FDINSERT shall store a t_uscalar_t whose	
20295		interpretation is specific to the STREAM end. The application shall ensure that	
20296		the <i>len</i> member in the databuf strbuf structure is set to the number of bytes of	
20297		data information to be sent with the message, or to 0 if no data part is to be	
20298		sent.	
20299		The <i>flags</i> member specifies the type of message to be created. A normal	
20300		message is created if <i>flags</i> is set to 0, and a high-priority message is created if	
20301		<i>flags</i> is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if	
20302		the STREAM write queue is full due to internal flow control conditions. For	
20303		priority messages, I_FDINSERT does not block on this condition. For non-	
20304		priority messages, I_FDINSERT does not block when the write queue is full	

20305		and O_NONBLOCK is set. Instead, it fails and sets <i>errno</i> to [EAGAIN].
20306		I_FDINSERT also blocks, unless prevented by lack of internal resources,
20307		waiting for the availability of message blocks in the STREAM, regardless of
20308		priority or whether O_NONBLOCK has been specified. No partial message is
20309		sent.
20310		The <i>ioctl()</i> function with the I_FDINSERT command shall fail if:
20311	[EAGAIN]	A non-priority message is specified, the O_NONBLOCK
20312		flag is set, and the STREAM write queue is full due to
20313		internal flow control conditions.
20314	[EAGAIN] or [ENOSR]	
20315		Buffers cannot be allocated for the message that is to be
20316		created.
20317	[EINVAL]	One of the following:
20318		— The <i>fildev</i> member of the strfdinsert structure is not a
20319		valid, open STREAM file descriptor.
20320		— The size of a t_uscalar_t plus <i>offset</i> is greater than the <i>len</i>
20321		member for the buffer specified through ctlbuf .
20322		— The <i>offset</i> member does not specify a properly-aligned
20323		location in the data buffer.
20324		— An undefined value is stored in <i>flags</i> .
20325	[ENXIO]	Hangup received on the STREAM identified by either the
20326		<i>fildev</i> argument or the <i>fildev</i> member of the strfdinsert
20327		structure.
20328	[ERANGE]	The <i>len</i> member for the buffer specified through databuf
20329		does not fall within the range specified by the maximum
20330		and minimum packet sizes of the topmost STREAM
20331		module; or the <i>len</i> member for the buffer specified through
20332		databuf is larger than the maximum configured size of the
20333		data part of a message; or the <i>len</i> member for the buffer
20334		specified through ctlbuf is larger than the maximum
20335		configured size of the control part of a message.
20336	I_STR	Constructs an internal STREAMS <i>ioctl()</i> message from the data pointed to by
20337		<i>arg</i> , and sends that message downstream.
20338		This mechanism is provided to send <i>ioctl()</i> requests to downstream modules
20339		and drivers. It allows information to be sent with <i>ioctl()</i> , and returns to the
20340		process any information sent upstream by the downstream recipient. I_STR
20341		shall block until the system responds with either a positive or negative
20342		acknowledgement message, or until the request times out after some period of
20343		time. If the request times out, it shall fail with <i>errno</i> set to [ETIME].
20344		At most, one I_STR can be active on a STREAM. Further I_STR calls shall
20345		block until the active I_STR completes at the STREAM head. The default
20346		timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has
20347		no effect on this call.
20348		To send requests downstream, the application shall ensure that <i>arg</i> points to a
20349		strioc structure.

20350		The <i>ic_cmd</i> member is the internal <i>ioctl()</i> command intended for a downstream module or driver and <i>ic_timeout</i> is the number of seconds (−1=infinite, 0=use implementation-defined timeout interval, >0=as specified) an I_STR request shall wait for acknowledgement before timing out. <i>ic_len</i> is the number of bytes in the data argument, and <i>ic_dp</i> is a pointer to the data argument. The <i>ic_len</i> member has two uses: on input, it contains the length of the data argument passed in, and on return from the command, it contains the number of bytes being returned to the process (the buffer pointed to by <i>ic_dp</i> should be large enough to contain the maximum amount of data that any module or the driver in the STREAM can return).
20351		
20352		
20353		
20354		
20355		
20356		
20357		
20358		
20359		
20360		The STREAM head shall convert the information pointed to by the strioc
20361		structure to an internal <i>ioctl()</i> command message and send it downstream.
20362		The <i>ioctl()</i> function with the I_STR command shall fail if:
20363		[EAGAIN] or [ENOSR]
20364		Unable to allocate buffers for the <i>ioctl()</i> message.
20365		[EINVAL] The <i>ic_len</i> member is less than 0 or larger than the
20366		maximum configured size of the data part of a message, or
20367		<i>ic_timeout</i> is less than −1.
20368		[ENXIO] Hangup received on <i>fil</i> des.
20369		[ETIME] A downstream <i>ioctl()</i> timed out before acknowledgement
20370		was received.
20371		An I_STR can also fail while waiting for an acknowledgement if a message
20372		indicating an error or a hangup is received at the STREAM head. In addition,
20373		an error code can be returned in the positive or negative acknowledgement
20374		message, in the event the <i>ioctl()</i> command sent downstream fails. For these
20375		cases, I_STR shall fail with <i>errno</i> set to the value in the message.
20376	I_SWROPT	Sets the write mode using the value of the argument <i>arg</i> . Valid bit settings for
20377		<i>arg</i> are:
20378		SNDZERO Send a zero-length message downstream when a <i>write()</i> of
20379		0 bytes occurs. To not send a zero-length message when a
20380		<i>write()</i> of 0 bytes occurs, the application shall ensure that
20381		this bit is not set in <i>arg</i> (for example, <i>arg</i> would be set to 0).
20382		The <i>ioctl()</i> function with the I_SWROPT command shall fail if:
20383		[EINVAL] <i>arg</i> is not the above value.
20384	I_GWROPT	Returns the current write mode setting, as described above, in the int that is
20385		pointed to by the argument <i>arg</i> .
20386	I_SENDFD	Creates a new reference to the open file description associated with the file
20387		descriptor <i>arg</i> , and writes a message on the STREAMS-based pipe <i>fil</i> des
20388		containing this reference, together with the user ID and group ID of the calling
20389		process.
20390		The <i>ioctl()</i> function with the I_SENDFD command shall fail if:
20391		[EAGAIN] The sending STREAM is unable to allocate a message block
20392		to contain the file pointer; or the read queue of the receiving
20393		STREAM head is full and cannot accept the message sent by
20394		I_SENDFD.

20395		[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
20396		[EINVAL]	The <i>fildev</i> argument is not connected to a STREAM pipe.
20397		[ENXIO]	Hangup received on <i>fildev</i> .
20398	I_RECVFD		Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The <i>arg</i> argument is a pointer to a strrecvfd data structure as defined in <stropts.h> .
20399			
20400			
20401			
20402			
20403			The <i>fd</i> member is a file descriptor. The <i>uid</i> and <i>gid</i> members are the effective user ID and effective group ID, respectively, of the sending process.
20404			
20405			If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with <i>errno</i> set to [EAGAIN] if no message is present at the STREAM head.
20406			
20407			
20408			If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the <i>fd</i> member of the strrecvfd structure pointed to by <i>arg</i> .
20409			
20410			
20411			
20412			The <i>ioctl()</i> function with the I_RECVFD command shall fail if:
20413		[EAGAIN]	A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.
20414			
20415		[EBADMSG]	The message at the STREAM head read queue is not a message containing a passed file descriptor.
20416			
20417		[EMFILE]	The process has the maximum number of file descriptors currently open that it is allowed.
20418			
20419		[ENXIO]	Hangup received on <i>fildev</i> .
20420	I_LIST		Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If <i>arg</i> is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by <i>fildev</i> . This lets the process allocate enough space for the module names. Otherwise, it should point to a str_list structure.
20421			
20422			
20423			
20424			
20425			The <i>sl_nmods</i> member indicates the number of entries the process has allocated in the array. Upon return, the <i>sl_modlist</i> member of the str_list structure shall contain the list of module names, and the number of entries that have been filled into the <i>sl_modlist</i> array is found in the <i>sl_nmods</i> member (the number includes the number of modules including the driver). The return value from <i>ioctl()</i> shall be 0. The entries are filled in starting at the top of the STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules (<i>sl_nmods</i>) is satisfied.
20426			
20427			
20428			
20429			
20430			
20431			
20432			
20433			The <i>ioctl()</i> function with the I_LIST command shall fail if:
20434		[EINVAL]	The <i>sl_nmods</i> member is less than 1.
20435		[EAGAIN] or [ENOSR]	Unable to allocate buffers.
20436			
20437	I_ATMARK		Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The <i>arg</i> argument determines
20438			

20439		how the checking is done when there may be multiple marked messages on
20440		the STREAM head read queue. It may take on the following values:
20441		ANYMARK Check if the message is marked.
20442		LASTMARK Check if the message is the last one marked on the queue.
20443		The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is
20444		permitted.
20445		The return value shall be 1 if the mark condition is satisfied; otherwise, the
20446		value shall be 0.
20447		The <i>ioctl()</i> function with the I_ATMARK command shall fail if:
20448		[EINVAL] Invalid <i>arg</i> value.
20449	I_CKBAND	Checks if the message of a given priority band exists on the STREAM head
20450		read queue. This shall return 1 if a message of the given priority exists, 0 if no
20451		such message exists, or –1 on error. <i>arg</i> should be of type int .
20452		The <i>ioctl()</i> function with the I_CKBAND command shall fail if:
20453		[EINVAL] Invalid <i>arg</i> value.
20454	I_GETBAND	Returns the priority band of the first message on the STREAM head read
20455		queue in the integer referenced by <i>arg</i> .
20456		The <i>ioctl()</i> function with the I_GETBAND command shall fail if:
20457		[ENODATA] No message on the STREAM head read queue.
20458	I_CANPUT	Checks if a certain band is writable. <i>arg</i> is set to the priority band in question.
20459		The return value shall be 0 if the band is flow-controlled, 1 if the band is
20460		writable, or –1 on error.
20461		The <i>ioctl()</i> function with the I_CANPUT command shall fail if:
20462		[EINVAL] Invalid <i>arg</i> value.
20463	I_SETCLTIME	This request allows the process to set the time the STREAM head shall delay
20464		when a STREAM is closing and there is data on the write queues. Before
20465		closing each module or driver, if there is data on its write queue, the STREAM
20466		head shall delay for the specified amount of time to allow the data to drain. If,
20467		after the delay, data is still present, it shall be flushed. The <i>arg</i> argument is a
20468		pointer to an integer specifying the number of milliseconds to delay, rounded
20469		up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM,
20470		an implementation-defined default timeout interval is used.
20471		The <i>ioctl()</i> function with the I_SETCLTIME command shall fail if:
20472		[EINVAL] Invalid <i>arg</i> value.
20473	I_GETCLTIME	Returns the close time delay in the integer pointed to by <i>arg</i> .

20474 Multiplexed STREAMS Configurations

20475 The following commands are used for connecting and disconnecting multiplexed STREAMS
20476 configurations. These commands use an implementation-defined default timeout interval.

20477 **I_LINK** Connects two STREAMs, where *fildev* is the file descriptor of the STREAM
20478 connected to the multiplexing driver, and *arg* is the file descriptor of the
20479 STREAM connected to another driver. The STREAM designated by *arg* is
20480 connected below the multiplexing driver. I_LINK requires the multiplexing
20481 driver to send an acknowledgement message to the STREAM head regarding
20482 the connection. This call shall return a multiplexer ID number (an identifier
20483 used to disconnect the multiplexer; see I_UNLINK) on success, and -1 on
20484 failure.

20485 The *ioctl()* function with the I_LINK command shall fail if:

20486 [ENXIO] Hangup received on *fildev*.
20487 [ETIME] Timeout before acknowledgement message was received at
20488 STREAM head.
20489 [EAGAIN] or [ENOSR]
20490 Unable to allocate STREAMS storage to perform the
20491 I_LINK.
20492 [EBADF] The *arg* argument is not a valid, open file descriptor.
20493 [EINVAL] The *fildev* argument does not support multiplexing; or *arg* is
20494 not a STREAM or is already connected downstream from a
20495 multiplexer; or the specified I_LINK operation would
20496 connect the STREAM head in more than one place in the
20497 multiplexed STREAM.

20498 An I_LINK can also fail while waiting for the multiplexing driver to
20499 acknowledge the request, if a message indicating an error or a hangup is
20500 received at the STREAM head of *fildev*. In addition, an error code can be
20501 returned in the positive or negative acknowledgement message. For these
20502 cases, I_LINK fails with *errno* set to the value in the message.

20503 **I_UNLINK** Disconnects the two STREAMs specified by *fildev* and *arg*. *fildev* is the file
20504 descriptor of the STREAM connected to the multiplexing driver. The *arg*
20505 argument is the multiplexer ID number that was returned by the I_LINK
20506 *ioctl()* command when a STREAM was connected downstream from the
20507 multiplexing driver. If *arg* is MUXID_ALL, then all STREAMs that were
20508 connected to *fildev* shall be disconnected. As in I_LINK, this command
20509 requires acknowledgement.

20510 The *ioctl()* function with the I_UNLINK command shall fail if:

20511 [ENXIO] Hangup received on *fildev*.
20512 [ETIME] Timeout before acknowledgement message was received at
20513 STREAM head.
20514 [EAGAIN] or [ENOSR]
20515 Unable to allocate buffers for the acknowledgement
20516 message.
20517 [EINVAL] Invalid multiplexer ID number.

20518		An I_UNLINK can also fail while waiting for the multiplexing driver to
20519		acknowledge the request if a message indicating an error or a hangup is
20520		received at the STREAM head of <i>filde</i> s. In addition, an error code can be
20521		returned in the positive or negative acknowledgement message. For these
20522		cases, I_UNLINK shall fail with <i>errno</i> set to the value in the message.
20523	I_PLINK	Creates a <i>persistent connection</i> between two STREAMs, where <i>filde</i> s is the file
20524		descriptor of the STREAM connected to the multiplexing driver, and <i>arg</i> is the
20525		file descriptor of the STREAM connected to another driver. This call shall
20526		create a persistent connection which can exist even if the file descriptor <i>filde</i> s
20527		associated with the upper STREAM to the multiplexing driver is closed. The
20528		STREAM designated by <i>arg</i> gets connected via a persistent connection below
20529		the multiplexing driver. I_PLINK requires the multiplexing driver to send an
20530		acknowledgement message to the STREAM head. This call shall return a
20531		multiplexer ID number (an identifier that may be used to disconnect the
20532		multiplexer; see I_PUNLINK) on success, and -1 on failure.
20533		The <i>ioctl()</i> function with the I_PLINK command shall fail if:
20534	[ENXIO]	Hangup received on <i>filde</i> s.
20535	[ETIME]	Timeout before acknowledgement message was received at
20536		STREAM head.
20537	[EAGAIN] or [ENOSR]	
20538		Unable to allocate STREAMS storage to perform the
20539		I_PLINK.
20540	[EBADF]	The <i>arg</i> argument is not a valid, open file descriptor.
20541	[EINVAL]	The <i>filde</i> s argument does not support multiplexing; or <i>arg</i> is
20542		not a STREAM or is already connected downstream from a
20543		multiplexer; or the specified I_PLINK operation would
20544		connect the STREAM head in more than one place in the
20545		multiplexed STREAM.
20546		An I_PLINK can also fail while waiting for the multiplexing driver to
20547		acknowledge the request, if a message indicating an error or a hangup is
20548		received at the STREAM head of <i>filde</i> s. In addition, an error code can be
20549		returned in the positive or negative acknowledgement message. For these
20550		cases, I_PLINK shall fail with <i>errno</i> set to the value in the message.
20551	I_PUNLINK	Disconnects the two STREAMs specified by <i>filde</i> s and <i>arg</i> from a persistent
20552		connection. The <i>filde</i> s argument is the file descriptor of the STREAM
20553		connected to the multiplexing driver. The <i>arg</i> argument is the multiplexer ID
20554		number that was returned by the I_PLINK <i>ioctl()</i> command when a STREAM
20555		was connected downstream from the multiplexing driver. If <i>arg</i> is
20556		MUXID_ALL, then all STREAMs which are persistent connections to <i>filde</i> s
20557		shall be disconnected. As in I_PLINK, this command requires the multiplexing
20558		driver to acknowledge the request.
20559		The <i>ioctl()</i> function with the I_PUNLINK command shall fail if:
20560	[ENXIO]	Hangup received on <i>filde</i> s.
20561	[ETIME]	Timeout before acknowledgement message was received at
20562		STREAM head.

20563 [EAGAIN] or [ENOSR]
 20564 Unable to allocate buffers for the acknowledgement
 20565 message.

20566 [EINVAL] Invalid multiplexer ID number.

20567 An I_PUNLINK can also fail while waiting for the multiplexing driver to
 20568 acknowledge the request if a message indicating an error or a hangup is
 20569 received at the STREAM head of *fildev*. In addition, an error code can be
 20570 returned in the positive or negative acknowledgement message. For these
 20571 cases, I_PUNLINK shall fail with *errno* set to the value in the message.

20572 RETURN VALUE

20573 Upon successful completion, *ioctl()* shall return a value other than -1 that depends upon the
 20574 STREAMS device control function. Otherwise, it shall return -1 and set *errno* to indicate the
 20575 error.

20576 ERRORS

20577 Under the following general conditions, *ioctl()* shall fail if:

20578 [EBADF] The *fildev* argument is not a valid open file descriptor.

20579 [EINTR] A signal was caught during the *ioctl()* operation.

20580 [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or
 20581 indirectly) downstream from a multiplexer.

20582 If an underlying device driver detects an error, then *ioctl()* shall fail if:

20583 [EINVAL] The *request* or *arg* argument is not valid for this device.

20584 [EIO] Some physical I/O error has occurred.

20585 [ENOTTY] The *fildev* argument is not associated with a STREAMS device that accepts
 20586 control functions.

20587 [ENXIO] The *request* and *arg* arguments are valid for this device driver, but the service
 20588 requested cannot be performed on this particular sub-device.

20589 [ENODEV] The *fildev* argument refers to a valid STREAMS device, but the corresponding
 20590 device driver does not support the *ioctl()* function.

20591 If a STREAM is connected downstream from a multiplexer, any *ioctl()* command except
 20592 I_UNLINK and I_PUNLINK shall set *errno* to [EINVAL].

20593 EXAMPLES

20594 None.

20595 APPLICATION USAGE

20596 The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

20597 RATIONALE

20598 None.

20599 FUTURE DIRECTIONS

20600 None.

20604 **CHANGE HISTORY**

20605 First released in Issue 4, Version 2.

20606 **Issue 5**

20607 Moved from X/OPEN UNIX extension to BASE.

20608 **Issue 6**

20609 The Open Group Corrigendum U028/4 is applied, correcting text in the `I_FDINSERT [EINVAL]`
 20610 case to refer to *ctlbuf*.

20611 This function is marked as part of the XSI STREAMS Option Group.

20612 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20613 **NAME**

20614 isalnum — test for an alphanumeric character

20615 **SYNOPSIS**

20616 #include <ctype.h>

20617 int isalnum(int c);

20618 **DESCRIPTION**

20619 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20620 conflict between the requirements described here and the ISO C standard is unintentional. This
20621 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20622 The *isalnum()* function shall test whether *c* is a character of class **alpha** or **digit** in the program's
20623 current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20624 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
20625 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
20626 behavior is undefined.

20627 **RETURN VALUE**

20628 The *isalnum()* function shall return non-zero if *c* is an alphanumeric character; otherwise, it shall
20629 return 0.

20630 **ERRORS**

20631 No errors are defined.

20632 **EXAMPLES**

20633 None.

20634 **APPLICATION USAGE**

20635 To ensure applications portability, especially across natural languages, only this function and
20636 those listed in the SEE ALSO section should be used for character classification.

20637 **RATIONALE**

20638 None.

20639 **FUTURE DIRECTIONS**

20640 None.

20641 **SEE ALSO**

20642 *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*,

20644 <stdio.h>

20645 **CHANGE HISTORY**

20646 First released in Issue 1. Derived from Issue 1 of the SVID.

20647 **Issue 6**

20648 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20649 **NAME**

20650 isalpha — test for an alphabetic character

20651 **SYNOPSIS**

20652 #include <ctype.h>

20653 int isalpha(int c);

20654 **DESCRIPTION**

20655 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20656 conflict between the requirements described here and the ISO C standard is unintentional. This
20657 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20658 The *isalpha()* function shall test whether *c* is a character of class **alpha** in the program's current
20659 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20660 The *c* argument is an **int**, the value of which the application shall ensure is representable as an
20661 **unsigned char** or equal to the value of the macro EOF. If the argument has any other value, the
20662 behavior is undefined.

20663 **RETURN VALUE**

20664 The *isalpha()* function shall return non-zero if *c* is an alphabetic character; otherwise, it shall
20665 return 0.

20666 **ERRORS**

20667 No errors are defined.

20668 **EXAMPLES**

20669 None.

20670 **APPLICATION USAGE**

20671 To ensure applications portability, especially across natural languages, only this function and
20672 those listed in the SEE ALSO section should be used for character classification.

20673 **RATIONALE**

20674 None.

20675 **FUTURE DIRECTIONS**

20676 None.

20677 **SEE ALSO**

20678 *isalnum()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,
20679 *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,
20680 <ctype.h>, <stdio.h>

20681 **CHANGE HISTORY**

20682 First released in Issue 1. Derived from Issue 1 of the SVID.

20683 **Issue 6**

20684 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20685 **NAME**

20686 isascii — test for a 7-bit US-ASCII character

20687 **SYNOPSIS**

20688 xSI #include <ctype.h>

20689 int isascii(int c);

20690

20691 **DESCRIPTION**20692 The *isascii()* function shall test whether *c* is a 7-bit US-ASCII character code.20693 The *isascii()* function is defined on all integer values.20694 **RETURN VALUE**20695 The *isascii()* function shall return non-zero if *c* is a 7-bit US-ASCII character code between 0 and
20696 octal 0177 inclusive; otherwise, it shall return 0.20697 **ERRORS**

20698 No errors are defined.

20699 **EXAMPLES**

20700 None.

20701 **APPLICATION USAGE**

20702 None.

20703 **RATIONALE**

20704 None.

20705 **FUTURE DIRECTIONS**

20706 None.

20707 **SEE ALSO**

20708 The Base Definitions volume of IEEE Std 1003.1-2001, <ctype.h>

20709 **CHANGE HISTORY**

20710 First released in Issue 1. Derived from Issue 1 of the SVID.

20711 **NAME**

20712 isastream — test a file descriptor (**STREAMS**)

20713 **SYNOPSIS**

20714 xSR `#include <stropts.h>`

20715 `int isastream(int fildes);`

20716

20717 **DESCRIPTION**

20718 The *isastream()* function shall test whether *fildes*, an open file descriptor, is associated with a
20719 STREAMS-based file.

20720 **RETURN VALUE**

20721 Upon successful completion, *isastream()* shall return 1 if *fildes* refers to a STREAMS-based file
20722 and 0 if not. Otherwise, *isastream()* shall return -1 and set *errno* to indicate the error.

20723 **ERRORS**

20724 The *isastream()* function shall fail if:

20725 [EBADF] The *fildes* argument is not a valid open file descriptor.

20726 **EXAMPLES**

20727 None.

20728 **APPLICATION USAGE**

20729 None.

20730 **RATIONALE**

20731 None.

20732 **FUTURE DIRECTIONS**

20733 None.

20734 **SEE ALSO**

20735 The Base Definitions volume of IEEE Std 1003.1-2001, <**stropts.h**>

20736 **CHANGE HISTORY**

20737 First released in Issue 4, Version 2.

20738 **Issue 5**

20739 Moved from X/OPEN UNIX extension to BASE.

20740 **NAME**

20741 isatty — test for a terminal device

20742 **SYNOPSIS**

20743 #include <unistd.h>

20744 int isatty(int *fildev*);20745 **DESCRIPTION**20746 The *isatty()* function shall test whether *fildev*, an open file descriptor, is associated with a
20747 terminal device.20748 **RETURN VALUE**20749 The *isatty()* function shall return 1 if *fildev* is associated with a terminal; otherwise, it shall return
20750 0 and may set *errno* to indicate the error.20751 **ERRORS**20752 The *isatty()* function may fail if:20753 [EBADF] The *fildev* argument is not a valid open file descriptor.20754 [ENOTTY] The *fildev* argument is not associated with a terminal.20755 **EXAMPLES**

20756 None.

20757 **APPLICATION USAGE**20758 The *isatty()* function does not necessarily indicate that a human being is available for interaction
20759 via *fildev*. It is quite possible that non-terminal devices are connected to the communications
20760 line.20761 **RATIONALE**

20762 None.

20763 **FUTURE DIRECTIONS**

20764 None.

20765 **SEE ALSO**20766 The Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>20767 **CHANGE HISTORY**

20768 First released in Issue 1. Derived from Issue 1 of the SVID.

20769 **Issue 6**20770 The following new requirements on POSIX implementations derive from alignment with the
20771 Single UNIX Specification:

- 20772
- The optional setting of *errno* to indicate an error is added.
 - The [EBADF] and [ENOTTY] optional error conditions are added.
- 20773

20774 **NAME**

20775 isblank — test for a blank character

20776 **SYNOPSIS**

20777 #include <ctype.h>

20778 int isblank(int c);

20779 **DESCRIPTION**

20780 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20781 conflict between the requirements described here and the ISO C standard is unintentional. This
20782 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20783 The *isblank()* function shall test whether *c* is a character of class **blank** in the program's current
20784 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20785 The *c* argument is a type **int**, the value of which the application shall ensure is a character
20786 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
20787 any other value, the behavior is undefined.

20788 **RETURN VALUE**20789 The *isblank()* function shall return non-zero if *c* is a <blank>; otherwise, it shall return 0.20790 **ERRORS**

20791 No errors are defined.

20792 **EXAMPLES**

20793 None.

20794 **APPLICATION USAGE**

20795 To ensure applications portability, especially across natural languages, only this function and
20796 those listed in the SEE ALSO section should be used for character classification.

20805 **CHANGE HISTORY**

20806 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20807 **NAME**

20808 isctrl — test for a control character

20809 **SYNOPSIS**

20810 #include <ctype.h>

20811 int isctrl(int c);

20812 **DESCRIPTION**

20813 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20814 conflict between the requirements described here and the ISO C standard is unintentional. This
20815 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20816 The *isctrl()* function shall test whether *c* is a character of class **cntrl** in the program's current
20817 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20818 The *c* argument is a type **int**, the value of which the application shall ensure is a character
20819 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
20820 any other value, the behavior is undefined.

20821 **RETURN VALUE**20822 The *isctrl()* function shall return non-zero if *c* is a control character; otherwise, it shall return 0.20823 **ERRORS**

20824 No errors are defined.

20825 **EXAMPLES**

20826 None.

20827 **APPLICATION USAGE**

20828 To ensure applications portability, especially across natural languages, only this function and
20829 those listed in the SEE ALSO section should be used for character classification.

20838 **CHANGE HISTORY**

20839 First released in Issue 1. Derived from Issue 1 of the SVID.

20840 **Issue 6**

20841 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20842 **NAME**

20843 isdigit — test for a decimal digit

20844 **SYNOPSIS**

20845 #include <ctype.h>

20846 int isdigit(int c);

20847 **DESCRIPTION**

20848 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20849 conflict between the requirements described here and the ISO C standard is unintentional. This
20850 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20851 The *isdigit()* function shall test whether *c* is a character of class **digit** in the program's current
20852 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20853 The *c* argument is an **int**, the value of which the application shall ensure is a character
20854 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
20855 any other value, the behavior is undefined.

20856 **RETURN VALUE**20857 The *isdigit()* function shall return non-zero if *c* is a decimal digit; otherwise, it shall return 0.20858 **ERRORS**

20859 No errors are defined.

20860 **EXAMPLES**

20861 None.

20862 **APPLICATION USAGE**

20863 To ensure applications portability, especially across natural languages, only this function and
20864 those listed in the SEE ALSO section should be used for character classification.

20865 **RATIONALE**

20866 None.

20867 **FUTURE DIRECTIONS**

20868 None.

20869 **SEE ALSO**

20870 *isalnum()*, *isalpha()*, *iscntrl()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,
20871 *isxdigit()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

20872 **CHANGE HISTORY**

20873 First released in Issue 1. Derived from Issue 1 of the SVID.

20874 **Issue 6**

20875 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20876 **NAME**

20877 isfinite — test for finite value

20878 **SYNOPSIS**

20879 #include <math.h>

20880 int isfinite(real-floating x);

20881 **DESCRIPTION**

20882 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20883 conflict between the requirements described here and the ISO C standard is unintentional. This
20884 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20885 The *isfinite()* macro shall determine whether its argument has a finite value (zero, subnormal, or
20886 normal, and not infinite or NaN). First, an argument represented in a format wider than its
20887 semantic type is converted to its semantic type. Then determination is based on the type of the
20888 argument.

20889 **RETURN VALUE**20890 The *isfinite()* macro shall return a non-zero value if and only if its argument has a finite value.20891 **ERRORS**

20892 No errors are defined.

20893 **EXAMPLES**

20894 None.

20895 **APPLICATION USAGE**

20896 None.

20897 **RATIONALE**

20898 None.

20899 **FUTURE DIRECTIONS**

20900 None.

20901 **SEE ALSO**

20902 *fpclassify()*, *isinf()*, *isnan()*, *isnormal()*, *signbit()*, the Base Definitions volume of
20903 IEEE Std 1003.1-2001 <math.h>

20904 **CHANGE HISTORY**

20905 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

20906 **NAME**

20907 isgraph — test for a visible character

20908 **SYNOPSIS**

20909 #include <ctype.h>

20910 int isgraph(int c);

20911 **DESCRIPTION**

20912 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20913 conflict between the requirements described here and the ISO C standard is unintentional. This
20914 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20915 The *isgraph()* function shall test whether *c* is a character of class **graph** in the program's current
20916 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

20917 The *c* argument is an **int**, the value of which the application shall ensure is a character
20918 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
20919 any other value, the behavior is undefined.

20920 **RETURN VALUE**

20921 The *isgraph()* function shall return non-zero if *c* is a character with a visible representation;
20922 otherwise, it shall return 0.

20923 **ERRORS**

20924 No errors are defined.

20925 **EXAMPLES**

20926 None.

20927 **APPLICATION USAGE**

20928 To ensure applications portability, especially across natural languages, only this function and
20929 those listed in the SEE ALSO section should be used for character classification.

20930 **RATIONALE**

20931 None.

20932 **FUTURE DIRECTIONS**

20933 None.

20934 **SEE ALSO**

20935 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*, *isxdigit()*,

20937 **CHANGE HISTORY**

20938 First released in Issue 1. Derived from Issue 1 of the SVID.

20939 **Issue 6**

20940 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

20941 **NAME**

20942 isgreater — test if x greater than y

20943 **SYNOPSIS**

20944 #include <math.h>

20945 int isgreater(real-floating x, real-floating y);

20946 **DESCRIPTION**

20947 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20948 conflict between the requirements described here and the ISO C standard is unintentional. This
20949 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20950 The *isgreater()* macro shall determine whether its first argument is greater than its second
20951 argument. The value of *isgreater(x, y)* shall be equal to $(x) > (y)$; however, unlike $(x) > (y)$,
20952 *isgreater(x, y)* shall not raise the invalid floating-point exception when x and y are unordered.

20953 **RETURN VALUE**20954 Upon successful completion, the *isgreater()* macro shall return the value of $(x) > (y)$.

20955 If x or y is NaN, 0 shall be returned.

20956 **ERRORS**

20957 No errors are defined.

20958 **EXAMPLES**

20959 None.

20960 **APPLICATION USAGE**

20961 The relational and equality operators support the usual mathematical relationships between
20962 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
20963 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
20964 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
20965 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
20966 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
20967 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
20968 indicates that the argument shall be an expression of **real-floating** type.

20969 **RATIONALE**

20970 None.

20971 **FUTURE DIRECTIONS**

20972 None.

20973 **SEE ALSO**

20974 *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*, *isunordered()*, the Base Definitions volume of
20975 IEEE Std 1003.1-2001 <math.h>

20976 **CHANGE HISTORY**

20977 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

20978 **NAME**20979 isgreaterqual — test if *x* is greater than or equal to *y*20980 **SYNOPSIS**

20981 #include <math.h>

20982 int isgreaterqual(real-floating *x*, real-floating *y*);20983 **DESCRIPTION**

20984 cx The functionality described on this reference page is aligned with the ISO C standard. Any
20985 conflict between the requirements described here and the ISO C standard is unintentional. This
20986 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

20987 The *isgreaterqual()* macro shall determine whether its first argument is greater than or equal to
20988 its second argument. The value of *isgreaterqual*(*x*, *y*) shall be equal to (*x*) >= (*y*); however, unlike
20989 (*x*) >= (*y*), *isgreaterqual*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are
20990 unordered.

20991 **RETURN VALUE**20992 Upon successful completion, the *isgreaterqual()* macro shall return the value of (*x*) >= (*y*).20993 If *x* or *y* is NaN, 0 shall be returned.20994 **ERRORS**

20995 No errors are defined.

20996 **EXAMPLES**

20997 None.

20998 **APPLICATION USAGE**

20999 The relational and equality operators support the usual mathematical relationships between
21000 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
21001 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
21002 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
21003 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
21004 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
21005 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
21006 indicates that the argument shall be an expression of **real-floating** type.

21007 **RATIONALE**

21008 None.

21009 **FUTURE DIRECTIONS**

21010 None.

21011 **SEE ALSO**

21013 IEEE Std 1003.1-2001 <math.h>

21014 **CHANGE HISTORY**

21015 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21016 **NAME**

21017 isinf — test for infinity

21018 **SYNOPSIS**

21019 #include <math.h>

21020 int isinf(real-floating x);

21021 **DESCRIPTION**

21022 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21023 conflict between the requirements described here and the ISO C standard is unintentional. This
21024 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21025 The *isinf()* macro shall determine whether its argument value is an infinity (positive or
21026 negative). First, an argument represented in a format wider than its semantic type is converted
21027 to its semantic type. Then determination is based on the type of the argument.

21028 **RETURN VALUE**21029 The *isinf()* macro shall return a non-zero value if and only if its argument has an infinite value.21030 **ERRORS**

21031 No errors are defined.

21032 **EXAMPLES**

21033 None.

21034 **APPLICATION USAGE**

21035 None.

21036 **RATIONALE**

21037 None.

21038 **FUTURE DIRECTIONS**

21039 None.

21040 **SEE ALSO**

21041 *fpclassify()*, *isfinite()*, *isnan()*, *isnormal()*, *signbit()*, the Base Definitions volume of

21043 **CHANGE HISTORY**

21044 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21045 **NAME**21046 isless — test if *x* is less than *y*21047 **SYNOPSIS**

21048 #include <math.h>

21049 int isless(real-floating *x*, real-floating *y*);21050 **DESCRIPTION**

21051 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21052 conflict between the requirements described here and the ISO C standard is unintentional. This
21053 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21054 The *isless()* macro shall determine whether its first argument is less than its second argument.
21055 The value of *isless*(*x*, *y*) shall be equal to (*x*) < (*y*); however, unlike (*x*) < (*y*), *isless*(*x*, *y*) shall not
21056 raise the invalid floating-point exception when *x* and *y* are unordered.

21057 **RETURN VALUE**21058 Upon successful completion, the *isless()* macro shall return the value of (*x*) < (*y*).21059 If *x* or *y* is NaN, 0 shall be returned.21060 **ERRORS**

21061 No errors are defined.

21062 **EXAMPLES**

21063 None.

21064 **APPLICATION USAGE**

21065 The relational and equality operators support the usual mathematical relationships between
21066 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
21067 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
21068 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
21069 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
21070 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
21071 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
21072 indicates that the argument shall be an expression of **real-floating** type.

21073 **RATIONALE**

21074 None.

21075 **FUTURE DIRECTIONS**

21076 None.

21077 **SEE ALSO**

21079 of IEEE Std 1003.1-2001, <math.h>

21080 **CHANGE HISTORY**

21081 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21082 **NAME**21083 islessequal — test if *x* is less than or equal to *y*21084 **SYNOPSIS**

21085 #include <math.h>

21086 int islessequal(real-floating *x*, real-floating *y*);21087 **DESCRIPTION**

21088 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
21089 conflict between the requirements described here and the ISO C standard is unintentional. This
21090 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21091 The *islessequal()* macro shall determine whether its first argument is less than or equal to its
21092 second argument. The value of *islessequal*(*x*, *y*) shall be equal to (*x*) <= (*y*); however, unlike
21093 (*x*) <= (*y*), *islessequal*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are
21094 unordered.

21095 **RETURN VALUE**21096 Upon successful completion, the *islessequal()* macro shall return the value of (*x*) <= (*y*).21097 If *x* or *y* is NaN, 0 shall be returned.21098 **ERRORS**

21099 No errors are defined.

21100 **EXAMPLES**

21101 None.

21102 **APPLICATION USAGE**

21103 The relational and equality operators support the usual mathematical relationships between
21104 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
21105 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
21106 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
21107 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
21108 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
21109 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
21110 indicates that the argument shall be an expression of **real-floating** type.

21111 **RATIONALE**

21112 None.

21113 **FUTURE DIRECTIONS**

21114 None.

21115 **SEE ALSO**

21116 *isgreater()*, *isgreaterequal()*, *isless()*, *islessgreater()*, *isunordered()*, the Base Definitions volume of
21117 IEEE Std 1003.1-2001 <math.h>

21118 **CHANGE HISTORY**

21119 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21120 **NAME**

21121 islessgreater — test if *x* is less than or greater than *y*

21122 **SYNOPSIS**

21123 #include <math.h>

21124 int islessgreater(real-floating *x*, real-floating *y*);

21125 **DESCRIPTION**

21126 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21127 conflict between the requirements described here and the ISO C standard is unintentional. This
21128 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21129 The *islessgreater()* macro shall determine whether its first argument is less than or greater than
21130 its second argument. The *islessgreater*(*x*, *y*) macro is similar to $(x) < (y) \mid \mid (x) > (y)$; however,
21131 *islessgreater*(*x*, *y*) shall not raise the invalid floating-point exception when *x* and *y* are unordered
21132 (nor shall it evaluate *x* and *y* twice).

21133 **RETURN VALUE**

21134 Upon successful completion, the *islessgreater()* macro shall return the value of
21135 $(x) < (y) \mid \mid (x) > (y)$.

21136 If *x* or *y* is NaN, 0 shall be returned.

21137 **ERRORS**

21138 No errors are defined.

21139 **EXAMPLES**

21140 None.

21141 **APPLICATION USAGE**

21142 The relational and equality operators support the usual mathematical relationships between
21143 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
21144 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
21145 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
21146 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
21147 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
21148 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
21149 indicates that the argument shall be an expression of **real-floating** type.

21150 **RATIONALE**

21151 None.

21152 **FUTURE DIRECTIONS**

21153 None.

21154 **SEE ALSO**

21155 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *isunordered()*, the Base Definitions volume of
21156 IEEE Std 1003.1-2001 <math.h>

21157 **CHANGE HISTORY**

21158 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21159 **NAME**

21160 islower — test for a lowercase letter

21161 **SYNOPSIS**

21162 #include <ctype.h>

21163 int islower(int c);

21164 **DESCRIPTION**

21165 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21166 conflict between the requirements described here and the ISO C standard is unintentional. This
 21167 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21168 The *islower()* function shall test whether *c* is a character of class **lower** in the program's current
 21169 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21170 The *c* argument is an **int**, the value of which the application shall ensure is a character
 21171 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
 21172 any other value, the behavior is undefined.

21173 **RETURN VALUE**21174 The *islower()* function shall return non-zero if *c* is a lowercase letter; otherwise, it shall return 0.21175 **ERRORS**

21176 No errors are defined.

21177 **EXAMPLES**21178 **Testing for a Lowercase Letter**

21179 The following example tests whether the value is a lowercase letter, based on the locale of the
 21180 user, then uses it as part of a key value.

```

21181 #include <ctype.h>
21182 #include <stdlib.h>
21183 #include <locale.h>
21184 ...
21185 char *keyst;
21186 int elementlen, len;
21187 char c;
21188 ...
21189 setlocale(LC_ALL, "");
21190 ...
21191 len = 0;
21192 while (len < elementlen) {
21193     c = (char) (rand() % 256);
21194     ...
21195     if (islower(c))
21196         keyst[len++] = c;
21197 }
21198 ...

```

21199 **APPLICATION USAGE**

21200 To ensure applications portability, especially across natural languages, only this function and
 21201 those listed in the SEE ALSO section should be used for character classification.

21202 **RATIONALE**

21203 None.

21204 **FUTURE DIRECTIONS**

21205 None.

21206 **SEE ALSO**

21207 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,

21210 **CHANGE HISTORY**

21211 First released in Issue 1. Derived from Issue 1 of the SVID.

21212 **Issue 6**

21213 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21214 An example is added.

21215 **NAME**

21216 isnan — test for a NaN

21217 **SYNOPSIS**

21218 #include <math.h>

21219 int isnan(real-floating x);

21220 **DESCRIPTION**

21221 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21222 conflict between the requirements described here and the ISO C standard is unintentional. This
21223 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21224 The *isnan()* macro shall determine whether its argument value is a NaN. First, an argument
21225 represented in a format wider than its semantic type is converted to its semantic type. Then
21226 determination is based on the type of the argument.

21227 **RETURN VALUE**21228 The *isnan()* macro shall return a non-zero value if and only if its argument has a NaN value.21229 **ERRORS**

21230 No errors are defined.

21231 **EXAMPLES**

21232 None.

21233 **APPLICATION USAGE**

21234 None.

21235 **RATIONALE**

21236 None.

21237 **FUTURE DIRECTIONS**

21238 None.

21239 **SEE ALSO**

21240 *fpclassify()*, *isfinite()*, *isinf()*, *isnormal()*, *signbit()*, the Base Definitions volume of

21242 **CHANGE HISTORY**

21243 First released in Issue 3.

21244 **Issue 5**

21245 The DESCRIPTION is updated to indicate the return value when NaN is not supported. This
21246 text was previously published in the APPLICATION USAGE section.

21247 **Issue 6**

21248 Re-written for alignment with the ISO/IEC 9899:1999 standard.

21249 **NAME**

21250 isnormal — test for a normal value

21251 **SYNOPSIS**

21252 #include <math.h>

21253 int isnormal(real-floating x);

21254 **DESCRIPTION**

21255 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21256 conflict between the requirements described here and the ISO C standard is unintentional. This
21257 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21258 The *isnormal()* macro shall determine whether its argument value is normal (neither zero,
21259 subnormal, infinite, nor NaN). First, an argument represented in a format wider than its
21260 semantic type is converted to its semantic type. Then determination is based on the type of the
21261 argument.

21262 **RETURN VALUE**

21263 The *isnormal()* macro shall return a non-zero value if and only if its argument has a normal
21264 value.

21265 **ERRORS**

21266 No errors are defined.

21267 **EXAMPLES**

21268 None.

21269 **APPLICATION USAGE**

21278 **CHANGE HISTORY**

21279 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21280 **NAME**

21281 isprint — test for a printable character

21282 **SYNOPSIS**

21283 #include <ctype.h>

21284 int isprint(int c);

21285 **DESCRIPTION**

21286 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21287 conflict between the requirements described here and the ISO C standard is unintentional. This
21288 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21289 The *isprint()* function shall test whether *c* is a character of class **print** in the program's current
21290 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21291 The *c* argument is an **int**, the value of which the application shall ensure is a character
21292 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
21293 any other value, the behavior is undefined.

21294 **RETURN VALUE**

21295 The *isprint()* function shall return non-zero if *c* is a printable character; otherwise, it shall return
21296 0.

21297 **ERRORS**

21298 No errors are defined.

21299 **EXAMPLES**

21300 None.

21301 **APPLICATION USAGE**

21302 To ensure applications portability, especially across natural languages, only this function and
21303 those listed in the SEE ALSO section should be used for character classification.

21310 *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,
21311 <ctype.h>

21312 **CHANGE HISTORY**

21313 First released in Issue 1. Derived from Issue 1 of the SVID.

21314 **Issue 6**

21315 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21316 **NAME**

21317 ispunct — test for a punctuation character

21318 **SYNOPSIS**

21319 #include <ctype.h>

21320 int ispunct(int c);

21321 **DESCRIPTION**

21322 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21323 conflict between the requirements described here and the ISO C standard is unintentional. This
21324 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21325 The *ispunct()* function shall test whether *c* is a character of class **punct** in the program's current
21326 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21327 The *c* argument is an **int**, the value of which the application shall ensure is a character
21328 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
21329 any other value, the behavior is undefined.

21330 **RETURN VALUE**

21331 The *ispunct()* function shall return non-zero if *c* is a punctuation character; otherwise, it shall
21332 return 0.

21333 **ERRORS**

21334 No errors are defined.

21335 **EXAMPLES**

21336 None.

21337 **APPLICATION USAGE**

21338 To ensure applications portability, especially across natural languages, only this function and
21339 those listed in the SEE ALSO section should be used for character classification.

21340 **RATIONALE**

21341 None.

21342 **FUTURE DIRECTIONS**

21343 None.

21344 **SEE ALSO**

21345 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *isspace()*, *isupper()*, *isxdigit()*,
21346 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

21347 **CHANGE HISTORY**

21348 First released in Issue 1. Derived from Issue 1 of the SVID.

21349 **Issue 6**

21350 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21351 **NAME**

21352 isspace — test for a white-space character

21353 **SYNOPSIS**

21354 #include <ctype.h>

21355 int isspace(int c);

21356 **DESCRIPTION**

21357 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21358 conflict between the requirements described here and the ISO C standard is unintentional. This
21359 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21360 The *isspace()* function shall test whether *c* is a character of class **space** in the program's current
21361 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21362 The *c* argument is an **int**, the value of which the application shall ensure is a character
21363 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
21364 any other value, the behavior is undefined.

21365 **RETURN VALUE**

21366 The *isspace()* function shall return non-zero if *c* is a white-space character; otherwise, it shall
21367 return 0.

21368 **ERRORS**

21369 No errors are defined.

21370 **EXAMPLES**

21371 None.

21372 **APPLICATION USAGE**

21373 To ensure applications portability, especially across natural languages, only this function and
21374 those listed in the SEE ALSO section should be used for character classification.

21375 **RATIONALE**

21376 None.

21377 **FUTURE DIRECTIONS**

21378 None.

21379 **SEE ALSO**

21380 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isupper()*,
21381 *isxdigit()*, *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale,
21382 <ctype.h>

21383 **CHANGE HISTORY**

21384 First released in Issue 1. Derived from Issue 1 of the SVID.

21385 **Issue 6**

21386 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21387 **NAME**

21388 isunordered — test if arguments are unordered

21389 **SYNOPSIS**

21390 #include <math.h>

21391 int isunordered(real-floating x, real-floating y);

21392 **DESCRIPTION**

21393 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21394 conflict between the requirements described here and the ISO C standard is unintentional. This
21395 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21396 The *isunordered()* macro shall determine whether its arguments are unordered.

21397 **RETURN VALUE**

21398 Upon successful completion, the *isunordered()* macro shall return 1 if its arguments are
21399 unordered, and 0 otherwise.

21400 If x or y is NaN, 0 shall be returned.

21401 **ERRORS**

21402 No errors are defined.

21403 **EXAMPLES**

21404 None.

21405 **APPLICATION USAGE**

21406 The relational and equality operators support the usual mathematical relationships between
21407 numeric values. For any ordered pair of numeric values, exactly one of the relationships (less,
21408 greater, and equal) is true. Relational operators may raise the invalid floating-point exception
21409 when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the
21410 unordered relationship is true. This macro is a quiet (non-floating-point exception raising)
21411 version of a relational operator. It facilitates writing efficient code that accounts for NaNs
21412 without suffering the invalid floating-point exception. In the SYNOPSIS section, **real-floating**
21413 indicates that the argument shall be an expression of **real-floating** type.

21414 **RATIONALE**

21415 None.

21416 **FUTURE DIRECTIONS**

21417 None.

21418 **SEE ALSO**

21419 *isgreater()*, *isgreaterequal()*, *isless()*, *islessequal()*, *islessgreater()*, the Base Definitions volume of
21420 IEEE Std 1003.1-2001, <math.h>

21421 **CHANGE HISTORY**

21422 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21423 **NAME**

21424 isupper — test for an uppercase letter

21425 **SYNOPSIS**

21426 #include <ctype.h>

21427 int isupper(int c);

21428 **DESCRIPTION**

21429 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21430 conflict between the requirements described here and the ISO C standard is unintentional. This
21431 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21432 The *isupper()* function shall test whether *c* is a character of class **upper** in the program's current
21433 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

21434 The *c* argument is an **int**, the value of which the application shall ensure is a character
21435 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
21436 any other value, the behavior is undefined.

21437 **RETURN VALUE**21438 The *isupper()* function shall return non-zero if *c* is an uppercase letter; otherwise, it shall return 0.21439 **ERRORS**

21440 No errors are defined.

21441 **EXAMPLES**

21442 None.

21443 **APPLICATION USAGE**

21444 To ensure applications portability, especially across natural languages, only this function and
21445 those listed in the SEE ALSO section should be used for character classification.

21446 **RATIONALE**

21447 None.

21448 **FUTURE DIRECTIONS**

21449 None.

21452 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, **<ctype.h>**

21453 **CHANGE HISTORY**

21454 First released in Issue 1. Derived from Issue 1 of the SVID.

21455 **Issue 6**

21456 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21457 **NAME**

21458 iswalnum — test for an alphanumeric wide-character code

21459 **SYNOPSIS**

21460 #include <wctype.h>

21461 int iswalnum(wint_t wc);

21462 **DESCRIPTION**

21463 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
21464 conflict between the requirements described here and the ISO C standard is unintentional. This
21465 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21466 The *iswalnum()* function shall test whether *wc* is a wide-character code representing a character
21467 of class **alpha** or **digit** in the program's current locale; see the Base Definitions volume of
21468 IEEE Std 1003.1-2001, Chapter 7, Locale.

21469 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
21470 code corresponding to a valid character in the current locale, or equal to the value of the macro
21471 WEOF. If the argument has any other value, the behavior is undefined.

21472 **RETURN VALUE**

21473 The *iswalnum()* function shall return non-zero if *wc* is an alphanumeric wide-character code;
21474 otherwise, it shall return 0.

21475 **ERRORS**

21476 No errors are defined.

21477 **EXAMPLES**

21478 None.

21479 **APPLICATION USAGE**

21480 To ensure applications portability, especially across natural languages, only this function and
21481 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21482 **RATIONALE**

21483 None.

21484 **FUTURE DIRECTIONS**

21485 None.

21486 **SEE ALSO**

21487 *iswalphabet()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
21488 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
21489 IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21490 **CHANGE HISTORY**

21491 First released as a World-wide Portability Interface in Issue 4.

21492 **Issue 5**

21493 The following change has been made in this issue for alignment with
21494 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21495 • The SYNOPSIS has been changed to indicate that this function and associated data types are
21496 now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

21497 **Issue 6**

21498 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21499 **NAME**

21500 iswalpha — test for an alphabetic wide-character code

21501 **SYNOPSIS**

21502 #include <wctype.h>

21503 int iswalpha(wint_t wc);

21504 **DESCRIPTION**

21505 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21506 conflict between the requirements described here and the ISO C standard is unintentional. This
 21507 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21508 The *iswalpha()* function shall test whether *wc* is a wide-character code representing a character of
 21509 class **alpha** in the program's current locale; see the Base Definitions volume of
 21510 IEEE Std 1003.1-2001, Chapter 7, Locale.

21511 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21512 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21513 WEOF. If the argument has any other value, the behavior is undefined.

21514 **RETURN VALUE**

21515 The *iswalpha()* function shall return non-zero if *wc* is an alphabetic wide-character code;
 21516 otherwise, it shall return 0.

21517 **ERRORS**

21518 No errors are defined.

21519 **EXAMPLES**

21520 None.

21521 **APPLICATION USAGE**

21522 To ensure applications portability, especially across natural languages, only this function and
 21523 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21524 **RATIONALE**

21525 None.

21526 **FUTURE DIRECTIONS**

21527 None.

21528 **SEE ALSO**

21529 *iswalnum()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
 21530 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
 21531 IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21532 **CHANGE HISTORY**

21533 First released in Issue 4.

21534 **Issue 5**

21535 The following change has been made in this issue for alignment with
 21536 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21537 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21538 now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

21539 **Issue 6**

21540 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21541 **NAME**

21542 iswblank — test for a blank wide-character code

21543 **SYNOPSIS**

21544 #include <wctype.h>

21545 int iswblank(wint_t wc);

21546 **DESCRIPTION**

21547 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21548 conflict between the requirements described here and the ISO C standard is unintentional. This
21549 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21550 The *iswblank()* function shall test whether *wc* is a wide-character code representing a character of
21551 class **blank** in the program's current locale; see the Base Definitions volume of
21552 IEEE Std 1003.1-2001, Chapter 7, Locale.

21553 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
21554 code corresponding to a valid character in the current locale, or equal to the value of the macro
21555 WEOF. If the argument has any other value, the behavior is undefined.

21556 **RETURN VALUE**

21557 The *iswblank()* function shall return non-zero if *wc* is a blank wide-character code; otherwise, it
21558 shall return 0.

21559 **ERRORS**

21560 No errors are defined.

21561 **EXAMPLES**

21562 None.

21563 **APPLICATION USAGE**

21564 To ensure applications portability, especially across natural languages, only this function and
21565 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21566 **RATIONALE**

21567 None.

21568 **FUTURE DIRECTIONS**

21569 None.

21570 **SEE ALSO**

21571 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*,

21573 IEEE Std 1003.1-2001, Chapter 7, Locale, <stdio.h>, <wchar.h>, <wctype.h>

21574 **CHANGE HISTORY**

21575 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

21576 **NAME**

21577 iswcntrl — test for a control wide-character code

21578 **SYNOPSIS**

21579 #include <wctype.h>

21580 int iswcntrl(wint_t wc);

21581 **DESCRIPTION**

21582 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21583 conflict between the requirements described here and the ISO C standard is unintentional. This
21584 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21585 The *iswcntrl()* function shall test whether *wc* is a wide-character code representing a character of
21586 class **cntrl** in the program's current locale; see the Base Definitions volume of
21587 IEEE Std 1003.1-2001, Chapter 7, Locale.

21588 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
21589 code corresponding to a valid character in the current locale, or equal to the value of the macro
21590 WEOF. If the argument has any other value, the behavior is undefined.

21591 **RETURN VALUE**

21592 The *iswcntrl()* function shall return non-zero if *wc* is a control wide-character code; otherwise, it
21593 shall return 0.

21594 **ERRORS**

21595 No errors are defined.

21596 **EXAMPLES**

21597 None.

21598 **APPLICATION USAGE**

21599 To ensure applications portability, especially across natural languages, only this function and
21600 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21601 **RATIONALE**

21602 None.

21603 **FUTURE DIRECTIONS**

21604 None.

21605 **SEE ALSO**

21606 *iswalnum()*, *iswalpha()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
21607 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
21608 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21609 **CHANGE HISTORY**

21610 First released in Issue 4.

21611 **Issue 5**

21612 The following change has been made in this issue for alignment with
21613 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21614 • The SYNOPSIS has been changed to indicate that this function and associated data types are
21615 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21616 **Issue 6**

21617 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21618 **NAME**

21619 iswctype — test character for a specified class

21620 **SYNOPSIS**

21621 #include <wctype.h>

21622 int iswctype(wint_t *wc*, wctype_t *charclass*);21623 **DESCRIPTION**

21624 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 21625 conflict between the requirements described here and the ISO C standard is unintentional. This
 21626 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21627 The *iswctype()* function shall determine whether the wide-character code *wc* has the character
 21628 class *charclass*, returning true or false. The *iswctype()* function is defined on WEOF and wide-
 21629 character codes corresponding to the valid character encodings in the current locale. If the *wc*
 21630 argument is not in the domain of the function, the result is undefined. If the value of *charclass* is
 21631 invalid (that is, not obtained by a call to *wctype()* or *charclass* is invalidated by a subsequent call
 21632 to *setlocale()* that has affected category *LC_CTYPE*) the result is unspecified.

21633 **RETURN VALUE**

21634 The *iswctype()* function shall return non-zero (true) if and only if *wc* has the property described
 21635 CX by *charclass*. If *charclass* is 0, *iswctype()* shall return 0.

21636 **ERRORS**

21637 No errors are defined.

21638 **EXAMPLES**21639 **Testing for a Valid Character**

```
21640 #include <wctype.h>
21641 ...
21642 int yes_or_no;
21643 wint_t wc;
21644 wctype_t valid_class;
21645 ...
21646 if ((valid_class=wctype("vowel")) == (wctype_t)0)
21647     /* Invalid character class. */
21648     yes_or_no=iswctype(wc,valid_class);
```

21649 **APPLICATION USAGE**

21650 The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower",
 21651 "print", "punct", "space", "upper", and "xdigit" are reserved for the standard
 21652 character classes. In the table below, the functions in the left column are equivalent to the
 21653 functions in the right column.

21654 iswalnum(<i>wc</i>)	iswctype(<i>wc</i> , wctype("alnum"))
21655 iswalpha(<i>wc</i>)	iswctype(<i>wc</i> , wctype("alpha"))
21656 iswblank(<i>wc</i>)	iswctype(<i>wc</i> , wctype("blank"))
21657 iswcntrl(<i>wc</i>)	iswctype(<i>wc</i> , wctype("cntrl"))
21658 iswdigit(<i>wc</i>)	iswctype(<i>wc</i> , wctype("digit"))
21659 iswgraph(<i>wc</i>)	iswctype(<i>wc</i> , wctype("graph"))
21660 iswlower(<i>wc</i>)	iswctype(<i>wc</i> , wctype("lower"))
21661 iswprint(<i>wc</i>)	iswctype(<i>wc</i> , wctype("print"))
21662 iswpunct(<i>wc</i>)	iswctype(<i>wc</i> , wctype("punct"))
21663 iswspace(<i>wc</i>)	iswctype(<i>wc</i> , wctype("space"))

```

21664      iswupper(wc)      iswctype(wc, wctype("upper"))
21665      iswxdigit(wc)      iswctype(wc, wctype("xdigit"))

```

21666 RATIONALE

21667 None.

21668 FUTURE DIRECTIONS

21669 None.

21674 CHANGE HISTORY

21675 First released as World-wide Portability Interfaces in Issue 4.

21676 Issue 5

21677 The following change has been made in this issue for alignment with
 21678 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21679 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21680 now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

21681 Issue 6

21682 The behavior of $n=0$ is now described.

21683 An example is added.

21684 A new function, *iswblank()*, is added to the list in the APPLICATION USAGE.

21685 **NAME**

21686 iswdigit — test for a decimal digit wide-character code

21687 **SYNOPSIS**

21688 #include <wctype.h>

21689 int iswdigit(wint_t wc);

21690 **DESCRIPTION**

21691 cx The functionality described on this reference page is aligned with the ISO C standard. Any
21692 conflict between the requirements described here and the ISO C standard is unintentional. This
21693 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21694 The *iswdigit()* function shall test whether *wc* is a wide-character code representing a character of
21695 class **digit** in the program's current locale; see the Base Definitions volume of
21696 IEEE Std 1003.1-2001, Chapter 7, Locale.

21697 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
21698 code corresponding to a valid character in the current locale, or equal to the value of the macro
21699 WEOF. If the argument has any other value, the behavior is undefined.

21700 **RETURN VALUE**

21701 The *iswdigit()* function shall return non-zero if *wc* is a decimal digit wide-character code;
21702 otherwise, it shall return 0.

21703 **ERRORS**

21704 No errors are defined.

21705 **EXAMPLES**

21706 None.

21707 **APPLICATION USAGE**

21708 To ensure applications portability, especially across natural languages, only this function and
21709 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21710 **RATIONALE**

21711 None.

21712 **FUTURE DIRECTIONS**

21713 None.

21714 **SEE ALSO**

21715 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswgraph()*, *iswlower()*, *iswprint()*, *iswpunct()*,
21716 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
21717 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21718 **CHANGE HISTORY**

21719 First released in Issue 4.

21720 **Issue 5**

21721 The following change has been made in this issue for alignment with
21722 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21723 • The SYNOPSIS has been changed to indicate that this function and associated data types are
21724 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21725 **Issue 6**

21726 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21727 **NAME**

21728 iswgraph — test for a visible wide-character code

21729 **SYNOPSIS**

21730 #include <wctype.h>

21731 int iswgraph(wint_t wc);

21732 **DESCRIPTION**

21733 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21734 conflict between the requirements described here and the ISO C standard is unintentional. This
 21735 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21736 The *iswgraph()* function shall test whether *wc* is a wide-character code representing a character
 21737 of class **graph** in the program's current locale; see the Base Definitions volume of
 21738 IEEE Std 1003.1-2001, Chapter 7, Locale.

21739 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21740 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21741 WEOF. If the argument has any other value, the behavior is undefined.

21742 **RETURN VALUE**

21743 The *iswgraph()* function shall return non-zero if *wc* is a wide-character code with a visible
 21744 representation; otherwise, it shall return 0.

21745 **ERRORS**

21746 No errors are defined.

21747 **EXAMPLES**

21748 None.

21749 **APPLICATION USAGE**

21750 To ensure applications portability, especially across natural languages, only this function and
 21751 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21752 **RATIONALE**

21753 None.

21754 **FUTURE DIRECTIONS**

21755 None.

21756 **SEE ALSO**

21757 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswlower()*, *iswprint()*, *iswpunct()*,
 21758 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
 21759 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21760 **CHANGE HISTORY**

21761 First released in Issue 4.

21762 **Issue 5**

21763 The following change has been made in this issue for alignment with
 21764 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21765 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21766 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21767 **Issue 6**

21768 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21769 **NAME**

21770 iswlower — test for a lowercase letter wide-character code

21771 **SYNOPSIS**

21772 #include <wctype.h>

21773 int iswlower(wint_t wc);

21774 **DESCRIPTION**

21775 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21776 conflict between the requirements described here and the ISO C standard is unintentional. This
 21777 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21778 The *iswlower()* function shall test whether *wc* is a wide-character code representing a character
 21779 of class **lower** in the program's current locale; see the Base Definitions volume of
 21780 IEEE Std 1003.1-2001, Chapter 7, Locale.

21781 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21782 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21783 WEOF. If the argument has any other value, the behavior is undefined.

21784 **RETURN VALUE**

21785 The *iswlower()* function shall return non-zero if *wc* is a lowercase letter wide-character code;
 21786 otherwise, it shall return 0.

21787 **ERRORS**

21788 No errors are defined.

21789 **EXAMPLES**

21790 None.

21791 **APPLICATION USAGE**

21792 To ensure applications portability, especially across natural languages, only this function and
 21793 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21794 **RATIONALE**

21795 None.

21796 **FUTURE DIRECTIONS**

21797 None.

21798 **SEE ALSO**

21799 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswprint()*, *iswpunct()*,
 21800 *iswspace()*, *iswupper()*, *iswxdigit()*, *setlocale()*, the Base Definitions volume of
 21801 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21802 **CHANGE HISTORY**

21803 First released in Issue 4.

21804 **Issue 5**

21805 The following change has been made in this issue for alignment with
 21806 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21807 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21808 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21809 **Issue 6**

21810 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21811 **NAME**

21812 iswprint — test for a printable wide-character code

21813 **SYNOPSIS**

21814 #include <wctype.h>

21815 int iswprint(wint_t wc);

21816 **DESCRIPTION**

21817 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21818 conflict between the requirements described here and the ISO C standard is unintentional. This
 21819 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21820 The *iswprint()* function shall test whether *wc* is a wide-character code representing a character of
 21821 class **print** in the program's current locale; see the Base Definitions volume of
 21822 IEEE Std 1003.1-2001, Chapter 7, Locale.

21823 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21824 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21825 WEOF. If the argument has any other value, the behavior is undefined.

21826 **RETURN VALUE**

21827 The *iswprint()* function shall return non-zero if *wc* is a printable wide-character code; otherwise,
 21828 it shall return 0.

21829 **ERRORS**

21830 No errors are defined.

21831 **EXAMPLES**

21832 None.

21833 **APPLICATION USAGE**

21834 To ensure applications portability, especially across natural languages, only this function and
 21835 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21836 **RATIONALE**

21837 None.

21838 **FUTURE DIRECTIONS**

21839 None.

21840 **SEE ALSO**

21841 *iswalnum()*, *iswalpha()*, *iswcntrl()*, *iswctype()*, *iswdigit()*, *iswgraph()*, *iswlower()*, *iswpunct()*,

21844 **CHANGE HISTORY**

21845 First released in Issue 4.

21846 **Issue 5**

21847 The following change has been made in this issue for alignment with
 21848 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21849 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21850 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21851 **Issue 6**

21852 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21853 **NAME**

21854 iswpunct — test for a punctuation wide-character code

21855 **SYNOPSIS**

21856 #include <wctype.h>

21857 int iswpunct(wint_t wc);

21858 **DESCRIPTION**

21859 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21860 conflict between the requirements described here and the ISO C standard is unintentional. This
 21861 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21862 The *iswpunct()* function shall test whether *wc* is a wide-character code representing a character
 21863 of class **punct** in the program's current locale; see the Base Definitions volume of
 21864 IEEE Std 1003.1-2001, Chapter 7, Locale.

21865 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21866 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21867 WEOF. If the argument has any other value, the behavior is undefined.

21868 **RETURN VALUE**

21869 The *iswpunct()* function shall return non-zero if *wc* is a punctuation wide-character code;
 21870 otherwise, it shall return 0.

21871 **ERRORS**

21872 No errors are defined.

21873 **EXAMPLES**

21874 None.

21875 **APPLICATION USAGE**

21876 To ensure applications portability, especially across natural languages, only this function and
 21877 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21878 **RATIONALE**

21879 None.

21880 **FUTURE DIRECTIONS**

21881 None.

21882 **SEE ALSO**

 21885 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21886 **CHANGE HISTORY**

21887 First released in Issue 4.

21888 **Issue 5**

21889 The following change has been made in this issue for alignment with
 21890 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21891 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21892 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21893 **Issue 6**

21894 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21895 **NAME**

21896 iswspace — test for a white-space wide-character code

21897 **SYNOPSIS**

21898 #include <wctype.h>

21899 int iswspace(wint_t wc);

21900 **DESCRIPTION**

21901 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21902 conflict between the requirements described here and the ISO C standard is unintentional. This
 21903 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21904 The *iswspace()* function shall test whether *wc* is a wide-character code representing a character of
 21905 class **space** in the program's current locale; see the Base Definitions volume of
 21906 IEEE Std 1003.1-2001, Chapter 7, Locale.

21907 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21908 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21909 WEOF. If the argument has any other value, the behavior is undefined.

21910 **RETURN VALUE**

21911 The *iswspace()* function shall return non-zero if *wc* is a white-space wide-character code;
 21912 otherwise, it shall return 0.

21913 **ERRORS**

21914 No errors are defined.

21915 **EXAMPLES**

21916 None.

21917 **APPLICATION USAGE**

21918 To ensure applications portability, especially across natural languages, only this function and
 21919 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21920 **RATIONALE**

21921 None.

21922 **FUTURE DIRECTIONS**

21923 None.

21924 **SEE ALSO**

 21927 IEEE Std 1003.1-2001, Chapter 7, Locale, <**wchar.h**>, <**wctype.h**>

21928 **CHANGE HISTORY**

21929 First released in Issue 4.

21930 **Issue 5**

21931 The following change has been made in this issue for alignment with
 21932 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21933 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21934 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21935 **Issue 6**

21936 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21937 **NAME**

21938 iswupper — test for an uppercase letter wide-character code

21939 **SYNOPSIS**

21940 #include <wctype.h>

21941 int iswupper(wint_t wc);

21942 **DESCRIPTION**

21943 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 21944 conflict between the requirements described here and the ISO C standard is unintentional. This
 21945 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21946 The *iswupper()* function shall test whether *wc* is a wide-character code representing a character
 21947 of class **upper** in the program's current locale; see the Base Definitions volume of
 21948 IEEE Std 1003.1-2001, Chapter 7, Locale.

21949 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21950 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21951 WEOF. If the argument has any other value, the behavior is undefined.

21952 **RETURN VALUE**

21953 The *iswupper()* function shall return non-zero if *wc* is an uppercase letter wide-character code;
 21954 otherwise, it shall return 0.

21955 **ERRORS**

21956 No errors are defined.

21957 **EXAMPLES**

21958 None.

21959 **APPLICATION USAGE**

21960 To ensure applications portability, especially across natural languages, only this function and
 21961 those listed in the SEE ALSO section should be used for classification of wide-character codes.

21962 **RATIONALE**

21963 None.

21964 **FUTURE DIRECTIONS**

21965 None.

21966 **SEE ALSO**

21970 **CHANGE HISTORY**

21971 First released in Issue 4.

21972 **Issue 5**

21973 The following change has been made in this issue for alignment with
 21974 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 21975 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 21976 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

21977 **Issue 6**

21978 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

21979 **NAME**

21980 iswxdigit — test for a hexadecimal digit wide-character code

21981 **SYNOPSIS**

21982 #include <wctype.h>

21983 int iswxdigit(wint_t wc);

21984 **DESCRIPTION**

21985 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 21986 conflict between the requirements described here and the ISO C standard is unintentional. This
 21987 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

21988 The *iswxdigit()* function shall test whether *wc* is a wide-character code representing a character
 21989 of class **xdigit** in the program's current locale; see the Base Definitions volume of
 21990 IEEE Std 1003.1-2001, Chapter 7, Locale.

21991 The *wc* argument is a **wint_t**, the value of which the application shall ensure is a wide-character
 21992 code corresponding to a valid character in the current locale, or equal to the value of the macro
 21993 WEOF. If the argument has any other value, the behavior is undefined.

21994 **RETURN VALUE**

21995 The *iswxdigit()* function shall return non-zero if *wc* is a hexadecimal digit wide-character code;
 21996 otherwise, it shall return 0.

21997 **ERRORS**

21998 No errors are defined.

21999 **EXAMPLES**

22000 None.

22001 **APPLICATION USAGE**

22002 To ensure applications portability, especially across natural languages, only this function and
 22003 those listed in the SEE ALSO section should be used for classification of wide-character codes.

22004 **RATIONALE**

22005 None.

22006 **FUTURE DIRECTIONS**

22007 None.

22012 **CHANGE HISTORY**

22013 First released in Issue 4.

22014 **Issue 5**

22015 The following change has been made in this issue for alignment with
 22016 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 22017 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 22018 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

22019 **Issue 6**

22020 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22021 **NAME**

22022 isxdigit — test for a hexadecimal digit

22023 **SYNOPSIS**

22024 #include <ctype.h>

22025 int isxdigit(int c);

22026 **DESCRIPTION**

22027 cx The functionality described on this reference page is aligned with the ISO C standard. Any
22028 conflict between the requirements described here and the ISO C standard is unintentional. This
22029 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22030 The *isxdigit()* function shall test whether *c* is a character of class **xdigit** in the program's current
22031 locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

22032 The *c* argument is an **int**, the value of which the application shall ensure is a character
22033 representable as an **unsigned char** or equal to the value of the macro EOF. If the argument has
22034 any other value, the behavior is undefined.

22035 **RETURN VALUE**

22036 The *isxdigit()* function shall return non-zero if *c* is a hexadecimal digit; otherwise, it shall return
22037 0.

22038 **ERRORS**

22039 No errors are defined.

22040 **EXAMPLES**

22041 None.

22042 **APPLICATION USAGE**

22043 To ensure applications portability, especially across natural languages, only this function and
22044 those listed in the SEE ALSO section should be used for character classification.

22045 **RATIONALE**

22046 None.

22047 **FUTURE DIRECTIONS**

22048 None.

22049 **SEE ALSO**

22050 *isalnum()*, *isalpha()*, *iscntrl()*, *isdigit()*, *isgraph()*, *islower()*, *isprint()*, *ispunct()*, *isspace()*, *isupper()*,
22051 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>

22052 **CHANGE HISTORY**

22053 First released in Issue 1. Derived from Issue 1 of the SVID.

22054 **Issue 6**

22055 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22056 **NAME**

22057 j0, j1, jn — Bessel functions of the first kind

22058 **SYNOPSIS**

```

22059 xSI      #include <math.h>

22060          double j0(double x);
22061          double j1(double x);
22062          double jn(int n, double x);
22063

```

22064 **DESCRIPTION**

22065 The *j0()*, *j1()*, and *jn()* functions shall compute Bessel functions of *x* of the first kind of orders 0, 1, and *n*, respectively.

22067 An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

22071 **RETURN VALUE**

22072 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the first kind.

22074 If the *x* argument is too large in magnitude, or the correct result would cause underflow, 0 shall be returned and a range error may occur.

22076 If *x* is NaN, a NaN shall be returned.

22077 **ERRORS**

22078 These functions may fail if:

22079 Range Error The value of *x* was too large in magnitude, or an underflow occurred.

22080 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

22084 No other errors shall occur.

22085 **EXAMPLES**

22086 None.

22087 **APPLICATION USAGE**

22088 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22090 **RATIONALE**

22091 None.

22092 **FUTURE DIRECTIONS**

22093 None.

22094 **SEE ALSO**

22097 CHANGE HISTORY

22098 First released in Issue 1. Derived from Issue 1 of the SVID.

22099 Issue 5

22100 The DESCRIPTION is updated to indicate how an application should check for an error. This
22101 text was previously published in the APPLICATION USAGE section.

22102 Issue 6

22103 The may fail [EDOM] error is removed for the case for NaN.

22104 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
22105 with the ISO / IEC 9899:1999 standard.

22106 **NAME**

22107 jrand48 — generate a uniformly distributed pseudo-random long signed integer

22108 **SYNOPSIS**

22109 xSI #include <stdlib.h>

22110 long jrand48(unsigned short xsubi[3]);

22111

22112 **DESCRIPTION**22113 Refer to *drand48()*.

22114 **NAME**

22115 kill — send a signal to a process or a group of processes

22116 **SYNOPSIS**22117 CX `#include <signal.h>`22118 `int kill(pid_t pid, int sig);`

22119

22120 **DESCRIPTION**

22121 The `kill()` function shall send a signal to a process or a group of processes specified by *pid*. The
 22122 signal to be sent is specified by *sig* and is either one from the list given in **<signal.h>** or 0. If *sig* is
 22123 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can
 22124 be used to check the validity of *pid*.

22125 For a process to have permission to send a signal to a process designated by *pid*, unless the
 22126 sending process has appropriate privileges, the real or effective user ID of the sending process
 22127 shall match the real or saved set-user-ID of the receiving process.

22128 If *pid* is greater than 0, *sig* shall be sent to the process whose process ID is equal to *pid*.

22129 If *pid* is 0, *sig* shall be sent to all processes (excluding an unspecified set of system processes)
 22130 whose process group ID is equal to the process group ID of the sender, and for which the
 22131 process has permission to send a signal.

22132 If *pid* is -1 , *sig* shall be sent to all processes (excluding an unspecified set of system processes) for
 22133 which the process has permission to send that signal.

22134 If *pid* is negative, but not -1 , *sig* shall be sent to all processes (excluding an unspecified set of
 22135 system processes) whose process group ID is equal to the absolute value of *pid*, and for which
 22136 the process has permission to send a signal.

22137 If the value of *pid* causes *sig* to be generated for the sending process, and if *sig* is not blocked for
 22138 the calling thread and if no other thread has *sig* unblocked or is waiting in a `sigwait()` function
 22139 for *sig*, either *sig* or at least one pending unblocked signal shall be delivered to the sending
 22140 thread before `kill()` returns.

22141 The user ID tests described above shall not be applied when sending SIGCONT to a process that
 22142 is a member of the same session as the sending process.

22143 An implementation that provides extended security controls may impose further
 22144 implementation-defined restrictions on the sending of signals, including the null signal. In
 22145 particular, the system may deny the existence of some or all of the processes specified by *pid*.

22146 The `kill()` function is successful if the process has permission to send *sig* to any of the processes
 22147 specified by *pid*. If `kill()` fails, no signal shall be sent.

22148 **RETURN VALUE**

22149 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 22150 indicate the error.

22151 **ERRORS**

22152 The `kill()` function shall fail if:

22153	[EINVAL]	The value of the <i>sig</i> argument is an invalid or unsupported signal number.
22154	[EPERM]	The process does not have permission to send the signal to any receiving
22155		process.
22156	[ESRCH]	No process or process group can be found corresponding to that specified by
22157		<i>pid</i> .

22158 **EXAMPLES**

22159 None.

22160 **APPLICATION USAGE**

22161 None.

22162 **RATIONALE**

22163 The semantics for permission checking for *kill()* differed between System V and most other
22164 implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of
22165 IEEE Std 1003.1-2001 agree with System V. Specifically, a set-user-ID process cannot protect
22166 itself against signals (or at least not against SIGKILL) unless it changes its real user ID. This
22167 choice allows the user who starts an application to send it signals even if it changes its effective
22168 user ID. The other semantics give more power to an application that wants to protect itself from
22169 the user who ran it.

22170 Some implementations provide semantic extensions to the *kill()* function when the absolute
22171 value of *pid* is greater than some maximum, or otherwise special, value. Negative values are a
22172 flag to *kill()*. Since most implementations return [ESRCH] in this case, this behavior is not
22173 included in this volume of IEEE Std 1003.1-2001, although a conforming implementation could
22174 provide such an extension.

22175 The implementation-defined processes to which a signal cannot be sent may include the
22176 scheduler or *init*.

22177 There was initially strong sentiment to specify that, if *pid* specifies that a signal be sent to the
22178 calling process and that signal is not blocked, that signal would be delivered before *kill()*
22179 returns. This would permit a process to call *kill()* and be guaranteed that the call never return.
22180 However, historical implementations that provide only the *signal()* function make only the
22181 weaker guarantee in this volume of IEEE Std 1003.1-2001, because they only deliver one signal
22182 each time a process enters the kernel. Modifications to such implementations to support the
22183 *sigaction()* function generally require entry to the kernel following return from a signal-catching
22184 function, in order to restore the signal mask. Such modifications have the effect of satisfying the
22185 stronger requirement, at least when *sigaction()* is used, but not necessarily when *signal()* is used.
22186 The developers of this volume of IEEE Std 1003.1-2001 considered making the stronger
22187 requirement except when *signal()* is used, but felt this would be unnecessarily complex.
22188 Implementors are encouraged to meet the stronger requirement whenever possible. In practice,
22189 the weaker requirement is the same, except in the rare case when two signals arrive during a
22190 very short window. This reasoning also applies to a similar requirement for *sigprocmask()*.

22191 In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID
22192 security checks. This allows a job control shell to continue a job even if processes in the job have
22193 altered their user IDs (as in the *su* command). In keeping with the addition of the concept of
22194 sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any
22195 process in the same session regardless of user ID security checks. This is less restrictive than BSD
22196 in the sense that ancestor processes (in the same session) can now be the recipient. It is more
22197 restrictive than BSD in the sense that descendant processes that form new sessions are now
22198 subject to the user ID checks. A similar relaxation of security is not necessary for the other job
22199 control signals since those signals are typically sent by the terminal driver in recognition of
22200 special characters being typed; the terminal driver bypasses all security checks.

22201 In secure implementations, a process may be restricted from sending a signal to a process having
22202 a different security label. In order to prevent the existence or nonexistence of a process from
22203 being used as a covert channel, such processes should appear nonexistent to the sender; that is,
22204 [ESRCH] should be returned, rather than [EPERM], if *pid* refers only to such processes.

Existing implementations vary on the result of a *kill()* with *pid* indicating an inactive process (a terminated process that has not been waited for by its parent). Some indicate success on such a call (subject to permission checking), while others give an error of [ESRCH]. Since the definition of process lifetime in this volume of IEEE Std 1003.1-2001 covers inactive processes, the [ESRCH] error as described is inappropriate in this case. In particular, this means that an application cannot have a parent process check for termination of a particular child with *kill()*. (Usually this is done with the null signal; this can be done reliably with *waitpid()*.)

There is some belief that the name *kill()* is misleading, since the function is not always intended to cause process termination. However, the name is common to all historical implementations, and any change would be in conflict with the goal of minimal changes to existing application code.

22216 FUTURE DIRECTIONS

22217 None.

22220 IEEE Std 1003.1-2001, **<signal.h>**, **<sys/types.h>**

22221 CHANGE HISTORY

22222 First released in Issue 1. Derived from Issue 1 of the SVID.

22223 Issue 5

22224 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

22225 Issue 6

22226 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

22227 The following new requirements on POSIX implementations derive from alignment with the
22228 Single UNIX Specification:

- 22229 • In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-
22230 ID of the calling process is checked in place of its effective user ID. This is a FIPS
22231 requirement.
- 22232 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
22233 required for conforming implementations of previous POSIX specifications, it was not
22234 required for UNIX applications.
- 22235 • The behavior when *pid* is *-1* is now specified. It was previously explicitly unspecified in the
22236 POSIX.1-1988 standard.

22237 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22238 **NAME**

22239 killpg — send a signal to a process group

22240 **SYNOPSIS**

22241 xSI #include <signal.h>

22242 int killpg(pid_t pgrp, int sig);

22243

22244 **DESCRIPTION**22245 The *killpg()* function shall send the signal specified by *sig* to the process group specified by *pgrp*.22246 If *pgrp* is greater than 1, *killpg(pgrp, sig)* shall be equivalent to *kill(-pgrp, sig)*. If *pgrp* is less than or
22247 equal to 1, the behavior of *killpg()* is undefined.22248 **RETURN VALUE**22249 Refer to *kill()*.22250 **ERRORS**22251 Refer to *kill()*.22252 **EXAMPLES**

22253 None.

22254 **APPLICATION USAGE**

22264 **Issue 5**

22265 Moved from X/OPEN UNIX extension to BASE.

22266 NAME

22267 l64a — convert a 32-bit integer to a radix-64 ASCII string

22268 SYNOPSIS

22269 xSI #include <stdlib.h>

22270 char *l64a(long value);

22271

22272 DESCRIPTION

22273 Refer to *a64l()*.

22274 **NAME**

22275 labs, llabs — return a long integer absolute value

22276 **SYNOPSIS**

22277 #include <stdlib.h>

22278 long labs(long i);

22279 long long llabs(long long i);

22280 **DESCRIPTION**

22281 cx The functionality described on this reference page is aligned with the ISO C standard. Any
22282 conflict between the requirements described here and the ISO C standard is unintentional. This
22283 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22284 The *labs()* function shall compute the absolute value of the **long** integer operand *i*. The *llabs()*
22285 function shall compute the absolute value of the **long long** integer operand *i*. If the result cannot
22286 be represented, the behavior is undefined.

22287 **RETURN VALUE**

22288 The *labs()* function shall return the absolute value of the **long** integer operand. The *labs()*
22289 function shall return the absolute value of the **long long** integer operand.

22290 **ERRORS**

22291 No errors are defined.

22292 **EXAMPLES**

22293 None.

22294 **APPLICATION USAGE**

22295 None.

22296 **RATIONALE**

22297 None.

22298 **FUTURE DIRECTIONS**

22299 None.

22300 **SEE ALSO**

22301 *abs()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

22302 **CHANGE HISTORY**

22303 First released in Issue 4. Derived from the ISO C standard.

22304 **Issue 6**

22305 The *llabs()* function is added for alignment with the ISO / IEC 9899:1999 standard.

22306 **NAME**

22307 lchown — change the owner and group of a symbolic link

22308 **SYNOPSIS**22309 xsi `#include <unistd.h>`22310 `int lchown(const char *path, uid_t owner, gid_t group);`

22311

22312 **DESCRIPTION**

22313 The *lchown()* function shall be equivalent to *chown()*, except in the case where the named file is a
 22314 symbolic link. In this case, *lchown()* shall change the ownership of the symbolic link file itself,
 22315 while *chown()* changes the ownership of the file or directory to which the symbolic link refers.

22316 **RETURN VALUE**

22317 Upon successful completion, *lchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 22318 indicate an error.

22319 **ERRORS**22320 The *lchown()* function shall fail if:22321 [EACCES] Search permission is denied on a component of the path prefix of *path*.

22322 [EINVAL] The owner or group ID is not a value supported by the implementation.

22323 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 22324 argument.

22325 [ENAMETOOLONG]

22326 The length of a pathname exceeds {PATH_MAX} or a pathname component is
 22327 longer than {NAME_MAX}.

22328 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.22329 [ENOTDIR] A component of the path prefix of *path* is not a directory.

22330 [EOPNOTSUPP] The *path* argument names a symbolic link and the implementation does not
 22331 support setting the owner or group of a symbolic link.

22332 [EPERM] The effective user ID does not match the owner of the file and the process
 22333 does not have appropriate privileges.

22334 [EROFS] The file resides on a read-only file system.

22335 The *lchown()* function may fail if:

22336 [EIO] An I/O error occurred while reading or writing to the file system.

22337 [EINTR] A signal was caught during execution of the function.

22338 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 22339 resolution of the *path* argument.

22340 [ENAMETOOLONG]

22341 Pathname resolution of a symbolic link produced an intermediate result
 22342 whose length exceeds {PATH_MAX}.

22343 EXAMPLES**22344 Changing the Current Owner of a File**

22345 The following example shows how to change the ownership of the symbolic link named
22346 **/modules/pass1** to the user ID associated with “jones” and the group ID associated with “cnd”.

22347 The numeric value for the user ID is obtained by using the *getpwnam()* function. The numeric
22348 value for the group ID is obtained by using the *getgrnam()* function.

```
22349 #include <sys/types.h>
22350 #include <unistd.h>
22351 #include <pwd.h>
22352 #include <grp.h>

22353 struct passwd *pwd;
22354 struct group *grp;
22355 char          *path = "/modules/pass1";
22356 ...
22357 pwd = getpwnam("jones");
22358 grp = getgrnam("cnd");
22359 lchown(path, pwd->pw_uid, grp->gr_gid);
```

22360 APPLICATION USAGE

22361 On implementations which support symbolic links as directory entries rather than files, *lchown()*
22362 may fail.

22363 RATIONALE

22364 None.

22365 FUTURE DIRECTIONS

22366 None.

22367 SEE ALSO

22368 *chown()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

22369 CHANGE HISTORY

22370 First released in Issue 4, Version 2.

22371 Issue 5

22372 Moved from X/OPEN UNIX extension to BASE.

22373 Issue 6

22374 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
22375 [ELOOP] error condition is added.

22376 The Open Group Base Resolution bwg2001-013 is applied, adding wording to the
22377 APPLICATION USAGE.

22378 NAME

22379 lcong48 — seed a uniformly distributed pseudo-random signed long integer generator

22380 SYNOPSIS

22381 xSI #include <stdlib.h>

22382 void lcong48(unsigned short param[7]);

22383

22384 DESCRIPTION

22385 Refer to *drand48()*.

22386 **NAME**

22387 ldexp, ldexpf, ldexpl — load exponent of a floating-point number

22388 **SYNOPSIS**

22389 #include <math.h>

22390 double ldexp(double x, int exp);

22391 float ldexpf(float x, int exp);

22392 long double ldexpl(long double x, int exp);

22393 **DESCRIPTION**

22394 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22395 conflict between the requirements described here and the ISO C standard is unintentional. This
 22396 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22397 These functions shall compute the quantity $x * 2^{exp}$.

22398 An application wishing to check for error situations should set *errno* to zero and call
 22399 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 22400 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 22401 zero, an error has occurred.

22402 **RETURN VALUE**22403 Upon successful completion, these functions shall return *x* multiplied by 2, raised to the power
22404 *exp*.

22405 If these functions would cause overflow, a range error shall occur and *ldexp*(), *ldexpf*(), and
 22406 *ldexpl*() shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (according to the sign of
 22407 *x*), respectively.

22408 If the correct value would cause underflow, and is not representable, a range error may occur,
 22409 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

22410 MX If *x* is NaN, a NaN shall be returned.22411 If *x* is ± 0 or $\pm\text{Inf}$, *x* shall be returned.22412 If *exp* is 0, *x* shall be returned.

22413 If the correct value would cause underflow, and is representable, a range error may occur and
 22414 the correct value shall be returned.

22415 **ERRORS**

22416 These functions shall fail if:

22417 Range Error The result overflows.

22418 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 22419 then *errno* shall be set to [ERANGE]. If the integer expression
 22420 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 22421 floating-point exception shall be raised.

22422 These functions may fail if:

22423 Range Error The result underflows.

22424 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 22425 then *errno* shall be set to [ERANGE]. If the integer expression
 22426 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 22427 floating-point exception shall be raised.

22428 **EXAMPLES**

22429 None.

22430 **APPLICATION USAGE**

22431 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
22432 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22433 **RATIONALE**

22434 None.

22435 **FUTURE DIRECTIONS**

22436 None.

22440 <math.h>

22441 **CHANGE HISTORY**

22442 First released in Issue 1. Derived from Issue 1 of the SVID.

22443 **Issue 5**

22444 The DESCRIPTION is updated to indicate how an application should check for an error. This
22445 text was previously published in the APPLICATION USAGE section.

22446 **Issue 6**

22447 The *ldexpf()* and *ldexpl()* functions are added for alignment with the ISO/IEC 9899:1999
22448 standard.

22449 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
22450 revised to align with the ISO/IEC 9899:1999 standard.

22451 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
22452 marked.

22453 **NAME**

22454 ldiv, lldiv — compute quotient and remainder of a long division

22455 **SYNOPSIS**

22456 #include <stdlib.h>

22457 ldiv_t ldiv(long *numer*, long *denom*);22458 lldiv_t lldiv(long long *numer*, long long *denom*);22459 **DESCRIPTION**

22460 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22461 conflict between the requirements described here and the ISO C standard is unintentional. This
 22462 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22463 These functions shall compute the quotient and remainder of the division of the numerator
 22464 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the **long**
 22465 integer (for the *ldiv()* function) or **long long** integer (for the *lldiv()* function) of lesser magnitude
 22466 that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is
 22467 undefined; otherwise, *quot * denom + rem* shall equal *numer*.

22468 **RETURN VALUE**

22469 The *ldiv()* function shall return a structure of type **ldiv_t**, comprising both the quotient and the
 22470 remainder. The structure shall include the following members, in any order:

22471 long quot; /* Quotient */
 22472 long rem; /* Remainder */

22473 The *lldiv()* function shall return a structure of type **lldiv_t**, comprising both the quotient and the
 22474 remainder. The structure shall include the following members, in any order:

22475 long long quot; /* Quotient */
 22476 long long rem; /* Remainder */

22477 **ERRORS**

22478 No errors are defined.

22479 **EXAMPLES**

22480 None.

22493 NAME

22494 lfind — find entry in a linear search table

22495 SYNOPSIS

22496 xSI #include <search.h>

```
22497       void *lfind(const void *key, const void *base, size_t *nelp,  
22498                   size_t width, int (*compar)(const void *, const void *));
```

22499

22500 DESCRIPTION

22501 Refer to *lsearch()*.

22502 **NAME**

22503 lgamma, lgammaf, lgammal — log gamma function

22504 **SYNOPSIS**

22505 #include <math.h>

22506 double lgamma(double x);

22507 float lgammaf(float x);

22508 long double lgammal(long double x);

22509 xsi extern int signgam;

22510

22511 **DESCRIPTION**

22512 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 22513 conflict between the requirements described here and the ISO C standard is unintentional. This
 22514 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22515 These functions shall compute $\log_e |\Gamma(x)|$ where $\Gamma(x)$ is defined as $\int_0^{\infty} e^{-t} t^{x-1} dt$. The argument x
 22516 need not be a non-positive integer ($\Gamma(x)$ is defined over the reals, except the non-positive
 22517 integers).
 22518

22519 xsi The sign of $\Gamma(x)$ is returned in the external integer *signgam*.

22520 cx These functions need not be reentrant. A function that is not required to be reentrant is not
 22521 required to be thread-safe.

22522 An application wishing to check for error situations should set *errno* to zero and call
 22523 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 22524 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 22525 zero, an error has occurred.

22526 **RETURN VALUE**22527 Upon successful completion, these functions shall return the logarithmic gamma of x .

22528 If x is a non-positive integer, a pole error shall occur and *lgamma()*, *lgammaf()*, and *lgammal()*
 22529 shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

22530 If the correct value would cause overflow, a range error shall occur and *lgamma()*, *lgammaf()*,
 22531 and *lgammal()* shall return $\pm$ HUGE_VAL, $\pm$ HUGE_VALF, and $\pm$ HUGE_VALL (having the same
 22532 sign as the correct value), respectively.

22533 mx If x is NaN, a NaN shall be returned.22534 If x is 1 or 2, +0 shall be returned.22535 If x is $\pm$ Inf, +Inf shall be returned.22536 **ERRORS**

22537 These functions shall fail if:

22538 Pole Error The x argument is a negative integer or zero.

22539 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 22540 then *errno* shall be set to [ERANGE]. If the integer expression
 22541 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 22542 zero floating-point exception shall be raised.

22543 Range Error The result overflows.

22544 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,
22545 then *errno* shall be set to `[ERANGE]`. If the integer expression
22546 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the overflow
22547 floating-point exception shall be raised.

22548 EXAMPLES

22549 None.

22550 APPLICATION USAGE

22551 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
22552 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

22553 RATIONALE

22554 None.

22555 FUTURE DIRECTIONS

22556 None.

22557 SEE ALSO

22558 *exp()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,

22560 CHANGE HISTORY

22561 First released in Issue 3.

22562 Issue 5

22563 The DESCRIPTION is updated to indicate how an application should check for an error. This
22564 text was previously published in the APPLICATION USAGE section.

22565 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

22566 Issue 6

22567 The *lgamma()* function is no longer marked as an extension.

22568 The *lgammaf()* and *lgammal()* functions are added for alignment with the ISO/IEC 9899:1999
22569 standard.

22570 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
22571 revised to align with the ISO/IEC 9899:1999 standard.

22572 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
22573 marked.

22574 XSI extensions are marked.

22575 **NAME**

22576 link — link to a file

22577 **SYNOPSIS**

22578 #include <unistd.h>

22579 int link(const char *path1, const char *path2);

22580 **DESCRIPTION**22581 The *link()* function shall create a new link (directory entry) for the existing file, *path1*.

22582 The *path1* argument points to a pathname naming an existing file. The *path2* argument points to
 22583 a pathname naming the new directory entry to be created. The *link()* function shall atomically
 22584 create a new link for the existing file and the link count of the file shall be incremented by one.

22585 If *path1* names a directory, *link()* shall fail unless the process has appropriate privileges and the
 22586 implementation supports using *link()* on directories.

22587 Upon successful completion, *link()* shall mark for update the *st_ctime* field of the file. Also, the
 22588 *st_ctime* and *st_mtime* fields of the directory that contains the new entry shall be marked for
 22589 update.

22590 If *link()* fails, no link shall be created and the link count of the file shall remain unchanged.

22591 The implementation may require that the calling process has permission to access the existing
 22592 file.

22593 **RETURN VALUE**

22594 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 22595 indicate the error.

22596 **ERRORS**22597 The *link()* function shall fail if:

22598 [EACCES] A component of either path prefix denies search permission, or the requested
 22599 link requires writing in a directory that denies write permission, or the calling
 22600 process does not have permission to access the existing file and this is
 22601 required by the implementation.

22602 [EEXIST] The *path2* argument resolves to an existing file or refers to a symbolic link.

22603 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path1* or
 22604 *path2* argument.

22605 [EMLINK] The number of links to the file named by *path1* would exceed {LINK_MAX}.

22606 [ENAMETOOLONG]

22607 The length of the *path1* or *path2* argument exceeds {PATH_MAX} or a
 22608 pathname component is longer than {NAME_MAX}.

22609 [ENOENT] A component of either path prefix does not exist; the file named by *path1* does
 22610 not exist; or *path1* or *path2* points to an empty string.

22611 [ENOSPC] The directory to contain the link cannot be extended.

22612 [ENOTDIR] A component of either path prefix is not a directory.

22613 [EPERM] The file named by *path1* is a directory and either the calling process does not
 22614 have appropriate privileges or the implementation prohibits using *link()* on
 22615 directories.

22616 [EROFS] The requested link requires writing in a directory on a read-only file system.

22617 [EXDEV] The link named by *path2* and the file named by *path1* are on different file

22618 systems and the implementation does not support links between file systems.

22619 XSR [EXDEV] *path1* refers to a named STREAM.

22620 The *link()* function may fail if:

22621 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during

22622 resolution of the *path1* or *path2* argument.

22623 [ENAMETOOLONG]

22624 As a result of encountering a symbolic link in resolution of the *path1* or *path2*

22625 argument, the length of the substituted pathname string exceeded

22626 {PATH_MAX}.

22627 EXAMPLES

22628 Creating a Link to a File

22629 The following example shows how to create a link to a file named **/home/cnd/mod1** by creating a

22630 new directory entry named **/modules/pass1**.

```
22631 #include <unistd.h>
22632 char *path1 = "/home/cnd/mod1";
22633 char *path2 = "/modules/pass1";
22634 int status;
22635 ...
22636 status = link (path1, path2);
```

22637 Creating a Link to a File Within a Program

22638 In the following program example, the *link()* function links the **/etc/passwd** file (defined as

22639 **PASSWDFILE**) to a file named **/etc/opasswd** (defined as **SAVEFILE**), which is used to save the

22640 current password file. Then, after removing the current password file (defined as

22641 **PASSWDFILE**), the new password file is saved as the current password file using the *link()*

22642 function again.

```
22643 #include <unistd.h>
22644 #define LOCKFILE "/etc/ptmp"
22645 #define PASSWDFILE "/etc/passwd"
22646 #define SAVEFILE "/etc/opasswd"
22647 ...
22648 /* Save current password file */
22649 link (PASSWDFILE, SAVEFILE);
22650
22651 /* Remove current password file. */
22652 unlink (PASSWDFILE);
22653
22654 /* Save new password file as current password file. */
22655 link (LOCKFILE, PASSWDFILE);
```

22654 APPLICATION USAGE

22655 Some implementations do allow links between file systems.

22656 RATIONALE

22657 Linking to a directory is restricted to the superuser in most historical implementations because
22658 this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This
22659 volume of IEEE Std 1003.1-2001 continues that philosophy by prohibiting *link()* and *unlink()*
22660 from doing this. Other functions could do it if the implementor designed such an extension.

22661 Some historical implementations allow linking of files on different file systems. Wording was
22662 added to explicitly allow this optional behavior.

22663 The exception for cross-file system links is intended to apply only to links that are
22664 programmatically indistinguishable from “hard” links.

22665 FUTURE DIRECTIONS

22666 None.

22667 SEE ALSO

22668 *symlink()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

22669 CHANGE HISTORY

22670 First released in Issue 1. Derived from Issue 1 of the SVID.

22671 Issue 6

22672 The following new requirements on POSIX implementations derive from alignment with the
22673 Single UNIX Specification:

- 22674 • The [ELOOP] mandatory error condition is added.
- 22675 • A second [ENAMETOOLONG] is added as an optional error condition.

22676 The following changes were made to align with the IEEE P1003.1a draft standard:

- 22677 • An explanation is added of the action when *path2* refers to a symbolic link.
- 22678 • The [ELOOP] optional error condition is added.

22679 **NAME**22680 lio_listio — list directed I/O (**REALTIME**)22681 **SYNOPSIS**

22682 AIO #include <aio.h>

```
22683       int lio_listio(int mode, struct aiocb *restrict const list[restrict],
22684           int nent, struct sigevent *restrict sig);
```

22685

22686 **DESCRIPTION**22687 The *lio_listio()* function shall initiate a list of I/O requests with a single function call.

22688 The *mode* argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in <aio.h> and
 22689 determines whether the function returns when the I/O operations have been completed, or as
 22690 soon as the operations have been queued. If the *mode* argument is LIO_WAIT, the function shall
 22691 wait until all I/O is complete and the *sig* argument shall be ignored.

22692 If the *mode* argument is LIO_NOWAIT, the function shall return immediately, and asynchronous
 22693 notification shall occur, according to the *sig* argument, when all the I/O operations complete. If
 22694 *sig* is NULL, then no asynchronous notification shall occur. If *sig* is not NULL, asynchronous
 22695 notification occurs as specified in Section 2.4.1 (on page 28) when all the requests in *list* have
 22696 completed.

22697 The I/O requests enumerated by *list* are submitted in an unspecified order.

22698 The *list* argument is an array of pointers to **aiocb** structures. The array contains *nent* elements.
 22699 The array may contain NULL elements, which shall be ignored.

22700 The *aio_lio_opcode* field of each **aiocb** structure specifies the operation to be performed. The
 22701 supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in
 22702 <aio.h>. The LIO_NOP operation causes the list entry to be ignored. If the *aio_lio_opcode*
 22703 element is equal to LIO_READ, then an I/O operation is submitted as if by a call to *aio_read()*
 22704 with the *aiocbp* equal to the address of the **aiocb** structure. If the *aio_lio_opcode* element is equal
 22705 to LIO_WRITE, then an I/O operation is submitted as if by a call to *aio_write()* with the *aiocbp*
 22706 equal to the address of the **aiocb** structure.

22707 The *aio_fildes* member specifies the file descriptor on which the operation is to be performed.22708 The *aio_buf* member specifies the address of the buffer to or from which the data is transferred.22709 The *aio_nbytes* member specifies the number of bytes of data to be transferred.

22710 The members of the **aiocb** structure further describe the I/O operation to be performed, in a
 22711 manner identical to that of the corresponding **aiocb** structure when used by the *aio_read()* and
 22712 *aio_write()* functions.

22713 The *nent* argument specifies how many elements are members of the list; that is, the length of the
 22714 array.

22715 The behavior of this function is altered according to the definitions of synchronized I/O data
 22716 integrity completion and synchronized I/O file integrity completion if synchronized I/O is
 22717 enabled on the file associated with *aio_fildes*.

22718 For regular files, no data transfer shall occur past the offset maximum established in the open
 22719 file description associated with *aiocbp->aio_fildes*.

22720 **RETURN VALUE**

22721 If the *mode* argument has the value LIO_NOWAIT, the *lio_listio()* function shall return the value
 22722 zero if the I/O operations are successfully queued; otherwise, the function shall return the value
 22723 -1 and set *errno* to indicate the error.

22724 If the *mode* argument has the value LIO_WAIT, the *lio_listio()* function shall return the value
 22725 zero when all the indicated I/O has completed successfully. Otherwise, *lio_listio()* shall return a
 22726 value of -1 and set *errno* to indicate the error.

22727 In either case, the return value only indicates the success or failure of the *lio_listio()* call itself,
 22728 not the status of the individual I/O requests. In some cases one or more of the I/O requests
 22729 contained in the list may fail. Failure of an individual request does not prevent completion of
 22730 any other individual request. To determine the outcome of each I/O request, the application
 22731 shall examine the error status associated with each **aiocb** control block. The error statuses so
 22732 returned are identical to those returned as the result of an *aio_read()* or *aio_write()* function.

22733 **ERRORS**

22734 The *lio_listio()* function shall fail if:

22735 [EAGAIN] The resources necessary to queue all the I/O requests were not available. The
 22736 application may check the error status for each **aiocb** to determine the
 22737 individual request(s) that failed.

22738 [EAGAIN] The number of entries indicated by *nent* would cause the system-wide limit
 22739 {AIO_MAX} to be exceeded.

22740 [EINVAL] The *mode* argument is not a proper value, or the value of *nent* was greater than
 22741 {AIO_LISTIO_MAX}.

22742 [EINTR] A signal was delivered while waiting for all I/O requests to complete during
 22743 an LIO_WAIT operation. Note that, since each I/O operation invoked by
 22744 *lio_listio()* may possibly provoke a signal when it completes, this error return
 22745 may be caused by the completion of one (or more) of the very I/O operations
 22746 being awaited. Outstanding I/O requests are not canceled, and the application
 22747 shall examine each list element to determine whether the request was
 22748 initiated, canceled, or completed.

22749 [EIO] One or more of the individual I/O operations failed. The application may
 22750 check the error status for each **aiocb** structure to determine the individual
 22751 request(s) that failed.

22752 In addition to the errors returned by the *lio_listio()* function, if the *lio_listio()* function succeeds
 22753 or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list
 22754 may have been initiated. If the *lio_listio()* function fails with an error code other than [EAGAIN],
 22755 [EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation
 22756 indicated by each list element can encounter errors specific to the individual read or write
 22757 function being performed. In this event, the error status for each **aiocb** control block contains the
 22758 associated error code. The error codes that can be set are the same as would be set by a *read()* or
 22759 *write()* function, with the following additional error codes possible:

22760 [EAGAIN] The requested I/O operation was not queued due to resource limitations.

22761 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 22762 *aio_cancel()* request.

22763 [EFBIG] The *aiocbp->aio_lio_opcode* is LIO_WRITE, the file is a regular file,
 22764 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is greater than or
 22765 equal to the offset maximum in the open file description associated with

22766 *aiocbp->aio_fildes*.

22767 [EINPROGRESS] The requested I/O is in progress.

22768 [EOVERFLOW] The *aiocbp->aio_lio_opcode* is LIO_READ, the file is a regular file,
 22769 *aiocbp->aio_nbytes* is greater than 0, and the *aiocbp->aio_offset* is before the
 22770 end-of-file and is greater than or equal to the offset maximum in the open file
 22771 description associated with *aiocbp->aio_fildes*.

22772 EXAMPLES

22773 None.

22774 APPLICATION USAGE

22775 None.

22776 RATIONALE

22777 Although it may appear that there are inconsistencies in the specified circumstances for error
 22778 codes, the [EIO] error condition applies when any circumstance relating to an individual
 22779 operation makes that operation fail. This might be due to a badly formulated request (for
 22780 example, the *aio_lio_opcode* field is invalid, and *aio_error()* returns [EINVAL]) or might arise from
 22781 application behavior (for example, the file descriptor is closed before the operation is initiated,
 22782 and *aio_error()* returns [EBADF]).

22783 The limitation on the set of error codes returned when operations from the list shall have been
 22784 initiated enables applications to know when operations have been started and whether
 22785 *aio_error()* is valid for a specific operation.

22786 FUTURE DIRECTIONS

22787 None.

22788 SEE ALSO

22789 *aio_read()*, *aio_write()*, *aio_error()*, *aio_return()*, *aio_cancel()*, *close()*, *exec*, *exit()*, *fork()*, *lseek()*,
 22790 *read()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**aio.h**>

22791 CHANGE HISTORY

22792 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

22793 Large File Summit extensions are added.

22794 Issue 6

22795 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 22796 implementation does not support the Asynchronous Input and Output option.

22797 The *lio_listio()* function is marked as part of the Asynchronous Input and Output option.

22798 The following new requirements on POSIX implementations derive from alignment with the
 22799 Single UNIX Specification:

22800 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs
 22801 past the offset maximum established in the open file description associated with
 22802 *aiocbp->aio_fildes*. This change is to support large files.

22803 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large
 22804 files.

22805 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22806 The **restrict** keyword is added to the *lio_listio()* prototype for alignment with the
 22807 ISO/IEC 9899:1999 standard.

22808 **NAME**

22809 listen — listen for socket connections and limit the queue of incoming connections

22810 **SYNOPSIS**

22811 #include <sys/socket.h>

22812 int listen(int *socket*, int *backlog*);

22813 **DESCRIPTION**

22814 The *listen()* function shall mark a connection-mode socket, specified by the *socket* argument, as
22815 accepting connections.

22816 The *backlog* argument provides a hint to the implementation which the implementation shall use
22817 to limit the number of outstanding connections in the socket's listen queue. Implementations
22818 may impose a limit on *backlog* and silently reduce the specified value. Normally, a larger *backlog*
22819 argument value shall result in a larger or equal length of the listen queue. Implementations shall
22820 support values of *backlog* up to SOMAXCONN, defined in <sys/socket.h>.

22821 The implementation may include incomplete connections in its listen queue. The limits on the
22822 number of incomplete connections and completed connections queued may be different.

22823 The implementation may have an upper limit on the length of the listen queue—either global or
22824 per accepting socket. If *backlog* exceeds this limit, the length of the listen queue is set to the limit.

22825 If *listen()* is called with a *backlog* argument value that is less than 0, the function behaves as if it
22826 had been called with a *backlog* argument value of 0.

22827 A *backlog* argument of 0 may allow the socket to accept connections, in which case the length of
22828 the listen queue may be set to an implementation-defined minimum value.

22829 The socket in use may require the process to have appropriate privileges to use the *listen()*
22830 function.

22831 **RETURN VALUE**

22832 Upon successful completions, *listen()* shall return 0; otherwise, -1 shall be returned and *errno* set
22833 to indicate the error.

22834 **ERRORS**

22835 The *listen()* function shall fail if:

22836 [EBADF] The *socket* argument is not a valid file descriptor.

22837 [EDESTADDRREQ]

22838 The socket is not bound to a local address, and the protocol does not support
22839 listening on an unbound socket.

22840 [EINVAL] The *socket* is already connected.

22841 [ENOTSOCK] The *socket* argument does not refer to a socket.

22842 [EOPNOTSUPP] The socket protocol does not support *listen()*.

22843 The *listen()* function may fail if:

22844 [EACCES] The calling process does not have the appropriate privileges.

22845 [EINVAL] The *socket* has been shut down.

22846 [ENOBUFS] Insufficient resources are available in the system to complete the call.

22847 **EXAMPLES**

22848 None.

22849 **APPLICATION USAGE**

22850 None.

22851 **RATIONALE**

22852 None.

22853 **FUTURE DIRECTIONS**

22854 None.

22855 **SEE ALSO**22856 *accept()*, *connect()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>22857 **CHANGE HISTORY**

22858 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

22859 The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the *backlog*
22860 argument.

22861 **NAME**

22862 llabs — return a long integer absolute value

22863 **SYNOPSIS**

22864 #include <stdlib.h>

22865 long long llabs(long long *i*);22866 **DESCRIPTION**22867 Refer to *labs()*.

22868 NAME

22869 `lldiv` — compute quotient and remainder of a long division

22870 SYNOPSIS

22871 `#include <stdlib.h>`

22872 `lldiv_t lldiv(long long numer, long long denom);`

22873 DESCRIPTION

22874 Refer to *ldiv()*.

22875 **NAME**

22876 llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

22877 **SYNOPSIS**

22878 #include <math.h>

22879 long long llrint(double x);

22880 long long llrintf(float x);

22881 long long llrintl(long double x);

22882 **DESCRIPTION**

22883 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22884 conflict between the requirements described here and the ISO C standard is unintentional. This
 22885 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22886 These functions shall round their argument to the nearest integer value, rounding according to
 22887 the current rounding direction.

22888 An application wishing to check for error situations should set *errno* to zero and call
 22889 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 22890 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 22891 zero, an error has occurred.

22892 **RETURN VALUE**

22893 Upon successful completion, these functions shall return the rounded integer value.

22894 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.22895 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.22896 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

22897 If the correct value is positive and too large to represent as a **long long**, a domain error shall
 22898 occur and an unspecified value is returned.

22899 If the correct value is negative and too large to represent as a **long long**, a domain error shall
 22900 occur and an unspecified value is returned.

22901 **ERRORS**

22902 These functions shall fail if:

22903 MX	Domain Error	The <i>x</i> argument is NaN or $\pm$ Inf, or the correct value is not representable as an integer.

22905	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

22909 **EXAMPLES**

22910 None.

22911 **APPLICATION USAGE**

22912 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 22913 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22914 **RATIONALE**

22915 These functions provide floating-to-integer conversions. They round according to the current
 22916 rounding direction. If the rounded value is outside the range of the return type, the numeric
 22917 result is unspecified and the invalid floating-point exception is raised. When they raise no other
 22918 floating-point exception and the result differs from the argument, they raise the inexact

22919 floating-point exception.

22920 **FUTURE DIRECTIONS**

22921 None.

22922 **SEE ALSO**

22923 *feclearexcept()*, *fetestexcept()*, *lrint()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section
22924 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

22925 **CHANGE HISTORY**

22926 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

22927 **NAME**

22928 llround, llroundf, llroundl — round to nearest integer value

22929 **SYNOPSIS**

22930 #include <math.h>

22931 long long llround(double x);

22932 long long llroundf(float x);

22933 long long llroundl(long double x);

22934 **DESCRIPTION**

22935 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 22936 conflict between the requirements described here and the ISO C standard is unintentional. This
 22937 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22938 These functions shall round their argument to the nearest integer value, rounding halfway cases
 22939 away from zero, regardless of the current rounding direction.

22940 An application wishing to check for error situations should set *errno* to zero and call
 22941 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 22942 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 22943 zero, an error has occurred.

22944 **RETURN VALUE**

22945 Upon successful completion, these functions shall return the rounded integer value.

22946 MX If *x* is NaN, a domain error shall occur, and an unspecified value is returned.22947 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.22948 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

22949 If the correct value is positive and too large to represent as a **long long**, a domain error shall
 22950 occur and an unspecified value is returned.

22951 If the correct value is negative and too large to represent as a **long long**, a domain error shall
 22952 occur and an unspecified value is returned.

22953 **ERRORS**

22954 These functions shall fail if:

22955 MX	Domain Error	The <i>x</i> argument is NaN or $\pm$ Inf, or the correct value is not representable as an integer.

22957	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

22961 **EXAMPLES**

22962 None.

22963 **APPLICATION USAGE**

22964 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 22965 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

22966 **RATIONALE**

22967 These functions differ from the *llrint*() functions in that the default rounding direction for the
 22968 *llround*() functions round halfway cases away from zero and need not raise the inexact floating-
 22969 point exception for non-integer arguments that round to within the range of the return type.

22970 **FUTURE DIRECTIONS**

22971 None.

22972 **SEE ALSO**

22973 *feclearexcept()*, *fetetestexcept()*, *lround()*, the Base Definitions volume of IEEE Std 1003.1-2001,
22974 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

22975 **CHANGE HISTORY**

22976 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

22977 **NAME**

22978 localeconv — return locale-specific information

22979 **SYNOPSIS**

22980 #include <locale.h>

22981 struct lconv *localeconv(void);

22982 **DESCRIPTION**

22983 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 22984 conflict between the requirements described here and the ISO C standard is unintentional. This
 22985 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

22986 The *localeconv()* function shall set the components of an object with the type **struct lconv** with
 22987 the values appropriate for the formatting of numeric quantities (monetary and otherwise)
 22988 according to the rules of the current locale.

22989 The members of the structure with type **char *** are pointers to strings, any of which (except
 22990 **decimal_point**) can point to " ", to indicate that the value is not available in the current locale or
 22991 is of zero length. The members with type **char** are non-negative numbers, any of which can be
 22992 {CHAR_MAX} to indicate that the value is not available in the current locale.

22993 The members include the following:

22994 **char *decimal_point**

22995 The radix character used to format non-monetary quantities.

22996 **char *thousands_sep**

22997 The character used to separate groups of digits before the decimal-point character in
 22998 formatted non-monetary quantities.

22999 **char *grouping**

23000 A string whose elements taken as one-byte integer values indicate the size of each group of
 23001 digits in formatted non-monetary quantities.

23002 **char *int_curr_symbol**

23003 The international currency symbol applicable to the current locale. The first three
 23004 characters contain the alphabetic international currency symbol in accordance with those |
 23005 specified in the ISO 4217:2001 standard. The fourth character (immediately preceding the |
 23006 null byte) is the character used to separate the international currency symbol from the
 23007 monetary quantity.

23008 **char *currency_symbol**

23009 The local currency symbol applicable to the current locale.

23010 **char *mon_decimal_point**

23011 The radix character used to format monetary quantities.

23012 **char *mon_thousands_sep**

23013 The separator for groups of digits before the decimal-point in formatted monetary
 23014 quantities.

23015 **char *mon_grouping**

23016 A string whose elements taken as one-byte integer values indicate the size of each group of
 23017 digits in formatted monetary quantities.

23018 **char *positive_sign**

23019 The string used to indicate a non-negative valued formatted monetary quantity.

23020	char *negative_sign	
23021	The string used to indicate a negative valued formatted monetary quantity.	
23022	char int_frac_digits	
23023	The number of fractional digits (those after the decimal-point) to be displayed in an	
23024	internationally formatted monetary quantity.	
23025	char frac_digits	
23026	The number of fractional digits (those after the decimal-point) to be displayed in a	
23027	formatted monetary quantity.	
23028	char p_cs_precedes	
23029	Set to 1 if the currency_symbol precedes the value for a non-negative formatted monetary	
23030	quantity. Set to 0 if the symbol succeeds the value.	
23031	char p_sep_by_space	
23032	Set to a value indicating the separation of the currency_symbol , the sign string, and the	
23033	value for a non-negative formatted monetary quantity.	
23034	char n_cs_precedes	
23035	Set to 1 if the currency_symbol precedes the value for a negative formatted monetary	
23036	quantity. Set to 0 if the symbol succeeds the value.	
23037	char n_sep_by_space	
23038	Set to a value indicating the separation of the currency_symbol , the sign string, and the	
23039	value for a negative formatted monetary quantity.	
23040	char p_sign_posn	
23041	Set to a value indicating the positioning of the positive_sign for a non-negative formatted	
23042	monetary quantity.	
23043	char n_sign_posn	
23044	Set to a value indicating the positioning of the negative_sign for a negative formatted	
23045	monetary quantity.	
23046	char int_p_cs_precedes	
23047	Set to 1 or 0 if the int_curr_symbol respectively precedes or succeeds the value for a non-	
23048	negative internationally formatted monetary quantity.	
23049	char int_n_cs_precedes	
23050	Set to 1 or 0 if the int_curr_symbol respectively precedes or succeeds the value for a	
23051	negative internationally formatted monetary quantity.	
23052	char int_p_sep_by_space	
23053	Set to a value indicating the separation of the int_curr_symbol , the sign string, and the	
23054	value for a non-negative internationally formatted monetary quantity.	
23055	char int_n_sep_by_space	
23056	Set to a value indicating the separation of the int_curr_symbol , the sign string, and the	
23057	value for a negative internationally formatted monetary quantity.	
23058	char int_p_sign_posn	
23059	Set to a value indicating the positioning of the positive_sign for a non-negative	
23060	internationally formatted monetary quantity.	
23061	char int_n_sign_posn	
23062	Set to a value indicating the positioning of the negative_sign for a negative internationally	
23063	formatted monetary quantity.	

23064	The elements of grouping and mon_grouping are interpreted according to the following:
23065	{CHAR_MAX} No further grouping is to be performed.
23066	0 The previous element is to be repeatedly used for the remainder of the digits.
23067	<i>other</i> The integer value is the number of digits that comprise the current group. The
23068	next element is examined to determine the size of the next group of digits
23069	before the current group.
23070	The values of p_sep_by_space , n_sep_by_space , int_p_sep_by_space , and int_n_sep_by_space
23071	are interpreted according to the following:
23072	0 No space separates the currency symbol and value.
23073	1 If the currency symbol and sign string are adjacent, a space separates them from the value;
23074	otherwise, a space separates the currency symbol from the value.
23075	2 If the currency symbol and sign string are adjacent, a space separates them; otherwise, a
23076	space separates the sign string from the value.
23077	For int_p_sep_by_space and int_n_sep_by_space , the fourth character of int_curr_symbol is
23078	used instead of a space.
23079	The values of p_sign_posn , n_sign_posn , int_p_sign_posn , and int_n_sign_posn are
23080	interpreted according to the following:
23081	0 Parentheses surround the quantity and currency_symbol or int_curr_symbol .
23082	1 The sign string precedes the quantity and currency_symbol or int_curr_symbol .
23083	2 The sign string succeeds the quantity and currency_symbol or int_curr_symbol .
23084	3 The sign string immediately precedes the currency_symbol or int_curr_symbol .
23085	4 The sign string immediately succeeds the currency_symbol or int_curr_symbol .
23086	The implementation shall behave as if no function in this volume of IEEE Std 1003.1-2001 calls
23087	<i>localeconv()</i> .
23088 CX	The <i>localeconv()</i> function need not be reentrant. A function that is not required to be reentrant is
23089	not required to be thread-safe.
23090	RETURN VALUE
23091	The <i>localeconv()</i> function shall return a pointer to the filled-in object. The application shall not
23092	modify the structure pointed to by the return value which may be overwritten by a subsequent
23093	call to <i>localeconv()</i> . In addition, calls to <i>setlocale()</i> with the categories <i>LC_ALL</i> , <i>LC_MONETARY</i> ,
23094	or <i>LC_NUMERIC</i> may overwrite the contents of the structure.
23095	ERRORS
23096	No errors are defined.
23097	EXAMPLES
23098	None.
23099	APPLICATION USAGE
23100	The following table illustrates the rules which may be used by four countries to format monetary
23101	quantities.

Country	Positive Format	Negative Format	International Format
Italy	L.1.230	−L.1.230	ITL.1.230
Netherlands	F 1.234,56	F −1.234,56	NLG 1.234,56
Norway	kr1.234,56	kr1.234,56−	NOK 1.234,56
Switzerland	SFr.s.1,234.56	SFr.s.1,234.56C	CHF 1,234.56

For these four countries, the respective values for the monetary members of the structure returned by `localeconv()` are:

	Italy	Netherlands	Norway	Switzerland
int_curr_symbol	"ITL. "	"NLG "	"NOK "	"CHF "
currency_symbol	"L. "	"F"	"kr"	"SFr.s. "
mon_decimal_point	" "	", "	", "	". "
mon_thousands_sep	". "	". "	". "	", "
mon_grouping	"\3 "	"\3 "	"\3 "	"\3 "
positive_sign	" "	" "	" "	" "
negative_sign	" − "	" − "	" − "	" C "
int_frac_digits	0	2	2	2
frac_digits	0	2	2	2
p_cs_precedes	1	1	1	1
p_sep_by_space	0	1	0	0
n_cs_precedes	1	1	1	1
n_sep_by_space	0	1	0	0
p_sign_posn	1	1	1	1
n_sign_posn	1	4	2	2
int_p_cs_precedes	1	1	1	1
int_n_cs_precedes	1	1	1	1
int_p_sep_by_space	0	0	0	0
int_n_sep_by_space	0	0	0	0
int_p_sign_posn	1	1	1	1
int_n_sign_posn	1	4	4	2

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The RETURN VALUE section is rewritten to avoid use of the term “must”.

This reference page is updated for alignment with the ISO / IEC 9899: 1999 standard.

ISO / IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

23147 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to
23148 **int_curr_symbol** and updating the descriptions of **p_sep_by_space** and **n_sep_by_space**. These
23149 changes are for alignment with the ISO C standard.

23150 **NAME**

23151 localtime, localtime_r — convert a time value to a broken-down local time

23152 **SYNOPSIS**

23153 #include <time.h>

23154 struct tm *localtime(const time_t *timer);

23155 TSF struct tm *localtime_r(const time_t *restrict timer,

23156 struct tm *restrict result);

23157

23158 **DESCRIPTION**

23159 CX For *localtime()*: The functionality described on this reference page is aligned with the ISO C
 23160 standard. Any conflict between the requirements described here and the ISO C standard is
 23161 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23162 The *localtime()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 23163 into a broken-down time, expressed as a local time. The function corrects for the timezone and
 23164 CX any seasonal time adjustments. Local timezone information is used as though *localtime()* calls
 23165 *tzset()*.

23166 The relationship between a time in seconds since the Epoch used as an argument to *localtime()*
 23167 and the **tm** structure (defined in the <time.h> header) is that the result shall be as specified in the
 23168 expression given in the definition of seconds since the Epoch (see the Base Definitions volume of
 23169 IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch) corrected for timezone and any
 23170 seasonal time adjustments, where the names in the structure and in the expression correspond.

23171 TSF The same relationship shall apply for *localtime_r()*.

23172 CX The *localtime()* function need not be reentrant. A function that is not required to be reentrant is
 23173 not required to be thread-safe.

23174 The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 23175 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 23176 functions may overwrite the information returned in either of these objects by any of the other
 23177 functions.

23178 TSF The *localtime_r()* function shall convert the time in seconds since the Epoch pointed to by *timer*
 23179 into a broken-down time stored in the structure to which *result* points. The *localtime_r()* function
 23180 shall also return a pointer to that same structure.

23181 Unlike *localtime()*, the reentrant version is not required to set *tzname*.23182 **RETURN VALUE**

23183 Upon successful completion, the *localtime()* function shall return a pointer to the broken-down
 23184 CX time structure. If an error is detected, *localtime()* shall return a null pointer and set *errno* to
 23185 indicate the error.

23186 TSF Upon successful completion, *localtime_r()* shall return a pointer to the structure pointed to by
 23187 the argument *result*.

23188 **ERRORS**23189 The *localtime()* function shall fail if:

23190 CX [EOVERFLOW] The result cannot be represented.

23191 **EXAMPLES**23192 **Getting the Local Date and Time**

23193 The following example uses the *time()* function to calculate the time elapsed, in seconds, since
 23194 January 1, 1970 0:00 UTC (the Epoch), *localtime()* to convert that value to a broken-down time,
 23195 and *asctime()* to convert the broken-down time values into a printable string.

```
23196 #include <stdio.h>
23197 #include <time.h>

23198 int main(void)
23199 {
23200     time_t result;

23201     result = time(NULL);
23202     printf("%s%ju secs since the Epoch\n",
23203           asctime(localtime(&result)),
23204           (uintmax_t)result);
23205     return(0);
23206 }
```

23207 This example writes the current time to *stdout* in a form like this:

```
23208 Wed Jun 26 10:32:15 1996
23209 835810335 secs since the Epoch
```

23210 **Getting the Modification Time for a File**

23211 The following example gets the modification time for a file. The *localtime()* function converts the
 23212 **time_t** value of the last modification date, obtained by a previous call to *stat()*, into a **tm**
 23213 structure that contains the year, month, day, and so on.

```
23214 #include <time.h>
23215 ...
23216 struct stat statbuf;
23217 ...
23218 tm = localtime(&statbuf.st_mtime);
23219 ...
```

23220 **Timing an Event**

23221 The following example gets the current time, converts it to a string using *localtime()* and
 23222 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to
 23223 an event being timed.

```
23224 #include <time.h>
23225 #include <stdio.h>
23226 ...
23227 time_t now;
23228 int minutes_to_event;
23229 ...
23230 time(&now);
23231 printf("The time is ");
23232 fputs(asctime(localtime(&now)), stdout);
23233 printf("There are still %d minutes to the event.\n",
```

23234 minutes_to_event);
 23235 ...

23236 APPLICATION USAGE

23237 The *localtime_r()* function is thread-safe and returns values in a user-supplied buffer instead of
 23238 possibly using a static data area that may be overwritten by each call.

23239 RATIONALE

23240 None.

23241 FUTURE DIRECTIONS

23242 None.

23243 SEE ALSO

23244 *asctime()*, *clock()*, *ctime()*, *difftime()*, *getdate()*, *gmtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*,
 23245 *utime()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<time.h>**

23246 CHANGE HISTORY

23247 First released in Issue 1. Derived from Issue 1 of the SVID.

23248 Issue 5

23249 A note indicating that the *localtime()* function need not be reentrant is added to the
 23250 DESCRIPTION.

23251 The *localtime_r()* function is included for alignment with the POSIX Threads Extension.

23252 Issue 6

23253 The *localtime_r()* function is marked as part of the Thread-Safe Functions option.

23254 Extensions beyond the ISO C standard are marked.

23255 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
 23256 its avoidance of possibly using a static data area.

23257 The **restrict** keyword is added to the *localtime_r()* prototype for alignment with the
 23258 ISO/IEC 9899:1999 standard.

23259 Examples are added.

23260 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/32 is applied, adding the
 23261 [EOverflow] error.

23262 **NAME**

23263 lockf — record locking on files

23264 **SYNOPSIS**23265 xSI `#include <unistd.h>`23266 `int lockf(int fildes, int function, off_t size);`

23267

23268 **DESCRIPTION**

23269 The *lockf()* function shall lock sections of a file with advisory-mode locks. Calls to *lockf()* from
 23270 other threads which attempt to lock the locked file section shall either return an error value or
 23271 block until the section becomes unlocked. All the locks for a process are removed when the
 23272 process terminates. Record locking with *lockf()* shall be supported for regular files and may be
 23273 supported for other files.

23274 The *fildes* argument is an open file descriptor. To establish a lock with this function, the file
 23275 descriptor shall be opened with write-only permission (O_WRONLY) or with read/write
 23276 permission (O_RDWR).

23277 The *function* argument is a control value which specifies the action to be taken. The permissible
 23278 values for *function* are defined in **<unistd.h>** as follows:

23279

23280

23281

23282

23283

23284

Function	Description
F_ULOCK	Unlock locked sections.
F_LOCK	Lock a section for exclusive use.
F_TLOCK	Test and lock a section for exclusive use.
F_TEST	Test a section for locks by other processes.

23285 F_TEST shall detect if a lock by another process is present on the specified section.

23286 F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

23287 F_ULOCK shall remove locks from a section of the file.

23288 The *size* argument is the number of contiguous bytes to be locked or unlocked. The section to be
 23289 locked or unlocked starts at the current offset in the file and extends forward for a positive size
 23290 or backward for a negative size (the preceding bytes up to but not including the current offset).
 23291 If *size* is 0, the section from the current offset through the largest possible file offset shall be
 23292 locked (that is, from the current offset through the present or any future end-of-file). An area
 23293 need not be allocated to the file to be locked because locks may exist past the end-of-file.

23294 The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained
 23295 by a previously locked section for the same process. When this occurs, or if adjacent locked
 23296 sections would occur, the sections shall be combined into a single locked section. If the request
 23297 would cause the number of locks to exceed a system-imposed limit, the request shall fail.

23298 F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available.
 23299 F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the
 23300 function to fail if the section is already locked by another process.

23301 File locks shall be released on first close by the locking process of any file descriptor for the file.

23302 F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the
 23303 process. Locked sections shall be unlocked starting at the current file offset through *size* bytes or
 23304 to the end-of-file if *size* is (**off_t**)0. When all of a locked section is not released (that is, when the
 23305 beginning or end of the area to be unlocked falls within a locked section), the remaining portions
 23306 of that section shall remain locked by the process. Releasing the center portion of a locked

23307	section shall cause the remaining locked beginning and end portions to become two separate
23308	locked sections. If the request would cause the number of locks in the system to exceed a
23309	system-imposed limit, the request shall fail.
23310	A potential for deadlock occurs if the threads of a process controlling a locked section are
23311	blocked by accessing another process' locked section. If the system detects that deadlock would
23312	occur, <i>lockf()</i> shall fail with an [EDEADLK] error.
23313	The interaction between <i>fcntl()</i> and <i>lockf()</i> locks is unspecified.
23314	Blocking on a section shall be interrupted by any signal.
23315	An F_ULOCK request in which <i>size</i> is non-zero and the offset of the last byte of the requested
23316	section is the maximum value for an object of type off_t , when the process has an existing lock
23317	in which <i>size</i> is 0 and which includes the last byte of the requested section, shall be treated as a
23318	request to unlock from the start of the requested section with a size equal to 0. Otherwise, an
23319	F_ULOCK request shall attempt to unlock only the requested section.
23320	Attempting to lock a section of a file that is associated with a buffered stream produces
23321	unspecified results.
23322	RETURN VALUE
23323	Upon successful completion, <i>lockf()</i> shall return 0. Otherwise, it shall return -1, set <i>errno</i> to
23324	indicate an error, and existing locks shall not be changed.
23325	ERRORS
23326	The <i>lockf()</i> function shall fail if:
23327	[EBADF] The <i>filides</i> argument is not a valid open file descriptor; or <i>function</i> is F_LOCK
23328	or F_TLOCK and <i>filides</i> is not a valid file descriptor open for writing.
23329	[EACCES] or [EAGAIN]
23330	The <i>function</i> argument is F_TLOCK or F_TEST and the section is already
23331	locked by another process.
23332	[EDEADLK] The <i>function</i> argument is F_LOCK and a deadlock is detected.
23333	[EINTR] A signal was caught during execution of the function.
23334	[EINVAL] The <i>function</i> argument is not one of F_LOCK, F_TLOCK, F_TEST, or
23335	F_ULOCK; or <i>size</i> plus the current file offset is less than 0.
23336	[EOVERFLOW] The offset of the first, or if <i>size</i> is not 0 then the last, byte in the requested
23337	section cannot be represented correctly in an object of type off_t .
23338	The <i>lockf()</i> function may fail if:
23339	[EAGAIN] The <i>function</i> argument is F_LOCK or F_TLOCK and the file is mapped with
23340	<i>mmap()</i> .
23341	[EDEADLK] or [ENOLCK]
23342	The <i>function</i> argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request
23343	would cause the number of locks to exceed a system-imposed limit.
23344	[EOPNOTSUPP] or [EINVAL]
23345	The implementation does not support the locking of files of the type indicated
23346	by the <i>filides</i> argument.

23347 **EXAMPLES**23348 **Locking a Portion of a File**

23349 In the following example, a file named **/home/cnd/mod1** is being modified. Other processes that
 23350 use locking are prevented from changing it during this process. Only the first 10 000 bytes are
 23351 locked, and the lock call fails if another process has any part of this area locked already.

```
23352 #include <fcntl.h>
23353 #include <unistd.h>

23354 int fildes;
23355 int status;
23356 ...
23357 fildes = open("/home/cnd/mod1", O_RDWR);
23358 status = lockf(fildes, F_TLOCK, (off_t)10000);
```

23359 **APPLICATION USAGE**

23360 Record-locking should not be used in combination with the *fopen()*, *fread()*, *fwrite()*, and other
 23361 *stdio* functions. Instead, the more primitive, non-buffered functions (such as *open()*) should be
 23362 used. Unexpected results may occur in processes that do buffering in the user address space. The
 23363 process may later read/write data which is/was locked. The *stdio* functions are the most
 23364 common source of unexpected buffering.

23365 The *alarm()* function may be used to provide a timeout facility in applications requiring it.

23366 **RATIONALE**

23367 None.

23368 **FUTURE DIRECTIONS**

23369 None.

23370 **SEE ALSO**

23371 *alarm()*, *chmod()*, *close()*, *creat()*, *fcntl()*, *fopen()*, *mmap()*, *open()*, *read()*, *write()*, the Base
 23372 Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

23373 **CHANGE HISTORY**

23374 First released in Issue 4, Version 2.

23375 **Issue 5**

23376 Moved from X/OPEN UNIX extension to BASE.

23377 Large File Summit extensions are added. In particular, the description of [EINVAL] is clarified
 23378 and moved from optional to mandatory status.

23379 A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a
 23380 file that is associated with a buffered stream.

23381 **Issue 6**

23382 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23383 **NAME**

23384 log, logf, logl — natural logarithm function

23385 **SYNOPSIS**

23386 #include <math.h>

23387 double log(double x);

23388 float logf(float x);

23389 long double logl(long double x);

23390 **DESCRIPTION**

23391 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23392 conflict between the requirements described here and the ISO C standard is unintentional. This
 23393 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23394 These functions shall compute the natural logarithm of their argument x , $\log_e(x)$.

23395 An application wishing to check for error situations should set *errno* to zero and call
 23396 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23397 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23398 zero, an error has occurred.

23399 **RETURN VALUE**23400 Upon successful completion, these functions shall return the natural logarithm of x .

23401 If x is ± 0 , a pole error shall occur and *log()*, *logf()*, and *logl()* shall return $-\text{HUGE\_VAL}$,
 23402 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

23403 MX For finite values of x that are less than 0, or if x is $-\text{Inf}$, a domain error shall occur, and either a
 23404 NaN (if supported), or an implementation-defined value shall be returned.

23405 MX If x is NaN, a NaN shall be returned.23406 If x is 1, +0 shall be returned.23407 If x is $+\text{Inf}$, x shall be returned.23408 **ERRORS**

23409 These functions shall fail if:

23410 MX Domain Error The finite value of x is negative, or x is $-\text{Inf}$.

23411 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23412 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 23413 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23414 shall be raised.

23415 Pole Error The value of x is zero.

23416 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23417 then *errno* shall be set to [ERANGE]. If the integer expression
 23418 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 23419 zero floating-point exception shall be raised.

23420 **EXAMPLES**

23421 None.

23422 **APPLICATION USAGE**

23423 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
23424 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23425 **RATIONALE**

23426 None.

23427 **FUTURE DIRECTIONS**

23428 None.

23429 **SEE ALSO**

23433 **CHANGE HISTORY**

23434 First released in Issue 1. Derived from Issue 1 of the SVID.

23435 **Issue 5**

23436 The DESCRIPTION is updated to indicate how an application should check for an error. This
23437 text was previously published in the APPLICATION USAGE section.

23438 **Issue 6**

23439 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23440 The *logf()* and *logl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

23441 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
23442 revised to align with the ISO/IEC 9899:1999 standard.

23443 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
23444 marked.

23445 **NAME**

23446 log10, log10f, log10l — base 10 logarithm function

23447 **SYNOPSIS**

23448 #include <math.h>

23449 double log10(double x);

23450 float log10f(float x);

23451 long double log10l(long double x);

23452 **DESCRIPTION**

23453 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23454 conflict between the requirements described here and the ISO C standard is unintentional. This
 23455 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23456 These functions shall compute the base 10 logarithm of their argument x , $\log_{10}(x)$.

23457 An application wishing to check for error situations should set *errno* to zero and call
 23458 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23459 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23460 zero, an error has occurred.

23461 **RETURN VALUE**23462 Upon successful completion, these functions shall return the base 10 logarithm of x .

23463 If x is ± 0 , a pole error shall occur and *log10()*, *log10f()*, and *log10l()* shall return $-\text{HUGE\_VAL}$,
 23464 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

23465 MX For finite values of x that are less than 0, or if x is $-\text{Inf}$, a domain error shall occur, and either a
 23466 NaN (if supported), or an implementation-defined value shall be returned.

23467 MX If x is NaN, a NaN shall be returned.23468 If x is 1, +0 shall be returned.23469 If x is +Inf, +Inf shall be returned.23470 **ERRORS**

23471 These functions shall fail if:

23472 MX Domain Error The finite value of x is negative, or x is $-\text{Inf}$.

23473 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23474 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 23475 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23476 shall be raised.

23477 Pole Error The value of x is zero.

23478 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23479 then *errno* shall be set to [ERANGE]. If the integer expression
 23480 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 23481 zero floating-point exception shall be raised.

23482 **EXAMPLES**

23483 None.

23484 **APPLICATION USAGE**

23485 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
23486 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23487 **RATIONALE**

23488 None.

23489 **FUTURE DIRECTIONS**

23490 None.

23495 **CHANGE HISTORY**

23496 First released in Issue 1. Derived from Issue 1 of the SVID.

23497 **Issue 5**

23498 The DESCRIPTION is updated to indicate how an application should check for an error. This
23499 text was previously published in the APPLICATION USAGE section.

23500 **Issue 6**

23501 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23502 The *log10f()* and *log10l()* functions are added for alignment with the ISO/IEC 9899:1999
23503 standard.

23504 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
23505 revised to align with the ISO/IEC 9899:1999 standard.

23506 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
23507 marked.

23508 **NAME**

23509 log1p, log1pf, log1pl — compute a natural logarithm

23510 **SYNOPSIS**

23511 #include <math.h>

23512 double log1p(double x);

23513 float log1pf(float x);

23514 long double log1pl(long double x);

23515 **DESCRIPTION**

23516 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23517 conflict between the requirements described here and the ISO C standard is unintentional. This
 23518 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23519 These functions shall compute $\log_e(1.0 + x)$.

23520 An application wishing to check for error situations should set *errno* to zero and call
 23521 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23522 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23523 zero, an error has occurred.

23524 **RETURN VALUE**23525 Upon successful completion, these functions shall return the natural logarithm of $1.0 + x$.

23526 If x is -1 , a pole error shall occur and *log1p()*, *log1pf()*, and *log1pl()* shall return $-\text{HUGE\_VAL}$,
 23527 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

23528 MX For finite values of x that are less than -1 , or if x is $-\text{Inf}$, a domain error shall occur, and either a
 23529 NaN (if supported), or an implementation-defined value shall be returned.

23530 MX If x is NaN, a NaN shall be returned.23531 If x is ± 0 , or $+\text{Inf}$, x shall be returned.23532 If x is subnormal, a range error may occur and x should be returned.23533 **ERRORS**

23534 These functions shall fail if:

23535 MX Domain Error The finite value of x is less than -1 , or x is $-\text{Inf}$.

23536 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23537 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 23538 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23539 shall be raised.

23540 Pole Error The value of x is -1 .

23541 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23542 then *errno* shall be set to [ERANGE]. If the integer expression
 23543 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 23544 zero floating-point exception shall be raised.

23545 These functions may fail if:

23546 MX Range Error The value of x is subnormal.

23547 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23548 then *errno* shall be set to [ERANGE]. If the integer expression
 23549 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 23550 floating-point exception shall be raised.

23551 **EXAMPLES**

23552 None.

23553 **APPLICATION USAGE**

23554 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
23555 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23556 **RATIONALE**

23564 First released in Issue 4, Version 2.

23565 **Issue 5**

23566 Moved from X/OPEN UNIX extension to BASE.

23567 **Issue 6**

23568 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23569 The *log1p()* function is no longer marked as an extension.

23570 The *log1pf()* and *log1pl()* functions are added for alignment with the ISO/IEC 9899:1999
23571 standard.

23572 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
23573 revised to align with the ISO/IEC 9899:1999 standard.

23574 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
23575 marked.

23576 **NAME**

23577 log2, log2f, log2l — compute base 2 logarithm functions

23578 **SYNOPSIS**

23579 #include <math.h>

23580 double log2(double x);

23581 float log2f(float x);

23582 long double log2l(long double x);

23583 **DESCRIPTION**

23584 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23585 conflict between the requirements described here and the ISO C standard is unintentional. This
 23586 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23587 These functions shall compute the base 2 logarithm of their argument x , $\log_2(x)$.

23588 An application wishing to check for error situations should set *errno* to zero and call
 23589 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23590 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23591 zero, an error has occurred.

23592 **RETURN VALUE**23593 Upon successful completion, these functions shall return the base 2 logarithm of x .

23594 If x is ± 0 , a pole error shall occur and *log2()*, *log2f()*, and *log2l()* shall return $-\text{HUGE\_VAL}$,
 23595 $-\text{HUGE\_VALF}$, and $-\text{HUGE\_VALL}$, respectively.

23596 MX For finite values of x that are less than 0, or if x is $-\text{Inf}$, a domain error shall occur, and either a
 23597 NaN (if supported), or an implementation-defined value shall be returned.

23598 MX If x is NaN, a NaN shall be returned.23599 If x is 1, +0 shall be returned.23600 If x is $+\text{Inf}$, x shall be returned.23601 **ERRORS**

23602 These functions shall fail if:

23603 MX Domain Error The finite value of x is less than zero, or x is $-\text{Inf}$.

23604 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23605 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 23606 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 23607 shall be raised.

23608 Pole Error The value of x is zero.

23609 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23610 then *errno* shall be set to [ERANGE]. If the integer expression
 23611 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 23612 zero floating-point exception shall be raised.

23613 **EXAMPLES**

23614 None.

23615 **APPLICATION USAGE**

23616 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
23617 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23618 **RATIONALE**

23619 None.

23624 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

23625 **CHANGE HISTORY**

23626 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

23627 **NAME**

23628 logb, logbf, logbl — radix-independent exponent

23629 **SYNOPSIS**

23630 #include <math.h>

23631 double logb(double x);

23632 float logbf(float x);

23633 long double logbl(long double x);

23634 **DESCRIPTION**

23635 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 23636 conflict between the requirements described here and the ISO C standard is unintentional. This
 23637 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23638 These functions shall compute the exponent of x , which is the integral part of $\log_r |x|$, as a
 23639 signed floating-point value, for non-zero x , where r is the radix of the machine's floating-point
 23640 arithmetic, which is the value of FLT_RADIX defined in the <float.h> header.

23641 If x is subnormal it is treated as though it were normalized; thus for finite positive x :

23642 $1 \leq x * \text{FLT\_RADIX}^{-\text{logb}(x)} < \text{FLT\_RADIX}$

23643 An application wishing to check for error situations should set *errno* to zero and call
 23644 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23645 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23646 zero, an error has occurred.

23647 **RETURN VALUE**

23648 Upon successful completion, these functions shall return the exponent of x .

23649 If x is ± 0 , a pole error shall occur and *logb*(), *logbf*(), and *logbl*() shall return *-HUGE_VAL*,
 23650 *-HUGE_VALF*, and *-HUGE_VALL*, respectively.

23651 **MX** If x is NaN, a NaN shall be returned.

23652 If x is $\pm\text{Inf}$, *+Inf* shall be returned.

23653 **ERRORS**

23654 These functions shall fail if:

23655 Pole Error The value of x is ± 0 .

23656 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 23657 then *errno* shall be set to [ERANGE]. If the integer expression
 23658 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 23659 zero floating-point exception shall be raised.

23660 **EXAMPLES**

23661 None.

23662 **APPLICATION USAGE**

23663 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 23664 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23665 **RATIONALE**

23666 None.

23667 **FUTURE DIRECTIONS**

23668 None.

23669 **SEE ALSO**

23670 *feclearexcept()*, *fetestexcept()*, *ilogb()*, *scalb()*, the Base Definitions volume of IEEE Std 1003.1-2001,
23671 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<float.h>**, **<math.h>**

23672 **CHANGE HISTORY**

23673 First released in Issue 4, Version 2.

23674 **Issue 5**

23675 Moved from X/OPEN UNIX extension to BASE.

23676 **Issue 6**23677 The *logb()* function is no longer marked as an extension.23678 The *logbf()* and *logbl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

23679 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
23680 revised to align with the ISO/IEC 9899:1999 standard.

23681 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
23682 marked.

23683 **NAME**

23684 logf, logl — natural logarithm function

23685 **SYNOPSIS**

23686 #include <math.h>

23687 float logf(float x);

23688 long double logl(long double x);

23689 **DESCRIPTION**23690 Refer to *log()*.

23691 **NAME**

23692 longjmp — non-local goto

23693 **SYNOPSIS**

23694 #include <setjmp.h>

23695 void longjmp(jmp_buf env, int val);

23696 **DESCRIPTION**

23697 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23698 conflict between the requirements described here and the ISO C standard is unintentional. This
 23699 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23700 The *longjmp()* function shall restore the environment saved by the most recent invocation of
 23701 *setjmp()* in the same thread, with the corresponding **jmp_buf** argument. If there is no such
 23702 invocation, or if the function containing the invocation of *setjmp()* has terminated execution in
 23703 the interim, or if the invocation of *setjmp()* was within the scope of an identifier with variably
 23704 CX modified type and execution has left that scope in the interim, the behavior is undefined. It is
 23705 unspecified whether *longjmp()* restores the signal mask, leaves the signal mask unchanged, or
 23706 restores it to its value at the time *setjmp()* was called.

23707 All accessible objects have values, and all other components of the abstract machine have state
 23708 (for example, floating-point status flags and open files), as of the time *longjmp()* was called,
 23709 except that the values of objects of automatic storage duration are unspecified if they meet all
 23710 the following conditions:

- 23711 • They are local to the function containing the corresponding *setjmp()* invocation.
- 23712 • They do not have volatile-qualified type.
- 23713 • They are changed between the *setjmp()* invocation and *longjmp()* call.

23714 CX As it bypasses the usual function call and return mechanisms, *longjmp()* shall execute correctly
 23715 in contexts of interrupts, signals, and any of their associated functions. However, if *longjmp()* is
 23716 invoked from a nested signal handler (that is, from a function invoked as a result of a signal
 23717 raised during the handling of another signal), the behavior is undefined.

23718 The effect of a call to *longjmp()* where initialization of the **jmp_buf** structure was not performed
 23719 in the calling thread is undefined.

23720 **RETURN VALUE**

23721 After *longjmp()* is completed, program execution continues as if the corresponding invocation of
 23722 *setjmp()* had just returned the value specified by *val*. The *longjmp()* function shall not cause
 23723 *setjmp()* to return 0; if *val* is 0, *setjmp()* shall return 1.

23724 **ERRORS**

23725 No errors are defined.

23726 **EXAMPLES**

23727 None.

23728 **APPLICATION USAGE**

23729 Applications whose behavior depends on the value of the signal mask should not use *longjmp()*
 23730 and *setjmp()*, since their effect on the signal mask is unspecified, but should instead use the
 23731 *siglongjmp()* and *sigsetjmp()* functions (which can save and restore the signal mask under
 23732 application control).

23733 RATIONALE

23734 None.

23735 FUTURE DIRECTIONS

23736 None.

23737 SEE ALSO

23738 *setjmp()*, *sigaction()*, *siglongjmp()*, *sigsetjmp()*, the Base Definitions volume of
23739 IEEE Std 1003.1-2001, <**setjmp.h**>

23740 CHANGE HISTORY

23741 First released in Issue 1. Derived from Issue 1 of the SVID.

23742 Issue 5

23743 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

23744 Issue 6

23745 Extensions beyond the ISO C standard are marked.

23746 The following new requirements on POSIX implementations derive from alignment with the
23747 Single UNIX Specification:

- 23748 • The DESCRIPTION now explicitly makes *longjmp()*'s effect on the signal mask unspecified.

23749 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

23750 **NAME**

23751 lrand48 — generate uniformly distributed pseudo-random non-negative long integers

23752 **SYNOPSIS**

23753 xSI #include <stdlib.h>

23754 long lrand48(void);

23755

23756 **DESCRIPTION**

23757 Refer to *drand48()*.

23758 **NAME**

23759 lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

23760 **SYNOPSIS**

23761 #include <math.h>

23762 long lrint(double x);

23763 long lrintf(float x);

23764 long lrintl(long double x);

23765 **DESCRIPTION**

23766 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23767 conflict between the requirements described here and the ISO C standard is unintentional. This
 23768 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23769 These functions shall round their argument to the nearest integer value, rounding according to
 23770 the current rounding direction.

23771 An application wishing to check for error situations should set *errno* to zero and call
 23772 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23773 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23774 zero, an error has occurred.

23775 **RETURN VALUE**

23776 Upon successful completion, these functions shall return the rounded integer value.

23777 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.23778 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.23779 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

23780 If the correct value is positive and too large to represent as a **long**, a domain error shall occur
 23781 and an unspecified value is returned.

23782 If the correct value is negative and too large to represent as a **long**, a domain error shall occur
 23783 and an unspecified value is returned.

23784 **ERRORS**

23785 These functions shall fail if:

23786 MX	Domain Error	The <i>x</i> argument is NaN or ±Inf, or the correct value is not representable as an integer.

23788	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, 23789 then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling 23790 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception 23791 shall be raised.

23792 **EXAMPLES**

23793 None.

23794 **APPLICATION USAGE**

23795 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 23796 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23797 **RATIONALE**

23798 These functions provide floating-to-integer conversions. They round according to the current
 23799 rounding direction. If the rounded value is outside the range of the return type, the numeric
 23800 result is unspecified and the invalid floating-point exception is raised. When they raise no other
 23801 floating-point exception and the result differs from the argument, they raise the inexact

23802 floating-point exception.

23803 **FUTURE DIRECTIONS**

23804 None.

23805 **SEE ALSO**

23806 *feclearexcept()*, *fetestexcept()*, *lrint()*, the Base Definitions volume of IEEE Std 1003.1-2001,
23807 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

23808 **CHANGE HISTORY**

23809 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23810 **NAME**

23811 lround, lroundf, lroundl — round to nearest integer value

23812 **SYNOPSIS**

23813 #include <math.h>

23814 long lround(double x);

23815 long lroundf(float x);

23816 long lroundl(long double x);

23817 **DESCRIPTION**

23818 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 23819 conflict between the requirements described here and the ISO C standard is unintentional. This
 23820 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

23821 These functions shall round their argument to the nearest integer value, rounding halfway cases
 23822 away from zero, regardless of the current rounding direction.

23823 An application wishing to check for error situations should set *errno* to zero and call
 23824 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 23825 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 23826 zero, an error has occurred.

23827 **RETURN VALUE**

23828 Upon successful completion, these functions shall return the rounded integer value.

23829 MX If *x* is NaN, a domain error shall occur and an unspecified value is returned.23830 If *x* is +Inf, a domain error shall occur and an unspecified value is returned.23831 If *x* is -Inf, a domain error shall occur and an unspecified value is returned.

23832 If the correct value is positive and too large to represent as a **long**, a domain error shall occur
 23833 and an unspecified value is returned.

23834 If the correct value is negative and too large to represent as a **long**, a domain error shall occur
 23835 and an unspecified value is returned.

23836 **ERRORS**

23837 These functions shall fail if:

23838 MX	Domain Error	The <i>x</i> argument is NaN or $\pm$ Inf, or the correct value is not representable as an integer.

23840	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

23844 **EXAMPLES**

23845 None.

23846 **APPLICATION USAGE**

23847 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 23848 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

23849 **RATIONALE**

23850 These functions differ from the *lrint()* functions in the default rounding direction, with the
 23851 *lround()* functions rounding halfway cases away from zero and needing not to raise the inexact
 23852 floating-point exception for non-integer arguments that round to within the range of the return
 23853 type.

23854 **FUTURE DIRECTIONS**

23855 None.

23856 **SEE ALSO**

23857 *feclearexcept()*, *fetetestexcept()*, *llround()*, the Base Definitions volume of IEEE Std 1003.1-2001,
23858 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

23859 **CHANGE HISTORY**

23860 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

23861 **NAME**

23862 lsearch, lfind — linear search and update

23863 **SYNOPSIS**

23864 xSI #include <search.h>

```

23865 void *lsearch(const void *key, void *base, size_t *nel, size_t width,
23866             int (*compar)(const void *, const void *));
23867 void *lfind(const void *key, const void *base, size_t *nel,
23868            size_t width, int (*compar)(const void *, const void *));
23869 
```

23870 **DESCRIPTION**

23871 The *lsearch()* function shall linearly search the table and return a pointer into the table for the
 23872 matching entry. If the entry does not occur, it shall be added at the end of the table. The *key*
 23873 argument points to the entry to be sought in the table. The *base* argument points to the first
 23874 element in the table. The *width* argument is the size of an element in bytes. The *nel* argument
 23875 points to an integer containing the current number of elements in the table. The integer to which
 23876 *nel* points shall be incremented if the entry is added to the table. The *compar* argument points to
 23877 a comparison function which the application shall supply (for example, *strcmp()*). It is called
 23878 with two arguments that point to the elements being compared. The application shall ensure
 23879 that the function returns 0 if the elements are equal, and non-zero otherwise.

23880 The *lfind()* function shall be equivalent to *lsearch()*, except that if the entry is not found, it is not
 23881 added to the table. Instead, a null pointer is returned.

23882 **RETURN VALUE**

23883 If the searched for entry is found, both *lsearch()* and *lfind()* shall return a pointer to it. Otherwise,
 23884 *lfind()* shall return a null pointer and *lsearch()* shall return a pointer to the newly added element.

23885 Both functions shall return a null pointer in case of error.

23886 **ERRORS**

23887 No errors are defined.

23888 **EXAMPLES**23889 **Storing Strings in a Table**

23890 This fragment reads in less than or equal to TABSIZE strings of length less than or equal to
 23891 ELSIZE and stores them in a table, eliminating duplicates.

```

23892 #include <stdio.h>
23893 #include <string.h>
23894 #include <search.h>
23895 #define TABSIZE 50
23896 #define ELSIZE 120
23897 ...
23898     char line[ELSIZE], tab[TABSIZE][ELSIZE];
23899     size_t nel = 0;
23900     ...
23901     while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
23902         (void) lsearch(line, tab, &nel,
23903                       ELSIZE, (int (*)(const void *, const void *)) strcmp);
23904     ...

```

23905 Finding a Matching Entry

23906 The following example finds any line that reads "This is a test.".

```
23907 #include <search.h>
23908 #include <string.h>
23909 ...
23910 char line[ELSIZE], tab[TABSIZE][ELSIZE];
23911 size_t nel = 0;
23912 char *findline;
23913 void *entry;

23914 findline = "This is a test.\n";

23915 entry = lfind(findline, tab, &nel, ELSIZE, (
23916     int (*)(const void *, const void *)) strcmp);
```

23917 APPLICATION USAGE

23918 The comparison function need not compare every byte, so arbitrary data may be contained in
23919 the elements in addition to the values being compared.

23920 Undefined results can occur if there is not enough room in the table to add a new item.

23921 RATIONALE

23922 None.

23923 FUTURE DIRECTIONS

23924 None.

23925 SEE ALSO

23926 *hcreate()*, *tsearch()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<search.h>**

23927 CHANGE HISTORY

23928 First released in Issue 1. Derived from Issue 1 of the SVID.

23929 Issue 6

23930 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

23931 **NAME**

23932 lseek — move the read/write file offset

23933 **SYNOPSIS**

23934 #include <unistd.h>

23935 off_t lseek(int *fildev*, off_t *offset*, int *whence*);23936 **DESCRIPTION**23937 The *lseek()* function shall set the file offset for the open file description associated with the file
23938 descriptor *fildev*, as follows:

- 23939 • If *whence* is SEEK_SET, the file offset shall be set to *offset* bytes.
- 23940 • If *whence* is SEEK_CUR, the file offset shall be set to its current location plus *offset*.
- 23941 • If *whence* is SEEK_END, the file offset shall be set to the size of the file plus *offset*.

23942 The symbolic constants SEEK_SET, SEEK_CUR, and SEEK_END are defined in <unistd.h>.

23943 The behavior of *lseek()* on devices which are incapable of seeking is implementation-defined.
23944 The value of the file offset associated with such a device is undefined.23945 The *lseek()* function shall allow the file offset to be set beyond the end of the existing data in the
23946 file. If data is later written at this point, subsequent reads of data in the gap shall return bytes
23947 with the value 0 until data is actually written into the gap.23948 The *lseek()* function shall not, by itself, extend the size of a file.23949 SHM If *fildev* refers to a shared memory object, the result of the *lseek()* function is unspecified.23950 TYM If *fildev* refers to a typed memory object, the result of the *lseek()* function is unspecified.23951 **RETURN VALUE**23952 Upon successful completion, the resulting offset, as measured in bytes from the beginning of the
23953 file, shall be returned. Otherwise, (**off_t**)-1 shall be returned, *errno* shall be set to indicate the
23954 error, and the file offset shall remain unchanged.23955 **ERRORS**23956 The *lseek()* function shall fail if:

23957	[EBADF]	The <i>fildev</i> argument is not an open file descriptor.
23958	[EINVAL]	The <i>whence</i> argument is not a proper value, or the resulting file offset would
23959		be negative for a regular file, block special file, or directory.
23960	[EOVERFLOW]	The resulting file offset would be a value which cannot be represented
23961		correctly in an object of type off_t .
23962	[ESPIPE]	The <i>fildev</i> argument is associated with a pipe, FIFO, or socket.

23963 **EXAMPLES**

23964 None.

23965 **APPLICATION USAGE**

23966 None.

23967 **RATIONALE**23968 The ISO C standard includes the functions *fgetpos()* and *fsetpos()*, which work on very large files
23969 by use of a special positioning type.23970 Although *lseek()* may position the file offset beyond the end of the file, this function does not
23971 itself extend the size of the file. While the only function in IEEE Std 1003.1-2001 that may directly

23972 extend the size of the file is *write()*, *truncate()*, and *ftruncate()*, several functions originally
 23973 derived from the ISO C standard, such as *fwrite()*, *fprintf()*, and so on, may do so (by causing
 23974 calls on *write()*).

23975 An invalid file offset that would cause [EINVAL] to be returned may be both implementation-
 23976 defined and device-dependent (for example, memory may have few invalid values). A negative
 23977 file offset may be valid for some devices in some implementations.

23978 The POSIX.1-1990 standard did not specifically prohibit *lseek()* from returning a negative offset.
 23979 Therefore, an application was required to clear *errno* prior to the call and check *errno* upon return
 23980 to determine whether a return value of (**off_t**)−1 is a negative offset or an indication of an error
 23981 condition. The standard developers did not wish to require this action on the part of a
 23982 conforming application, and chose to require that *errno* be set to [EINVAL] when the resulting
 23983 file offset would be negative for a regular file, block special file, or directory.

23984 **FUTURE DIRECTIONS**

23985 None.

23986 **SEE ALSO**

23987 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/types.h>**, **<unistd.h>**

23988 **CHANGE HISTORY**

23989 First released in Issue 1. Derived from Issue 1 of the SVID.

23990 **Issue 5**

23991 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

23992 Large File Summit extensions are added.

23993 **Issue 6**

23994 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

23995 The following new requirements on POSIX implementations derive from alignment with the
 23996 Single UNIX Specification:

23997 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 23998 required for conforming implementations of previous POSIX specifications, it was not
 23999 required for UNIX applications.

24000 • The [EOVERFLOW] error condition is added. This change is to support large files.

24001 An additional [ESPIPE] error condition is added for sockets.

24002 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 24003 *lseek()* results are unspecified for typed memory objects.

24004 **NAME**

24005 lstat — get symbolic link status

24006 **SYNOPSIS**

24007 #include <sys/stat.h>

24008 int lstat(const char *restrict *path*, struct stat *restrict *buf*);24009 **DESCRIPTION**

24010 The *lstat()* function shall be equivalent to *stat()*, except when *path* refers to a symbolic link. In
 24011 that case *lstat()* shall return information about the link, while *stat()* shall return information
 24012 about the file the link references.

24013 For symbolic links, the *st_mode* member shall contain meaningful information when used with
 24014 the file type macros, and the *st_size* member shall contain the length of the pathname contained
 24015 in the symbolic link. File mode bits and the contents of the remaining members of the **stat**
 24016 structure are unspecified. The value returned in the *st_size* member is the length of the contents
 24017 of the symbolic link, and does not count any trailing null.

24018 **RETURN VALUE**

24019 Upon successful completion, *lstat()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 24020 indicate the error.

24021 **ERRORS**24022 The *lstat()* function shall fail if:

24023 [EACCES] A component of the path prefix denies search permission.

24024 [EIO] An error occurred while reading from the file system.

24025 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 24026 argument.

24027 [ENAMETOOLONG]

24028 The length of a pathname exceeds {PATH_MAX} or a pathname component is
 24029 longer than {NAME_MAX}.

24030 [ENOTDIR] A component of the path prefix is not a directory.

24031 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

24032 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file
 24033 serial number cannot be represented correctly in the structure pointed to by
 24034 *buf*.

24035 The *lstat()* function may fail if:

24036 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 24037 resolution of the *path* argument.

24038 [ENAMETOOLONG]

24039 As a result of encountering a symbolic link in resolution of the *path* argument,
 24040 the length of the substituted pathname string exceeded {PATH_MAX}.

24041 [EOVERFLOW] One of the members is too large to store into the structure pointed to by the
 24042 *buf* argument.

24043 **EXAMPLES**24044 **Obtaining Symbolic Link Status Information**

24045 The following example shows how to obtain status information for a symbolic link named
24046 **/modules/pass1**. The structure variable *buffer* is defined for the **stat** structure. If the *path*
24047 argument specified the filename for the file pointed to by the symbolic link (**/home/cnd/mod1**),
24048 the results of calling the function would be the same as those returned by a call to the *stat()*
24049 function.

```
24050 #include <sys/stat.h>
24051 struct stat buffer;
24052 int status;
24053 ...
24054 status = lstat("/modules/pass1", &buffer);
```

24055 **APPLICATION USAGE**

24056 None.

24057 **RATIONALE**

24058 The *lstat()* function is not required to update the time-related fields if the named file is not a
24059 symbolic link. While the *st_uid*, *st_gid*, *st_atime*, *st_mtime*, and *st_ctime* members of the **stat**
24060 structure may apply to a symbolic link, they are not required to do so. No functions in
24061 IEEE Std 1003.1-2001 are required to maintain any of these time fields.

24062 **FUTURE DIRECTIONS**

24063 None.

24064 **SEE ALSO**

24065 *fstat()*, *readlink()*, *stat()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,
24066 **<sys/stat.h>**

24067 **CHANGE HISTORY**

24068 First released in Issue 4, Version 2.

24069 **Issue 5**

24070 Moved from X/OPEN UNIX extension to BASE.

24071 Large File Summit extensions are added.

24072 **Issue 6**

24073 The following changes were made to align with the IEEE P1003.1a draft standard:

- 24074 • This function is now mandatory.
- 24075 • The [ELOOP] optional error condition is added.

24076 The **restrict** keyword is added to the *lstat()* prototype for alignment with the ISO/IEC 9899:1999
24077 standard.

24078 **NAME**

24079 makecontext, swapcontext — manipulate user contexts

24080 **SYNOPSIS**

```

24081 xSI      #include <ucontext.h>

24082          void makecontext(ucontext_t *ucp, void (*func)(void),
24083                          int argc, ...);
24084          int swapcontext(ucontext_t *restrict oucp,
24085                          const ucontext_t *restrict ucp);
24086

```

24087 **DESCRIPTION**

24088 The *makecontext()* function shall modify the context specified by *ucp*, which has been initialized
 24089 using *getcontext()*. When this context is resumed using *swapcontext()* or *setcontext()*, program
 24090 execution shall continue by calling *func*, passing it the arguments that follow *argc* in the
 24091 *makecontext()* call.

24092 Before a call is made to *makecontext()*, the application shall ensure that the context being
 24093 modified has a stack allocated for it. The application shall ensure that the value of *argc* matches
 24094 the number of arguments of type **int** passed to *func*; otherwise, the behavior is undefined.

24095 The *uc_link* member is used to determine the context that shall be resumed when the context
 24096 being modified by *makecontext()* returns. The application shall ensure that the *uc_link* member is
 24097 initialized prior to the call to *makecontext()*.

24098 The *swapcontext()* function shall save the current context in the context structure pointed to by
 24099 *oucp* and shall set the context to the context structure pointed to by *ucp*.

24100 **RETURN VALUE**

24101 Upon successful completion, *swapcontext()* shall return 0. Otherwise, -1 shall be returned and
 24102 *errno* set to indicate the error.

24103 **ERRORS**

24104 The *swapcontext()* function shall fail if:

24105 [ENOMEM] The *ucp* argument does not have enough stack left to complete the operation.

24106 **EXAMPLES**

24107 The following example illustrates the use of *makecontext()*:

```

24108          #include <stdio.h>
24109          #include <ucontext.h>

24110          static ucontext_t ctx[3];

24111          static void
24112          f1 (void)
24113          {
24114              puts("start f1");
24115              swapcontext(&ctx[1], &ctx[2]);
24116              puts("finish f1");
24117          }

24118          static void
24119          f2 (void)
24120          {
24121              puts("start f2");
24122              swapcontext(&ctx[2], &ctx[1]);

```

```

24123         puts("finish f2");
24124     }
24125     int
24126     main (void)
24127     {
24128         char st1[8192];
24129         char st2[8192];
24130
24131         getcontext(&ctx[1]);
24132         ctx[1].uc_stack.ss_sp = st1;
24133         ctx[1].uc_stack.ss_size = sizeof st1;
24134         ctx[1].uc_link = &ctx[0];
24135         makecontext(&ctx[1], f1, 0);
24136
24137         getcontext(&ctx[2]);
24138         ctx[2].uc_stack.ss_sp = st2;
24139         ctx[2].uc_stack.ss_size = sizeof st2;
24140         ctx[2].uc_link = &ctx[1];
24141         makecontext(&ctx[2], f2, 0);
24142
24143         swapcontext(&ctx[0], &ctx[2]);
24144         return 0;
24145     }

```

24143 APPLICATION USAGE

24144 None.

24145 RATIONALE

24146 None.

24152 CHANGE HISTORY

24153 First released in Issue 4, Version 2.

24154 Issue 5

24155 Moved from X/OPEN UNIX extension to BASE.

24156 In the ERRORS section, the description of [ENOMEM] is changed to apply to *swapcontext()* only.

24157 Issue 6

24158 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

24159 The **restrict** keyword is added to the *swapcontext()* prototype for alignment with the
 24160 ISO/IEC 9899:1999 standard.

24161 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/33 is applied, clarifying that the
 24162 arguments passed to *func* are of type **int**.

24163 NAME

24164 malloc — a memory allocator

24165 SYNOPSIS

24166 #include <stdlib.h>

24167 void *malloc(size_t size);

24168 DESCRIPTION

24169 CX The functionality described on this reference page is aligned with the ISO C standard. Any
24170 conflict between the requirements described here and the ISO C standard is unintentional. This
24171 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24172 The *malloc()* function shall allocate unused space for an object whose size in bytes is specified by
24173 *size* and whose value is unspecified.

24174 The order and contiguity of storage allocated by successive calls to *malloc()* is unspecified. The
24175 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
24176 a pointer to any type of object and then used to access such an object in the space allocated (until
24177 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
24178 disjoint from any other object. The pointer returned points to the start (lowest byte address) of
24179 the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of
24180 the space requested is 0, the behavior is implementation-defined: the value returned shall be
24181 either a null pointer or a unique pointer.

24182 RETURN VALUE

24183 Upon successful completion with *size* not equal to 0, *malloc()* shall return a pointer to the
24184 allocated space. If *size* is 0, either a null pointer or a unique pointer that can be successfully
24185 CX passed to *free()* shall be returned. Otherwise, it shall return a null pointer and set *errno* to
24186 indicate the error.

24187 ERRORS

24188 The *malloc()* function shall fail if:

24189 CX [ENOMEM] Insufficient storage space is available.

24190 EXAMPLES

24191 None.

24192 APPLICATION USAGE

24193 None.

24194 RATIONALE

24195 None.

24196 FUTURE DIRECTIONS

24197 None.

24198 SEE ALSO

24200 CHANGE HISTORY

24201 First released in Issue 1. Derived from Issue 1 of the SVID.

24202 Issue 6

24203 Extensions beyond the ISO C standard are marked.

24204 The following new requirements on POSIX implementations derive from alignment with the
24205 Single UNIX Specification:

- 24206 • In the RETURN VALUE section, the requirement to set *errno* to indicate an error is added.
- 24207 • The [ENOMEM] error condition is added.

24208 **NAME**

24209 mblen — get number of bytes in a character

24210 **SYNOPSIS**

24211 #include <stdlib.h>

24212 int mblen(const char *s, size_t n);

24213 **DESCRIPTION**

24214 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 24215 conflict between the requirements described here and the ISO C standard is unintentional. This
 24216 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24217 If s is not a null pointer, *mblen()* shall determine the number of bytes constituting the character
 24218 pointed to by s. Except that the shift state of *mbtowc()* is not affected, it shall be equivalent to:

24219 mbtowc((wchar_t *)0, s, n);

24220 The implementation shall behave as if no function defined in this volume of
 24221 IEEE Std 1003.1-2001 calls *mblen()*.

24222 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 24223 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 24224 character pointer argument, s, is a null pointer. Subsequent calls with s as other than a null
 24225 pointer shall cause the internal state of the function to be altered as necessary. A call with s as a
 24226 null pointer shall cause this function to return a non-zero value if encodings have state
 24227 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 24228 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 24229 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 24230 unspecified.

24231 **RETURN VALUE**

24232 If s is a null pointer, *mblen()* shall return a non-zero or 0 value, if character encodings,
 24233 respectively, do or do not have state-dependent encodings. If s is not a null pointer, *mblen()* shall
 24234 either return 0 (if s points to the null byte), or return the number of bytes that constitute the
 24235 character (if the next n or fewer bytes form a valid character), or return -1 (if they do not form a
 24236 CX valid character) and may set *errno* to indicate the error. In no case shall the value returned be
 24237 greater than n or the value of the {MB_CUR_MAX} macro.

24238 **ERRORS**24239 The *mblen()* function may fail if:

24240 XSI [EILSEQ] Invalid character sequence is detected.

24241 **EXAMPLES**

24242 None.

24243 **APPLICATION USAGE**

24244 None.

24245 **RATIONALE**

24246 None.

24247 **FUTURE DIRECTIONS**

24248 None.

24249 **SEE ALSO**

24250 *mbtowc()*, *mbstowcs()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of
24251 IEEE Std 1003.1-2001, **<stdlib.h>**

24252 **CHANGE HISTORY**

24253 First released in Issue 4. Aligned with the ISO C standard.

24254 NAME

24255 mbrlen — get number of bytes in a character (restartable)

24256 SYNOPSIS

24257 #include <wchar.h>

24258 size_t mbrlen(const char *restrict s, size_t n,
24259 mbstate_t *restrict ps);

24260 DESCRIPTION

24261 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24262 conflict between the requirements described here and the ISO C standard is unintentional. This
24263 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24264 If *s* is not a null pointer, *mbrlen()* shall determine the number of bytes constituting the character
24265 pointed to by *s*. It shall be equivalent to:

24266 mbstate_t internal;
24267 mbrtowc(NULL, s, n, ps != NULL ? ps : &internal);

24268 If *ps* is a null pointer, the *mbrlen()* function shall use its own internal **mbstate_t** object, which is
24269 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
24270 pointed to by *ps* shall be used to completely describe the current conversion state of the
24271 associated character sequence. The implementation shall behave as if no function defined in this
24272 volume of IEEE Std 1003.1-2001 calls *mbrlen()*.

24273 The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

24274 RETURN VALUE

24275 The *mbrlen()* function shall return the first of the following that applies:

24276	0	If the next <i>n</i> or fewer bytes complete the character that corresponds to the null wide character.
24277		
24278	<i>positive</i>	If the next <i>n</i> or fewer bytes complete a valid character; the value returned shall be the number of bytes that complete the character.
24279		
24280	(size_t)−2	If the next <i>n</i> bytes contribute to an incomplete but potentially valid character, and all <i>n</i> bytes have been processed. When <i>n</i> has at least the value of the {MB_CUR_MAX} macro, this case can only occur if <i>s</i> points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).
24281		
24282		
24283		
24284		
24285	(size_t)−1	If an encoding error occurs, in which case the next <i>n</i> or fewer bytes do not contribute to a complete and valid character. In this case, [EILSEQ] shall be stored in <i>errno</i> and the conversion state is undefined.
24286		
24287		

24288 ERRORS

24289 The *mbrlen()* function may fail if:

24290	[EINVAL]	<i>ps</i> points to an object that contains an invalid conversion state.
24291	[EILSEQ]	Invalid character sequence is detected.

24292 **EXAMPLES**

24293 None.

24294 **APPLICATION USAGE**

24295 None.

24296 **RATIONALE**

24297 None.

24298 **FUTURE DIRECTIONS**

24299 None.

24300 **SEE ALSO**24301 *mbsinit()*, *mbrtowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>24302 **CHANGE HISTORY**24303 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
24304 (E).24305 **Issue 6**24306 The *mbrlen()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24307 **NAME**

24308 mbrtowc — convert a character to a wide-character code (restartable)

24309 **SYNOPSIS**

24310 #include <wchar.h>

```
24311       size_t mbrtowc(wchar_t *restrict pwc, const char *restrict s,
24312                      size_t n, mbstate_t *restrict ps);
```

24313 **DESCRIPTION**

24314 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 24315 conflict between the requirements described here and the ISO C standard is unintentional. This
 24316 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24317 If *s* is a null pointer, the *mbrtowc()* function shall be equivalent to the call:

```
24318     mbrtowc(NULL, "", 1, ps)
```

24319 In this case, the values of the arguments *pwc* and *n* are ignored.

24320 If *s* is not a null pointer, the *mbrtowc()* function shall inspect at most *n* bytes beginning at the
 24321 byte pointed to by *s* to determine the number of bytes needed to complete the next character
 24322 (including any shift sequences). If the function determines that the next character is completed, it
 24323 shall determine the value of the corresponding wide character and then, if *pwc* is not a null
 24324 pointer, shall store that value in the object pointed to by *pwc*. If the corresponding wide
 24325 character is the null wide character, the resulting state described shall be the initial conversion
 24326 state.

24327 If *ps* is a null pointer, the *mbrtowc()* function shall use its own internal **mbstate_t** object, which
 24328 shall be initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t**
 24329 object pointed to by *ps* shall be used to completely describe the current conversion state of the
 24330 associated character sequence. The implementation shall behave as if no function defined in this
 24331 volume of IEEE Std 1003.1-2001 calls *mbrtowc()*.

24332 The behavior of this function is affected by the *LC_CTYPE* category of the current locale.

24333 **RETURN VALUE**

24334 The *mbrtowc()* function shall return the first of the following that applies:

24335 0 If the next *n* or fewer bytes complete the character that corresponds to the null
 24336 wide character (which is the value stored).

24337 between 1 and *n* inclusive

24338 If the next *n* or fewer bytes complete a valid character (which is the value
 24339 stored); the value returned shall be the number of bytes that complete the
 24340 character.

24341 (**size_t**)−2 If the next *n* bytes contribute to an incomplete but potentially valid character,
 24342 and all *n* bytes have been processed (no value is stored). When *n* has at least
 24343 the value of the {MB_CUR_MAX} macro, this case can only occur if *s* points at
 24344 a sequence of redundant shift sequences (for implementations with state-
 24345 dependent encodings).

24346 (**size_t**)−1 If an encoding error occurs, in which case the next *n* or fewer bytes do not
 24347 contribute to a complete and valid character (no value is stored). In this case,
 24348 [EILSEQ] shall be stored in *errno* and the conversion state is undefined.

24349 **ERRORS**

24350 The *mbrtowc()* function may fail if:

24351 **CX** [EINVAL] *ps* points to an object that contains an invalid conversion state.

24352 [EILSEQ] Invalid character sequence is detected.

24353 **EXAMPLES**

24354 None.

24355 **APPLICATION USAGE**

24356 None.

24357 **RATIONALE**

24358 None.

24359 **FUTURE DIRECTIONS**

24360 None.

24361 **SEE ALSO**

24362 *mbstowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>

24363 **CHANGE HISTORY**

24364 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
24365 (E).

24366 **Issue 6**

24367 The *mbrtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24368 The following new requirements on POSIX implementations derive from alignment with the
24369 Single UNIX Specification:

- 24370 • The [EINVAL] error condition is added.

24371 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

24372 **NAME**

24373 mbsinit — determine conversion object status

24374 **SYNOPSIS**

24375 #include <wchar.h>

24376 int mbsinit(const mbstate_t *ps);

24377 **DESCRIPTION**

24378 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24379 conflict between the requirements described here and the ISO C standard is unintentional. This
24380 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24381 If *ps* is not a null pointer, the *mbsinit()* function shall determine whether the object pointed to by
24382 *ps* describes an initial conversion state.

24383 **RETURN VALUE**

24384 The *mbsinit()* function shall return non-zero if *ps* is a null pointer, or if the pointed-to object
24385 describes an initial conversion state; otherwise, it shall return zero.

24386 If an **mbstate_t** object is altered by any of the functions described as “restartable”, and is then
24387 used with a different character sequence, or in the other conversion direction, or with a different
24388 *LC_CTYPE* category setting than on earlier function calls, the behavior is undefined.

24389 **ERRORS**

24390 No errors are defined.

24391 **EXAMPLES**

24392 None.

24393 **APPLICATION USAGE**

24394 The **mbstate_t** object is used to describe the current conversion state from a particular character
24395 sequence to a wide-character sequence (or *vice versa*) under the rules of a particular setting of the
24396 *LC_CTYPE* category of the current locale.

24397 The initial conversion state corresponds, for a conversion in either direction, to the beginning of
24398 a new character sequence in the initial shift state. A zero valued **mbstate_t** object is at least one
24399 way to describe an initial conversion state. A zero valued **mbstate_t** object can be used to initiate
24400 conversion involving any character sequence, in any *LC_CTYPE* category setting.

24401 **RATIONALE**

24402 None.

24403 **FUTURE DIRECTIONS**

24407 IEEE Std 1003.1-2001, <**wchar.h**>

24408 **CHANGE HISTORY**

24409 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
24410 (E).

24411 **NAME**

24412 mbsrtowcs — convert a character string to a wide-character string (restartable)

24413 **SYNOPSIS**

24414 #include <wchar.h>

```
24415       size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src,
24416                       size_t len, mbstate_t *restrict ps);
```

24417 **DESCRIPTION**

24418 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 24419 conflict between the requirements described here and the ISO C standard is unintentional. This
 24420 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24421 The *mbsrtowcs()* function shall convert a sequence of characters, beginning in the conversion
 24422 state described by the object pointed to by *ps*, from the array indirectly pointed to by *src* into a
 24423 sequence of corresponding wide characters. If *dst* is not a null pointer, the converted characters
 24424 shall be stored into the array pointed to by *dst*. Conversion continues up to and including a
 24425 terminating null character, which shall also be stored. Conversion shall stop early in either of the
 24426 following cases:

- 24427 • A sequence of bytes is encountered that does not form a valid character.
- 24428 • *len* codes have been stored into the array pointed to by *dst* (and *dst* is not a null pointer).

24429 Each conversion shall take place as if by a call to the *mbrtowc()* function.

24430 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
 24431 pointer (if conversion stopped due to reaching a terminating null character) or the address just
 24432 past the last character converted (if any). If conversion stopped due to reaching a terminating
 24433 null character, and if *dst* is not a null pointer, the resulting state described shall be the initial
 24434 conversion state.

24435 If *ps* is a null pointer, the *mbsrtowcs()* function shall use its own internal **mbstate_t** object, which
 24436 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 24437 pointed to by *ps* shall be used to completely describe the current conversion state of the
 24438 associated character sequence. The implementation behaves as if no function defined in this
 24439 volume of IEEE Std 1003.1-2001 calls *mbsrtowcs()*.

24440 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

24441 **RETURN VALUE**

24442 If the input conversion encounters a sequence of bytes that do not form a valid character, an
 24443 encoding error occurs. In this case, the *mbsrtowcs()* function stores the value of the macro
 24444 [EILSEQ] in *errno* and shall return (**size_t**)-1; the conversion state is undefined. Otherwise, it
 24445 shall return the number of characters successfully converted, not including the terminating null
 24446 (if any).

24447 **ERRORS**

24448 The *mbsrtowcs()* function may fail if:

24449 CX	[EINVAL] <i>ps</i> points to an object that contains an invalid conversion state.
24450	[EILSEQ] Invalid character sequence is detected.

24451 **EXAMPLES**

24452 None.

24453 **APPLICATION USAGE**

24454 None.

24455 **RATIONALE**

24456 None.

24457 **FUTURE DIRECTIONS**

24458 None.

24459 **SEE ALSO**24460 *mbsinit()*, *mbrtowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<wchar.h>**24461 **CHANGE HISTORY**24462 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
24463 (E).24464 **Issue 6**24465 The *mbsrtowcs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24466 The [EINVAL] error condition is marked CX.

24467 **NAME**

24468 mbstowcs — convert a character string to a wide-character string

24469 **SYNOPSIS**

24470 #include <stdlib.h>

24471 size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s,
24472 size_t n);

24473 **DESCRIPTION**

24474 CX The functionality described on this reference page is aligned with the ISO C standard. Any
24475 conflict between the requirements described here and the ISO C standard is unintentional. This
24476 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24477 The *mbstowcs()* function shall convert a sequence of characters that begins in the initial shift
24478 state from the array pointed to by *s* into a sequence of corresponding wide-character codes and
24479 shall store not more than *n* wide-character codes into the array pointed to by *pwcs*. No
24480 characters that follow a null byte (which is converted into a wide-character code with value 0)
24481 shall be examined or converted. Each character shall be converted as if by a call to *mbtowc()*,
24482 except that the shift state of *mbtowc()* is not affected.

24483 No more than *n* elements shall be modified in the array pointed to by *pwcs*. If copying takes
24484 place between objects that overlap, the behavior is undefined.

24485 XSI The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale. If
24486 *pwcs* is a null pointer, *mbstowcs()* shall return the length required to convert the entire array
24487 regardless of the value of *n*, but no values are stored.

24488 **RETURN VALUE**

24489 CX If an invalid character is encountered, *mbstowcs()* shall return **(size_t)-1** and may set *errno* to
24490 indicate the error.

24491 XSI Otherwise, *mbstowcs()* shall return the number of the array elements modified (or required if
24492 *pwcs* is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if
24493 the value returned is *n*.

24494 **ERRORS**24495 The *mbstowcs()* function may fail if:

24496 XSI [EILSEQ] Invalid byte sequence is detected.

24497 **EXAMPLES**

24498 None.

24499 **APPLICATION USAGE**

24500 None.

24501 **RATIONALE**

24502 None.

24503 **FUTURE DIRECTIONS**

24504 None.

24505 **SEE ALSO**

24506 *mblen()*, *mbtowc()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,
24507 <stdlib.h>

24508 **CHANGE HISTORY**

24509 First released in Issue 4. Aligned with the ISO C standard.

24510 **Issue 6**

24511 The *mbstowcs()* prototype is updated for alignment with the ISO / IEC 9899:1999 standard.

24512 Extensions beyond the ISO C standard are marked.

24513 **NAME**

24514 mbtowc — convert a character to a wide-character code

24515 **SYNOPSIS**

24516 #include <stdlib.h>

24517 int mbtowc(wchar_t *restrict *pwc*, const char *restrict *s*, size_t *n*);24518 **DESCRIPTION**

24519 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 24520 conflict between the requirements described here and the ISO C standard is unintentional. This
 24521 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24522 If *s* is not a null pointer, *mbtowc()* shall determine the number of bytes that constitute the
 24523 character pointed to by *s*. It shall then determine the wide-character code for the value of type
 24524 **wchar_t** that corresponds to that character. (The value of the wide-character code corresponding
 24525 to the null byte is 0.) If the character is valid and *pwc* is not a null pointer, *mbtowc()* shall store
 24526 the wide-character code in the object pointed to by *pwc*.

24527 The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 24528 state-dependent encoding, this function is placed into its initial state by a call for which its
 24529 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 24530 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 24531 null pointer shall cause this function to return a non-zero value if encodings have state
 24532 dependency, and 0 otherwise. If the implementation employs special bytes to change the shift
 24533 state, these bytes shall not produce separate wide-character codes, but shall be grouped with an
 24534 adjacent character. Changing the *LC_CTYPE* category causes the shift state of this function to be
 24535 unspecified. At most *n* bytes of the array pointed to by *s* shall be examined.

24536 The implementation shall behave as if no function defined in this volume of
 24537 IEEE Std 1003.1-2001 calls *mbtowc()*.

24538 **RETURN VALUE**

24539 If *s* is a null pointer, *mbtowc()* shall return a non-zero or 0 value, if character encodings,
 24540 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *mbtowc()*
 24541 shall either return 0 (if *s* points to the null byte), or return the number of bytes that constitute the
 24542 CX converted character (if the next *n* or fewer bytes form a valid character), or return -1 and may
 24543 set *errno* to indicate the error (if they do not form a valid character).

24544 In no case shall the value returned be greater than *n* or the value of the {MB_CUR_MAX} macro.

24545 **ERRORS**

24546 The *mbtowc()* function may fail if:

24547 XSI [EILSEQ] Invalid character sequence is detected.

24548 **EXAMPLES**

24549 None.

24550 **APPLICATION USAGE**

24551 None.

24552 **RATIONALE**

24553 None.

24554 **FUTURE DIRECTIONS**

24555 None.

24556 **SEE ALSO**

24557 *mblen()*, *mbstowcs()*, *wctomb()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,
24558 **<stdlib.h>**

24559 **CHANGE HISTORY**

24560 First released in Issue 4. Aligned with the ISO C standard.

24561 **Issue 6**

24562 The *mbtowc()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

24563 Extensions beyond the ISO C standard are marked.

24564 **NAME**

24565 memccpy — copy bytes in memory

24566 **SYNOPSIS**

24567 xSI #include <string.h>

24568 void *memccpy(void *restrict s1, const void *restrict s2,
24569 int c, size_t n);

24570

24571 **DESCRIPTION**

24572 The *memccpy()* function shall copy bytes from memory area *s2* into *s1*, stopping after the first
24573 occurrence of byte *c* (converted to an **unsigned char**) is copied, or after *n* bytes are copied,
24574 whichever comes first. If copying takes place between objects that overlap, the behavior is
24575 undefined.

24576 **RETURN VALUE**

24577 The *memccpy()* function shall return a pointer to the byte after the copy of *c* in *s1*, or a null
24578 pointer if *c* was not found in the first *n* bytes of *s2*.

24579 **ERRORS**

24580 No errors are defined.

24581 **EXAMPLES**

24582 None.

24583 **APPLICATION USAGE**24584 The *memccpy()* function does not check for the overflow of the receiving memory area.24585 **RATIONALE**

24586 None.

24587 **FUTURE DIRECTIONS**

24588 None.

24589 **SEE ALSO**24590 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24591 **CHANGE HISTORY**

24592 First released in Issue 1. Derived from Issue 1 of the SVID.

24593 **Issue 6**

24594 The **restrict** keyword is added to the *memccpy()* prototype for alignment with the
24595 ISO/IEC 9899:1999 standard.

24596 **NAME**

24597 memchr — find byte in memory

24598 **SYNOPSIS**

24599 #include <string.h>

24600 void *memchr(const void *s, int c, size_t n);

24601 **DESCRIPTION**

24602 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24603 conflict between the requirements described here and the ISO C standard is unintentional. This
24604 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24605 The *memchr()* function shall locate the first occurrence of *c* (converted to an **unsigned char**) in
24606 the initial *n* bytes (each interpreted as **unsigned char**) of the object pointed to by *s*.

24607 **RETURN VALUE**

24608 The *memchr()* function shall return a pointer to the located byte, or a null pointer if the byte does
24609 not occur in the object.

24610 **ERRORS**

24611 No errors are defined.

24612 **EXAMPLES**

24613 None.

24614 **APPLICATION USAGE**

24615 None.

24616 **RATIONALE**

24617 None.

24618 **FUTURE DIRECTIONS**

24619 None.

24620 **SEE ALSO**24621 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24622 **CHANGE HISTORY**

24623 First released in Issue 1. Derived from Issue 1 of the SVID.

24624 **NAME**

24625 memcmp — compare bytes in memory

24626 **SYNOPSIS**

24627 #include <string.h>

24628 int memcmp(const void *s1, const void *s2, size_t n);

24629 **DESCRIPTION**

24630 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24631 conflict between the requirements described here and the ISO C standard is unintentional. This
24632 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24633 The *memcmp()* function shall compare the first *n* bytes (each interpreted as **unsigned char**) of the
24634 object pointed to by *s1* to the first *n* bytes of the object pointed to by *s2*.

24635 The sign of a non-zero return value shall be determined by the sign of the difference between the
24636 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the objects
24637 being compared.

24638 **RETURN VALUE**

24639 The *memcmp()* function shall return an integer greater than, equal to, or less than 0, if the object
24640 pointed to by *s1* is greater than, equal to, or less than the object pointed to by *s2*, respectively.

24641 **ERRORS**

24642 No errors are defined.

24643 **EXAMPLES**

24644 None.

24645 **APPLICATION USAGE**

24646 None.

24647 **RATIONALE**

24648 None.

24649 **FUTURE DIRECTIONS**

24650 None.

24651 **SEE ALSO**24652 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24653 **CHANGE HISTORY**

24654 First released in Issue 1. Derived from Issue 1 of the SVID.

24655 **NAME**

24656 memcpy — copy bytes in memory

24657 **SYNOPSIS**

24658 #include <string.h>

24659 void *memcpy(void *restrict *s1*, const void *restrict *s2*, size_t *n*);24660 **DESCRIPTION**

24661 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24662 conflict between the requirements described here and the ISO C standard is unintentional. This
24663 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24664 The *memcpy()* function shall copy *n* bytes from the object pointed to by *s2* into the object pointed
24665 to by *s1*. If copying takes place between objects that overlap, the behavior is undefined.

24666 **RETURN VALUE**24667 The *memcpy()* function shall return *s1*; no return value is reserved to indicate an error.24668 **ERRORS**

24669 No errors are defined.

24670 **EXAMPLES**

24671 None.

24672 **APPLICATION USAGE**24673 The *memcpy()* function does not check for the overflow of the receiving memory area.24674 **RATIONALE**

24675 None.

24676 **FUTURE DIRECTIONS**

24677 None.

24678 **SEE ALSO**24679 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24680 **CHANGE HISTORY**

24681 First released in Issue 1. Derived from Issue 1 of the SVID.

24682 **Issue 6**24683 The *memcpy()* prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

24684 **NAME**

24685 memmove — copy bytes in memory with overlapping areas

24686 **SYNOPSIS**

24687 #include <string.h>

24688 void *memmove(void *s1, const void *s2, size_t n);

24689 **DESCRIPTION**

24690 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24691 conflict between the requirements described here and the ISO C standard is unintentional. This
24692 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24693 The *memmove()* function shall copy *n* bytes from the object pointed to by *s2* into the object
24694 pointed to by *s1*. Copying takes place as if the *n* bytes from the object pointed to by *s2* are first
24695 copied into a temporary array of *n* bytes that does not overlap the objects pointed to by *s1* and
24696 *s2*, and then the *n* bytes from the temporary array are copied into the object pointed to by *s1*.

24697 **RETURN VALUE**24698 The *memmove()* function shall return *s1*; no return value is reserved to indicate an error.24699 **ERRORS**

24700 No errors are defined.

24701 **EXAMPLES**

24702 None.

24703 **APPLICATION USAGE**

24704 None.

24709 **SEE ALSO**24710 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>24711 **CHANGE HISTORY**

24712 First released in Issue 4. Derived from the ANSI C standard.

24713 NAME

24714 memset — set bytes in memory

24715 SYNOPSIS

24716 #include <string.h>

24717 void *memset(void *s, int c, size_t n);

24718 DESCRIPTION

24719 cx The functionality described on this reference page is aligned with the ISO C standard. Any
24720 conflict between the requirements described here and the ISO C standard is unintentional. This
24721 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

24722 The *memset()* function shall copy *c* (converted to an **unsigned char**) into each of the first *n* bytes
24723 of the object pointed to by *s*.

24724 RETURN VALUE

24725 The *memset()* function shall return *s*; no return value is reserved to indicate an error.

24726 ERRORS

24727 No errors are defined.

24728 EXAMPLES

24729 None.

24730 APPLICATION USAGE

24731 None.

24738 CHANGE HISTORY

24739 First released in Issue 1. Derived from Issue 1 of the SVID.

24740 **NAME**

24741 mkdir — make a directory

24742 **SYNOPSIS**

24743 #include <sys/stat.h>

24744 int mkdir(const char *path, mode_t mode);

24745 **DESCRIPTION**

24746 The *mkdir()* function shall create a new directory with name *path*. The file permission bits of the
 24747 new directory shall be initialized from *mode*. These file permission bits of the *mode* argument
 24748 shall be modified by the process' file creation mask.

24749 When bits in *mode* other than the file permission bits are set, the meaning of these additional bits
 24750 is implementation-defined.

24751 The directory's user ID shall be set to the process' effective user ID. The directory's group ID
 24752 shall be set to the group ID of the parent directory or to the effective group ID of the process.
 24753 Implementations shall provide a way to initialize the directory's group ID to the group ID of the
 24754 parent directory. Implementations may, but need not, provide an implementation-defined way
 24755 to initialize the directory's group ID to the effective group ID of the calling process.

24756 The newly created directory shall be an empty directory.

24757 If *path* names a symbolic link, *mkdir()* shall fail and set *errno* to [EEXIST].

24758 Upon successful completion, *mkdir()* shall mark for update the *st_atime*, *st_ctime*, and *st_mtime*
 24759 fields of the directory. Also, the *st_ctime* and *st_mtime* fields of the directory that contains the
 24760 new entry shall be marked for update.

24761 **RETURN VALUE**

24762 Upon successful completion, *mkdir()* shall return 0. Otherwise, -1 shall be returned, no directory
 24763 shall be created, and *errno* shall be set to indicate the error.

24764 **ERRORS**

24765 The *mkdir()* function shall fail if:

24766 [EACCES] Search permission is denied on a component of the path prefix, or write
 24767 permission is denied on the parent directory of the directory to be created.

24768 [EEXIST] The named file exists.

24769 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 24770 argument.

24771 [EMLINK] The link count of the parent directory would exceed {LINK_MAX}.

24772 [ENAMETOOLONG]

24773 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 24774 component is longer than {NAME_MAX}.

24775 [ENOENT] A component of the path prefix specified by *path* does not name an existing
 24776 directory or *path* is an empty string.

24777 [ENOSPC] The file system does not contain enough space to hold the contents of the new
 24778 directory or to extend the parent directory of the new directory.

24779 [ENOTDIR] A component of the path prefix is not a directory.

24780 [EROFS] The parent directory resides on a read-only file system.

24781 The *mkdir()* function may fail if:

24782 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
24783 resolution of the *path* argument.

24784 [ENAMETOOLONG]

24785 As a result of encountering a symbolic link in resolution of the *path* argument,
24786 the length of the substituted pathname string exceeded {PATH_MAX}.

24787 EXAMPLES

24788 Creating a Directory

24789 The following example shows how to create a directory named **/home/cnd/mod1**, with
24790 read/write/search permissions for owner and group, and with read/search permissions for
24791 others.

```
24792 #include <sys/types.h>
```

```
24793 #include <sys/stat.h>
```

```
24794 int status;
```

```
24795 ...
```

```
24796 status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

24797 APPLICATION USAGE

24798 None.

24799 RATIONALE

24800 The *mkdir()* function originated in 4.2 BSD and was added to System V in Release 3.0.

24801 4.3 BSD detects [ENAMETOOLONG].

24802 The POSIX.1-1990 standard required that the group ID of a newly created directory be set to the
24803 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2
24804 required that implementations provide a way to have the group ID be set to the group ID of the
24805 containing directory, but did not prohibit implementations also supporting a way to set the
24806 group ID to the effective group ID of the creating process. Conforming applications should not
24807 assume which group ID will be used. If it matters, an application can use *chown()* to set the
24808 group ID after the directory is created, or determine under what conditions the implementation
24809 will set the desired group ID.

24810 FUTURE DIRECTIONS

24811 None.

24812 SEE ALSO

24813 *umask()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/stat.h>**, **<sys/types.h>**

24814 CHANGE HISTORY

24815 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

24816 Issue 6

24817 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

24818 The following new requirements on POSIX implementations derive from alignment with the
24819 Single UNIX Specification:

- 24820 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
24821 required for conforming implementations of previous POSIX specifications, it was not
24822 required for UNIX applications.

24823 • The [ELOOP] mandatory error condition is added.

24824 • A second [ENAMETOOLONG] is added as an optional error condition.

24825 The following changes were made to align with the IEEE P1003.1a draft standard:

24826 • The [ELOOP] optional error condition is added.

24827 **NAME**

24828 mkfifo — make a FIFO special file

24829 **SYNOPSIS**

24830 #include <sys/stat.h>

24831 int mkfifo(const char *path, mode_t mode);

24832 **DESCRIPTION**

24833 The *mkfifo()* function shall create a new FIFO special file named by the pathname pointed to by
 24834 *path*. The file permission bits of the new FIFO shall be initialized from *mode*. The file permission
 24835 bits of the *mode* argument shall be modified by the process' file creation mask.

24836 When bits in *mode* other than the file permission bits are set, the effect is implementation-
 24837 defined.

24838 If *path* names a symbolic link, *mkfifo()* shall fail and set *errno* to [EEXIST].

24839 The FIFO's user ID shall be set to the process' effective user ID. The FIFO's group ID shall be set
 24840 to the group ID of the parent directory or to the effective group ID of the process.
 24841 Implementations shall provide a way to initialize the FIFO's group ID to the group ID of the
 24842 parent directory. Implementations may, but need not, provide an implementation-defined way
 24843 to initialize the FIFO's group ID to the effective group ID of the calling process.

24844 Upon successful completion, *mkfifo()* shall mark for update the *st_atime*, *st_ctime*, and *st_mtime*
 24845 fields of the file. Also, the *st_ctime* and *st_mtime* fields of the directory that contains the new
 24846 entry shall be marked for update.

24847 **RETURN VALUE**

24848 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, no FIFO shall
 24849 be created, and *errno* shall be set to indicate the error.

24850 **ERRORS**24851 The *mkfifo()* function shall fail if:

24852 [EACCES] A component of the path prefix denies search permission, or write permission
 24853 is denied on the parent directory of the FIFO to be created.

24854 [EEXIST] The named file already exists.

24855 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 24856 argument.

24857 [ENAMETOOLONG]

24858 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 24859 component is longer than {NAME_MAX}.

24860 [ENOENT] A component of the path prefix specified by *path* does not name an existing
 24861 directory or *path* is an empty string.

24862 [ENOSPC] The directory that would contain the new file cannot be extended or the file
 24863 system is out of file-allocation resources.

24864 [ENOTDIR] A component of the path prefix is not a directory.

24865 [EROFS] The named file resides on a read-only file system.

24866 The *mkfifo()* function may fail if:

24867 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 24868 resolution of the *path* argument.

24869 [ENAMETOOLONG]

24870 As a result of encountering a symbolic link in resolution of the *path* argument,
 24871 the length of the substituted pathname string exceeded {PATH_MAX}.

24872 EXAMPLES

24873 Creating a FIFO File

24874 The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with
 24875 read/write permissions for owner, and with read permissions for group and others.

```
24876 #include <sys/types.h>
24877 #include <sys/stat.h>

24878 int status;
24879 ...
24880 status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
24881               S_IRGRP | S_IROTH);
```

24882 APPLICATION USAGE

24883 None.

24884 RATIONALE

24885 The syntax of this function is intended to maintain compatibility with historical
 24886 implementations of *mknod()*. The latter function was included in the 1984 /usr/group standard
 24887 but only for use in creating FIFO special files. The *mknod()* function was originally excluded
 24888 from the POSIX.1-1988 standard as implementation-defined and replaced by *mkdir()* and
 24889 *mkfifo()*. The *mknod()* function is now included for alignment with the Single UNIX
 24890 Specification.

24891 The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the
 24892 group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2
 24893 required that implementations provide a way to have the group ID be set to the group ID of the
 24894 containing directory, but did not prohibit implementations also supporting a way to set the
 24895 group ID to the effective group ID of the creating process. Conforming applications should not
 24896 assume which group ID will be used. If it matters, an application can use *chown()* to set the
 24897 group ID after the FIFO is created, or determine under what conditions the implementation will
 24898 set the desired group ID.

24899 FUTURE DIRECTIONS

24900 None.

24901 SEE ALSO

24902 *umask()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

24903 CHANGE HISTORY

24904 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

24905 Issue 6

24906 In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

24907 The following new requirements on POSIX implementations derive from alignment with the
 24908 Single UNIX Specification:

- 24909 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
 24910 required for conforming implementations of previous POSIX specifications, it was not
 24911 required for UNIX applications.

24912 • The [ELOOP] mandatory error condition is added.

24913 • A second [ENAMETOOLONG] is added as an optional error condition.

24914 The following changes were made to align with the IEEE P1003.1a draft standard:

24915 • The [ELOOP] optional error condition is added.

24916 **NAME**

24917 mknod — make a directory, a special file, or a regular file

24918 **SYNOPSIS**24919 xSI `#include <sys/stat.h>`24920 `int mknod(const char *path, mode_t mode, dev_t dev);`

24921

24922 **DESCRIPTION**24923 The *mknod()* function shall create a new file named by the pathname to which the argument *path*
24924 points.24925 The file type for *path* is OR'ed into the *mode* argument, and the application shall select one of the
24926 following symbolic constants:

24927

24928

24929

24930

24931

24932

24933

Name	Description
S_IFIFO	FIFO-special
S_IFCHR	Character-special (non-portable)
S_IFDIR	Directory (non-portable)
S_IFBLK	Block-special (non-portable)
S_IFREG	Regular (non-portable)

24934 The only portable use of *mknod()* is to create a FIFO-special file. If *mode* is not S_IFIFO or *dev* is
24935 not 0, the behavior of *mknod()* is unspecified.24936 The permissions for the new file are OR'ed into the *mode* argument, and may be selected from
24937 any combination of the following symbolic constants:

24938

24939

24940

24941

24942

24943

24944

24945

24946

24947

24948

24949

24950

24951

24952

24953

24954

Name	Description
S_ISUID	Set user ID on execution.
S_ISGID	Set group ID on execution.
S_IRWXU	Read, write, or execute (search) by owner.
S_IRUSR	Read by owner.
S_IWUSR	Write by owner.
S_IXUSR	Execute (search) by owner.
S_IRWXG	Read, write, or execute (search) by group.
S_IRGRP	Read by group.
S_IWGRP	Write by group.
S_IXGRP	Execute (search) by group.
S_IRWXO	Read, write, or execute (search) by others.
S_IROTH	Read by others.
S_IWOTH	Write by others.
S_IXOTH	Execute (search) by others.
S_ISVTX	On directories, restricted deletion flag.

24955 The user ID of the file shall be initialized to the effective user ID of the process. The group ID of
 24956 the file shall be initialized to either the effective group ID of the process or the group ID of the
 24957 parent directory. Implementations shall provide a way to initialize the file's group ID to the
 24958 group ID of the parent directory. Implementations may, but need not, provide an
 24959 implementation-defined way to initialize the file's group ID to the effective group ID of the
 24960 calling process. The owner, group, and other permission bits of *mode* shall be modified by the file
 24961 mode creation mask of the process. The *mknod()* function shall clear each bit whose
 24962 corresponding bit in the file mode creation mask of the process is set.

24963	If <i>path</i> names a symbolic link, <i>mknod()</i> shall fail and set <i>errno</i> to [EEXIST].	
24964	Upon successful completion, <i>mknod()</i> shall mark for update the <i>st_atime</i> , <i>st_ctime</i> , and <i>st_mtime</i>	
24965	fields of the file. Also, the <i>st_ctime</i> and <i>st_mtime</i> fields of the directory that contains the new	
24966	entry shall be marked for update.	
24967	Only a process with appropriate privileges may invoke <i>mknod()</i> for file types other than FIFO-	
24968	special.	
24969	RETURN VALUE	
24970	Upon successful completion, <i>mknod()</i> shall return 0. Otherwise, it shall return -1 , the new file	
24971	shall not be created, and <i>errno</i> shall be set to indicate the error.	
24972	ERRORS	
24973	The <i>mknod()</i> function shall fail if:	
24974	[EACCES]	A component of the path prefix denies search permission, or write permission
24975		is denied on the parent directory.
24976	[EEXIST]	The named file exists.
24977	[EINVAL]	An invalid argument exists.
24978	[EIO]	An I/O error occurred while accessing the file system.
24979	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i>
24980		argument.
24981	[ENAMETOOLONG]	
24982		The length of a pathname exceeds {PATH_MAX} or a pathname component is
24983		longer than {NAME_MAX}.
24984	[ENOENT]	A component of the path prefix specified by <i>path</i> does not name an existing
24985		directory or <i>path</i> is an empty string.
24986	[ENOSPC]	The directory that would contain the new file cannot be extended or the file
24987		system is out of file allocation resources.
24988	[ENOTDIR]	A component of the path prefix is not a directory.
24989	[EPERM]	The invoking process does not have appropriate privileges and the file type is
24990		not FIFO-special.
24991	[EROFS]	The directory in which the file is to be created is located on a read-only file
24992		system.
24993	The <i>mknod()</i> function may fail if:	
24994	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
24995		resolution of the <i>path</i> argument.
24996	[ENAMETOOLONG]	
24997		Pathname resolution of a symbolic link produced an intermediate result
24998		whose length exceeds {PATH_MAX}.

24999 **EXAMPLES**25000 **Creating a FIFO Special File**

25001 The following example shows how to create a FIFO special file named `/home/cnd/mod_done`,
 25002 with read/write permissions for owner, and with read permissions for group and others.

```
25003 #include <sys/types.h>
25004 #include <sys/stat.h>

25005 dev_t dev;
25006 int status;
25007 ...
25008 status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
25009               S_IRUSR | S_IRGRP | S_IROTH, dev);
```

25010 **APPLICATION USAGE**

25011 The `mkfifo()` function is preferred over this function for making FIFO special files.

25012 **RATIONALE**

25013 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group
 25014 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required
 25015 that implementations provide a way to have the group ID be set to the group ID of the
 25016 containing directory, but did not prohibit implementations also supporting a way to set the
 25017 group ID to the effective group ID of the creating process. Conforming applications should not
 25018 assume which group ID will be used. If it matters, an application can use `chown()` to set the
 25019 group ID after the file is created, or determine under what conditions the implementation will
 25020 set the desired group ID.

25021 **FUTURE DIRECTIONS**

25022 None.

25023 **SEE ALSO**

25024 `chmod()`, `creat()`, `exec`, `mkdir()`, `mkfifo()`, `open()`, `stat()`, `umask()`, the Base Definitions volume of
 25025 IEEE Std 1003.1-2001, **<sys/stat.h>**

25026 **CHANGE HISTORY**

25027 First released in Issue 4, Version 2.

25028 **Issue 5**

25029 Moved from X/OPEN UNIX extension to BASE.

25030 **Issue 6**

25031 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25032 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 25033 [ELOOP] error condition is added.

25034 **NAME**

25035 mkstemp — make a unique filename

25036 **SYNOPSIS**25037 xSI `#include <stdlib.h>`25038 `int mkstemp(char *template);`

25039

25040 **DESCRIPTION**

25041 The *mkstemp()* function shall replace the contents of the string pointed to by *template* by a unique
25042 filename, and return a file descriptor for the file open for reading and writing. The function thus
25043 prevents any possible race condition between testing whether the file exists and opening it for
25044 use. The string in *template* should look like a filename with six trailing 'X's; *mkstemp()* replaces
25045 each 'X' with a character from the portable filename character set. The characters are chosen
25046 such that the resulting name does not duplicate the name of an existing file at the time of a call
25047 to *mkstemp()*.

25048 **RETURN VALUE**

25049 Upon successful completion, *mkstemp()* shall return an open file descriptor. Otherwise, `-1` shall
25050 be returned if no suitable file could be created.

25051 **ERRORS**

25052 No errors are defined.

25053 **EXAMPLES**25054 **Generating a Filename**

25055 The following example creates a file with a 10-character name beginning with the characters
25056 "file" and opens the file for reading and writing. The value returned as the value of *fd* is a file
25057 descriptor that identifies the file.

```
25058 #include <stdlib.h>
25059 ...
25060 char template[] = "/tmp/fileXXXXXX";
25061 int fd;
25062 fd = mkstemp(template);
```

25063 **APPLICATION USAGE**

25064 It is possible to run out of letters.

25065 The *mkstemp()* function need not check to determine whether the filename part of *template*
25066 exceeds the maximum allowable filename length.

25067 **RATIONALE**

25068 None.

25069 **FUTURE DIRECTIONS**

25070 None.

25071 **SEE ALSO**

25072 *getpid()*, *open()*, *tmpfile()*, *tmpnam()*, the Base Definitions volume of IEEE Std 1003.1-2001,
25073 `<stdlib.h>`

25074 **CHANGE HISTORY**

25075 First released in Issue 4, Version 2.

25076 **Issue 5**

25077 Moved from X/OPEN UNIX extension to BASE.

25078 **NAME**25079 mktemp — make a unique filename (**LEGACY**)25080 **SYNOPSIS**25081 xSI `#include <stdlib.h>`25082 `char *mktemp(char *template);`

25083

25084 **DESCRIPTION**

25085 The *mktemp()* function shall replace the contents of the string pointed to by *template* by a unique
 25086 filename and return *template*. The application shall initialize *template* to be a filename with six
 25087 trailing 'X's; *mktemp()* shall replace each 'X' with a single byte character from the portable
 25088 filename character set.

25089 **RETURN VALUE**

25090 The *mktemp()* function shall return the pointer *template*. If a unique name cannot be created,
 25091 *template* shall point to a null string.

25092 **ERRORS**

25093 No errors are defined.

25094 **EXAMPLES**25095 **Generating a Filename**

25096 The following example replaces the contents of the "template" string with a 10-character
 25097 filename beginning with the characters "file" and returns a pointer to the "template" string
 25098 that contains the new filename.

25099 `#include <stdlib.h>`25100 `...`25101 `char *template = "/tmp/fileXXXXXX";`25102 `char *ptr;`25103 `ptr = mktemp(template);`25104 **APPLICATION USAGE**

25105 Between the time a pathname is created and the file opened, it is possible for some other process
 25106 to create a file with the same name. The *mkstemp()* function avoids this problem and is preferred
 25107 over this function.

25108 **RATIONALE**

25109 None.

25110 **FUTURE DIRECTIONS**

25111 This function may be withdrawn in a future version.

25112 **SEE ALSO**25113 *mkstemp()*, *tmpfile()*, *tmpnam()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdlib.h>**25114 **CHANGE HISTORY**

25115 First released in Issue 4, Version 2.

25116 **Issue 5**

25117 Moved from X/OPEN UNIX extension to BASE.

25118 **Issue 6**

25119 This function is marked LEGACY.

25120 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25121 **NAME**

25122 mktime — convert broken-down time into time since the Epoch

25123 **SYNOPSIS**

25124 #include <time.h>

25125 time_t mktime(struct tm *timeptr);

25126 **DESCRIPTION**

25127 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25128 conflict between the requirements described here and the ISO C standard is unintentional. This
 25129 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

25130 The *mktime()* function shall convert the broken-down time, expressed as local time, in the
 25131 structure pointed to by *timeptr*, into a time since the Epoch value with the same encoding as that
 25132 of the values returned by *time()*. The original values of the *tm_wday* and *tm_yday* components of
 25133 the structure are ignored, and the original values of the other components are not restricted to
 25134 the ranges described in <time.h>.

25135 CX A positive or 0 value for *tm_isdst* shall cause *mktime()* to presume initially that Daylight Savings
 25136 Time, respectively, is or is not in effect for the specified time. A negative value for *tm_isdst* shall
 25137 cause *mktime()* to attempt to determine whether Daylight Savings Time is in effect for the
 25138 specified time.

25139 Local timezone information shall be set as though *mktime()* called *tzset()*.

25140 The relationship between the **tm** structure (defined in the <time.h> header) and the time in
 25141 seconds since the Epoch is that the result shall be as specified in the expression given in the
 25142 definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-2001,
 25143 Section 4.14, Seconds Since the Epoch) corrected for timezone and any seasonal time
 25144 adjustments, where the names in the structure and in the expression correspond.

25145 Upon successful completion, the values of the *tm_wday* and *tm_yday* components of the structure
 25146 shall be set appropriately, and the other components are set to represent the specified time since
 25147 the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final
 25148 value of *tm_mday* shall not be set until *tm_mon* and *tm_year* are determined.

25149 **RETURN VALUE**

25150 The *mktime()* function shall return the specified time since the Epoch encoded as a value of type
 25151 **time_t**. If the time since the Epoch cannot be represented, the function shall return the value
 25152 (**time_t**)-1.

25153 **ERRORS**

25154 No errors are defined.

25155 **EXAMPLES**

25156 What day of the week is July 4, 2001?

25157 #include <stdio.h>

25158 #include <time.h>

25159 struct tm time_str;

25160 char daybuf[20];

25161 int main(void)

25162 {

25163 time_str.tm_year = 2001 - 1900;

25164 time_str.tm_mon = 7 - 1;

25165 time_str.tm_mday = 4;

```
25166         time_str.tm_hour = 0;
25167         time_str.tm_min = 0;
25168         time_str.tm_sec = 1;
25169         time_str.tm_isdst = -1;
25170         if (mktime(&time_str) == -1)
25171             (void)puts("-unknown-");
25172         else {
25173             (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
25174             (void)puts(daybuf);
25175         }
25176         return 0;
25177     }
```

25178 APPLICATION USAGE

25187 CHANGE HISTORY

25188 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ANSI C
25189 standard.

25190 Issue 6

25191 Extensions beyond the ISO C standard are marked.

25192 **NAME**25193 mlock, munlock — lock or unlock a range of process address space (**REALTIME**)25194 **SYNOPSIS**25195 MLR `#include <sys/mman.h>`25196 `int mlock(const void *addr, size_t len);`25197 `int munlock(const void *addr, size_t len);`

25198

25199 **DESCRIPTION**

25200 The *mlock()* function shall cause those whole pages containing any part of the address space of
 25201 the process starting at address *addr* and continuing for *len* bytes to be memory-resident until
 25202 unlocked or until the process exits or *execs* another process image. The implementation may
 25203 require that *addr* be a multiple of {PAGESIZE}.

25204 The *munlock()* function shall unlock those whole pages containing any part of the address space
 25205 of the process starting at address *addr* and continuing for *len* bytes, regardless of how many
 25206 times *mlock()* has been called by the process for any of the pages in the specified range. The
 25207 implementation may require that *addr* be a multiple of {PAGESIZE}.

25208 If any of the pages in the range specified to a call to *munlock()* are also mapped into the address
 25209 spaces of other processes, any locks established on those pages by another process are
 25210 unaffected by the call of this process to *munlock()*. If any of the pages in the range specified by a
 25211 call to *munlock()* are also mapped into other portions of the address space of the calling process
 25212 outside the range specified, any locks established on those pages via the other mappings are also
 25213 unaffected by this call.

25214 Upon successful return from *mlock()*, pages in the specified range shall be locked and memory-
 25215 resident. Upon successful return from *munlock()*, pages in the specified range shall be unlocked
 25216 with respect to the address space of the process. Memory residency of unlocked pages is
 25217 unspecified.

25218 The appropriate privilege is required to lock process memory with *mlock()*.

25219 **RETURN VALUE**

25220 Upon successful completion, the *mlock()* and *munlock()* functions shall return a value of zero.
 25221 Otherwise, no change is made to any locks in the address space of the process, and the function
 25222 shall return a value of -1 and set *errno* to indicate the error.

25223 **ERRORS**

25224 The *mlock()* and *munlock()* functions shall fail if:

25225 [ENOMEM] Some or all of the address range specified by the *addr* and *len* arguments does
 25226 not correspond to valid mapped pages in the address space of the process.

25227 The *mlock()* function shall fail if:

25228 [EAGAIN] Some or all of the memory identified by the operation could not be locked
 25229 when the call was made.

25230 The *mlock()* and *munlock()* functions may fail if:

25231 [EINVAL] The *addr* argument is not a multiple of {PAGESIZE}.

25232 The *mlock()* function may fail if:

25233 [ENOMEM] Locking the pages mapped by the specified range would exceed an
 25234 implementation-defined limit on the amount of memory that the process may
 25235 lock.

25236 [EPERM] The calling process does not have the appropriate privilege to perform the
25237 requested operation.

25252 The *mlock()* and *munlock()* functions are marked as part of the Range Memory Locking option.

25253 The [ENOSYS] error condition has been removed as stubs need not be provided if an
25254 implementation does not support the Range Memory Locking option.

25255 **NAME**25256 mlockall, munlockall — lock/unlock the address space of a process (**REALTIME**)25257 **SYNOPSIS**25258 ML `#include <sys/mman.h>`25259 `int mlockall(int flags);`25260 `int munlockall(void);`

25261

25262 **DESCRIPTION**

25263 The *mlockall()* function shall cause all of the pages mapped by the address space of a process to
 25264 be memory-resident until unlocked or until the process exits or *execs* another process image. The
 25265 *flags* argument determines whether the pages to be locked are those currently mapped by the
 25266 address space of the process, those that are mapped in the future, or both. The *flags* argument is
 25267 constructed from the bitwise-inclusive OR of one or more of the following symbolic constants,
 25268 defined in **<sys/mman.h>**:

25269 MCL_CURRENT Lock all of the pages currently mapped into the address space of the process.

25270 MCL_FUTURE Lock all of the pages that become mapped into the address space of the
 25271 process in the future, when those mappings are established.

25272 If MCL_FUTURE is specified, and the automatic locking of future mappings eventually causes
 25273 the amount of locked memory to exceed the amount of available physical memory or any other
 25274 implementation-defined limit, the behavior is implementation-defined. The manner in which the
 25275 implementation informs the application of these situations is also implementation-defined.

25276 The *munlockall()* function shall unlock all currently mapped pages of the address space of the
 25277 process. Any pages that become mapped into the address space of the process after a call to
 25278 *munlockall()* shall not be locked, unless there is an intervening call to *mlockall()* specifying
 25279 MCL_FUTURE or a subsequent call to *mlockall()* specifying MCL_CURRENT. If pages mapped
 25280 into the address space of the process are also mapped into the address spaces of other processes
 25281 and are locked by those processes, the locks established by the other processes shall be
 25282 unaffected by a call by this process to *munlockall()*.

25283 Upon successful return from the *mlockall()* function that specifies MCL_CURRENT, all currently
 25284 mapped pages of the process' address space shall be memory-resident and locked. Upon return
 25285 from the *munlockall()* function, all currently mapped pages of the process' address space shall be
 25286 unlocked with respect to the process' address space. The memory residency of unlocked pages is
 25287 unspecified.

25288 The appropriate privilege is required to lock process memory with *mlockall()*.25289 **RETURN VALUE**

25290 Upon successful completion, the *mlockall()* function shall return a value of zero. Otherwise, no
 25291 additional memory shall be locked, and the function shall return a value of -1 and set *errno* to
 25292 indicate the error. The effect of failure of *mlockall()* on previously existing locks in the address
 25293 space is unspecified.

25294 If it is supported by the implementation, the *munlockall()* function shall always return a value of
 25295 zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

25296 **ERRORS**25297 The *mlockall()* function shall fail if:

25298 [EAGAIN] Some or all of the memory identified by the operation could not be locked
 25299 when the call was made.

25300	[EINVAL]	The <i>flags</i> argument is zero, or includes unimplemented flags.
25301		The <i>mlockall()</i> function may fail if:
25302	[ENOMEM]	Locking all of the pages currently mapped into the address space of the
25303		process would exceed an implementation-defined limit on the amount of
25304		memory that the process may lock.
25305	[EPERM]	The calling process does not have the appropriate privilege to perform the
25306		requested operation.

25325 **NAME**

25326 mmap — map pages of memory

25327 **SYNOPSIS**

25328 MC3 #include <sys/mman.h>

```
25329 void *mmap(void *addr, size_t len, int prot, int flags,
25330           int fildes, off_t off);
```

25331

25332 **DESCRIPTION**

25333 The *mmap()* function shall establish a mapping between a process' address space and a file,
 25334 TYM shared memory object, or typed memory object. The format of the call is as follows:

```
25335 pa=mmap(addr, len, prot, flags, fildes, off);
```

25336 The *mmap()* function shall establish a mapping between the address space of the process at an
 25337 address *pa* for *len* bytes to the memory object represented by the file descriptor *fildes* at offset *off*
 25338 for *len* bytes. The value of *pa* is an implementation-defined function of the parameter *addr* and
 25339 the values of *flags*, further described below. A successful *mmap()* call shall return *pa* as its result.
 25340 The address range starting at *pa* and continuing for *len* bytes shall be legitimate for the possible
 25341 (not necessarily current) address space of the process. The range of bytes starting at *off* and
 25342 continuing for *len* bytes shall be legitimate for the possible (not necessarily current) offsets in the
 25343 TYM file, shared memory object, or typed memory object represented by *fildes*.

25344 TYM If *fildes* represents a typed memory object opened with either the
 25345 POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG
 25346 flag, the memory object to be mapped shall be that portion of the typed memory object allocated
 25347 by the implementation as specified below. In this case, if *off* is non-zero, the behavior of *mmap()*
 25348 is undefined. If *fildes* refers to a valid typed memory object that is not accessible from the calling
 25349 process, *mmap()* shall fail.

25350 The mapping established by *mmap()* shall replace any previous mappings for those whole pages
 25351 containing any part of the address space of the process starting at *pa* and continuing for *len*
 25352 bytes.

25353 If the size of the mapped file changes after the call to *mmap()* as a result of some other operation
 25354 on the mapped file, the effect of references to portions of the mapped region that correspond to
 25355 added or removed portions of the file is unspecified.

25356 TYM The *mmap()* function shall be supported for regular files, shared memory objects, and typed
 25357 memory objects. Support for any other type of file is unspecified.

25358 The parameter *prot* determines whether read, write, execute, or some combination of accesses
 25359 are permitted to the data being mapped. The *prot* shall be either PROT_NONE or the bitwise-
 25360 inclusive OR of one or more of the other flags in the following table, defined in the
 25361 <sys/mman.h> header.

25362

25363

25364

25365

25366

25367

Symbolic Constant	Description
PROT_READ	Data can be read.
PROT_WRITE	Data can be written.
PROT_EXEC	Data can be executed.
PROT_NONE	Data cannot be accessed.

25368 If an implementation cannot support the combination of access types specified by *prot*, the call
 25369 to *mmap()* shall fail.

25370 MPR An implementation may permit accesses other than those specified by *prot*; however, if the
 25371 Memory Protection option is supported, the implementation shall not permit a write to succeed
 25372 where PROT_WRITE has not been set or shall not permit any access where PROT_NONE alone
 25373 has been set. The implementation shall support at least the following values of *prot*:
 25374 PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and
 25375 PROT_WRITE. If the Memory Protection option is not supported, the result of any access that
 25376 conflicts with the specified protection is undefined. The file descriptor *fildes* shall have been
 25377 opened with read permission, regardless of the protection options specified. If PROT_WRITE is
 25378 specified, the application shall ensure that it has opened the file descriptor *fildes* with write
 25379 permission unless MAP_PRIVATE is specified in the *flags* parameter as described below.

25380 The parameter *flags* provides other information about the handling of the mapped data. The
 25381 value of *flags* is the bitwise-inclusive OR of these options, defined in `<sys/mman.h>`:

25382

25383

25384

25385

25386

Symbolic Constant	Description
MAP_SHARED	Changes are shared.
MAP_PRIVATE	Changes are private.
MAP_FIXED	Interpret <i>addr</i> exactly.

25387 Implementations that do not support the Memory Mapped Files option are not required to
 25388 support MAP_PRIVATE.

25389 XSI It is implementation-defined whether MAP_FIXED shall be supported. MAP_FIXED shall be
 25390 supported on XSI-conformant systems.

25391 MAP_SHARED and MAP_PRIVATE describe the disposition of write references to the memory
 25392 object. If MAP_SHARED is specified, write references shall change the underlying object. If
 25393 MAP_PRIVATE is specified, modifications to the mapped data by the calling process shall be
 25394 visible only to the calling process and shall not change the underlying object. It is unspecified
 25395 whether modifications to the underlying object done after the MAP_PRIVATE mapping is
 25396 established are visible through the MAP_PRIVATE mapping. Either MAP_SHARED or
 25397 MAP_PRIVATE can be specified, but not both. The mapping type is retained across *fork()*.

25398 TYM When *fildes* represents a typed memory object opened with either the
 25399 POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG
 25400 flag, *mmap()* shall, if there are enough resources available, map *len* bytes allocated from the
 25401 corresponding typed memory object which were not previously allocated to any process in any
 25402 processor that may access that typed memory object. If there are not enough resources available,
 25403 the function shall fail. If *fildes* represents a typed memory object opened with the
 25404 POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, these allocated bytes shall be contiguous
 25405 within the typed memory object. If *fildes* represents a typed memory object opened with the
 25406 POSIX_TYPED_MEM_ALLOCATE flag, these allocated bytes may be composed of non-
 25407 contiguous fragments within the typed memory object. If *fildes* represents a typed memory
 25408 object opened with neither the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag nor the
 25409 POSIX_TYPED_MEM_ALLOCATE flag, *len* bytes starting at offset *off* within the typed memory
 25410 object are mapped, exactly as when mapping a file or shared memory object. In this case, if two
 25411 processes map an area of typed memory using the same *off* and *len* values and using file
 25412 descriptors that refer to the same memory pool (either from the same port or from a different
 25413 port), both processes shall map the same region of storage.

25414 When MAP_FIXED is set in the *flags* argument, the implementation is informed that the value of
 25415 *pa* shall be *addr*, exactly. If MAP_FIXED is set, *mmap()* may return MAP_FAILED and set *errno* to
 25416 [EINVAL]. If a MAP_FIXED request is successful, the mapping established by *mmap()* replaces
 25417 any previous mappings for the process' pages in the range [*pa*,*pa+len*).

When MAP_FIXED is not set, the implementation uses *addr* in an implementation-defined manner to arrive at *pa*. The *pa* so chosen shall be an area of the address space that the implementation deems suitable for a mapping of *len* bytes to the file. All implementations interpret an *addr* value of 0 as granting the implementation complete freedom in selecting *pa*, subject to constraints described below. A non-zero value of *addr* is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for *pa*, it never places a mapping at address 0, nor does it replace any extant mapping.

The *off* argument is constrained to be aligned and sized according to the value returned by *sysconf()* when passed *_SC_PAGESIZE* or *_SC_PAGE_SIZE*. When MAP_FIXED is specified, the application shall ensure that the argument *addr* also meets these constraints. The implementation performs mapping operations over whole pages. Thus, while the argument *len* need not meet a size or alignment constraint, the implementation shall include, in any mapping operation, any partial page specified by the range [*pa*,*pa+len*).

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at *pa* and continuing for *len* bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal.

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The *mmap()* function shall add an extra reference to the file associated with the file descriptor *fd* which is not removed by a subsequent *close()* on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The *st_atime* field of the mapped file may be marked for update at any time between the *mmap()* call and the corresponding *munmap()* call. The initial read or write reference to a mapped region shall cause the file's *st_atime* field to be marked for update if it has not already been marked for update.

The *st_ctime* and *st_mtime* fields of a file that is mapped with MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to *msync()* with MS_ASYNC or MS_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these fields shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of *shmat()* is implementation-defined.

If *mmap()* fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the mappings in the address range starting at *addr* and continuing for *len* bytes may have been unmapped.

25457 RETURN VALUE

Upon successful completion, the *mmap()* function shall return the address at which the mapping was placed (*pa*); otherwise, it shall return a value of MAP_FAILED and set *errno* to indicate the error. The symbol MAP_FAILED is defined in the <sys/mman.h> header. No successful return from *mmap()* shall return the value MAP_FAILED.

25462 **ERRORS**25463 The *mmap()* function shall fail if:

25464 [EACCES] The *fil*des argument is not open for read, regardless of the protection specified,
 25465 or *fil*des is not open for write and PROT_WRITE was specified for a
 25466 MAP_SHARED type mapping.

25467 ML [EAGAIN] The mapping could not be locked in memory, if required by *mlockall()*, due to
 25468 a lack of resources.

25469 [EBADF] The *fil*des argument is not a valid open file descriptor.

25470 [EINVAL] The *addr* argument (if MAP_FIXED was specified) or *off* is not a multiple of
 25471 the page size as returned by *sysconf()*, or is considered invalid by the
 25472 implementation.

25473 [EINVAL] The value of *flags* is invalid (neither MAP_PRIVATE nor MAP_SHARED is
 25474 set).

25475 [EMFILE] The number of mapped regions would exceed an implementation-defined
 25476 limit (per process or per system).

25477 [ENODEV] The *fil*des argument refers to a file whose type is not supported by *mmap()*.

25478 [ENOMEM] MAP_FIXED was specified, and the range [*addr*,*addr+len*) exceeds that allowed
 25479 for the address space of a process; or, if MAP_FIXED was not specified and
 25480 there is insufficient room in the address space to effect the mapping.

25481 ML [ENOMEM] The mapping could not be locked in memory, if required by *mlockall()*,
 25482 because it would require more space than the system is able to supply.

25483 TYM [ENOMEM] Not enough unallocated memory resources remain in the typed memory
 25484 object designated by *fil*des to allocate *len* bytes.

25485 [ENOTSUP] MAP_FIXED or MAP_PRIVATE was specified in the *flags* argument and the
 25486 implementation does not support this functionality.

25487 The implementation does not support the combination of accesses requested
 25488 in the *prot* argument.

25489 [ENXIO] Addresses in the range [*off*,*off+len*) are invalid for the object specified by *fil*des.

25490 [ENXIO] MAP_FIXED was specified in *flags* and the combination of *addr*, *len*, and *off* is
 25491 invalid for the object specified by *fil*des.

25492 TYM [ENXIO] The *fil*des argument refers to a typed memory object that is not accessible from
 25493 the calling process.

25494 [EOVERFLOW] The file is a regular file and the value of *off* plus *len* exceeds the offset
 25495 maximum established in the open file description associated with *fil*des.

25496 **EXAMPLES**

25497 None.

25498 **APPLICATION USAGE**

25499 Use of *mmap()* may reduce the amount of memory available to other memory allocation
 25500 functions.

25501 Use of MAP_FIXED may result in unspecified behavior in further use of *malloc()* and *shmat()*.
 25502 The use of MAP_FIXED is discouraged, as it may prevent an implementation from making the
 25503 most effective use of resources.

25504 The application must ensure correct synchronization when using *mmap()* in conjunction with
 25505 any other file access method, such as *read()* and *write()*, standard input/output, and *shmat()*.

25506 The *mmap()* function allows access to resources via address space manipulations, instead of
 25507 *read()/write()*. Once a file is mapped, all a process has to do to access it is use the data at the
 25508 address to which the file was mapped. So, using pseudo-code to illustrate the way in which an
 25509 existing program might be changed to use *mmap()*, the following:

```
25510 fildes = open(...)
25511 lseek(fildes, some_offset)
25512 read(fildes, buf, len)
25513 /* Use data in buf. */
```

25514 becomes:

```
25515 fildes = open(...)
25516 address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
25517 /* Use data at address. */
```

25518 RATIONALE

25519 After considering several other alternatives, it was decided to adopt the *mmap()* definition found
 25520 in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is
 25521 minimal, in that it describes only what has been built, and what appears to be necessary for a
 25522 general and portable mapping facility.

25523 Note that while *mmap()* was first designed for mapping files, it is actually a general-purpose
 25524 mapping facility. It can be used to map any appropriate object, such as memory, files, devices,
 25525 and so on, into the address space of a process.

25526 When a mapping is established, it is possible that the implementation may need to map more
 25527 than is requested into the address space of the process because of hardware requirements. An
 25528 application, however, cannot count on this behavior. Implementations that do not use a paged
 25529 architecture may simply allocate a common memory region and return the address of it; such
 25530 implementations probably do not allocate any more than is necessary. References past the end of
 25531 the requested area are unspecified.

25532 If an application requests a mapping that would overlay existing mappings in the process, it
 25533 might be desirable that an implementation detect this and inform the application. However, the
 25534 default, portable (not *MAP_FIXED*) operation does not overlay existing mappings. On the other
 25535 hand, if the program specifies a fixed address mapping (which requires some implementation
 25536 knowledge to determine a suitable address, if the function is supported at all), then the program
 25537 is presumed to be successfully managing its own address space and should be trusted when it
 25538 asks to map over existing data structures. Furthermore, it is also desirable to make as few system
 25539 calls as possible, and it might be considered onerous to require an *munmap()* before an *mmap()*
 25540 to the same address range. This volume of IEEE Std 1003.1-2001 specifies that the new mappings
 25541 replace any existing mappings, following existing practice in this regard.

25542 It is not expected, when the Memory Protection option is supported, that all hardware
 25543 implementations are able to support all combinations of permissions at all addresses. When this
 25544 option is supported, implementations are required to disallow write access to mappings without
 25545 write permission and to disallow access to mappings without any access permission. Other than
 25546 these restrictions, implementations may allow access types other than those requested by the
 25547 application. For example, if the application requests only *PROT_WRITE*, the implementation
 25548 may also allow read access. A call to *mmap()* fails if the implementation cannot support allowing
 25549 all the access requested by the application. For example, some implementations cannot support
 25550 a request for both write access and execute access simultaneously. All implementations
 25551 supporting the Memory Protection option must support requests for no access, read access,

25552 write access, and both read and write access. Strictly conforming code must only rely on the
25553 required checks. These restrictions allow for portability across a wide range of hardware.

25554 The MAP_FIXED address treatment is likely to fail for non-page-aligned values and for certain
25555 architecture-dependent address ranges. Conforming implementations cannot count on being
25556 able to choose address values for MAP_FIXED without utilizing non-portable, implementation-
25557 defined knowledge. Nonetheless, MAP_FIXED is provided as a standard interface conforming to
25558 existing practice for utilizing such knowledge when it is available.

25559 Similarly, in order to allow implementations that do not support virtual addresses, support for
25560 directly specifying any mapping addresses via MAP_FIXED is not required and thus a
25561 conforming application may not count on it.

25562 The MAP_PRIVATE function can be implemented efficiently when memory protection hardware
25563 is available. When such hardware is not available, implementations can implement such
25564 “mappings” by simply making a real copy of the relevant data into process private memory,
25565 though this tends to behave similarly to *read()*.

25566 The function has been defined to allow for many different models of using shared memory.
25567 However, all uses are not equally portable across all machine architectures. In particular, the
25568 *mmap()* function allows the system as well as the application to specify the address at which to
25569 map a specific region of a memory object. The most portable way to use the function is always to
25570 let the system choose the address, specifying NULL as the value for the argument *addr* and not
25571 to specify MAP_FIXED.

25572 If it is intended that a particular region of a memory object be mapped at the same address in a
25573 group of processes (on machines where this is even possible), then MAP_FIXED can be used to
25574 pass in the desired mapping address. The system can still be used to choose the desired address
25575 if the first such mapping is made without specifying MAP_FIXED, and then the resulting
25576 mapping address can be passed to subsequent processes for them to pass in via MAP_FIXED.
25577 The availability of a specific address range cannot be guaranteed, in general.

25578 The *mmap()* function can be used to map a region of memory that is larger than the current size
25579 of the object. Memory access within the mapping but beyond the current end of the underlying
25580 objects may result in SIGBUS signals being sent to the process. The reason for this is that the size
25581 of the object can be manipulated by other processes and can change at any moment. The
25582 implementation should tell the application that a memory reference is outside the object where
25583 this can be detected; otherwise, written data may be lost and read data may not reflect actual
25584 data in the object.

25585 Note that references beyond the end of the object do not extend the object as the new end cannot
25586 be determined precisely by most virtual memory hardware. Instead, the size can be directly
25587 manipulated by *ftruncate()*.

25588 Process memory locking does apply to shared memory regions, and the MEMLOCK_FUTURE
25589 argument to *mlockall()* can be relied upon to cause new shared memory regions to be
25590 automatically locked.

25591 Existing implementations of *mmap()* return the value -1 when unsuccessful. Since the casting of
25592 this value to type **void *** cannot be guaranteed by the ISO C standard to be distinct from a
25593 successful value, this volume of IEEE Std 1003.1-2001 defines the symbol MAP_FAILED, which a
25594 conforming implementation does not return as the result of a successful call.

25595 **FUTURE DIRECTIONS**

25596 None.

25597 **SEE ALSO**

25598 *exec*, *fcntl()*, *fork()*, *lockf()*, *msync()*, *munmap()*, *mprotect()*, *posix_typed_mem_open()*, *shmat()*,
 25599 *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

25600 **CHANGE HISTORY**

25601 First released in Issue 4, Version 2.

25602 **Issue 5**

25603 Moved from X/OPEN UNIX extension to BASE.

25604 Aligned with *mmap()* in the POSIX Realtime Extension as follows:

- 25605 • The DESCRIPTION is extensively reworded.
- 25606 • The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- 25607 • New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- 25608 • The value returned on failure is the value of the constant MAP_FAILED; this was previously
- 25609 defined as -1.

25610 Large File Summit extensions are added.

25611 **Issue 6**

25612 The *mmap()* function is marked as part of the Memory Mapped Files option.

25613 The Open Group Corrigendum U028/6 is applied, changing (void *)-1 to MAP_FAILED.

25614 The following new requirements on POSIX implementations derive from alignment with the
 25615 Single UNIX Specification:

- 25616 • The DESCRIPTION is updated to describe the use of MAP_FIXED.
- 25617 • The DESCRIPTION is updated to describe the addition of an extra reference to the file
- 25618 associated with the file descriptor passed to *mmap()*.
- 25619 • The DESCRIPTION is updated to state that there may be implementation-defined limits on
- 25620 the number of memory regions that can be mapped.
- 25621 • The DESCRIPTION is updated to describe constraints on the alignment and size of the *off*
- 25622 argument.
- 25623 • The [EINVAL] and [EMFILE] error conditions are added.
- 25624 • The [EOVERFLOW] error condition is added. This change is to support large files.

25625 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 25626 • The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and MAP_FIXED
- 25627 need not be supported.

25628 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 25629 • Semantics for typed memory objects are added to the DESCRIPTION.
- 25630 • New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- 25631 • The *posix_typed_mem_open()* function is added to the SEE ALSO section.

25632 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25633 IEEE Std 1003.1-2001 / Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code |
 25634 in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM). |

25635 **NAME**

25636 modf, modff, modfl — decompose a floating-point number

25637 **SYNOPSIS**

25638 #include <math.h>

25639 double modf(double *x*, double **iptr*);25640 float modff(float *value*, float **iptr*);25641 long double modfl(long double *value*, long double **iptr*);25642 **DESCRIPTION**

25643 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 25644 conflict between the requirements described here and the ISO C standard is unintentional. This
 25645 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

25646 These functions shall break the argument *x* into integral and fractional parts, each of which has
 25647 the same sign as the argument. It stores the integral part as a **double** (for the *modf*() function), a
 25648 **float** (for the *modff*() function), or a **long double** (for the *modfl*() function), in the object pointed
 25649 to by *iptr*.

25650 **RETURN VALUE**25651 Upon successful completion, these functions shall return the signed fractional part of *x*.25652 MX If *x* is NaN, a NaN shall be returned, and **iptr* shall be set to a NaN.25653 If *x* is $\pm\text{Inf}$, ± 0 shall be returned, and **iptr* shall be set to $\pm\text{Inf}$.25654 **ERRORS**

25655 No errors are defined.

25656 **EXAMPLES**

25657 None.

25658 **APPLICATION USAGE**25659 The *modf*() function computes the function result and **iptr* such that:25660 *a* = modf(*x*, *iptr*) ;25661 *x* == *a*+**iptr* ;

25662 allowing for the usual floating-point inaccuracies.

25663 **RATIONALE**

25664 None.

25665 **FUTURE DIRECTIONS**

25666 None.

25667 **SEE ALSO**25668 *frexp*(), *isnan*(), *ldexp*(), the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>25669 **CHANGE HISTORY**

25670 First released in Issue 1. Derived from Issue 1 of the SVID.

25671 **Issue 5**

25672 The DESCRIPTION is updated to indicate how an application should check for an error. This
 25673 text was previously published in the APPLICATION USAGE section.

25674 **Issue 6**

25675 The *modff*() and *modfl*() functions are added for alignment with the ISO/IEC 9899:1999
 25676 standard.

25677	The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
25678	revised to align with the ISO/IEC 9899:1999 standard.
25679	IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
25680	marked.
25681	IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example
25682	in the APPLICATION USAGE section.

25683 **NAME**

25684 mprotect — set protection of memory mapping

25685 **SYNOPSIS**

25686 MPR #include <sys/mman.h>

25687 int mprotect(void *addr, size_t len, int prot);

25688

25689 **DESCRIPTION**

25690 The *mprotect()* function shall change the access protections to be that specified by *prot* for those
 25691 whole pages containing any part of the address space of the process starting at address *addr* and
 25692 continuing for *len* bytes. The parameter *prot* determines whether read, write, execute, or some
 25693 combination of accesses are permitted to the data being mapped. The *prot* argument should be
 25694 either PROT_NONE or the bitwise-inclusive OR of one or more of PROT_READ, PROT_WRITE,
 25695 and PROT_EXEC.

25696 If an implementation cannot support the combination of access types specified by *prot*, the call
 25697 to *mprotect()* shall fail.

25698 An implementation may permit accesses other than those specified by *prot*; however, no
 25699 implementation shall permit a write to succeed where PROT_WRITE has not been set or shall
 25700 permit any access where PROT_NONE alone has been set. Implementations shall support at
 25701 least the following values of *prot*: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-
 25702 inclusive OR of PROT_READ and PROT_WRITE. If PROT_WRITE is specified, the application
 25703 shall ensure that it has opened the mapped objects in the specified address range with write
 25704 permission, unless MAP_PRIVATE was specified in the original mapping, regardless of whether
 25705 the file descriptors used to map the objects have since been closed.

25706 The implementation shall require that *addr* be a multiple of the page size as returned by
 25707 sysconf().

25708 The behavior of this function is unspecified if the mapping was not established by a call to
 25709 mmap().

25710 When *mprotect()* fails for reasons other than [EINVAL], the protections on some of the pages in
 25711 the range [*addr*,*addr*+*len*) may have been changed.

25712 **RETURN VALUE**

25713 Upon successful completion, *mprotect()* shall return 0; otherwise, it shall return -1 and set *errno*
 25714 to indicate the error.

25715 **ERRORS**25716 The *mprotect()* function shall fail if:

25717 [EACCES] The *prot* argument specifies a protection that violates the access permission
 25718 the process has to the underlying memory object.

25719 [EAGAIN] The *prot* argument specifies PROT_WRITE over a MAP_PRIVATE mapping
 25720 and there are insufficient memory resources to reserve for locking the private
 25721 page.

25722 [EINVAL] The *addr* argument is not a multiple of the page size as returned by sysconf().

25723 [ENOMEM] Addresses in the range [*addr*,*addr*+*len*) are invalid for the address space of a
 25724 process, or specify one or more pages which are not mapped.

25725 [ENOMEM] The *prot* argument specifies PROT_WRITE on a MAP_PRIVATE mapping, and
 25726 it would require more space than the system is able to supply for locking the
 25727 private pages, if required.

25728 [ENOTSUP] The implementation does not support the combination of accesses requested
 25729 in the *prot* argument.

25730 **EXAMPLES**

25731 None.

25732 **APPLICATION USAGE**

25733 The [EINVAL] error above is marked EX because it is defined as an optional error in the POSIX
 25734 Realtime Extension.

25735 **RATIONALE**

25736 None.

25737 **FUTURE DIRECTIONS**

25738 None.

25739 **SEE ALSO**

25740 *mmap()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

25741 **CHANGE HISTORY**

25742 First released in Issue 4, Version 2.

25743 **Issue 5**

25744 Moved from X/OPEN UNIX extension to BASE.

25745 Aligned with *mprotect()* in the POSIX Realtime Extension as follows:

- 25746 • The DESCRIPTION is largely reworded.
- 25747 • [ENOTSUP] and a second form of [ENOMEM] are added as mandatory error conditions.
- 25748 • [EAGAIN] is moved from the optional to the mandatory error conditions.

25749 **Issue 6**

25750 The *mprotect()* function is marked as part of the Memory Protection option.

25751 The following new requirements on POSIX implementations derive from alignment with the
 25752 Single UNIX Specification:

- 25753 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of
 25754 the page size as returned by *sysconf()*.
- 25755 • The [EINVAL] error condition is added.

25756 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

25757 **NAME**25758 mq_close — close a message queue (**REALTIME**)25759 **SYNOPSIS**

25760 MSG #include <mqueue.h>

25761 int mq_close(mqd_t mqdes);

25762

25763 **DESCRIPTION**

25764 The *mq_close()* function shall remove the association between the message queue descriptor,
 25765 *mqdes*, and its message queue. The results of using this message queue descriptor after
 25766 successful return from this *mq_close()*, and until the return of this message queue descriptor
 25767 from a subsequent *mq_open()*, are undefined.

25768 If the process has successfully attached a notification request to the message queue via this
 25769 *mqdes*, this attachment shall be removed, and the message queue is available for another process
 25770 to attach for notification.

25771 **RETURN VALUE**

25772 Upon successful completion, the *mq_close()* function shall return a value of zero; otherwise, the
 25773 function shall return a value of -1 and set *errno* to indicate the error.

25774 **ERRORS**25775 The *mq_close()* function shall fail if:

25776 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

25777 **EXAMPLES**

25778 None.

25779 **APPLICATION USAGE**

25780 None.

25781 **RATIONALE**

25782 None.

25783 **FUTURE DIRECTIONS**

25784 None.

25785 **SEE ALSO**

25786 *mq_open()*, *mq_unlink()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the Base Definitions volume of
 25787 IEEE Std 1003.1-2001, <**mqueue.h**>

25788 **CHANGE HISTORY**

25789 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25790 **Issue 6**25791 The *mq_close()* function is marked as part of the Message Passing option.

25792 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 25793 implementation does not support the Message Passing option.

25794 **NAME**25795 mq_getattr — get message queue attributes (**REALTIME**)25796 **SYNOPSIS**

25797 MSG #include <mqueue.h>

25798 int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);

25799

25800 **DESCRIPTION**25801 The *mq_getattr()* function shall obtain status information and attributes of the message queue
25802 and the open message queue description associated with the message queue descriptor.25803 The *mqdes* argument specifies a message queue descriptor.25804 The results shall be returned in the **mq_attr** structure referenced by the *mqstat* argument.25805 Upon return, the following members shall have the values associated with the open message
25806 queue description as set when the message queue was opened and as modified by subsequent
25807 *mq_setattr()* calls: *mq_flags*.25808 The following attributes of the message queue shall be returned as set at message queue
25809 creation: *mq_maxmsg*, *mq_msgsize*.25810 Upon return, the following members within the **mq_attr** structure referenced by the *mqstat*
25811 argument shall be set to the current state of the message queue:25812 *mq_curmsgs* The number of messages currently on the queue.25813 **RETURN VALUE**25814 Upon successful completion, the *mq_getattr()* function shall return zero. Otherwise, the function
25815 shall return -1 and set *errno* to indicate the error.25816 **ERRORS**25817 The *mq_getattr()* function shall fail if:25818 [EBADF] The *mqdes* argument is not a valid message queue descriptor.25819 **EXAMPLES**

25820 None.

25821 **APPLICATION USAGE**

25822 None.

25823 **RATIONALE**

25824 None.

25825 **FUTURE DIRECTIONS**

25826 None.

25827 **SEE ALSO**25828 *mq_open()*, *mq_send()*, *mq_setattr()*, *mq_timedsend()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the
25829 Base Definitions volume of IEEE Std 1003.1-2001, <mqueue.h>25830 **CHANGE HISTORY**

25831 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25832 **Issue 6**25833 The *mq_getattr()* function is marked as part of the Message Passing option.25834 The [ENOSYS] error condition has been removed as stubs need not be provided if an
25835 implementation does not support the Message Passing option.

25836 The *mq_timedsend()* function is added to the SEE ALSO section for alignment with
25837 IEEE Std 1003.1d-1999.

25838 **NAME**25839 mq_notify — notify process that a message is available (**REALTIME**)25840 **SYNOPSIS**

25841 MSG #include <mqueue.h>

25842 int mq_notify(mqd_t mqdes, const struct sigevent *notification);

25843

25844 **DESCRIPTION**

25845 If the argument *notification* is not NULL, this function shall register the calling process to be
 25846 notified of message arrival at an empty message queue associated with the specified message
 25847 queue descriptor, *mqdes*. The notification specified by the *notification* argument shall be sent to
 25848 the process when the message queue transitions from empty to non-empty. At any time, only
 25849 one process may be registered for notification by a message queue. If the calling process or any
 25850 other process has already registered for notification of message arrival at the specified message
 25851 queue, subsequent attempts to register for that message queue shall fail.

25852 If *notification* is NULL and the process is currently registered for notification by the specified
 25853 message queue, the existing registration shall be removed.

25854 When the notification is sent to the registered process, its registration shall be removed. The
 25855 message queue shall then be available for registration.

25856 If a process has registered for notification of message arrival at a message queue and some
 25857 thread is blocked in *mq_receive()* waiting to receive a message when a message arrives at the
 25858 queue, the arriving message shall satisfy the appropriate *mq_receive()*. The resulting behavior is
 25859 as if the message queue remains empty, and no notification shall be sent.

25860 **RETURN VALUE**

25861 Upon successful completion, the *mq_notify()* function shall return a value of zero; otherwise, the
 25862 function shall return a value of -1 and set *errno* to indicate the error.

25863 **ERRORS**25864 The *mq_notify()* function shall fail if:25865 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

25866 [EBUSY] A process is already registered for notification by the message queue.

25867 **EXAMPLES**

25868 None.

25869 **APPLICATION USAGE**

25870 None.

25871 **RATIONALE**

25872 None.

25873 **FUTURE DIRECTIONS**

25874 None.

25875 **SEE ALSO**

25876 *mq_open()*, *mq_send()*, *mq_timedsend()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the Base
 25877 Definitions volume of IEEE Std 1003.1-2001, <mqueue.h>

25878 **CHANGE HISTORY**

25879 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25880 **Issue 6**

25881 The *mq_notify()* function is marked as part of the Message Passing option.

25882 The [ENOSYS] error condition has been removed as stubs need not be provided if an
25883 implementation does not support the Message Passing option.

25884 The *mq_timedsend()* function is added to the SEE ALSO section for alignment with
25885 IEEE Std 1003.1d-1999.

25886 **NAME**25887 mq_open — open a message queue (**REALTIME**)25888 **SYNOPSIS**

25889 MSG #include <mqueue.h>

25890 mqd_t mq_open(const char *name, int oflag, ...);

25891

25892 **DESCRIPTION**

25893 The *mq_open()* function shall establish the connection between a process and a message queue
 25894 with a message queue descriptor. It shall create an open message queue description that refers to
 25895 the message queue, and a message queue descriptor that refers to that open message queue
 25896 description. The message queue descriptor is used by other functions to refer to that message
 25897 queue. The *name* argument points to a string naming a message queue. It is unspecified whether
 25898 the name appears in the file system and is visible to other functions that take pathnames as
 25899 arguments. The *name* argument shall conform to the construction rules for a pathname. If *name*
 25900 begins with the slash character, then processes calling *mq_open()* with the same value of *name*
 25901 shall refer to the same message queue object, as long as that name has not been removed. If *name*
 25902 does not begin with the slash character, the effect is implementation-defined. The interpretation
 25903 of slash characters other than the leading slash character in *name* is implementation-defined. If
 25904 the *name* argument is not the name of an existing message queue and creation is not requested,
 25905 *mq_open()* shall fail and return an error.

25906 A message queue descriptor may be implemented using a file descriptor, in which case
 25907 applications can open up to at least {OPEN_MAX} file and message queues.

25908 The *oflag* argument requests the desired receive and/or send access to the message queue. The
 25909 requested access permission to receive messages or send messages shall be granted if the calling
 25910 process would be granted read or write access, respectively, to an equivalently protected file.

25911 The value of *oflag* is the bitwise-inclusive OR of values from the following list. Applications
 25912 shall specify exactly one of the first three values (access modes) below in the value of *oflag*:

25913 O_RDONLY Open the message queue for receiving messages. The process can use the
 25914 returned message queue descriptor with *mq_receive()*, but not *mq_send()*. A
 25915 message queue may be open multiple times in the same or different processes
 25916 for receiving messages.

25917 O_WRONLY Open the queue for sending messages. The process can use the returned
 25918 message queue descriptor with *mq_send()* but not *mq_receive()*. A message
 25919 queue may be open multiple times in the same or different processes for
 25920 sending messages.

25921 O_RDWR Open the queue for both receiving and sending messages. The process can use
 25922 any of the functions allowed for O_RDONLY and O_WRONLY. A message
 25923 queue may be open multiple times in the same or different processes for
 25924 sending messages.

25925 Any combination of the remaining flags may be specified in the value of *oflag*:

25926 O_CREAT Create a message queue. It requires two additional arguments: *mode*, which
 25927 shall be of type **mode_t**, and *attr*, which shall be a pointer to an **mq_attr**
 25928 structure. If the pathname *name* has already been used to create a message
 25929 queue that still exists, then this flag shall have no effect, except as noted under
 25930 O_EXCL. Otherwise, a message queue shall be created without any messages
 25931 in it. The user ID of the message queue shall be set to the effective user ID of
 25932 the process, and the group ID of the message queue shall be set to the effective

25933		group ID of the process. The file permission bits shall be set to the value of
25934		<i>mode</i> . When bits in <i>mode</i> other than file permission bits are set, the effect is
25935		implementation-defined. If <i>attr</i> is NULL, the message queue shall be created
25936		with implementation-defined default message queue attributes. If <i>attr</i> is non-
25937		NULL and the calling process has the appropriate privilege on <i>name</i> , the
25938		message queue <i>mq_maxmsg</i> and <i>mq_msgsize</i> attributes shall be set to the values
25939		of the corresponding members in the mq_attr structure referred to by <i>attr</i> . If
25940		<i>attr</i> is non-NULL, but the calling process does not have the appropriate
25941		privilege on <i>name</i> , the <i>mq_open()</i> function shall fail and return an error
25942		without creating the message queue.
25943	O_EXCL	If O_EXCL and O_CREAT are set, <i>mq_open()</i> shall fail if the message queue
25944		<i>name</i> exists. The check for the existence of the message queue and the creation
25945		of the message queue if it does not exist shall be atomic with respect to other
25946		threads executing <i>mq_open()</i> naming the same <i>name</i> with O_EXCL and
25947		O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is
25948		undefined.
25949	O_NONBLOCK	Determines whether an <i>mq_send()</i> or <i>mq_receive()</i> waits for resources or
25950		messages that are not currently available, or fails with <i>errno</i> set to [EAGAIN];
25951		see <i>mq_send()</i> and <i>mq_receive()</i> for details.
25952	The <i>mq_open()</i> function does not add or remove messages from the queue.	
25953	RETURN VALUE	
25954	Upon successful completion, the function shall return a message queue descriptor; otherwise,	
25955	the function shall return (mqd_t)−1 and set <i>errno</i> to indicate the error.	
25956	ERRORS	
25957	The <i>mq_open()</i> function shall fail if:	
25958	[EACCES]	The message queue exists and the permissions specified by <i>oflag</i> are denied, or
25959		the message queue does not exist and permission to create the message queue
25960		is denied.
25961	[EEXIST]	O_CREAT and O_EXCL are set and the named message queue already exists.
25962	[EINTR]	The <i>mq_open()</i> function was interrupted by a signal.
25963	[EINVAL]	The <i>mq_open()</i> function is not supported for the given name.
25964	[EINVAL]	O_CREAT was specified in <i>oflag</i> , the value of <i>attr</i> is not NULL, and either
25965		<i>mq_maxmsg</i> or <i>mq_msgsize</i> was less than or equal to zero.
25966	[EMFILE]	Too many message queue descriptors or file descriptors are currently in use by
25967		this process.
25968	[ENAMETOOLONG]	
25969		The length of the <i>name</i> argument exceeds {PATH_MAX} or a pathname
25970		component is longer than {NAME_MAX}.
25971	[ENFILE]	Too many message queues are currently open in the system.
25972	[ENOENT]	O_CREAT is not set and the named message queue does not exist.
25973	[ENOSPC]	There is insufficient space for the creation of the new message queue.

25986 CHANGE HISTORY

25987 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

25988 Issue 6

25989 The *mq_open()* function is marked as part of the Message Passing option.

25990 The [ENOSYS] error condition has been removed as stubs need not be provided if an
25991 implementation does not support the Message Passing option.

25992 The *mq_timedreceive()* and *mq_timedsend()* functions are added to the SEE ALSO section for
25993 alignment with IEEE Std 1003.1d-1999.

25994 The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

25995 **NAME**25996 mq_receive, mq_timedreceive — receive a message from a message queue (**REALTIME**)25997 **SYNOPSIS**

25998 MSG #include <mqueue.h>

25999 ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len,
26000 unsigned *msg_prio);

26001

26002 MSG TMO #include <mqueue.h>

26003 #include <time.h>

26004 ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,
26005 size_t msg_len, unsigned *restrict msg_prio,
26006 const struct timespec *restrict abs_timeout);

26007

26008 **DESCRIPTION**26009 The *mq_receive()* function shall receive the oldest of the highest priority message(s) from the
26010 message queue specified by *mqdes*. If the size of the buffer in bytes, specified by the *msg_len*
26011 argument, is less than the *mq_msgsize* attribute of the message queue, the function shall fail and
26012 return an error. Otherwise, the selected message shall be removed from the queue and copied to
26013 the buffer pointed to by the *msg_ptr* argument.26014 If the value of *msg_len* is greater than {SSIZE_MAX}, the result is implementation-defined.26015 If the argument *msg_prio* is not NULL, the priority of the selected message shall be stored in the
26016 location referenced by *msg_prio*.26017 If the specified message queue is empty and O_NONBLOCK is not set in the message queue
26018 description associated with *mqdes*, *mq_receive()* shall block until a message is enqueued on the
26019 message queue or until *mq_receive()* is interrupted by a signal. If more than one thread is waiting
26020 to receive a message when a message arrives at an empty queue and the Priority Scheduling
26021 option is supported, then the thread of highest priority that has been waiting the longest shall be
26022 selected to receive the message. Otherwise, it is unspecified which waiting thread receives the
26023 message. If the specified message queue is empty and O_NONBLOCK is set in the message
26024 queue description associated with *mqdes*, no message shall be removed from the queue, and
26025 *mq_receive()* shall return an error.26026 TMO The *mq_timedreceive()* function shall receive the oldest of the highest priority messages from the
26027 message queue specified by *mqdes* as described for the *mq_receive()* function. However, if
26028 O_NONBLOCK was not specified when the message queue was opened via the *mq_open()*
26029 function, and no message exists on the queue to satisfy the receive, the wait for such a message
26030 shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is
26031 equivalent to *mq_receive()*.26032 The timeout expires when the absolute time specified by *abs_timeout* passes, as measured by the
26033 clock on which timeouts are based (that is, when the value of that clock equals or exceeds
26034 *abs_timeout*), or if the absolute time specified by *abs_timeout* has already been passed at the time
26035 of the call.26036 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
26037 the Timers option is not supported, the timeout shall be based on the system clock as returned
26038 by the *time()* function.26039 TMO The resolution of the timeout shall be the resolution of the clock on which it is based. The
26040 *timespec* argument is defined in the <time.h> header.

26041 Under no circumstance shall the operation fail with a timeout if a message can be removed from
 26042 the message queue immediately. The validity of the *abs_timeout* parameter need not be checked
 26043 if a message can be removed from the message queue immediately.

26044 RETURN VALUE

26045 TMO Upon successful completion, the *mq_receive()* and *mq_timedreceive()* functions shall return the
 26046 length of the selected message in bytes and the message shall be removed from the queue.
 26047 Otherwise, no message shall be removed from the queue, the functions shall return a value of -1,
 26048 and set *errno* to indicate the error.

26049 ERRORS

26050 TMO The *mq_receive()* and *mq_timedreceive()* functions shall fail if:

26051 [EAGAIN] O_NONBLOCK was set in the message description associated with *mqdes*,
 26052 and the specified message queue is empty.

26053 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for reading.

26054 [EMSGSIZE] The specified message buffer size, *msg_len*, is less than the message size
 26055 attribute of the message queue.

26056 TMO [EINTR] The *mq_receive()* or *mq_timedreceive()* operation was interrupted by a signal.

26057 TMO [EINVAL] The process or thread would have blocked, and the *abs_timeout* parameter
 26058 specified a nanoseconds field value less than zero or greater than or equal to
 26059 1 000 million.

26060 TMO [ETIMEDOUT] The O_NONBLOCK flag was not set when the message queue was opened,
 26061 but no message arrived on the queue before the specified timeout expired.

26062 TMO The *mq_receive()* and *mq_timedreceive()* functions may fail if:

26063 [EBADMSG] The implementation has detected a data corruption problem with the
 26064 message.

26076 CHANGE HISTORY

26077 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26078 Issue 6

26079 The *mq_receive()* function is marked as part of the Message Passing option.

26080 The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to
 26081 *msg_len* rather than *maxsize*.

26082 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 26083 implementation does not support the Message Passing option.

- 26084 The following new requirements on POSIX implementations derive from alignment with the
26085 Single UNIX Specification:
- 26086 • In this function it is possible for the return value to exceed the range of the type **ssize_t** (since
26087 **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of
26088 the **size_t** object is added to the description to resolve this conflict.
- 26089 The *mq_timedreceive()* function is added for alignment with IEEE Std 1003.1d-1999.
- 26090 The **restrict** keyword is added to the *mq_timedreceive()* prototype for alignment with the
26091 ISO/IEC 9899:1999 standard.
- 26092 IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for *mq_timedreceive()*
26093 from **int** to **ssize_t**.

26094 **NAME**26095 mq_send, mq_timedsend — send a message to a message queue (**REALTIME**)26096 **SYNOPSIS**

26097 MSG #include <mqueue.h>

```
26098 int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
26099             unsigned msg_prio);
```

26100

26101 MSG TMO #include <mqueue.h>

26102 #include <time.h>

```
26103 int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
26104                  unsigned msg_prio, const struct timespec *abs_timeout);
```

26105

26106 **DESCRIPTION**

26107 The *mq_send()* function shall add the message pointed to by the argument *msg_ptr* to the
 26108 message queue specified by *mqdes*. The *msg_len* argument specifies the length of the message, in
 26109 bytes, pointed to by *msg_ptr*. The value of *msg_len* shall be less than or equal to the *mq_msgsize*
 26110 attribute of the message queue, or *mq_send()* shall fail.

26111 If the specified message queue is not full, *mq_send()* shall behave as if the message is inserted
 26112 into the message queue at the position indicated by the *msg_prio* argument. A message with a
 26113 larger numeric value of *msg_prio* shall be inserted before messages with lower values of
 26114 *msg_prio*. A message shall be inserted after other messages in the queue, if any, with equal
 26115 *msg_prio*. The value of *msg_prio* shall be less than {MQ_PRIO_MAX}.

26116 If the specified message queue is full and O_NONBLOCK is not set in the message queue
 26117 description associated with *mqdes*, *mq_send()* shall block until space becomes available to
 26118 enqueue the message, or until *mq_send()* is interrupted by a signal. If more than one thread is
 26119 waiting to send when space becomes available in the message queue and the Priority Scheduling
 26120 option is supported, then the thread of the highest priority that has been waiting the longest
 26121 shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is
 26122 unblocked. If the specified message queue is full and O_NONBLOCK is set in the message
 26123 queue description associated with *mqdes*, the message shall not be queued and *mq_send()* shall
 26124 return an error.

26125 TMO The *mq_timedsend()* function shall add a message to the message queue specified by *mqdes* in the
 26126 manner defined for the *mq_send()* function. However, if the specified message queue is full and
 26127 O_NONBLOCK is not set in the message queue description associated with *mqdes*, the wait for
 26128 sufficient room in the queue shall be terminated when the specified timeout expires. If
 26129 O_NONBLOCK is set in the message queue description, this function shall be equivalent to
 26130 *mq_send()*.

26131 The timeout shall expire when the absolute time specified by *abs_timeout* passes, as measured by
 26132 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 26133 *abs_timeout*), or if the absolute time specified by *abs_timeout* has already been passed at the time
 26134 of the call.

26135 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
 26136 the Timers option is not supported, the timeout shall be based on the system clock as returned
 26137 by the *time()* function.

26138 TMO The resolution of the timeout shall be the resolution of the clock on which it is based. The
 26139 *timespec* argument is defined in the <time.h> header.

26140 Under no circumstance shall the operation fail with a timeout if there is sufficient room in the
 26141 queue to add the message immediately. The validity of the *abs_timeout* parameter need not be
 26142 checked when there is sufficient room in the queue.

26143 RETURN VALUE

26144 TMO Upon successful completion, the *mq_send()* and *mq_timedsend()* functions shall return a value of
 26145 zero. Otherwise, no message shall be enqueued, the functions shall return `-1`, and *errno* shall be
 26146 set to indicate the error.

26147 ERRORS

26148 TMO The *mq_send()* and *mq_timedsend()* functions shall fail if:

26149 [EAGAIN] The `O_NONBLOCK` flag is set in the message queue description associated
 26150 with *mqdes*, and the specified message queue is full.

26151 [EBADF] The *mqdes* argument is not a valid message queue descriptor open for writing.

26152 TMO [EINTR] A signal interrupted the call to *mq_send()* or *mq_timedsend()*.

26153 [EINVAL] The value of *msg_prio* was outside the valid range.

26154 TMO [EINVAL] The process or thread would have blocked, and the *abs_timeout* parameter
 26155 specified a nanoseconds field value less than zero or greater than or equal to
 26156 1 000 million.

26157 [EMSGSIZE] The specified message length, *msg_len*, exceeds the message size attribute of
 26158 the message queue.

26159 TMO [ETIMEDOUT] The `O_NONBLOCK` flag was not set when the message queue was opened,
 26160 but the timeout expired before the message could be added to the queue.

26161 EXAMPLES

26162 None.

26163 APPLICATION USAGE

26164 The value of the symbol `{MQ_PRIO_MAX}` limits the number of priority levels supported by the
 26165 application. Message priorities range from 0 to `{MQ_PRIO_MAX}-1`.

26166 RATIONALE

26167 None.

26168 FUTURE DIRECTIONS

26169 None.

26170 SEE ALSO

26171 *mq_open()*, *mq_receive()*, *mq_setattr()*, *mq_timedreceive()*, *time()*, the Base Definitions volume of
 26172 IEEE Std 1003.1-2001, `<mqqueue.h>`, `<time.h>`

26173 CHANGE HISTORY

26174 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26175 Issue 6

26176 The *mq_send()* function is marked as part of the Message Passing option.

26177 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an
 26178 implementation does not support the Message Passing option.

26179 The *mq_timedsend()* function is added for alignment with IEEE Std 1003.1d-1999.

26180 **NAME**26181 mq_setattr — set message queue attributes (**REALTIME**)26182 **SYNOPSIS**

26183 MSG #include <mqueue.h>

```
26184 int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict mqstat,
26185               struct mq_attr *restrict omqstat);
```

26186

26187 **DESCRIPTION**

26188 The *mq_setattr()* function shall set attributes associated with the open message queue
 26189 description referenced by the message queue descriptor specified by *mqdes*.

26190 The message queue attributes corresponding to the following members defined in the **mq_attr**
 26191 structure shall be set to the specified values upon successful completion of *mq_setattr()*:

26192 *mq_flags* The value of this member is the bitwise-logical OR of zero or more of
 26193 O_NONBLOCK and any implementation-defined flags.

26194 The values of the *mq_maxmsg*, *mq_msgsize*, and *mq_curmsgs* members of the **mq_attr** structure
 26195 shall be ignored by *mq_setattr()*.

26196 If *omqstat* is non-NULL, the *mq_setattr()* function shall store, in the location referenced by
 26197 *omqstat*, the previous message queue attributes and the current queue status. These values shall
 26198 be the same as would be returned by a call to *mq_getattr()* at that point.

26199 **RETURN VALUE**

26200 Upon successful completion, the function shall return a value of zero and the attributes of the
 26201 message queue shall have been changed as specified.

26202 Otherwise, the message queue attributes shall be unchanged, and the function shall return a
 26203 value of -1 and set *errno* to indicate the error.

26204 **ERRORS**

26205 The *mq_setattr()* function shall fail if:

26206 [EBADF] The *mqdes* argument is not a valid message queue descriptor.

26207 **EXAMPLES**

26208 None.

26209 **APPLICATION USAGE**

26210 None.

26211 **RATIONALE**

26212 None.

26213 **FUTURE DIRECTIONS**

26214 None.

26215 **SEE ALSO**

 26217 Definitions volume of IEEE Std 1003.1-2001, <**mqueue.h**>

26218 **CHANGE HISTORY**

26219 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26220 **Issue 6**

- 26221 The *mq_setattr()* function is marked as part of the Message Passing option.
- 26222 The [ENOSYS] error condition has been removed as stubs need not be provided if an
26223 implementation does not support the Message Passing option.
- 26224 The *mq_timedsend()* function is added to the SEE ALSO section for alignment with
26225 IEEE Std 1003.1d-1999.
- 26226 The **restrict** keyword is added to the *mq_setattr()* prototype for alignment with the
26227 ISO / IEC 9899:1999 standard.

26228 **NAME**

26229 mq_timedreceive — receive a message from a message queue (**ADVANCED REALTIME**)

26230 **SYNOPSIS**

26231 MSG TMO #include <mqueue.h>

26232 #include <time.h>

```
26233       ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,  
26234                               size_t msg_len, unsigned *restrict msg_prio,  
26235                               const struct timespec *restrict abs_timeout);
```

26236

26237 **DESCRIPTION**

26238 Refer to *mq_receive()*.

26239 **NAME**26240 mq_timedsend — send a message to a message queue (**ADVANCED REALTIME**)26241 **SYNOPSIS**26242 MSG TMO `#include <mqueue.h>`26243 `#include <time.h>`

```
26244       int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,  
26245                       unsigned msg_prio, const struct timespec *abs_timeout);
```

26246

26247 **DESCRIPTION**26248 Refer to *mq_send()*.

26249 **NAME**26250 mq_unlink — remove a message queue (**REALTIME**)26251 **SYNOPSIS**

26252 MSG #include <mqueue.h>

26253 int mq_unlink(const char *name);

26254

26255 **DESCRIPTION**

26256 The *mq_unlink()* function shall remove the message queue named by the pathname *name*. After
 26257 a successful call to *mq_unlink()* with *name*, a call to *mq_open()* with *name* shall fail if the flag
 26258 O_CREAT is not set in *flags*. If one or more processes have the message queue open when
 26259 *mq_unlink()* is called, destruction of the message queue shall be postponed until all references to
 26260 the message queue have been closed.

26261 Calls to *mq_open()* to recreate the message queue may fail until the message queue is actually
 26262 removed. However, the *mq_unlink()* call need not block until all references have been closed; it
 26263 may return immediately.

26264 **RETURN VALUE**

26265 Upon successful completion, the function shall return a value of zero. Otherwise, the named
 26266 message queue shall be unchanged by this function call, and the function shall return a value of
 26267 -1 and set *errno* to indicate the error.

26268 **ERRORS**26269 The *mq_unlink()* function shall fail if:

26270 [EACCES] Permission is denied to unlink the named message queue.

26271 [ENAMETOOLONG]

26272 The length of the *name* argument exceeds {PATH_MAX} or a pathname
 26273 component is longer than {NAME_MAX}.

26274 [ENOENT] The named message queue does not exist.

26275 **EXAMPLES**

26276 None.

26277 **APPLICATION USAGE**

26278 None.

26279 **RATIONALE**

26280 None.

26281 **FUTURE DIRECTIONS**

26282 None.

26283 **SEE ALSO**

26284 *mq_close()*, *mq_open()*, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*, the Base Definitions volume of
 26285 IEEE Std 1003.1-2001, <mqueue.h>

26286 **CHANGE HISTORY**

26287 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26288 **Issue 6**26289 The *mq_unlink()* function is marked as part of the Message Passing option.

26290 The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion,
 26291 the named message queue is unchanged by this function.

26292 The [ENOSYS] error condition has been removed as stubs need not be provided if an
26293 implementation does not support the Message Passing option.

26294 **NAME**

26295 mrnd48 — generate uniformly distributed pseudo-random signed long integers

26296 **SYNOPSIS**

26297 xSI #include <stdlib.h>

26298 long mrnd48(void);

26299

26300 **DESCRIPTION**

26301 Refer to *drand48()*.

26302 **NAME**

26303 msgctl — XSI message control operations

26304 **SYNOPSIS**26305 xsi `#include <sys/msg.h>`26306 `int msgctl(int msqid, int cmd, struct msqid_ds *buf);`

26307

26308 **DESCRIPTION**

26309 The *msgctl()* function operates on XSI message queues (see the Base Definitions volume of
 26310 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
 26311 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 26312 page 41).

26313 The *msgctl()* function shall provide message control operations as specified by *cmd*. The
 26314 following values for *cmd*, and the message control operations they specify, are:

26315 **IPC_STAT** Place the current value of each member of the **msqid_ds** data structure
 26316 associated with *msqid* into the structure pointed to by *buf*. The contents of this
 26317 structure are defined in **<sys/msg.h>**.

26318 **IPC_SET** Set the value of the following members of the **msqid_ds** data structure
 26319 associated with *msqid* to the corresponding value found in the structure
 26320 pointed to by *buf*:

26321 msg_perm.uid
 26322 msg_perm.gid
 26323 msg_perm.mode
 26324 msg_qbytes

26325 **IPC_SET** can only be executed by a process with appropriate privileges or that
 26326 has an effective user ID equal to the value of **msg_perm.cuid** or
 26327 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*. Only a
 26328 process with appropriate privileges can raise the value of **msg_qbytes**.

26329 **IPC_RMID** Remove the message queue identifier specified by *msqid* from the system and
 26330 destroy the message queue and **msqid_ds** data structure associated with it.
 26331 **IPC_RMD** can only be executed by a process with appropriate privileges or
 26332 one that has an effective user ID equal to the value of **msg_perm.cuid** or
 26333 **msg_perm.uid** in the **msqid_ds** data structure associated with *msqid*.

26334 **RETURN VALUE**

26335 Upon successful completion, *msgctl()* shall return 0; otherwise, it shall return -1 and set *errno* to
 26336 indicate the error.

26337 **ERRORS**26338 The *msgctl()* function shall fail if:

26339 **[EACCES]** The argument *cmd* is **IPC_STAT** and the calling process does not have read
 26340 permission; see Section 2.7 (on page 39).

26341 **[EINVAL]** The value of *msqid* is not a valid message queue identifier; or the value of *cmd*
 26342 is not a valid command.

26343 **[EPERM]** The argument *cmd* is **IPC_RMID** or **IPC_SET** and the effective user ID of the
 26344 calling process is not equal to that of a process with appropriate privileges
 26345 and it is not equal to the value of **msg_perm.cuid** or **msg_perm.uid** in the data
 26346 structure associated with *msqid*.

26347 [EPERM] The argument *cmd* is IPC_SET, an attempt is being made to increase to the
26348 value of **msg_qbytes**, and the effective user ID of the calling process does not
26349 have appropriate privileges.

26350 EXAMPLES

26351 None.

26352 APPLICATION USAGE

26353 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
26354 (IPC). Application developers who need to use IPC should design their applications so that
26355 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to
26356 use the alternative interfaces.

26365 CHANGE HISTORY

26366 First released in Issue 2. Derived from Issue 2 of the SVID.

26367 Issue 5

26368 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
26369 DIRECTIONS to a new APPLICATION USAGE section.

26370 **NAME**

26371 msgget — get the XSI message queue identifier

26372 **SYNOPSIS**

26373 xsi #include <sys/msg.h>

26374 int msgget(key_t key, int msgflg);

26375

26376 **DESCRIPTION**

26377 The *msgget()* function operates on XSI message queues (see the Base Definitions volume of
 26378 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
 26379 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 26380 page 41).

26381 The *msgget()* function shall return the message queue identifier associated with the argument
 26382 *key*.

26383 A message queue identifier, associated message queue, and data structure (see <sys/msg.h>),
 26384 shall be created for the argument *key* if one of the following is true:

- 26385 • The argument *key* is equal to IPC_PRIVATE.
- 26386 • The argument *key* does not already have a message queue identifier associated with it, and
 26387 (*msgflg* & IPC_CREAT) is non-zero.

26388 Upon creation, the data structure associated with the new message queue identifier shall be
 26389 initialized as follows:

- 26390 • **msg_perm.cuid**, **msg_perm.uid**, **msg_perm.cgid**, and **msg_perm.gid** shall be set equal to the
 26391 effective user ID and effective group ID, respectively, of the calling process.
- 26392 • The low-order 9 bits of **msg_perm.mode** shall be set equal to the low-order 9 bits of *msgflg*.
- 26393 • **msg_qnum**, **msg_lspid**, **msg_lrpid**, **msg_stime**, and **msg_rtime** shall be set equal to 0.
- 26394 • **msg_ctime** shall be set equal to the current time.
- 26395 • **msg_qbytes** shall be set equal to the system limit.

26396 **RETURN VALUE**

26397 Upon successful completion, *msgget()* shall return a non-negative integer, namely a message
 26398 queue identifier. Otherwise, it shall return -1 and set *errno* to indicate the error.

26399 **ERRORS**26400 The *msgget()* function shall fail if:

26401	[EACCES]	A message queue identifier exists for the argument <i>key</i> , but operation
26402		permission as specified by the low-order 9 bits of <i>msgflg</i> would not be granted;
26403		see Section 2.7 (on page 39).
26404	[EEXIST]	A message queue identifier exists for the argument <i>key</i> but ((<i>msgflg</i> &
26405		IPC_CREAT) && (<i>msgflg</i> & IPC_EXCL)) is non-zero.
26406	[ENOENT]	A message queue identifier does not exist for the argument <i>key</i> and (<i>msgflg</i> &
26407		IPC_CREAT) is 0.
26408	[ENOSPC]	A message queue identifier is to be created but the system-imposed limit on
26409		the maximum number of allowed message queue identifiers system-wide
26410		would be exceeded.

26411 **EXAMPLES**

26412 None.

26413 **APPLICATION USAGE**

26414 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
26415 (IPC). Application developers who need to use IPC should design their applications so that
26416 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to
26417 use the alternative interfaces.

26426 **CHANGE HISTORY**

26427 First released in Issue 2. Derived from Issue 2 of the SVID.

26428 **Issue 5**

26429 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
26430 DIRECTIONS to a new APPLICATION USAGE section.

26431 **NAME**

26432 msgrcv — XSI message receive operation

26433 **SYNOPSIS**26434 XSI

```
#include <sys/msg.h>
```

```
26435 ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
26436               int msgflg);
26437
```

26438 **DESCRIPTION**

26439 The *msgrcv()* function operates on XSI message queues (see the Base Definitions volume of
 26440 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
 26441 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 26442 page 41).

26443 The *msgrcv()* function shall read a message from the queue associated with the message queue
 26444 identifier specified by *msqid* and place it in the user-defined buffer pointed to by *msgp*.

26445 The application shall ensure that the argument *msgp* points to a user-defined buffer that contains
 26446 first a field of type **long** specifying the type of the message, and then a data portion that holds
 26447 the data bytes of the message. The structure below is an example of what this user-defined
 26448 buffer might look like:

```
26449 struct mymsg {
26450     long    mtype;      /* Message type. */
26451     char    mtext[1];   /* Message text. */
26452 }
```

26453 The structure member *mtype* is the received message's type as specified by the sending process.

26454 The structure member *mtext* is the text of the message.

26455 The argument *msgsz* specifies the size in bytes of *mtext*. The received message shall be truncated
 26456 to *msgsz* bytes if it is larger than *msgsz* and (*msgflg* & MSG_NOERROR) is non-zero. The
 26457 truncated part of the message shall be lost and no indication of the truncation shall be given to
 26458 the calling process.

26459 If the value of *msgsz* is greater than {SSIZE_MAX}, the result is implementation-defined.

26460 The argument *msgtyp* specifies the type of message requested as follows:

- 26461 • If *msgtyp* is 0, the first message on the queue shall be received.
- 26462 • If *msgtyp* is greater than 0, the first message of type *msgtyp* shall be received.
- 26463 • If *msgtyp* is less than 0, the first message of the lowest type that is less than or equal to the
 26464 absolute value of *msgtyp* shall be received.

26465 The argument *msgflg* specifies the action to be taken if a message of the desired type is not on the
 26466 queue. These are as follows:

- 26467 • If (*msgflg* & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a
 26468 return value of -1 and *errno* set to [ENOMSG].
- 26469 • If (*msgflg* & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the
 26470 following occurs:
 - 26471 — A message of the desired type is placed on the queue.
 - 26472 — The message queue identifier *msqid* is removed from the system; when this occurs, *errno*
 26473 shall be set equal to [EIDRM] and -1 shall be returned.

26474 — The calling thread receives a signal that is to be caught; in this case a message is not
 26475 received and the calling thread resumes execution in the manner prescribed in *sigaction()*.

26476 Upon successful completion, the following actions are taken with respect to the data structure
 26477 associated with *msqid*:

- 26478 • **msg_qnum** shall be decremented by 1.
- 26479 • **msg_lrpid** shall be set equal to the process ID of the calling process.
- 26480 • **msg_rtime** shall be set equal to the current time.

26481 RETURN VALUE

26482 Upon successful completion, *msgrcv()* shall return a value equal to the number of bytes actually
 26483 placed into the buffer *mtext*. Otherwise, no message shall be received, *msgrcv()* shall return
 26484 (**ssize_t**)−1, and *errno* shall be set to indicate the error.

26485 ERRORS

26486 The *msgrcv()* function shall fail if:

26487	[E2BIG]	The value of <i>mtext</i> is greater than <i>msgsz</i> and (<i>msgflg</i> & MSG_NOERROR) is 0.
26488	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 39).
26489		
26490	[EIDRM]	The message queue identifier <i>msqid</i> is removed from the system.
26491	[EINTR]	The <i>msgrcv()</i> function was interrupted by a signal.
26492	[EINVAL]	<i>msqid</i> is not a valid message queue identifier.
26493	[ENOMSG]	The queue does not contain a message of the desired type and (<i>msgflg</i> & IPC_NOWAIT) is non-zero.
26494		

26495 EXAMPLES

26496 Receiving a Message

26497 The following example receives the first message on the queue (based on the value of the *msgtyp*
 26498 argument, 0). The queue is identified by the *msqid* argument (assuming that the value has
 26499 previously been set). This call specifies that an error should be reported if no message is
 26500 available, but not if the message is too large. The message size is calculated directly using the
 26501 *sizeof* operator.

```

26502 #include <sys/msg.h>
26503 ...
26504 int result;
26505 int msqid;
26506 struct message {
26507     long type;
26508     char text[20];
26509 } msg;
26510 long msgtyp = 0;
26511 ...
26512 result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
26513               msgtyp, MSG_NOERROR | IPC_NOWAIT);
  
```

26514 APPLICATION USAGE

26515 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
26516 (IPC). Application developers who need to use IPC should design their applications so that
26517 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to
26518 use the alternative interfaces.

26527 CHANGE HISTORY

26528 First released in Issue 2. Derived from Issue 2 of the SVID.

26529 Issue 5

26530 The type of the return value is changed from **int** to **ssize_t**, and a warning is added to the
26531 DESCRIPTION about values of *msgsz* larger the {SSIZE_MAX}.

26532 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
26533 DIRECTIONS to the APPLICATION USAGE section.

26534 Issue 6

26535 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

26536 **NAME**

26537 msgsnd — XSI message send operation

26538 **SYNOPSIS**26539 xsi `#include <sys/msg.h>`26540 `int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);`

26541

26542 **DESCRIPTION**

26543 The `msgsnd()` function operates on XSI message queues (see the Base Definitions volume of
 26544 IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
 26545 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 26546 page 41).

26547 The `msgsnd()` function shall send a message to the queue associated with the message queue
 26548 identifier specified by `msqid`.

26549 The application shall ensure that the argument `msgp` points to a user-defined buffer that contains
 26550 first a field of type **long** specifying the type of the message, and then a data portion that holds
 26551 the data bytes of the message. The structure below is an example of what this user-defined
 26552 buffer might look like:

```
26553 struct mymsg {
26554     long    mtype;           /* Message type. */
26555     char    mtext[1];       /* Message text. */
26556 }
```

26557 The structure member `mtype` is a non-zero positive type **long** that can be used by the receiving
 26558 process for message selection.

26559 The structure member `mtext` is any text of length `msgsz` bytes. The argument `msgsz` can range
 26560 from 0 to a system-imposed maximum.

26561 The argument `msgflg` specifies the action to be taken if one or more of the following is true:

- 26562 • The number of bytes already on the queue is equal to **msg_qbytes**; see `<sys/msg.h>`.
- 26563 • The total number of messages on all queues system-wide is equal to the system-imposed
 26564 limit.

26565 These actions are as follows:

- 26566 • If `(msgflg & IPC_NOWAIT)` is non-zero, the message shall not be sent and the calling thread
 26567 shall return immediately.
- 26568 • If `(msgflg & IPC_NOWAIT)` is 0, the calling thread shall suspend execution until one of the
 26569 following occurs:
 - 26570 — The condition responsible for the suspension no longer exists, in which case the message
 26571 is sent.
 - 26572 — The message queue identifier `msqid` is removed from the system; when this occurs, `errno`
 26573 shall be set equal to `[EIDRM]` and `-1` shall be returned.
 - 26574 — The calling thread receives a signal that is to be caught; in this case the message is not
 26575 sent and the calling thread resumes execution in the manner prescribed in `sigaction()`.

26576 Upon successful completion, the following actions are taken with respect to the data structure
 26577 associated with `msqid`; see `<sys/msg.h>`:

- 26578 • **msg_qnum** shall be incremented by 1.
- 26579 • **msg_lspid** shall be set equal to the process ID of the calling process.
- 26580 • **msg_stime** shall be set equal to the current time.

26581 RETURN VALUE

26582 Upon successful completion, *msgsnd()* shall return 0; otherwise, no message shall be sent,
 26583 *msgsnd()* shall return -1, and *errno* shall be set to indicate the error.

26584 ERRORS

26585 The *msgsnd()* function shall fail if:

26586 26587	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 39).
26588 26589	[EAGAIN]	The message cannot be sent for one of the reasons cited above and (<i>msgflg</i> & <i>IPC_NOWAIT</i>) is non-zero.
26590	[EIDRM]	The message queue identifier <i>msqid</i> is removed from the system.
26591	[EINTR]	The <i>msgsnd()</i> function was interrupted by a signal.
26592 26593 26594	[EINVAL]	The value of <i>msqid</i> is not a valid message queue identifier, or the value of <i>mtype</i> is less than 1; or the value of <i>msgsz</i> is less than 0 or greater than the system-imposed limit.

26595 EXAMPLES**26596 Sending a Message**

26597 The following example sends a message to the queue identified by the *msqid* argument
 26598 (assuming that value has previously been set). This call specifies that an error should be
 26599 reported if no message is available. The message size is calculated directly using the *sizeof*
 26600 operator.

```

26601 #include <sys/msg.h>
26602 ...
26603 int result;
26604 int msqid;
26605 struct message {
26606     long type;
26607     char text[20];
26608 } msg;

26609 msg.type = 1;
26610 strcpy(msg.text, "This is message 1");
26611 ...
26612 result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
  
```

26613 APPLICATION USAGE

26614 The POSIX Realtime Extension defines alternative interfaces for interprocess communication
 26615 (IPC). Application developers who need to use IPC should design their applications so that
 26616 modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to
 26617 use the alternative interfaces.

26618 **RATIONALE**

26619 None.

26620 **FUTURE DIRECTIONS**

26621 None.

26622 **SEE ALSO**

26626 **CHANGE HISTORY**

26627 First released in Issue 2. Derived from Issue 2 of the SVID.

26628 **Issue 5**

26629 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
26630 DIRECTIONS to a new APPLICATION USAGE section.

26631 **Issue 6**

26632 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

26633 **NAME**

26634 msync — synchronize memory with physical storage

26635 **SYNOPSIS**

26636 MF SIO #include <sys/mman.h>

26637 int msync(void *addr, size_t len, int flags);

26638

26639 **DESCRIPTION**

26640 The *msync()* function shall write all modified data to permanent storage locations, if any, in
 26641 those whole pages containing any part of the address space of the process starting at address
 26642 *addr* and continuing for *len* bytes. If no such storage exists, *msync()* need not have any effect. If
 26643 requested, the *msync()* function shall then invalidate cached copies of data.

26644 The implementation shall require that *addr* be a multiple of the page size as returned by
 26645 *sysconf()*.

26646 For mappings to files, the *msync()* function shall ensure that all write operations are completed
 26647 as defined for synchronized I/O data integrity completion. It is unspecified whether the
 26648 implementation also writes out other file attributes. When the *msync()* function is called on
 26649 MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and
 26650 shall not cause such data to be made visible to other processes. It is unspecified whether data in
 26651 SHM|TYM MAP_PRIVATE mappings has any permanent storage locations. The effect of *msync()* on a
 26652 shared memory object or a typed memory object is unspecified. The behavior of this function is
 26653 unspecified if the mapping was not established by a call to *mmap()*.

26654 The *flags* argument is constructed from the bitwise-inclusive OR of one or more of the following
 26655 flags defined in the <sys/mman.h> header:

26656

26657

26658

26659

26660

Symbolic Constant	Description
MS_ASYNC	Perform asynchronous writes.
MS_SYNC	Perform synchronous writes.
MS_INVALIDATE	Invalidate cached data.

26661 When MS_ASYNC is specified, *msync()* shall return immediately once all the write operations
 26662 are initiated or queued for servicing; when MS_SYNC is specified, *msync()* shall not return until
 26663 all write operations are completed as defined for synchronized I/O data integrity completion.
 26664 Either MS_ASYNC or MS_SYNC is specified, but not both.

26665 When MS_INVALIDATE is specified, *msync()* shall invalidate all cached copies of mapped data
 26666 that are inconsistent with the permanent storage locations such that subsequent references shall
 26667 obtain data that was consistent with the permanent storage locations sometime between the call
 26668 to *msync()* and the first subsequent memory reference to the data.

26669 If *msync()* causes any write to a file, the file's *st_ctime* and *st_mtime* fields shall be marked for
 26670 update.

26671 **RETURN VALUE**

26672 Upon successful completion, *msync()* shall return 0; otherwise, it shall return *-1* and set *errno* to
 26673 indicate the error.

26674 **ERRORS**26675 The *msync()* function shall fail if:

26676 [EBUSY] Some or all of the addresses in the range starting at *addr* and continuing for *len*
 26677 bytes are locked, and MS_INVALIDATE is specified.

26678 [EINVAL] The value of *flags* is invalid.

26679 [EINVAL] The value of *addr* is not a multiple of the page size {PAGESIZE}.

26680 [ENOMEM] The addresses in the range starting at *addr* and continuing for *len* bytes are outside the range allowed for the address space of a process or specify one or more pages that are not mapped.

26681

26682

26683 EXAMPLES

26684 None.

26685 APPLICATION USAGE

26686 The *msync()* function is only supported if the Memory Mapped Files option and the Synchronized Input and Output option are supported, and thus need not be available on all implementations.

26687

26688

26689 The *msync()* function should be used by programs that require a memory object to be in a known state; for example, in building transaction facilities.

26690

26691 Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees that *msync()* is the only control over when pages are or are not written to disk.

26692

26693 RATIONALE

26694 The *msync()* function writes out data in a mapped region to the permanent storage for the underlying object. The call to *msync()* ensures data integrity of the file.

26695

26696 After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag was specified. This is useful on systems that do not support read/write consistency.

26697

26698 FUTURE DIRECTIONS

26699 None.

26702 CHANGE HISTORY

26703 First released in Issue 4, Version 2.

26704 Issue 5

26705 Moved from X/OPEN UNIX extension to BASE.

26706 Aligned with *msync()* in the POSIX Realtime Extension as follows:

- 26707 • The DESCRIPTION is extensively reworded.
- 26708 • [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

26709 Issue 6

26710 The *msync()* function is marked as part of the Memory Mapped Files and Synchronized Input and Output options.

26711

26712 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 26713 • The [EBUSY] mandatory error condition is added.

26714 The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

26715

- 26716 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of the page size.
- 26717
- 26718 • The second [EINVAL] error condition is made mandatory.

26719 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to
26720 typed memory objects.

26721 NAME

26722 munlock — unlock a range of process address space

26723 SYNOPSIS

26724 MLR #include <sys/mman.h>

26725 int munlock(const void *addr, size_t len);

26726

26727 DESCRIPTION

26728 Refer to *mlock()*.

26729 **NAME**

26730 munlockall — unlock the address space of a process

26731 **SYNOPSIS**

26732 ML #include <sys/mman.h>

26733 int munlockall(void);

26734

26735 **DESCRIPTION**26736 Refer to *mlockall()*.

26737 **NAME**

26738 munmap — unmap pages of memory

26739 **SYNOPSIS**

26740 MC3 #include <sys/mman.h>

26741 int munmap(void *addr, size_t len);

26742

26743 **DESCRIPTION**

26744 The *munmap()* function shall remove any mappings for those entire pages containing any part of
 26745 the address space of the process starting at *addr* and continuing for *len* bytes. Further references
 26746 to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no
 26747 mappings in the specified address range, then *munmap()* has no effect.

26748 The implementation shall require that *addr* be a multiple of the page size {PAGESIZE}.

26749 If a mapping to be removed was private, any modifications made in this address range shall be
 26750 discarded.

26751 ML|MLR Any memory locks (see *mlock()* and *mlockall()*) associated with this address range shall be
 26752 removed, as if by an appropriate call to *munlock()*.

26753 TYM If a mapping removed from a typed memory object causes the corresponding address range of
 26754 the memory pool to be inaccessible by any process in the system except through allocatable
 26755 mappings (that is, mappings of typed memory objects opened with the
 26756 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall
 26757 become deallocated and may become available to satisfy future typed memory allocation
 26758 requests.

26759 A mapping removed from a typed memory object opened with the
 26760 POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of
 26761 that typed memory for allocation.

26762 The behavior of this function is unspecified if the mapping was not established by a call to
 26763 *mmap()*.

26764 **RETURN VALUE**

26765 Upon successful completion, *munmap()* shall return 0; otherwise, it shall return -1 and set *errno*
 26766 to indicate the error.

26767 **ERRORS**26768 The *munmap()* function shall fail if:

26769 [EINVAL] Addresses in the range [*addr*,*addr*+*len*) are outside the valid range for the
 26770 address space of a process.

26771 [EINVAL] The *len* argument is 0.

26772 [EINVAL] The *addr* argument is not a multiple of the page size as returned by *sysconf()*.

26773 **EXAMPLES**

26774 None.

26775 **APPLICATION USAGE**

26776 The *munmap()* function is only supported if the Memory Mapped Files option or the Shared
 26777 Memory Objects option is supported.

26778 **RATIONALE**26779 The *munmap()* function corresponds to SVR4, just as the *mmap()* function does.

26780 It is possible that an application has applied process memory locking to a region that contains
 26781 shared memory. If this has occurred, the *munmap()* call ignores those locks and, if necessary,
 26782 causes those locks to be removed.

26783 **FUTURE DIRECTIONS**

26784 None.

26785 **SEE ALSO**

26786 *mlock()*, *mlockall()*, *mmap()*, *posix_typed_mem_open()*, *sysconf()*, the Base Definitions volume of
 26787 IEEE Std 1003.1-2001, <signal.h>, <sys/mman.h>

26788 **CHANGE HISTORY**

26789 First released in Issue 4, Version 2.

26790 **Issue 5**

26791 Moved from X/OPEN UNIX extension to BASE.

26792 Aligned with *munmap()* in the POSIX Realtime Extension as follows:

- 26793 • The DESCRIPTION is extensively reworded.
- 26794 • The SIGBUS error is no longer permitted to be generated.

26795 **Issue 6**

26796 The *munmap()* function is marked as part of the Memory Mapped Files and Shared Memory
 26797 Objects option.

26798 The following new requirements on POSIX implementations derive from alignment with the
 26799 Single UNIX Specification:

- 26800 • The DESCRIPTION is updated to state that implementations require *addr* to be a multiple of
 26801 the page size.
- 26802 • The [EINVAL] error conditions are added.

26803 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 26804 • Semantics for typed memory objects are added to the DESCRIPTION.
- 26805 • The *posix_typed_mem_open()* function is added to the SEE ALSO section.

26806 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code |
 26807 in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM). |

26808 **NAME**

26809 nan, nanf, nanl — return quiet NaN

26810 **SYNOPSIS**

26811 #include <math.h>

26812 double nan(const char *tagp);

26813 float nanf(const char *tagp);

26814 long double nanl(const char *tagp);

26815 **DESCRIPTION**

26816 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 26817 conflict between the requirements described here and the ISO C standard is unintentional. This
 26818 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26819 The function call *nan*("n-char-sequence") shall be equivalent to:

26820 strtod("NAN(n-char-sequence)", (char **) NULL);

26821 The function call *nan*("") shall be equivalent to:

26822 strtod("NAN()", (char **) NULL)

26823 If *tagp* does not point to an *n-char* sequence or an empty string, the function call shall be
 26824 equivalent to:

26825 strtod("NAN", (char **) NULL)

26826 Function calls to *nanf*() and *nanl*() are equivalent to the corresponding function calls to *strtof*()
 26827 and *strtold*().

26828 **RETURN VALUE**26829 These functions shall return a quiet NaN, if available, with content indicated through *tagp*.

26830 If the implementation does not support quiet NaNs, these functions shall return zero.

26831 **ERRORS**

26832 No errors are defined.

26833 **EXAMPLES**

26834 None.

26835 **APPLICATION USAGE**

26836 None.

26837 **RATIONALE**

26838 None.

26839 **FUTURE DIRECTIONS**

26840 None.

26841 **SEE ALSO**26842 *strtod*(), *strtold*(), the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>26843 **CHANGE HISTORY**

26844 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26845 **NAME**26846 nanosleep — high resolution sleep (**REALTIME**)26847 **SYNOPSIS**

26848 TMR #include <time.h>

26849 int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);

26850

26851 **DESCRIPTION**

26852 The *nanosleep()* function shall cause the current thread to be suspended from execution until
 26853 either the time interval specified by the *rqtp* argument has elapsed or a signal is delivered to the
 26854 calling thread, and its action is to invoke a signal-catching function or to terminate the process.
 26855 The suspension time may be longer than requested because the argument value is rounded up to
 26856 an integer multiple of the sleep resolution or because of the scheduling of other activity by the
 26857 system. But, except for the case of being interrupted by a signal, the suspension time shall not be
 26858 less than the time specified by *rqtp*, as measured by the system clock `CLOCK_REALTIME`.

26859 The use of the *nanosleep()* function has no effect on the action or blockage of any signal.26860 **RETURN VALUE**26861 If the *nanosleep()* function returns because the requested time has elapsed, its return value shall
26862 be zero.

26863 If the *nanosleep()* function returns because it has been interrupted by a signal, it shall return a
 26864 value of `-1` and set *errno* to indicate the interruption. If the *rmtp* argument is non-NULL, the
 26865 **timespec** structure referenced by it is updated to contain the amount of time remaining in the
 26866 interval (the requested time minus the time actually slept). If the *rmtp* argument is NULL, the
 26867 remaining time is not returned.

26868 If *nanosleep()* fails, it shall return a value of `-1` and set *errno* to indicate the error.26869 **ERRORS**26870 The *nanosleep()* function shall fail if:26871 [EINTR] The *nanosleep()* function was interrupted by a signal.

26872 [EINVAL] The *rqtp* argument specified a nanosecond value less than zero or greater than
 26873 or equal to 1 000 million.

26874 **EXAMPLES**

26875 None.

26876 **APPLICATION USAGE**

26877 None.

26878 **RATIONALE**

26879 It is common to suspend execution of a process for an interval in order to poll the status of a
 26880 non-interrupting function. A large number of actual needs can be met with a simple extension to
 26881 *sleep()* that provides finer resolution.

26882 In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the
 26883 frequency of wakeup is limited by the resolution of the *alarm()* and *sleep()* functions. In 4.3 BSD,
 26884 it is possible to write such a routine using no static storage and reserving no system facilities.
 26885 Although it is possible to write a function with similar functionality to *sleep()* using the
 26886 remainder of the *timer_**() functions, such a function requires the use of signals and the
 26887 reservation of some signal number. This volume of IEEE Std 1003.1-2001 requires that
 26888 *nanosleep()* be non-intrusive of the signals function.

26889 The *nanosleep()* function shall return a value of 0 on success and –1 on failure or if interrupted.
26890 This latter case is different from *sleep()*. This was done because the remaining time is returned
26891 via an argument structure pointer, *rmtp*, instead of as the return value.

26892 **FUTURE DIRECTIONS**

26893 None.

26894 **SEE ALSO**

26895 *clock_nanosleep()*, *sleep()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**> |

26896 **CHANGE HISTORY**

26897 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

26898 **Issue 6**

26899 The *nanosleep()* function is marked as part of the Timers option.

26900 The [ENOSYS] error condition has been removed as stubs need not be provided if an
26901 implementation does not support the Timers option.

26902 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO |
26903 section to include the *clock_nanosleep()* function. |

26904 **NAME**

26905 nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

26906 **SYNOPSIS**

26907 #include <math.h>

26908 double nearbyint(double x);

26909 float nearbyintf(float x);

26910 long double nearbyintl(long double x);

26911 **DESCRIPTION**

26912 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 26913 conflict between the requirements described here and the ISO C standard is unintentional. This
 26914 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26915 These functions shall round their argument to an integer value in floating-point format, using
 26916 the current rounding direction and without raising the inexact floating-point exception.

26917 An application wishing to check for error situations should set *errno* to zero and call
 26918 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 26919 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 26920 zero, an error has occurred.

26921 **RETURN VALUE**

26922 Upon successful completion, these functions shall return the rounded integer value.

26923 MX If *x* is NaN, a NaN shall be returned.26924 If *x* is ± 0 , ± 0 shall be returned.26925 If *x* is $\pm \text{Inf}$, *x* shall be returned.

26926 XSI If the correct value would cause overflow, a range error shall occur and *nearbyint*(), *nearbyintf*(),
 26927 and *nearbyintl*() shall return the value of the macro $\pm \text{HUGE\_VAL}$, $\pm \text{HUGE\_VALF}$, and
 26928 $\pm \text{HUGE\_VALL}$ (with the same sign as *x*), respectively.

26929 **ERRORS**

26930 These functions shall fail if:

26931 XSI **Range Error** The result would cause an overflow.

26932 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 26933 then *errno* shall be set to [ERANGE]. If the integer expression
 26934 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 26935 floating-point exception shall be raised.

26936 **EXAMPLES**

26937 None.

26938 **APPLICATION USAGE**

26939 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 26940 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

26941 **RATIONALE**

26942 None.

26943 **FUTURE DIRECTIONS**

26944 None.

26945 **SEE ALSO**

26946 *feclearexcept()*, *fetetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,
26947 Treatment of Error Conditions for Mathematical Functions, **<math.h>**

26948 **CHANGE HISTORY**

26949 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

26950 **NAME**

26951 nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable
 26952 floating-point number

26953 **SYNOPSIS**

26954 #include <math.h>

26955 double nextafter(double x, double y);
 26956 float nextafterf(float x, float y);
 26957 long double nextafterl(long double x, long double y);
 26958 double nexttoward(double x, long double y);
 26959 float nexttowardf(float x, long double y);
 26960 long double nexttowardl(long double x, long double y);

26961 **DESCRIPTION**

26962 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 26963 conflict between the requirements described here and the ISO C standard is unintentional. This
 26964 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

26965 The *nextafter()*, *nextafterf()*, and *nextafterl()* functions shall compute the next representable
 26966 floating-point value following *x* in the direction of *y*. Thus, if *y* is less than *x*, *nextafter()* shall
 26967 return the largest representable floating-point number less than *x*. The *nextafter()*, *nextafterf()*,
 26968 and *nextafterl()* functions shall return *y* if *x* equals *y*.

26969 The *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions shall be equivalent to the
 26970 corresponding *nextafter()* functions, except that the second parameter shall have type **long**
 26971 **double** and the functions shall return *y* converted to the type of the function if *x* equals *y*.

26972 An application wishing to check for error situations should set *errno* to zero and call
 26973 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 26974 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 26975 zero, an error has occurred.

26976 **RETURN VALUE**

26977 Upon successful completion, these functions shall return the next representable floating-point
 26978 value following *x* in the direction of *y*.

26979 If *x*==*y*, *y* (of the type *x*) shall be returned.

26980 If *x* is finite and the correct function value would overflow, a range error shall occur and
 26981 $\pm$ HUGE_VAL, $\pm$ HUGE_VALF, and $\pm$ HUGE_VALL (with the same sign as *x*) shall be returned as
 26982 appropriate for the return type of the function.

26983 **MX** If *x* or *y* is NaN, a NaN shall be returned.

26984 If *x*!=*y* and the correct function value is subnormal, zero, or underflows, a range error shall
 26985 occur, and either the correct function value (if representable) or 0.0 shall be returned.

26986 **ERRORS**

26987 These functions shall fail if:

26988 **Range Error** The correct value overflows.

26989 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 26990 then *errno* shall be set to [ERANGE]. If the integer expression
 26991 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 26992 floating-point exception shall be raised.

26993 **MX** **Range Error** The correct value is subnormal or underflows.

26994 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,
 26995 then *errno* shall be set to [ERANGE]. If the integer expression
 26996 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the underflow
 26997 floating-point exception shall be raised.

26998 **EXAMPLES**

26999 None.

27000 **APPLICATION USAGE**

27001 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
 27002 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

27003 **RATIONALE**

27004 None.

27005 **FUTURE DIRECTIONS**

27006 None.

27007 **SEE ALSO**

27008 *feclearexcept()*, *fetestexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,
 27009 Treatment of Error Conditions for Mathematical Functions, **<math.h>**

27010 **CHANGE HISTORY**

27011 First released in Issue 4, Version 2.

27012 **Issue 5**

27013 Moved from X/OPEN UNIX extension to BASE.

27014 **Issue 6**

27015 The *nextafter()* function is no longer marked as an extension.

27016 The *nextafterf()*, *nextafterl()*, *nexttoward()*, *nexttowardf()*, and *nexttowardl()* functions are added
 27017 for alignment with the ISO/IEC 9899:1999 standard.

27018 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 27019 revised to align with the ISO/IEC 9899:1999 standard.

27020 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 27021 marked.

27022 **NAME**

27023 nftw — walk a file tree

27024 **SYNOPSIS**

27025 xSI #include <ftw.h>

```
27026 int nftw(const char *path, int (*fn)(const char *,
27027     const struct stat *, int, struct FTW *), int depth, int flags);
27028
```

27029 **DESCRIPTION**

27030 The *nftw()* function shall recursively descend the directory hierarchy rooted in *path*. The *nftw()*
 27031 function has a similar effect to *ftw()* except that it takes an additional argument *flags*, which is a
 27032 bitwise-inclusive OR of zero or more of the following flags:

27033 **FTW_CHDIR** If set, *nftw()* shall change the current working directory to each directory as it
 27034 reports files in that directory. If clear, *nftw()* shall not change the current
 27035 working directory.

27036 **FTW_DEPTH** If set, *nftw()* shall report all files in a directory before reporting the directory
 27037 itself. If clear, *nftw()* shall report any directory before reporting the files in that
 27038 directory.

27039 **FTW_MOUNT** If set, *nftw()* shall only report files in the same file system as *path*. If clear,
 27040 *nftw()* shall report all files encountered during the walk.

27041 **FTW_PHYS** If set, *nftw()* shall perform a physical walk and shall not follow symbolic links.

27042 If **FTW_PHYS** is clear and **FTW_DEPTH** is set, *nftw()* shall follow links instead of reporting
 27043 them, but shall not report any directory that would be a descendant of itself. If **FTW_PHYS** is
 27044 clear and **FTW_DEPTH** is clear, *nftw()* shall follow links instead of reporting them, but shall not
 27045 report the contents of any directory that would be a descendant of itself.

27046 At each file it encounters, *nftw()* shall call the user-supplied function *fn* with four arguments:

- 27047 • The first argument is the pathname of the object.
- 27048 • The second argument is a pointer to the **stat** buffer containing information on the object.
- 27049 • The third argument is an integer giving additional information. Its value is one of the
 27050 following:

27051 **FTW_F** The object is a file.

27052 **FTW_D** The object is a directory.

27053 **FTW_DP** The object is a directory and subdirectories have been visited. (This condition
 27054 shall only occur if the **FTW_DEPTH** flag is included in *flags*.)

27055 **FTW_SL** The object is a symbolic link. (This condition shall only occur if the **FTW_PHYS**
 27056 flag is included in *flags*.)

27057 **FTW_SLN** The object is a symbolic link that does not name an existing file. (This
 27058 condition shall only occur if the **FTW_PHYS** flag is not included in *flags*.)

27059 **FTW_DNR** The object is a directory that cannot be read. The *fn* function shall not be called
 27060 for any of its descendants.

27061 **FTW_NS** The *stat()* function failed on the object because of lack of appropriate
 27062 permission. The **stat** buffer passed to *fn* is undefined. Failure of *stat()* for any
 27063 other reason is considered an error and *nftw()* shall return -1 .

27064 • The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the
 27065 object's filename in the pathname passed as the first argument to *fn*. The value of **level**
 27066 indicates depth relative to the root of the walk, where the root level is 0.

27067 The results are unspecified if the application-supplied *fn* function does not preserve the current
 27068 working directory.

27069 The argument *depth* sets the maximum number of file descriptors that shall be used by *nftw()*
 27070 while traversing the file tree. At most one file descriptor shall be used for each directory level.

27071 The *nftw()* function need not be reentrant. A function that is not required to be reentrant is not
 27072 required to be thread-safe.

27073 RETURN VALUE

27074 The *nftw()* function shall continue until the first of the following conditions occurs:

- 27075 • An invocation of *fn* shall return a non-zero value, in which case *nftw()* shall return that value.
- 27076 • The *nftw()* function detects an error other than [EACCES] (see FTW_DNR and FTW_NS
 27077 above), in which case *nftw()* shall return -1 and set *errno* to indicate the error.
- 27078 • The tree is exhausted, in which case *nftw()* shall return 0.

27079 ERRORS

27080 The *nftw()* function shall fail if:

27081 [EACCES] Search permission is denied for any component of *path* or read permission is
 27082 denied for *path*, or *fn* returns -1 and does not reset *errno*.

27083 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 27084 argument.

27085 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
 27086 component is longer than {NAME_MAX}.
 27087

27088 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

27089 [ENOTDIR] A component of *path* is not a directory.

27090 [EOVERFLOW] A field in the **stat** structure cannot be represented correctly in the current
 27091 programming environment for one or more files found in the file hierarchy.

27092 The *nftw()* function may fail if:

27093 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 27094 resolution of the *path* argument.

27095 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

27096 [ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
 27097 whose length exceeds {PATH_MAX}.
 27098

27099 [ENFILE] Too many files are currently open in the system.

27100 In addition, *errno* may be set if the function pointed to by *fn* causes *errno* to be set.

27101 **EXAMPLES**

27102 The following example walks the **/tmp** directory and its subdirectories, calling the *nftw()*
 27103 function for every directory entry, to a maximum of 5 levels deep.

```
27104       #include <ftw.h>
27105       ...
27106       int nftwfunc(const char *, const struct stat *, int, struct FTW *);
27107       int nftwfunc(const char *filename, const struct stat *statptr,
27108                    int fileflags, struct FTW *pftw)
27109       {
27110           return 0;
27111       }
27112       ...
27113       char *startpath = "/tmp";
27114       int depth = 5;
27115       int flags = FTW_CHDIR | FTW_DEPTH | FTW_MOUNT;
27116       int ret;
27117       ret = nftw(startpath, nftwfunc, depth, flags);
```

27118 **APPLICATION USAGE**

27119 None.

27120 **RATIONALE**

27121 None.

27122 **FUTURE DIRECTIONS**

27123 None.

27124 **SEE ALSO**

27125 *lstat()*, *opendir()*, *readdir()*, *stat()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<ftw.h>**

27126 **CHANGE HISTORY**

27127 First released in Issue 4, Version 2.

27128 **Issue 5**

27129 Moved from X/OPEN UNIX extension to BASE.

27130 In the DESCRIPTION, the definition of the *depth* argument is clarified.

27131 **Issue 6**

27132 The Open Group Base Resolution bwg97-003 is applied.

27133 The ERRORS section is updated as follows:

- 27134 • The wording of the mandatory [ELOOP] error condition is updated.
- 27135 • A second optional [ELOOP] error condition is added.
- 27136 • The [Eoverflow] mandatory error condition is added.

27137 Text is added to the DESCRIPTION to say that the *nftw()* function need not be reentrant and
 27138 that the results are unspecified if the application-supplied *fn* function does not preserve the
 27139 current working directory.

27140 **NAME**

27141 *nice* — change the nice value of a process

27142 **SYNOPSIS**

27143 XSI `#include <unistd.h>`

27144 `int nice(int incr);`

27145

27146 **DESCRIPTION**

27147 The *nice()* function shall add the value of *incr* to the nice value of the calling process. A process' nice value is a non-negative number for which a more positive value shall result in less favorable scheduling.

27150 A maximum nice value of 2*{NZERO}-1 and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

27153 PS|TPS Calling the *nice()* function has no effect on the priority of processes or threads with policy SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

27156 The nice value set with *nice()* shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

27158 As -1 is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call *nice()*, and if it returns -1, check to see whether *errno* is non-zero.

27161 **RETURN VALUE**

27162 Upon successful completion, *nice()* shall return the new nice value -{NZERO}. Otherwise, -1 shall be returned, the process' nice value shall not be changed, and *errno* shall be set to indicate the error.

27165 **ERRORS**

27166 The *nice()* function shall fail if:

27167 [EPERM] The *incr* argument is negative and the calling process does not have appropriate privileges.

27169 **EXAMPLES**

27170 **Changing the Nice Value**

27171 The following example adds the value of the *incr* argument, -20, to the nice value of the calling process.

27173 `#include <unistd.h>`

27174 `...`

27175 `int incr = -20;`

27176 `int ret;`

27177 `ret = nice(incr);`

27178 **APPLICATION USAGE**

27179 None.

27180 **RATIONALE**

27181 None.

27182 **FUTURE DIRECTIONS**

27183 None.

27184 **SEE ALSO**

27185 *getpriority()*, *setpriority()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<limits.h>**,
27186 **<unistd.h>**

27187 **CHANGE HISTORY**

27188 First released in Issue 1. Derived from Issue 1 of the SVID.

27189 **Issue 5**

27190 A statement is added to the description indicating the effects of this function on the different
27191 scheduling policies and multi-threaded processes.

27192 **NAME**

27193 nl_langinfo — language information

27194 **SYNOPSIS**

27195 xSI #include <langinfo.h>

27196 char *nl_langinfo(nl_item item);

27197

27198 **DESCRIPTION**

27199 The *nl_langinfo()* function shall return a pointer to a string containing information relevant to
 27200 the particular language or cultural area defined in the program's locale (see <langinfo.h>). The
 27201 manifest constant names and values of *item* are defined in <langinfo.h>. For example:

27202 nl_langinfo(ABDAY_1)

27203 would return a pointer to the string "Dom" if the identified language was Portuguese, and
 27204 "Sun" if the identified language was English.

27205 Calls to *setlocale()* with a category corresponding to the category of *item* (see <langinfo.h>), or to
 27206 the category *LC_ALL*, may overwrite the array pointed to by the return value.

27207 The *nl_langinfo()* function need not be reentrant. A function that is not required to be reentrant is
 27208 not required to be thread-safe.

27209 **RETURN VALUE**

27210 In a locale where *langinfo* data is not defined, *nl_langinfo()* shall return a pointer to the
 27211 corresponding string in the POSIX locale. In all locales, *nl_langinfo()* shall return a pointer to an
 27212 empty string if *item* contains an invalid setting.

27213 This pointer may point to static data that may be overwritten on the next call.

27214 **ERRORS**

27215 No errors are defined.

27216 **EXAMPLES**27217 **Getting Date and Time Formatting Information**

27218 The following example returns a pointer to a string containing date and time formatting
 27219 information, as defined in the *LC_TIME* category of the current locale.

27220 #include <time.h>

27221 #include <langinfo.h>

27222 ...

27223 strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

27224 ...

27225 **APPLICATION USAGE**

27226 The array pointed to by the return value should not be modified by the program, but may be
 27227 modified by further calls to *nl_langinfo()*.

27228 **RATIONALE**

27229 None.

27230 **FUTURE DIRECTIONS**

27231 None.

27232 **SEE ALSO**

27233 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <**langinfo.h**>,
27234 <**nl_types.h**>

27235 **CHANGE HISTORY**

27236 First released in Issue 2.

27237 **Issue 5**

27238 The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.

27239 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

27240 NAME

27241 nrand48 — generate uniformly distributed pseudo-random non-negative long integers

27242 SYNOPSIS

27243 xSI `#include <stdlib.h>`

27244 `long nrand48(unsigned short xsubi[3]);`

27245

27246 DESCRIPTION

27247 Refer to *drand48()*.

27248 **NAME**

27249 ntohl, ntohs — convert values between host and network byte order

27250 **SYNOPSIS**

27251 #include <arpa/inet.h>

27252 uint32_t ntohl(uint32_t *netlong*);27253 uint16_t ntohs(uint16_t *netshort*);27254 **DESCRIPTION**27255 Refer to *htonl()*.

27256 **NAME**

27257 open — open a file

27258 **SYNOPSIS**

27259 OH #include <sys/stat.h>

27260 #include <fcntl.h>

27261 int open(const char *path, int oflag, ...);

27262 **DESCRIPTION**

27263 The *open()* function shall establish the connection between a file and a file descriptor. It shall
 27264 create an open file description that refers to a file and a file descriptor that refers to that open file
 27265 description. The file descriptor is used by other I/O functions to refer to that file. The *path*
 27266 argument points to a pathname naming the file.

27267 The *open()* function shall return a file descriptor for the named file that is the lowest file
 27268 descriptor not currently open for that process. The open file description is new, and therefore the
 27269 file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file
 27270 descriptor flag associated with the new file descriptor shall be cleared.

27271 The file offset used to mark the current position within the file shall be set to the beginning of the
 27272 file.

27273 The file status flags and file access modes of the open file description shall be set according to
 27274 the value of *oflag*.

27275 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list,
 27276 defined in <fcntl.h>. Applications shall specify exactly one of the first three values (file access
 27277 modes) below in the value of *oflag*:

27278 O_RDONLY Open for reading only.

27279 O_WRONLY Open for writing only.

27280 O_RDWR Open for reading and writing. The result is undefined if this flag is applied to
 27281 a FIFO.

27282 Any combination of the following may be used:

27283 O_APPEND If set, the file offset shall be set to the end of the file prior to each write.

27284 O_CREAT If the file exists, this flag has no effect except as noted under O_EXCL below.
 27285 Otherwise, the file shall be created; the user ID of the file shall be set to the
 27286 effective user ID of the process; the group ID of the file shall be set to the
 27287 group ID of the file's parent directory or to the effective group ID of the
 27288 process; and the access permission bits (see <sys/stat.h>) of the file mode shall
 27289 be set to the value of the third argument taken as type **mode_t** modified as
 27290 follows: a bitwise AND is performed on the file-mode bits and the
 27291 corresponding bits in the complement of the process' file mode creation mask.
 27292 Thus, all bits in the file mode whose corresponding bit in the file mode
 27293 creation mask is set are cleared. When bits other than the file permission bits
 27294 are set, the effect is unspecified. The third argument does not affect whether
 27295 the file is open for reading, writing, or for both. Implementations shall provide
 27296 a way to initialize the file's group ID to the group ID of the parent directory.
 27297 Implementations may, but need not, provide an implementation-defined way
 27298 to initialize the file's group ID to the effective group ID of the calling process.

27299 SIO O_DSYNC Write I/O operations on the file descriptor shall complete as defined by
 27300 synchronized I/O data integrity completion.

27301	O_EXCL	If O_CREAT and O_EXCL are set, <i>open()</i> shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing <i>open()</i> naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and <i>path</i> names a symbolic link, <i>open()</i> shall fail and set <i>errno</i> to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.
27302		
27303		
27304		
27305		
27306		
27307		
27308	O_NOCTTY	If set and <i>path</i> identifies a terminal device, <i>open()</i> shall not cause the terminal device to become the controlling terminal for the process.
27309		
27310	O_NONBLOCK	When opening a FIFO with O_RDONLY or O_WRONLY set:
27311		• If O_NONBLOCK is set, an <i>open()</i> for reading-only shall return without delay. An <i>open()</i> for writing-only shall return an error if no process currently has the file open for reading.
27312		
27313		
27314		• If O_NONBLOCK is clear, an <i>open()</i> for reading-only shall block the calling thread until a thread opens the file for writing. An <i>open()</i> for writing-only shall block the calling thread until a thread opens the file for reading.
27315		
27316		
27317		
27318		When opening a block special or character special file that supports non-
27319		blocking opens:
27320		• If O_NONBLOCK is set, the <i>open()</i> function shall return without blocking for the device to be ready or available. Subsequent behavior of the device is device-specific.
27321		
27322		
27323		• If O_NONBLOCK is clear, the <i>open()</i> function shall block the calling thread until the device is ready or available before returning.
27324		
27325		Otherwise, the behavior of O_NONBLOCK is unspecified.
27326 SIO	O_RSYNC	Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in <i>oflag</i> , all I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
27327		
27328		
27329		
27330		
27331		
27332		
27333 SIO	O_SYNC	Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.
27334		
27335	O_TRUNC	If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files or terminal device files. Its effect on other file types is implementation-defined. The result of using O_TRUNC with O_RDONLY is undefined.
27336		
27337		
27338		
27339		
27340		If O_CREAT is set and the file did not previously exist, upon successful completion, <i>open()</i> shall mark for update the <i>st_atime</i> , <i>st_ctime</i> , and <i>st_mtime</i> fields of the file and the <i>st_ctime</i> and <i>st_mtime</i> fields of the parent directory.
27341		
27342		
27343		If O_TRUNC is set and the file did previously exist, upon successful completion, <i>open()</i> shall mark for update the <i>st_ctime</i> and <i>st_mtime</i> fields of the file.
27344		

27345 SIO	If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.	
27346		
27347 XSR	If <i>path</i> refers to a STREAMS file, <i>oflag</i> may be constructed from O_NONBLOCK OR'ed with	
27348	either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to	
27349	STREAMS devices and shall have no effect on them. The value O_NONBLOCK affects the	
27350	operation of STREAMS drivers and certain functions applied to file descriptors associated with	
27351	STREAMS files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.	
27352		
27353 XSI	If <i>path</i> names the master side of a pseudo-terminal device, then it is unspecified whether <i>open()</i>	
27354	locks the slave side so that it cannot be opened. Conforming applications shall call <i>unlockpt()</i>	
27355	before opening the slave side.	
27356	The largest value that can be represented correctly in an object of type off_t shall be established	
27357	as the offset maximum in the open file description.	
27358	RETURN VALUE	
27359	Upon successful completion, the function shall open the file and return a non-negative integer	
27360	representing the lowest numbered unused file descriptor. Otherwise, -1 shall be returned and	
27361	<i>errno</i> set to indicate the error. No files shall be created or modified if the function returns -1.	
27362	ERRORS	
27363	The <i>open()</i> function shall fail if:	
27364	[EACCES]	Search permission is denied on a component of the path prefix, or the file
27365		exists and the permissions specified by <i>oflag</i> are denied, or the file does not
27366		exist and write permission is denied for the parent directory of the file to be
27367		created, or O_TRUNC is specified and write permission is denied.
27368	[EEXIST]	O_CREAT and O_EXCL are set, and the named file exists.
27369	[EINTR]	A signal was caught during <i>open()</i> .
27370 SIO	[EINVAL]	The implementation does not support synchronized I/O for this file.
27371 XSR	[EIO]	The <i>path</i> argument names a STREAMS file and a hangup or error occurred
27372		during the <i>open()</i> .
27373	[EISDIR]	The named file is a directory and <i>oflag</i> includes O_WRONLY or O_RDWR.
27374	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i>
27375		argument.
27376	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
27377	[ENAMETOOLONG]	
27378		The length of the <i>path</i> argument exceeds {PATH_MAX} or a pathname
27379		component is longer than {NAME_MAX}.
27380	[ENFILE]	The maximum allowable number of files is currently open in the system.
27381	[ENOENT]	O_CREAT is not set and the named file does not exist; or O_CREAT is set and
27382		either the path prefix does not exist or the <i>path</i> argument points to an empty
27383		string.
27384 XSR	[ENOSR]	The <i>path</i> argument names a STREAMS-based file and the system is unable to
27385		allocate a STREAM.
27386	[ENOSPC]	The directory or file system that would contain the new file cannot be
27387		expanded, the file does not exist, and O_CREAT is specified.

27388	[ENOTDIR]	A component of the path prefix is not a directory.
27389	[ENXIO]	O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no
27390		process has the file open for reading.
27391	[ENXIO]	The named file is a character special or block special file, and the device
27392		associated with this special file does not exist.
27393	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented
27394		correctly in an object of type off_t .
27395	[EROFS]	The named file resides on a read-only file system and either O_WRONLY,
27396		O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the <i>oflag</i>
27397		argument.
27398	The <i>open()</i> function may fail if:	
27399 XSI	[EAGAIN]	The <i>path</i> argument names the slave side of a pseudo-terminal device that is
27400		locked.
27401	[EINVAL]	The value of the <i>oflag</i> argument is not valid.
27402	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
27403		resolution of the <i>path</i> argument.
27404	[ENAMETOOLONG]	
27405		As a result of encountering a symbolic link in resolution of the <i>path</i> argument,
27406		the length of the substituted pathname string exceeded {PATH_MAX}.
27407 XSR	[ENOMEM]	The <i>path</i> argument names a STREAMS file and the system is unable to allocate
27408		resources.
27409	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>oflag</i> is
27410		O_WRONLY or O_RDWR.

27411 EXAMPLES

27412 Opening a File for Writing by the Owner

27413 The following example opens the file **/tmp/file**, either by creating it (if it does not already exist),
 27414 or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file,
 27415 the access permission bits in the file mode of the file are set to permit reading and writing by the
 27416 owner, and to permit reading only by group members and others.

27417 If the call to *open()* is successful, the file is opened for writing.

```

27418 #include <fcntl.h>
27419 ...
27420 int fd;
27421 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
27422 char *filename = "/tmp/file";
27423 ...
27424 fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
27425 ...

```

Opening a File Using an Existence Check

The following example uses the *open()* function to try to create the **LOCKFILE** file and open it for writing. Since the *open()* function specifies the **O_EXCL** flag, the call fails if the file already exists. In that case, the program assumes that someone else is updating the password file and exits.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd; /* Integer for file descriptor returned by open() call. */
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
```

Opening a File for Writing

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

```
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
char filename[PATH_MAX+1];
...
if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    perror("Cannot open output file\n"); exit(1);
}
...
```

APPLICATION USAGE

None.

RATIONALE

Except as specified in this volume of IEEE Std 1003.1-2001, the flags allowed in *oflag* are not mutually-exclusive and any number of them may be used simultaneously.

Some implementations permit opening FIFOs with **O_RDWR**. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

See *getgroups()* about the group of a newly created file.

27471 The use of *open()* to create a regular file is preferable to the use of *creat()*, because the latter is
 27472 redundant and included only for historical reasons.

27473 The use of the *O_TRUNC* flag on FIFOs and directories (pipes cannot be *open()*-ed) must be
 27474 permissible without unexpected side effects (for example, *creat()* on a FIFO must not remove
 27475 data). Since terminal special files might have type-ahead data stored in the buffer, *O_TRUNC*
 27476 should not affect their content, particularly if a program that normally opens a regular file
 27477 should open the current controlling terminal instead. Other file types, particularly
 27478 implementation-defined ones, are left implementation-defined.

27479 IEEE Std 1003.1-2001 permits [*EACCES*] to be returned for conditions other than those explicitly
 27480 listed.

27481 The *O_NOCTTY* flag was added to allow applications to avoid unintentionally acquiring a
 27482 controlling terminal as a side effect of opening a terminal file. This volume of
 27483 IEEE Std 1003.1-2001 does not specify how a controlling terminal is acquired, but it allows an
 27484 implementation to provide this on *open()* if the *O_NOCTTY* flag is not set and other conditions
 27485 specified in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal
 27486 Interface are met. The *O_NOCTTY* flag is an effective no-op if the file being opened is not a
 27487 terminal device.

27488 In historical implementations the value of *O_RDONLY* is zero. Because of that, it is not possible
 27489 to detect the presence of *O_RDONLY* and another option. Future implementations should
 27490 encode *O_RDONLY* and *O_WRONLY* as bit flags so that:

27491 *O_RDONLY* | *O_WRONLY* == *O_RDWR*

27492 In general, the *open()* function follows the symbolic link if *path* names a symbolic link. However,
 27493 the *open()* function, when called with *O_CREAT* and *O_EXCL*, is required to fail with [*EEXIST*]
 27494 if *path* names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This
 27495 behavior is required so that privileged applications can create a new file in a known location
 27496 without the possibility that a symbolic link might cause the file to be created in a different
 27497 location.

27498 For example, a privileged application that must create a file with a predictable name in a user-
 27499 writable directory, such as the user's home directory, could be compromised if the user creates a
 27500 symbolic link with that name that refers to a nonexistent file in a system directory. If the user can
 27501 influence the contents of a file, the user could compromise the system by creating a new system
 27502 configuration or spool file that would then be interpreted by the system. The test for a symbolic
 27503 link which refers to a nonexistent file must be atomic with the creation of a new file.

27504 The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group
 27505 ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required
 27506 that implementations provide a way to have the group ID be set to the group ID of the
 27507 containing directory, but did not prohibit implementations also supporting a way to set the
 27508 group ID to the effective group ID of the creating process. Conforming applications should not
 27509 assume which group ID will be used. If it matters, an application can use *chown()* to set the
 27510 group ID after the file is created, or determine under what conditions the implementation will
 27511 set the desired group ID.

27512 FUTURE DIRECTIONS

27513 None.

27514 SEE ALSO

27515 *chmod()*, *close()*, *creat()*, *dup()*, *fcntl()*, *lseek()*, *read()*, *umask()*, *unlockpt()*, *write()*, the Base
 27516 Definitions volume of IEEE Std 1003.1-2001, <*fcntl.h*>, <*sys/stat.h*>, <*sys/types.h*>

27517 **CHANGE HISTORY**

27518 First released in Issue 1. Derived from Issue 1 of the SVID.

27519 **Issue 5**

27520 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
27521 Threads Extension.

27522 Large File Summit extensions are added.

27523 **Issue 6**

27524 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

27525 The following new requirements on POSIX implementations derive from alignment with the
27526 Single UNIX Specification:

27527 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
27528 required for conforming implementations of previous POSIX specifications, it was not
27529 required for UNIX applications.

27530 • In the DESCRIPTION, O_CREAT is amended to state that the group ID of the file is set to the
27531 group ID of the file's parent directory or to the effective group ID of the process. This is a
27532 FIPS requirement.

27533 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file
27534 description. This change is to support large files.

27535 • In the ERRORS section, the [Eoverflow] condition is added. This change is to support
27536 large files.

27537 • The [ENXIO] mandatory error condition is added.

27538 • The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.

27539 The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI
27540 STREAMS Option Group are marked.

27541 The following changes were made to align with the IEEE P1003.1a draft standard:

27542 • An explanation is added of the effect of the O_CREAT and O_EXCL flags when the path
27543 refers to a symbolic link.

27544 • The [ELOOP] optional error condition is added.

27545 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

27546 The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.

27547 **NAME**

27548 opendir — open a directory

27549 **SYNOPSIS**

27550 #include <dirent.h>

27551 DIR *opendir(const char *dirname);

27552 **DESCRIPTION**

27553 The *opendir()* function shall open a directory stream corresponding to the directory named by
 27554 the *dirname* argument. The directory stream is positioned at the first entry. If the type **DIR** is
 27555 implemented using a file descriptor, applications shall only be able to open up to a total of
 27556 {OPEN_MAX} files and directories.

27557 **RETURN VALUE**

27558 Upon successful completion, *opendir()* shall return a pointer to an object of type **DIR**.
 27559 Otherwise, a null pointer shall be returned and *errno* set to indicate the error.

27560 **ERRORS**27561 The *opendir()* function shall fail if:

27562 [EACCES] Search permission is denied for the component of the path prefix of *dirname* or
 27563 read permission is denied for *dirname*.

27564 [ELOOP] A loop exists in symbolic links encountered during resolution of the *dirname*
 27565 argument.

27566 [ENAMETOOLONG] The length of the *dirname* argument exceeds {PATH_MAX} or a pathname
 27567 component is longer than {NAME_MAX}.
 27568

27569 [ENOENT] A component of *dirname* does not name an existing directory or *dirname* is an
 27570 empty string.

27571 [ENOTDIR] A component of *dirname* is not a directory.

27572 The *opendir()* function may fail if:

27573 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 27574 resolution of the *dirname* argument.

27575 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

27576 [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the *dirname*
 27577 argument, the length of the substituted pathname string exceeded
 27578 {PATH_MAX}.
 27579

27580 [ENFILE] Too many files are currently open in the system.

27581 EXAMPLES

27582 Open a Directory Stream

27583 The following program fragment demonstrates how the *opendir()* function is used.

```
27584 #include <sys/types.h>
27585 #include <dirent.h>
27586 #include <libgen.h>
27587 ...
27588     DIR *dir;
27589     struct dirent *dp;
27590 ...
27591     if ((dir = opendir(".")) == NULL) {
27592         perror("Cannot open .");
27593         exit(1);
27594     }
27595     while ((dp = readdir(dir)) != NULL) {
27596         ...
```

27597 APPLICATION USAGE

27598 The *opendir()* function should be used in conjunction with *readdir()*, *closedir()*, and *rewinddir()* to
 27599 examine the contents of the directory (see the EXAMPLES section in *readdir()*). This method is
 27600 recommended for portability.

27601 RATIONALE

27602 Based on historical implementations, the rules about file descriptors apply to directory streams
 27603 as well. However, this volume of IEEE Std 1003.1-2001 does not mandate that the directory
 27604 stream be implemented using file descriptors. The description of *closedir()* clarifies that if a file
 27605 descriptor is used for the directory stream, it is mandatory that *closedir()* deallocate the file
 27606 descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the
 27607 FD_CLOEXEC had been set for the file descriptor.

27608 The directory entries for dot and dot-dot are optional. This volume of IEEE Std 1003.1-2001 does
 27609 not provide a way to test *a priori* for their existence because an application that is portable must
 27610 be written to look for (and usually ignore) those entries. Writing code that presumes that they
 27611 are the first two entries does not always work, as many implementations permit them to be
 27612 other than the first two entries, with a “normal” entry preceding them. There is negligible value
 27613 in providing a way to determine what the implementation does because the code to deal with
 27614 dot and dot-dot must be written in any case and because such a flag would add to the list of
 27615 those flags (which has proven in itself to be objectionable) and might be abused.

27616 Since the structure and buffer allocation, if any, for directory operations are defined by the
 27617 implementation, this volume of IEEE Std 1003.1-2001 imposes no portability requirements for
 27618 erroneous program constructs, erroneous data, or the use of unspecified values such as the use
 27619 or referencing of a *dirp* value or a **dirent** structure value after a directory stream has been closed
 27620 or after a *fork()* or one of the *exec* function calls.

27621 FUTURE DIRECTIONS

27622 None.

27623 SEE ALSO

27624 *closedir()*, *lstat()*, *readdir()*, *rewinddir()*, *symlink()*, the Base Definitions volume of
 27625 IEEE Std 1003.1-2001, **<dirent.h>**, **<limits.h>**, **<sys/types.h>**

27626 **CHANGE HISTORY**

27627 First released in Issue 2.

27628 **Issue 6**27629 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.27630 The following new requirements on POSIX implementations derive from alignment with the
27631 Single UNIX Specification:27632 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
27633 required for conforming implementations of previous POSIX specifications, it was not
27634 required for UNIX applications.

27635 • The [ELOOP] mandatory error condition is added.

27636 • A second [ENAMETOOLONG] is added as an optional error condition.

27637 The following changes were made to align with the IEEE P1003.1a draft standard:

27638 • The [ELOOP] optional error condition is added.

27639 NAME

27640 openlog — open a connection to the logging facility

27641 SYNOPSIS

27642 xSI #include <syslog.h>

27643 void openlog(const char *ident, int logopt, int facility);

27644

27645 DESCRIPTION

27646 Refer to *closelog()*.

27647 **NAME**

27648 optarg, opterr, optind, optopt — options parsing variables

27649 **SYNOPSIS**

27650 #include <unistd.h>

27651 extern char *optarg;

27652 extern int opterr, optind, optopt;

27653 **DESCRIPTION**

27654 Refer to *getopt()*.

27655 **NAME**

27656 pathconf — get configurable pathname variables

27657 **SYNOPSIS**

27658 #include <unistd.h>

27659 long pathconf(const char *path, int name);

27660 **DESCRIPTION**

27661 Refer to *fpathconf()*.

27662 **NAME**

27663 *pause* — suspend the thread until a signal is received

27664 **SYNOPSIS**

27665 `#include <unistd.h>`

27666 `int pause(void);`

27667 **DESCRIPTION**

27668 The *pause()* function shall suspend the calling thread until delivery of a signal whose action is either to execute a signal-catching function or to terminate the process.

27670 If the action is to terminate the process, *pause()* shall not return.

27671 If the action is to execute a signal-catching function, *pause()* shall return after the signal-catching function returns.

27673 **RETURN VALUE**

27674 Since *pause()* suspends thread execution indefinitely unless interrupted by a signal, there is no successful completion return value. A value of `-1` shall be returned and *errno* set to indicate the error.

27677 **ERRORS**

27678 The *pause()* function shall fail if:

27679 [EINTR] A signal is caught by the calling process and control is returned from the
27680 signal-catching function.

27681 **EXAMPLES**

27682 None.

27683 **APPLICATION USAGE**

27684 Many common uses of *pause()* have timing windows. The scenario involves checking a
27685 condition related to a signal and, if the signal has not occurred, calling *pause()*. When the signal
27686 occurs between the check and the call to *pause()*, the process often blocks indefinitely. The
27687 *sigprocmask()* and *sigsuspend()* functions can be used to avoid this type of problem.

27688 **RATIONALE**

27689 None.

27690 **FUTURE DIRECTIONS**

27691 None.

27692 **SEE ALSO**

27693 *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

27694 **CHANGE HISTORY**

27695 First released in Issue 1. Derived from Issue 1 of the SVID.

27696 **Issue 5**

27697 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

27698 **Issue 6**

27699 The APPLICATION USAGE section is added.

27700 **NAME**

27701 pclose — close a pipe stream to or from a process

27702 **SYNOPSIS**27703 `CX` #include <stdio.h>

27704 int pclose(FILE *stream);

27705

27706 **DESCRIPTION**

27707 The *pclose()* function shall close a stream that was opened by *popen()*, wait for the command to
 27708 terminate, and return the termination status of the process that was running the command
 27709 language interpreter. However, if a call caused the termination status to be unavailable to
 27710 *pclose()*, then *pclose()* shall return -1 with *errno* set to [ECHILD] to report this situation. This can
 27711 happen if the application calls one of the following functions:

- 27712 • *wait()*
- 27713 • *waitpid()* with a *pid* argument less than or equal to 0 or equal to the process ID of the
 27714 command line interpreter
- 27715 • Any other function not defined in this volume of IEEE Std 1003.1-2001 that could do one of
 27716 the above

27717 In any case, *pclose()* shall not return before the child process created by *popen()* has terminated.

27718 If the command language interpreter cannot be executed, the child termination status returned
 27719 by *pclose()* shall be as if the command language interpreter terminated using *exit(127)* or
 27720 *_exit(127)*.

27721 The *pclose()* function shall not affect the termination status of any child of the calling process
 27722 other than the one created by *popen()* for the associated stream.

27723 If the argument *stream* to *pclose()* is not a pointer to a stream created by *popen()*, the result of
 27724 *pclose()* is undefined.

27725 **RETURN VALUE**

27726 Upon successful return, *pclose()* shall return the termination status of the command language
 27727 interpreter. Otherwise, *pclose()* shall return -1 and set *errno* to indicate the error.

27728 **ERRORS**

27729 The *pclose()* function shall fail if:

27730 [ECHILD] The status of the child process could not be obtained, as described above.

27731 **EXAMPLES**

27732 None.

27733 **APPLICATION USAGE**

27734 None.

27735 **RATIONALE**

27736 There is a requirement that *pclose()* not return before the child process terminates. This is
 27737 intended to disallow implementations that return [EINTR] if a signal is received while waiting.
 27738 If *pclose()* returned before the child terminated, there would be no way for the application to
 27739 discover which child used to be associated with the stream, and it could not do the cleanup
 27740 itself.

27741 If the stream pointed to by *stream* was not created by *popen()*, historical implementations of
 27742 *pclose()* return -1 without setting *errno*. To avoid requiring *pclose()* to set *errno* in this case,
 27743 IEEE Std 1003.1-2001 makes the behavior unspecified. An application should not use *pclose()* to

27744 close any stream that was not created by *popen()*.

27745 Some historical implementations of *pclose()* either block or ignore the signals SIGINT, SIGQUIT,
27746 and SIGHUP while waiting for the child process to terminate. Since this behavior is not
27747 described for the *pclose()* function in IEEE Std 1003.1-2001, such implementations are not
27748 conforming. Also, some historical implementations return [EINTR] if a signal is received, even
27749 though the child process has not terminated. Such implementations are also considered non-
27750 conforming.

27751 Consider, for example, an application that uses:

```
27752 popen("command", "r")
```

27753 to start *command*, which is part of the same application. The parent writes a prompt to its
27754 standard output (presumably the terminal) and then reads from the *popen()*ed stream. The child
27755 reads the response from the user, does some transformation on the response (pathname
27756 expansion, perhaps) and writes the result to its standard output. The parent process reads the
27757 result from the pipe, does something with it, and prints another prompt. The cycle repeats.
27758 Assuming that both processes do appropriate buffer flushing, this would be expected to work.

27759 To conform to IEEE Std 1003.1-2001, *pclose()* must use *waitpid()*, or some similar function,
27760 instead of *wait()*.

27761 The code sample below illustrates how the *pclose()* function might be implemented on a system
27762 conforming to IEEE Std 1003.1-2001.

```
27763 int pclose(FILE *stream)
27764 {
27765     int stat;
27766     pid_t pid;
27767
27768     pid = <pid for process created for stream by popen()>
27769     (void) fclose(stream);
27770     while (waitpid(pid, &stat, 0) == -1) {
27771         if (errno != EINTR) {
27772             stat = -1;
27773             break;
27774         }
27775     }
27776     return(stat);
27777 }
```

27777 FUTURE DIRECTIONS

27778 None.

27779 SEE ALSO

27780 *fork()*, *popen()*, *waitpid()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

27781 CHANGE HISTORY

27782 First released in Issue 1. Derived from Issue 1 of the SVID.

27783 **NAME**

27784 perror — write error messages to standard error

27785 **SYNOPSIS**

27786 #include <stdio.h>

27787 void perror(const char *s);

27788 **DESCRIPTION**

27789 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 27790 conflict between the requirements described here and the ISO C standard is unintentional. This
 27791 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

27792 The *perror()* function shall map the error number accessed through the symbol *errno* to a
 27793 language-dependent error message, which shall be written to the standard error stream as
 27794 follows:

- 27795 • First (if *s* is not a null pointer and the character pointed to by *s* is not the null byte), the string
 27796 pointed to by *s* followed by a colon and a <space>.
- 27797 • Then an error message string followed by a <newline>.

27798 The contents of the error message strings shall be the same as those returned by *strerror()* with
 27799 argument *errno*.

27800 CX The *perror()* function shall mark the file associated with the standard error stream as having
 27801 been written (*st_ctime*, *st_mtime* marked for update) at some time between its successful
 27802 completion and *exit()*, *abort()*, or the completion of *fflush()* or *fclose()* on *stderr*.

27803 The *perror()* function shall not change the orientation of the standard error stream.

27804 **RETURN VALUE**27805 The *perror()* function shall not return a value.27806 **ERRORS**

27807 No errors are defined.

27808 **EXAMPLES**27809 **Printing an Error Message for a Function**

27810 The following example replaces *bufptr* with a buffer that is the necessary size. If an error occurs,
 27811 the *perror()* function prints a message and the program exits.

```

27812     #include <stdio.h>
27813     #include <stdlib.h>
27814     ...
27815     char *bufptr;
27816     size_t szbuf;
27817     ...
27818     if ((bufptr = malloc(szbuf)) == NULL) {
27819         perror("malloc"); exit(2);
27820     }
27821     ...
```

27822 **APPLICATION USAGE**

27823 None.

27824 **RATIONALE**

27825 None.

27826 **FUTURE DIRECTIONS**

27827 None.

27828 **SEE ALSO**27829 *strerror()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>27830 **CHANGE HISTORY**

27831 First released in Issue 1. Derived from Issue 1 of the SVID.

27832 **Issue 5**27833 A paragraph is added to the DESCRIPTION indicating that *perror()* does not change the
27834 orientation of the standard error stream.27835 **Issue 6**

27836 Extensions beyond the ISO C standard are marked.

27837 **NAME**

27838 pipe — create an interprocess channel

27839 **SYNOPSIS**

27840 #include <unistd.h>

27841 int pipe(int *fildes*[2]);27842 **DESCRIPTION**

27843 The *pipe()* function shall create a pipe and place two file descriptors, one each into the
 27844 arguments *fildes*[0] and *fildes*[1], that refer to the open file descriptions for the read and write
 27845 ends of the pipe. Their integer values shall be the two lowest available at the time of the *pipe()*
 27846 call. The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The
 27847 *fcntl()* function can be used to set both these flags.)

27848 Data can be written to the file descriptor *fildes*[1] and read from the file descriptor *fildes*[0]. A
 27849 read on the file descriptor *fildes*[0] shall access data written to the file descriptor *fildes*[1] on a
 27850 first-in-first-out basis. It is unspecified whether *fildes*[0] is also open for writing and whether
 27851 *fildes*[1] is also open for reading.

27852 A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open
 27853 that refers to the read end, *fildes*[0] (write end, *fildes*[1]).

27854 Upon successful completion, *pipe()* shall mark for update the *st_atime*, *st_ctime*, and *st_mtime*
 27855 fields of the pipe.

27856 **RETURN VALUE**

27857 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 27858 indicate the error.

27859 **ERRORS**27860 The *pipe()* function shall fail if:

27861	[EMFILE]	More than {OPEN_MAX} minus two file descriptors are already in use by this process.
27862		

27863	[ENFILE]	The number of simultaneously open files in the system would exceed a system-imposed limit.
27864		

27865 **EXAMPLES**

27866 None.

27867 **APPLICATION USAGE**

27868 None.

27869 **RATIONALE**

27870 The wording carefully avoids using the verb “to open” in order to avoid any implication of use
 27871 of *open()*; see also *write()*.

27872 **FUTURE DIRECTIONS**

27873 None.

27874 **SEE ALSO**

27875 *fcntl()*, *read()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <*fcntl.h*>,
 27876 <*unistd.h*>

27877 **CHANGE HISTORY**

27878 First released in Issue 1. Derived from Issue 1 of the SVID.

27879 **Issue 6**

27880 The following new requirements on POSIX implementations derive from alignment with the
27881 Single UNIX Specification:

- 27882 • The DESCRIPTION is updated to indicate that certain dispositions of *fildev[0]* and *fildev[1]*
27883 are unspecified.

27884 **NAME**

27885 poll — input/output multiplexing

27886 **SYNOPSIS**27887 xSI `#include <poll.h>`27888 `int poll(struct pollfd fds[], nfds_t nfds, int timeout);`

27889

27890 **DESCRIPTION**

27891 The `poll()` function provides applications with a mechanism for multiplexing input/output over
 27892 a set of file descriptors. For each member of the array pointed to by `fds`, `poll()` shall examine the
 27893 given file descriptor for the event(s) specified in `events`. The number of **pollfd** structures in the
 27894 `fds` array is specified by `nfds`. The `poll()` function shall identify those file descriptors on which an
 27895 application can read or write data, or on which certain events have occurred.

27896 The `fds` argument specifies the file descriptors to be examined and the events of interest for each
 27897 file descriptor. It is a pointer to an array with one member for each open file descriptor of
 27898 interest. The array's members are **pollfd** structures within which `fd` specifies an open file
 27899 descriptor and `events` and `revents` are bitmasks constructed by OR'ing a combination of the
 27900 following event flags:

27901	POLLIN	Data other than high-priority data may be read without blocking.
27902 xSR		For STREAMS, this flag is set in <code>revents</code> even if the message is of zero length.
27903		This flag shall be equivalent to <code>POLLRDNORM POLLRDBAND</code> .
27904	POLLRDNORM	Normal data may be read without blocking.
27905 xSR		For STREAMS, data on priority band 0 may be read without blocking. This
27906		flag is set in <code>revents</code> even if the message is of zero length.
27907	POLLRDBAND	Priority data may be read without blocking.
27908 xSR		For STREAMS, data on priority bands greater than 0 may be read without
27909		blocking. This flag is set in <code>revents</code> even if the message is of zero length.
27910	POLLPRI	High-priority data may be read without blocking.
27911 xSR		For STREAMS, this flag is set in <code>revents</code> even if the message is of zero length.
27912	POLLOUT	Normal data may be written without blocking.
27913 xSR		For STREAMS, data on priority band 0 may be written without blocking.
27914	POLLWRNORM	Equivalent to <code>POLLOUT</code> .
27915	POLLWRBAND	Priority data may be written.
27916 xSR		For STREAMS, data on priority bands greater than 0 may be written without
27917		blocking. If any priority band has been written to on this STREAM, this event
27918		only examines bands that have been written to at least once.
27919	POLLERR	An error has occurred on the device or stream. This flag is only valid in the
27920		<code>revents</code> bitmask; it shall be ignored in the <code>events</code> member.
27921	POLLHUP	The device has been disconnected. This event and <code>POLLOUT</code> are mutually-
27922		exclusive; a stream can never be writable if a hangup has occurred. However,
27923		this event and <code>POLLIN</code> , <code>POLLRDNORM</code> , <code>POLLRDBAND</code> , or <code>POLLPRI</code> are not
27924		mutually-exclusive. This flag is only valid in the <code>revents</code> bitmask; it shall be
27925		ignored in the <code>events</code> member.

27926	POLLNVAL	The specified <i>fd</i> value is invalid. This flag is only valid in the <i>revents</i> member; it shall ignored in the <i>events</i> member.
27927		
27928		The significance and semantics of normal, priority, and high-priority data are file and device-specific.
27929		
27930		If the value of <i>fd</i> is less than 0, <i>events</i> shall be ignored, and <i>revents</i> shall be set to 0 in that entry on return from <i>poll()</i> .
27931		
27932		In each pollfd structure, <i>poll()</i> shall clear the <i>revents</i> member, except that where the application requested a report on a condition by setting one of the bits of <i>events</i> listed above, <i>poll()</i> shall set the corresponding bit in <i>revents</i> if the requested condition is true. In addition, <i>poll()</i> shall set the POLLHUP, POLLERR, and POLLNVAL flag in <i>revents</i> if the condition is true, even if the application did not set the corresponding bit in <i>events</i> .
27933		
27934		
27935		
27936		
27937		If none of the defined events have occurred on any selected file descriptor, <i>poll()</i> shall wait at least <i>timeout</i> milliseconds for an event to occur on any of the selected file descriptors. If the value of <i>timeout</i> is 0, <i>poll()</i> shall return immediately. If the value of <i>timeout</i> is -1, <i>poll()</i> shall block until a requested event occurs or until the call is interrupted.
27938		
27939		
27940		
27941		Implementations may place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.
27942		
27943		
27944		The <i>poll()</i> function shall not be affected by the O_NONBLOCK flag.
27945		The <i>poll()</i> function shall support regular files, terminal and pseudo-terminal devices, FIFOs, pipes, sockets and STREAMS-based files. The behavior of <i>poll()</i> on elements of <i>fds</i> that refer to other types of file is unspecified.
27946	XSR	
27947		
27948		Regular files shall always poll TRUE for reading and writing.
27949		A file descriptor for a socket that is listening for connections shall indicate that it is ready for reading, once connections are available. A file descriptor for a socket that is connecting asynchronously shall indicate that it is ready for writing, once a connection has been established.
27950		
27951		
27952	RETURN VALUE	
27953		Upon successful completion, <i>poll()</i> shall return a non-negative value. A positive value indicates the total number of file descriptors that have been selected (that is, file descriptors for which the <i>revents</i> member is non-zero). A value of 0 indicates that the call timed out and no file descriptors have been selected. Upon failure, <i>poll()</i> shall return -1 and set <i>errno</i> to indicate the error.
27954		
27955		
27956		
27957	ERRORS	
27958		The <i>poll()</i> function shall fail if:
27959	[EAGAIN]	The allocation of internal data structures failed but a subsequent request may succeed.
27960		
27961	[EINTR]	A signal was caught during <i>poll()</i> .
27962	XSR	
27963	[EINVAL]	The <i>nfds</i> argument is greater than {OPEN_MAX}, or one of the <i>fd</i> members refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.
27964		

27965 **EXAMPLES**27966 **Checking for Events on a Stream**

27967 The following example opens a pair of STREAMS devices and then waits for either one to
 27968 become writable. This example proceeds as follows:

- 27969 1. Sets the *timeout* parameter to 500 milliseconds.
- 27970 2. Opens the STREAMS devices **/dev/dev0** and **/dev/dev1**, and then polls them, specifying
 27971 POLLOUT and POLLWRBAND as the events of interest.
- 27972 The STREAMS device names **/dev/dev0** and **/dev/dev1** are only examples of how
 27973 STREAMS devices can be named; STREAMS naming conventions may vary among
 27974 systems conforming to the IEEE Std 1003.1-2001.
- 27975 3. Uses the *ret* variable to determine whether an event has occurred on either of the two
 27976 STREAMS. The *poll()* function is given 500 milliseconds to wait for an event to occur (if it
 27977 has not occurred prior to the *poll()* call).
- 27978 4. Checks the returned value of *ret*. If a positive value is returned, one of the following can
 27979 be done:
 - 27980 a. Priority data can be written to the open STREAM on priority bands greater than 0,
 27981 because the POLLWRBAND event occurred on the open STREAM (*fds*[0] or *fds*[1]).
 - 27982 b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT
 27983 event occurred on the open STREAM (*fds*[0] or *fds*[1]).
- 27984 5. If the returned value is not a positive value, permission to write data to the open STREAM
 27985 (on any priority band) is denied.
- 27986 6. If the POLLHUP event occurs on the open STREAM (*fds*[0] or *fds*[1]), the device on the
 27987 open STREAM has disconnected.

```

27988 #include <stropts.h>
27989 #include <poll.h>
27990 ...
27991 struct pollfd fds[2];
27992 int timeout_msecs = 500;
27993 int ret;
27994 int i;

27995 /* Open STREAMS device. */
27996 fds[0].fd = open("/dev/dev0", ...);
27997 fds[1].fd = open("/dev/dev1", ...);
27998     fds[0].events = POLLOUT | POLLWRBAND;
27999     fds[1].events = POLLOUT | POLLWRBAND;

28000 ret = poll(fds, 2, timeout_msecs);

28001 if (ret > 0) {
28002     /* An event on one of the fds has occurred. */
28003     for (i=0; i<2; i++) {
28004         if (fds[i].revents & POLLWRBAND) {
28005             /* Priority data may be written on device number i. */
28006             ...
28007         }
28008         if (fds[i].revents & POLLOUT) {

```

```

28009          /* Data may be written on device number i. */
28010      ...
28011      }
28012      if (fds[i].revents & POLLHUP) {
28013          /* A hangup has occurred on device number i. */
28014      ...
28015      }
28016      }
28017  }

```

28027 CHANGE HISTORY

28028 First released in Issue 4, Version 2.

28029 Issue 5

28030 Moved from X/OPEN UNIX extension to BASE.

28031 The description of POLLWRBAND is updated.

28032 Issue 6

28033 Text referring to sockets is added to the DESCRIPTION.

28034 Text relating to the XSI STREAMS Option Group is marked.

28035 The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of
 28036 POLLWRBAND.

28037 **NAME**

28038 popen — initiate pipe streams to or from a process

28039 **SYNOPSIS**28040 CX `#include <stdio.h>`28041 `FILE *popen(const char *command, const char *mode);`

28042

28043 **DESCRIPTION**

28044 The *popen()* function shall execute the command specified by the string *command*. It shall create a
 28045 pipe between the calling program and the executed command, and shall return a pointer to a
 28046 stream that can be used to either read from or write to the pipe.

28047 The environment of the executed command shall be as if a child process were created within the
 28048 *popen()* call using the *fork()* function, and the child invoked the *sh* utility using the call:

28049 `execl(shell_path, "sh", "-c", command, (char *)0);`28050 where *shell_path* is an unspecified pathname for the *sh* utility.

28051 The *popen()* function shall ensure that any streams from previous *popen()* calls that remain open
 28052 in the parent process are closed in the new child process.

28053 The *mode* argument to *popen()* is a string that specifies I/O mode:

- 28054 1. If *mode* is *r*, when the child process is started, its file descriptor `STDOUT_FILENO` shall be
 28055 the writable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,
 28056 where *stream* is the stream pointer returned by *popen()*, shall be the readable end of the
 28057 pipe.
- 28058 2. If *mode* is *w*, when the child process is started its file descriptor `STDIN_FILENO` shall be
 28059 the readable end of the pipe, and the file descriptor *fileno(stream)* in the calling process,
 28060 where *stream* is the stream pointer returned by *popen()*, shall be the writable end of the
 28061 pipe.
- 28062 3. If *mode* is any other value, the result is undefined.

28063 After *popen()*, both the parent and the child process shall be capable of executing independently
 28064 before either terminates.

28065 Pipe streams are byte-oriented.

28066 **RETURN VALUE**

28067 Upon successful completion, *popen()* shall return a pointer to an open stream that can be used to
 28068 read or write to the pipe. Otherwise, it shall return a null pointer and may set *errno* to indicate
 28069 the error.

28070 **ERRORS**28071 The *popen()* function may fail if:

28072 [EMFILE] {FOPEN_MAX} or {STREAM_MAX} streams are currently open in the calling
 28073 process.

28074 [EINVAL] The *mode* argument is invalid.28075 The *popen()* function may also set *errno* values as described by *fork()* or *pipe()*.

28076 **EXAMPLES**

28077 None.

28078 **APPLICATION USAGE**

28079 Since open files are shared, a mode *r* command can be used as an input filter and a mode *w*
 28080 command as an output filter.

28081 Buffered reading before opening an input filter may leave the standard input of that filter
 28082 mispositioned. Similar problems with an output filter may be prevented by careful buffer
 28083 flushing; for example, with *fflush()*.

28084 A stream opened by *popen()* should be closed by *pclose()*.

28085 The behavior of *popen()* is specified for values of *mode* of *r* and *w*. Other modes such as *rb* and
 28086 *wb* might be supported by specific implementations, but these would not be portable features.
 28087 Note that historical implementations of *popen()* only check to see if the first character of *mode* is
 28088 *r*. Thus, a *mode* of *robert the robot* would be treated as *mode r*, and a *mode* of *anything else* would be
 28089 treated as *mode w*.

28090 If the application calls *waitpid()* or *waitid()* with a *pid* argument greater than 0, and it still has a
 28091 stream that was called with *popen()* open, it must ensure that *pid* does not refer to the process
 28092 started by *popen()*.

28093 To determine whether or not the environment specified in the Shell and Utilities volume of
 28094 IEEE Std 1003.1-2001 is present, use the function call:

28095 *sysconf* (*_SC_2_VERSION*)

28096 (See *sysconf()*).

28097 **RATIONALE**

28098 The *popen()* function should not be used by programs that have set user (or group) ID privileges.
 28099 The *fork()* and *exec* family of functions (except *execlp()* and *execvp()*), should be used instead.
 28100 This prevents any unforeseen manipulation of the environment of the user that could cause
 28101 execution of commands not anticipated by the calling program.

28102 If the original and *popen()*ed processes both intend to read or write or read and write a common
 28103 file, and either will be using FILE-type C functions (*fread()*, *fwrite()*, and so on), the rules for
 28104 sharing file handles must be observed (see Section 2.5.1 (on page 35)).

28105 **FUTURE DIRECTIONS**

28106 None.

28107 **SEE ALSO**

28108 *pclose()*, *pipe()*, *sysconf()*, *system()*, the Base Definitions volume of IEEE Std 1003.1-2001,

28110 **CHANGE HISTORY**

28111 First released in Issue 1. Derived from Issue 1 of the SVID.

28112 **Issue 5**

28113 A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

28114 **Issue 6**

28115 The following new requirements on POSIX implementations derive from alignment with the
 28116 Single UNIX Specification:

- 28117 • The optional [EMFILE] error condition is added.

28118 NAME

28119 posix_fadvise — file advisory information (**ADVANCED REALTIME**)

28120 SYNOPSIS

28121 ADV `#include <fcntl.h>`

28122 `int posix_fadvise(int fd, off_t offset, size_t len, int advice);`

28123

28124 DESCRIPTION

28125 The *posix_fadvise()* function shall advise the implementation on the expected behavior of the
 28126 application with respect to the data in the file associated with the open file descriptor, *fd*,
 28127 starting at *offset* and continuing for *len* bytes. The specified range need not currently exist in the
 28128 file. If *len* is zero, all data following *offset* is specified. The implementation may use this
 28129 information to optimize handling of the specified data. The *posix_fadvise()* function shall have no
 28130 effect on the semantics of other operations on the specified data, although it may affect the
 28131 performance of other operations.

28132 The advice to be applied to the data is specified by the *advice* parameter and may be one of the
 28133 following values:

28134 POSIX_FADV_NORMAL

28135 Specifies that the application has no advice to give on its behavior with respect to the
 28136 specified data. It is the default characteristic if no advice is given for an open file.

28137 POSIX_FADV_SEQUENTIAL

28138 Specifies that the application expects to access the specified data sequentially from lower
 28139 offsets to higher offsets.

28140 POSIX_FADV_RANDOM

28141 Specifies that the application expects to access the specified data in a random order.

28142 POSIX_FADV_WILLNEED

28143 Specifies that the application expects to access the specified data in the near future.

28144 POSIX_FADV_DONTNEED

28145 Specifies that the application expects that it will not access the specified data in the near
 28146 future.

28147 POSIX_FADV_NOREUSE

28148 Specifies that the application expects to access the specified data once and then not reuse it
 28149 thereafter.

28150 These values are defined in `<fcntl.h>`.

28151 RETURN VALUE

28152 Upon successful completion, *posix_fadvise()* shall return zero; otherwise, an error number shall
 28153 be returned to indicate the error.

28154 ERRORS

28155 The *posix_fadvise()* function shall fail if:

28156 [EBADF] The *fd* argument is not a valid file descriptor.

28157 [EINVAL] The value of *advice* is invalid.

28158 [ESPIPE] The *fd* argument is associated with a pipe or FIFO.

28159 **EXAMPLES**

28160 None.

28161 **APPLICATION USAGE**

28162 The *posix_fadvise()* function is part of the Advisory Information option and need not be provided
28163 on all implementations.

28164 **RATIONALE**

28165 None.

28166 **FUTURE DIRECTIONS**

28167 None.

28168 **SEE ALSO**28169 *posix_madvise()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>28170 **CHANGE HISTORY**

28171 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28172 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

28173 NAME

28174 posix_fallocate — file space control (**ADVANCED REALTIME**)

28175 SYNOPSIS

28176 ADV `#include <fcntl.h>`

28177 `int posix_fallocate(int fd, off_t offset, size_t len);`

28178

28179 DESCRIPTION

28180 The *posix_fallocate()* function shall ensure that any required storage for regular file data starting
28181 at *offset* and continuing for *len* bytes is allocated on the file system storage media. If
28182 *posix_fallocate()* returns successfully, subsequent writes to the specified file data shall not fail
28183 due to the lack of free space on the file system storage media.

28184 If the *offset+len* is beyond the current file size, then *posix_fallocate()* shall adjust the file size to
28185 *offset+len*. Otherwise, the file size shall not be changed.

28186 It is implementation-defined whether a previous *posix_fadvise()* call influences allocation
28187 strategy.

28188 Space allocated via *posix_fallocate()* shall be freed by a successful call to *creat()* or *open()* that
28189 truncates the size of the file. Space allocated via *posix_fallocate()* may be freed by a successful call
28190 to *ftruncate()* that reduces the file size to a size smaller than *offset+len*.

28191 RETURN VALUE

28192 Upon successful completion, *posix_fallocate()* shall return zero; otherwise, an error number shall
28193 be returned to indicate the error.

28194 ERRORS

28195 The *posix_fallocate()* function shall fail if:

- 28196 [EBADF] The *fd* argument is not a valid file descriptor.
- 28197 [EBADF] The *fd* argument references a file that was opened without write permission.
- 28198 [EFBIG] The value of *offset+len* is greater than the maximum file size.
- 28199 [EINTR] A signal was caught during execution.
- 28200 [EINVAL] The *len* argument was zero or the *offset* argument was less than zero.
- 28201 [EIO] An I/O error occurred while reading from or writing to a file system.
- 28202 [ENODEV] The *fd* argument does not refer to a regular file.
- 28203 [ENOSPC] There is insufficient free space remaining on the file system storage media.
- 28204 [ESPIPE] The *fd* argument is associated with a pipe or FIFO.

28205 EXAMPLES

28206 None.

28207 APPLICATION USAGE

28208 The *posix_fallocate()* function is part of the Advisory Information option and need not be
28209 provided on all implementations.

28210 RATIONALE

28211 None.

28212 **FUTURE DIRECTIONS**

28213 None.

28214 **SEE ALSO**

28215 *creat()*, *ftruncate()*, *open()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,
28216 <fcntl.h>

28217 **CHANGE HISTORY**

28218 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28219 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

28220 NAME

28221 posix_madvise — memory advisory information and alignment control (**ADVANCED**
28222 **REALTIME**)

28223 SYNOPSIS

28224 ADV `#include <sys/mman.h>`

28225 `int posix_madvise(void *addr, size_t len, int advice);`
28226

28227 DESCRIPTION

28228 MF|SHM The *posix_madvise()* function need only be supported if either the Memory Mapped Files or the
28229 Shared Memory Objects options are supported.

28230 The *posix_madvise()* function shall advise the implementation on the expected behavior of the
28231 application with respect to the data in the memory starting at address *addr*, and continuing for
28232 *len* bytes. The implementation may use this information to optimize handling of the specified
28233 data. The *posix_madvise()* function shall have no effect on the semantics of access to memory in
28234 the specified range, although it may affect the performance of access.

28235 The implementation may require that *addr* be a multiple of the page size, which is the value
28236 returned by *sysconf()* when the name value *_SC_PAGESIZE* is used.

28237 The advice to be applied to the memory range is specified by the *advice* parameter and may be
28238 one of the following values:

28239 POSIX_MADV_NORMAL

28240 Specifies that the application has no advice to give on its behavior with respect to the
28241 specified range. It is the default characteristic if no advice is given for a range of memory.

28242 POSIX_MADV_SEQUENTIAL

28243 Specifies that the application expects to access the specified range sequentially from lower
28244 addresses to higher addresses.

28245 POSIX_MADV_RANDOM

28246 Specifies that the application expects to access the specified range in a random order.

28247 POSIX_MADV_WILLNEED

28248 Specifies that the application expects to access the specified range in the near future.

28249 POSIX_MADV_DONTNEED

28250 Specifies that the application expects that it will not access the specified range in the near
28251 future.

28252 These values are defined in the `<sys/mman.h>` header.

28253 RETURN VALUE

28254 Upon successful completion, *posix_madvise()* shall return zero; otherwise, an error number shall
28255 be returned to indicate the error.

28256 ERRORS

28257 The *posix_madvise()* function shall fail if:

28258 [EINVAL] The value of *advice* is invalid.

28259 [ENOMEM] Addresses in the range starting at *addr* and continuing for *len* bytes are partly
28260 or completely outside the range allowed for the address space of the calling
28261 process.

28262 The *posix_madvise()* function may fail if:

28263 [EINVAL] The value of *addr* is not a multiple of the value returned by *sysconf()* when the
28264 name value *_SC_PAGESIZE* is used.

28265 [EINVAL] The value of *len* is zero.

28266 **EXAMPLES**

28267 None.

28268 **APPLICATION USAGE**

28269 The *posix_madvise()* function is part of the Advisory Information option and need not be
28270 provided on all implementations.

28271 **RATIONALE**

28272 None.

28281 NAME

28282 `posix_mem_offset` — find offset and length of a mapped typed memory block (**ADVANCED**
28283 **REALTIME**)

28284 SYNOPSIS

28285 TYM `#include <sys/mman.h>`

```
28286        int posix_mem_offset(const void *restrict addr, size_t len,
28287                            off_t *restrict off, size_t *restrict contig_len,
28288                            int *restrict fildes);
28289
```

28290 DESCRIPTION

28291 The `posix_mem_offset()` function shall return in the variable pointed to by *off* a value that
28292 identifies the offset (or location), within a memory object, of the memory block currently
28293 mapped at *addr*. The function shall return in the variable pointed to by *fildes*, the descriptor used
28294 (via `mmap()`) to establish the mapping which contains *addr*. If that descriptor was closed since
28295 the mapping was established, the returned value of *fildes* shall be `-1`. The *len* argument specifies
28296 the length of the block of the memory object the user wishes the offset for; upon return, the value
28297 pointed to by *contig_len* shall equal either *len*, or the length of the largest contiguous block of the
28298 memory object that is currently mapped to the calling process starting at *addr*, whichever is
28299 smaller.

28300 If the memory object mapped at *addr* is a typed memory object, then if the *off* and *contig_len*
28301 values obtained by calling `posix_mem_offset()` are used in a call to `mmap()` with a file descriptor
28302 that refers to the same memory pool as *fildes* (either through the same port or through a different
28303 port), and that was opened with neither the `POSIX_TYPED_MEM_ALLOCATE` nor the
28304 `POSIX_TYPED_MEM_ALLOCATE_CONTIG` flag, the typed memory area that is mapped shall
28305 be exactly the same area that was mapped at *addr* in the address space of the process that called
28306 `posix_mem_offset()`.

28307 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this
28308 function is implementation-defined.

28309 RETURN VALUE

28310 Upon successful completion, the `posix_mem_offset()` function shall return zero; otherwise, the
28311 corresponding error status value shall be returned.

28312 ERRORS

28313 The `posix_mem_offset()` function shall fail if:

28314 [EACCES] The process has not mapped a memory object supported by this function at
28315 the given address *addr*.

28316 This function shall not return an error code of [EINTR].

28330 NAME

28331 posix_memalign — aligned memory allocation (**ADVANCED REALTIME**)

28332 SYNOPSIS

28333 ADV `#include <stdlib.h>`

28334 `int posix_memalign(void **memptr, size_t alignment, size_t size);`

28335

28336 DESCRIPTION

28337 The *posix_memalign()* function shall allocate *size* bytes aligned on a boundary specified by
 28338 *alignment*, and shall return a pointer to the allocated memory in *memptr*. The value of *alignment*
 28339 shall be a multiple of *sizeof(void *)*, that is also a power of two. Upon successful completion, the
 28340 value pointed to by *memptr* shall be a multiple of *alignment*.

28341 CX The *free()* function shall deallocate memory that has previously been allocated by
 28342 *posix_memalign()*.

28343 RETURN VALUE

28344 Upon successful completion, *posix_memalign()* shall return zero; otherwise, an error number
 28345 shall be returned to indicate the error.

28346 ERRORS

28347 The *posix_memalign()* function shall fail if:

28348 [EINVAL] The value of the alignment parameter is not a power of two multiple of
 28349 *sizeof(void *)*.

28350 [ENOMEM] There is insufficient memory available with the requested alignment.

28351 EXAMPLES

28352 None.

28353 APPLICATION USAGE

28354 The *posix_memalign()* function is part of the Advisory Information option and need not be
 28355 provided on all implementations.

28356 RATIONALE

28357 None.

28358 FUTURE DIRECTIONS

28359 None.

28360 SEE ALSO

28362 CHANGE HISTORY

28363 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28364 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

28365 **NAME**

28366 posix_openpt — open a pseudo-terminal device

28367 **SYNOPSIS**

28368 xSI #include <stdlib.h>

28369 #include <fcntl.h>

28370 int posix_openpt(int oflag);

28371

28372 **DESCRIPTION**

28373 The *posix_openpt()* function shall establish a connection between a master device for a pseudo-terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that pseudo-terminal.

28376 The file status flags and file access modes of the open file description shall be set according to the value of *oflag*.

28378 Values for *oflag* are constructed by a bitwise-inclusive OR of flags from the following list, defined in <fcntl.h>:

28380 O_RDWR Open for reading and writing.

28381 O_NOCTTY If set *posix_openpt()* shall not cause the terminal device to become the controlling terminal for the process.

28383 The behavior of other values for the *oflag* argument is unspecified.

28384 **RETURN VALUE**

28385 Upon successful completion, the *posix_openpt()* function shall open a master pseudo-terminal device and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, -1 shall be returned and *errno* set to indicate the error.

28388 **ERRORS**

28389 The *posix_openpt()* function shall fail if:

28390 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

28391 [ENFILE] The maximum allowable number of files is currently open in the system.

28392 The *posix_openpt()* function may fail if:

28393 [EINVAL] The value of *oflag* is not valid.

28394 [EAGAIN] Out of pseudo-terminal resources.

28395 xSR [ENOSR] Out of STREAMS resources.

28396 **EXAMPLES**

28397 **Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File Descriptor**

28399 #include <fcntl.h>

28400 #include <stdio.h>

28401 int masterfd, slavefd;

28402 char *slavedevice;

28403 masterfd = posix_openpt(O_RDWR|O_NOCTTY);

28404 if (masterfd == -1

28405 || grantpt(masterfd) == -1

```
28406         || unlockpt (masterfd) == -1
28407         || (slavedevice = ptsname (masterfd)) == NULL)
28408         return -1;

28409     printf("slave device is: %s\n", slavedevice);

28410     slavefd = open(slave, O_RDWR|O_NOCTTY);
28411     if (slavefd < 0)
28412         return -1;
```

28413 APPLICATION USAGE

28414 This function is a method for portably obtaining a file descriptor of a master terminal device for
28415 a pseudo-terminal. The *grantpt()* and *ptsname()* functions can be used to manipulate mode and
28416 ownership permissions, and to obtain the name of the slave device, respectively.

28417 RATIONALE

28418 The standard developers considered the matter of adding a special device for cloning master
28419 pseudo-terminals: the **/dev/ptmx** device. However, consensus could not be reached, and it was
28420 felt that adding a new function would permit other implementations. The *posix_openpt()*
28421 function is designed to complement the *grantpt()*, *ptsname()*, and *unlockpt()* functions.

28422 On implementations supporting the **/dev/ptmx** clone device, opening the master device of a
28423 pseudo-terminal is simply:

```
28424     mfdp = open("/dev/ptmx", oflag );
28425     if (mfdp < 0)
28426         return -1;
```

28427 FUTURE DIRECTIONS

28428 None.

28429 SEE ALSO

28432 CHANGE HISTORY

28433 First released in Issue 6.

28434 **NAME**28435 posix_spawn, posix_spawnnp — spawn a process (**ADVANCED REALTIME**)28436 **SYNOPSIS**28437 SPN `#include <spawn.h>`

```

28438 int posix_spawn(pid_t *restrict pid, const char *restrict path,
28439               const posix_spawn_file_actions_t *file_actions,
28440               const posix_spawnattr_t *restrict attrp,
28441               char *const argv[restrict], char *const envp[restrict]);
28442 int posix_spawnnp(pid_t *restrict pid, const char *restrict file,
28443               const posix_spawn_file_actions_t *file_actions,
28444               const posix_spawnattr_t *restrict attrp,
28445               char *const argv[restrict], char * const envp[restrict]);
28446

```

28447 **DESCRIPTION**

28448 The *posix_spawn()* and *posix_spawnnp()* functions shall create a new process (child process) from
 28449 the specified process image. The new process image shall be constructed from a regular
 28450 executable file called the new process image file.

28451 When a C program is executed as the result of this call, it shall be entered as a C-language
 28452 function call as follows:

```
28453 int main(int argc, char *argv[]);
```

28454 where *argc* is the argument count and *argv* is an array of character pointers to the arguments
 28455 themselves. In addition, the following variable:

```
28456 extern char **environ;
```

28457 shall be initialized as a pointer to an array of character pointers to the environment strings.

28458 The argument *argv* is an array of character pointers to null-terminated strings. The last member
 28459 of this array shall be a null pointer and is not counted in *argc*. These strings constitute the
 28460 argument list available to the new process image. The value in *argv*[0] should point to a filename
 28461 that is associated with the process image being started by the *posix_spawn()* or *posix_spawnnp()*
 28462 function.

28463 The argument *envp* is an array of character pointers to null-terminated strings. These strings
 28464 constitute the environment for the new process image. The environment array is terminated by a
 28465 null pointer.

28466 The number of bytes available for the child process' combined argument and environment lists
 28467 is {ARG_MAX}. The implementation shall specify in the system documentation (see the Base
 28468 Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance) whether any list
 28469 overhead, such as length words, null terminators, pointers, or alignment bytes, is included in
 28470 this total.

28471 The *path* argument to *posix_spawn()* is a pathname that identifies the new process image file to
 28472 execute.

28473 The *file* parameter to *posix_spawnnp()* shall be used to construct a pathname that identifies the
 28474 new process image file. If the *file* parameter contains a slash character, the *file* parameter shall be
 28475 used as the pathname for the new process image file. Otherwise, the path prefix for this file shall
 28476 be obtained by a search of the directories passed as the environment variable *PATH* (see the Base
 28477 Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If this
 28478 environment variable is not defined, the results of the search are implementation-defined.

28479 If *file_actions* is a null pointer, then file descriptors open in the calling process shall remain open
 28480 in the child process, except for those whose close-on-exec flag FD_CLOEXEC is set (see *fcntl()*).
 28481 For those file descriptors that remain open, all attributes of the corresponding open file
 28482 descriptions, including file locks (see *fcntl()*), shall remain unchanged.

28483 If *file_actions* is not NULL, then the file descriptors open in the child process shall be those open
 28484 in the calling process as modified by the spawn file actions object pointed to by *file_actions* and
 28485 the FD_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have
 28486 been processed. The effective order of processing the spawn file actions shall be:

- 28487 1. The set of open file descriptors for the child process shall initially be the same set as is
 28488 open for the calling process. All attributes of the corresponding open file descriptions,
 28489 including file locks (see *fcntl()*), shall remain unchanged.
- 28490 2. The signal mask, signal default actions, and the effective user and group IDs for the child
 28491 process shall be changed as specified in the attributes object referenced by *attrp*.
- 28492 3. The file actions specified by the spawn file actions object shall be performed in the order in
 28493 which they were added to the spawn file actions object.
- 28494 4. Any file descriptor that has its FD_CLOEXEC flag set (see *fcntl()*) shall be closed.

28495 The **posix_spawnattr_t** spawn attributes object type is defined in **<spawn.h>**. It shall contain at
 28496 least the attributes defined below.

28497 If the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of the object
 28498 referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is non-zero, then the
 28499 child's process group shall be as specified in the *spawn-pgroup* attribute of the object referenced
 28500 by *attrp*.

28501 As a special case, if the POSIX_SPAWN_SETPGROUP flag is set in the *spawn-flags* attribute of
 28502 the object referenced by *attrp*, and the *spawn-pgroup* attribute of the same object is set to zero,
 28503 then the child shall be in a new process group with a process group ID equal to its process ID.

28504 If the POSIX_SPAWN_SETPGROUP flag is not set in the *spawn-flags* attribute of the object
 28505 referenced by *attrp*, the new child process shall inherit the parent's process group.

28506 PS If the POSIX_SPAWN_SETSCHEDPARAM flag is set in the *spawn-flags* attribute of the object
 28507 referenced by *attrp*, but POSIX_SPAWN_SETSCHEDULER is not set, the new process image
 28508 shall initially have the scheduling policy of the calling process with the scheduling parameters
 28509 specified in the *spawn-schedparam* attribute of the object referenced by *attrp*.

28510 If the POSIX_SPAWN_SETSCHEDULER flag is set in the *spawn-flags* attribute of the object
 28511 referenced by *attrp* (regardless of the setting of the POSIX_SPAWN_SETSCHEDPARAM flag),
 28512 the new process image shall initially have the scheduling policy specified in the *spawn-*
 28513 *schedpolicy* attribute of the object referenced by *attrp* and the scheduling parameters specified in
 28514 the *spawn-schedparam* attribute of the same object.

28515 The POSIX_SPAWN_RESETPIDS flag in the *spawn-flags* attribute of the object referenced by *attrp*
 28516 governs the effective user ID of the child process. If this flag is not set, the child process shall
 28517 inherit the parent process' effective user ID. If this flag is set, the child process' effective user ID
 28518 shall be reset to the parent's real user ID. In either case, if the set-user-ID mode bit of the new
 28519 process image file is set, the effective user ID of the child process shall become that file's owner
 28520 ID before the new process image begins execution.

28521 The POSIX_SPAWN_RESETPIDS flag in the *spawn-flags* attribute of the object referenced by *attrp*
 28522 also governs the effective group ID of the child process. If this flag is not set, the child process
 28523 shall inherit the parent process' effective group ID. If this flag is set, the child process' effective
 28524 group ID shall be reset to the parent's real group ID. In either case, if the set-group-ID mode bit

28525 of the new process image file is set, the effective group ID of the child process shall become that
 28526 file's group ID before the new process image begins execution.

28527 If the POSIX_SPAWN_SETSIGMASK flag is set in the *spawn_flags* attribute of the object
 28528 referenced by *attrp*, the child process shall initially have the signal mask specified in the *spawn-*
 28529 *sigmask* attribute of the object referenced by *attrp*.

28530 If the POSIX_SPAWN_SETSIGDEF flag is set in the *spawn_flags* attribute of the object referenced
 28531 by *attrp*, the signals specified in the *spawn-sigdefault* attribute of the same object shall be set to
 28532 their default actions in the child process. Signals set to the default action in the parent process
 28533 shall be set to the default action in the child process.

28534 Signals set to be caught by the calling process shall be set to the default action in the child
 28535 process.

28536 Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be
 28537 ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag
 28538 being set in the *spawn_flags* attribute of the object referenced by *attrp* and the signals being
 28539 indicated in the *spawn-sigdefault* attribute of the object referenced by *attrp*.

28540 If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the
 28541 SIGCHLD signal is set to be ignored or to the default action in the child process, unless
 28542 otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the *spawn_flags*
 28543 attribute of the object referenced by *attrp* and the SIGCHLD signal being indicated in the
 28544 *spawn-sigdefault* attribute of the object referenced by *attrp*.

28545 If the value of the *attrp* pointer is NULL, then the default values are used.

28546 All process attributes, other than those influenced by the attributes set in the object referenced
 28547 by *attrp* as specified above or by the file descriptor manipulations specified in *file_actions*, shall
 28548 appear in the new process image as though *fork()* had been called to create a child process and
 28549 then a member of the *exec* family of functions had been called by the child process to execute the
 28550 new process image.

28551 THR It is implementation-defined whether the fork handlers are run when *posix_spawn()* or
 28552 *posix_spawnnp()* is called.

28553 RETURN VALUE

28554 Upon successful completion, *posix_spawn()* and *posix_spawnnp()* shall return the process ID of the
 28555 child process to the parent process, in the variable pointed to by a non-NULL *pid* argument, and
 28556 shall return zero as the function return value. Otherwise, no child process shall be created, the
 28557 value stored into the variable pointed to by a non-NULL *pid* is unspecified, and an error number
 28558 shall be returned as the function return value to indicate the error. If the *pid* argument is a null
 28559 pointer, the process ID of the child is not returned to the caller.

28560 ERRORS

28561 The *posix_spawn()* and *posix_spawnnp()* functions may fail if:

28562 [EINVAL] The value specified by *file_actions* or *attrp* is invalid.

28563 If this error occurs after the calling process successfully returns from the *posix_spawn()* or
 28564 *posix_spawnnp()* function, the child process may exit with exit status 127.

28565 If *posix_spawn()* or *posix_spawnnp()* fail for any of the reasons that would cause *fork()* or one of
 28566 the *exec* family of functions to fail, an error value shall be returned as described by *fork()* and
 28567 *exec*, respectively (or, if the error occurs after the calling process successfully returns, the child
 28568 process shall exit with exit status 127).

28569 If `POSIX_SPAWN_SETPGROUP` is set in the *spawn-flags* attribute of the object referenced by
 28570 *attrp*, and *posix_spawn()* or *posix_spawnnp()* fails while changing the child's process group, an
 28571 error value shall be returned as described by *setpgid()* (or, if the error occurs after the calling
 28572 process successfully returns, the child process shall exit with exit status 127).

28573 PS If `POSIX_SPAWN_SETSCHEDPARAM` is set and `POSIX_SPAWN_SETSCHEDULER` is not set
 28574 in the *spawn-flags* attribute of the object referenced by *attrp*, then if *posix_spawn()* or
 28575 *posix_spawnnp()* fails for any of the reasons that would cause *sched_setparam()* to fail, an error
 28576 value shall be returned as described by *sched_setparam()* (or, if the error occurs after the calling
 28577 process successfully returns, the child process shall exit with exit status 127).

28578 If `POSIX_SPAWN_SETSCHEDULER` is set in the *spawn-flags* attribute of the object referenced by
 28579 *attrp*, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause
 28580 *sched_setscheduler()* to fail, an error value shall be returned as described by *sched_setscheduler()*
 28581 (or, if the error occurs after the calling process successfully returns, the child process shall exit
 28582 with exit status 127).

28583 If the *file_actions* argument is not `NULL`, and specifies any *close*, *dup2*, or *open* actions to be
 28584 performed, and if *posix_spawn()* or *posix_spawnnp()* fails for any of the reasons that would cause
 28585 *close()*, *dup2()*, or *open()* to fail, an error value shall be returned as described by *close()*, *dup2()*,
 28586 and *open()*, respectively (or, if the error occurs after the calling process successfully returns, the
 28587 child process shall exit with exit status 127). An open file action may, by itself, result in any of
 28588 the errors described by *close()* or *dup2()*, in addition to those described by *open()*.

28589 EXAMPLES

28590 None.

28591 APPLICATION USAGE

28592 These functions are part of the Spawn option and need not be provided on all implementations.

28593 RATIONALE

28594 The *posix_spawn()* function and its close relation *posix_spawnnp()* have been introduced to
 28595 overcome the following perceived difficulties with *fork()*: the *fork()* function is difficult or
 28596 impossible to implement without swapping or dynamic address translation.

- 28597 • Swapping is generally too slow for a realtime environment.
- 28598 • Dynamic address translation is not available everywhere that POSIX might be useful.
- 28599 • Processes are too useful to simply option out of POSIX whenever it must run without
- 28600 address translation or other MMU services.

28601 Thus, POSIX needs process creation and file execution primitives that can be efficiently
 28602 implemented without address translation or other MMU services.

28603 The *posix_spawn()* function is implementable as a library routine, but both *posix_spawn()* and
 28604 *posix_spawnnp()* are designed as kernel operations. Also, although they may be an efficient
 28605 replacement for many *fork()/exec* pairs, their goal is to provide useful process creation
 28606 primitives for systems that have difficulty with *fork()*, not to provide drop-in replacements for
 28607 *fork()/exec*.

28608 This view of the role of *posix_spawn()* and *posix_spawnnp()* influenced the design of their API. It
 28609 does not attempt to provide the full functionality of *fork()/exec* in which arbitrary user-specified
 28610 operations of any sort are permitted between the creation of the child process and the execution
 28611 of the new process image; any attempt to reach that level would need to provide a programming
 28612 language as parameters. Instead, *posix_spawn()* and *posix_spawnnp()* are process creation
 28613 primitives like the *Start_Process* and *Start_Process_Search* Ada language bindings package
 28614 *POSIX_Process_Primitives* and also like those in many operating systems that are not UNIX

systems, but with some POSIX-specific additions.

To achieve its coverage goals, *posix_spawn()* and *posix_spawnnp()* have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the child process' job control relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of *system()*. Although support for *system()* is not explicitly one of the goals for *posix_spawn()* and *posix_spawnnp()*, it is covered under the "at least 50%" coverage goal.

The intention is that the normal file descriptor inheritance across *fork()*, the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the *exec* family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their *FD_CLOEXEC* flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX *Start_Process* Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with *posix_spawn()* and *posix_spawnnp()*, but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the *attrp* or *file_actions* arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with *fork()/exec*. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of *posix_spawn()* and *posix_spawnnp()* that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of *posix_spawn()* and *posix_spawnnp()* is appropriate design.

The *posix_spawn()* and *posix_spawnnp()* functions do not have all the power of *fork()/exec*. This is to be expected. The *fork()* function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that *posix_spawn()* and *posix_spawnnp()* are very similar to the process creation operations on many operating systems that are not UNIX systems.

Requirements

The requirements for *posix_spawn()* and *posix_spawnnp()* are:

- They must be implementable without an MMU or unusual hardware.
- They must be compatible with existing POSIX standards.

Additional goals are:

- They should be efficiently implementable.
- They should be able to replace at least 50% of typical executions of *fork()*.

28659 • A system with *posix_spawn()* and *posix_spawnnp()* and without *fork()* should be useful, at least
28660 for realtime applications.

28661 • A system with *fork()* and the *exec* family should be able to implement *posix_spawn()* and
28662 *posix_spawnnp()* as library routines.

28663 Two-Syntax

28664 POSIX *exec* has several calling sequences with approximately the same functionality. These
28665 appear to be required for compatibility with existing practice. Since the existing practice for the
28666 *posix_spawn*()* functions is otherwise substantially unlike POSIX, we feel that simplicity
28667 outweighs compatibility. There are, therefore, only two names for the *posix_spawn*()* functions.

28668 The parameter list does not differ between *posix_spawn()* and *posix_spawnnp()*; *posix_spawnnp()*
28669 interprets the second parameter more elaborately than *posix_spawn()*.

28670 Compatibility with POSIX.5 (Ada)

28671 The *Start_Process* and *Start_Process_Search* procedures from the *POSIX_Process_Primitives*
28672 package from the Ada language binding to POSIX.1 encapsulate *fork()* and *exec* functionality in a
28673 manner similar to that of *posix_spawn()* and *posix_spawnnp()*. Originally, in keeping with our
28674 simplicity goal, the standard developers had limited the capabilities of *posix_spawn()* and
28675 *posix_spawnnp()* to a subset of the capabilities of *Start_Process* and *Start_Process_Search*; certain
28676 non-default capabilities were not supported. However, based on suggestions by the ballot group
28677 to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings
28678 working group member, the standard developers decided that *posix_spawn()* and *posix_spawnnp()*
28679 should be sufficiently powerful to implement *Start_Process* and *Start_Process_Search*. The
28680 rationale is that if the Ada language binding to such a primitive had already been approved as
28681 an IEEE standard, there can be little justification for not approving the functionally-equivalent
28682 parts of a C binding. The only three capabilities provided by *posix_spawn()* and *posix_spawnnp()*
28683 that are not provided by *Start_Process* and *Start_Process_Search* are optionally specifying the
28684 child's process group ID, the set of signals to be reset to default signal handling in the child
28685 process, and the child's scheduling policy and parameters.

28686 For the Ada language binding for *Start_Process* to be implemented with *posix_spawn()*, that
28687 binding would need to explicitly pass an empty signal mask and the parent's environment to
28688 *posix_spawn()* whenever the caller of *Start_Process* allowed these arguments to default, since
28689 *posix_spawn()* does not provide such defaults. The ability of *Start_Process* to mask user-specified
28690 signals during its execution is functionally unique to the Ada language binding and must be
28691 dealt with in the binding separately from the call to *posix_spawn()*.

28692 Process Group

28693 The process group inheritance field can be used to join the child process with an existing process
28694 group. By assigning a value of zero to the *spawn-pgroup* attribute of the object referenced by
28695 *attrp*, the *setpgid()* mechanism will place the child process in a new process group.

Threads

Without the *posix_spawn()* and *posix_spawnnp()* functions, systems without address translation can still use threads to give an abstraction of concurrency. In many cases, thread creation suffices, but it is not always a good substitute. The *posix_spawn()* and *posix_spawnnp()* functions are considerably “heavier” than thread creation. Processes have several important attributes that threads do not. Even without address translation, a process may have base-and-bound memory protection. Each process has a process environment including security attributes and file capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-uniform-memory-architecture multi-processors better than threads, and they are more convenient to use for activities that are not closely linked.

The *posix_spawn()* and *posix_spawnnp()* functions may not bring support for multiple processes to every configuration. Process creation is not the only piece of operating system support required to support multiple processes. The total cost of support for multiple processes may be quite high in some circumstances. Existing practice shows that support for multiple processes is uncommon and threads are common among “tiny kernels”. There should, therefore, probably continue to be AEPs for operating systems with only one process.

Asynchronous Error Notification

A library implementation of *posix_spawn()* or *posix_spawnnp()* may not be able to detect all possible errors before it forks the child process. IEEE Std 1003.1-2001 provides for an error indication returned from a child process which could not successfully complete the spawn operation via a special exit status which may be detected using the status value returned by *wait()* and *waitpid()*.

The *stat_val* interface and the macros used to interpret it are not well suited to the purpose of returning API errors, but they are the only path available to a library implementation. Thus, an implementation may cause the child process to exit with exit status 127 for any error detected during the spawn process after the *posix_spawn()* or *posix_spawnnp()* function has successfully returned.

The standard developers had proposed using two additional macros to interpret *stat_val*. The first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because of an error detected during the *posix_spawn()* or *posix_spawnnp()* operations rather than during actual execution of the child process image; the second, WSPAWNERRNO, would have extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group strongly opposed this because it would make a library implementation of *posix_spawn()* or *posix_spawnnp()* dependent on kernel modifications to *waitpid()* to be able to embed special information in *stat_val* to indicate a spawn failure.

The 8 bits of child process exit status that are guaranteed by IEEE Std 1003.1-2001 to be accessible to the waiting parent process are insufficient to disambiguate a spawn error from any other kind of error that may be returned by an arbitrary process image. No other bits of the exit status are required to be visible in *stat_val*, so these macros could not be strictly implemented at the library level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this value by *system()* and *popen()* to signal failures in these operations that occur after the function has returned but before a shell is able to execute. The exit status of 127 does not uniquely identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of *posix_spawn()* or *posix_spawnnp()* is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous *posix_spawn()* or *posix_spawnnp()* errors. Instead, errors detected by the *posix_spawn()* or *posix_spawnnp()* operations in the context

28744 of the child process before the new process image executes are reported by setting the child's
 28745 exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on
 28746 the *stat_val* stored by the *wait()* or *waitpid()* functions to detect spawn failures to the extent that
 28747 other status values with which the child process image may exit (before the parent can
 28748 conclusively determine that the child process image has begun execution) are distinct from exit
 28749 status 127.

 28766 changed as well as the signal mask in step 2.

28767 IEEE PASC Interpretation 1003.1 #132 is applied.

28768 NAME

28769 `posix_spawn_file_actions_addclose`, `posix_spawn_file_actions_addopen` — add close or open
 28770 action to spawn file actions object (**ADVANCED REALTIME**)

28771 SYNOPSIS

```
28772 SPN      #include <spawn.h>

28773      int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *
28774          file_actions, int fildes);
28775      int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *
28776          restrict file_actions, int fildes,
28777          const char *restrict path, int oflag, mode_t mode);
28778
```

28779 DESCRIPTION

28780 These functions shall add or delete a close or open action to a spawn file actions object.

28781 A spawn file actions object is of type **posix_spawn_file_actions_t** (defined in `<spawn.h>`) and is
 28782 used to specify a series of actions to be performed by a `posix_spawn()` or `posix_spawnnp()`
 28783 operation in order to arrive at the set of open file descriptors for the child process given the set of
 28784 open file descriptors of the parent. IEEE Std 1003.1-2001 does not define comparison or
 28785 assignment operators for the type **posix_spawn_file_actions_t**.

28786 A spawn file actions object, when passed to `posix_spawn()` or `posix_spawnnp()`, shall specify how
 28787 the set of open file descriptors in the calling process is transformed into a set of potentially open
 28788 file descriptors for the spawned process. This transformation shall be as if the specified sequence
 28789 of actions was performed exactly once, in the context of the spawned process (prior to execution
 28790 of the new process image), in the order in which the actions were added to the object;
 28791 additionally, when the new process image is executed, any file descriptor (from this new set)
 28792 which has its `FD_CLOEXEC` flag set shall be closed (see `posix_spawn()`).

28793 The `posix_spawn_file_actions_addclose()` function shall add a *close* action to the object referenced
 28794 by *file_actions* that shall cause the file descriptor *fildes* to be closed (as if `close(fildes)` had been
 28795 called) when a new process is spawned using this file actions object.

28796 The `posix_spawn_file_actions_addopen()` function shall add an *open* action to the object referenced
 28797 by *file_actions* that shall cause the file named by *path* to be opened (as if `open(path, oflag, mode)`
 28798 had been called, and the returned file descriptor, if not *fildes*, had been changed to *fildes*) when a
 28799 new process is spawned using this file actions object. If *fildes* was already an open file descriptor,
 28800 it shall be closed before the new file is opened.

28801 The string described by *path* shall be copied by the `posix_spawn_file_actions_addopen()` function.

28802 RETURN VALUE

28803 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 28804 be returned to indicate the error.

28805 ERRORS

28806 These functions shall fail if:

28807 [EBADF] The value specified by *fildes* is negative or greater than or equal to
 28808 {OPEN_MAX}.

28809 These functions may fail if:

28810 [EINVAL] The value specified by *file_actions* is invalid.

28811 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

28812 It shall not be considered an error for the *files* argument passed to these functions to specify a
 28813 file descriptor for which the specified operation could not be performed at the time of the call.
 28814 Any such error will be detected when the associated file actions object is later used during a
 28815 *posix_spawn()* or *posix_spawnnp()* operation.

28816 EXAMPLES

28817 None.

28818 APPLICATION USAGE

28819 These functions are part of the Spawn option and need not be provided on all implementations.

28820 RATIONALE

28821 A spawn file actions object may be initialized to contain an ordered sequence of *close()*, *dup2()*,
 28822 and *open()* operations to be used by *posix_spawn()* or *posix_spawnnp()* to arrive at the set of open
 28823 file descriptors inherited by the spawned process from the set of open file descriptors in the
 28824 parent at the time of the *posix_spawn()* or *posix_spawnnp()* call. It had been suggested that the
 28825 *close()* and *dup2()* operations alone are sufficient to rearrange file descriptors, and that files
 28826 which need to be opened for use by the spawned process can be handled either by having the
 28827 calling process open them before the *posix_spawn()* or *posix_spawnnp()* call (and close them after),
 28828 or by passing filenames to the spawned process (in *argv*) so that it may open them itself. The
 28829 standard developers recommend that applications use one of these two methods when practical,
 28830 since detailed error status on a failed open operation is always available to the application this
 28831 way. However, the standard developers feel that allowing a spawn file actions object to specify
 28832 open operations is still appropriate because:

- 28833 1. It is consistent with equivalent POSIX.5 (Ada) functionality.
- 28834 2. It supports the I/O redirection paradigm commonly employed by POSIX programs
 28835 designed to be invoked from a shell. When such a program is the child process, it may not
 28836 be designed to open files on its own.
- 28837 3. It allows file opens that might otherwise fail or violate file ownership/access rights if
 28838 executed by the parent process.

28839 Regarding 2. above, note that the spawn open file action provides to *posix_spawn()* and
 28840 *posix_spawnnp()* the same capability that the shell redirection operators provide to *system()*, only
 28841 without the intervening execution of a shell; for example:

```
28842 system ("myprog <file1 3<file2");
```

28843 Regarding 3. above, note that if the calling process needs to open one or more files for access by
 28844 the spawned process, but has insufficient spare file descriptors, then the open action is necessary
 28845 to allow the *open()* to occur in the context of the child process after other file descriptors have
 28846 been closed (that must remain open in the parent).

28847 Additionally, if a parent is executed from a file having a “set-user-id” mode bit set and the
 28848 POSIX_SPAWN_RESETPIDS flag is set in the spawn attributes, a file created within the parent
 28849 process will (possibly incorrectly) have the parent’s effective user ID as its owner, whereas a file
 28850 created via an *open()* action during *posix_spawn()* or *posix_spawnnp()* will have the parent’s real
 28851 ID as its owner; and an open by the parent process may successfully open a file to which the real
 28852 user should not have access or fail to open a file to which the real user should have access.

28853 File Descriptor Mapping

28854 The standard developers had originally proposed using an array which specified the mapping of
28855 child file descriptors back to those of the parent. It was pointed out by the ballot group that it is
28856 not possible to reshuffle file descriptors arbitrarily in a library implementation of *posix_spawn()*
28857 or *posix_spawnnp()* without provision for one or more spare file descriptor entries (which simply
28858 may not be available). Such an array requires that an implementation develop a complex
28859 strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor
28860 at the wrong time.

28861 It was noted by a member of the Ada Language Bindings working group that the approved Ada
28862 Language *Start_Process* family of POSIX process primitives use a caller-specified set of file
28863 actions to alter the normal *fork()/exec* semantics for inheritance of file descriptors in a very
28864 flexible way, yet no such problems exist because the burden of determining how to achieve the
28865 final file descriptor mapping is completely on the application. Furthermore, although the file
28866 actions interface appears frightening at first glance, it is actually quite simple to implement in
28867 either a library or the kernel.

28868 FUTURE DIRECTIONS

28869 None.

28874 CHANGE HISTORY

28875 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28876 IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the
28877 string pointed to by *path* is copied by the *posix_spawn_file_actions_addopen()* function.

28878 NAME

28879 `posix_spawn_file_actions_adddup2` — add `dup2` action to spawn file actions object
28880 (**ADVANCED REALTIME**)

28881 SYNOPSIS

28882 SPN `#include <spawn.h>`

```
28883        int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *
28884                                                file_actions, int fildes, int newfildes);
```

28885

28886 DESCRIPTION

28887 The `posix_spawn_file_actions_adddup2()` function shall add a `dup2()` action to the object
28888 referenced by `file_actions` that shall cause the file descriptor `fildes` to be duplicated as `newfildes` (as
28889 if `dup2(fildes, newfildes)` had been called) when a new process is spawned using this file actions
28890 object.

28891 A spawn file actions object is as defined in `posix_spawn_file_actions_addclose()`.

28892 RETURN VALUE

28893 Upon successful completion, the `posix_spawn_file_actions_adddup2()` function shall return zero;
28894 otherwise, an error number shall be returned to indicate the error.

28895 ERRORS

28896 The `posix_spawn_file_actions_adddup2()` function shall fail if:

28897 [EBADF] The value specified by `fildes` or `newfildes` is negative or greater than or equal to
28898 {OPEN_MAX}.

28899 [ENOMEM] Insufficient memory exists to add to the spawn file actions object.

28900 The `posix_spawn_file_actions_adddup2()` function may fail if:

28901 [EINVAL] The value specified by `file_actions` is invalid.

28902 It shall not be considered an error for the `fildes` argument passed to the
28903 `posix_spawn_file_actions_adddup2()` function to specify a file descriptor for which the specified
28904 operation could not be performed at the time of the call. Any such error will be detected when
28905 the associated file actions object is later used during a `posix_spawn()` or `posix_spawnnp()`
28906 operation.

28907 EXAMPLES

28908 None.

28909 APPLICATION USAGE

28910 The `posix_spawn_file_actions_adddup2()` function is part of the Spawn option and need not be
28911 provided on all implementations.

28912 RATIONALE

28913 Refer to the RATIONALE in `posix_spawn_file_actions_addclose()`.

28923 NAME

28924 posix_spawn_file_actions_addopen — add open action to spawn file actions object
28925 **(ADVANCED REALTIME)**

28926 SYNOPSIS

```
28927 SPN   #include <spawn.h>  
  
28928       int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *  
28929       restrict file_actions, int fildes,  
28930       const char *restrict path, int oflag, mode_t mode);  
28931
```

28932 DESCRIPTION

28933 Refer to *posix_spawn_file_actions_addclose()*.

28934 NAME

28935 `posix_spawn_file_actions_destroy`, `posix_spawn_file_actions_init` — destroy and initialize
 28936 spawn file actions object (**ADVANCED REALTIME**)

28937 SYNOPSIS

28938 SPN `#include <spawn.h>`

```
28939 int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *
28940     file_actions);
28941 int posix_spawn_file_actions_init(posix_spawn_file_actions_t *
28942     file_actions);
28943
```

28944 DESCRIPTION

28945 The `posix_spawn_file_actions_destroy()` function shall destroy the object referenced by `file_actions`;
 28946 the object becomes, in effect, uninitialized. An implementation may cause
 28947 `posix_spawn_file_actions_destroy()` to set the object referenced by `file_actions` to an invalid value. A
 28948 destroyed spawn file actions object can be reinitialized using `posix_spawn_file_actions_init()`; the
 28949 results of otherwise referencing the object after it has been destroyed are undefined.

28950 The `posix_spawn_file_actions_init()` function shall initialize the object referenced by `file_actions` to
 28951 contain no file actions for `posix_spawn()` or `posix_spawnnp()` to perform.

28952 A spawn file actions object is as defined in `posix_spawn_file_actions_addclose()`.

28953 The effect of initializing an already initialized spawn file actions object is undefined.

28954 RETURN VALUE

28955 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 28956 be returned to indicate the error.

28957 ERRORS

28958 The `posix_spawn_file_actions_init()` function shall fail if:

28959 [ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

28960 The `posix_spawn_file_actions_destroy()` function may fail if:

28961 [EINVAL] The value specified by `file_actions` is invalid.

28962 EXAMPLES

28963 None.

28964 APPLICATION USAGE

28965 These functions are part of the Spawn option and need not be provided on all implementations.

28966 RATIONALE

28967 Refer to the RATIONALE in `posix_spawn_file_actions_addclose()`.

28968 FUTURE DIRECTIONS

28970 SEE ALSO

28971 `posix_spawn()`, `posix_spawnnp()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<spawn.h>**

28972 CHANGE HISTORY

28973 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

28974 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

28975 NAME

28976 `posix_spawnattr_destroy`, `posix_spawnattr_init` — destroy and initialize spawn attributes object
28977 (**ADVANCED REALTIME**)

28978 SYNOPSIS

28979 SPN `#include <spawn.h>`

28980 `int posix_spawnattr_destroy(posix_spawnattr_t *attr);`

28981 `int posix_spawnattr_init(posix_spawnattr_t *attr);`

28982

28983 DESCRIPTION

28984 The `posix_spawnattr_destroy()` function shall destroy a spawn attributes object. A destroyed *attr*
28985 attributes object can be reinitialized using `posix_spawnattr_init()`; the results of otherwise
28986 referencing the object after it has been destroyed are undefined. An implementation may cause
28987 `posix_spawnattr_destroy()` to set the object referenced by *attr* to an invalid value.

28988 The `posix_spawnattr_init()` function shall initialize a spawn attributes object *attr* with the default
28989 value for all of the individual attributes used by the implementation. Results are undefined if
28990 `posix_spawnattr_init()` is called specifying an already initialized *attr* attributes object.

28991 A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to
28992 specify the inheritance of process attributes across a spawn operation. IEEE Std 1003.1-2001 does
28993 not define comparison or assignment operators for the type **posix_spawnattr_t**.

28994 Each implementation shall document the individual attributes it uses and their default values
28995 unless these values are defined by IEEE Std 1003.1-2001. Attributes not defined by
28996 IEEE Std 1003.1-2001, their default values, and the names of the associated functions to get and
28997 set those attribute values are implementation-defined.

28998 The resulting spawn attributes object (possibly modified by setting individual attribute values),
28999 is used to modify the behavior of `posix_spawn()` or `posix_spawnnp()`. After a spawn attributes
29000 object has been used to spawn a process by a call to a `posix_spawn()` or `posix_spawnnp()`, any
29001 function affecting the attributes object (including destruction) shall not affect any process that
29002 has been spawned in this way.

29003 RETURN VALUE

29004 Upon successful completion, `posix_spawnattr_destroy()` and `posix_spawnattr_init()` shall return
29005 zero; otherwise, an error number shall be returned to indicate the error.

29006 ERRORS

29007 The `posix_spawnattr_init()` function shall fail if:

29008 [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

29009 The `posix_spawnattr_destroy()` function may fail if:

29010 [EINVAL] The value specified by *attr* is invalid.

29011 EXAMPLES

29012 None.

29013 APPLICATION USAGE

29014 These functions are part of the Spawn option and need not be provided on all implementations.

29015 RATIONALE

29016 The original spawn interface proposed in IEEE Std 1003.1-2001 defined the attributes that specify
29017 the inheritance of process attributes across a spawn operation as a structure. In order to be able
29018 to separate optional individual attributes under their appropriate options (that is, the *spawn-*
29019 *schedparam* and *spawn-schedpolicy* attributes depending upon the Process Scheduling option), and

also for extensibility and consistency with the newer POSIX interfaces, the attributes interface has been changed to an opaque data type. This interface now consists of the type **posix_spawnattr_t**, representing a spawn attributes object, together with associated functions to initialize or destroy the attributes object, and to set or get each individual attribute. Although the new object-oriented interface is more verbose than the original structure, it is simple to use, more extensible, and easy to implement.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already initialized spawn attributes option is undefined.

29039 NAME

29040 posix_spawnattr_getflags, posix_spawnattr_setflags — get and set the spawn-flags attribute of a
29041 spawn attributes object (**ADVANCED REALTIME**)

29042 SYNOPSIS

```
29043 SPN    #include <spawn.h>

29044    int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr,
29045                                short *restrict flags);
29046    int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);
29047
```

29048 DESCRIPTION

29049 The *posix_spawnattr_getflags()* function shall obtain the value of the *spawn-flags* attribute from
29050 the attributes object referenced by *attr*.

29051 The *posix_spawnattr_setflags()* function shall set the *spawn-flags* attribute in an initialized
29052 attributes object referenced by *attr*.

29053 The *spawn-flags* attribute is used to indicate which process attributes are to be changed in the
29054 new process image when invoking *posix_spawn()* or *posix_spawnp()*. It is the bitwise-inclusive
29055 OR of zero or more of the following flags:

```
29056 POSIX_SPAWN_RESETEIDS
29057 POSIX_SPAWN_SETPGROUP
29058 POSIX_SPAWN_SETSIGDEF
29059 POSIX_SPAWN_SETSIGMASK
29060 PS  POSIX_SPAWN_SETSCHEDPARAM
29061    POSIX_SPAWN_SETSCHEDULER
29062
```

29063 These flags are defined in **<spawn.h>**. The default value of this attribute shall be as if no flags
29064 were set.

29065 RETURN VALUE

29066 Upon successful completion, *posix_spawnattr_getflags()* shall return zero and store the value of
29067 the *spawn-flags* attribute of *attr* into the object referenced by the *flags* parameter; otherwise, an
29068 error number shall be returned to indicate the error.

29069 Upon successful completion, *posix_spawnattr_setflags()* shall return zero; otherwise, an error
29070 number shall be returned to indicate the error.

29071 ERRORS

29072 These functions may fail if:

29073 [EINVAL] The value specified by *attr* is invalid.

29074 The *posix_spawnattr_setflags()* function may fail if:

29075 [EINVAL] The value of the attribute being set is not valid.

29076 EXAMPLES

29077 None.

29078 APPLICATION USAGE

29079 These functions are part of the Spawn option and need not be provided on all implementations.

29080 RATIONALE

29081 None.

29082 FUTURE DIRECTIONS

29083 None.

29090 CHANGE HISTORY

29091 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29092 NAME

29093 posix_spawnattr_getpgroup, posix_spawnattr_setpgroup — get and set the spawn-pgroup
29094 attribute of a spawn attributes object (**ADVANCED REALTIME**)

29095 SYNOPSIS

```
29096 SPN    #include <spawn.h>

29097    int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr,
29098                                pid_t *restrict pgroup);
29099    int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);
29100
```

29101 DESCRIPTION

29102 The *posix_spawnattr_getpgroup()* function shall obtain the value of the *spawn-pgroup* attribute
29103 from the attributes object referenced by *attr*.

29104 The *posix_spawnattr_setpgroup()* function shall set the *spawn-pgroup* attribute in an initialized
29105 attributes object referenced by *attr*.

29106 The *spawn-pgroup* attribute represents the process group to be joined by the new process image
29107 in a spawn operation (if POSIX_SPAWN_SETPGROUP is set in the *spawn-flags* attribute). The
29108 default value of this attribute shall be zero.

29109 RETURN VALUE

29110 Upon successful completion, *posix_spawnattr_getpgroup()* shall return zero and store the value of
29111 the *spawn-pgroup* attribute of *attr* into the object referenced by the *pgroup* parameter; otherwise,
29112 an error number shall be returned to indicate the error.

29113 Upon successful completion, *posix_spawnattr_setpgroup()* shall return zero; otherwise, an error
29114 number shall be returned to indicate the error.

29115 ERRORS

29116 These functions may fail if:

29117 [EINVAL] The value specified by *attr* is invalid.

29118 The *posix_spawnattr_setpgroup()* function may fail if:

29119 [EINVAL] The value of the attribute being set is not valid.

29120 EXAMPLES

29121 None.

29122 APPLICATION USAGE

29123 These functions are part of the Spawn option and need not be provided on all implementations.

29124 RATIONALE

29125 None.

29134 **CHANGE HISTORY**

29135 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

29136 NAME

29137 posix_spawnattr_getschedparam, posix_spawnattr_setschedparam — get and set the spawn-
29138 schedparam attribute of a spawn attributes object (**ADVANCED REALTIME**)

29139 SYNOPSIS

29140 SPN PS #include <spawn.h>

29141 #include <sched.h>

```
29142 int posix_spawnattr_getschedparam(const posix_spawnattr_t *
29143     restrict attr, struct sched_param *restrict schedparam);
29144 int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,
29145     const struct sched_param *restrict schedparam);
```

29146

29147 DESCRIPTION

29148 The *posix_spawnattr_getschedparam()* function shall obtain the value of the *spawn-schedparam*
29149 attribute from the attributes object referenced by *attr*.

29150 The *posix_spawnattr_setschedparam()* function shall set the *spawn-schedparam* attribute in an
29151 initialized attributes object referenced by *attr*.

29152 The *spawn-schedparam* attribute represents the scheduling parameters to be assigned to the new
29153 process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER or
29154 POSIX_SPAWN_SETSCHEDPARAM is set in the *spawn-flags* attribute). The default value of this
29155 attribute is unspecified.

29156 RETURN VALUE

29157 Upon successful completion, *posix_spawnattr_getschedparam()* shall return zero and store the
29158 value of the *spawn-schedparam* attribute of *attr* into the object referenced by the *schedparam*
29159 parameter; otherwise, an error number shall be returned to indicate the error.

29160 Upon successful completion, *posix_spawnattr_setschedparam()* shall return zero; otherwise, an
29161 error number shall be returned to indicate the error.

29162 ERRORS

29163 These functions may fail if:

29164 [EINVAL] The value specified by *attr* is invalid.

29165 The *posix_spawnattr_setschedparam()* function may fail if:

29166 [EINVAL] The value of the attribute being set is not valid.

29167 EXAMPLES

29168 None.

29169 APPLICATION USAGE

29170 These functions are part of the Spawn and Process Scheduling options and need not be provided
29171 on all implementations.

29184 NAME

29185 posix_spawnattr_getschedpolicy, posix_spawnattr_setschedpolicy — get and set the spawn-
29186 schedpolicy attribute of a spawn attributes object (**ADVANCED REALTIME**)

29187 SYNOPSIS

29188 SPN PS #include <spawn.h>

29189 #include <sched.h>

```
29190 int posix_spawnattr_getschedpolicy(const posix_spawnattr_t *
29191     restrict attr, int *restrict schedpolicy);
29192 int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
29193     int schedpolicy);
29194
```

29195 DESCRIPTION

29196 The *posix_spawnattr_getschedpolicy()* function shall obtain the value of the *spawn-schedpolicy*
29197 attribute from the attributes object referenced by *attr*.

29198 The *posix_spawnattr_setschedpolicy()* function shall set the *spawn-schedpolicy* attribute in an
29199 initialized attributes object referenced by *attr*.

29200 The *spawn-schedpolicy* attribute represents the scheduling policy to be assigned to the new
29201 process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER is set in the *spawn-*
29202 *flags* attribute). The default value of this attribute is unspecified.

29203 RETURN VALUE

29204 Upon successful completion, *posix_spawnattr_getschedpolicy()* shall return zero and store the
29205 value of the *spawn-schedpolicy* attribute of *attr* into the object referenced by the *schedpolicy*
29206 parameter; otherwise, an error number shall be returned to indicate the error.

29207 Upon successful completion, *posix_spawnattr_setschedpolicy()* shall return zero; otherwise, an
29208 error number shall be returned to indicate the error.

29209 ERRORS

29210 These functions may fail if:

29211 [EINVAL] The value specified by *attr* is invalid.

29231 NAME

29232 posix_spawnattr_getsigdefault, posix_spawnattr_setsigdefault — get and set the spawn-
29233 sigdefault attribute of a spawn attributes object (**ADVANCED REALTIME**)

29234 SYNOPSIS

```
29235 SPN    #include <signal.h>
29236        #include <spawn.h>

29237        int posix_spawnattr_getsigdefault(const posix_spawnattr_t *
29238            restrict attr, sigset_t *restrict sigdefault);
29239        int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
29240            const sigset_t *restrict sigdefault);
```

29242 DESCRIPTION

29243 The *posix_spawnattr_getsigdefault()* function shall obtain the value of the *spawn-sigdefault*
29244 attribute from the attributes object referenced by *attr*.

29245 The *posix_spawnattr_setsigdefault()* function shall set the *spawn-sigdefault* attribute in an
29246 initialized attributes object referenced by *attr*.

29247 The *spawn-sigdefault* attribute represents the set of signals to be forced to default signal handling
29248 in the new process image (if POSIX_SPAWN_SETSIGDEF is set in the *spawn-flags* attribute) by a
29249 spawn operation. The default value of this attribute shall be an empty signal set.

29250 RETURN VALUE

29251 Upon successful completion, *posix_spawnattr_getsigdefault()* shall return zero and store the value
29252 of the *spawn-sigdefault* attribute of *attr* into the object referenced by the *sigdefault* parameter;
29253 otherwise, an error number shall be returned to indicate the error.

29254 Upon successful completion, *posix_spawnattr_setsigdefault()* shall return zero; otherwise, an error
29255 number shall be returned to indicate the error.

29256 ERRORS

29257 These functions may fail if:

29258 [EINVAL] The value specified by *attr* is invalid.

29259 The *posix_spawnattr_setsigdefault()* function may fail if:

29260 [EINVAL] The value of the attribute being set is not valid.

29261 EXAMPLES

29262 None.

29345 `int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);`
29346

29347 DESCRIPTION

29348 Refer to *posix_spawnattr_getpgroup()*.

29349 **NAME**

29350 `posix_spawnattr_setschedparam` — set the spawn-schedparam attribute of a spawn attributes
29351 object (**ADVANCED REALTIME**)

29352 **SYNOPSIS**

29353 SPN PS `#include <sched.h>`

29354 `#include <spawn.h>`

```
29355        int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr,  
29356                                          const struct sched_param *restrict schedparam);
```

29357

29358 **DESCRIPTION**

29359 Refer to `posix_spawnattr_getschedparam()`.

29360 NAME

29361 posix_spawnattr_setschedpolicy — set the spawn-schedpolicy attribute of a spawn attributes
29362 object (**ADVANCED REALTIME**)

29363 SYNOPSIS

29364 SPN PS #include <sched.h>

29365 #include <spawn.h>

```
29366        int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,  
29367                                          int schedpolicy);
```

29368

29369 DESCRIPTION

29370 Refer to *posix_spawnattr_getschedpolicy()*.

29371 **NAME**

29372 posix_spawnattr_setsigdefault — set the spawn-sigdefault attribute of a spawn attributes object
29373 **(ADVANCED REALTIME)**

29374 **SYNOPSIS**

29375 SPN #include <signal.h>

29376 #include <spawn.h>

29377 int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
29378 const sigset_t *restrict sigdefault);

29379

29380 **DESCRIPTION**

29381 Refer to *posix_spawnattr_getsigdefault()*.

29382 NAME

29383 posix_spawnattr_setsigmask — set the spawn-sigmask attribute of a spawn attributes object
29384 **(ADVANCED REALTIME)**

29385 SYNOPSIS

```
29386 SPN     #include <signal.h>  
29387     #include <spawn.h>  
  
29388     int posix_spawnattr_setsigmask(posix_spawnattr_t *restrict attr,  
29389         const sigset_t *restrict sigmask);  
29390
```

29391 DESCRIPTION

29392 Refer to *posix_spawnattr_getsigmask()*.

29393 **NAME**29394 `posix_spawn` — spawn a process (**ADVANCED REALTIME**)29395 **SYNOPSIS**29396 SPN `#include <spawn.h>`

```
29397        int posix_spawn(pid_t *restrict pid, const char *restrict file,  
29398            const posix_spawn_file_actions_t *file_actions,  
29399            const posix_spawnattr_t *restrict attrp,  
29400            char *const argv[restrict], char *const envp[restrict]);  
29401
```

29402 **DESCRIPTION**29403 Refer to `posix_spawn()`.

29404 NAME

29405 `posix_trace_attr_destroy`, `posix_trace_attr_init` — destroy and initialize the trace stream
29406 attributes object (**TRACING**)

29407 SYNOPSIS

29408 TRC `#include <trace.h>`

29409 `int posix_trace_attr_destroy(trace_attr_t *attr);`

29410 `int posix_trace_attr_init(trace_attr_t *attr);`

29411

29412 DESCRIPTION

29413 The `posix_trace_attr_destroy()` function shall destroy an initialized trace attributes object. A
29414 destroyed `attr` attributes object can be reinitialized using `posix_trace_attr_init()`; the results of
29415 otherwise referencing the object after it has been destroyed are undefined.

29416 The `posix_trace_attr_init()` function shall initialize a trace attributes object `attr` with the default
29417 value for all of the individual attributes used by a given implementation. The read-only
29418 *generation-version* and *clock-resolution* attributes of the newly initialized trace attributes object
29419 shall be set to their appropriate values (see Section 2.11.1.2 (on page 75)).

29420 Results are undefined if `posix_trace_attr_init()` is called specifying an already initialized `attr`
29421 attributes object.

29422 Implementations may add extensions to the trace attributes object structure as permitted in the
29423 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

29424 The resulting attributes object (possibly modified by setting individual attributes values), when
29425 used by `posix_trace_create()`, defines the attributes of the trace stream created. A single attributes
29426 object can be used in multiple calls to `posix_trace_create()`. After one or more trace streams have
29427 been created using an attributes object, any function affecting that attributes object, including
29428 destruction, shall not affect any trace stream previously created. An initialized attributes object
29429 also serves to receive the attributes of an existing trace stream or trace log when calling the
29430 `posix_trace_get_attr()` function.

29431 RETURN VALUE

29432 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
29433 return the corresponding error number.

29434 ERRORS

29435 The `posix_trace_attr_destroy()` function may fail if:

29436 [EINVAL] The value of `attr` is invalid.

29437 The `posix_trace_attr_init()` function shall fail if:

29438 [ENOMEM] Insufficient memory exists to initialize the trace attributes object.

29439 EXAMPLES

29440 None.

29441 APPLICATION USAGE

29442 None.

29443 RATIONALE

29444 None.

29445 **FUTURE DIRECTIONS**

29446 None.

29447 **SEE ALSO**

29449 IEEE Std 1003.1-2001, <**trace.h**>

29450 **CHANGE HISTORY**

29451 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

29452 IEEE PASC Interpretation 1003.1 #123 is applied.

29453 NAME

29454 posix_trace_attr_getclockres, posix_trace_attr_getcreatetime, posix_trace_attr_getgenversion,
29455 posix_trace_attr_getname, posix_trace_attr_setname — retrieve and set information about a
29456 trace stream (**TRACING**)

29457 SYNOPSIS

```
29458 TRC    #include <time.h>
29459         #include <trace.h>

29460         int posix_trace_attr_getclockres(const trace_attr_t *attr,
29461         struct timespec *resolution);
29462         int posix_trace_attr_getcreatetime(const trace_attr_t *attr,
29463         struct timespec *createtime);

29464         #include <trace.h>

29465         int posix_trace_attr_getgenversion(const trace_attr_t *attr,
29466         char *genversion);
29467         int posix_trace_attr_getname(const trace_attr_t *attr,
29468         char *tracename);
29469         int posix_trace_attr_setname(trace_attr_t *attr,
29470         const char *tracename);
29471
```

29472 DESCRIPTION

29473 The *posix_trace_attr_getclockres()* function shall copy the clock resolution of the clock used to
29474 generate timestamps from the *clock-resolution* attribute of the attributes object pointed to by the
29475 *attr* argument into the structure pointed to by the *resolution* argument.

29476 The *posix_trace_attr_getcreatetime()* function shall copy the trace stream creation time from the
29477 *creation-time* attribute of the attributes object pointed to by the *attr* argument into the structure
29478 pointed to by the *createtime* argument. The *creation-time* attribute shall represent the time of
29479 creation of the trace stream.

29480 The *posix_trace_attr_getgenversion()* function shall copy the string containing version information
29481 from the *generation-version* attribute of the attributes object pointed to by the *attr* argument into
29482 the string pointed to by the *genversion* argument. The *genversion* argument shall be the address of
29483 a character array which can store at least {TRACE_NAME_MAX} characters.

29484 The *posix_trace_attr_getname()* function shall copy the string containing the trace name from the
29485 *trace-name* attribute of the attributes object pointed to by the *attr* argument into the string
29486 pointed to by the *tracename* argument. The *tracename* argument shall be the address of a character
29487 array which can store at least {TRACE_NAME_MAX} characters.

29488 The *posix_trace_attr_setname()* function shall set the name in the *trace-name* attribute of the
29489 attributes object pointed to by the *attr* argument, using the trace name string supplied by the
29490 *tracename* argument. If the supplied string contains more than {TRACE_NAME_MAX}
29491 characters, the name copied into the *trace-name* attribute may be truncated to one less than the
29492 length of {TRACE_NAME_MAX} characters. The default value is a null string.

29493 RETURN VALUE

29494 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
29495 return the corresponding error number.

29496 If successful, the *posix_trace_attr_getclockres()* function stores the *clock-resolution* attribute value
29497 in the object pointed to by *resolution*. Otherwise, the content of this object is unspecified.

29498 If successful, the *posix_trace_attr_getcreatetime()* function stores the trace stream creation time in
29499 the object pointed to by *createtime*. Otherwise, the content of this object is unspecified.

29500 If successful, the *posix_trace_attr_getgenversion()* function stores the trace version information in
29501 the string pointed to by *genversion*. Otherwise, the content of this string is unspecified.

29502 If successful, the *posix_trace_attr_getname()* function stores the trace name in the string pointed
29503 to by *tracename*. Otherwise, the content of this string is unspecified.

29504 **ERRORS**

29505 The *posix_trace_attr_getclockres()*, *posix_trace_attr_getcreatetime()*, *posix_trace_attr_getgenversion()*,
29506 and *posix_trace_attr_getname()* functions may fail if:

29507 [EINVAL] The value specified by one of the arguments is invalid.

29508 **EXAMPLES**

29509 None.

29510 **APPLICATION USAGE**

29511 None.

29538 TRC      int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
29539                                     int streampolicy);
29540
```

29541 DESCRIPTION

29542 TRI The *posix_trace_attr_getinherited()* and *posix_trace_attr_setinherited()* functions, respectively, shall
29543 get and set the inheritance policy stored in the *inheritance* attribute for traced processes across
29544 the *fork()* and *spawn()* operations. The *inheritance* attribute of the attributes object pointed to by
29545 the *attr* argument shall be set to one of the following values defined by manifest constants in the
29546 **<trace.h>** header:

29547 POSIX_TRACE_CLOSE_FOR_CHILD
29548 After a *fork()* or *spawn()* operation, the child shall not be traced, and tracing of the parent
29549 shall continue.

29550 POSIX_TRACE_INHERITED
29551 After a *fork()* or *spawn()* operation, if the parent is being traced, its child shall be
29552 concurrently traced using the same trace stream.

29553 The default value for the *inheritance* attribute is POSIX_TRACE_CLOSE_FOR_CHILD.

29554 TRL The *posix_trace_attr_getlogfullpolicy()* and *posix_trace_attr_setlogfullpolicy()* functions,
29555 respectively, shall get and set the trace log full policy stored in the *log-full-policy* attribute of the
29556 attributes object pointed to by the *attr* argument.

29557 The *log-full-policy* attribute shall be set to one of the following values defined by manifest
29558 constants in the **<trace.h>** header:

29559 POSIX_TRACE_LOOP
29560 The trace log shall loop until the associated trace stream is stopped. This policy means that
29561 when the trace log gets full, the file system shall reuse the resources allocated to the oldest
29562 trace events that were recorded. In this way, the trace log will always contain the most
29563 recent trace events flushed.

29564 POSIX_TRACE_UNTIL_FULL
29565 The trace stream shall be flushed to the trace log until the trace log is full. This condition can
29566 be deduced from the *posix_log_full_status* member status (see the **posix_trace_status_info**
29567 structure defined in **<trace.h>**). The last recorded trace event shall be the

29568	POSIX_TRACE_STOP trace event.
29569	POSIX_TRACE_APPEND
29570	The associated trace stream shall be flushed to the trace log without log size limitation. If
29571	the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the
29572	<i>log-max-size</i> attribute.
29573	The default value for the <i>log-full-policy</i> attribute is POSIX_TRACE_LOOP.
29574	The <i>posix_trace_attr_getstreamfullpolicy()</i> and <i>posix_trace_attr_setstreamfullpolicy()</i> functions,
29575	respectively, shall get and set the trace stream full policy stored in the <i>stream-full-policy</i> attribute
29576	of the attributes object pointed to by the <i>attr</i> argument.
29577	The <i>stream-full-policy</i> attribute shall be set to one of the following values defined by manifest
29578	constants in the <trace.h> header:
29579	POSIX_TRACE_LOOP
29580	The trace stream shall loop until explicitly stopped by the <i>posix_trace_stop()</i> function. This
29581	policy means that when the trace stream is full, the trace system shall reuse the resources
29582	allocated to the oldest trace events recorded. In this way, the trace stream will always
29583	contain the most recent trace events recorded.
29584	POSIX_TRACE_UNTIL_FULL
29585	The trace stream will run until the trace stream resources are exhausted. Then the trace
29586	stream will stop. This condition can be deduced from <i>posix_stream_status</i> and
29587	<i>posix_stream_full_status</i> (see the posix_trace_status_info structure defined in <trace.h>).
29588	When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after
29589	reporting the last recorded trace event. The trace system shall reuse the resources allocated
29590	to any trace events already reported—see the <i>posix_trace_getnext_event()</i> ,
29591	<i>posix_trace_trygetnext_event()</i> , and <i>posix_trace_timedgetnext_event()</i> functions—or already
29592	flushed for an active trace stream with log if the Trace Log option is supported; see the
29593	<i>posix_trace_flush()</i> function. The trace system shall restart the trace stream when it is empty
29594	and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before
29595	reporting the next recorded trace event.
29596 TRL	POSIX_TRACE_FLUSH
29597	If the Trace Log option is supported, this policy is identical to the
29598	POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be
29599	flushed regularly as if <i>posix_trace_flush()</i> had been explicitly called. Defining this policy for
29600	an active trace stream without log shall be invalid.
29601	The default value for the <i>stream-full-policy</i> attribute shall be POSIX_TRACE_LOOP for an active
29602	trace stream without log.
29603 TRL	If the Trace Log option is supported, the default value for the <i>stream-full-policy</i> attribute shall be
29604	POSIX_TRACE_FLUSH for an active trace stream with log.
29605	RETURN VALUE
29606	Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
29607	return the corresponding error number.
29608 TRI	If successful, the <i>posix_trace_attr_getinherited()</i> function shall store the <i>inheritance</i> attribute value
29609	in the object pointed to by <i>inheritancepolicy</i> . Otherwise, the content of this object is undefined.
29610 TRL	If successful, the <i>posix_trace_attr_getlogfullpolicy()</i> function shall store the <i>log-full-policy</i> attribute
29611	value in the object pointed to by <i>logpolicy</i> . Otherwise, the content of this object is undefined.
29612	If successful, the <i>posix_trace_attr_getstreamfullpolicy()</i> function shall store the <i>stream-full-policy</i>
29613	attribute value in the object pointed to by <i>streampolicy</i> . Otherwise, the content of this object is

29614 undefined.

29615 ERRORS

29616 These functions may fail if:

29617 [EINVAL] The value specified by at least one of the arguments is invalid.

29618 EXAMPLES

29619 None.

29657         size_t maxdatasize);
29658      int posix_trace_attr_setstreamsize(trace_attr_t *attr,
29659         size_t streamsize);
29660
```

29661 **DESCRIPTION**

29662 TRL The *posix_trace_attr_getlogsize()* function shall copy the log size, in bytes, from the *log-max-size*
 29663 attribute of the attributes object pointed to by the *attr* argument into the variable pointed to by
 29664 the *logsize* argument. This log size is the maximum total of bytes that shall be allocated for
 29665 system and user trace events in the trace log. The default value for the *log-max-size* attribute is
 29666 implementation-defined.

29667 The *posix_trace_attr_setlogsize()* function shall set the maximum allowed size, in bytes, in the
 29668 *log-max-size* attribute of the attributes object pointed to by the *attr* argument, using the size value
 29669 supplied by the *logsize* argument.

29670 The trace log size shall be used if the *log-full-policy* attribute is set to *POSIX_TRACE_LOOP* or
 29671 *POSIX_TRACE_UNTIL_FULL*. If the *log-full-policy* attribute is set to *POSIX_TRACE_APPEND*,
 29672 the implementation shall ignore the *log-max-size* attribute.

29673 The *posix_trace_attr_getmaxdatasize()* function shall copy the maximum user trace event data
 29674 size, in bytes, from the *max-data-size* attribute of the attributes object pointed to by the *attr*
 29675 argument into the variable pointed to by the *maxdatasize* argument. The default value for the
 29676 *max-data-size* attribute is implementation-defined.

29677 The *posix_trace_attr_getmaxsystemeventsize()* function shall calculate the maximum memory size,
 29678 in bytes, required to store a single system trace event. This value is calculated for the trace
 29679 stream attributes object pointed to by the *attr* argument and is returned in the variable pointed
 29680 to by the *eventsize* argument.

29681 The values returned as the maximum memory sizes of the user and system trace events shall be
 29682 such that if the sum of the maximum memory sizes of a set of the trace events that may be
 29683 recorded in a trace stream is less than or equal to the *stream-min-size* attribute of that trace
 29684 stream, the system provides the necessary resources for recording all those trace events, without
 29685 loss.

29686 The *posix_trace_attr_getmaxusereventsize()* function shall calculate the maximum memory size, in
 29687 bytes, required to store a single user trace event generated by a call to *posix_trace_event()* with a
 29688 *data_len* parameter equal to the *data_len* value specified in this call. This value is calculated for
 29689 the trace stream attributes object pointed to by the *attr* argument and is returned in the variable
 29690 pointed to by the *eventsize* argument.

29691 The *posix_trace_attr_getstreamsize()* function shall copy the stream size, in bytes, from the
 29692 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument into the variable
 29693 pointed to by the *streamsize* argument.

29694 This stream size is the current total memory size reserved for system and user trace events in the
 29695 trace stream. The default value for the *stream-min-size* attribute is implementation-defined. The
 29696 stream size refers to memory used to store trace event records. Other stream data (for example,
 29697 trace attribute values) shall not be included in this size.

29698 The *posix_trace_attr_setmaxdatasize()* function shall set the maximum allowed size, in bytes, in
 29699 the *max-data-size* attribute of the attributes object pointed to by the *attr* argument, using the size
 29700 value supplied by the *maxdatasize* argument. This maximum size is the maximum allowed size
 29701 for the user data argument which may be passed to *posix_trace_event()*. The implementation
 29702 shall be allowed to truncate data passed to *trace_user_event* which is longer than *maxdatasize*.

29703 The *posix_trace_attr_setstreamsize()* function shall set the minimum allowed size, in bytes, in the
 29704 *stream-min-size* attribute of the attributes object pointed to by the *attr* argument, using the size
 29705 value supplied by the *streamsize* argument.

29706 RETURN VALUE

29707 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 29708 return the corresponding error number.

29709 TRL The *posix_trace_attr_getlogsize()* function stores the maximum trace log allowed size in the object
 29710 pointed to by *logsize*, if successful.

29711 The *posix_trace_attr_getmaxdatasize()* function stores the maximum trace event record memory
 29712 size in the object pointed to by *maxdatasize*, if successful.

29713 The *posix_trace_attr_getmaxsystemeventsize()* function stores the maximum memory size to store
 29714 a single system trace event in the object pointed to by *eventsize*, if successful.

29715 The *posix_trace_attr_getmaxusereventsize()* function stores the maximum memory size to store a
 29716 single user trace event in the object pointed to by *eventsize*, if successful.

29717 The *posix_trace_attr_getstreamsize()* function stores the maximum trace stream allowed size in
 29718 the object pointed to by *streamsize*, if successful.

29719 ERRORS

29720 These functions may fail if:

29721 [EINVAL] The value specified by one of the arguments is invalid.

29823

29824 DESCRIPTION

29825 Refer to *posix_trace_attr_getlogsize()*.

29826 **NAME**29827 posix_trace_clear — clear trace stream and trace log (**TRACING**)29828 **SYNOPSIS**

29829 TRC #include <sys/types.h>

29830 #include <trace.h>

29831 int posix_trace_clear(trace_id_t trid);

29832

29833 **DESCRIPTION**

29834 The *posix_trace_clear()* function shall reinitialize the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create()* function, except that the same allocated resources shall be reused, the mapping of trace event type identifiers to trace event names shall be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it remains running and if it was suspended, it remains suspended).

29839 All trace events in the trace stream recorded before the call to *posix_trace_clear()* shall be lost. The *posix_stream_full_status* status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that all trace events that occurred during the *posix_trace_clear()* call are recorded; the behavior with respect to trace points that may occur during this call is unspecified.

29843 TRL If the Trace Log option is supported and the trace stream has been created with a log, the *posix_trace_clear()* function shall reinitialize the trace stream with the same behavior as if the trace stream was created without the log, plus it shall reinitialize the trace log associated with the trace stream identified by the argument *trid* as if it were returning from the *posix_trace_create_withlog()* function, except that the same allocated resources, for the trace log, may be reused and the associated trace stream status remains unchanged. The first trace event recorded in the trace log after the call to *posix_trace_clear()* shall be the same as the first trace event recorded in the active trace stream after the call to *posix_trace_clear()*. The *posix_log_full_status* status shall be set to `POSIX_TRACE_NOT_FULL`. There is no guarantee that all trace events that occurred during the *posix_trace_clear()* call are recorded in the trace log; the behavior with respect to trace points that may occur during this call is unspecified. If the log full policy is `POSIX_TRACE_APPEND`, the effect of a call to this function is unspecified for the trace log associated with the trace stream identified by the *trid* argument.

29856 **RETURN VALUE**

29857 Upon successful completion, the *posix_trace_clear()* function shall return a value of zero. Otherwise, it shall return the corresponding error number.

29859 **ERRORS**29860 The *posix_trace_clear()* function shall fail if:29861 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream.29862 **EXAMPLES**

29863 None.

29864 **APPLICATION USAGE**

29865 None.

29866 **RATIONALE**

29867 None.

29868 **FUTURE DIRECTIONS**

29869 None.

29873 CHANGE HISTORY

29874 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

29875 IEEE PASC Interpretation 1003.1 #123 is applied.

29876 **NAME**29877 posix_trace_close, posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)29878 **SYNOPSIS**

29879 TRC TRL #include <trace.h>

```

29880        int posix_trace_close(trace_id_t trid);
29881        int posix_trace_open(int file_desc, trace_id_t *trid);
29882        int posix_trace_rewind(trace_id_t trid);
29883 
```

29884 **DESCRIPTION**

29885 The *posix_trace_close()* function shall deallocate the trace log identifier indicated by *trid*, and all
 29886 of its associated resources. If there is no valid trace log pointed to by the *trid*, this function shall
 29887 fail.

29888 The *posix_trace_open()* function shall allocate the necessary resources and establish the
 29889 connection between a trace log identified by the *file_desc* argument and a trace stream identifier
 29890 identified by the object pointed to by the *trid* argument. The *file_desc* argument should be a valid
 29891 open file descriptor that corresponds to a trace log. The *file_desc* argument shall be open for
 29892 reading. The current trace event timestamp, which specifies the timestamp of the trace event
 29893 that will be read by the next call to *posix_trace_getnext_event()*, shall be set to the timestamp of
 29894 the oldest trace event recorded in the trace log identified by *trid*.

29895 The *posix_trace_open()* function shall return a trace stream identifier in the variable pointed to by
 29896 the *trid* argument, that may only be used by the following functions:

29897 <i>posix_trace_close()</i>	<i>posix_trace_get_attr()</i>
29898 <i>posix_trace_eventid_equal()</i>	<i>posix_trace_get_status()</i>
29899 <i>posix_trace_eventid_get_name()</i>	<i>posix_trace_getnext_event()</i>
29900 <i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_rewind()</i>
29901 <i>posix_trace_eventtypelist_rewind()</i>	

29902 In particular, notice that the operations normally used by a trace controller process, such as
 29903 *posix_trace_start()*, *posix_trace_stop()*, or *posix_trace_shutdown()*, cannot be invoked using the
 29904 trace stream identifier returned by the *posix_trace_open()* function.

29905 The *posix_trace_rewind()* function shall reset the current trace event timestamp, which specifies
 29906 the timestamp of the trace event that will be read by the next call to *posix_trace_getnext_event()*,
 29907 to the timestamp of the oldest trace event recorded in the trace log identified by *trid*.

29908 **RETURN VALUE**

29909 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
 29910 return the corresponding error number.

29911 If successful, the *posix_trace_open()* function stores the trace stream identifier value in the object
 29912 pointed to by *trid*.

29913 **ERRORS**

29914 The *posix_trace_open()* function shall fail if:

29915 [EINTR]	The operation was interrupted by a signal and thus no trace log was opened.
29916 [EINVAL]	The object pointed to by <i>file_desc</i> does not correspond to a valid trace log.

29917 The *posix_trace_close()* and *posix_trace_rewind()* functions may fail if:

29918 [EINVAL]	The object pointed to by <i>trid</i> does not correspond to a valid trace log.

29919 **EXAMPLES**

29920 None.

29921 **APPLICATION USAGE**

29922 None.

29923 **RATIONALE**

29924 None.

29925 **FUTURE DIRECTIONS**

29933 **NAME**

29934 posix_trace_create, posix_trace_create_withlog, posix_trace_flush, posix_trace_shutdown —
 29935 trace stream initialization, flush, and shutdown from a process (**TRACING**)

29936 **SYNOPSIS**

```
29937 TRC    #include <sys/types.h>
29938        #include <trace.h>

29939        int posix_trace_create(pid_t pid,
29940                               const trace_attr_t *restrict attr,
29941                               trace_id_t *restrict trid);
29942 TRC TRL int posix_trace_create_withlog(pid_t pid,
29943                                         const trace_attr_t *restrict attr, int file_desc,
29944                                         trace_id_t *restrict trid);
29945        int posix_trace_flush(trace_id_t trid);
29946 TRC        int posix_trace_shutdown(trace_id_t trid);
29947
```

29948 **DESCRIPTION**

29949 The *posix_trace_create()* function shall create an active trace stream. It allocates all the resources
 29950 needed by the trace stream being created for tracing the process specified by *pid* in accordance
 29951 with the *attr* argument. The *attr* argument represents the initial attributes of the trace stream and
 29952 shall have been initialized by the function *posix_trace_attr_init()* prior to the *posix_trace_create()*
 29953 call. If the argument *attr* is NULL, the default attributes shall be used. The *attr* attributes object
 29954 shall be manipulated through a set of functions described in the *posix_trace_attr* family of
 29955 functions. If the attributes of the object pointed to by *attr* are modified later, the attributes of the
 29956 trace stream shall not be affected. The *creation-time* attribute of the newly created trace stream
 29957 shall be set to the value of the system clock, if the Timers option is not supported, or to the value
 29958 of the CLOCK_REALTIME clock, if the Timers option is supported.

29959 The *pid* argument represents the target process to be traced. If the process executing this
 29960 function does not have appropriate privileges to trace the process identified by *pid*, an error shall
 29961 be returned. If the *pid* argument is zero, the calling process shall be traced.

29962 The *posix_trace_create()* function shall store the trace stream identifier of the new trace stream in
 29963 the object pointed to by the *trid* argument. This trace stream identifier shall be used in
 29964 subsequent calls to control tracing. The *trid* argument may only be used by the following
 29965 functions:

29966	<i>posix_trace_clear()</i>	<i>posix_trace_getnext_event()</i>
29967	<i>posix_trace_eventid_equal()</i>	<i>posix_trace_shutdown()</i>
29968	<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_start()</i>
29969	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_stop()</i>
29970	<i>posix_trace_eventtypelist_rewind()</i>	<i>posix_trace_timedgetnext_event()</i>
29971	<i>posix_trace_get_attr()</i>	<i>posix_trace_trid_eventid_open()</i>
29972	<i>posix_trace_get_status()</i>	<i>posix_trace_trygetnext_event()</i>

29973 TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*
 29974 argument:

29975 *posix_trace_get_filter()* *posix_trace_set_filter()*

29976

29977 In particular, notice that the operations normally used by a trace analyzer process, such as
 29978 *posix_trace_rewind()* or *posix_trace_close()*, cannot be invoked using the trace stream identifier
 29979 returned by the *posix_trace_create()* function.

29980 TEF A trace stream shall be created in a suspended state. If the Trace Event Filter option is
 29981 supported, its trace event type filter shall be empty.

29982 The *posix_trace_create()* function may be called multiple times from the same or different
 29983 processes, with the system-wide limit indicated by the runtime invariant value
 29984 {TRACE_SYS_MAX}, which has the minimum value {_POSIX_TRACE_SYS_MAX}.

29985 The trace stream identifier returned by the *posix_trace_create()* function in the argument pointed
 29986 to by *trid* is valid only in the process that made the function call. If it is used from another
 29987 process, that is a child process, in functions defined in IEEE Std 1003.1-2001, these functions shall
 29988 return with the error [EINVAL].

29989 TRL The *posix_trace_create_withlog()* function shall be equivalent to *posix_trace_create()*, except that it
 29990 associates a trace log with this stream. The *file_desc* argument shall be the file descriptor
 29991 designating the trace log destination. The function shall fail if this file descriptor refers to a file
 29992 with a file type that is not compatible with the log policy associated with the trace log. The list of
 29993 the appropriate file types that are compatible with each log policy is implementation-defined.

29994 The *posix_trace_create_withlog()* function shall return in the parameter pointed to by *trid* the trace
 29995 stream identifier, which uniquely identifies the newly created trace stream, and shall be used in
 29996 subsequent calls to control tracing. The *trid* argument may only be used by the following
 29997 functions:

29998	<i>posix_trace_clear()</i>	<i>posix_trace_getnext_event()</i>
29999	<i>posix_trace_eventid_equal()</i>	<i>posix_trace_shutdown()</i>
30000	<i>posix_trace_eventid_get_name()</i>	<i>posix_trace_start()</i>
30001	<i>posix_trace_eventtypelist_getnext_id()</i>	<i>posix_trace_stop()</i>
30002	<i>posix_trace_eventtypelist_rewind()</i>	<i>posix_trace_timedgetnext_event()</i>
30003	<i>posix_trace_flush()</i>	<i>posix_trace_trid_eventid_open()</i>
30004	<i>posix_trace_get_attr()</i>	<i>posix_trace_trygetnext_event()</i>
30005	<i>posix_trace_get_status()</i>	

30006

30007 TRL TEF If the Trace Event Filter option is supported, the following additional functions may use the *trid*
 30008 argument:

30009 *posix_trace_get_filter()* *posix_trace_set_filter()*

30010

30011 TRL In particular, notice that the operations normally used by a trace analyzer process, such as
 30012 *posix_trace_rewind()* or *posix_trace_close()*, cannot be invoked using the trace stream identifier
 30013 returned by the *posix_trace_create_withlog()* function.

30014 The *posix_trace_flush()* function shall initiate a flush operation which copies the contents of the
 30015 trace stream identified by the argument *trid* into the trace log associated with the trace stream at
 30016 the creation time. If no trace log has been associated with the trace stream pointed to by *trid*, this
 30017 function shall return an error. The termination of the flush operation can be polled by the
 30018 *posix_trace_get_status()* function. During the flush operation, it shall be possible to trace new
 30019 trace events up to the point when the trace stream becomes full. After flushing is completed, the
 30020 space used by the flushed trace events shall be available for tracing new trace events.

30021	If flushing the trace stream causes the resulting trace log to become full, the trace log full policy shall be applied. If the trace <i>log-full-policy</i> attribute is set, the following occurs:	
30022		
30023	POSIX_TRACE_UNTIL_FULL	
30024	The trace events that have not yet been flushed shall be discarded.	
30025	POSIX_TRACE_LOOP	
30026	The trace events that have not yet been flushed shall be written to the beginning of the trace log, overwriting previous trace events stored there.	
30027		
30028	POSIX_TRACE_APPEND	
30029	The trace events that have not yet been flushed shall be appended to the trace log.	
30030		
30031	The <i>posix_trace_shutdown()</i> function shall stop the tracing of trace events in the trace stream identified by <i>trid</i> , as if <i>posix_trace_stop()</i> had been invoked. The <i>posix_trace_shutdown()</i> function shall free all the resources associated with the trace stream.	
30032		
30033		
30034	The <i>posix_trace_shutdown()</i> function shall not return until all the resources associated with the trace stream have been freed. When the <i>posix_trace_shutdown()</i> function returns, the <i>trid</i> argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the <i>trace_getnext_event()</i> functions (which specified this <i>trid</i>) before this call is unblocked with the error [EINVAL].	
30035		
30036		
30037		
30038		
30039		
30040	If the process exits, invokes a member of the <i>exec</i> family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the <i>posix_trace_shutdown()</i> function.	
30041		
30042		
30043	TRL	For an active trace stream with log, when the <i>posix_trace_shutdown()</i> function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the <i>posix_trace_flush()</i> function, and the trace log shall be closed.
30044		
30045		
30046	When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.	
30047		
30048		
30049		
30050	In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the <i>posix_trace_open()</i> operation.	
30051		
30052	The <i>posix_trace_shutdown()</i> function shall not return until all trace events have been flushed.	
30053	RETURN VALUE	
30054	Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.	
30055		
30056	TRL	The <i>posix_trace_create()</i> and <i>posix_trace_create_withlog()</i> functions store the trace stream identifier value in the object pointed to by <i>trid</i> , if successful.
30057		
30058	ERRORS	
30059	TRL	The <i>posix_trace_create()</i> and <i>posix_trace_create_withlog()</i> functions shall fail if:
30060	[EAGAIN]	No more trace streams can be started now. {TRACE_SYS_MAX} has been exceeded.
30061		
30062	[EINTR]	The operation was interrupted by a signal. No trace stream was created.
30063	[EINVAL]	One or more of the trace parameters specified by the <i>attr</i> parameter is invalid.

30064	[ENOMEM]	The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.
30065		
30066	[EPERM]	The caller does not have appropriate privilege to trace the process specified by <i>pid</i> .
30067		
30068	[ESRCH]	The <i>pid</i> argument does not refer to an existing process.
30069	TRL	The <i>posix_trace_create_withlog()</i> function shall fail if:
30070	[EBADF]	The <i>file_desc</i> argument is not a valid file descriptor open for writing.
30071	[EINVAL]	The <i>file_desc</i> argument refers to a file with a file type that does not support the log policy associated with the trace log.
30072		
30073	[ENOSPC]	No space left on device. The device corresponding to the argument <i>file_desc</i> does not contain the space required to create this trace log.
30074		
30075		
30076	TRL	The <i>posix_trace_flush()</i> and <i>posix_trace_shutdown()</i> functions shall fail if:
30077	[EINVAL]	The value of the <i>trid</i> argument does not correspond to an active trace stream with log.
30078		
30079	[EFBIG]	The trace log file has attempted to exceed an implementation-defined maximum file size.
30080		
30081	[ENOSPC]	No space left on device.
30082

 30097 Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <trace.h>

30098 CHANGE HISTORY

30099 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30100 **NAME**

30101 posix_trace_event, posix_trace_eventid_open — trace functions for instrumenting application
 30102 code (**TRACING**)

30103 **SYNOPSIS**

30104 TRC #include <sys/types.h>

30105 #include <trace.h>

```
30106 void posix_trace_event(trace_event_id_t event_id,
30107     const void *restrict data_ptr, size_t data_len);
30108 int posix_trace_eventid_open(const char *restrict event_name,
30109     trace_event_id_t *restrict event_id);
30110
```

30111 **DESCRIPTION**

30112 The *posix_trace_event()* function shall record the *event_id* and the user data pointed to by *data_ptr*
 30113 in the trace stream into which the calling process is being traced and in which *event_id* is not
 30114 filtered out. If the total size of the user trace event data represented by *data_len* is not greater
 30115 than the declared maximum size for user trace event data, then the *truncation-status* attribute of
 30116 the trace event recorded is POSIX_TRACE_NOT_TRUNCATED. Otherwise, the user trace event
 30117 data is truncated to this declared maximum size and the *truncation-status* attribute of the trace
 30118 event recorded is POSIX_TRACE_TRUNCATED_RECORD.

30119 If there is no trace stream created for the process or if the created trace stream is not running, or
 30120 if the trace event specified by *event_id* is filtered out in the trace stream, the *posix_trace_event()*
 30121 function shall have no effect.

30122 The *posix_trace_eventid_open()* function shall associate a user trace event name with a trace event
 30123 type identifier for the calling process. The trace event name is the string pointed to by the
 30124 argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
 30125 (which has the minimum value {POSIX_TRACE_EVENT_NAME_MAX}). The number of user
 30126 trace event type identifiers that can be defined for any given process is limited by the maximum
 30127 value {TRACE_USER_EVENT_MAX}, which has the minimum value
 30128 {POSIX_TRACE_USER_EVENT_MAX}.

30129 If the Trace Inherit option is not supported, the *posix_trace_eventid_open()* function shall
 30130 associate the user trace event name pointed to by the *event_name* argument with a trace event
 30131 type identifier that is unique for the traced process, and is returned in the variable pointed to by
 30132 the *event_id* argument. If the user trace event name has already been mapped for the traced
 30133 process, then the previously assigned trace event type identifier shall be returned. If the per-
 30134 process user trace event name limit represented by {TRACE_USER_EVENT_MAX} has been
 30135 reached, the pre-defined POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7 (on page 79))
 30136 user trace event shall be returned.

30137 TRI If the Trace Inherit option is supported, the *posix_trace_eventid_open()* function shall associate the
 30138 user trace event name pointed to by the *event_name* argument with a trace event type identifier
 30139 that is unique for all the processes being traced in this same trace stream, and is returned in the
 30140 variable pointed to by the *event_id* argument. If the user trace event name has already been
 30141 mapped for the traced processes, then the previously assigned trace event type identifier shall be
 30142 returned. If the per-process user trace event name limit represented by
 30143 {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
 30144 POSIX_TRACE_UNNAMED_USEREVENT (Table 2-7 (on page 79)) user trace event shall be
 30145 returned.

30146 **Note:** The above procedure, together with the fact that multiple processes can only be traced into the
 30147 same trace stream by inheritance, ensure that all the processes that are traced into a trace
 30148 stream have the same mapping of trace event names to trace event type identifiers.

30149

30150 If there is no trace stream created, the *posix_trace_eventid_open()* function shall store this
30151 information for future trace streams created for this process.

30152 RETURN VALUE

30153 No return value is defined for the *posix_trace_event()* function.

30154 Upon successful completion, the *posix_trace_eventid_open()* function shall return a value of zero.
30155 Otherwise, it shall return the corresponding error number. The *posix_trace_eventid_open()*
30156 function stores the trace event type identifier value in the object pointed to by *event_id*, if
30157 successful.

30158 ERRORS

30159 The *posix_trace_eventid_open()* function shall fail if:

30160 [ENAMETOOLONG]

30161 The size of the name pointed to by the *event_name* argument was longer than
30162 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

30163 EXAMPLES

30174 CHANGE HISTORY

30175 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30176 IEEE PASC Interpretation 1003.1 #123 is applied.

30177 IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of
30178 the *posix_trace_eventid_open()* function and the *event_id* argument.

30179 **NAME**

30180 posix_trace_eventid_equal, posix_trace_eventid_get_name, posix_trace_trid_eventid_open —
 30181 manipulate the trace event type identifier (**TRACING**)

30182 **SYNOPSIS**

```
30183 TRC      #include <trace.h>

30184      int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
30185                                  trace_event_id_t event2);
30186      int posix_trace_eventid_get_name(trace_id_t trid,
30187                                     trace_event_id_t event, char *event_name);
30188 TRC TEF   int posix_trace_trid_eventid_open(trace_id_t trid,
30189                                             const char *restrict event_name,
30190                                             trace_event_id_t *restrict event);
30191
```

30192 **DESCRIPTION**

30193 The *posix_trace_eventid_equal()* function shall compare the trace event type identifiers *event1* and
 30194 *event2* from the same trace stream or the same trace log identified by the *trid* argument. If the
 30195 trace event type identifiers *event1* and *event2* are from different trace streams, the return value
 30196 shall be unspecified.

30197 The *posix_trace_eventid_get_name()* function shall return, in the argument pointed to by
 30198 *event_name*, the trace event name associated with the trace event type identifier identified by the
 30199 argument *event*, for the trace stream or for the trace log identified by the *trid* argument. The
 30200 name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
 30201 (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to
 30202 this function with the same trace event type identifier and the same trace stream identifier shall
 30203 return the same event name.

30204 TEF The *posix_trace_trid_eventid_open()* function shall associate a user trace event name with a trace
 30205 event type identifier for a given trace stream. The trace stream is identified by the *trid* argument,
 30206 and it shall be an active trace stream. The trace event name is the string pointed to by the
 30207 argument *event_name*. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
 30208 (which has the minimum value {_POSIX_TRACE_EVENT_NAME_MAX}). The number of user
 30209 trace event type identifiers that can be defined for any given process is limited by the maximum
 30210 value {TRACE_USER_EVENT_MAX}, which has the minimum value
 30211 {_POSIX_TRACE_USER_EVENT_MAX}.

30212 If the Trace Inherit option is not supported, the *posix_trace_trid_eventid_open()* function shall
 30213 associate the user trace event name pointed to by the *event_name* argument with a trace event
 30214 type identifier that is unique for the process being traced in the trace stream identified by the *trid*
 30215 argument, and is returned in the variable pointed to by the *event* argument. If the user trace
 30216 event name has already been mapped for the traced process, then the previously assigned trace
 30217 event type identifier shall be returned. If the per-process user trace event name limit represented
 30218 by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
 30219 POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be
 30220 returned.

30221 TEF TRI If the Trace Inherit option is supported, the *posix_trace_trid_eventid_open()* function shall
 30222 associate the user trace event name pointed to by the *event_name* argument with a trace event
 30223 type identifier that is unique for all the processes being traced in the trace stream identified by
 30224 the *trid* argument, and is returned in the variable pointed to by the *event* argument. If the user
 30225 trace event name has already been mapped for the traced processes, then the previously
 30226 assigned trace event type identifier shall be returned. If the per-process user trace event name
 30227 limit represented by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined

30228 POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be
30229 returned.

30230 RETURN VALUE

30231 TEF Upon successful completion, the *posix_trace_eventid_get_name()* and
30232 *posix_trace_trid_eventid_open()* functions shall return a value of zero. Otherwise, they shall return
30233 the corresponding error number.

30234 The *posix_trace_eventid_equal()* function shall return a non-zero value if *event1* and *event2* are
30235 equal; otherwise, a value of zero shall be returned. No errors are defined. If either *event1* or
30236 *event2* are not valid trace event type identifiers for the trace stream specified by *trid* or if the *trid*
30237 is invalid, the behavior shall be unspecified.

30238 The *posix_trace_eventid_get_name()* function stores the trace event name value in the object
30239 pointed to by *event_name*, if successful.

30240 TEF The *posix_trace_trid_eventid_open()* function stores the trace event type identifier value in the
30241 object pointed to by *event*, if successful.

30242 ERRORS

30243 TEF The *posix_trace_eventid_get_name()* and *posix_trace_trid_eventid_open()* functions shall fail if:

30244 [EINVAL] The *trid* argument was not a valid trace stream identifier.

30245 TEF The *posix_trace_trid_eventid_open()* function shall fail if:

30246 TEF [ENAMETOOLONG]

30247 The size of the name pointed to by the *event_name* argument was longer than
30248 the implementation-defined value {TRACE_EVENT_NAME_MAX}.

30249 The *posix_trace_eventid_get_name()* function shall fail if:

30250 [EINVAL] The trace event type identifier *event* was not associated with any name.

30265 **NAME**

30266 posix_trace_eventid_open — trace functions for instrumenting application code (**TRACING**)

30267 **SYNOPSIS**

30268 TRC #include <sys/types.h>

30269 #include <trace.h>

30270 int posix_trace_eventid_open(const char *restrict event_name,
30271 trace_event_id_t *restrict event_id);

30272

30273 **DESCRIPTION**

30274 Refer to *posix_trace_event()*.

30275 NAME

30276 posix_trace_eventset_add, posix_trace_eventset_del, posix_trace_eventset_empty,
30277 posix_trace_eventset_fill, posix_trace_eventset_ismember — manipulate trace event type sets
30278 (TRACING)

30279 SYNOPSIS

```
30280 TRC TEF #include <trace.h>

30281 int posix_trace_eventset_add(trace_event_id_t event_id,
30282     trace_event_set_t *set);
30283 int posix_trace_eventset_del(trace_event_id_t event_id,
30284     trace_event_set_t *set);
30285 int posix_trace_eventset_empty(trace_event_set_t *set);
30286 int posix_trace_eventset_fill(trace_event_set_t *set, int what);
30287 int posix_trace_eventset_ismember(trace_event_id_t event_id,
30288     const trace_event_set_t *restrict set, int *restrict ismember);
30289
```

30290 DESCRIPTION

30291 These primitives manipulate sets of trace event types. They operate on data objects addressable
30292 by the application, not on the current trace event filter of any trace stream.

30293 The *posix_trace_eventset_add()* and *posix_trace_eventset_del()* functions, respectively, shall add or
30294 delete the individual trace event type specified by the value of the argument *event_id* to or from
30295 the trace event type set pointed to by the argument *set*. Adding a trace event type already in the
30296 set or deleting a trace event type not in the set shall not be considered an error.

30297 The *posix_trace_eventset_empty()* function shall initialize the trace event type set pointed to by
30298 the *set* argument such that all trace event types defined, both system and user, shall be excluded
30299 from the set.

30300 The *posix_trace_eventset_fill()* function shall initialize the trace event type set pointed to by the
30301 argument *set*, such that the set of trace event types defined by the argument *what* shall be
30302 included in the set. The value of the argument *what* shall consist of one of the following values,
30303 as defined in the **<trace.h>** header:

30304 POSIX_TRACE_WOPID_EVENTS

30305 All the process-independent implementation-defined system trace event types are included
30306 in the set.

30307 POSIX_TRACE_SYSTEM_EVENTS

30308 All the implementation-defined system trace event types are included in the set, as are those
30309 defined in IEEE Std 1003.1-2001.

30310 POSIX_TRACE_ALL_EVENTS

30311 All trace event types defined, both system and user, are included in the set.

30312 Applications shall call either *posix_trace_eventset_empty()* or *posix_trace_eventset_fill()* at least
30313 once for each object of type **trace_event_set_t** prior to any other use of that object. If such an
30314 object is not initialized in this way, but is nonetheless supplied as an argument to any of the
30315 *posix_trace_eventset_add()*, *posix_trace_eventset_del()*, or *posix_trace_eventset_ismember()* functions,
30316 the results are undefined.

30317 The *posix_trace_eventset_ismember()* function shall test whether the trace event type specified by
30318 the value of the argument *event_id* is a member of the set pointed to by the argument *set*. The
30319 value returned in the object pointed to by *ismember* argument is zero if the trace event type
30320 identifier is not a member of the set and a value different from zero if it is a member of the set.

30321 RETURN VALUE

30322 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30323 return the corresponding error number.

30324 ERRORS

30325 These functions may fail if:

30326 [EINVAL] The value of one of the arguments is invalid.

30327 EXAMPLES

30328 None.

30338 CHANGE HISTORY

30339 First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

30340 NAME

30341 posix_trace_eventtypelist_getnext_id, posix_trace_eventtypelist_rewind — iterate over a
30342 mapping of trace event types (**TRACING**)

30343 SYNOPSIS

```
30344 TRC    #include <trace.h>

30345    int posix_trace_eventtypelist_getnext_id(trace_id_t trid,
30346      trace_event_id_t *restrict event, int *restrict unavailable);
30347    int posix_trace_eventtypelist_rewind(trace_id_t trid);
30348
```

30349 DESCRIPTION

30350 The first time *posix_trace_eventtypelist_getnext_id()* is called, the function shall return in the
30351 variable pointed to by *event* the first trace event type identifier of the list of trace events of the
30352 trace stream identified by the *trid* argument. Successive calls to
30353 *posix_trace_eventtypelist_getnext_id()* return in the variable pointed to by *event* the next trace
30354 event type identifier in that same list. Each time a trace event type identifier is successfully
30355 written into the variable pointed to by the *event* argument, the variable pointed to by the
30356 *unavailable* argument shall be set to zero. When no more trace event type identifiers are
30357 available, and so none is returned, the variable pointed to by the *unavailable* argument shall be
30358 set to a value different from zero.

30359 The *posix_trace_eventtypelist_rewind()* function shall reset the next trace event type identifier to
30360 be read to the first trace event type identifier from the list of trace events used in the trace stream
30361 identified by *trid*.

30362 RETURN VALUE

30363 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30364 return the corresponding error number.

30365 The *posix_trace_eventtypelist_getnext_id()* function stores the trace event type identifier value in
30366 the object pointed to by *event*, if successful.

30367 ERRORS

30368 These functions shall fail if:

30369 [EINVAL] The *trid* argument was not a valid trace stream identifier.

30370 EXAMPLES

30371 None.

30391 **DESCRIPTION**30392 Refer to *posix_trace_create()*.

30393 NAME

30394 `posix_trace_get_attr`, `posix_trace_get_status` — retrieve the trace attributes or trace status
30395 (TRACING)

30396 SYNOPSIS

30397 TRC `#include <trace.h>`

```
30398        int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
30399        int posix_trace_get_status(trace_id_t trid,
30400                                  struct posix_trace_status_info *statusinfo);
30401
```

30402 DESCRIPTION

30403 The `posix_trace_get_attr()` function shall copy the attributes of the active trace stream identified
30404 TRL by *trid* into the object pointed to by the *attr* argument. If the Trace Log option is supported, *trid*
30405 may represent a pre-recorded trace log.

30406 The `posix_trace_get_status()` function shall return, in the structure pointed to by the *statusinfo*
30407 argument, the current trace status for the trace stream identified by the *trid* argument. These
30408 status values returned in the structure pointed to by *statusinfo* shall have been appropriately
30409 TRL read to ensure that the returned values are consistent. If the Trace Log option is supported and
30410 the *trid* argument refers to a pre-recorded trace stream, the status shall be the status of the
30411 completed trace stream.

30412 Each time the `posix_trace_get_status()` function is used, the overrun status of the trace stream
30413 TRL shall be reset to `POSIX_TRACE_NO_OVERRUN` immediately after the call completes. If the
30414 Trace Log option is supported, the `posix_trace_get_status()` function shall behave the same as
30415 when the option is not supported except for the following differences:

- 30416 • If the *trid* argument refers to a trace stream with log, each time the `posix_trace_get_status()`
30417 function is used, the log overrun status of the trace stream shall be reset to
30418 `POSIX_TRACE_NO_OVERRUN` and the *flush_error* status shall be reset to zero immediately
30419 after the call completes.
- 30420 • If the *trid* argument refers to a pre-recorded trace stream, the status returned shall be the
30421 status of the completed trace stream and the status values of the trace stream shall not be
30422 reset.

30424 RETURN VALUE

30425 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30426 return the corresponding error number.

30427 The `posix_trace_get_attr()` function stores the trace attributes in the object pointed to by *attr*, if
30428 successful.

30429 The `posix_trace_get_status()` function stores the trace status in the object pointed to by *statusinfo*,
30430 if successful.

30431 ERRORS

30432 These functions shall fail if:

30433 [EINVAL] The trace stream argument *trid* does not correspond to a valid active trace
30434 stream or a valid trace log.

30449 NAME

30450 posix_trace_get_filter, posix_trace_set_filter — retrieve and set the filter of an initialized trace
30451 stream (**TRACING**)

30452 SYNOPSIS

30453 TRC TEF `#include <trace.h>`

```
30454 int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
30455 int posix_trace_set_filter(trace_id_t trid,
30456     const trace_event_set_t *set, int how);
30457
```

30458 DESCRIPTION

30459 The *posix_trace_get_filter()* function shall retrieve, into the argument pointed to by *set*, the actual
30460 trace event filter from the trace stream specified by *trid*.

30461 The *posix_trace_set_filter()* function shall change the set of filtered trace event types after a trace
30462 stream identified by the *trid* argument is created. This function may be called prior to starting
30463 the trace stream, or while the trace stream is active. By default, if no call is made to
30464 *posix_trace_set_filter()*, all trace events shall be recorded (that is, none of the trace event types are
30465 filtered out).

30466 If this function is called while the trace is in progress, a special system trace event,
30467 POSIX_TRACE_FILTER, shall be recorded in the trace indicating both the old and the new sets
30468 of filtered trace event types (see Table 2-4 (on page 78) and Table 2-6 (on page 79)).

30469 If the *posix_trace_set_filter()* function is interrupted by a signal, an error shall be returned and the
30470 filter shall not be changed. In this case, the state of the trace stream shall not be changed.

30471 The value of the argument *how* indicates the manner in which the set is to be changed and shall
30472 have one of the following values, as defined in the **<trace.h>** header:

30473 POSIX_TRACE_SET_EVENTSET

30474 The resulting set of trace event types to be filtered shall be the trace event type set pointed
30475 to by the argument *set*.

30476 POSIX_TRACE_ADD_EVENTSET

30477 The resulting set of trace event types to be filtered shall be the union of the current set and
30478 the trace event type set pointed to by the argument *set*.

30479 POSIX_TRACE_SUB_EVENTSET

30480 The resulting set of trace event types to be filtered shall be all trace event types in the
30481 current set that are not in the set pointed to by the argument *set*; that is, remove each
30482 element of the specified set from the current filter.

30483 RETURN VALUE

30484 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30485 return the corresponding error number.

30486 The *posix_trace_get_filter()* function stores the set of filtered trace event types in *set*, if successful.

30487 ERRORS

30488 These functions shall fail if:

30489 [EINVAL] The value of the *trid* argument does not correspond to an active trace stream
30490 or the value of the argument pointed to by *set* is invalid.

30491 [EINTR] The operation was interrupted by a signal.

30492 **EXAMPLES**

30493 None.

30494 **APPLICATION USAGE**

30495 None.

30496 **RATIONALE**

30497 None.

30498 **FUTURE DIRECTIONS**

30499 None.

30506 NAME

30507 posix_trace_get_status — retrieve the trace status (**TRACING**)

30508 SYNOPSIS

30509 TRC `#include <trace.h>`

30510 `int posix_trace_get_status(trace_id_t trid,`
30511 `struct posix_trace_status_info *statusinfo);`

30512

30513 DESCRIPTION

30514 Refer to *posix_trace_get_attr()*.

30515 **NAME**

30516 posix_trace_getnext_event, posix_trace_timedgetnext_event, posix_trace_trygetnext_event —
 30517 retrieve a trace event (**TRACING**)

30518 **SYNOPSIS**

```
30519 TRC    #include <sys/types.h>
30520         #include <trace.h>

30521         int posix_trace_getnext_event(trace_id_t trid,
30522         struct posix_trace_event_info *restrict event,
30523         void *restrict data, size_t num_bytes,
30524         size_t *restrict data_len, int *restrict unavailable);
30525 TRC TMO int posix_trace_timedgetnext_event(trace_id_t trid,
30526         struct posix_trace_event_info *restrict event,
30527         void *restrict data, size_t num_bytes,
30528         size_t *restrict data_len, int *restrict unavailable,
30529         const struct timespec *restrict abs_timeout);
30530 TRC    int posix_trace_trygetnext_event(trace_id_t trid,
30531         struct posix_trace_event_info *restrict event,
30532         void *restrict data, size_t num_bytes,
30533         size_t *restrict data_len, int *restrict unavailable);
30534
```

30535 **DESCRIPTION**

30536 The *posix_trace_getnext_event()* function shall report a recorded trace event either from an active
 30537 TRL trace stream without log or a pre-recorded trace stream identified by the *trid* argument. The
 30538 *posix_trace_trygetnext_event()* function shall report a recorded trace event from an active trace
 30539 stream without log identified by the *trid* argument.

30540 The trace event information associated with the recorded trace event shall be copied by the
 30541 function into the structure pointed to by the argument *event* and the data associated with the
 30542 trace event shall be copied into the buffer pointed to by the *data* argument.

30543 The *posix_trace_getnext_event()* function shall block if the *trid* argument identifies an active trace
 30544 stream and there is currently no trace event ready to be retrieved. When returning, if a recorded
 30545 trace event was reported, the variable pointed to by the *unavailable* argument shall be set to zero.
 30546 Otherwise, the variable pointed to by the *unavailable* argument shall be set to a value different
 30547 from zero.

30548 TMO The *posix_trace_timedgetnext_event()* function shall attempt to get another trace event from an
 30549 active trace stream without log, as in the *posix_trace_getnext_event()* function. However, if no
 30550 trace event is available from the trace stream, the implied wait shall be terminated when the
 30551 timeout specified by the argument *abs_timeout* expires, and the function shall return the error
 30552 [ETIMEDOUT].

30553 The timeout shall expire when the absolute time specified by *abs_timeout* passes, as measured by
 30554 the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds
 30555 *abs_timeout*), or if the absolute time specified by *abs_timeout* has already passed at the time of the
 30556 call.

30557 TMO TMR If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock;
 30558 if the Timers option is not supported, the timeout shall be based on the system clock as returned
 30559 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which
 30560 it is based. The **timespec** data type is defined in the **<time.h>** header.

30561 TMO Under no circumstance shall the function fail with a timeout if a trace event is immediately
 30562 available from the trace stream. The validity of the *abs_timeout* argument need not be checked if

30563	a trace event is immediately available from the trace stream.
30564	The behavior of this function for a pre-recorded trace stream is unspecified.
30565 TRL	The <i>posix_trace_trygetnext_event()</i> function shall not block. This function shall return an error if
30566	the <i>trid</i> argument identifies a pre-recorded trace stream. If a recorded trace event was reported,
30567	the variable pointed to by the <i>unavailable</i> argument shall be set to zero. Otherwise, if no trace
30568	event was reported, the variable pointed to by the <i>unavailable</i> argument shall be set to a value
30569	different from zero.
30570	The argument <i>num_bytes</i> shall be the size of the buffer pointed to by the <i>data</i> argument. The
30571	argument <i>data_len</i> reports to the application the length in bytes of the data record just
30572	transferred. If <i>num_bytes</i> is greater than or equal to the size of the data associated with the trace
30573	event pointed to by the <i>event</i> argument, all the recorded data shall be transferred. In this case, the
30574	<i>truncation-status</i> member of the trace event structure shall be either
30575	POSIX_TRACE_NOT_TRUNCATED, if the trace event data was recorded without truncation
30576	while tracing, or POSIX_TRACE_TRUNCATED_RECORD, if the trace event data was truncated
30577	when it was recorded. If the <i>num_bytes</i> argument is less than the length of recorded trace event
30578	data, the data transferred shall be truncated to a length of <i>num_bytes</i> , the value stored in the
30579	variable pointed to by <i>data_len</i> shall be equal to <i>num_bytes</i> , and the <i>truncation-status</i> member of
30580	the <i>event</i> structure argument shall be set to POSIX_TRACE_TRUNCATED_READ (see the
30581	posix_trace_event_info structure defined in <trace.h>).
30582	The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace
30583	events shall be reported in the order in which they were generated, up to an implementation-
30584	defined time resolution that causes the ordering of trace events occurring very close to each
30585	other to be unknown. Once reported, a trace event cannot be reported again from an active trace
30586	stream. Once a trace event is reported from an active trace stream without log, the trace stream
30587	shall make the resources associated with that trace event available to record future generated
30588	trace events.
30589	RETURN VALUE
30590	Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30591	return the corresponding error number.
30592	If successful, these functions store:
30593	• The recorded trace event in the object pointed to by <i>event</i>
30594	• The trace event information associated with the recorded trace event in the object pointed to
30595	by <i>data</i>
30596	• The length of this trace event information in the object pointed to by <i>data_len</i>
30597	• The value of zero in the object pointed to by <i>unavailable</i>
30598	ERRORS
30599	These functions shall fail if:
30600	[EINVAL] The trace stream identifier argument <i>trid</i> is invalid.
30601	The <i>posix_trace_getnext_event()</i> and <i>posix_trace_timedgetnext_event()</i> functions shall fail if:
30602	[EINTR] The operation was interrupted by a signal, and so the call had no effect.
30603	The <i>posix_trace_trygetnext_event()</i> function shall fail if:
30604	[EINVAL] The trace stream identifier argument <i>trid</i> does not correspond to an active
30605	trace stream.

30606	TMO	The <i>posix_trace_timedgetnext_event()</i> function shall fail if:
30607	[EINVAL]	There is no trace event immediately available from the trace stream, and the
30608		<i>timeout</i> argument is invalid.
30609	[ETIMEDOUT]	No trace event was available from the trace stream before the specified
30610		timeout <i>timeout</i> expired.
30611

30626 NAME

30627 posix_trace_open, posix_trace_rewind — trace log management (**TRACING**)

30628 SYNOPSIS

30629 TRC TRL `#include <trace.h>`

30630 `int posix_trace_open(int file_desc, trace_id_t *trid);`

30631 `int posix_trace_rewind(trace_id_t trid);`

30632

30633 DESCRIPTION

30634 Refer to *posix_trace_close()*.

30635 **NAME**30636 posix_trace_set_filter — set filter of an initialized trace stream (**TRACING**)30637 **SYNOPSIS**30638 TRC TEF `#include <trace.h>`30639 int posix_trace_set_filter(trace_id_t trid,
30640 const trace_event_set_t *set, int how);

30641

30642 **DESCRIPTION**30643 Refer to *posix_trace_get_filter()*.

30644 NAME

30645 posix_trace_shutdown — trace stream shutdown from a process (**TRACING**)

30646 SYNOPSIS

30647 TRC #include <sys/types.h>

30648 #include <trace.h>

30649 int posix_trace_shutdown(trace_id_t *trid*);

30650

30651 DESCRIPTION

30652 Refer to *posix_trace_create()*.

30653 **NAME**30654 posix_trace_start, posix_trace_stop — trace start and stop (**TRACING**)30655 **SYNOPSIS**

30656 TRC #include <trace.h>

30657 int posix_trace_start(trace_id_t trid);

30658 int posix_trace_stop (trace_id_t trid);

30659

30660 **DESCRIPTION**30661 The *posix_trace_start()* and *posix_trace_stop()* functions, respectively, shall start and stop the
30662 trace stream identified by the argument *trid*.30663 The effect of calling the *posix_trace_start()* function shall be recorded in the trace stream as the
30664 POSIX_TRACE_START system trace event and the status of the trace stream shall become
30665 POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the
30666 POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall
30667 continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall
30668 not be recorded and the status of the trace stream shall not be changed.30669 The effect of calling the *posix_trace_stop()* function shall be recorded in the trace stream as the
30670 POSIX_TRACE_STOP system trace event and the status of the trace stream shall become
30671 POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the
30672 POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain
30673 suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be
30674 recorded and the status of the trace stream shall not be changed.30675 **RETURN VALUE**30676 Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
30677 return the corresponding error number.30678 **ERRORS**

30679 These functions shall fail if:

30680 [EINVAL] The value of the argument *trid* does not correspond to an active trace stream
30681 and thus no trace stream was started or stopped.30682 [EINTR] The operation was interrupted by a signal and thus the trace stream was not
30683 necessarily started or stopped.30684 **EXAMPLES**

30685 None.

30686 **APPLICATION USAGE**

30687 None.

30688 **RATIONALE**

30689 None.

30690 **FUTURE DIRECTIONS**

30691 None.

30697 **NAME**30698 `posix_trace_timedgetnext_event`, — retrieve a trace event (**TRACING**)30699 **SYNOPSIS**30700 TRC TMO `#include <sys/types.h>`30701 `#include <trace.h>`

```
30702     int posix_trace_timedgetnext_event(trace_id_t trid,  
30703         struct posix_trace_event_info *restrict event,  
30704         void *restrict data, size_t num_bytes,  
30705         size_t *restrict data_len, int *restrict unavailable,  
30706         const struct timespec *restrict abs_timeout);  
30707
```

30708 **DESCRIPTION**30709 Refer to `posix_trace_getnext_event()`.

30710 NAME

30711 posix_trace_trid_eventid_open — open a trace event type identifier (**TRACING**)

30712 SYNOPSIS

30713 TRC TEF `#include <trace.h>`

```
30714        int posix_trace_trid_eventid_open(trace_id_t trid,  
30715                                          const char *restrict event_name,  
30716                                          trace_event_id_t *restrict event);  
30717
```

30718 DESCRIPTION

30719 Refer to *posix_trace_eventid_equal()*.

30720 **NAME**30721 `posix_trace_trygetnext_event` — retrieve a trace event (**TRACING**)30722 **SYNOPSIS**30723 TRC `#include <sys/types.h>`30724 `#include <trace.h>`

```
30725        int posix_trace_trygetnext_event(trace_id_t trid,  
30726                    struct posix_trace_event_info *restrict event,  
30727                    void *restrict data, size_t num_bytes,  
30728                    size_t *restrict data_len, int *restrict unavailable);
```

30729

30730 **DESCRIPTION**30731 Refer to `posix_trace_getnext_event()`.

30732 NAME

30733 posix_typed_mem_get_info — query typed memory information (**ADVANCED REALTIME**)

30734 SYNOPSIS

30735 **TYM** #include <sys/mman.h>

```
30736 int posix_typed_mem_get_info(int fildes,
30737 struct posix_typed_mem_info *info);
```

30738

30739 DESCRIPTION

30740 The *posix_typed_mem_get_info()* function shall return, in the *posix_tmi_length* field of the
 30741 **posix_typed_mem_info** structure pointed to by *info*, the maximum length which may be
 30742 successfully allocated by the typed memory object designated by *fildes*. This maximum length
 30743 shall take into account the flag **POSIX_TYPED_MEM_ALLOCATE** or
 30744 **POSIX_TYPED_MEM_ALLOCATE_CONTIG** specified when the typed memory object
 30745 represented by *fildes* was opened. The maximum length is dynamic; therefore, the value returned
 30746 is valid only while the current mapping of the corresponding typed memory pool remains
 30747 unchanged.

30748 If *fildes* represents a typed memory object opened with neither the
 30749 **POSIX_TYPED_MEM_ALLOCATE** flag nor the **POSIX_TYPED_MEM_ALLOCATE_CONTIG**
 30750 flag specified, the returned value of *info*->*posix_tmi_length* is unspecified.

30751 The *posix_typed_mem_get_info()* function may return additional implementation-defined
 30752 information in other fields of the **posix_typed_mem_info** structure pointed to by *info*.

30753 If the memory object specified by *fildes* is not a typed memory object, then the behavior of this
 30754 function is undefined.

30755 RETURN VALUE

30756 Upon successful completion, the *posix_typed_mem_get_info()* function shall return zero;
 30757 otherwise, the corresponding error status value shall be returned.

30758 ERRORS

30759 The *posix_typed_mem_get_info()* function shall fail if:

30760 [EBADF] The *fildes* argument is not a valid open file descriptor.

30761 [ENODEV] The *fildes* argument is not connected to a memory object supported by this
 30762 function.

30763 This function shall not return an error code of [EINTR].

30764 EXAMPLES

30765 None.

30766 APPLICATION USAGE

30767 None.

30768 RATIONALE

30769 An application that needs to allocate a block of typed memory with length dependent upon the
 30770 amount of memory currently available must either query the typed memory object to obtain the
 30771 amount available, or repeatedly invoke *mmap()* attempting to guess an appropriate length.
 30772 While the latter method is existing practice with *malloc()*, it is awkward and imprecise. The
 30773 *posix_typed_mem_get_info()* function allows an application to immediately determine available
 30774 memory. This is particularly important for typed memory objects that may in some cases be
 30775 scarce resources. Note that when a typed memory pool is a shared resource, some form of
 30776 mutual-exclusion or synchronization may be required while typed memory is being queried and

30777 allocated to prevent race conditions.

30778 The existing *fstat()* function is not suitable for this purpose. We realize that implementations
30779 may wish to provide other attributes of typed memory objects (for example, alignment
30780 requirements, page size, and so on). The *fstat()* function returns a structure which is not
30781 extensible and, furthermore, contains substantial information that is inappropriate for typed
30782 memory objects.

30788 **CHANGE HISTORY**

30789 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

30790 NAME

30791 posix_typed_mem_open — open a typed memory object (**ADVANCED REALTIME**)

30792 SYNOPSIS

30793 TYM `#include <sys/mman.h>`

30794 `int posix_typed_mem_open(const char *name, int oflag, int tflag);`
 30795

30796 DESCRIPTION

30797 The *posix_typed_mem_open()* function shall establish a connection between the typed memory
 30798 object specified by the string pointed to by *name* and a file descriptor. It shall create an open file
 30799 description that refers to the typed memory object and a file descriptor that refers to that open
 30800 file description. The file descriptor is used by other functions to refer to that typed memory
 30801 object. It is unspecified whether the name appears in the file system and is visible to other
 30802 functions that take pathnames as arguments. The *name* argument shall conform to the
 30803 construction rules for a pathname. If *name* begins with the slash character, then processes calling
 30804 *posix_typed_mem_open()* with the same value of *name* shall refer to the same typed memory
 30805 object. If *name* does not begin with the slash character, the effect is implementation-defined. The
 30806 interpretation of slash characters other than the leading slash character in *name* is
 30807 implementation-defined.

30808 Each typed memory object supported in a system shall be identified by a name which specifies
 30809 not only its associated typed memory pool, but also the path or port by which it is accessed. That
 30810 is, the same typed memory pool accessed via several different ports shall have several different
 30811 corresponding names. The binding between names and typed memory objects is established in
 30812 an implementation-defined manner. Unlike shared memory objects, there is no way within
 30813 IEEE Std 1003.1-2001 for a program to create a typed memory object.

30814 The value of *tflag* shall determine how the typed memory object behaves when subsequently
 30815 mapped by calls to *mmap()*. At most, one of the following flags defined in **<sys/mman.h>** may
 30816 be specified:

30817 POSIX_TYPED_MEM_ALLOCATE

30818 Allocate on *mmap()*.

30819 POSIX_TYPED_MEM_ALLOCATE_CONTIG

30820 Allocate contiguously on *mmap()*.

30821 POSIX_TYPED_MEM_MAP_ALLOCATABLE

30822 Map on *mmap()*, without affecting allocatability.

30823 If *tflag* has the flag POSIX_TYPED_MEM_ALLOCATE specified, any subsequent call to *mmap()*
 30824 using the returned file descriptor shall result in allocation and mapping of typed memory from
 30825 the specified typed memory pool. The allocated memory may be a contiguous previously
 30826 unallocated area of the typed memory pool or several non-contiguous previously unallocated
 30827 areas (mapped to a contiguous portion of the process address space). If *tflag* has the flag
 30828 POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the
 30829 returned file descriptor shall result in allocation and mapping of a single contiguous previously
 30830 unallocated area of the typed memory pool (also mapped to a contiguous portion of the process
 30831 address space). If *tflag* has none of the flags POSIX_TYPED_MEM_ALLOCATE or
 30832 POSIX_TYPED_MEM_ALLOCATE_CONTIG specified, any subsequent call to *mmap()* using the
 30833 returned file descriptor shall map an application-chosen area from the specified typed memory
 30834 pool such that this mapped area becomes unavailable for allocation until unmapped by all
 30835 processes. If *tflag* has the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE specified, any
 30836 subsequent call to *mmap()* using the returned file descriptor shall map an application-chosen
 30837 area from the specified typed memory pool without an effect on the availability of that area for

allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. The appropriate privilege to specify the `POSIX_TYPED_MEM_MAP_ALLOCATABLE` flag is implementation-defined.

If successful, `posix_typed_mem_open()` shall return a file descriptor for the typed memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The `FD_CLOEXEC` file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of `msync()`, `ftruncate()`, and all file operations other than `mmap()`, `posix_mem_offset()`, `posix_typed_mem_get_info()`, `fstat()`, `dup()`, `dup2()`, and `close()`, is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of *oflag*. Applications shall specify exactly one of the three access mode values described below and defined in the `<fcntl.h>` header, as the value of *oflag*.

30853	<code>O_RDONLY</code>	Open for read access only.
30854	<code>O_WRONLY</code>	Open for write access only.
30855	<code>O_RDWR</code>	Open for read or write access.

30856 RETURN VALUE

Upon successful completion, the `posix_typed_mem_open()` function shall return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, it shall return `-1` and set *errno* to indicate the error.

30860 ERRORS

The `posix_typed_mem_open()` function shall fail if:

30862 30863	<code>[EACCES]</code>	The typed memory object exists and the permissions specified by <i>oflag</i> are denied.
30864	<code>[EINTR]</code>	The <code>posix_typed_mem_open()</code> operation was interrupted by a signal.
30865 30866 30867 30868	<code>[EINVAL]</code>	The flags specified in <i>tflag</i> are invalid (more than one of <code>POSIX_TYPED_MEM_ALLOCATE</code> , <code>POSIX_TYPED_MEM_ALLOCATE_CONTIG</code> , or <code>POSIX_TYPED_MEM_MAP_ALLOCATABLE</code> is specified).
30869	<code>[EMFILE]</code>	Too many file descriptors are currently in use by this process.
30870 30871 30872	<code>[ENAMETOOLONG]</code>	The length of the <i>name</i> argument exceeds <code>{PATH_MAX}</code> or a pathname component is longer than <code>{NAME_MAX}</code> .
30873	<code>[ENFILE]</code>	Too many file descriptors are currently open in the system.
30874	<code>[ENOENT]</code>	The named typed memory object does not exist.
30875 30876	<code>[EPERM]</code>	The caller lacks the appropriate privilege to specify the flag <code>POSIX_TYPED_MEM_MAP_ALLOCATABLE</code> in argument <i>tflag</i> .

30889 CHANGE HISTORY

30890 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

30891 **NAME**

30892 pow, powf, powl — power function

30893 **SYNOPSIS**

30894 #include <math.h>

30895 double pow(double x, double y);

30896 float powf(float x, float y);

30897 long double powl(long double x, long double y);

30898 **DESCRIPTION**

30899 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 30900 conflict between the requirements described here and the ISO C standard is unintentional. This
 30901 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

30902 These functions shall compute the value of x raised to the power y , x^y . If x is negative, the
 30903 application shall ensure that y is an integer value.

30904 An application wishing to check for error situations should set *errno* to zero and call
 30905 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 30906 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 30907 zero, an error has occurred.

30908 **RETURN VALUE**30909 Upon successful completion, these functions shall return the value of x raised to the power y .

30910 **MX** For finite values of $x < 0$, and finite non-integer values of y , a domain error shall occur and either
 30911 a NaN (if representable), or an implementation-defined value shall be returned.

30912 If the correct value would cause overflow, a range error shall occur and *pow()*, *powf()*, and
 30913 *powl()* shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively, with the
 30914 same sign as the correct value of the function.

30915 If the correct value would cause underflow, and is not representable, a range error may occur,
 30916 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

30917 **MX** If x or y is a NaN, a NaN shall be returned (unless specified elsewhere in this description).30918 For any value of y (including NaN), if x is +1, 1.0 shall be returned.30919 For any value of x (including NaN), if y is ± 0 , 1.0 shall be returned.30920 For any odd integer value of $y > 0$, if x is ± 0 , ± 0 shall be returned.30921 For $y > 0$ and not an odd integer, if x is ± 0 , +0 shall be returned.30922 If x is -1 , and y is $\pm\text{Inf}$, 1.0 shall be returned.30923 For $|x| < 1$, if y is $-\text{Inf}$, $+\text{Inf}$ shall be returned.30924 For $|x| > 1$, if y is $-\text{Inf}$, +0 shall be returned.30925 For $|x| < 1$, if y is $+\text{Inf}$, +0 shall be returned.30926 For $|x| > 1$, if y is $+\text{Inf}$, $+\text{Inf}$ shall be returned.30927 For y an odd integer < 0 , if x is $-\text{Inf}$, -0 shall be returned.30928 For $y < 0$ and not an odd integer, if x is $-\text{Inf}$, +0 shall be returned.30929 For y an odd integer > 0 , if x is $-\text{Inf}$, $-\text{Inf}$ shall be returned.30930 For $y > 0$ and not an odd integer, if x is $-\text{Inf}$, $+\text{Inf}$ shall be returned.

30931 For $y < 0$, if x is $+\text{Inf}$, $+0$ shall be returned.

30932 For $y > 0$, if x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

30933 For y an odd integer < 0 , if x is ± 0 , a pole error shall occur and $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and
 30934 $\pm\text{HUGE\_VALL}$ shall be returned for $\text{pow}()$, $\text{powf}()$, and $\text{powl}()$, respectively.

30935 For $y < 0$ and not an odd integer, if x is ± 0 , a pole error shall occur and HUGE_VAL ,
 30936 HUGE_VALF , and HUGE_VALL shall be returned for $\text{pow}()$, $\text{powf}()$, and $\text{powl}()$, respectively.

30937 If the correct value would cause underflow, and is representable, a range error may occur and
 30938 the correct value shall be returned.

30939 ERRORS

30940 These functions shall fail if:

30941 Domain Error The value of x is negative and y is a finite non-integer.

30942 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 30943 then *errno* shall be set to $[\text{EDOM}]$. If the integer expression $(\text{math\_errhandling}$
 30944 $\ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the invalid floating-point exception
 30945 shall be raised.

30946 MX Pole Error The value of x is zero and y is negative.

30947 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 30948 then *errno* shall be set to $[\text{ERANGE}]$. If the integer expression
 30949 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the divide-by-
 30950 zero floating-point exception shall be raised.

30951 Range Error The result overflows.

30952 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 30953 then *errno* shall be set to $[\text{ERANGE}]$. If the integer expression
 30954 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the overflow
 30955 floating-point exception shall be raised.

30956 These functions may fail if:

30957 Range Error The result underflows.

30958 If the integer expression $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ is non-zero,
 30959 then *errno* shall be set to $[\text{ERANGE}]$. If the integer expression
 30960 $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$ is non-zero, then the underflow
 30961 floating-point exception shall be raised.

30962 EXAMPLES

30963 None.

30964 APPLICATION USAGE

30965 On error, the expressions $(\text{math\_errhandling} \ \& \ \text{MATH\_ERRNO})$ and $(\text{math\_errhandling} \ \& \ \text{MATH\_ERREXCEPT})$
 30966 are independent of each other, but at least one of them must be non-zero.

30967 RATIONALE

30968 None.

30969 FUTURE DIRECTIONS

30970 None.

30974 **CHANGE HISTORY**

30975 First released in Issue 1. Derived from Issue 1 of the SVID.

30976 **Issue 5**

30977 The DESCRIPTION is updated to indicate how an application should check for an error. This
30978 text was previously published in the APPLICATION USAGE section.

30979 **Issue 6**

30980 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

30981 The *powf()* and *powl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

30982 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
30983 revised to align with the ISO/IEC 9899:1999 standard.

30984 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
30985 marked.

30986 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/42 is applied, correcting the third
30987 paragraph in the RETURN VALUE section.

31004 pselect, select — synchronous I/O multiplexing

31005 **SYNOPSIS**

```

31006     #include <sys/select.h>

31007     int pselect(int nfds, fd_set *restrict readfds,
31008                 fd_set *restrict writefds, fd_set *restrict errorfds,
31009                 const struct timespec *restrict timeout,
31010                 const sigset_t *restrict sigmask);
31011     int select(int nfds, fd_set *restrict readfds,
31012                fd_set *restrict writefds, fd_set *restrict errorfds,
31013                struct timeval *restrict timeout);
31014     void FD_CLR(int fd, fd_set *fdset);
31015     int FD_ISSET(int fd, fd_set *fdset);
31016     void FD_SET(int fd, fd_set *fdset);
31017     void FD_ZERO(fd_set *fdset);

```

31018 **DESCRIPTION**

31019 The *pselect()* function shall examine the file descriptor sets whose addresses are passed in the
 31020 *readfds*, *writefds*, and *errorfds* parameters to see whether some of their descriptors are ready for
 31021 reading, are ready for writing, or have an exceptional condition pending, respectively.

31022 The *select()* function shall be equivalent to the *pselect()* function, except as follows:

- 31023 • For the *select()* function, the timeout period is given in seconds and microseconds in an
 31024 argument of type **struct timeval**, whereas for the *pselect()* function the timeout period is
 31025 given in seconds and nanoseconds in an argument of type **struct timespec**.
- 31026 • The *select()* function has no *sigmask* argument; it shall behave as *pselect()* does when *sigmask*
 31027 is a null pointer.
- 31028 • Upon successful completion, the *select()* function may modify the object pointed to by the
 31029 *timeout* argument.

31030 The *pselect()* and *select()* functions shall support regular files, terminal and pseudo-terminal
 31031 XSR devices, **STREAMS**-based files, FIFOs, pipes, and sockets. The behavior of *pselect()* and *select()*
 31032 on file descriptors that refer to other types of file is unspecified.

31033 The *nfds* argument specifies the range of descriptors to be tested. The first *nfds* descriptors shall
 31034 be checked in each set; that is, the descriptors from zero through *nfds*–1 in the descriptor sets
 31035 shall be examined.

31036 If the *readfds* argument is not a null pointer, it points to an object of type **fd_set** that on input
 31037 specifies the file descriptors to be checked for being ready to read, and on output indicates
 31038 which file descriptors are ready to read.

31039 If the *writefds* argument is not a null pointer, it points to an object of type **fd_set** that on input
 31040 specifies the file descriptors to be checked for being ready to write, and on output indicates
 31041 which file descriptors are ready to write.

31042 If the *errorfds* argument is not a null pointer, it points to an object of type **fd_set** that on input
 31043 specifies the file descriptors to be checked for error conditions pending, and on output indicates
 31044 which file descriptors have error conditions pending.

31045 Upon successful completion, the *pselect()* or *select()* function shall modify the objects pointed to
 31046 by the *readfds*, *writefds*, and *errorfds* arguments to indicate which file descriptors are ready for
 31047 reading, ready for writing, or have an error condition pending, respectively, and shall return the
 31048 total number of ready descriptors in all the output sets. For each file descriptor less than *nfds*, the

31049 corresponding bit shall be set on successful completion if it was set on input and the associated
31050 condition is true for that file descriptor.

31051 If none of the selected descriptors are ready for the requested operation, the *pselect()* or *select()*
31052 function shall block until at least one of the requested operations becomes ready, until the
31053 *timeout* occurs, or until interrupted by a signal. The *timeout* parameter controls how long the
31054 *pselect()* or *select()* function shall take before timing out. If the *timeout* parameter is not a null
31055 pointer, it specifies a maximum interval to wait for the selection to complete. If the specified
31056 time interval expires without any requested operation becoming ready, the function shall return.
31057 If the *timeout* parameter is a null pointer, then the call to *pselect()* or *select()* shall block
31058 indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the *timeout*
31059 parameter should not be a null pointer, and should point to a zero-valued **timespec** structure.

31060 The use of a timeout does not affect any pending timers set up by *alarm()*, *ualarm()*, or
31061 *setitimer()*.

31062 Implementations may place limitations on the maximum timeout interval supported. All
31063 implementations shall support a maximum timeout interval of at least 31 days. If the *timeout*
31064 argument specifies a timeout interval greater than the implementation-defined maximum value,
31065 the maximum value shall be used as the actual timeout value. Implementations may also place
31066 limitations on the granularity of timeout intervals. If the requested timeout interval requires a
31067 finer granularity than the implementation supports, the actual timeout interval shall be rounded
31068 up to the next supported value.

31069 If *sigmask* is not a null pointer, then the *pselect()* function shall replace the signal mask of the
31070 process by the set of signals pointed to by *sigmask* before examining the descriptors, and shall
31071 restore the signal mask of the process before returning.

31072 A descriptor shall be considered ready for reading when a call to an input function with
31073 O_NONBLOCK clear would not block, whether or not the function would transfer data
31074 successfully. (The function might return data, an end-of-file indication, or an error other than
31075 one indicating that it is blocked, and in each of these cases the descriptor shall be considered
31076 ready for reading.)

31077 A descriptor shall be considered ready for writing when a call to an output function with
31078 O_NONBLOCK clear would not block, whether or not the function would transfer data
31079 successfully.

31080 If a socket has a pending error, it shall be considered to have an exceptional condition pending.
31081 Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for
31082 use with a socket, it is protocol-specific except as noted below. For other file types it is
31083 implementation-defined. If the operation is meaningless for a particular file type, *pselect()* or
31084 *select()* shall indicate that the descriptor is ready for read or write operations, and shall indicate
31085 that the descriptor has no exceptional condition pending.

31086 If a descriptor refers to a socket, the implied input function is the *recvmsg()* function with
31087 parameters requesting normal and ancillary data, such that the presence of either type shall
31088 cause the socket to be marked as readable. The presence of out-of-band data shall be checked if
31089 the socket option SO_OOBINLINE has been enabled, as out-of-band data is enqueued with
31090 normal data. If the socket is currently listening, then it shall be marked as readable if an
31091 incoming connection request has been received, and a call to the *accept()* function shall complete
31092 without blocking.

31093 If a descriptor refers to a socket, the implied output function is the *sendmsg()* function supplying
31094 an amount of normal data equal to the current value of the SO_SNDLOWAT option for the
31095 socket. If a non-blocking call to the *connect()* function has been made for a socket, and the
31096 connection attempt has either succeeded or failed leaving a pending error, the socket shall be

31097 marked as writable.

31098 A socket shall be considered to have an exceptional condition pending if a receive operation
 31099 with `O_NONBLOCK` clear for the open file description and with the `MSG_OOB` flag set would
 31100 return out-of-band data without blocking. (It is protocol-specific whether the `MSG_OOB` flag
 31101 would be used to read out-of-band data.) A socket shall also be considered to have an
 31102 exceptional condition pending if an out-of-band data mark is present in the receive queue. Other
 31103 circumstances under which a socket may be considered to have an exceptional condition
 31104 pending are protocol-specific and implementation-defined.

31105 If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the *timeout* argument is not
 31106 a null pointer, the *pselect()* or *select()* function shall block for the time specified, or until
 31107 interrupted by a signal. If the *readfds*, *writefds*, and *errorfds* arguments are all null pointers and the
 31108 *timeout* argument is a null pointer, the *pselect()* or *select()* function shall block until interrupted
 31109 by a signal.

31110 File descriptors associated with regular files shall always select true for ready to read, ready to
 31111 write, and error conditions.

31112 On failure, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments shall not be
 31113 modified. If the timeout interval expires without the specified condition being true for any of the
 31114 specified file descriptors, the objects pointed to by the *readfds*, *writefds*, and *errorfds* arguments
 31115 shall have all bits set to 0.

31116 File descriptor masks of type **fd_set** can be initialized and tested with *FD_CLR()*, *FD_ISSET()*,
 31117 *FD_SET()*, and *FD_ZERO()*. It is unspecified whether each of these is a macro or a function. If a
 31118 macro definition is suppressed in order to access an actual function, or a program defines an
 31119 external identifier with any of these names, the behavior is undefined.

31120 *FD_CLR(fd, fdsetp)* shall remove the file descriptor *fd* from the set pointed to by *fdsetp*. If *fd* is not
 31121 a member of this set, there shall be no effect on the set, nor will an error be returned.

31122 *FD_ISSET(fd, fdsetp)* shall evaluate to non-zero if the file descriptor *fd* is a member of the set
 31123 pointed to by *fdsetp*, and shall evaluate to zero otherwise.

31124 *FD_SET(fd, fdsetp)* shall add the file descriptor *fd* to the set pointed to by *fdsetp*. If the file
 31125 descriptor *fd* is already in this set, there shall be no effect on the set, nor will an error be returned.

31126 *FD_ZERO(fdsetp)* shall initialize the descriptor set pointed to by *fdsetp* to the null set. No error is
 31127 returned if the set is not empty at the time *FD_ZERO()* is invoked.

31128 The behavior of these macros is undefined if the *fd* argument is less than 0 or greater than or
 31129 equal to `FD_SETSIZE`, or if *fd* is not a valid file descriptor, or if any of the arguments are
 31130 expressions with side effects.

31131 **RETURN VALUE**

31132 Upon successful completion, the *pselect()* and *select()* functions shall return the total number of
 31133 bits set in the bit masks. Otherwise, `-1` shall be returned, and *errno* shall be set to indicate the
 31134 error.

31135 *FD_CLR()*, *FD_SET()*, and *FD_ZERO()* do not return a value. *FD_ISSET()* shall return a non-
 31136 zero value if the bit for the file descriptor *fd* is set in the file descriptor set pointed to by *fdset*, and
 31137 0 otherwise.

31138 **ERRORS**

31139 Under the following conditions, *pselect()* and *select()* shall fail and set *errno* to:

31140 [EBADF] One or more of the file descriptor sets specified a file descriptor that is not a
 31141 valid open file descriptor.

31142	[EINTR]	The function was interrupted before any of the selected events occurred and
31143		before the timeout interval expired.
31144 XSI		If SA_RESTART has been set for the interrupting signal, it is implementation-
31145		defined whether the function restarts or returns with [EINTR].
31146	[EINVAL]	An invalid timeout interval was specified.
31147	[EINVAL]	The <i>nfds</i> argument is less than 0 or greater than FD_SETSIZE.
31148 XSR	[EINVAL]	One of the specified file descriptors refers to a STREAM or multiplexer that is
31149		linked (directly or indirectly) downstream from a multiplexer.

31150 EXAMPLES

31151 None.

31152 APPLICATION USAGE

31153 None.

31154 RATIONALE

31155 In previous versions of the Single UNIX Specification, the *select()* function was defined in the
 31156 **<sys/time.h>** header. This is now changed to **<sys/select.h>**. The rationale for this change was
 31157 as follows: the introduction of the *pselect()* function included the **<sys/select.h>** header and the
 31158 **<sys/select.h>** header defines all the related definitions for the *pselect()* and *select()* functions.
 31159 Backwards-compatibility to existing XSI implementations is handled by allowing **<sys/time.h>**
 31160 to include **<sys/select.h>**.

31161 FUTURE DIRECTIONS

31162 None.

31166 CHANGE HISTORY

31167 First released in Issue 4, Version 2.

31168 Issue 5

31169 Moved from X/OPEN UNIX extension to BASE.

31170 In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when
 31171 *nfds* is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or
 31172 equal to FD_SETSIZE.

31173 Text about *timeout* is moved from the APPLICATION USAGE section to the DESCRIPTION.

31174 Issue 6

31175 The Open Group Corrigendum U026/6 is applied, changing the occurrences of *readfs* and *writefs*
 31176 in the *select()* DESCRIPTION to be *readfds* and *writefds*.

31177 Text referring to sockets is added to the DESCRIPTION.

31178 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
 31179 marked as part of the XSI STREAMS Option Group.

31180 The following new requirements on POSIX implementations derive from alignment with the
 31181 Single UNIX Specification:

- 31182 • These functions are now mandatory.

31183 The *pselect()* function is added for alignment with IEEE Std 1003.1g-2000 and additional detail
 31184 related to sockets semantics is added to the DESCRIPTION.

31185 The *select()* function now requires inclusion of **<sys/select.h>**.

31186 The **restrict** keyword is added to the *select()* prototype for alignment with the

31187 ISO/IEC 9899:1999 standard.

31188 **NAME**

31189 pthread_atfork — register fork handlers

31190 **SYNOPSIS**

31191 THR #include <pthread.h>

```
31192 int pthread_atfork(void (*prepare)(void), void (*parent)(void),
31193 void (*child)(void));
```

31194

31195 **DESCRIPTION**

31196 The *pthread_atfork()* function shall declare fork handlers to be called before and after *fork()*, in
 31197 the context of the thread that called *fork()*. The *prepare* fork handler shall be called before *fork()*
 31198 processing commences. The *parent* fork handler shall be called after *fork()* processing completes
 31199 in the parent process. The *child* fork handler shall be called after *fork()* processing completes
 31200 in the child process. If no handling is desired at one or more of these three points, the
 31201 corresponding fork handler address(es) may be set to NULL.

31202 The order of calls to *pthread_atfork()* is significant. The *parent* and *child* fork handlers shall be
 31203 called in the order in which they were established by calls to *pthread_atfork()*. The *prepare* fork
 31204 handlers shall be called in the opposite order.

31205 **RETURN VALUE**

31206 Upon successful completion, *pthread_atfork()* shall return a value of zero; otherwise, an error
 31207 number shall be returned to indicate the error.

31208 **ERRORS**31209 The *pthread_atfork()* function shall fail if:

31210 [ENOMEM] Insufficient table space exists to record the fork handler addresses.

31211 The *pthread_atfork()* function shall not return an error code of [EINTR].31212 **EXAMPLES**

31213 None.

31214 **APPLICATION USAGE**

31215 None.

31216 **RATIONALE**

31217 There are at least two serious problems with the semantics of *fork()* in a multi-threaded
 31218 program. One problem has to do with state (for example, memory) covered by mutexes.
 31219 Consider the case where one thread has a mutex locked and the state covered by that mutex is
 31220 inconsistent while another thread calls *fork()*. In the child, the mutex is in the locked state
 31221 (locked by a nonexistent thread and thus can never be unlocked). Having the child simply
 31222 reinitialize the mutex is unsatisfactory since this approach does not resolve the question about
 31223 how to correct or otherwise deal with the inconsistent state in the child.

31224 It is suggested that programs that use *fork()* call an *exec* function very soon afterwards in the
 31225 child process, thus resetting all states. In the meantime, only a short list of async-signal-safe
 31226 library routines are promised to be available.

31227 Unfortunately, this solution does not address the needs of multi-threaded libraries. Application
 31228 programs may not be aware that a multi-threaded library is in use, and they feel free to call any
 31229 number of library routines between the *fork()* and *exec* calls, just as they always have. Indeed,
 31230 they may be extant single-threaded programs and cannot, therefore, be expected to obey new
 31231 restrictions imposed by the threads library.

On the other hand, the multi-threaded library needs a way to protect its internal state during *fork()* in case it is re-entered later in the child process. The problem arises especially in multi-threaded I/O libraries, which are almost sure to be invoked between the *fork()* and *exec* calls to effect I/O redirection. The solution may require locking mutex variables during *fork()*, or it may entail simply resetting the state in the child after the *fork()* processing completes.

The *pthread_atfork()* function provides multi-threaded libraries with a means to protect themselves from innocent application programs that call *fork()*, and it provides multi-threaded application programs with a standard mechanism for protecting themselves from *fork()* calls in a library routine or the application itself.

The expected usage is that the *prepare* handler acquires all mutex locks and the other two fork handlers release them.

For example, an application can supply a *prepare* routine that acquires the necessary mutexes the library maintains and supply *child* and *parent* routines that release those mutexes, thus ensuring that the child gets a consistent snapshot of the state of the library (and that no mutexes are left stranded). Alternatively, some libraries might be able to supply just a *child* routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed).

When *fork()* is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time *fork()* was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The parent process may avoid this by explicit code that acquires and releases locks critical to the child via *pthread_atfork()*. In addition, any critical threads need to be recreated and reinitialized to the proper state in the child (also via *pthread_atfork()*).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the *pthread_atfork()* function for itself.

31264 CHANGE HISTORY

31265 First released in Issue 5. Derived from the POSIX Threads Extension.

31266 IEEE PASC Interpretation 1003.1c #4 is applied.

31267 Issue 6

31268 The *pthread_atfork()* function is marked as part of the Threads option.

31269 The <pthread.h> header is added to the SYNOPSIS.

31270 NAME

31271 pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

31272 SYNOPSIS

31273 THR `#include <pthread.h>`

31274 `int pthread_attr_destroy(pthread_attr_t *attr);`

31275 `int pthread_attr_init(pthread_attr_t *attr);`

31276

31277 DESCRIPTION

31278 The *pthread_attr_destroy()* function shall destroy a thread attributes object. An implementation
 31279 may cause *pthread_attr_destroy()* to set *attr* to an implementation-defined invalid value. A
 31280 destroyed *attr* attributes object can be reinitialized using *pthread_attr_init()*; the results of
 31281 otherwise referencing the object after it has been destroyed are undefined.

31282 The *pthread_attr_init()* function shall initialize a thread attributes object *attr* with the default
 31283 value for all of the individual attributes used by a given implementation.

31284 The resulting attributes object (possibly modified by setting individual attribute values) when
 31285 used by *pthread_create()* defines the attributes of the thread created. A single attributes object can
 31286 be used in multiple simultaneous calls to *pthread_create()*. Results are undefined if
 31287 *pthread_attr_init()* is called specifying an already initialized *attr* attributes object.

31288 RETURN VALUE

31289 Upon successful completion, *pthread_attr_destroy()* and *pthread_attr_init()* shall return a value of
 31290 0; otherwise, an error number shall be returned to indicate the error.

31291 ERRORS

31292 The *pthread_attr_init()* function shall fail if:

31293 [ENOMEM] Insufficient memory exists to initialize the thread attributes object.

31294 These functions shall not return an error code of [EINTR].

31295 EXAMPLES

31296 None.

31297 APPLICATION USAGE

31298 None.

31299 RATIONALE

31300 Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to
 31301 support probable future standardization in these areas without requiring that the function itself
 31302 be changed.

31303 Attributes objects provide clean isolation of the configurable aspects of threads. For example,
 31304 “stack size” is an important attribute of a thread, but it cannot be expressed portably. When
 31305 porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects
 31306 can help by allowing the changes to be isolated in a single place, rather than being spread across
 31307 every instance of thread creation.

31308 Attributes objects can be used to set up “classes” of threads with similar attributes; for example,
 31309 “threads with large stacks and high priority” or “threads with minimal stacks”. These classes
 31310 can be defined in a single place and then referenced wherever threads need to be created.
 31311 Changes to “class” decisions become straightforward, and detailed analysis of each
 31312 *pthread_create()* call is not required.

31313 The attributes objects are defined as opaque types as an aid to extensibility. If these objects had
 31314 been specified as structures, adding new attributes would force recompilation of all multi-

threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (*pthread_create()*, *pthread_mutex_init()*, *pthread_cond_init()*). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.
2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the **pthread_mutex_t** and **pthread_cond_t** objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an **int**, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, *get* and *set* functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.
2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by *get* and *set* functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontinuous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of IEEE Std 1003.1-2001 has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as *malloc()*, may have their size fixed at compile time. This means, for example, a *pthread_create()* in an implementation with extensions to **pthread_attr_t** cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions

31362 (possibly by different vendors) are to be accommodated.

31363 **FUTURE DIRECTIONS**

31364 None.

31365 **SEE ALSO**

31366 *pthread_attr_getstackaddr()*, *pthread_attr_getstacksize()*, *pthread_attr_getdetachstate()*,
31367 *pthread_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**

31368 **CHANGE HISTORY**

31369 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31370 **Issue 6**

31371 The *pthread_attr_destroy()* and *pthread_attr_init()* functions are marked as part of the Threads
31372 option.

31373 IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already
31374 initialized thread attributes object is undefined.

31375 **NAME**

31376 pthread_attr_getdetachstate, pthread_attr_setdetachstate — get and set the detachstate attribute

31377 **SYNOPSIS**

31378 THR #include <pthread.h>

```

31379 int pthread_attr_getdetachstate(const pthread_attr_t *attr,
31380 int *detachstate);
31381 int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
31382

```

31383 **DESCRIPTION**

31384 The *detachstate* attribute controls whether the thread is created in a detached state. If the thread
 31385 is created detached, then use of the ID of the newly created thread by the *pthread_detach()* or
 31386 *pthread_join()* function is an error.

31387 The *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* functions, respectively, shall
 31388 get and set the *detachstate* attribute in the *attr* object.

31389 For *pthread_attr_getdetachstate()*, *detachstate* shall be set to either
 31390 PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

31391 For *pthread_attr_setdetachstate()*, the application shall set *detachstate* to either
 31392 PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

31393 A value of PTHREAD_CREATE_DETACHED shall cause all threads created with *attr* to be in
 31394 the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all
 31395 threads created with *attr* to be in the joinable state. The default value of the *detachstate* attribute
 31396 shall be PTHREAD_CREATE_JOINABLE.

31397 **RETURN VALUE**

31398 Upon successful completion, *pthread_attr_getdetachstate()* and *pthread_attr_setdetachstate()* shall
 31399 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31400 The *pthread_attr_getdetachstate()* function stores the value of the *detachstate* attribute in *detachstate*
 31401 if successful.

31402 **ERRORS**

31403 The *pthread_attr_setdetachstate()* function shall fail if:

31404 [EINVAL] The value of *detachstate* was not valid

31405 These functions shall not return an error code of [EINTR].

31406 **EXAMPLES**

31407 None.

31408 **APPLICATION USAGE**

31409 None.

31410 **RATIONALE**

31411 None.

31412 **FUTURE DIRECTIONS**

31413 None.

31414 **SEE ALSO**

31415 *pthread_attr_destroy()*, *pthread_attr_getstackaddr()*, *pthread_attr_getstacksize()*, *pthread_create()*, the
 31416 Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

31417 **CHANGE HISTORY**

31418 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31419 **Issue 6**

31420 The *pthread_attr_setdetachstate()* and *pthread_attr_getdetachstate()* functions are marked as part of
31421 the Threads option.

31422 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

31423 **NAME**

31424 pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize
 31425 attribute

31426 **SYNOPSIS**

31427 XSI `#include <pthread.h>`

```
31428 int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
31429                             size_t *restrict guardsize);
31430 int pthread_attr_setguardsize(pthread_attr_t *attr,
31431                             size_t guardsize);
31432
```

31433 **DESCRIPTION**

31434 The *pthread_attr_getguardsize()* function shall get the *guardsize* attribute in the *attr* object. This
 31435 attribute shall be returned in the *guardsize* parameter.

31436 The *pthread_attr_setguardsize()* function shall set the *guardsize* attribute in the *attr* object. The new
 31437 value of this attribute shall be obtained from the *guardsize* parameter. If *guardsize* is zero, a guard
 31438 area shall not be provided for threads created with *attr*. If *guardsize* is greater than zero, a guard
 31439 area of at least size *guardsize* bytes shall be provided for each thread created with *attr*.

31440 The *guardsize* attribute controls the size of the guard area for the created thread's stack. The
 31441 *guardsize* attribute provides protection against overflow of the stack pointer. If a thread's stack is
 31442 created with guard protection, the implementation allocates extra memory at the overflow end
 31443 of the stack as a buffer against stack overflow of the stack pointer. If an application overflows
 31444 into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

31445 A conforming implementation may round up the value contained in *guardsize* to a multiple of
 31446 the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation
 31447 rounds up the value of *guardsize* to a multiple of {PAGESIZE}, a call to *pthread_attr_getguardsize()*
 31448 specifying *attr* shall store in the *guardsize* parameter the guard size specified by the previous
 31449 *pthread_attr_setguardsize()* function call.

31450 The default value of the *guardsize* attribute is {PAGESIZE} bytes. The actual value of {PAGESIZE}
 31451 is implementation-defined.

31452 If the *stackaddr* or *stack* attribute has been set (that is, the caller is allocating and managing its
 31453 own thread stacks), the *guardsize* attribute shall be ignored and no protection shall be provided
 31454 by the implementation. It is the responsibility of the application to manage stack overflow along
 31455 with stack allocation and management in this case.

31456 **RETURN VALUE**

31457 If successful, the *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions shall return
 31458 zero; otherwise, an error number shall be returned to indicate the error.

31459 **ERRORS**

31460 The *pthread_attr_getguardsize()* and *pthread_attr_setguardsize()* functions shall fail if:

31461 [EINVAL] The attribute *attr* is invalid.

31462 [EINVAL] The parameter *guardsize* is invalid.

31463 These functions shall not return an error code of [EINTR].

31464 **EXAMPLES**

31465 None.

31466 **APPLICATION USAGE**

31467 None.

31468 **RATIONALE**31469 The *guardsize* attribute is provided to the application for two reasons:

- 31470 1. Overflow protection can potentially result in wasted system resources. An application
31471 that creates a large number of threads, and which knows its threads never overflow their
31472 stack, can save system resources by turning off guard areas.
- 31473 2. When threads allocate large data structures on the stack, large guard areas may be needed
31474 to detect stack overflow.

31475 **FUTURE DIRECTIONS**

31476 None.

31477 **SEE ALSO**31478 The Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**, **<sys/mman.h>**31479 **CHANGE HISTORY**

31480 First released in Issue 5.

31481 **Issue 6**

31482 In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the
31483 second error condition.

31484 The **restrict** keyword is added to the *pthread_attr_getguardsize()* prototype for alignment with the
31485 ISO / IEC 9899:1999 standard.

31486 **NAME**

31487 pthread_attr_getinheritsched, pthread_attr_setinheritsched — get and set the inheritsched
 31488 attribute (**REALTIME THREADS**)

31489 **SYNOPSIS**

```
31491 int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
31492 int *restrict inheritsched);
31493 int pthread_attr_setinheritsched(pthread_attr_t *attr,
31494 int inheritsched);
31495
```

31496 **DESCRIPTION**

31497 The *pthread_attr_getinheritsched()*, and *pthread_attr_setinheritsched()* functions, respectively, shall
 31498 get and set the *inheritsched* attribute in the *attr* argument.

31499 When the attributes objects are used by *pthread_create()*, the *inheritsched* attribute determines
 31500 how the other scheduling attributes of the created thread shall be set.

31501 **PTHREAD_INHERIT_SCHED**

31502 Specifies that the thread scheduling attributes shall be inherited from the creating thread,
 31503 and the scheduling attributes in this *attr* argument shall be ignored.

31504 **PTHREAD_EXPLICIT_SCHED**

31505 Specifies that the thread scheduling attributes shall be set to the corresponding values from
 31506 this attributes object.

31507 The symbols **PTHREAD_INHERIT_SCHED** and **PTHREAD_EXPLICIT_SCHED** are defined in
 31508 the **<pthread.h>** header.

31509 The following thread scheduling attributes defined by IEEE Std 1003.1-2001 are affected by the
 31510 *inheritsched* attribute: scheduling policy (*schedpolicy*), scheduling parameters (*schedparam*), and
 31511 scheduling contention scope (*contentionscope*).

31512 **RETURN VALUE**

31513 If successful, the *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions shall
 31514 return zero; otherwise, an error number shall be returned to indicate the error.

31515 **ERRORS**

31516 The *pthread_attr_setinheritsched()* function may fail if:

31517 [EINVAL] The value of *inheritsched* is not valid.

31518 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31519 These functions shall not return an error code of [EINTR].

31520 **EXAMPLES**

31521 None.

31522 **APPLICATION USAGE**

31523 After these attributes have been set, a thread can be created with the specified attributes using
 31524 *pthread_create()*. Using these routines does not affect the current running thread.

31525 **RATIONALE**

31526 None.

31527 **FUTURE DIRECTIONS**

31528 None.

31529 **SEE ALSO**

31530 *pthread_attr_destroy()*, *pthread_attr_getscope()*, *pthread_attr_getschedpolicy()*,
31531 *pthread_attr_getschedparam()*, *pthread_create()*, the Base Definitions volume of
31532 IEEE Std 1003.1-2001, <**pthread.h**>, <**sched.h**>

31533 **CHANGE HISTORY**

31534 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31535 Marked as part of the Realtime Threads Feature Group.

31536 **Issue 6**

31537 The *pthread_attr_getinheritsched()* and *pthread_attr_setinheritsched()* functions are marked as part
31538 of the Threads and Thread Execution Scheduling options.

31539 The [ENOSYS] error condition has been removed as stubs need not be provided if an
31540 implementation does not support the Thread Execution Scheduling option.

31541 The **restrict** keyword is added to the *pthread_attr_getinheritsched()* prototype for alignment with
31542 the ISO / IEC 9899:1999 standard.

31543 **NAME**

31544 pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam
 31545 attribute

31546 **SYNOPSIS**

31547 THR #include <pthread.h>

```
31548 int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
31549 struct sched_param *restrict param);
31550 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
31551 const struct sched_param *restrict param);
31552
```

31553 **DESCRIPTION**

31554 The *pthread_attr_getschedparam()*, and *pthread_attr_setschedparam()* functions, respectively, shall
 31555 get and set the scheduling parameter attributes in the *attr* argument. The contents of the *param*
 31556 structure are defined in the <**sched.h**> header. For the SCHED_FIFO and SCHED_RR policies,
 31557 the only required member of *param* is *sched_priority*.

31558 TSP For the SCHED_SPORADIC policy, the required members of the *param* structure are
 31559 *sched_priority*, *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and
 31560 *sched_ss_max_repl*. The specified *sched_ss_repl_period* must be greater than or equal to the
 31561 specified *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.
 31562 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
 31563 function to succeed; if not, the function shall fail.

31564 **RETURN VALUE**

31565 If successful, the *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions shall
 31566 return zero; otherwise, an error number shall be returned to indicate the error.

31567 **ERRORS**

31568 The *pthread_attr_setschedparam()* function may fail if:

31569 [EINVAL] The value of *param* is not valid.

31570 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31571 These functions shall not return an error code of [EINTR].

31572 **EXAMPLES**

31573 None.

31574 **APPLICATION USAGE**

31575 After these attributes have been set, a thread can be created with the specified attributes using
 31576 *pthread_create()*. Using these routines does not affect the current running thread.

31577 **RATIONALE**

31578 None.

31579 **FUTURE DIRECTIONS**

31580 None.

31581 **SEE ALSO**

31582 *pthread_attr_destroy()*, *pthread_attr_getscope()*, *pthread_attr_getinheritsched()*,
 31583 *pthread_attr_getschedpolicy()*, *pthread_create()*, the Base Definitions volume of
 31584 IEEE Std 1003.1-2001, <**pthread.h**>, <**sched.h**>

CHANGE HISTORY

31585
31586 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

31588 The *pthread_attr_getschedparam()* and *pthread_attr_setschedparam()* functions are marked as part
31589 of the Threads option.

31590 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

31591 The **restrict** keyword is added to the *pthread_attr_getschedparam()* and
31592 *pthread_attr_setschedparam()* prototypes for alignment with the ISO / IEC 9899:1999 standard.

31593 **NAME**

31594 pthread_attr_getschedpolicy, pthread_attr_setschedpolicy — get and set the schedpolicy
 31595 attribute (**REALTIME THREADS**)

31596 **SYNOPSIS**

31597 THR TPS #include <pthread.h>

```
31598 int pthread_attr_getschedpolicy(const pthread_attr_t *restrict attr,
31599 int *restrict policy);
31600 int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);
31601
```

31602 **DESCRIPTION**

31603 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions, respectively, shall
 31604 get and set the *schedpolicy* attribute in the *attr* argument.

31605 The supported values of *policy* shall include SCHED_FIFO, SCHED_RR, and SCHED_OTHER,
 31606 which are defined in the <sched.h> header. When threads executing with the scheduling policy
 31607 TSP SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on a mutex, they shall acquire
 31608 the mutex in priority order when the mutex is unlocked.

31609 **RETURN VALUE**

31610 If successful, the *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions shall
 31611 return zero; otherwise, an error number shall be returned to indicate the error.

31612 **ERRORS**

31613 The *pthread_attr_setschedpolicy()* function may fail if:

31614 [EINVAL] The value of *policy* is not valid.

31615 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31616 These functions shall not return an error code of [EINTR].

31617 **EXAMPLES**

31618 None.

31619 **APPLICATION USAGE**

31620 After these attributes have been set, a thread can be created with the specified attributes using
 31621 *pthread_create()*. Using these routines does not affect the current running thread.

31622 **RATIONALE**

31623 None.

31624 **FUTURE DIRECTIONS**

31625 None.

31626 **SEE ALSO**

31627 *pthread_attr_destroy()*, *pthread_attr_getscope()*, *pthread_attr_getinheritsched()*,
 31628 *pthread_attr_getschedparam()*, *pthread_create()*, the Base Definitions volume of
 31629 IEEE Std 1003.1-2001, <pthread.h>, <sched.h>

31630 **CHANGE HISTORY**

31631 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31632 Marked as part of the Realtime Threads Feature Group.

31633 **Issue 6**

31634 The *pthread_attr_getschedpolicy()* and *pthread_attr_setschedpolicy()* functions are marked as part of
31635 the Threads and Thread Execution Scheduling options.

31636 The [ENOSYS] error condition has been removed as stubs need not be provided if an
31637 implementation does not support the Thread Execution Scheduling option.

31638 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

31639 The **restrict** keyword is added to the *pthread_attr_getschedpolicy()* prototype for alignment with
31640 the ISO / IEC 9899:1999 standard.

31641 **NAME**

31642 pthread_attr_getscope, pthread_attr_setscope — get and set the contentionscope attribute
 31643 (**REALTIME THREADS**)

31644 **SYNOPSIS**

31645 THR TPS #include <pthread.h>

```
31646 int pthread_attr_getscope(const pthread_attr_t *restrict attr,
31647 int *restrict contentionscope);
31648 int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);
31649
```

31650 **DESCRIPTION**

31651 The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions, respectively, shall get and set
 31652 the *contentionscope* attribute in the *attr* object.

31653 The *contentionscope* attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying
 31654 system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process
 31655 scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and
 31656 PTHREAD_SCOPE_PROCESS are defined in the <pthread.h> header.

31657 **RETURN VALUE**

31658 If successful, the *pthread_attr_getscope()* and *pthread_attr_setscope()* functions shall return zero;
 31659 otherwise, an error number shall be returned to indicate the error.

31660 **ERRORS**

31661 The *pthread_attr_setscope()* function may fail if:

31662 [EINVAL] The value of *contentionscope* is not valid.

31663 [ENOTSUP] An attempt was made to set the attribute to an unsupported value.

31664 These functions shall not return an error code of [EINTR].

31665 **EXAMPLES**

31666 None.

31667 **APPLICATION USAGE**

31668 After these attributes have been set, a thread can be created with the specified attributes using
 31669 *pthread_create()*. Using these routines does not affect the current running thread.

31670 **RATIONALE**

31671 None.

31672 **FUTURE DIRECTIONS**

31673 None.

31674 **SEE ALSO**

31675 *pthread_attr_destroy()*, *pthread_attr_getinheritsched()*, *pthread_attr_getschedpolicy()*,
 31676 *pthread_attr_getschedparam()*, *pthread_create()*, the Base Definitions volume of
 31677 IEEE Std 1003.1-2001, <pthread.h>, <sched.h>

31678 **CHANGE HISTORY**

31679 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31680 Marked as part of the Realtime Threads Feature Group.

31681 **Issue 6**

31682 The *pthread_attr_getscope()* and *pthread_attr_setscope()* functions are marked as part of the
31683 Threads and Thread Execution Scheduling options.

31684 The [ENOSYS] error condition has been removed as stubs need not be provided if an
31685 implementation does not support the Thread Execution Scheduling option.

31686 The **restrict** keyword is added to the *pthread_attr_getscope()* prototype for alignment with the
31687 ISO / IEC 9899:1999 standard.

31688 **NAME**

31689 pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

31690 **SYNOPSIS**

31691 THR #include <pthread.h>

```

31692 TSA TSS int pthread_attr_getstack(const pthread_attr_t *restrict attr,
31693 void **restrict stackaddr, size_t *restrict stacksize);
31694 int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,
31695 size_t stacksize);
31696

```

31697 **DESCRIPTION**

31698 The *pthread_attr_getstack()* and *pthread_attr_setstack()* functions, respectively, shall get and set
 31699 the thread creation stack attributes *stackaddr* and *stacksize* in the *attr* object.

31700 The stack attributes specify the area of storage to be used for the created thread's stack. The base
 31701 (lowest addressable byte) of the storage shall be *stackaddr*, and the size of the storage shall be
 31702 *stacksize* bytes. The *stacksize* shall be at least {PTHREAD_STACK_MIN}. The *stackaddr* shall be
 31703 aligned appropriately to be used as a stack; for example, *pthread_attr_setstack()* may fail with
 31704 [EINVAL] if (*stackaddr* & 0x7) is not 0. All pages within the stack described by *stackaddr* and
 31705 *stacksize* shall be both readable and writable by the thread.

31706 **RETURN VALUE**

31707 Upon successful completion, these functions shall return a value of 0; otherwise, an error
 31708 number shall be returned to indicate the error.

31709 The *pthread_attr_getstack()* function shall store the stack attribute values in *stackaddr* and *stacksize*
 31710 if successful.

31711 **ERRORS**

31712 The *pthread_attr_setstack()* function shall fail if:

31713 [EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds an
 31714 implementation-defined limit.

31715 The *pthread_attr_setstack()* function may fail if:

31716 [EINVAL] The value of *stackaddr* does not have proper alignment to be used as a stack, or
 31717 if (*stackaddr* + *stacksize*) lacks proper alignment.

31718 [EACCES] The stack page(s) described by *stackaddr* and *stacksize* are not both readable
 31719 and writable by the thread.

31720 These functions shall not return an error code of [EINTR].

31721 **EXAMPLES**

31722 None.

31723 **APPLICATION USAGE**

31724 These functions are appropriate for use by applications in an environment where the stack for a
 31725 thread must be placed in some particular region of memory.

31726 While it might seem that an application could detect stack overflow by providing a protected
 31727 page outside the specified stack region, this cannot be done portably. Implementations are free
 31728 to place the thread's initial stack pointer anywhere within the specified region to accommodate
 31729 the machine's stack pointer behavior and allocation requirements. Furthermore, on some
 31730 architectures, such as the IA-64, "overflow" might mean that two separate stack pointers
 31731 allocated within the region will overlap somewhere in the middle of the region.

31732 **RATIONALE**

31733 None.

31734 **FUTURE DIRECTIONS**

31735 None.

31736 **SEE ALSO**

31737 *pthread_attr_init()*, *pthread_attr_setdetachstate()*, *pthread_attr_setstacksize()*, *pthread_create()*, the
31738 Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

31739 **CHANGE HISTORY**

31740 First released in Issue 6. Developed as an XSI extension and brought into the BASE by IEEE
31741 PASC Interpretation 1003.1 #101.

31742 **NAME**

31743 pthread_attr_getstackaddr, pthread_attr_setstackaddr — get and set the stackaddr attribute

31744 **SYNOPSIS**

31745 THR TSA #include <pthread.h>

```

31746 OB      int pthread_attr_getstackaddr(const pthread_attr_t *restrict attr,
31747      void **restrict stackaddr);
31748      int pthread_attr_setstackaddr(pthread_attr_t *attr, void *stackaddr);
31749

```

31750 **DESCRIPTION**

31751 The *pthread_attr_getstackaddr()* and *pthread_attr_setstackaddr()* functions, respectively, shall get
 31752 and set the thread creation *stackaddr* attribute in the *attr* object.

31753 The *stackaddr* attribute specifies the location of storage to be used for the created thread's stack.
 31754 The size of the storage shall be at least {PTHREAD_STACK_MIN}.

31755 **RETURN VALUE**

31756 Upon successful completion, *pthread_attr_getstackaddr()* and *pthread_attr_setstackaddr()* shall
 31757 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31758 The *pthread_attr_getstackaddr()* function stores the *stackaddr* attribute value in *stackaddr* if
 31759 successful.

31760 **ERRORS**

31761 No errors are defined.

31762 These functions shall not return an error code of [EINTR].

31763 **EXAMPLES**

31764 None.

31765 **APPLICATION USAGE**

31766 The specification of the *stackaddr* attribute presents several ambiguities that make portable use of
 31767 these interfaces impossible. The description of the single address parameter as a “stack” does
 31768 not specify a particular relationship between the address and the “stack” implied by that
 31769 address. For example, the address may be taken as the low memory address of a buffer intended
 31770 for use as a stack, or it may be taken as the address to be used as the initial stack pointer register
 31771 value for the new thread. These two are not the same except for a machine on which the stack
 31772 grows “up” from low memory to high, and on which a “push” operation first stores the value in
 31773 memory and then increments the stack pointer register. Further, on a machine where the stack
 31774 grows “down” from high memory to low, interpretation of the address as the “low memory”
 31775 address requires a determination of the intended size of the stack. IEEE Std 1003.1-2001 has
 31776 introduced the new interfaces *pthread_attr_setstack()* and *pthread_attr_getstack()* to resolve these
 31777 ambiguities.

31778 **RATIONALE**

31779 None.

31780 **FUTURE DIRECTIONS**

31781 None.

31782 **SEE ALSO**

31783 *pthread_attr_destroy()*, *pthread_attr_getdetachstate()*, *pthread_attr_getstack()*,
 31784 *pthread_attr_getstacksize()*, *pthread_attr_setstack()*, *pthread_create()*, the Base Definitions volume
 31785 of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

31786 **CHANGE HISTORY**

31787 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31788 **Issue 6**

31789 The *pthread_attr_getstackaddr()* and *pthread_attr_setstackaddr()* functions are marked as part of
31790 the Threads and Thread Stack Address Attribute options.

31791 The **restrict** keyword is added to the *pthread_attr_getstackaddr()* prototype for alignment with the
31792 ISO / IEC 9899:1999 standard.

31793 These functions are marked obsolescent.

31794 **NAME**

31795 pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stacksize attribute

31796 **SYNOPSIS**

31797 THR TSS #include <pthread.h>

```
31798 int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
31799                             size_t *restrict stacksize);
31800 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
31801
```

31802 **DESCRIPTION**

31803 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions, respectively, shall get
31804 and set the thread creation *stacksize* attribute in the *attr* object.

31805 The *stacksize* attribute shall define the minimum stack size (in bytes) allocated for the created
31806 threads stack.

31807 **RETURN VALUE**

31808 Upon successful completion, *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* shall
31809 return a value of 0; otherwise, an error number shall be returned to indicate the error.

31810 The *pthread_attr_getstacksize()* function stores the *stacksize* attribute value in *stacksize* if
31811 successful.

31812 **ERRORS**

31813 The *pthread_attr_setstacksize()* function shall fail if:

31814 [EINVAL] The value of *stacksize* is less than {PTHREAD_STACK_MIN} or exceeds a
31815 system-imposed limit.

31816 These functions shall not return an error code of [EINTR].

31817 **EXAMPLES**

31818 None.

31819 **APPLICATION USAGE**

31820 None.

31821 **RATIONALE**

31822 None.

31823 **FUTURE DIRECTIONS**

31824 None.

31828 **CHANGE HISTORY**

31829 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

31830 **Issue 6**

31831 The *pthread_attr_getstacksize()* and *pthread_attr_setstacksize()* functions are marked as part of the
31832 Threads and Thread Stack Size Attribute options.

31833 The **restrict** keyword is added to the *pthread_attr_getstacksize()* prototype for alignment with the
31834 ISO / IEC 9899:1999 standard.

31835	IEEE Std 1003.1-2001 / Cor 1-2002, item XSH / TC1 / D6 / 43 is applied, correcting the margin code	
31836	in the SYNOPSIS from TSA to TSS and updating the CHANGE HISTORY from “Thread Stack	
31837	Address Attribute” option to “Thread Stack Size Attribute” option.	

31838 NAME

31839 pthread_attr_init — initialize the thread attributes object

31840 SYNOPSIS

31841 THR `#include <pthread.h>`

31842 `int pthread_attr_init(pthread_attr_t *attr);`

31843

31844 DESCRIPTION

31845 Refer to *pthread_attr_destroy()*.

31846 **NAME**

31847 pthread_attr_setdetachstate — set the detachstate attribute

31848 **SYNOPSIS**31849 THR `#include <pthread.h>`31850 `int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);`

31851

31852 **DESCRIPTION**31853 Refer to *pthread_attr_getdetachstate()*.

31854 **NAME**

31855 pthread_attr_setguardsize — set the thread guardsize attribute

31856 **SYNOPSIS**

31857 xSI #include <pthread.h>

31858 int pthread_attr_setguardsize(pthread_attr_t *attr,
31859 size_t guardsize);

31860

31861 **DESCRIPTION**

31862 Refer to *pthread_attr_getguardsize()*.

31863 **NAME**31864 pthread_attr_setinheritsched — set the inheritsched attribute (**REALTIME THREADS**)31865 **SYNOPSIS**

31866 THR TPS #include <pthread.h>

31867 int pthread_attr_setinheritsched(pthread_attr_t *attr,
31868 int inheritsched);

31869

31870 **DESCRIPTION**31871 Refer to *pthread_attr_getinheritsched()*.

31872 NAME

31873 pthread_attr_setschedparam — set the schedparam attribute

31874 SYNOPSIS

31875 THR #include <pthread.h>

```
31876 int pthread_attr_setschedparam(pthread_attr_t *restrict attr,  
31877                               const struct sched_param *restrict param);
```

31878

31879 DESCRIPTION

31880 Refer to *pthread_attr_getschedparam()*.

31881 **NAME**

31882 pthread_attr_setschedpolicy — set the schedpolicy attribute (**REALTIME THREADS**)

31883 **SYNOPSIS**

31884 THR TPS `#include <pthread.h>`

31885 `int pthread_attr_setschedpolicy(pthread_attr_t *attr, int policy);`

31886

31887 **DESCRIPTION**

31888 Refer to *pthread_attr_getschedpolicy()*.

31889 **NAME**

31890 pthread_attr_setscope — set the contentionscope attribute (**REALTIME THREADS**)

31891 **SYNOPSIS**

31892 THR TPS `#include <pthread.h>`

31893 `int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);`

31894

31895 **DESCRIPTION**

31896 Refer to *pthread_attr_getscope()*.

31897 **NAME**

31898 pthread_attr_setstack — set the stack attribute

31899 **SYNOPSIS**31900 xSI `#include <pthread.h>`31901 `int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr,`
31902 `size_t stacksize);`

31903

31904 **DESCRIPTION**31905 Refer to *pthread_attr_getstack()*.

31906 **NAME**

31907 pthread_attr_setstackaddr — set the stackaddr attribute

31908 **SYNOPSIS**

31909 THR TSA #include <pthread.h>

31910 OB int pthread_attr_setstackaddr(pthread_attr_t *attr, void *stackaddr);

31911

31912 **DESCRIPTION**

31913 Refer to *pthread_attr_getstackaddr()*.

31914 **NAME**

31915 pthread_attr_setstacksize — set the stacksize attribute

31916 **SYNOPSIS**

31917 THR TSS #include <pthread.h>

31918 int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);

31919

31920 **DESCRIPTION**31921 Refer to *pthread_attr_getstacksize()*.

31922 **NAME**

31923 pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object
 31924 (**ADVANCED REALTIME THREADS**)

31925 **SYNOPSIS**

```
31926 THR BAR #include <pthread.h>

31927 int pthread_barrier_destroy(pthread_barrier_t *barrier);
31928 int pthread_barrier_init(pthread_barrier_t *restrict barrier,
31929     const pthread_barrierattr_t *restrict attr, unsigned count);
31930
```

31931 **DESCRIPTION**

31932 The *pthread_barrier_destroy()* function shall destroy the barrier referenced by *barrier* and release
 31933 any resources used by the barrier. The effect of subsequent use of the barrier is undefined until
 31934 the barrier is reinitialized by another call to *pthread_barrier_init()*. An implementation may use
 31935 this function to set *barrier* to an invalid value. The results are undefined if
 31936 *pthread_barrier_destroy()* is called when any thread is blocked on the barrier, or if this function is
 31937 called with an uninitialized barrier.

31938 The *pthread_barrier_init()* function shall allocate any resources required to use the barrier
 31939 referenced by *barrier* and shall initialize the barrier with attributes referenced by *attr*. If *attr* is
 31940 NULL, the default barrier attributes shall be used; the effect is the same as passing the address of
 31941 a default barrier attributes object. The results are undefined if *pthread_barrier_init()* is called
 31942 when any thread is blocked on the barrier (that is, has not returned from the
 31943 *pthread_barrier_wait()* call). The results are undefined if a barrier is used without first being
 31944 initialized. The results are undefined if *pthread_barrier_init()* is called specifying an already
 31945 initialized barrier.

31946 The *count* argument specifies the number of threads that must call *pthread_barrier_wait()* before
 31947 any of them successfully return from the call. The value specified by *count* must be greater than
 31948 zero.

31949 If the *pthread_barrier_init()* function fails, the barrier shall not be initialized and the contents of
 31950 *barrier* are undefined.

31951 Only the object referenced by *barrier* may be used for performing synchronization. The result of
 31952 referring to copies of that object in calls to *pthread_barrier_destroy()* or *pthread_barrier_wait()* is
 31953 undefined.

31954 **RETURN VALUE**

31955 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 31956 be returned to indicate the error.

31957 **ERRORS**

31958 The *pthread_barrier_destroy()* function may fail if:

31959 [EBUSY] The implementation has detected an attempt to destroy a barrier while it is in
 31960 use (for example, while being used in a *pthread_barrier_wait()* call) by another
 31961 thread.

31962 [EINVAL] The value specified by *barrier* is invalid.

31963 The *pthread_barrier_init()* function shall fail if:

31964 [EAGAIN] The system lacks the necessary resources to initialize another barrier.

31965 [EINVAL] The value specified by *count* is equal to zero.

- 31966 [ENOMEM] Insufficient memory exists to initialize the barrier.
- 31967 The *pthread_barrier_init()* function may fail if:
- 31968 [EBUSY] The implementation has detected an attempt to reinitialize a barrier while it is
31969 in use (for example, while being used in a *pthread_barrier_wait()* call) by
31970 another thread.
- 31971 [EINVAL] The value specified by *attr* is invalid.
- 31972 These functions shall not return an error code of [EINTR].
- 31973 **EXAMPLES**
- 31974 None.
- 31975 **APPLICATION USAGE**
- 31976 The *pthread_barrier_destroy()* and *pthread_barrier_init()* functions are part of the Barriers option
31977 and need not be provided on all implementations.
- 31978 **RATIONALE**
- 31979 None.
- 31980 **FUTURE DIRECTIONS**
- 31981 None.
- 31982 **SEE ALSO**

- 31985 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

31986 **NAME**31987 pthread_barrier_wait — synchronize at a barrier (**ADVANCED REALTIME THREADS**)31988 **SYNOPSIS**

31989 THR BAR #include <pthread.h>

31990 int pthread_barrier_wait(pthread_barrier_t *barrier);

31991

31992 **DESCRIPTION**

31993 The *pthread_barrier_wait()* function shall synchronize participating threads at the barrier
 31994 referenced by *barrier*. The calling thread shall block until the required number of threads have
 31995 called *pthread_barrier_wait()* specifying the barrier.

31996 When the required number of threads have called *pthread_barrier_wait()* specifying the barrier,
 31997 the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified
 31998 thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall
 31999 be reset to the state it had as a result of the most recent *pthread_barrier_init()* function that
 32000 referenced it.

32001 The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in <pthread.h> and its value
 32002 shall be distinct from any other value returned by *pthread_barrier_wait()*.

32003 The results are undefined if this function is called with an uninitialized barrier.

32004 If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the
 32005 thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the
 32006 required number of threads have not arrived at the barrier during the execution of the signal
 32007 handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until
 32008 the thread in the signal handler returns from it, it is unspecified whether other threads may
 32009 proceed past the barrier once they have all reached it.

32010 A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to
 32011 use the same processing resources from eventually making forward progress in its execution.
 32012 Eligibility for processing resources shall be determined by the scheduling policy.

32013 **RETURN VALUE**

32014 Upon successful completion, the *pthread_barrier_wait()* function shall return
 32015 PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the
 32016 barrier and zero for each of the other threads. Otherwise, an error number shall be returned to
 32017 indicate the error.

32018 **ERRORS**

32019 The *pthread_barrier_wait()* function may fail if:

32020 [EINVAL] The value specified by *barrier* does not refer to an initialized barrier object.

32021 This function shall not return an error code of [EINTR].

32022 **EXAMPLES**

32023 None.

32024 **APPLICATION USAGE**

32025 Applications using this function may be subject to priority inversion, as discussed in the Base
 32026 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

32027 The *pthread_barrier_wait()* function is part of the Barriers option and need not be provided on all
 32028 implementations.

32029 **RATIONALE**

32030 None.

32031 **FUTURE DIRECTIONS**

32032 None.

32033 **SEE ALSO**32034 *pthread_barrier_destroy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>32035 **CHANGE HISTORY**

32036 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

32037 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

32038 **NAME**

32039 pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier
32040 attributes object (**ADVANCED REALTIME THREADS**)

32041 **SYNOPSIS**

32042 THR BAR #include <pthread.h>

32043 int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);

32044 int pthread_barrierattr_init(pthread_barrierattr_t *attr);

32045

32046 **DESCRIPTION**

32047 The *pthread_barrierattr_destroy()* function shall destroy a barrier attributes object. A destroyed
32048 *attr* attributes object can be reinitialized using *pthread_barrierattr_init()*; the results of otherwise
32049 referencing the object after it has been destroyed are undefined. An implementation may cause
32050 *pthread_barrierattr_destroy()* to set the object referenced by *attr* to an invalid value.

32051 The *pthread_barrierattr_init()* function shall initialize a barrier attributes object *attr* with the
32052 default value for all of the attributes defined by the implementation.

32053 Results are undefined if *pthread_barrierattr_init()* is called specifying an already initialized *attr*
32054 attributes object.

32055 After a barrier attributes object has been used to initialize one or more barriers, any function
32056 affecting the attributes object (including destruction) shall not affect any previously initialized
32057 barrier.

32058 **RETURN VALUE**

32059 If successful, the *pthread_barrierattr_destroy()* and *pthread_barrierattr_init()* functions shall return
32060 zero; otherwise, an error number shall be returned to indicate the error.

32061 **ERRORS**

32062 The *pthread_barrierattr_destroy()* function may fail if:

32063 [EINVAL] The value specified by *attr* is invalid.

32064 The *pthread_barrierattr_init()* function shall fail if:

32065 [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

32066 These functions shall not return an error code of [EINTR].

32067 **EXAMPLES**

32068 None.

32069 **APPLICATION USAGE**

32070 The *pthread_barrierattr_destroy()* and *pthread_barrierattr_init()* functions are part of the Barriers
32071 option and need not be provided on all implementations.

32072 **RATIONALE**

32073 None.

32074 **FUTURE DIRECTIONS**

32075 None.

32076 **SEE ALSO**

32077 *pthread_barrierattr_getpshared()*, *pthread_barrierattr_setpshared()*, the Base Definitions volume of
32078 IEEE Std 1003.1-2001, <pthread.h>.

32079 **CHANGE HISTORY**

32080 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

32081 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

32082 **NAME**

32083 pthread_barrierattr_getpshared, pthread_barrierattr_setpshared — get and set the process-
 32084 shared attribute of the barrier attributes object (**ADVANCED REALTIME THREADS**)

32085 **SYNOPSIS**

```
32086 THR      #include <pthread.h>

32087 BAR TSH   int pthread_barrierattr_getpshared(const pthread_barrierattr_t *
32088             restrict attr, int *restrict pshared);
32089             int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
32090             int pshared);
32091
```

32092 **DESCRIPTION**

32093 The *pthread_barrierattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 32094 from the attributes object referenced by *attr*. The *pthread_barrierattr_setpshared()* function shall
 32095 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

32096 The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a barrier to be
 32097 operated upon by any thread that has access to the memory where the barrier is allocated. If the
 32098 *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the barrier shall only be operated
 32099 upon by threads created within the same process as the thread that initialized the barrier; if
 32100 threads of different processes attempt to operate on such a barrier, the behavior is undefined.
 32101 The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE. Both constants
 32102 PTHREAD_PROCESS_SHARED and PTHREAD_PROCESS_PRIVATE are defined in
 32103 **<pthread.h>**.

32104 Additional attributes, their default values, and the names of the associated functions to get and
 32105 set those attribute values are implementation-defined.

32106 **RETURN VALUE**

32107 If successful, the *pthread_barrierattr_getpshared()* function shall return zero and store the value of
 32108 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,
 32109 an error number shall be returned to indicate the error.

32110 If successful, the *pthread_barrierattr_setpshared()* function shall return zero; otherwise, an error
 32111 number shall be returned to indicate the error.

32112 **ERRORS**

32113 These functions may fail if:

32114 [EINVAL] The value specified by *attr* is invalid.

32115 The *pthread_barrierattr_setpshared()* function may fail if:

32116 [EINVAL] The new value specified for the *process-shared* attribute is not one of the legal
 32117 values PTHREAD_PROCESS_SHARED or PTHREAD_PROCESS_PRIVATE.

32118 These functions shall not return an error code of [EINTR].

32119 EXAMPLES

32120 None.

32121 APPLICATION USAGE

32122 The *pthread_barrierattr_getpshared()* and *pthread_barrierattr_setpshared()* functions are part of the
32123 Barriers option and need not be provided on all implementations.

32124 RATIONALE

32125 None.

32126 FUTURE DIRECTIONS

32127 None.

32131 CHANGE HISTORY

32132 First released in Issue 6. Derived from IEEE Std 1003.1j-2000

32133 NAME

32134 pthread_barrierattr_init — initialize the barrier attributes object (**ADVANCED REALTIME**
32135 **THREADS**)

32136 SYNOPSIS

32137 THR BAR #include <pthread.h>

32138 int pthread_barrierattr_init(pthread_barrierattr_t *attr);

32139

32140 DESCRIPTION

32141 Refer to *pthread_barrierattr_destroy()*.

32142 **NAME**

32143 pthread_barrierattr_setpshared — set the process-shared attribute of the barrier attributes object
32144 (**ADVANCED REALTIME THREADS**)

32145 **SYNOPSIS**

32146 THR #include <pthread.h>

32147 BAR TSH int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr,
32148 int pshared);

32149

32150 **DESCRIPTION**

32151 Refer to *pthread_barrierattr_getpshared()*.

32152 **NAME**

32153 pthread_cancel — cancel execution of a thread

32154 **SYNOPSIS**

32155 THR #include <pthread.h>

32156 int pthread_cancel(pthread_t thread);

32157

32158 **DESCRIPTION**

32159 The *pthread_cancel()* function shall request that *thread* be canceled. The target thread's
 32160 cancelability state and type determines when the cancellation takes effect. When the cancellation
 32161 is acted on, the cancellation cleanup handlers for *thread* shall be called. When the last
 32162 cancellation cleanup handler returns, the thread-specific data destructor functions shall be called
 32163 for *thread*. When the last destructor function returns, *thread* shall be terminated.

32164 The cancellation processing in the target thread shall run asynchronously with respect to the
 32165 calling thread returning from *pthread_cancel()*.

32166 **RETURN VALUE**

32167 If successful, the *pthread_cancel()* function shall return zero; otherwise, an error number shall be
 32168 returned to indicate the error.

32169 **ERRORS**32170 The *pthread_cancel()* function may fail if:

32171 [ESRCH] No thread could be found corresponding to that specified by the given thread
 32172 ID.

32173 The *pthread_cancel()* function shall not return an error code of [EINTR].32174 **EXAMPLES**

32175 None.

32176 **APPLICATION USAGE**

32177 None.

32178 **RATIONALE**

32179 Two alternative functions were considered for sending the cancellation notification to a thread.
 32180 One would be to define a new SIGCANCEL signal that had the cancellation semantics when
 32181 delivered; the other was to define the new *pthread_cancel()* function, which would trigger the
 32182 cancellation semantics.

32183 The advantage of a new signal was that so much of the delivery criteria were identical to that
 32184 used when trying to deliver a signal that making cancellation notification a signal was seen as
 32185 consistent. Indeed, many implementations implement cancellation using a special signal. On the
 32186 other hand, there would be no signal functions that could be used with this signal except
 32187 *pthread_kill()*, and the behavior of the delivered cancellation signal would be unlike any
 32188 previously existing defined signal.

32189 The benefits of a special function include the recognition that this signal would be defined
 32190 because of the similar delivery criteria and that this is the only common behavior between a
 32191 cancellation request and a signal. In addition, the cancellation delivery mechanism does not
 32192 have to be implemented as a signal. There are also strong, if not stronger, parallels with
 32193 language exception mechanisms than with signals that are potentially obscured if the delivery
 32194 mechanism is visibly closer to signals.

32195 In the end, it was considered that as there were so many exceptions to the use of the new signal
 32196 with existing signals functions it would be misleading. A special function has resolved this

32197 problem. This function was carefully defined so that an implementation wishing to provide the
32198 cancellation functions on top of signals could do so. The special function also means that
32199 implementations are not obliged to implement cancellation with signals.

32200 **FUTURE DIRECTIONS**

32201 None.

32202 **SEE ALSO**

32203 *pthread_exit()*, *pthread_cond_timedwait()*, *pthread_join()*, *pthread_setcancelstate()*, the Base
32204 Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

32205 **CHANGE HISTORY**

32206 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32207 **Issue 6**

32208 The *pthread_cancel()* function is marked as part of the Threads option.

32209 **NAME**

32210 pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers |

32211 **SYNOPSIS**

32212 THR #include <pthread.h>

32213 void pthread_cleanup_pop(int execute);

32214 void pthread_cleanup_push(void (*routine)(void*), void *arg);

32215

32216 **DESCRIPTION**32217 The *pthread_cleanup_pop()* function shall remove the routine at the top of the calling thread's
32218 cancellation cleanup stack and optionally invoke it (if *execute* is non-zero). |32219 The *pthread_cleanup_push()* function shall push the specified cancellation cleanup handler *routine*
32220 onto the calling thread's cancellation cleanup stack. The cancellation cleanup handler shall be
32221 popped from the cancellation cleanup stack and invoked with the argument *arg* when: |32222 • The thread exits (that is, calls *pthread_exit()*).

32223 • The thread acts upon a cancellation request. |

32224 • The thread calls *pthread_cleanup_pop()* with a non-zero *execute* argument.32225 These functions may be implemented as macros. The application shall ensure that they appear
32226 as statements, and in pairs within the same lexical scope (that is, the *pthread_cleanup_push()*
32227 macro may be thought to expand to a token list whose first token is '{' with
32228 *pthread_cleanup_pop()* expanding to a token list whose last token is the corresponding '}').32229 The effect of calling *longjmp()* or *siglongjmp()* is undefined if there have been any calls to
32230 *pthread_cleanup_push()* or *pthread_cleanup_pop()* made without the matching call since the jump
32231 buffer was filled. The effect of calling *longjmp()* or *siglongjmp()* from inside a cancellation
32232 cleanup handler is also undefined unless the jump buffer was also filled in the cancellation
32233 cleanup handler. |32234 **RETURN VALUE**32235 The *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions shall not return a value.32236 **ERRORS**

32237 No errors are defined.

32238 These functions shall not return an error code of [EINTR].

32239 **EXAMPLES**32240 The following is an example using thread primitives to implement a cancelable, writers-priority
32241 read-write lock:

```

32242 typedef struct {
32243     pthread_mutex_t lock;
32244     pthread_cond_t rcond,
32245     wcond;
32246     int lock_count; /* < 0 .. Held by writer. */
32247                   /* > 0 .. Held by lock_count readers. */
32248                   /* = 0 .. Held by nobody. */
32249     int waiting_writers; /* Count of waiting writers. */
32250 } rwlock;

32251 void
32252 waiting_reader_cleanup(void *arg)
32253 {

```

```

32254         rwlock *l;
32255         l = (rwlock *) arg;
32256         pthread_mutex_unlock(&l->lock);
32257     }
32258
32258 void
32259 lock_for_read(rwlock *l)
32260 {
32261     pthread_mutex_lock(&l->lock);
32262     pthread_cleanup_push(waiting_reader_cleanup, l);
32263     while ((l->lock_count < 0) && (l->waiting_writers != 0))
32264         pthread_cond_wait(&l->rcond, &l->lock);
32265     l->lock_count++;
32266     /*
32267      * Note the pthread_cleanup_pop executes
32268      * waiting_reader_cleanup.
32269      */
32270     pthread_cleanup_pop(1);
32271 }
32272
32272 void
32273 release_read_lock(rwlock *l)
32274 {
32275     pthread_mutex_lock(&l->lock);
32276     if (--l->lock_count == 0)
32277         pthread_cond_signal(&l->wcond);
32278     pthread_mutex_unlock(l);
32279 }
32280
32280 void
32281 waiting_writer_cleanup(void *arg)
32282 {
32283     rwlock *l;
32284
32285     l = (rwlock *) arg;
32286     if ((--l->waiting_writers == 0) && (l->lock_count >= 0)) {
32287         /*
32288          * This only happens if we have been canceled.
32289          */
32290         pthread_cond_broadcast(&l->wcond);
32291     }
32292     pthread_mutex_unlock(&l->lock);
32293 }
32294
32294 void
32295 lock_for_write(rwlock *l)
32296 {
32297     pthread_mutex_lock(&l->lock);
32298     l->waiting_writers++;
32299     pthread_cleanup_push(waiting_writer_cleanup, l);
32300     while (l->lock_count != 0)
32301         pthread_cond_wait(&l->wcond, &l->lock);
32302     l->lock_count = -1;
32303     /*

```

```

32303         * Note the pthread_cleanup_pop executes
32304         * waiting_writer_cleanup.
32305         */
32306         pthread_cleanup_pop(1);
32307     }

32308 void
32309 release_write_lock(rwlock *l)
32310 {
32311     pthread_mutex_lock(&l->lock);
32312     l->lock_count = 0;
32313     if (l->waiting_writers == 0)
32314         pthread_cond_broadcast(&l->rcond)
32315     else
32316         pthread_cond_signal(&l->wcond);
32317     pthread_mutex_unlock(&l->lock);
32318 }

32319 /*
32320  * This function is called to initialize the read/write lock.
32321  */
32322 void
32323 initialize_rwlock(rwlock *l)
32324 {
32325     pthread_mutex_init(&l->lock, pthread_mutexattr_default);
32326     pthread_cond_init(&l->wcond, pthread_condattr_default);
32327     pthread_cond_init(&l->rcond, pthread_condattr_default);
32328     l->lock_count = 0;
32329     l->waiting_writers = 0;
32330 }

32331 reader_thread()
32332 {
32333     lock_for_read(&lock);
32334     pthread_cleanup_push(release_read_lock, &lock);
32335     /*
32336      * Thread has read lock.
32337      */
32338     pthread_cleanup_pop(1);
32339 }

32340 writer_thread()
32341 {
32342     lock_for_write(&lock);
32343     pthread_cleanup_push(release_write_lock, &lock);
32344     /*
32345      * Thread has write lock.
32346      */
32347     pthread_cleanup_pop(1);
32348 }

```

32349 **APPLICATION USAGE**

32350 The two routines that push and pop cancellation cleanup handlers, *pthread_cleanup_push()* and
 32351 *pthread_cleanup_pop()*, can be thought of as left and right parentheses. They always need to be
 32352 matched.

32353 **RATIONALE**

32354 The restriction that the two routines that push and pop cancellation cleanup handlers,
 32355 *pthread_cleanup_push()* and *pthread_cleanup_pop()*, have to appear in the same lexical scope
 32356 allows for efficient macro or compiler implementations and efficient storage management. A
 32357 sample implementation of these routines as macros might look like this:

```
32358 #define pthread_cleanup_push(rtn,arg) { \
32359     struct _pthread_handler_rec __cleanup_handler, *__head; \
32360     __cleanup_handler.rtn = rtn; \
32361     __cleanup_handler.arg = arg; \
32362     (void) pthread_getspecific(_pthread_handler_key, &__head); \
32363     __cleanup_handler.next = *__head; \
32364     *__head = &__cleanup_handler;

32365 #define pthread_cleanup_pop(ex) \
32366     *__head = __cleanup_handler.next; \
32367     if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \
32368 }
```

32369 A more ambitious implementation of these routines might do even better by allowing the
 32370 compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

32371 This volume of IEEE Std 1003.1-2001 currently leaves unspecified the effect of calling *longjmp()*
 32372 from a signal handler executing in a POSIX System Interfaces function. If an implementation
 32373 wants to allow this and give the programmer reasonable behavior, the *longjmp()* function has to
 32374 call all cancellation cleanup handlers that have been pushed but not popped since the time
 32375 *setjmp()* was called.

32376 Consider a multi-threaded function called by a thread that uses signals. If a signal were
 32377 delivered to a signal handler during the operation of *qsort()* and that handler were to call
 32378 *longjmp()* (which, in turn, did *not* call the cancellation cleanup handlers) the helper threads
 32379 created by the *qsort()* function would not be canceled. Instead, they would continue to execute
 32380 and write into the argument array even though the array might have been popped off the stack.

32381 Note that the specified cleanup handling mechanism is especially tied to the C language and,
 32382 while the requirement for a uniform mechanism for expressing cleanup is language-
 32383 independent, the mechanism used in other languages may be quite different. In addition, this
 32384 mechanism is really only necessary due to the lack of a real exception mechanism in the C
 32385 language, which would be the ideal solution.

32386 There is no notion of a cancellation cleanup-safe function. If an application has no cancellation
 32387 points in its signal handlers, blocks any signal whose handler may have cancellation points
 32388 while calling async-unsafe functions, or disables cancellation while calling async-unsafe
 32389 functions, all functions may be safely called from cancellation cleanup routines.

32395 **CHANGE HISTORY**

32396 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32397 **Issue 6**

32398 The *pthread_cleanup_pop()* and *pthread_cleanup_push()* functions are marked as part of the
32399 Threads option.

32400 The APPLICATION USAGE section is added.

32401 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

32402 NAME

32403 pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

32404 SYNOPSIS

32405 THR `#include <pthread.h>`

32406 `int pthread_cond_broadcast(pthread_cond_t *cond);`

32407 `int pthread_cond_signal(pthread_cond_t *cond);`

32408

32409 DESCRIPTION

32410 These functions shall unblock threads blocked on a condition variable.

32411 The *pthread_cond_broadcast()* function shall unblock all threads currently blocked on the
32412 specified condition variable *cond*.

32413 The *pthread_cond_signal()* function shall unblock at least one of the threads that are blocked on
32414 the specified condition variable *cond* (if any threads are blocked on *cond*).

32415 If more than one thread is blocked on a condition variable, the scheduling policy shall determine
32416 the order in which threads are unblocked. When each thread unblocked as a result of a
32417 *pthread_cond_broadcast()* or *pthread_cond_signal()* returns from its call to *pthread_cond_wait()* or
32418 *pthread_cond_timedwait()*, the thread shall own the mutex with which it called
32419 *pthread_cond_wait()* or *pthread_cond_timedwait()*. The thread(s) that are unblocked shall contend
32420 for the mutex according to the scheduling policy (if applicable), and as if each had called
32421 *pthread_mutex_lock()*.

32422 The *pthread_cond_broadcast()* or *pthread_cond_signal()* functions may be called by a thread
32423 whether or not it currently owns the mutex that threads calling *pthread_cond_wait()* or
32424 *pthread_cond_timedwait()* have associated with the condition variable during their waits;
32425 however, if predictable scheduling behavior is required, then that mutex shall be locked by the
32426 thread calling *pthread_cond_broadcast()* or *pthread_cond_signal()*.

32427 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall have no effect if there are
32428 no threads currently blocked on *cond*.

32429 RETURN VALUE

32430 If successful, the *pthread_cond_broadcast()* and *pthread_cond_signal()* functions shall return zero;
32431 otherwise, an error number shall be returned to indicate the error.

32432 ERRORS

32433 The *pthread_cond_broadcast()* and *pthread_cond_signal()* function may fail if:

32434 [EINVAL] The value *cond* does not refer to an initialized condition variable.

32435 These functions shall not return an error code of [EINTR].

32436 EXAMPLES

32437 None.

32438 APPLICATION USAGE

32439 The *pthread_cond_broadcast()* function is used whenever the shared-variable state has been
32440 changed in a way that more than one thread can proceed with its task. Consider a single
32441 producer/multiple consumer problem, where the producer can insert multiple items on a list
32442 that is accessed one item at a time by the consumers. By calling the *pthread_cond_broadcast()*
32443 function, the producer would notify all consumers that might be waiting, and thereby the
32444 application would receive more throughput on a multi-processor. In addition,
32445 *pthread_cond_broadcast()* makes it easier to implement a read-write lock. The
32446 *pthread_cond_broadcast()* function is needed in order to wake up all waiting readers when a

writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function to notify all clients of an impending transaction commit.

It is not safe to use the *pthread_cond_signal()* function in a signal handler that is invoked asynchronously. Even if it were safe, there would still be a race between the test of the Boolean *pthread_cond_wait()* that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling from code running in a signal handler.

RATIONALE

Multiple Awakenings by Condition Signal

On a multi-processor, it may be impossible for an implementation of *pthread_cond_signal()* to avoid the unblocking of more than one thread blocked on a condition variable. For example, consider the following partial implementation of *pthread_cond_wait()* and *pthread_cond_signal()*, executed by two threads in the order given. One thread is trying to wait on the condition variable, another is concurrently executing *pthread_cond_signal()*, while a third thread is already waiting.

```
pthread_cond_wait(mutex, cond):
    value = cond->value; /* 1 */
    pthread_mutex_unlock(mutex); /* 2 */
    pthread_mutex_lock(cond->mutex); /* 10 */
    if (value == cond->value) { /* 11 */
        me->next_cond = cond->waiter;
        cond->waiter = me;
        pthread_mutex_unlock(cond->mutex);
        unable_to_run(me);
    } else
        pthread_mutex_unlock(cond->mutex); /* 12 */
    pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
    pthread_mutex_lock(cond->mutex); /* 3 */
    cond->value++; /* 4 */
    if (cond->waiter) { /* 5 */
        sleeper = cond->waiter; /* 6 */
        cond->waiter = sleeper->next_cond; /* 7 */
        able_to_run(sleeper); /* 8 */
    }
    pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to *pthread_cond_wait()* or *pthread_cond_timedwait()* as a result of one call to *pthread_cond_signal()*. This effect is called “spurious wakeup”. Note that the situation is self-correcting in that the number of threads that are so awakened is finite; for example, the next thread to call *pthread_cond_wait()* after the sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs only rarely is unacceptable, especially given that one has to check the predicate associated with a condition variable anyway. Correcting this problem would unnecessarily reduce the degree of concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a predicate-testing-loop around the condition wait. This also makes the application tolerate

32494 superfluous condition broadcasts or signals on the same condition variable that may be coded in
32495 some other part of the application. The resulting applications are thus more robust. Therefore,
32496 IEEE Std 1003.1-2001 explicitly documents that spurious wakeups may occur.

32497 **FUTURE DIRECTIONS**

32498 None.

32501 IEEE Std 1003.1-2001, <**pthread.h**>

32502 **CHANGE HISTORY**

32503 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32504 **Issue 6**

32505 The *pthread_cond_broadcast()* and *pthread_cond_signal()* functions are marked as part of the
32506 Threads option.

32507 The APPLICATION USAGE section is added.

32508 **NAME**

32509 pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

32510 **SYNOPSIS**

32511 THR #include <pthread.h>

```

32512 int pthread_cond_destroy(pthread_cond_t *cond);
32513 int pthread_cond_init(pthread_cond_t *restrict cond,
32514     const pthread_condattr_t *restrict attr);
32515 pthread_cond_t cond = PTHREAD_COND_INITIALIZER;
32516

```

32517 **DESCRIPTION**

32518 The *pthread_cond_destroy()* function shall destroy the given condition variable specified by *cond*;
 32519 the object becomes, in effect, uninitialized. An implementation may cause *pthread_cond_destroy()*
 32520 to set the object referenced by *cond* to an invalid value. A destroyed condition variable object can
 32521 be reinitialized using *pthread_cond_init()*; the results of otherwise referencing the object after it
 32522 has been destroyed are undefined.

32523 It shall be safe to destroy an initialized condition variable upon which no threads are currently
 32524 blocked. Attempting to destroy a condition variable upon which other threads are currently
 32525 blocked results in undefined behavior.

32526 The *pthread_cond_init()* function shall initialize the condition variable referenced by *cond* with
 32527 attributes referenced by *attr*. If *attr* is NULL, the default condition variable attributes shall be
 32528 used; the effect is the same as passing the address of a default condition variable attributes
 32529 object. Upon successful initialization, the state of the condition variable shall become initialized.

32530 Only *cond* itself may be used for performing synchronization. The result of referring to copies of
 32531 *cond* in calls to *pthread_cond_wait()*, *pthread_cond_timedwait()*, *pthread_cond_signal()*,
 32532 *pthread_cond_broadcast()*, and *pthread_cond_destroy()* is undefined.

32533 Attempting to initialize an already initialized condition variable results in undefined behavior.

32534 In cases where default condition variable attributes are appropriate, the macro
 32535 PTHREAD_COND_INITIALIZER can be used to initialize condition variables that are statically
 32536 allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_cond_init()*
 32537 with parameter *attr* specified as NULL, except that no error checks are performed.

32538 **RETURN VALUE**

32539 If successful, the *pthread_cond_destroy()* and *pthread_cond_init()* functions shall return zero;
 32540 otherwise, an error number shall be returned to indicate the error.

32541 The [EBUSY] and [EINVAL] error checks, if implemented, shall act as if they were performed
 32542 immediately at the beginning of processing for the function and caused an error return prior to
 32543 modifying the state of the condition variable specified by *cond*.

32544 **ERRORS**

32545 The *pthread_cond_destroy()* function may fail if:

32546 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 32547 by *cond* while it is referenced (for example, while being used in a
 32548 *pthread_cond_wait()* or *pthread_cond_timedwait()*) by another thread.

32549 [EINVAL] The value specified by *cond* is invalid.

32550 The *pthread_cond_init()* function shall fail if:

32551 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
 32552 another condition variable.

32553 [ENOMEM] Insufficient memory exists to initialize the condition variable.

32554 The `pthread_cond_init()` function may fail if:

32555 [EBUSY] The implementation has detected an attempt to reinitialize the object
 32556 referenced by `cond`, a previously initialized, but not yet destroyed, condition
 32557 variable.

32558 [EINVAL] The value specified by `attr` is invalid.

32559 These functions shall not return an error code of [EINTR].

EXAMPLES

32561 A condition variable can be destroyed immediately after all the threads that are blocked on it are
 32562 awakened. For example, consider the following code:

```

32563 struct list {
32564     pthread_mutex_t lm;
32565     ...
32566 }

32567 struct elt {
32568     key k;
32569     int busy;
32570     pthread_cond_t notbusy;
32571     ...
32572 }

32573 /* Find a list element and reserve it. */
32574 struct elt *
32575 list_find(struct list *lp, key k)
32576 {
32577     struct elt *ep;

32578     pthread_mutex_lock(&lp->lm);
32579     while ((ep = find_elt(l, k) != NULL) && ep->busy)
32580         pthread_cond_wait(&ep->notbusy, &lp->lm);
32581     if (ep != NULL)
32582         ep->busy = 1;
32583     pthread_mutex_unlock(&lp->lm);
32584     return(ep);
32585 }

32586 delete_elt(struct list *lp, struct elt *ep)
32587 {
32588     pthread_mutex_lock(&lp->lm);
32589     assert(ep->busy);
32590     ... remove ep from list ...
32591     ep->busy = 0; /* Paranoid. */
32592     (A) pthread_cond_broadcast(&ep->notbusy);
32593     pthread_mutex_unlock(&lp->lm);
32594     (B) pthread_cond_destroy(&ep->notbusy);
32595     free(ep);
32596 }

```

32597 In this example, the condition variable and its list element may be freed (line B) immediately
 32598 after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no
 32599 other thread can touch the element to be deleted.

32600 APPLICATION USAGE

32601 None.

32602 RATIONALE

32603 See *pthread_mutex_init()*; a similar rationale applies to condition variables.

32609 CHANGE HISTORY

32610 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32611 Issue 6

32612 The *pthread_cond_destroy()* and *pthread_cond_init()* functions are marked as part of the Threads
32613 option.

32614 IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

32615 The **restrict** keyword is added to the *pthread_cond_init()* prototype for alignment with the
32616 ISO / IEC 9899:1999 standard.

32617 **NAME**

32618 pthread_cond_signal — signal a condition

32619 **SYNOPSIS**32620 THR `#include <pthread.h>`32621 `int pthread_cond_signal(pthread_cond_t *cond);`

32622

32623 **DESCRIPTION**32624 Refer to *pthread_cond_broadcast()*.

32625 **NAME**

32626 pthread_cond_timedwait, pthread_cond_wait — wait on a condition

32627 **SYNOPSIS**

32628 THR #include <pthread.h>

```

32629 int pthread_cond_timedwait(pthread_cond_t *restrict cond,
32630 pthread_mutex_t *restrict mutex,
32631 const struct timespec *restrict abstime);
32632 int pthread_cond_wait(pthread_cond_t *restrict cond,
32633 pthread_mutex_t *restrict mutex);
32634

```

32635 **DESCRIPTION**

32636 The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions shall block on a condition
 32637 variable. They shall be called with *mutex* locked by the calling thread or undefined behavior
 32638 results.

32639 These functions atomically release *mutex* and cause the calling thread to block on the condition
 32640 variable *cond*; atomically here means “atomically with respect to access by another thread to the
 32641 mutex and then the condition variable”. That is, if another thread is able to acquire the mutex
 32642 after the about-to-block thread has released it, then a subsequent call to *pthread_cond_broadcast()*
 32643 or *pthread_cond_signal()* in that thread shall behave as if it were issued after the about-to-block
 32644 thread has blocked.

32645 Upon successful return, the mutex shall have been locked and shall be owned by the calling
 32646 thread.

32647 When using condition variables there is always a Boolean predicate involving shared variables
 32648 associated with each condition wait that is true if the thread should proceed. Spurious wakeups
 32649 from the *pthread_cond_timedwait()* or *pthread_cond_wait()* functions may occur. Since the return
 32650 from *pthread_cond_timedwait()* or *pthread_cond_wait()* does not imply anything about the value
 32651 of this predicate, the predicate should be re-evaluated upon such return.

32652 The effect of using more than one mutex for concurrent *pthread_cond_timedwait()* or
 32653 *pthread_cond_wait()* operations on the same condition variable is undefined; that is, a condition
 32654 variable becomes bound to a unique mutex when a thread waits on the condition variable, and
 32655 this (dynamic) binding shall end when the wait returns.

32656 A condition wait (whether timed or not) is a cancellation point. When the cancelability enable
 32657 state of a thread is set to *PTHREAD_CANCEL_DEFERRED*, a side effect of acting upon a
 32658 cancellation request while in a condition wait is that the mutex is (in effect) re-acquired before
 32659 calling the first cancellation cleanup handler. The effect is as if the thread were unblocked,
 32660 allowed to execute up to the point of returning from the call to *pthread_cond_timedwait()* or
 32661 *pthread_cond_wait()*, but at that point notices the cancellation request and instead of returning to
 32662 the caller of *pthread_cond_timedwait()* or *pthread_cond_wait()*, starts the thread cancellation
 32663 activities, which includes calling cancellation cleanup handlers.

32664 A thread that has been unblocked because it has been canceled while blocked in a call to
 32665 *pthread_cond_timedwait()* or *pthread_cond_wait()* shall not consume any condition signal that
 32666 may be directed concurrently at the condition variable if there are other threads blocked on the
 32667 condition variable.

32668 The *pthread_cond_timedwait()* function shall be equivalent to *pthread_cond_wait()*, except that an
 32669 error is returned if the absolute time specified by *abstime* passes (that is, system time equals or
 32670 exceeds *abstime*) before the condition *cond* is signaled or broadcasted, or if the absolute time
 32671 specified by *abstime* has already been passed at the time of the call.

32672 cs If the Clock Selection option is supported, the condition variable shall have a clock attribute
 32673 which specifies the clock that shall be used to measure the time specified by the *abstime*
 32674 argument. When such timeouts occur, *pthread_cond_timedwait()* shall nonetheless release and
 32675 re-acquire the mutex referenced by *mutex*. The *pthread_cond_timedwait()* function is also a
 32676 cancellation point.

32677 If a signal is delivered to a thread waiting for a condition variable, upon return from the signal
 32678 handler the thread resumes waiting for the condition variable as if it was not interrupted, or it
 32679 shall return zero due to spurious wakeup.

32680 RETURN VALUE

32681 Except in the case of [ETIMEDOUT], all these error checks shall act as if they were performed
 32682 immediately at the beginning of processing for the function and shall cause an error return, in
 32683 effect, prior to modifying the state of the mutex specified by *mutex* or the condition variable
 32684 specified by *cond*.

32685 Upon successful completion, a value of zero shall be returned; otherwise, an error number shall
 32686 be returned to indicate the error.

32687 ERRORS

32688 The *pthread_cond_timedwait()* function shall fail if:

32689 [ETIMEDOUT] The time specified by *abstime* to *pthread_cond_timedwait()* has passed.

32690 The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions may fail if:

32691 [EINVAL] The value specified by *cond*, *mutex*, or *abstime* is invalid.

32692 [EINVAL] Different mutexes were supplied for concurrent *pthread_cond_timedwait()* or
 32693 *pthread_cond_wait()* operations on the same condition variable.

32694 [EPERM] The mutex was not owned by the current thread at the time of the call.

32695 These functions shall not return an error code of [EINTR].

32696 EXAMPLES

32697 None.

32698 APPLICATION USAGE

32699 None.

32700 RATIONALE

32701 Condition Wait Semantics

32702 It is important to note that when *pthread_cond_wait()* and *pthread_cond_timedwait()* return
 32703 without error, the associated predicate may still be false. Similarly, when
 32704 *pthread_cond_timedwait()* returns with the timeout error, the associated predicate may be true
 32705 due to an unavoidable race between the expiration of the timeout and the predicate state change.

32706 Some implementations, particularly on a multi-processor, may sometimes cause multiple
 32707 threads to wake up when the condition variable is signaled simultaneously on different
 32708 processors.

32709 In general, whenever a condition wait returns, the thread has to re-evaluate the predicate
 32710 associated with the condition wait to determine whether it can safely proceed, should wait
 32711 again, or should declare a timeout. A return from the wait does not imply that the associated
 32712 predicate is either true or false.

32713 It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop”
 32714 that checks the predicate.

Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons. First, a relative time measure can be easily implemented on top of a function that specifies absolute time, but there is a race condition associated with specifying an absolute timeout on top of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns the current time and `cond_relative_timed_wait()` uses relative timeouts:

```
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time - now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout also need not be recomputed if it is used multiple times in a loop, such as that enclosing a condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that implementations process any timed wait expiring at an intervening time as if that time had actually occurred.

Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions `pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent) cancellation request is noticed. The reason for this is that an indefinite wait is possible at these points—whatever event is being waited for, even if the program is totally correct, might never occur; for example, some input data being awaited might never be sent. By making condition wait a cancellation point, the thread can be canceled and perform its cancellation cleanup handler even though it may be stuck in some indefinite wait.

A side effect of acting on a cancellation request while a thread is blocked on a condition variable is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in order to ensure that the cancellation cleanup handler is executed in the same state as the critical code that lies both before and after the call to the condition wait function. This rule is also required when interfacing to POSIX threads from languages, such as Ada or C++, which may choose to map cancellation onto a language exception; this rule ensures that each exception handler guarding a critical section can always safely depend upon the fact that the associated mutex has already been locked regardless of exactly where within the critical section the exception was raised. Without this rule, there would not be a uniform rule that exception handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since *some* statement has to be made regarding the state of the lock when a cancellation is delivered during a wait, a definition has been chosen that makes application coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the implementation is required to ensure that the thread does not consume any condition signals directed at that condition variable if there are any other threads waiting on that condition variable. This rule is specified in order to avoid deadlock conditions that could occur if these two independent requests (one acting on a thread and the other acting on the condition variable) were not processed independently.

Performance of Mutexes and Condition Variables

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

Features of Mutexes and Condition Variables

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

Scheduling Behavior of Mutexes and Condition Variables

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

Timed Condition Wait

The `pthread_cond_timedwait()` function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

```
(void) pthread_mutex_lock(&t.mn);
        t.waiters++;
        clock_gettime(CLOCK_REALTIME, &ts);
        ts.tv_sec += 5;
        rc = 0;
        while (! mypredicate(&t) && rc == 0)
            rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
        t.waiters--;
        if (rc == 0) setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```

32802 By making the timeout parameter absolute, it does not need to be recomputed each time the
32803 program checks its blocking predicate. If the timeout was relative, it would have to be
32804 recomputed before each call. This would be especially difficult since such code would need to
32805 take into account the possibility of extra wakeups that result from extra broadcasts or signals on
32806 the condition variable that occur before either the predicate is true or the timeout is due.

32807 FUTURE DIRECTIONS

32808 None.

32811 IEEE Std 1003.1-2001, <pthread.h>

32812 CHANGE HISTORY

32813 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32814 Issue 6

32815 The *pthread_cond_timedwait()* and *pthread_cond_wait()* functions are marked as part of the
32816 Threads option.

32817 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the
32818 *pthread_cond_wait()* function.

32819 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for
32820 the Clock Selection option.

32821 The ERRORS section has an additional case for [EPERM] in response to IEEE PASC
32822 Interpretation 1003.1c #28.

32823 The **restrict** keyword is added to the *pthread_cond_timedwait()* and *pthread_cond_wait()*
32824 prototypes for alignment with the ISO / IEC 9899:1999 standard.

32825 NAME

32826 pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable
 32827 attributes object

32828 SYNOPSIS

32829 THR `#include <pthread.h>`

32830 `int pthread_condattr_destroy(pthread_condattr_t *attr);`

32831 `int pthread_condattr_init(pthread_condattr_t *attr);`

32832

32833 DESCRIPTION

32834 The *pthread_condattr_destroy()* function shall destroy a condition variable attributes object; the
 32835 object becomes, in effect, uninitialized. An implementation may cause *pthread_condattr_destroy()*
 32836 to set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be
 32837 reinitialized using *pthread_condattr_init()*; the results of otherwise referencing the object after it
 32838 has been destroyed are undefined.

32839 The *pthread_condattr_init()* function shall initialize a condition variable attributes object *attr* with
 32840 the default value for all of the attributes defined by the implementation.

32841 Results are undefined if *pthread_condattr_init()* is called specifying an already initialized *attr*
 32842 attributes object.

32843 After a condition variable attributes object has been used to initialize one or more condition
 32844 variables, any function affecting the attributes object (including destruction) shall not affect any
 32845 previously initialized condition variables.

32846 This volume of IEEE Std 1003.1-2001 requires two attributes, the *clock* attribute and the *process-*
 32847 *shared* attribute.

32848 Additional attributes, their default values, and the names of the associated functions to get and
 32849 set those attribute values are implementation-defined.

32850 RETURN VALUE

32851 If successful, the *pthread_condattr_destroy()* and *pthread_condattr_init()* functions shall return
 32852 zero; otherwise, an error number shall be returned to indicate the error.

32853 ERRORS

32854 The *pthread_condattr_destroy()* function may fail if:

32855 [EINVAL] The value specified by *attr* is invalid.

32856 The *pthread_condattr_init()* function shall fail if:

32857 [ENOMEM] Insufficient memory exists to initialize the condition variable attributes object.

32858 These functions shall not return an error code of [EINTR].

32859 EXAMPLES

32860 None.

32861 APPLICATION USAGE

32862 None.

32863 RATIONALE

32864 See *pthread_attr_init()* and *pthread_mutex_init()*.

32865 A *process-shared* attribute has been defined for condition variables for the same reason it has been
 32866 defined for mutexes.

32867 FUTURE DIRECTIONS

32868 None.

32872 CHANGE HISTORY

32873 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

32874 Issue 6

32875 The *pthread_condattr_destroy()* and *pthread_condattr_init()* functions are marked as part of the
32876 Threads option.

32877 **NAME**

32878 pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection
 32879 condition variable attribute (**ADVANCED REALTIME**)

32880 **SYNOPSIS**

```
32881 THR CS #include <pthread.h>

32882 int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
32883 clockid_t *restrict clock_id);
32884 int pthread_condattr_setclock(pthread_condattr_t *attr,
32885 clockid_t clock_id);
32886
```

32887 **DESCRIPTION**

32888 The *pthread_condattr_getclock()* function shall obtain the value of the *clock* attribute from the
 32889 attributes object referenced by *attr*. The *pthread_condattr_setclock()* function shall set the *clock*
 32890 attribute in an initialized attributes object referenced by *attr*. If *pthread_condattr_setclock()* is
 32891 called with a *clock_id* argument that refers to a CPU-time clock, the call shall fail.

32892 The *clock* attribute is the clock ID of the clock that shall be used to measure the timeout service of
 32893 *pthread_cond_timedwait()*. The default value of the *clock* attribute shall refer to the system clock.

32894 **RETURN VALUE**

32895 If successful, the *pthread_condattr_getclock()* function shall return zero and store the value of the
 32896 clock attribute of *attr* into the object referenced by the *clock_id* argument. Otherwise, an error
 32897 number shall be returned to indicate the error.

32898 If successful, the *pthread_condattr_setclock()* function shall return zero; otherwise, an error
 32899 number shall be returned to indicate the error.

32900 **ERRORS**

32901 These functions may fail if:

32902 [EINVAL] The value specified by *attr* is invalid.

32903 The *pthread_condattr_setclock()* function may fail if:

32904 [EINVAL] The value specified by *clock_id* does not refer to a known clock, or is a CPU-
 32905 time clock.

32906 These functions shall not return an error code of [EINTR].

32907 **EXAMPLES**

32908 None.

32909 **APPLICATION USAGE**

32910 None.

32911 **RATIONALE**

32912 None.

32922 NAME

32923 pthread_condattr_getpshared, pthread_condattr_setpshared — get and set the process-shared
 32924 condition variable attributes

32925 SYNOPSIS

```
32926 THR TSH #include <pthread.h>

32927 int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
32928 int *restrict pshared);
32929 int pthread_condattr_setpshared(pthread_condattr_t *attr,
32930 int pshared);
32931
```

32932 DESCRIPTION

32933 The *pthread_condattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 32934 from the attributes object referenced by *attr*. The *pthread_condattr_setpshared()* function shall set
 32935 the *process-shared* attribute in an initialized attributes object referenced by *attr*.

32936 The *process-shared* attribute is set to *PTHREAD_PROCESS_SHARED* to permit a condition
 32937 variable to be operated upon by any thread that has access to the memory where the condition
 32938 variable is allocated, even if the condition variable is allocated in memory that is shared by
 32939 multiple processes. If the *process-shared* attribute is *PTHREAD_PROCESS_PRIVATE*, the
 32940 condition variable shall only be operated upon by threads created within the same process as the
 32941 thread that initialized the condition variable; if threads of differing processes attempt to operate
 32942 on such a condition variable, the behavior is undefined. The default value of the attribute is
 32943 *PTHREAD_PROCESS_PRIVATE*.

32944 RETURN VALUE

32945 If successful, the *pthread_condattr_setpshared()* function shall return zero; otherwise, an error
 32946 number shall be returned to indicate the error.

32947 If successful, the *pthread_condattr_getpshared()* function shall return zero and store the value of
 32948 the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter. Otherwise,
 32949 an error number shall be returned to indicate the error.

32950 ERRORS

32951 The *pthread_condattr_getpshared()* and *pthread_condattr_setpshared()* functions may fail if:

32952 [EINVAL] The value specified by *attr* is invalid.

32953 The *pthread_condattr_setpshared()* function may fail if:

32954 [EINVAL] The new value specified for the attribute is outside the range of legal values
 32955 for that attribute.

32956 These functions shall not return an error code of [EINTR].

32957 EXAMPLES

32958 None.

32959 APPLICATION USAGE

32960 None.

32988 clockid_t clock_id);
```

32989

32990 DESCRIPTION

32991 Refer to *pthread_condattr_getclock()*.

32992 **NAME**

32993 pthread_condattr_setpshared — set the process-shared condition variable attribute

32994 **SYNOPSIS**

32995 THR TSH `#include <pthread.h>`

32996 `int pthread_condattr_setpshared(pthread_condattr_t *attr,`
32997 `int pshared);`

32998

32999 **DESCRIPTION**

33000 Refer to *pthread_condattr_getpshared()*.

33001 **NAME**

33002 pthread_create — thread creation

33003 **SYNOPSIS**

33004 THR #include <pthread.h>

```
33005 int pthread_create(pthread_t *restrict thread,
33006     const pthread_attr_t *restrict attr,
33007     void *(*start_routine) (void*), void *restrict arg);
33008
```

33009 **DESCRIPTION**

33010 The *pthread_create()* function shall create a new thread, with attributes specified by *attr*, within a
 33011 process. If *attr* is NULL, the default attributes shall be used. If the attributes specified by *attr* are
 33012 modified later, the thread's attributes shall not be affected. Upon successful completion,
 33013 *pthread_create()* shall store the ID of the created thread in the location referenced by *thread*.

33014 The thread is created executing *start_routine* with *arg* as its sole argument. If the *start_routine*
 33015 returns, the effect shall be as if there was an implicit call to *pthread_exit()* using the return value
 33016 of *start_routine* as the exit status. Note that the thread in which *main()* was originally invoked
 33017 differs from this. When it returns from *main()*, the effect shall be as if there was an implicit call
 33018 to *exit()* using the return value of *main()* as the exit status.

33019 The signal state of the new thread shall be initialized as follows:

- 33020 • The signal mask shall be inherited from the creating thread.
- 33021 • The set of signals pending for the new thread shall be empty.

33022 XSI The alternate stack shall not be inherited.

33023 The floating-point environment shall be inherited from the creating thread.

33024 If *pthread_create()* fails, no new thread is created and the contents of the location referenced by
 33025 *thread* are undefined.

33026 TCT If `_POSIX_THREAD_CPUTIME` is defined, the new thread shall have a CPU-time clock
 33027 accessible, and the initial value of this clock shall be set to zero.

33028 **RETURN VALUE**

33029 If successful, the *pthread_create()* function shall return zero; otherwise, an error number shall be
 33030 returned to indicate the error.

33031 **ERRORS**

33032 The *pthread_create()* function shall fail if:

33033 [EAGAIN] The system lacked the necessary resources to create another thread, or the
 33034 system-imposed limit on the total number of threads in a process
 33035 {PTHREAD_THREADS_MAX} would be exceeded.

33036 [EINVAL] The value specified by *attr* is invalid.

33037 [EPERM] The caller does not have appropriate permission to set the required
 33038 scheduling parameters or scheduling policy.

33039 The *pthread_create()* function shall not return an error code of [EINTR].

33040 **EXAMPLES**

33041 None.

33042 **APPLICATION USAGE**

33043 None.

33044 **RATIONALE**

33045 A suggested alternative to *pthread_create()* would be to define two separate operations: create
 33046 and start. Some applications would find such behavior more natural. Ada, in particular,
 33047 separates the “creation” of a task from its “activation”.

33048 Splitting the operation was rejected by the standard developers for many reasons:

- 33049 • The number of calls required to start a thread would increase from one to two and thus place
 33050 an additional burden on applications that do not require the additional synchronization. The
 33051 second call, however, could be avoided by the additional complication of a start-up state
 33052 attribute.
- 33053 • An extra state would be introduced: “created but not started”. This would require the
 33054 standard to specify the behavior of the thread operations when the target has not yet started
 33055 executing.
- 33056 • For those applications that require such behavior, it is possible to simulate the two separate
 33057 steps with the facilities that are currently provided. The *start_routine()* can synchronize by
 33058 waiting on a condition variable that is signaled by the start operation.

33059 An Ada implementor can choose to create the thread at either of two points in the Ada program:
 33060 when the task object is created, or when the task is activated (generally at a “begin”). If the first
 33061 approach is adopted, the *start_routine()* needs to wait on a condition variable to receive the
 33062 order to begin “activation”. The second approach requires no such condition variable or extra
 33063 synchronization. In either approach, a separate Ada task control block would need to be created
 33064 when the task object is created to hold rendezvous queues, and so on.

33065 An extension of the preceding model would be to allow the state of the thread to be modified
 33066 between the create and start. This would allow the thread attributes object to be eliminated. This
 33067 has been rejected because:

- 33068 • All state in the thread attributes object has to be able to be set for the thread. This would
 33069 require the definition of functions to modify thread attributes. There would be no reduction
 33070 in the number of function calls required to set up the thread. In fact, for an application that
 33071 creates all threads using identical attributes, the number of function calls required to set up
 33072 the threads would be dramatically increased. Use of a thread attributes object permits the
 33073 application to make one set of attribute setting function calls. Otherwise, the set of attribute
 33074 setting function calls needs to be made for each thread creation.
- 33075 • Depending on the implementation architecture, functions to set thread state would require
 33076 kernel calls, or for other implementation reasons would not be able to be implemented as
 33077 macros, thereby increasing the cost of thread creation.
- 33078 • The ability for applications to segregate threads by class would be lost.

33079 Another suggested alternative uses a model similar to that for process creation, such as “thread
 33080 fork”. The fork semantics would provide more flexibility and the “create” function can be
 33081 implemented simply by doing a thread fork followed immediately by a call to the desired “start
 33082 routine” for the thread. This alternative has these problems:

- 33083 • For many implementations, the entire stack of the calling thread would need to be
 33084 duplicated, since in many architectures there is no way to determine the size of the calling
 33085 frame.

33086 • Efficiency is reduced since at least some part of the stack has to be copied, even though in
 33087 most cases the thread never needs the copied context, since it merely calls the desired start
 33088 routine.

33089 FUTURE DIRECTIONS

33090 None.

33091 SEE ALSO

33092 *fork()*, *pthread_exit()*, *pthread_join()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 33093 <pthread.h>

33094 CHANGE HISTORY

33095 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33096 Issue 6

33097 The *pthread_create()* function is marked as part of the Threads option.

33098 The following new requirements on POSIX implementations derive from alignment with the
 33099 Single UNIX Specification:

33100 • The [EPERM] mandatory error condition is added.

33101 The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.

33102 The **restrict** keyword is added to the *pthread_create()* prototype for alignment with the
 33103 ISO/IEC 9899:1999 standard.

33104 The DESCRIPTION is updated to make it explicit that the floating-point environment is
 33105 inherited from the creating thread.

33106 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the
 33107 alternate stack is not inherited.

33108 **NAME**

33109 pthread_detach — detach a thread

33110 **SYNOPSIS**

33111 THR #include <pthread.h>

33112 int pthread_detach(pthread_t thread);

33113

33114 **DESCRIPTION**

33115 The *pthread_detach()* function shall indicate to the implementation that storage for the thread
 33116 *thread* can be reclaimed when that thread terminates. If *thread* has not terminated,
 33117 *pthread_detach()* shall not cause it to terminate. The effect of multiple *pthread_detach()* calls on
 33118 the same target thread is unspecified.

33119 **RETURN VALUE**

33120 If the call succeeds, *pthread_detach()* shall return 0; otherwise, an error number shall be returned
 33121 to indicate the error.

33122 **ERRORS**33123 The *pthread_detach()* function shall fail if:

33124 [EINVAL] The implementation has detected that the value specified by *thread* does not
 33125 refer to a joinable thread.

33126 [ESRCH] No thread could be found corresponding to that specified by the given thread
 33127 ID.

33128 The *pthread_detach()* function shall not return an error code of [EINTR].33129 **EXAMPLES**

33130 None.

33131 **APPLICATION USAGE**

33132 None.

33133 **RATIONALE**

33134 The *pthread_join()* or *pthread_detach()* functions should eventually be called for every thread that
 33135 is created so that storage associated with the thread may be reclaimed.

33136 It has been suggested that a “detach” function is not necessary; the *detachstate* thread creation
 33137 attribute is sufficient, since a thread need never be dynamically detached. However, need arises
 33138 in at least two cases:

33139 1. In a cancellation handler for a *pthread_join()* it is nearly essential to have a *pthread_detach()* |
 33140 function in order to detach the thread on which *pthread_join()* was waiting. Without it, it |
 33141 would be necessary to have the handler do another *pthread_join()* to attempt to detach the |
 33142 thread, which would both delay the cancellation processing for an unbounded period and |
 33143 introduce a new call to *pthread_join()*, which might itself need a cancellation handler. A |
 33144 dynamic detach is nearly essential in this case. |

33145 2. In order to detach the “initial thread” (as may be desirable in processes that set up server
 33146 threads).

33147 **FUTURE DIRECTIONS**

33148 None.

33149 **SEE ALSO**

33150 *pthread_join()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

33151 **CHANGE HISTORY**

33152 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33153 **Issue 6**

33154 The *pthread_detach()* function is marked as part of the Threads option.

33155 **NAME**

33156 pthread_equal — compare thread IDs

33157 **SYNOPSIS**

33158 THR #include <pthread.h>

33159 int pthread_equal(pthread_t t1, pthread_t t2);

33160

33161 **DESCRIPTION**33162 This function shall compare the thread IDs *t1* and *t2*.33163 **RETURN VALUE**33164 The *pthread_equal()* function shall return a non-zero value if *t1* and *t2* are equal; otherwise, zero
33165 shall be returned.33166 If either *t1* or *t2* are not valid thread IDs, the behavior is undefined.33167 **ERRORS**

33168 No errors are defined.

33169 The *pthread_equal()* function shall not return an error code of [EINTR].33170 **EXAMPLES**

33171 None.

33172 **APPLICATION USAGE**

33173 None.

33174 **RATIONALE**33175 Implementations may choose to define a thread ID as a structure. This allows additional
33176 flexibility and robustness over using an **int**. For example, a thread ID could include a sequence
33177 number that allows detection of “dangling IDs” (copies of a thread ID that has been detached).
33178 Since the C language does not support comparison on structure types, the *pthread_equal()*
33179 function is provided to compare thread IDs.33180 **FUTURE DIRECTIONS**

33181 None.

33182 **SEE ALSO**33183 *pthread_create()*, *pthread_self()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>33184 **CHANGE HISTORY**

33185 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33186 **Issue 6**33187 The *pthread_equal()* function is marked as part of the Threads option.

33188 **NAME**

33189 pthread_exit — thread termination

33190 **SYNOPSIS**

33191 THR #include <pthread.h>

33192 void pthread_exit(void *value_ptr);

33193

33194 **DESCRIPTION**

33195 The *pthread_exit()* function shall terminate the calling thread and make the value *value_ptr*
 33196 available to any successful join with the terminating thread. Any cancellation cleanup handlers
 33197 that have been pushed and not yet popped shall be popped in the reverse order that they were
 33198 pushed and then executed. After all cancellation cleanup handlers have been executed, if the
 33199 thread has any thread-specific data, appropriate destructor functions shall be called in an
 33200 unspecified order. Thread termination does not release any application visible process resources,
 33201 including, but not limited to, mutexes and file descriptors, nor does it perform any process-level
 33202 cleanup actions, including, but not limited to, calling any *atexit()* routines that may exist.

33203 An implicit call to *pthread_exit()* is made when a thread other than the thread in which *main()*
 33204 was first invoked returns from the start routine that was used to create it. The function's return
 33205 value shall serve as the thread's exit status.

33206 The behavior of *pthread_exit()* is undefined if called from a cancellation cleanup handler or
 33207 destructor function that was invoked as a result of either an implicit or explicit call to
 33208 *pthread_exit()*.

33209 After a thread has terminated, the result of access to local (auto) variables of the thread is
 33210 undefined. Thus, references to local variables of the exiting thread should not be used for the
 33211 *pthread_exit()* *value_ptr* parameter value.

33212 The process shall exit with an exit status of 0 after the last thread has been terminated. The
 33213 behavior shall be as if the implementation called *exit()* with a zero argument at thread
 33214 termination time.

33215 **RETURN VALUE**33216 The *pthread_exit()* function cannot return to its caller.33217 **ERRORS**

33218 No errors are defined.

33219 **EXAMPLES**

33220 None.

33221 **APPLICATION USAGE**

33222 None.

33223 **RATIONALE**

33224 The normal mechanism by which a thread terminates is to return from the routine that was
 33225 specified in the *pthread_create()* call that started it. The *pthread_exit()* function provides the
 33226 capability for a thread to terminate without requiring a return from the start routine of that
 33227 thread, thereby providing a function analogous to *exit()*.

33228 Regardless of the method of thread termination, any cancellation cleanup handlers that have
 33229 been pushed and not yet popped are executed, and the destructors for any existing thread-
 33230 specific data are executed. This volume of IEEE Std 1003.1-2001 requires that cancellation
 33231 cleanup handlers be popped and called in order. After all cancellation cleanup handlers have
 33232 been executed, thread-specific data destructors are called, in an unspecified order, for each item
 33233 of thread-specific data that exists in the thread. This ordering is necessary because cancellation

33234 cleanup handlers may rely on thread-specific data.

33235 As the meaning of the status is determined by the application (except when the thread has been
33236 canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an
33237 illegal status value is, which is why no address error checking is done.

33238 **FUTURE DIRECTIONS**

33239 None.

33240 **SEE ALSO**

33241 *exit()*, *pthread_create()*, *pthread_join()*, the Base Definitions volume of IEEE Std 1003.1-2001,
33242 **<pthread.h>**

33243 **CHANGE HISTORY**

33244 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33245 **Issue 6**

33246 The *pthread_exit()* function is marked as part of the Threads option.

33247 **NAME**

33248 pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

33249 **SYNOPSIS**

33250 xSI #include <pthread.h>

33251 int pthread_getconcurrency(void);

33252 int pthread_setconcurrency(int new_level);

33253

33254 **DESCRIPTION**

33255 Unbound threads in a process may or may not be required to be simultaneously active. By
 33256 default, the threads implementation ensures that a sufficient number of threads are active so that
 33257 the process can continue to make progress. While this conserves system resources, it may not
 33258 produce the most effective level of concurrency.

33259 The *pthread_setconcurrency()* function allows an application to inform the threads
 33260 implementation of its desired concurrency level, *new_level*. The actual level of concurrency
 33261 provided by the implementation as a result of this function call is unspecified.

33262 If *new_level* is zero, it causes the implementation to maintain the concurrency level at its
 33263 discretion as if *pthread_setconcurrency()* had never been called.

33264 The *pthread_getconcurrency()* function shall return the value set by a previous call to the
 33265 *pthread_setconcurrency()* function. If the *pthread_setconcurrency()* function was not previously
 33266 called, this function shall return zero to indicate that the implementation is maintaining the
 33267 concurrency level.

33268 A call to *pthread_setconcurrency()* shall inform the implementation of its desired concurrency
 33269 level. The implementation shall use this as a hint, not a requirement.

33270 If an implementation does not support multiplexing of user threads on top of several kernel-
 33271 scheduled entities, the *pthread_setconcurrency()* and *pthread_getconcurrency()* functions are
 33272 provided for source code compatibility but they shall have no effect when called. To maintain
 33273 the function semantics, the *new_level* parameter is saved when *pthread_setconcurrency()* is called
 33274 so that a subsequent call to *pthread_getconcurrency()* shall return the same value.

33275 **RETURN VALUE**

33276 If successful, the *pthread_setconcurrency()* function shall return zero; otherwise, an error number
 33277 shall be returned to indicate the error.

33278 The *pthread_getconcurrency()* function shall always return the concurrency level set by a previous
 33279 call to *pthread_setconcurrency()*. If the *pthread_setconcurrency()* function has never been called,
 33280 *pthread_getconcurrency()* shall return zero.

33281 **ERRORS**33282 The *pthread_setconcurrency()* function shall fail if:33283 [EINVAL] The value specified by *new_level* is negative.33284 [EAGAIN] The value specific by *new_level* would cause a system resource to be exceeded.

33285 These functions shall not return an error code of [EINTR].

33286 EXAMPLES

33287 None.

33288 APPLICATION USAGE

33289 Use of these functions changes the state of the underlying concurrency upon which the
33290 application depends. Library developers are advised to not use the *pthread_getconcurrency()* and
33291 *pthread_setconcurrency()* functions since their use may conflict with an applications use of these
33292 functions.

33293 RATIONALE

33294 None.

33295 FUTURE DIRECTIONS

33296 None.

33299 CHANGE HISTORY

33300 First released in Issue 5.

33301 **NAME**

33302 pthread_getcpuclockid — access a thread CPU-time clock (**ADVANCED REALTIME**
 33303 **THREADS**)

33304 **SYNOPSIS**

33305 THR TCT #include <pthread.h>

33306 #include <time.h>

33307 int pthread_getcpuclockid(pthread_t thread_id, clockid_t *clock_id);

33308

33309 **DESCRIPTION**

33310 The *pthread_getcpuclockid()* function shall return in *clock_id* the clock ID of the CPU-time clock of
 33311 the thread specified by *thread_id*, if the thread specified by *thread_id* exists.

33312 **RETURN VALUE**

33313 Upon successful completion, *pthread_getcpuclockid()* shall return zero; otherwise, an error
 33314 number shall be returned to indicate the error.

33315 **ERRORS**

33316 The *pthread_getcpuclockid()* function may fail if:

33317 [ESRCH] The value specified by *thread_id* does not refer to an existing thread.

33318 **EXAMPLES**

33319 None.

33320 **APPLICATION USAGE**

33321 The *pthread_getcpuclockid()* function is part of the Thread CPU-Time Clocks option and need not
 33322 be provided on all implementations.

33323 **RATIONALE**

33324 None.

33325 **FUTURE DIRECTIONS**

33326 None.

33327 **SEE ALSO**

33328 *clock_getcpuclockid()*, *clock_getres()*, *timer_create()*, the Base Definitions volume of
 33329 IEEE Std 1003.1-2001, <pthread.h>, <time.h>

33330 **CHANGE HISTORY**

33331 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

33332 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

33333 **NAME**

33334 pthread_getschedparam, pthread_setschedparam — dynamic thread scheduling parameters
 33335 access (**REALTIME THREADS**)

33336 **SYNOPSIS**

33337 THR TPS #include <pthread.h>

```
33338 int pthread_getschedparam(pthread_t thread, int *restrict policy,
33339 struct sched_param *restrict param);
33340 int pthread_setschedparam(pthread_t thread, int policy,
33341 const struct sched_param *param);
33342
```

33343 **DESCRIPTION**

33344 The *pthread_getschedparam()* and *pthread_setschedparam()* functions shall, respectively, get and set
 33345 the scheduling policy and parameters of individual threads within a multi-threaded process to
 33346 be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the
 33347 **sched_param** structure is the priority *sched_priority*. For SCHED_OTHER, the affected
 33348 scheduling parameters are implementation-defined.

33349 The *pthread_getschedparam()* function shall retrieve the scheduling policy and scheduling
 33350 parameters for the thread whose thread ID is given by *thread* and shall store those values in
 33351 *policy* and *param*, respectively. The priority value returned from *pthread_getschedparam()* shall be
 33352 the value specified by the most recent *pthread_setschedparam()*, *pthread_setschedprio()*, or
 33353 *pthread_create()* call affecting the target thread. It shall not reflect any temporary adjustments to
 33354 its priority as a result of any priority inheritance or ceiling functions. The *pthread_setschedparam()*
 33355 function shall set the scheduling policy and associated scheduling parameters for the thread
 33356 whose thread ID is given by *thread* to the policy and associated parameters provided in *policy*
 33357 and *param*, respectively.

33358 The *policy* parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The
 33359 scheduling parameters for the SCHED_OTHER policy are implementation-defined. The
 33360 SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, *priority*.

33361 TSP If _POSIX_THREAD_SPORADIC_SERVER is defined, then the *policy* argument may have the
 33362 value SCHED_SPORADIC, with the exception for the *pthread_setschedparam()* function that if the
 33363 scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-
 33364 defined whether the function is supported; in other words, the implementation need not allow
 33365 the application to dynamically change the scheduling policy to SCHED_SPORADIC. The
 33366 sporadic server scheduling policy has the associated parameters *sched_ss_low_priority*,
 33367 *sched_ss_repl_period*, *sched_ss_init_budget*, *sched_priority*, and *sched_ss_max_repl*. The specified
 33368 *sched_ss_repl_period* shall be greater than or equal to the specified *sched_ss_init_budget* for the
 33369 function to succeed; if it is not, then the function shall fail. The value of *sched_ss_max_repl* shall
 33370 be within the inclusive range [1,{SS_REPL_MAX}] for the function to succeed; if not, the function
 33371 shall fail.

33372 If the *pthread_setschedparam()* function fails, the scheduling parameters shall not be changed for
 33373 the target thread.

33374 **RETURN VALUE**

33375 If successful, the *pthread_getschedparam()* and *pthread_setschedparam()* functions shall return zero;
 33376 otherwise, an error number shall be returned to indicate the error.

33377 **ERRORS**

33378 The *pthread_getschedparam()* function may fail if:

33379 [ESRCH] The value specified by *thread* does not refer to an existing thread.

33380 The *pthread_setschedparam()* function may fail if:

33381 [EINVAL] The value specified by *policy* or one of the scheduling parameters associated
33382 with the scheduling policy *policy* is invalid.

33383 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an
33384 unsupported value.

33385 TSP [ENOTSUP] An attempt was made to dynamically change the scheduling policy to
33386 SCHED_SPORADIC, and the implementation does not support this change.

33387 [EPERM] The caller does not have the appropriate permission to set either the
33388 scheduling parameters or the scheduling policy of the specified thread.

33389 [EPERM] The implementation does not allow the application to modify one of the
33390 parameters to the value specified.

33391 [ESRCH] The value specified by *thread* does not refer to a existing thread.

33392 These functions shall not return an error code of [EINTR].

33393 **EXAMPLES**

33394 None.

33395 **APPLICATION USAGE**

33396 None.

33397 **RATIONALE**

33398 None.

33399 **FUTURE DIRECTIONS**

33400 None.

33401 **SEE ALSO**

33402 *pthread_setschedprio()*, *sched_getparam()*, *sched_getscheduler()*, the Base Definitions volume of
33403 IEEE Std 1003.1-2001, <pthread.h>, <sched.h>

33404 **CHANGE HISTORY**

33405 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33406 **Issue 6**

33407 The *pthread_getschedparam()* and *pthread_setschedparam()* functions are marked as part of the
33408 Threads and Thread Execution Scheduling options.

33409 The [ENOSYS] error condition has been removed as stubs need not be provided if an
33410 implementation does not support the Thread Execution Scheduling option.

33411 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the
33412 *pthread_setschedparam()* function so that its second argument is of type **int**.

33413 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

33414 The **restrict** keyword is added to the *pthread_getschedparam()* prototype for alignment with the
33415 ISO/IEC 9899:1999 standard.

33416 The Open Group Corrigendum U047/1 is applied.

33417 IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a
33418 call to the *pthread_setschedprio()* function.

33419 **NAME**

33420 pthread_getspecific, pthread_setspecific — thread-specific data management

33421 **SYNOPSIS**

33422 THR #include <pthread.h>

33423 void *pthread_getspecific(pthread_key_t key);

33424 int pthread_setspecific(pthread_key_t key, const void *value);

33425

33426 **DESCRIPTION**33427 The *pthread_getspecific()* function shall return the value currently bound to the specified *key* on
33428 behalf of the calling thread.33429 The *pthread_setspecific()* function shall associate a thread-specific *value* with a *key* obtained via a
33430 previous call to *pthread_key_create()*. Different threads may bind different values to the same
33431 key. These values are typically pointers to blocks of dynamically allocated memory that have
33432 been reserved for use by the calling thread.33433 The effect of calling *pthread_getspecific()* or *pthread_setspecific()* with a *key* value not obtained
33434 from *pthread_key_create()* or after *key* has been deleted with *pthread_key_delete()* is undefined.33435 Both *pthread_getspecific()* and *pthread_setspecific()* may be called from a thread-specific data
33436 destructor function. A call to *pthread_getspecific()* for the thread-specific data *key* being
33437 destroyed shall return the value NULL, unless the value is changed (after the destructor starts)
33438 by a call to *pthread_setspecific()*. Calling *pthread_setspecific()* from a thread-specific data
33439 destructor routine may result either in lost storage (after at least
33440 PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

33441 Both functions may be implemented as macros.

33442 **RETURN VALUE**33443 The *pthread_getspecific()* function shall return the thread-specific data value associated with the
33444 given *key*. If no thread-specific data value is associated with *key*, then the value NULL shall be
33445 returned.33446 If successful, the *pthread_setspecific()* function shall return zero; otherwise, an error number shall
33447 be returned to indicate the error.33448 **ERRORS**33449 No errors are returned from *pthread_getspecific()*.33450 The *pthread_setspecific()* function shall fail if:

33451 [ENOMEM] Insufficient memory exists to associate the value with the key.

33452 The *pthread_setspecific()* function may fail if:

33453 [EINVAL] The key value is invalid.

33454 These functions shall not return an error code of [EINTR].

33455 EXAMPLES

33456 None.

33457 APPLICATION USAGE

33458 None.

33459 RATIONALE

33460 Performance and ease-of-use of *pthread_getspecific()* are critical for functions that rely on
33461 maintaining state in thread-specific data. Since no errors are required to be detected by it, and
33462 since the only error that could be detected is the use of an invalid key, the function to
33463 *pthread_getspecific()* has been designed to favor speed and simplicity over error reporting.

33464 FUTURE DIRECTIONS

33465 None.

33466 SEE ALSO

33467 *pthread_key_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

33468 CHANGE HISTORY

33469 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33470 Issue 6

33471 The *pthread_getspecific()* and *pthread_setspecific()* functions are marked as part of the Threads
33472 option.

33473 IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.

33474 **NAME**

33475 pthread_join — wait for thread termination

33476 **SYNOPSIS**

33477 THR #include <pthread.h>

33478 int pthread_join(pthread_t thread, void **value_ptr);

33479

33480 **DESCRIPTION**

33481 The *pthread_join()* function shall suspend execution of the calling thread until the target *thread*
 33482 terminates, unless the target *thread* has already terminated. On return from a successful
 33483 *pthread_join()* call with a non-NULL *value_ptr* argument, the value passed to *pthread_exit()* by
 33484 the terminating thread shall be made available in the location referenced by *value_ptr*. When a
 33485 *pthread_join()* returns successfully, the target thread has been terminated. The results of multiple
 33486 simultaneous calls to *pthread_join()* specifying the same target thread are undefined. If the
 33487 thread calling *pthread_join()* is canceled, then the target thread shall not be detached.

33488 It is unspecified whether a thread that has exited but remains unjoined counts against
 33489 {PTHREAD_THREADS_MAX}.

33490 **RETURN VALUE**

33491 If successful, the *pthread_join()* function shall return zero; otherwise, an error number shall be
 33492 returned to indicate the error.

33493 **ERRORS**33494 The *pthread_join()* function shall fail if:

33495 [EINVAL] The implementation has detected that the value specified by *thread* does not
 33496 refer to a joinable thread.

33497 [ESRCH] No thread could be found corresponding to that specified by the given thread
 33498 ID.

33499 The *pthread_join()* function may fail if:

33500 [EDEADLK] A deadlock was detected or the value of *thread* specifies the calling thread.

33501 The *pthread_join()* function shall not return an error code of [EINTR].33502 **EXAMPLES**

33503 An example of thread creation and deletion follows:

```

33504 typedef struct {
33505     int *ar;
33506     long n;
33507 } subarray;

33508 void *
33509 incer(void *arg)
33510 {
33511     long i;

33512     for (i = 0; i < ((subarray *)arg)->n; i++)
33513         ((subarray *)arg)->ar[i]++;
33514 }

33515 int main(void)
33516 {
33517     int          ar[1000000];

```

```

33518         pthread_t  th1, th2;
33519         subarray   sb1, sb2;

33520         sb1.ar = &ar[0];
33521         sb1.n  = 500000;
33522         (void) pthread_create(&th1, NULL, incer, &sb1);

33523         sb2.ar = &ar[500000];
33524         sb2.n  = 500000;
33525         (void) pthread_create(&th2, NULL, incer, &sb2);

33526         (void) pthread_join(th1, NULL);
33527         (void) pthread_join(th2, NULL);
33528         return 0;
33529     }

```

33530 APPLICATION USAGE

33531 None.

33532 RATIONALE

33533 The *pthread_join()* function is a convenience that has proven useful in multi-threaded
 33534 applications. It is true that a programmer could simulate this function if it were not provided by
 33535 passing extra state as part of the argument to the *start_routine()*. The terminating thread would
 33536 set a flag to indicate termination and broadcast a condition that is part of that state; a joining
 33537 thread would wait on that condition variable. While such a technique would allow a thread to
 33538 wait on more complex conditions (for example, waiting for multiple threads to terminate),
 33539 waiting on individual thread termination is considered widely useful. Also, including the
 33540 *pthread_join()* function in no way precludes a programmer from coding such complex waits.
 33541 Thus, while not a primitive, including *pthread_join()* in this volume of IEEE Std 1003.1-2001 was
 33542 considered valuable.

33543 The *pthread_join()* function provides a simple mechanism allowing an application to wait for a
 33544 thread to terminate. After the thread terminates, the application may then choose to clean up
 33545 resources that were used by the thread. For instance, after *pthread_join()* returns, any
 33546 application-provided stack storage could be reclaimed.

33547 The *pthread_join()* or *pthread_detach()* function should eventually be called for every thread that
 33548 is created with the *detachstate* attribute set to *PTHREAD_CREATE_JOINABLE* so that storage
 33549 associated with the thread may be reclaimed.

33550 The interaction between *pthread_join()* and cancellation is well-defined for the following
 33551 reasons:

- 33552 • The *pthread_join()* function, like all other non-async-cancel-safe functions, can only be called
 33553 with deferred cancelability type.
- 33554 • Cancellation cannot occur in the disabled cancelability state.

33555 Thus, only the default cancelability state need be considered. As specified, either the
 33556 *pthread_join()* call is canceled, or it succeeds, but not both. The difference is obvious to the
 33557 application, since either a cancellation handler is run or *pthread_join()* returns. There are no race
 33558 conditions since *pthread_join()* was called in the deferred cancelability state.

33559 FUTURE DIRECTIONS

33560 None.

33561 **SEE ALSO**

33562 *pthread_create()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

33563 **CHANGE HISTORY**

33564 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33565 **Issue 6**

33566 The *pthread_join()* function is marked as part of the Threads option.

33567 **NAME**

33568 pthread_key_create — thread-specific data key creation

33569 **SYNOPSIS**33570 THR `#include <pthread.h>`33571 `int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));`

33572

33573 **DESCRIPTION**

33574 The *pthread_key_create()* function shall create a thread-specific data key visible to all threads in
 33575 the process. Key values provided by *pthread_key_create()* are opaque objects used to locate
 33576 thread-specific data. Although the same key value may be used by different threads, the values
 33577 bound to the key by *pthread_setspecific()* are maintained on a per-thread basis and persist for the
 33578 life of the calling thread.

33579 Upon key creation, the value NULL shall be associated with the new key in all active threads.
 33580 Upon thread creation, the value NULL shall be associated with all defined keys in the new
 33581 thread.

33582 An optional destructor function may be associated with each key value. At thread exit, if a key
 33583 value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with
 33584 that key, the value of the key is set to NULL, and then the function pointed to is called with the
 33585 previously associated value as its sole argument. The order of destructor calls is unspecified if
 33586 more than one destructor exists for a thread when it exits.

33587 If, after all the destructors have been called for all non-NULL values with associated destructors,
 33588 there are still some non-NULL values with associated destructors, then the process is repeated.
 33589 If, after at least {PTHREAD_DESTRUCTOR_ITERATIONS} iterations of destructor calls for
 33590 outstanding non-NULL values, there are still some non-NULL values with associated
 33591 destructors, implementations may stop calling destructors, or they may continue calling
 33592 destructors until no non-NULL values with associated destructors exist, even though this might
 33593 result in an infinite loop.

33594 **RETURN VALUE**

33595 If successful, the *pthread_key_create()* function shall store the newly created key value at **key* and
 33596 shall return zero. Otherwise, an error number shall be returned to indicate the error.

33597 **ERRORS**33598 The *pthread_key_create()* function shall fail if:

33599 [EAGAIN] The system lacked the necessary resources to create another thread-specific
 33600 data key, or the system-imposed limit on the total number of keys per process
 33601 {PTHREAD_KEYS_MAX} has been exceeded.

33602 [ENOMEM] Insufficient memory exists to create the key.

33603 The *pthread_key_create()* function shall not return an error code of [EINTR].

33604 **EXAMPLES**

33605 The following example demonstrates a function that initializes a thread-specific data key when
 33606 it is first called, and associates a thread-specific object with each calling thread, initializing this
 33607 object when necessary.

```

33608       static pthread_key_t key;
33609       static pthread_once_t key_once = PTHREAD_ONCE_INIT;

33610       static void
33611       make_key()
33612       {
33613           (void) pthread_key_create(&key, NULL);
33614       }

33615       func()
33616       {
33617           void *ptr;

33618           (void) pthread_once(&key_once, make_key);
33619           if ((ptr = pthread_getspecific(key)) == NULL) {
33620               ptr = malloc(OBJECT_SIZE);
33621               ...
33622               (void) pthread_setspecific(key, ptr);
33623           }
33624           ...
33625       }
```

33626 Note that the key has to be initialized before *pthread_getspecific()* or *pthread_setspecific()* can be
 33627 used. The *pthread_key_create()* call could either be explicitly made in a module initialization
 33628 routine, or it can be done implicitly by the first call to a module as in this example. Any attempt
 33629 to use the key before it is initialized is a programming error, making the code below incorrect.

```

33630       static pthread_key_t key;

33631       func()
33632       {
33633           void *ptr;

33634           /* KEY NOT INITIALIZED!!! THIS WON'T WORK!!! */
33635           if ((ptr = pthread_getspecific(key)) == NULL &&
33636               pthread_setspecific(key, NULL) != 0) {
33637               pthread_key_create(&key, NULL);
33638               ...
33639           }
33640       }
```

33641 **APPLICATION USAGE**

33642 None.

33643 **RATIONALE**33644 **Destructor Functions**

33645 Normally, the value bound to a key on behalf of a particular thread is a pointer to storage
 33646 allocated dynamically on behalf of the calling thread. The destructor functions specified with
 33647 *pthread_key_create()* are intended to be used to free this storage when the thread exits. Thread
 33648 cancellation cleanup handlers cannot be used for this purpose because thread-specific data may
 33649 persist outside the lexical scope in which the cancellation cleanup handlers operate.

33650 If the value associated with a key needs to be updated during the lifetime of the thread, it may
 33651 be necessary to release the storage associated with the old value before the new value is bound.
 33652 Although the *pthread_setspecific()* function could do this automatically, this feature is not needed
 33653 often enough to justify the added complexity. Instead, the programmer is responsible for freeing
 33654 the stale storage:

```
33655 pthread_getspecific(key, &old);
33656 new = allocate();
33657 destructor(old);
33658 pthread_setspecific(key, new);
```

33659 **Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such
 33660 problems occur in the default cancellation state if no cancellation points occur between the get
 33661 and set.

33662 There is no notion of a destructor-safe function. If an application does not call *pthread_exit()*
 33663 from a signal handler, or if it blocks any signal whose handler may call *pthread_exit()* while
 33664 calling async-unsafe functions, all functions may be safely called from destructors.

33665 **Non-Idempotent Data Key Creation**

33666 There were requests to make *pthread_key_create()* idempotent with respect to a given *key* address
 33667 parameter. This would allow applications to call *pthread_key_create()* multiple times for a given
 33668 *key* address and be guaranteed that only one key would be created. Doing so would require the
 33669 key value to be previously initialized (possibly at compile time) to a known null value and
 33670 would require that implicit mutual-exclusion be performed based on the address and contents of
 33671 the *key* parameter in order to guarantee that exactly one key would be created.

33672 Unfortunately, the implicit mutual-exclusion would not be limited to only *pthread_key_create()*.
 33673 On many implementations, implicit mutual-exclusion would also have to be performed by
 33674 *pthread_getspecific()* and *pthread_setspecific()* in order to guard against using incompletely stored
 33675 or not-yet-visible key values. This could significantly increase the cost of important operations,
 33676 particularly *pthread_getspecific()*.

33677 Thus, this proposal was rejected. The *pthread_key_create()* function performs no implicit
 33678 synchronization. It is the responsibility of the programmer to ensure that it is called exactly once
 33679 per key before use of the key. Several straightforward mechanisms can already be used to
 33680 accomplish this, including calling explicit module initialization functions, using mutexes, and
 33681 using *pthread_once()*. This places no significant burden on the programmer, introduces no
 33682 possibly confusing *ad hoc* implicit synchronization mechanism, and potentially allows
 33683 commonly used thread-specific data operations to be more efficient.

33684 **FUTURE DIRECTIONS**

33685 None.

33686 SEE ALSO

33688 **<pthread.h>**

33689 CHANGE HISTORY

33690 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33691 Issue 6

33692 The *pthread_key_create()* function is marked as part of the Threads option.

33693 IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.

33694 **NAME**

33695 pthread_key_delete — thread-specific data key deletion

33696 **SYNOPSIS**

33697 THR #include <pthread.h>

33698 int pthread_key_delete(pthread_key_t key);

33699

33700 **DESCRIPTION**

33701 The *pthread_key_delete()* function shall delete a thread-specific data key previously returned by
 33702 *pthread_key_create()*. The thread-specific data values associated with *key* need not be NULL at
 33703 the time *pthread_key_delete()* is called. It is the responsibility of the application to free any
 33704 application storage or perform any cleanup actions for data structures related to the deleted key
 33705 or associated thread-specific data in any threads; this cleanup can be done either before or after
 33706 *pthread_key_delete()* is called. Any attempt to use *key* following the call to *pthread_key_delete()*
 33707 results in undefined behavior.

33708 The *pthread_key_delete()* function shall be callable from within destructor functions. No
 33709 destructor functions shall be invoked by *pthread_key_delete()*. Any destructor function that may
 33710 have been associated with *key* shall no longer be called upon thread exit.

33711 **RETURN VALUE**

33712 If successful, the *pthread_key_delete()* function shall return zero; otherwise, an error number shall
 33713 be returned to indicate the error.

33714 **ERRORS**33715 The *pthread_key_delete()* function may fail if:33716 [EINVAL] The *key* value is invalid.33717 The *pthread_key_delete()* function shall not return an error code of [EINTR].33718 **EXAMPLES**

33719 None.

33720 **APPLICATION USAGE**

33721 None.

33722 **RATIONALE**

33723 A thread-specific data key deletion function has been included in order to allow the resources
 33724 associated with an unused thread-specific data key to be freed. Unused thread-specific data keys
 33725 can arise, among other scenarios, when a dynamically loaded module that allocated a key is
 33726 unloaded.

33727 Conforming applications are responsible for performing any cleanup actions needed for data
 33728 structures associated with the key to be deleted, including data referenced by thread-specific
 33729 data values. No such cleanup is done by *pthread_key_delete()*. In particular, destructor functions
 33730 are not called. There are several reasons for this division of responsibility:

- 33731 1. The associated destructor functions used to free thread-specific data at thread exit time are
 33732 only guaranteed to work correctly when called in the thread that allocated the thread-
 33733 specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot
 33734 be used to free thread-specific data in other threads at key deletion time. Attempting to
 33735 have them called by other threads at key deletion time would require other threads to be
 33736 asynchronously interrupted. But since interrupted threads could be in an arbitrary state,
 33737 including holding locks necessary for the destructor to run, this approach would fail. In
 33738 general, there is no safe mechanism whereby an implementation could free thread-specific
 33739 data at key deletion time.

33740 2. Even if there were a means of safely freeing thread-specific data associated with keys to be
33741 deleted, doing so would require that implementations be able to enumerate the threads
33742 with non-NULL data and potentially keep them from creating more thread-specific data
33743 while the key deletion is occurring. This special case could cause extra synchronization in
33744 the normal case, which would otherwise be unnecessary.

33745 For an application to know that it is safe to delete a key, it has to know that all the threads that
33746 might potentially ever use the key do not attempt to use it again. For example, it could know this
33747 if all the client threads have called a cleanup procedure declaring that they are through with the
33748 module that is being shut down, perhaps by setting a reference count to zero.

33749 **FUTURE DIRECTIONS**

33750 None.

33751 **SEE ALSO**

33752 *pthread_key_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

33753 **CHANGE HISTORY**

33754 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33755 **Issue 6**

33756 The *pthread_key_delete()* function is marked as part of the Threads option.

33757 **NAME**

33758 pthread_kill — send a signal to a thread

33759 **SYNOPSIS**

33760 THR #include <signal.h>

33761 int pthread_kill(pthread_t thread, int sig);

33762

33763 **DESCRIPTION**33764 The *pthread_kill()* function shall request that a signal be delivered to the specified thread.33765 As in *kill()*, if *sig* is zero, error checking shall be performed but no signal shall actually be sent.33766 **RETURN VALUE**33767 Upon successful completion, the function shall return a value of zero. Otherwise, the function
33768 shall return an error number. If the *pthread_kill()* function fails, no signal shall be sent.33769 **ERRORS**33770 The *pthread_kill()* function shall fail if:33771 [ESRCH] No thread could be found corresponding to that specified by the given thread
33772 ID.33773 [EINVAL] The value of the *sig* argument is an invalid or unsupported signal number.33774 The *pthread_kill()* function shall not return an error code of [EINTR].33775 **EXAMPLES**

33776 None.

33777 **APPLICATION USAGE**33778 The *pthread_kill()* function provides a mechanism for asynchronously directing a signal at a
33779 thread in the calling process. This could be used, for example, by one thread to affect broadcast
33780 delivery of a signal to a set of threads.33781 Note that *pthread_kill()* only causes the signal to be handled in the context of the given thread;
33782 the signal action (termination or stopping) affects the process as a whole.33783 **RATIONALE**

33784 None.

33785 **FUTURE DIRECTIONS**

33786 None.

33787 **SEE ALSO**33788 *kill()*, *pthread_self()*, *raise()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>33789 **CHANGE HISTORY**

33790 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

33791 **Issue 6**33792 The *pthread_kill()* function is marked as part of the Threads option.

33793 The APPLICATION USAGE section is added.

33794 **NAME**

33795 pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

33796 **SYNOPSIS**

33797 THR #include <pthread.h>

```

33798 int pthread_mutex_destroy(pthread_mutex_t *mutex);
33799 int pthread_mutex_init(pthread_mutex_t *restrict mutex,
33800     const pthread_mutexattr_t *restrict attr);
33801 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
33802

```

33803 **DESCRIPTION**

33804 The *pthread_mutex_destroy()* function shall destroy the mutex object referenced by *mutex*; the
 33805 mutex object becomes, in effect, uninitialized. An implementation may cause
 33806 *pthread_mutex_destroy()* to set the object referenced by *mutex* to an invalid value. A destroyed
 33807 mutex object can be reinitialized using *pthread_mutex_init()*; the results of otherwise referencing
 33808 the object after it has been destroyed are undefined.

33809 It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked
 33810 mutex results in undefined behavior.

33811 The *pthread_mutex_init()* function shall initialize the mutex referenced by *mutex* with attributes
 33812 specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the
 33813 same as passing the address of a default mutex attributes object. Upon successful initialization,
 33814 the state of the mutex becomes initialized and unlocked.

33815 Only *mutex* itself may be used for performing synchronization. The result of referring to copies
 33816 of *mutex* in calls to *pthread_mutex_lock()*, *pthread_mutex_trylock()*, *pthread_mutex_unlock()*, and
 33817 *pthread_mutex_destroy()* is undefined.

33818 Attempting to initialize an already initialized mutex results in undefined behavior.

33819 In cases where default mutex attributes are appropriate, the macro
 33820 PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes that are statically allocated.
 33821 The effect shall be equivalent to dynamic initialization by a call to *pthread_mutex_init()* with
 33822 parameter *attr* specified as NULL, except that no error checks are performed.

33823 **RETURN VALUE**

33824 If successful, the *pthread_mutex_destroy()* and *pthread_mutex_init()* functions shall return zero;
 33825 otherwise, an error number shall be returned to indicate the error.

33826 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed
 33827 immediately at the beginning of processing for the function and shall cause an error return prior
 33828 to modifying the state of the mutex specified by *mutex*.

33829 **ERRORS**

33830 The *pthread_mutex_destroy()* function may fail if:

33831 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 33832 by *mutex* while it is locked or referenced (for example, while being used in a
 33833 *pthread_cond_timedwait()* or *pthread_cond_wait()*) by another thread.

33834 [EINVAL] The value specified by *mutex* is invalid.

33835 The *pthread_mutex_init()* function shall fail if:

33836 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
 33837 another mutex.

- 33838 [ENOMEM] Insufficient memory exists to initialize the mutex.
- 33839 [EPERM] The caller does not have the privilege to perform the operation.
- 33840 The *pthread_mutex_init()* function may fail if:
- 33841 [EBUSY] The implementation has detected an attempt to reinitialize the object
33842 referenced by *mutex*, a previously initialized, but not yet destroyed, mutex.
- 33843 [EINVAL] The value specified by *attr* is invalid.
- 33844 These functions shall not return an error code of [EINTR].

33845 EXAMPLES

33846 None.

33847 APPLICATION USAGE

33848 None.

33849 RATIONALE**33850 Alternate Implementations Possible**

33851 This volume of IEEE Std 1003.1-2001 supports several alternative implementations of mutexes.
33852 An implementation may store the lock directly in the object of type **pthread_mutex_t**.
33853 Alternatively, an implementation may store the lock in the heap and merely store a pointer,
33854 handle, or unique ID in the mutex object. Either implementation has advantages or may be
33855 required on certain hardware configurations. So that portable code can be written that is
33856 invariant to this choice, this volume of IEEE Std 1003.1-2001 does not define assignment or
33857 equality for this type, and it uses the term “initialize” to reinforce the (more restrictive) notion
33858 that the lock may actually reside in the mutex object itself.

33859 Note that this precludes an over-specification of the type of the mutex or condition variable and
33860 motivates the opaqueness of the type.

33861 An implementation is permitted, but not required, to have *pthread_mutex_destroy()* store an
33862 illegal value into the mutex. This may help detect erroneous programs that try to lock (or
33863 otherwise reference) a mutex that has already been destroyed.

33864 Tradeoff Between Error Checks and Performance Supported

33865 Many of the error checks were made optional in order to let implementations trade off
33866 performance *versus* degree of error checking according to the needs of their specific applications
33867 and execution environment. As a general rule, errors or conditions caused by the system (such as
33868 insufficient memory) always need to be reported, but errors due to an erroneously coded
33869 application (such as failing to provide adequate synchronization to prevent a mutex from being
33870 deleted while in use) are made optional.

33871 A wide range of implementations is thus made possible. For example, an implementation
33872 intended for application debugging may implement all of the error checks, but an
33873 implementation running a single, provably correct application under very tight performance
33874 constraints in an embedded computer might implement minimal checks. An implementation
33875 might even be provided in two versions, similar to the options that compilers provide: a full-
33876 checking, but slower version; and a limited-checking, but faster version. To forbid this
33877 optionality would be a disservice to users.

33878 By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly
33879 coded) application might do, and by defining that resource-not-available errors are mandatory,
33880 this volume of IEEE Std 1003.1-2001 ensures that a fully-conforming application is portable

across the full range of implementations, while not forcing all implementations to add overhead to check for numerous things that a correct program never does.

Why No Limits are Defined

Defining symbols for the maximum number of mutexes and condition variables was considered but rejected because the number of these objects may change dynamically. Furthermore, many implementations place these objects into application memory; thus, there is no explicit maximum.

Static Initializers for Mutexes and Condition Variables

Providing for static initialization of statically allocated synchronization objects allows modules with private static synchronization variables to avoid runtime initialization tests and overhead. Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in C libraries, where for various reasons the design calls for self-initialization instead of requiring an explicit module initialization function to be called. An example use of static initialization follows.

Without static initialization, a self-initializing routine *foo()* might look as follows:

```
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;

void foo()
{
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

Note that the static initialization both eliminates the need for the initialization test inside *pthread_once()* and the fetch of *&foo_mutex* to learn the address to be passed to *pthread_mutex_lock()* or *pthread_mutex_unlock()*.

Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a large class of systems; those where the (entire) synchronization object can be stored in application memory.

Yet the locking performance question is likely to be raised for machines that require mutexes to be allocated out of special memory. Such machines actually have to have mutexes and possibly

condition variables contain pointers to the actual hardware locks. For static initialization to work on such machines, *pthread_mutex_lock()* also has to test whether or not the pointer to the actual lock has been allocated. If it has not, *pthread_mutex_lock()* has to initialize it before use. The reservation of such resources can be made when the program is loaded, and hence return codes have not been added to mutex locking and condition variable waiting to indicate failure to complete initialization.

This runtime test in *pthread_mutex_lock()* would at first seem to be extra work; an extra test is required to see whether the pointer has been initialized. On most machines this would actually be implemented as a fetch of the pointer, testing the pointer against zero, and then using the pointer if it has already been initialized. While the test might seem to add extra work, the extra effort of testing a register is usually negligible since no extra memory references are actually done. As more and more machines provide caches, the real expenses are memory references, not instructions executed.

Alternatively, depending on the machine architecture, there are often ways to eliminate *all* overhead in the most important case: on the lock operations that occur *after* the lock has been initialized. This can be done by shifting more overhead to the less frequent operation: initialization. Since out-of-line mutex allocation also means that an address has to be dereferenced to find the actual lock, one technique that is widely applicable is to have static initialization store a bogus value for that address; in particular, an address that causes a machine fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity checks can be done, and then the correct address for the actual lock can be filled in. Subsequent lock operations incur no extra overhead since they do not “fault”. This is merely one technique that can be used to support static initialization, while not adversely affecting the performance of lock acquisition. No doubt there are other techniques that are highly machine-dependent.

The locking overhead for machines doing out-of-line mutex allocation is thus similar for modules being implicitly initialized, where it is improved for those doing mutex allocation entirely inline. The inline case is thus made much faster, and the out-of-line case is not significantly worse.

Besides the issue of locking performance for such machines, a concern is raised that it is possible that threads would serialize contending for initialization locks when attempting to finish initializing statically allocated mutexes. (Such finishing would typically involve taking an internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing the internal lock.) First, many implementations would reduce such serialization by hashing on the mutex address. Second, such serialization can only occur a bounded number of times. In particular, it can happen at most as many times as there are statically allocated synchronization objects. Dynamically allocated objects would still be initialized via *pthread_mutex_init()* or *pthread_cond_init()*.

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient performance for an application on some implementation, the application can avoid static initialization altogether by explicitly initializing all synchronization objects with the corresponding *pthread_*_init()* functions, which are supported by all implementations. An implementation can also document the tradeoffs and advise which initialization technique is more efficient for that particular implementation.

Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. For example, consider the following code:

```
struct obj {
    pthread_mutex_t om;
    int refcnt;
    ...
};

obj_done(struct obj *op)
{
    pthread_mutex_lock(&op->om);
    if (--op->refcnt == 0) {
        pthread_mutex_unlock(&op->om);
        (A) pthread_mutex_destroy(&op->om);
        (B) free(op);
    } else
        (C) pthread_mutex_unlock(&op->om);
}
```

In this case *obj* is reference counted and *obj_done()* is called whenever a reference to the object is dropped. Implementations are required to allow an object to be destroyed and freed and potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line C).

FUTURE DIRECTIONS

None.

SEE ALSO

pthread_mutex_getprioceiling(), *pthread_mutex_lock()*, *pthread_mutex_timedlock()*, *pthread_mutexattr_getpshared()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The *pthread_mutex_destroy()* and *pthread_mutex_init()* functions are marked as part of the Threads option.

The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The **restrict** keyword is added to the *pthread_mutex_init()* prototype for alignment with the ISO/IEC 9899:1999 standard.

34006 NAME

34007 pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling
 34008 of a mutex (**REALTIME THREADS**)

34009 SYNOPSIS

34010 THR TPP #include <pthread.h>

```
34011 int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex,
34012 int *restrict prioceiling);
34013 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
34014 int prioceiling, int *restrict old_ceiling);
34015
```

34016 DESCRIPTION

34017 The *pthread_mutex_getprioceiling()* function shall return the current priority ceiling of the mutex.

34018 The *pthread_mutex_setprioceiling()* function shall either lock the mutex if it is unlocked, or block
 34019 until it can successfully lock the mutex, then it shall change the mutex's priority ceiling and
 34020 release the mutex. When the change is successful, the previous value of the priority ceiling shall
 34021 be returned in *old_ceiling*. The process of locking the mutex need not adhere to the priority
 34022 protect protocol.

34023 If the *pthread_mutex_setprioceiling()* function fails, the mutex priority ceiling shall not be
 34024 changed.

34025 RETURN VALUE

34026 If successful, the *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions shall
 34027 return zero; otherwise, an error number shall be returned to indicate the error.

34028 ERRORS

34029 The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions may fail if:

- 34030 [EINVAL] The priority requested by *prioceiling* is out of range.
- 34031 [EINVAL] The value specified by *mutex* does not refer to a currently existing mutex.
- 34032 [EPERM] The caller does not have the privilege to perform the operation.
- 34033 These functions shall not return an error code of [EINTR].

34034 EXAMPLES

34035 None.

34036 APPLICATION USAGE

34037 None.

34038 RATIONALE

34039 None.

34040 FUTURE DIRECTIONS

34042 SEE ALSO

34043 *pthread_mutex_destroy()*, *pthread_mutex_lock()*, *pthread_mutex_timedlock()*, the Base Definitions
 34044 volume of IEEE Std 1003.1-2001, <**pthread.h**>

34045 CHANGE HISTORY

- 34046 First released in Issue 5. Included for alignment with the POSIX Threads Extension.
- 34047 Marked as part of the Realtime Threads Feature Group.

Issue 6

The *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* functions are marked as part of the Threads and Thread Priority Protection options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

The [ENOSYS] error denoting non-support of the priority ceiling protocol for mutexes has been removed. This is because if the implementation provides the functions (regardless of whether `_POSIX_PTHREAD_PRIO_PROTECT` is defined), they must function as in the DESCRIPTION and therefore the priority ceiling protocol for mutexes is supported.

The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The **restrict** keyword is added to the *pthread_mutex_getprioceiling()* and *pthread_mutex_setprioceiling()* prototypes for alignment with the ISO / IEC 9899:1999 standard.

34061 **NAME**

34062 pthread_mutex_init — initialize a mutex

34063 **SYNOPSIS**

34064 THR #include <pthread.h>

34065 int pthread_mutex_init(pthread_mutex_t *restrict mutex,

34066 const pthread_mutexattr_t *restrict attr);

34067 pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;

34068

34069 **DESCRIPTION**34070 Refer to *pthread_mutex_destroy()*.

34071 **NAME**

34072 pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a
 34073 mutex

34074 **SYNOPSIS**

34075 THR #include <pthread.h>

```
34076 int pthread_mutex_lock(pthread_mutex_t *mutex);
34077 int pthread_mutex_trylock(pthread_mutex_t *mutex);
34078 int pthread_mutex_unlock(pthread_mutex_t *mutex);
34079
```

34080 **DESCRIPTION**

34081 The mutex object referenced by *mutex* shall be locked by calling *pthread_mutex_lock()*. If the
 34082 mutex is already locked, the calling thread shall block until the mutex becomes available. This
 34083 operation shall return with the mutex object referenced by *mutex* in the locked state with the
 34084 calling thread as its owner.

34085 XSI If the mutex type is PTHREAD_MUTEX_NORMAL, deadlock detection shall not be provided.
 34086 Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it
 34087 has not locked or a mutex which is unlocked, undefined behavior results.

34088 If the mutex type is PTHREAD_MUTEX_ERRORCHECK, then error checking shall be provided.
 34089 If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a
 34090 thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error
 34091 shall be returned.

34092 If the mutex type is PTHREAD_MUTEX_RECURSIVE, then the mutex shall maintain the
 34093 concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock
 34094 count shall be set to one. Every time a thread relocks this mutex, the lock count shall be
 34095 incremented by one. Each time the thread unlocks the mutex, the lock count shall be
 34096 decremented by one. When the lock count reaches zero, the mutex shall become available for
 34097 other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex
 34098 which is unlocked, an error shall be returned.

34099 If the mutex type is PTHREAD_MUTEX_DEFAULT, attempting to recursively lock the mutex
 34100 results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling
 34101 thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in
 34102 undefined behavior.

34103 The *pthread_mutex_trylock()* function shall be equivalent to *pthread_mutex_lock()*, except that if
 34104 the mutex object referenced by *mutex* is currently locked (by any thread, including the current
 34105 thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE
 34106 and the mutex is currently owned by the calling thread, the mutex lock count shall be
 34107 incremented by one and the *pthread_mutex_trylock()* function shall immediately return success.

34108 XSI The *pthread_mutex_unlock()* function shall release the mutex object referenced by *mutex*. The
 34109 manner in which a mutex is released is dependent upon the mutex's type attribute. If there are
 34110 threads blocked on the mutex object referenced by *mutex* when *pthread_mutex_unlock()* is called,
 34111 resulting in the mutex becoming available, the scheduling policy shall determine which thread
 34112 shall acquire the mutex.

34113 XSI (In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available
 34114 when the count reaches zero and the calling thread no longer has any locks on this mutex.)

34115 If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the
 34116 thread shall resume waiting for the mutex as if it was not interrupted.

34117 RETURN VALUE

34118 If successful, the *pthread_mutex_lock()* and *pthread_mutex_unlock()* functions shall return zero;
 34119 otherwise, an error number shall be returned to indicate the error.

34120 The *pthread_mutex_trylock()* function shall return zero if a lock on the mutex object referenced by
 34121 *mutex* is acquired. Otherwise, an error number is returned to indicate the error.

34122 ERRORS

34123 The *pthread_mutex_lock()* and *pthread_mutex_trylock()* functions shall fail if:

34124 [EINVAL] The *mutex* was created with the protocol attribute having the value
 34125 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
 34126 the mutex's current priority ceiling.

34127 The *pthread_mutex_trylock()* function shall fail if:

34128 [EBUSY] The *mutex* could not be acquired because it was already locked.

34129 The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions may
 34130 fail if:

34131 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.

34132 xsi [EAGAIN] The mutex could not be acquired because the maximum number of recursive
 34133 locks for *mutex* has been exceeded.

34134 The *pthread_mutex_lock()* function may fail if:

34135 [EDEADLK] The current thread already owns the mutex.

34136 The *pthread_mutex_unlock()* function may fail if:

34137 [EPERM] The current thread does not own the mutex.

34138 These functions shall not return an error code of [EINTR].

34139 EXAMPLES

34140 None.

34141 APPLICATION USAGE

34142 None.

34143 RATIONALE

34144 Mutex objects are intended to serve as a low-level primitive from which other thread
 34145 synchronization functions can be built. As such, the implementation of mutexes should be as
 34146 efficient as possible, and this has ramifications on the features available at the interface.

34147 The mutex functions and the particular default settings of the mutex attributes have been
 34148 motivated by the desire to not preclude fast, inlined implementations of mutex locking and
 34149 unlocking.

34150 For example, deadlocking on a double-lock is explicitly allowed behavior in order to avoid
 34151 requiring more overhead in the basic mechanism than is absolutely necessary. (More “friendly”
 34152 mutexes that detect deadlock or that allow multiple locking by the same thread are easily
 34153 constructed by the user via the other mechanisms provided. For example, *pthread_self()* can be
 34154 used to record mutex ownership.) Implementations might also choose to provide such extended
 34155 features as options via special mutex attributes.

34156 Since most attributes only need to be checked when a thread is going to be blocked, the use of
 34157 attributes does not slow the (common) mutex-locking case.

34158 Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it
34159 would require storing the current thread ID when each mutex is locked, and this could incur
34160 unacceptable levels of overhead. Similar arguments apply to a *mutex_tryunlock* operation.

34161 FUTURE DIRECTIONS

34162 None.

34163 SEE ALSO

34164 *pthread_mutex_destroy()*, *pthread_mutex_timedlock()*, the Base Definitions volume of
34165 IEEE Std 1003.1-2001, <pthread.h>

34166 CHANGE HISTORY

34167 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34168 Issue 6

34169 The *pthread_mutex_lock()*, *pthread_mutex_trylock()*, and *pthread_mutex_unlock()* functions are
34170 marked as part of the Threads option.

34171 The following new requirements on POSIX implementations derive from alignment with the
34172 Single UNIX Specification:

- 34173 • The behavior when attempting to relock a mutex is defined.

34174 The *pthread_mutex_timedlock()* function is added to the SEE ALSO section for alignment with
34175 IEEE Std 1003.1d-1999.

34176 **NAME**

34177 pthread_mutex_setprioceiling — change the priority ceiling of a mutex (**REALTIME**
34178 **THREADS**)

34179 **SYNOPSIS**

34180 THR TPP #include <pthread.h>

34181 int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
34182 int prioceiling, int *restrict old_ceiling);

34183

34184 **DESCRIPTION**

34185 Refer to *pthread_mutex_getprioceiling()*.

34186 **NAME**34187 pthread_mutex_timedlock — lock a mutex (**ADVANCED REALTIME**)34188 **SYNOPSIS**

34189 THR TMO #include <pthread.h>

34190 #include <time.h>

```
34191 int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
34192     const struct timespec *restrict abs_timeout);
```

34193

34194 **DESCRIPTION**

34195 The *pthread_mutex_timedlock()* function shall lock the mutex object referenced by *mutex*. If the
 34196 mutex is already locked, the calling thread shall block until the mutex becomes available as in
 34197 the *pthread_mutex_lock()* function. If the mutex cannot be locked without waiting for another
 34198 thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

34199 The timeout shall expire when the absolute time specified by *abs_timeout* passes, as measured by
 34200 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 34201 *abs_timeout*), or if the absolute time specified by *abs_timeout* has already been passed at the time
 34202 of the call.

34203 TMR If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
 34204 the Timers option is not supported, the timeout shall be based on the system clock as returned
 34205 by the *time()* function.

34206 The resolution of the timeout shall be the resolution of the clock on which it is based. The
 34207 **timespec** data type is defined in the <time.h> header.

34208 Under no circumstance shall the function fail with a timeout if the mutex can be locked
 34209 immediately. The validity of the *abs_timeout* parameter need not be checked if the mutex can be
 34210 locked immediately.

34211 As a consequence of the priority inheritance rules (for mutexes initialized with the
 34212 PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the
 34213 priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this
 34214 thread is no longer among the threads waiting for the mutex.

34215 **RETURN VALUE**

34216 If successful, the *pthread_mutex_timedlock()* function shall return zero; otherwise, an error
 34217 number shall be returned to indicate the error.

34218 **ERRORS**

34219 The *pthread_mutex_timedlock()* function shall fail if:

34220 [EINVAL] The mutex was created with the protocol attribute having the value
 34221 PTHREAD_PRIO_PROTECT and the calling thread's priority is higher than
 34222 the mutex' current priority ceiling.

34223 [EINVAL] The process or thread would have blocked, and the *abs_timeout* parameter
 34224 specified a nanoseconds field value less than zero or greater than or equal to
 34225 1 000 million.

34226 [ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

34227 The *pthread_mutex_timedlock()* function may fail if:

34228 [EINVAL] The value specified by *mutex* does not refer to an initialized mutex object.

34229 xSI [EAGAIN] The mutex could not be acquired because the maximum number of recursive
34230 locks for *mutex* has been exceeded.

34231 [EDEADLK] The current thread already owns the mutex.

34232 This function shall not return an error code of [EINTR].

34233 **EXAMPLES**

34234 None.

34235 **APPLICATION USAGE**

34236 The *pthread_mutex_timedlock()* function is part of the Threads and Timeouts options and need
34237 not be provided on all implementations.

34238 **RATIONALE**

34239 None.

34240 **FUTURE DIRECTIONS**

34247 NAME

34248 pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

34249 SYNOPSIS

34250 THR `#include <pthread.h>`

34251 `int pthread_mutex_trylock(pthread_mutex_t *mutex);`

34252 `int pthread_mutex_unlock(pthread_mutex_t *mutex);`

34253

34254 DESCRIPTION

34255 Refer to *pthread_mutex_lock()*.

34256 NAME

34257 pthread_mutexattr_destroy, pthread_mutexattr_init — destroy and initialize the mutex
 34258 attributes object

34259 SYNOPSIS

34260 THR #include <pthread.h>

34261 int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);

34262 int pthread_mutexattr_init(pthread_mutexattr_t *attr);

34263

34264 DESCRIPTION

34265 The *pthread_mutexattr_destroy()* function shall destroy a mutex attributes object; the object
 34266 becomes, in effect, uninitialized. An implementation may cause *pthread_mutexattr_destroy()* to
 34267 set the object referenced by *attr* to an invalid value. A destroyed *attr* attributes object can be
 34268 reinitialized using *pthread_mutexattr_init()*; the results of otherwise referencing the object after it
 34269 has been destroyed are undefined.

34270 The *pthread_mutexattr_init()* function shall initialize a mutex attributes object *attr* with the
 34271 default value for all of the attributes defined by the implementation.

34272 Results are undefined if *pthread_mutexattr_init()* is called specifying an already initialized *attr*
 34273 attributes object.

34274 After a mutex attributes object has been used to initialize one or more mutexes, any function
 34275 affecting the attributes object (including destruction) shall not affect any previously initialized
 34276 mutexes.

34277 RETURN VALUE

34278 Upon successful completion, *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* shall
 34279 return zero; otherwise, an error number shall be returned to indicate the error.

34280 ERRORS

34281 The *pthread_mutexattr_destroy()* function may fail if:

34282 [EINVAL] The value specified by *attr* is invalid.

34283 The *pthread_mutexattr_init()* function shall fail if:

34284 [ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

34285 These functions shall not return an error code of [EINTR].

34286 EXAMPLES

34287 None.

34288 APPLICATION USAGE

34289 None.

34290 RATIONALE

34291 See *pthread_attr_init()* for a general explanation of attributes. Attributes objects allow
 34292 implementations to experiment with useful extensions and permit extension of this volume of
 34293 IEEE Std 1003.1-2001 without changing the existing functions. Thus, they provide for future
 34294 extensibility of this volume of IEEE Std 1003.1-2001 and reduce the temptation to standardize
 34295 prematurely on semantics that are not yet widely implemented or understood.

34296 Examples of possible additional mutex attributes that have been discussed are *spin_only*,
 34297 *limited_spin*, *no_spin*, *recursive*, and *metered*. (To explain what the latter attributes might mean:
 34298 recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes
 34299 would transparently keep records of queue length, wait time, and so on.) Since there is not yet

wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of IEEE Std 1003.1-2001. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

Mutex Attributes and Performance

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the “slow path” as if the mutex were unavailable; then, on the slow path, the implementation can do the “real work” to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered “most frequently used” can be processed most efficiently.

Process Shared Memory and Synchronization

The existence of memory mapping functions in this volume of IEEE Std 1003.1-2001 leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```
/* sem.h */
struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};
typedef struct semaphore semaphore_t;

semaphore_t *semaphore_create(char *semaphore_name);
semaphore_t *semaphore_open(char *semaphore_name);
```

```

34346 void semaphore_post(semaphore_t *semap);
34347 void semaphore_wait(semaphore_t *semap);

34469 CHANGE HISTORY

34470 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34471 Issue 6

34472 The *pthread_mutexattr_destroy()* and *pthread_mutexattr_init()* functions are marked as part of the
34473 Threads option.

34474 IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.

34475 **NAME**

34476 pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling — get and set the
 34477 prioceiling attribute of the mutex attributes object (**REALTIME THREADS**)

34478 **SYNOPSIS**

34479 THR TPP #include <pthread.h>

```
34480 int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t *
34481     restrict attr, int *restrict prioceiling);
34482 int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr,
34483     int prioceiling);
```

34485 **DESCRIPTION**

34486 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions,
 34487 respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to
 34488 by *attr* which was previously created by the function *pthread_mutexattr_init()*.

34489 The *prioceiling* attribute contains the priority ceiling of initialized mutexes. The values of
 34490 *prioceiling* are within the maximum range of priorities defined by SCHED_FIFO.

34491 The *prioceiling* attribute defines the priority ceiling of initialized mutexes, which is the minimum
 34492 priority level at which the critical section guarded by the mutex is executed. In order to avoid
 34493 priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal
 34494 to the highest priority of all the threads that may lock that mutex. The values of *prioceiling* are
 34495 within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

34496 **RETURN VALUE**

34497 Upon successful completion, the *pthread_mutexattr_getprioceiling()* and
 34498 *pthread_mutexattr_setprioceiling()* functions shall return zero; otherwise, an error number shall be
 34499 returned to indicate the error.

34500 **ERRORS**

34501 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions may fail if:

34502 [EINVAL] The value specified by *attr* or *prioceiling* is invalid.

34503 [EPERM] The caller does not have the privilege to perform the operation.

34504 These functions shall not return an error code of [EINTR].

CHANGE HISTORY

34517 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34518 Marked as part of the Realtime Threads Feature Group.

Issue 6

34520 The *pthread_mutexattr_getprioceiling()* and *pthread_mutexattr_setprioceiling()* functions are marked as part of the Threads and Thread Priority Protection options.

34522 The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

34524 The [ENOTSUP] error condition has been removed since these functions do not have a *protocol* argument.

34526 The **restrict** keyword is added to the *pthread_mutexattr_getprioceiling()* prototype for alignment with the ISO / IEC 9899:1999 standard.

34528 **NAME**

34529 pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol — get and set the protocol
 34530 attribute of the mutex attributes object (**REALTIME THREADS**)

34531 **SYNOPSIS**

34532 THR #include <pthread.h>

34533 TPP|TPI int pthread_mutexattr_getprotocol(const pthread_mutexattr_t *
 34534 restrict attr, int *restrict protocol);
 34535 int pthread_mutexattr_setprotocol(pthread_mutexattr_t *attr,
 34536 int protocol);
 34537

34538 **DESCRIPTION**

34539 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions, respectively,
 34540 shall get and set the protocol attribute of a mutex attributes object pointed to by *attr* which was
 34541 previously created by the function *pthread_mutexattr_init()*.

34542 The *protocol* attribute defines the protocol to be followed in utilizing mutexes. The value of
 34543 *protocol* may be one of:

34544 PTHREAD_PRIO_NONE
 34545 TPI PTHREAD_PRIO_INHERIT
 34546 TPP PTHREAD_PRIO_PROTECT
 34547

34548 which are defined in the <pthread.h> header.

34549 When a thread owns a mutex with the PTHREAD_PRIO_NONE *protocol* attribute, its priority
 34550 and scheduling shall not be affected by its mutex ownership.

34551 TPI When a thread is blocking higher priority threads because of owning one or more mutexes with
 34552 the PTHREAD_PRIO_INHERIT *protocol* attribute, it shall execute at the higher of its priority or
 34553 the priority of the highest priority thread waiting on any of the mutexes owned by this thread
 34554 and initialized with this protocol.

34555 TPP When a thread owns one or more mutexes initialized with the PTHREAD_PRIO_PROTECT
 34556 protocol, it shall execute at the higher of its priority or the highest of the priority ceilings of all
 34557 the mutexes owned by this thread and initialized with this attribute, regardless of whether other
 34558 threads are blocked on any of these mutexes or not.

34559 While a thread is holding a mutex which has been initialized with the
 34560 PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT protocol attributes, it shall not be
 34561 subject to being moved to the tail of the scheduling queue at its priority in the event that its
 34562 original priority is changed, such as by a call to *sched_setparam()*. Likewise, when a thread
 34563 unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or
 34564 PTHREAD_PRIO_PROTECT protocol attributes, it shall not be subject to being moved to the tail
 34565 of the scheduling queue at its priority in the event that its original priority is changed.

34566 If a thread simultaneously owns several mutexes initialized with different protocols, it shall
 34567 execute at the highest of the priorities that it would have obtained by each of these protocols.

34568 TPI When a thread makes a call to *pthread_mutex_lock()*, the mutex was initialized with the protocol
 34569 attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked
 34570 because the mutex is owned by another thread, that owner thread shall inherit the priority level
 34571 of the calling thread as long as it continues to own the mutex. The implementation shall update
 34572 its execution priority to the maximum of its assigned priority and all its inherited priorities.
 34573 Furthermore, if this owner thread itself becomes blocked on another mutex, the same priority

34574 inheritance effect shall be propagated to this other owner thread, in a recursive manner.

34575 RETURN VALUE

34576 Upon successful completion, the *pthread_mutexattr_getprotocol()* and
34577 *pthread_mutexattr_setprotocol()* functions shall return zero; otherwise, an error number shall be
34578 returned to indicate the error.

34579 ERRORS

34580 The *pthread_mutexattr_setprotocol()* function shall fail if:

34581 [ENOTSUP] The value specified by *protocol* is an unsupported value.

34582 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions may fail if:

34583 [EINVAL] The value specified by *attr* or *protocol* is invalid.

34584 [EPERM] The caller does not have the privilege to perform the operation.

34585 These functions shall not return an error code of [EINTR].

34586 EXAMPLES

34596 IEEE Std 1003.1-2001, <pthread.h>

34597 CHANGE HISTORY

34598 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34599 Marked as part of the Realtime Threads Feature Group.

34600 Issue 6

34601 The *pthread_mutexattr_getprotocol()* and *pthread_mutexattr_setprotocol()* functions are marked as
34602 part of the Threads option and either the Thread Priority Protection or Thread Priority
34603 Inheritance options.

34604 The [ENOSYS] error condition has been removed as stubs need not be provided if an
34605 implementation does not support the Thread Priority Protection or Thread Priority Inheritance
34606 options.

34607 The **restrict** keyword is added to the *pthread_mutexattr_getprotocol()* prototype for alignment
34608 with the ISO / IEC 9899:1999 standard.

34609 **NAME**

34610 pthread_mutexattr_getpshared, pthread_mutexattr_setpshared — get and set the process-
 34611 shared attribute

34612 **SYNOPSIS**

34613 THR TSH #include <pthread.h>

```
34614 int pthread_mutexattr_getpshared(const pthread_mutexattr_t *
34615     restrict attr, int *restrict pshared);
34616 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,
34617     int pshared);
34618
```

34619 **DESCRIPTION**

34620 The *pthread_mutexattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 34621 from the attributes object referenced by *attr*. The *pthread_mutexattr_setpshared()* function shall
 34622 set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

34623 The *process-shared* attribute is set to PTHREAD_PROCESS_SHARED to permit a mutex to be
 34624 operated upon by any thread that has access to the memory where the mutex is allocated, even if
 34625 the mutex is allocated in memory that is shared by multiple processes. If the *process-shared*
 34626 attribute is PTHREAD_PROCESS_PRIVATE, the mutex shall only be operated upon by threads
 34627 created within the same process as the thread that initialized the mutex; if threads of differing
 34628 processes attempt to operate on such a mutex, the behavior is undefined. The default value of
 34629 the attribute shall be PTHREAD_PROCESS_PRIVATE.

34630 **RETURN VALUE**

34631 Upon successful completion, *pthread_mutexattr_setpshared()* shall return zero; otherwise, an error
 34632 number shall be returned to indicate the error.

34633 Upon successful completion, *pthread_mutexattr_getpshared()* shall return zero and store the value
 34634 of the *process-shared* attribute of *attr* into the object referenced by the *pshared* parameter.
 34635 Otherwise, an error number shall be returned to indicate the error.

34636 **ERRORS**

34637 The *pthread_mutexattr_getpshared()* and *pthread_mutexattr_setpshared()* functions may fail if:

34638 [EINVAL] The value specified by *attr* is invalid.

34639 The *pthread_mutexattr_setpshared()* function may fail if:

34640 [EINVAL] The new value specified for the attribute is outside the range of legal values
 34641 for that attribute.

34642 These functions shall not return an error code of [EINTR].

34643 **EXAMPLES**

34644 None.

34645 **APPLICATION USAGE**

34646 None.

34647 **RATIONALE**

34648 None.

34649 **FUTURE DIRECTIONS**

34650 None.

34651 **SEE ALSO**

34652 *pthread_cond_destroy()*, *pthread_create()*, *pthread_mutex_destroy()*, *pthread_mutexattr_destroy()*, the
34653 Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

34654 **CHANGE HISTORY**

34655 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34656 **Issue 6**

34657 The *pthread_mutexattr_getpshared()* and *pthread_mutexattr_setpshared()* functions are marked as
34658 part of the Threads and Thread Process-Shared Synchronization options.

34659 The **restrict** keyword is added to the *pthread_mutexattr_getpshared()* prototype for alignment
34660 with the ISO / IEC 9899:1999 standard.

34661 **NAME**

34662 pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

34663 **SYNOPSIS**34664 XSI

```
#include <pthread.h>
```

34665

```
int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,  
34666 int *restrict type);
```

34667

```
int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

34668

34669 **DESCRIPTION**34670 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions, respectively, shall get
34671 and set the mutex *type* attribute. This attribute is set in the *type* parameter to these functions. The
34672 default value of the *type* attribute is PTHREAD_MUTEX_DEFAULT.34673 The type of mutex is contained in the *type* attribute of the mutex attributes. Valid mutex types
34674 include:

34675 PTHREAD_MUTEX_NORMAL

34676 This type of mutex does not detect deadlock. A thread attempting to relock this mutex
34677 without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a
34678 different thread results in undefined behavior. Attempting to unlock an unlocked mutex
34679 results in undefined behavior.

34680 PTHREAD_MUTEX_ERRORCHECK

34681 This type of mutex provides error checking. A thread attempting to relock this mutex
34682 without first unlocking it shall return with an error. A thread attempting to unlock a mutex
34683 which another thread has locked shall return with an error. A thread attempting to unlock
34684 an unlocked mutex shall return with an error.

34685 PTHREAD_MUTEX_RECURSIVE

34686 A thread attempting to relock this mutex without first unlocking it shall succeed in locking
34687 the mutex. The relocking deadlock which can occur with mutexes of type
34688 PTHREAD_MUTEX_NORMAL cannot occur with this type of mutex. Multiple locks of this
34689 mutex shall require the same number of unlocks to release the mutex before another thread
34690 can acquire the mutex. A thread attempting to unlock a mutex which another thread has
34691 locked shall return with an error. A thread attempting to unlock an unlocked mutex shall
34692 return with an error.

34693 PTHREAD_MUTEX_DEFAULT

34694 Attempting to recursively lock a mutex of this type results in undefined behavior.
34695 Attempting to unlock a mutex of this type which was not locked by the calling thread
34696 results in undefined behavior. Attempting to unlock a mutex of this type which is not
34697 locked results in undefined behavior. An implementation may map this mutex to one of the
34698 other mutex types.34699 **RETURN VALUE**34700 Upon successful completion, the *pthread_mutexattr_gettype()* function shall return zero and store
34701 the value of the *type* attribute of *attr* into the object referenced by the *type* parameter. Otherwise,
34702 an error shall be returned to indicate the error.34703 If successful, the *pthread_mutexattr_settype()* function shall return zero; otherwise, an error
34704 number shall be returned to indicate the error.

34705 **ERRORS**

34706 The *pthread_mutexattr_settype()* function shall fail if:

34707 [EINVAL] The value *type* is invalid.

34708 The *pthread_mutexattr_gettype()* and *pthread_mutexattr_settype()* functions may fail if:

34709 [EINVAL] The value specified by *attr* is invalid.

34710 These functions shall not return an error code of [EINTR].

34711 **EXAMPLES**

34712 None.

34713 **APPLICATION USAGE**

34714 It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with
34715 condition variables because the implicit unlock performed for a *pthread_cond_timedwait()* or
34716 *pthread_cond_wait()* may not actually release the mutex (if it had been locked multiple times). If
34717 this happens, no other thread can satisfy the condition of the predicate.

34718 **RATIONALE**

34719 None.

34720 **FUTURE DIRECTIONS**

34721 None.

34722 **SEE ALSO**

34723 *pthread_cond_timedwait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

34724 **CHANGE HISTORY**

34725 First released in Issue 5.

34726 **Issue 6**

34727 The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for
34728 *pthread_mutexattr_gettype()* is updated so that the first argument is of type **const**
34729 **pthread_mutexattr_t***.

34730 The **restrict** keyword is added to the *pthread_mutexattr_gettype()* prototype for alignment with
34731 the ISO / IEC 9899:1999 standard.

34757

34758 DESCRIPTION

34759 Refer to *pthread_mutexattr_getprotocol()*.

34760 **NAME**

34761 pthread_mutexattr_setpshared — set the process-shared attribute

34762 **SYNOPSIS**34763 THR TSH `#include <pthread.h>`

```
34764 int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr,  
34765 int pshared);
```

34766

34767 **DESCRIPTION**34768 Refer to *pthread_mutexattr_getpshared()*.

34769 NAME

34770 pthread_mutexattr_settype — set the mutex type attribute

34771 SYNOPSIS

34772 xSI `#include <pthread.h>`

34773 `int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);`

34774

34775 DESCRIPTION

34776 Refer to *pthread_mutexattr_gettype()*.

34777 **NAME**

34778 pthread_once — dynamic package initialization

34779 **SYNOPSIS**

```
34780 THR    #include <pthread.h>

34781        int pthread_once(pthread_once_t *once_control,
34782                          void (*init_routine)(void));
34783        pthread_once_t once_control = PTHREAD_ONCE_INIT;
34784
```

34785 **DESCRIPTION**

34786 The first call to *pthread_once()* by any thread in a process, with a given *once_control*, shall call the
 34787 *init_routine* with no arguments. Subsequent calls of *pthread_once()* with the same *once_control*
 34788 shall not call the *init_routine*. On return from *pthread_once()*, *init_routine* shall have completed.
 34789 The *once_control* parameter shall determine whether the associated initialization routine has
 34790 been called.

34791 The *pthread_once()* function is not a cancellation point. However, if *init_routine* is a cancellation
 34792 point and is canceled, the effect on *once_control* shall be as if *pthread_once()* was never called.

34793 The constant PTHREAD_ONCE_INIT is defined in the **<pthread.h>** header.

34794 The behavior of *pthread_once()* is undefined if *once_control* has automatic storage duration or is
 34795 not initialized by PTHREAD_ONCE_INIT.

34796 **RETURN VALUE**

34797 Upon successful completion, *pthread_once()* shall return zero; otherwise, an error number shall
 34798 be returned to indicate the error.

34799 **ERRORS**

34800 The *pthread_once()* function may fail if:

34801 [EINVAL] If either *once_control* or *init_routine* is invalid.

34802 The *pthread_once()* function shall not return an error code of [EINTR].

34803 **EXAMPLES**

34804 None.

34805 **APPLICATION USAGE**

34806 None.

34807 **RATIONALE**

34808 Some C libraries are designed for dynamic initialization. That is, the global initialization for the
 34809 library is performed when the first procedure in the library is called. In a single-threaded
 34810 program, this is normally implemented using a static variable whose value is checked on entry
 34811 to a routine, as follows:

```
34812 static int random_is_initialized = 0;
34813 extern int initialize_random();

34814 int random_function()
34815 {
34816     if (random_is_initialized == 0) {
34817         initialize_random();
34818         random_is_initialized = 1;
34819     }
34820     ... /* Operations performed after initialization. */
34821 }
```

34822 To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise,
34823 library initialization has to be accomplished by an explicit call to a library-exported initialization
34824 function prior to any use of the library.

34825 For dynamic library initialization in a multi-threaded process, a simple initialization flag is not
34826 sufficient; the flag needs to be protected against modification by multiple threads
34827 simultaneously calling into the library. Protecting the flag requires the use of a mutex; however,
34828 mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized
34829 once requires a recursive solution to this problem.

34830 The use of *pthread_once()* not only supplies an implementation-guaranteed means of dynamic
34831 initialization, it provides an aid to the reliable construction of multi-threaded and realtime
34832 systems. The preceding example then becomes:

```
34833 #include <pthread.h>
34834 static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
34835 extern int initialize_random();

34836 int random_function()
34837 {
34838     (void) pthread_once(&random_is_initialized, initialize_random);
34839     ... /* Operations performed after initialization. */
34840 }
```

34841 Note that a **pthread_once_t** cannot be an array because some compilers do not accept the
34842 construct **&<array_name>**.

34843 FUTURE DIRECTIONS

34844 None.

34845 SEE ALSO

34846 The Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**

34847 CHANGE HISTORY

34848 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

34849 Issue 6

34850 The *pthread_once()* function is marked as part of the Threads option.

34851 The [EINVAL] error is added as a may fail case for if either argument is invalid.

34852 **NAME**

34853 pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

34854 **SYNOPSIS**34855 THR

```
#include <pthread.h>
```

```
34856 int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
34857 int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
34858     const pthread_rwlockattr_t *restrict attr);
34859
```

34860 **DESCRIPTION**

34861 The *pthread_rwlock_destroy()* function shall destroy the read-write lock object referenced by
 34862 *rwlock* and release any resources used by the lock. The effect of subsequent use of the lock is
 34863 undefined until the lock is reinitialized by another call to *pthread_rwlock_init()*. An
 34864 implementation may cause *pthread_rwlock_destroy()* to set the object referenced by *rwlock* to an
 34865 invalid value. Results are undefined if *pthread_rwlock_destroy()* is called when any thread holds
 34866 *rwlock*. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

34867 The *pthread_rwlock_init()* function shall allocate any resources required to use the read-write
 34868 lock referenced by *rwlock* and initializes the lock to an unlocked state with attributes referenced
 34869 by *attr*. If *attr* is NULL, the default read-write lock attributes shall be used; the effect is the same
 34870 as passing the address of a default read-write lock attributes object. Once initialized, the lock can
 34871 be used any number of times without being reinitialized. Results are undefined if
 34872 *pthread_rwlock_init()* is called specifying an already initialized read-write lock. Results are
 34873 undefined if a read-write lock is used without first being initialized.

34874 If the *pthread_rwlock_init()* function fails, *rwlock* shall not be initialized and the contents of *rwlock*
 34875 are undefined.

34876 Only the object referenced by *rwlock* may be used for performing synchronization. The result of
 34877 referring to copies of that object in calls to *pthread_rwlock_destroy()*, *pthread_rwlock_rdlock()*,
 34878 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_rwlock_tryrdlock()*,
 34879 *pthread_rwlock_trywrlock()*, *pthread_rwlock_unlock()*, or *pthread_rwlock_wrlock()* is undefined.

34880 **RETURN VALUE**

34881 If successful, the *pthread_rwlock_destroy()* and *pthread_rwlock_init()* functions shall return zero;
 34882 otherwise, an error number shall be returned to indicate the error.

34883 The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed
 34884 immediately at the beginning of processing for the function and caused an error return prior to
 34885 modifying the state of the read-write lock specified by *rwlock*.

34886 **ERRORS**

34887 The *pthread_rwlock_destroy()* function may fail if:

34888 [EBUSY] The implementation has detected an attempt to destroy the object referenced
 34889 by *rwlock* while it is locked.

34890 [EINVAL] The value specified by *rwlock* is invalid.

34891 The *pthread_rwlock_init()* function shall fail if:

34892 [EAGAIN] The system lacked the necessary resources (other than memory) to initialize
 34893 another read-write lock.

34894 [ENOMEM] Insufficient memory exists to initialize the read-write lock.

34895 [EPERM] The caller does not have the privilege to perform the operation.

34896 The *pthread_rwlock_init()* function may fail if:

34897 [EBUSY] The implementation has detected an attempt to reinitialize the object
34898 referenced by *rwlock*, a previously initialized but not yet destroyed read-write
34899 lock.

34900 [EINVAL] The value specified by *attr* is invalid.

34901 These functions shall not return an error code of [EINTR].

34902 **EXAMPLES**

34903 None.

34904 **APPLICATION USAGE**

34905 Applications using these and related read-write lock functions may be subject to priority
34906 inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285,
34907 Priority Inversion.

34908 **RATIONALE**

34909 None.

34910 **FUTURE DIRECTIONS**

34911 None.

34912 **SEE ALSO**

34913 *pthread_rwlock_rdlock()*, *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*,
34914 *pthread_rwlock_tryrdlock()*, *pthread_rwlock_trywrlock()*, *pthread_rwlock_unlock()*,
34915 *pthread_rwlock_wrlock()*, the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

34916 **CHANGE HISTORY**

34917 First released in Issue 5.

34918 **Issue 6**

34919 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 34920 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
34921 now part of the Threads option (previously it was part of the Read-Write Locks option in
34922 IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted
34923 from the SYNOPSIS.
- 34924 • The DESCRIPTION is updated as follows:
 - 34925 — It explicitly notes allocation of resources upon initialization of a read-write lock object.
 - 34926 — A paragraph is added specifying that copies of read-write lock objects may not be used.
- 34927 • An [EINVAL] error is added to the ERRORS section for *pthread_rwlock_init()*, indicating that
34928 the *rwlock* value is invalid.
- 34929 • The SEE ALSO section is updated.

34930 The **restrict** keyword is added to the *pthread_rwlock_init()* prototype for alignment with the
34931 ISO/IEC 9899:1999 standard.

34932 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding APPLICATION
34933 USAGE relating to priority inversion.

34934 NAME

34935 pthread_rwlock_rdlock, pthread_rwlock_tryrdlock — lock a read-write lock object for reading

34936 SYNOPSIS

34937 THR `#include <pthread.h>`

34938 `int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);`

34939 `int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);`

34940

34941 DESCRIPTION

34942 The *pthread_rwlock_rdlock()* function shall apply a read lock to the read-write lock referenced by
34943 *rwlock*. The calling thread acquires the read lock if a writer does not hold the lock and there are
34944 no writers blocked on the lock.

34945 TPS If the Thread Execution Scheduling option is supported, and the threads involved in the lock are
34946 executing with the scheduling policies SCHED_FIFO or SCHED_RR, the calling thread shall not
34947 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on
34948 the lock; otherwise, the calling thread shall acquire the lock.

34949 TPS TSP If the Threads Execution Scheduling option is supported, and the threads involved in the lock
34950 are executing with the SCHED_SPORADIC scheduling policy, the calling thread shall not
34951 acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on
34952 the lock; otherwise, the calling thread shall acquire the lock.

34953 If the Thread Execution Scheduling option is not supported, it is implementation-defined
34954 whether the calling thread acquires the lock when a writer does not hold the lock and there are
34955 writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the
34956 read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the
34957 lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

34958 A thread may hold multiple concurrent read locks on *rwlock* (that is, successfully call the
34959 *pthread_rwlock_rdlock()* function *n* times). If so, the application shall ensure that the thread
34960 performs matching unlocks (that is, it calls the *pthread_rwlock_unlock()* function *n* times).

34961 The maximum number of simultaneous read locks that an implementation guarantees can be
34962 applied to a read-write lock shall be implementation-defined. The *pthread_rwlock_rdlock()*
34963 function may fail if this maximum would be exceeded.

34964 The *pthread_rwlock_tryrdlock()* function shall apply a read lock as in the *pthread_rwlock_rdlock()*
34965 function, with the exception that the function shall fail if the equivalent *pthread_rwlock_rdlock()*
34966 call would have blocked the calling thread. In no case shall the *pthread_rwlock_tryrdlock()*
34967 function ever block; it always either acquires the lock or fails and returns immediately.

34968 Results are undefined if any of these functions are called with an uninitialized read-write lock.

34969 If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the
34970 signal handler the thread resumes waiting for the read-write lock for reading as if it was not
34971 interrupted.

34972 RETURN VALUE

34973 If successful, the *pthread_rwlock_rdlock()* function shall return zero; otherwise, an error number
34974 shall be returned to indicate the error.

34975 The *pthread_rwlock_tryrdlock()* function shall return zero if the lock for reading on the read-write
34976 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to
34977 indicate the error.

34978 **ERRORS**

34979 The *pthread_rwlock_tryrdlock()* function shall fail if:

34980 [EBUSY] The read-write lock could not be acquired for reading because a writer holds
34981 the lock or a writer with the appropriate priority was blocked on it.

34982 The *pthread_rwlock_rdlock()* and *pthread_rwlock_tryrdlock()* functions may fail if:

34983 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
34984 object.

34985 [EAGAIN] The read lock could not be acquired because the maximum number of read
34986 locks for *rwlock* has been exceeded.

34987 The *pthread_rwlock_rdlock()* function may fail if:

34988 [EDEADLK] The current thread already owns the read-write lock for writing.

34989 These functions shall not return an error code of [EINTR].

34990 **EXAMPLES**

34991 None.

34992 **APPLICATION USAGE**

34993 Applications using these functions may be subject to priority inversion, as discussed in the Base
34994 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

34995 **RATIONALE**

34996 None.

34997 **FUTURE DIRECTIONS**

34998 None.

34999 **SEE ALSO**

35000 *pthread_rwlock_destroy()*, *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*,
35001 *pthread_rwlock_trywrlock()*, *pthread_rwlock_unlock()*, *pthread_rwlock_wrlock()*, the Base Definitions
35002 volume of IEEE Std 1003.1-2001, <**pthread.h**>

35003 **CHANGE HISTORY**

35004 First released in Issue 5.

35005 **Issue 6**

35006 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35007 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
35008 now part of the Threads option (previously it was part of the Read-Write Locks option in
35009 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35010 • The DESCRIPTION is updated as follows:
 - 35011 — Conditions under which writers have precedence over readers are specified.
 - 35012 — Failure of *pthread_rwlock_tryrdlock()* is clarified.
 - 35013 — A paragraph on the maximum number of read locks is added.
- 35014 • In the ERRORS sections, [EBUSY] is modified to take into account write priority, and
35015 [EDEADLK] is deleted as a *pthread_rwlock_tryrdlock()* error.
- 35016 • The SEE ALSO section is updated.

35017 NAME

35018 pthread_rwlock_timedrdlock — lock a read-write lock for reading

35019 SYNOPSIS

```
35020 THR TMO #include <pthread.h>
35021          #include <time.h>
```

```
35022          int pthread_rwlock_timedrdlock(pthread_rwlock_t *restrict rwlock,
35023                                         const struct timespec *restrict abs_timeout);
35024
```

35025 DESCRIPTION

35026 The *pthread_rwlock_timedrdlock()* function shall apply a read lock to the read-write lock
 35027 referenced by *rwlock* as in the *pthread_rwlock_rdlock()* function. However, if the lock cannot be
 35028 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
 35029 when the specified timeout expires. The timeout shall expire when the absolute time specified
 35030 by *abs_timeout* passes, as measured by the clock on which timeouts are based (that is, when the
 35031 value of that clock equals or exceeds *abs_timeout*), or if the absolute time specified by *abs_timeout*
 35032 has already been passed at the time of the call.

35033 TMR If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If
 35034 the Timers option is not supported, the timeout shall be based on the system clock as returned
 35035 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which
 35036 it is based. The **timespec** data type is defined in the `<time.h>` header. Under no circumstances
 35037 shall the function fail with a timeout if the lock can be acquired immediately. The validity of the
 35038 *abs_timeout* parameter need not be checked if the lock can be immediately acquired.

35039 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
 35040 write lock via a call to *pthread_rwlock_timedrdlock()*, upon return from the signal handler the
 35041 thread shall resume waiting for the lock as if it was not interrupted.

35042 The calling thread may deadlock if at the time the call is made it holds a write lock on *rwlock*.
 35043 The results are undefined if this function is called with an uninitialized read-write lock.

35044 RETURN VALUE

35045 The *pthread_rwlock_timedrdlock()* function shall return zero if the lock for reading on the read-
 35046 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
 35047 to indicate the error.

35048 ERRORS

35049 The *pthread_rwlock_timedrdlock()* function shall fail if:

35050 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

35051 The *pthread_rwlock_timedrdlock()* function may fail if:

35052 [EAGAIN] The read lock could not be acquired because the maximum number of read
 35053 locks for lock would be exceeded.

35054 [EDEADLK] The calling thread already holds a write lock on *rwlock*.

35055 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
 35056 object, or the *abs_timeout* nanosecond value is less than zero or greater than or
 35057 equal to 1 000 million.

35058 This function shall not return an error code of [EINTR].

35059 EXAMPLES

35060 None.

35061 APPLICATION USAGE

35062 Applications using this function may be subject to priority inversion, as discussed in the Base
35063 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35064 The *pthread_rwlock_timedrdlock()* function is part of the Threads and Timeouts options and need
35065 not be provided on all implementations.

35066 RATIONALE

35067 None.

35068 FUTURE DIRECTIONS

35069 None.

35075 CHANGE HISTORY

35076 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35077 NAME

35078 pthread_rwlock_timedwrlock — lock a read-write lock for writing

35079 SYNOPSIS

```
35080 THR TMO #include <pthread.h>
35081          #include <time.h>
```

```
35082          int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
35083                                         const struct timespec *restrict abs_timeout);
35084
```

35085 DESCRIPTION

35086 The *pthread_rwlock_timedwrlock()* function shall apply a write lock to the read-write lock
 35087 referenced by *rwlock* as in the *pthread_rwlock_wrlock()* function. However, if the lock cannot be
 35088 acquired without waiting for other threads to unlock the lock, this wait shall be terminated
 35089 when the specified timeout expires. The timeout shall expire when the absolute time specified
 35090 by *abs_timeout* passes, as measured by the clock on which timeouts are based (that is, when the
 35091 value of that clock equals or exceeds *abs_timeout*), or if the absolute time specified by *abs_timeout*
 35092 has already been passed at the time of the call.

35093 TMR If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If
 35094 the Timers option is not supported, the timeout shall be based on the system clock as returned
 35095 by the *time()* function. The resolution of the timeout shall be the resolution of the clock on which
 35096 it is based. The **timespec** data type is defined in the `<time.h>` header. Under no circumstances
 35097 shall the function fail with a timeout if the lock can be acquired immediately. The validity of the
 35098 *abs_timeout* parameter need not be checked if the lock can be immediately acquired.

35099 If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
 35100 write lock via a call to *pthread_rwlock_timedwrlock()*, upon return from the signal handler the
 35101 thread shall resume waiting for the lock as if it was not interrupted.

35102 The calling thread may deadlock if at the time the call is made it holds the read-write lock. The
 35103 results are undefined if this function is called with an uninitialized read-write lock.

35104 RETURN VALUE

35105 The *pthread_rwlock_timedwrlock()* function shall return zero if the lock for writing on the read-
 35106 write lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned
 35107 to indicate the error.

35108 ERRORS

35109 The *pthread_rwlock_timedwrlock()* function shall fail if:

35110 [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

35111 The *pthread_rwlock_timedwrlock()* function may fail if:

35112 [EDEADLK] The calling thread already holds the *rwlock*.

35113 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
 35114 object, or the *abs_timeout* nanosecond value is less than zero or greater than or
 35115 equal to 1 000 million.

35116 This function shall not return an error code of [EINTR].

35117 **EXAMPLES**

35118 None.

35119 **APPLICATION USAGE**

35120 Applications using this function may be subject to priority inversion, as discussed in the Base
35121 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35122 The *pthread_rwlock_timedwrlock()* function is part of the Threads and Timeouts options and need
35123 not be provided on all implementations.

35124 **RATIONALE**

35125 None.

35126 **FUTURE DIRECTIONS**

35127 None.

35133 **CHANGE HISTORY**

35134 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35135 **NAME**

35136 pthread_rwlock_tryrdlock — lock a read-write lock object for reading

35137 **SYNOPSIS**

35138 THR `#include <pthread.h>`

35139 `int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);`

35140

35141 **DESCRIPTION**

35142 Refer to *pthread_rwlock_rdlock()*.

35143 **NAME**

35144 pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

35145 **SYNOPSIS**

35146 THR #include <pthread.h>

35147 int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);

35148 int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);

35149

35150 **DESCRIPTION**

35151 The *pthread_rwlock_trywrlock()* function shall apply a write lock like the *pthread_rwlock_wrlock()*
 35152 function, with the exception that the function shall fail if any thread currently holds *rwlock* (for
 35153 reading or writing).

35154 The *pthread_rwlock_wrlock()* function shall apply a write lock to the read-write lock referenced
 35155 by *rwlock*. The calling thread acquires the write lock if no other thread (reader or writer) holds
 35156 the read-write lock *rwlock*. Otherwise, the thread shall block until it can acquire the lock. The
 35157 calling thread may deadlock if at the time the call is made it holds the read-write lock (whether a
 35158 read or write lock).

35159 Implementations may favor writers over readers to avoid writer starvation.

35160 Results are undefined if any of these functions are called with an uninitialized read-write lock.

35161 If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the
 35162 signal handler the thread resumes waiting for the read-write lock for writing as if it was not
 35163 interrupted.

35164 **RETURN VALUE**

35165 The *pthread_rwlock_trywrlock()* function shall return zero if the lock for writing on the read-write
 35166 lock object referenced by *rwlock* is acquired. Otherwise, an error number shall be returned to
 35167 indicate the error.

35168 If successful, the *pthread_rwlock_wrlock()* function shall return zero; otherwise, an error number
 35169 shall be returned to indicate the error.

35170 **ERRORS**

35171 The *pthread_rwlock_trywrlock()* function shall fail if:

35172 [EBUSY] The read-write lock could not be acquired for writing because it was already
 35173 locked for reading or writing.

35174 The *pthread_rwlock_trywrlock()* and *pthread_rwlock_wrlock()* functions may fail if:

35175 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
 35176 object.

35177 The *pthread_rwlock_wrlock()* function may fail if:

35178 [EDEADLK] The current thread already owns the read-write lock for writing or reading.

35179 These functions shall not return an error code of [EINTR].

35180 EXAMPLES

35181 None.

35182 APPLICATION USAGE

35183 Applications using these functions may be subject to priority inversion, as discussed in the Base
35184 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35185 RATIONALE

35186 None.

35187 FUTURE DIRECTIONS

35188 None.

35189 SEE ALSO

35191 *pthread_rwlock_timedwrlock()*, *pthread_rwlock_tryrdlock()*, *pthread_rwlock_unlock()*, the Base
35192 Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

35193 CHANGE HISTORY

35194 First released in Issue 5.

35195 Issue 6

35196 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35197 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
35198 now part of the Threads option (previously it was part of the Read-Write Locks option in
35199 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35200 • The [EDEADLK] error is deleted as a *pthread_rwlock_trywrlock()* error.
- 35201 • The SEE ALSO section is updated.

35202 **NAME**

35203 pthread_rwlock_unlock — unlock a read-write lock object

35204 **SYNOPSIS**

35205 THR #include <pthread.h>

35206 int pthread_rwlock_unlock(pthread_rwlock_t *rwlock);

35207

35208 **DESCRIPTION**

35209 The *pthread_rwlock_unlock()* function shall release a lock held on the read-write lock object
 35210 referenced by *rwlock*. Results are undefined if the read-write lock *rwlock* is not held by the
 35211 calling thread.

35212 If this function is called to release a read lock from the read-write lock object and there are other
 35213 read locks currently held on this read-write lock object, the read-write lock object remains in the
 35214 read locked state. If this function releases the last read lock for this read-write lock object, the
 35215 read-write lock object shall be put in the unlocked state with no owners.

35216 If this function is called to release a write lock for this read-write lock object, the read-write lock
 35217 object shall be put in the unlocked state.

35218 If there are threads blocked on the lock when it becomes available, the scheduling policy shall
 35219 TPS determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is
 35220 supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or
 35221 SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when
 35222 the lock becomes available. For equal priority threads, write locks shall take precedence over
 35223 read locks. If the Thread Execution Scheduling option is not supported, it is implementation-
 35224 defined whether write locks take precedence over read locks.

35225 Results are undefined if any of these functions are called with an uninitialized read-write lock.

35226 **RETURN VALUE**

35227 If successful, the *pthread_rwlock_unlock()* function shall return zero; otherwise, an error number
 35228 shall be returned to indicate the error.

35229 **ERRORS**

35230 The *pthread_rwlock_unlock()* function may fail if:

35231 [EINVAL] The value specified by *rwlock* does not refer to an initialized read-write lock
 35232 object.

35233 [EPERM] The current thread does not hold a lock on the read-write lock.

35234 The *pthread_rwlock_unlock()* function shall not return an error code of [EINTR].

35235 **EXAMPLES**

35236 None.

35237 **APPLICATION USAGE**

35238 None.

35239 **RATIONALE**

35240 None.

35241 **FUTURE DIRECTIONS**

35242 None.

35247 CHANGE HISTORY

35248 First released in Issue 5.

35249 Issue 6

35250 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35251 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
35252 now part of the Threads option (previously it was part of the Read-Write Locks option in
35253 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35254 • The DESCRIPTION is updated as follows:
 - 35255 — The conditions under which writers have precedence over readers are specified.
 - 35256 — The concept of read-write lock owner is deleted.
- 35257 • The SEE ALSO section is updated.

35258 NAME

35259 pthread_rwlock_wrlock — lock a read-write lock object for writing

35260 SYNOPSIS

35261 THR `#include <pthread.h>`

35262 `int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);`

35263

35264 DESCRIPTION

35265 Refer to *pthread_rwlock_trywrlock()*.

35266 **NAME**

35267 pthread_rwlockattr_destroy, pthread_rwlockattr_init — destroy and initialize the read-write
 35268 lock attributes object

35269 **SYNOPSIS**

35270 THR `#include <pthread.h>`

35271 `int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);`

35272 `int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);`

35273

35274 **DESCRIPTION**

35275 The *pthread_rwlockattr_destroy()* function shall destroy a read-write lock attributes object. A
 35276 destroyed *attr* attributes object can be reinitialized using *pthread_rwlockattr_init()*; the results of
 35277 otherwise referencing the object after it has been destroyed are undefined. An implementation
 35278 may cause *pthread_rwlockattr_destroy()* to set the object referenced by *attr* to an invalid value.

35279 The *pthread_rwlockattr_init()* function shall initialize a read-write lock attributes object *attr* with
 35280 the default value for all of the attributes defined by the implementation.

35281 Results are undefined if *pthread_rwlockattr_init()* is called specifying an already initialized *attr*
 35282 attributes object.

35283 After a read-write lock attributes object has been used to initialize one or more read-write locks,
 35284 any function affecting the attributes object (including destruction) shall not affect any previously
 35285 initialized read-write locks.

35286 **RETURN VALUE**

35287 If successful, the *pthread_rwlockattr_destroy()* and *pthread_rwlockattr_init()* functions shall return
 35288 zero; otherwise, an error number shall be returned to indicate the error.

35289 **ERRORS**

35290 The *pthread_rwlockattr_destroy()* function may fail if:

35291 [EINVAL] The value specified by *attr* is invalid.

35292 The *pthread_rwlockattr_init()* function shall fail if:

35293 [ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

35294 These functions shall not return an error code of [EINTR].

35295 **EXAMPLES**

35296 None.

35297 **APPLICATION USAGE**

35298 None.

35299 **RATIONALE**

35300 None.

35301 **FUTURE DIRECTIONS**

35302 None.

35303 **SEE ALSO**

35304 *pthread_rwlock_destroy()*, *pthread_rwlockattr_getpshared()*, *pthread_rwlockattr_setpshared()*, the
 35305 Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**

35306 **CHANGE HISTORY**

35307 First released in Issue 5.

35308 **Issue 6**

35309 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35310 • The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
- 35311 now part of the Threads option (previously it was part of the Read-Write Locks option in
- 35312 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35313 • The SEE ALSO section is updated.

35314 **NAME**

35315 pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared — get and set the process-
 35316 shared attribute of the read-write lock attributes object

35317 **SYNOPSIS**

35318 THR TSH #include <pthread.h>

```
35319 int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t *
35320     restrict attr, int *restrict pshared);
35321 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
35322     int pshared);
35323
```

35324 **DESCRIPTION**

35325 The *pthread_rwlockattr_getpshared()* function shall obtain the value of the *process-shared* attribute
 35326 from the initialized attributes object referenced by *attr*. The *pthread_rwlockattr_setpshared()*
 35327 function shall set the *process-shared* attribute in an initialized attributes object referenced by *attr*.

35328 The *process-shared* attribute shall be set to PTHREAD_PROCESS_SHARED to permit a read-
 35329 write lock to be operated upon by any thread that has access to the memory where the read-
 35330 write lock is allocated, even if the read-write lock is allocated in memory that is shared by
 35331 multiple processes. If the *process-shared* attribute is PTHREAD_PROCESS_PRIVATE, the read-
 35332 write lock shall only be operated upon by threads created within the same process as the thread
 35333 that initialized the read-write lock; if threads of differing processes attempt to operate on such a
 35334 read-write lock, the behavior is undefined. The default value of the *process-shared* attribute shall
 35335 be PTHREAD_PROCESS_PRIVATE.

35336 Additional attributes, their default values, and the names of the associated functions to get and
 35337 set those attribute values are implementation-defined.

35338 **RETURN VALUE**

35339 Upon successful completion, the *pthread_rwlockattr_getpshared()* function shall return zero and
 35340 store the value of the *process-shared* attribute of *attr* into the object referenced by the *pshared*
 35341 parameter. Otherwise, an error number shall be returned to indicate the error.

35342 If successful, the *pthread_rwlockattr_setpshared()* function shall return zero; otherwise, an error
 35343 number shall be returned to indicate the error.

35344 **ERRORS**

35345 The *pthread_rwlockattr_getpshared()* and *pthread_rwlockattr_setpshared()* functions may fail if:

35346 [EINVAL] The value specified by *attr* is invalid.

35347 The *pthread_rwlockattr_setpshared()* function may fail if:

35348 [EINVAL] The new value specified for the attribute is outside the range of legal values
 35349 for that attribute.

35350 These functions shall not return an error code of [EINTR].

35351 **EXAMPLES**

35352 None.

35353 **APPLICATION USAGE**

35354 None.

35355 **RATIONALE**

35356 None.

35357 **FUTURE DIRECTIONS**

35358 None.

35359 **SEE ALSO**

35360 *pthread_rwlock_destroy()*, *pthread_rwlockattr_destroy()*, *pthread_rwlockattr_init()*, the Base
35361 Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

35362 **CHANGE HISTORY**

35363 First released in Issue 5.

35364 **Issue 6**

35365 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 35366 • The margin code in the SYNOPSIS is changed to THR TSH to indicate that the functionality
35367 is now part of the Threads option (previously it was part of the Read-Write Locks option in
35368 IEEE Std 1003.1j-2000 and also part of the XSI extension).
- 35369 • The DESCRIPTION notes that additional attributes are implementation-defined.
- 35370 • The SEE ALSO section is updated.

35371 The **restrict** keyword is added to the *pthread_rwlockattr_getpshared()* prototype for alignment
35372 with the ISO / IEC 9899:1999 standard.

35373 **NAME**

35374 pthread_rwlockattr_init — initialize the read-write lock attributes object

35375 **SYNOPSIS**

35376 THR #include <pthread.h>

35377 int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

35378

35379 **DESCRIPTION**35380 Refer to *pthread_rwlockattr_destroy()*.

35381 NAME

35382 pthread_rwlockattr_setpshared — set the process-shared attribute of the read-write lock
35383 attributes object

35384 SYNOPSIS

35385 THR TSH #include <pthread.h>

35386 int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
35387 int pshared);

35388

35389 DESCRIPTION

35390 Refer to *pthread_rwlockattr_getpshared()*.

35391 **NAME**

35392 pthread_self — get the calling thread ID

35393 **SYNOPSIS**

35394 THR #include <pthread.h>

35395 pthread_t pthread_self(void);

35396

35397 **DESCRIPTION**35398 The *pthread_self()* function shall return the thread ID of the calling thread.35399 **RETURN VALUE**

35400 Refer to the DESCRIPTION.

35401 **ERRORS**

35402 No errors are defined.

35403 The *pthread_self()* function shall not return an error code of [EINTR].35404 **EXAMPLES**

35405 None.

35406 **APPLICATION USAGE**

35407 None.

35408 **RATIONALE**

35409 The *pthread_self()* function provides a capability similar to the *getpid()* function for processes
35410 and the rationale is the same: the creation call does not provide the thread ID to the created
35411 thread.

35412 **FUTURE DIRECTIONS**

35413 None.

35414 **SEE ALSO**

35415 *pthread_create()*, *pthread_equal()*, the Base Definitions volume of IEEE Std 1003.1-2001,
35416 <pthread.h>

35417 **CHANGE HISTORY**

35418 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

35419 **Issue 6**35420 The *pthread_self()* function is marked as part of the Threads option.

35421 **NAME**

35422 pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

35423 **SYNOPSIS**

35424 THR #include <pthread.h>

35425 int pthread_setcancelstate(int *state*, int **oldstate*);35426 int pthread_setcanceltype(int *type*, int **oldtype*);

35427 void pthread_testcancel(void);

35428

35429 **DESCRIPTION**

35430 The *pthread_setcancelstate()* function shall atomically both set the calling thread's cancelability
 35431 state to the indicated *state* and return the previous cancelability state at the location referenced
 35432 by *oldstate*. Legal values for *state* are PTHREAD_CANCEL_ENABLE and
 35433 PTHREAD_CANCEL_DISABLE.

35434 The *pthread_setcanceltype()* function shall atomically both set the calling thread's cancelability
 35435 type to the indicated *type* and return the previous cancelability type at the location referenced by
 35436 *oldtype*. Legal values for *type* are PTHREAD_CANCEL_DEFERRED and
 35437 PTHREAD_CANCEL_ASYNCHRONOUS.

35438 The cancelability state and type of any newly created threads, including the thread in which
 35439 *main()* was first invoked, shall be PTHREAD_CANCEL_ENABLE and
 35440 PTHREAD_CANCEL_DEFERRED respectively.

35441 The *pthread_testcancel()* function shall create a cancellation point in the calling thread. The
 35442 *pthread_testcancel()* function shall have no effect if cancelability is disabled.

35443 **RETURN VALUE**

35444 If successful, the *pthread_setcancelstate()* and *pthread_setcanceltype()* functions shall return zero;
 35445 otherwise, an error number shall be returned to indicate the error.

35446 **ERRORS**35447 The *pthread_setcancelstate()* function may fail if:

35448 [EINVAL] The specified *state* is not PTHREAD_CANCEL_ENABLE or
 35449 PTHREAD_CANCEL_DISABLE.

35450 The *pthread_setcanceltype()* function may fail if:

35451 [EINVAL] The specified *type* is not PTHREAD_CANCEL_DEFERRED or
 35452 PTHREAD_CANCEL_ASYNCHRONOUS.

35453 These functions shall not return an error code of [EINTR].

35454 **EXAMPLES**

35455 None.

35456 **APPLICATION USAGE**

35457 None.

35458 **RATIONALE**

35459 The *pthread_setcancelstate()* and *pthread_setcanceltype()* functions control the points at which a
 35460 thread may be asynchronously canceled. For cancellation control to be usable in modular
 35461 fashion, some rules need to be followed.

35462 An object can be considered to be a generalization of a procedure. It is a set of procedures and
 35463 global variables written as a unit and called by clients not known by the object. Objects may
 35464 depend on other objects.

35465 First, cancelability should only be disabled on entry to an object, never explicitly enabled. On
35466 exit from an object, the cancelability state should always be restored to its value on entry to the
35467 object.

35468 This follows from a modularity argument: if the client of an object (or the client of an object that
35469 uses that object) has disabled cancelability, it is because the client does not want to be concerned
35470 about cleaning up if the thread is canceled while executing some sequence of actions. If an object
35471 is called in such a state and it enables cancelability and a cancellation request is pending for that
35472 thread, then the thread is canceled, contrary to the wish of the client that disabled.

35473 Second, the cancelability type may be explicitly set to either *deferred* or *asynchronous* upon entry
35474 to an object. But as with the cancelability state, on exit from an object the cancelability type
35475 should always be restored to its value on entry to the object.

35476 Finally, only functions that are cancel-safe may be called from a thread that is asynchronously
35477 cancelable.

35478 **FUTURE DIRECTIONS**

35479 None.

35480 **SEE ALSO**

35481 *pthread_cancel()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**pthread.h**>

35482 **CHANGE HISTORY**

35483 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

35484 **Issue 6**

35485 The *pthread_setcancelstate()*, *pthread_setcanceltype()*, and *pthread_testcancel()* functions are marked
35486 as part of the Threads option.

35487 NAME

35488 pthread_setconcurrency — set the level of concurrency

35489 SYNOPSIS

35490 xSI `#include <pthread.h>`

35491 `int pthread_setconcurrency(int new_level);`

35492

35493 DESCRIPTION

35494 Refer to *pthread_getconcurrency()*.

35495 **NAME**

35496 pthread_setschedparam — dynamic thread scheduling parameters access (**REALTIME**
35497 **THREADS**)

35498 **SYNOPSIS**

35499 THR TPS #include <pthread.h>

```
35500 int pthread_setschedparam(pthread_t thread, int policy,  
35501     const struct sched_param *param);  
35502
```

35503 **DESCRIPTION**

35504 Refer to *pthread_getschedparam()*.

35505 **NAME**

35506 pthread_setschedprio — dynamic thread scheduling parameters access (**REALTIME**
 35507 **THREADS**)

35508 **SYNOPSIS**

35509 THR TPS #include <pthread.h>

35510 int pthread_setschedprio(pthread_t thread, int prio);

35511

35512 **DESCRIPTION**

35513 The *pthread_setschedprio()* function shall set the scheduling priority for the thread whose thread
 35514 ID is given by *thread* to the value given by *prio*. See **Scheduling Policies** (on page 44) for a
 35515 description on how this function call affects the ordering of the thread in the thread list for its
 35516 new priority.

35517 If the *pthread_setschedprio()* function fails, the scheduling priority of the target thread shall not be
 35518 changed.

35519 **RETURN VALUE**

35520 If successful, the *pthread_setschedprio()* function shall return zero; otherwise, an error number
 35521 shall be returned to indicate the error.

35522 **ERRORS**

35523 The *pthread_setschedprio()* function may fail if:

35524 [EINVAL] The value of *prio* is invalid for the scheduling policy of the specified thread.

35525 [ENOTSUP] An attempt was made to set the priority to an unsupported value.

35526 [EPERM] The caller does not have the appropriate permission to set the scheduling
 35527 policy of the specified thread.

35528 [EPERM] The implementation does not allow the application to modify the priority to
 35529 the value specified.

35530 [ESRCH] The value specified by *thread* does not refer to an existing thread.

35531 The *pthread_setschedprio()* function shall not return an error code of [EINTR].

35532 **EXAMPLES**

35533 None.

35534 **APPLICATION USAGE**

35535 None.

35536 **RATIONALE**

35537 The *pthread_setschedprio()* function provides a way for an application to temporarily raise its
 35538 priority and then lower it again, without having the undesired side effect of yielding to other
 35539 threads of the same priority. This is necessary if the application is to implement its own
 35540 strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This
 35541 capability is especially important if the implementation does not support the Thread Priority
 35542 Protection or Thread Priority Inheritance options, but even if those options are supported it is
 35543 needed if the application is to bound priority inheritance for other resources, such as
 35544 semaphores.

35545 The standard developers considered that while it might be preferable conceptually to solve this
 35546 problem by modifying the specification of *pthread_setschedparam()*, it was too late to make such a
 35547 change, as there may be implementations that would need to be changed. Therefore, this new
 35548 function was introduced.

35549 **FUTURE DIRECTIONS**

35550 None.

35551 **SEE ALSO**

35552 **Scheduling Policies** (on page 44), *pthread_getschedparam()*, the Base Definitions volume of
35553 IEEE Std 1003.1-2001, <**pthread.h**>

35554 **CHANGE HISTORY**

35555 First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.

35556 **NAME**

35557 pthread_setspecific — thread-specific data management

35558 **SYNOPSIS**

35559 THR `#include <pthread.h>`

35560 `int pthread_setspecific(pthread_key_t key, const void *value);`

35561

35562 **DESCRIPTION**

35563 Refer to *pthread_getspecific()*.

35564 **NAME**

35565 pthread_sigmask, sigprocmask — examine and change blocked signals

35566 **SYNOPSIS**

35567 #include <signal.h>

```
35568 THR  int pthread_sigmask(int how, const sigset_t *restrict set,
35569                      sigset_t *restrict oset);
35570 CX    int sigprocmask(int how, const sigset_t *restrict set,
35571                      sigset_t *restrict oset);
35572
```

35573 **DESCRIPTION**

35574 THR The *pthread_sigmask()* function shall examine or change (or both) the calling thread's signal mask, regardless of the number of threads in the process. The function shall be equivalent to *sigprocmask()*, without the restriction that the call be made in a single-threaded process.

35577 In a single-threaded process, the *sigprocmask()* function shall examine or change (or both) the signal mask of the calling thread.

35579 If the argument *set* is not a null pointer, it points to a set of signals to be used to change the currently blocked set.

35581 The argument *how* indicates the way in which the set is changed, and the application shall ensure it consists of one of the following values:

35583 SIG_BLOCK The resulting set shall be the union of the current set and the signal set pointed to by *set*.

35585 SIG_SETMASK The resulting set shall be the signal set pointed to by *set*.

35586 SIG_UNBLOCK The resulting set shall be the intersection of the current set and the complement of the signal set pointed to by *set*.

35588 If the argument *oset* is not a null pointer, the previous mask shall be stored in the location pointed to by *oset*. If *set* is a null pointer, the value of the argument *how* is not significant and the process' signal mask shall be unchanged; thus the call can be used to enquire about currently blocked signals.

35592 If there are any pending unblocked signals after the call to *sigprocmask()*, at least one of those signals shall be delivered before the call to *sigprocmask()* returns.

35594 It is not possible to block those signals which cannot be ignored. This shall be enforced by the system without causing an error to be indicated.

35596 If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked, the result is undefined, unless the signal was generated by the *kill()* function, the *sigqueue()* function, or the *raise()* function.

35599 If *sigprocmask()* fails, the thread's signal mask shall not be changed.

35600 The use of the *sigprocmask()* function is unspecified in a multi-threaded process.

35601 **RETURN VALUE**

35602 THR Upon successful completion *pthread_sigmask()* shall return 0; otherwise, it shall return the corresponding error number.

35604 Upon successful completion, *sigprocmask()* shall return 0; otherwise, -1 shall be returned, *errno* shall be set to indicate the error, and the process' signal mask shall be unchanged.

35606 **ERRORS**

35607 THR The `pthread_sigmask()` and `sigprocmask()` functions shall fail if:

35608 [EINVAL] The value of the *how* argument is not equal to one of the defined values.

35609 THR The `pthread_sigmask()` function shall not return an error code of [EINTR].

35610 **EXAMPLES**

35611 None.

35612 **APPLICATION USAGE**

35613 None.

35614 **RATIONALE**

35615 When a process' signal mask is changed in a signal-catching function that is installed by
 35616 `sigaction()`, the restoration of the signal mask on return from the signal-catching function
 35617 overrides that change (see `sigaction()`). If the signal-catching function was installed with
 35618 `signal()`, it is unspecified whether this occurs.

35619 See `kill()` for a discussion of the requirement on delivery of signals.

35620 **FUTURE DIRECTIONS**

35621 None.

35622 **SEE ALSO**

35623 `sigaction()`, `sigaddset()`, `sigdelset()`, `sigemptyset()`, `sigfillset()`, `sigismember()`, `sigpending()`,
 35624 `sigqueue()`, `sigsuspend()`, the Base Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>

35625 **CHANGE HISTORY**

35626 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

35627 **Issue 5**

35628 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

35629 The `pthread_sigmask()` function is added for alignment with the POSIX Threads Extension.

35630 **Issue 6**

35631 The `pthread_sigmask()` function is marked as part of the Threads option.

35632 The SYNOPSIS for `sigprocmask()` is marked as a CX extension to note that the presence of this
 35633 function in the <**signal.h**> header is an extension to the ISO C standard.

35634 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 35635 • The DESCRIPTION is updated to explicitly state the functions which may generate the
 35636 signal.

35637 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

35638 The **restrict** keyword is added to the `pthread_sigmask()` and `sigprocmask()` prototypes for
 35639 alignment with the ISO / IEC 9899: 1999 standard.

35640 **NAME**

35641 pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object (**ADVANCED**
 35642 **REALTIME THREADS**)

35643 **SYNOPSIS**

35644 THR SPI #include <pthread.h>

```
35645 int pthread_spin_destroy(pthread_spinlock_t *lock);
35646 int pthread_spin_init(pthread_spinlock_t *lock, int pshared);
35647
```

35648 **DESCRIPTION**

35649 The *pthread_spin_destroy()* function shall destroy the spin lock referenced by *lock* and release any
 35650 resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is
 35651 reinitialized by another call to *pthread_spin_init()*. The results are undefined if
 35652 *pthread_spin_destroy()* is called when a thread holds the lock, or if this function is called with an
 35653 uninitialized thread spin lock.

35654 The *pthread_spin_init()* function shall allocate any resources required to use the spin lock
 35655 referenced by *lock* and initialize the lock to an unlocked state.

35656 TSH If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is
 35657 PTHREAD_PROCESS_SHARED, the implementation shall permit the spin lock to be operated
 35658 upon by any thread that has access to the memory where the spin lock is allocated, even if it is
 35659 allocated in memory that is shared by multiple processes.

35660 If the Thread Process-Shared Synchronization option is supported and the value of *pshared* is
 35661 PTHREAD_PROCESS_PRIVATE, or if the option is not supported, the spin lock shall only be
 35662 operated upon by threads created within the same process as the thread that initialized the spin
 35663 lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is
 35664 undefined.

35665 The results are undefined if *pthread_spin_init()* is called specifying an already initialized spin
 35666 lock. The results are undefined if a spin lock is used without first being initialized.

35667 If the *pthread_spin_init()* function fails, the lock is not initialized and the contents of *lock* are
 35668 undefined.

35669 Only the object referenced by *lock* may be used for performing synchronization.

35670 The result of referring to copies of that object in calls to *pthread_spin_destroy()*,
 35671 *pthread_spin_lock()*, *pthread_spin_trylock()*, or *pthread_spin_unlock()* is undefined.

35672 **RETURN VALUE**

35673 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 35674 be returned to indicate the error.

35675 **ERRORS**

35676 These functions may fail if:

35677 [EBUSY] The implementation has detected an attempt to initialize or destroy a spin
 35678 lock while it is in use (for example, while being used in a *pthread_spin_lock()*
 35679 call) by another thread.

35680 [EINVAL] The value specified by *lock* is invalid.

35681 The *pthread_spin_init()* function shall fail if:

35682 [EAGAIN] The system lacks the necessary resources to initialize another spin lock.

35683 [ENOMEM] Insufficient memory exists to initialize the lock.

35684 These functions shall not return an error code of [EINTR].

35685 **EXAMPLES**

35686 None.

35687 **APPLICATION USAGE**

35688 The *pthread_spin_destroy()* and *pthread_spin_init()* functions are part of the Spin Locks option
35689 and need not be provided on all implementations.

35690 **RATIONALE**

35691 None.

35692 **FUTURE DIRECTIONS**

35693 None.

35694 **SEE ALSO**

35695 *pthread_spin_lock()*, *pthread_spin_unlock()*, the Base Definitions volume of IEEE Std 1003.1-2001,
35696 <pthread.h>

35697 **CHANGE HISTORY**

35698 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35699 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

35700 **NAME**

35701 pthread_spin_lock, pthread_spin_trylock — lock a spin lock object (**ADVANCED REALTIME**
 35702 **THREADS**)

35703 **SYNOPSIS**

35704 THR SPI #include <pthread.h>

```
35705 int pthread_spin_lock(pthread_spinlock_t *lock);
35706 int pthread_spin_trylock(pthread_spinlock_t *lock);
35707
```

35708 **DESCRIPTION**

35709 The *pthread_spin_lock()* function shall lock the spin lock referenced by *lock*. The calling thread
 35710 shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,
 35711 shall not return from the *pthread_spin_lock()* call) until the lock becomes available. The results
 35712 are undefined if the calling thread holds the lock at the time the call is made. The
 35713 *pthread_spin_trylock()* function shall lock the spin lock referenced by *lock* if it is not held by any
 35714 thread. Otherwise, the function shall fail.

35715 The results are undefined if any of these functions is called with an uninitialized spin lock.

35716 **RETURN VALUE**

35717 Upon successful completion, these functions shall return zero; otherwise, an error number shall
 35718 be returned to indicate the error.

35719 **ERRORS**

35720 These functions may fail if:

35721 [EINVAL] The value specified by *lock* does not refer to an initialized spin lock object.

35722 The *pthread_spin_lock()* function may fail if:

35723 [EDEADLK] The calling thread already holds the lock.

35724 The *pthread_spin_trylock()* function shall fail if:

35725 [EBUSY] A thread currently holds the lock.

35726 These functions shall not return an error code of [EINTR].

35727 **EXAMPLES**

35728 None.

35729 **APPLICATION USAGE**

35730 Applications using this function may be subject to priority inversion, as discussed in the Base
 35731 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

35732 The *pthread_spin_lock()* and *pthread_spin_trylock()* functions are part of the Spin Locks option
 35733 and need not be provided on all implementations.

35734 **RATIONALE**

35735 None.

35736 **FUTURE DIRECTIONS**

35737 None.

35738 **SEE ALSO**

35739 *pthread_spin_destroy()*, *pthread_spin_unlock()*, the Base Definitions volume of
 35740 IEEE Std 1003.1-2001, <pthread.h>

35741 **CHANGE HISTORY**

35742 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35743 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

35744 **NAME**35745 pthread_spin_unlock — unlock a spin lock object (**ADVANCED REALTIME THREADS**)35746 **SYNOPSIS**

35747 THR SPI #include <pthread.h>

35748 int pthread_spin_unlock(pthread_spinlock_t *lock);

35749

35750 **DESCRIPTION**

35751 The *pthread_spin_unlock()* function shall release the spin lock referenced by *lock* which was
 35752 locked via the *pthread_spin_lock()* or *pthread_spin_trylock()* functions. The results are undefined if
 35753 the lock is not held by the calling thread. If there are threads spinning on the lock when
 35754 *pthread_spin_unlock()* is called, the lock becomes available and an unspecified spinning thread
 35755 shall acquire the lock.

35756 The results are undefined if this function is called with an uninitialized thread spin lock.

35757 **RETURN VALUE**

35758 Upon successful completion, the *pthread_spin_unlock()* function shall return zero; otherwise, an
 35759 error number shall be returned to indicate the error.

35760 **ERRORS**35761 The *pthread_spin_unlock()* function may fail if:

35762 [EINVAL] An invalid argument was specified.

35763 [EPERM] The calling thread does not hold the lock.

35764 This function shall not return an error code of [EINTR].

35765 **EXAMPLES**

35766 None.

35767 **APPLICATION USAGE**

35768 The *pthread_spin_unlock()* function is part of the Spin Locks option and need not be provided on
 35769 all implementations.

35770 **RATIONALE**

35771 None.

35772 **FUTURE DIRECTIONS**

35773 None.

35774 **SEE ALSO**

35775 *pthread_spin_destroy()*, *pthread_spin_lock()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 35776 <pthread.h>

35777 **CHANGE HISTORY**

35778 First released in Issue 6. Derived from IEEE Std 1003.1j-2000.

35779 In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.

35780 **NAME**

35781 pthread_testcancel — set cancelability state

35782 **SYNOPSIS**

35783 THR `#include <pthread.h>`

35784 `void pthread_testcancel(void);`

35785

35786 **DESCRIPTION**

35787 Refer to *pthread_setcancelstate()*.

35788 **NAME**

35789 ptsname — get name of the slave pseudo-terminal device

35790 **SYNOPSIS**

35791 xSI #include <stdlib.h>

35792 char *ptsname(int *fildes*);

35793

35794 **DESCRIPTION**

35795 The *ptsname()* function shall return the name of the slave pseudo-terminal device associated
35796 with a master pseudo-terminal device. The *fildes* argument is a file descriptor that refers to the
35797 master device. The *ptsname()* function shall return a pointer to a string containing the pathname
35798 of the corresponding slave device.

35799 The *ptsname()* function need not be reentrant. A function that is not required to be reentrant is
35800 not required to be thread-safe.

35801 **RETURN VALUE**

35802 Upon successful completion, *ptsname()* shall return a pointer to a string which is the name of the
35803 pseudo-terminal slave device. Upon failure, *ptsname()* shall return a null pointer. This could
35804 occur if *fildes* is an invalid file descriptor or if the slave device name does not exist in the file
35805 system.

35806 **ERRORS**

35807 No errors are defined.

35808 **EXAMPLES**

35809 None.

35810 **APPLICATION USAGE**35811 The value returned may point to a static data area that is overwritten by each call to *ptsname()*.35812 **RATIONALE**

35813 None.

35814 **FUTURE DIRECTIONS**

35815 None.

35816 **SEE ALSO**

35817 *grantpt()*, *open()*, *ttyname()*, *unlockpt()*, the Base Definitions volume of IEEE Std 1003.1-2001,
35818 <stdlib.h>

35819 **CHANGE HISTORY**

35820 First released in Issue 4, Version 2.

35821 **Issue 5**

35822 Moved from X/OPEN UNIX extension to BASE.

35823 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

35824 NAME

35825 putc — put a byte on a stream

35826 SYNOPSIS

35827 #include <stdio.h>

35828 int putc(int *c*, FILE **stream*);

35829 DESCRIPTION

35830 cx The functionality described on this reference page is aligned with the ISO C standard. Any
35831 conflict between the requirements described here and the ISO C standard is unintentional. This
35832 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35833 The *putc()* function shall be equivalent to *fputc()*, except that if it is implemented as a macro it
35834 may evaluate *stream* more than once, so the argument should never be an expression with side
35835 effects.

35836 RETURN VALUE

35837 Refer to *fputc()*.

35838 ERRORS

35839 Refer to *fputc()*.

35840 EXAMPLES

35841 None.

35842 APPLICATION USAGE

35843 Since it may be implemented as a macro, *putc()* may treat a *stream* argument with side effects
35844 incorrectly. In particular, *putc(c,*f++)* does not necessarily work correctly. Therefore, use of this
35845 function is not recommended in such situations; *fputc()* should be used instead.

35846 RATIONALE

35847 None.

35848 FUTURE DIRECTIONS

35849 None.

35850 SEE ALSO

35851 *fputc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

35852 CHANGE HISTORY

35853 First released in Issue 1. Derived from Issue 1 of the SVID.

35854 **NAME**

35855 putc_unlocked — stdio with explicit client locking

35856 **SYNOPSIS**

35857 TSF #include <stdio.h>

35858 int putc_unlocked(int *c*, FILE **stream*);

35859

35860 **DESCRIPTION**35861 Refer to *getc_unlocked()*.

35862 NAME

35863 putchar — put a byte on a stdout stream

35864 SYNOPSIS

35865 #include <stdio.h>

35866 int putchar(int c);

35867 DESCRIPTION

35868 cx The functionality described on this reference page is aligned with the ISO C standard. Any
35869 conflict between the requirements described here and the ISO C standard is unintentional. This
35870 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

35871 The function call *putchar(c)* shall be equivalent to *putc(c,stdout)*.

35872 RETURN VALUE

35873 Refer to *fputc()*.

35874 ERRORS

35875 Refer to *fputc()*.

35876 EXAMPLES

35877 None.

35878 APPLICATION USAGE

35879 None.

35880 RATIONALE

35881 None.

35882 FUTURE DIRECTIONS

35883 None.

35884 SEE ALSO

35885 *putc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>

35886 CHANGE HISTORY

35887 First released in Issue 1. Derived from Issue 1 of the SVID.

35888 **NAME**

35889 putchar_unlocked — stdio with explicit client locking

35890 **SYNOPSIS**35891 TSF `#include <stdio.h>`35892 `int putchar_unlocked(int c);`

35893

35894 **DESCRIPTION**35895 Refer to *getc_unlocked()*.

35896 **NAME**

35897 putenv — change or add a value to an environment

35898 **SYNOPSIS**35899 xSI `#include <stdlib.h>`35900 `int putenv(char *string);`

35901

35902 **DESCRIPTION**

35903 The *putenv()* function shall use the *string* argument to set environment variable values. The
 35904 *string* argument should point to a string of the form "*name=value*". The *putenv()* function shall
 35905 make the value of the environment variable *name* equal to *value* by altering an existing variable
 35906 or creating a new one. In either case, the string pointed to by *string* shall become part of the
 35907 environment, so altering the string shall change the environment. The space used by *string* is no
 35908 longer used once a new string which defines *name* is passed to *putenv()*.

35909 The *putenv()* function need not be reentrant. A function that is not required to be reentrant is not
 35910 required to be thread-safe.

35911 **RETURN VALUE**

35912 Upon successful completion, *putenv()* shall return 0; otherwise, it shall return a non-zero value
 35913 and set *errno* to indicate the error.

35914 **ERRORS**35915 The *putenv()* function may fail if:

35916 [ENOMEM] Insufficient memory was available.

35917 **EXAMPLES**35918 **Changing the Value of an Environment Variable**

35919 The following example changes the value of the *HOME* environment variable to the value
 35920 */usr/home*.

```
35921 #include <stdlib.h>
35922 ...
35923 static char *var = "HOME=/usr/home";
35924 int ret;
35925 ret = putenv(var);
```

35926 **APPLICATION USAGE**

35927 The *putenv()* function manipulates the environment pointed to by *environ*, and can be used in
 35928 conjunction with *getenv()*.

35929 See *exec*, for restrictions on changing the environment in multi-threaded applications.

35930 This routine may use *malloc()* to enlarge the environment.

35931 A potential error is to call *putenv()* with an automatic variable as the argument, then return from
 35932 the calling function while *string* is still part of the environment.

35933 The *setenv()* function is preferred over this function.

35934 **RATIONALE**

35935 The standard developers noted that *putenv()* is the only function available to add to the
 35936 environment without permitting memory leaks.

35937 **FUTURE DIRECTIONS**

35938 None.

35939 **SEE ALSO**35940 *exec*, *getenv()*, *malloc()*, *setenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>35941 **CHANGE HISTORY**

35942 First released in Issue 1. Derived from Issue 1 of the SVID.

35943 **Issue 5**35944 The type of the argument to this function is changed from **const char *** to **char ***. This was
35945 indicated as a FUTURE DIRECTION in previous issues.

35946 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

35947 **Issue 6**35948 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the
35949 DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to
35950 *exec*. |

35951 **NAME**35952 putmsg, putpmsg — send a message on a STREAM (**STREAMS**)35953 **SYNOPSIS**

35954 xSR #include <stropts.h>

```

35955 int putmsg(int fildev, const struct strbuf *ctlptr,
35956           const struct strbuf *dataptr, int flags);
35957 int putpmsg(int fildev, const struct strbuf *ctlptr,
35958            const struct strbuf *dataptr, int band, int flags);
35959 
```

35960 **DESCRIPTION**

35961 The *putmsg()* function shall create a message from a process buffer(s) and send the message to a
 35962 STREAMS file. The message may contain either a data part, a control part, or both. The data and
 35963 control parts are distinguished by placement in separate buffers, as described below. The
 35964 semantics of each part are defined by the STREAMS module that receives the message.

35965 The *putpmsg()* function is equivalent to *putmsg()*, except that the process can send messages in
 35966 different priority bands. Except where noted, all requirements on *putmsg()* also pertain to
 35967 *putpmsg()*.

35968 The *fildev* argument specifies a file descriptor referencing an open STREAM. The *ctlptr* and
 35969 *dataptr* arguments each point to a **strbuf** structure.

35970 The *ctlptr* argument points to the structure describing the control part, if any, to be included in
 35971 the message. The *buf* member in the **strbuf** structure points to the buffer where the control
 35972 information resides, and the *len* member indicates the number of bytes to be sent. The *maxlen*
 35973 member is not used by *putmsg()*. In a similar manner, the argument *dataptr* specifies the data, if
 35974 any, to be included in the message. The *flags* argument indicates what type of message should be
 35975 sent and is described further below.

35976 To send the data part of a message, the application shall ensure that *dataptr* is not a null pointer
 35977 and the *len* member of *dataptr* is 0 or greater. To send the control part of a message, the
 35978 application shall ensure that the corresponding values are set for *ctlptr*. No data (control) part
 35979 shall be sent if either *dataptr(ctlptr)* is a null pointer or the *len* member of *dataptr(ctlptr)* is set to
 35980 -1.

35981 For *putmsg()*, if a control part is specified and *flags* is set to RS_HIPRI, a high priority message
 35982 shall be sent. If no control part is specified, and *flags* is set to RS_HIPRI, *putmsg()* shall fail and
 35983 set *errno* to [EINVAL]. If *flags* is set to 0, a normal message (priority band equal to 0) shall be
 35984 sent. If a control part and data part are not specified and *flags* is set to 0, no message shall be
 35985 sent and 0 shall be returned.

35986 For *putpmsg()*, the flags are different. The *flags* argument is a bitmask with the following
 35987 mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If *flags* is set to 0, *putpmsg()*
 35988 shall fail and set *errno* to [EINVAL]. If a control part is specified and *flags* is set to MSG_HIPRI
 35989 and *band* is set to 0, a high-priority message shall be sent. If *flags* is set to MSG_HIPRI and either
 35990 no control part is specified or *band* is set to a non-zero value, *putpmsg()* shall fail and set *errno* to
 35991 [EINVAL]. If *flags* is set to MSG_BAND, then a message shall be sent in the priority band
 35992 specified by *band*. If a control part and data part are not specified and *flags* is set to MSG_BAND,
 35993 no message shall be sent and 0 shall be returned.

35994 The *putmsg()* function shall block if the STREAM write queue is full due to internal flow control
 35995 conditions, with the following exceptions:

- 35996 • For high-priority messages, *putmsg()* shall not block on this condition and continues
 35997 processing the message.

35998 • For other messages, *putmsg()* shall not block but shall fail when the write queue is full and
 35999 O_NONBLOCK is set.

36000 The *putmsg()* function shall also block, unless prevented by lack of internal resources, while
 36001 waiting for the availability of message blocks in the STREAM, regardless of priority or whether
 36002 O_NONBLOCK has been specified. No partial message shall be sent.

36003 RETURN VALUE

36004 Upon successful completion, *putmsg()* and *putpmsg()* shall return 0; otherwise, they shall return
 36005 −1 and set *errno* to indicate the error.

36006 ERRORS

36007 The *putmsg()* and *putpmsg()* functions shall fail if:

36008 [EAGAIN] A non-priority message was specified, the O_NONBLOCK flag is set, and the
 36009 STREAM write queue is full due to internal flow control conditions; or buffers
 36010 could not be allocated for the message that was to be created.

36011 [EBADF] *fildes* is not a valid file descriptor open for writing.

36012 [EINTR] A signal was caught during *putmsg()*.

36013 [EINVAL] An undefined value is specified in *flags*, or *flags* is set to RS_HIPRI or
 36014 MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer
 36015 referenced by *fildes* is linked (directly or indirectly) downstream from a
 36016 multiplexer, or *flags* is set to MSG_HIPRI and *band* is non-zero (for *putpmsg()*
 36017 only).

36018 [ENOSR] Buffers could not be allocated for the message that was to be created due to
 36019 insufficient STREAMS memory resources.

36020 [ENOSTR] A STREAM is not associated with *fildes*.

36021 [ENXIO] A hangup condition was generated downstream for the specified STREAM.

36022 [EPIPE] or [EIO] The *fildes* argument refers to a STREAMS-based pipe and the other end of the
 36023 pipe is closed. A SIGPIPE signal is generated for the calling thread.

36024 [ERANGE] The size of the data part of the message does not fall within the range
 36025 specified by the maximum and minimum packet sizes of the topmost
 36026 STREAM module. This value is also returned if the control part of the message
 36027 is larger than the maximum configured size of the control part of a message,
 36028 or if the data part of a message is larger than the maximum configured size of
 36029 the data part of a message.

36030 In addition, *putmsg()* and *putpmsg()* shall fail if the STREAM head had processed an
 36031 asynchronous error before the call. In this case, the value of *errno* does not reflect the result of
 36032 *putmsg()* or *putpmsg()*, but reflects the prior error.

36033 **EXAMPLES**36034 **Sending a High-Priority Message**

36035 The value of *fd* is assumed to refer to an open STREAMS file. This call to *putmsg()* does the
 36036 following:

- 36037 1. Creates a high-priority message with a control part and a data part, using the buffers
 36038 pointed to by *ctrlbuf* and *databuf*, respectively.
- 36039 2. Sends the message to the STREAMS file identified by *fd*.

```

36040 #include <stropts.h>
36041 #include <string.h>
36042 ...
36043 int fd;
36044 char *ctrlbuf = "This is the control part";
36045 char *databuf = "This is the data part";
36046 struct strbuf ctrl;
36047 struct strbuf data;
36048 int ret;

36049 ctrl.buf = ctrlbuf;
36050 ctrl.len = strlen(ctrlbuf);

36051 data.buf = databuf;
36052 data.len = strlen(databuf);

36053 ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

36054 **Using putpmsg()**

36055 This example has the same effect as the previous example. In this example, however, the
 36056 *putpmsg()* function creates and sends the message to the STREAMS file.

```

36057 #include <stropts.h>
36058 #include <string.h>
36059 ...
36060 int fd;
36061 char *ctrlbuf = "This is the control part";
36062 char *databuf = "This is the data part";
36063 struct strbuf ctrl;
36064 struct strbuf data;
36065 int ret;

36066 ctrl.buf = ctrlbuf;
36067 ctrl.len = strlen(ctrlbuf);

36068 data.buf = databuf;
36069 data.len = strlen(databuf);

36070 ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

36071 **APPLICATION USAGE**

36072 None.

36073 **RATIONALE**

36074 None.

36075 **FUTURE DIRECTIONS**

36076 None.

36077 **SEE ALSO**

36078 Section 2.6 (on page 38), *getmsg()*, *poll()*, *read()*, *write()*, the Base Definitions volume of
36079 IEEE Std 1003.1-2001, <**stropts.h**>

36080 **CHANGE HISTORY**

36081 First released in Issue 4, Version 2.

36082 **Issue 5**

36083 Moved from X/OPEN UNIX extension to BASE.

36084 The following text is removed from the DESCRIPTION: “The STREAM head guarantees that the
36085 control part of a message generated by *putmsg()* is at least 64 bytes in length”.

36086 **Issue 6**

36087 This function is marked as part of the XSI STREAMS Option Group.

36088 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

36089 **NAME**

36090 puts — put a string on standard output

36091 **SYNOPSIS**

36092 #include <stdio.h>

36093 int puts(const char *s);

36094 **DESCRIPTION**

36095 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36096 conflict between the requirements described here and the ISO C standard is unintentional. This
 36097 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36098 The *puts()* function shall write the string pointed to by *s*, followed by a <newline>, to the
 36099 standard output stream *stdout*. The terminating null byte shall not be written.

36100 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 36101 execution of *puts()* and the next successful completion of a call to *fflush()* or *fclose()* on the same
 36102 stream or a call to *exit()* or *abort()*.

36103 **RETURN VALUE**

36104 Upon successful completion, *puts()* shall return a non-negative number. Otherwise, it shall
 36105 CX return EOF, shall set an error indicator for the stream, and *errno* shall be set to indicate the error.

36106 **ERRORS**36107 Refer to *fputc()*.36108 **EXAMPLES**36109 **Printing to Standard Output**

36110 The following example gets the current time, converts it to a string using *localtime()* and
 36111 *asctime()*, and prints it to standard output using *puts()*. It then prints the number of minutes to
 36112 an event for which it is waiting.

```

36113 #include <time.h>
36114 #include <stdio.h>
36115 ...
36116 time_t now;
36117 int minutes_to_event;
36118 ...
36119 time(&now);
36120 printf("The time is ");
36121 puts(asctime(localtime(&now)));
36122 printf("There are %d minutes to the event.\n",
36123        minutes_to_event);
36124 ...

```

36125 **APPLICATION USAGE**36126 The *puts()* function appends a <newline>, while *fputs()* does not.36127 **RATIONALE**

36128 None.

36129 **FUTURE DIRECTIONS**

36130 None.

36131 **SEE ALSO**

36132 *fopen()*, *fputs()*, *putc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

36133 **CHANGE HISTORY**

36134 First released in Issue 1. Derived from Issue 1 of the SVID.

36135 **Issue 6**

36136 Extensions beyond the ISO C standard are marked.

36137 NAME

36138 pututxline — put an entry into the user accounting database

36139 SYNOPSIS

36140 xSI #include <utmpx.h>

36141 struct utmpx *pututxline(const struct utmpx *utmpx);

36142

36143 DESCRIPTION

36144 Refer to *endutxent()*.

36145 **NAME**

36146 putwc — put a wide character on a stream

36147 **SYNOPSIS**

36148 #include <stdio.h>

36149 #include <wchar.h>

36150 wint_t putwc(wchar_t wc, FILE *stream);

36151 **DESCRIPTION**

36152 cx The functionality described on this reference page is aligned with the ISO C standard. Any
36153 conflict between the requirements described here and the ISO C standard is unintentional. This
36154 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36155 The *putwc()* function shall be equivalent to *fputwc()*, except that if it is implemented as a macro
36156 it may evaluate *stream* more than once, so the argument should never be an expression with side
36157 effects.

36158 **RETURN VALUE**36159 Refer to *fputwc()*.36160 **ERRORS**36161 Refer to *fputwc()*.36162 **EXAMPLES**

36163 None.

36164 **APPLICATION USAGE**

36165 Since it may be implemented as a macro, *putwc()* may treat a *stream* argument with side effects
36166 incorrectly. In particular, *putwc(wc,*f++)* need not work correctly. Therefore, use of this function
36167 is not recommended; *fputwc()* should be used instead.

36168 **RATIONALE**

36169 None.

36170 **FUTURE DIRECTIONS**

36171 None.

36172 **SEE ALSO**36173 *fputwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>36174 **CHANGE HISTORY**

36175 First released as a World-wide Portability Interface in Issue 4.

36176 **Issue 5**

36177 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
36178 is changed from **wint_t** to **wchar_t**.

36179 The Optional Header (OH) marking is removed from <stdio.h>.

36180 **NAME**

36181 putwchar — put a wide character on a stdout stream

36182 **SYNOPSIS**

36183 #include <wchar.h>

36184 wint_t putwchar(wchar_t wc);

36185 **DESCRIPTION**

36186 cx The functionality described on this reference page is aligned with the ISO C standard. Any
36187 conflict between the requirements described here and the ISO C standard is unintentional. This
36188 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36189 The function call *putwchar(wc)* shall be equivalent to *putwc(wc,stdout)*.

36190 **RETURN VALUE**

36191 Refer to *fputwc()*.

36192 **ERRORS**

36193 Refer to *fputwc()*.

36194 **EXAMPLES**

36195 None.

36196 **APPLICATION USAGE**

36197 None.

36198 **RATIONALE**

36199 None.

36200 **FUTURE DIRECTIONS**

36201 None.

36202 **SEE ALSO**

36203 *fputwc()*, *putwc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

36204 **CHANGE HISTORY**

36205 First released in Issue 4.

36206 **Issue 5**

36207 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
36208 is changed from **wint_t** to **wchar_t**.

36209 **NAME**

36210 pwrite — write on a file

36211 **SYNOPSIS**

36212 #include <unistd.h>

```
36213 xSI      ssize_t pwrite(int fildes, const void *buf, size_t nbyte,  
36214           off_t offset);
```

36215

36216 **DESCRIPTION**36217 Refer to *write()*.

36218 **NAME**

36219 qsort — sort a table of data

36220 **SYNOPSIS**

36221 #include <stdlib.h>

```
36222       void qsort(void *base, size_t nel, size_t width,
36223                   int (*compar)(const void *, const void *));
```

36224 **DESCRIPTION**

36225 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 36226 conflict between the requirements described here and the ISO C standard is unintentional. This
 36227 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36228 The *qsort()* function shall sort an array of *nel* objects, the initial element of which is pointed to by
 36229 *base*. The size of each object, in bytes, is specified by the *width* argument. If the *nel* argument has
 36230 the value zero, the comparison function pointed to by *compar* shall not be called and no
 36231 rearrangement shall take place.

36232 The application shall ensure that the comparison function pointed to by *compar* does not alter the
 36233 contents of the array. The implementation may reorder elements of the array between calls to the
 36234 comparison function, but shall not alter the contents of any individual element.

36235 When the same objects (consisting of *width* bytes, irrespective of their current positions in the
 36236 array) are passed more than once to the comparison function, the results shall be consistent with
 36237 one another. That is, they shall define a total ordering on the array.

36238 The contents of the array shall be sorted in ascending order according to a comparison function.
 36239 The *compar* argument is a pointer to the comparison function, which is called with two
 36240 arguments that point to the elements being compared. The application shall ensure that the
 36241 function returns an integer less than, equal to, or greater than 0, if the first argument is
 36242 considered respectively less than, equal to, or greater than the second. If two members compare
 36243 as equal, their order in the sorted array is unspecified.

36244 **RETURN VALUE**36245 The *qsort()* function shall not return a value.36246 **ERRORS**

36247 No errors are defined.

36248 **EXAMPLES**

36249 None.

36250 **APPLICATION USAGE**

36251 The comparison function need not compare every byte, so arbitrary data may be contained in
 36252 the elements in addition to the values being compared.

36253 **RATIONALE**

36254 The requirement that each argument (hereafter referred to as *p*) to the comparison function is a
 36255 pointer to elements of the array implies that for every call, for each argument separately, all of
 36256 the following expressions are nonzero:

```
36257       ((char *)p - (char *)base) % width == 0
36258       (char *)p >= (char *)base
36259       (char *)p < (char *)base + nel * width
```

36260 **FUTURE DIRECTIONS**

36261 None.

36262 **SEE ALSO**

36263 The Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

36264 **CHANGE HISTORY**

36265 First released in Issue 1. Derived from Issue 1 of the SVID.

36266 **Issue 6**

36267 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

36268 IEEE Std 1003.1-2001 / Cor 1-2002, item XSH / TC1 / D6 / 49 is applied, adding the last sentence to
36269 the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The
36270 RATIONALE is also updated. These changes are for alignment with the ISO C standard.

36271 **NAME**

36272 raise — send a signal to the executing process

36273 **SYNOPSIS**

36274 #include <signal.h>

36275 int raise(int *sig*);36276 **DESCRIPTION**

36277 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36278 conflict between the requirements described here and the ISO C standard is unintentional. This
 36279 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36280 CX The *raise()* function shall send the signal *sig* to the executing thread or process. If a signal
 36281 handler is called, the *raise()* function shall not return until after the signal handler does.

36282 THR If the implementation supports the Threads option, the effect of the *raise()* function shall be
 36283 equivalent to calling:

36284 pthread_kill(pthread_self(), sig);

36285

36286 CX Otherwise, the effect of the *raise()* function shall be equivalent to calling:

36287 kill(getpid(), sig);

36288

36289 **RETURN VALUE**

36290 CX Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned
 36291 and *errno* shall be set to indicate the error.

36292 **ERRORS**36293 The *raise()* function shall fail if:36294 CX [EINVAL] The value of the *sig* argument is an invalid signal number.36295 **EXAMPLES**

36296 None.

36297 **APPLICATION USAGE**

36298 None.

36299 **RATIONALE**

36300 The term “thread” is an extension to the ISO C standard.

36301 **FUTURE DIRECTIONS**

36302 None.

36303 **SEE ALSO**

36304 *kill()*, *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>,
 36305 <sys/types.h>

36306 **CHANGE HISTORY**

36307 First released in Issue 4. Derived from the ANSI C standard.

36308 **Issue 5**

36309 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

36310 **Issue 6**

36311 Extensions beyond the ISO C standard are marked.

36312 The following new requirements on POSIX implementations derive from alignment with the
36313 Single UNIX Specification:

- 36314 • In the RETURN VALUE section, the requirement to set *errno* on error is added.
- 36315 • The [EINVAL] error condition is added.

36316 **NAME**

36317 rand, rand_r, srand — pseudo-random number generator

36318 **SYNOPSIS**

36319 #include <stdlib.h>

36320 int rand(void);

36321 TSF int rand_r(unsigned *seed);

36322 void srand(unsigned seed);

36323 **DESCRIPTION**

36324 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 36325 conflict between the requirements described here and the ISO C standard is unintentional. This
 36326 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

36327 The *rand()* function shall compute a sequence of pseudo-random integers in the range
 36328 XSI [0,{RAND_MAX}] with a period of at least 2^{32} .

36329 CX The *rand()* function need not be reentrant. A function that is not required to be reentrant is not
 36330 required to be thread-safe.

36331 TSF The *rand_r()* function shall compute a sequence of pseudo-random integers in the range
 36332 [0,{RAND_MAX}]. (The value of the {RAND_MAX} macro shall be at least 32 767.)

36333 If *rand_r()* is called with the same initial value for the object pointed to by *seed* and that object is
 36334 not modified between successive returns and calls to *rand_r()*, the same sequence shall be
 36335 generated.

36336 The *srand()* function uses the argument as a seed for a new sequence of pseudo-random
 36337 numbers to be returned by subsequent calls to *rand()*. If *srand()* is then called with the same
 36338 seed value, the sequence of pseudo-random numbers shall be repeated. If *rand()* is called before
 36339 any calls to *srand()* are made, the same sequence shall be generated as when *srand()* is first
 36340 called with a seed value of 1.

36341 The implementation shall behave as if no function defined in this volume of
 36342 IEEE Std 1003.1-2001 calls *rand()* or *srand()*.

36343 **RETURN VALUE**36344 The *rand()* function shall return the next pseudo-random number in the sequence.36345 TSF The *rand_r()* function shall return a pseudo-random integer.36346 The *srand()* function shall not return a value.36347 **ERRORS**

36348 No errors are defined.

36349 **EXAMPLES**36350 **Generating a Pseudo-Random Number Sequence**

36351 The following example demonstrates how to generate a sequence of pseudo-random numbers.

36352 #include <stdio.h>

36353 #include <stdlib.h>

36354 ...

36355 long count, i;

36356 char *keyst;

36357 int elementlen, len;

36358 char c;

```

36359     ...
36360     /* Initial random number generator. */
36361     srand(1);

36362     /* Create keys using only lowercase characters */
36363     len = 0;
36364     for (i=0; i<count; i++) {
36365         while (len < elementlen) {
36366             c = (char) (rand() % 128);
36367             if (islower(c))
36368                 keystr[len++] = c;
36369         }

36370         keystr[len] = '\0';
36371         printf("%s Element%0*ld\n", keystr, elementlen, i);
36372         len = 0;
36373     }

```

Generating the Same Sequence on Different Machines

The following code defines a pair of functions that could be incorporated into applications wishing to ensure that the same sequence of numbers is generated across different machines.

```

36377 static unsigned long next = 1;
36378 int myrand(void) /* RAND_MAX assumed to be 32767. */
36379 {
36380     next = next * 1103515245 + 12345;
36381     return((unsigned)(next/65536) % 32768);
36382 }

36383 void mysrand(unsigned seed)
36384 {
36385     next = seed;
36386 }

```

APPLICATION USAGE

The *drand48()* function provides a much more elaborate random number generator.

The limitations on the amount of state that can be carried between one function call and another mean the *rand_r()* function can never be implemented in a way which satisfies all of the requirements on a pseudo-random number generator. Therefore this function should be avoided whenever non-trivial requirements (including safety) have to be fulfilled.

RATIONALE

The ISO C standard *rand()* and *srand()* functions allow per-process pseudo-random streams shared by all threads. Those two functions need not change, but there has to be mutual-exclusion that prevents interference between two threads concurrently accessing the random number generator.

With regard to *rand()*, there are two different behaviors that may be wanted in a multi-threaded program:

1. A single per-process sequence of pseudo-random numbers that is shared by all threads that call *rand()*
2. A different sequence of pseudo-random numbers for each thread that calls *rand()*

36403 This is provided by the modified thread-safe function based on whether the seed value is global
36404 to the entire process or local to each thread.

36405 This does not address the known deficiencies of the *rand()* function implementations, which
36406 have been approached by maintaining more state. In effect, this specifies new thread-safe forms
36407 of a deficient function.

36408 **FUTURE DIRECTIONS**

36409 None.

36412 **CHANGE HISTORY**

36413 First released in Issue 1. Derived from Issue 1 of the SVID.

36414 **Issue 5**

36415 The *rand_r()* function is included for alignment with the POSIX Threads Extension.

36416 A note indicating that the *rand()* function need not be reentrant is added to the DESCRIPTION.

36417 **Issue 6**

36418 Extensions beyond the ISO C standard are marked.

36419 The *rand_r()* function is marked as part of the Thread-Safe Functions option.

36420 **NAME**

36421 random — generate pseudo-random number

36422 **SYNOPSIS**

36423 xSI #include <stdlib.h>

36424 long random(void);

36425

36426 **DESCRIPTION**36427 Refer to *initstate()*.

36428 **NAME**

36429 pread, read — read from a file

36430 **SYNOPSIS**

36431 #include <unistd.h>

36432 xSI ssize_t pread(int *fildes*, void *buf, size_t *nbyte*, off_t *offset*);36433 ssize_t read(int *fildes*, void *buf, size_t *nbyte*);36434 **DESCRIPTION**

36435 The *read()* function shall attempt to read *nbyte* bytes from the file associated with the open file
 36436 descriptor, *fildes*, into the buffer pointed to by *buf*. The behavior of multiple concurrent reads on
 36437 the same pipe, FIFO, or terminal device is unspecified.

36438 Before any action described below is taken, and if *nbyte* is zero, the *read()* function may detect
 36439 and return errors as described below. In the absence of errors, or if error detection is not
 36440 performed, the *read()* function shall return zero and have no other results.

36441 On files that support seeking (for example, a regular file), the *read()* shall start at a position in
 36442 the file given by the file offset associated with *fildes*. The file offset shall be incremented by the
 36443 number of bytes actually read.

36444 Files that do not support seeking—for example, terminals—always read from the current
 36445 position. The value of a file offset associated with such a file is undefined.

36446 No data transfer shall occur past the current end-of-file. If the starting position is at or after the
 36447 end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent
 36448 *read()* requests is implementation-defined.

36449 If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.

36450 When attempting to read from an empty pipe or FIFO:

- 36451 • If no process has the pipe open for writing, *read()* shall return 0 to indicate end-of-file.
- 36452 • If some process has the pipe open for writing and O_NONBLOCK is set, *read()* shall return
 36453 –1 and set *errno* to [EAGAIN].
- 36454 • If some process has the pipe open for writing and O_NONBLOCK is clear, *read()* shall block
 36455 the calling thread until some data is written or the pipe is closed by all processes that had the
 36456 pipe open for writing.

36457 When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and
 36458 has no data currently available:

- 36459 • If O_NONBLOCK is set, *read()* shall return –1 and set *errno* to [EAGAIN].
- 36460 • If O_NONBLOCK is clear, *read()* shall block the calling thread until some data becomes
 36461 available.
- 36462 • The use of the O_NONBLOCK flag has no effect if there is some data available.

36463 The *read()* function reads data previously written to a file. If any portion of a regular file prior to
 36464 the end-of-file has not been written, *read()* shall return bytes with value 0. For example, *lseek()*
 36465 allows the file offset to be set beyond the end of existing data in the file. If data is later written at
 36466 this point, subsequent reads in the gap between the previous end of data and the newly written
 36467 data shall return bytes with value 0 until data is written into the gap.

36468 Upon successful completion, where *nbyte* is greater than 0, *read()* shall mark for update the
 36469 *st_atime* field of the file, and shall return the number of bytes read. This number shall never be
 36470 greater than *nbyte*. The value returned may be less than *nbyte* if the number of bytes left in the

36471	file is less than <i>nbyte</i> , if the <i>read()</i> request was interrupted by a signal, or if the file is a pipe or
36472	FIFO or special file and has fewer than <i>nbyte</i> bytes immediately available for reading. For
36473	example, a <i>read()</i> from a file associated with a terminal may return one typed line of data.
36474	If a <i>read()</i> is interrupted by a signal before it reads any data, it shall return <code>-1</code> with <i>errno</i> set to
36475	<code>[EINTR]</code> .
36476	If a <i>read()</i> is interrupted by a signal after it has successfully read some data, it shall return the
36477	number of bytes read.
36478	For regular files, no data transfer shall occur past the offset maximum established in the open
36479	file description associated with <i>fildev</i> .
36480	If <i>fildev</i> refers to a socket, <i>read()</i> shall be equivalent to <i>recv()</i> with no flags set.
36481 SIO	If the <code>O_DSYNC</code> and <code>O_RSYNC</code> bits have been set, read I/O operations on the file descriptor
36482	shall complete as defined by synchronized I/O data integrity completion. If the <code>O_SYNC</code> and
36483	<code>O_RSYNC</code> bits have been set, read I/O operations on the file descriptor shall complete as
36484	defined by synchronized I/O file integrity completion.
36485 SHM	If <i>fildev</i> refers to a shared memory object, the result of the <i>read()</i> function is unspecified.
36486 TYM	If <i>fildev</i> refers to a typed memory object, the result of the <i>read()</i> function is unspecified.
36487 XSR	A <i>read()</i> from a STREAMS file can read data in three different modes: <i>byte-stream</i> mode,
36488	<i>message-nondiscard</i> mode, and <i>message-discard</i> mode. The default shall be <i>byte-stream</i> mode. This
36489	can be changed using the <code>I_SRDOPT ioctl()</code> request, and can be tested with <code>I_GRDOPT ioctl()</code> .
36490	In <i>byte-stream</i> mode, <i>read()</i> shall retrieve data from the STREAM until as many bytes as were
36491	requested are transferred, or until there is no more data to be retrieved. <i>Byte-stream</i> mode
36492	ignores message boundaries.
36493	In STREAMS <i>message-nondiscard</i> mode, <i>read()</i> shall retrieve data until as many bytes as were
36494	requested are transferred, or until a message boundary is reached. If <i>read()</i> does not retrieve all
36495	the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by
36496	the next <i>read()</i> call. <i>Message-discard</i> mode also retrieves data until as many bytes as were
36497	requested are transferred, or a message boundary is reached. However, unread data remaining
36498	in a message after the <i>read()</i> returns shall be discarded, and shall not be available for a
36499	subsequent <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> call.
36500	How <i>read()</i> handles zero-byte STREAMS messages is determined by the current read mode
36501	setting. In <i>byte-stream</i> mode, <i>read()</i> shall accept data until it has read <i>nbyte</i> bytes, or until there
36502	is no more data to read, or until a zero-byte message block is encountered. The <i>read()</i> function
36503	shall then return the number of bytes read, and place the zero-byte message back on the
36504	STREAM to be retrieved by the next <i>read()</i> , <i>getmsg()</i> , or <i>getpmsg()</i> . In <i>message-nondiscard</i> mode
36505	or <i>message-discard</i> mode, a zero-byte message shall return 0 and the message shall be removed
36506	from the STREAM. When a zero-byte message is read as the first message on a STREAM, the
36507	message shall be removed from the STREAM and 0 shall be returned, regardless of the read
36508	mode.
36509	A <i>read()</i> from a STREAMS file shall return the data in the message at the front of the STREAM
36510	head read queue, regardless of the priority band of the message.
36511	By default, STREAMs are in <i>control-normal</i> mode, in which a <i>read()</i> from a STREAMS file can
36512	only process messages that contain a data part but do not contain a control part. The <i>read()</i> shall
36513	fail if a message containing a control part is encountered at the STREAM head. This default
36514	action can be changed by placing the STREAM in either <i>control-data</i> mode or <i>control-discard</i>
36515	mode with the <code>I_SRDOPT ioctl()</code> command. In <i>control-data</i> mode, <i>read()</i> shall convert any
36516	control part to data and pass it to the application before passing any data part originally present

36517 in the same message. In control-discard mode, *read()* shall discard message control parts but
 36518 return to the process any data part in the message.

36519 In addition, *read()* shall fail if the STREAM head had processed an asynchronous error before the
 36520 call. In this case, the value of *errno* shall not reflect the result of *read()*, but reflect the prior error.
 36521 If a hangup occurs on the STREAM being read, *read()* shall continue to operate normally until
 36522 the STREAM head read queue is empty. Thereafter, it shall return 0.

36523 XSI The *pread()* function shall be equivalent to *read()*, except that it shall read from a given position
 36524 in the file without changing the file pointer. The first three arguments to *pread()* are the same as
 36525 *read()* with the addition of a fourth argument *offset* for the desired position inside the file. An
 36526 attempt to perform a *pread()* on a file that is incapable of seeking shall result in an error.

36527 RETURN VALUE

36528 XSI Upon successful completion, *read()* and *pread()* shall return a non-negative integer indicating the
 36529 number of bytes actually read. Otherwise, the functions shall return -1 and set *errno* to indicate
 36530 the error.

36531 ERRORS

36532 XSI The *read()* and *pread()* functions shall fail if:

36533 [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the process would be
 36534 delayed.

36535 [EBADF] The *fildev* argument is not a valid file descriptor open for reading.

36536 XSR [EBADMSG] The file is a STREAM file that is set to control-normal mode and the message
 36537 waiting to be read includes a control part.

36538 [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 36539 was transferred.

36540 XSR [EINVAL] The STREAM or multiplexer referenced by *fildev* is linked (directly or
 36541 indirectly) downstream from a multiplexer.

36542 [EIO] The process is a member of a background process attempting to read from its
 36543 controlling terminal, the process is ignoring or blocking the SIGTTIN signal,
 36544 or the process group is orphaned. This error may also be generated for
 36545 implementation-defined reasons.

36546 XSI [EISDIR] The *fildev* argument refers to a directory and the implementation does not
 36547 allow the directory to be read using *read()* or *pread()*. The *readdir()* function
 36548 should be used instead.

36549 [EOVERFLOW] The file is a regular file, *nbyte* is greater than 0, the starting position is before
 36550 the end-of-file, and the starting position is greater than or equal to the offset
 36551 maximum established in the open file description associated with *fildev*.

36552 The *read()* function shall fail if:

36553 [EAGAIN] or [EWOULDBLOCK]

36554 The file descriptor is for a socket, is marked O_NONBLOCK, and no data is
 36555 waiting to be received.

36556 [ECONNRESET] A read was attempted on a socket and the connection was forcibly closed by
 36557 its peer.

36558 [ENOTCONN] A read was attempted on a socket that is not connected.

36559 [ETIMEDOUT] A read was attempted on a socket and a transmission timeout occurred.

36560 XSI The `read()` and `pread()` functions may fail if:

36561 [EIO] A physical I/O error has occurred.

36562 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

36563 [ENOMEM] Insufficient memory was available to fulfill the request.

36564 [ENXIO] A request was made of a nonexistent device, or the request was outside the capabilities of the device.

36566 The `pread()` function shall fail, and the file pointer shall remain unchanged, if:

36567 XSI [EINVAL] The *offset* argument is invalid. The value is negative.

36568 XSI [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the file.

36570 XSI [ENXIO] A request was outside the capabilities of the device.

36571 XSI [ESPIPE] *fdes* is associated with a pipe or FIFO.

36572 EXAMPLES

36573 Reading Data into a Buffer

36574 The following example reads data from the file associated with the file descriptor *fd* into the
36575 buffer pointed to by *buf*.

```
36576 #include <sys/types.h>
36577 #include <unistd.h>
36578 ...
36579 char buf[20];
36580 size_t nbytes;
36581 ssize_t bytes_read;
36582 int fd;
36583 ...
36584 nbytes = sizeof(buf);
36585 bytes_read = read(fd, buf, nbytes);
36586 ...
```

36587 APPLICATION USAGE

36588 None.

36589 RATIONALE

36590 This volume of IEEE Std 1003.1-2001 does not specify the value of the file offset after an error is
36591 returned; there are too many cases. For programming errors, such as [EBADF], the concept is
36592 meaningless since no file is involved. For errors that are detected immediately, such as
36593 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,
36594 an updated value would be very useful and is the behavior of many implementations.

36595 Note that a `read()` of zero bytes does not modify *st_atime*. A `read()` that requests more than zero
36596 bytes, but returns zero, shall modify *st_atime*.

36597 Implementations are allowed, but not required, to perform error checking for `read()` requests of
36598 zero bytes.

Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as *lread()* and *lwrite()* (using and returning **longs**) were considered at one time. The current solution is to use abstract types on the ISO C standard function to *read()* and *write()*. The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of **size_t** also limit portable I/O requests to the same range. This volume of IEEE Std 1003.1-2001 also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an **int** can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of {PIPE_BUF} or any other size that would be an aid to applications portability.

This volume of IEEE Std 1003.1-2001 requires that no action be taken for *read()* or *write()* when *nbyte* is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of IEEE Std 1003.1-2001, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to *read()* and *write()* in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of IEEE Std 1003.1-2001. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a *read()* or *write()* that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, *select()*, whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for *select()* to be used before *read()* in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an “unrecoverable error”. It is considered beyond the scope of this volume of IEEE Std 1003.1-2001 to describe what happens in the case of hardware errors.

Previous versions of IEEE Std 1003.1-2001 allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that IEEE Std 1003.1-2001 should support only one of these behaviors. Historical practice on AT&T-derived systems was to have *read()* and *write()* return -1 and set *errno* to [EINTR] when interrupted after some, but not all, of the data requested had been transferred. However, the U.S. Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in

36647 which *read()* and *write()* return the number of bytes actually transferred before the interrupt. If
 36648 -1 is returned when any data is transferred, it is difficult to recover from the error on a seekable
 36649 device and impossible on a non-seekable device. Most new implementations support this
 36650 behavior. The behavior required by IEEE Std 1003.1-2001 is to return the number of bytes
 36651 transferred.

36652 IEEE Std 1003.1-2001 does not specify when an implementation that buffers *read()*s actually
 36653 moves the data into the user-supplied buffer, so an implementation may chose to do this at the
 36654 latest possible moment. Therefore, an interrupt arriving earlier may not cause *read()* to return a
 36655 partial byte count, but rather to return -1 and set *errno* to [EINTR].

36656 Consideration was also given to combining the two previous options, and setting *errno* to
 36657 [EINTR] while returning a short count. However, not only is there no existing practice that
 36658 implements this, it is also contradictory to the idea that when *errno* is set, the function
 36659 responsible shall return -1.

36660 FUTURE DIRECTIONS

36661 None.

36666 CHANGE HISTORY

36667 First released in Issue 1. Derived from Issue 1 of the SVID.

36668 Issue 5

36669 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 36670 Threads Extension.

36671 Large File Summit extensions are added.

36672 The *pread()* function is added.

36673 Issue 6

36674 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
 36675 marked as part of the XSI STREAMS Option Group.

36676 The following new requirements on POSIX implementations derive from alignment with the
 36677 Single UNIX Specification:

36678 • The DESCRIPTION now states that if *read()* is interrupted by a signal after it has successfully
 36679 read some data, it returns the number of bytes read. In Issue 3, it was optional whether *read()*
 36680 returned the number of bytes read, or whether it returned -1 with *errno* set to [EINTR]. This
 36681 is a FIPS requirement.

36682 • In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs
 36683 past the offset maximum established in the open file description associated with *files*. This
 36684 change is to support large files.

36685 • The [EOVERFLOW] mandatory error condition is added.

36686 • The [ENXIO] optional error condition is added.

36687 Text referring to sockets is added to the DESCRIPTION.

36688 The following changes were made to align with the IEEE P1003.1a draft standard:

36689 • The effect of reading zero bytes is clarified.

36690 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
36691 *read()* results are unspecified for typed memory objects.

36692 New RATIONALE is added to explain the atomicity requirements for input and output
36693 operations.

36694 The following error conditions are added for operations on sockets: [EAGAIN],
36695 [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

36696 The [EIO] error is changed to “may fail”.

36697 The following error conditions are added for operations on sockets: [ENOBUFFS] and
36698 [ENOMEM].

36699 The *readv()* function is split out into a separate reference page.

36700 **NAME**

36701 readdir, readdir_r — read a directory

36702 **SYNOPSIS**

36703 #include <dirent.h>

36704 struct dirent *readdir(DIR *dirp);

36705 TSF int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,

36706 struct dirent **restrict result);

36707

36708 **DESCRIPTION**

36709 The type **DIR**, which is defined in the <**dirent.h**> header, represents a *directory stream*, which is
 36710 an ordered sequence of all the directory entries in a particular directory. Directory entries
 36711 represent files; files may be removed from a directory or added to a directory asynchronously to
 36712 the operation of *readdir()*.

36713 The *readdir()* function shall return a pointer to a structure representing the directory entry at the
 36714 current position in the directory stream specified by the argument *dirp*, and position the
 36715 directory stream at the next entry. It shall return a null pointer upon reaching the end of the
 36716 directory stream. The structure **dirent** defined in the <**dirent.h**> header describes a directory
 36717 entry.

36718 The *readdir()* function shall not return directory entries containing empty names. If entries for
 36719 dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-
 36720 dot; otherwise, they shall not be returned.

36721 The pointer returned by *readdir()* points to data which may be overwritten by another call to
 36722 *readdir()* on the same directory stream. This data is not overwritten by another call to *readdir()*
 36723 on a different directory stream.

36724 If a file is removed from or added to the directory after the most recent call to *opendir()* or
 36725 *rewinddir()*, whether a subsequent call to *readdir()* returns an entry for that file is unspecified.

36726 The *readdir()* function may buffer several directory entries per actual read operation; *readdir()*
 36727 shall mark for update the *st_atime* field of the directory each time the directory is actually read.

36728 After a call to *fork()*, either the parent or child (but not both) may continue processing the
 36729 XSI directory stream using *readdir()*, *rewinddir()*, or *seekdir()*. If both the parent and child processes
 36730 use these functions, the result is undefined.

36731 If the entry names a symbolic link, the value of the *d_ino* member is unspecified.

36732 The *readdir()* function need not be reentrant. A function that is not required to be reentrant is not
 36733 required to be thread-safe.

36734 TSF The *readdir_r()* function shall initialize the **dirent** structure referenced by *entry* to represent the
 36735 directory entry at the current position in the directory stream referred to by *dirp*, store a pointer
 36736 to this structure at the location referenced by *result*, and position the directory stream at the next
 36737 entry.

36738 The storage pointed to by *entry* shall be large enough for a **dirent** with an array of **char** *d_name*
 36739 members containing at least {NAME_MAX}+1 elements.

36740 Upon successful return, the pointer returned at **result* shall have the same value as the argument
 36741 *entry*. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

36742 The *readdir_r()* function shall not return directory entries containing empty names.

36743 If a file is removed from or added to the directory after the most recent call to *opendir()* or
 36744 *rewinddir()*, whether a subsequent call to *readdir_r()* returns an entry for that file is unspecified.

36745 The *readdir_r()* function may buffer several directory entries per actual read operation; the
 36746 *readdir_r()* function shall mark for update the *st_atime* field of the directory each time the
 36747 directory is actually read.

36748 Applications wishing to check for error situations should set *errno* to 0 before calling *readdir()*. If
 36749 *errno* is set to non-zero on return, an error occurred.

36750 RETURN VALUE

36751 Upon successful completion, *readdir()* shall return a pointer to an object of type **struct dirent**.
 36752 When an error is encountered, a null pointer shall be returned and *errno* shall be set to indicate
 36753 the error. When the end of the directory is encountered, a null pointer shall be returned and *errno*
 36754 is not changed.

36755 TSF If successful, the *readdir_r()* function shall return zero; otherwise, an error number shall be
 36756 returned to indicate the error.

36757 ERRORS

36758 The *readdir()* function shall fail if:

36759 [EOVERFLOW] One of the values in the structure to be returned cannot be represented
 36760 correctly.

36761 The *readdir_r()* function may fail if:

36762 [EBADF] The *dirp* argument does not refer to an open directory stream.

36763 [ENOENT] The current position of the directory stream is invalid.

36764 The *readdir_r()* function may fail if:

36765 [EBADF] The *dirp* argument does not refer to an open directory stream.

36766 EXAMPLES

36767 The following sample program searches the current directory for each of the arguments supplied
 36768 on the command line.

```
36769 #include <dirent.h>
36770 #include <errno.h>
36771 #include <stdio.h>
36772 #include <string.h>

36773 static void lookup(const char *arg)
36774 {
36775     DIR *dirp;
36776     struct dirent *dp;

36777     if ((dirp = opendir(".")) == NULL) {
36778         perror("couldn't open '.');
36779         return;
36780     }

36781     do {
36782         errno = 0;
36783         if ((dp = readdir(dirp)) != NULL) {
36784             if (strcmp(dp->d_name, arg) != 0)
36785                 continue;
```

```

36786         (void) printf("found %s\n", arg);
36787         (void) closedir(dirp);
36788         return;
36789     }
36790     } while (dp != NULL);
36791     if (errno != 0)
36792         perror("error reading directory");
36793     else
36794         (void) printf("failed to find %s\n", arg);
36795     (void) closedir(dirp);
36796     return;
36797 }
36798 int main(int argc, char *argv[])
36799 {
36800     int i;
36801     for (i = 1; i < argc; i++)
36802         lookup(argv[i]);
36803     return (0);
36804 }

```

36805 APPLICATION USAGE

36806 The *readdir()* function should be used in conjunction with *opendir()*, *closedir()*, and *rewinddir()* to
 36807 examine the contents of the directory.

36808 The *readdir_r()* function is thread-safe and shall return values in a user-supplied buffer instead
 36809 of possibly using a static data area that may be overwritten by each call.

36810 RATIONALE

36811 The returned value of *readdir()* merely *represents* a directory entry. No equivalence should be
 36812 inferred.

36813 Historical implementations of *readdir()* obtain multiple directory entries on a single read
 36814 operation, which permits subsequent *readdir()* operations to operate from the buffered
 36815 information. Any wording that required each successful *readdir()* operation to mark the
 36816 directory *st_atime* field for update would disallow such historical performance-oriented
 36817 implementations.

36818 Since *readdir()* returns NULL when it detects an error and when the end of the directory is
 36819 encountered, an application that needs to tell the difference must set *errno* to zero before the call
 36820 and check it if NULL is returned. Since the function must not change *errno* in the second case
 36821 and must set it to a non-zero value in the first case, a zero *errno* after a call returning NULL
 36822 indicates end-of-directory; otherwise, an error.

36823 Routines to deal with this problem more directly were proposed:

```

36824 int derror (dirp)
36825 DIR *dirp;
36826 void clearderr (dirp)
36827 DIR *dirp;

```

36828 The first would indicate whether an error had occurred, and the second would clear the error
 36829 indication. The simpler method involving *errno* was adopted instead by requiring that *readdir()*
 36830 not change *errno* when end-of-directory is encountered.

36831 An error or signal indicating that a directory has changed while open was considered but
36832 rejected.

36833 The thread-safe version of the directory reading function returns values in a user-supplied buffer
36834 instead of possibly using a static data area that may be overwritten by each call. Either the
36835 {NAME_MAX} compile-time constant or the corresponding *pathconf()* option can be used to
36836 determine the maximum sizes of returned pathnames.

36837 FUTURE DIRECTIONS

36838 None.

36842 CHANGE HISTORY

36843 First released in Issue 2.

36844 Issue 5

36845 Large File Summit extensions are added.

36846 The *readdir_r()* function is included for alignment with the POSIX Threads Extension.

36847 A note indicating that the *readdir()* function need not be reentrant is added to the
36848 DESCRIPTION.

36849 Issue 6

36850 The *readdir_r()* function is marked as part of the Thread-Safe Functions option.

36851 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r()*.

36852 The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful
36853 return for the *readdir_r()* function.

36854 The following new requirements on POSIX implementations derive from alignment with the
36855 Single UNIX Specification:

- 36856 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
36857 required for conforming implementations of previous POSIX specifications, it was not
36858 required for UNIX applications.
- 36859 • A statement is added to the DESCRIPTION indicating the disposition of certain fields in
36860 **struct dirent** when an entry refers to a symbolic link.
- 36861 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
36862 files.
- 36863 • The [ENOENT] optional error condition is added.

36864 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
36865 its avoidance of possibly using a static data area.

36866 The **restrict** keyword is added to the *readdir_r()* prototype for alignment with the
36867 ISO/IEC 9899:1999 standard.

36868 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES
36869 section with a new example. |

36870 **NAME**

36871 readlink — read the contents of a symbolic link

36872 **SYNOPSIS**

36873 #include <unistd.h>

36874 ssize_t readlink(const char *restrict path, char *restrict buf,
 36875 size_t bufsize);

36876 **DESCRIPTION**

36877 The *readlink()* function shall place the contents of the symbolic link referred to by *path* in the
 36878 buffer *buf* which has size *bufsize*. If the number of bytes in the symbolic link is less than *bufsize*,
 36879 the contents of the remainder of *buf* are unspecified. If the *buf* argument is not large enough to
 36880 contain the link content, the first *bufsize* bytes shall be placed in *buf*.

36881 If the value of *bufsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

36882 **RETURN VALUE**

36883 Upon successful completion, *readlink()* shall return the count of bytes placed in the buffer.
 36884 Otherwise, it shall return a value of -1, leave the buffer unchanged, and set *errno* to indicate the
 36885 error.

36886 **ERRORS**

36887 The *readlink()* function shall fail if:

36888 [EACCES] Search permission is denied for a component of the path prefix of *path*.

36889 [EINVAL] The *path* argument names a file that is not a symbolic link.

36890 [EIO] An I/O error occurred while reading from the file system.

36891 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 36892 argument.

36893 [ENAMETOOLONG]

36894 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 36895 component is longer than {NAME_MAX}.

36896 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

36897 [ENOTDIR] A component of the path prefix is not a directory.

36898 The *readlink()* function may fail if:

36899 [EACCES] Read permission is denied for the directory.

36900 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 36901 resolution of the *path* argument.

36902 [ENAMETOOLONG]

36903 As a result of encountering a symbolic link in resolution of the *path* argument,
 36904 the length of the substituted pathname string exceeded {PATH_MAX}.

36905 **EXAMPLES**36906 **Reading the Name of a Symbolic Link**

36907 The following example shows how to read the name of a symbolic link named **/modules/pass1**.

```
36908 #include <unistd.h>
36909 char buf[1024];
36910 ssize_t len;
36911 ...
36912 if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
36913     buf[len] = '\0';
```

36914 **APPLICATION USAGE**

36915 Conforming applications should not assume that the returned contents of the symbolic link are
 36916 null-terminated.

36917 **RATIONALE**

36918 Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links,
 36919 there is no requirement that file times be updated by *readlink()*. The type associated with *bufsiz*
 36920 is a **size_t** in order to be consistent with both the ISO C standard and the definition of *read()*.
 36921 The behavior specified for *readlink()* when *bufsiz* is zero represents historical practice. For this
 36922 case, the standard developers considered a change whereby *readlink()* would return the number
 36923 of non-null bytes contained in the symbolic link with the buffer *buf* remaining unchanged;
 36924 however, since the **stat** structure member *st_size* value can be used to determine the size of
 36925 buffer necessary to contain the contents of the symbolic link as returned by *readlink()*, this
 36926 proposal was rejected, and the historical practice retained.

36927 **FUTURE DIRECTIONS**

36928 None.

36929 **SEE ALSO**

36930 *lstat()*, *stat()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

36931 **CHANGE HISTORY**

36932 First released in Issue 4, Version 2.

36933 **Issue 5**

36934 Moved from X/OPEN UNIX extension to BASE.

36935 **Issue 6**

36936 The return type is changed to **ssize_t**, to align with the IEEE P1003.1a draft standard.

36937 The following new requirements on POSIX implementations derive from alignment with the
 36938 Single UNIX Specification:

- 36939 • This function is made mandatory.
- 36940 • In this function it is possible for the return value to exceed the range of the type **ssize_t** (since
 36941 **size_t** has a larger range of positive values than **ssize_t**). A sentence restricting the size of
 36942 the **size_t** object is added to the description to resolve this conflict.

36943 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 36944 • The FUTURE DIRECTIONS section is changed to None.

36945 The following changes were made to align with the IEEE P1003.1a draft standard:

- 36946 • The [ELOOP] optional error condition is added.

36947 The **restrict** keyword is added to the *readlink()* prototype for alignment with the
36948 ISO / IEC 9899:1999 standard.

36949 **NAME**

36950 readv — read a vector

36951 **SYNOPSIS**

36952 xSI #include <sys/uio.h>

36953 ssize_t readv(int *fildes*, const struct iovec **iov*, int *iovcnt*);

36954

36955 **DESCRIPTION**

36956 The *readv()* function shall be equivalent to *read()*, except as described below. The *readv()*
 36957 function shall place the input data into the *iovcnt* buffers specified by the members of the *iov*
 36958 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than
 36959 or equal to {IOV_MAX}.

36960 Each *iovec* entry specifies the base address and length of an area in memory where data should
 36961 be placed. The *readv()* function shall always fill an area completely before proceeding to the
 36962 next.

36963 Upon successful completion, *readv()* shall mark for update the *st_atime* field of the file.

36964 **RETURN VALUE**36965 Refer to *read()*.36966 **ERRORS**36967 Refer to *read()*.36968 In addition, the *readv()* function shall fail if:

36969 [EINVAL] The sum of the *iov_len* values in the *iov* array overflowed an **ssize_t**.

36970 The *readv()* function may fail if:

36971 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

36972 **EXAMPLES**36973 **Reading Data into an Array**

36974 The following example reads data from the file associated with the file descriptor *fd* into the
 36975 buffers specified by members of the *iov* array.

```

36976 #include <sys/types.h>
36977 #include <sys/uio.h>
36978 #include <unistd.h>
36979 ...
36980 ssize_t bytes_read;
36981 int fd;
36982 char buf0[20];
36983 char buf1[30];
36984 char buf2[40];
36985 int iovcnt;
36986 struct iovec iov[3];

36987 iov[0].iov_base = buf0;
36988 iov[0].iov_len = sizeof(buf0);
36989 iov[1].iov_base = buf1;
36990 iov[1].iov_len = sizeof(buf1);
36991 iov[2].iov_base = buf2;
36992 iov[2].iov_len = sizeof(buf2);

```

```
36993     ...
36994     iovcnt = sizeof(iov) / sizeof(struct iovec);
36995     bytes_read = readv(fd, iov, iovcnt);
36996     ...
```

36997 **APPLICATION USAGE**

36998 None.

36999 **RATIONALE**

37000 Refer to *read()*.

37001 **FUTURE DIRECTIONS**

37002 None.

37003 **SEE ALSO**

37004 *read()*, *writew()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/uio.h**>

37005 **CHANGE HISTORY**

37006 First released in Issue 4, Version 2.

37007 **Issue 6**

37008 Split out from the *read()* reference page.

37009 **NAME**

37010 realloc — memory reallocator

37011 **SYNOPSIS**

37012 #include <stdlib.h>

37013 void *realloc(void *ptr, size_t size);

37014 **DESCRIPTION**

37015 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37016 conflict between the requirements described here and the ISO C standard is unintentional. This
 37017 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37018 The *realloc()* function shall change the size of the memory object pointed to by *ptr* to the size
 37019 specified by *size*. The contents of the object shall remain unchanged up to the lesser of the new
 37020 and old sizes. If the new size of the memory object would require movement of the object, the
 37021 space for the previous instantiation of the object is freed. If the new size is larger, the contents of
 37022 the newly allocated portion of the object are unspecified. If *size* is 0 and *ptr* is not a null pointer,
 37023 the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

37024 If *ptr* is a null pointer, *realloc()* shall be equivalent to *malloc()* for the specified size.

37025 If *ptr* does not match a pointer returned earlier by *calloc()*, *malloc()*, or *realloc()* or if the space has
 37026 previously been deallocated by a call to *free()* or *realloc()*, the behavior is undefined.

37027 The order and contiguity of storage allocated by successive calls to *realloc()* is unspecified. The
 37028 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
 37029 a pointer to any type of object and then used to access such an object in the space allocated (until
 37030 the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
 37031 disjoint from any other object. The pointer returned shall point to the start (lowest byte address)
 37032 of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

37033 **RETURN VALUE**

37034 Upon successful completion with a size not equal to 0, *realloc()* shall return a pointer to the
 37035 (possibly moved) allocated space. If *size* is 0, either a null pointer or a unique pointer that can be
 37036 successfully passed to *free()* shall be returned. If there is not enough available memory, *realloc()*
 37037 CX shall return a null pointer and set *errno* to [ENOMEM].

37038 **ERRORS**37039 The *realloc()* function shall fail if:

37040 CX [ENOMEM] Insufficient memory is available.

37041 **EXAMPLES**

37042 None.

37043 **APPLICATION USAGE**

37044 None.

37045 **RATIONALE**

37046 None.

37047 **FUTURE DIRECTIONS**

37048 None.

37049 **SEE ALSO**37050 *calloc()*, *free()*, *malloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

37051 **CHANGE HISTORY**

37052 First released in Issue 1. Derived from Issue 1 of the SVID.

37053 **Issue 6**

37054 Extensions beyond the ISO C standard are marked.

37055 The following new requirements on POSIX implementations derive from alignment with the
37056 Single UNIX Specification:

- 37057 • In the RETURN VALUE section, if there is not enough available memory, the setting of *errno*
37058 to [ENOMEM] is added.
- 37059 • The [ENOMEM] error condition is added.

37060 **NAME**

37061 realpath — resolve a pathname

37062 **SYNOPSIS**

37063 xSI #include <stdlib.h>

```
37064       char *realpath(const char *restrict file_name,
37065                      char *restrict resolved_name);
```

37066

37067 **DESCRIPTION**

37068 The *realpath()* function shall derive, from the pathname pointed to by *file_name*, an absolute
 37069 pathname that names the same file, whose resolution does not involve '.', '..', or symbolic
 37070 links. The generated pathname shall be stored as a null-terminated string, up to a maximum of
 37071 {PATH_MAX} bytes, in the buffer pointed to by *resolved_name*.

37072 If *resolved_name* is a null pointer, the behavior of *realpath()* is implementation-defined.

37073 **RETURN VALUE**

37074 Upon successful completion, *realpath()* shall return a pointer to the resolved name. Otherwise,
 37075 *realpath()* shall return a null pointer and set *errno* to indicate the error, and the contents of the
 37076 buffer pointed to by *resolved_name* are undefined.

37077 **ERRORS**

37078 The *realpath()* function shall fail if:

37079	[EACCES]	Read or search permission was denied for a component of <i>file_name</i> .
37080	[EINVAL]	The <i>file_name</i> argument is a null pointer.
37081	[EIO]	An error occurred while reading from the file system.
37082	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
37083		
37084	[ENAMETOOLONG]	
37085		The length of the <i>file_name</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
37086		
37087	[ENOENT]	A component of <i>file_name</i> does not name an existing file or <i>file_name</i> points to an empty string.
37088		
37089	[ENOTDIR]	A component of the path prefix is not a directory.

37090 The *realpath()* function may fail if:

37091	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
37092		
37093	[ENAMETOOLONG]	
37094		Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
37095		
37096	[ENOMEM]	Insufficient storage space is available.

37097 **EXAMPLES**37098 **Generating an Absolute Pathname**

37099 The following example generates an absolute pathname for the file identified by the *symlinkpath*
 37100 argument. The generated pathname is stored in the *actualpath* array.

```
37101 #include <stdlib.h>
37102 ...
37103 char *symlinkpath = "/tmp/symlink/file";
37104 char actualpath [PATH_MAX+1];
37105 char *ptr;
37106 ptr = realpath(symlinkpath, actualpath);
```

37107 **APPLICATION USAGE**

37108 None.

37109 **RATIONALE**

37110 Since the maximum pathname length is arbitrary unless {PATH_MAX} is defined, an application
 37111 generally cannot supply a *resolved_name* buffer with size {{PATH_MAX}+1}.

37112 **FUTURE DIRECTIONS**

37113 In the future, passing a null pointer to *realpath()* for the *resolved_name* argument may be defined
 37114 to have *realpath()* allocate space for the generated pathname.

37115 **SEE ALSO**

37116 *getcwd()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

37117 **CHANGE HISTORY**

37118 First released in Issue 4, Version 2.

37119 **Issue 5**

37120 Moved from X/OPEN UNIX extension to BASE.

37121 **Issue 6**

37122 The **restrict** keyword is added to the *realpath()* prototype for alignment with the
 37123 ISO/IEC 9899:1999 standard.

37124 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
 37125 [ELOOP] error condition is added.

37126 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the
 37127 DESCRIPTION for the case when *resolved_name* is a null pointer, changing the [EINVAL] error
 37128 text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.

37129 **NAME**

37130 recv — receive a message from a connected socket

37131 **SYNOPSIS**

37132 #include <sys/socket.h>

37133 ssize_t recv(int *socket*, void **buffer*, size_t *length*, int *flags*);37134 **DESCRIPTION**

37135 The *recv()* function shall receive a message from a connection-mode or connectionless-mode
 37136 socket. It is normally used with connected sockets because it does not permit the application to
 37137 retrieve the source address of received data.

37138 The *recv()* function takes the following arguments:

37139	<i>socket</i>	Specifies the socket file descriptor.
37140	<i>buffer</i>	Points to a buffer where the message should be stored.
37141	<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
37142	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
37144	MSG_PEEK	Peeks at an incoming message. The data is treated as unread and the next <i>recv()</i> or similar function shall still return this data.
37146	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
37148	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.

37154 The *recv()* function shall return the length of the message written to the buffer pointed to by the
 37155 *buffer* argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET,
 37156 the entire message shall be read in a single operation. If a message is too long to fit in the
 37157 supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess bytes shall be
 37158 discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be
 37159 ignored. In this case, data shall be returned to the user as soon as it becomes available, and no
 37160 data shall be discarded.

37161 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 37162 message.

37163 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 37164 descriptor, *recv()* shall block until a message arrives. If no messages are available at the socket
 37165 and O_NONBLOCK is set on the socket's file descriptor, *recv()* shall fail and set *errno* to
 37166 [EAGAIN] or [EWOULDBLOCK].

37167 **RETURN VALUE**

37168 Upon successful completion, *recv()* shall return the length of the message in bytes. If no
 37169 messages are available to be received and the peer has performed an orderly shutdown, *recv()*
 37170 shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

37171 **ERRORS**37172 The *recv()* function shall fail if:

37173 [EAGAIN] or [EWOULDBLOCK]

37174 The socket's file descriptor is marked O_NONBLOCK and no data is waiting
 37175 to be received; or MSG_OOB is set and no out-of-band data is available and
 37176 either the socket's file descriptor is marked O_NONBLOCK or the socket does
 37177 not support blocking to await out-of-band data.

37178 [EBADF] The *socket* argument is not a valid file descriptor.

37179 [ECONNRESET] A connection was forcibly closed by a peer.

37180 [EINTR] The *recv()* function was interrupted by a signal that was caught, before any
 37181 data was available.

37182 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

37183 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

37184 [ENOTSOCK] The *socket* argument does not refer to a socket.

37185 [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.

37186 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
 37187 transmission timeout on active connection.

37188 The *recv()* function may fail if:

37189 [EIO] An I/O error occurred while reading from or writing to the file system.

37190 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

37191 [ENOMEM] Insufficient memory was available to fulfill the request.

37192 **EXAMPLES**

37193 None.

37194 **APPLICATION USAGE**

37195 The *recv()* function is equivalent to *recvfrom()* with a zero *address_len* argument, and to *read()* if
 37196 no flags are used.

37197 The *select()* and *poll()* functions can be used to determine when data is available to be received.37198 **RATIONALE**

37199 None.

37200 **FUTURE DIRECTIONS**

37201 None.

37202 **SEE ALSO**

37205 **CHANGE HISTORY**

37206 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37207 **NAME**

37208 recvfrom — receive a message from a socket

37209 **SYNOPSIS**

37210 #include <sys/socket.h>

```
37211       ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
37212                       int flags, struct sockaddr *restrict address,
37213                       socklen_t *restrict address_len);
```

37214 **DESCRIPTION**

37215 The *recvfrom()* function shall receive a message from a connection-mode or connectionless-mode
 37216 socket. It is normally used with connectionless-mode sockets because it permits the application
 37217 to retrieve the source address of received data.

37218 The *recvfrom()* function takes the following arguments:

37219	<i>socket</i>	Specifies the socket file descriptor.
37220	<i>buffer</i>	Points to the buffer where the message should be stored.
37221	<i>length</i>	Specifies the length in bytes of the buffer pointed to by the <i>buffer</i> argument.
37222	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed 37223 by logically OR'ing zero or more of the following values:
37224	MSG_PEEK	Peeks at an incoming message. The data is treated as unread 37225 and the next <i>recvfrom()</i> or similar function shall still return 37226 this data.
37227	MSG_OOB	Requests out-of-band data. The significance and semantics 37228 of out-of-band data are protocol-specific.
37229	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function 37230 block until the full amount of data can be returned. The 37231 function may return the smaller amount of data if the socket 37232 is a message-based socket, if a signal is caught, if the 37233 connection is terminated, if MSG_PEEK was specified, or if 37234 an error is pending for the socket.
37235	<i>address</i>	A null pointer, or points to a sockaddr structure in which the sending address 37236 is to be stored. The length and format of the address depend on the address 37237 family of the socket.
37238	<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> 37239 argument.

37240 The *recvfrom()* function shall return the length of the message written to the buffer pointed to by
 37241 RS the *buffer* argument. For message-based sockets, such as SOCK_RAW, SOCK_DGRAM, and
 37242 SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too
 37243 long to fit in the supplied buffer, and MSG_PEEK is not set in the *flags* argument, the excess
 37244 bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message
 37245 boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes
 37246 available, and no data shall be discarded.

37247 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 37248 message.

37249 Not all protocols provide the source address for messages. If the *address* argument is not a null
 37250 pointer and the protocol provides the source address of messages, the source address of the

37251 received message shall be stored in the **sockaddr** structure pointed to by the *address* argument,
 37252 and the length of this address shall be stored in the object pointed to by the *address_len*
 37253 argument.

37254 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 37255 the stored address shall be truncated.

37256 If the *address* argument is not a null pointer and the protocol does not provide the source address
 37257 of messages, the value stored in the object pointed to by *address* is unspecified.

37258 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 37259 descriptor, *recvfrom()* shall block until a message arrives. If no messages are available at the
 37260 socket and O_NONBLOCK is set on the socket's file descriptor, *recvfrom()* shall fail and set *errno*
 37261 to [EAGAIN] or [EWOULDBLOCK].

37262 RETURN VALUE

37263 Upon successful completion, *recvfrom()* shall return the length of the message in bytes. If no
 37264 messages are available to be received and the peer has performed an orderly shutdown,
 37265 *recvfrom()* shall return 0. Otherwise, the function shall return -1 and set *errno* to indicate the
 37266 error.

37267 ERRORS

37268 The *recvfrom()* function shall fail if:

37269 [EAGAIN] or [EWOULDBLOCK]

37270 The socket's file descriptor is marked O_NONBLOCK and no data is waiting
 37271 to be received; or MSG_OOB is set and no out-of-band data is available and
 37272 either the socket's file descriptor is marked O_NONBLOCK or the socket does
 37273 not support blocking to await out-of-band data.

37274 [EBADF] The *socket* argument is not a valid file descriptor.

37275 [ECONNRESET] A connection was forcibly closed by a peer.

37276 [EINTR] A signal interrupted *recvfrom()* before any data was available.

37277 [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

37278 [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

37279 [ENOTSOCK] The *socket* argument does not refer to a socket.

37280 [EOPNOTSUPP] The specified flags are not supported for this socket type.

37281 [ETIMEDOUT] The connection timed out during connection establishment, or due to a
 37282 transmission timeout on active connection.

37283 The *recvfrom()* function may fail if:

37284 [EIO] An I/O error occurred while reading from or writing to the file system.

37285 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

37286 [ENOMEM] Insufficient memory was available to fulfill the request.

37287 **EXAMPLES**

37288 None.

37289 **APPLICATION USAGE**37290 The *select()* and *poll()* functions can be used to determine when data is available to be received.37291 **RATIONALE**

37292 None.

37293 **FUTURE DIRECTIONS**

37294 None.

37295 **SEE ALSO**

37297 the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>

37298 **CHANGE HISTORY**

37299 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37300 **NAME**

37301 recvmsg — receive a message from a socket

37302 **SYNOPSIS**

37303 #include <sys/socket.h>

37304 ssize_t recvmsg(int *socket*, struct msghdr **message*, int *flags*);37305 **DESCRIPTION**

37306 The *recvmsg()* function shall receive a message from a connection-mode or connectionless-mode
 37307 socket. It is normally used with connectionless-mode sockets because it permits the application
 37308 to retrieve the source address of received data.

37309 The *recvmsg()* function takes the following arguments:

37310	<i>socket</i>	Specifies the socket file descriptor.
37311	<i>message</i>	Points to a msghdr structure, containing both the buffer to store the source address and the buffers for the incoming message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored on input, but may contain meaningful values on output.
37312		
37313		
37314		
37315	<i>flags</i>	Specifies the type of message reception. Values of this argument are formed by logically OR'ing zero or more of the following values:
37316		
37317	MSG_OOB	Requests out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
37318		
37319	MSG_PEEK	Peeks at the incoming message.
37320	MSG_WAITALL	On SOCK_STREAM sockets this requests that the function block until the full amount of data can be returned. The function may return the smaller amount of data if the socket is a message-based socket, if a signal is caught, if the connection is terminated, if MSG_PEEK was specified, or if an error is pending for the socket.
37321		
37322		
37323		
37324		
37325		

37326 The *recvmsg()* function shall receive messages from unconnected or connected sockets and shall
 37327 return the length of the message.

37328 The *recvmsg()* function shall return the total length of the message. For message-based sockets,
 37329 such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single
 37330 operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the
 37331 *flags* argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the
 37332 *msg_flags* member of the **msghdr** structure. For stream-based sockets, such as SOCK_STREAM,
 37333 message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it
 37334 becomes available, and no data shall be discarded.

37335 If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
 37336 message.

37337 If no messages are available at the socket and O_NONBLOCK is not set on the socket's file
 37338 descriptor, *recvmsg()* shall block until a message arrives. If no messages are available at the
 37339 socket and O_NONBLOCK is set on the socket's file descriptor, the *recvmsg()* function shall fail
 37340 and set *errno* to [EAGAIN] or [EWOULDBLOCK].

37341 In the **msghdr** structure, the *msg_name* and *msg_namelen* members specify the source address if
 37342 the socket is unconnected. If the socket is connected, the *msg_name* and *msg_namelen* members
 37343 shall be ignored. The *msg_name* member may be a null pointer if no names are desired or
 37344 required. The *msg_iov* and *msg_iovlen* fields are used to specify where the received data shall be

37345 stored. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of
 37346 this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field
 37347 gives its size in bytes. Each storage area indicated by *msg_iov* is filled with received data in turn
 37348 until all of the received data is stored or all of the areas have been filled.

37349 Upon successful completion, the *msg_flags* member of the message header shall be the bitwise-
 37350 inclusive OR of all of the following flags that indicate conditions detected for the received
 37351 message:

37352	MSG_EOR	End-of-record was received (if supported by the protocol).
37353	MSG_OOB	Out-of-band data was received.
37354	MSG_TRUNC	Normal data was truncated.
37355	MSG_CTRUNC	Control data was truncated.

37356 RETURN VALUE

37357 Upon successful completion, *recvmsg()* shall return the length of the message in bytes. If no
 37358 messages are available to be received and the peer has performed an orderly shutdown,
 37359 *recvmsg()* shall return 0. Otherwise, -1 shall be returned and *errno* set to indicate the error.

37360 ERRORS

37361 The *recvmsg()* function shall fail if:

37362	[EAGAIN] or [EWOULDBLOCK]	
37363		The socket's file descriptor is marked O_NONBLOCK and no data is waiting
37364		to be received; or MSG_OOB is set and no out-of-band data is available and
37365		either the socket's file descriptor is marked O_NONBLOCK or the socket does
37366		not support blocking to await out-of-band data.

37367	[EBADF]	The <i>socket</i> argument is not a valid open file descriptor.

37368	[ECONNRESET]	A connection was forcibly closed by a peer.

37369	[EINTR]	This function was interrupted by a signal before any data was available.

37370	[EINVAL]	The sum of the <i>iov_len</i> values overflows a ssize_t , or the MSG_OOB flag is set
37371		and no out-of-band data is available.

37372	[EMSGSIZE]	The <i>msg_iovlen</i> member of the msghdr structure pointed to by <i>message</i> is less
37373		than or equal to 0, or is greater than {IOV_MAX}.

37374	[ENOTCONN]	A receive is attempted on a connection-mode socket that is not connected.

37375	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.

37376	[EOPNOTSUPP]	The specified flags are not supported for this socket type.

37377	[ETIMEDOUT]	The connection timed out during connection establishment, or due to a
37378		transmission timeout on active connection.

37379 The *recvmsg()* function may fail if:

37380	[EIO]	An I/O error occurred while reading from or writing to the file system.

37381	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.

37382	[ENOMEM]	Insufficient memory was available to fulfill the request.

37383 **EXAMPLES**

37384 None.

37385 **APPLICATION USAGE**37386 The *select()* and *poll()* functions can be used to determine when data is available to be received.37387 **RATIONALE**

37388 None.

37389 **FUTURE DIRECTIONS**

37390 None.

37391 **SEE ALSO**37392 *poll()*, *recv()*, *recvfrom()*, *select()*, *send()*, *sendmsg()*, *sendto()*, *shutdown()*, *socket()*, the Base37393 Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>37394 **CHANGE HISTORY**

37395 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

37396 **NAME**

37397 regcomp, regerror, regex, regfree — regular expression matching

37398 **SYNOPSIS**

37399 #include <regex.h>

```

37400 int regcomp(regex_t *restrict preg, const char *restrict pattern,
37401             int cflags);
37402 size_t regerror(int errcode, const regex_t *restrict preg,
37403                char *restrict errbuf, size_t errbuf_size);
37404 int regexexec(const regex_t *restrict preg, const char *restrict string,
37405               size_t nmatch, regmatch_t pmatch[restrict], int eflags);
37406 void regfree(regex_t *preg);

```

37407 **DESCRIPTION**

37408 These functions interpret *basic* and *extended* regular expressions as described in the Base
 37409 Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular Expressions.

37410 The **regex_t** structure is defined in <**regex.h**> and contains at least the following member:

Member Type	Member Name	Description
size_t	re_nsub	Number of parenthesized subexpressions.

37414 The **regmatch_t** structure is defined in <**regex.h**> and contains at least the following members:

Member Type	Member Name	Description
regoff_t	rm_so	Byte offset from start of <i>string</i> to start of substring.
regoff_t	rm_eo	Byte offset from start of <i>string</i> of the first character after the end of substring.

37420 The *regcomp()* function shall compile the regular expression contained in the string pointed to by
 37421 the *pattern* argument and place the results in the structure pointed to by *preg*. The *cflags*
 37422 argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in
 37423 the <**regex.h**> header:

37424	REG_EXTENDED	Use Extended Regular Expressions.
37425	REG_ICASE	Ignore case in match. (See the Base Definitions volume of 37426 IEEE Std 1003.1-2001, Chapter 9, Regular Expressions.)
37427	REG_NOSUB	Report only success / fail in <i>regexexec()</i> .
37428	REG_NEWLINE	Change the handling of <newline>s, as described in the text.

37429 The default regular expression type for *pattern* is a Basic Regular Expression. The application can
 37430 specify Extended Regular Expressions using the REG_EXTENDED *cflags* flag.

37431 If the REG_NOSUB flag was not set in *cflags*, then *regcomp()* shall set *re_nsub* to the number of
 37432 parenthesized subexpressions (delimited by "\(\)" in basic regular expressions or "()" in
 37433 extended regular expressions) found in *pattern*.

37434 The *regexexec()* function compares the null-terminated string specified by *string* with the compiled
 37435 regular expression *preg* initialized by a previous call to *regcomp()*. If it finds a match, *regexexec()*
 37436 shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The
 37437 *eflags* argument is the bitwise-inclusive OR of zero or more of the following flags, which are
 37438 defined in the <**regex.h**> header:

37439 REG_NOTBOL The first character of the string pointed to by *string* is not the beginning of the
 37440 line. Therefore, the circumflex character ('^'), when taken as a special
 37441 character, shall not match the beginning of *string*.

37442 REG_NOTEOL The last character of the string pointed to by *string* is not the end of the line.
 37443 Therefore, the dollar sign ('\$'), when taken as a special character, shall not
 37444 match the end of *string*.

37445 If *nmatch* is 0 or REG_NOSUB was set in the *cflags* argument to *regcomp()*, then *regexec()* shall
 37446 ignore the *pmatch* argument. Otherwise, the application shall ensure that the *pmatch* argument
 37447 points to an array with at least *nmatch* elements, and *regexec()* shall fill in the elements of that
 37448 array with offsets of the substrings of *string* that correspond to the parenthesized subexpressions
 37449 of *pattern*: *pmatch[i].rm_so* shall be the byte offset of the beginning and *pmatch[i].rm_eo* shall be
 37450 one greater than the byte offset of the end of substring *i*. (Subexpression *i* begins at the *i*th
 37451 matched open parenthesis, counting from 1.) Offsets in *pmatch[0]* identify the substring that
 37452 corresponds to the entire regular expression. Unused elements of *pmatch* up to *pmatch[nmatch-1]*
 37453 shall be filled with -1. If there are more than *nmatch* subexpressions in *pattern* (*pattern* itself
 37454 counts as a subexpression), then *regexec()* shall still do the match, but shall record only the first
 37455 *nmatch* substrings.

37456 When matching a basic or extended regular expression, any given parenthesized subexpression
 37457 of *pattern* might participate in the match of several different substrings of *string*, or it might not
 37458 match any substring even though the pattern as a whole did match. The following rules shall be
 37459 used to determine which substrings to report in *pmatch* when matching regular expressions:

- 37460 1. If subexpression *i* in a regular expression is not contained within another subexpression,
 37461 and it participated in the match several times, then the byte offsets in *pmatch[i]* shall
 37462 delimit the last such match.
- 37463 2. If subexpression *i* is not contained within another subexpression, and it did not participate
 37464 in an otherwise successful match, the byte offsets in *pmatch[i]* shall be -1. A subexpression
 37465 does not participate in the match when:

37466 ' * ' or "\{\}" appears immediately after the subexpression in a basic regular
 37467 expression, or ' * ', ' ? ', or "{ }" appears immediately after the subexpression in an
 37468 extended regular expression, and the subexpression did not match (matched 0 times)

37469 or:

37470 ' | ' is used in an extended regular expression to select this subexpression or another,
 37471 and the other subexpression matched.

- 37472 3. If subexpression *i* is contained within another subexpression *j*, and *i* is not contained
 37473 within any other subexpression that is contained within *j*, and a match of subexpression *j*
 37474 is reported in *pmatch[j]*, then the match or non-match of subexpression *i* reported in
 37475 *pmatch[i]* shall be as described in 1. and 2. above, but within the substring reported in
 37476 *pmatch[j]* rather than the whole string. The offsets in *pmatch[i]* are still relative to the start
 37477 of *string*.

- 37478 4. If subexpression *i* is contained in subexpression *j*, and the byte offsets in *pmatch[j]* are -1,
 37479 then the pointers in *pmatch[i]* shall also be -1.

- 37480 5. If subexpression *i* matched a zero-length string, then both byte offsets in *pmatch[i]* shall be
 37481 the byte offset of the character or null terminator immediately following the zero-length
 37482 string.

37483 If, when *regexec()* is called, the locale is different from when the regular expression was
 37484 compiled, the result is undefined.

37485 If REG_NEWLINE is not set in *cflags*, then a <newline> in *pattern* or *string* shall be treated as an
 37486 ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary
 37487 character except as follows:

- 37488 1. A <newline> in *string* shall not be matched by a period outside a bracket expression or by
 37489 any form of a non-matching list (see the Base Definitions volume of IEEE Std 1003.1-2001,
 37490 Chapter 9, Regular Expressions).
- 37491 2. A circumflex ('^') in *pattern*, when used to specify expression anchoring (see the Base
 37492 Definitions volume of IEEE Std 1003.1-2001, Section 9.3.8, BRE Expression Anchoring),
 37493 shall match the zero-length string immediately after a <newline> in *string*, regardless of
 37494 the setting of REG_NOTBOL.
- 37495 3. A dollar sign ('\$') in *pattern*, when used to specify expression anchoring, shall match the
 37496 zero-length string immediately before a <newline> in *string*, regardless of the setting of
 37497 REG_NOTEOL.

37498 The *regfree()* function frees any memory allocated by *regcomp()* associated with *preg*.

37499 The following constants are defined as error return values:

37500	REG_NOMATCH	<i>regexec()</i> failed to match.
37501	REG_BADPAT	Invalid regular expression.
37502	REG_ECOLLATE	Invalid collating element referenced.
37503	REG_ETYPE	Invalid character class type referenced.
37504	REG_EESCAPE	Trailing '\\' in pattern.
37505	REG_ESUBREG	Number in "\digit" invalid or in error.
37506	REG_EBRACK	"[]" imbalance.
37507	REG_EPAREN	"\(\)" or "()" imbalance.
37508	REG_EBRACE	"\{\}" imbalance.
37509	REG_BADBR	Content of "\{\}" invalid: not a number, number too large, more than 37510 two numbers, first larger than second.
37511	REG_ERANGE	Invalid endpoint in range expression.
37512	REG_ESPACE	Out of memory.
37513	REG_BADRPT	'?', '*', or '+' not preceded by valid regular expression.

37514 The *regerror()* function provides a mapping from error codes returned by *regcomp()* and
 37515 *regexec()* to unspecified printable strings. It generates a string corresponding to the value of the
 37516 *errcode* argument, which the application shall ensure is the last non-zero value returned by
 37517 *regcomp()* or *regexec()* with the given value of *preg*. If *errcode* is not such a value, the content of
 37518 the generated string is unspecified.

37519 If *preg* is a null pointer, but *errcode* is a value returned by a previous call to *regexec()* or *regcomp()*,
 37520 the *regerror()* still generates an error string corresponding to the value of *errcode*, but it might not
 37521 be as detailed under some implementations.

37522 If the *errbuf_size* argument is not 0, *regerror()* shall place the generated string into the buffer of
 37523 size *errbuf_size* bytes pointed to by *errbuf*. If the string (including the terminating null) cannot fit
 37524 in the buffer, *regerror()* shall truncate the string and null-terminate the result.

37525 If *errbuf_size* is 0, *regerror()* shall ignore the *errbuf* argument, and return the size of the buffer
 37526 needed to hold the generated string.

37527 If the *preg* argument to *regex()* or *regfree()* is not a compiled regular expression returned by
 37528 *regcomp()*, the result is undefined. A *preg* is no longer treated as a compiled regular expression
 37529 after it is given to *regfree()*.

37530 RETURN VALUE

37531 Upon successful completion, the *regcomp()* function shall return 0. Otherwise, it shall return an
 37532 integer value indicating an error as described in **<regex.h>**, and the content of *preg* is undefined.
 37533 If a code is returned, the interpretation shall be as given in **<regex.h>**.

37534 If *regcomp()* detects an invalid RE, it may return REG_BADPAT, or it may return one of the error
 37535 codes that more precisely describes the error.

37536 Upon successful completion, the *regex()* function shall return 0. Otherwise, it shall return
 37537 REG_NOMATCH to indicate no match.

37538 Upon successful completion, the *regerror()* function shall return the number of bytes needed to
 37539 hold the entire generated string, including the null termination. If the return value is greater than
 37540 *errbuf_size*, the string returned in the buffer pointed to by *errbuf* has been truncated.

37541 The *regfree()* function shall not return a value.

37542 ERRORS

37543 No errors are defined.

37544 EXAMPLES

```
37545 #include <regex.h>
37546 /*
37547  * Match string against the extended regular expression in
37548  * pattern, treating errors as no match.
37549  *
37550  * Return 1 for match, 0 for no match.
37551  */
37552 int
37553 match(const char *string, char *pattern)
37554 {
37555     int    status;
37556     regex_t re;
37557     if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
37558         return(0);      /* Report error. */
37559     }
37560     status = regexexec(&re, string, (size_t) 0, NULL, 0);
37561     regfree(&re);
37562     if (status != 0) {
37563         return(0);      /* Report error. */
37564     }
37565     return(1);
37566 }
```

37567 The following demonstrates how the REG_NOTBOL flag could be used with *regex()* to find all
 37568 substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very
 37569 little error checking is done.)

```

37570     (void) regcomp (&re, pattern, 0);
37571     /* This call to regexec() finds the first match on the line. */
37572     error = regexec (&re, &buffer[0], 1, &pm, 0);
37573     while (error == 0) { /* While matches found. */
37574         /* Substring found between pm.rm_so and pm.rm_eo. */
37575         /* This call to regexec() finds the next match. */
37576         error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
37577     }

```

37578 APPLICATION USAGE

37579 An application could use:

```

37580     regerror(code, preg, (char *)NULL, (size_t)0)

```

37581 to find out how big a buffer is needed for the generated string, *malloc()* a buffer to hold the
 37582 string, and then call *regerror()* again to get the string. Alternatively, it could allocate a fixed,
 37583 static buffer that is big enough to hold most strings, and then use *malloc()* to allocate a larger
 37584 buffer if it finds that this is too small.

37585 To match a pattern as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
 37586 2.13, Pattern Matching Notation, use the *fnmatch()* function.

37587 RATIONALE

37588 The *regexec()* function must fill in all *nmatch* elements of *pmatch*, where *nmatch* and *pmatch* are
 37589 supplied by the application, even if some elements of *pmatch* do not correspond to
 37590 subexpressions in *pattern*. The application writer should note that there is probably no reason
 37591 for using a value of *nmatch* that is larger than *preg->re_nsub*+1.

37592 The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like
 37593 text editors. In such applications, the user supplies an RE asking the application to find a line
 37594 that matches the given expression. An anchor in such an RE anchors at the beginning or end of
 37595 any line. Such an application can pass a sequence of <newline>-separated lines to *regexec()* as a
 37596 single long string and specify REG_NEWLINE to *regcomp()* to get the desired behavior. The
 37597 application must ensure that there are no explicit <newline>s in *pattern* if it wants to ensure that
 37598 any match occurs entirely within a single line.

37599 The REG_NEWLINE flag affects the behavior of *regexec()*, but it is in the *cflags* parameter to
 37600 *regcomp()* to allow flexibility of implementation. Some implementations will want to generate
 37601 the same compiled RE in *regcomp()* regardless of the setting of REG_NEWLINE and have
 37602 *regexec()* handle anchors differently based on the setting of the flag. Other implementations will
 37603 generate different compiled REs based on the REG_NEWLINE.

37604 The REG_ICASE flag supports the operations taken by the *grep -i* option and the historical
 37605 implementations of *ex* and *vi*. Including this flag will make it easier for application code to be
 37606 written that does the same thing as these utilities.

37607 The substrings reported in *pmatch[]* are defined using offsets from the start of the string rather
 37608 than pointers. Since this is a new interface, there should be no impact on historical
 37609 implementations or applications, and offsets should be just as easy to use as pointers. The
 37610 change to offsets was made to facilitate future extensions in which the string to be searched is
 37611 presented to *regexec()* in blocks, allowing a string to be searched that is not all in memory at
 37612 once.

37613 The type **regoff_t** is used for the elements of *pmatch[]* to ensure that the application can
 37614 represent either the largest possible array in memory (important for an application conforming
 37615 to the Shell and Utilities volume of IEEE Std 1003.1-2001) or the largest possible file (important
 37616 for an application using the extension where a file is searched in chunks).

37617 The standard developers rejected the inclusion of a *regsub()* function that would be used to do
37618 substitutions for a matched RE. While such a routine would be useful to some applications, its
37619 utility would be much more limited than the matching function described here. Both RE parsing
37620 and substitution are possible to implement without support other than that required by the
37621 ISO C standard, but matching is much more complex than substituting. The only difficult part of
37622 substitution, given the information supplied by *regexexec()*, is finding the next character in a string
37623 when there can be multi-byte characters. That is a much larger issue, and one that needs a more
37624 general solution.

37625 The *errno* variable has not been used for error returns to avoid filling the *errno* name space for
37626 this feature.

37627 The interface is defined so that the matched substrings *rm_sp* and *rm_ep* are in a separate
37628 **regmatch_t** structure instead of in **regex_t**. This allows a single compiled RE to be used
37629 simultaneously in several contexts; in *main()* and a signal handler, perhaps, or in multiple
37630 threads of lightweight processes. (The *preg* argument to *regexexec()* is declared with type **const**, so
37631 the implementation is not permitted to use the structure to store intermediate results.) It also
37632 allows an application to request an arbitrary number of substrings from an RE. The number of
37633 subexpressions in the RE is reported in *re_nsub* in *preg*. With this change to *regexexec()*,
37634 consideration was given to dropping the REG_NOSUB flag since the user can now specify this
37635 with a zero *nmatch* argument to *regexexec()*. However, keeping REG_NOSUB allows an
37636 implementation to use a different (perhaps more efficient) algorithm if it knows in *regcomp()*
37637 that no subexpressions need be reported. The implementation is only required to fill in *pmatch* if
37638 *nmatch* is not zero and if REG_NOSUB is not specified. Note that the **size_t** type, as defined in
37639 the ISO C standard, is unsigned, so the description of *regexexec()* does not need to address
37640 negative values of *nmatch*.

37641 REG_NOTBOL was added to allow an application to do repeated searches for the same pattern
37642 in a line. If the pattern contains a circumflex character that should match the beginning of a line,
37643 then the pattern should only match when matched against the beginning of the line. Without
37644 the REG_NOTBOL flag, the application could rewrite the expression for subsequent matches,
37645 but in the general case this would require parsing the expression. The need for REG_NOTEOL is
37646 not as clear; it was added for symmetry.

37647 The addition of the *regerror()* function addresses the historical need for conforming application
37648 programs to have access to error information more than “Function failed to compile/match your
37649 RE for unknown reasons”.

37650 This interface provides for two different methods of dealing with error conditions. The specific
37651 error codes (REG_EBRACE, for example), defined in **<regex.h>**, allow an application to recover
37652 from an error if it is so able. Many applications, especially those that use patterns supplied by a
37653 user, will not try to deal with specific error cases, but will just use *regerror()* to obtain a human-
37654 readable error message to present to the user.

37655 The *regerror()* function uses a scheme similar to *confstr()* to deal with the problem of allocating
37656 memory to hold the generated string. The scheme used by *strerror()* in the ISO C standard was
37657 considered unacceptable since it creates difficulties for multi-threaded applications.

37658 The *preg* argument is provided to *regerror()* to allow an implementation to generate a more
37659 descriptive message than would be possible with *errcode* alone. An implementation might, for
37660 example, save the character offset of the offending character of the pattern in a field of *preg*, and
37661 then include that in the generated message string. The implementation may also ignore *preg*.

37662 A REG_FILENAME flag was considered, but omitted. This flag caused *regexexec()* to match
37663 patterns as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13,
37664 Pattern Matching Notation instead of REs. This service is now provided by the *fnmatch()*

37665 function.

37666 Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and
37667 IEEE Std 1003.1-2001 in how to handle a “bad” regular expression. The ISO POSIX-2:1993
37668 standard says that many bad constructs “produce undefined results”, or that “the interpretation
37669 is undefined”. IEEE Std 1003.1-2001, however, says that the interpretation of such REs is
37670 unspecified. The term “undefined” means that the action by the application is an error, of
37671 similar severity to passing a bad pointer to a function.

37672 The *regcomp()* and *regexexec()* functions are required to accept any null-terminated string as the
37673 *pattern* argument. If the meaning of the string is “undefined”, the behavior of the function is
37674 “unspecified”. IEEE Std 1003.1-2001 does not specify how the functions will interpret the
37675 pattern; they might return error codes, or they might do pattern matching in some completely
37676 unexpected way, but they should not do something like abort the process.

37677 FUTURE DIRECTIONS

37678 None.

37679 SEE ALSO

37680 *fnmatch()*, *glob()*, Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern
37681 Matching Notation, Base Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular
37682 Expressions, **<regex.h>**, **<sys/types.h>**

37683 CHANGE HISTORY

37684 First released in Issue 4. Derived from the ISO POSIX-2 standard.

37685 Issue 5

37686 Moved from POSIX2 C-language Binding to BASE.

37687 Issue 6

37688 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

37689 The following new requirements on POSIX implementations derive from alignment with the
37690 Single UNIX Specification:

- 37691 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
37692 required for conforming implementations of previous POSIX specifications, it was not
37693 required for UNIX applications.

37694 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

37695 The REG_ENOSYS constant is removed.

37696 The **restrict** keyword is added to the *regcomp()*, *regerror()*, and *regexexec()* prototypes for
37697 alignment with the ISO / IEC 9899:1999 standard.

37698 **NAME**

37699 remainder, remainderf, remainderl — remainder function

37700 **SYNOPSIS**

37701 #include <math.h>

37702 double remainder(double x, double y);

37703 float remainderf(float x, float y);

37704 long double remainderl(long double x, long double y);

37705 **DESCRIPTION**

37706 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37707 conflict between the requirements described here and the ISO C standard is unintentional. This
 37708 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37709 These functions shall return the floating-point remainder $r=x-ny$ when y is non-zero. The value
 37710 n is the integral value nearest the exact value x/y . When $|n-x/y| = 1/2$, the value n is chosen to
 37711 be even.

37712 The behavior of *remainder()* shall be independent of the rounding mode.37713 **RETURN VALUE**

37714 Upon successful completion, these functions shall return the floating-point remainder $r=x-ny$
 37715 when y is non-zero.

37716 MX If x or y is NaN, a NaN shall be returned.

37717 If x is infinite or y is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if
 37718 supported), or an implementation-defined value shall be returned.

37719 **ERRORS**

37720 These functions shall fail if:

37721 MX	Domain Error	The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-NaN.

37723		If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
37724		then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling
37725		& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
37726		shall be raised.

37727 **EXAMPLES**

37728 None.

37729 **APPLICATION USAGE**

37730 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 37731 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

37732 **RATIONALE**

37733 None.

37734 **FUTURE DIRECTIONS**

37735 None.

37736 **SEE ALSO**

37737 *abs()*, *div()*, *feclearexcept()*, *fetestexcept()*, *ldiv()*, the Base Definitions volume of
 37738 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
 37739 <math.h>

37740 **CHANGE HISTORY**

37741 First released in Issue 4, Version 2.

37742 **Issue 5**

37743 Moved from X/OPEN UNIX extension to BASE.

37744 **Issue 6**

37745 The *remainder()* function is no longer marked as an extension.

37746 The *remainderf()* and *remainderl()* functions are added for alignment with the ISO/IEC 9899:1999
37747 standard.

37748 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
37749 revised to align with the ISO/IEC 9899:1999 standard.

37750 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
37751 marked.

37752 **NAME**

37753 remove — remove a file

37754 **SYNOPSIS**

37755 #include <stdio.h>

37756 int remove(const char *path);

37757 **DESCRIPTION**

37758 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37759 conflict between the requirements described here and the ISO C standard is unintentional. This
 37760 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37761 The *remove()* function shall cause the file named by the pathname pointed to by *path* to be no
 37762 longer accessible by that name. A subsequent attempt to open that file using that name shall fail,
 37763 unless it is created anew.

37764 CX If *path* does not name a directory, *remove(path)* shall be equivalent to *unlink(path)*.

37765 If *path* names a directory, *remove(path)* shall be equivalent to *rmdir(path)*.

37766 **RETURN VALUE**37767 CX Refer to *rmdir()* or *unlink()*.37768 **ERRORS**37769 CX Refer to *rmdir()* or *unlink()*.37770 **EXAMPLES**37771 **Removing Access to a File**37772 The following example shows how to remove access to a file named */home/cnd/old_mods*.

37773 #include <stdio.h>

37774 int status;

37775 ...

37776 status = remove("/home/cnd/old_mods");

37777 **APPLICATION USAGE**

37778 None.

37779 **RATIONALE**

37780 None.

37781 **FUTURE DIRECTIONS**

37782 None.

37783 **SEE ALSO**37784 *rmdir()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>37785 **CHANGE HISTORY**

37786 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard and the ISO C
 37787 standard.

37788 **Issue 6**

37789 Extensions beyond the ISO C standard are marked.

37790 The following new requirements on POSIX implementations derive from alignment with the
 37791 Single UNIX Specification:

37792
37793
37794

- The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if *path* is not a directory, *remove()* is equivalent to *unlink()*, and if it is a directory, it is equivalent to *rmdir()*.

37795 **NAME**

37796 remque — remove an element from a queue

37797 **SYNOPSIS**

37798 xSI #include <search.h>

37799 void remque(void *element);

37800

37801 **DESCRIPTION**37802 Refer to *insque()*.

37803 **NAME**

37804 remquo, remquof, remquol — remainder functions

37805 **SYNOPSIS**

37806 #include <math.h>

37807 double remquo(double x, double y, int *quo);

37808 float remquof(float x, float y, int *quo);

37809 long double remquol(long double x, long double y, int *quo);

37810 **DESCRIPTION**

37811 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37812 conflict between the requirements described here and the ISO C standard is unintentional. This
 37813 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37814 The *remquo()*, *remquof()*, and *remquol()* functions shall compute the same remainder as the
 37815 *remainder()*, *remainderf()*, and *remainderl()* functions, respectively. In the object pointed to by
 37816 *quo*, they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo
 37817 2^n to the magnitude of the integral quotient of x/y , where n is an implementation-defined
 37818 integer greater than or equal to 3.

37819 An application wishing to check for error situations should set *errno* to zero and call
 37820 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 37821 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 37822 zero, an error has occurred.

37823 **RETURN VALUE**37824 These functions shall return $x \text{ REM } y$.37825 MX If x or y is NaN, a NaN shall be returned.

37826 If x is $\pm\text{Inf}$ or y is zero and the other argument is non-NaN, a domain error shall occur, and either
 37827 a NaN (if supported), or an implementation-defined value shall be returned.

37828 **ERRORS**

37829 These functions shall fail if:

37830 MX	Domain Error	The x argument is $\pm\text{Inf}$, or the y argument is ± 0 and the other argument is non-NaN.

37832	If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then <i>errno</i> shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.
37833	
37834	
37835	

37836 **EXAMPLES**

37837 None.

37838 **APPLICATION USAGE**

37839 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 37840 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

37841 **RATIONALE**

37842 These functions are intended for implementing argument reductions which can exploit a few
 37843 low-order bits of the quotient. Note that x may be so large in magnitude relative to y that an
 37844 exact representation of the quotient is not practical.

37845 **FUTURE DIRECTIONS**

37846 None.

37847 **SEE ALSO**

37848 *feclearexcept()*, *fetetestexcept()*, *remainder()*, the Base Definitions volume of IEEE Std 1003.1-2001,
37849 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

37850 **CHANGE HISTORY**

37851 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

37852 **NAME**

37853 rename — rename a file

37854 **SYNOPSIS**

37855 #include <stdio.h>

37856 int rename(const char *old, const char *new);

37857 **DESCRIPTION**

37858 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 37859 conflict between the requirements described here and the ISO C standard is unintentional. This
 37860 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

37861 The *rename()* function shall change the name of a file. The *old* argument points to the pathname
 37862 of the file to be renamed. The *new* argument points to the new pathname of the file.

37863 CX If either the *old* or *new* argument names a symbolic link, *rename()* shall operate on the symbolic
 37864 link itself, and shall not resolve the last component of the argument. If the *old* argument and the
 37865 *new* argument resolve to the same existing file, *rename()* shall return successfully and perform no
 37866 other action.

37867 If the *old* argument points to the pathname of a file that is not a directory, the *new* argument shall
 37868 not point to the pathname of a directory. If the link named by the *new* argument exists, it shall be
 37869 removed and *old* renamed to *new*. In this case, a link named *new* shall remain visible to other
 37870 processes throughout the renaming operation and refer either to the file referred to by *new* or *old*
 37871 before the operation began. Write access permission is required for both the directory containing
 37872 *old* and the directory containing *new*.

37873 If the *old* argument points to the pathname of a directory, the *new* argument shall not point to the
 37874 pathname of a file that is not a directory. If the directory named by the *new* argument exists, it
 37875 shall be removed and *old* renamed to *new*. In this case, a link named *new* shall exist throughout
 37876 the renaming operation and shall refer either to the directory referred to by *new* or *old* before the
 37877 operation began. If *new* names an existing directory, it shall be required to be an empty directory.

37878 If the *old* argument points to a pathname of a symbolic link, the symbolic link shall be renamed.
 37879 If the *new* argument points to a pathname of a symbolic link, the symbolic link shall be removed.

37880 The *new* pathname shall not contain a path prefix that names *old*. Write access permission is
 37881 required for the directory containing *old* and the directory containing *new*. If the *old* argument
 37882 points to the pathname of a directory, write access permission may be required for the directory
 37883 named by *old*, and, if it exists, the directory named by *new*.

37884 If the link named by the *new* argument exists and the file's link count becomes 0 when it is
 37885 removed and no process has the file open, the space occupied by the file shall be freed and the
 37886 file shall no longer be accessible. If one or more processes have the file open when the last link is
 37887 removed, the link shall be removed before *rename()* returns, but the removal of the file contents
 37888 shall be postponed until all references to the file are closed.

37889 Upon successful completion, *rename()* shall mark for update the *st_ctime* and *st_mtime* fields of
 37890 the parent directory of each file.

37891 If the *rename()* function fails for any reason other than [EIO], any file named by *new* shall be
 37892 unaffected.

37893 **RETURN VALUE**

37894 CX Upon successful completion, *rename()* shall return 0; otherwise, -1 shall be returned, *errno* shall
 37895 be set to indicate the error, and neither the file named by *old* nor the file named by *new* shall be
 37896 changed or created.

37897 **ERRORS**

37898 The *rename()* function shall fail if:

37899 CX	[EACCES]	A component of either path prefix denies search permission; or one of the directories containing <i>old</i> or <i>new</i> denies write permissions; or, write permission is required and is denied for a directory pointed to by the <i>old</i> or <i>new</i> arguments.
37900		
37901		
37902		
37903 CX	[EBUSY]	The directory named by <i>old</i> or <i>new</i> is currently in use by the system or another process, and the implementation considers this an error.
37904		
37905 CX	[EEXIST] or [ENOTEMPTY]	
37906		The link named by <i>new</i> is a directory that is not an empty directory.
37907 CX	[EINVAL]	The <i>new</i> directory pathname contains a path prefix that names the <i>old</i> directory.
37908		
37909 CX	[EIO]	A physical I/O error has occurred.
37910 CX	[EISDIR]	The <i>new</i> argument points to a directory and the <i>old</i> argument points to a file that is not a directory.
37911		
37912 CX	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
37913		
37914 CX	[EMLINK]	The file named by <i>old</i> is a directory, and the link count of the parent directory of <i>new</i> would exceed {LINK_MAX}.
37915		
37916 CX	[ENAMETOOLONG]	
37917		The length of the <i>old</i> or <i>new</i> argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
37918		
37919 CX	[ENOENT]	The link named by <i>old</i> does not name an existing file, or either <i>old</i> or <i>new</i> points to an empty string.
37920		
37921 CX	[ENOSPC]	The directory that would contain <i>new</i> cannot be extended.
37922 CX	[ENOTDIR]	A component of either path prefix is not a directory; or the <i>old</i> argument names a directory and <i>new</i> argument names a non-directory file.
37923		
37924 XSI	[EPERM] or [EACCES]	
37925		The S_ISVTX flag is set on the directory containing the file referred to by <i>old</i> and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges; or <i>new</i> refers to an existing file, the S_ISVTX flag is set on the directory containing this file, and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges.
37926		
37927		
37928		
37929		
37930		
37931 CX	[EROFS]	The requested operation requires writing in a directory on a read-only file system.
37932		
37933 CX	[EXDEV]	The links named by <i>new</i> and <i>old</i> are on different file systems and the implementation does not support links between file systems.
37934		
37935		The <i>rename()</i> function may fail if:
37936 XSI	[EBUSY]	The file named by the <i>old</i> or <i>new</i> arguments is a named STREAM.
37937 CX	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
37938		

37939 CX [ENAMETOOLONG]
 37940 As a result of encountering a symbolic link in resolution of the *path* argument,
 37941 the length of the substituted pathname string exceeded {PATH_MAX}.

37942 CX [ETXTBSY] The file to be renamed is a pure procedure (shared text) file that is being
 37943 executed.

37944 EXAMPLES

37945 Renaming a File

37946 The following example shows how to rename a file named **/home/cnd/mod1** to
 37947 **/home/cnd/mod2**.

```
37948 #include <stdio.h>
37949 int status;
37950 ...
37951 status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

37952 APPLICATION USAGE

37953 Some implementations mark for update the *st_ctime* field of renamed files and some do not.
 37954 Applications which make use of the *st_ctime* field may behave differently with respect to
 37955 renamed files unless they are designed to allow for either behavior.

37956 RATIONALE

37957 This *rename()* function is equivalent for regular files to that defined by the ISO C standard. Its
 37958 inclusion here expands that definition to include actions on directories and specifies behavior
 37959 when the *new* parameter names a file that already exists. That specification requires that the
 37960 action of the function be atomic.

37961 One of the reasons for introducing this function was to have a means of renaming directories
 37962 while permitting implementations to prohibit the use of *link()* and *unlink()* with directories,
 37963 thus constraining links to directories to those made by *mkdir()*.

37964 The specification that if *old* and *new* refer to the same file is intended to guarantee that:

```
37965 rename("x", "x");
37966 does not remove the file.
```

37967 Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

37968 See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in *rmdir()* and [EBUSY] in
 37969 *unlink()*. For a discussion of [EXDEV], see *link()*.

37970 FUTURE DIRECTIONS

37971 None.

37972 SEE ALSO

37973 *link()*, *rmdir()*, *symlink()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 37974 **<stdio.h>**

37975 CHANGE HISTORY

37976 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

37977 Issue 5

37978 The [EBUSY] error is added to the “may fail” part of the ERRORS section.

37979 **Issue 6**

37980 Extensions beyond the ISO C standard are marked.

37981 The following new requirements on POSIX implementations derive from alignment with the
37982 Single UNIX Specification:

- 37983 • The [EIO] mandatory error condition is added.
- 37984 • The [ELOOP] mandatory error condition is added.
- 37985 • A second [ENAMETOOLONG] is added as an optional error condition.
- 37986 • The [ETXTBSY] optional error condition is added.

37987 The following changes were made to align with the IEEE P1003.1a draft standard:

- 37988 • Details are added regarding the treatment of symbolic links.
- 37989 • The [ELOOP] optional error condition is added.

37990 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

37991 **NAME**

37992 rewind — reset the file position indicator in a stream

37993 **SYNOPSIS**

37994 #include <stdio.h>

37995 void rewind(FILE *stream);

37996 **DESCRIPTION**

37997 CX The functionality described on this reference page is aligned with the ISO C standard. Any
37998 conflict between the requirements described here and the ISO C standard is unintentional. This
37999 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38000 The call:

38001 rewind(stream)

38002 shall be equivalent to:

38003 (void) fseek(stream, 0L, SEEK_SET)

38004 except that *rewind()* shall also clear the error indicator.

38005 CX Since *rewind()* does not return a value, an application wishing to detect errors should clear *errno*,
38006 then call *rewind()*, and if *errno* is non-zero, assume an error has occurred.

38007 **RETURN VALUE**

38008 The *rewind()* function shall not return a value.

38009 **ERRORS**

38010 CX Refer to *fseek()* with the exception of [EINVAL] which does not apply.

38011 **EXAMPLES**

38012 None.

38013 **APPLICATION USAGE**

38014 None.

38015 **RATIONALE**

38016 None.

38017 **FUTURE DIRECTIONS**

38018 None.

38019 **SEE ALSO**

38020 *fseek()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

38021 **CHANGE HISTORY**

38022 First released in Issue 1. Derived from Issue 1 of the SVID.

38023 **Issue 6**

38024 Extensions beyond the ISO C standard are marked.

38025 **NAME**

38026 `rewinddir` — reset the position of a directory stream to the beginning of a directory

38027 **SYNOPSIS**

38028 `#include <dirent.h>`

38029 `void rewinddir(DIR *dirp);`

38030 **DESCRIPTION**

38031 The `rewinddir()` function shall reset the position of the directory stream to which *dirp* refers to
38032 the beginning of the directory. It shall also cause the directory stream to refer to the current state
38033 of the corresponding directory, as a call to `opendir()` would have done. If *dirp* does not refer to a
38034 directory stream, the effect is undefined.

38035 After a call to the `fork()` function, either the parent or child (but not both) may continue
38036 xsi processing the directory stream using `readdir()`, `rewinddir()`, or `seekdir()`. If both the parent and
38037 child processes use these functions, the result is undefined.

38038 **RETURN VALUE**

38039 The `rewinddir()` function shall not return a value.

38040 **ERRORS**

38041 No errors are defined.

38042 **EXAMPLES**

38043 None.

38044 **APPLICATION USAGE**

38045 The `rewinddir()` function should be used in conjunction with `opendir()`, `readdir()`, and `closedir()` to
38046 examine the contents of the directory. This method is recommended for portability.

38047 **RATIONALE**

38048 None.

38049 **FUTURE DIRECTIONS**

38050 None.

38051 **SEE ALSO**

38052 `closedir()`, `opendir()`, `readdir()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<dirent.h>**
38053 **<sys/types.h>**

38054 **CHANGE HISTORY**

38055 First released in Issue 2.

38056 **Issue 6**

38057 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

38058 The following new requirements on POSIX implementations derive from alignment with the
38059 Single UNIX Specification:

- 38060 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
38061 required for conforming implementations of previous POSIX specifications, it was not
38062 required for UNIX applications.

38063 **NAME**38064 rindex — character string operations (**LEGACY**)38065 **SYNOPSIS**

38066 xSI #include <strings.h>

38067 char *rindex(const char *s, int c);

38068

38069 **DESCRIPTION**38070 The *rindex()* function shall be equivalent to *strrchr()*.38071 **RETURN VALUE**38072 Refer to *strrchr()*.38073 **ERRORS**38074 Refer to *strrchr()*.38075 **EXAMPLES**

38076 None.

38077 **APPLICATION USAGE**38078 The *strrchr()* function is preferred over this function.38079 For maximum portability, it is recommended to replace the function call to *rindex()* as follows:

38080 #define rindex(a,b) strrchr((a),(b))

38081 **RATIONALE**

38082 None.

38083 **FUTURE DIRECTIONS**

38084 This function may be withdrawn in a future version.

38085 **SEE ALSO**38086 *strrchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <strings.h>38087 **CHANGE HISTORY**

38088 First released in Issue 4, Version 2.

38089 **Issue 5**

38090 Moved from X/OPEN UNIX extension to BASE.

38091 **Issue 6**

38092 This function is marked LEGACY.

38093 **NAME**

38094 rint, rintf, rintl — round-to-nearest integral value

38095 **SYNOPSIS**

38096 #include <math.h>

38097 double rint(double x);

38098 float rintf(float x);

38099 long double rintl(long double x);

38100 **DESCRIPTION**

38101 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 38102 conflict between the requirements described here and the ISO C standard is unintentional. This
 38103 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38104 These functions shall return the integral value (represented as a **double**) nearest x in the
 38105 direction of the current rounding mode. The current rounding mode is implementation-defined.

38106 If the current rounding mode rounds toward negative infinity, then *rint()* shall be equivalent to
 38107 *floor()*. If the current rounding mode rounds toward positive infinity, then *rint()* shall be
 38108 equivalent to *ceil()*.

38109 These functions differ from the *nearbyint()*, *nearbyintf()*, and *nearbyintl()* functions only in that
 38110 they may raise the inexact floating-point exception if the result differs in value from the
 38111 argument.

38112 An application wishing to check for error situations should set *errno* to zero and call
 38113 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 38114 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 38115 zero, an error has occurred.

38116 **RETURN VALUE**

38117 Upon successful completion, these functions shall return the integer (represented as a double
 38118 precision number) nearest x in the direction of the current rounding mode.

38119 MX If x is NaN, a NaN shall be returned.

38120 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.

38121 XSI If the correct value would cause overflow, a range error shall occur and *rint()*, *rintf()*, and *rintl()*
 38122 shall return the value of the macro $\pm \text{HUGE\_VAL}$, $\pm \text{HUGE\_VALF}$, and $\pm \text{HUGE\_VALL}$ (with the
 38123 same sign as x), respectively.

38124 **ERRORS**

38125 These functions shall fail if:

38126 XSI **Range Error** The result would cause an overflow.

38127 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 38128 then *errno* shall be set to [ERANGE]. If the integer expression
 38129 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 38130 floating-point exception shall be raised.

38131 **EXAMPLES**

38132 None.

38133 **APPLICATION USAGE**

38134 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
38135 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

38136 **RATIONALE**

38137 None.

38138 **FUTURE DIRECTIONS**

38139 None.

38140 **SEE ALSO**

38141 *abs()*, *ceil()*, *feclearexcept()*, *fetestexcept()*, *floor()*, *isnan()*, *nearbyint()*, the Base Definitions volume
38142 of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
38143 <math.h>

38144 **CHANGE HISTORY**

38145 First released in Issue 4, Version 2.

38146 **Issue 5**

38147 Moved from X/OPEN UNIX extension to BASE.

38148 **Issue 6**

38149 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 38150 • The *rintf()* and *rintl()* functions are added.
- 38151 • The *rint()* function is no longer marked as an extension.
- 38152 • The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
38153 revised to align with the ISO/IEC 9899:1999 standard.
- 38154 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
38155 marked.

38156 NAME

38157 rmdir — remove a directory

38158 SYNOPSIS

38159 #include <unistd.h>

38160 int rmdir(const char *path);

38161 DESCRIPTION

38162 The *rmdir()* function shall remove a directory whose name is given by *path*. The directory shall
38163 be removed only if it is an empty directory.

38164 If the directory is the root directory or the current working directory of any process, it is
38165 unspecified whether the function succeeds, or whether it shall fail and set *errno* to [EBUSY].

38166 If *path* names a symbolic link, then *rmdir()* shall fail and set *errno* to [ENOTDIR].

38167 If the *path* argument refers to a path whose final component is either dot or dot-dot, *rmdir()* shall
38168 fail.

38169 If the directory's link count becomes 0 and no process has the directory open, the space occupied
38170 by the directory shall be freed and the directory shall no longer be accessible. If one or more
38171 processes have the directory open when the last link is removed, the dot and dot-dot entries, if
38172 present, shall be removed before *rmdir()* returns and no new entries may be created in the
38173 directory, but the directory shall not be removed until all references to the directory are closed.

38174 If the directory is not an empty directory, *rmdir()* shall fail and set *errno* to [EEXIST] or
38175 [ENOTEMPTY].

38176 Upon successful completion, the *rmdir()* function shall mark for update the *st_ctime* and
38177 *st_mtime* fields of the parent directory.

38178 RETURN VALUE

38179 Upon successful completion, the function *rmdir()* shall return 0. Otherwise, -1 shall be returned,
38180 and *errno* set to indicate the error. If -1 is returned, the named directory shall not be changed.

38181 ERRORS

38182 The *rmdir()* function shall fail if:

38183 [EACCES] Search permission is denied on a component of the path prefix, or write
38184 permission is denied on the parent directory of the directory to be removed.

38185 [EBUSY] The directory to be removed is currently in use by the system or some process
38186 and the implementation considers this to be an error.

38187 [EEXIST] or [ENOTEMPTY]

38188 The *path* argument names a directory that is not an empty directory, or there
38189 are hard links to the directory other than dot or a single entry in dot-dot.

38190 [EINVAL] The *path* argument contains a last component that is dot.

38191 [EIO] A physical I/O error has occurred.

38192 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
38193 argument.

38194 [ENAMETOOLONG]

38195 The length of the *path* argument exceeds {PATH_MAX} or a pathname
38196 component is longer than {NAME_MAX}.

38197 [ENOENT] A component of *path* does not name an existing file, or the *path* argument
38198 names a nonexistent directory or points to an empty string.

38199 [ENOTDIR] A component of *path* is not a directory.

38200 xsi [EPERM] or [EACCES]
 38201 The S_ISVTX flag is set on the parent directory of the directory to be removed
 38202 and the caller is not the owner of the directory to be removed, nor is the caller
 38203 the owner of the parent directory, nor does the caller have the appropriate
 38204 privileges.

38205 [EROFS] The directory entry to be removed resides on a read-only file system.

38206 The *rmdir()* function may fail if:

38207 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 38208 resolution of the *path* argument.

38209 [ENAMETOOLONG]
 38210 As a result of encountering a symbolic link in resolution of the *path* argument,
 38211 the length of the substituted pathname string exceeded {PATH_MAX}.

38212 EXAMPLES

38213 Removing a Directory

38214 The following example shows how to remove a directory named **/home/cnd/mod1**.

```
38215 #include <unistd.h>
38216 int status;
38217 ...
38218 status = rmdir("/home/cnd/mod1");
```

38219 APPLICATION USAGE

38220 None.

38221 RATIONALE

38222 The *rmdir()* and *rename()* functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the
 38223 condition when the directory to be removed does not exist or *new* already exists. When the 1984
 38224 /usr/group standard was published, it contained [EEXIST] instead. When these functions were
 38225 adopted into System V, the 1984 /usr/group standard was used as a reference. Therefore, several
 38226 existing applications and implementations support/use both forms, and no agreement could be
 38227 reached on either value. All implementations are required to supply both [EEXIST] and
 38228 [ENOTEMPTY] in **<errno.h>** with distinct values, so that applications can use both values in C-
 38229 language **case** statements.

38230 The meaning of deleting *pathname/dot* is unclear, because the name of the file (directory) in the
 38231 parent directory to be removed is not clear, particularly in the presence of multiple links to a
 38232 directory.

38233 The POSIX.1-1990 standard was silent with regard to the behavior of *rmdir()* when there are
 38234 multiple hard links to the directory being removed. The requirement to set *errno* to [EEXIST] or
 38235 [ENOTEMPTY] clarifies the behavior in this case.

38236 If the process' current working directory is being removed, that should be an allowed error.

38237 Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in
 38238 Section 2.3 (on page 21) about returning any one of the possible errors permits that behavior to
 38239 continue. The [ELOOP] error may be returned if more than {SYMLOOP_MAX} symbolic links
 38240 are encountered during resolution of the *path* argument.

38241 **FUTURE DIRECTIONS**

38242 None.

38243 **SEE ALSO**

38244 Section 2.3 (on page 21), *mkdir()*, *remove()*, *unlink()*, the Base Definitions volume of
38245 IEEE Std 1003.1-2001, <**unistd.h**>

38246 **CHANGE HISTORY**

38247 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

38248 **Issue 6**

38249 The following new requirements on POSIX implementations derive from alignment with the
38250 Single UNIX Specification:

- 38251 • The DESCRIPTION is updated to indicate the results of naming a symbolic link in *path*.
- 38252 • The [EIO] mandatory error condition is added.
- 38253 • The [ELOOP] mandatory error condition is added.
- 38254 • A second [ENAMETOOLONG] is added as an optional error condition.

38255 The following changes were made to align with the IEEE P1003.1a draft standard:

- 38256 • The [ELOOP] optional error condition is added.

38257 **NAME**

38258 round, roundf, roundl — round to the nearest integer value in a floating-point format

38259 **SYNOPSIS**

38260 #include <math.h>

38261 double round(double x);

38262 float roundf(float x);

38263 long double roundl(long double x);

38264 **DESCRIPTION**

38265 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 38266 conflict between the requirements described here and the ISO C standard is unintentional. This
 38267 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38268 These functions shall round their argument to the nearest integer value in floating-point format,
 38269 rounding halfway cases away from zero, regardless of the current rounding direction.

38270 An application wishing to check for error situations should set *errno* to zero and call
 38271 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 38272 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 38273 zero, an error has occurred.

38274 **RETURN VALUE**

38275 Upon successful completion, these functions shall return the rounded integer value.

38276 MX If *x* is NaN, a NaN shall be returned.38277 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.

38278 XSI If the correct value would cause overflow, a range error shall occur and *round()*, *roundf()*, and
 38279 *roundl()* shall return the value of the macro $\pm \text{HUGE\_VAL}$, $\pm \text{HUGE\_VALF}$, and $\pm \text{HUGE\_VALL}$
 38280 (with the same sign as *x*), respectively.

38281 **ERRORS**

38282 These functions may fail if:

38283 XSI **Range Error** The result overflows.

38284 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 38285 then *errno* shall be set to [ERANGE]. If the integer expression
 38286 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 38287 floating-point exception shall be raised.

38288 **EXAMPLES**

38289 None.

38290 **APPLICATION USAGE**

38291 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 38292 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

38293 **RATIONALE**

38294 None.

38295 **FUTURE DIRECTIONS**

38296 None.

38297 **SEE ALSO**

38299 Treatment of Error Conditions for Mathematical Functions, **<math.h>**

38300 **CHANGE HISTORY**

38301 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38302 **NAME**

38303 scalb — load exponent of a radix-independent floating-point number

38304 **SYNOPSIS**

38305 OB XSI #include <math.h>

38306 double scalb(double x, double n);

38307

38308 **DESCRIPTION**

38309 The *scalb()* function shall compute $x \cdot r^n$, where r is the radix of the machine's floating-point arithmetic. When r is 2, *scalb()* shall be equivalent to *ldexp()*. The value of r is FLT_RADIX which is defined in <float.h>.

38312 An application wishing to check for error situations should set *errno* to zero and call *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

38316 **RETURN VALUE**38317 Upon successful completion, the *scalb()* function shall return $x \cdot r^n$.38318 If x or n is NaN, a NaN shall be returned.38319 If n is zero, x shall be returned.38320 If x is $\pm\text{Inf}$ and n is not $-\text{Inf}$, x shall be returned.38321 If x is ± 0 and n is not $+\text{Inf}$, x shall be returned.

38322 If x is ± 0 and n is $+\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

38324 If x is $\pm\text{Inf}$ and n is $-\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

38326 If the result would cause an overflow, a range error shall occur and $\pm\text{HUGE\_VAL}$ (according to the sign of x) shall be returned.

38328 If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

38330 If the correct value would cause underflow, and is not representable, a range error may occur, and 0.0 shall be returned.

38332 **ERRORS**38333 The *scalb()* function shall fail if:38334 Domain Error If x is zero and n is $+\text{Inf}$, or x is Inf and n is $-\text{Inf}$.

38335 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

38339 Range Error The result would overflow.

38340 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

38344 The *scalb()* function may fail if:

38345 Range Error The result underflows.

38346 If the integer expression (*math_errhandling* & *MATH_ERRNO*) is non-zero,
 38347 then *errno* shall be set to [ERANGE]. If the integer expression
 38348 (*math_errhandling* & *MATH_ERREXCEPT*) is non-zero, then the underflow
 38349 floating-point exception shall be raised.

38350 EXAMPLES

38351 None.

38352 APPLICATION USAGE

38353 Applications should use either *scalbln()*, *scalblnf()*, or *scalblnl()* in preference to this function.

38354 IEEE Std 1003.1-2001 only defines the behavior for the *scalb()* function when the *n* argument is
 38355 an integer, a NaN, or Inf. The behavior of other values for the *n* argument is unspecified.

38356 On error, the expressions (*math_errhandling* & *MATH_ERRNO*) and (*math_errhandling* &
 38357 *MATH_ERREXCEPT*) are independent of each other, but at least one of them must be non-zero.

38358 RATIONALE

38359 None.

38360 FUTURE DIRECTIONS

38361 None.

 38365 <float.h>, <math.h>

38366 CHANGE HISTORY

38367 First released in Issue 4, Version 2.

38368 Issue 5

38369 Moved from X/OPEN UNIX extension to BASE.

38370 The DESCRIPTION is updated to indicate how an application should check for an error. This
 38371 text was previously published in the APPLICATION USAGE section.

38372 Issue 6

38373 This function is marked obsolescent.

38374 Although this function is not part of the ISO/IEC 9899:1999 standard, the RETURN VALUE and
 38375 ERRORS sections are updated to align with the error handling in the ISO/IEC 9899:1999
 38376 standard.

38377 **NAME**

38378 scalbn, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX |

38379 **SYNOPSIS**

38380 #include <math.h>

```

38381       double scalbn(double x, long n);
38382       float scalblnf(float x, long n);
38383       long double scalblnl(long double x, long n);
38384       double scalbn(double x, int n);
38385       float scalbnf(float x, int n);
38386       long double scalbnl(long double x, int n);

```

38387 **DESCRIPTION**

38388 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 38389 conflict between the requirements described here and the ISO C standard is unintentional. This
 38390 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

38391 These functions shall compute $x * \text{FLT\_RADIX}^n$ efficiently, not normally by computing
 38392 FLT_RADIX^n explicitly.

38393 An application wishing to check for error situations should set *errno* to zero and call
 38394 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 38395 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 38396 zero, an error has occurred.

38397 **RETURN VALUE**38398 Upon successful completion, these functions shall return $x * \text{FLT\_RADIX}^n$.

38399 If the result would cause overflow, a range error shall occur and these functions shall return
 38400 $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (according to the sign of *x*) as appropriate for
 38401 the return type of the function.

38402 If the correct value would cause underflow, and is not representable, a range error may occur,
 38403 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

38404 MX If *x* is NaN, a NaN shall be returned.38405 If *x* is ± 0 or $\pm\text{Inf}$, *x* shall be returned.38406 If *n* is 0, *x* shall be returned.

38407 If the correct value would cause underflow, and is representable, a range error may occur and
 38408 the correct value shall be returned.

38409 **ERRORS**

38410 These functions shall fail if:

38411 Range Error The result overflows.

38412 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 38413 then *errno* shall be set to [ERANGE]. If the integer expression
 38414 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 38415 floating-point exception shall be raised.

38416 These functions may fail if:

38417 Range Error The result underflows.

38418 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 38419 then *errno* shall be set to [ERANGE]. If the integer expression

38420 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
38421 floating-point exception shall be raised.

38422 **EXAMPLES**

38423 None.

38424 **APPLICATION USAGE**

38425 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
38426 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

38427 **RATIONALE**

38428 These functions are named so as to avoid conflicting with the historical definition of the *scalb()*
38429 function from the Single UNIX Specification. The difference is that the *scalb()* function has a
38430 second argument of **double** instead of **int**. The *scalb()* function is not part of the ISO C standard.
38431 The three functions whose second type is **long** are provided because the factor required to scale
38432 from the smallest positive floating-point value to the largest finite one, on many
38433 implementations, is too large to represent in the minimum-width **int** format.

38434 **FUTURE DIRECTIONS**

38435 None.

38436 **SEE ALSO**

38437 *feclearexcept()*, *fetestexcept()*, *scalb()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section
38438 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

38439 **CHANGE HISTORY**

38440 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

38441 **NAME**

38442 scanf — convert formatted input

38443 **SYNOPSIS**

38444 #include <stdio.h>

38445 int scanf(const char *restrict *format*, ...);

38446 **DESCRIPTION**

38447 Refer to *fscanf()*.

38448 **NAME**38449 sched_get_priority_max, sched_get_priority_min — get priority limits (**REALTIME**)38450 **SYNOPSIS**

38451 PS|TPS #include <sched.h>

38452 int sched_get_priority_max(int *policy*);38453 int sched_get_priority_min(int *policy*);

38454

38455 **DESCRIPTION**38456 The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the appropriate
38457 maximum or minimum, respectively, for the scheduling policy specified by *policy*.38458 The value of *policy* shall be one of the scheduling policy values defined in <**sched.h**>.38459 **RETURN VALUE**38460 If successful, the *sched_get_priority_max()* and *sched_get_priority_min()* functions shall return the
38461 appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a
38462 value of -1 and set *errno* to indicate the error.38463 **ERRORS**38464 The *sched_get_priority_max()* and *sched_get_priority_min()* functions shall fail if:38465 [EINVAL] The value of the *policy* parameter does not represent a defined scheduling
38466 policy.38467 **EXAMPLES**

38468 None.

38469 **APPLICATION USAGE**

38470 None.

38471 **RATIONALE**

38472 None.

38473 **FUTURE DIRECTIONS**

38479 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38480 **Issue 6**

38481 These functions are marked as part of the Process Scheduling option.

38482 The [ENOSYS] error condition has been removed as stubs need not be provided if an
38483 implementation does not support the Process Scheduling option.38484 The [ESRCH] error condition has been removed since these functions do not take a *pid*
38485 argument.38486 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin
38487 code in the SYNOPSIS to PS|TPS.

38488 NAME

38489 sched_getparam — get scheduling parameters (**REALTIME**)

38490 SYNOPSIS

38491 PS `#include <sched.h>`

38492 `int sched_getparam(pid_t pid, struct sched_param *param);`

38493

38494 DESCRIPTION

38495 The *sched_getparam()* function shall return the scheduling parameters of a process specified by
38496 *pid* in the **sched_param** structure pointed to by *param*.

38497 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
38498 parameters for the process whose process ID is equal to *pid* shall be returned.

38499 If *pid* is zero, the scheduling parameters for the calling process shall be returned. The behavior of
38500 the *sched_getparam()* function is unspecified if the value of *pid* is negative.

38501 RETURN VALUE

38502 Upon successful completion, the *sched_getparam()* function shall return zero. If the call to
38503 *sched_getparam()* is unsuccessful, the function shall return a value of -1 and set *errno* to indicate
38504 the error.

38505 ERRORS

38506 The *sched_getparam()* function shall fail if:

38507 [EPERM] The requesting process does not have permission to obtain the scheduling
38508 parameters of the specified process.

38509 [ESRCH] No process can be found corresponding to that specified by *pid*.

38510 EXAMPLES

38511 None.

38512 APPLICATION USAGE

38513 None.

38514 RATIONALE

38515 None.

38516 FUTURE DIRECTIONS

38520 IEEE Std 1003.1-2001, **<sched.h>**

38521 CHANGE HISTORY

38522 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38523 Issue 6

38524 The *sched_getparam()* function is marked as part of the Process Scheduling option.

38525 The [ENOSYS] error condition has been removed as stubs need not be provided if an
38526 implementation does not support the Process Scheduling option.

38527 **NAME**38528 sched_getscheduler — get scheduling policy (**REALTIME**)38529 **SYNOPSIS**

38530 PS #include <sched.h>

38531 int sched_getscheduler(pid_t pid);

38532

38533 **DESCRIPTION**

38534 The *sched_getscheduler()* function shall return the scheduling policy of the process specified by
 38535 *pid*. If the value of *pid* is negative, the behavior of the *sched_getscheduler()* function is
 38536 unspecified.

38537 The values that can be returned by *sched_getscheduler()* are defined in the <**sched.h**> header.

38538 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
 38539 policy shall be returned for the process whose process ID is equal to *pid*.

38540 If *pid* is zero, the scheduling policy shall be returned for the calling process.

38541 **RETURN VALUE**

38542 Upon successful completion, the *sched_getscheduler()* function shall return the scheduling policy
 38543 of the specified process. If unsuccessful, the function shall return -1 and set *errno* to indicate the
 38544 error.

38545 **ERRORS**

38546 The *sched_getscheduler()* function shall fail if:

38547 [EPERM] The requesting process does not have permission to determine the scheduling
 38548 policy of the specified process.

38549 [ESRCH] No process can be found corresponding to that specified by *pid*.

38550 **EXAMPLES**

 38560 IEEE Std 1003.1-2001, <**sched.h**>

38561 **CHANGE HISTORY**

38562 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38563 **Issue 6**

38564 The *sched_getscheduler()* function is marked as part of the Process Scheduling option.

38565 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 38566 implementation does not support the Process Scheduling option.

38567 NAME

38568 sched_rr_get_interval — get execution time limits (**REALTIME**)

38569 SYNOPSIS

38570 PS|TPS #include <sched.h>

38571 int sched_rr_get_interval(pid_t pid, struct timespec *interval);

38572

38573 DESCRIPTION

38574 The *sched_rr_get_interval()* function shall update the **timespec** structure referenced by the
38575 *interval* argument to contain the current execution time limit (that is, time quantum) for the
38576 process specified by *pid*. If *pid* is zero, the current execution time limit for the calling process
38577 shall be returned.

38578 RETURN VALUE

38579 If successful, the *sched_rr_get_interval()* function shall return zero. Otherwise, it shall return a
38580 value of -1 and set *errno* to indicate the error.

38581 ERRORS

38582 The *sched_rr_get_interval()* function shall fail if:

38583 [ESRCH] No process can be found corresponding to that specified by *pid*.

38584 EXAMPLES

38585 None.

38586 APPLICATION USAGE

38587 None.

38588 RATIONALE

38589 None.

38590 FUTURE DIRECTIONS

38594 *sched_setscheduler()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sched.h**>

38595 CHANGE HISTORY

38596 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38597 Issue 6

38598 The *sched_rr_get_interval()* function is marked as part of the Process Scheduling option.

38599 The [ENOSYS] error condition has been removed as stubs need not be provided if an
38600 implementation does not support the Process Scheduling option.

38601 IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in
38602 the SYNOPSIS to PS|TPS.

38603 **NAME**38604 sched_setparam — set scheduling parameters (**REALTIME**)38605 **SYNOPSIS**38606 PS `#include <sched.h>`38607 `int sched_setparam(pid_t pid, const struct sched_param *param);`

38608

38609 **DESCRIPTION**

38610 The *sched_setparam()* function shall set the scheduling parameters of the process specified by *pid*
 38611 to the values specified by the **sched_param** structure pointed to by *param*. The value of the
 38612 *sched_priority* member in the **sched_param** structure shall be any integer within the inclusive
 38613 priority range for the current scheduling policy of the process specified by *pid*. Higher
 38614 numerical values for the priority represent higher priorities. If the value of *pid* is negative, the
 38615 behavior of the *sched_setparam()* function is unspecified.

38616 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
 38617 parameters shall be set for the process whose process ID is equal to *pid*.

38618 If *pid* is zero, the scheduling parameters shall be set for the calling process.

38619 The conditions under which one process has permission to change the scheduling parameters of
 38620 another process are implementation-defined.

38621 Implementations may require the requesting process to have the appropriate privilege to set its
 38622 own scheduling parameters or those of another process.

38623 The target process, whether it is running or not running, shall be moved to the tail of the thread
 38624 list for its priority.

38625 If the priority of the process specified by the *pid* argument is set higher than that of the lowest
 38626 priority running process and if the specified process is ready to run, the process specified by the
 38627 *pid* argument shall preempt a lowest priority running process. Similarly, if the process calling
 38628 *sched_setparam()* sets its own priority lower than that of one or more other non-empty process
 38629 lists, then the process that is the head of the highest priority list shall also preempt the calling
 38630 process. Thus, in either case, the originating process might not receive notification of the
 38631 completion of the requested priority change until the higher priority process has executed.

38632 ss If the scheduling policy of the target process is SCHED_SPORADIC, the value specified by the
 38633 *sched_ss_low_priority* member of the *param* argument shall be any integer within the inclusive
 38634 priority range for the sporadic server policy. The *sched_ss_repl_period* and *sched_ss_init_budget*
 38635 members of the *param* argument shall represent the time parameters to be used by the sporadic
 38636 server scheduling policy for the target process. The *sched_ss_max_repl* member of the *param*
 38637 argument shall represent the maximum number of replenishments that are allowed to be
 38638 pending simultaneously for the process scheduled under this scheduling policy.

38639 The specified *sched_ss_repl_period* shall be greater than or equal to the specified
 38640 *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

38641 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
 38642 function to succeed; if not, the function shall fail.

38643 If the scheduling policy of the target process is either SCHED_FIFO or SCHED_RR, the
 38644 *sched_ss_low_priority*, *sched_ss_repl_period*, and *sched_ss_init_budget* members of the *param*
 38645 argument shall have no effect on the scheduling behavior. If the scheduling policy of this process
 38646 is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the effects of these members are
 38647 implementation-defined; this case includes the SCHED_OTHER policy.

38648 If the current scheduling policy for the process specified by *pid* is not SCHED_FIFO,
 38649 ss SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the
 38650 SCHED_OTHER policy.

38651 The effect of this function on individual threads is dependent on the scheduling contention
 38652 scope of the threads:

- 38653 • For threads with system scheduling contention scope, these functions shall have no effect on
 38654 their scheduling.
- 38655 • For threads with process scheduling contention scope, the threads' scheduling parameters
 38656 shall not be affected. However, the scheduling of these threads with respect to threads in
 38657 other processes may be dependent on the scheduling parameters of their process, which are
 38658 governed using these functions.

38659 If an implementation supports a two-level scheduling model in which library threads are
 38660 multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled
 38661 entities for the system contention scope threads shall not be affected by these functions.

38662 The underlying kernel-scheduled entities for the process contention scope threads shall have
 38663 their scheduling parameters changed to the value specified in *param*. Kernel-scheduled entities
 38664 for use by process contention scope threads that are created after this call completes shall inherit
 38665 their scheduling policy and associated scheduling parameters from the process.

38666 This function is not atomic with respect to other threads in the process. Threads may continue to
 38667 execute while this function call is in the process of changing the scheduling policy for the
 38668 underlying kernel-scheduled entities used by the process contention scope threads.

38669 RETURN VALUE

38670 If successful, the *sched_setparam()* function shall return zero.

38671 If the call to *sched_setparam()* is unsuccessful, the priority shall remain unchanged, and the
 38672 function shall return a value of -1 and set *errno* to indicate the error.

38673 ERRORS

38674 The *sched_setparam()* function shall fail if:

- 38675 [EINVAL] One or more of the requested scheduling parameters is outside the range
 38676 defined for the scheduling policy of the specified *pid*.
- 38677 [EPERM] The requesting process does not have permission to set the scheduling
 38678 parameters for the specified process, or does not have the appropriate
 38679 privilege to invoke *sched_setparam()*.
- 38680 [ESRCH] No process can be found corresponding to that specified by *pid*.

38692 **CHANGE HISTORY**

38693 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38694 **Issue 6**

38695 The *sched_setparam()* function is marked as part of the Process Scheduling option.

38696 The [ENOSYS] error condition has been removed as stubs need not be provided if an
38697 implementation does not support the Process Scheduling option.

38698 The following new requirements on POSIX implementations derive from alignment with the
38699 Single UNIX Specification:

38700 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is
38701 added.

38702 • Sections describing two-level scheduling and atomicity of the function are added.

38703 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

38704 IEEE PASC Interpretation 1003.1 #100 is applied.

38705 NAME

38706 sched_setscheduler — set scheduling policy and parameters (**REALTIME**)

38707 SYNOPSIS

38708 PS `#include <sched.h>`

38709 `int sched_setscheduler(pid_t pid, int policy,`
38710 `const struct sched_param *param);`

38711

38712 DESCRIPTION

38713 The *sched_setscheduler()* function shall set the scheduling policy and scheduling parameters of
38714 the process specified by *pid* to *policy* and the parameters specified in the **sched_param** structure
38715 pointed to by *param*, respectively. The value of the *sched_priority* member in the **sched_param**
38716 structure shall be any integer within the inclusive priority range for the scheduling policy
38717 specified by *policy*. If the value of *pid* is negative, the behavior of the *sched_setscheduler()*
38718 function is unspecified.

38719 The possible values for the *policy* parameter are defined in the **<sched.h>** header.

38720 If a process specified by *pid* exists, and if the calling process has permission, the scheduling
38721 policy and scheduling parameters shall be set for the process whose process ID is equal to *pid*.

38722 If *pid* is zero, the scheduling policy and scheduling parameters shall be set for the calling
38723 process.

38724 The conditions under which one process has the appropriate privilege to change the scheduling
38725 parameters of another process are implementation-defined.

38726 Implementations may require that the requesting process have permission to set its own
38727 scheduling parameters or those of another process. Additionally, implementation-defined
38728 restrictions may apply as to the appropriate privileges required to set a process' own scheduling
38729 policy, or another process' scheduling policy, to a particular value.

38730 The *sched_setscheduler()* function shall be considered successful if it succeeds in setting the
38731 scheduling policy and scheduling parameters of the process specified by *pid* to the values
38732 specified by *policy* and the structure pointed to by *param*, respectively.

38733 ss If the scheduling policy specified by *policy* is SCHED_SPORADIC, the value specified by the
38734 *sched_ss_low_priority* member of the *param* argument shall be any integer within the inclusive
38735 priority range for the sporadic server policy. The *sched_ss_repl_period* and *sched_ss_init_budget*
38736 members of the *param* argument shall represent the time parameters used by the sporadic server
38737 scheduling policy for the target process. The *sched_ss_max_repl* member of the *param* argument
38738 shall represent the maximum number of replenishments that are allowed to be pending
38739 simultaneously for the process scheduled under this scheduling policy.

38740 The specified *sched_ss_repl_period* shall be greater than or equal to the specified
38741 *sched_ss_init_budget* for the function to succeed; if it is not, then the function shall fail.

38742 The value of *sched_ss_max_repl* shall be within the inclusive range [1,{SS_REPL_MAX}] for the
38743 function to succeed; if not, the function shall fail.

38744 If the scheduling policy specified by *policy* is either SCHED_FIFO or SCHED_RR, the
38745 *sched_ss_low_priority*, *sched_ss_repl_period*, and *sched_ss_init_budget* members of the *param*
38746 argument shall have no effect on the scheduling behavior.

38747 The effect of this function on individual threads is dependent on the scheduling contention
38748 scope of the threads:

38749 • For threads with system scheduling contention scope, these functions shall have no effect on
38750 their scheduling.

38751 • For threads with process scheduling contention scope, the threads' scheduling policy and
38752 associated parameters shall not be affected. However, the scheduling of these threads with
38753 respect to threads in other processes may be dependent on the scheduling parameters of their
38754 process, which are governed using these functions.

38755 If an implementation supports a two-level scheduling model in which library threads are
38756 multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled
38757 entities for the system contention scope threads shall not be affected by these functions.

38758 The underlying kernel-scheduled entities for the process contention scope threads shall have
38759 their scheduling policy and associated scheduling parameters changed to the values specified in
38760 *policy* and *param*, respectively. Kernel-scheduled entities for use by process contention scope
38761 threads that are created after this call completes shall inherit their scheduling policy and
38762 associated scheduling parameters from the process.

38763 This function is not atomic with respect to other threads in the process. Threads may continue to
38764 execute while this function call is in the process of changing the scheduling policy and
38765 associated scheduling parameters for the underlying kernel-scheduled entities used by the
38766 process contention scope threads.

38767 **RETURN VALUE**

38768 Upon successful completion, the function shall return the former scheduling policy of the
38769 specified process. If the *sched_setscheduler()* function fails to complete successfully, the policy
38770 and scheduling parameters shall remain unchanged, and the function shall return a value of *-1*
38771 and set *errno* to indicate the error.

38772 **ERRORS**

38773 The *sched_setscheduler()* function shall fail if:

38774 [EINVAL] The value of the *policy* parameter is invalid, or one or more of the parameters
38775 contained in *param* is outside the valid range for the specified scheduling
38776 policy.

38777 [EPERM] The requesting process does not have permission to set either or both of the
38778 scheduling parameters or the scheduling policy of the specified process.

38779 [ESRCH] No process can be found corresponding to that specified by *pid*.

38790 IEEE Std 1003.1-2001, <**sched.h**>

38791 **CHANGE HISTORY**

38792 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38793 **Issue 6**

38794 The *sched_setscheduler()* function is marked as part of the Process Scheduling option.

38795 The [ENOSYS] error condition has been removed as stubs need not be provided if an
38796 implementation does not support the Process Scheduling option.

38797 The following new requirements on POSIX implementations derive from alignment with the
38798 Single UNIX Specification:

38799 • In the DESCRIPTION, the effect of this function on a thread's scheduling parameters is
38800 added.

38801 • Sections describing two-level scheduling and atomicity of the function are added.

38802 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

38803 **NAME**

38804 sched_yield — yield the processor

38805 **SYNOPSIS**38806 PS|THR `#include <sched.h>`38807 `int sched_yield(void);`

38808

38809 **DESCRIPTION**

38810 The *sched_yield()* function shall force the running thread to relinquish the processor until it again
38811 becomes the head of its thread list. It takes no arguments.

38812 **RETURN VALUE**

38813 The *sched_yield()* function shall return 0 if it completes successfully; otherwise, it shall return a
38814 value of -1 and set *errno* to indicate the error.

38815 **ERRORS**

38816 No errors are defined.

38817 **EXAMPLES**

38818 None.

38819 **APPLICATION USAGE**

38820 None.

38821 **RATIONALE**

38822 None.

38823 **FUTURE DIRECTIONS**

38824 None.

38825 **SEE ALSO**38826 The Base Definitions volume of IEEE Std 1003.1-2001, <**sched.h**>38827 **CHANGE HISTORY**

38828 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
38829 POSIX Threads Extension.

38830 **Issue 6**38831 The *sched_yield()* function is now marked as part of the Process Scheduling and Threads options.

38832 **NAME**

38833 seed48 — seed a uniformly distributed pseudo-random non-negative long integer generator

38834 **SYNOPSIS**

38835 xSI #include <stdlib.h>

38836 unsigned short *seed48(unsigned short *seed16v*[3]);

38837

38838 **DESCRIPTION**38839 Refer to *drand48()*.

38840 NAME

38841 seekdir — set the position of a directory stream

38842 SYNOPSIS

38843 XSI `#include <dirent.h>`

38844 `void seekdir(DIR *dirp, long loc);`

38845

38846 DESCRIPTION

38847 The *seekdir()* function shall set the position of the next *readdir()* operation on the directory
38848 stream specified by *dirp* to the position specified by *loc*. The value of *loc* should have been
38849 returned from an earlier call to *telldir()*. The new position reverts to the one associated with the
38850 directory stream when *telldir()* was performed.

38851 If the value of *loc* was not obtained from an earlier call to *telldir()*, or if a call to *rewinddir()*
38852 occurred between the call to *telldir()* and the call to *seekdir()*, the results of subsequent calls to
38853 *readdir()* are unspecified.

38854 RETURN VALUE

38855 The *seekdir()* function shall not return a value.

38856 ERRORS

38857 No errors are defined.

38858 EXAMPLES

38859 None.

38860 APPLICATION USAGE

38861 None.

38862 RATIONALE

38863 The original standard developers perceived that there were restrictions on the use of the
38864 *seekdir()* and *telldir()* functions related to implementation details, and for that reason these
38865 functions need not be supported on all POSIX-conforming systems. They are required on
38866 implementations supporting the XSI extension.

38867 One of the perceived problems of implementation is that returning to a given point in a directory
38868 is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-
38869 trees, hashing functions, or other similar mechanisms to order their directories are considered.
38870 The definition of *seekdir()* and *telldir()* does not specify whether, when using these interfaces, a
38871 given directory entry will be seen at all, or more than once.

38872 On systems not supporting these functions, their capability can sometimes be accomplished by
38873 saving a filename found by *readdir()* and later using *rewinddir()* and a loop on *readdir()* to
38874 relocate the position from which the filename was saved.

38875 FUTURE DIRECTIONS

38876 None.

38877 SEE ALSO

38878 *opendir()*, *readdir()*, *telldir()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<dirent.h>**,
38879 **<stdio.h>**, **<sys/types.h>**

38880 CHANGE HISTORY

38881 First released in Issue 2.

38882 **Issue 6**

38883 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

38884 **NAME**

38885 select — synchronous I/O multiplexing

38886 **SYNOPSIS**

38887 #include <sys/time.h>

```
38888       int select(int nfds, fd_set *restrict readfds,  
38889                 fd_set *restrict writefds, fd_set *restrict errorfds,  
38890                 struct timeval *restrict timeout);
```

38891

38892 **DESCRIPTION**38893 Refer to *pselect()*.

38894 **NAME**38895 sem_close — close a named semaphore (**REALTIME**)38896 **SYNOPSIS**38897 SEM `#include <semaphore.h>`38898 `int sem_close(sem_t *sem);`

38899

38900 **DESCRIPTION**

38901 The `sem_close()` function shall indicate that the calling process is finished using the named
 38902 semaphore indicated by `sem`. The effects of calling `sem_close()` for an unnamed semaphore (one
 38903 created by `sem_init()`) are undefined. The `sem_close()` function shall deallocate (that is, make
 38904 available for reuse by a subsequent `sem_open()` by this process) any system resources allocated
 38905 by the system for use by this process for this semaphore. The effect of subsequent use of the
 38906 semaphore indicated by `sem` by this process is undefined. If the semaphore has not been
 38907 removed with a successful call to `sem_unlink()`, then `sem_close()` has no effect on the state of the
 38908 semaphore. If the `sem_unlink()` function has been successfully invoked for `name` after the most
 38909 recent call to `sem_open()` with `O_CREAT` for this semaphore, then when all processes that have
 38910 opened the semaphore close it, the semaphore is no longer accessible.

38911 **RETURN VALUE**

38912 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be
 38913 returned and `errno` set to indicate the error.

38914 **ERRORS**38915 The `sem_close()` function shall fail if:38916 [EINVAL] The `sem` argument is not a valid semaphore descriptor.38917 **EXAMPLES**

38918 None.

38919 **APPLICATION USAGE**

38920 The `sem_close()` function is part of the Semaphores option and need not be available on all
 38921 implementations.

38922 **RATIONALE**

38923 None.

38924 **FUTURE DIRECTIONS**

38925 None.

38926 **SEE ALSO**

38927 `semctl()`, `semget()`, `semop()`, `sem_init()`, `sem_open()`, `sem_unlink()`, the Base Definitions volume of
 38928 IEEE Std 1003.1-2001, **<semaphore.h>**

38929 **CHANGE HISTORY**

38930 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38931 **Issue 6**38932 The `sem_close()` function is marked as part of the Semaphores option.

38933 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 38934 implementation does not support the Semaphores option.

38935 NAME

38936 `sem_destroy` — destroy an unnamed semaphore (**REALTIME**)

38937 SYNOPSIS

38938 SEM `#include <semaphore.h>`

38939 `int sem_destroy(sem_t *sem);`

38940

38941 DESCRIPTION

38942 The `sem_destroy()` function shall destroy the unnamed semaphore indicated by `sem`. Only a
 38943 semaphore that was created using `sem_init()` may be destroyed using `sem_destroy()`; the effect of
 38944 calling `sem_destroy()` with a named semaphore is undefined. The effect of subsequent use of the
 38945 semaphore `sem` is undefined until `sem` is reinitialized by another call to `sem_init()`.

38946 It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The
 38947 effect of destroying a semaphore upon which other threads are currently blocked is undefined.

38948 RETURN VALUE

38949 Upon successful completion, a value of zero shall be returned. Otherwise, a value of `-1` shall be
 38950 returned and `errno` set to indicate the error.

38951 ERRORS

38952 The `sem_destroy()` function shall fail if:

38953 [EINVAL] The `sem` argument is not a valid semaphore.

38954 The `sem_destroy()` function may fail if:

38955 [EBUSY] There are currently processes blocked on the semaphore.

38956 EXAMPLES

38957 None.

38958 APPLICATION USAGE

38959 The `sem_destroy()` function is part of the Semaphores option and need not be available on all
 38960 implementations.

38961 RATIONALE

38962 None.

38963 FUTURE DIRECTIONS

38964 None.

 38967 IEEE Std 1003.1-2001, **<semaphore.h>**

38968 CHANGE HISTORY

38969 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

38970 Issue 6

38971 The `sem_destroy()` function is marked as part of the Semaphores option.

38972 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 38973 implementation does not support the Semaphores option.

38974 **NAME**38975 `sem_getvalue` — get the value of a semaphore (**REALTIME**)38976 **SYNOPSIS**38977 SEM `#include <semaphore.h>`38978 `int sem_getvalue(sem_t *restrict sem, int *restrict sval);`

38979

38980 **DESCRIPTION**

38981 The `sem_getvalue()` function shall update the location referenced by the `sval` argument to have
 38982 the value of the semaphore referenced by `sem` without affecting the state of the semaphore. The
 38983 updated value represents an actual semaphore value that occurred at some unspecified time
 38984 during the call, but it need not be the actual value of the semaphore when it is returned to the
 38985 calling process.

38986 If `sem` is locked, then the object to which `sval` points shall either be set to zero or to a negative
 38987 number whose absolute value represents the number of processes waiting for the semaphore at
 38988 some unspecified time during the call.

38989 **RETURN VALUE**

38990 Upon successful completion, the `sem_getvalue()` function shall return a value of zero. Otherwise,
 38991 it shall return a value of `-1` and set `errno` to indicate the error.

38992 **ERRORS**38993 The `sem_getvalue()` function shall fail if:38994 [EINVAL] The `sem` argument does not refer to a valid semaphore.38995 **EXAMPLES**

38996 None.

38997 **APPLICATION USAGE**

38998 The `sem_getvalue()` function is part of the Semaphores option and need not be available on all
 38999 implementations.

39000 **RATIONALE**

39001 None.

39002 **FUTURE DIRECTIONS**

39003 None.

39004 **SEE ALSO**

39005 `semctl()`, `semget()`, `semop()`, `sem_post()`, `sem_timedwait()`, `sem_trywait()`, `sem_wait()`, the Base
 39006 Definitions volume of IEEE Std 1003.1-2001, **<semaphore.h>**

39007 **CHANGE HISTORY**

39008 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39009 **Issue 6**39010 The `sem_getvalue()` function is marked as part of the Semaphores option.

39011 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 39012 implementation does not support the Semaphores option.

39013 The `sem_timedwait()` function is added to the SEE ALSO section for alignment with
 39014 IEEE Std 1003.1d-1999.

39015 The **restrict** keyword is added to the `sem_getvalue()` prototype for alignment with the
 39016 ISO/IEC 9899:1999 standard.

39017

IEEE Std 1003.1-2001 / Cor 1-2002, item XSH/TC1/D6/54 is applied.

39018 **NAME**39019 sem_init — initialize an unnamed semaphore (**REALTIME**)39020 **SYNOPSIS**39021 SEM `#include <semaphore.h>`39022 `int sem_init(sem_t *sem, int pshared, unsigned value);`

39023

39024 **DESCRIPTION**

39025 The *sem_init()* function shall initialize the unnamed semaphore referred to by *sem*. The value of
 39026 the initialized semaphore shall be *value*. Following a successful call to *sem_init()*, the semaphore
 39027 may be used in subsequent calls to *sem_wait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()*.
 39028 This semaphore shall remain usable until the semaphore is destroyed.

39029 If the *pshared* argument has a non-zero value, then the semaphore is shared between processes;
 39030 in this case, any process that can access the semaphore *sem* can use *sem* for performing
 39031 *sem_wait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* operations.

39032 Only *sem* itself may be used for performing synchronization. The result of referring to copies of
 39033 *sem* in calls to *sem_wait()*, *sem_trywait()*, *sem_post()*, and *sem_destroy()* is undefined.

39034 If the *pshared* argument is zero, then the semaphore is shared between threads of the process; any
 39035 thread in this process can use *sem* for performing *sem_wait()*, *sem_trywait()*, *sem_post()*, and
 39036 *sem_destroy()* operations. The use of the semaphore by threads other than those created in the
 39037 same process is undefined.

39038 Attempting to initialize an already initialized semaphore results in undefined behavior.

39039 **RETURN VALUE**

39040 Upon successful completion, the *sem_init()* function shall initialize the semaphore in *sem*.
 39041 Otherwise, it shall return `-1` and set *errno* to indicate the error.

39042 **ERRORS**39043 The *sem_init()* function shall fail if:

39044	[EINVAL]	The <i>value</i> argument exceeds {SEM_VALUE_MAX}.
39045	[ENOSPC]	A resource required to initialize the semaphore has been exhausted, or the
39046		limit on semaphores ({SEM_NSEMS_MAX}) has been reached.
39047	[EPERM]	The process lacks the appropriate privileges to initialize the semaphore.

39048 **EXAMPLES**

39049 None.

39050 **APPLICATION USAGE**

39051 The *sem_init()* function is part of the Semaphores option and need not be available on all
 39052 implementations.

39053 **RATIONALE**

39054 Although this volume of IEEE Std 1003.1-2001 fails to specify a successful return value, it is
 39055 likely that a later version may require the implementation to return a value of zero if the call to
 39056 *sem_init()* is successful.

39057 **FUTURE DIRECTIONS**

39058 None.

39059 **SEE ALSO**

39060 *sem_destroy()*, *sem_post()*, *sem_timedwait()*, *sem_trywait()*, *sem_wait()*, the Base Definitions
39061 volume of IEEE Std 1003.1-2001, <**semaphore.h**>

39062 **CHANGE HISTORY**

39063 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39064 **Issue 6**

39065 The *sem_init()* function is marked as part of the Semaphores option.

39066 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39067 implementation does not support the Semaphores option.

39068 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with
39069 IEEE Std 1003.1d-1999.

39070 **NAME**39071 sem_open — initialize and open a named semaphore (**REALTIME**)39072 **SYNOPSIS**39073 SEM `#include <semaphore.h>`39074 `sem_t *sem_open(const char *name, int oflag, ...);`

39075

39076 **DESCRIPTION**

39077 The *sem_open()* function shall establish a connection between a named semaphore and a process.
 39078 Following a call to *sem_open()* with semaphore name *name*, the process may reference the
 39079 semaphore associated with *name* using the address returned from the call. This semaphore may
 39080 be used in subsequent calls to *sem_wait()*, *sem_trywait()*, *sem_post()*, and *sem_close()*. The
 39081 semaphore remains usable by this process until the semaphore is closed by a successful call to
 39082 *sem_close()*, *_exit()*, or one of the *exec* functions.

39083 The *oflag* argument controls whether the semaphore is created or merely accessed by the call to
 39084 *sem_open()*. The following flag bits may be set in *oflag*:

39085 **O_CREAT** This flag is used to create a semaphore if it does not already exist. If **O_CREAT** is
 39086 set and the semaphore already exists, then **O_CREAT** has no effect, except as noted
 39087 under **O_EXCL**. Otherwise, *sem_open()* creates a named semaphore. The **O_CREAT**
 39088 flag requires a third and a fourth argument: *mode*, which is of type **mode_t**, and
 39089 *value*, which is of type **unsigned**. The semaphore is created with an initial value of
 39090 *value*. Valid initial values for semaphores are less than or equal to
 39091 {SEM_VALUE_MAX}.

39092 The user ID of the semaphore is set to the effective user ID of the process; the
 39093 group ID of the semaphore is set to a system default group ID or to the effective
 39094 group ID of the process. The permission bits of the semaphore are set to the value
 39095 of the *mode* argument except those set in the file mode creation mask of the
 39096 process. When bits in *mode* other than the file permission bits are specified, the
 39097 effect is unspecified.

39098 After the semaphore named *name* has been created by *sem_open()* with the
 39099 **O_CREAT** flag, other processes can connect to the semaphore by calling
 39100 *sem_open()* with the same value of *name*.

39101 **O_EXCL** If **O_EXCL** and **O_CREAT** are set, *sem_open()* fails if the semaphore *name* exists.
 39102 The check for the existence of the semaphore and the creation of the semaphore if
 39103 it does not exist are atomic with respect to other processes executing *sem_open()*
 39104 with **O_EXCL** and **O_CREAT** set. If **O_EXCL** is set and **O_CREAT** is not set, the
 39105 effect is undefined.

39106 If flags other than **O_CREAT** and **O_EXCL** are specified in the *oflag* parameter, the
 39107 effect is unspecified.

39108 The *name* argument points to a string naming a semaphore object. It is unspecified whether the
 39109 name appears in the file system and is visible to functions that take pathnames as arguments.
 39110 The *name* argument conforms to the construction rules for a pathname. If *name* begins with the
 39111 slash character, then processes calling *sem_open()* with the same value of *name* shall refer to the
 39112 same semaphore object, as long as that name has not been removed. If *name* does not begin with
 39113 the slash character, the effect is implementation-defined. The interpretation of slash characters
 39114 other than the leading slash character in *name* is implementation-defined.

39115 If a process makes multiple successful calls to *sem_open()* with the same value for *name*, the
 39116 same semaphore address shall be returned for each such successful call, provided that there

39117 have been no calls to *sem_unlink()* for this semaphore.

39118 References to copies of the semaphore produce undefined results.

39119 RETURN VALUE

39120 Upon successful completion, the *sem_open()* function shall return the address of the semaphore.

39121 Otherwise, it shall return a value of SEM_FAILED and set *errno* to indicate the error. The symbol

39122 SEM_FAILED is defined in the **<semaphore.h>** header. No successful return from *sem_open()*

39123 shall return the value SEM_FAILED.

39124 ERRORS

39125 If any of the following conditions occur, the *sem_open()* function shall return SEM_FAILED and
39126 set *errno* to the corresponding value:

39127 [EACCES] The named semaphore exists and the permissions specified by *oflag* are
39128 denied, or the named semaphore does not exist and permission to create the
39129 named semaphore is denied.

39130 [EEXIST] O_CREAT and O_EXCL are set and the named semaphore already exists.

39131 [EINTR] The *sem_open()* operation was interrupted by a signal.

39132 [EINVAL] The *sem_open()* operation is not supported for the given name, or O_CREAT
39133 was specified in *oflag* and *value* was greater than {SEM_VALUE_MAX}.

39134 [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by
39135 this process.

39136 [ENAMETOOLONG]

39137 The length of the *name* argument exceeds {PATH_MAX} or a pathname
39138 component is longer than {NAME_MAX}.

39139 [ENFILE] Too many semaphores are currently open in the system.

39140 [ENOENT] O_CREAT is not set and the named semaphore does not exist.

39141 [ENOSPC] There is insufficient space for the creation of the new named semaphore.

39142 EXAMPLES

39143 None.

39144 APPLICATION USAGE

39145 The *sem_open()* function is part of the Semaphores option and need not be available on all
39146 implementations.

39147 RATIONALE

39148 Early drafts required an error return value of -1 with the type **sem_t *** for the *sem_open()*
39149 function, which is not guaranteed to be portable across implementations. The revised text
39150 provides the symbolic error code SEM_FAILED to eliminate the type conflict.

39151 FUTURE DIRECTIONS

39152 None.

39153 SEE ALSO

39156 CHANGE HISTORY

39157 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39158 **Issue 6**

39159 The *sem_open()* function is marked as part of the Semaphores option.

39160 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39161 implementation does not support the Semaphores option.

39162 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with
39163 IEEE Std 1003.1d-1999.

39164 **NAME**39165 sem_post — unlock a semaphore (**REALTIME**)39166 **SYNOPSIS**39167 SEM `#include <semaphore.h>`39168 `int sem_post(sem_t *sem);`

39169

39170 **DESCRIPTION**39171 The `sem_post()` function shall unlock the semaphore referenced by `sem` by performing a
39172 semaphore unlock operation on that semaphore.39173 If the semaphore value resulting from this operation is positive, then no threads were blocked
39174 waiting for the semaphore to become unlocked; the semaphore value is simply incremented.39175 If the value of the semaphore resulting from this operation is zero, then one of the threads
39176 blocked waiting for the semaphore shall be allowed to return successfully from its call to
39177 PS `sem_wait()`. If the Process Scheduling option is supported, the thread to be unblocked shall be
39178 chosen in a manner appropriate to the scheduling policies and parameters in effect for the
39179 blocked threads. In the case of the schedulers `SCHED_FIFO` and `SCHED_RR`, the highest
39180 priority waiting thread shall be unblocked, and if there is more than one highest priority thread
39181 blocked waiting for the semaphore, then the highest priority thread that has been waiting the
39182 longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread
39183 to unblock is unspecified.39184 SS If the Process Sporadic Server option is supported, and the scheduling policy is
39185 `SCHED_SPORADIC`, the semantics are as per `SCHED_FIFO` above.39186 The `sem_post()` function shall be reentrant with respect to signals and may be invoked from a
39187 signal-catching function.39188 **RETURN VALUE**39189 If successful, the `sem_post()` function shall return zero; otherwise, the function shall return `-1`
39190 and set `errno` to indicate the error.39191 **ERRORS**39192 The `sem_post()` function shall fail if:39193 [EINVAL] The `sem` argument does not refer to a valid semaphore.39194 **EXAMPLES**

39195 None.

39196 **APPLICATION USAGE**39197 The `sem_post()` function is part of the Semaphores option and need not be available on all
39198 implementations.39199 **RATIONALE**

39200 None.

39201 **FUTURE DIRECTIONS**

39202 None.

39203 **SEE ALSO**39204 `semctl()`, `semget()`, `semop()`, `sem_timedwait()`, `sem_trywait()`, `sem_wait()`, the Base Definitions

CHANGE HISTORY

39207 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

39209 The *sem_post()* function is marked as part of the Semaphores option.

39210 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39211 implementation does not support the Semaphores option.

39212 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with
39213 IEEE Std 1003.1d-1999.

39214 SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be
39215 unblocked is specified for alignment with IEEE Std 1003.1d-1999.

39216 **NAME**39217 `sem_timedwait` — lock a semaphore (**ADVANCED REALTIME**)39218 **SYNOPSIS**39219 SEM TMO `#include <semaphore.h>`39220 `#include <time.h>`

```
39221 int sem_timedwait(sem_t *restrict sem,
39222                  const struct timespec *restrict abs_timeout);
39223
```

39224 **DESCRIPTION**

39225 The `sem_timedwait()` function shall lock the semaphore referenced by `sem` as in the `sem_wait()`
 39226 function. However, if the semaphore cannot be locked without waiting for another process or
 39227 thread to unlock the semaphore by performing a `sem_post()` function, this wait shall be
 39228 terminated when the specified timeout expires.

39229 The timeout shall expire when the absolute time specified by `abs_timeout` passes, as measured by
 39230 the clock on which timeouts are based (that is, when the value of that clock equals or exceeds
 39231 `abs_timeout`), or if the absolute time specified by `abs_timeout` has already been passed at the time
 39232 of the call.

39233 TMR If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If
 39234 the Timers option is not supported, the timeout shall be based on the system clock as returned
 39235 by the `time()` function. The resolution of the timeout shall be the resolution of the clock on which
 39236 it is based. The **timespec** data type is defined as a structure in the `<time.h>` header.

39237 Under no circumstance shall the function fail with a timeout if the semaphore can be locked
 39238 immediately. The validity of the `abs_timeout` need not be checked if the semaphore can be locked
 39239 immediately.

39240 **RETURN VALUE**

39241 The `sem_timedwait()` function shall return zero if the calling process successfully performed the
 39242 semaphore lock operation on the semaphore designated by `sem`. If the call was unsuccessful, the
 39243 state of the semaphore shall be unchanged, and the function shall return a value of `-1` and set
 39244 `errno` to indicate the error.

39245 **ERRORS**39246 The `sem_timedwait()` function shall fail if:

39247 [EINVAL] The `sem` argument does not refer to a valid semaphore.

39248 [EINVAL] The process or thread would have blocked, and the `abs_timeout` parameter
 39249 specified a nanoseconds field value less than zero or greater than or equal to
 39250 1 000 million.

39251 [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.

39252 The `sem_timedwait()` function may fail if:

39253 [EDEADLK] A deadlock condition was detected.

39254 [EINTR] A signal interrupted this function.

39255 EXAMPLES

39256 None.

39257 APPLICATION USAGE

39258 Applications using these functions may be subject to priority inversion, as discussed in the Base
39259 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

39260 The *sem_timedwait()* function is part of the Semaphores and Timeouts options and need not be
39261 provided on all implementations.

39262 RATIONALE

39263 None.

39264 FUTURE DIRECTIONS

39265 None.

39266 SEE ALSO

39267 *sem_post()*, *sem_trywait()*, *sem_wait()*, *semctl()*, *semget()*, *semop()*, *time()*, the Base Definitions
39268 volume of IEEE Std 1003.1-2001, <**semaphore.h**>, <**time.h**>

39269 CHANGE HISTORY

39270 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

39271 **NAME**39272 sem_trywait, sem_wait — lock a semaphore (**REALTIME**)39273 **SYNOPSIS**39274 SEM `#include <semaphore.h>`39275 `int sem_trywait(sem_t *sem);`39276 `int sem_wait(sem_t *sem);`

39277

39278 **DESCRIPTION**

39279 The `sem_trywait()` function shall lock the semaphore referenced by `sem` only if the semaphore is
 39280 currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not
 39281 lock the semaphore.

39282 The `sem_wait()` function shall lock the semaphore referenced by `sem` by performing a semaphore
 39283 lock operation on that semaphore. If the semaphore value is currently zero, then the calling
 39284 thread shall not return from the call to `sem_wait()` until it either locks the semaphore or the call is
 39285 interrupted by a signal.

39286 Upon successful return, the state of the semaphore shall be locked and shall remain locked until
 39287 the `sem_post()` function is executed and returns successfully.

39288 The `sem_wait()` function is interruptible by the delivery of a signal.

39289 **RETURN VALUE**

39290 The `sem_trywait()` and `sem_wait()` functions shall return zero if the calling process successfully
 39291 performed the semaphore lock operation on the semaphore designated by `sem`. If the call was
 39292 unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a
 39293 value of `-1` and set `errno` to indicate the error.

39294 **ERRORS**

39295 The `sem_trywait()` and `sem_wait()` functions shall fail if:

39296 [EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the
 39297 `sem_trywait()` operation (`sem_trywait()` only).

39298 [EINVAL] The `sem` argument does not refer to a valid semaphore.

39299 The `sem_trywait()` and `sem_wait()` functions may fail if:

39300 [EDEADLK] A deadlock condition was detected.

39301 [EINTR] A signal interrupted this function.

39302 **EXAMPLES**

39303 None.

39304 **APPLICATION USAGE**

39305 Applications using these functions may be subject to priority inversion, as discussed in the Base
 39306 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

39307 The `sem_trywait()` and `sem_wait()` functions are part of the Semaphores option and need not be
 39308 provided on all implementations.

39309 **RATIONALE**

39310 None.

39311 **FUTURE DIRECTIONS**

39312 None.

39313 **SEE ALSO**

39314 *semctl()*, *semget()*, *semop()*, *sem_post()*, *sem_timedwait()*, the Base Definitions volume of
39315 IEEE Std 1003.1-2001, <**semaphore.h**>

39316 **CHANGE HISTORY**

39317 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39318 **Issue 6**39319 The *sem_trywait()* and *sem_wait()* functions are marked as part of the Semaphores option.

39320 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39321 implementation does not support the Semaphores option.

39322 The *sem_timedwait()* function is added to the SEE ALSO section for alignment with
39323 IEEE Std 1003.1d-1999.

39324 **NAME**39325 sem_unlink — remove a named semaphore (**REALTIME**)39326 **SYNOPSIS**39327 SEM `#include <semaphore.h>`39328 `int sem_unlink(const char *name);`

39329

39330 **DESCRIPTION**

39331 The `sem_unlink()` function shall remove the semaphore named by the string *name*. If the
 39332 semaphore named by *name* is currently referenced by other processes, then `sem_unlink()` shall
 39333 have no effect on the state of the semaphore. If one or more processes have the semaphore open
 39334 when `sem_unlink()` is called, destruction of the semaphore is postponed until all references to the
 39335 semaphore have been destroyed by calls to `sem_close()`, `_exit()`, or `exec`. Calls to `sem_open()` to
 39336 recreate or reconnect to the semaphore refer to a new semaphore after `sem_unlink()` is called. The
 39337 `sem_unlink()` call shall not block until all references have been destroyed; it shall return
 39338 immediately.

39339 **RETURN VALUE**

39340 Upon successful completion, the `sem_unlink()` function shall return a value of 0. Otherwise, the
 39341 semaphore shall not be changed and the function shall return a value of `-1` and set *errno* to
 39342 indicate the error.

39343 **ERRORS**39344 The `sem_unlink()` function shall fail if:

39345 [EACCES] Permission is denied to unlink the named semaphore.

39346 [ENAMETOOLONG]

39347 The length of the *name* argument exceeds {PATH_MAX} or a pathname
 39348 component is longer than {NAME_MAX}.

39349 [ENOENT] The named semaphore does not exist.

39350 **EXAMPLES**

39351 None.

39352 **APPLICATION USAGE**

39353 The `sem_unlink()` function is part of the Semaphores option and need not be available on all
 39354 implementations.

39355 **RATIONALE**

39356 None.

39357 **FUTURE DIRECTIONS**

39358 None.

39359 **SEE ALSO**

39360 `semctl()`, `semget()`, `semop()`, `sem_close()`, `sem_open()`, the Base Definitions volume of
 39361 IEEE Std 1003.1-2001, <**semaphore.h**>

39362 **CHANGE HISTORY**

39363 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

39364 **Issue 6**39365 The `sem_unlink()` function is marked as part of the Semaphores option.

39366 The [ENOSYS] error condition has been removed as stubs need not be provided if an
39367 implementation does not support the Semaphores option.

39368 **NAME**

39369 `sem_wait` — lock a semaphore (**REALTIME**)

39370 **SYNOPSIS**

39371 SEM `#include <semaphore.h>`

39372 `int sem_wait(sem_t *sem);`

39373

39374 **DESCRIPTION**

39375 Refer to `sem_trywait()`.

39376 **NAME**

39377 semctl — XSI semaphore control operations

39378 **SYNOPSIS**39379 xsi `#include <sys/sem.h>`39380 `int semctl(int semid, int semnum, int cmd, ...);`

39381

39382 **DESCRIPTION**

39383 The *semctl()* function operates on XSI semaphores (see the Base Definitions volume of
 39384 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function
 39385 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 39386 page 41).

39387 The *semctl()* function provides a variety of semaphore control operations as specified by *cmd*.
 39388 The fourth argument is optional and depends upon the operation requested. If required, it is of
 39389 type **union semun**, which the application shall explicitly declare:

```
39390 union semun {
39391     int val;
39392     struct semid_ds *buf;
39393     unsigned short *array;
39394 } arg;
```

39395 The following semaphore control operations as specified by *cmd* are executed with respect to the
 39396 semaphore specified by *semid* and *semnum*. The level of permission required for each operation
 39397 is shown with each command; see Section 2.7 (on page 39). The symbolic names for the values
 39398 of *cmd* are defined in the **<sys/sem.h>** header:

39399	GETVAL	Return the value of <i>semval</i> ; see <sys/sem.h> . Requires read permission.
39400	SETVAL	Set the value of <i>semval</i> to <i>arg.val</i> , where <i>arg</i> is the value of the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> value corresponding to the specified semaphore in all processes is cleared. Requires alter permission; see Section 2.7 (on page 39).

39402		
39403		
39404	GETPID	Return the value of <i>sempid</i> . Requires read permission.
39405	GETNCNT	Return the value of <i>semncnt</i> . Requires read permission.
39406	GETZCNT	Return the value of <i>semzcnt</i> . Requires read permission.

39407 The following values of *cmd* operate on each *semval* in the set of semaphores:

39408	GETALL	Return the value of <i>semval</i> for each semaphore in the semaphore set and place into the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . Requires read permission.
39409		
39410		
39411	SETALL	Set the value of <i>semval</i> for each semaphore in the semaphore set according to the array pointed to by <i>arg.array</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . When this command is successfully executed, the <i>semadj</i> values corresponding to each specified semaphore in all processes are cleared. Requires alter permission.
39412		
39413		
39414		
39415		

39416 The following values of *cmd* are also available:

39417	IPC_STAT	Place the current value of each member of the semid_ds data structure associated with <i>semid</i> into the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> . The contents of this structure are defined in
39418		
39419		

39420		<sys/sem.h>. Requires read permission.
39421	IPC_SET	Set the value of the following members of the semid_ds data structure associated with <i>semid</i> to the corresponding value found in the structure pointed to by <i>arg.buf</i> , where <i>arg</i> is the fourth argument to <i>semctl()</i> :
39422		
39423		
39424		<i>sem_perm.uid</i>
39425		<i>sem_perm.gid</i>
39426		<i>sem_perm.mode</i>
39427		The mode bits specified in Section 2.7.1 (on page 40) are copied into the corresponding bits of the <i>sem_perm.mode</i> associated with <i>semid</i> . The stored values of any other bits are unspecified.
39428		
39429		
39430		This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the semid_ds data structure associated with <i>semid</i> .
39431		
39432		
39433		
39434	IPC_RMID	Remove the semaphore identifier specified by <i>semid</i> from the system and destroy the set of semaphores and semid_ds data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the semid_ds data structure associated with <i>semid</i> .
39435		
39436		
39437		
39438		
39439		
39440	RETURN VALUE	
39441		If successful, the value returned by <i>semctl()</i> depends on <i>cmd</i> as follows:
39442	GETVAL	The value of <i>semval</i> .
39443	GETPID	The value of <i>sempid</i> .
39444	GETNCNT	The value of <i>semncnt</i> .
39445	GETZCNT	The value of <i>semzcnt</i> .
39446	All others	0.
39447		Otherwise, <i>semctl()</i> shall return -1 and set <i>errno</i> to indicate the error.
39448	ERRORS	
39449		The <i>semctl()</i> function shall fail if:
39450	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 39).
39451		
39452	[EINVAL]	The value of <i>semid</i> is not a valid semaphore identifier, or the value of <i>semnum</i> is less than 0 or greater than or equal to <i>sem_nsems</i> , or the value of <i>cmd</i> is not a valid command.
39453		
39454		
39455	[EPERM]	The argument <i>cmd</i> is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of <i>sem_perm.cuid</i> or <i>sem_perm.uid</i> in the data structure associated with <i>semid</i> .
39456		
39457		
39458		
39459	[ERANGE]	The argument <i>cmd</i> is equal to SETVAL or SETALL and the value to which <i>semval</i> is to be set is greater than the system-imposed maximum.
39460		

39461 **EXAMPLES**

39462 None.

39463 **APPLICATION USAGE**

39464 The fourth parameter in the SYNOPSIS section is now specified as ". . ." in order to avoid a
39465 clash with the ISO C standard when referring to the union *semun* (as defined in Issue 3) and for
39466 backwards-compatibility.

39467 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
39468 Application developers who need to use IPC should design their applications so that modules
39469 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
39470 alternative interfaces.

39471 **RATIONALE**

39472 None.

39473 **FUTURE DIRECTIONS**

39474 None.

39482 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
39483 DIRECTIONS to the APPLICATION USAGE section.

39484 **NAME**

39485 semget — get set of XSI semaphores

39486 **SYNOPSIS**

39487 XSI #include <sys/sem.h>

39488 int semget(key_t key, int nsems, int semflg);

39489

39490 **DESCRIPTION**

39491 The *semget()* function operates on XSI semaphores (see the Base Definitions volume of
 39492 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function
 39493 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 39494 page 41).

39495 The *semget()* function shall return the semaphore identifier associated with *key*.

39496 A semaphore identifier with its associated **semid_ds** data structure and its associated set of
 39497 *nsems* semaphores (see <sys/sem.h>) is created for *key* if one of the following is true:

- 39498 • The argument *key* is equal to IPC_PRIVATE.
- 39499 • The argument *key* does not already have a semaphore identifier associated with it and (*semflg*
 39500 &IPC_CREAT) is non-zero.

39501 Upon creation, the **semid_ds** data structure associated with the new semaphore identifier is
 39502 initialized as follows:

- 39503 • In the operation permissions structure *sem_perm.cuid*, *sem_perm.uid*, *sem_perm.cgid*, and
 39504 *sem_perm.gid* shall be set equal to the effective user ID and effective group ID, respectively, of
 39505 the calling process.
- 39506 • The low-order 9 bits of *sem_perm.mode* shall be set equal to the low-order 9 bits of *semflg*.
- 39507 • The variable *sem_nsems* shall be set equal to the value of *nsems*.
- 39508 • The variable *sem_otime* shall be set equal to 0 and *sem_ctime* shall be set equal to the current
 39509 time.
- 39510 • The data structure associated with each semaphore in the set shall not be initialized. The
 39511 *semctl()* function with the command SETVAL or SETALL can be used to initialize each
 39512 semaphore.

39513 **RETURN VALUE**

39514 Upon successful completion, *semget()* shall return a non-negative integer, namely a semaphore
 39515 identifier; otherwise, it shall return -1 and set *errno* to indicate the error.

39516 **ERRORS**

39517 The *semget()* function shall fail if:

39518 39519 39520	[EACCES]	A semaphore identifier exists for <i>key</i> , but operation permission as specified by the low-order 9 bits of <i>semflg</i> would not be granted; see Section 2.7 (on page 39).
39521 39522	[EEXIST]	A semaphore identifier exists for the argument <i>key</i> but ((<i>semflg</i> &IPC_CREAT) &&(semflg &IPC_EXCL)) is non-zero.
39523 39524 39525 39526	[EINVAL]	The value of <i>nsems</i> is either less than or equal to 0 or greater than the system-imposed limit, or a semaphore identifier exists for the argument <i>key</i> , but the number of semaphores in the set associated with it is less than <i>nsems</i> and <i>nsems</i> is not equal to 0.

39527 [ENOENT] A semaphore identifier does not exist for the argument *key* and (*semflg*
 39528 &IPC_CREAT) is equal to 0.

39529 [ENOSPC] A semaphore identifier is to be created but the system-imposed limit on the
 39530 maximum number of allowed semaphores system-wide would be exceeded.

39531 EXAMPLES

39532 Creating a Semaphore Identifier

39533 The following example gets a unique semaphore key using the *ftok()* function, then gets a
 39534 semaphore ID associated with that key using the *semget()* function (the first call also tests to
 39535 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
 39536 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the
 39537 program attempts to create one semaphore with read/write permission for all. It also uses the
 39538 IPC_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

39539 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in
 39540 the *sbuf* array. The number of processes that can execute concurrently without queuing is
 39541 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in
 39542 the program.

```

39543 #include <sys/types.h>
39544 #include <stdio.h>
39545 #include <sys/ipc.h>
39546 #include <sys/sem.h>
39547 #include <sys/stat.h>
39548 #include <errno.h>
39549 #include <unistd.h>
39550 #include <stdlib.h>
39551 #include <pwd.h>
39552 #include <fcntl.h>
39553 #include <limits.h>
39554 ...
39555 key_t semkey;
39556 int semid, pfd, fv;
39557 struct sembuf sbuf;
39558 char *lgn;
39559 char filename[PATH_MAX+1];
39560 struct stat outstat;
39561 struct passwd *pw;
39562 ...
39563 /* Get unique key for semaphore. */
39564 if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
39565     perror("IPC error: ftok"); exit(1);
39566 }
39567
39568 /* Get semaphore ID associated with this key. */
39569 if ((semid = semget(semkey, 0, 0)) == -1) {
39570     /* Semaphore does not exist - Create. */
39571     if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
39572         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
39573     {
39574         /* Initialize the semaphore. */
39575         sbuf.sem_num = 0;
```

```

39575         sbuf.sem_op = 2;  /* This is the number of runs
39576                        without queuing. */
39577         sbuf.sem_flg = 0;
39578         if (semop(semid, &sbuf, 1) == -1) {
39579             perror("IPC error: semop"); exit(1);
39580         }
39581     }
39582     else if (errno == EEXIST) {
39583         if ((semid = semget(semkey, 0, 0)) == -1) {
39584             perror("IPC error 1: semget"); exit(1);
39585         }
39586     }
39587     else {
39588         perror("IPC error 2: semget"); exit(1);
39589     }
39590 }
39591 ...

```

39592 APPLICATION USAGE

39593 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 39594 Application developers who need to use IPC should design their applications so that modules
 39595 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
 39596 alternative interfaces.

39605 CHANGE HISTORY

39606 First released in Issue 2. Derived from Issue 2 of the SVID.

39607 Issue 5

39608 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
 39609 DIRECTIONS to a new APPLICATION USAGE section.

39610 **NAME**

39611 semop — XSI semaphore operations

39612 **SYNOPSIS**39613 XSI `#include <sys/sem.h>`39614 `int semop(int semid, struct sembuf *sops, size_t nsops);`

39615

39616 **DESCRIPTION**

39617 The *semop()* function operates on XSI semaphores (see the Base Definitions volume of
 39618 IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function
 39619 interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
 39620 page 41).

39621 The *semop()* function shall perform atomically a user-defined array of semaphore operations on
 39622 the set of semaphores associated with the semaphore identifier specified by the argument *semid*.

39623 The argument *sops* is a pointer to a user-defined array of semaphore operation structures. The
 39624 implementation shall not modify elements of this array unless the application uses
 39625 implementation-defined extensions.

39626 The argument *nsops* is the number of such structures in the array.

39627 Each structure, **sembuf**, includes the following members:

39628

39629

39630

39631

39632

Member Type	Member Name	Description
short	<i>sem_num</i>	Semaphore number.
short	<i>sem_op</i>	Semaphore operation.
short	<i>sem_flg</i>	Operation flags.

39633 Each semaphore operation specified by *sem_op* is performed on the corresponding semaphore
 39634 specified by *semid* and *sem_num*.

39635 The variable *sem_op* specifies one of three semaphore operations:

- 39636 1. If *sem_op* is a negative integer and the calling process has alter permission, one of the
 39637 following shall occur:
 - 39638 • If *semval*(see <sys/sem.h>) is greater than or equal to the absolute value of *sem_op*, the
 39639 absolute value of *sem_op* is subtracted from *semval*. Also, if (*sem_flg* & SEM_UNDO) is
 39640 non-zero, the absolute value of *sem_op* shall be added to the calling process' *semadj*
 39641 value for the specified semaphore.
 - 39642 • If *semval* is less than the absolute value of *sem_op* and (*sem_flg* & IPC_NOWAIT) is non-
 39643 zero, *semop()* shall return immediately.
 - 39644 • If *semval* is less than the absolute value of *sem_op* and (*sem_flg* & IPC_NOWAIT) is 0,
 39645 *semop()* shall increment the *semncnt* associated with the specified semaphore and
 39646 suspend execution of the calling thread until one of the following conditions occurs:
 - 39647 — The value of *semval* becomes greater than or equal to the absolute value of *sem_op*.
 39648 When this occurs, the value of *semncnt* associated with the specified semaphore
 39649 shall be decremented, the absolute value of *sem_op* shall be subtracted from *semval*
 39650 and, if (*sem_flg* & SEM_UNDO) is non-zero, the absolute value of *sem_op* shall be
 39651 added to the calling process' *semadj* value for the specified semaphore.
 - 39652 — The *semid* for which the calling thread is awaiting action is removed from the
 39653 system. When this occurs, *errno* shall be set equal to [EIDRM] and *-1* shall be

39654 returned.

39655 — The calling thread receives a signal that is to be caught. When this occurs, the value
39656 of *semcnt* associated with the specified semaphore shall be decremented, and the
39657 calling thread shall resume execution in the manner prescribed in *sigaction()*.

39658 2. If *sem_op* is a positive integer and the calling process has alter permission, the value of
39659 *sem_op* shall be added to *semval* and, if (*sem_flg* & SEM_UNDO) is non-zero, the value of
39660 *sem_op* shall be subtracted from the calling process' *semadj* value for the specified
39661 semaphore.

39662 3. If *sem_op* is 0 and the calling process has read permission, one of the following shall occur:

39663 • If *semval* is 0, *semop()* shall return immediately.

39664 • If *semval* is non-zero and (*sem_flg* & IPC_NOWAIT) is non-zero, *semop()* shall return
39665 immediately.

39666 • If *semval* is non-zero and (*sem_flg* & IPC_NOWAIT) is 0, *semop()* shall increment the
39667 *semzcnt* associated with the specified semaphore and suspend execution of the calling
39668 thread until one of the following occurs:

39669 — The value of *semval* becomes 0, at which time the value of *semzcnt* associated with
39670 the specified semaphore shall be decremented.

39671 — The *semid* for which the calling thread is awaiting action is removed from the
39672 system. When this occurs, *errno* shall be set equal to [EIDRM] and -1 shall be
39673 returned.

39674 — The calling thread receives a signal that is to be caught. When this occurs, the value
39675 of *semzcnt* associated with the specified semaphore shall be decremented, and the
39676 calling thread shall resume execution in the manner prescribed in *sigaction()*.

39677 Upon successful completion, the value of *sempid* for each semaphore specified in the array
39678 pointed to by *sops* shall be set equal to the process ID of the calling process.

39679 **RETURN VALUE**

39680 Upon successful completion, *semop()* shall return 0; otherwise, it shall return -1 and set *errno* to
39681 indicate the error.

39682 **ERRORS**

39683 The *semop()* function shall fail if:

39684 [E2BIG] The value of *nsops* is greater than the system-imposed maximum.

39685 [EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page
39686 39).

39687 [EAGAIN] The operation would result in suspension of the calling process but (*sem_flg*
39688 & IPC_NOWAIT) is non-zero.

39689 [EFBIG] The value of *sem_num* is less than 0 or greater than or equal to the number of
39690 semaphores in the set associated with *semid*.

39691 [EIDRM] The semaphore identifier *semid* is removed from the system.

39692 [EINTR] The *semop()* function was interrupted by a signal.

39693 [EINVAL] The value of *semid* is not a valid semaphore identifier, or the number of
39694 individual semaphores for which the calling process requests a SEM_UNDO
39695 would exceed the system-imposed limit.

39696 [ENOSPC] The limit on the number of individual processes requesting a SEM_UNDO
 39697 would be exceeded.

39698 [ERANGE] An operation would cause a *semval* to overflow the system-imposed limit, or
 39699 an operation would cause a *semadj* value to overflow the system-imposed
 39700 limit.

39701 EXAMPLES

39702 Setting Values in Semaphores

39703 The following example sets the values of the two semaphores associated with the *semid*
 39704 identifier to the values contained in the *sb* array.

```
39705 #include <sys/sem.h>
39706 ...
39707 int semid;
39708 struct sembuf sb[2];
39709 int nsops = 2;
39710 int result;

39711 /* Adjust value of semaphore in the semaphore array semid. */
39712 sb[0].sem_num = 0;
39713 sb[0].sem_op = -1;
39714 sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
39715 sb[1].sem_num = 1;
39716 sb[1].sem_op = 1;
39717 sb[1].sem_flg = 0;

39718 result = semop(semid, sb, nsops);
```

39719 Creating a Semaphore Identifier

39720 The following example gets a unique semaphore key using the *ftok()* function, then gets a
 39721 semaphore ID associated with that key using the *semget()* function (the first call also tests to
 39722 make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
 39723 shown by the second call to *semget()*. In creating the semaphore for the queuing process, the
 39724 program attempts to create one semaphore with read/write permission for all. It also uses the
 39725 IPC_EXCL flag, which forces *semget()* to fail if the semaphore already exists.

39726 After creating the semaphore, the program uses a call to *semop()* to initialize it to the values in
 39727 the *sbuf* array. The number of processes that can execute concurrently without queuing is
 39728 initially set to 2. The final call to *semget()* creates a semaphore identifier that can be used later in
 39729 the program.

39730 The final call to *semop()* acquires the semaphore and waits until it is free; the SEM_UNDO
 39731 option releases the semaphore when the process exits, waiting until there are less than two
 39732 processes running concurrently.

```
39733 #include <sys/types.h>
39734 #include <stdio.h>
39735 #include <sys/ipc.h>
39736 #include <sys/sem.h>
39737 #include <sys/stat.h>
39738 #include <errno.h>
39739 #include <unistd.h>
39740 #include <stdlib.h>
```

```

39741     #include <pwd.h>
39742     #include <fcntl.h>
39743     #include <limits.h>
39744     ...
39745     key_t semkey;
39746     int semid, pfd, fv;
39747     struct sembuf sbuf;
39748     char *lgn;
39749     char filename[PATH_MAX+1];
39750     struct stat outstat;
39751     struct passwd *pw;
39752     ...
39753     /* Get unique key for semaphore. */
39754     if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
39755         perror("IPC error: ftok"); exit(1);
39756     }
39757     /* Get semaphore ID associated with this key. */
39758     if ((semid = semget(semkey, 0, 0)) == -1) {
39759         /* Semaphore does not exist - Create. */
39760         if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
39761             S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1)
39762         {
39763             /* Initialize the semaphore. */
39764             sbuf.sem_num = 0;
39765             sbuf.sem_op = 2; /* This is the number of runs without queuing. */
39766             sbuf.sem_flg = 0;
39767             if (semop(semid, &sbuf, 1) == -1) {
39768                 perror("IPC error: semop"); exit(1);
39769             }
39770         }
39771         else if (errno == EEXIST) {
39772             if ((semid = semget(semkey, 0, 0)) == -1) {
39773                 perror("IPC error 1: semget"); exit(1);
39774             }
39775         }
39776         else {
39777             perror("IPC error 2: semget"); exit(1);
39778         }
39779     }
39780     ...
39781     sbuf.sem_num = 0;
39782     sbuf.sem_op = -1;
39783     sbuf.sem_flg = SEM_UNDO;
39784     if (semop(semid, &sbuf, 1) == -1) {
39785         perror("IPC Error: semop"); exit(1);
39786     }

```

39787 APPLICATION USAGE

39788 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
39789 Application developers who need to use IPC should design their applications so that modules
39790 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
39791 alternative interfaces.

39792 **RATIONALE**

39793 None.

39794 **FUTURE DIRECTIONS**

39795 None.

39801 **CHANGE HISTORY**

39802 First released in Issue 2. Derived from Issue 2 of the SVID.

39803 **Issue 5**

39804 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
39805 DIRECTIONS to a new APPLICATION USAGE section.

39806 **NAME**

39807 send — send a message on a socket

39808 **SYNOPSIS**

39809 #include <sys/socket.h>

39810 ssize_t send(int *socket*, const void **buffer*, size_t *length*, int *flags*);39811 **DESCRIPTION**39812 The *send()* function shall initiate transmission of a message from the specified socket to its peer.39813 The *send()* function shall send a message only when the socket is connected (including when the
39814 peer of a connectionless socket has been set via *connect()*).39815 The *send()* function takes the following arguments:39816 *socket* Specifies the socket file descriptor.39817 *buffer* Points to the buffer containing the message to send.39818 *length* Specifies the length of the message in bytes.39819 *flags* Specifies the type of message transmission. Values of this argument are
39820 formed by logically OR'ing zero or more of the following flags:

39821 MSG_EOR Terminates a record (if supported by the protocol).

39822 MSG_OOB Sends out-of-band data on sockets that support out-of-band
39823 communications. The significance and semantics of out-of-
39824 band data are protocol-specific.39825 The length of the message to be sent is specified by the *length* argument. If the message is too
39826 long to pass through the underlying protocol, *send()* shall fail and no data shall be transmitted.39827 Successful completion of a call to *send()* does not guarantee delivery of the message. A return
39828 value of -1 indicates only locally-detected errors.39829 If space is not available at the sending socket to hold the message to be transmitted, and the
39830 socket file descriptor does not have O_NONBLOCK set, *send()* shall block until space is
39831 available. If space is not available at the sending socket to hold the message to be transmitted,
39832 and the socket file descriptor does have O_NONBLOCK set, *send()* shall fail. The *select()* and
39833 *poll()* functions can be used to determine when it is possible to send more data.39834 The socket in use may require the process to have appropriate privileges to use the *send()*
39835 function.39836 **RETURN VALUE**39837 Upon successful completion, *send()* shall return the number of bytes sent. Otherwise, -1 shall be
39838 returned and *errno* set to indicate the error.39839 **ERRORS**39840 The *send()* function shall fail if:

39841 [EAGAIN] or [EWOULDBLOCK]

39842 The socket's file descriptor is marked O_NONBLOCK and the requested
39843 operation would block.39844 [EBADF] The *socket* argument is not a valid file descriptor.

39845 [ECONNRESET] A connection was forcibly closed by a peer.

39846 [EDESTADDRREQ]

39847 The socket is not connection-mode and no peer address is set.

39848	[EINTR]	A signal interrupted <i>send()</i> before any data was transmitted.
39849	[EMSGSIZE]	The message is too large to be sent all at once, as the socket requires.
39850	[ENOTCONN]	The socket is not connected or otherwise has not had the peer pre-specified.
39851	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
39852	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
39854	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type <code>SOCK_STREAM</code> , the <code>SIGPIPE</code> signal is generated to the calling thread.
39855		
39856		
39857		The <i>send()</i> function may fail if:
39858	[EACCES]	The calling process does not have the appropriate privileges.
39859	[EIO]	An I/O error occurred while reading from or writing to the file system.
39860	[ENETDOWN]	The local network interface used to reach the destination is down.
39861	[ENETUNREACH]	
39862		No route to the network is present.
39863	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.

39864 EXAMPLES

39865 None.

39866 APPLICATION USAGE

39867 The *send()* function is equivalent to *sendto()* with a null pointer *dest_len* argument, and to *write()*
 39868 if no flags are used.

39869 RATIONALE

39870 None.

39871 FUTURE DIRECTIONS

39877 CHANGE HISTORY

39878 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39879 **NAME**

39880 sendmsg — send a message on a socket using a message structure

39881 **SYNOPSIS**

39882 #include <sys/socket.h>

39883 ssize_t sendmsg(int *socket*, const struct msghdr **message*, int *flags*);39884 **DESCRIPTION**

39885 The *sendmsg()* function shall send a message through a connection-mode or connectionless-mode socket. If the socket is connectionless-mode, the message shall be sent to the address specified by **msghdr**. If the socket is connection-mode, the destination address in **msghdr** shall be ignored.

39889 The *sendmsg()* function takes the following arguments:

39890	<i>socket</i>	Specifies the socket file descriptor.
39891	<i>message</i>	Points to a msghdr structure, containing both the destination address and the buffers for the outgoing message. The length and format of the address depend on the address family of the socket. The <i>msg_flags</i> member is ignored.
39892		
39893		
39894	<i>flags</i>	Specifies the type of message transmission. The application may specify 0 or the following flag:
39895		
39896	MSG_EOR	Terminates a record (if supported by the protocol).
39897	MSG_OOB	Sends out-of-band data on sockets that support out-of-band data. The significance and semantics of out-of-band data are protocol-specific.
39898		
39899		

39900 The *msg_iov* and *msg_iovlen* fields of *message* specify zero or more buffers containing the data to be sent. *msg_iov* points to an array of **iovec** structures; *msg_iovlen* shall be set to the dimension of this array. In each **iovec** structure, the *iov_base* field specifies a storage area and the *iov_len* field gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated by *msg_iov* is sent in turn.

39905 Successful completion of a call to *sendmsg()* does not guarantee delivery of the message. A return value of -1 indicates only locally-detected errors.

39907 If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does not have **O_NONBLOCK** set, the *sendmsg()* function shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted and the socket file descriptor does have **O_NONBLOCK** set, the *sendmsg()* function shall fail.

39912 If the socket protocol supports broadcast and the specified address is a broadcast address for the socket protocol, *sendmsg()* shall fail if the **SO_BROADCAST** option is not set for the socket.

39914 The socket in use may require the process to have appropriate privileges to use the *sendmsg()* function.

39916 **RETURN VALUE**

39917 Upon successful completion, *sendmsg()* shall return the number of bytes sent. Otherwise, -1 shall be returned and *errno* set to indicate the error.

39919 **ERRORS**39920 The *sendmsg()* function shall fail if:

39921 [EAGAIN] or [EWOULDBLOCK]

39922 The socket's file descriptor is marked **O_NONBLOCK** and the requested

39923		operation would block.
39924	[EAFNOSUPPORT]	
39925		Addresses in the specified address family cannot be used with this socket.
39926	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
39927	[ECONNRESET]	A connection was forcibly closed by a peer.
39928	[EINTR]	A signal interrupted <i>sendmsg()</i> before any data was transmitted.
39929	[EINVAL]	The sum of the <i>iov_len</i> values overflows an ssize_t .
39930	[EMSGSIZE]	The message is too large to be sent all at once (as the socket requires), or the <i>msg_iovlen</i> member of the msghdr structure pointed to by <i>message</i> is less than or equal to 0 or is greater than {IOV_MAX}.
39931		
39932		
39933	[ENOTCONN]	The socket is connection-mode but is not connected.
39934	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
39935	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
39936		
39937	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.
39938		
39939		
39940		If the address family of the socket is AF_UNIX, then <i>sendmsg()</i> shall fail if:
39941	[EIO]	An I/O error occurred while reading from or writing to the file system.
39942	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in the socket address.
39943		
39944	[ENAMETOOLONG]	
39945		A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.
39946		
39947	[ENOENT]	A component of the pathname does not name an existing file or the path name is an empty string.
39948		
39949	[ENOTDIR]	A component of the path prefix of the pathname in the socket address is not a directory.
39950		
39951		The <i>sendmsg()</i> function may fail if:
39952	[EACCES]	Search permission is denied for a component of the path prefix; or write access to the named socket is denied.
39953		
39954	[EDESTADDRREQ]	
39955		The socket is not connection-mode and does not have its peer address set, and no destination address was specified.
39956		
39957	[EHOSTUNREACH]	
39958		The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).
39959		
39960	[EIO]	An I/O error occurred while reading from or writing to the file system.
39961	[EISCONN]	A destination address was specified and the socket is already connected.
39962	[ENETDOWN]	The local network interface used to reach the destination is down.

39963 [ENETUNREACH]
39964 No route to the network is present.

39965 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

39966 [ENOMEM] Insufficient memory was available to fulfill the request.

39967 If the address family of the socket is AF_UNIX, then *sendmsg()* may fail if:

39968 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
39969 resolution of the pathname in the socket address.

39970 [ENAMETOOLONG]
39971 Pathname resolution of a symbolic link produced an intermediate result
39972 whose length exceeds {PATH_MAX}.

39973 **EXAMPLES**
39974 Done.

39975 **APPLICATION USAGE**
39976 The *select()* and *poll()* functions can be used to determine when it is possible to send more data.

39977 **RATIONALE**
39978 None.

39979 **FUTURE DIRECTIONS**
39980 None.

39981 **SEE ALSO**
39982 *getsockopt()*, *poll()*, *recv()*, *recvfrom()*, *recvmsg()*, *select()*, *send()*, *sendto()*, *setsockopt()*,
39983 *shutdown()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>

39984 **CHANGE HISTORY**
39985 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

39986 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
39987 [ELOOP] error condition is added.

39988 **NAME**

39989 sendto — send a message on a socket

39990 **SYNOPSIS**

39991 #include <sys/socket.h>

```
39992        ssize_t sendto(int socket, const void *message, size_t length,
39993                        int flags, const struct sockaddr *dest_addr,
39994                        socklen_t dest_len);
```

39995 **DESCRIPTION**

39996 The *sendto()* function shall send a message through a connection-mode or connectionless-mode
 39997 socket. If the socket is connectionless-mode, the message shall be sent to the address specified by
 39998 *dest_addr*. If the socket is connection-mode, *dest_addr* shall be ignored.

39999 The *sendto()* function takes the following arguments:

40000	<i>socket</i>	Specifies the socket file descriptor.
40001	<i>message</i>	Points to a buffer containing the message to be sent.
40002	<i>length</i>	Specifies the size of the message in bytes.
40003	<i>flags</i>	Specifies the type of message transmission. Values of this argument are
40004		formed by logically OR'ing zero or more of the following flags:
40005	MSG_EOR	Terminates a record (if supported by the protocol).
40006	MSG_OOB	Sends out-of-band data on sockets that support out-of-band
40007		data. The significance and semantics of out-of-band data are
40008		protocol-specific.
40009	<i>dest_addr</i>	Points to a sockaddr structure containing the destination address. The length
40010		and format of the address depend on the address family of the socket.
40011	<i>dest_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>dest_addr</i>
40012		argument.

40013 If the socket protocol supports broadcast and the specified address is a broadcast address for the
 40014 socket protocol, *sendto()* shall fail if the SO_BROADCAST option is not set for the socket.

40015 The *dest_addr* argument specifies the address of the target. The *length* argument specifies the
 40016 length of the message.

40017 Successful completion of a call to *sendto()* does not guarantee delivery of the message. A return
 40018 value of -1 indicates only locally-detected errors.

40019 If space is not available at the sending socket to hold the message to be transmitted and the
 40020 socket file descriptor does not have O_NONBLOCK set, *sendto()* shall block until space is
 40021 available. If space is not available at the sending socket to hold the message to be transmitted
 40022 and the socket file descriptor does have O_NONBLOCK set, *sendto()* shall fail.

40023 The socket in use may require the process to have appropriate privileges to use the *sendto()*
 40024 function.

40025 **RETURN VALUE**

40026 Upon successful completion, *sendto()* shall return the number of bytes sent. Otherwise, -1 shall
 40027 be returned and *errno* set to indicate the error.

40028 **ERRORS**

40029	The <i>sendto()</i> function shall fail if:	
40030	[EAFNOSUPPORT]	Addresses in the specified address family cannot be used with this socket.
40031		
40032	[EAGAIN] or [EWOULDBLOCK]	The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.
40033		
40034		
40035	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
40036	[ECONNRESET]	A connection was forcibly closed by a peer.
40037	[EINTR]	A signal interrupted <i>sendto()</i> before any data was transmitted.
40038	[EMSGSIZE]	The message is too large to be sent all at once, as the socket requires.
40039	[ENOTCONN]	The socket is connection-mode but is not connected.
40040	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
40041	[EOPNOTSUPP]	The <i>socket</i> argument is associated with a socket that does not support one or more of the values set in <i>flags</i> .
40042		
40043	[EPIPE]	The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.
40044		
40045		
40046	If the address family of the socket is AF_UNIX, then <i>sendto()</i> shall fail if:	
40047	[EIO]	An I/O error occurred while reading from or writing to the file system.
40048	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname in the socket address.
40049		
40050	[ENAMETOOLONG]	A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.
40051		
40052		
40053	[ENOENT]	A component of the pathname does not name an existing file or the pathname is an empty string.
40054		
40055	[ENOTDIR]	A component of the path prefix of the pathname in the socket address is not a directory.
40056		
40057	The <i>sendto()</i> function may fail if:	
40058	[EACCES]	Search permission is denied for a component of the path prefix; or write access to the named socket is denied.
40059		
40060	[EDESTADDRREQ]	The socket is not connection-mode and does not have its peer address set, and no destination address was specified.
40061		
40062		
40063	[EHOSTUNREACH]	The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).
40064		
40065		
40066	[EINVAL]	The <i>dest_len</i> argument is not a valid length for the address family.
40067	[EIO]	An I/O error occurred while reading from or writing to the file system.

40068	[EISCONN]	A destination address was specified and the socket is already connected. This error may or may not be returned for connection mode sockets.
40069		
40070	[ENETDOWN]	The local network interface used to reach the destination is down.
40071	[ENETUNREACH]	
40072		No route to the network is present.
40073	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
40074	[ENOMEM]	Insufficient memory was available to fulfill the request.
40075		If the address family of the socket is AF_UNIX, then <i>sendto()</i> may fail if:
40076	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the pathname in the socket address.
40077		
40078	[ENAMETOOLONG]	
40079		Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
40080		
40081	EXAMPLES	
40082		None.
40083	APPLICATION USAGE	
40084		The <i>select()</i> and <i>poll()</i> functions can be used to determine when it is possible to send more data.
40085	RATIONALE	
40086		None.
40087	FUTURE DIRECTIONS	
40088		None.
40089	SEE ALSO

40095		

40096 **NAME**

40097 setbuf — assign buffering to a stream

40098 **SYNOPSIS**

40099 #include <stdio.h>

40100 void setbuf(FILE *restrict stream, char *restrict buf);

40101 **DESCRIPTION**

40102 cx The functionality described on this reference page is aligned with the ISO C standard. Any
40103 conflict between the requirements described here and the ISO C standard is unintentional. This
40104 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

40105 Except that it returns no value, the function call:

40106 setbuf(stream, buf)

40107 shall be equivalent to:

40108 setvbuf(stream, buf, _IOFBF, BUFSIZ)

40109 if *buf* is not a null pointer, or to:

40110 setvbuf(stream, buf, _IONBF, BUFSIZ)

40111 if *buf* is a null pointer.40112 **RETURN VALUE**40113 The *setbuf()* function shall not return a value.40114 **ERRORS**

40115 No errors are defined.

40116 **EXAMPLES**

40117 None.

40118 **APPLICATION USAGE**

40119 A common source of error is allocating buffer space as an “automatic” variable in a code block,
40120 and then failing to close the stream in the same block.

40121 With *setbuf()*, allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ
40122 bytes are used for the buffer area.

40123 **RATIONALE**

40124 None.

40125 **FUTURE DIRECTIONS**

40126 None.

40127 **SEE ALSO**40128 *fopen()*, *setvbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>40129 **CHANGE HISTORY**

40130 First released in Issue 1. Derived from Issue 1 of the SVID.

40131 **Issue 6**40132 The prototype for *setbuf()* is updated for alignment with the ISO / IEC 9899: 1999 standard.

40133 **NAME**

40134 setcontext — set current user context

40135 **SYNOPSIS**

40136 xSI #include <ucontext.h>

40137 int setcontext(const ucontext_t *ucp);

40138

40139 **DESCRIPTION**

40140 Refer to *getcontext()*.

40141 **NAME**

40142 setegid — set the effective group ID

40143 **SYNOPSIS**

40144 #include <unistd.h>

40145 int setegid(gid_t *gid*);40146 **DESCRIPTION**

40147 If *gid* is equal to the real group ID or the saved set-group-ID, or if the process has appropriate
40148 privileges, *setegid()* shall set the effective group ID of the calling process to *gid*; the real group
40149 ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged.

40150 The *setegid()* function shall not affect the supplementary group list in any way.

40151 **RETURN VALUE**

40152 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
40153 indicate the error.

40154 **ERRORS**

40155 The *setegid()* function shall fail if:

40156 [EINVAL] The value of the *gid* argument is invalid and is not supported by the
40157 implementation.

40158 [EPERM] The process does not have appropriate privileges and *gid* does not match the
40159 real group ID or the saved set-group-ID.

40160 **EXAMPLES**

40161 None.

40162 **APPLICATION USAGE**

40163 None.

40164 **RATIONALE**

40165 Refer to the RATIONALE section in *setuid()*.

40166 **FUTURE DIRECTIONS**

40167 None.

40171 **CHANGE HISTORY**

40172 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

40173 **NAME**

40174 setenv — add or change environment variable

40175 **SYNOPSIS**

40176 CX #include <stdlib.h>

40177 int setenv(const char *envname, const char *envval, int overwrite);

40178

40179 **DESCRIPTION**

40180 The *setenv()* function shall update or add a variable in the environment of the calling process.
 40181 The *envname* argument points to a string containing the name of an environment variable to be
 40182 added or altered. The environment variable shall be set to the value to which *envval* points. The
 40183 function shall fail if *envname* points to a string which contains an '=' character. If the
 40184 environment variable named by *envname* already exists and the value of *overwrite* is non-zero,
 40185 the function shall return success and the environment shall be updated. If the environment
 40186 variable named by *envname* already exists and the value of *overwrite* is zero, the function shall
 40187 return success and the environment shall remain unchanged.

40188 If the application modifies *environ* or the pointers to which it points, the behavior of *setenv()* is
 40189 undefined. The *setenv()* function shall update the list of pointers to which *environ* points.

40190 The strings described by *envname* and *envval* are copied by this function.

40191 The *setenv()* function need not be reentrant. A function that is not required to be reentrant is not
 40192 required to be thread-safe.

40193 **RETURN VALUE**

40194 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to
 40195 indicate the error, and the environment shall be unchanged.

40196 **ERRORS**40197 The *setenv()* function shall fail if:

40198 [EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a
 40199 string containing an '=' character.

40200 [ENOMEM] Insufficient memory was available to add a variable or its value to the
 40201 environment.

40202 **EXAMPLES**

40203 None.

40204 **APPLICATION USAGE**40205 See *exec*, for restrictions on changing the environment in multi-threaded applications.40206 **RATIONALE**

40207 Unanticipated results may occur if *setenv()* changes the external variable *environ*. In particular,
 40208 if the optional *envp* argument to *main()* is present, it is not changed, and thus may point to an
 40209 obsolete copy of the environment (as may any other copy of *environ*). However, other than the
 40210 aforementioned restriction, the developers of IEEE Std 1003.1-2001 intended that the traditional
 40211 method of walking through the environment by way of the *environ* pointer must be supported.

40212 It was decided that *setenv()* should be required by this revision because it addresses a piece of
 40213 missing functionality, and does not impose a significant burden on the implementor.

40214 There was considerable debate as to whether the System V *putenv()* function or the BSD *setenv()*
 40215 function should be required as a mandatory function. The *setenv()* function was chosen because
 40216 it permitted the implementation of the *unsetenv()* function to delete environmental variables,
 40217 without specifying an additional interface. The *putenv()* function is available as an XSI

40218 extension.

40219 The standard developers considered requiring that *setenv()* indicate an error when a call to it
40220 would result in exceeding {ARG_MAX}. The requirement was rejected since the condition might
40221 be temporary, with the application eventually reducing the environment size. The ultimate
40222 success or failure depends on the size at the time of a call to *exec*, which returns an indication of
40223 this error condition.

40224 **FUTURE DIRECTIONS**

40225 None.

40233 **NAME**

40234 seteuid — set effective user ID

40235 **SYNOPSIS**

40236 #include <unistd.h>

40237 int seteuid(uid_t uid);

40238 **DESCRIPTION**

40239 If *uid* is equal to the real user ID or the saved set-user-ID, or if the process has appropriate
40240 privileges, *seteuid()* shall set the effective user ID of the calling process to *uid*; the real user ID
40241 and saved set-user-ID shall remain unchanged.

40242 The *seteuid()* function shall not affect the supplementary group list in any way.

40243 **RETURN VALUE**

40244 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
40245 indicate the error.

40246 **ERRORS**

40247 The *seteuid()* function shall fail if:

40248 [EINVAL] The value of the *uid* argument is invalid and is not supported by the
40249 implementation.

40250 [EPERM] The process does not have appropriate privileges and *uid* does not match the
40251 real group ID or the saved set-group-ID.

40252 **EXAMPLES**

40253 None.

40254 **APPLICATION USAGE**

40255 None.

40256 **RATIONALE**

40257 Refer to the RATIONALE section in *setuid()*.

40265 **NAME**

40266 setgid — set-group-ID

40267 **SYNOPSIS**

40268 #include <unistd.h>

40269 int setgid(gid_t *gid*);40270 **DESCRIPTION**

40271 If the process has appropriate privileges, *setgid()* shall set the real group ID, effective group ID, and the saved set-group-ID of the calling process to *gid*.

40273 If the process does not have appropriate privileges, but *gid* is equal to the real group ID or the saved set-group-ID, *setgid()* shall set the effective group ID to *gid*; the real group ID and saved set-group-ID shall remain unchanged.

40276 The *setgid()* function shall not affect the supplementary group list in any way.

40277 Any supplementary group IDs of the calling process shall remain unchanged.

40278 **RETURN VALUE**

40279 Upon successful completion, 0 is returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

40281 **ERRORS**

40282 The *setgid()* function shall fail if:

40283 [EINVAL] The value of the *gid* argument is invalid and is not supported by the
40284 implementation.

40285 [EPERM] The process does not have appropriate privileges and *gid* does not match the
40286 real group ID or the saved set-group-ID.

40287 **EXAMPLES**

40288 None.

40289 **APPLICATION USAGE**

40290 None.

40291 **RATIONALE**

40292 Refer to the RATIONALE section in *setuid()*.

40293 **FUTURE DIRECTIONS**

40294 None.

40298 **CHANGE HISTORY**

40299 First released in Issue 1. Derived from Issue 1 of the SVID.

40300 **Issue 6**

40301 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

40302 The following new requirements on POSIX implementations derive from alignment with the
40303 Single UNIX Specification:

- 40304 • The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
40305 required for conforming implementations of previous POSIX specifications, it was not
40306 required for UNIX applications.

- 40307 • Functionality associated with `_POSIX_SAVED_IDS` is now mandated. This is a FIPS
- 40308 requirement.
- 40309 The following changes were made to align with the IEEE P1003.1a draft standard:
- 40310 • The effects of `setgid()` in processes without appropriate privileges are changed.
- 40311 • A requirement that the supplementary group list is not affected is added.

40312 **NAME**

40313 setgrent — reset the group database to the first entry

40314 **SYNOPSIS**

40315 xSI #include <grp.h>

40316 void setgrent(void);

40317

40318 **DESCRIPTION**40319 Refer to *endgrent()*.

40320 NAME

40321 sethostent — network host database functions

40322 SYNOPSIS

40323 #include <netdb.h>

40324 void sethostent(int *stayopen*);

40325 DESCRIPTION

40326 Refer to *endhostent()*.

40327 **NAME**

40328 setitimer — set the value of an interval timer

40329 **SYNOPSIS**

40330 xSI #include <sys/time.h>

40331 int setitimer(int *which*, const struct itimerval *restrict *value*,
40332 struct itimerval *restrict *ovalue*);

40333

40334 **DESCRIPTION**40335 Refer to *getitimer()*.

40336 **NAME**

40337 setjmp — set jump point for a non-local goto

40338 **SYNOPSIS**

40339 #include <setjmp.h>

40340 int setjmp(jmp_buf env);

40341 **DESCRIPTION**

40342 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 40343 conflict between the requirements described here and the ISO C standard is unintentional. This
 40344 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

40345 A call to *setjmp()* shall save the calling environment in its *env* argument for later use by
 40346 *longjmp()*.

40347 It is unspecified whether *setjmp()* is a macro or a function. If a macro definition is suppressed in
 40348 order to access an actual function, or a program defines an external identifier with the name
 40349 *setjmp*, the behavior is undefined.

40350 An application shall ensure that an invocation of *setjmp()* appears in one of the following
 40351 contexts only:

- 40352 • The entire controlling expression of a selection or iteration statement
- 40353 • One operand of a relational or equality operator with the other operand an integral constant
 40354 expression, with the resulting expression being the entire controlling expression of a
 40355 selection or iteration statement
- 40356 • The operand of a unary '!' operator with the resulting expression being the entire
 40357 controlling expression of a selection or iteration
- 40358 • The entire expression of an expression statement (possibly cast to **void**)

40359 If the invocation appears in any other context, the behavior is undefined.

40360 **RETURN VALUE**

40361 If the return is from a direct invocation, *setjmp()* shall return 0. If the return is from a call to
 40362 *longjmp()*, *setjmp()* shall return a non-zero value.

40363 **ERRORS**

40364 No errors are defined.

40365 **EXAMPLES**

40366 None.

40367 **APPLICATION USAGE**

40368 In general, *sigsetjmp()* is more useful in dealing with errors and interrupts encountered in a low-
 40369 level subroutine of a program.

40370 **RATIONALE**

40371 None.

40372 **FUTURE DIRECTIONS**

40373 None.

40374 **SEE ALSO**

40375 *longjmp()*, *sigsetjmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**setjmp.h**>

40376 **CHANGE HISTORY**

40377 First released in Issue 1. Derived from Issue 1 of the SVID.

40378 **Issue 6**

40379 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

40380 **NAME**40381 setkey — set encoding key (**CRYPT**)40382 **SYNOPSIS**

40383 xSI #include <stdlib.h>

40384 void setkey(const char *key);

40385

40386 **DESCRIPTION**

40387 The *setkey()* function provides access to an implementation-defined encoding algorithm. The
40388 argument of *setkey()* is an array of length 64 bytes containing only the bytes with numerical
40389 value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is
40390 ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used
40391 with the algorithm to encode a string *block* passed to *encrypt()*.

40392 The *setkey()* function shall not change the setting of *errno* if successful. An application wishing to
40393 check for error situations should set *errno* to 0 before calling *setkey()*. If *errno* is non-zero on
40394 return, an error has occurred.

40395 The *setkey()* function need not be reentrant. A function that is not required to be reentrant is not
40396 required to be thread-safe.

40397 **RETURN VALUE**

40398 No values are returned.

40399 **ERRORS**40400 The *setkey()* function shall fail if:

40401 [ENOSYS] The functionality is not supported on this implementation.

40402 **EXAMPLES**

40403 None.

40404 **APPLICATION USAGE**

40405 Decoding need not be implemented in all environments. This is related to government
40406 restrictions in some countries on encryption and decryption routines. Historical practice has
40407 been to ship a different version of the encryption library without the decryption feature in the
40408 routines supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

40409 **RATIONALE**

40410 None.

40411 **FUTURE DIRECTIONS**

40412 None.

40413 **SEE ALSO**40414 *crypt()*, *encrypt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>40415 **CHANGE HISTORY**

40416 First released in Issue 1. Derived from Issue 1 of the SVID.

40417 **Issue 5**40418 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

40419 **NAME**

40420 setlocale — set program locale

40421 **SYNOPSIS**

40422 #include <locale.h>

40423 char *setlocale(int *category*, const char **locale*);40424 **DESCRIPTION**

40425 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 40426 conflict between the requirements described here and the ISO C standard is unintentional. This
 40427 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

40428 The *setlocale()* function selects the appropriate piece of the program's locale, as specified by the
 40429 *category* and *locale* arguments, and may be used to change or query the program's entire locale or
 40430 portions thereof. The value *LC_ALL* for *category* names the program's entire locale; other values
 40431 for *category* name only a part of the program's locale:

40432 *LC_COLLATE* Affects the behavior of regular expressions and the collation functions.

40433 *LC_CTYPE* Affects the behavior of regular expressions, character classification, character
 40434 conversion functions, and wide-character functions.

40435 CX *LC_MESSAGES* Affects what strings are expected by commands and utilities as affirmative or
 40436 negative responses.

40437 XSI It also affects what strings are given by commands and utilities as affirmative
 40438 or negative responses, and the content of messages.

40439 *LC_MONETARY* Affects the behavior of functions that handle monetary values.

40440 *LC_NUMERIC* Affects the behavior of functions that handle numeric values.

40441 *LC_TIME* Affects the behavior of the time conversion functions.

40442 The *locale* argument is a pointer to a character string containing the required setting of *category*.
 40443 The contents of this string are implementation-defined. In addition, the following preset values
 40444 of *locale* are defined for all settings of *category*:

40445 CX "POSIX" Specifies the minimal environment for C-language translation called the
 40446 POSIX locale. If *setlocale()* is not invoked, the POSIX locale is the default at
 40447 entry to *main()*.

40448 "C" Equivalent to "POSIX".

40449 CX "" Specifies an implementation-defined native environment. This corresponds to
 40450 the value of the associated environment variables, *LC_** and *LANG*; see the
 40451 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale and the
 40452 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment
 40453 Variables.

40454 A null pointer Used to direct *setlocale()* to query the current internationalized environment
 40455 and return the name of the locale.

40456 THR The locale state is common to all threads within a process.

40457 **RETURN VALUE**

40458 Upon successful completion, *setlocale()* shall return the string associated with the specified
 40459 category for the new locale. Otherwise, *setlocale()* shall return a null pointer and the program's
 40460 locale is not changed.

40461 A null pointer for *locale* causes *setlocale()* to return a pointer to the string associated with the
 40462 *category* for the program's current locale. The program's locale shall not be changed.

40463 The string returned by *setlocale()* is such that a subsequent call with that string and its associated
 40464 *category* shall restore that part of the program's locale. The application shall not modify the string
 40465 returned which may be overwritten by a subsequent call to *setlocale()*.

40466 ERRORS

40467 No errors are defined.

40468 EXAMPLES

40469 None.

40470 APPLICATION USAGE

40471 The following code illustrates how a program can initialize the international environment for
 40472 one language, while selectively modifying the program's locale such that regular expressions
 40473 and string operations can be applied to text recorded in a different language:

```
40474 setlocale(LC_ALL, "De");
40475 setlocale(LC_COLLATE, "Fr@dict");
```

40476 Internationalized programs must call *setlocale()* to initiate a specific language operation. This can
 40477 be done by calling *setlocale()* as follows:

```
40478 setlocale(LC_ALL, "");
```

40479 Changing the setting of *LC_MESSAGES* has no effect on catalogs that have already been opened
 40480 by calls to *catopen()*.

40481 RATIONALE

40482 The ISO C standard defines a collection of functions to support internationalization. One of the
 40483 most significant aspects of these functions is a facility to set and query the *international*
 40484 *environment*. The international environment is a repository of information that affects the
 40485 behavior of certain functionality, namely:

- 40486 1. Character handling
- 40487 2. Collating
- 40488 3. Date/time formatting
- 40489 4. Numeric editing
- 40490 5. Monetary formatting
- 40491 6. Messaging

40492 The *setlocale()* function provides the application developer with the ability to set all or portions,
 40493 called *categories*, of the international environment. These categories correspond to the areas of
 40494 functionality mentioned above. The syntax for *setlocale()* is as follows:

```
40495 char *setlocale(int category, const char *locale);
```

40496 where *category* is the name of one of following categories, namely:

```
40497 LC_COLLATE
40498 LC_CTYPE
40499 LC_MESSAGES
40500 LC_MONETARY
40501 LC_NUMERIC
40502 LC_TIME
```

In addition, a special value called *LC_ALL* directs *setlocale()* to set all categories.

There are two primary uses of *setlocale()*:

1. Querying the international environment to find out what it is set to
2. Setting the international environment, or *locale*, to a specific value

The behavior of *setlocale()* in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, *setlocale()* is invoked with a specific category and the NULL pointer as the locale. The NULL pointer is a special directive to *setlocale()* that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

```
setlocale({LC_ALL, LC_COLLATE, LC_CTYPE, LC_MESSAGES, LC_MONETARY, \
          LC_NUMERIC, LC_TIME}, (char *) NULL);
```

The *setlocale()* function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to *setlocale()* to reset the international environment to this value. However, it should be noted that the return value from *setlocale()* may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to *setlocale()*). Therefore, if the purpose of calling *setlocale()* is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of **char** in the calling program.

There are three ways to set the international environment with *setlocale()*:

setlocale(category, string)

This usage sets a specific *category* in the international environment to a specific value corresponding to the value of the *string*. A specific example is provided below:

```
setlocale(LC_ALL, "fr_FR.ISO-8859-1");
```

In this example, all categories of the international environment are set to the locale corresponding to the string "fr_FR.ISO-8859-1", or to the French language as spoken in France using the ISO/IEC 8859-1:1998 standard codeset.

If the string does not correspond to a valid locale, *setlocale()* shall return a NULL pointer and the international environment is not changed. Otherwise, *setlocale()* shall return the name of the locale just set.

setlocale(category, "C")

The ISO C standard states that one locale must exist on all conforming implementations. The name of the locale is C and corresponds to a minimal international environment needed to support the C programming language.

setlocale(category, "")

This sets a specific category to an implementation-defined default. This corresponds to the value of the environment variables.

FUTURE DIRECTIONS

None.

40551 **CHANGE HISTORY**

40552 First released in Issue 3.

40553 **Issue 5**

40554 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

40555 **Issue 6**

40556 Extensions beyond the ISO C standard are marked.

40557 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

40558 **NAME**

40559 setlogmask — set the log priority mask

40560 **SYNOPSIS**

40561 xSI #include <syslog.h>

40562 int setlogmask(int maskpri);

40563

40564 **DESCRIPTION**40565 Refer to *closelog()*.

40566 NAME

40567 setnetent — network database function

40568 SYNOPSIS

40569 #include <netdb.h>

40570 void setnetent(int stayopen);

40571 DESCRIPTION

40572 Refer to *endnetent()*.

40573 **NAME**

40574 setpgid — set process group ID for job control

40575 **SYNOPSIS**

40576 #include <unistd.h>

40577 int setpgid(pid_t pid, pid_t pgid);

40578 **DESCRIPTION**

40579 The *setpgid()* function shall either join an existing process group or create a new process group
 40580 within the session of the calling process. The process group ID of a session leader shall not
 40581 change. Upon successful completion, the process group ID of the process with a process ID that
 40582 matches *pid* shall be set to *pgid*. As a special case, if *pid* is 0, the process ID of the calling process
 40583 shall be used. Also, if *pgid* is 0, the process ID of the indicated process shall be used.

40584 **RETURN VALUE**

40585 Upon successful completion, *setpgid()* shall return 0; otherwise, -1 shall be returned and *errno*
 40586 shall be set to indicate the error.

40587 **ERRORS**40588 The *setpgid()* function shall fail if:

40589 [EACCES] The value of the *pid* argument matches the process ID of a child process of the
 40590 calling process and the child process has successfully executed one of the *exec*
 40591 functions.

40592 [EINVAL] The value of the *pgid* argument is less than 0, or is not a value supported by
 40593 the implementation.

40594 [EPERM] The process indicated by the *pid* argument is a session leader.

40595 [EPERM] The value of the *pid* argument matches the process ID of a child process of the
 40596 calling process and the child process is not in the same session as the calling
 40597 process.

40598 [EPERM] The value of the *pgid* argument is valid but does not match the process ID of
 40599 the process indicated by the *pid* argument and there is no process with a
 40600 process group ID that matches the value of the *pgid* argument in the same
 40601 session as the calling process.

40602 [ESRCH] The value of the *pid* argument does not match the process ID of the calling
 40603 process or of a child process of the calling process.

40604 **EXAMPLES**

40605 None.

40606 **APPLICATION USAGE**

40607 None.

40608 **RATIONALE**

40609 The *setpgid()* function shall group processes together for the purpose of signaling, placement in
 40610 foreground or background, and other job control actions.

40611 The *setpgid()* function is similar to the *setpgrp()* function of 4.2 BSD, except that 4.2 BSD allowed
 40612 the specified new process group to assume any value. This presents certain security problems
 40613 and is more flexible than necessary to support job control.

40614 To provide tighter security, *setpgid()* only allows the calling process to join a process group
 40615 already in use inside its session or create a new process group whose process group ID was
 40616 equal to its process ID.

When a job control shell spawns a new job, the processes in the job must be placed into a new process group via *setpgid()*. There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the *exec* functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call *setpgid()* to alter their own process groups after *fork()* but before *exec*. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of *vfork()*; that is, the shell is suspended until the child has completed the *exec*, thus ensuring that the child has completed the *setpgid()*. A new version of *fork()* with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via *setpgid()*. Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after *exec*), and because the child process would already have adjusted its process group before this, the [EACCES] error was added to disallow this.

One non-obvious use of *setpgid()* is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control “state” back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The *setpgid()* function is mandatory since `_POSIX_JOB_CONTROL` is required to be defined in this issue. This is a FIPS requirement.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the process ID of the indicated process shall be used”. This change reverts the wording to as in the ISO POSIX-1: 1996 standard; it appeared to be an unintentional change.

40661 **NAME**

40662 setpgrp — set the process group ID

40663 **SYNOPSIS**

40664 XSI #include <unistd.h>

40665 pid_t setpgrp(void);

40666

40667 **DESCRIPTION**

40668 If the calling process is not already a session leader, *setpgrp()* sets the process group ID of the
40669 calling process to the process ID of the calling process. If *setpgrp()* creates a new session, then
40670 the new session has no controlling terminal.

40671 The *setpgrp()* function has no effect when the calling process is a session leader.

40672 **RETURN VALUE**

40673 Upon completion, *setpgrp()* shall return the process group ID.

40674 **ERRORS**

40675 No errors are defined.

40676 **EXAMPLES**

40677 None.

40678 **APPLICATION USAGE**

40679 None.

40680 **RATIONALE**

40681 None.

40682 **FUTURE DIRECTIONS**

40683 None.

40686 IEEE Std 1003.1-2001, <unistd.h>

40687 **CHANGE HISTORY**

40688 First released in Issue 4, Version 2.

40689 **Issue 5**

40690 Moved from X/OPEN UNIX extension to BASE.

40691 NAME

40692 setpriority — set the nice value

40693 SYNOPSIS

40694 xSI #include <sys/resource.h>

40695 int setpriority(int *which*, id_t *who*, int *nice*);

40696

40697 DESCRIPTION

40698 Refer to *getpriority()*.

40699 **NAME**

40700 setprotoent — network protocol database functions

40701 **SYNOPSIS**

40702 #include <netdb.h>

40703 void setprotoent(int *stayopen*);40704 **DESCRIPTION**40705 Refer to *endprotoent()*.

40706 NAME

40707 setpwent — user database function

40708 SYNOPSIS

40709 xSI #include <pwd.h>

40710 void setpwent(void);

40711

40712 DESCRIPTION

40713 Refer to *endpwent()*.

40714 **NAME**

40715 setregid — set real and effective group IDs

40716 **SYNOPSIS**

40717 xSI #include <unistd.h>

40718 int setregid(gid_t rgid, gid_t egid);

40719

40720 **DESCRIPTION**40721 The *setregid()* function shall set the real and effective group IDs of the calling process.40722 If *rgid* is *-1*, the real group ID shall not be changed; if *egid* is *-1*, the effective group ID shall not
40723 be changed.

40724 The real and effective group IDs may be set to different values in the same call.

40725 Only a process with appropriate privileges can set the real group ID and the effective group ID
40726 to any valid value.40727 A non-privileged process can set either the real group ID to the saved set-group-ID from one of
40728 the *exec* family of functions, or the effective group ID to the saved set-group-ID or the real group
40729 ID.

40730 Any supplementary group IDs of the calling process remain unchanged.

40731 **RETURN VALUE**40732 Upon successful completion, 0 shall be returned. Otherwise, *-1* shall be returned and *errno* set to
40733 indicate the error, and neither of the group IDs are changed.40734 **ERRORS**40735 The *setregid()* function shall fail if:40736 [EINVAL] The value of the *rgid* or *egid* argument is invalid or out-of-range.40737 [EPERM] The process does not have appropriate privileges and a change other than
40738 changing the real group ID to the saved set-group-ID, or changing the
40739 effective group ID to the real group ID or the saved set-group-ID, was
40740 requested.40741 **EXAMPLES**

40742 None.

40743 **APPLICATION USAGE**40744 If a set-group-ID process sets its effective group ID to its real group ID, it can still set its effective
40745 group ID back to the saved set-group-ID.40746 **RATIONALE**

40747 None.

40748 **FUTURE DIRECTIONS**

40749 None.

40750 **SEE ALSO**40751 *exec*, *getegid()*, *geteuid()*, *getgid()*, *getuid()*, *setegid()*, *seteuid()*, *setgid()*, *setreuid()*, *setuid()*, the
40752 Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>40753 **CHANGE HISTORY**

40754 First released in Issue 4, Version 2.

40755 **Issue 5**

40756 Moved from X/OPEN UNIX extension to BASE.

40757 The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the
40758 *exec* family of functions, not just *execve()*.

40759 **NAME**

40760 setreuid — set real and effective user IDs

40761 **SYNOPSIS**

```
40762 xSI      #include <unistd.h>
40763          int setreuid(uid_t ruid, uid_t euid);
40764
```

40765 **DESCRIPTION**

40766 The *setreuid()* function shall set the real and effective user IDs of the current process to the
 40767 values specified by the *ruid* and *euid* arguments. If *ruid* or *euid* is -1 , the corresponding effective
 40768 or real user ID of the current process shall be left unchanged.

40769 A process with appropriate privileges can set either ID to any value. An unprivileged process
 40770 can only set the effective user ID if the *euid* argument is equal to either the real, effective, or
 40771 saved user ID of the process.

40772 It is unspecified whether a process without appropriate privileges is permitted to change the real
 40773 user ID to match the current real, effective, or saved set-user-ID of the process.

40774 **RETURN VALUE**

40775 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 40776 indicate the error.

40777 **ERRORS**

40778 The *setreuid()* function shall fail if:

40779	[EINVAL]	The value of the <i>ruid</i> or <i>euid</i> argument is invalid or out-of-range.
40780	[EPERM]	The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation.

40784 **EXAMPLES**40785 **Setting the Effective User ID to the Real User ID**

40786 The following example sets the effective user ID of the calling process to the real user ID, so that
 40787 files created later will be owned by the current user.

```
40788 #include <unistd.h>
40789 #include <sys/types.h>
40790 ...
40791 setreuid(getuid(), getuid());
40792 ...
```

40793 **APPLICATION USAGE**

40794 None.

40795 **RATIONALE**

40796 None.

40797 **FUTURE DIRECTIONS**

40798 None.

40801 Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

40802 **CHANGE HISTORY**

40803 First released in Issue 4, Version 2.

40804 **Issue 5**

40805 Moved from X/OPEN UNIX extension to BASE.

40806 **NAME**

40807 setrlimit — control maximum resource consumption

40808 **SYNOPSIS**

40809 xSI #include <sys/resource.h>

40810 int setrlimit(int resource, const struct rlimit *rlp);

40811

40812 **DESCRIPTION**40813 Refer to *getrlimit()*.

40814 NAME

40815 setservent — network services database functions

40816 SYNOPSIS

40817 #include <netdb.h>

40818 void setservent(int *stayopen*);

40819 DESCRIPTION

40820 Refer to *endservent()*.

40821 NAME

40822 setsid — create session and set process group ID

40823 SYNOPSIS

40824 #include <unistd.h>

40825 pid_t setsid(void);

40826 DESCRIPTION

40827 The *setsid()* function shall create a new session, if the calling process is not a process group
40828 leader. Upon return the calling process shall be the session leader of this new session, shall be
40829 the process group leader of a new process group, and shall have no controlling terminal. The
40830 process group ID of the calling process shall be set equal to the process ID of the calling process.
40831 The calling process shall be the only process in the new process group and the only process in
40832 the new session.

40833 RETURN VALUE

40834 Upon successful completion, *setsid()* shall return the value of the new process group ID of the
40835 calling process. Otherwise, it shall return (**pid_t**)-1 and set *errno* to indicate the error.

40836 ERRORS

40837 The *setsid()* function shall fail if:

40838 [EPERM]	The calling process is already a process group leader, or the process group ID
40839	of a process other than the calling process matches the process ID of the
40840	calling process.

40841 EXAMPLES

40842 None.

40843 APPLICATION USAGE

40844 None.

40845 RATIONALE

40846 The *setsid()* function is similar to the *setpgp()* function of System V. System V, without job
40847 control, groups processes into process groups and creates new process groups via *setpgp()*; only
40848 one process group may be part of a login session.

40849 Job control allows multiple process groups within a login session. In order to limit job control
40850 actions so that they can only affect processes in the same login session, this volume of
40851 IEEE Std 1003.1-2001 adds the concept of a session that is created via *setsid()*. The *setsid()*
40852 function also creates the initial process group contained in the session. Additional process
40853 groups can be created via the *setpgid()* function. A System V process group would correspond to
40854 a POSIX System Interfaces session containing a single POSIX process group. Note that this
40855 function requires that the calling process not be a process group leader. The usual way to ensure
40856 this is true is to create a new process with *fork()* and have it call *setsid()*. The *fork()* function
40857 guarantees that the process ID of the new process does not match any existing process group ID.

40858 FUTURE DIRECTIONS

40859 None.

40860 SEE ALSO

40862 <unistd.h>

40863 **CHANGE HISTORY**

40864 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

40865 **Issue 6**

40866 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

40867 The following new requirements on POSIX implementations derive from alignment with the
40868 Single UNIX Specification:

- 40869 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
40870 required for conforming implementations of previous POSIX specifications, it was not
40871 required for UNIX applications.

40872 **NAME**

40873 setsockopt — set the socket options

40874 **SYNOPSIS**

40875 #include <sys/socket.h>

```
40876       int setsockopt(int socket, int level, int option_name,
40877                      const void *option_value, socklen_t option_len);
```

40878 **DESCRIPTION**

40879 The *setsockopt()* function shall set the option specified by the *option_name* argument, at the
 40880 protocol level specified by the *level* argument, to the value pointed to by the *option_value*
 40881 argument for the socket associated with the file descriptor specified by the *socket* argument.

40882 The *level* argument specifies the protocol level at which the option resides. To set options at the
 40883 socket level, specify the *level* argument as SOL_SOCKET. To set options at other levels, supply
 40884 the appropriate *level* identifier for the protocol controlling the option. For example, to indicate
 40885 that an option is interpreted by the TCP (Transport Control Protocol), set *level* to IPPROTO_TCP
 40886 as defined in the <netinet/in.h> header.

40887 The *option_name* argument specifies a single option to set. The *option_name* argument and any
 40888 specified options are passed uninterpreted to the appropriate protocol module for
 40889 interpretations. The <sys/socket.h> header defines the socket-level options. The options are as
 40890 follows:

40891 SO_DEBUG Turns on recording of debugging information. This option enables or
 40892 disables debugging in the underlying protocol modules. This option takes
 40893 an **int** value. This is a Boolean option.

40894 SO_BROADCAST Permits sending of broadcast messages, if this is supported by the
 40895 protocol. This option takes an **int** value. This is a Boolean option.

40896 SO_REUSEADDR Specifies that the rules used in validating addresses supplied to *bind()*
 40897 should allow reuse of local addresses, if this is supported by the protocol.
 40898 This option takes an **int** value. This is a Boolean option.

40899 SO_KEEPALIVE Keeps connections active by enabling the periodic transmission of
 40900 messages, if this is supported by the protocol. This option takes an **int**
 40901 value.

40902 If the connected socket fails to respond to these messages, the connection
 40903 is broken and threads writing to that socket are notified with a SIGPIPE
 40904 signal. This is a Boolean option.

40905 SO_LINGER Lingers on a *close()* if data is present. This option controls the action
 40906 taken when unsent messages queue on a socket and *close()* is performed.
 40907 If SO_LINGER is set, the system shall block the process during *close()*
 40908 until it can transmit the data or until the time expires. If SO_LINGER is
 40909 not specified, and *close()* is issued, the system handles the call in a way
 40910 that allows the process to continue as quickly as possible. This option
 40911 takes a **linger** structure, as defined in the <sys/socket.h> header, to
 40912 specify the state of the option and linger interval.

40913 SO_OOBINLINE Leaves received out-of-band data (data marked urgent) inline. This
 40914 option takes an **int** value. This is a Boolean option.

40915 SO_SNDBUF Sets send buffer size. This option takes an **int** value.

40916	SO_RCVBUF	Sets receive buffer size. This option takes an int value.	
40917	SO_DONTROUTE	Requests that outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option takes an int value. This is a Boolean option.	
40918			
40919			
40920			
40921			
40922	SO_RCVLOWAT	Sets the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option takes an int value. Note that not all implementations allow this option to be set.	
40923			
40924			
40925			
40926			
40927			
40928			
40929			
40930	SO_RCVTIMEO	Sets the timeout value that specifies the maximum amount of time an input function waits until it completes. It accepts a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data is received. The default for this option is zero, which indicates that a receive operation shall not time out. This option takes a timeval structure. Note that not all implementations allow this option to be set.	
40931			
40932			
40933			
40934			
40935			
40936			
40937			
40938			
40939			
40940	SO_SNDLOWAT	Sets the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option takes an int value. Note that not all implementations allow this option to be set.	
40941			
40942			
40943			
40944			
40945	SO_SNDTIMEO	Sets the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with <i>errno</i> set to [EAGAIN] or [EWOULDBLOCK] if no data is sent. The default for this option is zero, which indicates that a send operation shall not time out. This option stores a timeval structure. Note that not all implementations allow this option to be set.	
40946			
40947			
40948			
40949			
40950			
40951			
40952	For Boolean options, 0 indicates that the option is disabled and 1 indicates that the option is enabled.		
40953			
40954	Options at other protocol levels vary in format and name.		
40955	RETURN VALUE		
40956	Upon successful completion, <i>setsockopt()</i> shall return 0. Otherwise, -1 shall be returned and <i>errno</i> set to indicate the error.		
40957			
40958	ERRORS		
40959	The <i>setsockopt()</i> function shall fail if:		
40960	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.	
40961	[EDOM]	The send and receive timeout values are too big to fit into the timeout fields in the socket structure.	
40962			

40963	[EINVAL]	The specified option is invalid at the specified socket level or the socket has been shut down.
40964		
40965	[EISCONN]	The socket is already connected, and a specified option cannot be set while the socket is connected.
40966		
40967	[ENOPROTOOPT]	
40968		The option is not supported by the protocol.
40969	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
40970		The <i>setsockopt()</i> function may fail if:
40971	[ENOMEM]	There was insufficient memory available for the operation to complete.
40972	[ENOBUFS]	Insufficient resources are available in the system to complete the call.

EXAMPLES

40973
40974 None.

APPLICATION USAGE

40976 The *setsockopt()* function provides an application program with the means to control socket behavior. An application program can use *setsockopt()* to allocate buffer space, control timeouts, or permit socket data broadcasts. The **<sys/socket.h>** header defines the socket-level options available to *setsockopt()*.

40980 Options may exist at multiple protocol levels. The SO_ options are always present at the uppermost socket level.

RATIONALE

40982
40983 None.

FUTURE DIRECTIONS

40984
40985 None.

CHANGE HISTORY

40990 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

40991 NAME

40992 setstate — switch pseudo-random number generator state arrays

40993 SYNOPSIS

40994 xSI #include <stdlib.h>

40995 char *setstate(const char *state);

40996

40997 DESCRIPTION

40998 Refer to *initstate()*.

40999 **NAME**

41000 setuid — set user ID

41001 **SYNOPSIS**

41002 #include <unistd.h>

41003 int setuid(uid_t uid);

41004 **DESCRIPTION**41005 If the process has appropriate privileges, *setuid()* shall set the real user ID, effective user ID, and
41006 the saved set-user-ID of the calling process to *uid*.41007 If the process does not have appropriate privileges, but *uid* is equal to the real user ID or the
41008 saved set-user-ID, *setuid()* shall set the effective user ID to *uid*; the real user ID and saved set-
41009 user-ID shall remain unchanged.41010 The *setuid()* function shall not affect the supplementary group list in any way.41011 **RETURN VALUE**41012 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
41013 indicate the error.41014 **ERRORS**41015 The *setuid()* function shall fail, return -1, and set *errno* to the corresponding value if one or more
41016 of the following are true:41017 [EINVAL] The value of the *uid* argument is invalid and not supported by the
41018 implementation.41019 [EPERM] The process does not have appropriate privileges and *uid* does not match the
41020 real user ID or the saved set-user-ID.41021 **EXAMPLES**

41022 None.

41023 **APPLICATION USAGE**

41024 None.

41025 **RATIONALE**41026 The various behaviors of the *setuid()* and *setgid()* functions when called by non-privileged
41027 processes reflect the behavior of different historical implementations. For portability, it is
41028 recommended that new non-privileged applications use the *seteuid()* and *setegid()* functions
41029 instead.41030 The saved set-user-ID capability allows a program to regain the effective user ID established at
41031 the last *exec* call. Similarly, the saved set-group-ID capability allows a program to regain the
41032 effective group ID established at the last *exec* call. These capabilities are derived from System V.
41033 Without them, a program might have to run as superuser in order to perform the same
41034 functions, because superuser can write on the user's files. This is a problem because such a
41035 program can write on any user's files, and so must be carefully written to emulate the
41036 permissions of the calling process properly. In System V, these capabilities have traditionally
41037 been implemented only via the *setuid()* and *setgid()* functions for non-privileged processes. The
41038 fact that the behavior of those functions was different for privileged processes made them
41039 difficult to use. The POSIX.1-1990 standard defined the *setuid()* function to behave differently
41040 for privileged and unprivileged users. When the caller had the appropriate privilege, the
41041 function set the calling process' real user ID, effective user ID, and saved set-user ID on
41042 implementations that supported it. When the caller did not have the appropriate privilege, the
41043 function set only the effective user ID, subject to permission checks. The former use is generally
41044 needed for utilities like *login* and *su*, which are not conforming applications and thus outside the

scope of IEEE Std 1003.1-2001. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

IEEE Std 1003.1-2001 augments the latter functionality with a mandatory feature named `_POSIX_SAVED_IDS`. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its *exec*-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with the (implementation-defined) appropriate privilege. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by IEEE Std 1003.1-2001. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: *setuid()* (which always sets both the real and effective user IDs, like *setuid()* in IEEE Std 1003.1-2001 for privileged users), and *seteuid()* (which always sets just the effective user ID, like *setuid()* in IEEE Std 1003.1-2001 for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via *setreuid()*, which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side effect. The current 4.4BSD includes saved effective IDs and uses them for *seteuid()* and *setegid()* as described above. The *setreuid()* and *setregid()* functions will be deprecated or removed.

The solution here is:

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the *exec* functions and by privileged calls to *setuid()*.
- Add the *seteuid()* and *setegid()* functions as portable alternatives to *setuid()* and *setgid()* for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the *setuid()* function in the presence of a saved set-user-ID, or the use of the BSD *setreuid()* function, which was able to swap the real and effective user IDs. The changes included in IEEE Std 1003.1-2001 provide a new mechanism using *seteuid()* in conjunction with a saved set-user-ID. Thus, all implementations with the new *seteuid()* mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by `_POSIX_SAVED_IDS` has been changed to agree with the case where the option was defined. The *kill()* function is an exception. Implementors of the new *seteuid()* mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of *setreuid()* and with the `_POSIX_SAVED_IDS` behavior of *kill()* is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use *setreuid()* to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the *kill()* behavior of `_POSIX_SAVED_IDS` was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to *setreuid()*. The standard developers considered that alternative to be less correct than the

41094 retention of the old behavior of *kill()* in such systems. Current conforming applications shall
41095 accommodate either behavior from *kill()*, and there appears to be no strong reason for *kill()* to
41096 check the saved set-user-ID rather than the effective user ID.

41097 **FUTURE DIRECTIONS**

41098 None.

41099 **SEE ALSO**

41101 Base Definitions volume of IEEE Std 1003.1-2001, **<sys/types.h>**, **<unistd.h>**

41102 **CHANGE HISTORY**

41103 First released in Issue 1. Derived from Issue 1 of the SVID.

41104 **Issue 6**

41105 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

41106 The following new requirements on POSIX implementations derive from alignment with the
41107 Single UNIX Specification:

- 41108 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
41109 required for conforming implementations of previous POSIX specifications, it was not
41110 required for UNIX applications.
- 41111 • The functionality associated with `_POSIX_SAVED_IDS` is now mandatory. This is a FIPS
41112 requirement.

41113 The following changes were made to align with the IEEE P1003.1a draft standard:

- 41114 • The effects of *setuid()* in processes without appropriate privileges are changed.
- 41115 • A requirement that the supplementary group list is not affected is added.

41116 NAME

41117 setutxent — reset the user accounting database to the first entry

41118 SYNOPSIS

41119 xSI #include <utmpx.h>

41120 void setutxent(void);

41121

41122 DESCRIPTION

41123 Refer to *endutxent()*.

41124 **NAME**

41125 setvbuf — assign buffering to a stream

41126 **SYNOPSIS**

41127 #include <stdio.h>

41128 int setvbuf(FILE *restrict *stream*, char *restrict *buf*, int *type*,
 41129 size_t *size*);

41130 **DESCRIPTION**

41131 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 41132 conflict between the requirements described here and the ISO C standard is unintentional. This
 41133 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

41134 The *setvbuf()* function may be used after the stream pointed to by *stream* is associated with an
 41135 open file but before any other operation (other than an unsuccessful call to *setvbuf()*) is
 41136 performed on the stream. The argument *type* determines how *stream* shall be buffered, as
 41137 follows:

- 41138 • {_IOFBF} shall cause input/output to be fully buffered.
- 41139 • {_IOLBF} shall cause input/output to be line buffered.
- 41140 • {_IONBF} shall cause input/output to be unbuffered.

41141 If *buf* is not a null pointer, the array it points to may be used instead of a buffer allocated by
 41142 *setvbuf()* and the argument *size* specifies the size of the array; otherwise, *size* may determine the
 41143 size of a buffer allocated by the *setvbuf()* function. The contents of the array at any time are
 41144 unspecified.

41145 For information about streams, see Section 2.5 (on page 34).

41146 **RETURN VALUE**

41147 Upon successful completion, *setvbuf()* shall return 0. Otherwise, it shall return a non-zero value
 41148 CX if an invalid value is given for *type* or if the request cannot be honored, and may set *errno* to
 41149 indicate the error.

41150 **ERRORS**

41151 The *setvbuf()* function may fail if:

41152 CX [EBADF] The file descriptor underlying *stream* is not valid.

41153 **EXAMPLES**

41154 None.

41155 **APPLICATION USAGE**

41156 A common source of error is allocating buffer space as an “automatic” variable in a code block,
 41157 and then failing to close the stream in the same block.

41158 With *setvbuf()*, allocating a buffer of *size* bytes does not necessarily imply that all of *size* bytes are
 41159 used for the buffer area.

41160 Applications should note that many implementations only provide line buffering on input from
 41161 terminal devices.

41162 **RATIONALE**

41163 None.

41164 **FUTURE DIRECTIONS**

41165 None.

41166 **SEE ALSO**41167 Section 2.5 (on page 34), *fopen()*, *setbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001,
41168 <**stdio.h**>41169 **CHANGE HISTORY**

41170 First released in Issue 1. Derived from Issue 1 of the SVID.

41171 **Issue 6**

41172 Extensions beyond the ISO C standard are marked.

41173 The *setvbuf()* prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

41174 **NAME**41175 shm_open — open a shared memory object (**REALTIME**)41176 **SYNOPSIS**

41177 SHM #include <sys/mman.h>

41178 int shm_open(const char *name, int oflag, mode_t mode);

41179

41180 **DESCRIPTION**

41181 The *shm_open()* function shall establish a connection between a shared memory object and a file
 41182 descriptor. It shall create an open file description that refers to the shared memory object and a
 41183 file descriptor that refers to that open file description. The file descriptor is used by other
 41184 functions to refer to that shared memory object. The *name* argument points to a string naming a
 41185 shared memory object. It is unspecified whether the name appears in the file system and is
 41186 visible to other functions that take pathnames as arguments. The *name* argument conforms to the
 41187 construction rules for a pathname. If *name* begins with the slash character, then processes calling
 41188 *shm_open()* with the same value of *name* refer to the same shared memory object, as long as that
 41189 name has not been removed. If *name* does not begin with the slash character, the effect is
 41190 implementation-defined. The interpretation of slash characters other than the leading slash
 41191 character in *name* is implementation-defined.

41192 If successful, *shm_open()* shall return a file descriptor for the shared memory object that is the
 41193 lowest numbered file descriptor not currently open for that process. The open file description is
 41194 new, and therefore the file descriptor does not share it with any other processes. It is unspecified
 41195 whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file
 41196 descriptor is set.

41197 The file status flags and file access modes of the open file description are according to the value
 41198 of *oflag*. The *oflag* argument is the bitwise-inclusive OR of the following flags defined in the
 41199 <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below
 41200 in the value of *oflag*:

41201 O_RDONLY Open for read access only.

41202 O_RDWR Open for read or write access.

41203 Any combination of the remaining flags may be specified in the value of *oflag*:

41204 O_CREAT If the shared memory object exists, this flag has no effect, except as noted
 41205 under O_EXCL below. Otherwise, the shared memory object is created; the
 41206 user ID of the shared memory object shall be set to the effective user ID of the
 41207 process; the group ID of the shared memory object is set to a system default
 41208 group ID or to the effective group ID of the process. The permission bits of the
 41209 shared memory object shall be set to the value of the *mode* argument except
 41210 those set in the file mode creation mask of the process. When bits in *mode*
 41211 other than the file permission bits are set, the effect is unspecified. The *mode*
 41212 argument does not affect whether the shared memory object is opened for
 41213 reading, for writing, or for both. The shared memory object has a size of zero.

41214 O_EXCL If O_EXCL and O_CREAT are set, *shm_open()* fails if the shared memory
 41215 object exists. The check for the existence of the shared memory object and the
 41216 creation of the object if it does not exist is atomic with respect to other
 41217 processes executing *shm_open()* naming the same shared memory object with
 41218 O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the
 41219 result is undefined.

41220 O_TRUNC If the shared memory object exists, and it is successfully opened O_RDWR,
 41221 the object shall be truncated to zero length and the mode and owner shall be
 41222 unchanged by this function call. The result of using O_TRUNC with
 41223 O_RDONLY is undefined.

41224 When a shared memory object is created, the state of the shared memory object, including all
 41225 data associated with the shared memory object, persists until the shared memory object is
 41226 unlinked and all other references are gone. It is unspecified whether the name and shared
 41227 memory object state remain valid after a system reboot.

41228 RETURN VALUE

41229 Upon successful completion, the *shm_open()* function shall return a non-negative integer
 41230 representing the lowest numbered unused file descriptor. Otherwise, it shall return `-1` and set
 41231 *errno* to indicate the error.

41232 ERRORS

41233 The *shm_open()* function shall fail if:

41234 [EACCES] The shared memory object exists and the permissions specified by *oflag* are
 41235 denied, or the shared memory object does not exist and permission to create
 41236 the shared memory object is denied, or O_TRUNC is specified and write
 41237 permission is denied.

41238 [EEXIST] O_CREAT and O_EXCL are set and the named shared memory object already
 41239 exists.

41240 [EINTR] The *shm_open()* operation was interrupted by a signal.

41241 [EINVAL] The *shm_open()* operation is not supported for the given name.

41242 [EMFILE] Too many file descriptors are currently in use by this process.

41243 [ENAMETOOLONG]

41244 The length of the *name* argument exceeds {PATH_MAX} or a pathname
 41245 component is longer than {NAME_MAX}.

41246 [ENFILE] Too many shared memory objects are currently open in the system.

41247 [ENOENT] O_CREAT is not set and the named shared memory object does not exist.

41248 [ENOSPC] There is insufficient space for the creation of the new shared memory object.

41249 EXAMPLES

41250 None.

41251 APPLICATION USAGE

41252 None.

41253 RATIONALE

41254 When the Memory Mapped Files option is supported, the normal *open()* call is used to obtain a
 41255 descriptor to a file to be mapped according to existing practice with *mmap()*. When the Shared
 41256 Memory Objects option is supported, the *shm_open()* function shall obtain a descriptor to the
 41257 shared memory object to be mapped.

41258 There is ample precedent for having a file descriptor represent several types of objects. In the
 41259 POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.
 41260 Many implementations simply have an operations vector, which is indexed by the file descriptor
 41261 type and does very different operations. Note that in some cases the file descriptor passed to
 41262 generic operations on file descriptors is returned by *open()* or *creat()* and in some cases returned
 41263 by alternate functions, such as *pipe()*. The latter technique is used by *shm_open()*.

Note that such shared memory objects can actually be implemented as mapped files. In both cases, the size can be set after the open using *ftruncate()*. The *shm_open()* function itself does not create a shared object of a specified size because this would duplicate an extant function that set the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the *shm_open()* function may be implemented using a macro that invokes *open()*, and the *shm_unlink()* function may be implemented using a macro that invokes *unlink()*.

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a *shm_open()* followed by an *ftruncate()* and *close()* can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to *shm_open()* was restricted to *O_RDONLY*, *O_RDWR*, *O_CREAT*, and *O_TRUNC* because these could be easily implemented on most memory mapping systems. This volume of IEEE Std 1003.1-2001 is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The *shm_open()* function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via *getenv()*. Another would be from a configuration file.

This volume of IEEE Std 1003.1-2001 specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.

41308 **FUTURE DIRECTIONS**

41309 None.

41310 **SEE ALSO**

41311 *close()*, *dup()*, *exec*, *fcntl()*, *mmap()*, *shmat()*, *shmctl()*, *shmdt()*, *shm_unlink()*, *umask()*, the Base

41313 **CHANGE HISTORY**

41314 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

41315 **Issue 6**41316 The *shm_open()* function is marked as part of the Shared Memory Objects option.

41317 The [ENOSYS] error condition has been removed as stubs need not be provided if an
41318 implementation does not support the Shared Memory Objects option.

41319 **NAME**41320 shm_unlink — remove a shared memory object (**REALTIME**)41321 **SYNOPSIS**

41322 SHM #include <sys/mman.h>

41323 int shm_unlink(const char *name);

41324

41325 **DESCRIPTION**

41326 The *shm_unlink()* function shall remove the name of the shared memory object named by the
 41327 string pointed to by *name*.

41328 If one or more references to the shared memory object exist when the object is unlinked, the
 41329 name shall be removed before *shm_unlink()* returns, but the removal of the memory object
 41330 contents shall be postponed until all open and map references to the shared memory object have
 41331 been removed.

41332 Even if the object continues to exist after the last *shm_unlink()*, reuse of the name shall
 41333 subsequently cause *shm_open()* to behave as if no shared memory object of this name exists (that
 41334 is, *shm_open()* will fail if O_CREAT is not set, or will create a new shared memory object if
 41335 O_CREAT is set).

41336 **RETURN VALUE**

41337 Upon successful completion, a value of zero shall be returned. Otherwise, a value of -1 shall be
 41338 returned and *errno* set to indicate the error. If -1 is returned, the named shared memory object
 41339 shall not be changed by this function call.

41340 **ERRORS**41341 The *shm_unlink()* function shall fail if:

41342 [EACCES] Permission is denied to unlink the named shared memory object.

41343 [ENAMETOOLONG]

41344 The length of the *name* argument exceeds {PATH_MAX} or a pathname
 41345 component is longer than {NAME_MAX}.

41346 [ENOENT] The named shared memory object does not exist.

41347 **EXAMPLES**

41348 None.

41349 **APPLICATION USAGE**

41350 Names of memory objects that were allocated with *open()* are deleted with *unlink()* in the usual
 41351 fashion. Names of memory objects that were allocated with *shm_open()* are deleted with
 41352 *shm_unlink()*. Note that the actual memory object is not destroyed until the last close and
 41353 unmap on it have occurred if it was already in use.

41354 **RATIONALE**

41355 None.

41356 **FUTURE DIRECTIONS**

41357 None.

CHANGE HISTORY

41361 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

41364 The *shm_unlink()* function is marked as part of the Shared Memory Objects option.

41365 In the DESCRIPTION, text is added to clarify that reusing the same name after a *shm_unlink()*
41366 will not attach to the old shared memory object.

41367 The [ENOSYS] error condition has been removed as stubs need not be provided if an
41368 implementation does not support the Shared Memory Objects option.

41369 **NAME**

41370 shmat — XSI shared memory attach operation

41371 **SYNOPSIS**

41372 xsi #include <sys/shm.h>

41373 void *shmat(int *shmid*, const void **shmaddr*, int *shmflg*);

41374

41375 **DESCRIPTION**

41376 The *shmat()* function operates on XSI shared memory (see the Base Definitions volume of
 41377 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
 41378 function interoperates with the realtime interprocess communication facilities defined in Section
 41379 2.8 (on page 41).

41380 The *shmat()* function attaches the shared memory segment associated with the shared memory
 41381 identifier specified by *shmid* to the address space of the calling process. The segment is attached
 41382 at the address specified by one of the following criteria:

- 41383 • If *shmaddr* is a null pointer, the segment is attached at the first available address as selected
 41384 by the system.
- 41385 • If *shmaddr* is not a null pointer and (*shmflg* & SHM_RND) is non-zero, the segment is attached
 41386 at the address given by (*shmaddr* - ((uintptr_t)*shmaddr* % SHMLBA)). The character '%' is the
 41387 C-language remainder operator.
- 41388 • If *shmaddr* is not a null pointer and (*shmflg* & SHM_RND) is 0, the segment is attached at the
 41389 address given by *shmaddr*.
- 41390 • The segment is attached for reading if (*shmflg* & SHM_RDONLY) is non-zero and the calling
 41391 process has read permission; otherwise, if it is 0 and the calling process has read and write
 41392 permission, the segment is attached for reading and writing.

41393 **RETURN VALUE**

41394 Upon successful completion, *shmat()* shall increment the value of *shm_nattch* in the data
 41395 structure associated with the shared memory ID of the attached shared memory segment and
 41396 return the segment's start address.

41397 Otherwise, the shared memory segment shall not be attached, *shmat()* shall return -1, and *errno*
 41398 shall be set to indicate the error.

41399 **ERRORS**41400 The *shmat()* function shall fail if:

41401 41402	[EACCES]	Operation permission is denied to the calling process; see Section 2.7 (on page 39).
41403 41404 41405 41406 41407	[EINVAL]	The value of <i>shmid</i> is not a valid shared memory identifier, the <i>shmaddr</i> is not a null pointer, and the value of (<i>shmaddr</i> - ((uintptr_t) <i>shmaddr</i> % SHMLBA)) is an illegal address for attaching shared memory; or the <i>shmaddr</i> is not a null pointer, (<i>shmflg</i> & SHM_RND) is 0, and the value of <i>shmaddr</i> is an illegal address for attaching shared memory.
41408 41409	[EMFILE]	The number of shared memory segments attached to the calling process would exceed the system-imposed limit.
41410 41411	[ENOMEM]	The available data space is not large enough to accommodate the shared memory segment.

41412 **EXAMPLES**

41413 None.

41414 **APPLICATION USAGE**

41415 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
41416 Application developers who need to use IPC should design their applications so that modules
41417 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
41418 alternative interfaces.

41419 **RATIONALE**

41420 None.

41421 **FUTURE DIRECTIONS**

41422 None.

41423 **SEE ALSO**

41426 **CHANGE HISTORY**

41427 First released in Issue 2. Derived from Issue 2 of the SVID.

41428 **Issue 5**

41429 Moved from SHARED MEMORY to BASE.

41430 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
41431 DIRECTIONS to a new APPLICATION USAGE section.

41432 **Issue 6**

41433 The Open Group Corrigendum U021/13 is applied.

41434 **NAME**

41435 shmctl — XSI shared memory control operations

41436 **SYNOPSIS**41437 xsi `#include <sys/shm.h>`41438 `int shmctl(int shmid, int cmd, struct shm_id_ds *buf);`

41439

41440 **DESCRIPTION**

41441 The *shmctl()* function operates on XSI shared memory (see the Base Definitions volume of
 41442 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
 41443 function interoperates with the realtime interprocess communication facilities defined in Section
 41444 2.8 (on page 41).

41445 The *shmctl()* function provides a variety of shared memory control operations as specified by
 41446 *cmd*. The following values for *cmd* are available:

41447 **IPC_STAT** Place the current value of each member of the **shm_id_ds** data structure
 41448 associated with *shmid* into the structure pointed to by *buf*. The contents of the
 41449 structure are defined in **<sys/shm.h>**.

41450 **IPC_SET** Set the value of the following members of the **shm_id_ds** data structure
 41451 associated with *shmid* to the corresponding value found in the structure
 41452 pointed to by *buf*:

41453 `shm_perm.uid`
 41454 `shm_perm.gid`
 41455 `shm_perm.mode` Low-order nine bits.

41456 **IPC_SET** can only be executed by a process that has an effective user ID equal
 41457 to either that of a process with appropriate privileges or to the value of
 41458 *shm_perm.cuid* or *shm_perm.uid* in the **shm_id_ds** data structure associated with
 41459 *shmid*.

41460 **IPC_RMID** Remove the shared memory identifier specified by *shmid* from the system and
 41461 destroy the shared memory segment and **shm_id_ds** data structure associated
 41462 with it. **IPC_RMID** can only be executed by a process that has an effective user
 41463 ID equal to either that of a process with appropriate privileges or to the value
 41464 of *shm_perm.cuid* or *shm_perm.uid* in the **shm_id_ds** data structure associated
 41465 with *shmid*.

41466 **RETURN VALUE**

41467 Upon successful completion, *shmctl()* shall return 0; otherwise, it shall return `-1` and set *errno* to
 41468 indicate the error.

41469 **ERRORS**41470 The *shmctl()* function shall fail if:

41471 **[EACCES]** The argument *cmd* is equal to **IPC_STAT** and the calling process does not have
 41472 read permission; see Section 2.7 (on page 39).

41473 **[EINVAL]** The value of *shmid* is not a valid shared memory identifier, or the value of *cmd*
 41474 is not a valid command.

41475 **[EPERM]** The argument *cmd* is equal to **IPC_RMID** or **IPC_SET** and the effective user ID
 41476 of the calling process is not equal to that of a process with appropriate
 41477 privileges and it is not equal to the value of *shm_perm.cuid* or *shm_perm.uid* in
 41478 the data structure associated with *shmid*.

41479 The *shmctl()* function may fail if:

41480 [EOVERFLOW] The *cmd* argument is IPC_STAT and the *gid* or *uid* value is too large to be
41481 stored in the structure pointed to by the *buf* argument.

41482 **EXAMPLES**

41483 None.

41484 **APPLICATION USAGE**

41485 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
41486 Application developers who need to use IPC should design their applications so that modules
41487 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
41488 alternative interfaces.

41489 **RATIONALE**

41490 None.

41502 **NAME**

41503 shmdt — XSI shared memory detach operation

41504 **SYNOPSIS**

41505 xsi #include <sys/shm.h>

41506 int shmdt(const void *shmaddr);

41507

41508 **DESCRIPTION**

41509 The *shmdt()* function operates on XSI shared memory (see the Base Definitions volume of
 41510 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
 41511 function interoperates with the realtime interprocess communication facilities defined in Section
 41512 2.8 (on page 41).

41513 The *shmdt()* function detaches the shared memory segment located at the address specified by
 41514 *shmaddr* from the address space of the calling process.

41515 **RETURN VALUE**

41516 Upon successful completion, *shmdt()* shall decrement the value of *shm_nattch* in the data
 41517 structure associated with the shared memory ID of the attached shared memory segment and
 41518 return 0.

41519 Otherwise, the shared memory segment shall not be detached, *shmdt()* shall return -1 , and *errno*
 41520 shall be set to indicate the error.

41521 **ERRORS**41522 The *shmdt()* function shall fail if:

41523 [EINVAL] The value of *shmaddr* is not the data segment start address of a shared
 41524 memory segment.

41525 **EXAMPLES**

41526 None.

41527 **APPLICATION USAGE**

41528 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 41529 Application developers who need to use IPC should design their applications so that modules
 41530 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
 41531 alternative interfaces.

41532 **RATIONALE**

41533 None.

41534 **FUTURE DIRECTIONS**

41535 None.

41539 **CHANGE HISTORY**

41540 First released in Issue 2. Derived from Issue 2 of the SVID.

41541 **Issue 5**

41542 Moved from SHARED MEMORY to BASE.

41543 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE
 41544 DIRECTIONS to a new APPLICATION USAGE section.

41545 **NAME**

41546 shmget — get an XSI shared memory segment

41547 **SYNOPSIS**41548 xsi `#include <sys/shm.h>`41549 `int shmget(key_t key, size_t size, int shmflg);`

41550

41551 **DESCRIPTION**

41552 The *shmget()* function operates on XSI shared memory (see the Base Definitions volume of
 41553 IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
 41554 function interoperates with the realtime interprocess communication facilities defined in Section
 41555 2.8 (on page 41).

41556 The *shmget()* function shall return the shared memory identifier associated with *key*.

41557 A shared memory identifier, associated data structure, and shared memory segment of at least
 41558 *size* bytes (see <sys/shm.h>) are created for *key* if one of the following is true:

- 41559 • The argument *key* is equal to `IPC_PRIVATE`.
- 41560 • The argument *key* does not already have a shared memory identifier associated with it and
 41561 (*shmflg* & `IPC_CREAT`) is non-zero.

41562 Upon creation, the data structure associated with the new shared memory identifier shall be
 41563 initialized as follows:

- 41564 • The values of *shm_perm.cuid*, *shm_perm.uid*, *shm_perm.cgid*, and *shm_perm.gid* are set equal to
 41565 the effective user ID and effective group ID, respectively, of the calling process.
- 41566 • The low-order nine bits of *shm_perm.mode* are set equal to the low-order nine bits of *shmflg*.
- 41567 • The value of *shm_segsz* is set equal to the value of *size*.
- 41568 • The values of *shm_lpid*, *shm_nattch*, *shm_atime*, and *shm_dtime* are set equal to 0.
- 41569 • The value of *shm_ctime* is set equal to the current time.

41570 When the shared memory segment is created, it shall be initialized with all zero values.

41571 **RETURN VALUE**

41572 Upon successful completion, *shmget()* shall return a non-negative integer, namely a shared
 41573 memory identifier; otherwise, it shall return `-1` and set *errno* to indicate the error.

41574 **ERRORS**

41575 The *shmget()* function shall fail if:

41576 41577 41578	[EACCES]	A shared memory identifier exists for <i>key</i> but operation permission as specified by the low-order nine bits of <i>shmflg</i> would not be granted; see Section 2.7 (on page 39).
41579 41580	[EEXIST]	A shared memory identifier exists for the argument <i>key</i> but (<i>shmflg</i> & <code>IPC_CREAT</code>) && (<i>shmflg</i> & <code>IPC_EXCL</code>) is non-zero.
41581 41582	[EINVAL]	A shared memory segment is to be created and the value of <i>size</i> is less than the system-imposed minimum or greater than the system-imposed maximum.
41583 41584 41585	[EINVAL]	No shared memory segment is to be created and a shared memory segment exists for <i>key</i> but the size of the segment associated with it is less than <i>size</i> and <i>size</i> is not 0.

41586 [ENOENT] A shared memory identifier does not exist for the argument *key* and (*shmflg*
 41587 &IPC_CREAT) is 0.

41588 [ENOMEM] A shared memory identifier and associated shared memory segment shall be
 41589 created, but the amount of available physical memory is not sufficient to fill
 41590 the request.

41591 [ENOSPC] A shared memory identifier is to be created, but the system-imposed limit on
 41592 the maximum number of allowed shared memory identifiers system-wide
 41593 would be exceeded.

EXAMPLES

41594
 41595 None.

APPLICATION USAGE

41597 The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
 41598 Application developers who need to use IPC should design their applications so that modules
 41599 using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
 41600 alternative interfaces.

41614 **NAME**

41615 shutdown — shut down socket send and receive operations

41616 **SYNOPSIS**

41617 #include <sys/socket.h>

41618 int shutdown(int *socket*, int *how*);41619 **DESCRIPTION**41620 The *shutdown()* function shall cause all or part of a full-duplex connection on the socket
41621 associated with the file descriptor *socket* to be shut down.41622 The *shutdown()* function takes the following arguments:41623 *socket* Specifies the file descriptor of the socket.41624 *how* Specifies the type of shutdown. The values are as follows:

41625 SHUT_RD Disables further receive operations.

41626 SHUT_WR Disables further send operations.

41627 SHUT_RDWR Disables further send and receive operations.

41628 The *shutdown()* function disables subsequent send and/or receive operations on a socket,
41629 depending on the value of the *how* argument.41630 **RETURN VALUE**41631 Upon successful completion, *shutdown()* shall return 0; otherwise, -1 shall be returned and *errno*
41632 set to indicate the error.41633 **ERRORS**41634 The *shutdown()* function shall fail if:41635 [EBADF] The *socket* argument is not a valid file descriptor.41636 [EINVAL] The *how* argument is invalid.

41637 [ENOTCONN] The socket is not connected.

41638 [ENOTSOCK] The *socket* argument does not refer to a socket.41639 The *shutdown()* function may fail if:

41640 [ENOBUFS] Insufficient resources were available in the system to perform the operation.

41652 **CHANGE HISTORY**

41653 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

41654 **NAME**

41655 sigaction — examine and change a signal action

41656 **SYNOPSIS**41657 CX `#include <signal.h>`

```
41658 int sigaction(int sig, const struct sigaction *restrict act,
41659             struct sigaction *restrict oact);
```

41660

41661 **DESCRIPTION**

41662 The *sigaction()* function allows the calling process to examine and/or specify the action to be
 41663 associated with a specific signal. The argument *sig* specifies the signal; acceptable values are
 41664 defined in **<signal.h>**.

41665 The structure **sigaction**, used to describe an action to be taken, is defined in the **<signal.h>**
 41666 header to include at least the following members:

41667

41668

41669

41670

41671

41672

41673

41674

41675

41676

41677

Member Type	Member Name	Description
void(*) (int)	<i>sa_handler</i>	Pointer to a signal-catching function or one of the macros SIG_IGN or SIG_DFL.
sigset_t	<i>sa_mask</i>	Additional set of signals to be blocked during execution of signal-catching function.
int	<i>sa_flags</i>	Special flags to affect behavior of signal.
void(*) (int, siginfo_t *, void *)	<i>sa_sigaction</i>	Pointer to a signal-catching function.

41678 The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application
 41679 shall not use both simultaneously.

41680 If the argument *act* is not a null pointer, it points to a structure specifying the action to be
 41681 associated with the specified signal. If the argument *oact* is not a null pointer, the action
 41682 previously associated with the signal is stored in the location pointed to by the argument *oact*. If
 41683 the argument *act* is a null pointer, signal handling is unchanged; thus, the call can be used to
 41684 enquire about the current handling of a given signal. The SIGKILL and SIGSTOP signals shall
 41685 not be added to the signal mask using this mechanism; this restriction shall be enforced by the
 41686 system without causing an error to be indicated.

41687 If the SA_SIGINFO flag (see below) is cleared in the *sa_flags* field of the **sigaction** structure, the
 41688 XSI|RTS *sa_handler* field identifies the action to be associated with the specified signal. If the
 41689 SA_SIGINFO flag is set in the *sa_flags* field, and the implementation supports the Realtime
 41690 Signals Extension option or the XSI Extension option, the *sa_sigaction* field specifies a signal-
 41691 catching function. If the SA_SIGINFO bit is cleared and the *sa_handler* field specifies a signal-
 41692 catching function, or if the SA_SIGINFO bit is set, the *sa_mask* field identifies a set of signals that
 41693 shall be added to the signal mask of the thread before the signal-catching function is invoked. If
 41694 the *sa_handler* field specifies a signal-catching function, the *sa_mask* field identifies a set of
 41695 signals that shall be added to the process' signal mask before the signal-catching function is
 41696 invoked.

41697 The *sa_flags* field can be used to modify the behavior of the specified signal.

41698 The following flags, defined in the **<signal.h>** header, can be set in *sa_flags*:

41699 XSI	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop or stopped children continue.
41700		
41701		If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is not set in <i>sa_flags</i> , and the implementation supports the SIGCHLD signal, then a SIGCHLD signal shall be generated for the calling process whenever any of its child processes stop and a SIGCHLD signal may be generated for the calling process whenever any of its stopped child processes are continued. If <i>sig</i> is SIGCHLD and the SA_NOCLDSTOP flag is set in <i>sa_flags</i> , then the implementation shall not generate a SIGCHLD signal in this way.
41702		
41703		
41704 XSI		
41705		
41706		
41707		
41708 XSI	SA_ONSTACK	If set and an alternate signal stack has been declared with <i>sigaltstack()</i> , the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.
41709		
41710		
41711 XSI	SA_RESETHAND	If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.
41712		
41713		Note: SIGILL and SIGTRAP cannot be automatically reset when delivered; the system silently enforces this restriction.
41714		
41715		Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.
41716		
41717		In addition, if this flag is set, <i>sigaction()</i> behaves as if the SA_NODEFER flag were also set.
41718		
41719 XSI	SA_RESTART	This flag affects the behavior of interruptible functions; that is, those specified to fail with <i>errno</i> set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If the flag is not set, interruptible functions interrupted by this signal shall fail with <i>errno</i> set to [EINTR].
41720		
41721		
41722		
41723		
41724		
41725	SA_SIGINFO	If cleared and the signal is caught, the signal-catching function shall be entered as:
41726		
41727		<pre>void func(int signo);</pre>
41728		where <i>signo</i> is the only argument to the signal-catching function. In this case, the application shall use the <i>sa_handler</i> member to describe the signal-catching function and the application shall not modify the <i>sa_sigaction</i> member.
41729		
41730		
41731		
41732 XSI RTS		If SA_SIGINFO is set and the signal is caught, the signal-catching function shall be entered as:
41733		
41734		<pre>void func(int signo, siginfo_t *info, void *context);</pre>
41735		where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type siginfo_t explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type ucontext_t to refer to the receiving process' context that was interrupted when the signal was delivered. In this case, the application shall use the <i>sa_sigaction</i> member to describe the signal-catching function and the application shall not modify the <i>sa_handler</i> member.
41736		
41737		
41738		
41739		
41740		
41741		
41742		
41743		The <i>si_signo</i> member contains the system-generated signal number.

41744 XSI		The <i>si_errno</i> member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.
41745		
41746		
41747 XSI RTS		The <i>si_code</i> member contains a code identifying the cause of the signal.
41748 XSI		If the value of <i>si_code</i> is less than or equal to 0, then the signal was generated by a process and <i>si_pid</i> and <i>si_uid</i> , respectively, indicate the process ID and the real user ID of the sender. The <signal.h> header description contains information about the signal-specific contents of the elements of the siginfo_t type.
41749		
41750		
41751		
41752		
41753 XSI	SA_NOCLDWAIT	If set, and <i>sig</i> equals SIGCHLD, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and <i>wait()</i> , <i>waitid()</i> , and <i>waitpid()</i> shall fail and set <i>errno</i> to [ECHILD]. Otherwise, terminating child processes shall be transformed into zombie processes, unless SIGCHLD is set to SIG_IGN.
41754		
41755		
41756		
41757		
41758		
41759		
41760		
41761 XSI	SA_NODEFER	If set and <i>sig</i> is caught, <i>sig</i> shall not be added to the process' signal mask on entry to the signal handler unless it is included in <i>sa_mask</i> . Otherwise, <i>sig</i> shall always be added to the process' signal mask on entry to the signal handler.
41762		
41763		
41764		
41765		When a signal is caught by a signal-catching function installed by <i>sigaction()</i> , a new signal mask is calculated and installed for the duration of the signal-catching function (or until a call to either <i>sigprocmask()</i> or <i>sigsuspend()</i> is made). This mask is formed by taking the union of the current signal mask and the value of the <i>sa_mask</i> for the signal being delivered unless SA_NODEFER or SA_RESETHAND is set, and then including the signal being delivered. If and when the user's signal handler returns normally, the original signal mask is restored.
41766		
41767		
41768 XSI		
41769		
41770		
41771		Once an action is installed for a specific signal, it shall remain installed until another action is explicitly requested (by another call to <i>sigaction()</i>), until the SA_RESETHAND flag causes resetting of the handler, or until one of the <i>exec</i> functions is called.
41772 XSI		
41773		
41774		If the previous action for <i>sig</i> had been established by <i>signal()</i> , the values of the fields returned in the structure pointed to by <i>oact</i> are unspecified, and in particular <i>oact->sa_handler</i> is not necessarily the same value passed to <i>signal()</i> . However, if a pointer to the same structure or a copy thereof is passed to a subsequent call to <i>sigaction()</i> via the <i>act</i> argument, handling of the signal shall be as if the original call to <i>signal()</i> were repeated.
41775		
41776		
41777		
41778		
41779		If <i>sigaction()</i> fails, no new signal handler is installed.
41780		It is unspecified whether an attempt to set the action for a signal that cannot be caught or ignored to SIG_DFL is ignored or causes an error to be returned with <i>errno</i> set to [EINVAL].
41781		
41782		If SA_SIGINFO is not set in <i>sa_flags</i> , then the disposition of subsequent occurrences of <i>sig</i> when it is already pending is implementation-defined; the signal-catching function shall be invoked with a single argument. If the implementation supports the Realtime Signals Extension option, and if SA_SIGINFO is set in <i>sa_flags</i> , then subsequent occurrences of <i>sig</i> generated by <i>sigqueue()</i> or as a result of any signal-generating function that supports the specification of an application-defined value (when <i>sig</i> is already pending) shall be queued in FIFO order until delivered or accepted; the signal-catching function shall be invoked with three arguments. The application specified value is passed to the signal-catching function as the <i>si_value</i> member of the siginfo_t structure.
41783		
41784 RTS		
41785		
41786		
41787		
41788		
41789		
41790		

41791 The result of the use of *sigaction()* and a *sigwait()* function concurrently within a process on the
 41792 same signal is unspecified.

41793 RETURN VALUE

41794 Upon successful completion, *sigaction()* shall return 0; otherwise, *-1* shall be returned, *errno* shall
 41795 be set to indicate the error, and no new signal-catching function shall be installed.

41796 ERRORS

41797 The *sigaction()* function shall fail if:

41798 [EINVAL] The *sig* argument is not a valid signal number or an attempt is made to catch a
 41799 signal that cannot be caught or ignore a signal that cannot be ignored.

41800 [ENOTSUP] The SA_SIGINFO bit flag is set in the *sa_flags* field of the **sigaction** structure,
 41801 and the implementation does not support either the Realtime Signals
 41802 Extension option, or the XSI Extension option.

41803 The *sigaction()* function may fail if:

41804 [EINVAL] An attempt was made to set the action to SIG_DFL for a signal that cannot be
 41805 caught or ignored (or both).

41806 EXAMPLES

41807 None.

41808 APPLICATION USAGE

41809 The *sigaction()* function supersedes the *signal()* function, and should be used in preference. In
 41810 particular, *sigaction()* and *signal()* should not be used in the same process to control the same
 41811 signal. The behavior of reentrant functions, as defined in the DESCRIPTION, is as specified by
 41812 this volume of IEEE Std 1003.1-2001, regardless of invocation from a signal-catching function.
 41813 This is the only intended meaning of the statement that reentrant functions may be used in
 41814 signal-catching functions without restrictions. Applications must still consider all effects of such
 41815 functions on such things as data structures, files, and process state. In particular, application
 41816 writers need to consider the restrictions on interactions when interrupting *sleep()* and
 41817 interactions among multiple handles for a file description. The fact that any specific function is
 41818 listed as reentrant does not necessarily mean that invocation of that function from a signal-
 41819 catching function is recommended.

41820 In order to prevent errors arising from interrupting non-reentrant function calls, applications
 41821 should protect calls to these functions either by blocking the appropriate signals or through the
 41822 use of some programmatic semaphore (see *semget()*, *sem_init()*, *sem_open()*, and so on). Note in
 41823 particular that even the “safe” functions may modify *errno*; the signal-catching function, if not
 41824 executing as an independent thread, may want to save and restore its value. Naturally, the same
 41825 principles apply to the reentrancy of application routines and asynchronous data access. Note
 41826 that *longjmp()* and *siglongjmp()* are not in the list of reentrant functions. This is because the code
 41827 executing after *longjmp()* and *siglongjmp()* can call any unsafe functions with the same danger as
 41828 calling those unsafe functions directly from the signal handler. Applications that use *longjmp()*
 41829 and *siglongjmp()* from within signal handlers require rigorous protection in order to be portable.
 41830 Many of the other functions that are excluded from the list are traditionally implemented using
 41831 either *malloc()* or *free()* functions or the standard I/O library, both of which traditionally use
 41832 data structures in a non-reentrant manner. Since any combination of different functions using a
 41833 common data structure can cause reentrancy problems, this volume of IEEE Std 1003.1-2001
 41834 does not define the behavior when any unsafe function is called in a signal handler that
 41835 interrupts an unsafe function.

41836 If the signal occurs other than as the result of calling *abort()*, *kill()*, or *raise()*, the behavior is
 41837 undefined if the signal handler calls any function in the standard library other than one of the

functions listed in the table above or refers to any object with static storage duration other than by assigning a value to a static storage duration variable of type **volatile sig_atomic_t**. Furthermore, if such a call fails, the value of *errno* is unspecified.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving process resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If *longjmp()* or *_longjmp()* is used to leave the signal handler, then the signal mask must be explicitly restored by the process.

This volume of IEEE Std 1003.1-2001 defines the third argument of a signal handling function when SA_SIGINFO is set as a **void *** instead of a **ucontext_t ***, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to **ucontext_t ***.

The BSD optional four argument signal handling function is not supported by this volume of IEEE Std 1003.1-2001. The BSD declaration would be:

```
void handler(int sig, int code, struct sigcontext *scp,
             char *addr);
```

where *sig* is the signal number, *code* is additional information on certain signals, *scp* is a pointer to the **sigcontext** structure, and *addr* is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA_SIGINFO is set.

RATIONALE

Although this volume of IEEE Std 1003.1-2001 requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catching function is entered, there is no explicit requirement that subsequent calls to *sigaction()* reflect this in the information returned in the *oact* argument. In other words, if SIGKILL is included in the *sa_mask* field of *act*, it is unspecified whether or not a subsequent call to *sigaction()* returns with SIGKILL included in the *sa_mask* field of *oact*.

The SA_NOCLDSTOP flag, when supplied in the *act->sa_flags* parameter, allows overloading SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catching functions that repeatedly call the *waitpid()* function with the WNOHANG flag set, acting on each child for which status is returned, until *waitpid()* returns zero. If stopped children are not of interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the signal-catching routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the *ptrace()* function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of IEEE Std 1003.1-2001.

This volume of IEEE Std 1003.1-2001 requires that calls to *sigaction()* that supply a NULL *act* argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V *signal()* and BSD *sigvec()* functions return [EINVAL] in these cases and, in this respect, their behavior varies from *sigaction()*.

This volume of IEEE Std 1003.1-2001 requires that *sigaction()* properly save and restore a signal action set up by the ISO C standard *signal()* function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the **sigaction** structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose

41885 library routines, they should always be implemented with *sigaction()*.

41886 It was intended that the *signal()* function should be implementable as a library routine using
41887 *sigaction()*.

41888 The POSIX Realtime Extension extends the *sigaction()* function as specified by the POSIX.1-1990
41889 standard to allow the application to request on a per-signal basis via an additional signal action
41890 flag that the extra parameters, including the application-defined signal value, if any, be passed
41891 to the signal-catching function.

41892 **FUTURE DIRECTIONS**

41893 None.

41899 **CHANGE HISTORY**

41900 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41901 **Issue 5**

41902 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX
41903 Threads Extension.

41904 In the DESCRIPTION, the second argument to *func* when SA_SIGINFO is set is no longer
41905 permitted to be NULL, and the description of permitted **siginfo_t** contents is expanded by
41906 reference to <**signal.h**>.

41907 Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP]
41908 error is deleted.

41909 **Issue 6**

41910 The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on
41911 Other Functions”, a reference to *sigpending()* is added.

41912 In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal
41913 Effects on Other Functions” are moved to a separate section of this volume of
41914 IEEE Std 1003.1-2001.

41915 Text describing functionality from the Realtime Signals option is marked.

41916 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 41917 • The [ENOTSUP] error condition is added.

41918 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

41919 The **restrict** keyword is added to the *sigaction()* prototype for alignment with the
41920 ISO/IEC 9899: 1999 standard.

41921 References to the *wait3()* function are removed.

41922 The SYNOPSIS is marked CX since the presence of this function in the <**signal.h**> header is an
41923 extension over the ISO C standard.

41924 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table
41925 describing the **sigaction** structure.

41926 **NAME**

41927 sigaddset — add a signal to a signal set

41928 **SYNOPSIS**41929 CX `#include <signal.h>`41930 `int sigaddset(sigset_t *set, int signo);`

41931

41932 **DESCRIPTION**41933 The *sigaddset()* function adds the individual signal specified by the *signo* to the signal set pointed
41934 to by *set*.41935 Applications shall call either *sigemptyset()* or *sigfillset()* at least once for each object of type
41936 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
41937 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
41938 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
41939 *sigwaitinfo()*, the results are undefined.41940 **RETURN VALUE**41941 Upon successful completion, *sigaddset()* shall return 0; otherwise, it shall return *-1* and set *errno*
41942 to indicate the error.41943 **ERRORS**41944 The *sigaddset()* function may fail if:41945 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.41946 **EXAMPLES**

41957 **<signal.h>**41958 **CHANGE HISTORY**

41959 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

41960 **Issue 5**41961 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
41962 previous issues.41963 **Issue 6**

41964 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

41965 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
41966 extension over the ISO C standard.

41967 **NAME**

41968 sigaltstack — set and get signal alternate stack context

41969 **SYNOPSIS**41970 xSI `#include <signal.h>`41971 `int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);`

41972

41973 **DESCRIPTION**

41974 The *sigaltstack()* function allows a process to define and examine the state of an alternate stack
 41975 for signal handlers for the current thread. Signals that have been explicitly declared to execute
 41976 on the alternate stack shall be delivered on the alternate stack.

41977 If *ss* is not a null pointer, it points to a **stack_t** structure that specifies the alternate signal stack
 41978 that shall take effect upon return from *sigaltstack()*. The *ss_flags* member specifies the new stack
 41979 state. If it is set to *SS_DISABLE*, the stack is disabled and *ss_sp* and *ss_size* are ignored.
 41980 Otherwise, the stack shall be enabled, and the *ss_sp* and *ss_size* members specify the new address
 41981 and size of the stack.

41982 The range of addresses starting at *ss_sp* up to but not including *ss_sp+ss_size* is available to the
 41983 implementation for use as the stack. This function makes no assumptions regarding which end
 41984 is the stack base and in which direction the stack grows as items are pushed.

41985 If *oss* is not a null pointer, on successful completion it shall point to a **stack_t** structure that
 41986 specifies the alternate signal stack that was in effect prior to the call to *sigaltstack()*. The *ss_sp*
 41987 and *ss_size* members specify the address and size of that stack. The *ss_flags* member specifies the
 41988 stack's state, and may contain one of the following values:

41989 **SS_ONSTACK** The process is currently executing on the alternate signal stack. Attempts to
 41990 modify the alternate signal stack while the process is executing on it fail. This
 41991 flag shall not be modified by processes.

41992 **SS_DISABLE** The alternate signal stack is currently disabled.

41993 The value *SIGSTKSZ* is a system default specifying the number of bytes that would be used to
 41994 cover the usual case when manually allocating an alternate stack area. The value *MINSIGSTKSZ*
 41995 is defined to be the minimum stack size for a signal handler. In computing an alternate stack
 41996 size, a program should add that amount to its stack requirements to allow for the system
 41997 implementation overhead. The constants *SS_ONSTACK*, *SS_DISABLE*, *SIGSTKSZ*, and
 41998 *MINSIGSTKSZ* are defined in **<signal.h>**.

41999 After a successful call to one of the *exec* functions, there are no alternate signal stacks in the new
 42000 process image.

42001 In some implementations, a signal (whether or not indicated to execute on the alternate stack)
 42002 shall always execute on the alternate stack if it is delivered while another signal is being caught
 42003 using the alternate stack.

42004 Use of this function by library threads that are not bound to kernel-scheduled entities results in
 42005 undefined behavior.

42006 **RETURN VALUE**

42007 Upon successful completion, *sigaltstack()* shall return 0; otherwise, it shall return *-1* and set *errno*
 42008 to indicate the error.

42009 **ERRORS**42010 The *sigaltstack()* function shall fail if:

42011 [EINVAL] The *ss* argument is not a null pointer, and the *ss_flags* member pointed to by *ss*
 42012 contains flags other than *SS_DISABLE*.

42013 [ENOMEM] The size of the alternate stack area is less than *MINSIGSTKSZ*.

42014 [EPERM] An attempt was made to modify an active stack.

42015 **EXAMPLES**42016 **Allocating Memory for an Alternate Stack**

42017 The following example illustrates a method for allocating memory for an alternate stack.

```
42018 #include <signal.h>
42019 ...
42020 if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
42021     /* Error return. */
42022     sigstk.ss_size = SIGSTKSZ;
42023     sigstk.ss_flags = 0;
42024     if (sigaltstack(&sigstk, (stack_t *)0) < 0)
42025         perror("sigaltstack");
```

42026 **APPLICATION USAGE**

42027 On some implementations, stack space is automatically extended as needed. On those
 42028 implementations, automatic extension is typically not available for an alternate stack. If the stack
 42029 overflows, the behavior is undefined.

42030 **RATIONALE**

42031 None.

42032 **FUTURE DIRECTIONS**

42033 None.

42034 **SEE ALSO**

 42036 IEEE Std 1003.1-2001, <**signal.h**>

42037 **CHANGE HISTORY**

42038 First released in Issue 4, Version 2.

42039 **Issue 5**

42040 Moved from X/OPEN UNIX extension to BASE.

42041 The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in
 42042 previous issues.

42043 **Issue 6**

42044 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

42045 The **restrict** keyword is added to the *sigaltstack()* prototype for alignment with the
 42046 ISO/IEC 9899:1999 standard.

42047 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence
 42048 to include “for the current thread”.

42049 NAME

42050 sigdelset — delete a signal from a signal set

42051 SYNOPSIS

42052 CX `#include <signal.h>`

42053 `int sigdelset(sigset_t *set, int signo);`

42054

42055 DESCRIPTION

42056 The *sigdelset()* function deletes the individual signal specified by *signo* from the signal set
42057 pointed to by *set*.

42058 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type
42059 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
42060 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
42061 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
42062 *sigwaitinfo()*, the results are undefined.

42063 RETURN VALUE

42064 Upon successful completion, *sigdelset()* shall return 0; otherwise, it shall return *-1* and set *errno*
42065 to indicate the error.

42066 ERRORS

42067 The *sigdelset()* function may fail if:

42068	[EINVAL]	The <i>signo</i> argument is not a valid signal number, or is an unsupported signal
42069		number.

42070 EXAMPLES

42081 **<signal.h>**

42082 CHANGE HISTORY

42083 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42084 Issue 5

42085 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
42086 previous issues.

42087 Issue 6

42088 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
42089 extension over the ISO C standard.

42090 **NAME**

42091 sigemptyset — initialize and empty a signal set

42092 **SYNOPSIS**42093 **CX** #include <signal.h>

42094 int sigemptyset(sigset_t *set);

42095

42096 **DESCRIPTION**42097 The *sigemptyset()* function initializes the signal set pointed to by *set*, such that all signals defined
42098 in IEEE Std 1003.1-2001 are excluded.42099 **RETURN VALUE**42100 Upon successful completion, *sigemptyset()* shall return 0; otherwise, it shall return *-1* and set
42101 *errno* to indicate the error.42102 **ERRORS**

42103 No errors are defined.

42104 **EXAMPLES**

42105 None.

42106 **APPLICATION USAGE**

42107 None.

42108 **RATIONALE**42109 The implementation of the *sigemptyset()* (or *sigfillset()*) function could quite trivially clear (or
42110 set) all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the
42111 structure, such as a version field, to permit binary-compatibility between releases where the size
42112 of the set varies. For such reasons, either *sigemptyset()* or *sigfillset()* must be called prior to any
42113 other use of the signal set, even if such use is read-only (for example, as an argument to
42114 *sigpending()*). This function is not intended for dynamic allocation.42115 The *sigfillset()* and *sigemptyset()* functions require that the resulting signal set include (or
42116 exclude) all the signals defined in this volume of IEEE Std 1003.1-2001. Although it is outside the
42117 scope of this volume of IEEE Std 1003.1-2001 to place this requirement on signals that are
42118 implemented as extensions, it is recommended that implementation-defined signals also be
42119 affected by these functions. However, there may be a good reason for a particular signal not to
42120 be affected. For example, blocking or ignoring an implementation-defined signal may have
42121 undesirable side effects, whereas the default action for that signal is harmless. In such a case, it
42122 would be preferable for such a signal to be excluded from the signal set returned by *sigfillset()*.42123 In early proposals there was no distinction between invalid and unsupported signals (the names
42124 of optional signals that were not supported by an implementation were not defined by that
42125 implementation). The [EINVAL] error was thus specified as a required error for invalid signals.
42126 With that distinction, it is not necessary to require implementations of these functions to
42127 determine whether an optional signal is actually supported, as that could have a significant
42128 performance impact for little value. The error could have been required for invalid signals and
42129 optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is
42130 optional in both cases.42131 **FUTURE DIRECTIONS**

42132 None.

42166 **<signal.h>**42167 **CHANGE HISTORY**

42168 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42169 **Issue 6**42170 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
42171 extension over the ISO C standard.

42172 **NAME**

42173 sighold, sigignore, sigpause, sigrelse, sigset — signal management

42174 **SYNOPSIS**

```
42175 xsi      #include <signal.h>

42176      int sighold(int sig);
42177      int sigignore(int sig);
42178      int sigpause(int sig);
42179      int sigrelse(int sig);
42180      void (*sigset(int sig, void (*disp)(int)))(int);
42181
```

42182 **DESCRIPTION**

42183 Use of any of these functions is unspecified in a multi-threaded process.

42184 The *sighold()*, *sigignore()*, *sigpause()*, *sigrelse()*, and *sigset()* functions provide simplified signal
42185 management.

42186 The *sigset()* function shall modify signal dispositions. The *sig* argument specifies the signal,
42187 which may be any signal except SIGKILL and SIGSTOP. The *disp* argument specifies the signal's
42188 disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If *sigset()* is
42189 used, and *disp* is the address of a signal handler, the system shall add *sig* to the calling process'
42190 signal mask before executing the signal handler; when the signal handler returns, the system
42191 shall restore the calling process' signal mask to its state prior to the delivery of the signal. In
42192 addition, if *sigset()* is used, and *disp* is equal to SIG_HOLD, *sig* shall be added to the calling
42193 process' signal mask and *sig*'s disposition shall remain unchanged. If *sigset()* is used, and *disp* is
42194 not equal to SIG_HOLD, *sig* shall be removed from the calling process' signal mask.

42195 The *sighold()* function shall add *sig* to the calling process' signal mask.42196 The *sigrelse()* function shall remove *sig* from the calling process' signal mask.42197 The *sigignore()* function shall set the disposition of *sig* to SIG_IGN.

42198 The *sigpause()* function shall remove *sig* from the calling process' signal mask and suspend the
42199 calling process until a signal is received. The *sigpause()* function shall restore the process' signal
42200 mask to its original state before returning.

42201 If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes
42202 shall not be transformed into zombie processes when they terminate. If the calling process
42203 subsequently waits for its children, and the process has no unwaited-for children that were
42204 transformed into zombie processes, it shall block until all of its children terminate, and *wait()*,
42205 *waitid()*, and *waitpid()* shall fail and set *errno* to [ECHILD].

42206 **RETURN VALUE**

42207 Upon successful completion, *sigset()* shall return SIG_HOLD if the signal had been blocked and
42208 the signal's previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be
42209 returned and *errno* set to indicate the error.

42210 The *sigpause()* function shall suspend execution of the thread until a signal is received,
42211 whereupon it shall return -1 and set *errno* to [EINTR].

42212 For all other functions, upon successful completion, 0 shall be returned. Otherwise, -1 shall be
42213 returned and *errno* set to indicate the error.

42214 **ERRORS**

42215 These functions shall fail if:

42216 [EINVAL] The *sig* argument is an illegal signal number.42217 The *sigset()* and *sigignore()* functions shall fail if:42218 [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a
42219 signal that cannot be ignored.42220 **EXAMPLES**

42221 None.

42222 **APPLICATION USAGE**42223 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling
42224 signals; new applications should use *sigaction()* rather than *sigset()*.42225 The *sighold()* function, in conjunction with *sigrelse()* or *sigpause()*, may be used to establish
42226 critical regions of code that require the delivery of a signal to be temporarily deferred.42227 The *sigsuspend()* function should be used in preference to *sigpause()* for broader portability.42228 **RATIONALE**

42229 None.

42230 **FUTURE DIRECTIONS**

42231 None.

42232 **SEE ALSO**42233 Section 2.4 (on page 28), *exec*, *pause()*, *sigaction()*, *signal()*, *sigsuspend()*, *waitid()*, the Base
42234 Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>42235 **CHANGE HISTORY**

42236 First released in Issue 4, Version 2.

42237 **Issue 5**

42238 Moved from X/OPEN UNIX extension to BASE.

42239 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the process'
42240 signal mask to its original state before returning.42241 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends
42242 execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to
42243 [EINTR].42244 **Issue 6**

42245 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

42246 References to the *wait3()* function are removed.

42247 The XSI functions are split out into their own reference page.

42248 NAME

42249 siginterrupt — allow signals to interrupt functions

42250 SYNOPSIS

42251 xSI #include <signal.h>

42252 int siginterrupt(int *sig*, int *flag*);

42253

42254 DESCRIPTION

42255 The *siginterrupt()* function shall change the restart behavior when a function is interrupted by
 42256 the specified signal. The function *siginterrupt(sig, flag)* has an effect as if implemented as:

```

42257 int siginterrupt(int sig, int flag) {
42258     int ret;
42259     struct sigaction act;

42260     (void) sigaction(sig, NULL, &act);
42261     if (flag)
42262         act.sa_flags &= ~SA_RESTART;
42263     else
42264         act.sa_flags |= SA_RESTART;
42265     ret = sigaction(sig, &act, NULL);
42266     return ret;
42267 }
```

42268 RETURN VALUE

42269 Upon successful completion, *siginterrupt()* shall return 0; otherwise, -1 shall be returned and
 42270 *errno* set to indicate the error.

42271 ERRORS

42272 The *siginterrupt()* function shall fail if:

42273 [EINVAL] The *sig* argument is not a valid signal number.

42274 EXAMPLES

42275 None.

42276 APPLICATION USAGE

42277 The *siginterrupt()* function supports programs written to historical system interfaces. A
 42278 conforming application, when being written or rewritten, should use *sigaction()* with the
 42279 SA_RESTART flag instead of *siginterrupt()*.

42280 RATIONALE

42281 None.

42282 FUTURE DIRECTIONS

42283 None.

42284 SEE ALSO

42285 Section 2.4 (on page 28), *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001,

42287 CHANGE HISTORY

42288 First released in Issue 4, Version 2.

42289 **Issue 5**

42290 Moved from X/OPEN UNIX extension to BASE.

42291 **Issue 6**42292 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in
42293 the sample implementation given in the DESCRIPTION. |

42294 **NAME**

42295 sigismember — test for a signal in a signal set

42296 **SYNOPSIS**42297 CX `#include <signal.h>`42298 `int sigismember(const sigset_t *set, int signo);`

42299

42300 **DESCRIPTION**42301 The *sigismember()* function shall test whether the signal specified by *signo* is a member of the set
42302 pointed to by *set*.42303 Applications should call either *sigemptyset()* or *sigfillset()* at least once for each object of type
42304 **sigset_t** prior to any other use of that object. If such an object is not initialized in this way, but is
42305 nonetheless supplied as an argument to any of *pthread_sigmask()*, *sigaction()*, *sigaddset()*,
42306 *sigdelset()*, *sigismember()*, *sigpending()*, *sigprocmask()*, *sigsuspend()*, *sigtimedwait()*, *sigwait()*, or
42307 *sigwaitinfo()*, the results are undefined.42308 **RETURN VALUE**42309 Upon successful completion, *sigismember()* shall return 1 if the specified signal is a member of
42310 the specified set, or 0 if it is not. Otherwise, it shall return -1 and set *errno* to indicate the error.42311 **ERRORS**42312 The *sigismember()* function may fail if:42313 [EINVAL] The *signo* argument is not a valid signal number, or is an unsupported signal
42314 number.42315 **EXAMPLES**

42316 None.

42317 **APPLICATION USAGE**

42318 None.

42319 **RATIONALE**

42320 None.

42321 **FUTURE DIRECTIONS**

42322 None.

42323 **SEE ALSO**42324 Section 2.4 (on page 28), *sigaction()*, *sigaddset()*, *sigdelset()*, *sigfillset()*, *sigemptyset()*, *sigpending()*,
42325 *sigprocmask()*, *sigsuspend()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<signal.h>**42326 **CHANGE HISTORY**

42327 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42328 **Issue 5**42329 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
42330 previous issues.42331 **Issue 6**42332 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
42333 extension over the ISO C standard.

42334 **NAME**

42335 siglongjmp — non-local goto with signal handling

42336 **SYNOPSIS**42337 CX `#include <setjmp.h>`42338 `void siglongjmp(sigjmp_buf env, int val);`

42339

42340 **DESCRIPTION**42341 The *siglongjmp()* function shall be equivalent to the *longjmp()* function, except as follows:

- 42342 • References to *setjmp()* shall be equivalent to *sigsetjmp()*.
- 42343 • The *siglongjmp()* function shall restore the saved signal mask if and only if the *env* argument
- 42344 was initialized by a call to *sigsetjmp()* with a non-zero *savemask* argument.

42345 **RETURN VALUE**

42346 After *siglongjmp()* is completed, program execution shall continue as if the corresponding
 42347 invocation of *sigsetjmp()* had just returned the value specified by *val*. The *siglongjmp()* function
 42348 shall not cause *sigsetjmp()* to return 0; if *val* is 0, *sigsetjmp()* shall return the value 1.

42349 **ERRORS**

42350 No errors are defined.

42351 **EXAMPLES**

42352 None.

42353 **APPLICATION USAGE**

42354 The distinction between *setjmp()* or *longjmp()* and *sigsetjmp()* or *siglongjmp()* is only significant
 42355 for programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

42356 **RATIONALE**

42357 None.

42358 **FUTURE DIRECTIONS**

42359 None.

42360 **SEE ALSO**

42361 *longjmp()*, *setjmp()*, *sigprocmask()*, *sigsetjmp()*, *sigsuspend()*, the Base Definitions volume of
 42362 IEEE Std 1003.1-2001, **<setjmp.h>**

42363 **CHANGE HISTORY**

42364 First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

42365 **Issue 5**

42366 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42367 **Issue 6**42368 The DESCRIPTION is rewritten in terms of *longjmp()*.

42369 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
 42370 extension over the ISO C standard.

42371 **NAME**

42372 signal — signal management

42373 **SYNOPSIS**

42374 #include <signal.h>

42375 void (*signal(int *sig*, void (**func*)(int)))(int);42376 **DESCRIPTION**

42377 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42378 conflict between the requirements described here and the ISO C standard is unintentional. This
 42379 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42380 CX Use of this function is unspecified in a multi-threaded process.

42381 The *signal()* function chooses one of three ways in which receipt of the signal number *sig* is to be
 42382 subsequently handled. If the value of *func* is SIG_DFL, default handling for that signal shall
 42383 occur. If the value of *func* is SIG_IGN, the signal shall be ignored. Otherwise, the application
 42384 shall ensure that *func* points to a function to be called when that signal occurs. An invocation of
 42385 such a function because of a signal, or (recursively) of any further functions called by that
 42386 invocation (other than functions in the standard library), is called a “signal handler”.

42387 When a signal occurs, and *func* points to a function, it is implementation-defined whether the
 42388 equivalent of a:

42389 signal(*sig*, SIG_DFL);

42390 is executed or the implementation prevents some implementation-defined set of signals (at least
 42391 including *sig*) from occurring until the current signal handling has completed. (If the value of *sig*
 42392 is SIGILL, the implementation may alternatively define that no action is taken.) Next the
 42393 equivalent of:

42394 (**func*)(*sig*);

42395 is executed. If and when the function returns, if the value of *sig* was SIGFPE, SIGILL, or
 42396 SIGSEGV or any other implementation-defined value corresponding to a computational
 42397 exception, the behavior is undefined. Otherwise, the program shall resume execution at the
 42398 CX point it was interrupted. If the signal occurs as the result of calling the *abort()*, *raise()*, *kill()*,
 42399 *pthread_kill()*, or *sigqueue()* function, the signal handler shall not call the *raise()* function.

42400 CX If the signal occurs other than as the result of calling *abort()*, *raise()*, *kill()*, *pthread_kill()*, or
 42401 *sigqueue()*, the behavior is undefined if the signal handler refers to any object with static storage
 42402 duration other than by assigning a value to an object declared as volatile **sig_atomic_t**, or if the
 42403 signal handler calls any function in the standard library other than one of the functions listed in
 42404 Section 2.4 (on page 28). Furthermore, if such a call fails, the value of *errno* is unspecified.

42405 At program start-up, the equivalent of:

42406 signal(*sig*, SIG_IGN);

42407 is executed for some signals, and the equivalent of:

42408 signal(*sig*, SIG_DFL);

42409 CX is executed for all other signals (see *exec*).

42410 **RETURN VALUE**

42411 If the request can be honored, *signal()* shall return the value of *func* for the most recent call to
 42412 *signal()* for the specified signal *sig*. Otherwise, SIG_ERR shall be returned and a positive value
 42413 shall be stored in *errno*.

42414 ERRORS

42415 The *signal()* function shall fail if:

42416 CX	[EINVAL]	The <i>sig</i> argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.
42417		

42418 The *signal()* function may fail if:

42419 CX	[EINVAL]	An attempt was made to set the action to SIG_DFL for a signal that cannot be caught or ignored (or both).
42420		

42421 EXAMPLES

42422 None.

42423 APPLICATION USAGE

42424 The *sigaction()* function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use *sigaction()* rather than *signal()*.

42425

42426 RATIONALE

42427 None.

42428 FUTURE DIRECTIONS

42429 None.

42430 SEE ALSO

42433 CHANGE HISTORY

42434 First released in Issue 1. Derived from Issue 1 of the SVID.

42435 Issue 5

42436 Moved from X/OPEN UNIX extension to BASE.

42437 The DESCRIPTION is updated to indicate that the *sigpause()* function restores the process' signal mask to its original state before returning.

42438

42439 The RETURN VALUE section is updated to indicate that the *sigpause()* function suspends execution of the process until a signal is received, whereupon it returns -1 and sets *errno* to [EINTR].

42440

42441

42442 Issue 6

42443 Extensions beyond the ISO C standard are marked.

42444 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

42445 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

42446 References to the *wait3()* function are removed.

42447 The *sighold()*, *sigignore()*, *sigrelse()*, and *sigset()* functions are split out onto their own reference

42448 page.

42449 **NAME**

42450 signbit — test sign

42451 **SYNOPSIS**

42452 #include <math.h>

42453 int signbit(real-floating x);

42454 **DESCRIPTION**

42455 cx The functionality described on this reference page is aligned with the ISO C standard. Any
42456 conflict between the requirements described here and the ISO C standard is unintentional. This
42457 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42458 The *signbit()* macro shall determine whether the sign of its argument value is negative. NaNs,
42459 zeros, and infinities have a sign bit.

42460 **RETURN VALUE**

42461 The *signbit()* macro shall return a non-zero value if and only if the sign of its argument value is
42462 negative.

42463 **ERRORS**

42464 No errors are defined.

42465 **EXAMPLES**

42466 None.

42467 **APPLICATION USAGE**

42468 None.

42476 **CHANGE HISTORY**

42477 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

42478 **NAME**

42479 sigpause — remove a signal from the signal mask and suspend the thread

42480 **SYNOPSIS**

42481 XSI #include <signal.h>

42482 int sigpause(int *sig*);

42483

42484 **DESCRIPTION**

42485 Refer to *sighold()*.

42486 **NAME**

42487 sigpending — examine pending signals

42488 **SYNOPSIS**42489 CX `#include <signal.h>`42490 `int sigpending(sigset_t *set);`

42491

42492 **DESCRIPTION**

42493 The *sigpending()* function shall store, in the location referenced by the *set* argument, the set of
42494 signals that are blocked from delivery to the calling thread and that are pending on the process
42495 or the calling thread.

42496 **RETURN VALUE**

42497 Upon successful completion, *sigpending()* shall return 0; otherwise, *-1* shall be returned and
42498 *errno* set to indicate the error.

42499 **ERRORS**

42500 No errors are defined.

42501 **EXAMPLES**

42502 None.

42503 **APPLICATION USAGE**

42504 None.

42505 **RATIONALE**

42506 None.

42517 The SYNOPSIS is marked CX since the presence of this function in the **<signal.h>** header is an
42518 extension over the ISO C standard.

42519 NAME

42520 sigprocmask — examine and change blocked signals

42521 SYNOPSIS

42522 CX `#include <signal.h>`

42523 `int sigprocmask(int how, const sigset_t *restrict set,`
42524 `sigset_t *restrict oset);`

42525

42526 DESCRIPTION

42527 Refer to *pthread_sigmask()*.

42528 **NAME**42529 sigqueue — queue a signal to a process (**REALTIME**)42530 **SYNOPSIS**42531 RTS `#include <signal.h>`42532 `int sigqueue(pid_t pid, int signo, const union sigval value);`

42533

42534 **DESCRIPTION**

42535 The *sigqueue()* function shall cause the signal specified by *signo* to be sent with the value
 42536 specified by *value* to the process specified by *pid*. If *signo* is zero (the null signal), error checking
 42537 is performed but no signal is actually sent. The null signal can be used to check the validity of
 42538 *pid*.

42539 The conditions required for a process to have permission to queue a signal to another process
 42540 are the same as for the *kill()* function.

42541 The *sigqueue()* function shall return immediately. If SA_SIGINFO is set for *signo* and if the
 42542 resources were available to queue the signal, the signal shall be queued and sent to the receiving
 42543 process. If SA_SIGINFO is not set for *signo*, then *signo* shall be sent at least once to the receiving
 42544 process; it is unspecified whether *value* shall be sent to the receiving process as a result of this
 42545 call.

42546 If the value of *pid* causes *signo* to be generated for the sending process, and if *signo* is not blocked
 42547 for the calling thread and if no other thread has *signo* unblocked or is waiting in a *sigwait()*
 42548 function for *signo*, either *signo* or at least the pending, unblocked signal shall be delivered to the
 42549 calling thread before the *sigqueue()* function returns. Should any multiple pending signals in the
 42550 range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.
 42551 The selection order between realtime and non-realtime signals, or between multiple pending
 42552 non-realtime signals, is unspecified.

42553 **RETURN VALUE**

42554 Upon successful completion, the specified signal shall have been queued, and the *sigqueue()*
 42555 function shall return a value of zero. Otherwise, the function shall return a value of -1 and set
 42556 *errno* to indicate the error.

42557 **ERRORS**42558 The *sigqueue()* function shall fail if:

42559 [EAGAIN] No resources are available to queue the signal. The process has already
 42560 queued {SIGQUEUE_MAX} signals that are still pending at the receiver(s), or
 42561 a system-wide resource limit has been exceeded.

42562 [EINVAL] The value of the *signo* argument is an invalid or unsupported signal number.

42563 [EPERM] The process does not have the appropriate privilege to send the signal to the
 42564 receiving process.

42565 [ESRCH] The process *pid* does not exist.

42566 **EXAMPLES**

42567 None.

42568 **APPLICATION USAGE**

42569 None.

42570 **RATIONALE**

42571 The *sigqueue()* function allows an application to queue a realtime signal to itself or to another
42572 process, specifying the application-defined value. This is common practice in realtime
42573 applications on existing realtime systems. It was felt that specifying another function in the
42574 *sig...* name space already carved out for signals was preferable to extending the interface to
42575 *kill()*.

42576 Such a function became necessary when the put/get event function of the message queues was
42577 removed. It should be noted that the *sigqueue()* function implies reduced performance in a
42578 security-conscious implementation as the access permissions between the sender and receiver
42579 have to be checked on each send when the *pid* is resolved into a target process. Such access
42580 checks were necessary only at message queue open in the previous interface.

42581 The standard developers required that *sigqueue()* have the same semantics with respect to the
42582 null signal as *kill()*, and that the same permission checking be used. But because of the difficulty
42583 of implementing the “broadcast” semantic of *kill()* (for example, to process groups) and the
42584 interaction with resource allocation, this semantic was not adopted. The *sigqueue()* function
42585 queues a signal to a single process specified by the *pid* argument.

42586 The *sigqueue()* function can fail if the system has insufficient resources to queue the signal. An
42587 explicit limit on the number of queued signals that a process could send was introduced. While
42588 the limit is “per-sender”, this volume of IEEE Std 1003.1-2001 does not specify that the resources
42589 be part of the state of the sender. This would require either that the sender be maintained after
42590 exit until all signals that it had sent to other processes were handled or that all such signals that
42591 had not yet been acted upon be removed from the queue(s) of the receivers. This volume of
42592 IEEE Std 1003.1-2001 does not preclude this behavior, but an implementation that allocated
42593 queuing resources from a system-wide pool (with per-sender limits) and that leaves queued
42594 signals pending after the sender exits is also permitted.

42595 **FUTURE DIRECTIONS**

42596 None.

42597 **SEE ALSO**

42598 Section 2.8.1 (on page 41), the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>

42599 **CHANGE HISTORY**

42600 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
42601 POSIX Threads Extension.

42602 **Issue 6**42603 The *sigqueue()* function is marked as part of the Realtime Signals Extension option.

42604 The [ENOSYS] error condition has been removed as stubs need not be provided if an
42605 implementation does not support the Realtime Signals Extension option.

42606 **NAME**

42607 sigrelse, sigset — signal management

42608 **SYNOPSIS**42609 XSI `#include <signal.h>`42610 `int sigrelse(int sig);`42611 `void (*sigset(int sig, void (*disp)(int)))(int);`

42612

42613 **DESCRIPTION**42614 Refer to *sighold()*.

42615 **NAME**

42616 sigsetjmp — set jump point for a non-local goto

42617 **SYNOPSIS**42618 CX `#include <setjmp.h>`42619 `int sigsetjmp(sigjmp_buf env, int savemask);`

42620

42621 **DESCRIPTION**42622 The *sigsetjmp()* function shall be equivalent to the *setjmp()* function, except as follows:

- 42623 • References to *setjmp()* are equivalent to *sigsetjmp()*.
- 42624 • References to *longjmp()* are equivalent to *siglongjmp()*.
- 42625 • If the value of the *savemask* argument is not 0, *sigsetjmp()* shall also save the current signal
- 42626 mask of the calling thread as part of the calling environment.

42627 **RETURN VALUE**

42628 If the return is from a successful direct invocation, *sigsetjmp()* shall return 0. If the return is from

42629 a call to *siglongjmp()*, *sigsetjmp()* shall return a non-zero value.

42630 **ERRORS**

42631 No errors are defined.

42632 **EXAMPLES**

42633 None.

42634 **APPLICATION USAGE**

42635 The distinction between *setjmp()*/*longjmp()* and *sigsetjmp()*/*siglongjmp()* is only significant for

42636 programs which use *sigaction()*, *sigprocmask()*, or *sigsuspend()*.

42637 Note that since this function is defined in terms of *setjmp()*, if *savemask* is zero, it is unspecified

42638 whether the signal mask is saved.

42639 **RATIONALE**

42640 The ISO C standard specifies various restrictions on the usage of the *setjmp()* macro in order to

42641 permit implementors to recognize the name in the compiler and not implement an actual

42642 function. These same restrictions apply to the *sigsetjmp()* macro.

42643 There are processors that cannot easily support these calls, but this was not considered a

42644 sufficient reason to exclude them.

42645 4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named *_setjmp()* and

42646 *_longjmp()* that, together with *setjmp()* and *longjmp()*, provide the same functionality as

42647 *sigsetjmp()* and *siglongjmp()*. On those systems, *setjmp()* and *longjmp()* save and restore signal

42648 masks, while *_setjmp()* and *_longjmp()* do not. On System V Release 3 and in corresponding

42649 issues of the SVID, *setjmp()* and *longjmp()* are explicitly defined not to save and restore signal

42650 masks. In order to permit existing practice in both cases, the relation of *setjmp()* and *longjmp()* to

42651 signal masks is not specified, and a new set of functions is defined instead.

42652 The *longjmp()* and *siglongjmp()* functions operate as in the previous issue provided the matching

42653 *setjmp()* or *sigsetjmp()* has been performed in the same thread. Non-local jumps into contexts

42654 saved by other threads would be at best a questionable practice and were not considered worthy

42655 of standardization.

42656 **FUTURE DIRECTIONS**

42657 None.

42658 **SEE ALSO**

42659 *siglongjmp()*, *signal()*, *sigprocmask()*, *sigsuspend()*, the Base Definitions volume of
42660 IEEE Std 1003.1-2001, **<setjmp.h>**

42661 **CHANGE HISTORY**

42662 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42663 **Issue 5**

42664 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42665 **Issue 6**42666 The DESCRIPTION is reworded in terms of *setjmp()*.

42667 The SYNOPSIS is marked CX since the presence of this function in the **<setjmp.h>** header is an
42668 extension over the ISO C standard.

42669 **NAME**

42670 sigsuspend — wait for a signal

42671 **SYNOPSIS**42672 CX `#include <signal.h>`42673 `int sigsuspend(const sigset_t *sigmask);`

42674

42675 **DESCRIPTION**

42676 The *sigsuspend()* function shall replace the current signal mask of the calling thread with the set
 42677 of signals pointed to by *sigmask* and then suspend the thread until delivery of a signal whose
 42678 action is either to execute a signal-catching function or to terminate the process. This shall not
 42679 cause any other signals that may have been pending on the process to become pending on the
 42680 thread.

42681 If the action is to terminate the process then *sigsuspend()* shall never return. If the action is to
 42682 execute a signal-catching function, then *sigsuspend()* shall return after the signal-catching
 42683 function returns, with the signal mask restored to the set that existed prior to the *sigsuspend()*
 42684 call.

42685 It is not possible to block signals that cannot be ignored. This is enforced by the system without
 42686 causing an error to be indicated.

42687 **RETURN VALUE**

42688 Since *sigsuspend()* suspends thread execution indefinitely, there is no successful completion
 42689 return value. If a return occurs, `-1` shall be returned and *errno* set to indicate the error.

42690 **ERRORS**42691 The *sigsuspend()* function shall fail if:

42692 [EINTR] A signal is caught by the calling process and control is returned from the
 42693 signal-catching function.

42694 **EXAMPLES**

42695 None.

42696 **APPLICATION USAGE**

42697 Normally, at the beginning of a critical code section, a specified set of signals is blocked using
 42698 the *sigprocmask()* function. When the thread has completed the critical section and needs to wait
 42699 for the previously blocked signal(s), it pauses by calling *sigsuspend()* with the mask that was
 42700 returned by the *sigprocmask()* call.

42701 **RATIONALE**

42702 None.

42703 **FUTURE DIRECTIONS**

42704 None.

42705 **SEE ALSO**

42706 Section 2.4 (on page 28), *pause()*, *sigaction()*, *sigaddset()*, *sigdelset()*, *sigemptyset()*, *sigfillset()*, the
 42707 Base Definitions volume of IEEE Std 1003.1-2001, **<signal.h>**

42708 **CHANGE HISTORY**

42709 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

42710 **Issue 5**

42711 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

42712 **Issue 6**

42713 The text in the RETURN VALUE section has been changed from “suspends process execution”
42714 to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

42715 Text in the APPLICATION USAGE section has been replaced.

42716 The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an
42717 extension over the ISO C standard.

42718 **NAME**42719 sigtimedwait, sigwaitinfo — wait for queued signals (**REALTIME**)42720 **SYNOPSIS**42721 RTS

```
#include <signal.h>
```

```
42722 int sigtimedwait(const sigset_t *restrict set,
42723                 siginfo_t *restrict info,
42724                 const struct timespec *restrict timeout);
42725 int sigwaitinfo(const sigset_t *restrict set,
42726                 siginfo_t *restrict info);
42727
```

42728 **DESCRIPTION**

42729 The *sigtimedwait()* function shall be equivalent to *sigwaitinfo()* except that if none of the signals
 42730 specified by *set* are pending, *sigtimedwait()* shall wait for the time interval specified in the
 42731 **timespec** structure referenced by *timeout*. If the **timespec** structure pointed to by *timeout* is
 42732 zero-valued and if none of the signals specified by *set* are pending, then *sigtimedwait()* shall
 42733 MON return immediately with an error. If *timeout* is the NULL pointer, the behavior is unspecified. If
 42734 the Monotonic Clock option is supported, the CLOCK_MONOTONIC clock shall be used to
 42735 measure the time interval specified by the *timeout* argument.

42736 The *sigwaitinfo()* function selects the pending signal from the set specified by *set*. Should any of
 42737 multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the
 42738 lowest numbered one. The selection order between realtime and non-realtime signals, or
 42739 between multiple pending non-realtime signals, is unspecified. If no signal in *set* is pending at
 42740 the time of the call, the calling thread shall be suspended until one or more signals in *set* become
 42741 pending or until it is interrupted by an unblocked, caught signal.

42742 The *sigwaitinfo()* function shall be equivalent to the *sigwait()* function if the *info* argument is
 42743 NULL. If the *info* argument is non-NULL, the *sigwaitinfo()* function shall be equivalent to
 42744 *sigwait()*, except that the selected signal number shall be stored in the *si_signo* member, and the
 42745 cause of the signal shall be stored in the *si_code* member. If any value is queued to the selected
 42746 signal, the first such queued value shall be dequeued and, if the *info* argument is non-NULL, the
 42747 value shall be stored in the *si_value* member of *info*. The system resource used to queue the
 42748 signal shall be released and returned to the system for other use. If no value is queued, the
 42749 content of the *si_value* member is undefined. If no further signals are queued for the selected
 42750 signal, the pending indication for that signal shall be reset.

42751 **RETURN VALUE**

42752 Upon successful completion (that is, one of the signals specified by *set* is pending or is
 42753 generated) *sigwaitinfo()* and *sigtimedwait()* shall return the selected signal number. Otherwise,
 42754 the function shall return a value of -1 and set *errno* to indicate the error.

42755 **ERRORS**42756 The *sigtimedwait()* function shall fail if:42757 [EAGAIN] No signal specified by *set* was generated within the specified timeout period.42758 The *sigtimedwait()* and *sigwaitinfo()* functions may fail if:

42759 [EINTR] The wait was interrupted by an unblocked, caught signal. It shall be
 42760 documented in system documentation whether this error causes these
 42761 functions to fail.

42762 The *sigtimedwait()* function may also fail if:

42763 [EINVAL] The *timeout* argument specified a *tv_nsec* value less than zero or greater than
42764 or equal to 1 000 million.

42765 An implementation only checks for this error if no signal is pending in *set* and it is necessary to
42766 wait.

42767 EXAMPLES

42768 None.

42769 APPLICATION USAGE

42770 The *sigtimedwait()* function times out and returns an [EAGAIN] error. Application writers
42771 should note that this is inconsistent with other functions such as *pthread_cond_timedwait()* that
42772 return [ETIMEDOUT].

42773 RATIONALE

42774 Existing programming practice on realtime systems uses the ability to pause waiting for a
42775 selected set of events and handle the first event that occurs in-line instead of in a signal-handling
42776 function. This allows applications to be written in an event-directed style similar to a state
42777 machine. This style of programming is useful for largescale transaction processing in which the
42778 overall throughput of an application and the ability to clearly track states are more important
42779 than the ability to minimize the response time of individual event handling.

42780 It is possible to construct a signal-waiting macro function out of the realtime signal function
42781 mechanism defined in this volume of IEEE Std 1003.1-2001. However, such a macro has to
42782 include the definition of a generalized handler for all signals to be waited on. A significant
42783 portion of the overhead of handler processing can be avoided if the signal-waiting function is
42784 provided by the kernel. This volume of IEEE Std 1003.1-2001 therefore provides two signal-
42785 waiting functions—one that waits indefinitely and one with a timeout—as part of the overall
42786 realtime signal function specification.

42787 The specification of a function with a timeout allows an application to be written that can be
42788 broken out of a wait after a set period of time if no event has occurred. It was argued that setting
42789 a timer event before the wait and recognizing the timer event in the wait would also implement
42790 the same functionality, but at a lower performance level. Because of the performance
42791 degradation associated with the user-level specification of a timer event and the subsequent
42792 cancellation of that timer event after the wait completes for a valid event, and the complexity
42793 associated with handling potential race conditions associated with the user-level method, the
42794 separate function has been included.

42795 Note that the semantics of the *sigwaitinfo()* function are nearly identical to that of the *sigwait()*
42796 function defined by this volume of IEEE Std 1003.1-2001. The only difference is that *sigwaitinfo()*
42797 returns the queued signal value in the *value* argument. The return of the queued value is
42798 required so that applications can differentiate between multiple events queued to the same
42799 signal number.

42800 The two distinct functions are being maintained because some implementations may choose to
42801 implement the POSIX Threads Extension functions and not implement the queued signals
42802 extensions. Note, though, that *sigwaitinfo()* does not return the queued value if the *value*
42803 argument is NULL, so the POSIX Threads Extension *sigwait()* function can be implemented as a
42804 macro on *sigwaitinfo()*.

42805 The *sigtimedwait()* function was separated from the *sigwaitinfo()* function to address concerns
42806 regarding the overloading of the *timeout* pointer to indicate indefinite wait (no timeout), timed
42807 wait, and immediate return, and concerns regarding consistency with other functions where the
42808 conditional and timed waits were separate functions from the pure blocking function. The

42809 semantics of *sigtimedwait()* are specified such that *sigwaitinfo()* could be implemented as a
42810 macro with a NULL pointer for *timeout*.

42811 The *sigwait* functions provide a synchronous mechanism for threads to wait for
42812 asynchronously-generated signals. One important question was how many threads that are
42813 suspended in a call to a *sigwait()* function for a signal should return from the call when the
42814 signal is sent. Four choices were considered:

- 42815 1. Return an error for multiple simultaneous calls to *sigwait* functions for the same signal.
- 42816 2. One or more threads return.
- 42817 3. All waiting threads return.
- 42818 4. Exactly one thread returns.

42819 Prohibiting multiple calls to *sigwait()* for the same signal was felt to be overly restrictive. The
42820 “one or more” behavior made implementation of conforming packages easy at the expense of
42821 forcing POSIX threads clients to protect against multiple simultaneous calls to *sigwait()* in
42822 application code in order to achieve predictable behavior. There was concern that the “all
42823 waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU
42824 resources by replicating the signals in the general case. Furthermore, no convincing examples
42825 could be presented that delivery to all was either simpler or more powerful than delivery to one.

42826 Thus, the consensus was that exactly one thread that was suspended in a call to a *sigwait*
42827 function for a signal should return when that signal occurs. This is not an onerous restriction as:

- 42828 • A multi-way signal wait can be built from the single-way wait.
- 42829 • Signals should only be handled by application-level code, as library routines cannot guess
42830 what the application wants to do with signals generated for the entire process.
- 42831 • Applications can thus arrange for a single thread to wait for any given signal and call any
42832 needed routines upon its arrival.

42833 In an application that is using signals for interprocess communication, signal processing is
42834 typically done in one place. Alternatively, if the signal is being caught so that process cleanup
42835 can be done, the signal handler thread can call separate process cleanup routines for each
42836 portion of the application. Since the application main line started each portion of the application,
42837 it is at the right abstraction level to tell each portion of the application to clean up.

42838 Certainly, there exist programming styles where it is logical to consider waiting for a single
42839 signal in multiple threads. A simple *sigwait_multiple()* routine can be constructed to achieve this
42840 goal. A possible implementation would be to have each *sigwait_multiple()* caller registered as
42841 having expressed interest in a set of signals. The caller then waits on a thread-specific condition
42842 variable. A single server thread calls a *sigwait()* function on the union of all registered signals.
42843 When the *sigwait()* function returns, the appropriate state is set and condition variables are
42844 broadcast. New *sigwait_multiple()* callers may cause the pending *sigwait()* call to be canceled
42845 and reissued in order to update the set of signals being waited for.

42846 FUTURE DIRECTIONS

42847 None.

42851 **CHANGE HISTORY**

42852 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
42853 POSIX Threads Extension.

42854 **Issue 6**

42855 These functions are marked as part of the Realtime Signals Extension option.

42856 The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the *sigwaitinfo()* function
42857 has been corrected so that the second argument is of type **siginfo_t***.

42858 The [ENOSYS] error condition has been removed as stubs need not be provided if an
42859 implementation does not support the Realtime Signals Extension option.

42860 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
42861 CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.

42862 The **restrict** keyword is added to the *sigtimedwait()* and *sigwaitinfo()* prototypes for alignment
42863 with the ISO / IEC 9899:1999 standard.

42864 **NAME**

42865 sigwait — wait for queued signals

42866 **SYNOPSIS**42867 CX `#include <signal.h>`42868 `int sigwait(const sigset_t *restrict set, int *restrict sig);`

42869

42870 **DESCRIPTION**

42871 The *sigwait()* function shall select a pending signal from *set*, atomically clear it from the system's
 42872 set of pending signals, and return that signal number in the location referenced by *sig*. If prior to
 42873 the call to *sigwait()* there are multiple pending instances of a single signal number, it is
 42874 implementation-defined whether upon successful return there are any remaining pending
 42875 signals for that signal number. If the implementation supports queued signals and there are
 42876 multiple signals queued for the signal number selected, the first such queued signal shall cause a
 42877 return from *sigwait()* and the remainder shall remain queued. If no signal in *set* is pending at the
 42878 time of the call, the thread shall be suspended until one or more becomes pending. The signals
 42879 defined by *set* shall have been blocked at the time of the call to *sigwait()*; otherwise, the behavior
 42880 is undefined. The effect of *sigwait()* on the signal actions for the signals in *set* is unspecified.

42881 If more than one thread is using *sigwait()* to wait for the same signal, no more than one of these
 42882 threads shall return from *sigwait()* with the signal number. Which thread returns from *sigwait()*
 42883 if more than a single thread is waiting is unspecified.

42884 RTS Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it
 42885 shall be the lowest numbered one. The selection order between realtime and non-realtime
 42886 signals, or between multiple pending non-realtime signals, is unspecified.

42887 **RETURN VALUE**

42888 Upon successful completion, *sigwait()* shall store the signal number of the received signal at the
 42889 location referenced by *sig* and return zero. Otherwise, an error number shall be returned to
 42890 indicate the error.

42891 **ERRORS**42892 The *sigwait()* function may fail if:

42893 [EINVAL] The *set* argument contains an invalid or unsupported signal number.

42894 **EXAMPLES**

42895 None.

42896 **APPLICATION USAGE**

42897 None.

42898 **RATIONALE**

42899 To provide a convenient way for a thread to wait for a signal, this volume of
 42900 IEEE Std 1003.1-2001 provides the *sigwait()* function. For most cases where a thread has to wait
 42901 for a signal, the *sigwait()* function should be quite convenient, efficient, and adequate.

42902 However, requests were made for a lower-level primitive than *sigwait()* and for semaphores that
 42903 could be used by threads. After some consideration, threads were allowed to use semaphores
 42904 and *sem_post()* was defined to be async-signal and async-cancel-safe.

42905 In summary, when it is necessary for code run in response to an asynchronous signal to notify a
 42906 thread, *sigwait()* should be used to handle the signal. Alternatively, if the implementation
 42907 provides semaphores, they also can be used, either following *sigwait()* or from within a signal
 42908 handling routine previously registered with *sigaction()*.

42909 **FUTURE DIRECTIONS**

42910 None.

42914 **<signal.h>**, **<time.h>**

42915 **CHANGE HISTORY**

42916 First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the
42917 POSIX Threads Extension.

42918 **Issue 6**

42919 The **restrict** keyword is added to the *sigwait()* prototype for alignment with the
42920 ISO / IEC 9899:1999 standard.

42921 **NAME**

42922 sigwaitinfo — wait for queued signals (**REALTIME**)

42923 **SYNOPSIS**

42924 RTS `#include <signal.h>`

42925 `int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);`

42926

42927 **DESCRIPTION**

42928 Refer to *sigtimedwait()*.

42929 **NAME**

42930 sin, sinf, sinl — sine function

42931 **SYNOPSIS**

42932 #include <math.h>

42933 double sin(double x);

42934 float sinf(float x);

42935 long double sinl(long double x);

42936 **DESCRIPTION**

42937 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 42938 conflict between the requirements described here and the ISO C standard is unintentional. This
 42939 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

42940 These functions shall compute the sine of their argument *x*, measured in radians.

42941 An application wishing to check for error situations should set *errno* to zero and call
 42942 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 42943 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 42944 zero, an error has occurred.

42945 **RETURN VALUE**42946 Upon successful completion, these functions shall return the sine of *x*.42947 MX If *x* is NaN, a NaN shall be returned.42948 If *x* is ± 0 , *x* shall be returned.42949 If *x* is subnormal, a range error may occur and *x* should be returned.

42950 If *x* is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 42951 defined value shall be returned.

42952 **ERRORS**

42953 These functions shall fail if:

42954 MX **Domain Error** The *x* argument is $\pm \text{Inf}$.

42955 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 42956 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 42957 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 42958 shall be raised.

42959 These functions may fail if:

42960 MX **Range Error** The value of *x* is subnormal

42961 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 42962 then *errno* shall be set to [ERANGE]. If the integer expression
 42963 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 42964 floating-point exception shall be raised.

42965 **EXAMPLES**42966 **Taking the Sine of a 45-Degree Angle**

```
42967 #include <math.h>
42968 ...
42969 double radians = 45.0 * M_PI / 180;
42970 double result;
42971 ...
42972 result = sin(radians);
```

42973 **APPLICATION USAGE**

42974 These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

42975 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
42976 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

42977 **RATIONALE**

42978 None.

42979 **FUTURE DIRECTIONS**

42980 None.

42984 **CHANGE HISTORY**

42985 First released in Issue 1. Derived from Issue 1 of the SVID.

42986 **Issue 5**

42987 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
42988 in previous issues.

42989 **Issue 6**

42990 The *sinf()* and *sinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

42991 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
42992 revised to align with the ISO/IEC 9899:1999 standard.

42993 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
42994 marked.

42995 **NAME**

42996 sinh, sinhf, sinhl — hyperbolic sine functions

42997 **SYNOPSIS**

42998 #include <math.h>

42999 double sinh(double x);

43000 float sinhf(float x);

43001 long double sinhl(long double x);

43002 **DESCRIPTION**

43003 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43004 conflict between the requirements described here and the ISO C standard is unintentional. This
 43005 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43006 These functions shall compute the hyperbolic sine of their argument *x*.

43007 An application wishing to check for error situations should set *errno* to zero and call
 43008 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 43009 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 43010 zero, an error has occurred.

43011 **RETURN VALUE**43012 Upon successful completion, these functions shall return the hyperbolic sine of *x*.

43013 If the result would cause an overflow, a range error shall occur and $\pm\text{HUGE\_VAL}$,
 43014 $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$ (with the same sign as *x*) shall be returned as appropriate for
 43015 the type of the function.

43016 MX If *x* is NaN, a NaN shall be returned.43017 If *x* is ± 0 or $\pm\text{Inf}$, *x* shall be returned.43018 If *x* is subnormal, a range error may occur and *x* should be returned.43019 **ERRORS**

43020 These functions shall fail if:

43021 Range Error The result would cause an overflow.

43022 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 43023 then *errno* shall be set to [ERANGE]. If the integer expression
 43024 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 43025 floating-point exception shall be raised.

43026 These functions may fail if:

43027 MX Range Error The value *x* is subnormal.

43028 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 43029 then *errno* shall be set to [ERANGE]. If the integer expression
 43030 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 43031 floating-point exception shall be raised.

43032 **EXAMPLES**

43033 None.

43034 **APPLICATION USAGE**

43035 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
43036 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

43037 **RATIONALE**

43038 None.

43039 **FUTURE DIRECTIONS**

43040 None.

43045 **CHANGE HISTORY**

43046 First released in Issue 1. Derived from Issue 1 of the SVID.

43047 **Issue 5**

43048 The DESCRIPTION is updated to indicate how an application should check for an error. This
43049 text was previously published in the APPLICATION USAGE section.

43050 **Issue 6**43051 The *sinhf()* and *sinhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

43052 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
43053 revised to align with the ISO/IEC 9899:1999 standard.

43054 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
43055 marked.

43056 **NAME**

43057 sinl — sine function

43058 **SYNOPSIS**

43059 #include <math.h>

43060 long double sinl(long double x);

43061 **DESCRIPTION**43062 Refer to *sin()*.

43063 **NAME**

43064 sleep — suspend execution for an interval of time

43065 **SYNOPSIS**

43066 #include <unistd.h>

43067 unsigned sleep(unsigned *seconds*);43068 **DESCRIPTION**

43069 The *sleep()* function shall cause the calling thread to be suspended from execution until either
 43070 the number of realtime seconds specified by the argument *seconds* has elapsed or a signal is
 43071 delivered to the calling thread and its action is to invoke a signal-catching function or to
 43072 terminate the process. The suspension time may be longer than requested due to the scheduling
 43073 of other activity by the system.

43074 If a SIGALRM signal is generated for the calling process during execution of *sleep()* and if the
 43075 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *sleep()*
 43076 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
 43077 unspecified whether it remains pending after *sleep()* returns or it is discarded.

43078 If a SIGALRM signal is generated for the calling process during execution of *sleep()*, except as a
 43079 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from
 43080 delivery, it is unspecified whether that signal has any effect other than causing *sleep()* to return.

43081 If a signal-catching function interrupts *sleep()* and examines or changes either the time a
 43082 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
 43083 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

43084 If a signal-catching function interrupts *sleep()* and calls *siglongjmp()* or *longjmp()* to restore an
 43085 environment saved prior to the *sleep()* call, the action associated with the SIGALRM signal and
 43086 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
 43087 unspecified whether the SIGALRM signal is blocked, unless the process' signal mask is restored
 43088 as part of the environment.

43089 XSI Interactions between *sleep()* and any of *setitimer()*, *ualarm()*, or *usleep()* are unspecified.

43090 **RETURN VALUE**

43091 If *sleep()* returns because the requested time has elapsed, the value returned shall be 0. If *sleep()*
 43092 returns due to delivery of a signal, the return value shall be the “unslept” amount (the requested
 43093 time minus the time actually slept) in seconds.

43094 **ERRORS**

43095 No errors are defined.

43096 **EXAMPLES**

43097 None.

43098 **APPLICATION USAGE**

43099 None.

43100 **RATIONALE**

43101 There are two general approaches to the implementation of the *sleep()* function. One is to use the
 43102 *alarm()* function to schedule a SIGALRM signal and then suspend the process waiting for that
 43103 signal. The other is to implement an independent facility. This volume of IEEE Std 1003.1-2001
 43104 permits either approach.

43105 In order to comply with the requirement that no primitive shall change a process attribute unless
 43106 explicitly described by this volume of IEEE Std 1003.1-2001, an implementation using SIGALRM
 43107 must carefully take into account any SIGALRM signal scheduled by previous *alarm()* calls, the

action previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the *sleep()* would ordinarily complete, the *sleep()* must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before *sleep()* returns. If a SIGALRM has been scheduled after the *sleep()* would ordinarily complete, it must be rescheduled for the same time before *sleep()* returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using *alarm()* and *pause()*. One such implementation is prone to infinite hangups, as described in *pause()*. Another such implementation uses the C-language *setjmp()* and *longjmp()* functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the *longjmp()* aborts that signal-catching function. An implementation based on *sigprocmask()*, *alarm()*, and *sigsuspend()* can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of IEEE Std 1003.1-2001 where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term *realtime* in *alarm()*.

Since *sleep()* can be implemented using *alarm()*, the discussion about alarms occurring early under *alarm()* applies to *sleep()* as well.

Application writers should note that the type of the argument *seconds* and the return value of *sleep()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX}, which the ISO C standard sets as 65535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit **int** type, consistently use either **unsigned** or **int**.

Scheduling delays may cause the process to return from the *sleep()* function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and *sleep()* returns an **unsigned**.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

43148 NAME

43149 snprintf — print formatted output

43150 SYNOPSIS

43151 #include <stdio.h>

43152 int snprintf(char *restrict *s*, size_t *n*,

43153 const char *restrict *format*, ...);

43154 DESCRIPTION

43155 Refer to *fprintf()*.

43156 NAME

43157 socketmark — determine whether a socket is at the out-of-band mark

43158 SYNOPSIS

```
43159        #include <sys/socket.h>

43160        int socketmark(int s);
```

43161 DESCRIPTION

43162 The *socketmark()* function shall determine whether the socket specified by the descriptor *s* is at
 43163 the out-of-band data mark (see the System Interfaces volume of IEEE Std 1003.1-2001, Section
 43164 2.10.12, Socket Out-of-Band Data State). If the protocol for the socket supports out-of-band data
 43165 by marking the stream with an out-of-band data mark, the *socketmark()* function shall return 1
 43166 when all data preceding the mark has been read and the out-of-band data mark is the first
 43167 element in the receive queue. The *socketmark()* function shall not remove the mark from the
 43168 stream.

43169 RETURN VALUE

43170 Upon successful completion, the *socketmark()* function shall return a value indicating whether
 43171 the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data
 43172 preceding the mark has been read, the return value shall be 1; if there is no mark, or if data
 43173 precedes the mark in the receive queue, the *socketmark()* function shall return 0. Otherwise, it
 43174 shall return a value of -1 and set *errno* to indicate the error.

43175 ERRORS

43176 The *socketmark()* function shall fail if:

43177	[EBADF]	The <i>s</i> argument is not a valid file descriptor.
43178	[ENOTTY]	The <i>s</i> argument does not specify a descriptor for a socket.

43179 EXAMPLES

43180 None.

43181 APPLICATION USAGE

43182 The use of this function between receive operations allows an application to determine which
 43183 received data precedes the out-of-band data and which follows the out-of-band data.

43184 There is an inherent race condition in the use of this function. On an empty receive queue, the
 43185 current read of the location might well be at the “mark”, but the system has no way of knowing
 43186 that the next data segment that will arrive from the network will carry the mark, and
 43187 *socketmark()* will return false, and the next read operation will silently consume the mark.

43188 Hence, this function can only be used reliably when the application already knows that the out-
 43189 of-band data has been seen by the system or that it is known that there is data waiting to be read
 43190 at the socket (via SIGURG or *select()*). See Section 2.10.11 (on page 61), Section 2.10.12 (on page
 43191 61), Section 2.10.14 (on page 62), and *pselect()* for details.

43192 RATIONALE

43193 The *socketmark()* function replaces the historical SIOCATMARK command to *ioctl()* which
 43194 implemented the same functionality on many implementations. Using a wrapper function
 43195 follows the adopted conventions to avoid specifying commands to the *ioctl()* function, other
 43196 than those now included to support XSI STREAMS. The *socketmark()* function could be
 43197 implemented as follows:

```
43198        #include <sys/ioctl.h>

43199        int socketmark(int s)
43200        {
```

```
43201         int val;
43202         if (ioctl(s, SIOCATMARK, &val) == -1)
43203             return(-1);
43204         return(val);
43205     }
```

43206 The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of
43207 SIOCATMARK.

43208 **FUTURE DIRECTIONS**

43209 None.

43210 **SEE ALSO**

43211 *pselect()*, *recv()*, *recvmsg()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>

43212 **CHANGE HISTORY**

43213 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

43214 **NAME**

43215 socket — create an endpoint for communication

43216 **SYNOPSIS**

43217 #include <sys/socket.h>

43218 int socket(int *domain*, int *type*, int *protocol*);43219 **DESCRIPTION**

43220 The *socket()* function shall create an unbound socket in a communications domain, and return a
 43221 file descriptor that can be used in later function calls that operate on sockets.

43222 The *socket()* function takes the following arguments:

43223 *domain* Specifies the communications domain in which a socket is to be created.

43224 *type* Specifies the type of socket to be created.

43225 *protocol* Specifies a particular protocol to be used with the socket. Specifying a *protocol*
 43226 of 0 causes *socket()* to use an unspecified default protocol appropriate for the
 43227 requested socket type.

43228 The *domain* argument specifies the address family used in the communications domain. The
 43229 address families supported by the system are implementation-defined.

43230 Symbolic constants that can be used for the domain argument are defined in the <sys/socket.h>
 43231 header.

43232 The *type* argument specifies the socket type, which determines the semantics of communication
 43233 over the socket. The following socket types are defined; implementations may specify additional
 43234 socket types:

43235 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte
 43236 streams, and may provide a transmission mechanism for out-of-band
 43237 data.

43238 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages
 43239 of fixed maximum length.

43240 SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode
 43241 transmission paths for records. A record can be sent using one or more
 43242 output operations and received using one or more input operations, but a
 43243 single operation never transfers part of more than one record. Record
 43244 boundaries are visible to the receiver via the MSG_EOR flag.

43245 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
 43246 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
 43247 be used. The protocols supported by the system are implementation-defined.

43248 The process may need to have appropriate privileges to use the *socket()* function or to create
 43249 some sockets.

43250 **RETURN VALUE**

43251 Upon successful completion, *socket()* shall return a non-negative integer, the socket file
 43252 descriptor. Otherwise, a value of -1 shall be returned and *errno* set to indicate the error.

43253 **ERRORS**

43254 The *socket()* function shall fail if:

43255 [EAFNOSUPPORT]

43256 The implementation does not support the specified address family.

- 43257 [EMFILE] No more file descriptors are available for this process.
- 43258 [ENFILE] No more file descriptors are available for the system.
- 43259 [EPROTONOSUPPORT]
 43260 The protocol is not supported by the address family, or the protocol is not
 43261 supported by the implementation.
- 43262 [EPROTOYPE] The socket type is not supported by the protocol.
- 43263 The *socket()* function may fail if:
- 43264 [EACCES] The process does not have appropriate privileges.
- 43265 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 43266 [ENOMEM] Insufficient memory was available to fulfill the request.

43267 EXAMPLES

43268 None.

43269 APPLICATION USAGE

43270 The documentation for specific address families specifies which protocols each address family
 43271 supports. The documentation for specific protocols specifies which socket types each protocol
 43272 supports.

43273 The application can determine whether an address family is supported by trying to create a
 43274 socket with *domain* set to the protocol in question.

43275 RATIONALE

43276 None.

43277 FUTURE DIRECTIONS

43283 CHANGE HISTORY

43284 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

43285 **NAME**

43286 socketpair — create a pair of connected sockets

43287 **SYNOPSIS**

43288 #include <sys/socket.h>

```
43289 int socketpair(int domain, int type, int protocol,
43290               int socket_vector[2]);
```

43291 **DESCRIPTION**

43292 The *socketpair()* function shall create an unbound pair of connected sockets in a specified *domain*,
 43293 of a specified *type*, under the protocol optionally specified by the *protocol* argument. The two
 43294 sockets shall be identical. The file descriptors used in referencing the created sockets shall be
 43295 returned in *socket_vector*[0] and *socket_vector*[1].

43296 The *socketpair()* function takes the following arguments:

43297 *domain* Specifies the communications domain in which the sockets are to be created.

43298 *type* Specifies the type of sockets to be created.

43299 *protocol* Specifies a particular protocol to be used with the sockets. Specifying a
 43300 *protocol* of 0 causes *socketpair()* to use an unspecified default protocol
 43301 appropriate for the requested socket type.

43302 *socket_vector* Specifies a 2-integer array to hold the file descriptors of the created socket
 43303 pair.

43304 The *type* argument specifies the socket type, which determines the semantics of communications
 43305 over the socket. The following socket types are defined; implementations may specify additional
 43306 socket types:

43307 SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte
 43308 streams, and may provide a transmission mechanism for out-of-band
 43309 data.

43310 SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages
 43311 of fixed maximum length.

43312 SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode
 43313 transmission paths for records. A record can be sent using one or more
 43314 output operations and received using one or more input operations, but a
 43315 single operation never transfers part of more than one record. Record
 43316 boundaries are visible to the receiver via the MSG_EOR flag.

43317 If the *protocol* argument is non-zero, it shall specify a protocol that is supported by the address
 43318 family. If the *protocol* argument is zero, the default protocol for this address family and type shall
 43319 be used. The protocols supported by the system are implementation-defined.

43320 The process may need to have appropriate privileges to use the *socketpair()* function or to create
 43321 some sockets.

43322 **RETURN VALUE**

43323 Upon successful completion, this function shall return 0; otherwise, -1 shall be returned and
 43324 *errno* set to indicate the error.

43325 **ERRORS**

43326 The *socketpair()* function shall fail if:

43327 [EAFNOSUPPORT]

43328 The implementation does not support the specified address family.

- 43329 [EMFILE] No more file descriptors are available for this process.
- 43330 [ENFILE] No more file descriptors are available for the system.
- 43331 [EOPNOTSUPP] The specified protocol does not permit creation of socket pairs.
- 43332 [EPROTONOSUPPORT]
- 43333 The protocol is not supported by the address family, or the protocol is not
- 43334 supported by the implementation.
- 43335 [EPROTOTYPE] The socket type is not supported by the protocol.
- 43336 The *socketpair()* function may fail if:
- 43337 [EACCES] The process does not have appropriate privileges.
- 43338 [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- 43339 [ENOMEM] Insufficient memory was available to fulfill the request.

43340 EXAMPLES

43341 None.

43342 APPLICATION USAGE

43343 The documentation for specific address families specifies which protocols each address family
 43344 supports. The documentation for specific protocols specifies which socket types each protocol
 43345 supports.

43346 The *socketpair()* function is used primarily with UNIX domain sockets and need not be
 43347 supported for other domains.

43348 RATIONALE

43349 None.

43350 FUTURE DIRECTIONS

43351 None.

43352 SEE ALSO

43353 *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>

43354 CHANGE HISTORY

43355 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

43356 **NAME**

43357 sprintf — print formatted output

43358 **SYNOPSIS**

43359 #include <stdio.h>

43360 int sprintf(char *restrict *s*, const char *restrict *format*, ...);43361 **DESCRIPTION**43362 Refer to *fprintf()*.

43363 **NAME**

43364 sqrt, sqrtf, sqrtl — square root function

43365 **SYNOPSIS**

43366 #include <math.h>

43367 double sqrt(double x);

43368 float sqrtf(float x);

43369 long double sqrtl(long double x);

43370 **DESCRIPTION**

43371 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43372 conflict between the requirements described here and the ISO C standard is unintentional. This
 43373 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43374 These functions shall compute the square root of their argument x , $\sqrt{x}$.

43375 An application wishing to check for error situations should set *errno* to zero and call
 43376 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 43377 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 43378 zero, an error has occurred.

43379 **RETURN VALUE**43380 Upon successful completion, these functions shall return the square root of x .

43381 MX For finite values of $x < -0$, a domain error shall occur, and either a NaN (if supported), or an
 43382 implementation-defined value shall be returned.

43383 MX If x is NaN, a NaN shall be returned.

43384 If x is ± 0 or $+\text{Inf}$, x shall be returned.

43385 If x is $-\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 43386 defined value shall be returned.

43387 **ERRORS**

43388 These functions shall fail if:

43389 MX Domain Error The finite value of x is < -0 , or x is $-\text{Inf}$.

43390 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 43391 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 43392 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 43393 shall be raised.

43394 **EXAMPLES**43395 **Taking the Square Root of 9.0**

43396 #include <math.h>

43397 ...

43398 double x = 9.0;

43399 double result;

43400 ...

43401 result = sqrt(x);

43402 APPLICATION USAGE

43403 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
43404 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

43405 RATIONALE

43406 None.

43407 FUTURE DIRECTIONS

43408 None.

43409 SEE ALSO

43412 CHANGE HISTORY

43413 First released in Issue 1. Derived from Issue 1 of the SVID.

43414 Issue 5

43415 The DESCRIPTION is updated to indicate how an application should check for an error. This
43416 text was previously published in the APPLICATION USAGE section.

43417 Issue 6

43418 The `sqrtf()` and `sqrtrl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

43419 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
43420 revised to align with the ISO/IEC 9899:1999 standard.

43421 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
43422 marked.

43423 **NAME**

43424 srand — pseudo-random number generator

43425 **SYNOPSIS**

43426 #include <stdlib.h>

43427 void srand(unsigned *seed*) ;43428 **DESCRIPTION**43429 Refer to *rand()*.

43430 **NAME**

43431 srand48 — seed the uniformly distributed double-precision pseudo-random number generator

43432 **SYNOPSIS**

43433 XSI #include <stdlib.h>

43434 void srand48(long *seedval*);

43435

43436 **DESCRIPTION**43437 Refer to *drand48()*.

43438 NAME

43439 srandom — seed pseudo-random number generator

43440 SYNOPSIS

43441 xSI #include <stdlib.h>

43442 void srandom(unsigned *seed*);

43443

43444 DESCRIPTION

43445 Refer to *initstate()*.

43446 **NAME**

43447 sscanf — convert formatted input

43448 **SYNOPSIS**

43449 #include <stdio.h>

43450 int sscanf(const char *restrict *s*, const char *restrict *format*, ...);43451 **DESCRIPTION**43452 Refer to *fscanf()*.

43453 **NAME**

43454 stat — get file status

43455 **SYNOPSIS**

43456 #include <sys/stat.h>

43457 int stat(const char *restrict *path*, struct stat *restrict *buf*);43458 **DESCRIPTION**

43459 The *stat()* function shall obtain information about the named file and write it to the area pointed to by the *buf* argument. The *path* argument points to a pathname naming a file. Read, write, or execute permission of the named file is not required. An implementation that provides additional or alternate file access control mechanisms may, under implementation-defined conditions, cause *stat()* to fail. In particular, the system may deny the existence of the file specified by *path*.

43465 If the named file is a symbolic link, the *stat()* function shall continue pathname resolution using the contents of the symbolic link, and shall return information pertaining to the resulting file if the file exists.

43468 The *buf* argument is a pointer to a **stat** structure, as defined in the <sys/stat.h> header, into which information is placed concerning the file.

43470 The *stat()* function shall update any time-related fields (as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.7, File Times Update), before writing into the **stat** structure.

43473 Unless otherwise specified, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*, *st_ctime*, and *st_mtime* shall have meaningful values for all file types defined in this volume of IEEE Std 1003.1-2001. The value of the member *st_nlink* shall be set to the number of links to the file.

43477 **RETURN VALUE**

43478 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

43480 **ERRORS**43481 The *stat()* function shall fail if:

43482 [EACCES] Search permission is denied for a component of the path prefix.

43483 [EIO] An error occurred while reading from the file system.

43484 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

43486 [ENAMETOOLONG]

43487 The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.

43489 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

43490 [ENOTDIR] A component of the path prefix is not a directory.

43491 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by *buf*.

43494 The `stat()` function may fail if:

43495 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
43496 resolution of the *path* argument.

43497 [ENAMETOOLONG]

43498 As a result of encountering a symbolic link in resolution of the *path* argument,
43499 the length of the substituted pathname string exceeded {PATH_MAX}.

43500 [EOVERFLOW] A value to be stored would overflow one of the members of the **stat** structure.

43501 EXAMPLES

43502 Obtaining File Status Information

43503 The following example shows how to obtain file status information for a file named
43504 **/home/cnd/mod1**. The structure variable *buffer* is defined for the **stat** structure.

```
43505 #include <sys/types.h>
43506 #include <sys/stat.h>
43507 #include <fcntl.h>

43508 struct stat buffer;
43509 int      status;
43510 ...
43511 status = stat("/home/cnd/mod1", &buffer);
```

43512 Getting Directory Information

43513 The following example fragment gets status information for each entry in a directory. The call to
43514 the `stat()` function stores file information in the **stat** structure pointed to by *statbuf*. The lines
43515 that follow the `stat()` call format the fields in the **stat** structure for presentation to the user of the
43516 program.

```
43517 #include <sys/types.h>
43518 #include <sys/stat.h>
43519 #include <dirent.h>
43520 #include <pwd.h>
43521 #include <grp.h>
43522 #include <time.h>
43523 #include <locale.h>
43524 #include <langinfo.h>
43525 #include <stdio.h>
43526 #include <stdint.h>

43527 struct dirent *dp;
43528 struct stat   statbuf;
43529 struct passwd *pwd;
43530 struct group  *grp;
43531 struct tm     *tm;
43532 char          datestring[256];
43533 ...
43534 /* Loop through directory entries. */
43535 while ((dp = readdir(dir)) != NULL) {

43536     /* Get entry's information. */
43537     if (stat(dp->d_name, &statbuf) == -1)
```

```

43538         continue;

43539         /* Print out type, permissions, and number of links. */
43540         printf("%10.10s", sperm (statbuf.st_mode));
43541         printf("%4d", statbuf.st_nlink);

43542         /* Print out owner's name if it is found using getpwuid(). */
43543         if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
43544             printf(" %-8.8s", pwd->pw_name);
43545         else
43546             printf(" %-8d", statbuf.st_uid);

43547         /* Print out group name if it is found using getgrgid(). */
43548         if ((grp = getgrgid(statbuf.st_gid)) != NULL)
43549             printf(" %-8.8s", grp->gr_name);
43550         else
43551             printf(" %-8d", statbuf.st_gid);

43552         /* Print size of file. */
43553         printf(" %9jd", (intmax_t)statbuf.st_size);

43554         tm = localtime(&statbuf.st_mtime);

43555         /* Get localized date string. */
43556         strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);

43557         printf(" %s %s\n", datestring, dp->d_name);
43558     }

```

43559 APPLICATION USAGE

43560 None.

43561 RATIONALE

43562 The intent of the paragraph describing “additional or alternate file access control mechanisms”
 43563 is to allow a secure implementation where a process with a label that does not dominate the
 43564 file’s label cannot perform a *stat()* function. This is not related to read permission; a process with
 43565 a label that dominates the file’s label does not need read permission. An implementation that
 43566 supports write-up operations could fail *fstat()* function calls even though it has a valid file
 43567 descriptor open for writing.

43568 FUTURE DIRECTIONS

43569 None.

43570 SEE ALSO

43571 *fstat()*, *lstat()*, *readlink()*, *symlink()*, the Base Definitions volume of IEEE Std 1003.1-2001,

43573 CHANGE HISTORY

43574 First released in Issue 1. Derived from Issue 1 of the SVID.

43575 Issue 5

43576 Large File Summit extensions are added.

43577 Issue 6

43578 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.

43579 The following new requirements on POSIX implementations derive from alignment with the
 43580 Single UNIX Specification:

- 43581 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
43582 required for conforming implementations of previous POSIX specifications, it was not
43583 required for UNIX applications.
 - 43584 • The [EIO] mandatory error condition is added.
 - 43585 • The [ELOOP] mandatory error condition is added.
 - 43586 • The [EOVERFLOW] mandatory error condition is added. This change is to support large
43587 files.
 - 43588 • The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are
43589 added.
- 43590 The following changes were made to align with the IEEE P1003.1a draft standard:
- 43591 • Details are added regarding the treatment of symbolic links.
 - 43592 • The [ELOOP] optional error condition is added.
- 43593 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 43594 The **restrict** keyword is added to the `stat()` prototype for alignment with the ISO/IEC 9899:1999
43595 standard.

43596 **NAME**

43597 statvfs — get file system information

43598 **SYNOPSIS**

43599 xSI #include <sys/statvfs.h>

43600 int statvfs(const char *restrict *path*, struct statvfs *restrict *buf*);

43601

43602 **DESCRIPTION**43603 Refer to *fstatvfs()*.

43604 **NAME**

43605 stderr, stdin, stdout — standard I/O streams

43606 **SYNOPSIS**

43607 #include <stdio.h>

43608 extern FILE *stderr, *stdin, *stdout;

43609 **DESCRIPTION**

43610 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43611 conflict between the requirements described here and the ISO C standard is unintentional. This
 43612 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43613 A file with associated buffering is called a *stream* and is declared to be a pointer to a defined type
 43614 **FILE**. The *fopen()* function shall create certain descriptive data for a stream and return a pointer
 43615 to designate the stream in all further transactions. Normally, there are three open streams with
 43616 constant pointers declared in the <stdio.h> header and associated with the standard open files.

43617 At program start-up, three streams shall be predefined and need not be opened explicitly:
 43618 *standard input* (for reading conventional input), *standard output* (for writing conventional output),
 43619 and *standard error* (for writing diagnostic output). When opened, the standard error stream is not
 43620 fully buffered; the standard input and standard output streams are fully buffered if and only if
 43621 the stream can be determined not to refer to an interactive device.

43622 CX The following symbolic values in <unistd.h> define the file descriptors that shall be associated
 43623 with the C-language *stdin*, *stdout*, and *stderr* when the application is started:

43624 STDIN_FILENO Standard input value, *stdin*. Its value is 0.

43625 STDOUT_FILENO Standard output value, *stdout*. Its value is 1.

43626 STDERR_FILENO Standard error value, *stderr*. Its value is 2.

43627 The *stderr* stream is expected to be open for reading and writing.

43628 **RETURN VALUE**

43629 None.

43630 **ERRORS**

43631 No errors are defined.

43632 **EXAMPLES**

43633 None.

43634 **APPLICATION USAGE**

43635 None.

43636 **RATIONALE**

43637 None.

43638 **FUTURE DIRECTIONS**

43639 None.

 43643 volume of IEEE Std 1003.1-2001, <stdio.h>, <unistd.h>

43644 **CHANGE HISTORY**

43645 First released in Issue 1.

43646 **Issue 6**

43647 Extensions beyond the ISO C standard are marked.

43648 A note that *stderr* is expected to be open for reading and writing is added to the DESCRIPTION.

43649 **NAME**

43650 strcasecmp, strncasecmp — case-insensitive string comparisons

43651 **SYNOPSIS**43652 XSI `#include <strings.h>`43653 `int strcasecmp(const char *s1, const char *s2);`43654 `int strncasecmp(const char *s1, const char *s2, size_t n);`

43655

43656 **DESCRIPTION**

43657 The *strcasecmp()* function shall compare, while ignoring differences in case, the string pointed to
43658 by *s1* to the string pointed to by *s2*. The *strncasecmp()* function shall compare, while ignoring
43659 differences in case, not more than *n* bytes from the string pointed to by *s1* to the string pointed to
43660 by *s2*.

43661 In the POSIX locale, *strcasecmp()* and *strncasecmp()* shall behave as if the strings had been
43662 converted to lowercase and then a byte comparison performed. The results are unspecified in
43663 other locales.

43664 **RETURN VALUE**

43665 Upon completion, *strcasecmp()* shall return an integer greater than, equal to, or less than 0, if the
43666 string pointed to by *s1* is, ignoring case, greater than, equal to, or less than the string pointed to
43667 by *s2*, respectively.

43668 Upon successful completion, *strncasecmp()* shall return an integer greater than, equal to, or less
43669 than 0, if the possibly null-terminated array pointed to by *s1* is, ignoring case, greater than, equal
43670 to, or less than the possibly null-terminated array pointed to by *s2*, respectively.

43671 **ERRORS**

43672 No errors are defined.

43673 **EXAMPLES**

43674 None.

43675 **APPLICATION USAGE**

43676 None.

43677 **RATIONALE**

43678 None.

43679 **FUTURE DIRECTIONS**

43680 None.

43681 **SEE ALSO**43682 The Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>43683 **CHANGE HISTORY**

43684 First released in Issue 4, Version 2.

43685 **Issue 5**

43686 Moved from X/OPEN UNIX extension to BASE.

43687 **NAME**

43688 strcat — concatenate two strings

43689 **SYNOPSIS**

43690 #include <string.h>

43691 char *strcat(char *restrict s1, const char *restrict s2);

43692 **DESCRIPTION**

43693 cx The functionality described on this reference page is aligned with the ISO C standard. Any
43694 conflict between the requirements described here and the ISO C standard is unintentional. This
43695 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43696 The *strcat()* function shall append a copy of the string pointed to by *s2* (including the
43697 terminating null byte) to the end of the string pointed to by *s1*. The initial byte of *s2* overwrites
43698 the null byte at the end of *s1*. If copying takes place between objects that overlap, the behavior is
43699 undefined.

43700 **RETURN VALUE**43701 The *strcat()* function shall return *s1*; no return value is reserved to indicate an error.43702 **ERRORS**

43703 No errors are defined.

43704 **EXAMPLES**

43705 None.

43706 **APPLICATION USAGE**

43707 This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3
43708 applications. Reliable error detection by this function was never guaranteed.

43709 **RATIONALE**

43710 None.

43711 **FUTURE DIRECTIONS**

43712 None.

43713 **SEE ALSO**43714 *strncat()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>43715 **CHANGE HISTORY**

43716 First released in Issue 1. Derived from Issue 1 of the SVID.

43717 **Issue 6**43718 The *strcat()* prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

43719 **NAME**

43720 strchr — string scanning operation

43721 **SYNOPSIS**

43722 #include <string.h>

43723 char *strchr(const char *s, int c);

43724 **DESCRIPTION**

43725 cx The functionality described on this reference page is aligned with the ISO C standard. Any
43726 conflict between the requirements described here and the ISO C standard is unintentional. This
43727 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43728 The *strchr()* function shall locate the first occurrence of *c* (converted to a **char**) in the string
43729 pointed to by *s*. The terminating null byte is considered to be part of the string.

43730 **RETURN VALUE**

43731 Upon completion, *strchr()* shall return a pointer to the byte, or a null pointer if the byte was not
43732 found.

43733 **ERRORS**

43734 No errors are defined.

43735 **EXAMPLES**

43736 None.

43737 **APPLICATION USAGE**

43738 None.

43739 **RATIONALE**

43740 None.

43741 **FUTURE DIRECTIONS**

43742 None.

43743 **SEE ALSO**43744 *strrchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>43745 **CHANGE HISTORY**

43746 First released in Issue 1. Derived from Issue 1 of the SVID.

43747 **Issue 6**

43748 Extensions beyond the ISO C standard are marked.

43749 **NAME**

43750 strcmp — compare two strings

43751 **SYNOPSIS**

43752 #include <string.h>

43753 int strcmp(const char *s1, const char *s2);

43754 **DESCRIPTION**

43755 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 43756 conflict between the requirements described here and the ISO C standard is unintentional. This
 43757 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43758 The *strcmp()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*.

43759 The sign of a non-zero return value shall be determined by the sign of the difference between the
 43760 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
 43761 being compared.

43762 **RETURN VALUE**

43763 Upon completion, *strcmp()* shall return an integer greater than, equal to, or less than 0, if the
 43764 string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*,
 43765 respectively.

43766 **ERRORS**

43767 No errors are defined.

43768 **EXAMPLES**43769 **Checking a Password Entry**

43770 The following example compares the information read from standard input to the value of the
 43771 name of the user entry. If the *strcmp()* function returns 0 (indicating a match), a further check
 43772 will be made to see if the user entered the proper old password. The *crypt()* function shall
 43773 encrypt the old password entered by the user, using the value of the encrypted password in the
 43774 **passwd** structure as the salt. If this value matches the value of the encrypted **passwd** in the
 43775 structure, the entered password *oldpasswd* is the correct user's password. Finally, the program
 43776 encrypts the new password so that it can store the information in the **passwd** structure.

```

43777 #include <string.h>
43778 #include <unistd.h>
43779 #include <stdio.h>
43780 ...
43781 int valid_change;
43782 struct passwd *p;
43783 char user[100];
43784 char oldpasswd[100];
43785 char newpasswd[100];
43786 char savepasswd[100];
43787 ...
43788 if (strcmp(p->pw_name, user) == 0) {
43789     if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
43790         strcpy(savepasswd, crypt(newpasswd, user));
43791         p->pw_passwd = savepasswd;
43792         valid_change = 1;
43793     }
43794     else {

```

```
43795         fprintf(stderr, "Old password is not valid\n");
43796     }
43797 }
43798 ...
```

43799 **APPLICATION USAGE**

43800 None.

43801 **RATIONALE**

43802 None.

43803 **FUTURE DIRECTIONS**

43804 None.

43805 **SEE ALSO**

43806 *strncmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

43807 **CHANGE HISTORY**

43808 First released in Issue 1. Derived from Issue 1 of the SVID.

43809 **Issue 6**

43810 Extensions beyond the ISO C standard are marked.

43811 **NAME**

43812 strcoll — string comparison using collating information

43813 **SYNOPSIS**

43814 #include <string.h>

43815 int strcoll(const char *s1, const char *s2);

43816 **DESCRIPTION**

43817 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43818 conflict between the requirements described here and the ISO C standard is unintentional. This
 43819 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43820 The *strcoll()* function shall compare the string pointed to by *s1* to the string pointed to by *s2*,
 43821 both interpreted as appropriate to the *LC_COLLATE* category of the current locale.

43822 CX The *strcoll()* function shall not change the setting of *errno* if successful.

43823 Since no return value is reserved to indicate an error, an application wishing to check for error
 43824 situations should set *errno* to 0, then call *strcoll()*, then check *errno*.

43825 **RETURN VALUE**

43826 Upon successful completion, *strcoll()* shall return an integer greater than, equal to, or less than 0,
 43827 according to whether the string pointed to by *s1* is greater than, equal to, or less than the string
 43828 CX pointed to by *s2* when both are interpreted as appropriate to the current locale. On error,
 43829 *strcoll()* may set *errno*, but no return value is reserved to indicate an error.

43830 **ERRORS**43831 The *strcoll()* function may fail if:

43832 CX	[EINVAL]	The <i>s1</i> or <i>s2</i> arguments contain characters outside the domain of the collating
43833		sequence.

43834 **EXAMPLES**43835 **Comparing Nodes**

43836 The following example uses an application-defined function, *node_compare()*, to compare two
 43837 nodes based on an alphabetical ordering of the *string* field.

```

43838 #include <string.h>
43839 ...
43840 struct node { /* These are stored in the table. */
43841     char *string;
43842     int length;
43843 };
43844 ...
43845 int node_compare(const void *node1, const void *node2)
43846 {
43847     return strcoll(((const struct node *)node1)->string,
43848                   ((const struct node *)node2)->string);
43849 }
43850 ...
  
```

43851 **APPLICATION USAGE**43852 The *strxfrm()* and *strcmp()* functions should be used for sorting large lists.

43853 **RATIONALE**

43854 None.

43855 **FUTURE DIRECTIONS**

43856 None.

43857 **SEE ALSO**43858 *strcmp()*, *strxfrm()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>43859 **CHANGE HISTORY**

43860 First released in Issue 3.

43861 **Issue 5**43862 The DESCRIPTION is updated to indicate that *errno* does not change if the function is
43863 successful.43864 **Issue 6**

43865 Extensions beyond the ISO C standard are marked.

43866 The following new requirements on POSIX implementations derive from alignment with the
43867 Single UNIX Specification:

- 43868
- The [EINVAL] optional error condition is added.

43869 An example is added.

43870 **NAME**

43871 strcpy — copy a string

43872 **SYNOPSIS**

43873 #include <string.h>

43874 char *strcpy(char *restrict s1, const char *restrict s2);

43875 **DESCRIPTION**

43876 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 43877 conflict between the requirements described here and the ISO C standard is unintentional. This
 43878 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43879 The *strcpy()* function shall copy the string pointed to by *s2* (including the terminating null byte)
 43880 into the array pointed to by *s1*. If copying takes place between objects that overlap, the behavior
 43881 is undefined.

43882 **RETURN VALUE**43883 The *strcpy()* function shall return *s1*; no return value is reserved to indicate an error.43884 **ERRORS**

43885 No errors are defined.

43886 **EXAMPLES**43887 **Initializing a String**43888 The following example copies the string "-----" into the *permstring* variable.

```
43889       #include <string.h>
43890       ...
43891       static char permstring[11];
43892       ...
43893       strcpy(permstring, "-----");
43894       ...
```

43895 **Storing a Key and Data**

43896 The following example allocates space for a key using *malloc()* then uses *strcpy()* to place the
 43897 key there. Then it allocates space for data using *malloc()*, and uses *strcpy()* to place data there.
 43898 (The user-defined function *dbfree()* frees memory previously allocated to an array of type **struct**
 43899 **element** *.)

```
43900       #include <string.h>
43901       #include <stdlib.h>
43902       #include <stdio.h>
43903       ...
43904       /* Structure used to read data and store it. */
43905       struct element {
43906           char *key;
43907           char *data;
43908       };
43909       struct element *tbl, *curtbl;
43910       char *key, *data;
43911       int count;
43912       ...
43913       void dbfree(struct element *, int);
```

```
43914     ...
43915     if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
43916         perror("malloc"); dbfree(tbl, count); return NULL;
43917     }
43918     strcpy(curtbl->key, key);
43919     if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
43920         perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
43921     }
43922     strcpy(curtbl->data, data);
43923     ...
```

43924 **APPLICATION USAGE**

43925 Character movement is performed differently in different implementations. Thus, overlapping
43926 moves may yield surprises.

43927 This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3
43928 applications. Reliable error detection by this function was never guaranteed.

43929 **RATIONALE**

43930 None.

43931 **FUTURE DIRECTIONS**

43932 None.

43933 **SEE ALSO**

43934 *strncpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

43935 **CHANGE HISTORY**

43936 First released in Issue 1. Derived from Issue 1 of the SVID.

43937 **Issue 6**

43938 The *strcpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

43939 **NAME**

43940 strcspn — get the length of a complementary substring

43941 **SYNOPSIS**

43942 #include <string.h>

43943 size_t strcspn(const char *s1, const char *s2);

43944 **DESCRIPTION**

43945 cx The functionality described on this reference page is aligned with the ISO C standard. Any
43946 conflict between the requirements described here and the ISO C standard is unintentional. This
43947 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

43948 The *strcspn()* function shall compute the length (in bytes) of the maximum initial segment of the
43949 string pointed to by *s1* which consists entirely of bytes *not* from the string pointed to by *s2*.

43950 **RETURN VALUE**

43951 The *strcspn()* function shall return the length of the computed segment of the string pointed to
43952 by *s1*; no return value is reserved to indicate an error.

43953 **ERRORS**

43954 No errors are defined.

43955 **EXAMPLES**

43956 None.

43957 **APPLICATION USAGE**

43958 None.

43959 **RATIONALE**

43960 None.

43961 **FUTURE DIRECTIONS**

43962 None.

43963 **SEE ALSO**43964 *strspn()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>43965 **CHANGE HISTORY**

43966 First released in Issue 1. Derived from Issue 1 of the SVID.

43967 **Issue 5**

43968 The RETURN VALUE section is updated to indicate that *strcspn()* returns the length of *s1*, and
43969 not *s1* itself as was previously stated.

43970 **Issue 6**

43971 The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is
43972 updated to indicate that the computed segment length is returned, not the *s1* length.

43973 **NAME**

43974 strdup — duplicate a string

43975 **SYNOPSIS**

43976 XSI #include <string.h>

43977 char *strdup(const char *s1);

43978

43979 **DESCRIPTION**

43980 The *strdup()* function shall return a pointer to a new string, which is a duplicate of the string
43981 pointed to by *s1*. The returned pointer can be passed to *free()*. A null pointer is returned if the
43982 new string cannot be created.

43983 **RETURN VALUE**

43984 The *strdup()* function shall return a pointer to a new string on success. Otherwise, it shall return
43985 a null pointer and set *errno* to indicate the error.

43986 **ERRORS**43987 The *strdup()* function may fail if:

43988 [ENOMEM] Storage space available is insufficient.

43989 **EXAMPLES**

43990 None.

44000 First released in Issue 4, Version 2.

44001 **Issue 5**

44002 Moved from X/OPEN UNIX extension to BASE.

44003 **NAME**

44004 strerror, strerror_r — get error message string

44005 **SYNOPSIS**

44006 #include <string.h>

44007 char *strerror(int *errnum*);44008 TSF int strerror_r(int *errnum*, char **strerrbuf*, size_t *buflen*);

44009

44010 **DESCRIPTION**

44011 CX For *strerror()*: The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44014 The *strerror()* function shall map the error number in *errnum* to a locale-dependent error message string and shall return a pointer to it. Typically, the values for *errnum* come from *errno*, but *strerror()* shall map any value of type **int** to a message.

44017 The string pointed to shall not be modified by the application, but may be overwritten by a subsequent call to *strerror()* or *perror()*.

44019 CX The contents of the error message strings returned by *strerror()* should be determined by the setting of the *LC_MESSAGES* category in the current locale.

44021 The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls *strerror()*.

44023 CX The *strerror()* function shall not change the setting of *errno* if successful.

44024 Since no return value is reserved to indicate an error, an application wishing to check for error situations should set *errno* to 0, then call *strerror()*, then check *errno*.

44026 The *strerror()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

44028 TSF The *strerror_r()* function shall map the error number in *errnum* to a locale-dependent error message string and shall return the string in the buffer pointed to by *strerrbuf*, with length *buflen*.

44030

44031 **RETURN VALUE**

44032 Upon successful completion, *strerror()* shall return a pointer to the generated message string. On error *errno* may be set, but no return value is reserved to indicate an error.

44034 TSF Upon successful completion, *strerror_r()* shall return 0. Otherwise, an error number shall be returned to indicate the error.

44036 **ERRORS**

44037 These functions may fail if:

44038 [EINVAL] The value of *errnum* is not a valid error number.

44039 The *strerror_r()* function may fail if:

44040 TSF [ERANGE] Insufficient storage was supplied via *strerrbuf* and *buflen* to contain the generated message string.

44041

44042 **EXAMPLES**

44043 None.

44044 **APPLICATION USAGE**

44045 None.

44046 **RATIONALE**

44047 None.

44048 **FUTURE DIRECTIONS**

44049 None.

44050 **SEE ALSO**44051 *perror()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44052 **CHANGE HISTORY**

44053 First released in Issue 3.

44054 **Issue 5**44055 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

44056 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

44057 **Issue 6**

44058 Extensions beyond the ISO C standard are marked.

44059 The following new requirements on POSIX implementations derive from alignment with the
44060 Single UNIX Specification:

- 44061 • In the RETURN VALUE section, the fact that *errno* may be set is added.
- 44062 • The [EINVAL] optional error condition is added.

44063 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

44064 The *strerror_r()* function is added in response to IEEE PASC Interpretation 1003.1c #39.44065 The *strerror_r()* function is marked as part of the Thread-Safe Functions option.

44066 **NAME**

44067 strfmon — convert monetary value to a string

44068 **SYNOPSIS**44069 xSI `#include <monetary.h>`

```
44070 ssize_t strfmon(char *restrict s, size_t maxsize,
44071               const char *restrict format, ...);
44072
```

44073 **DESCRIPTION**

44074 The *strfmon()* function shall place characters into the array pointed to by *s* as controlled by the
 44075 string pointed to by *format*. No more than *maxsize* bytes are placed into the array.

44076 The format is a character string, beginning and ending in its initial state, if any, that contains two
 44077 types of objects: *plain characters*, which are simply copied to the output stream, and *conversion*
 44078 *specifications*, each of which shall result in the fetching of zero or more arguments which are
 44079 converted and formatted. The results are undefined if there are insufficient arguments for the
 44080 format. If the format is exhausted while arguments remain, the excess arguments are simply
 44081 ignored.

44082 The application shall ensure that a conversion specification consists of the following sequence:

- 44083 • A '%' character
- 44084 • Optional flags
- 44085 • Optional field width
- 44086 • Optional left precision
- 44087 • Optional right precision
- 44088 • A required conversion specifier character that determines the conversion to be performed

44089 **Flags**

44090 One or more of the following optional flags can be specified to control the conversion:

- 44091 *=f* An '=' followed by a single character *f* which is used as the numeric fill character. In
 44092 order to work with precision or width counts, the fill character shall be a single byte
 44093 character; if not, the behavior is undefined. The default numeric fill character is the
 44094 <space>. This flag does not affect field width filling which always uses the <space>.
 44095 This flag is ignored unless a left precision (see below) is specified.
- 44096 ^ Do not format the currency amount with grouping characters. The default is to insert
 44097 the grouping characters if defined for the current locale.
- 44098 + or (Specify the style of representing positive and negative currency amounts. Only one of
 44099 '+' or '(' may be specified. If '+' is specified, the locale's equivalent of '+' and '-'
 44100 are used (for example, in the U.S., the empty string if positive and '-' if negative). If
 44101 '(' is specified, negative amounts are enclosed within parentheses. If neither flag is
 44102 specified, the '+' style is used.
- 44103 ! Suppress the currency symbol from the output conversion.
- 44104 - Specify the alignment. If this flag is present the result of the conversion is left-justified
 44105 (padded to the right) rather than right-justified. This flag shall be ignored unless a field
 44106 width (see below) is specified.

44107 **Field Width**

44108 **w** A decimal digit string *w* specifying a minimum field width in bytes in which the result
 44109 of the conversion is right-justified (or left-justified if the flag ‘-’ is specified). The
 44110 default is 0.

44111 **Left Precision**

44112 **#n** A ‘#’ followed by a decimal digit string *n* specifying a maximum number of digits
 44113 expected to be formatted to the left of the radix character. This option can be used to
 44114 keep the formatted output from multiple calls to the *strfmon()* function aligned in the
 44115 same columns. It can also be used to fill unused positions with a special character as in
 44116 "\$***123.45". This option causes an amount to be formatted as if it has the number
 44117 of digits specified by *n*. If more than *n* digit positions are required, this conversion
 44118 specification is ignored. Digit positions in excess of those actually required are filled
 44119 with the numeric fill character (see the *=f* flag above).

44120 If grouping has not been suppressed with the ‘^’ flag, and it is defined for the current
 44121 locale, grouping separators are inserted before the fill characters (if any) are added.
 44122 Grouping separators are not applied to fill characters even if the fill character is a digit.

44123 To ensure alignment, any characters appearing before or after the number in the
 44124 formatted output such as currency or sign symbols are padded as necessary with
 44125 <space>s to make their positive and negative formats an equal length.

44126 **Right Precision**

44127 **.p** A period followed by a decimal digit string *p* specifying the number of digits after the
 44128 radix character. If the value of the right precision *p* is 0, no radix character appears. If a
 44129 right precision is not included, a default specified by the current locale is used. The
 44130 amount being formatted is rounded to the specified number of digits prior to
 44131 formatting.

44132 **Conversion Specifier Characters**

44133 The conversion specifier characters and their meanings are:

44134 **i** The **double** argument is formatted according to the locale’s international currency
 44135 format (for example, in the U.S.: USD 1,234.56). If the argument is $\pm\text{Inf}$ or NaN, the
 44136 result of the conversion is unspecified.

44137 **n** The **double** argument is formatted according to the locale’s national currency format
 44138 (for example, in the U.S.: \$1,234.56). If the argument is $\pm\text{Inf}$ or NaN, the result of the
 44139 conversion is unspecified.

44140 **%** Convert to a ‘%’; no argument is converted. The entire conversion specification shall
 44141 be %%.

44142 **Locale Information**

44143 The *LC_MONETARY* category of the program’s locale affects the behavior of this function
 44144 including the monetary radix character (which may be different from the numeric radix
 44145 character affected by the *LC_NUMERIC* category), the grouping separator, the currency
 44146 symbols, and formats. The international currency symbol should be conformant with the
 44147 ISO 4217:2001 standard.

44148 If the value of *maxsize* is greater than {SSIZE_MAX}, the result is implementation-defined.

44149 **RETURN VALUE**

44150 If the total number of resulting bytes including the terminating null byte is not more than
 44151 *maxsize*, *strfmon()* shall return the number of bytes placed into the array pointed to by *s*, not
 44152 including the terminating null byte. Otherwise, -1 shall be returned, the contents of the array are
 44153 unspecified, and *errno* shall be set to indicate the error.

44154 **ERRORS**

44155 The *strfmon()* function shall fail if:

44156 [E2BIG] Conversion stopped due to lack of space in the buffer.

44157 **EXAMPLES**

44158 Given a locale for the U.S. and the values 123.45, -123.45, and 3456.781, the following output
 44159 might be produced. Square brackets (" [] ") are used in this example to delimit the output.

44160	%n	[\$123.45]	Default formatting
44161		[-\$123.45]	
44162		[\$3,456.78]	
44163	%11n	[\$123.45]	Right align within an 11-character field
44164		[-\$123.45]	
44165		[\$3,456.78]	
44166	%#5n	[\$ 123.45]	Aligned columns for values up to 99999
44167		[-\$ 123.45]	
44168		[\$ 3,456.78]	
44169	%=*#5n	[\$***123.45]	Specify a fill character
44170		[-\$***123.45]	
44171		[\$*3,456.78]	
44172	%=0#5n	[\$000123.45]	Fill characters do not use grouping
44173		[-\$000123.45]	even if the fill character is a digit
44174		[\$03,456.78]	
44175	%^#5n	[\$ 123.45]	Disable the grouping separator
44176		[-\$ 123.45]	
44177		[\$ 3456.78]	
44178	%^#5.0n	[\$ 123]	Round off to whole units
44179		[-\$ 123]	
44180		[\$ 3457]	
44181	%^#5.4n	[\$ 123.4500]	Increase the precision
44182		[-\$ 123.4500]	
44183		[\$ 3456.7810]	
44184	%(#5n	[\$ 123.45]	Use an alternative pos/neg style
44185		[(\$ 123.45)]	
44186		[\$ 3,456.78]	
44187	%!(#5n	[123.45]	Disable the currency symbol
44188		[(123.45)]	
44189		[3,456.78]	
44190	%-14#5.4n	[\$ 123.4500]	Left-justify the output
44191		[-\$ 123.4500]	
44192		[\$ 3,456.7810]	

```

44193      %14#5.4n    [  $    123.4500]    Corresponding right-justified output
44194                        [  -$    123.4500]
44195                        [  $ 3,456.7810]

```

44196 See also the EXAMPLES section in *fprintf()*.

44197 **APPLICATION USAGE**

44198 None.

44199 **RATIONALE**

44200 None.

44201 **FUTURE DIRECTIONS**

44202 Lowercase conversion characters are reserved for future standards use and uppercase for
 44203 implementation-defined use.

44204 **SEE ALSO**

44205 *fprintf()*, *localeconv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**monetary.h**>

44206 **CHANGE HISTORY**

44207 First released in Issue 4.

44208 **Issue 5**

44209 Moved from ENHANCED I18N to BASE.

44210 The [ENOSYS] error is removed.

44211 A sentence is added to the DESCRIPTION warning about values of *maxsize* that are greater than
 44212 {SSIZE_MAX}.

44213 **Issue 6**

44214 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

44215 The **restrict** keyword is added to the *strfmon()* prototype for alignment with the
 44216 ISO/IEC 9899:1999 standard.

44217 The EXAMPLES section is reworked, clarifying the output format.

44218 **NAME**

44219 strftime — convert date and time to a string

44220 **SYNOPSIS**

44221 #include <time.h>

```
44222           size_t strftime(char *restrict s, size_t maxsize,
44223                           const char *restrict format, const struct tm *restrict timeptr);
```

44224 **DESCRIPTION**

44225 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 44226 conflict between the requirements described here and the ISO C standard is unintentional. This
 44227 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44228 The *strftime()* function shall place bytes into the array pointed to by *s* as controlled by the string
 44229 pointed to by *format*. The format is a character string, beginning and ending in its initial shift
 44230 state, if any. The *format* string consists of zero or more conversion specifications and ordinary
 44231 characters. A conversion specification consists of a '%' character, possibly followed by an E or O
 44232 modifier, and a terminating conversion specifier character that determines the conversion
 44233 specification's behavior. All ordinary characters (including the terminating null byte) are copied
 44234 unchanged into the array. If copying takes place between objects that overlap, the behavior is
 44235 undefined. No more than *maxsize* bytes are placed into the array. Each conversion specifier is
 44236 replaced by appropriate characters as described in the following list. The appropriate characters
 44237 are determined using the *LC_TIME* category of the current locale and by the values of zero or
 44238 more members of the broken-down time structure pointed to by *timeptr*, as specified in brackets
 44239 in the description. If any of the specified values are outside the normal range, the characters
 44240 stored are unspecified.

44241 CX Local timezone information is used as though *strftime()* called *tzset()*.

44242 The following conversion specifications are supported:

44243	%a	Replaced by the locale's abbreviated weekday name. [<i>tm_wday</i>]
44244	%A	Replaced by the locale's full weekday name. [<i>tm_wday</i>]
44245	%b	Replaced by the locale's abbreviated month name. [<i>tm_mon</i>]
44246	%B	Replaced by the locale's full month name. [<i>tm_mon</i>]
44247	%c	Replaced by the locale's appropriate date and time representation. (See the Base Definitions volume of IEEE Std 1003.1-2001, < time.h >.)
44248		
44249	%C	Replaced by the year divided by 100 and truncated to an integer, as a decimal number [00,99]. [<i>tm_year</i>]
44250		
44251	%d	Replaced by the day of the month as a decimal number [01,31]. [<i>tm_mday</i>]
44252	%D	Equivalent to %m/%d/%Y. [<i>tm_mon</i> , <i>tm_mday</i> , <i>tm_year</i>]
44253	%e	Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded by a space. [<i>tm_mday</i>]
44254		
44255	%F	Equivalent to %Y-%m-%d (the ISO 8601:2000 standard date format). [<i>tm_year</i> , <i>tm_mon</i> , <i>tm_mday</i>]
44256		
44257	%g	Replaced by the last 2 digits of the week-based year (see below) as a decimal number [00,99]. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
44258		
44259	%G	Replaced by the week-based year (see below) as a decimal number (for example, 1977). [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
44260		

44261	%h	Equivalent to %b. [<i>tm_mon</i>]
44262	%H	Replaced by the hour (24-hour clock) as a decimal number [00,23]. [<i>tm_hour</i>]
44263	%I	Replaced by the hour (12-hour clock) as a decimal number [01,12]. [<i>tm_hour</i>]
44264	%j	Replaced by the day of the year as a decimal number [001,366]. [<i>tm_yday</i>]
44265	%m	Replaced by the month as a decimal number [01,12]. [<i>tm_mon</i>]
44266	%M	Replaced by the minute as a decimal number [00,59]. [<i>tm_min</i>]
44267	%n	Replaced by a <newline>.
44268	%p	Replaced by the locale's equivalent of either a.m. or p.m. [<i>tm_hour</i>]
44269 CX	%r	Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be
44270		equivalent to %I:%M:%S %p. [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
44271	%R	Replaced by the time in 24-hour notation (%H:%M). [<i>tm_hour</i> , <i>tm_min</i>]
44272	%S	Replaced by the second as a decimal number [00,60]. [<i>tm_sec</i>]
44273	%t	Replaced by a <tab>.
44274	%T	Replaced by the time (%H:%M:%S). [<i>tm_hour</i> , <i>tm_min</i> , <i>tm_sec</i>]
44275	%u	Replaced by the weekday as a decimal number [1,7], with 1 representing Monday.
44276		[<i>tm_wday</i>]
44277	%U	Replaced by the week number of the year as a decimal number [00,53]. The first
44278		Sunday of January is the first day of week 1; days in the new year before this are in
44279		week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
44280	%V	Replaced by the week number of the year (Monday as the first day of the week) as a
44281		decimal number [01,53]. If the week containing 1 January has four or more days in the
44282		new year, then it is considered week 1. Otherwise, it is the last week of the previous
44283		year, and the next week is week 1. Both January 4th and the first Thursday of January
44284		are always in week 1. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
44285	%w	Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday.
44286		[<i>tm_wday</i>]
44287	%W	Replaced by the week number of the year as a decimal number [00,53]. The first
44288		Monday of January is the first day of week 1; days in the new year before this are in
44289		week 0. [<i>tm_year</i> , <i>tm_wday</i> , <i>tm_yday</i>]
44290	%x	Replaced by the locale's appropriate date representation. (See the Base Definitions
44291		volume of IEEE Std 1003.1-2001, <time.h>.)
44292	%X	Replaced by the locale's appropriate time representation. (See the Base Definitions
44293		volume of IEEE Std 1003.1-2001, <time.h>.)
44294	%y	Replaced by the last two digits of the year as a decimal number [00,99]. [<i>tm_year</i>]
44295	%Y	Replaced by the year as a decimal number (for example, 1997). [<i>tm_year</i>]
44296	%z	Replaced by the offset from UTC in the ISO 8601:2000 standard format (+hhmm or
44297		-hhmm), or by no characters if no timezone is determinable. For example, "-0430"
44298 CX		means 4 hours 30 minutes behind UTC (west of Greenwich). If <i>tm_isdst</i> is zero, the
44299		standard time offset is used. If <i>tm_isdst</i> is greater than zero, the daylight savings time
44300		offset is used. If <i>tm_isdst</i> is negative, no characters are returned. [<i>tm_isdst</i>]

44301 %Z Replaced by the timezone name or abbreviation, or by no bytes if no timezone
44302 information exists. [*tm_isdst*]

44303 %% Replaced by %.

44304 If a conversion specification does not correspond to any of the above, the behavior is undefined.

44305 CX If a **struct tm** broken-down time structure is created by *localtime()* or *localtime_r()*, or modified
44306 by *mktime()*, and the value of *TZ* is subsequently modified, the results of the %Z and %z *strftime()*
44307 conversion specifiers are undefined, when *strftime()* is called with such a broken-down time
44308 structure.

44309 If a **struct tm** broken-down time structure is created or modified by *gmtime()* or *gmtime_r()*, it is
44310 unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the
44311 current local timezone, when *strftime()* is called with such a broken-down time structure.

44312 **Modified Conversion Specifiers**

44313 Some conversion specifiers can be modified by the E or O modifier characters to indicate that an
44314 alternative format or specification should be used rather than the one normally used by the
44315 unmodified conversion specifier. If the alternative format or specification does not exist for the
44316 current locale (see ERA in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5,
44317 LC_TIME), the behavior shall be as if the unmodified conversion specification were used.

44318 %Ec Replaced by the locale's alternative appropriate date and time representation.

44319 %EC Replaced by the name of the base year (period) in the locale's alternative
44320 representation.

44321 %Ex Replaced by the locale's alternative date representation.

44322 %EX Replaced by the locale's alternative time representation.

44323 %Ey Replaced by the offset from %EC (year only) in the locale's alternative representation.

44324 %EY Replaced by the full alternative year representation.

44325 %Od Replaced by the day of the month, using the locale's alternative numeric symbols, filled
44326 as needed with leading zeros if there is any alternative symbol for zero; otherwise, with
44327 leading spaces.

44328 %Oe Replaced by the day of the month, using the locale's alternative numeric symbols, filled
44329 as needed with leading spaces.

44330 %OH Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.

44331 %OI Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.

44332 %Om Replaced by the month using the locale's alternative numeric symbols.

44333 %OM Replaced by the minutes using the locale's alternative numeric symbols.

44334 %OS Replaced by the seconds using the locale's alternative numeric symbols.

44335 %Ou Replaced by the weekday as a number in the locale's alternative representation
44336 (Monday=1).

44337 %OU Replaced by the week number of the year (Sunday as the first day of the week, rules
44338 corresponding to %U) using the locale's alternative numeric symbols.

44339 %OV Replaced by the week number of the year (Monday as the first day of the week, rules
44340 corresponding to %V) using the locale's alternative numeric symbols.

44341 %Ow Replaced by the number of the weekday (Sunday=0) using the locale's alternative
 44342 numeric symbols.

44343 %OW Replaced by the week number of the year (Monday as the first day of the week) using
 44344 the locale's alternative numeric symbols.

44345 %Oy Replaced by the year (offset from %C) using the locale's alternative numeric symbols.

44346 %g, %G, and %V give values according to the ISO 8601:2000 standard week-based year. In this
 44347 system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th,
 44348 which is also the week that includes the first Thursday of the year, and is also the first week that
 44349 contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the
 44350 preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January
 44351 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a
 44352 Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday
 44353 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

44354 If a conversion specifier is not one of the above, the behavior is undefined.

44355 RETURN VALUE

44356 If the total number of resulting bytes including the terminating null byte is not more than
 44357 *maxsize*, *strftime()* shall return the number of bytes placed into the array pointed to by *s*, not
 44358 including the terminating null byte. Otherwise, 0 shall be returned and the contents of the array
 44359 are unspecified.

44360 ERRORS

44361 No errors are defined.

44362 EXAMPLES

44363 **Getting a Localized Date String**

44364 The following example first sets the locale to the user's default. The locale information will be
 44365 used in the *nl_langinfo()* and *strftime()* functions. The *nl_langinfo()* function returns the localized
 44366 date string which specifies how the date is laid out. The *strftime()* function takes this information
 44367 and, using the **tm** structure for values, places the date and time information into *datestring*.

```
44368        #include <time.h>
44369        #include <locale.h>
44370        #include <langinfo.h>
44371        ...
44372        struct tm *tm;
44373        char datestring[256];
44374        ...
44375        setlocale (LC_ALL, "");
44376        ...
44377        strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
44378        ...
```

44379 APPLICATION USAGE

44380 The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.

44381 Some of the conversion specifications are duplicates of others. They are included for
 44382 compatibility with *nl_cxtime()* and *nl_ascxtime()*, which were published in Issue 2.

44383 Applications should use %Y (4-digit years) in preference to %y (2-digit years).

44384 In the C locale, the E and O modifiers are ignored and the replacement strings for the following
 44385 specifiers are:

44386	%a	The first three characters of %A.
44387	%A	One of Sunday, Monday, ..., Saturday.
44388	%b	The first three characters of %B.
44389	%B	One of January, February, ..., December.
44390	%c	Equivalent to %a %b %e %T %Y.
44391	%p	One of AM or PM.
44392	%r	Equivalent to %I:%M:%S %p.
44393	%x	Equivalent to %m/%d/%Y.
44394	%X	Equivalent to %T.
44395	%Z	Implementation-defined.
44396	RATIONALE	
44397	None.	
44398	FUTURE DIRECTIONS	
44399	None.	
44400	SEE ALSO	
44401	<i>asctime()</i> , <i>clock()</i> , <i>ctime()</i> , <i>difftime()</i> , <i>getdate()</i> , <i>gmtime()</i> , <i>localtime()</i> , <i>mktime()</i> , <i>strptime()</i> , <i>time()</i> ,	
44402	<i>tzset()</i> , <i>utime()</i> , Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5, LC_TIME,	
44403	< time.h >	
44404	CHANGE HISTORY	
44405	First released in Issue 3.	
44406	Issue 5	
44407	The description of %OV is changed to be consistent with %V and defines Monday as the first day	
44408	of the week.	
44409	The description of %Oy is clarified.	
44410	Issue 6	
44411	Extensions beyond the ISO C standard are marked.	
44412	The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from	
44413	“Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is	
44414	the last week of the previous year, and the next week is week 1”.	
44415	The following new requirements on POSIX implementations derive from alignment with the	
44416	Single UNIX Specification:	
44417	• The %C, %D, %e, %h, %n, %r, %R, %t, and %T conversion specifiers are added.	
44418	• The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard	
44419	date utility.	
44420	The following changes are made for alignment with the ISO/IEC 9899:1999 standard:	
44421	• The <i>strptime()</i> prototype is updated.	
44422	• The DESCRIPTION is extensively revised.	
44423	• The %z conversion specifier is added.	
44424	A new example is added.	

44425

IEEE Std 1003.1-2001 / Cor 1-2002, item XSH/TC1/D6/60 is applied.

44426 NAME

44427 strlen — get string length

44428 SYNOPSIS

44429 #include <string.h>

44430 size_t strlen(const char *s);

44431 DESCRIPTION

44432 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44433 conflict between the requirements described here and the ISO C standard is unintentional. This
44434 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44435 The *strlen()* function shall compute the number of bytes in the string to which *s* points, not
44436 including the terminating null byte.

44437 RETURN VALUE

44438 The *strlen()* function shall return the length of *s*; no return value shall be reserved to indicate an
44439 error.

44440 ERRORS

44441 No errors are defined.

44442 EXAMPLES

44443 Getting String Lengths

44444 The following example sets the maximum length of *key* and *data* by using *strlen()* to get the
44445 lengths of those strings.

```
44446       #include <string.h>
44447       ...
44448       struct element {
44449           char *key;
44450           char *data;
44451       };
44452       ...
44453       char *key, *data;
44454       int len;

44455       *keylength = *datalength = 0;
44456       ...
44457       if ((len = strlen(key)) > *keylength)
44458           *keylength = len;
44459       if ((len = strlen(data)) > *datalength)
44460           *datalength = len;
44461       ...
```

44462 APPLICATION USAGE

44463 None.

44464 RATIONALE

44465 None.

44466 FUTURE DIRECTIONS

44467 None.

44468 **SEE ALSO**

44469 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>

44470 **CHANGE HISTORY**

44471 First released in Issue 1. Derived from Issue 1 of the SVID.

44472 **Issue 5**

44473 The RETURN VALUE section is updated to indicate that *strlen()* returns the length of *s*, and not
44474 *s* itself as was previously stated.

44475 NAME

44476 strncasecmp — case-insensitive string comparison

44477 SYNOPSIS

44478 xSI #include <strings.h>

44479 int strncasecmp(const char *s1, const char *s2, size_t n);

44480

44481 DESCRIPTION

44482 Refer to *strcasecmp()*.

44483 **NAME**

44484 strncat — concatenate a string with part of another

44485 **SYNOPSIS**

44486 #include <string.h>

44487 char *strncat(char *restrict *s1*, const char *restrict *s2*, size_t *n*);44488 **DESCRIPTION**

44489 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
44490 conflict between the requirements described here and the ISO C standard is unintentional. This
44491 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44492 The *strncat()* function shall append not more than *n* bytes (a null byte and bytes that follow it
44493 are not appended) from the array pointed to by *s2* to the end of the string pointed to by *s1*. The
44494 initial byte of *s2* overwrites the null byte at the end of *s1*. A terminating null byte is always
44495 appended to the result. If copying takes place between objects that overlap, the behavior is
44496 undefined.

44497 **RETURN VALUE**44498 The *strncat()* function shall return *s1*; no return value shall be reserved to indicate an error.44499 **ERRORS**

44500 No errors are defined.

44501 **EXAMPLES**

44502 None.

44503 **APPLICATION USAGE**

44504 None.

44505 **RATIONALE**

44506 None.

44507 **FUTURE DIRECTIONS**

44508 None.

44509 **SEE ALSO**44510 *strcat()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44511 **CHANGE HISTORY**

44512 First released in Issue 1. Derived from Issue 1 of the SVID.

44513 **Issue 6**44514 The *strncat()* prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

44515 **NAME**

44516 strncmp — compare part of two strings

44517 **SYNOPSIS**

44518 #include <string.h>

44519 int strncmp(const char *s1, const char *s2, size_t n);

44520 **DESCRIPTION**

44521 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44522 conflict between the requirements described here and the ISO C standard is unintentional. This
44523 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44524 The *strncmp()* function shall compare not more than *n* bytes (bytes that follow a null byte are not
44525 compared) from the array pointed to by *s1* to the array pointed to by *s2*.

44526 The sign of a non-zero return value is determined by the sign of the difference between the
44527 values of the first pair of bytes (both interpreted as type **unsigned char**) that differ in the strings
44528 being compared.

44529 **RETURN VALUE**

44530 Upon successful completion, *strncmp()* shall return an integer greater than, equal to, or less than
44531 0, if the possibly null-terminated array pointed to by *s1* is greater than, equal to, or less than the
44532 possibly null-terminated array pointed to by *s2* respectively.

44533 **ERRORS**

44534 No errors are defined.

44535 **EXAMPLES**

44536 None.

44537 **APPLICATION USAGE**

44538 None.

44539 **RATIONALE**

44540 None.

44541 **FUTURE DIRECTIONS**

44542 None.

44543 **SEE ALSO**44544 *strcmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44545 **CHANGE HISTORY**

44546 First released in Issue 1. Derived from Issue 1 of the SVID.

44547 **Issue 6**

44548 Extensions beyond the ISO C standard are marked.

44549 **NAME**

44550 strncpy — copy part of a string

44551 **SYNOPSIS**

44552 #include <string.h>

44553 char *strncpy(char *restrict *s1*, const char *restrict *s2*, size_t *n*);44554 **DESCRIPTION**

44555 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44556 conflict between the requirements described here and the ISO C standard is unintentional. This
44557 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44558 The *strncpy()* function shall copy not more than *n* bytes (bytes that follow a null byte are not
44559 copied) from the array pointed to by *s2* to the array pointed to by *s1*. If copying takes place
44560 between objects that overlap, the behavior is undefined.

44561 If the array pointed to by *s2* is a string that is shorter than *n* bytes, null bytes shall be appended
44562 to the copy in the array pointed to by *s1*, until *n* bytes in all are written.

44563 **RETURN VALUE**44564 The *strncpy()* function shall return *s1*; no return value is reserved to indicate an error.44565 **ERRORS**

44566 No errors are defined.

44567 **EXAMPLES**

44568 None.

44569 **APPLICATION USAGE**

44570 Character movement is performed differently in different implementations. Thus, overlapping
44571 moves may yield surprises.

44572 If there is no null byte in the first *n* bytes of the array pointed to by *s2*, the result is not null-
44573 terminated.

44574 **RATIONALE**

44575 None.

44576 **FUTURE DIRECTIONS**

44577 None.

44578 **SEE ALSO**44579 *strcpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44580 **CHANGE HISTORY**

44581 First released in Issue 1. Derived from Issue 1 of the SVID.

44582 **Issue 6**44583 The *strncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

44584 **NAME**

44585 strpbrk — scan a string for a byte

44586 **SYNOPSIS**

44587 #include <string.h>

44588 char *strpbrk(const char *s1, const char *s2);

44589 **DESCRIPTION**

44590 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44591 conflict between the requirements described here and the ISO C standard is unintentional. This
44592 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44593 The *strpbrk()* function shall locate the first occurrence in the string pointed to by *s1* of any byte
44594 from the string pointed to by *s2*.

44595 **RETURN VALUE**

44596 Upon successful completion, *strpbrk()* shall return a pointer to the byte or a null pointer if no
44597 byte from *s2* occurs in *s1*.

44598 **ERRORS**

44599 No errors are defined.

44600 **EXAMPLES**

44601 None.

44602 **APPLICATION USAGE**

44603 None.

44604 **RATIONALE**

44605 None.

44606 **FUTURE DIRECTIONS**

44607 None.

44608 **SEE ALSO**44609 *strchr()*, *strrchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>44610 **CHANGE HISTORY**

44611 First released in Issue 1. Derived from Issue 1 of the SVID.

44612 **NAME**

44613 strptime — date and time conversion

44614 **SYNOPSIS**44615 xSI `#include <time.h>`

```
44616 char *strptime(const char *restrict buf, const char *restrict format,
44617               struct tm *restrict tm);
44618
```

44619 **DESCRIPTION**

44620 The *strptime()* function shall convert the character string pointed to by *buf* to values which are
 44621 stored in the **tm** structure pointed to by *tm*, using the format specified by *format*.

44622 The *format* is composed of zero or more directives. Each directive is composed of one of the
 44623 following: one or more white-space characters (as specified by *isspace()*); an ordinary character
 44624 (neither '%' nor a white-space character); or a conversion specification. Each conversion
 44625 specification is composed of a '%' character followed by a conversion character which specifies
 44626 the replacement required. The application shall ensure that there is white-space or other non-
 44627 alphanumeric characters between any two conversion specifications. The following conversion
 44628 specifications are supported:

44629	%a	The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.
44630		
44631	%A	Equivalent to %a.
44632	%b	The month, using the locale's month names; either the abbreviated or full name may be specified.
44633		
44634	%B	Equivalent to %b.
44635	%c	Replaced by the locale's appropriate date and time representation.
44636	%C	The century number [00,99]; leading zeros are permitted but not required.
44637	%d	The day of the month [01,31]; leading zeros are permitted but not required.
44638	%D	The date as %m/%d/%y.
44639	%e	Equivalent to %d.
44640	%h	Equivalent to %b.
44641	%H	The hour (24-hour clock) [00,23]; leading zeros are permitted but not required.
44642	%I	The hour (12-hour clock) [01,12]; leading zeros are permitted but not required.
44643	%j	The day number of the year [001,366]; leading zeros are permitted but not required.
44644	%m	The month number [01,12]; leading zeros are permitted but not required.
44645	%M	The minute [00,59]; leading zeros are permitted but not required.
44646	%n	Any white space.
44647	%p	The locale's equivalent of a.m or p.m.
44648	%r	12-hour clock time using the AM/PM notation if t_fmt_ampm is not an empty string in the LC_TIME portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
44649		
44650		
44651	%R	The time as %H:%M.

44652	%S	The seconds [00,60]; leading zeros are permitted but not required.
44653	%t	Any white space.
44654	%T	The time as %H:%M:%S.
44655	%U	The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros are permitted but not required.
44656		
44657	%w	The weekday as a decimal number [0,6], with 0 representing Sunday; leading zeros are permitted but not required.
44658		
44659	%W	The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros are permitted but not required.
44660		
44661	%x	The date, using the locale's date format.
44662	%X	The time, using the locale's time format.
44663	%y	The year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required.
44664		
44665		
44666		
44667	Note:	It is expected that in a future version of IEEE Std 1003.1-2001 the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.)
44668		
44669		
44670	%Y	The year, including the century (for example, 1988).
44671	%%	Replaced by %.

44672 **Modified Conversion Specifiers**

44673	Some conversion specifiers can be modified by the E and O modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist in the current locale, the behavior shall be as if the unmodified conversion specification were used.	
44674		
44675		
44676		
44677	%Ec	The locale's alternative appropriate date and time representation.
44678	%EC	The name of the base year (period) in the locale's alternative representation.
44679	%Ex	The locale's alternative date representation.
44680	%EX	The locale's alternative time representation.
44681	%Ey	The offset from %EC (year only) in the locale's alternative representation.
44682	%EY	The full alternative year representation.
44683	%Od	The day of the month using the locale's alternative numeric symbols; leading zeros are permitted but not required.
44684		
44685	%Oe	Equivalent to %Od.
44686	%OH	The hour (24-hour clock) using the locale's alternative numeric symbols.
44687	%OI	The hour (12-hour clock) using the locale's alternative numeric symbols.
44688	%Om	The month using the locale's alternative numeric symbols.
44689	%OM	The minutes using the locale's alternative numeric symbols.

44690	%OS	The seconds using the locale's alternative numeric symbols.
44691	%OU	The week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.
44692		
44693	%Ow	The number of the weekday (Sunday=0) using the locale's alternative numeric symbols.
44694	%OW	The week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.
44695		
44696	%Oy	The year (offset from %C) using the locale's alternative numeric symbols.
44697		A conversion specification composed of white-space characters is executed by scanning input up to the first character that is not white-space (which remains unscanned), or until no more characters can be scanned.
44698		
44699		
44700		A conversion specification that is an ordinary character is executed by scanning the next character from the buffer. If the character scanned from the buffer differs from the one comprising the directive, the directive fails, and the differing and subsequent characters remain unscanned.
44701		
44702		
44703		
44704		A series of conversion specifications composed of %n, %t, white-space characters, or any combination is executed by scanning up to the first character that is not white space (which remains unscanned), or until no more characters can be scanned.
44705		
44706		
44707		Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the appropriate tm structure members are set to values corresponding to the locale information. Case is ignored when matching items in <i>buf</i> such as month or weekday names. If no match is found, <i>strptime()</i> fails and no more characters are scanned.
44708		
44709		
44710		
44711		
44712		
44713		
44714	RETURN VALUE	
44715		Upon successful completion, <i>strptime()</i> shall return a pointer to the character following the last character parsed. Otherwise, a null pointer shall be returned.
44716		
44717	ERRORS	
44718		No errors are defined.
44719	EXAMPLES	
44720		None.
44721	APPLICATION USAGE	
44722		Several “equivalent to” formats and the special processing of white-space characters are provided in order to ease the use of identical <i>format</i> strings for <i>strftime()</i> and <i>strptime()</i> .
44723		
44724		Applications should use %Y (4-digit years) in preference to %y (2-digit years).
44725		It is unspecified whether multiple calls to <i>strptime()</i> using the same tm structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to <i>strptime()</i> with a format and all data needed to completely specify the date and time being converted.
44726		
44727		
44728		
44729	RATIONALE	
44730		None.

44731 **FUTURE DIRECTIONS**

44732 The *strptime()* function is expected to be mandatory in the next version of this volume of
44733 IEEE Std 1003.1-2001.

44734 **SEE ALSO**

44735 *scanf()*, *strptime()*, *time()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<time.h>**

44736 **CHANGE HISTORY**

44737 First released in Issue 4.

44738 **Issue 5**

44739 Moved from ENHANCED I18N to BASE.

44740 The [ENOSYS] error is removed.

44741 The exact meaning of the %y and %Oy specifiers is clarified in the DESCRIPTION.

44742 **Issue 6**

44743 The Open Group Corrigendum U033/5 is applied. The %r specifier description is reworded.

44744 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

44745 The **restrict** keyword is added to the *strptime()* prototype for alignment with the
44746 ISO/IEC 9899:1999 standard.

44747 The Open Group Corrigendum U047/2 is applied.

44748 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
44749 specification” for consistency with *strptime()*.

44750 **NAME**

44751 strrchr — string scanning operation

44752 **SYNOPSIS**

44753 #include <string.h>

44754 char *strrchr(const char *s, int c);

44755 **DESCRIPTION**

44756 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44757 conflict between the requirements described here and the ISO C standard is unintentional. This
44758 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44759 The *strrchr()* function shall locate the last occurrence of *c* (converted to a **char**) in the string
44760 pointed to by *s*. The terminating null byte is considered to be part of the string.

44761 **RETURN VALUE**

44762 Upon successful completion, *strrchr()* shall return a pointer to the byte or a null pointer if *c* does
44763 not occur in the string.

44764 **ERRORS**

44765 No errors are defined.

44766 **EXAMPLES**44767 **Finding the Base Name of a File**

44768 The following example uses *strrchr()* to get a pointer to the base name of a file. The *strrchr()*
44769 function searches backwards through the name of the file to find the last '/' character in *name*.
44770 This pointer (plus one) will point to the base name of the file.

```
44771       #include <string.h>
44772       ...
44773       const char *name;
44774       char *basename;
44775       ...
44776       basename = strrchr(name, '/') + 1;
44777       ...
```

44778 **APPLICATION USAGE**

44779 None.

44780 **RATIONALE**

44781 None.

44782 **FUTURE DIRECTIONS**

44783 None.

44784 **SEE ALSO**44785 *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44786 **CHANGE HISTORY**

44787 First released in Issue 1. Derived from Issue 1 of the SVID.

44788 **NAME**

44789 strspn — get length of a substring

44790 **SYNOPSIS**

44791 #include <string.h>

44792 size_t strspn(const char *s1, const char *s2);

44793 **DESCRIPTION**

44794 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44795 conflict between the requirements described here and the ISO C standard is unintentional. This
44796 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44797 The *strspn()* function shall compute the length (in bytes) of the maximum initial segment of the
44798 string pointed to by *s1* which consists entirely of bytes from the string pointed to by *s2*.

44799 **RETURN VALUE**

44800 The *strspn()* function shall return the length of *s1*; no return value is reserved to indicate an
44801 error.

44802 **ERRORS**

44803 No errors are defined.

44804 **EXAMPLES**

44805 None.

44806 **APPLICATION USAGE**

44807 None.

44808 **RATIONALE**

44809 None.

44810 **FUTURE DIRECTIONS**

44811 None.

44812 **SEE ALSO**44813 *strcspn()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44814 **CHANGE HISTORY**

44815 First released in Issue 1. Derived from Issue 1 of the SVID.

44816 **Issue 5**

44817 The RETURN VALUE section is updated to indicate that *strspn()* returns the length of *s*, and not
44818 *s* itself as was previously stated.

44819 **NAME**

44820 strstr — find a substring

44821 **SYNOPSIS**

44822 #include <string.h>

44823 char *strstr(const char *s1, const char *s2);

44824 **DESCRIPTION**

44825 cx The functionality described on this reference page is aligned with the ISO C standard. Any
44826 conflict between the requirements described here and the ISO C standard is unintentional. This
44827 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

44828 The *strstr()* function shall locate the first occurrence in the string pointed to by *s1* of the
44829 sequence of bytes (excluding the terminating null byte) in the string pointed to by *s2*.

44830 **RETURN VALUE**

44831 Upon successful completion, *strstr()* shall return a pointer to the located string or a null pointer
44832 if the string is not found.

44833 If *s2* points to a string with zero length, the function shall return *s1*.

44834 **ERRORS**

44835 No errors are defined.

44836 **EXAMPLES**

44837 None.

44838 **APPLICATION USAGE**

44839 None.

44843 None.

44844 **SEE ALSO**44845 *strchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>44846 **CHANGE HISTORY**

44847 First released in Issue 3. Included for alignment with the ANSI C standard.

NAME

strtod, strtodf, strtold — convert a string to a double-precision number

SYNOPSIS

```
#include <stdlib.h>
```

```
double strtod(const char *restrict nptr, char **restrict endptr);
```

```
float strtodf(const char *restrict nptr, char **restrict endptr);
```

```
long double strtold(const char *restrict nptr, char **restrict endptr);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by *nptr* to **double**, **float**, and **long double** representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating null byte of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character, then an optional exponent part
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character, then an optional binary exponent part
- One of INF or INFINITY, ignoring case
- One of NAN or NAN(*n-char-sequence_{opt}*), ignoring case in the NAN part, where:

```
n-char-sequence:
    digit
    nondigit
    n-char-sequence digit
    n-char-sequence nondigit
```

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string. If the subject sequence begins with a minus sign, the sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an

44892 infinity, if representable in the return type, else as if it were a floating constant that is too large
 44893 for the range of the return type. A character sequence NAN or NAN(*n-char-sequence_{opt}*) shall be
 44894 interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence
 44895 part that does not have the expected form; the meaning of the *n-char* sequences is
 44896 implementation-defined. A pointer to the final string is stored in the object pointed to by *endptr*,
 44897 provided that *endptr* is not a null pointer.

44898 If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value
 44899 resulting from the conversion is correctly rounded.

44900 CX The radix character is defined in the program's locale (category *LC_NUMERIC*). In the POSIX
 44901 locale, or in a locale where the radix character is not defined, the radix character shall default to a
 44902 period ('.').

44903 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 44904 accepted.

44905 If the subject sequence is empty or does not have the expected form, no conversion shall be
 44906 performed; the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not
 44907 a null pointer.

44908 CX The *strtod()* function shall not change the setting of *errno* if successful.

44909 Since 0 is returned on error and is also a valid return on success, an application wishing to check
 44910 for error situations should set *errno* to 0, then call *strtod()*, *strtof()*, or *strtold()*, then check *errno*.

44911 RETURN VALUE

44912 Upon successful completion, these functions shall return the converted value. If no conversion
 44913 could be performed, 0 shall be returned, and *errno* may be set to [EINVAL].

44914 If the correct value is outside the range of representable values, $\pm$ HUGE_VAL, $\pm$ HUGE_VALF, or |
 44915 $\pm$ HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to |
 44916 [ERANGE].

44917 If the correct value would cause an underflow, a value whose magnitude is no greater than the
 44918 smallest normalized positive number in the return type shall be returned and *errno* set to
 44919 [ERANGE].

44920 ERRORS

44921 These functions shall fail if:

44922 CX [ERANGE] The value to be returned would cause overflow or underflow.

44923 These functions may fail if:

44924 CX [EINVAL] No conversion could be performed.

44925 EXAMPLES

44926 None.

44927 APPLICATION USAGE

44928 If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the
 44929 result is not exactly representable, the result should be one of the two numbers in the
 44930 appropriate internal format that are adjacent to the hexadecimal floating source value, with the
 44931 extra stipulation that the error should have a correct sign for the current rounding direction.

44932 If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in <float.h>)
 44933 significant digits, the result should be correctly rounded. If the subject sequence *D* has the
 44934 decimal form and more than DECIMAL_DIG significant digits, consider the two bounding,
 44935 adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the

values of L , D , and U satisfy $L \leq D \leq U$. The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding L and U according to the current rounding direction, with the extra stipulation that the error with respect to D should have a correct sign for the current rounding direction.

The changes to `strtod()` introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of the base documents. One such example would be:

```
int
what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;

    d = strtod(s, &endp);
    if (s != endp && *endp == '\\0')
        printf("It's a float with value %g\\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == '\\0')
            printf("It's an integer with value %ld\\n", l);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

44979 **Issue 5**

44980 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

44981 **Issue 6**

44982 Extensions beyond the ISO C standard are marked.

44983 The following new requirements on POSIX implementations derive from alignment with the
44984 Single UNIX Specification:

- 44985 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
44986 added if no conversion could be performed.

44987 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 44988 • The *strtod()* function is updated.
- 44989 • The *strtof()* and *strtold()* functions are added.
- 44990 • The DESCRIPTION is extensively revised.

44991 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

44992 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second |
44993 paragraph in the RETURN VALUE section. This change clarifies the sign of the return value. |

44994 NAME

44995 strtoimax, strtoumax — convert string to integer type

44996 SYNOPSIS

44997 #include <inttypes.h>

44998 intmax_t strtoimax(const char *restrict nptr, char **restrict endptr,
44999 int base);

45000 uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,
45001 int base);

45002 DESCRIPTION

45003 CX The functionality described on this reference page is aligned with the ISO C standard. Any
45004 conflict between the requirements described here and the ISO C standard is unintentional. This
45005 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45006 These functions shall be equivalent to the *strtol()*, *strtoll()*, *strtoul()*, and *strtoull()* functions,
45007 except that the initial portion of the string shall be converted to **intmax_t** and **uintmax_t**
45008 representation, respectively.

45009 RETURN VALUE

45010 These functions shall return the converted value, if any.

45011 If no conversion could be performed, zero shall be returned.

45012 If the correct value is outside the range of representable values, {INTMAX_MAX},
45013 {INTMAX_MIN}, or {UINTMAX_MAX} shall be returned (according to the return type and sign
45014 of the value, if any), and *errno* shall be set to [ERANGE].

45015 ERRORS

45016 These functions shall fail if:

45017 [ERANGE] The value to be returned is not representable.

45018 These functions may fail if:

45019 [EINVAL] The value of *base* is not supported.

45020 EXAMPLES

45021 None.

45022 APPLICATION USAGE

45023 None.

45024 RATIONALE

45025 None.

45026 FUTURE DIRECTIONS

45027 None.

45028 SEE ALSO

45029 *strtol()*, *strtoul()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>

45030 CHANGE HISTORY

45031 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

45032 **NAME**45033 *strtok*, *strtok_r* — split string into tokens45034 **SYNOPSIS**

45035 #include <string.h>

45036 char **strtok*(char *restrict *s1*, const char *restrict *s2*);45037 TSF char **strtok_r*(char *restrict *s*, const char *restrict *sep*,45038 char **restrict *lasts*);

45039

45040 **DESCRIPTION**

45041 CX For *strtok()*: The functionality described on this reference page is aligned with the ISO C
 45042 standard. Any conflict between the requirements described here and the ISO C standard is
 45043 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45044 A sequence of calls to *strtok()* breaks the string pointed to by *s1* into a sequence of tokens, each
 45045 of which is delimited by a byte from the string pointed to by *s2*. The first call in the sequence has
 45046 *s1* as its first argument, and is followed by calls with a null pointer as their first argument. The
 45047 separator string pointed to by *s2* may be different from call to call.

45048 The first call in the sequence searches the string pointed to by *s1* for the first byte that is *not*
 45049 contained in the current separator string pointed to by *s2*. If no such byte is found, then there
 45050 are no tokens in the string pointed to by *s1* and *strtok()* shall return a null pointer. If such a byte
 45051 is found, it is the start of the first token.

45052 The *strtok()* function then searches from there for a byte that is contained in the current
 45053 separator string. If no such byte is found, the current token extends to the end of the string
 45054 pointed to by *s1*, and subsequent searches for a token shall return a null pointer. If such a byte is
 45055 found, it is overwritten by a null byte, which terminates the current token. The *strtok()* function
 45056 saves a pointer to the following byte, from which the next search for a token shall start.

45057 Each subsequent call, with a null pointer as the value of the first argument, starts searching from
 45058 the saved pointer and behaves as described above.

45059 The implementation shall behave as if no function defined in this volume of
 45060 IEEE Std 1003.1-2001 calls *strtok()*.

45061 CX The *strtok()* function need not be reentrant. A function that is not required to be reentrant is not
 45062 required to be thread-safe.

45063 TSF The *strtok_r()* function considers the null-terminated string *s* as a sequence of zero or more text
 45064 tokens separated by spans of one or more characters from the separator string *sep*. The
 45065 argument *lasts* points to a user-provided pointer which points to stored information necessary
 45066 for *strtok_r()* to continue scanning the same string.

45067 In the first call to *strtok_r()*, *s* points to a null-terminated string, *sep* to a null-terminated string of
 45068 separator characters, and the value pointed to by *lasts* is ignored. The *strtok_r()* function shall
 45069 return a pointer to the first character of the first token, write a null character into *s* immediately
 45070 following the returned token, and update the pointer to which *lasts* points.

45071 In subsequent calls, *s* is a NULL pointer and *lasts* shall be unchanged from the previous call so
 45072 that subsequent calls shall move through the string *s*, returning successive tokens until no
 45073 tokens remain. The separator string *sep* may be different from call to call. When no token
 45074 remains in *s*, a NULL pointer shall be returned.

45075 **RETURN VALUE**

45076 Upon successful completion, *strtok()* shall return a pointer to the first byte of a token. Otherwise,
 45077 if there is no token, *strtok()* shall return a null pointer.

45078 TSF The *strtok_r()* function shall return a pointer to the token found, or a NULL pointer when no
 45079 token is found.

45080 **ERRORS**

45081 No errors are defined.

45082 **EXAMPLES**45083 **Searching for Word Separators**

45084 The following example searches for tokens separated by <space>s.

```
45085 #include <string.h>
45086 ...
45087 char *token;
45088 char *line = "LINE TO BE SEPARATED";
45089 char *search = " ";

45090 /* Token will point to "LINE". */
45091 token = strtok(line, search);

45092 /* Token will point to "TO". */
45093 token = strtok(NULL, search);
```

45094 **Breaking a Line**

45095 The following example uses *strtok()* to break a line into two character strings separated by any
 45096 combination of <space>s, <tab>s, or <newline>s.

```
45097 #include <string.h>
45098 ...
45099 struct element {
45100     char *key;
45101     char *data;
45102 };
45103 ...
45104 char line[LINE_MAX];
45105 char *key, *data;
45106 ...
45107 key = strtok(line, " \n");
45108 data = strtok(NULL, " \n");
45109 ...
```

45110 **APPLICATION USAGE**

45111 The *strtok_r()* function is thread-safe and stores its state in a user-supplied buffer instead of
 45112 possibly using a static data area that may be overwritten by an unrelated call from another
 45113 thread.

45114 **RATIONALE**

45115 The *strtok()* function searches for a separator string within a larger string. It returns a pointer to
 45116 the last substring between separator strings. This function uses static storage to keep track of
 45117 the current string position between calls. The new function, *strtok_r()*, takes an additional
 45118 argument, *lasts*, to keep track of the current position in the string.

45119 **FUTURE DIRECTIONS**

45120 None.

45121 **SEE ALSO**45122 The Base Definitions volume of IEEE Std 1003.1-2001, <**string.h**>45123 **CHANGE HISTORY**

45124 First released in Issue 1. Derived from Issue 1 of the SVID.

45125 **Issue 5**45126 The *strtok_r()* function is included for alignment with the POSIX Threads Extension.45127 A note indicating that the *strtok()* function need not be reentrant is added to the DESCRIPTION.45128 **Issue 6**

45129 Extensions beyond the ISO C standard are marked.

45130 The *strtok_r()* function is marked as part of the Thread-Safe Functions option.

45131 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

45132 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
45133 its avoidance of possibly using a static data area.45134 The **restrict** keyword is added to the *strtok()* and *strtok_r()* prototypes for alignment with the
45135 ISO / IEC 9899:1999 standard.

45136 **NAME**

45137 strtol, strtoll — convert a string to a long integer

45138 **SYNOPSIS**

45139 #include <stdlib.h>

45140 long strtol(const char *restrict *str*, char **restrict *endptr*, int *base*);

45141 long long strtoll(const char *restrict *str*, char **restrict *endptr*,

45142 int *base*)

45143 **DESCRIPTION**

45144 CX The functionality described on this reference page is aligned with the ISO C standard. Any
45145 conflict between the requirements described here and the ISO C standard is unintentional. This
45146 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45147 These functions shall convert the initial portion of the string pointed to by *str* to a type **long** and
45148 **long long** representation, respectively. First, they decompose the input string into three parts:

- 45149 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 45150 2. A subject sequence interpreted as an integer represented in some radix determined by the
45151 value of *base*
- 45152 3. A final string of one or more unrecognized characters, including the terminating null byte
45153 of the input string.

45154 Then they shall attempt to convert the subject sequence to an integer, and return the result.

45155 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
45156 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A
45157 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
45158 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to
45159 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
45160 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

45161 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
45162 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
45163 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the
45164 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
45165 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
45166 digits, following the sign if present.

45167 The subject sequence is defined as the longest initial subsequence of the input string, starting
45168 with the first non-white-space character that is of the expected form. The subject sequence shall
45169 contain no characters if the input string is empty or consists entirely of white-space characters,
45170 or if the first non-white-space character is other than a sign or a permissible letter or digit.

45171 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
45172 characters starting with the first digit shall be interpreted as an integer constant. If the subject
45173 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
45174 base for conversion, ascribing to each letter its value as given above. If the subject sequence
45175 begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
45176 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null
45177 pointer.

45178 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
45179 accepted.

45180 If the subject sequence is empty or does not have the expected form, no conversion is performed;
 45181 the value of *str* is stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 45182 pointer.

45183 CX The *strtol()* function shall not change the setting of *errno* if successful.

45184 Since 0, {LONG_MIN} or {LLONG_MIN}, and {LONG_MAX} or {LLONG_MAX} are returned on
 45185 error and are also valid returns on success, an application wishing to check for error situations
 45186 should set *errno* to 0, then call *strtol()* or *strtoll()*, then check *errno*.

45187 RETURN VALUE

45188 Upon successful completion, these functions shall return the converted value, if any. If no
 45189 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

45190 If the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},
 45191 {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and
 45192 *errno* set to [ERANGE].

45193 ERRORS

45194 These functions shall fail if:

45195 [ERANGE] The value to be returned is not representable.

45196 These functions may fail if:

45197 CX [EINVAL] The value of *base* is not supported.

45198 EXAMPLES

45199 None.

45208 CHANGE HISTORY

45209 First released in Issue 1. Derived from Issue 1 of the SVID.

45210 Issue 5

45211 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

45212 Issue 6

45213 Extensions beyond the ISO C standard are marked.

45214 The following new requirements on POSIX implementations derive from alignment with the
 45215 Single UNIX Specification:

- 45216 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 45217 added if no conversion could be performed.

45218 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 45219 • The *strtol()* prototype is updated.
- 45220 • The *strtoll()* function is added.

45221 **NAME**45222 **strtold** — convert a string to a double-precision number45223 **SYNOPSIS**45224 `#include <stdlib.h>`45225 `long double strtold(const char *restrict nptr, char **restrict endptr);`45226 **DESCRIPTION**45227 Refer to *strtod()*.

45228 **NAME**45229 `strtoll` — convert a string to a long integer45230 **SYNOPSIS**45231 `#include <stdlib.h>`45232 `long long strtoll(const char *restrict str, char **restrict endptr,`
45233 `int base);`45234 **DESCRIPTION**45235 Refer to *strtol()*.

45236 **NAME**

45237 strtol, strtoull — convert a string to an unsigned long

45238 **SYNOPSIS**

45239 #include <stdlib.h>

```

45240       unsigned long strtol(const char *restrict str,
45241                           char **restrict endptr, int base);
45242       unsigned long long strtoull(const char *restrict str,
45243                                   char **restrict endptr, int base);

```

45244 **DESCRIPTION**

45245 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 45246 conflict between the requirements described here and the ISO C standard is unintentional. This
 45247 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45248 These functions shall convert the initial portion of the string pointed to by *str* to a type **unsigned**
 45249 **long** and **unsigned long long** representation, respectively. First, they decompose the input
 45250 string into three parts:

- 45251 1. An initial, possibly empty, sequence of white-space characters (as specified by *isspace()*)
- 45252 2. A subject sequence interpreted as an integer represented in some radix determined by the
 45253 value of *base*
- 45254 3. A final string of one or more unrecognized characters, including the terminating null byte
 45255 of the input string

45256 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
 45257 result.

45258 If the value of *base* is 0, the expected form of the subject sequence is that of a decimal constant,
 45259 octal constant, or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A
 45260 decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
 45261 octal constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to
 45262 '7' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 45263 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

45264 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 45265 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 45266 by a '+' or '-' sign. The letters from 'a' (or 'A') to 'z' (or 'Z') inclusive are ascribed the
 45267 values 10 to 35; only letters whose ascribed values are less than that of *base* are permitted. If the
 45268 value of *base* is 16, the characters 0x or 0X may optionally precede the sequence of letters and
 45269 digits, following the sign if present.

45270 The subject sequence is defined as the longest initial subsequence of the input string, starting
 45271 with the first non-white-space character that is of the expected form. The subject sequence shall
 45272 contain no characters if the input string is empty or consists entirely of white-space characters,
 45273 or if the first non-white-space character is other than a sign or a permissible letter or digit.

45274 If the subject sequence has the expected form and the value of *base* is 0, the sequence of
 45275 characters starting with the first digit shall be interpreted as an integer constant. If the subject
 45276 sequence has the expected form and the value of *base* is between 2 and 36, it shall be used as the
 45277 base for conversion, ascribing to each letter its value as given above. If the subject sequence
 45278 begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
 45279 the final string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null
 45280 pointer.

45281 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 45282 accepted.

45283 If the subject sequence is empty or does not have the expected form, no conversion shall be
 45284 performed; the value of *str* shall be stored in the object pointed to by *endptr*, provided that *endptr*
 45285 is not a null pointer.

45286 CX The *strtoul()* function shall not change the setting of *errno* if successful.

45287 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and are also valid returns
 45288 on success, an application wishing to check for error situations should set *errno* to 0, then call
 45289 *strtoul()* or *strtoull()*, then check *errno*.

45290 RETURN VALUE

45291 Upon successful completion, these functions shall return the converted value, if any. If no
 45292 CX conversion could be performed, 0 shall be returned and *errno* may be set to [EINVAL]. If the
 45293 correct value is outside the range of representable values, {ULONG_MAX} or {ULLONG_MAX}
 45294 shall be returned and *errno* set to [ERANGE].

45295 ERRORS

45296 These functions shall fail if:

45297 CX [EINVAL] The value of *base* is not supported.

45298 [ERANGE] The value to be returned is not representable.

45299 These functions may fail if:

45300 CX [EINVAL] No conversion could be performed.

45301 EXAMPLES

45302 None.

45303 APPLICATION USAGE

45304 None.

45305 RATIONALE

45306 None.

45307 FUTURE DIRECTIONS

45308 None.

45309 SEE ALSO

 45311 <stdlib.h>

45312 CHANGE HISTORY

45313 First released in Issue 4. Derived from the ANSI C standard.

45314 Issue 5

45315 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

45316 Issue 6

45317 Extensions beyond the ISO C standard are marked.

45318 The following new requirements on POSIX implementations derive from alignment with the
 45319 Single UNIX Specification:

- 45320 • The [EINVAL] error condition is added for when the value of *base* is not supported.

45321 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
 45322 added if no conversion could be performed.

- 45323 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 45324 • The *strtoul()* prototype is updated.
- 45325 • The *strtoull()* function is added.

45326 **NAME**45327 `strtoumax` — convert a string to an integer type45328 **SYNOPSIS**45329 `#include <inttypes.h>`45330 `uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr,`
45331 `int base);`45332 **DESCRIPTION**45333 Refer to *strtoimax()*.

45334 **NAME**

45335 strxfrm — string transformation

45336 **SYNOPSIS**

45337 #include <string.h>

45338 size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);

45339 **DESCRIPTION**

45340 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 45341 conflict between the requirements described here and the ISO C standard is unintentional. This
 45342 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45343 The *strxfrm()* function shall transform the string pointed to by *s2* and place the resulting string
 45344 into the array pointed to by *s1*. The transformation is such that if *strcmp()* is applied to two
 45345 transformed strings, it shall return a value greater than, equal to, or less than 0, corresponding to
 45346 the result of *strcoll()* applied to the same two original strings. No more than *n* bytes are placed
 45347 into the resulting array pointed to by *s1*, including the terminating null byte. If *n* is 0, *s1* is
 45348 permitted to be a null pointer. If copying takes place between objects that overlap, the behavior
 45349 is undefined.

45350 CX The *strxfrm()* function shall not change the setting of *errno* if successful.

45351 Since no return value is reserved to indicate an error, an application wishing to check for error
 45352 situations should set *errno* to 0, then call *strxfrm()*, then check *errno*.

45353 **RETURN VALUE**

45354 Upon successful completion, *strxfrm()* shall return the length of the transformed string (not
 45355 including the terminating null byte). If the value returned is *n* or more, the contents of the array
 45356 pointed to by *s1* are unspecified.

45357 CX On error, *strxfrm()* may set *errno* but no return value is reserved to indicate an error.

45358 **ERRORS**

45359 The *strxfrm()* function may fail if:

45360 CX	[EINVAL]	The string pointed to by the <i>s2</i> argument contains characters outside the domain of the collating sequence.
45361		

45362 **EXAMPLES**

45363 None.

45364 **APPLICATION USAGE**

45365 The transformation function is such that two transformed strings can be ordered by *strcmp()* as
 45366 appropriate to collating sequence information in the program's locale (category *LC_COLLATE*).

45367 The fact that when *n* is 0 *s1* is permitted to be a null pointer is useful to determine the size of the
 45368 *s1* array prior to making the transformation.

45369 **RATIONALE**

45370 None.

45371 **FUTURE DIRECTIONS**

45372 None.

45373 **SEE ALSO**

45374 *strcmp()*, *strcoll()*, the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

45375 **CHANGE HISTORY**

45376 First released in Issue 3. Included for alignment with the ISO C standard.

45377 **Issue 5**

45378 The DESCRIPTION is updated to indicate that *errno* does not change if the function is
45379 successful.

45380 **Issue 6**

45381 Extensions beyond the ISO C standard are marked.

45382 The following new requirements on POSIX implementations derive from alignment with the
45383 Single UNIX Specification:

- 45384 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
45385 added if no conversion could be performed.

45386 The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

45387 **NAME**

45388 swab — swap bytes

45389 **SYNOPSIS**

45390 xSI #include <unistd.h>

45391 void swab(const void *restrict *src*, void *restrict *dest*,
45392 ssize_t *nbytes*);

45393

45394 **DESCRIPTION**

45395 The *swab()* function shall copy *nbytes* bytes, which are pointed to by *src*, to the object pointed to
45396 by *dest*, exchanging adjacent bytes. The *nbytes* argument should be even. If *nbytes* is odd, *swab()*
45397 copies and exchanges *nbytes*–1 bytes and the disposition of the last byte is unspecified. If
45398 copying takes place between objects that overlap, the behavior is undefined. If *nbytes* is
45399 negative, *swab()* does nothing.

45400 **RETURN VALUE**

45401 None.

45402 **ERRORS**

45403 No errors are defined.

45404 **EXAMPLES**

45405 None.

45406 **APPLICATION USAGE**

45407 None.

45408 **RATIONALE**

45409 None.

45410 **FUTURE DIRECTIONS**

45411 None.

45412 **SEE ALSO**

45413 The Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

45414 **CHANGE HISTORY**

45415 First released in Issue 1. Derived from Issue 1 of the SVID.

45416 **Issue 6**

45417 The **restrict** keyword is added to the *swab()* prototype for alignment with the
45418 ISO/IEC 9899:1999 standard.

45419 **NAME**

45420 swapcontext — swap user context

45421 **SYNOPSIS**

45422 xSI #include <ucontext.h>

45423 int swapcontext(ucontext_t *restrict oucp,
45424 const ucontext_t *restrict ucp);

45425

45426 **DESCRIPTION**45427 Refer to *makecontext()*.

45428 NAME

45429 swprintf — print formatted wide-character output

45430 SYNOPSIS

45431 #include <stdio.h>

45432 #include <wchar.h>

45433 int swprintf(wchar_t *restrict *ws*, size_t *n*,

45434 const wchar_t *restrict *format*, ...);

45435 DESCRIPTION

45436 Refer to *fwprintf()*.

45437 **NAME**

45438 swscanf — convert formatted wide-character input

45439 **SYNOPSIS**

45440 #include <stdio.h>

45441 #include <wchar.h>

```
45442 int swscanf(const wchar_t *restrict ws,  
45443             const wchar_t *restrict format, ... );
```

45444 **DESCRIPTION**45445 Refer to *fwscanf()*.

45446 **NAME**45447 `symlink` — make a symbolic link to a file45448 **SYNOPSIS**45449 `#include <unistd.h>`45450 `int symlink(const char *path1, const char *path2);`45451 **DESCRIPTION**

45452 The `symlink()` function shall create a symbolic link called *path2* that contains the string pointed
 45453 to by *path1* (*path2* is the name of the symbolic link created, *path1* is the string contained in the
 45454 symbolic link).

45455 The string pointed to by *path1* shall be treated only as a character string and shall not be
 45456 validated as a pathname.

45457 If the `symlink()` function fails for any reason other than [EIO], any file named by *path2* shall be
 45458 unaffected.

45459 **RETURN VALUE**

45460 Upon successful completion, `symlink()` shall return 0; otherwise, it shall return `-1` and set *errno* to
 45461 indicate the error.

45462 **ERRORS**45463 The `symlink()` function shall fail if:

45464 [EACCES] Write permission is denied in the directory where the symbolic link is being
 45465 created, or search permission is denied for a component of the path prefix of
 45466 *path2*.

45467 [EEXIST] The *path2* argument names an existing file or symbolic link.

45468 [EIO] An I/O error occurs while reading from or writing to the file system.

45469 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path2*
 45470 argument.

45471 [ENAMETOOLONG]

45472 The length of the *path2* argument exceeds {PATH_MAX} or a pathname
 45473 component is longer than {NAME_MAX} or the length of the *path1* argument
 45474 is longer than {SYMLINK_MAX}.

45475 [ENOENT] A component of *path2* does not name an existing file or *path2* is an empty
 45476 string.

45477 [ENOSPC] The directory in which the entry for the new symbolic link is being placed
 45478 cannot be extended because no space is left on the file system containing the
 45479 directory, or the new symbolic link cannot be created because no space is left
 45480 on the file system which shall contain the link, or the file system is out of file-
 45481 allocation resources.

45482 [ENOTDIR] A component of the path prefix of *path2* is not a directory.

45483 [EROFS] The new symbolic link would reside on a read-only file system.

45484 The `symlink()` function may fail if:

45485 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 45486 resolution of the *path2* argument.

45487 [ENAMETOOLONG]

45488 As a result of encountering a symbolic link in resolution of the *path2*

45489 argument, the length of the substituted pathname string exceeded
45490 {PATH_MAX} bytes (including the terminating null byte), or the length of the
45491 string pointed to by *path1* exceeded {SYMLINK_MAX}.

45492 EXAMPLES

45493 None.

45494 APPLICATION USAGE

45495 Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a
45496 hard link guarantees the existence of a file, even after the original name has been removed. A
45497 symbolic link provides no such assurance; in fact, the file named by the *path1* argument need not
45498 exist when the link is created. A symbolic link can cross file system boundaries.

45499 Normal permission checks are made on each component of the symbolic link pathname during
45500 its resolution.

45501 RATIONALE

45502 Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links,
45503 there is no requirement that file times be updated by *symlink()*.

45504 FUTURE DIRECTIONS

45505 None.

45506 SEE ALSO

45507 *lchown()*, *link()*, *lstat()*, *open()*, *readlink()*, *unlink()*, the Base Definitions volume of
45508 IEEE Std 1003.1-2001, <**unistd.h**>

45509 CHANGE HISTORY

45510 First released in Issue 4, Version 2.

45511 Issue 5

45512 Moved from X/OPEN UNIX extension to BASE.

45513 Issue 6

45514 The following changes were made to align with the IEEE P1003.1a draft standard:

- 45515 • The DESCRIPTION text is updated.
- 45516 • The [ELOOP] optional error condition is added.

45517 **NAME**

45518 sync — schedule file system updates

45519 **SYNOPSIS**45520 xSI `#include <unistd.h>`45521 `void sync(void);`

45522

45523 **DESCRIPTION**45524 The `sync()` function shall cause all information in memory that updates file systems to be
45525 scheduled for writing out to all file systems.45526 The writing, although scheduled, is not necessarily complete upon return from `sync()`.45527 **RETURN VALUE**45528 The `sync()` function shall not return a value.45529 **ERRORS**

45530 No errors are defined.

45531 **EXAMPLES**

45532 None.

45533 **APPLICATION USAGE**

45534 None.

45535 **RATIONALE**

45536 None.

45537 **FUTURE DIRECTIONS**

45538 None.

45539 **SEE ALSO**45540 `fsync()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`45541 **CHANGE HISTORY**

45542 First released in Issue 4, Version 2.

45543 **Issue 5**

45544 Moved from X/OPEN UNIX extension to BASE.

45545 **NAME**

45546 sysconf — get configurable system variables

45547 **SYNOPSIS**

45548 #include <unistd.h>

45549 long sysconf(int name);

45550 **DESCRIPTION**

45551 The *sysconf()* function provides a method for the application to determine the current value of a
 45552 configurable system limit or option (*variable*). The implementation shall support all of the
 45553 variables listed in the following table and may support others.

45554 The *name* argument represents the system variable to be queried. The following table lists the
 45555 minimal set of system variables from <limits.h> or <unistd.h> that can be returned by *sysconf()*,
 45556 and the symbolic constants defined in <unistd.h> that are the corresponding values used for
 45557 *name*.

45689

45690

45691

Variable	Value of Name
_XOPEN_XCU_VERSION	_SC_XOPEN_XCU_VERSION

45692 **RETURN VALUE**

45693

45694

45695

If *name* is an invalid value, `sysconf()` shall return `-1` and set *errno* to indicate the error. If the variable corresponding to *name* has no limit, `sysconf()` shall return `-1` without changing the value of *errno*. Note that indefinite limits do not imply infinite limits; see **<limits.h>**.

45696

45697

45698

45699 XSI

45700

45701

Otherwise, `sysconf()` shall return the current variable value on the system. The value returned shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's **<limits.h>** or **<unistd.h>**. The value shall not change during the lifetime of the calling process, except that `sysconf(_SC_OPEN_MAX)` may return different values before and after a call to `setrlimit()` which changes the `RLIMIT_NOFILE` soft limit.

45702 **ERRORS**

45703

The `sysconf()` function shall fail if:

45704

[EINVAL] The value of the *name* argument is invalid.

45705 **EXAMPLES**

45706

None.

45707 **APPLICATION USAGE**

45708

45709

45710

As `-1` is a permissible return value in a successful situation, an application wishing to check for error situations should set *errno* to 0, then call `sysconf()`, and, if it returns `-1`, check to see if *errno* is non-zero.

45711

45712

45713

45714

45715

45716

45717

45718

If the value of `sysconf(_SC_2_VERSION)` is not equal to the value of the `_POSIX2_VERSION` symbolic constant, the utilities available via `system()` or `popen()` might not behave as described in the Shell and Utilities volume of IEEE Std 1003.1-2001. This would mean that the application is not running in an environment that conforms to the Shell and Utilities volume of IEEE Std 1003.1-2001. Some applications might be able to deal with this, others might not. However, the functions defined in this volume of IEEE Std 1003.1-2001 continue to operate as specified, even if `sysconf(_SC_2_VERSION)` reports that the utilities no longer perform as specified.

45719 **RATIONALE**

45720

45721

45722

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to `pathconf()` and `fpathconf()`.

45723

45724

45725

45726

45727

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of IEEE Std 1003.1-2001, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in **<limits.h>** or **<unistd.h>**.

45728

45729

45730

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

45731

Two examples are offered:

45732

45733

45734

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it

were to rely solely on the `<unistd.h>` value published in this volume of IEEE Std 1003.1-2001.

2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application writer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of IEEE Std 1003.1-2001 specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The latter are described in *pathconf()*.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as `{PATH_MAX}`, are sometimes so large that they must not be used to, say, allocate arrays. The *sysconf()* function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to *pathconf()*, this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The `_XBS_` variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.

45780 **Issue 6**

45781 The symbol CLK_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks
45782 per second”.

45783 The symbol {PASS_MAX} is removed.

45784 The following changes were made to align with the IEEE P1003.1a draft standard:

- 45785 • Table entries are added for the following variables: _SC_REGEX, _SC_SHELL,
45786 _SC_REGEX_VERSION, _SC_SYMLINK_MAX.

45787 The following `sysconf()` variables and their associated names are added for alignment with
45788 IEEE Std 1003.1d-1999:

```
45789     _POSIX_ADVISORY_INFO
45790     _POSIX_CPUTIME
45791     _POSIX_SPAWN
45792     _POSIX_SPORADIC_SERVER
45793     _POSIX_THREAD_CPUTIME
45794     _POSIX_THREAD_SPORADIC_SERVER
45795     _POSIX_TIMEOUTS
```

45796 The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- 45797 • A statement expressing the dependency of support for some system variables on
45798 implementation options is added.
- 45799 • The following system variables are added:

```
45800     _POSIX_BARRIERS
45801     _POSIX_CLOCK_SELECTION
45802     _POSIX_MONOTONIC_CLOCK
45803     _POSIX_READER_WRITER_LOCKS
45804     _POSIX_SPIN_LOCKS
45805     _POSIX_TYPED_MEMORY_OBJECTS
```

45806 The following system variables are added for alignment with IEEE Std 1003.2d-1994:

```
45807     _POSIX2_PBS
45808     _POSIX2_PBS_ACCOUNTING
45809     _POSIX2_PBS_LOCATE
45810     _POSIX2_PBS_MESSAGE
45811     _POSIX2_PBS_TRACK
```

45812 The following `sysconf()` variables and their associated names are added for alignment with
45813 IEEE Std 1003.1q-2000:

```
45814     _POSIX_TRACE
45815     _POSIX_TRACE_EVENT_FILTER
45816     _POSIX_TRACE_INHERIT
45817     _POSIX_TRACE_LOG
```

45818 The macros associated with the `c89` programming models are marked `LEGACY`, and new
45819 equivalent macros associated with `c99` are introduced.

45820 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/62 is applied, updating the
45821 DESCRIPTION to denote that the `_PC*` and `_SC*` symbols are now required to be supported. A
45822 corresponding change has been made in the Base Definitions volume of IEEE Std 1003.1-2001.
45823 The deletion in the second paragraph removes some duplicated text. Additional symbols that
45824 were erroneously omitted from this reference page have been added.

45825 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the
45826 RETURN VALUE section that the value returned for `sysconf(_SC_OPEN_MAX)` may change if a
45827 call to `setrlimit()` adjusts the `RLIMIT_NOFILE` soft limit.

45828 NAME

45829 syslog — log a message

45830 SYNOPSIS

45831 xSI #include <syslog.h>

45832 void syslog(int *priority*, const char **message*, ... /* *argument* */);

45833

45834 DESCRIPTION

45835 Refer to *closelog()*.

45836 **NAME**

45837 system — issue a command

45838 **SYNOPSIS**

45839 #include <stdlib.h>

45840 int system(const char **command*);45841 **DESCRIPTION**

45842 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 45843 conflict between the requirements described here and the ISO C standard is unintentional. This
 45844 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

45845 If *command* is a null pointer, the *system()* function shall determine whether the host environment
 45846 has a command processor. If *command* is not a null pointer, the *system()* function shall pass the
 45847 string pointed to by *command* to that command processor to be executed in an implementation-
 45848 defined manner; this might then cause the program calling *system()* to behave in a non-
 45849 conforming manner or to terminate.

45850 CX The environment of the executed command shall be as if a child process were created using
 45851 *fork()*, and the child process invoked the *sh* utility using *execl()* as follows:

45852 *execl*(<*shell path*>, "sh", "-c", *command*, (char *)0);45853 where <*shell path*> is an unspecified pathname for the *sh* utility.

45854 The *system()* function shall ignore the SIGINT and SIGQUIT signals, and shall block the
 45855 SIGCHLD signal, while waiting for the command to terminate. If this might cause the
 45856 application to miss a signal that would have killed it, then the application should examine the
 45857 return value from *system()* and take whatever action is appropriate to the application if the
 45858 command terminated due to receipt of a signal.

45859 The *system()* function shall not affect the termination status of any child of the calling processes
 45860 other than the process or processes it itself creates.

45861 The *system()* function shall not return until the child process has terminated.45862 **RETURN VALUE**

45863 If *command* is a null pointer, *system()* shall return non-zero to indicate that a command processor
 45864 CX is available, or zero if none is available. The *system()* function shall always return non-zero when
 45865 *command* is NULL.

45866 CX If *command* is not a null pointer, *system()* shall return the termination status of the command
 45867 language interpreter in the format specified by *waitpid()*. The termination status shall be as
 45868 defined for the *sh* utility; otherwise, the termination status is unspecified. If some error prevents
 45869 the command language interpreter from executing after the child process is created, the return
 45870 value from *system()* shall be as if the command language interpreter had terminated using
 45871 *exit*(127) or *_exit*(127). If a child process cannot be created, or if the termination status for the
 45872 command language interpreter cannot be obtained, *system()* shall return -1 and set *errno* to
 45873 indicate the error.

45874 **ERRORS**45875 CX The *system()* function may set *errno* values as described by *fork()*.45876 In addition, *system()* may fail if:45877 CX [ECHILD] The status of the child process created by *system()* is no longer available.

45878 **EXAMPLES**

45879 None.

45880 **APPLICATION USAGE**

45881 If the return value of `system()` is not `-1`, its value can be decoded through the use of the macros
 45882 described in `<sys/wait.h>`. For convenience, these macros are also provided in `<stdlib.h>`.

45883 Note that, while `system()` must ignore `SIGINT` and `SIGQUIT` and block `SIGCHLD` while waiting
 45884 for the child to terminate, the handling of signals in the executed command is as specified by
 45885 `fork()` and `exec`. For example, if `SIGINT` is being caught or is set to `SIG_DFL` when `system()` is
 45886 called, then the child is started with `SIGINT` handling set to `SIG_DFL`.

45887 Ignoring `SIGINT` and `SIGQUIT` in the parent process prevents coordination problems (two
 45888 processes reading from the same terminal, for example) when the executed command ignores or
 45889 catches one of the signals. It is also usually the correct action when the user has given a
 45890 command to the application to be executed synchronously (as in the `'!'` command in many
 45891 interactive applications). In either case, the signal should be delivered only to the child process,
 45892 not to the application itself. There is one situation where ignoring the signals might have less
 45893 than the desired effect. This is when the application uses `system()` to perform some task invisible
 45894 to the user. If the user typed the interrupt character ("`^C`", for example) while `system()` is being
 45895 used in this way, one would expect the application to be killed, but only the executed command
 45896 is killed. Applications that use `system()` in this way should carefully check the return status from
 45897 `system()` to see if the executed command was successful, and should take appropriate action
 45898 when the command fails.

45899 Blocking `SIGCHLD` while waiting for the child to terminate prevents the application from
 45900 catching the signal and obtaining status from `system()`'s child process before `system()` can get the
 45901 status itself.

45902 The context in which the utility is ultimately executed may differ from that in which `system()`
 45903 was called. For example, file descriptors that have the `FD_CLOEXEC` flag set are closed, and the
 45904 process ID and parent process ID are different. Also, if the executed utility changes its
 45905 environment variables or its current working directory, that change is not reflected in the caller's
 45906 context.

45907 There is no defined way for an application to find the specific path for the shell. However,
 45908 `confstr()` can provide a value for `PATH` that is guaranteed to find the `sh` utility.

45909 **RATIONALE**

45910 The `system()` function should not be used by programs that have set user (or group) ID
 45911 privileges. The `fork()` and `exec` family of functions (except `execlp()` and `execvp()`), should be used
 45912 instead. This prevents any unforeseen manipulation of the environment of the user that could
 45913 cause execution of commands not anticipated by the calling program.

45914 There are three levels of specification for the `system()` function. The ISO C standard gives the
 45915 most basic. It requires that the function exists, and defines a way for an application to query
 45916 whether a command language interpreter exists. It says nothing about the command language or
 45917 the environment in which the command is interpreted.

45918 IEEE Std 1003.1-2001 places additional restrictions on `system()`. It requires that if there is a
 45919 command language interpreter, the environment must be as specified by `fork()` and `exec`. This
 45920 ensures, for example, that close-on-exec works, that file locks are not inherited, and that the
 45921 process ID is different. It also specifies the return value from `system()` when the command line
 45922 can be run, thus giving the application some information about the command's completion
 45923 status.

Finally, IEEE Std 1003.1-2001 requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of IEEE Std 1003.1-2001.

Note that, `system(NULL)` is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows `system(NULL)` to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the `system()` function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to IEEE Std 1003.1-2001 if `system(NULL)` returns zero.

It was explicitly decided that when `command` is `NULL`, `system()` should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call `system(NULL)` could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any `system()` call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, `system()` to return with `errno` set to `[EINTR]` if it was interrupted with a signal. This error return was removed, and a requirement that `system()` not return until the child has terminated was added. This means that if a `waitpid()` call in `system()` exits with `errno` set to `[EINTR]`, `system()` must reissue the `waitpid()`. This change was made for two reasons:

1. There is no way for an application to clean up if `system()` returns `[EINTR]`, short of calling `wait()`, and that could have the undesirable effect of returning the status of children other than the one started by `system()`.
2. While it might require a change in some historical implementations, those implementations already have to be changed because they use `wait()` instead of `waitpid()`.

Note that if the application is catching `SIGCHLD` signals, it will receive such a signal before a successful `system()` call returns.

To conform to IEEE Std 1003.1-2001, `system()` must use `waitpid()`, or some similar function, instead of `wait()`.

The following code sample illustrates how `system()` might be implemented on an implementation conforming to IEEE Std 1003.1-2001.

```
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    sigemptyset(&savintr.sa_mask);
    sigemptyset(&savequit.sa_mask);
    sigaction(SIGINT, &sa, &savintr);
    sigaction(SIGQUIT, &sa, &savequit);
```

```

45972     sigaddset(&sa.sa_mask, SIGCHLD);
45973     sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
45974     if ((pid = fork()) == 0) {
45975         sigaction(SIGINT, &saveintr, (struct sigaction *)0);
45976         sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45977         sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45978         execl("/bin/sh", "sh", "-c", cmd, (char *)0);
45979         _exit(127);
45980     }
45981     if (pid == -1) {
45982         stat = -1; /* errno comes from fork() */
45983     } else {
45984         while (waitpid(pid, &stat, 0) == -1) {
45985             if (errno != EINTR) {
45986                 stat = -1;
45987                 break;
45988             }
45989         }
45990     }
45991     sigaction(SIGINT, &saveintr, (struct sigaction *)0);
45992     sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45993     sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45994     return(stat);
45995 }

```

45996 Note that, while a particular implementation of *system()* (such as the one above) can assume a
 45997 particular path for the shell, such a path is not necessarily valid on another system. The above
 45998 example is not portable, and is not intended to be.

45999 One reviewer suggested that an implementation of *system()* might want to use an environment
 46000 variable such as *SHELL* to determine which command interpreter to use. The supposed
 46001 implementation would use the default command interpreter if the one specified by the
 46002 environment variable was not available. This would allow a user, when using an application
 46003 that prompts for command lines to be processed using *system()*, to specify a different command
 46004 interpreter. Such an implementation is discouraged. If the alternate command interpreter did not
 46005 follow the command line syntax specified in the Shell and Utilities volume of
 46006 IEEE Std 1003.1-2001, then changing *SHELL* would render *system()* non-conforming. This would
 46007 affect applications that expected the specified behavior from *system()*, and since the Shell and
 46008 Utilities volume of IEEE Std 1003.1-2001 does not mention that *SHELL* affects *system()*, the
 46009 application would not know that it needed to unset *SHELL*.

46010 FUTURE DIRECTIONS

46011 None.

46012 SEE ALSO

46015 CHANGE HISTORY

46016 First released in Issue 1. Derived from Issue 1 of the SVID.

46017 Issue 6

46018 Extensions beyond the ISO C standard are marked.

46019 **NAME**

46020 tan, tanf, tanl — tangent function

46021 **SYNOPSIS**

46022 #include <math.h>

46023 double tan(double x);

46024 float tanf(float x);

46025 long double tanl(long double x);

46026 **DESCRIPTION**

46027 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 46028 conflict between the requirements described here and the ISO C standard is unintentional. This
 46029 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46030 These functions shall compute the tangent of their argument *x*, measured in radians.

46031 An application wishing to check for error situations should set *errno* to zero and call
 46032 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 46033 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 46034 zero, an error has occurred.

46035 **RETURN VALUE**

46036 Upon successful completion, these functions shall return the tangent of *x*.

46037 If the correct value would cause underflow, and is not representable, a range error may occur,
 46038 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

46039 MX If *x* is NaN, a NaN shall be returned.

46040 If *x* is ± 0 , *x* shall be returned.

46041 If *x* is subnormal, a range error may occur and *x* should be returned.

46042 If *x* is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 46043 defined value shall be returned.

46044 If the correct value would cause underflow, and is representable, a range error may occur and
 46045 the correct value shall be returned.

46046 XSI If the correct value would cause overflow, a range error shall occur and *tan()*, *tanf()*, and *tanl()*
 46047 shall return $\pm \text{HUGE\_VAL}$, $\pm \text{HUGE\_VALF}$, and $\pm \text{HUGE\_VALL}$, respectively, with the same sign
 46048 as the correct value of the function.

46049 **ERRORS**

46050 These functions shall fail if:

46051 MX **Domain Error** The value of *x* is $\pm \text{Inf}$.

46052 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46053 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 46054 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 46055 shall be raised.

46056 XSI **Range Error** The result overflows

46057 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46058 then *errno* shall be set to [ERANGE]. If the integer expression
 46059 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 46060 floating-point exception shall be raised.

46061 These functions may fail if:

46062 MX Range Error The result underflows, or the value of x is subnormal.

46063 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46064 then *errno* shall be set to [ERANGE]. If the integer expression
 46065 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 46066 floating-point exception shall be raised.

46067 EXAMPLES

46068 Taking the Tangent of a 45-Degree Angle

```
46069 #include <math.h>
46070 ...
46071 double radians = 45.0 * M_PI / 180;
46072 double result;
46073 ...
46074 result = tan (radians);
```

46075 APPLICATION USAGE

46076 There are no known floating-point representations such that for a normal argument, $\tan(x)$ is
 46077 either overflow or underflow.

46078 These functions may lose accuracy when their argument is near a multiple of $\pi/2$ or is far from
 46079 0.0.

46080 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 46081 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

46082 RATIONALE

46083 None.

46084 FUTURE DIRECTIONS

46085 None.

46086 SEE ALSO

46087 *atan()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 46088 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

46089 CHANGE HISTORY

46090 First released in Issue 1. Derived from Issue 1 of the SVID.

46091 Issue 5

46092 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
 46093 in previous issues.

46094 Issue 6

46095 The *tanf()* and *tanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

46096 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 46097 revised to align with the ISO/IEC 9899:1999 standard.

46098 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 46099 marked.

46100 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last
 46101 paragraph in the RETURN VALUE section.

46102 **NAME**

46103 tanh, tanhf, tanhl — hyperbolic tangent functions

46104 **SYNOPSIS**

46105 #include <math.h>

46106 double tanh(double x);

46107 float tanhf(float x);

46108 long double tanhl(long double x);

46109 **DESCRIPTION**

46110 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 46111 conflict between the requirements described here and the ISO C standard is unintentional. This
 46112 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46113 These functions shall compute the hyperbolic tangent of their argument *x*.

46114 An application wishing to check for error situations should set *errno* to zero and call
 46115 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 46116 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 46117 zero, an error has occurred.

46118 **RETURN VALUE**46119 Upon successful completion, these functions shall return the hyperbolic tangent of *x*.46120 MX If *x* is NaN, a NaN shall be returned.46121 If *x* is ± 0 , *x* shall be returned.46122 If *x* is $\pm \text{Inf}$, ± 1 shall be returned.46123 If *x* is subnormal, a range error may occur and *x* should be returned.46124 **ERRORS**

46125 These functions may fail if:

46126 MX Range Error The value of *x* is subnormal.

46127 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46128 then *errno* shall be set to [ERANGE]. If the integer expression
 46129 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 46130 floating-point exception shall be raised.

46131 **EXAMPLES**

46132 None.

46133 **APPLICATION USAGE**

46134 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 46135 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

46136 **RATIONALE**

46137 None.

46138 **FUTURE DIRECTIONS**

46139 None.

46140 **SEE ALSO**

46141 *atanh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *tan()*, the Base Definitions volume of

 46143 <math.h>

46144 **CHANGE HISTORY**

46145 First released in Issue 1. Derived from Issue 1 of the SVID.

46146 **Issue 5**

46147 The DESCRIPTION is updated to indicate how an application should check for an error. This
46148 text was previously published in the APPLICATION USAGE section.

46149 **Issue 6**

46150 The *tanhf()* and *tanhl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

46151 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
46152 revised to align with the ISO/IEC 9899:1999 standard.

46153 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
46154 marked.

46155 **NAME**

46156 tanl — tangent function

46157 **SYNOPSIS**

46158 #include <math.h>

46159 long double tanl(long double x);

46160 **DESCRIPTION**46161 Refer to *tan()*.

46162 **NAME**

46163 tcdrain — wait for transmission of output

46164 **SYNOPSIS**

46165 #include <termios.h>

46166 int tcdrain(int *fildev*);46167 **DESCRIPTION**46168 The *tcdrain()* function shall block until all output written to the object referred to by *fildev* is
46169 transmitted. The *fildev* argument is an open file descriptor associated with a terminal.46170 Any attempts to use *tcdrain()* from a process which is a member of a background process group
46171 on a *fildev* associated with its controlling terminal, shall cause the process group to be sent a
46172 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
46173 shall be allowed to perform the operation, and no signal is sent.46174 **RETURN VALUE**46175 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
46176 indicate the error.46177 **ERRORS**46178 The *tcdrain()* function shall fail if:46179 [EBADF] The *fildev* argument is not a valid file descriptor.46180 [EINTR] A signal interrupted *tcdrain()*.46181 [ENOTTY] The file associated with *fildev* is not a terminal.46182 The *tcdrain()* function may fail if:46183 [EIO] The process group of the writing process is orphaned, and the writing process
46184 is not ignoring or blocking SIGTTOU.46185 **EXAMPLES**

46186 None.

46187 **APPLICATION USAGE**

46188 None.

46189 **RATIONALE**

46190 None.

46191 **FUTURE DIRECTIONS**

46192 None.

46193 **SEE ALSO**46194 *tcflush()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal
46195 Interface, <termios.h>, <unistd.h>46196 **CHANGE HISTORY**

46197 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46198 **Issue 6**

46199 The following new requirements on POSIX implementations derive from alignment with the
46200 Single UNIX Specification:

- 46201 • In the DESCRIPTION, the final paragraph is no longer conditional on
46202 _POSIX_JOB_CONTROL. This is a FIPS requirement.
- 46203 • The [EIO] error is added.

46204 **NAME**

46205 tcflow — suspend or restart the transmission or reception of data

46206 **SYNOPSIS**

46207 #include <termios.h>

46208 int tcflow(int *fildes*, int *action*);46209 **DESCRIPTION**

46210 The *tcflow()* function shall suspend or restart transmission or reception of data on the object referred to by *fildes*, depending on the value of *action*. The *fildes* argument is an open file descriptor associated with a terminal.

- 46213 • If *action* is TCOOFF, output shall be suspended.
- 46214 • If *action* is TCOON, suspended output shall be restarted.
- 46215 • If *action* is TCIOFF, the system shall transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system.
- 46216 • If *action* is TCION, the system shall transmit a START character, which is intended to cause the terminal device to start transmitting data to the system.

46219 The default on the opening of a terminal file is that neither its input nor its output are suspended.

46221 Attempts to use *tcflow()* from a process which is a member of a background process group on a *fildes* associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

46225 **RETURN VALUE**

46226 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

46228 **ERRORS**46229 The *tcflow()* function shall fail if:

- 46230 [EBADF] The *fildes* argument is not a valid file descriptor.
- 46231 [EINVAL] The *action* argument is not a supported value.
- 46232 [ENOTTY] The file associated with *fildes* is not a terminal.

46233 The *tcflow()* function may fail if:

- 46234 [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

46236 **EXAMPLES**

46237 None.

46238 **APPLICATION USAGE**

46239 None.

46240 **RATIONALE**

46241 None.

46242 **FUTURE DIRECTIONS**

46243 None.

46244 **SEE ALSO**

46245 *tcsendbreak()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal
46246 Interface, **<termios.h>**, **<unistd.h>**

46247 **CHANGE HISTORY**

46248 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46249 **Issue 6**

46250 The following new requirements on POSIX implementations derive from alignment with the
46251 Single UNIX Specification:

- 46252 • The [EIO] error is added.

46253 **NAME**

46254 tcflush — flush non-transmitted output data, non-read input data, or both

46255 **SYNOPSIS**

46256 #include <termios.h>

46257 int tcflush(int *fildes*, int *queue_selector*);46258 **DESCRIPTION**

46259 Upon successful completion, *tcflush()* shall discard data written to the object referred to by *fildes*
 46260 (an open file descriptor associated with a terminal) but not transmitted, or data received but not
 46261 read, depending on the value of *queue_selector*:

- 46262 • If *queue_selector* is TCIFLUSH, it shall flush data received but not read.
- 46263 • If *queue_selector* is TCOFLUSH, it shall flush data written but not transmitted.
- 46264 • If *queue_selector* is TCIOFLUSH, it shall flush both data received but not read and data
 46265 written but not transmitted.

46266 Attempts to use *tcflush()* from a process which is a member of a background process group on a
 46267 *fildes* associated with its controlling terminal shall cause the process group to be sent a SIGTTOU
 46268 signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be
 46269 allowed to perform the operation, and no signal is sent.

46270 **RETURN VALUE**

46271 Upon successful completion, 0 shall be returned. Otherwise, –1 shall be returned and *errno* set to
 46272 indicate the error.

46273 **ERRORS**46274 The *tcflush()* function shall fail if:

- 46275 [EBADF] The *fildes* argument is not a valid file descriptor.
- 46276 [EINVAL] The *queue_selector* argument is not a supported value.
- 46277 [ENOTTY] The file associated with *fildes* is not a terminal.

46278 The *tcflush()* function may fail if:

- 46279 [EIO] The process group of the writing process is orphaned, and the writing process
 46280 is not ignoring or blocking SIGTTOU.

46281 **EXAMPLES**

46282 None.

46283 **APPLICATION USAGE**

46284 None.

46285 **RATIONALE**

46286 None.

46287 **FUTURE DIRECTIONS**

46288 None.

46289 **SEE ALSO**

46290 *tcdrain()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal
 46291 Interface, <termios.h>, <unistd.h>

46292 **CHANGE HISTORY**

46293 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46294 **Issue 6**

46295 The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE
46296 sections, references to *tcflow()* are replaced with *tcflush()*.

46297 The following new requirements on POSIX implementations derive from alignment with the
46298 Single UNIX Specification:

- 46299 • In the DESCRIPTION, the final paragraph is no longer conditional on
46300 `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- 46301 • The [EIO] error is added.

46302 **NAME**

46303 tcgetattr — get the parameters associated with the terminal

46304 **SYNOPSIS**

46305 #include <termios.h>

46306 int tcgetattr(int *fildev*, struct termios **termios_p*);46307 **DESCRIPTION**

46308 The *tcgetattr()* function shall get the parameters associated with the terminal referred to by *fildev*
 46309 and store them in the **termios** structure referenced by *termios_p*. The *fildev* argument is an open
 46310 file descriptor associated with a terminal.

46311 The *termios_p* argument is a pointer to a **termios** structure.

46312 The *tcgetattr()* operation is allowed from any process.

46313 If the terminal device supports different input and output baud rates, the baud rates stored in
 46314 the **termios** structure returned by *tcgetattr()* shall reflect the actual baud rates, even if they are
 46315 equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be
 46316 the actual baud rate. If the terminal device does not support split baud rates, the input baud rate
 46317 stored in the **termios** structure shall be the output rate (as one of the symbolic values).

46318 **RETURN VALUE**

46319 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 46320 indicate the error.

46321 **ERRORS**

46322 The *tcgetattr()* function shall fail if:

46323 [EBADF] The *fildev* argument is not a valid file descriptor.

46324 [ENOTTY] The file associated with *fildev* is not a terminal.

46325 **EXAMPLES**

46326 None.

46327 **APPLICATION USAGE**

46328 None.

46329 **RATIONALE**

46330 Care must be taken when changing the terminal attributes. Applications should always do a
 46331 *tcgetattr()*, save the **termios** structure values returned, and then do a *tcsetattr()*, changing only
 46332 the necessary fields. The application should use the values saved from the *tcgetattr()* to reset the
 46333 terminal state whenever it is done with the terminal. This is necessary because terminal
 46334 attributes apply to the underlying port and not to each individual open instance; that is, all
 46335 processes that have used the terminal see the latest attribute changes.

46336 A program that uses these functions should be written to catch all signals and take other
 46337 appropriate actions to ensure that when the program terminates, whether planned or not, the
 46338 terminal device's state is restored to its original state.

46339 Existing practice dealing with error returns when only part of a request can be honored is based
 46340 on calls to the *ioctl()* function. In historical BSD and System V implementations, the
 46341 corresponding *ioctl()* returns zero if the requested actions were semantically correct, even if
 46342 some of the requested changes could not be made. Many existing applications assume this
 46343 behavior and would no longer work correctly if the return value were changed from zero to -1
 46344 in this case.

46345 Note that either specification has a problem. When zero is returned, it implies everything
46346 succeeded even if some of the changes were not made. When -1 is returned, it implies
46347 everything failed even though some of the changes were made.

46348 Applications that need all of the requested changes made to work properly should follow
46349 *tcsetattr()* with a call to *tcgetattr()* and compare the appropriate field values.

46350 **FUTURE DIRECTIONS**

46351 None.

46352 **SEE ALSO**

46353 *tcsetattr()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal
46354 Interface, <**termios.h**>

46355 **CHANGE HISTORY**

46356 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46357 **Issue 6**

46358 In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate.
46359 Previously, the number zero was also allowed but was obsolescent.

46360 **NAME**

46361 tcgetpgrp — get the foreground process group ID

46362 **SYNOPSIS**

46363 #include <unistd.h>

46364 pid_t tcgetpgrp(int *fildes*);46365 **DESCRIPTION**46366 The *tcgetpgrp()* function shall return the value of the process group ID of the foreground process
46367 group associated with the terminal.46368 If there is no foreground process group, *tcgetpgrp()* shall return a value greater than 1 that does
46369 not match the process group ID of any existing process group.46370 The *tcgetpgrp()* function is allowed from a process that is a member of a background process
46371 group; however, the information may be subsequently changed by a process that is a member of
46372 a foreground process group.46373 **RETURN VALUE**46374 Upon successful completion, *tcgetpgrp()* shall return the value of the process group ID of the
46375 foreground process associated with the terminal. Otherwise, -1 shall be returned and *errno* set to
46376 indicate the error.46377 **ERRORS**46378 The *tcgetpgrp()* function shall fail if:46379 [EBADF] The *fildes* argument is not a valid file descriptor.46380 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
46381 controlling terminal.46382 **EXAMPLES**

46383 None.

46384 **APPLICATION USAGE**

46385 None.

46386 **RATIONALE**

46387 None.

46388 **FUTURE DIRECTIONS**

46389 None.

46392 <sys/types.h>, <unistd.h>46393 **CHANGE HISTORY**

46394 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46395 **Issue 6**

46396 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

46397 The following new requirements on POSIX implementations derive from alignment with the
46398 Single UNIX Specification:

- 46399
- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
46400 required for conforming implementations of previous POSIX specifications, it was not
46401 required for UNIX applications.

46402

46403

- In the DESCRIPTION, text previously conditional on support for _POSIX_JOB_CONTROL is now mandatory. This is a FIPS requirement.

46404 **NAME**

46405 tcgetsid — get the process group ID for the session leader for the controlling terminal

46406 **SYNOPSIS**

46407 xSI #include <termios.h>

46408 pid_t tcgetsid(int *fildes*);

46409

46410 **DESCRIPTION**46411 The *tcgetsid()* function shall obtain the process group ID of the session for which the terminal
46412 specified by *fildes* is the controlling terminal.46413 **RETURN VALUE**46414 Upon successful completion, *tcgetsid()* shall return the process group ID associated with the
46415 terminal. Otherwise, a value of (**pid_t**)-1 shall be returned and *errno* set to indicate the error.46416 **ERRORS**46417 The *tcgetsid()* function shall fail if:46418 [EBADF] The *fildes* argument is not a valid file descriptor.46419 [ENOTTY] The calling process does not have a controlling terminal, or the file is not the
46420 controlling terminal.46421 **EXAMPLES**

46422 None.

46423 **APPLICATION USAGE**

46424 None.

46425 **RATIONALE**

46426 None.

46427 **FUTURE DIRECTIONS**

46428 None.

46429 **SEE ALSO**46430 The Base Definitions volume of IEEE Std 1003.1-2001, <**termios.h**>46431 **CHANGE HISTORY**

46432 First released in Issue 4, Version 2.

46433 **Issue 5**

46434 Moved from X/OPEN UNIX extension to BASE.

46435 The [EACCES] error has been removed from the list of mandatory errors, and the description of
46436 [ENOTTY] has been reworded.

46437 **NAME**

46438 tcsendbreak — send a break for a specific duration

46439 **SYNOPSIS**

46440 #include <termios.h>

46441 int tcsendbreak(int *fildes*, int *duration*);46442 **DESCRIPTION**

46443 If the terminal is using asynchronous serial data transmission, *tcsendbreak()* shall cause
46444 transmission of a continuous stream of zero-valued bits for a specific duration. If *duration* is 0, it
46445 shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5
46446 seconds. If *duration* is not 0, it shall send zero-valued bits for an implementation-defined period
46447 of time.

46448 The *fildes* argument is an open file descriptor associated with a terminal.

46449 If the terminal is not using asynchronous serial data transmission, it is implementation-defined
46450 whether *tcsendbreak()* sends data to generate a break condition or returns without taking any
46451 action.

46452 Attempts to use *tcsendbreak()* from a process which is a member of a background process group
46453 on a *fildes* associated with its controlling terminal shall cause the process group to be sent a
46454 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
46455 shall be allowed to perform the operation, and no signal is sent.

46456 **RETURN VALUE**

46457 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
46458 indicate the error.

46459 **ERRORS**

46460 The *tcsendbreak()* function shall fail if:

46461 [EBADF] The *fildes* argument is not a valid file descriptor.

46462 [ENOTTY] The file associated with *fildes* is not a terminal.

46463 The *tcsendbreak()* function may fail if:

46464 [EIO] The process group of the writing process is orphaned, and the writing process
46465 is not ignoring or blocking SIGTTOU.

46466 **EXAMPLES**

46467 None.

46468 **APPLICATION USAGE**

46469 None.

46470 **RATIONALE**

46471 None.

46472 **FUTURE DIRECTIONS**

46473 None.

46474 **SEE ALSO**

46475 The Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface,
46476 <termios.h>, <unistd.h>

46477 CHANGE HISTORY

46478 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46479 Issue 6

46480 The following new requirements on POSIX implementations derive from alignment with the
46481 Single UNIX Specification:

- 46482 • In the DESCRIPTION, text previously conditional on `_POSIX_JOB_CONTROL` is now
46483 mandated. This is a FIPS requirement.
- 46484 • The [EIO] error is added.

46485 **NAME**

46486 tcsetattr — set the parameters associated with the terminal

46487 **SYNOPSIS**

46488 #include <termios.h>

```
46489 int tcsetattr(int fildes, int optional_actions,
46490               const struct termios *termios_p);
```

46491 **DESCRIPTION**

46492 The *tcsetattr()* function shall set the parameters associated with the terminal referred to by the
 46493 open file descriptor *fildes* (an open file descriptor associated with a terminal) from the **termios**
 46494 structure referenced by *termios_p* as follows:

- 46495 • If *optional_actions* is TCSANOW, the change shall occur immediately.
- 46496 • If *optional_actions* is TCSADRAIN, the change shall occur after all output written to *fildes* is
 46497 transmitted. This function should be used when changing parameters that affect output.
- 46498 • If *optional_actions* is TCSAFLUSH, the change shall occur after all output written to *fildes* is
 46499 transmitted, and all input so far received but not read shall be discarded before the change is
 46500 made.

46501 If the output baud rate stored in the **termios** structure pointed to by *termios_p* is the zero baud
 46502 rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the
 46503 line.

46504 If the input baud rate stored in the **termios** structure pointed to by *termios_p* is 0, the input baud
 46505 rate given to the hardware is the same as the output baud rate stored in the **termios** structure.

46506 The *tcsetattr()* function shall return successfully if it was able to perform any of the requested
 46507 actions, even if some of the requested actions could not be performed. It shall set all the
 46508 attributes that the implementation supports as requested and leave all the attributes not
 46509 supported by the implementation unchanged. If no part of the request can be honored, it shall
 46510 return `-1` and set *errno* to `[EINVAL]`. If the input and output baud rates differ and are a
 46511 combination that is not supported, neither baud rate shall be changed. A subsequent call to
 46512 *tcgetattr()* shall return the actual state of the terminal device (reflecting both the changes made
 46513 and not made in the previous *tcsetattr()* call). The *tcsetattr()* function shall not change the values
 46514 found in the **termios** structure under any circumstances.

46515 The effect of *tcsetattr()* is undefined if the value of the **termios** structure pointed to by *termios_p*
 46516 was not derived from the result of a call to *tcgetattr()* on *fildes*; an application should modify
 46517 only fields and flags defined by this volume of IEEE Std 1003.1-2001 between the call to
 46518 *tcgetattr()* and *tcsetattr()*, leaving all other fields and flags unmodified.

46519 No actions defined by this volume of IEEE Std 1003.1-2001, other than a call to *tcsetattr()* or a
 46520 close of the last file descriptor in the system associated with this terminal device, shall cause any
 46521 of the terminal attributes defined by this volume of IEEE Std 1003.1-2001 to change.

46522 If *tcsetattr()* is called from a process which is a member of a background process group on a
 46523 *fildes* associated with its controlling terminal:

- 46524 • If the calling process is blocking or ignoring SIGTTOU signals, the operation completes
 46525 normally and no signal is sent.
- 46526 • Otherwise, a SIGTTOU signal shall be sent to the process group.

46527 **RETURN VALUE**

46528 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 46529 indicate the error.

46530 **ERRORS**

46531 The *tcsetattr()* function shall fail if:

46532 [EBADF] The *fildev* argument is not a valid file descriptor.

46533 [EINTR] A signal interrupted *tcsetattr()*.

46534 [EINVAL] The *optional_actions* argument is not a supported value, or an attempt was
 46535 made to change an attribute represented in the **termios** structure to an
 46536 unsupported value.

46537 [ENOTTY] The file associated with *fildev* is not a terminal.

46538 The *tcsetattr()* function may fail if:

46539 [EIO] The process group of the writing process is orphaned, and the writing process
 46540 is not ignoring or blocking SIGTTOU.

46541 **EXAMPLES**

46542 None.

46543 **APPLICATION USAGE**

46544 If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to
 46545 determine what baud rates were actually selected.

46546 **RATIONALE**

46547 The *tcsetattr()* function can be interrupted in the following situations:

- 46548 • It is interrupted while waiting for output to drain.
- 46549 • It is called from a process in a background process group and SIGTTOU is caught.

46550 See also the RATIONALE section in *tcgetattr()*.

46551 **FUTURE DIRECTIONS**

46552 Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be
 46553 supported in a future version of this volume of IEEE Std 1003.1-2001.

46554 **SEE ALSO**

 46556 General Terminal Interface, **<termios.h>**, **<unistd.h>**

46557 **CHANGE HISTORY**

46558 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46559 **Issue 6**

46560 The following new requirements on POSIX implementations derive from alignment with the
 46561 Single UNIX Specification:

- 46562 • In the DESCRIPTION, text previously conditional on **_POSIX_JOB_CONTROL** is now
 46563 mandated. This is a FIPS requirement.
- 46564 • The [EIO] error is added.

46565 In the DESCRIPTION, the text describing use of *tcsetattr()* from a process which is a member of
46566 a background process group is clarified.

46567 **NAME**

46568 tcsetpgrp — set the foreground process group ID

46569 **SYNOPSIS**

46570 #include <unistd.h>

46571 int tcsetpgrp(int *fildev*, pid_t *pgid_id*);46572 **DESCRIPTION**

46573 If the process has a controlling terminal, *tcsetpgrp()* shall set the foreground process group ID
 46574 associated with the terminal to *pgid_id*. The application shall ensure that the file associated with
 46575 *fildev* is the controlling terminal of the calling process and the controlling terminal is currently
 46576 associated with the session of the calling process. The application shall ensure that the value of
 46577 *pgid_id* matches a process group ID of a process in the same session as the calling process.

46578 Attempts to use *tcsetpgrp()* from a process which is a member of a background process group on
 46579 a *fildev* associated with its controlling terminal shall cause the process group to be sent a
 46580 SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
 46581 shall be allowed to perform the operation, and no signal is sent.

46582 **RETURN VALUE**

46583 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 46584 indicate the error.

46585 **ERRORS**46586 The *tcsetpgrp()* function shall fail if:

46587	[EBADF]	The <i>fildev</i> argument is not a valid file descriptor.
46588	[EINVAL]	This implementation does not support the value in the <i>pgid_id</i> argument.
46589	[ENOTTY]	The calling process does not have a controlling terminal, or the file is not the controlling terminal, or the controlling terminal is no longer associated with the session of the calling process.
46590		
46591		
46592	[EPERM]	The value of <i>pgid_id</i> is a value supported by the implementation, but does not match the process group ID of a process in the same session as the calling process.
46593		
46594		

46595 **EXAMPLES**

46596 None.

46597 **APPLICATION USAGE**

46598 None.

46599 **RATIONALE**

46600 None.

46601 **FUTURE DIRECTIONS**

46602 None.

46603 **SEE ALSO**46604 *tcgetpgrp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>46605 **CHANGE HISTORY**

46606 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

46607 **Issue 6**

46608 In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

46609 The following new requirements on POSIX implementations derive from alignment with the
46610 Single UNIX Specification:

46611 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
46612 required for conforming implementations of previous POSIX specifications, it was not
46613 required for UNIX applications.

46614 • In the DESCRIPTION and ERRORS sections, text previously conditional on
46615 `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

46616 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

46617 The Open Group Corrigendum U047/4 is applied.

46618 **NAME**

46619 tdelete, tfind, tsearch, twalk — manage a binary search tree

46620 **SYNOPSIS**

```

46621 xSI #include <search.h>

46622 void *tdelete(const void *restrict key, void **restrict rootp,
46623             int (*compar)(const void *, const void *));
46624 void *tfind(const void *key, void *const *rootp,
46625            int (*compar)(const void *, const void *));
46626 void *tsearch(const void *key, void **rootp,
46627              int (*compar)(const void *, const void *));
46628 void twalk(const void *root,
46629           void (*action)(const void *, VISIT, int));
46630

```

46631 **DESCRIPTION**

46632 The *tdelete()*, *tfind()*, *tsearch()*, and *twalk()* functions manipulate binary search trees.
 46633 Comparisons are made with a user-supplied routine, the address of which is passed as the
 46634 *compar* argument. This routine is called with two arguments, which are the pointers to the
 46635 elements being compared. The application shall ensure that the user-supplied routine returns an
 46636 integer less than, equal to, or greater than 0, according to whether the first argument is to be
 46637 considered less than, equal to, or greater than the second argument. The comparison function
 46638 need not compare every byte, so arbitrary data may be contained in the elements in addition to
 46639 the values being compared.

46640 The *tsearch()* function shall build and access the tree. The *key* argument is a pointer to an element
 46641 to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed
 46642 to by *key*, a pointer to this found node shall be returned. Otherwise, the value pointed to by *key*
 46643 shall be inserted (that is, a new node is created and the value of *key* is copied to this node), and a
 46644 pointer to this node returned. Only pointers are copied, so the application shall ensure that the
 46645 calling routine stores the data. The *rootp* argument points to a variable that points to the root
 46646 node of the tree. A null pointer value for the variable pointed to by *rootp* denotes an empty tree;
 46647 in this case, the variable shall be set to point to the node which shall be at the root of the new
 46648 tree.

46649 Like *tsearch()*, *tfind()* shall search for a node in the tree, returning a pointer to it if found.
 46650 However, if it is not found, *tfind()* shall return a null pointer. The arguments for *tfind()* are the
 46651 same as for *tsearch()*.

46652 The *tdelete()* function shall delete a node from a binary search tree. The arguments are the same
 46653 as for *tsearch()*. The variable pointed to by *rootp* shall be changed if the deleted node was the
 46654 root of the tree. The *tdelete()* function shall return a pointer to the parent of the deleted node, or a
 46655 null pointer if the node is not found.

46656 The *twalk()* function shall traverse a binary search tree. The *root* argument is a pointer to the root
 46657 node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below
 46658 that node.) The argument *action* is the name of a routine to be invoked at each node. This routine
 46659 is, in turn, called with three arguments. The first argument shall be the address of the node being
 46660 visited. The structure pointed to by this argument is unspecified and shall not be modified by
 46661 the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-
 46662 element to access the element stored in the node. The second argument shall be a value from an
 46663 enumeration data type:

```

46664 typedef enum { preorder, postorder, endorder, leaf } VISIT;

```

46665 (defined in **<search.h>**), depending on whether this is the first, second, or third time that the
 46666 node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a
 46667 leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

46668 If the calling function alters the pointer to the root, the result is undefined.

46669 RETURN VALUE

46670 If the node is found, both *tsearch()* and *tfind()* shall return a pointer to it. If not, *tfind()* shall
 46671 return a null pointer, and *tsearch()* shall return a pointer to the inserted item.

46672 A null pointer shall be returned by *tsearch()* if there is not enough space available to create a new
 46673 node.

46674 A null pointer shall be returned by *tdelete()*, *tfind()*, and *tsearch()* if *rootp* is a null pointer on
 46675 entry.

46676 The *tdelete()* function shall return a pointer to the parent of the deleted node, or a null pointer if
 46677 the node is not found.

46678 The *twalk()* function shall not return a value.

46679 ERRORS

46680 No errors are defined.

46681 EXAMPLES

46682 The following code reads in strings and stores structures containing a pointer to each string and
 46683 a count of its length. It then walks the tree, printing out the stored strings and their lengths in
 46684 alphabetical order.

```

46685 #include <search.h>
46686 #include <string.h>
46687 #include <stdio.h>

46688 #define STRSZ    10000
46689 #define NODSZ    500

46690 struct node {      /* Pointers to these are stored in the tree. */
46691     char    *string;
46692     int     length;
46693 };

46694 char    string_space[STRSZ]; /* Space to store strings. */
46695 struct node nodes[NODSZ];    /* Nodes to store. */
46696 void    *root = NULL;        /* This points to the root. */

46697 int main(int argc, char *argv[])
46698 {
46699     char    *strptr = string_space;
46700     struct node *nodeptr = nodes;
46701     void    print_node(const void *, VISIT, int);
46702     int     i = 0, node_compare(const void *, const void *);

46703     while (gets(strptr) != NULL && i++ < NODSZ) {
46704         /* Set node. */
46705         nodeptr->string = strptr;
46706         nodeptr->length = strlen(strptr);
46707         /* Put node into the tree. */
46708         (void) tsearch((void *)nodeptr, (void **)&root,
46709             node_compare);

```

```

46710         /* Adjust pointers, so we do not overwrite tree. */
46711         strptr += nodeptr->length + 1;
46712         nodeptr++;
46713     }
46714     twalk(root, print_node);
46715     return 0;
46716 }

46717 /*
46718  * This routine compares two nodes, based on an
46719  * alphabetical ordering of the string field.
46720  */
46721 int
46722 node_compare(const void *node1, const void *node2)
46723 {
46724     return strcmp(((const struct node *) node1)->string,
46725                  ((const struct node *) node2)->string);
46726 }

46727 /*
46728  * This routine prints out a node, the second time
46729  * twalk encounters it or if it is a leaf.
46730  */
46731 void
46732 print_node(const void *ptr, VISIT order, int level)
46733 {
46734     const struct node *p = *(const struct node **) ptr;
46735     if (order == postorder || order == leaf) {
46736         (void) printf("string = %s, length = %d\n",
46737                     p->string, p->length);
46738     }
46739 }

```

46740 APPLICATION USAGE

46741 The *root* argument to *twalk()* is one level of indirection less than the *rootp* arguments to *tdelete()*
 46742 and *tsearch()*.

46743 There are two nomenclatures used to refer to the order in which tree nodes are visited. The
 46744 *tsearch()* function uses **preorder**, **postorder**, and **endorder** to refer respectively to visiting a node
 46745 before any of its children, after its left child and before its right, and after both its children. The
 46746 alternative nomenclature uses **preorder**, **inorder**, and **postorder** to refer to the same visits, which
 46747 could result in some confusion over the meaning of **postorder**.

46748 RATIONALE

46749 None.

46750 FUTURE DIRECTIONS

46751 None.

46752 SEE ALSO

46754 **CHANGE HISTORY**

46755 First released in Issue 1. Derived from Issue 1 of the SVID.

46756 **Issue 5**

46757 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
46758 previous issues.

46759 **Issue 6**

46760 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

46761 The **restrict** keyword is added to the *tdelete()* prototype for alignment with the
46762 ISO / IEC 9899:1999 standard.

46763 **NAME**

46764 telldir — current location of a named directory stream

46765 **SYNOPSIS**46766 XSI `#include <dirent.h>`46767 `long telldir(DIR *dirp);`

46768

46769 **DESCRIPTION**46770 The *telldir()* function shall obtain the current location associated with the directory stream
46771 specified by *dirp*.46772 If the most recent operation on the directory stream was a *seekdir()*, the directory position
46773 returned from the *telldir()* shall be the same as that supplied as a *loc* argument for *seekdir()*.46774 **RETURN VALUE**46775 Upon successful completion, *telldir()* shall return the current location of the specified directory
46776 stream.46777 **ERRORS**

46778 No errors are defined.

46787 **SEE ALSO**46788 *opendir()*, *readdir()*, *seekdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<dirent.h>**46789 **CHANGE HISTORY**

46790 First released in Issue 2.

46791 **NAME**

46792 tempnam — create a name for a temporary file

46793 **SYNOPSIS**46794 xSI `#include <stdio.h>`46795 `char *tempnam(const char *dir, const char *pfx);`

46796

46797 **DESCRIPTION**46798 The *tempnam()* function shall generate a pathname that may be used for a temporary file.

46799 The *tempnam()* function allows the user to control the choice of a directory. The *dir* argument
 46800 points to the name of the directory in which the file is to be created. If *dir* is a null pointer or
 46801 points to a string which is not a name for an appropriate directory, the path prefix defined as
 46802 P_tmpdir in the **<stdio.h>** header shall be used. If that directory is not accessible, an
 46803 implementation-defined directory may be used.

46804 Many applications prefer their temporary files to have certain initial letter sequences in their
 46805 names. The *pfx* argument should be used for this. This argument may be a null pointer or point
 46806 to a string of up to five bytes to be used as the beginning of the filename.

46807 Some implementations of *tempnam()* may use *tmpnam()* internally. On such implementations, if
 46808 called more than {TMP_MAX} times in a single process, the behavior is implementation-defined.

46809 **RETURN VALUE**

46810 Upon successful completion, *tempnam()* shall allocate space for a string, put the generated
 46811 pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a
 46812 subsequent call to *free()*. Otherwise, it shall return a null pointer and set *errno* to indicate the
 46813 error.

46814 **ERRORS**46815 The *tempnam()* function shall fail if:

46816 [ENOMEM] Insufficient storage space is available.

46817 **EXAMPLES**46818 **Generating a Pathname**

46819 The following example generates a pathname for a temporary file in directory **/tmp**, with the
 46820 prefix *file*. After the filename has been created, the call to *free()* deallocates the space used to
 46821 store the filename.

```
46822 #include <stdio.h>
46823 #include <stdlib.h>
46824 ...
46825 char *directory = "/tmp";
46826 char *fileprefix = "file";
46827 char *file;

46828 file = tempnam(directory, fileprefix);
46829 free(file);
```

46830 **APPLICATION USAGE**

46831 This function only creates pathnames. It is the application's responsibility to create and remove
 46832 the files. Between the time a pathname is created and the file is opened, it is possible for some
 46833 other process to create a file with the same name. Applications may find *tmpfile()* more useful.

46834 **RATIONALE**

46835 None.

46836 **FUTURE DIRECTIONS**

46837 None.

46838 **SEE ALSO**

46839 *fopen()*, *free()*, *open()*, *tmpfile()*, *tmpnam()*, *unlink()*, the Base Definitions volume of
46840 IEEE Std 1003.1-2001, <**stdio.h**>

46841 **CHANGE HISTORY**

46842 First released in Issue 1. Derived from Issue 1 of the SVID.

46843 **Issue 5**

46844 The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
46845 previous issues.

46846 **NAME**

46847 tfind — search binary search tree

46848 **SYNOPSIS**

46849 XSI #include <search.h>

46850 void *tfind(const void *key, void *const *rootp,
46851 int (*compar)(const void *, const void *));

46852

46853 **DESCRIPTION**46854 Refer to *tdelete()*.

46855 **NAME**

46856 tgamma, tgammaf, tgammal — compute gamma() function

46857 **SYNOPSIS**

46858 #include <math.h>

46859 double tgamma(double x);

46860 float tgammaf(float x);

46861 long double tgammal(long double x);

46862 **DESCRIPTION**

46863 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 46864 conflict between the requirements described here and the ISO C standard is unintentional. This
 46865 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46866 These functions shall compute the *gamma()* function of *x*.

46867 An application wishing to check for error situations should set *errno* to zero and call
 46868 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 46869 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 46870 zero, an error has occurred.

46871 **RETURN VALUE**46872 Upon successful completion, these functions shall return *Gamma(x)*.

46873 If *x* is a negative integer, a domain error shall occur, and either a NaN (if supported), or an
 46874 implementation-defined value shall be returned.

46875 If the correct value would cause overflow, a range error shall occur and *tgamma()*, *tgammaf()*,
 46876 and *tgammal()* shall return $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, or $\pm\text{HUGE\_VALL}$, respectively, with
 46877 the same sign as the correct value of the function.

46878 MX If *x* is NaN, a NaN shall be returned.46879 If *x* is +Inf, *x* shall be returned.

46880 If *x* is ± 0 , a pole error shall occur, and *tgamma()*, *tgammaf()*, and *tgammal()* shall return
 46881 $\pm\text{HUGE\_VAL}$, $\pm\text{HUGE\_VALF}$, and $\pm\text{HUGE\_VALL}$, respectively.

46882 If *x* is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-
 46883 defined value shall be returned.

46884 **ERRORS**

46885 These functions shall fail if:

46886 MX Domain Error The value of *x* is a negative integer, or *x* is -Inf.

46887 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46888 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 46889 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 46890 shall be raised.

46891 MX Pole Error The value of *x* is zero.

46892 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 46893 then *errno* shall be set to [ERANGE]. If the integer expression
 46894 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
 46895 zero floating-point exception shall be raised.

46896 Range Error The value overflows.

46897 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,
 46898 then *errno* shall be set to [ERANGE]. If the integer expression
 46899 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the overflow
 46900 floating-point exception shall be raised.

46901 **EXAMPLES**

46902 None.

46903 **APPLICATION USAGE**

46904 For IEEE Std 754-1985 **double**, overflow happens when $0 < x < 1/\text{DBL\_MAX}$, and $171.7 < x$.

46905 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
 46906 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

46907 **RATIONALE**

46908 This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and
 46909 *lgamma()* functions.

46910 **FUTURE DIRECTIONS**

46911 It is possible that the error response for a negative integer argument may be changed to a pole
 46912 error and a return value of $\pm\text{Inf}$.

46913 **SEE ALSO**

46914 *feclearexcept()*, *fetestexcept()*, *lgamma()*, the Base Definitions volume of IEEE Std 1003.1-2001,

46916 **CHANGE HISTORY**

46917 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

46918 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third |
 46919 paragraph in the RETURN VALUE section. |

46920 **NAME**

46921 time — get time

46922 **SYNOPSIS**

46923 #include <time.h>

46924 time_t time(time_t *tloc);

46925 **DESCRIPTION**

46926 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 46927 conflict between the requirements described here and the ISO C standard is unintentional. This
 46928 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

46929 CX The *time()* function shall return the value of time in seconds since the Epoch.

46930 The *tloc* argument points to an area where the return value is also stored. If *tloc* is a null pointer,
 46931 no value is stored.

46932 **RETURN VALUE**

46933 Upon successful completion, *time()* shall return the value of time. Otherwise, (**time_t**)−1 shall be
 46934 returned.

46935 **ERRORS**

46936 No errors are defined.

46937 **EXAMPLES**46938 **Getting the Current Time**

46939 The following example uses the *time()* function to calculate the time elapsed, in seconds, since
 46940 the Epoch, *localtime()* to convert that value to a broken-down time, and *asctime()* to convert the
 46941 broken-down time values into a printable string.

```
46942       #include <stdio.h>
46943       #include <time.h>

46944       int main(void)
46945       {
46946       time_t result;

46947           result = time(NULL);
46948           printf("%s%ju secs since the Epoch\n",
46949                asctime(localtime(&result)),
46950                (uintmax_t)result);
46951           return(0);
46952       }
```

46953 This example writes the current time to *stdout* in a form like this:

```
46954       Wed Jun 26 10:32:15 1996
46955       835810335 secs since the Epoch
```

Timing an Event

The following example gets the current time, prints it out in the user's format, and prints the number of minutes to an event being timed.

```
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
minutes_to_event = ...;
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",
      minutes_to_event);
...
```

APPLICATION USAGE

None.

RATIONALE

The *time()* function returns a value in seconds (type **time_t**) while *times()* returns a set of values in clock ticks (type **clock_t**). Some historical implementations, such as 4.3 BSD, have mechanisms capable of returning more precise times (see below). A generalized timing scheme to unify these various timing mechanisms has been proposed but not adopted.

Implementations in which **time_t** is a 32-bit signed integer (many historical implementations) fail in the year 2038. IEEE Std 1003.1-2001 does not address this problem. However, the use of the **time_t** type is mandated in order to ease the eventual fix.

The use of the **<time.h>** header instead of **<sys/types.h>** allows compatibility with the ISO C standard.

Many historical implementations (including Version 7) and the 1984 /usr/group standard use **long** instead of **time_t**. This volume of IEEE Std 1003.1-2001 uses the latter type in order to agree with the ISO C standard.

4.3 BSD includes *time()* only as an alternate function to the more flexible *gettimeofday()* function.

FUTURE DIRECTIONS

In a future version of this volume of IEEE Std 1003.1-2001, **time_t** is likely to be required to be capable of representing times far in the future. Whether this will be mandated as a 64-bit type or a requirement that a specific date in the future be representable (for example, 10000 AD) is not yet determined. Systems purchased after the approval of this volume of IEEE Std 1003.1-2001 should be evaluated to determine whether their lifetime will extend past 2038.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

46999 **Issue 6**

47000 Extensions beyond the ISO C standard are marked.

47001 The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.

47002 **NAME**47003 timer_create — create a per-process timer (**REALTIME**)47004 **SYNOPSIS**

```
47005 TMR    #include <signal.h>
47006         #include <time.h>
```

```
47007         int timer_create(clockid_t clockid, struct sigevent *restrict evp,
47008                         timer_t *restrict timerid);
47009
```

47010 **DESCRIPTION**

47011 The *timer_create()* function shall create a per-process timer using the specified clock, *clock_id*, as
 47012 the timing base. The *timer_create()* function shall return, in the location referenced by *timerid*, a
 47013 timer ID of type **timer_t** used to identify the timer in timer requests. This timer ID shall be
 47014 unique within the calling process until the timer is deleted. The particular clock, *clock_id*, is
 47015 defined in **<time.h>**. The timer whose ID is returned shall be in a disarmed state upon return
 47016 from *timer_create()*.

47017 The *evp* argument, if non-NULL, points to a **sigevent** structure. This structure, allocated by the
 47018 application, defines the asynchronous notification to occur as specified in Section 2.4.1 (on page
 47019 28) when the timer expires. If the *evp* argument is NULL, the effect is as if the *evp* argument
 47020 pointed to a **sigevent** structure with the *sigev_notify* member having the value SIGEV_SIGNAL,
 47021 the *sigev_signo* having a default signal number, and the *sigev_value* member having the value of
 47022 the timer ID.

47023 Each implementation shall define a set of clocks that can be used as timing bases for per-process
 47024 MON timers. All implementations shall support a *clock_id* of CLOCK_REALTIME. If the Monotonic
 47025 Clock option is supported, implementations shall support a *clock_id* of CLOCK_MONOTONIC.

47026 Per-process timers shall not be inherited by a child process across a *fork()* and shall be disarmed
 47027 and deleted by an *exec*.

47028 CPT If _POSIX_CPUTIME is defined, implementations shall support *clock_id* values representing the
 47029 CPU-time clock of the calling process.

47030 TCT If _POSIX_THREAD_CPUTIME is defined, implementations shall support *clock_id* values
 47031 representing the CPU-time clock of the calling thread.

47032 CPT|TCT It is implementation-defined whether a *timer_create()* function will succeed if the value defined
 47033 by *clock_id* corresponds to the CPU-time clock of a process or thread different from the process
 47034 or thread invoking the function.

47035 **RETURN VALUE**

47036 If the call succeeds, *timer_create()* shall return zero and update the location referenced by *timerid*
 47037 to a **timer_t**, which can be passed to the per-process timer calls. If an error occurs, the function
 47038 shall return a value of -1 and set *errno* to indicate the error. The value of *timerid* is undefined if
 47039 an error occurs.

47040 **ERRORS**

47041 The *timer_create()* function shall fail if:

47042	[EAGAIN]	The system lacks sufficient signal queuing resources to honor the request.
47043	[EAGAIN]	The calling process has already created all of the timers it is allowed by this
47044		implementation.
47045	[EINVAL]	The specified clock ID is not defined.

47046 CPT|TCT [ENOTSUP] The implementation does not support the creation of a timer attached to the
 47047 CPU-time clock that is specified by *clock_id* and associated with a process or
 47048 thread different from the process or thread invoking *timer_create()*.

47049 EXAMPLES

47050 None.

47051 APPLICATION USAGE

47052 None.

47053 RATIONALE

47054 Periodic Timer Overrun and Resource Allocation

47055 The specified timer facilities may deliver realtime signals (that is, queued signals) on
 47056 implementations that support this option. Since realtime applications cannot afford to lose
 47057 notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it
 47058 must be possible to ensure that sufficient resources exist to deliver the signal when the event
 47059 occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a
 47060 request and a subsequent signal generation. If the request cannot allocate the signal delivery
 47061 resources, it can fail the call with an [EAGAIN] error.

47062 Periodic timers are a special case. A single request can generate an unspecified number of
 47063 signals. This is not a problem if the requesting process can service the signals as fast as they are
 47064 generated, thus making the signal delivery resources available for delivery of subsequent
 47065 periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic
 47066 timer signals may “overrun”; that is, subsequent periodic timer expirations may occur before the
 47067 currently pending signal has been delivered.

47068 Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a
 47069 pending signal are generated, it is implementation-defined whether a signal is delivered for each
 47070 occurrence. This is not adequate for some realtime applications. So a mechanism is required to
 47071 allow applications to detect how many timer expirations were delayed without requiring an
 47072 indefinite amount of system resources to store the delayed expirations.

47073 The specified facilities provide for an overrun count. The overrun count is defined as the number
 47074 of extra timer expirations that occurred between the time a timer expiration signal is generated
 47075 and the time the signal is delivered. The signal-catching function, if it is concerned with
 47076 overruns, can retrieve this count on entry. With this method, a periodic timer only needs one
 47077 “signal queuing resource” that can be allocated at the time of the *timer_create()* function call.

47078 A function is defined to retrieve the overrun count so that an application need not allocate static
 47079 storage to contain the count, and an implementation need not update this storage
 47080 asynchronously on timer expirations. But, for some high-frequency periodic applications, the
 47081 overhead of an additional system call on each timer expiration may be prohibitive. The
 47082 functions, as defined, permit an implementation to maintain the overrun count in user space,
 47083 associated with the *timerid*. The *timer_getoverrun()* function can then be implemented as a macro
 47084 that uses the *timerid* argument (which may just be a pointer to a user space structure containing
 47085 the counter) to locate the overrun count with no system call overhead. Other implementations,
 47086 less concerned with this class of applications, can avoid the asynchronous update of user space
 47087 by maintaining the count in a system structure at the cost of the extra system call to obtain it.

47088 **Timer Expiration Signal Parameters**

47089 The Realtime Signals Extension option supports an application-specific datum that is delivered
47090 to the extended signal handler. This value is explicitly specified by the application, along with
47091 the signal number to be delivered, in a **sigevent** structure. The type of the application-defined
47092 value can be either an integer constant or a pointer. This explicit specification of the value, as
47093 opposed to always sending the timer ID, was selected based on existing practice.

47094 It is common practice for realtime applications (on non-POSIX systems or realtime extended
47095 POSIX systems) to use the parameters of event handlers as the case label of a switch statement
47096 or as a pointer to an application-defined data structure. Since *timer_ids* are dynamically allocated
47097 by the *timer_create()* function, they can be used for neither of these functions without additional
47098 application overhead in the signal handler; for example, to search an array of saved timer IDs to
47099 associate the ID with a constant or application data structure.

47100 **FUTURE DIRECTIONS**

47101 None.

47102 **SEE ALSO**

47103 *clock_getres()*, *timer_delete()*, *timer_getoverrun()*, the Base Definitions volume of
47104 IEEE Std 1003.1-2001, <**time.h**>

47105 **CHANGE HISTORY**

47106 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

47107 **Issue 6**

47108 The *timer_create()* function is marked as part of the Timers option.

47109 The [ENOSYS] error condition has been removed as stubs need not be provided if an
47110 implementation does not support the Timers option.

47111 CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

47112 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the
47113 requirement for the CLOCK_MONOTONIC clock under the Monotonic Clock option.

47114 The **restrict** keyword is added to the *timer_create()* prototype for alignment with the
47115 ISO/IEC 9899:1999 standard.

47116 **NAME**

47117 timer_delete — delete a per-process timer (**REALTIME**)

47118 **SYNOPSIS**

47119 TMR `#include <time.h>`

47120 `int timer_delete(timer_t timerid);`

47121

47122 **DESCRIPTION**

47123 The *timer_delete()* function deletes the specified timer, *timerid*, previously created by the
47124 *timer_create()* function. If the timer is armed when *timer_delete()* is called, the behavior shall be
47125 as if the timer is automatically disarmed before removal. The disposition of pending signals for
47126 the deleted timer is unspecified.

47127 **RETURN VALUE**

47128 If successful, the *timer_delete()* function shall return a value of zero. Otherwise, the function shall
47129 return a value of `-1` and set *errno* to indicate the error.

47130 **ERRORS**

47131 The *timer_delete()* function shall fail if:

47132 [EINVAL] The timer ID specified by *timerid* is not a valid timer ID.

47133 **EXAMPLES**

47134 None.

47135 **APPLICATION USAGE**

47136 None.

47137 **RATIONALE**

47138 None.

47139 **FUTURE DIRECTIONS**

47140 None.

47141 **SEE ALSO**

47142 *timer_create()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<time.h>**

47143 **CHANGE HISTORY**

47144 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

47145 **Issue 6**

47146 The *timer_delete()* function is marked as part of the Timers option.

47147 The [ENOSYS] error condition has been removed as stubs need not be provided if an
47148 implementation does not support the Timers option.

47149 **NAME**47150 timer_getoverrun, timer_gettime, timer_settime — per-process timers (**REALTIME**)47151 **SYNOPSIS**47152 TMR `#include <time.h>`

```

47153 int timer_getoverrun(timer_t timerid);
47154 int timer_gettime(timer_t timerid, struct itimerspec *value);
47155 int timer_settime(timer_t timerid, int flags,
47156                  const struct itimerspec *restrict value,
47157                  struct itimerspec *restrict ovalue);
47158

```

47159 **DESCRIPTION**

47160 The *timer_gettime()* function shall store the amount of time until the specified timer, *timerid*,
 47161 expires and the reload value of the timer into the space pointed to by the *value* argument. The
 47162 *it_value* member of this structure shall contain the amount of time before the timer expires, or
 47163 zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if
 47164 the timer was armed with absolute time. The *it_interval* member of *value* shall contain the reload
 47165 value last set by *timer_settime()*.

47166 The *timer_settime()* function shall set the time until the next expiration of the timer specified by
 47167 *timerid* from the *it_value* member of the *value* argument and arm the timer if the *it_value* member
 47168 of *value* is non-zero. If the specified timer was already armed when *timer_settime()* is called, this
 47169 call shall reset the time until next expiration to the *value* specified. If the *it_value* member of *value*
 47170 is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending
 47171 expiration notifications is unspecified.

47172 If the flag **TIMER_ABSTIME** is not set in the argument *flags*, *timer_settime()* shall behave as if the
 47173 time until next expiration is set to be equal to the interval specified by the *it_value* member of
 47174 *value*. That is, the timer shall expire in *it_value* nanoseconds from when the call is made. If the
 47175 flag **TIMER_ABSTIME** is set in the argument *flags*, *timer_settime()* shall behave as if the time
 47176 until next expiration is set to be equal to the difference between the absolute time specified by
 47177 the *it_value* member of *value* and the current value of the clock associated with *timerid*. That is,
 47178 the timer shall expire when the clock reaches the value specified by the *it_value* member of *value*.
 47179 If the specified time has already passed, the function shall succeed and the expiration
 47180 notification shall be made.

47181 The reload value of the timer shall be set to the value specified by the *it_interval* member of
 47182 *value*. When a timer is armed with a non-zero *it_interval*, a periodic (or repetitive) timer is
 47183 specified.

47184 Time values that are between two consecutive non-negative integer multiples of the resolution
 47185 of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization
 47186 error shall not cause the timer to expire earlier than the rounded time value.

47187 If the argument *ovalue* is not NULL, the *timer_settime()* function shall store, in the location
 47188 referenced by *ovalue*, a value representing the previous amount of time before the timer would
 47189 have expired, or zero if the timer was disarmed, together with the previous timer reload value.
 47190 Timers shall not expire before their scheduled time.

47191 Only a single signal shall be queued to the process for a given timer at any point in time. When a
 47192 timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun
 47193 shall occur. When a timer expiration signal is delivered to or accepted by a process, if the
 47194 implementation supports the Realtime Signals Extension, the *timer_getoverrun()* function shall
 47195 return the timer expiration overrun count for the specified timer. The overrun count returned
 47196 contains the number of extra timer expirations that occurred between the time the signal was

generated (queued) and when it was delivered or accepted, up to but not including an implementation-defined maximum of {DELAYTIMER_MAX}. If the number of such extra expirations is greater than or equal to {DELAYTIMER_MAX}, then the overrun count shall be set to {DELAYTIMER_MAX}. The value returned by *timer_getoverrun()* shall apply to the most recent expiration signal delivery or acceptance for the timer. If no expiration signal has been delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of *timer_getoverrun()* is unspecified.

47204 RETURN VALUE

47205 If the *timer_getoverrun()* function succeeds, it shall return the timer expiration overrun count as
47206 explained above.

47207 If the *timer_gettime()* or *timer_settime()* functions succeed, a value of 0 shall be returned.

47208 If an error occurs for any of these functions, the value -1 shall be returned, and *errno* set to
47209 indicate the error.

47210 ERRORS

47211 The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions shall fail if:

47212 [EINVAL] The *timerid* argument does not correspond to an ID returned by *timer_create()*
47213 but not yet deleted by *timer_delete()*.

47214 The *timer_settime()* function shall fail if:

47215 [EINVAL] A *value* structure specified a nanosecond value less than zero or greater than
47216 or equal to 1 000 million, and the *it_value* member of that structure did not
47217 specify zero seconds and nanoseconds.

47218 EXAMPLES

47219 None.

47220 APPLICATION USAGE

47221 None.

47222 RATIONALE

47223 Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The
47224 inverse of this tick rate is the clock resolution, also called the clock granularity, which in either
47225 case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for
47226 these common rates. The granularity of practical clocks implies that if one reads a given clock
47227 twice in rapid succession, one may get the same time value twice; and that timers must wait for
47228 the next clock tick after the theoretical expiration time, to ensure that a timer never returns too
47229 soon. Note also that the granularity of the clock may be significantly coarser than the resolution
47230 of the data format used to set and get time and interval values. Also note that some
47231 implementations may choose to adjust time and/or interval values to exactly match the ticks of
47232 the underlying clock.

47233 This volume of IEEE Std 1003.1-2001 defines functions that allow an application to determine the
47234 implementation-supported resolution for the clocks and requires an implementation to
47235 document the resolution supported for timers and *nanosleep()* if they differ from the supported
47236 clock resolution. This is more of a procurement issue than a runtime application issue.

47237 FUTURE DIRECTIONS

47238 None.

47241 **CHANGE HISTORY**

47242 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

47243 **Issue 6**

47244 The *timer_getoverrun()*, *timer_gettime()*, and *timer_settime()* functions are marked as part of the
47245 Timers option.

47246 The [ENOSYS] error condition has been removed as stubs need not be provided if an
47247 implementation does not support the Timers option.

47248 The [EINVAL] error condition is updated to include the following: “and the *it_value* member of
47249 that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC
47250 Interpretation 1003.1 #89.

47251 The DESCRIPTION for *timer_getoverrun()* is updated to clarify that “If no expiration signal has
47252 been delivered for the timer, or if the Realtime Signals Extension is not supported, the return
47253 value of *timer_getoverrun()* is unspecified”.

47254 The **restrict** keyword is added to the *timer_settime()* prototype for alignment with the
47255 ISO / IEC 9899:1999 standard.

47256 **NAME**

47257 times — get process and waited-for child process times

47258 **SYNOPSIS**

47259 #include <sys/times.h>

47260 clock_t times(struct tms *buffer);

47261 **DESCRIPTION**47262 The *times()* function shall fill the **tms** structure pointed to by *buffer* with time-accounting
47263 information. The **tms** structure is defined in <sys/times.h>.

47264 All times are measured in terms of the number of clock ticks used.

47265 The times of a terminated child process shall be included in the *tms_cutime* and *tms_cstime*
47266 elements of the parent when *wait()* or *waitpid()* returns the process ID of this terminated child. If
47267 a child process has not waited for its children, their times shall not be included in its times.47268 • The *tms_utime* structure member is the CPU time charged for the execution of user
47269 instructions of the calling process.47270 • The *tms_stime* structure member is the CPU time charged for execution by the system on
47271 behalf of the calling process.47272 • The *tms_cutime* structure member is the sum of the *tms_utime* and *tms_cutime* times of the
47273 child processes.47274 • The *tms_cstime* structure member is the sum of the *tms_stime* and *tms_cstime* times of the child
47275 processes.47276 **RETURN VALUE**47277 Upon successful completion, *times()* shall return the elapsed real time, in clock ticks, since an
47278 arbitrary point in the past (for example, system start-up time). This point does not change from
47279 one invocation of *times()* within the process to another. The return value may overflow the
47280 possible range of type **clock_t**. If *times()* fails, (**clock_t**)-1 shall be returned and *errno* set to
47281 indicate the error.47282 **ERRORS**

47283 No errors are defined.

47284 **EXAMPLES**47285 **Timing a Database Lookup**47286 The following example defines two functions, *start_clock()* and *end_clock()*, that are used to time
47287 a lookup. It also defines variables of type **clock_t** and **tms** to measure the duration of
47288 transactions. The *start_clock()* function saves the beginning times given by the *times()* function.
47289 The *end_clock()* function gets the ending times and prints the difference between the two times.47290 #include <sys/times.h>
47291 #include <stdio.h>
47292 ...
47293 void start_clock(void);
47294 void end_clock(char *msg);
47295 ...
47296 static clock_t st_time;
47297 static clock_t en_time;
47298 static struct tms st_cpu;
47299 static struct tms en_cpu;

```

47300     ...
47301     void
47302     start_clock()
47303     {
47304         st_time = times(&st_cpu);
47305     }

47306     /* This example assumes that the result of each subtraction
47307        is within the range of values that can be represented in
47308        an integer type. */
47309     void
47310     end_clock(char *msg)
47311     {
47312         en_time = times(&en_cpu);

47313         fputs(msg, stdout);
47314         printf("Real Time: %jd, User Time %jd, System Time %jd\n",
47315             (intmax_t)(en_time - st_time),
47316             (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
47317             (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
47318     }

```

47319 APPLICATION USAGE

47320 Applications should use `sysconf(_SC_CLK_TCK)` to determine the number of clock ticks per
 47321 second as it may vary from system to system.

47322 RATIONALE

47323 The accuracy of the times reported is intentionally left unspecified to allow implementations
 47324 flexibility in design, from uniprocessor to multi-processor networks.

47325 The inclusion of times of child processes is recursive, so that a parent process may collect the
 47326 total times of all of its descendants. But the times of a child are only added to those of its parent
 47327 when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process
 47328 can always see the total times of all its descendants; see also the discussion of the term
 47329 “realtime” in *alarm()*.

47330 If the type **clock_t** is defined to be a signed 32-bit integer, it overflows in somewhat more than a
 47331 year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual
 47332 systems that run continuously for longer than that. This volume of IEEE Std 1003.1-2001 permits
 47333 an implementation to make the reference point for the returned value be the start-up time of the
 47334 process, rather than system start-up time.

47335 The term “charge” in this context has nothing to do with billing for services. The operating
 47336 system accounts for time used in this way. That information must be correct, regardless of how
 47337 that information is used.

47338 FUTURE DIRECTIONS

47339 None.

47340 SEE ALSO

47341 *alarm()*, *exec*, *fork()*, *sysconf()*, *time()*, *wait()*, the Base Definitions volume of
 47342 IEEE Std 1003.1-2001, <**sys/times.h**>

47343 CHANGE HISTORY

47344 First released in Issue 1. Derived from Issue 1 of the SVID.

47345 NAME

47346 timezone — difference from UTC and local standard time

47347 SYNOPSIS

47348 xSI #include <time.h>

47349 extern long timezone;

47350

47351 DESCRIPTION

47352 Refer to *tzset()*.

47353 **NAME**

47354 tmpfile — create a temporary file

47355 **SYNOPSIS**

47356 #include <stdio.h>

47357 FILE *tmpfile(void);

47358 **DESCRIPTION**

47359 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 47360 conflict between the requirements described here and the ISO C standard is unintentional. This
 47361 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47362 The *tmpfile()* function shall create a temporary file and open a corresponding stream. The file
 47363 shall be automatically deleted when all references to the file are closed. The file is opened as in
 47364 *fopen()* for update (w+).

47365 CX In some implementations, a permanent file may be left behind if the process calling *tmpfile()* is
 47366 killed while it is processing a call to *tmpfile()*.

47367 An error message may be written to standard error if the stream cannot be opened.

47368 **RETURN VALUE**

47369 Upon successful completion, *tmpfile()* shall return a pointer to the stream of the file that is
 47370 CX created. Otherwise, it shall return a null pointer and set *errno* to indicate the error.

47371 **ERRORS**47372 The *tmpfile()* function shall fail if:

47373 CX [EINTR] A signal was caught during *tmpfile()*.

47374 CX [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

47375 CX [ENFILE] The maximum allowable number of files is currently open in the system.

47376 CX [ENOSPC] The directory or file system which would contain the new file cannot be
 47377 expanded.

47378 CX [EOVERFLOW] The file is a regular file and the size of the file cannot be represented correctly
 47379 in an object of type **off_t**.

47380 The *tmpfile()* function may fail if:

47381 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

47382 CX [ENOMEM] Insufficient storage space is available.

47383 **EXAMPLES**47384 **Creating a Temporary File**

47385 The following example creates a temporary file for update, and returns a pointer to a stream for
 47386 the created file in the *fp* variable.

47387 #include <stdio.h>

47388 ...

47389 FILE *fp;

47390 fp = tmpfile ();

47391 **APPLICATION USAGE**

47392 It should be possible to open at least {TMP_MAX} temporary files during the lifetime of the
47393 program (this limit may be shared with *tmpnam()*) and there should be no limit on the number
47394 simultaneously open other than this limit and any limit on the number of open files
47395 ({FOPEN_MAX}).

47396 **RATIONALE**

47397 None.

47398 **FUTURE DIRECTIONS**

47399 None.

47400 **SEE ALSO**

47401 *fopen()*, *tmpnam()*, *unlink()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>

47402 **CHANGE HISTORY**

47403 First released in Issue 1. Derived from Issue 1 of the SVID.

47404 **Issue 5**

47405 Large File Summit extensions are added.

47406 The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes
47407 in previous issues.

47408 **Issue 6**

47409 Extensions beyond the ISO C standard are marked.

47410 The following new requirements on POSIX implementations derive from alignment with the
47411 Single UNIX Specification:

- 47412 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
47413 large files.
- 47414 • The [EMFILE] optional error condition is added.

47415 The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999
47416 standard.

47417 **NAME**

47418 tmpnam — create a name for a temporary file

47419 **SYNOPSIS**

47420 #include <stdio.h>

47421 char *tmpnam(char *s);

47422 **DESCRIPTION**

47423 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 47424 conflict between the requirements described here and the ISO C standard is unintentional. This
 47425 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47426 The *tmpnam()* function shall generate a string that is a valid filename and that is not the same as
 47427 the name of an existing file. The function is potentially capable of generating {TMP_MAX}
 47428 different strings, but any or all of them may already be in use by existing files and thus not be
 47429 suitable return values.

47430 The *tmpnam()* function generates a different string each time it is called from the same process,
 47431 up to {TMP_MAX} times. If it is called more than {TMP_MAX} times, the behavior is
 47432 implementation-defined.

47433 The implementation shall behave as if no function defined in this volume of
 47434 IEEE Std 1003.1-2001 calls *tmpnam()*.

47435 CX If the application uses any of the functions guaranteed to be available if either
 47436 _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS is defined, the application shall
 47437 ensure that the *tmpnam()* function is called with a non-NULL parameter.

47438 **RETURN VALUE**

47439 Upon successful completion, *tmpnam()* shall return a pointer to a string. If no suitable string can
 47440 be generated, the *tmpnam()* function shall return a null pointer.

47441 If the argument *s* is a null pointer, *tmpnam()* shall leave its result in an internal static object and
 47442 return a pointer to that object. Subsequent calls to *tmpnam()* may modify the same object. If the
 47443 argument *s* is not a null pointer, it is presumed to point to an array of at least L_tmpnam **chars**;
 47444 *tmpnam()* shall write its result in that array and shall return the argument as its value.

47445 **ERRORS**

47446 No errors are defined.

47447 **EXAMPLES**47448 **Generating a Filename**47449 The following example generates a unique filename and stores it in the array pointed to by *ptr*.

47450 #include <stdio.h>

47451 ...

47452 char filename[L_tmpnam+1];

47453 char *ptr;

47454 ptr = tmpnam(filename);

47455 **APPLICATION USAGE**

47456 This function only creates filenames. It is the application's responsibility to create and remove
 47457 the files.

47458 Between the time a pathname is created and the file is opened, it is possible for some other
 47459 process to create a file with the same name. Applications may find *tmpfile()* more useful.

47460 **RATIONALE**

47461 None.

47462 **FUTURE DIRECTIONS**

47463 None.

47464 **SEE ALSO**

47465 *fopen()*, *open()*, *tempnam()*, *tmpfile()*, *unlink()*, the Base Definitions volume of
47466 IEEE Std 1003.1-2001, **<stdio.h>**

47467 **CHANGE HISTORY**

47468 First released in Issue 1. Derived from Issue 1 of the SVID.

47469 **Issue 5**

47470 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

47471 **Issue 6**

47472 Extensions beyond the ISO C standard are marked.

47473 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47474 The DESCRIPTION is expanded for alignment with the ISO/IEC 9899:1999 standard.

47475 **NAME**

47476 toascii — translate an integer to a 7-bit ASCII character

47477 **SYNOPSIS**

47478 xSI #include <ctype.h>

47479 int toascii(int c);

47480

47481 **DESCRIPTION**47482 The *toascii()* function shall convert its argument into a 7-bit ASCII character.47483 **RETURN VALUE**47484 The *toascii()* function shall return the value (*c* & 0x7f).47485 **ERRORS**

47486 No errors are returned.

47487 **EXAMPLES**

47488 None.

47489 **APPLICATION USAGE**

47490 None.

47491 **RATIONALE**

47492 None.

47493 **FUTURE DIRECTIONS**

47494 None.

47498 First released in Issue 1. Derived from Issue 1 of the SVID.

47499 NAME

47500 tolower — transliterate uppercase characters to lowercase

47501 SYNOPSIS

47502 #include <ctype.h>

47503 int tolower(int c);

47504 DESCRIPTION

47505 CX The functionality described on this reference page is aligned with the ISO C standard. Any
47506 conflict between the requirements described here and the ISO C standard is unintentional. This
47507 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47508 The *tolower()* function has as a domain a type **int**, the value of which is representable as an
47509 **unsigned char** or the value of EOF. If the argument has any other value, the behavior is
47510 undefined. If the argument of *tolower()* represents an uppercase letter, and there exists a
47511 CX corresponding lowercase letter (as defined by character type information in the program locale
47512 category *LC_CTYPE*), the result shall be the corresponding lowercase letter. All other arguments
47513 in the domain are returned unchanged.

47514 RETURN VALUE

47515 Upon successful completion, *tolower()* shall return the lowercase letter corresponding to the
47516 argument passed; otherwise, it shall return the argument unchanged.

47517 ERRORS

47518 No errors are defined.

47519 EXAMPLES

47520 None.

47521 APPLICATION USAGE

47522 None.

47523 RATIONALE

47524 None.

47525 FUTURE DIRECTIONS

47526 None.

47527 SEE ALSO

47528 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, **<ctype.h>**

47529 CHANGE HISTORY

47530 First released in Issue 1. Derived from Issue 1 of the SVID.

47531 Issue 6

47532 Extensions beyond the ISO C standard are marked.

47533 **NAME**

47534 toupper — transliterate lowercase characters to uppercase

47535 **SYNOPSIS**

47536 #include <ctype.h>

47537 int toupper(int c);

47538 **DESCRIPTION**

47539 CX The functionality described on this reference page is aligned with the ISO C standard. Any
47540 conflict between the requirements described here and the ISO C standard is unintentional. This
47541 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47542 The *toupper()* function has as a domain a type **int**, the value of which is representable as an
47543 **unsigned char** or the value of EOF. If the argument has any other value, the behavior is
47544 undefined. If the argument of *toupper()* represents a lowercase letter, and there exists a
47545 CX corresponding uppercase letter (as defined by character type information in the program locale
47546 category *LC_CTYPE*), the result shall be the corresponding uppercase letter. All other arguments
47547 in the domain are returned unchanged.

47548 **RETURN VALUE**

47549 Upon successful completion, *toupper()* shall return the uppercase letter corresponding to the
47550 argument passed.

47551 **ERRORS**

47552 No errors are defined.

47553 **EXAMPLES**

47554 None.

47555 **APPLICATION USAGE**

47556 None.

47557 **RATIONALE**

47558 None.

47559 **FUTURE DIRECTIONS**

47560 None.

47561 **SEE ALSO**47562 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <ctype.h>47563 **CHANGE HISTORY**

47564 First released in Issue 1. Derived from Issue 1 of the SVID.

47565 **Issue 6**

47566 Extensions beyond the ISO C standard are marked.

47567 **NAME**

47568 towctrans — wide-character transliteration

47569 **SYNOPSIS**

47570 #include <wctype.h>

47571 wint_t towctrans(wint_t *wc*, wctrans_t *desc*);47572 **DESCRIPTION**

47573 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 47574 conflict between the requirements described here and the ISO C standard is unintentional. This
 47575 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47576 The *towctrans()* function shall transliterate the wide-character code *wc* using the mapping
 47577 described by *desc*. The current setting of the *LC_CTYPE* category should be the same as during
 47578 CX the call to *wctrans()* that returned the value *desc*. If the value of *desc* is invalid (that is, not
 47579 obtained by a call to *wctrans()* or *desc* is invalidated by a subsequent call to *setlocale()* that has
 47580 affected category *LC_CTYPE*), the result is unspecified.

47581 An application wishing to check for error situations should set *errno* to 0 before calling
 47582 *towctrans()*. If *errno* is non-zero on return, an error has occurred.

47583 **RETURN VALUE**

47584 If successful, the *towctrans()* function shall return the mapped value of *wc* using the mapping
 47585 described by *desc*. Otherwise, it shall return *wc* unchanged.

47586 **ERRORS**47587 The *towctrans()* function may fail if:

47588 CX [EINVAL] *desc* contains an invalid transliteration descriptor.

47589 **EXAMPLES**

47590 None.

47591 **APPLICATION USAGE**

47592 The strings "tolower" and "toupper" are reserved for the standard mapping names. In the
 47593 table below, the functions in the left column are equivalent to the functions in the right column.

47594 tolower(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("tolower"))
47595 toupper(<i>wc</i>)	towctrans(<i>wc</i> , wctrans("toupper"))

47596 **RATIONALE**

47597 None.

47598 **FUTURE DIRECTIONS**

47599 None.

47600 **SEE ALSO**

47601 *tolower()*, *toupper()*, *wctrans()*, the Base Definitions volume of IEEE Std 1003.1-2001,
 47602 <wctype.h>

47603 **CHANGE HISTORY**

47604 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

47605 **Issue 6**

47606 Extensions beyond the ISO C standard are marked.

47607 **NAME**

47608 tolower — transliterate uppercase wide-character code to lowercase

47609 **SYNOPSIS**

47610 #include <wctype.h>

47611 wint_t tolower(wint_t wc);

47612 **DESCRIPTION**

47613 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 47614 conflict between the requirements described here and the ISO C standard is unintentional. This
 47615 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47616 The *tolower()* function has as a domain a type **wint_t**, the value of which the application shall
 47617 ensure is a character representable as a **wchar_t**, and a wide-character code corresponding to a
 47618 valid character in the current locale or the value of WEOF. If the argument has any other value,
 47619 the behavior is undefined. If the argument of *tolower()* represents an uppercase wide-character
 47620 code, and there exists a corresponding lowercase wide-character code (as defined by character
 47621 type information in the program locale category *LC_CTYPE*), the result shall be the
 47622 corresponding lowercase wide-character code. All other arguments in the domain are returned
 47623 unchanged.

47624 **RETURN VALUE**

47625 Upon successful completion, *tolower()* shall return the lowercase letter corresponding to the
 47626 argument passed; otherwise, it shall return the argument unchanged.

47627 **ERRORS**

47628 No errors are defined.

47629 **EXAMPLES**

47630 None.

47631 **APPLICATION USAGE**

47632 None.

47633 **RATIONALE**

47634 None.

47635 **FUTURE DIRECTIONS**

47636 None.

47637 **SEE ALSO**

47638 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <**wctype.h**>,
 47639 <**wchar.h**>

47640 **CHANGE HISTORY**

47641 First released in Issue 4.

47642 **Issue 5**

47643 The following change has been made in this issue for alignment with
 47644 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 47645 • The SYNOPSIS has been changed to indicate that this function and associated data types are
 47646 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

47647 **Issue 6**

47648 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47649 **NAME**

47650 towupper — transliterate lowercase wide-character code to uppercase

47651 **SYNOPSIS**

47652 #include <wctype.h>

47653 wint_t towupper(wint_t wc);

47654 **DESCRIPTION**

47655 cx The functionality described on this reference page is aligned with the ISO C standard. Any
47656 conflict between the requirements described here and the ISO C standard is unintentional. This
47657 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

47658 The *towupper()* function has as a domain a type **wint_t**, the value of which the application shall
47659 ensure is a character representable as a **wchar_t**, and a wide-character code corresponding to a
47660 valid character in the current locale or the value of WEOF. If the argument has any other value,
47661 the behavior is undefined. If the argument of *towupper()* represents a lowercase wide-character
47662 code, and there exists a corresponding uppercase wide-character code (as defined by character
47663 type information in the program locale category *LC_CTYPE*), the result shall be the
47664 corresponding uppercase wide-character code. All other arguments in the domain are returned
47665 unchanged.

47666 **RETURN VALUE**

47667 Upon successful completion, *towupper()* shall return the uppercase letter corresponding to the
47668 argument passed. Otherwise, it shall return the argument unchanged.

47669 **ERRORS**

47670 No errors are defined.

47671 **EXAMPLES**

47672 None.

47673 **APPLICATION USAGE**

47674 None.

47675 **RATIONALE**

47676 None.

47677 **FUTURE DIRECTIONS**

47678 None.

47679 **SEE ALSO**

47680 *setlocale()*, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <**wctype.h**>,
47681 <**wchar.h**>

47682 **CHANGE HISTORY**

47683 First released in Issue 4.

47684 **Issue 5**

47685 The following change has been made in this issue for alignment with
47686 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 47687 • The SYNOPSIS has been changed to indicate that this function and associated data types are
47688 now made visible by inclusion of the <**wctype.h**> header rather than <**wchar.h**>.

47689 **Issue 6**

47690 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47691 **NAME**

47692 trunc, truncf, trunc1 — round to truncated integer value

47693 **SYNOPSIS**

47694 #include <math.h>

47695 double trunc(double x);

47696 float truncf(float x);

47697 long double trunc1(long double x);

47698 **DESCRIPTION**47699 CX The functionality described on this reference page is aligned with the ISO C standard. Any
47700 conflict between the requirements described here and the ISO C standard is unintentional. This
47701 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.47702 These functions shall round their argument to the integer value, in floating format, nearest to but
47703 no larger in magnitude than the argument.47704 **RETURN VALUE**

47705 Upon successful completion, these functions shall return the truncated integer value.

47706 MX If x is NaN, a NaN shall be returned.47707 If x is ± 0 or $\pm \text{Inf}$, x shall be returned.47708 **ERRORS**

47709 No errors are defined.

47710 **EXAMPLES**

47711 None.

47712 **APPLICATION USAGE**

47713 None.

47714 **RATIONALE**

47715 None.

47716 **FUTURE DIRECTIONS**

47717 None.

47718 **SEE ALSO**

47719 The Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

47720 **CHANGE HISTORY**

47721 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

47722 **NAME**

47723 truncate — truncate a file to a specified length

47724 **SYNOPSIS**

47725 xSI #include <unistd.h>

47726 int truncate(const char *path, off_t length);

47727

47728 **DESCRIPTION**47729 The *truncate()* function shall cause the regular file named by *path* to have a size which shall be
47730 equal to *length* bytes.47731 If the file previously was larger than *length*, the extra data is discarded. If the file was previously
47732 shorter than *length*, its size is increased, and the extended area appears as if it were zero-filled.

47733 The application shall ensure that the process has write permission for the file.

47734 If the request would cause the file size to exceed the soft file size limit for the process, the
47735 request shall fail and the implementation shall generate the SIGXFSZ signal for the process.47736 This function shall not modify the file offset for any open file descriptions associated with the
47737 file. Upon successful completion, if the file size is changed, this function shall mark for update
47738 the *st_ctime* and *st_mtime* fields of the file, and the S_ISUID and S_ISGID bits of the file mode
47739 may be cleared.47740 **RETURN VALUE**47741 Upon successful completion, *truncate()* shall return 0. Otherwise, -1 shall be returned, and *errno*
47742 set to indicate the error.47743 **ERRORS**47744 The *truncate()* function shall fail if:

47745 [EINTR] A signal was caught during execution.

47746 [EINVAL] The *length* argument was less than 0.

47747 [EFBIG] or [EINVAL]

47748 The *length* argument was greater than the maximum file size.

47749 [EIO] An I/O error occurred while reading from or writing to a file system.

47750 [EACCES] A component of the path prefix denies search permission, or write permission
47751 is denied on the file.

47752 [EISDIR] The named file is a directory.

47753 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
47754 argument.

47755 [ENAMETOOLONG]

47756 The length of the *path* argument exceeds {PATH_MAX} or a pathname
47757 component is longer than {NAME_MAX}.47758 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.47759 [ENOTDIR] A component of the path prefix of *path* is not a directory.

47760 [EROFS] The named file resides on a read-only file system.

47761 The *truncate()* function may fail if:

47762 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
47763 resolution of the *path* argument.

47764 [ENAMETOOLONG]

47765 Pathname resolution of a symbolic link produced an intermediate result
47766 whose length exceeds {PATH_MAX}.

47767 **EXAMPLES**

47768 None.

47769 **APPLICATION USAGE**

47770 None.

47771 **RATIONALE**

47772 None.

47773 **FUTURE DIRECTIONS**

47774 None.

47775 **SEE ALSO**

47776 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

47777 **CHANGE HISTORY**

47778 First released in Issue 4, Version 2.

47779 **Issue 5**

47780 Moved from X/OPEN UNIX extension to BASE.

47781 Large File Summit extensions are added.

47782 **Issue 6**

47783 This reference page is split out from the *ftruncate()* reference page.

47784 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

47785 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
47786 [ELOOP] error condition is added.

47787 **NAME**

47788 truncf, trunc1 — round to truncated integer value

47789 **SYNOPSIS**

47790 #include <math.h>

47791 float truncf(float x);

47792 long double trunc1(long double x);

47793 **DESCRIPTION**47794 Refer to *trunc()*.

47795 **NAME**

47796 tsearch — search a binary search tree

47797 **SYNOPSIS**

47798 XSI #include <search.h>

47799 void *tsearch(const void *key, void **rootp,
47800 int (*compar)(const void *, const void *));

47801

47802 **DESCRIPTION**47803 Refer to *tdelete()*.

47804 NAME

47805 ttyname, ttyname_r — find the pathname of a terminal

47806 SYNOPSIS

47807 #include <unistd.h>

47808 char *ttyname(int *fildes*);

47809 TSF int ttyname_r(int *fildes*, char **name*, size_t *namesize*);

47810

47811 DESCRIPTION

47812 The *ttyname()* function shall return a pointer to a string containing a null-terminated pathname of the terminal associated with file descriptor *fildes*. The return value may point to static data whose content is overwritten by each call.

47815 The *ttyname()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

47817 TSF The *ttyname_r()* function shall store the null-terminated pathname of the terminal associated with the file descriptor *fildes* in the character array referenced by *name*. The array is *namesize* characters long and should have space for the name and the terminating null character. The maximum length of the terminal name shall be {TTY_NAME_MAX}.

47821 RETURN VALUE

47822 Upon successful completion, *ttyname()* shall return a pointer to a string. Otherwise, a null pointer shall be returned and *errno* set to indicate the error.

47824 TSF If successful, the *ttyname_r()* function shall return zero. Otherwise, an error number shall be returned to indicate the error.

47826 ERRORS

47827 The *ttyname()* function may fail if:

47828 [EBADF] The *fildes* argument is not a valid file descriptor.

47829 [ENOTTY] The *fildes* argument does not refer to a terminal.

47830 The *ttyname_r()* function may fail if:

47831 TSF [EBADF] The *fildes* argument is not a valid file descriptor.

47832 TSF [ENOTTY] The *fildes* argument does not refer to a terminal.

47833 TSF [ERANGE] The value of *namesize* is smaller than the length of the string to be returned including the terminating null character.

47835 EXAMPLES

47836 None.

47837 APPLICATION USAGE

47838 None.

47839 RATIONALE

47840 The term “terminal” is used instead of the historical term “terminal device” in order to avoid a reference to an undefined term.

47842 The thread-safe version places the terminal name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

47845 **FUTURE DIRECTIONS**

47846 None.

47847 **SEE ALSO**

47848 The Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

47849 **CHANGE HISTORY**

47850 First released in Issue 1. Derived from Issue 1 of the SVID.

47851 **Issue 5**47852 The *ttyname_r()* function is included for alignment with the POSIX Threads Extension.

47853 A note indicating that the *ttyname()* function need not be reentrant is added to the
47854 DESCRIPTION.

47855 **Issue 6**47856 The *ttyname_r()* function is marked as part of the Thread-Safe Functions option.

47857 The following new requirements on POSIX implementations derive from alignment with the
47858 Single UNIX Specification:

- 47859 • The statement that *errno* is set on error is added.
- 47860 • The [EBADF] and [ENOTTY] optional error conditions are added.

47861 NAME

47862 twalk — traverse a binary search tree

47863 SYNOPSIS

47864 XSI `#include <search.h>`

47865 `void twalk(const void *root,`
47866 `void (*action)(const void *, VISIT, int ));`

47867

47868 DESCRIPTION

47869 Refer to *tdelete()*.

47870 NAME

47871 daylight, timezone, tzname, tzset — set timezone conversion information

47872 SYNOPSIS

47873 #include <time.h>

```
47874 xSI extern int daylight;
47875      extern long timezone;
47876 CX   extern char *tzname[2];
47877      void tzset(void);
```

47878

47879 DESCRIPTION

47880 The *tzset()* function shall use the value of the environment variable *TZ* to set time conversion information used by *ctime()*, *localtime()*, *mktime()*, and *strftime()*. If *TZ* is absent from the environment, implementation-defined default timezone information shall be used.

47883 The *tzset()* function shall set the external variable *tzname* as follows:

```
47884      tzname[0] = "std";
47885      tzname[1] = "dst";
```

47886 where *std* and *dst* are as described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

47888 xSI The *tzset()* function also shall set the external variable *daylight* to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable *timezone* shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

47892 RETURN VALUE

47893 The *tzset()* function shall not return a value.

47894 ERRORS

47895 No errors are defined.

47896 EXAMPLES

47897 Example *TZ* variables and their timezone differences are given in the table below:

	<i>TZ</i>	<i>timezone</i>
47900	EST5EDT	5*60*60
47901	GMT0	0*60*60
47902	JST-9	-9*60*60
47903	MET-1MEST	-1*60*60
47904	MST7MDT	7*60*60
47905	PST8PDT	8*60*60

47906 APPLICATION USAGE

47907 None.

47908 RATIONALE

47909 None.

47910 FUTURE DIRECTIONS

47911 None.

47912 **SEE ALSO**

47913 *ctime()*, *localtime()*, *mktime()*, *strftime()*, the Base Definitions volume of IEEE Std 1003.1-2001,
47914 Chapter 8, Environment Variables, **<time.h>**

47915 **CHANGE HISTORY**

47916 First released in Issue 1. Derived from Issue 1 of the SVID.

47917 **Issue 6**

47918 The example is corrected.

47919 **NAME**

47920 ualarm — set the interval timer

47921 **SYNOPSIS**

47922 OB XSI #include <unistd.h>

47923 useconds_t ualarm(useconds_t useconds, useconds_t interval);

47924

47925 **DESCRIPTION**

47926 The *ualarm()* function shall cause the SIGALRM signal to be generated for the calling process
 47927 after the number of realtime microseconds specified by the *useconds* argument has elapsed.
 47928 When the *interval* argument is non-zero, repeated timeout notification occurs with a period in
 47929 microseconds specified by the *interval* argument. If the notification signal, SIGALRM, is not
 47930 caught or ignored, the calling process is terminated.

47931 Implementations may place limitations on the granularity of timer values. For each interval
 47932 timer, if the requested timer value requires a finer granularity than the implementation supports,
 47933 the actual timer value shall be rounded up to the next supported value.

47934 Interactions between *ualarm()* and any of the following are unspecified:

47935 alarm()
 47936 nanosleep()
 47937 setitimer()
 47938 timer_create()
 47939 timer_delete()
 47940 timer_getoverrun()
 47941 timer_gettime()
 47942 timer_settime()
 47943 sleep()

47944 **RETURN VALUE**

47945 The *ualarm()* function shall return the number of microseconds remaining from the previous
 47946 *ualarm()* call. If no timeouts are pending or if *ualarm()* has not previously been called, *ualarm()*
 47947 shall return 0.

47948 **ERRORS**

47949 No errors are defined.

47950 **EXAMPLES**

47951 None.

47952 **APPLICATION USAGE**

47953 Applications are recommended to use *nanosleep()* if the Timers option is supported, or
 47954 *setitimer()*, *timer_create()*, *timer_delete()*, *timer_getoverrun()*, *timer_gettime()*, or *timer_settime()*
 47955 instead of this function.

47956 **RATIONALE**

47957 None.

47958 **FUTURE DIRECTIONS**

47959 None.

47960 **SEE ALSO**

47961 *alarm()*, *nanosleep()*, *setitimer()*, *sleep()*, *timer_create()*, *timer_delete()*, *timer_getoverrun()*, the Base
 47962 Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

47963 **CHANGE HISTORY**

47964 First released in Issue 4, Version 2.

47965 **Issue 5**

47966 Moved from X/OPEN UNIX extension to BASE.

47967 **Issue 6**

47968 This function is marked obsolescent.

47969 **NAME**47970 `ulimit` — get and set process limits47971 **SYNOPSIS**47972 xSI `#include <ulimit.h>`47973 `long ulimit(int cmd, ...);`

47974

47975 **DESCRIPTION**

47976 The `ulimit()` function shall control process limits. The process limits that can be controlled by
 47977 this function include the maximum size of a single file that can be written (this is equivalent to
 47978 using `setrlimit()` with `RLIMIT_FSIZE`). The `cmd` values, defined in `<ulimit.h>`, include:

47979 **UL_GETFSIZE** Return the file size limit (`RLIMIT_FSIZE`) of the process. The limit shall be in
 47980 units of 512-byte blocks and shall be inherited by child processes. Files of any
 47981 size can be read. The return value shall be the integer part of the soft file size
 47982 limit divided by 512. If the result cannot be represented as a **long**, the result is
 47983 unspecified.

47984 **UL_SETFSIZE** Set the file size limit for output operations of the process to the value of the
 47985 second argument, taken as a **long**, multiplied by 512. If the result would
 47986 overflow an **rlim_t**, the actual value set is unspecified. Any process may
 47987 decrease its own limit, but only a process with appropriate privileges may
 47988 increase the limit. The return value shall be the integer part of the new file size
 47989 limit divided by 512.

47990 The `ulimit()` function shall not change the setting of `errno` if successful.

47991 As all return values are permissible in a successful situation, an application wishing to check for
 47992 error situations should set `errno` to 0, then call `ulimit()`, and, if it returns `-1`, check to see if `errno` is
 47993 non-zero.

47994 **RETURN VALUE**
