47995 Upon successful completion, `ulimit()` shall return the value of the requested limit. Otherwise, `-1`
 47996 shall be returned and `errno` set to indicate the error.

47997 **ERRORS**

47998 The `ulimit()` function shall fail and the limit shall be unchanged if:

47999 **[EINVAL]** The `cmd` argument is not valid.

48000 **[EPERM]** A process not having appropriate privileges attempts to increase its file size
 48001 limit.

48002 **EXAMPLES**

48003 None.

48004 **APPLICATION USAGE**

48005 None.

48006 **RATIONALE**

48007 None.

48008 **FUTURE DIRECTIONS**

48009 None.

48010 **SEE ALSO**

48011 *getrlimit()*, *setrlimit()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<ulimit.h>**

48012 **CHANGE HISTORY**

48013 First released in Issue 1. Derived from Issue 1 of the SVID.

48014 **Issue 5**

48015 In the description of `UL_SETFSIZE`, the text is corrected to refer to **`rlim_t`** rather than the
48016 spurious **`rlimit_t`**.

48017 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

48018 **NAME**

48019 umask — set and get the file mode creation mask

48020 **SYNOPSIS**

48021 #include <sys/stat.h>

48022 mode_t umask(mode_t *cmask*);48023 **DESCRIPTION**

48024 The *umask()* function shall set the process' file mode creation mask to *cmask* and return the
48025 previous value of the mask. Only the file permission bits of *cmask* (see <sys/stat.h>) are used; the
48026 meaning of the other bits is implementation-defined.

48027 The process' file mode creation mask is used during *open()*, *creat()*, *mkdir()*, and *mkfifo()* to turn
48028 off permission bits in the *mode* argument supplied. Bit positions that are set in *cmask* are cleared
48029 in the mode of the created file.

48030 **RETURN VALUE**

48031 The file permission bits in the value returned by *umask()* shall be the previous value of the file
48032 mode creation mask. The state of any other bits in that value is unspecified, except that a
48033 subsequent call to *umask()* with the returned value as *cmask* shall leave the state of the mask the
48034 same as its state before the first call, including any unspecified use of those bits.

48035 **ERRORS**

48036 No errors are defined.

48037 **EXAMPLES**

48038 None.

48039 **APPLICATION USAGE**

48040 None.

48041 **RATIONALE**

48042 Unsigned argument and return types for *umask()* were proposed. The return type and the
48043 argument were both changed to **mode_t**.

48044 Historical implementations have made use of additional bits in *cmask* for their implementation-
48045 defined purposes. The addition of the text that the meaning of other bits of the field is
48046 implementation-defined permits these implementations to conform to this volume of
48047 IEEE Std 1003.1-2001.

48048 **FUTURE DIRECTIONS**

48049 None.

48050 **SEE ALSO**

48051 *creat()*, *mkdir()*, *mkfifo()*, *open()*, the Base Definitions volume of IEEE Std 1003.1-2001,
48052 <sys/stat.h>, <sys/types.h>

48053 **CHANGE HISTORY**

48054 First released in Issue 1. Derived from Issue 1 of the SVID.

48055 **Issue 6**

48056 In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

- 48057 The following new requirements on POSIX implementations derive from alignment with the
48058 Single UNIX Specification:
- 48059 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
48060 required for conforming implementations of previous POSIX specifications, it was not
48061 required for UNIX applications.

48062 **NAME**

48063 uname — get the name of the current system

48064 **SYNOPSIS**

48065 #include <sys/utsname.h>

48066 int uname(struct utsname *name);

48067 **DESCRIPTION**48068 The *uname()* function shall store information identifying the current system in the structure pointed to by *name*.48070 The *uname()* function uses the **utsname** structure defined in <sys/utsname.h>.

48071 The *uname()* function shall return a string naming the current system in the character array *sysname*. Similarly, *nodename* shall contain the name of this node within an implementation-defined communications network. The arrays *release* and *version* shall further identify the operating system. The array *machine* shall contain a name that identifies the hardware that the system is running on.

48076 The format of each member is implementation-defined.

48077 **RETURN VALUE**

48078 Upon successful completion, a non-negative value shall be returned. Otherwise, -1 shall be returned and *errno* set to indicate the error.

48080 **ERRORS**

48081 No errors are defined.

48082 **EXAMPLES**

48083 None.

48084 **APPLICATION USAGE**

48085 The inclusion of the *nodename* member in this structure does not imply that it is sufficient information for interfacing to communications networks.

48087 **RATIONALE**

48088 The values of the structure members are not constrained to have any relation to the version of this volume of IEEE Std 1003.1-2001 implemented in the operating system. An application should instead depend on *_POSIX_VERSION* and related constants defined in <unistd.h>.

48091 This volume of IEEE Std 1003.1-2001 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for *nodename* is not enough for use with many networks.

48095 The *uname()* function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.

48098 4.3 BSD has *gethostname()* and *gethostid()*, which return a symbolic name and a numeric value, respectively. There are related *sethostname()* and *sethostid()* functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.

48102 **FUTURE DIRECTIONS**

48103 None.

48106 CHANGE HISTORY

48107 First released in Issue 1. Derived from Issue 1 of the SVID.

48108 **NAME**

48109 ungetc — push byte back into input stream

48110 **SYNOPSIS**

48111 #include <stdio.h>

48112 int ungetc(int *c*, FILE **stream*);48113 **DESCRIPTION**

48114 CX The functionality described on this reference page is aligned with the ISO C standard. Any
48115 conflict between the requirements described here and the ISO C standard is unintentional. This
48116 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

48117 The *ungetc()* function shall push the byte specified by *c* (converted to an **unsigned char**) back
48118 onto the input stream pointed to by *stream*. The pushed-back bytes shall be returned by
48119 subsequent reads on that stream in the reverse order of their pushing. A successful intervening
48120 call (with the stream pointed to by *stream*) to a file-positioning function (*fseek()*, *fsetpos()*, or
48121 *rewind()*) shall discard any pushed-back bytes for the stream. The external storage
48122 corresponding to the stream shall be unchanged.

48123 One byte of push-back shall be provided. If *ungetc()* is called too many times on the same stream
48124 without an intervening read or file-positioning operation on that stream, the operation may fail.

48125 If the value of *c* equals that of the macro EOF, the operation shall fail and the input stream shall
48126 be left unchanged.

48127 A successful call to *ungetc()* shall clear the end-of-file indicator for the stream. The value of the
48128 file-position indicator for the stream after reading or discarding all pushed-back bytes shall be
48129 the same as it was before the bytes were pushed back. The file-position indicator is decremented
48130 by each successful call to *ungetc()*; if its value was 0 before a call, its value is unspecified after
48131 the call.

48132 **RETURN VALUE**

48133 Upon successful completion, *ungetc()* shall return the byte pushed back after conversion.
48134 Otherwise, it shall return EOF.

48135 **ERRORS**

48136 No errors are defined.

48137 **EXAMPLES**

48138 None.

48139 **APPLICATION USAGE**

48140 None.

48141 **RATIONALE**

48142 None.

48143 **FUTURE DIRECTIONS**

48144 None.

48145 **SEE ALSO**

48146 *fseek()*, *getc()*, *fsetpos()*, *read()*, *rewind()*, *setbuf()*, the Base Definitions volume of
48147 IEEE Std 1003.1-2001, <stdio.h>

48148 **CHANGE HISTORY**

48149 First released in Issue 1. Derived from Issue 1 of the SVID.

48150 **NAME**

48151 ungetwc — push wide-character code back into the input stream

48152 **SYNOPSIS**

48153 #include <stdio.h>

48154 #include <wchar.h>

48155 wint_t ungetwc(wint_t wc, FILE *stream);

48156 **DESCRIPTION**

48157 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 48158 conflict between the requirements described here and the ISO C standard is unintentional. This
 48159 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

48160 The *ungetwc()* function shall push the character corresponding to the wide-character code
 48161 specified by *wc* back onto the input stream pointed to by *stream*. The pushed-back characters
 48162 shall be returned by subsequent reads on that stream in the reverse order of their pushing. A
 48163 successful intervening call (with the stream pointed to by *stream*) to a file-positioning function
 48164 (*fseek()*, *fsetpos()*, or *rewind()*) discards any pushed-back characters for the stream. The external
 48165 storage corresponding to the stream is unchanged.

48166 At least one character of push-back shall be provided. If *ungetwc()* is called too many times on
 48167 the same stream without an intervening read or file-positioning operation on that stream, the
 48168 operation may fail.

48169 If the value of *wc* equals that of the macro WEOF, the operation shall fail and the input stream
 48170 shall be left unchanged.

48171 A successful call to *ungetwc()* shall clear the end-of-file indicator for the stream. The value of the
 48172 file-position indicator for the stream after reading or discarding all pushed-back characters shall
 48173 be the same as it was before the characters were pushed back. The file-position indicator is
 48174 decremented (by one or more) by each successful call to *ungetwc()*; if its value was 0 before a
 48175 call, its value is unspecified after the call.

48176 **RETURN VALUE**

48177 Upon successful completion, *ungetwc()* shall return the wide-character code corresponding to
 48178 the pushed-back character. Otherwise, it shall return WEOF.

48179 **ERRORS**48180 The *ungetwc()* function may fail if:

48181 CX [EILSEQ] An invalid character sequence is detected, or a wide-character code does not
 48182 correspond to a valid character.

48183 **EXAMPLES**

48184 None.

48185 **APPLICATION USAGE**

48186 None.

48187 **RATIONALE**

48188 None.

48189 **FUTURE DIRECTIONS**

48190 None.

48191 **SEE ALSO**

48192 *fseek()*, *fsetpos()*, *read()*, *rewind()*, *setbuf()*, the Base Definitions volume of IEEE Std 1003.1-2001,
48193 **<stdio.h>**, **<wchar.h>**

48194 **CHANGE HISTORY**

48195 First released in Issue 4. Derived from the MSE working draft.

48196 **Issue 5**

48197 The Optional Header (OH) marking is removed from **<stdio.h>**.

48198 **Issue 6**

48199 The [EILSEQ] optional error condition is marked CX.

48200 NAME

48201 unlink — remove a directory entry

48202 SYNOPSIS

48203 #include <unistd.h>

48204 int unlink(const char *path);

48205 DESCRIPTION

48206 The *unlink()* function shall remove a link to a file. If *path* names a symbolic link, *unlink()* shall
 48207 remove the symbolic link named by *path* and shall not affect any file or directory named by the
 48208 contents of the symbolic link. Otherwise, *unlink()* shall remove the link named by the pathname
 48209 pointed to by *path* and shall decrement the link count of the file referenced by the link.

48210 When the file's link count becomes 0 and no process has the file open, the space occupied by the
 48211 file shall be freed and the file shall no longer be accessible. If one or more processes have the file
 48212 open when the last link is removed, the link shall be removed before *unlink()* returns, but the
 48213 removal of the file contents shall be postponed until all references to the file are closed.

48214 The *path* argument shall not name a directory unless the process has appropriate privileges and
 48215 the implementation supports using *unlink()* on directories.

48216 Upon successful completion, *unlink()* shall mark for update the *st_ctime* and *st_mtime* fields of
 48217 the parent directory. Also, if the file's link count is not 0, the *st_ctime* field of the file shall be
 48218 marked for update.

48219 RETURN VALUE

48220 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 48221 indicate the error. If -1 is returned, the named file shall not be changed.

48222 ERRORS

48223 The *unlink()* function shall fail and shall not unlink the file if:

48224 [EACCES] Search permission is denied for a component of the path prefix, or write
 48225 permission is denied on the directory containing the directory entry to be
 48226 removed.

48227 [EBUSY] The file named by the *path* argument cannot be unlinked because it is being
 48228 used by the system or another process and the implementation considers this
 48229 an error.

48230 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 48231 argument.

48232 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
 48233 component is longer than {NAME_MAX}.
 48234

48235 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

48236 [ENOTDIR] A component of the path prefix is not a directory.

48237 [EPERM] The file named by *path* is a directory, and either the calling process does not
 48238 have appropriate privileges, or the implementation prohibits using *unlink()*
 48239 on directories.

48240 XSI [EPERM] or [EACCES]
 48241 The S_ISVTX flag is set on the directory containing the file referred to by the
 48242 *path* argument and the caller is not the file owner, nor is the caller the
 48243 directory owner, nor does the caller have appropriate privileges.

48244 [EROFS] The directory entry to be unlinked is part of a read-only file system.

48245 The `unlink()` function may fail and not unlink the file if:

48246 XSI [EBUSY] The file named by *path* is a named STREAM.

48247 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
48248 resolution of the *path* argument.

48249 [ENAMETOOLONG]
48250 As a result of encountering a symbolic link in resolution of the *path* argument,
48251 the length of the substituted pathname string exceeded {PATH_MAX}.

48252 [ETXTBSY] The entry to be unlinked is the last directory entry to a pure procedure (shared
48253 text) file that is being executed.

48254 EXAMPLES

48255 Removing a Link to a File

48256 The following example shows how to remove a link to a file named `/home/cnd/mod1` by
48257 removing the entry named `/modules/pass1`.

```
48258 #include <unistd.h>
48259 char *path = "/modules/pass1";
48260 int status;
48261 ...
48262 status = unlink(path);
```

48263 Checking for an Error

48264 The following example fragment creates a temporary password lock file named **LOCKFILE**,
48265 which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for
48266 writing, `unlink()` is used to remove the link between the file descriptor and **LOCKFILE**.

```
48267 #include <sys/types.h>
48268 #include <stdio.h>
48269 #include <fcntl.h>
48270 #include <errno.h>
48271 #include <unistd.h>
48272 #include <sys/stat.h>
48273 #define LOCKFILE "/etc/ptmp"
48274 int pfd; /* Integer for file descriptor returned by open call. */
48275 FILE *fpfd; /* File pointer for use in putpwent(). */
48276 ...
48277 /* Open password Lock file. If it exists, this is an error. */
48278 if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL, S_IRUSR
48279 | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
48280     fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
48281     exit(1);
48282 }
48283 /* Lock file created; proceed with fdopen of lock file so that
48284 putpwent() can be used.
48285 */
48286 if ((fpfd = fdopen(pfd, "w")) == NULL) {
```

```

48287         close(pfd);
48288         unlink(LOCKFILE);
48289         exit(1);
48290     }

```

48291 Replacing Files

48292 The following example fragment uses *unlink()* to discard links to files, so that they can be
 48293 replaced with new versions of the files. The first call removes the link to **LOCKFILE** if an error
 48294 occurs. Successive calls remove the links to **SAVEFILE** and **PASSWDFILE** so that new links can
 48295 be created, then removes the link to **LOCKFILE** when it is no longer needed.

```

48296     #include <sys/types.h>
48297     #include <stdio.h>
48298     #include <fcntl.h>
48299     #include <errno.h>
48300     #include <unistd.h>
48301     #include <sys/stat.h>

48302     #define LOCKFILE "/etc/ptmp"
48303     #define PASSWDFILE "/etc/passwd"
48304     #define SAVEFILE "/etc/opasswd"
48305     ...
48306     /* If no change was made, assume error and leave passwd unchanged. */
48307     if (!valid_change) {
48308         fprintf(stderr, "Could not change password for user %s\n", user);
48309         unlink(LOCKFILE);
48310         exit(1);
48311     }

48312     /* Change permissions on new password file. */
48313     chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);

48314     /* Remove saved password file. */
48315     unlink(SAVEFILE);

48316     /* Save current password file. */
48317     link(PASSWDFILE, SAVEFILE);

48318     /* Remove current password file. */
48319     unlink(PASSWDFILE);

48320     /* Save new password file as current password file. */
48321     link(LOCKFILE, PASSWDFILE);

48322     /* Remove lock file. */
48323     unlink(LOCKFILE);

48324     exit(0);

```

48325 APPLICATION USAGE

48326 Applications should use *rmdir()* to remove a directory.

48327 RATIONALE

48328 Unlinking a directory is restricted to the superuser in many historical implementations for
 48329 reasons given in *link()* (see also *rename()*).

48330 The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume
48331 of IEEE Std 1003.1-2001 does not cover the system administration concepts of mounting and
48332 unmounting, the description of the error was changed to “resource busy”. (This meaning is used
48333 by some device drivers when a second process tries to open an exclusive use device.) The
48334 wording is also intended to allow implementations to refuse to remove a directory if it is the
48335 root or current working directory of any process.

48336 **FUTURE DIRECTIONS**

48337 None.

48338 **SEE ALSO**

48339 *close()*, *link()*, *remove()*, *rmdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

48340 **CHANGE HISTORY**

48341 First released in Issue 1. Derived from Issue 1 of the SVID.

48342 **Issue 5**

48343 The [EBUSY] error is added to the “may fail” part of the ERRORS section.

48344 **Issue 6**

48345 The following new requirements on POSIX implementations derive from alignment with the
48346 Single UNIX Specification:

- 48347 • In the DESCRIPTION, the effect is specified if *path* specifies a symbolic link.
- 48348 • The [ELOOP] mandatory error condition is added.
- 48349 • A second [ENAMETOOLONG] is added as an optional error condition.
- 48350 • The [ETXTBSY] optional error condition is added.

48351 The following changes were made to align with the IEEE P1003.1a draft standard:

- 48352 • The [ELOOP] optional error condition is added.

48353 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48354 **NAME**

48355 unlockpt — unlock a pseudo-terminal master/slave pair

48356 **SYNOPSIS**48357 xSI `#include <stdlib.h>`48358 `int unlockpt(int fildev);`

48359

48360 **DESCRIPTION**48361 The *unlockpt()* function shall unlock the slave pseudo-terminal device associated with the
48362 master to which *fildev* refers.48363 Conforming applications shall ensure that they call *unlockpt()* before opening the slave side of a
48364 pseudo-terminal device.48365 **RETURN VALUE**48366 Upon successful completion, *unlockpt()* shall return 0. Otherwise, it shall return -1 and set *errno*
48367 to indicate the error.48368 **ERRORS**48369 The *unlockpt()* function may fail if:48370 [EBADF] The *fildev* argument is not a file descriptor open for writing.48371 [EINVAL] The *fildev* argument is not associated with a master pseudo-terminal device.48372 **EXAMPLES**

48373 None.

48374 **APPLICATION USAGE**

48375 None.

48376 **RATIONALE**

48377 None.

48378 **FUTURE DIRECTIONS**

48379 None.

48380 **SEE ALSO**48381 *grantpt()*, *open()*, *ptsname()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`48382 **CHANGE HISTORY**

48383 First released in Issue 4, Version 2.

48384 **Issue 5**

48385 Moved from X/OPEN UNIX extension to BASE.

48386 **Issue 6**

48387 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48388 **NAME**

48389 unsetenv — remove an environment variable

48390 **SYNOPSIS**48391 **CX** #include <stdlib.h>

48392 int unsetenv(const char *name);

48393

48394 **DESCRIPTION**

48395 The *unsetenv()* function shall remove an environment variable from the environment of the
 48396 calling process. The *name* argument points to a string, which is the name of the variable to be
 48397 removed. The named argument shall not contain an '=' character. If the named variable does
 48398 not exist in the current environment, the environment shall be unchanged and the function is
 48399 considered to have completed successfully.

48400 If the application modifies *environ* or the pointers to which it points, the behavior of *unsetenv()* is
 48401 undefined. The *unsetenv()* function shall update the list of pointers to which *environ* points.

48402 The *unsetenv()* function need not be reentrant. A function that is not required to be reentrant is
 48403 not required to be thread-safe.

48404 **RETURN VALUE**

48405 Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, *errno* set to
 48406 indicate the error, and the environment shall be unchanged.

48407 **ERRORS**48408 The *unsetenv()* function shall fail if:

48409 [EINVAL] The *name* argument is a null pointer, points to an empty string, or points to a
 48410 string containing an '=' character.

48411 **EXAMPLES**

48412 None.

48413 **APPLICATION USAGE**

48414 None.

48415 **RATIONALE**48416 Refer to the RATIONALE section in *setenv()*.48417 **FUTURE DIRECTIONS**

48422 **CHANGE HISTORY**

48423 First released in Issue 6. Derived from the IEEE P1003.1a draft standard.

48424 **NAME**

48425 usleep — suspend execution for an interval

48426 **SYNOPSIS**

48427 OB XSI #include <unistd.h>

48428 int usleep(useconds_t useconds);

48429

48430 **DESCRIPTION**

48431 The *usleep()* function shall cause the calling thread to be suspended from execution until either
 48432 the number of realtime microseconds specified by the argument *useconds* has elapsed or a signal
 48433 is delivered to the calling thread and its action is to invoke a signal-catching function or to
 48434 terminate the process. The suspension time may be longer than requested due to the scheduling
 48435 of other activity by the system.

48436 The *useconds* argument shall be less than one million. If the value of *useconds* is 0, then the call
 48437 has no effect.

48438 If a SIGALRM signal is generated for the calling process during execution of *usleep()* and if the
 48439 SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether *usleep()*
 48440 returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
 48441 unspecified whether it remains pending after *usleep()* returns or it is discarded.

48442 If a SIGALRM signal is generated for the calling process during execution of *usleep()*, except as a
 48443 result of a prior call to *alarm()*, and if the SIGALRM signal is not being ignored or blocked from
 48444 delivery, it is unspecified whether that signal has any effect other than causing *usleep()* to return.

48445 If a signal-catching function interrupts *usleep()* and examines or changes either the time a
 48446 SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
 48447 whether the SIGALRM signal is blocked from delivery, the results are unspecified.

48448 If a signal-catching function interrupts *usleep()* and calls *siglongjmp()* or *longjmp()* to restore an
 48449 environment saved prior to the *usleep()* call, the action associated with the SIGALRM signal and
 48450 the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
 48451 unspecified whether the SIGALRM signal is blocked, unless the process' signal mask is restored
 48452 as part of the environment.

48453 Implementations may place limitations on the granularity of timer values. For each interval
 48454 timer, if the requested timer value requires a finer granularity than the implementation supports,
 48455 the actual timer value shall be rounded up to the next supported value.

48456 Interactions between *usleep()* and any of the following are unspecified:

48457 *nanosleep()*
 48458 *setitimer()*
 48459 *timer_create()*
 48460 *timer_delete()*
 48461 *timer_getoverrun()*
 48462 *timer_gettime()*
 48463 *timer_settime()*
 48464 *ualarm()*
 48465 *sleep()*

48466 RETURN VALUE

48467 Upon successful completion, *usleep()* shall return 0; otherwise, it shall return -1 and set *errno* to
48468 indicate the error.

48469 ERRORS

48470 The *usleep()* function may fail if:

48471 [EINVAL] The time interval specified one million or more microseconds.

48472 EXAMPLES

48473 None.

48474 APPLICATION USAGE

48475 Applications are recommended to use *nanosleep()* if the Timers option is supported, or
48476 *setitimer()*, *timer_create()*, *timer_delete()*, *timer_getoverrun()*, *timer_gettime()*, or *timer_settime()*
48477 instead of this function.

48478 RATIONALE

48479 None.

48480 FUTURE DIRECTIONS

48481 None.

48485 CHANGE HISTORY

48486 First released in Issue 4, Version 2.

48487 Issue 5

48488 Moved from X/OPEN UNIX extension to BASE.

48489 The DESCRIPTION is changed to indicate that timers are now thread-based rather than
48490 process-based.

48491 Issue 6

48492 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48493 This function is marked obsolescent.

NAME

utime — set file access and modification times

SYNOPSIS

```
#include <utime.h>
```

```
int utime(const char *path, const struct utimbuf *times);
```

DESCRIPTION

The *utime()* function shall set the access and modification times of the file named by the *path* argument.

If *times* is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or the process has write permission to the file or has appropriate privileges, to use *utime()* in this manner.

If *times* is not a null pointer, *times* shall be interpreted as a pointer to a **utimbuf** structure and the access and modification times shall be set to the values contained in the designated structure. Only a process with the effective user ID equal to the user ID of the file or a process with appropriate privileges may use *utime()* this way.

The **utimbuf** structure is defined in the **<utime.h>** header. The times in the structure **utimbuf** are measured in seconds since the Epoch.

Upon successful completion, *utime()* shall mark the time of the last file status change, *st_ctime*, to be updated; see **<sys/stat.h>**.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall be set to indicate the error, and the file times shall not be affected.

ERRORS

The *utime()* function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the *times* argument is a null pointer and the effective user ID of the process does not match the owner of the file, the process does not have write permission for the file, and the process does not have appropriate privileges.

[ELOOP] A loop exists in symbolic links encountered during resolution of the *path* argument.

[ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.

[ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The *times* argument is not a null pointer and the calling process' effective user ID does not match the owner of the file and the calling process does not have the appropriate privileges.

[EROFS] The file system containing the file is read-only.

The *utime()* function may fail if:

[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the *path* argument.

48536 [ENAMETOOLONG]

48537 As a result of encountering a symbolic link in resolution of the *path* argument,
48538 the length of the substituted pathname string exceeded {PATH_MAX}.

48539 **EXAMPLES**

48540 None.

48541 **APPLICATION USAGE**

48542 None.

48543 **RATIONALE**

48544 The *actime* structure member must be present so that an application may set it, even though an
48545 implementation may ignore it and not change the access time on the file. If an application
48546 intends to leave one of the times of a file unchanged while changing the other, it should use
48547 *stat()* to retrieve the file's *st_atime* and *st_mtime* parameters, set *actime* and *modtime* in the buffer,
48548 and change one of them before making the *utime()* call.

48549 **FUTURE DIRECTIONS**

48550 None.

48551 **SEE ALSO**

48552 The Base Definitions volume of IEEE Std 1003.1-2001, <**sys/stat.h**>, <**utime.h**>

48553 **CHANGE HISTORY**

48554 First released in Issue 1. Derived from Issue 1 of the SVID.

48555 **Issue 6**

48556 The following new requirements on POSIX implementations derive from alignment with the
48557 Single UNIX Specification:

- 48558 • The requirement to include <**sys/types.h**> has been removed. Although <**sys/types.h**> was
48559 required for conforming implementations of previous POSIX specifications, it was not
48560 required for UNIX applications.
- 48561 • The [ELOOP] mandatory error condition is added.
- 48562 • A second [ENAMETOOLONG] is added as an optional error condition.

48563 The following changes were made to align with the IEEE P1003.1a draft standard:

- 48564 • The [ELOOP] optional error condition is added.

48565 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48566 **NAME**48567 utimes — set file access and modification times (**LEGACY**)48568 **SYNOPSIS**48569 xSI `#include <sys/time.h>`48570 `int utimes(const char *path, const struct timeval times[2]);`

48571

48572 **DESCRIPTION**

48573 The *utimes()* function shall set the access and modification times of the file pointed to by the *path*
 48574 argument to the value of the *times* argument. The *utimes()* function allows time specifications
 48575 accurate to the microsecond.

48576 For *utimes()*, the *times* argument is an array of **timeval** structures. The first array member
 48577 represents the date and time of last access, and the second member represents the date and time
 48578 of last modification. The times in the **timeval** structure are measured in seconds and
 48579 microseconds since the Epoch, although rounding toward the nearest second may occur.

48580 If the *times* argument is a null pointer, the access and modification times of the file shall be set to
 48581 the current time. The effective user ID of the process shall match the owner of the file, or has
 48582 write access to the file or appropriate privileges to use this call in this manner. Upon completion,
 48583 *utimes()* shall mark the time of the last file status change, *st_ctime*, for update.

48584 **RETURN VALUE**

48585 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* shall
 48586 be set to indicate the error, and the file times shall not be affected.

48587 **ERRORS**48588 The *utimes()* function shall fail if:

48589 [EACCES] Search permission is denied by a component of the path prefix; or the *times*
 48590 argument is a null pointer and the effective user ID of the process does not
 48591 match the owner of the file and write access is denied.

48592 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 48593 argument.

48594 [ENAMETOOLONG]
 48595 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 48596 component is longer than {NAME_MAX}.

48597 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

48598 [ENOTDIR] A component of the path prefix is not a directory.

48599 [EPERM] The *times* argument is not a null pointer and the calling process' effective user
 48600 ID has write access to the file but does not match the owner of the file and the
 48601 calling process does not have the appropriate privileges.

48602 [EROFS] The file system containing the file is read-only.

48603 The *utimes()* function may fail if:

48604 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 48605 resolution of the *path* argument.

48606 [ENAMETOOLONG]
 48607 Pathname resolution of a symbolic link produced an intermediate result
 48608 whose length exceeds {PATH_MAX}.

48609 **EXAMPLES**

48610 None.

48611 **APPLICATION USAGE**

48612 For applications portability, the *utime()* function should be used to set file access and
48613 modification times instead of *utimes()*.

48614 **RATIONALE**

48615 None.

48616 **FUTURE DIRECTIONS**

48617 This function may be withdrawn in a future version.

48618 **SEE ALSO**48619 *utime()*, the Base Definitions volume of IEEE Std 1003.1-2001, <sys/time.h>48620 **CHANGE HISTORY**

48621 First released in Issue 4, Version 2.

48622 **Issue 5**

48623 Moved from X/OPEN UNIX extension to BASE.

48624 **Issue 6**

48625 This function is marked LEGACY.

48626 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

48627 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
48628 [ELOOP] error condition is added.

48629 **NAME**

48630 va_arg, va_copy, va_end, va_start — handle variable argument list

48631 **SYNOPSIS**

48632 #include <stdarg.h>

48633 type va_arg(va_list ap, type);

48634 void va_copy(va_list dest, va_list src);

48635 void va_end(va_list ap);

48636 void va_start(va_list ap, argN);

48637 **DESCRIPTION**

48638 Refer to the Base Definitions volume of IEEE Std 1003.1-2001, <stdarg.h>.

48639 **NAME**

48640 vfork — create a new process; share virtual memory

48641 **SYNOPSIS**48642 OB XSI `#include <unistd.h>`48643 `pid_t vfork(void);`

48644

48645 **DESCRIPTION**

48646 The `vfork()` function shall be equivalent to `fork()`, except that the behavior is undefined if the
 48647 process created by `vfork()` either modifies any data other than a variable of type **pid_t** used to
 48648 store the return value from `vfork()`, or returns from the function in which `vfork()` was called, or
 48649 calls any other function before successfully calling `_exit()` or one of the *exec* family of functions.

48650 **RETURN VALUE**

48651 Upon successful completion, `vfork()` shall return 0 to the child process and return the process ID
 48652 of the child process to the parent process. Otherwise, `-1` shall be returned to the parent, no child
 48653 process shall be created, and *errno* shall be set to indicate the error.

48654 **ERRORS**48655 The `vfork()` function shall fail if:

48656 [EAGAIN] The system-wide limit on the total number of processes under execution
 48657 would be exceeded, or the system-imposed limit on the total number of
 48658 processes under execution by a single user would be exceeded.

48659 [ENOMEM] There is insufficient swap space for the new process.

48660 **EXAMPLES**

48661 None.

48662 **APPLICATION USAGE**

48663 Conforming applications are recommended not to depend on `vfork()`, but to use `fork()` instead.
 48664 The `vfork()` function may be withdrawn in a future version.

48665 On some implementations, `vfork()` is equivalent to `fork()`.

48666 The `vfork()` function differs from `fork()` only in that the child process can share code and data
 48667 with the calling process (parent process). This speeds cloning activity significantly at a risk to
 48668 the integrity of the parent process if `vfork()` is misused.

48669 The use of `vfork()` for any purpose except as a prelude to an immediate call to a function from
 48670 the *exec* family, or to `_exit()`, is not advised.

48671 The `vfork()` function can be used to create new processes without fully copying the address
 48672 space of the old process. If a forked process is simply going to call *exec*, the data space copied
 48673 from the parent to the child by `fork()` is not used. This is particularly inefficient in a paged
 48674 environment, making `vfork()` particularly useful. Depending upon the size of the parent's data
 48675 space, `vfork()` can give a significant performance improvement over `fork()`.

48676 The `vfork()` function can normally be used just like `fork()`. It does not work, however, to return
 48677 while running in the child's context from the caller of `vfork()` since the eventual return from
 48678 `vfork()` would then return to a no longer existent stack frame. Care should be taken, also, to call
 48679 `_exit()` rather than `exit()` if *exec* cannot be used, since `exit()` flushes and closes standard I/O
 48680 channels, thereby damaging the parent process' standard I/O data structures. (Even with `fork()`,
 48681 it is wrong to call `exit()`, since buffered data would then be flushed twice.)

48682 If signal handlers are invoked in the child process after `vfork()`, they must follow the same rules
 48683 as other code in the child process.

48684 **RATIONALE**

48685 None.

48686 **FUTURE DIRECTIONS**

48687 This function may be withdrawn in a future version.

48688 **SEE ALSO**48689 *exec*, *exit()*, *fork()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>48690 **CHANGE HISTORY**

48924 **NAME**

48925 wait, waitpid — wait for a child process to stop or terminate

48926 **SYNOPSIS**

48927 #include <sys/wait.h>

48928 pid_t wait(int *stat_loc);

48929 pid_t waitpid(pid_t pid, int *stat_loc, int options);

48930 **DESCRIPTION**

48931 The *wait()* and *waitpid()* functions shall obtain status information pertaining to one of the
 48932 caller's child processes. Various options permit status information to be obtained for child
 48933 processes that have terminated or stopped. If status information is available for two or more
 48934 child processes, the order in which their status is reported is unspecified.

48935 The *wait()* function shall suspend execution of the calling thread until status information for one
 48936 of the terminated child processes of the calling process is available, or until delivery of a signal
 48937 whose action is either to execute a signal-catching function or to terminate the process. If more
 48938 than one thread is suspended in *wait()* or *waitpid()* awaiting termination of the same process,
 48939 exactly one thread shall return the process status at the time of the target process termination. If
 48940 status information is available prior to the call to *wait()*, return shall be immediate.

48941 The *waitpid()* function shall be equivalent to *wait()* if the *pid* argument is (**pid_t**)−1 and the
 48942 *options* argument is 0. Otherwise, its behavior shall be modified by the values of the *pid* and
 48943 *options* arguments.

48944 The *pid* argument specifies a set of child processes for which *status* is requested. The *waitpid()*
 48945 function shall only return the status of a child process from this set:

- 48946 • If *pid* is equal to (**pid_t**)−1, *status* is requested for any child process. In this respect, *waitpid()*
 48947 is then equivalent to *wait()*.
- 48948 • If *pid* is greater than 0, it specifies the process ID of a single child process for which *status* is
 48949 requested.
- 48950 • If *pid* is 0, *status* is requested for any child process whose process group ID is equal to that of
 48951 the calling process.
- 48952 • If *pid* is less than (**pid_t**)−1, *status* is requested for any child process whose process group ID
 48953 is equal to the absolute value of *pid*.

48954 The *options* argument is constructed from the bitwise-inclusive OR of zero or more of the
 48955 following flags, defined in the <sys/wait.h> header:

48956 XSI **WCONTINUED** The *waitpid()* function shall report the status of any continued child process
 48957 specified by *pid* whose status has not been reported since it continued from a
 48958 job control stop.

48959 **WNOHANG** The *waitpid()* function shall not suspend execution of the calling thread if
 48960 *status* is not immediately available for one of the child processes specified by
 48961 *pid*.

48962 **WUNTRACED** The status of any child processes specified by *pid* that are stopped, and whose
 48963 status has not yet been reported since they stopped, shall also be reported to
 48964 the requesting process.

48965 XSI If the calling process has SA_NOCLDWAIT set or has SIGCHLD set to SIG_IGN, and the
 48966 process has no unwaited-for children that were transformed into zombie processes, the calling
 48967 thread shall block until all of the children of the process containing the calling thread terminate,
 48968 and *wait()* and *waitpid()* shall fail and set *errno* to [ECHILD].

If *wait()* or *waitpid()* return because the status of a child process is available, these functions shall return a value equal to the process ID of the child process. In this case, if the value of the argument *stat_loc* is not a null pointer, information shall be stored in the location pointed to by *stat_loc*. The value stored at the location pointed to by *stat_loc* shall be 0 if and only if the status returned is from a terminated child process that terminated by one of the following means:

1. The process returned 0 from *main()*.
2. The process called *_exit()* or *exit()* with a *status* argument of 0.
3. The process was terminated because the last thread in the process terminated.

Regardless of its value, this information may be interpreted using the following macros, which are defined in **<sys/wait.h>** and evaluate to integral expressions; the *stat_val* argument is the integer value pointed to by *stat_loc*.

WIFEXITED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that terminated normally.

WEXITSTATUS(*stat_val*)

If the value of **WIFEXITED(*stat_val*)** is non-zero, this macro evaluates to the low-order 8 bits of the *status* argument that the child process passed to *_exit()* or *exit()*, or the value the child process returned from *main()*.

WIFSIGNALED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that terminated due to the receipt of a signal that was not caught (see **<signal.h>**).

WTERMSIG(*stat_val*)

If the value of **WIFSIGNALED(*stat_val*)** is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.

WIFSTOPPED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that is currently stopped.

WSTOPSIG(*stat_val*)

If the value of **WIFSTOPPED(*stat_val*)** is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.

WIFCONTINUED(*stat_val*)

Evaluates to a non-zero value if *status* was returned for a child process that has continued from a job control stop.

It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes created by *posix_spawn()* or *posix_spawnnp()* can indicate a **WIFSTOPPED(*stat_val*)** before subsequent calls to *wait()* or *waitpid()* indicate **WIFEXITED(*stat_val*)** as the result of an error detected before the new process image starts executing.

It is unspecified whether the *status* value returned by calls to *wait()* or *waitpid()* for processes created by *posix_spawn()* or *posix_spawnnp()* can indicate a **WIFSIGNALED(*stat_val*)** if a signal is sent to the parent's process group after *posix_spawn()* or *posix_spawnnp()* is called.

If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that specified the **WUNTRACED** flag and did not specify the **WCONTINUED** flag, exactly one of the macros **WIFEXITED(**stat_loc*)**, **WIFSIGNALED(**stat_loc*)**, and **WIFSTOPPED(**stat_loc*)** shall evaluate to a non-zero value.

49013 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that specified the
 49014 XSI WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(**stat_loc*),
 49015 XSI WIFSIGNALED(**stat_loc*), WIFSTOPPED(**stat_loc*), and WIFCONTINUED(**stat_loc*) shall
 49016 evaluate to a non-zero value.

49017 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 49018 XSI WUNTRACED or WCONTINUED flags, or by a call to the *wait()* function, exactly one of the
 49019 macros WIFEXITED(**stat_loc*) and WIFSIGNALED(**stat_loc*) shall evaluate to a non-zero value.

49020 If the information pointed to by *stat_loc* was stored by a call to *waitpid()* that did not specify the
 49021 XSI WUNTRACED flag and specified the WCONTINUED flag, or by a call to the *wait()* function,
 49022 XSI exactly one of the macros WIFEXITED(**stat_loc*), WIFSIGNALED(**stat_loc*), and
 49023 WIFCONTINUED(**stat_loc*) shall evaluate to a non-zero value.

49024 If _POSIX_REALTIME_SIGNALS is defined, and the implementation queues the SIGCHLD
 49025 signal, then if *wait()* or *waitpid()* returns because the status of a child process is available, any
 49026 pending SIGCHLD signal associated with the process ID of the child process shall be discarded.
 49027 Any other pending SIGCHLD signals shall remain pending.

49028 Otherwise, if SIGCHLD is blocked, if *wait()* or *waitpid()* return because the status of a child
 49029 process is available, any pending SIGCHLD signal shall be cleared unless the status of another
 49030 child process is available.

49031 For all other conditions, it is unspecified whether child *status* will be available when a SIGCHLD
 49032 signal is delivered.

49033 There may be additional implementation-defined circumstances under which *wait()* or *waitpid()*
 49034 report *status*. This shall not occur unless the calling process or one of its child processes explicitly
 49035 makes use of a non-standard extension. In these cases the interpretation of the reported *status* is
 49036 implementation-defined.

49037 XSI If a parent process terminates without waiting for all of its child processes to terminate, the
 49038 remaining child processes shall be assigned a new parent process ID corresponding to an
 49039 implementation-defined system process.

49040 RETURN VALUE

49041 If *wait()* or *waitpid()* returns because the status of a child process is available, these functions
 49042 shall return a value equal to the process ID of the child process for which *status* is reported. If
 49043 *wait()* or *waitpid()* returns due to the delivery of a signal to the calling process, -1 shall be
 49044 returned and *errno* set to [EINTR]. If *waitpid()* was invoked with WNOHANG set in *options*, it
 49045 has at least one child process specified by *pid* for which *status* is not available, and *status* is not
 49046 available for any process specified by *pid*, 0 is returned. Otherwise, (*pid_t*)-1 shall be returned,
 49047 and *errno* set to indicate the error.

49048 ERRORS

49049 The *wait()* function shall fail if:

49050 [ECHILD] The calling process has no existing unwaited-for child processes.

49051 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 49052 by *stat_loc* is undefined.

49053 The *waitpid()* function shall fail if:

49054 [ECHILD] The process specified by *pid* does not exist or is not a child of the calling
 49055 process, or the process group specified by *pid* does not exist or does not have
 49056 any member process that is a child of the calling process.

49057 [EINTR] The function was interrupted by a signal. The value of the location pointed to
 49058 by *stat_loc* is undefined.

49059 [EINVAL] The *options* argument is not valid.

49060 EXAMPLES

49061 None.

49062 APPLICATION USAGE

49063 None.

49064 RATIONALE

49065 A call to the *wait()* or *waitpid()* function only returns *status* on an immediate child process of the
 49066 calling process; that is, a child that was produced by a single *fork()* call (perhaps followed by an
 49067 *exec* or other function calls) from the parent. If a child produces grandchildren by further use of
 49068 *fork()*, none of those grandchildren nor any of their descendants affect the behavior of a *wait()*
 49069 from the original parent process. Nothing in this volume of IEEE Std 1003.1-2001 prevents an
 49070 implementation from providing extensions that permit a process to get *status* from a grandchild
 49071 or any other process, but a process that does not use such extensions must be guaranteed to see
 49072 *status* from only its direct children.

49073 The *waitpid()* function is provided for three reasons:

- 49074 1. To support job control
- 49075 2. To permit a non-blocking version of the *wait()* function
- 49076 3. To permit a library routine, such as *system()* or *pclose()*, to wait for its children without
 49077 interfering with other terminated children for which the process has not waited

49078 The first two of these facilities are based on the *wait3()* function provided by 4.3 BSD. The
 49079 function uses the *options* argument, which is equivalent to an argument to *wait3()*. The
 49080 WUNTRACED flag is used only in conjunction with job control on systems supporting job
 49081 control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped
 49082 processes in that implementation: processes being traced via the *ptrace()* debugging facility and
 49083 (untraced) processes stopped by job control signals. Since *ptrace()* is not part of this volume of
 49084 IEEE Std 1003.1-2001, only the second type is relevant. The name WUNTRACED was retained
 49085 because its usage is the same, even though the name is not intuitively meaningful in this context.

49086 The third reason for the *waitpid()* function is to permit independent sections of a process to
 49087 spawn and wait for children without interfering with each other. For example, the following
 49088 problem occurs in developing a portable shell, or command interpreter:

```
49089 stream = popen("/bin/true");
49090 (void) system("sleep 100");
49091 (void) pclose(stream);
```

49092 On all historical implementations, the final *pclose()* fails to reap the *wait()* *status* of the *popen()*.

49093 The status values are retrieved by macros, rather than given as specific bit encodings as they are
 49094 in most historical implementations (and thus expected by existing programs). This was
 49095 necessary to eliminate a limitation on the number of signals an implementation can support that
 49096 was inherent in the traditional encodings. This volume of IEEE Std 1003.1-2001 does require that
 49097 a *status* value of zero corresponds to a process calling *_exit(0)*, as this is the most common
 49098 encoding expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

49099 These macros syntactically operate on an arbitrary integer value. The behavior is undefined
 49100 unless that value is one stored by a successful call to *wait()* or *waitpid()* in the location pointed
 49101 to by the *stat_loc* argument. An early proposal attempted to make this clearer by specifying each

argument as **stat_loc* rather than *stat_val*. However, that did not follow the conventions of other specifications in this volume of IEEE Std 1003.1-2001 or traditional usage. It also could have implied that the argument to the macro must literally be **stat_loc*; in fact, that value can be stored or passed as an argument to other functions before being interpreted by these macros.

The extension that affects *wait()* and *waitpid()* and is common in historical implementations is the *ptrace()* function. It is called by a child process and causes that child to stop and return a *status* that appears identical to the *status* indicated by WIFSTOPPED. The *status* of *ptrace()* children is traditionally returned regardless of the WUNTRACED flag (or by the *wait()* function). Most applications do not need to concern themselves with such extensions because they have control over what extensions they or their children use. However, applications, such as command interpreters, that invoke arbitrary processes may see this behavior when those arbitrary processes misuse such extensions.

Implementations that support **core** file creation or other implementation-defined actions on termination of some processes traditionally provide a bit in the *status* returned by *wait()* to indicate that such actions have occurred.

Allowing the *wait()* family of functions to discard a pending SIGCHLD signal that is associated with a successfully waited-for child process puts them into the *sigwait()* and *sigwaitinfo()* category with respect to SIGCHLD.

This definition allows implementations to treat a pending SIGCHLD signal as accepted by the process in *wait()*, with the same meaning of “accepted” as when that word is applied to the *sigwait()* family of functions.

Allowing the *wait()* family of functions to behave this way permits an implementation to be able to deal precisely with SIGCHLD signals.

In particular, an implementation that does accept (discard) the SIGCHLD signal can make the following guarantees regardless of the queuing depth of signals in general (the list of waitable children can hold the SIGCHLD queue):

1. If a SIGCHLD signal handler is established via *sigaction()* without the SA_RESETHAND flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will be delivered to or accepted by the process for every child process that terminates.
2. A single *wait()* issued from a SIGCHLD signal handler can be guaranteed to return immediately with status information for a child process.
3. When SA_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to receive a non-NULL pointer to a **siginfo_t** structure that describes a child process for which a wait via *waitpid()* or *waitid()* will not block or fail.
4. The *system()* function will not cause a process' SIGCHLD handler to be called as a result of the *fork()/exec* executed within *system()* because *system()* will accept the SIGCHLD signal when it performs a *waitpid()* for its child process. This is a desirable behavior of *system()* so that it can be used in a library without causing side effects to the application linked with the library.

An implementation that does not permit the *wait()* family of functions to accept (discard) a pending SIGCHLD signal associated with a successfully waited-for child, cannot make the guarantees described above for the following reasons:

Guarantee #1

Although it might be assumed that reliable queuing of all SIGCHLD signals generated by the system can make this guarantee, the counter-example is the case of a process that blocks SIGCHLD and performs an indefinite loop of *fork()/wait()* operations. If the

49148 implementation supports queued signals, then eventually the system will run out of
 49149 memory for the queue. The guarantee cannot be made because there must be some limit to
 49150 the depth of queuing.

49151 Guarantees #2 and #3

49152 These cannot be guaranteed unless the *wait()* family of functions accepts the SIGCHLD
 49153 signal. Otherwise, a *fork()/wait()* executed while SIGCHLD is blocked (as in the *system()*
 49154 function) will result in an invocation of the handler when SIGCHLD is unblocked, after the
 49155 process has disappeared.

49156 Guarantee #4

49157 Although possible to make this guarantee, *system()* would have to set the SIGCHLD
 49158 handler to SIG_DFL so that the SIGCHLD signal generated by its *fork()* would be discarded
 49159 (the SIGCHLD default action is to be ignored), then restore it to its previous setting. This
 49160 would have the undesirable side effect of discarding all SIGCHLD signals pending to the
 49161 process.

49162 FUTURE DIRECTIONS

49163 None.

49164 SEE ALSO

49165 *exec*, *exit()*, *fork()*, *waitid()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<signal.h>**,

49167 CHANGE HISTORY

49168 First released in Issue 1. Derived from Issue 1 of the SVID.

49169 Issue 5

49170 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

49171 Issue 6

49172 The following new requirements on POSIX implementations derive from alignment with the
 49173 Single UNIX Specification:

- 49174 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
 49175 required for conforming implementations of previous POSIX specifications, it was not
 49176 required for UNIX applications.

49177 The following changes were made to align with the IEEE P1003.1a draft standard:

- 49178 • The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

49179 The semantics of WIFSTOPPED(*stat_val*), WIFEXITED(*stat_val*), and WIFSIGNALED(*stat_val*)
 49180 are defined with respect to *posix_spawn()* or *posix_spawnnp()* for alignment with
 49181 IEEE Std 1003.1d-1999.

49182 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

49183 **NAME**

49184 waitid — wait for a child process to change state

49185 **SYNOPSIS**

49186 xSI #include <sys/wait.h>

49187 int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);

49188

49189 **DESCRIPTION**

49190 The *waitid()* function shall suspend the calling thread until one child of the process containing
 49191 the calling thread changes state. It records the current state of a child in the structure pointed to
 49192 by *infop*. If a child process changed state prior to the call to *waitid()*, *waitid()* shall return
 49193 immediately. If more than one thread is suspended in *wait()* or *waitpid()* waiting for termination
 49194 of the same process, exactly one thread shall return the process status at the time of the target
 49195 process termination.

49196 The *idtype* and *id* arguments are used to specify which children *waitid()* waits for.

49197 If *idtype* is P_PID, *waitid()* shall wait for the child with a process ID equal to (**pid_t**)*id*.

49198 If *idtype* is P_PGID, *waitid()* shall wait for any child with a process group ID equal to (**pid_t**)*id*.

49199 If *idtype* is P_ALL, *waitid()* shall wait for any children and *id* is ignored.

49200 The *options* argument is used to specify which state changes *waitid()* shall wait for. It is formed
 49201 by OR'ing together one or more of the following flags:

49202 WEXITED Wait for processes that have exited.

49203 WSTOPPED Status shall be returned for any child that has stopped upon receipt of a signal.

49204 WCONTINUED Status shall be returned for any child that was stopped and has been
 49205 continued.

49206 WNOHANG Return immediately if there are no children to wait for.

49207 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state. This
 49208 shall not affect the state of the process; the process may be waited for again
 49209 after this call completes.

49210 The application shall ensure that the *infop* argument points to a **siginfo_t** structure. If *waitid()*
 49211 returns because a child process was found that satisfied the conditions indicated by the
 49212 arguments *idtype* and *options*, then the structure pointed to by *infop* shall be filled in by the
 49213 system with the status of the process. The *si_signo* member shall always be equal to SIGCHLD.

49214 **RETURN VALUE**

49215 If WNOHANG was specified and there are no children to wait for, 0 shall be returned. If *waitid()*
 49216 returns due to the change of state of one of its children, 0 shall be returned. Otherwise, -1 shall
 49217 be returned and *errno* set to indicate the error.

49218 **ERRORS**

49219 The *waitid()* function shall fail if:

49220 [ECHILD] The calling process has no existing unwaited-for child processes.

49221 [EINTR] The *waitid()* function was interrupted by a signal.

49222 [EINVAL] An invalid value was specified for *options*, or *idtype* and *id* specify an invalid
 49223 set of processes.

49224 **EXAMPLES**

49225 None.

49226 **APPLICATION USAGE**

49227 None.

49228 **RATIONALE**

49229 None.

49230 **FUTURE DIRECTIONS**

49231 None.

49232 **SEE ALSO**49233 *exec*, *exit()*, *wait()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/wait.h**>49234 **CHANGE HISTORY**

49235 First released in Issue 4, Version 2.

49236 **Issue 5**

49237 Moved from X/OPEN UNIX extension to BASE.

49238 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

49239 **Issue 6**

49240 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49241 **NAME**

49242 waitpid — wait for a child process to stop or terminate

49243 **SYNOPSIS**

49244 #include <sys/wait.h>

49245 pid_t waitpid(pid_t *pid*, int **stat_loc*, int *options*);49246 **DESCRIPTION**49247 Refer to *wait()*.

49248 **NAME**

49249 wrtomb — convert a wide-character code to a character (restartable)

49250 **SYNOPSIS**

49251 #include <stdio.h>

49252 size_t wrtomb(char *restrict *s*, wchar_t *wc*, mbstate_t *restrict *ps*);49253 **DESCRIPTION**

49254 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49255 conflict between the requirements described here and the ISO C standard is unintentional. This
 49256 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49257 If *s* is a null pointer, the *wrtomb()* function shall be equivalent to the call:49258 wrtomb(*buf*, L'\0', *ps*)49259 where *buf* is an internal buffer.

49260 If *s* is not a null pointer, the *wrtomb()* function shall determine the number of bytes needed to
 49261 represent the character that corresponds to the wide character given by *wc* (including any shift
 49262 sequences), and store the resulting bytes in the array whose first element is pointed to by *s*. At
 49263 most {MB_CUR_MAX} bytes are stored. If *wc* is a null wide character, a null byte shall be stored,
 49264 preceded by any shift sequence needed to restore the initial shift state. The resulting state
 49265 described shall be the initial conversion state.

49266 If *ps* is a null pointer, the *wrtomb()* function shall use its own internal **mbstate_t** object, which is
 49267 initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 49268 pointed to by *ps* shall be used to completely describe the current conversion state of the
 49269 associated character sequence. The implementation shall behave as if no function defined in this
 49270 volume of IEEE Std 1003.1-2001 calls *wrtomb()*.

49271 CX If the application uses any of the _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS
 49272 functions, the application shall ensure that the *wrtomb()* function is called with a non-NULL *ps*
 49273 argument.

49274 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.49275 **RETURN VALUE**

49276 The *wrtomb()* function shall return the number of bytes stored in the array object (including any
 49277 shift sequences). When *wc* is not a valid wide character, an encoding error shall occur. In this
 49278 case, the function shall store the value of the macro [EILSEQ] in *errno* and shall return (**size_t**)−1;
 49279 the conversion state shall be undefined.

49280 **ERRORS**49281 The *wrtomb()* function may fail if:49282 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.

49283 [EILSEQ] Invalid wide-character code is detected.

49284 **EXAMPLES**

49285 None.

49286 **APPLICATION USAGE**

49287 None.

49288 **RATIONALE**

49289 None.

49290 **FUTURE DIRECTIONS**

49291 None.

49292 **SEE ALSO**49293 *mb sinit()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49294 **CHANGE HISTORY**49295 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
49296 (E).49297 **Issue 6**

49298 In the DESCRIPTION, a note on using this function in a threaded application is added.

49299 Extensions beyond the ISO C standard are marked.

49300 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49301 The *wcr tomb()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49302 **NAME**

49303 wcscat — concatenate two wide-character strings

49304 **SYNOPSIS**

49305 #include <wchar.h>

49306 wchar_t *wcscat(wchar_t *restrict *ws1*, const wchar_t *restrict *ws2*);49307 **DESCRIPTION**

49308 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49309 conflict between the requirements described here and the ISO C standard is unintentional. This
49310 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49311 The *wcscat()* function shall append a copy of the wide-character string pointed to by *ws2*
49312 (including the terminating null wide-character code) to the end of the wide-character string
49313 pointed to by *ws1*. The initial wide-character code of *ws2* shall overwrite the null wide-character
49314 code at the end of *ws1*. If copying takes place between objects that overlap, the behavior is
49315 undefined.

49316 **RETURN VALUE**49317 The *wcscat()* function shall return *ws1*; no return value is reserved to indicate an error.49318 **ERRORS**

49319 No errors are defined.

49320 **EXAMPLES**

49321 None.

49322 **APPLICATION USAGE**

49323 None.

49324 **RATIONALE**

49325 None.

49326 **FUTURE DIRECTIONS**

49327 None.

49328 **SEE ALSO**49329 *wcncat()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49330 **CHANGE HISTORY**

49331 First released in Issue 4. Derived from the MSE working draft.

49332 **Issue 6**

49333 The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, *s1* is changed
49334 to *ws1*.

49335 The *wcscat()* prototype is updated for alignment with the ISO / IEC 9899:1999 standard.

49336 **NAME**

49337 wcschr — wide-character string scanning operation

49338 **SYNOPSIS**

49339 #include <wchar.h>

49340 wchar_t *wcschr(const wchar_t *ws, wchar_t wc);

49341 **DESCRIPTION**

49342 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49343 conflict between the requirements described here and the ISO C standard is unintentional. This
49344 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49345 The *wcschr()* function shall locate the first occurrence of *wc* in the wide-character string pointed
49346 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type
49347 **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The
49348 terminating null wide-character code is considered to be part of the wide-character string.

49349 **RETURN VALUE**

49350 Upon completion, *wcschr()* shall return a pointer to the wide-character code, or a null pointer if
49351 the wide-character code is not found.

49352 **ERRORS**

49353 No errors are defined.

49354 **EXAMPLES**

49355 None.

49356 **APPLICATION USAGE**

49357 None.

49358 **RATIONALE**

49359 None.

49360 **FUTURE DIRECTIONS**

49361 None.

49362 **SEE ALSO**49363 *wcsrchr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49364 **CHANGE HISTORY**

49365 First released in Issue 4. Derived from the MSE working draft.

49366 **Issue 6**

49367 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49368 **NAME**

49369 wcscmp — compare two wide-character strings

49370 **SYNOPSIS**

49371 #include <wchar.h>

49372 int wcscmp(const wchar_t *ws1, const wchar_t *ws2);

49373 **DESCRIPTION**

49374 CX The functionality described on this reference page is aligned with the ISO C standard. Any
49375 conflict between the requirements described here and the ISO C standard is unintentional. This
49376 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49377 The *wcscmp()* function shall compare the wide-character string pointed to by *ws1* to the wide-
49378 character string pointed to by *ws2*.

49379 The sign of a non-zero return value shall be determined by the sign of the difference between the
49380 values of the first pair of wide-character codes that differ in the objects being compared.

49381 **RETURN VALUE**

49382 Upon completion, *wcscmp()* shall return an integer greater than, equal to, or less than 0, if the
49383 wide-character string pointed to by *ws1* is greater than, equal to, or less than the wide-character
49384 string pointed to by *ws2*, respectively.

49385 **ERRORS**

49386 No errors are defined.

49387 **EXAMPLES**

49388 None.

49389 **APPLICATION USAGE**

49390 None.

49391 **RATIONALE**

49392 None.

49393 **FUTURE DIRECTIONS**

49394 None.

49395 **SEE ALSO**49396 *wcsncmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49397 **CHANGE HISTORY**

49398 First released in Issue 4. Derived from the MSE working draft.

49399 **NAME**

49400 wcscoll — wide-character string comparison using collating information

49401 **SYNOPSIS**

49402 #include <wchar.h>

49403 int wcscoll(const wchar_t *ws1, const wchar_t *ws2);

49404 **DESCRIPTION**

49405 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49406 conflict between the requirements described here and the ISO C standard is unintentional. This
 49407 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49408 The *wcscoll()* function shall compare the wide-character string pointed to by *ws1* to the wide-
 49409 character string pointed to by *ws2*, both interpreted as appropriate to the *LC_COLLATE* category
 49410 of the current locale.

49411 CX The *wcscoll()* function shall not change the setting of *errno* if successful.

49412 An application wishing to check for error situations should set *errno* to 0 before calling *wcscoll()*.
 49413 If *errno* is non-zero on return, an error has occurred.

49414 **RETURN VALUE**

49415 Upon successful completion, *wcscoll()* shall return an integer greater than, equal to, or less than
 49416 0, according to whether the wide-character string pointed to by *ws1* is greater than, equal to, or
 49417 less than the wide-character string pointed to by *ws2*, when both are interpreted as appropriate
 49418 CX to the current locale. On error, *wcscoll()* shall set *errno*, but no return value is reserved to
 49419 indicate an error.

49420 **ERRORS**49421 The *wcscoll()* function may fail if:

49422 CX [EINVAL] The *ws1* or *ws2* arguments contain wide-character codes outside the domain of
 49423 the collating sequence.

49424 **EXAMPLES**

49425 None.

49426 **APPLICATION USAGE**49427 The *wcsxfrm()* and *wcscmp()* functions should be used for sorting large lists.49428 **RATIONALE**

49429 None.

49430 **FUTURE DIRECTIONS**

49431 None.

49432 **SEE ALSO**49433 *wcscmp()*, *wcsxfrm()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49434 **CHANGE HISTORY**

49435 First released in Issue 4. Derived from the MSE working draft.

49436 **Issue 5**

49437 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

49438 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

49439 **NAME**

49440 wcscpy — copy a wide-character string

49441 **SYNOPSIS**

49442 #include <wchar.h>

49443 wchar_t *wcscpy(wchar_t *restrict *ws1*, const wchar_t *restrict *ws2*);49444 **DESCRIPTION**

49445 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49446 conflict between the requirements described here and the ISO C standard is unintentional. This
49447 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49448 The *wcscpy()* function shall copy the wide-character string pointed to by *ws2* (including the
49449 terminating null wide-character code) into the array pointed to by *ws1*. If copying takes place
49450 between objects that overlap, the behavior is undefined.

49451 **RETURN VALUE**49452 The *wcscpy()* function shall return *ws1*; no return value is reserved to indicate an error.49453 **ERRORS**

49454 No errors are defined.

49455 **EXAMPLES**

49456 None.

49457 **APPLICATION USAGE**

49458 None.

49459 **RATIONALE**

49460 None.

49461 **FUTURE DIRECTIONS**

49462 None.

49463 **SEE ALSO**49464 *wcsncpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49465 **CHANGE HISTORY**

49466 First released in Issue 4. Derived from the MSE working draft.

49467 **Issue 6**49468 The *wcscpy()* prototype is updated for alignment with the ISO / IEC 9899:1999 standard.

49469 **NAME**

49470 wcscspn — get the length of a complementary wide substring

49471 **SYNOPSIS**

49472 #include <wchar.h>

49473 size_t wcscspn(const wchar_t *ws1, const wchar_t *ws2);

49474 **DESCRIPTION**

49475 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49476 conflict between the requirements described here and the ISO C standard is unintentional. This
49477 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49478 The *wcscspn()* function shall compute the length (in wide characters) of the maximum initial
49479 segment of the wide-character string pointed to by *ws1* which consists entirely of wide-character
49480 codes *not* from the wide-character string pointed to by *ws2*.

49481 **RETURN VALUE**

49482 The *wcscspn()* function shall return the length of the initial substring of *ws1*; no return value is
49483 reserved to indicate an error.

49484 **ERRORS**

49485 No errors are defined.

49486 **EXAMPLES**

49487 None.

49488 **APPLICATION USAGE**

49489 None.

49490 **RATIONALE**

49491 None.

49492 **FUTURE DIRECTIONS**

49493 None.

49494 **SEE ALSO**49495 *wcssp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49496 **CHANGE HISTORY**

49497 First released in Issue 4. Derived from the MSE working draft.

49498 **Issue 5**

49499 The RETURN VALUE section is updated to indicate that *wcscspn()* returns the length of *ws1*,
49500 rather than *ws1* itself.

49501 **NAME**

49502 wcsftime — convert date and time to a wide-character string

49503 **SYNOPSIS**

49504 #include <wchar.h>

```
49505       size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,
49506                      const wchar_t *restrict format, const struct tm *restrict timeptr);
```

49507 **DESCRIPTION**

49508 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 49509 conflict between the requirements described here and the ISO C standard is unintentional. This
 49510 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49511 The *wcsftime()* function shall be equivalent to the *strftime()* function, except that:

- 49512 • The argument *wcs* points to the initial element of an array of wide characters into which the
 49513 generated output is to be placed.
- 49514 • The argument *maxsize* indicates the maximum number of wide characters to be placed in the
 49515 output array.
- 49516 • The argument *format* is a wide-character string and the conversion specifications are replaced
 49517 by corresponding sequences of wide characters.
- 49518 • The return value indicates the number of wide characters placed in the output array.

49519 If copying takes place between objects that overlap, the behavior is undefined.

49520 **RETURN VALUE**

49521 If the total number of resulting wide-character codes including the terminating null wide-
 49522 character code is no more than *maxsize*, *wcsftime()* shall return the number of wide-character
 49523 codes placed into the array pointed to by *wcs*, not including the terminating null wide-character
 49524 code. Otherwise, zero is returned and the contents of the array are unspecified.

49525 **ERRORS**

49526 No errors are defined.

49527 **EXAMPLES**

49528 None.

49529 **APPLICATION USAGE**

49530 None.

49531 **RATIONALE**

49532 None.

49533 **FUTURE DIRECTIONS**

49534 None.

49535 **SEE ALSO**

49536 *strftime()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

49537 **CHANGE HISTORY**

49538 First released in Issue 4.

49539 **Issue 5**

49540 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

49541 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the *format*
 49542 argument is changed from **const char *** to **const wchar_t ***.

49543 **Issue 6**

49544 The *wcsftime()* prototype is updated for alignment with the ISO / IEC 9899: 1999 standard.

49545 **NAME**

49546 wcslen — get wide-character string length

49547 **SYNOPSIS**

49548 #include <wchar.h>

49549 size_t wcslen(const wchar_t *ws);

49550 **DESCRIPTION**

49551 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49552 conflict between the requirements described here and the ISO C standard is unintentional. This
49553 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49554 The *wcslen()* function shall compute the number of wide-character codes in the wide-character
49555 string to which *ws* points, not including the terminating null wide-character code.

49556 **RETURN VALUE**

49557 The *wcslen()* function shall return the length of *ws*; no return value is reserved to indicate an
49558 error.

49559 **ERRORS**

49560 No errors are defined.

49561 **EXAMPLES**

49562 None.

49563 **APPLICATION USAGE**

49564 None.

49565 **RATIONALE**

49566 None.

49567 **FUTURE DIRECTIONS**

49568 None.

49569 **SEE ALSO**49570 The Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49571 **CHANGE HISTORY**

49572 First released in Issue 4. Derived from the MSE working draft.

49573 **NAME**49574 `wcsncat` — concatenate a wide-character string with part of another49575 **SYNOPSIS**49576 `#include <wchar.h>`49577 `wchar_t *wcsncat(wchar_t *restrict ws1, const wchar_t *restrict ws2,`
49578 `size_t n);`49579 **DESCRIPTION**49580 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
49581 conflict between the requirements described here and the ISO C standard is unintentional. This
49582 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49583 The `wcsncat()` function shall append not more than *n* wide-character codes (a null wide-
49584 character code and wide-character codes that follow it are not appended) from the array pointed
49585 to by *ws2* to the end of the wide-character string pointed to by *ws1*. The initial wide-character
49586 code of *ws2* shall overwrite the null wide-character code at the end of *ws1*. A terminating null
49587 wide-character code shall always be appended to the result. If copying takes place between
49588 objects that overlap, the behavior is undefined.49589 **RETURN VALUE**49590 The `wcsncat()` function shall return *ws1*; no return value is reserved to indicate an error.49591 **ERRORS**

49592 No errors are defined.

49593 **EXAMPLES**

49594 None.

49595 **APPLICATION USAGE**

49596 None.

49597 **RATIONALE**

49598 None.

49599 **FUTURE DIRECTIONS**

49600 None.

49601 **SEE ALSO**49602 `wscat()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49603 **CHANGE HISTORY**

49604 First released in Issue 4. Derived from the MSE working draft.

49605 **Issue 6**49606 The `wcsncat()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49607 **NAME**

49608 wcsncmp — compare part of two wide-character strings

49609 **SYNOPSIS**

49610 #include <wchar.h>

49611 int wcsncmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);

49612 **DESCRIPTION**

49613 CX The functionality described on this reference page is aligned with the ISO C standard. Any
49614 conflict between the requirements described here and the ISO C standard is unintentional. This
49615 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49616 The *wcsncmp()* function shall compare not more than *n* wide-character codes (wide-character
49617 codes that follow a null wide-character code are not compared) from the array pointed to by *ws1*
49618 to the array pointed to by *ws2*.

49619 The sign of a non-zero return value shall be determined by the sign of the difference between the
49620 values of the first pair of wide-character codes that differ in the objects being compared.

49621 **RETURN VALUE**

49622 Upon successful completion, *wcsncmp()* shall return an integer greater than, equal to, or less
49623 than 0, if the possibly null-terminated array pointed to by *ws1* is greater than, equal to, or less
49624 than the possibly null-terminated array pointed to by *ws2*, respectively.

49625 **ERRORS**

49626 No errors are defined.

49627 **EXAMPLES**

49628 None.

49629 **APPLICATION USAGE**

49630 None.

49631 **RATIONALE**

49632 None.

49633 **FUTURE DIRECTIONS**

49634 None.

49638 First released in Issue 4. Derived from the MSE working draft.

49639 **NAME**

49640 wcsncpy — copy part of a wide-character string

49641 **SYNOPSIS**

49642 #include <wchar.h>

49643 wchar_t *wcsncpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,
49644 size_t n);49645 **DESCRIPTION**49646 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
49647 conflict between the requirements described here and the ISO C standard is unintentional. This
49648 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49649 The *wcsncpy()* function shall copy not more than *n* wide-character codes (wide-character codes
49650 that follow a null wide-character code are not copied) from the array pointed to by *ws2* to the
49651 array pointed to by *ws1*. If copying takes place between objects that overlap, the behavior is
49652 undefined.49653 If the array pointed to by *ws2* is a wide-character string that is shorter than *n* wide-character
49654 codes, null wide-character codes shall be appended to the copy in the array pointed to by *ws1*,
49655 until *n* wide-character codes in all are written.49656 **RETURN VALUE**49657 The *wcsncpy()* function shall return *ws1*; no return value is reserved to indicate an error.49658 **ERRORS**

49659 No errors are defined.

49660 **EXAMPLES**

49661 None.

49662 **APPLICATION USAGE**49663 If there is no null wide-character code in the first *n* wide-character codes of the array pointed to
49664 by *ws2*, the result is not null-terminated.49665 **RATIONALE**

49666 None.

49667 **FUTURE DIRECTIONS**

49668 None.

49669 **SEE ALSO**49670 *wscpy()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49671 **CHANGE HISTORY**

49672 First released in Issue 4. Derived from the MSE working draft.

49673 **Issue 6**49674 The *wcsncpy()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49675 **NAME**

49676 wenspbrk — scan a wide-character string for a wide-character code

49677 **SYNOPSIS**

49678 #include <wchar.h>

49679 wchar_t *wenspbrk(const wchar_t *ws1, const wchar_t *ws2);

49680 **DESCRIPTION**

49681 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49682 conflict between the requirements described here and the ISO C standard is unintentional. This
49683 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49684 The *wenspbrk()* function shall locate the first occurrence in the wide-character string pointed to by
49685 *ws1* of any wide-character code from the wide-character string pointed to by *ws2*.

49686 **RETURN VALUE**

49687 Upon successful completion, *wenspbrk()* shall return a pointer to the wide-character code or a null
49688 pointer if no wide-character code from *ws2* occurs in *ws1*.

49689 **ERRORS**

49690 No errors are defined.

49691 **EXAMPLES**

49692 None.

49693 **APPLICATION USAGE**

49694 None.

49695 **RATIONALE**

49696 None.

49697 **FUTURE DIRECTIONS**

49698 None.

49699 **SEE ALSO**49700 *wenschr()*, *wenschr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>49701 **CHANGE HISTORY**

49702 First released in Issue 4. Derived from the MSE working draft.

49703 **NAME**

49704 wcsrchr — wide-character string scanning operation

49705 **SYNOPSIS**

49706 #include <wchar.h>

49707 wchar_t *wcsrchr(const wchar_t *ws, wchar_t wc);

49708 **DESCRIPTION**

49709 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49710 conflict between the requirements described here and the ISO C standard is unintentional. This
49711 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49712 The *wcsrchr()* function shall locate the last occurrence of *wc* in the wide-character string pointed
49713 to by *ws*. The application shall ensure that the value of *wc* is a character representable as a type
49714 **wchar_t** and a wide-character code corresponding to a valid character in the current locale. The
49715 terminating null wide-character code shall be considered to be part of the wide-character string.

49716 **RETURN VALUE**

49717 Upon successful completion, *wcsrchr()* shall return a pointer to the wide-character code or a null
49718 pointer if *wc* does not occur in the wide-character string.

49719 **ERRORS**

49720 No errors are defined.

49721 **EXAMPLES**

49722 None.

49723 **APPLICATION USAGE**

49724 None.

49725 **RATIONALE**

49726 None.

49727 **FUTURE DIRECTIONS**

49728 None.

49729 **SEE ALSO**49730 *wcschr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49731 **CHANGE HISTORY**

49732 First released in Issue 4. Derived from the MSE working draft.

49733 **Issue 6**

49734 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49735 **NAME**

49736 wcsrtoombs — convert a wide-character string to a character string (restartable)

49737 **SYNOPSIS**

49738 #include <wchar.h>

```
49739       size_t wcsrtoombs(char *restrict dst, const wchar_t **restrict src,
49740                       size_t len, mbstate_t *restrict ps);
```

49741 **DESCRIPTION**

49742 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49743 conflict between the requirements described here and the ISO C standard is unintentional. This
 49744 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49745 The *wcsrtoombs()* function shall convert a sequence of wide characters from the array indirectly
 49746 pointed to by *src* into a sequence of corresponding characters, beginning in the conversion state
 49747 described by the object pointed to by *ps*. If *dst* is not a null pointer, the converted characters
 49748 shall then be stored into the array pointed to by *dst*. Conversion continues up to and including a
 49749 terminating null wide character, which shall also be stored. Conversion shall stop earlier in the
 49750 following cases:

- 49751 • When a code is reached that does not correspond to a valid character
- 49752 • When the next character would exceed the limit of *len* total bytes to be stored in the array
 49753 pointed to by *dst* (and *dst* is not a null pointer)

49754 Each conversion shall take place as if by a call to the *wcrtomb()* function.

49755 If *dst* is not a null pointer, the pointer object pointed to by *src* shall be assigned either a null
 49756 pointer (if conversion stopped due to reaching a terminating null wide character) or the address
 49757 just past the last wide character converted (if any). If conversion stopped due to reaching a
 49758 terminating null wide character, the resulting state described shall be the initial conversion state.

49759 If *ps* is a null pointer, the *wcsrtoombs()* function shall use its own internal **mbstate_t** object, which
 49760 is initialized at program start-up to the initial conversion state. Otherwise, the **mbstate_t** object
 49761 pointed to by *ps* shall be used to completely describe the current conversion state of the
 49762 associated character sequence. The implementation shall behave as if no function defined in this
 49763 volume of IEEE Std 1003.1-2001 calls *wcsrtoombs()*.

49764 CX If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`
 49765 functions, the application shall ensure that the *wcsrtoombs()* function is called with a non-NULL
 49766 *ps* argument.

49767 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

49768 **RETURN VALUE**

49769 If conversion stops because a code is reached that does not correspond to a valid character, an
 49770 encoding error occurs. In this case, the *wcsrtoombs()* function shall store the value of the macro
 49771 [EILSEQ] in *errno* and return (**size_t**)−1; the conversion state is undefined. Otherwise, it shall
 49772 return the number of bytes in the resulting character sequence, not including the terminating
 49773 null (if any).

49774 **ERRORS**

49775 The *wcsrtoombs()* function may fail if:

- 49776 CX [EINVAL] *ps* points to an object that contains an invalid conversion state.
- 49777 [EILSEQ] A wide-character code does not correspond to a valid character.

49778 **EXAMPLES**

49779 None.

49780 **APPLICATION USAGE**

49781 None.

49782 **RATIONALE**

49783 None.

49784 **FUTURE DIRECTIONS**

49785 None.

49786 **SEE ALSO**49787 *mbstinit()*, *wcrtomb()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>49788 **CHANGE HISTORY**49789 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
49790 (E).49791 **Issue 6**

49792 In the DESCRIPTION, a note on using this function in a threaded application is added.

49793 Extensions beyond the ISO C standard are marked.

49794 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

49795 The *wcsrtombs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49796 **NAME**

49797 wcssp — get the length of a wide substring

49798 **SYNOPSIS**

49799 #include <wchar.h>

49800 size_t wcssp(const wchar_t *ws1, const wchar_t *ws2);

49801 **DESCRIPTION**

49802 cx The functionality described on this reference page is aligned with the ISO C standard. Any
49803 conflict between the requirements described here and the ISO C standard is unintentional. This
49804 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49805 The wcssp() function shall compute the length (in wide characters) of the maximum initial
49806 segment of the wide-character string pointed to by ws1 which consists entirely of wide-character
49807 codes from the wide-character string pointed to by ws2.

49808 **RETURN VALUE**

49809 The wcssp() function shall return the length of the initial substring of ws1; no return value is
49810 reserved to indicate an error.

49811 **ERRORS**

49812 No errors are defined.

49813 **EXAMPLES**

49814 None.

49815 **APPLICATION USAGE**

49816 None.

49817 **RATIONALE**

49818 None.

49819 **FUTURE DIRECTIONS**

49820 None.

49821 **SEE ALSO**

49822 wcscsp(), the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

49823 **CHANGE HISTORY**

49824 First released in Issue 4. Derived from the MSE working draft.

49825 **Issue 5**

49826 The RETURN VALUE section is updated to indicate that wcssp() returns the length of ws1
49827 rather than ws1 itself.

49828 **NAME**49829 `wcsstr` — find a wide-character substring49830 **SYNOPSIS**49831 `#include <wchar.h>`49832 `wchar_t *wcsstr(const wchar_t *restrict ws1,`
49833 `const wchar_t *restrict ws2);`49834 **DESCRIPTION**49835 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
49836 conflict between the requirements described here and the ISO C standard is unintentional. This
49837 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.49838 The `wcsstr()` function shall locate the first occurrence in the wide-character string pointed to by
49839 `ws1` of the sequence of wide characters (excluding the terminating null wide character) in the
49840 wide-character string pointed to by `ws2`.49841 **RETURN VALUE**49842 Upon successful completion, `wcsstr()` shall return a pointer to the located wide-character string,
49843 or a null pointer if the wide-character string is not found.49844 If `ws2` points to a wide-character string with zero length, the function shall return `ws1`.49845 **ERRORS**

49846 No errors are defined.

49847 **EXAMPLES**

49848 None.

49849 **APPLICATION USAGE**

49850 None.

49851 **RATIONALE**

49852 None.

49853 **FUTURE DIRECTIONS**

49854 None.

49855 **SEE ALSO**49856 `wcschr()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`49857 **CHANGE HISTORY**49858 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
49859 (E).49860 **Issue 6**49861 The `wcsstr()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

49862 **NAME**

49863 wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

49864 **SYNOPSIS**

49865 #include <wchar.h>

49866 double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);

49867 float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);

49868 long double wcstold(const wchar_t *restrict nptr,

49869 wchar_t **restrict endptr);

49870 **DESCRIPTION**

49871 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49872 conflict between the requirements described here and the ISO C standard is unintentional. This
 49873 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49874 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to
 49875 **double**, **float**, and **long double** representation, respectively. First, they shall decompose the
 49876 input wide-character string into three parts:

- 49877 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 49878 *iswspace()*)
- 49879 2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
- 49880 3. A final wide-character string of one or more unrecognized wide-character codes, including
 49881 the terminating null wide-character code of the input wide-character string

49882 Then they shall attempt to convert the subject sequence to a floating-point number, and return
 49883 the result.

49884 The expected form of the subject sequence is an optional plus or minus sign, then one of the
 49885 following:

- 49886 • A non-empty sequence of decimal digits optionally containing a radix character, then an
 49887 optional exponent part
- 49888 • A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix
 49889 character, then an optional binary exponent part
- 49890 • One of INF or INFINITY, or any other wide string equivalent except for case
- 49891 • One of NAN or NAN(*n-wchar-sequence_{opt}*), or any other wide string ignoring case in the NAN
 49892 part, where:

49893 n-wchar-sequence:

49894 digit

49895 nondigit

49896 n-wchar-sequence digit

49897 n-wchar-sequence nondigit

49898 The subject sequence is defined as the longest initial subsequence of the input wide string,
 49899 starting with the first non-white-space wide character, that is of the expected form. The subject
 49900 sequence contains no wide characters if the input wide string is not of the expected form.

49901 If the subject sequence has the expected form for a floating-point number, the sequence of wide
 49902 characters starting with the first digit or the radix character (whichever occurs first) shall be
 49903 interpreted as a floating constant according to the rules of the C language, except that the radix
 49904 character shall be used in place of a period, and that if neither an exponent part nor a radix
 49905 character appears in a decimal floating-point number, or if a binary exponent part does not

49906 appear in a hexadecimal floating-point number, an exponent part of the appropriate type with
 49907 value zero shall be assumed to follow the last digit in the string. If the subject sequence begins
 49908 with a minus sign, the sequence shall be interpreted as negated. A wide-character sequence INF
 49909 or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it
 49910 were a floating constant that is too large for the range of the return type. A wide-character
 49911 sequence NAN or NAN(*n-wchar-sequence_{opt}*) shall be interpreted as a quiet NaN, if supported in
 49912 the return type, else as if it were a subject sequence part that does not have the expected form;
 49913 the meaning of the *n-wchar* sequences is implementation-defined. A pointer to the final wide
 49914 string shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

49915 If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the
 49916 conversion shall be rounded in an implementation-defined manner.

49917 CX The radix character shall be as defined in the program's locale (category *LC_NUMERIC*). In the
 49918 POSIX locale, or in a locale where the radix character is not defined, the radix character shall
 49919 default to a period ('.').

49920 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
 49921 accepted.

49922 If the subject sequence is empty or does not have the expected form, no conversion shall be
 49923 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
 49924 *endptr* is not a null pointer.

49925 CX The *wcstod()* function shall not change the setting of *errno* if successful.

49926 Since 0 is returned on error and is also a valid return on success, an application wishing to check
 49927 for error situations should set *errno* to 0, then call *wcstod()*, *wcstof()*, or *wcstold()*, then check
 49928 *errno*.

49929 RETURN VALUE

49930 Upon successful completion, these functions shall return the converted value. If no conversion
 49931 CX could be performed, 0 shall be returned and *errno* may be set to [EINVAL].

49932 If the correct value is outside the range of representable values, ±HUGE_VAL, ±HUGE_VALF, or |
 49933 ±HUGE_VALL shall be returned (according to the sign of the value), and *errno* shall be set to |
 49934 [ERANGE].

49935 If the correct value would cause underflow, a value whose magnitude is no greater than the
 49936 smallest normalized positive number in the return type shall be returned and *errno* set to
 49937 [ERANGE].

49938 ERRORS

49939 The *wcstod()* function shall fail if:

49940 [ERANGE] The value to be returned would cause overflow or underflow.

49941 The *wcstod()* function may fail if:

49942 CX [EINVAL] No conversion could be performed.

49943 **EXAMPLES**

49944 None.

49945 **APPLICATION USAGE**

49946 If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the
 49947 result is not exactly representable, the result should be one of the two numbers in the
 49948 appropriate internal format that are adjacent to the hexadecimal floating source value, with the
 49949 extra stipulation that the error should have a correct sign for the current rounding direction.

49950 If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in **<float.h>**)
 49951 significant digits, the result should be correctly rounded. If the subject sequence *D* has the
 49952 decimal form and more than DECIMAL_DIG significant digits, consider the two bounding,
 49953 adjacent decimal strings *L* and *U*, both having DECIMAL_DIG significant digits, such that the
 49954 values of *L*, *D*, and *U* satisfy "*L* ≤ *D* ≤ *U*". The result should be one of the (equal or
 49955 adjacent) values that would be obtained by correctly rounding *L* and *U* according to the current
 49956 rounding direction, with the extra stipulation that the error with respect to *D* should have a
 49957 correct sign for the current rounding direction.

49958 **RATIONALE**

49959 None.

49960 **FUTURE DIRECTIONS**

49961 None.

49962 **SEE ALSO**

49963 *iswspace()*, *localeconv()*, *scanf()*, *setlocale()*, *wcstol()*, the Base Definitions volume of
 49964 IEEE Std 1003.1-2001, Chapter 7, Locale, **<float.h>**, **<wchar.h>**

49965 **CHANGE HISTORY**

49966 First released in Issue 4. Derived from the MSE working draft.

49967 **Issue 5**49968 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.49969 **Issue 6**

49970 Extensions beyond the ISO C standard are marked.

49971 The following new requirements on POSIX implementations derive from alignment with the
 49972 Single UNIX Specification:

- 49973 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
- 49974 added if no conversion could be performed.

49975 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 49976 • The *wcstod()* prototype is updated.
- 49977 • The *wcstof()* and *wcstold()* functions are added.
- 49978 • If the correct value for *wcstod()* would cause underflow, the return value changed from 0 (as
- 49979 specified in Issue 5) to the smallest normalized positive number.
- 49980 • The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively
- 49981 updated.

49982 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

49983 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second
 49984 paragraph in the RETURN VALUE section.

49985 **NAME**

49986 wcstoimax, wcstoumax — convert a wide-character string to an integer type

49987 **SYNOPSIS**

49988 #include <stddef.h>

49989 #include <inttypes.h>

49990 intmax_t wcstoimax(const wchar_t *restrict nptr,

49991 wchar_t **restrict endptr, int base);

49992 uintmax_t wcstoumax(const wchar_t *restrict nptr,

49993 wchar_t **restrict endptr, int base);

49994 **DESCRIPTION**

49995 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 49996 conflict between the requirements described here and the ISO C standard is unintentional. This
 49997 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

49998 These functions shall be equivalent to the *wcstol()*, *wcstoll()*, *wcstoul()*, and *wcstoull()* functions,
 49999 respectively, except that the initial portion of the wide string shall be converted to **intmax_t** and
 50000 **uintmax_t** representation, respectively.

50001 **RETURN VALUE**

50002 These functions shall return the converted value, if any.

50003 If no conversion could be performed, zero shall be returned. If the correct value is outside the
 50004 range of representable values, {INTMAX_MAX}, {INTMAX_MIN}, or {UINTMAX_MAX} shall
 50005 be returned (according to the return type and sign of the value, if any), and *errno* shall be set to
 50006 [ERANGE].

50007 **ERRORS**

50008 These functions shall fail if:

50009 [EINVAL] The value of *base* is not supported.

50010 [ERANGE] The value to be returned is not representable.

50011 These functions may fail if:

50012 [EINVAL] No conversion could be performed.

50013 **EXAMPLES**

50014 None.

50015 **APPLICATION USAGE**

50016 None.

50017 **RATIONALE**

50018 None.

50019 **FUTURE DIRECTIONS**

50020 None.

50021 **SEE ALSO**50022 *wcstol()*, *wcstoul()*, the Base Definitions volume of IEEE Std 1003.1-2001, <inttypes.h>,
 50023 <stddef.h>50024 **CHANGE HISTORY**

50025 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

50026 **NAME**

50027 wcstok — split a wide-character string into tokens

50028 **SYNOPSIS**

50029 #include <wchar.h>

50030 wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,
 50031 wchar_t **restrict ptr);

50032 **DESCRIPTION**

50033 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 50034 conflict between the requirements described here and the ISO C standard is unintentional. This
 50035 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50036 A sequence of calls to *wcstok()* shall break the wide-character string pointed to by *ws1* into a
 50037 sequence of tokens, each of which shall be delimited by a wide-character code from the wide-
 50038 character string pointed to by *ws2*. The *ptr* argument points to a caller-provided **wchar_t** pointer
 50039 into which the *wcstok()* function shall store information necessary for it to continue scanning the
 50040 same wide-character string.

50041 The first call in the sequence has *ws1* as its first argument, and is followed by calls with a null
 50042 pointer as their first argument. The separator string pointed to by *ws2* may be different from call
 50043 to call.

50044 The first call in the sequence shall search the wide-character string pointed to by *ws1* for the first
 50045 wide-character code that is *not* contained in the current separator string pointed to by *ws2*. If no
 50046 such wide-character code is found, then there are no tokens in the wide-character string pointed
 50047 to by *ws1* and *wcstok()* shall return a null pointer. If such a wide-character code is found, it shall
 50048 be the start of the first token.

50049 The *wcstok()* function shall then search from there for a wide-character code that *is* contained in
 50050 the current separator string. If no such wide-character code is found, the current token extends
 50051 to the end of the wide-character string pointed to by *ws1*, and subsequent searches for a token
 50052 shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a
 50053 null wide character, which terminates the current token. The *wcstok()* function shall save a
 50054 pointer to the following wide-character code, from which the next search for a token shall start.

50055 Each subsequent call, with a null pointer as the value of the first argument, shall start searching
 50056 from the saved pointer and behave as described above.

50057 The implementation shall behave as if no function calls *wcstok()*.

50058 **RETURN VALUE**

50059 Upon successful completion, the *wcstok()* function shall return a pointer to the first wide-
 50060 character code of a token. Otherwise, if there is no token, *wcstok()* shall return a null pointer.

50061 **ERRORS**

50062 No errors are defined.

50063 **EXAMPLES**

50064 None.

50065 **APPLICATION USAGE**

50066 None.

50067 **RATIONALE**

50068 None.

50069 **FUTURE DIRECTIONS**

50070 None.

50071 **SEE ALSO**

50072 The Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

50073 **CHANGE HISTORY**

50074 First released in Issue 4.

50075 **Issue 5**50076 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is
50077 added to the definition of *wcstok()* in the SYNOPSIS.50078 **Issue 6**50079 The *wcstok()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

50080 **NAME**

50081 wcstol, wcstoll — convert a wide-character string to a long integer

50082 **SYNOPSIS**

50083 #include <wchar.h>

50084 long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr,
50085 int base);50086 long long wcstoll(const wchar_t *restrict nptr,
50087 wchar_t **restrict endptr, int base);50088 **DESCRIPTION**50089 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
50090 conflict between the requirements described here and the ISO C standard is unintentional. This
50091 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.50092 These functions shall convert the initial portion of the wide-character string pointed to by *nptr* to
50093 **long**, **long long**, **unsigned long**, and **unsigned long long** representation, respectively. First, they
50094 shall decompose the input string into three parts:

- 50095 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
50096 *iswspace()*)
- 50097 2. A subject sequence interpreted as an integer represented in some radix determined by the
50098 value of *base*
- 50099 3. A final wide-character string of one or more unrecognized wide-character codes, including
50100 the terminating null wide-character code of the input wide-character string

50101 Then they shall attempt to convert the subject sequence to an integer, and return the result.

50102 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
50103 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal
50104 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
50105 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
50106 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
50107 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.50108 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
50109 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
50110 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
50111 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
50112 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character code
50113 representations of 0x or 0X may optionally precede the sequence of letters and digits, following
50114 the sign if present.50115 The subject sequence is defined as the longest initial subsequence of the input wide-character
50116 string, starting with the first non-white-space wide-character code that is of the expected form.
50117 The subject sequence contains no wide-character codes if the input wide-character string is
50118 empty or consists entirely of white-space wide-character code, or if the first non-white-space
50119 wide-character code is other than a sign or a permissible letter or digit.50120 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes
50121 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
50122 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for
50123 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
50124 minus sign, the value resulting from the conversion shall be negated. A pointer to the final
50125 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

- 50126 not a null pointer.
- 50127 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
50128 accepted.
- 50129 If the subject sequence is empty or does not have the expected form, no conversion shall be
50130 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
50131 *endptr* is not a null pointer.
- 50132 CX These functions shall not change the setting of *errno* if successful.
- 50133 Since 0, {LONG_MIN} or {LLONG_MIN} and {LONG_MAX} or {LLONG_MAX} are returned on
50134 error and are also valid returns on success, an application wishing to check for error situations
50135 should set *errno* to 0, then call *wcstol()* or *wcstoll()*, then check *errno*.
- 50136 **RETURN VALUE**
- 50137 Upon successful completion, these functions shall return the converted value, if any. If no
50138 CX conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If
50139 the correct value is outside the range of representable values, {LONG_MIN}, {LONG_MAX},
50140 {LLONG_MIN}, or {LLONG_MAX} shall be returned (according to the sign of the value), and
50141 *errno* set to [ERANGE].
- 50142 **ERRORS**
- 50143 These functions shall fail if:
- 50144 CX [EINVAL] The value of *base* is not supported.
- 50145 [ERANGE] The value to be returned is not representable.
- 50146 These functions may fail if:
- 50147 CX [EINVAL] No conversion could be performed.
- 50148 **EXAMPLES**
- 50149 None.
- 50150 **APPLICATION USAGE**
- 50151 None.
- 50152 **RATIONALE**
- 50153 None.
- 50154 **FUTURE DIRECTIONS**
- 50155 None.
- 50156 **SEE ALSO**
- 50157 *iswalpha()*, *scanf()*, *wcstod()*, the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>
- 50158 **CHANGE HISTORY**
- 50159 First released in Issue 4. Derived from the MSE working draft.
- 50160 **Issue 5**
- 50161 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
- 50162 **Issue 6**
- 50163 Extensions beyond the ISO C standard are marked.
- 50164 The following new requirements on POSIX implementations derive from alignment with the
50165 Single UNIX Specification:
- 50166 • In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
50167 added if no conversion could be performed.

50168 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

50169 • The *wcstol()* prototype is updated.

50170 • The *wcstoll()* function is added.

50171 **NAME**

50172 wcstold — convert a wide-character string to a double-precision number

50173 **SYNOPSIS**

50174 #include <wchar.h>

50175 long double wcstold(const wchar_t *restrict *nptr*,

50176 wchar_t **restrict *endptr*);

50177 **DESCRIPTION**

50178 Refer to *wcstod()*.

50179 **NAME**

50180 wcstoll — convert a wide-character string to a long integer

50181 **SYNOPSIS**

50182 #include <wchar.h>

50183 long long wcstoll(const wchar_t *restrict *nptr*,50184 wchar_t **restrict *endptr*, int *base*);50185 **DESCRIPTION**50186 Refer to *wcstol()*.

50187 **NAME**

50188 wcstombs — convert a wide-character string to a character string

50189 **SYNOPSIS**

50190 #include <stdlib.h>

50191 size_t wcstombs(char *restrict s, const wchar_t *restrict pwcs,
50192 size_t n);

50193 **DESCRIPTION**

50194 CX The functionality described on this reference page is aligned with the ISO C standard. Any
50195 conflict between the requirements described here and the ISO C standard is unintentional. This
50196 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50197 The *wcstombs()* function shall convert the sequence of wide-character codes that are in the array
50198 pointed to by *pwcs* into a sequence of characters that begins in the initial shift state and store
50199 these characters into the array pointed to by *s*, stopping if a character would exceed the limit of *n*
50200 total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to
50201 *wctomb()*, except that the shift state of *wctomb()* shall not be affected.

50202 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

50203 No more than *n* bytes shall be modified in the array pointed to by *s*. If copying takes place
50204 CX between objects that overlap, the behavior is undefined. If *s* is a null pointer, *wcstombs()* shall
50205 return the length required to convert the entire array regardless of the value of *n*, but no values
50206 are stored.

50207 The *wcstombs()* function need not be reentrant. A function that is not required to be reentrant is
50208 not required to be thread-safe.

50209 **RETURN VALUE**

50210 If a wide-character code is encountered that does not correspond to a valid character (of one or
50211 more bytes each), *wcstombs()* shall return **(size_t)−1**. Otherwise, *wcstombs()* shall return the
50212 number of bytes stored in the character array, not including any terminating null byte. The array
50213 shall not be null-terminated if the value returned is *n*.

50214 **ERRORS**

50215 The *wcstombs()* function may fail if:

50216 CX [EILSEQ] A wide-character code does not correspond to a valid character.

50217 **EXAMPLES**

50218 None.

50219 **APPLICATION USAGE**

50220 None.

50221 **RATIONALE**

50222 None.

50223 **FUTURE DIRECTIONS**

50224 None.

50225 **SEE ALSO**

50226 *mblen()*, *mbtowc()*, *mbstowcs()*, *wctomb()*, the Base Definitions volume of IEEE Std 1003.1-2001,
50227 <stdlib.h>

50228 **CHANGE HISTORY**

50229 First released in Issue 4. Derived from the ISO C standard.

50230 **Issue 6**

50231 The following new requirements on POSIX implementations derive from alignment with the
50232 Single UNIX Specification:

- 50233 • The DESCRIPTION states the effect of when *s* is a null pointer.
- 50234 • The [EILSEQ] error condition is added.

50235 The *wcstombs()* prototype is updated for alignment with the ISO / IEC 9899:1999 standard.

50236 **NAME**

50237 wcstoul, wcstoull — convert a wide-character string to an unsigned long

50238 **SYNOPSIS**

50239 #include <wchar.h>

50240 unsigned long wcstoul(const wchar_t *restrict nptr,

50241 wchar_t **restrict endptr, int base);

50242 unsigned long long wcstoull(const wchar_t *restrict nptr,

50243 wchar_t **restrict endptr, int base);

50244 **DESCRIPTION**

50245 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 50246 conflict between the requirements described here and the ISO C standard is unintentional. This
 50247 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50248 The `wcstoul()` and `wcstoull()` functions shall convert the initial portion of the wide-character
 50249 string pointed to by *nptr* to **unsigned long** and **unsigned long long** representation, respectively.
 50250 First, they shall decompose the input wide-character string into three parts:

- 50251 1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
 50252 *iswspace()*)
- 50253 2. A subject sequence interpreted as an integer represented in some radix determined by the
 50254 value of *base*
- 50255 3. A final wide-character string of one or more unrecognized wide-character codes, including
 50256 the terminating null wide-character code of the input wide-character string

50257 Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
 50258 result.

50259 If *base* is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
 50260 or hexadecimal constant, any of which may be preceded by a '+' or '-' sign. A decimal
 50261 constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
 50262 constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
 50263 only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
 50264 decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

50265 If the value of *base* is between 2 and 36, the expected form of the subject sequence is a sequence
 50266 of letters and digits representing an integer with the radix specified by *base*, optionally preceded
 50267 by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
 50268 (or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
 50269 than that of *base* shall be permitted. If the value of *base* is 16, the wide-character codes 0x or 0X
 50270 may optionally precede the sequence of letters and digits, following the sign if present.

50271 The subject sequence is defined as the longest initial subsequence of the input wide-character
 50272 string, starting with the first wide-character code that is not white space and is of the expected
 50273 form. The subject sequence contains no wide-character codes if the input wide-character string is
 50274 empty or consists entirely of white-space wide-character codes, or if the first wide-character
 50275 code that is not white space is other than a sign or a permissible letter or digit.

50276 If the subject sequence has the expected form and *base* is 0, the sequence of wide-character codes
 50277 starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
 50278 the expected form and the value of *base* is between 2 and 36, it shall be used as the base for
 50279 conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
 50280 minus sign, the value resulting from the conversion shall be negated. A pointer to the final
 50281 wide-character string shall be stored in the object pointed to by *endptr*, provided that *endptr* is

- 50282 not a null pointer.
- 50283 CX In other than the C or POSIX locales, other implementation-defined subject sequences may be
50284 accepted.
- 50285 If the subject sequence is empty or does not have the expected form, no conversion shall be
50286 performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that
50287 *endptr* is not a null pointer.
- 50288 CX The *wcstoul()* function shall not change the setting of *errno* if successful.
- 50289 Since 0, {ULONG_MAX}, and {ULLONG_MAX} are returned on error and 0 is also a valid return
50290 on success, an application wishing to check for error situations should set *errno* to 0, then call
50291 *wcstoul()* or *wcstoull()*, then check *errno*.
- 50292 **RETURN VALUE**
- 50293 Upon successful completion, the *wcstoul()* and *wcstoull()* functions shall return the converted
50294 CX value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to
50295 indicate the error. If the correct value is outside the range of representable values,
50296 {ULONG_MAX} or {ULLONG_MAX} respectively shall be returned and *errno* set to [ERANGE].
- 50297 **ERRORS**
- 50298 These functions shall fail if:
- 50299 CX [EINVAL] The value of *base* is not supported.
- 50300 [ERANGE] The value to be returned is not representable.
- 50301 These functions may fail if:
- 50302 CX [EINVAL] No conversion could be performed.
- 50303 **EXAMPLES**
- 50304 None.
- 50305 **APPLICATION USAGE**
- 50306 None.
- 50307 **RATIONALE**
- 50308 None.
- 50309 **FUTURE DIRECTIONS**
- 50310 None.
- 50311 **SEE ALSO**
- 50312 *iswalph()*, *scanf()*, *wcstod()*, *wcstol()*, the Base Definitions volume of IEEE Std 1003.1-2001,
50313 <wchar.h>
- 50314 **CHANGE HISTORY**
- 50315 First released in Issue 4. Derived from the MSE working draft.
- 50316 **Issue 5**
- 50317 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.
- 50318 **Issue 6**
- 50319 Extensions beyond the ISO C standard are marked.
- 50320 The following new requirements on POSIX implementations derive from alignment with the
50321 Single UNIX Specification:
- 50322 • The [EINVAL] error condition is added for when the value of *base* is not supported.

- 50323 In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
50324 added if no conversion could be performed.
- 50325 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 50326 • The *wcstoul()* prototype is updated.
- 50327 • The *wcstoull()* function is added.

50328 **NAME**

50329 wcstoumax — convert a wide-character string to an integer type

50330 **SYNOPSIS**

50331 #include <stddef.h>

50332 #include <inttypes.h>

50333 uintmax_t wcstoumax(const wchar_t *restrict nptr,

50334 wchar_t **restrict endptr, int base);

50335 **DESCRIPTION**50336 Refer to *wcstoimax()*.

50337 **NAME**50338 wcswcs — find a wide substring (**LEGACY**)50339 **SYNOPSIS**

50340 xSI #include <wchar.h>

50341 wchar_t *wcswcs(const wchar_t *ws1, const wchar_t *ws2);

50342

50343 **DESCRIPTION**

50344 The wcswcs() function shall locate the first occurrence in the wide-character string pointed to by
50345 ws1 of the sequence of wide-character codes (excluding the terminating null wide-character
50346 code) in the wide-character string pointed to by ws2.

50347 **RETURN VALUE**

50348 Upon successful completion, wcswcs() shall return a pointer to the located wide-character string
50349 or a null pointer if the wide-character string is not found.

50350 If ws2 points to a wide-character string with zero length, the function shall return ws1.

50351 **ERRORS**

50352 No errors are defined.

50353 **EXAMPLES**

50354 None.

50355 **APPLICATION USAGE**

50356 This function was not included in the final ISO/IEC 9899:1990/Amendment 1:1995 (E).
50357 Application developers are strongly encouraged to use the wcsstr() function instead.

50358 **RATIONALE**

50359 None.

50360 **FUTURE DIRECTIONS**

50361 This function may be withdrawn in a future version.

50362 **SEE ALSO**

50363 wcschr(), wcsstr(), the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

50364 **CHANGE HISTORY**

50365 First released in Issue 4. Derived from the MSE working draft.

50366 **Issue 5**

50367 Marked EX.

50368 **Issue 6**

50369 This function is marked LEGACY.

50370 **NAME**

50371 wcswidth — number of column positions of a wide-character string

50372 **SYNOPSIS**

50373 xSI #include <wchar.h>

50374 int wcswidth(const wchar_t *pwcs, size_t n);

50375

50376 **DESCRIPTION**

50377 The *wcswidth()* function shall determine the number of column positions required for *n* wide-character codes (or fewer than *n* wide-character codes if a null wide-character code is encountered before *n* wide-character codes are exhausted) in the string pointed to by *pwcs*.

50380 **RETURN VALUE**

50381 The *wcswidth()* function either shall return 0 (if *pwcs* points to a null wide-character code), or return the number of column positions to be occupied by the wide-character string pointed to by *pwcs*, or return -1 (if any of the first *n* wide-character codes in the wide-character string pointed to by *pwcs* is not a printable wide-character code).

50385 **ERRORS**

50386 No errors are defined.

50387 **EXAMPLES**

50388 None.

50389 **APPLICATION USAGE**

50390 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the return value for a non-printable wide character is not specified.

50392 **RATIONALE**

50393 None.

50394 **FUTURE DIRECTIONS**

50395 None.

50396 **SEE ALSO**

50397 *wcwidth()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.103, Column Position, <wchar.h>

50399 **CHANGE HISTORY**

50400 First released in Issue 4. Derived from the MSE working draft.

50401 **Issue 6**

50402 The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.

50403 **NAME**50404 `wcsxfrm` — wide-character string transformation50405 **SYNOPSIS**50406 `#include <wchar.h>`

```
50407        size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2,  

50408                size_t n);
```

50409 **DESCRIPTION**

50410 CX The functionality described on this reference page is aligned with the ISO C standard. Any
50411 conflict between the requirements described here and the ISO C standard is unintentional. This
50412 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50413 The `wcsxfrm()` function shall transform the wide-character string pointed to by `ws2` and place the
50414 resulting wide-character string into the array pointed to by `ws1`. The transformation shall be
50415 such that if `wcscmp()` is applied to two transformed wide strings, it shall return a value greater
50416 than, equal to, or less than 0, corresponding to the result of `wscoll()` applied to the same two
50417 original wide-character strings. No more than *n* wide-character codes shall be placed into the
50418 resulting array pointed to by `ws1`, including the terminating null wide-character code. If *n* is 0,
50419 `ws1` is permitted to be a null pointer. If copying takes place between objects that overlap, the
50420 behavior is undefined.

50421 CX The `wcsxfrm()` function shall not change the setting of `errno` if successful.

50422 Since no return value is reserved to indicate an error, an application wishing to check for error
50423 situations should set `errno` to 0, then call `wcsxfrm()`, then check `errno`.

50424 **RETURN VALUE**

50425 The `wcsxfrm()` function shall return the length of the transformed wide-character string (not
50426 including the terminating null wide-character code). If the value returned is *n* or more, the
50427 contents of the array pointed to by `ws1` are unspecified.

50428 CX On error, the `wcsxfrm()` function may set `errno`, but no return value is reserved to indicate an
50429 error.

50430 **ERRORS**

50431 The `wcsxfrm()` function may fail if:

50432 CX [EINVAL] The wide-character string pointed to by `ws2` contains wide-character codes
50433 outside the domain of the collating sequence.

50434 **EXAMPLES**

50435 None.

50436 **APPLICATION USAGE**

50437 The transformation function is such that two transformed wide-character strings can be ordered
50438 by `wcscmp()` as appropriate to collating sequence information in the program's locale (category
50439 `LC_COLLATE`).

50440 The fact that when *n* is 0 `ws1` is permitted to be a null pointer is useful to determine the size of
50441 the `ws1` array prior to making the transformation.

50442 **RATIONALE**

50443 None.

50444 **FUTURE DIRECTIONS**

50445 None.

50446 **SEE ALSO**50447 `wscmp()`, `wscoll()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`50448 **CHANGE HISTORY**

50449 First released in Issue 4. Derived from the MSE working draft.

50450 **Issue 5**

50451 Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

50452 The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.50453 **Issue 6**50454 In previous versions, this function was required to return `-1` on error.

50455 Extensions beyond the ISO C standard are marked.

50456 The following new requirements on POSIX implementations derive from alignment with the
50457 Single UNIX Specification:

- 50458
- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
-
- 50459 added if no conversion could be performed.

50460 The `wcsxfrm()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

50461 **NAME**

50462 wctob — wide-character to single-byte conversion

50463 **SYNOPSIS**

50464 #include <stdio.h>

50465 #include <wchar.h>

50466 int wctob(wint_t c);

50467 **DESCRIPTION**

50468 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50469 conflict between the requirements described here and the ISO C standard is unintentional. This
50470 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50471 The *wctob()* function shall determine whether *c* corresponds to a member of the extended
50472 character set whose character representation is a single byte when in the initial shift state.

50473 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

50474 **RETURN VALUE**

50475 The *wctob()* function shall return EOF if *c* does not correspond to a character with length one in
50476 the initial shift state. Otherwise, it shall return the single-byte representation of that character as
50477 an **unsigned char** converted to **int**.

50478 **ERRORS**

50479 No errors are defined.

50480 **EXAMPLES**

50481 None.

50482 **APPLICATION USAGE**

50483 None.

50484 **RATIONALE**

50485 None.

50486 **FUTURE DIRECTIONS**

50487 None.

50488 **SEE ALSO**50489 *btowc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>50490 **CHANGE HISTORY**

50491 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
50492 (E).

50493 **NAME**

50494 wctomb — convert a wide-character code to a character

50495 **SYNOPSIS**

50496 #include <stdlib.h>

50497 int wctomb(char *s, wchar_t wchar);

50498 **DESCRIPTION**

50499 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 50500 conflict between the requirements described here and the ISO C standard is unintentional. This
 50501 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50502 The *wctomb()* function shall determine the number of bytes needed to represent the character
 50503 corresponding to the wide-character code whose value is *wchar* (including any change in the
 50504 shift state). It shall store the character representation (possibly multiple bytes and any special
 50505 bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most
 50506 {MB_CUR_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any
 50507 shift sequence needed to restore the initial shift state, and *wctomb()* shall be left in the initial shift
 50508 state.

50509 CX The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a
 50510 state-dependent encoding, this function shall be placed into its initial state by a call for which its
 50511 character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null
 50512 pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a
 50513 null pointer shall cause this function to return a non-zero value if encodings have state
 50514 dependency, and 0 otherwise. Changing the *LC_CTYPE* category causes the shift state of this
 50515 function to be unspecified.

50516 The *wctomb()* function need not be reentrant. A function that is not required to be reentrant is
 50517 not required to be thread-safe.

50518 The implementation shall behave as if no function defined in this volume of
 50519 IEEE Std 1003.1-2001 calls *wctomb()*.

50520 **RETURN VALUE**

50521 If *s* is a null pointer, *wctomb()* shall return a non-zero or 0 value, if character encodings,
 50522 respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb()*
 50523 shall return -1 if the value of *wchar* does not correspond to a valid character, or return the
 50524 number of bytes that constitute the character corresponding to the value of *wchar*.

50525 In no case shall the value returned be greater than the value of the {MB_CUR_MAX} macro.

50526 **ERRORS**

50527 No errors are defined.

50528 **EXAMPLES**

50529 None.

50530 **APPLICATION USAGE**

50531 None.

50532 **RATIONALE**

50533 None.

50534 **FUTURE DIRECTIONS**

50535 None.

50536 **SEE ALSO**

50537 *mblen()*, *mbtowc()*, *mbstowcs()*, *wcstombs()*, the Base Definitions volume of IEEE Std 1003.1-2001,
50538 **<stdlib.h>**

50539 **CHANGE HISTORY**

50540 First released in Issue 4. Derived from the ANSI C standard.

50541 **Issue 6**

50542 Extensions beyond the ISO C standard are marked.

50543 In the DESCRIPTION, a note about reentrancy and thread-safety is added.

50544 **NAME**

50545 wctrans — define character mapping

50546 **SYNOPSIS**

50547 #include <wctype.h>

50548 wctrans_t wctrans(const char *charclass);

50549 **DESCRIPTION**

50550 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 50551 conflict between the requirements described here and the ISO C standard is unintentional. This
 50552 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50553 The *wctrans()* function is defined for valid character mapping names identified in the current
 50554 locale. The *charclass* is a string identifying a generic character mapping name for which codeset-
 50555 specific information is required. The following character mapping names are defined in all
 50556 locales: **tolower** and **toupper**.

50557 The function shall return a value of type **wctrans_t**, which can be used as the second argument
 50558 to subsequent calls of *towctrans()*. The *wctrans()* function shall determine values of **wctrans_t**
 50559 according to the rules of the coded character set defined by character mapping information in
 50560 the program's locale (category *LC_CTYPE*). The values returned by *wctrans()* shall be valid until
 50561 a call to *setlocale()* that modifies the category *LC_CTYPE*.

50562 **RETURN VALUE**

50563 CX The *wctrans()* function shall return 0 and may set *errno* to indicate the error if the given
 50564 character mapping name is not valid for the current locale (category *LC_CTYPE*); otherwise, it
 50565 shall return a non-zero object of type **wctrans_t** that can be used in calls to *towctrans()*.

50566 **ERRORS**50567 The *wctrans()* function may fail if:

50568 CX [EINVAL] The character mapping name pointed to by *charclass* is not valid in the current
 50569 locale.

50570 **EXAMPLES**

50571 None.

50572 **APPLICATION USAGE**

50573 None.

50574 **RATIONALE**

50575 None.

50576 **FUTURE DIRECTIONS**

50577 None.

50578 **SEE ALSO**50579 *towctrans()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wctype.h**>50580 **CHANGE HISTORY**

50581 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

50582 **NAME**

50583 wctype — define character class

50584 **SYNOPSIS**

50585 #include <wctype.h>

50586 wctype_t wctype(const char *property);

50587 **DESCRIPTION**

50588 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 50589 conflict between the requirements described here and the ISO C standard is unintentional. This
 50590 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50591 The *wctype()* function is defined for valid character class names as defined in the current locale.
 50592 The *property* argument is a string identifying a generic character class for which codeset-specific
 50593 type information is required. The following character class names shall be defined in all locales:

50594	alnum	digit	punct
50595	alpha	graph	space
50596	blank	lower	upper
50597	cntrl	print	xdigit

50598 Additional character class names defined in the locale definition file (category *LC_CTYPE*) can
 50599 also be specified.

50600 The function shall return a value of type **wctype_t**, which can be used as the second argument to
 50601 subsequent calls of *iswctype()*. The *wctype()* function shall determine values of **wctype_t**
 50602 according to the rules of the coded character set defined by character type information in the
 50603 program's locale (category *LC_CTYPE*). The values returned by *wctype()* shall be valid until a
 50604 call to *setlocale()* that modifies the category *LC_CTYPE*.

50605 **RETURN VALUE**

50606 The *wctype()* function shall return 0 if the given character class name is not valid for the current
 50607 locale (category *LC_CTYPE*); otherwise, it shall return an object of type **wctype_t** that can be
 50608 used in calls to *iswctype()*.

50609 **ERRORS**

50610 No errors are defined.

50611 **EXAMPLES**

50612 None.

50613 **APPLICATION USAGE**

50614 None.

50615 **RATIONALE**

50616 None.

50617 **FUTURE DIRECTIONS**

50618 None.

50619 **SEE ALSO**50620 *iswctype()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wctype.h**>50621 **CHANGE HISTORY**

50622 First released in Issue 4.

50623 **Issue 5**

50624 The following change has been made in this issue for alignment with
50625 ISO/IEC 9899:1990/Amendment 1:1995 (E):

- 50626 • The SYNOPSIS has been changed to indicate that this function and associated data types are
50627 now made visible by inclusion of the **<wctype.h>** header rather than **<wchar.h>**.

50628 **NAME**

50629 wctype — number of column positions of a wide-character code

50630 **SYNOPSIS**

50631 xSI #include <wctype.h>

50632 int wctype(wctype_t wc);

50633

50634 **DESCRIPTION**

50635 The wctype() function shall determine the number of column positions required for the wide
50636 character wc. The application shall ensure that the value of wc is a character representable as a
50637 **wctype_t**, and is a wide-character code corresponding to a valid character in the current locale.

50638 **RETURN VALUE**

50639 The wctype() function shall either return 0 (if wc is a null wide-character code), or return the
50640 number of column positions to be occupied by the wide-character code wc, or return -1 (if wc
50641 does not correspond to a printable wide-character code).

50642 **ERRORS**

50643 No errors are defined.

50644 **EXAMPLES**

50645 None.

50646 **APPLICATION USAGE**

50647 This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the
50648 return value for a non-printable wide character is not specified.

50649 **RATIONALE**

50650 None.

50651 **FUTURE DIRECTIONS**

50652 None.

50653 **SEE ALSO**

50654 wctype(), the Base Definitions volume of IEEE Std 1003.1-2001, <wctype.h>

50655 **CHANGE HISTORY**

50656 First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
50657 draft.

50658 **Issue 6**

50659 The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

50660 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50661 **NAME**

50662 wmemchr — find a wide character in memory

50663 **SYNOPSIS**

50664 #include <wchar.h>

50665 wchar_t *wmemchr(const wchar_t *ws, wchar_t wc, size_t n);

50666 **DESCRIPTION**

50667 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50668 conflict between the requirements described here and the ISO C standard is unintentional. This
50669 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50670 The *wmemchr()* function shall locate the first occurrence of *wc* in the initial *n* wide characters of
50671 the object pointed to by *ws*. This function shall not be affected by locale and all **wchar_t** values
50672 shall be treated identically. The null wide character and **wchar_t** values not corresponding to
50673 valid characters shall not be treated specially.

50674 If *n* is zero, the application shall ensure that *ws* is a valid pointer and the function behaves as if
50675 no valid occurrence of *wc* is found.

50676 **RETURN VALUE**

50677 The *wmemchr()* function shall return a pointer to the located wide character, or a null pointer if
50678 the wide character does not occur in the object.

50679 **ERRORS**

50680 No errors are defined.

50681 **EXAMPLES**

50682 None.

50683 **APPLICATION USAGE**

50684 None.

50685 **RATIONALE**

50686 None.

50687 **FUTURE DIRECTIONS**

50688 None.

50689 **SEE ALSO**

50690 *wmemcmp()*, *wmemcpy()*, *wmemmove()*, *wmemset()*, the Base Definitions volume of
50691 IEEE Std 1003.1-2001, <**wchar.h**>

50692 **CHANGE HISTORY**

50693 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
50694 (E).

50695 **Issue 6**

50696 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50697 **NAME**

50698 wmemcmp — compare wide characters in memory

50699 **SYNOPSIS**

50700 #include <wchar.h>

50701 int wmemcmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);

50702 **DESCRIPTION**

50703 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50704 conflict between the requirements described here and the ISO C standard is unintentional. This
50705 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50706 The *wmemcmp()* function shall compare the first *n* wide characters of the object pointed to by
50707 *ws1* to the first *n* wide characters of the object pointed to by *ws2*. This function shall not be
50708 affected by locale and all **wchar_t** values shall be treated identically. The null wide character and
50709 **wchar_t** values not corresponding to valid characters shall not be treated specially.

50710 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
50711 shall behave as if the two objects compare equal.

50712 **RETURN VALUE**

50713 The *wmemcmp()* function shall return an integer greater than, equal to, or less than zero,
50714 respectively, as the object pointed to by *ws1* is greater than, equal to, or less than the object
50715 pointed to by *ws2*.

50716 **ERRORS**

50717 No errors are defined.

50718 **EXAMPLES**

50719 None.

50720 **APPLICATION USAGE**

50721 None.

50722 **RATIONALE**

50723 None.

50724 **FUTURE DIRECTIONS**

50725 None.

50726 **SEE ALSO**

50729 **CHANGE HISTORY**

50730 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
50731 (E).

50732 **Issue 6**

50733 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50734 **NAME**

50735 wmemcpy — copy wide characters in memory

50736 **SYNOPSIS**

50737 #include <wchar.h>

```
50738 wchar_t *wmemcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,  
50739                 size_t n);
```

50740 **DESCRIPTION**

50741 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50742 conflict between the requirements described here and the ISO C standard is unintentional. This
50743 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50744 The `wmemcpy()` function shall copy *n* wide characters from the object pointed to by `ws2` to the
50745 object pointed to by `ws1`. This function shall not be affected by locale and all **wchar_t** values
50746 shall be treated identically. The null wide character and **wchar_t** values not corresponding to
50747 valid characters shall not be treated specially.

50748 If *n* is zero, the application shall ensure that `ws1` and `ws2` are valid pointers, and the function
50749 shall copy zero wide characters.

50750 **RETURN VALUE**50751 The `wmemcpy()` function shall return the value of `ws1`.50752 **ERRORS**

50753 No errors are defined.

50754 **EXAMPLES**

50755 None.

50756 **APPLICATION USAGE**

50757 None.

50758 **RATIONALE**

50759 None.

50764 IEEE Std 1003.1-2001, <**wchar.h**>

50765 **CHANGE HISTORY**

50766 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
50767 (E).

50768 **Issue 6**

50769 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50770 The `wmemcpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

50771 NAME

50772 wmemmove — copy wide characters in memory with overlapping areas

50773 SYNOPSIS

50774 #include <wchar.h>

50775 wchar_t *wmemmove(wchar_t *ws1, const wchar_t *ws2, size_t n);

50776 DESCRIPTION

50777 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50778 conflict between the requirements described here and the ISO C standard is unintentional. This
50779 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50780 The *wmemmove()* function shall copy *n* wide characters from the object pointed to by *ws2* to the
50781 object pointed to by *ws1*. Copying shall take place as if the *n* wide characters from the object
50782 pointed to by *ws2* are first copied into a temporary array of *n* wide characters that does not
50783 overlap the objects pointed to by *ws1* or *ws2*, and then the *n* wide characters from the temporary
50784 array are copied into the object pointed to by *ws1*.

50785 This function shall not be affected by locale and all **wchar_t** values shall be treated identically.
50786 The null wide character and **wchar_t** values not corresponding to valid characters shall not be
50787 treated specially.

50788 If *n* is zero, the application shall ensure that *ws1* and *ws2* are valid pointers, and the function
50789 shall copy zero wide characters.

50790 RETURN VALUE

50791 The *wmemmove()* function shall return the value of *ws1*.

50792 ERRORS

50807 (E).

50808 Issue 6

50809 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50810 **NAME**

50811 wmemset — set wide characters in memory

50812 **SYNOPSIS**

50813 #include <wchar.h>

50814 wchar_t *wmemset(wchar_t *ws, wchar_t wc, size_t n);

50815 **DESCRIPTION**

50816 cx The functionality described on this reference page is aligned with the ISO C standard. Any
50817 conflict between the requirements described here and the ISO C standard is unintentional. This
50818 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

50819 The *wmemset()* function shall copy the value of *wc* into each of the first *n* wide characters of the
50820 object pointed to by *ws*. This function shall not be affected by locale and all **wchar_t** values shall
50821 be treated identically. The null wide character and **wchar_t** values not corresponding to valid
50822 characters shall not be treated specially.

50823 If *n* is zero, the application shall ensure that *ws* is a valid pointer, and the function shall copy
50824 zero wide characters.

50825 **RETURN VALUE**50826 The *wmemset()* functions shall return the value of *ws*.50827 **ERRORS**

50828 No errors are defined.

50844 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

50845 **NAME**

50846 wordexp, wordfree — perform word expansions

50847 **SYNOPSIS**

50848 #include <wordexp.h>

50849 int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
50850 int flags);

50851 void wordfree(wordexp_t *pwordexp);

50852 **DESCRIPTION**

50853 The *wordexp()* function shall perform word expansions as described in the Shell and Utilities
 50854 volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions, subject to quoting as in the Shell
 50855 and Utilities volume of IEEE Std 1003.1-2001, Section 2.2, Quoting, and place the list of expanded
 50856 words into the structure pointed to by *pwordexp*.

50857 The *words* argument is a pointer to a string containing one or more words to be expanded. The
 50858 expansions shall be the same as would be performed by the command line interpreter if *words*
 50859 were the part of a command line representing the arguments to a utility. Therefore, the
 50860 application shall ensure that *words* does not contain an unquoted <newline> or any of the
 50861 unquoted shell special characters ' | ', ' & ', ' ; ', ' < ', ' > ' except in the context of command
 50862 substitution as specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.3,
 50863 Command Substitution. It also shall not contain unquoted parentheses or braces, except in the
 50864 context of command or variable substitution. The application shall ensure that every member of
 50865 *words* which it expects to have expanded by *wordexp()* does not contain an unquoted initial
 50866 comment character. The application shall also ensure that any words which it intends to be
 50867 ignored (because they begin or continue a comment) are deleted from *words*. If the argument
 50868 *words* contains an unquoted comment character (number sign) that is the beginning of a token,
 50869 *wordexp()* shall either treat the comment character as a regular character, or interpret it as a
 50870 comment indicator and ignore the remainder of *words*.

50871 The structure type **wordexp_t** is defined in the <**wordexp.h**> header and includes at least the
 50872 following members:

50873

50874

50875

50876

50877

Member Type	Member Name	Description
size_t	<i>we_wordc</i>	Count of words matched by <i>words</i> .
char **	<i>we_wordv</i>	Pointer to list of expanded words.
size_t	<i>we_offs</i>	Slots to reserve at the beginning of <i>pwordexp->we_wordv</i> .

50878 The *wordexp()* function shall store the number of generated words into *pwordexp->we_wordc* and
 50879 a pointer to a list of pointers to words in *pwordexp->we_wordv*. Each individual field created
 50880 during field splitting (see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.5,
 50881 Field Splitting) or pathname expansion (see the Shell and Utilities volume of
 50882 IEEE Std 1003.1-2001, Section 2.6.6, Pathname Expansion) shall be a separate word in the
 50883 *pwordexp->we_wordv* list. The words shall be in order as described in the Shell and Utilities
 50884 volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions. The first pointer after the last
 50885 word pointer shall be a null pointer. The expansion of special parameters described in the Shell
 50886 and Utilities volume of IEEE Std 1003.1-2001, Section 2.5.2, Special Parameters is unspecified.

50887 It is the caller's responsibility to allocate the storage pointed to by *pwordexp*. The *wordexp()*
 50888 function shall allocate other space as needed, including memory pointed to by
 50889 *pwordexp->we_wordv*. The *wordfree()* function frees any memory associated with *pwordexp* from a
 50890 previous call to *wordexp()*.

50891 The *flags* argument is used to control the behavior of *wordexp()*. The value of *flags* is the
 50892 bitwise-inclusive OR of zero or more of the following constants, which are defined in
 50893 **<wordexp.h>**:

50894	WRDE_APPEND	Append words generated to the ones from a previous call to <i>wordexp()</i> .
50895	WRDE_DOOFFS	Make use of <i>pwordexp->we_offs</i> . If this flag is set, <i>pwordexp->we_offs</i> is used
50896		to specify how many null pointers to add to the beginning of
50897		<i>pwordexp->we_wordv</i> . In other words, <i>pwordexp->we_wordv</i> shall point to
50898		<i>pwordexp->we_offs</i> null pointers, followed by <i>pwordexp->we_wordc</i> word
50899		pointers, followed by a null pointer.
50900	WRDE_NOCMD	If the implementation supports the utilities defined in the Shell and
50901		Utilities volume of IEEE Std 1003.1-2001, fail if command substitution, as
50902		specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
50903		2.6.3, Command Substitution, is requested.
50904	WRDE_REUSE	The <i>pwordexp</i> argument was passed to a previous successful call to
50905		<i>wordexp()</i> , and has not been passed to <i>wordfree()</i> . The result shall be the
50906		same as if the application had called <i>wordfree()</i> and then called <i>wordexp()</i>
50907		without WRDE_REUSE.
50908	WRDE_SHOWERR	Do not redirect <i>stderr</i> to /dev/null .
50909	WRDE_UNDEF	Report error on an attempt to expand an undefined shell variable.

50910 The WRDE_APPEND flag can be used to append a new set of words to those generated by a
 50911 previous call to *wordexp()*. The following rules apply to applications when two or more calls to
 50912 *wordexp()* are made with the same value of *pwordexp* and without intervening calls to *wordfree()*:

- 50913 1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.
- 50914 2. All of the calls shall set WRDE_DOOFFS, or all shall not set it.
- 50915 3. After the second and each subsequent call, *pwordexp->we_wordv* shall point to a list
 50916 containing the following:
 - 50917 a. Zero or more null pointers, as specified by WRDE_DOOFFS and *pwordexp->we_offs*
 - 50918 b. Pointers to the words that were in the *pwordexp->we_wordv* list before the call, in the
 50919 same order as before
 - 50920 c. Pointers to the new words generated by the latest call, in the specified order
- 50921 4. The count returned in *pwordexp->we_wordc* shall be the total number of words from all of
 50922 the calls.
- 50923 5. The application can change any of the fields after a call to *wordexp()*, but if it does it shall
 50924 reset them to the original value before a subsequent call, using the same *pwordexp* value, to
 50925 *wordfree()* or *wordexp()* with the WRDE_APPEND or WRDE_REUSE flag.

50926 If the implementation supports the utilities defined in the Shell and Utilities volume of
 50927 IEEE Std 1003.1-2001, and *words* contains an unquoted character—<newline>, ' | ', ' & ', ' ; ',
 50928 ' < ', ' > ', ' (', ') ', ' { ', ' } '—in an inappropriate context, *wordexp()* shall fail, and the number
 50929 of expanded words shall be 0.

50930 Unless WRDE_SHOWERR is set in *flags*, *wordexp()* shall redirect *stderr* to **/dev/null** for any
 50931 utilities executed as a result of command substitution while expanding *words*. If
 50932 WRDE_SHOWERR is set, *wordexp()* may write messages to *stderr* if syntax errors are detected
 50933 while expanding *words*.

50934 The application shall ensure that if WRDE_DOOFFS is set, then *pwordexp->we_offs* has the same
 50935 value for each *wordexp()* call and *wordfree()* call using a given *pwordexp*.

50936 The following constants are defined as error return values:

50937 WRDE_BADCHAR One of the unquoted characters—<newline>, ' | ', ' & ', ' ; ', ' < ', ' > ',
 50938 ' (', ') ', ' { ', ' } '—appears in *words* in an inappropriate context.

50939 WRDE_BADVAL Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.

50940 WRDE_CMDSUB Command substitution requested when WRDE_NOCMD was set in *flags*.

50941 WRDE_NOSPACE Attempt to allocate memory failed.

50942 WRDE_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated
 50943 string.

50944 RETURN VALUE

50945 Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described
 50946 in <**wordexp.h**>, shall be returned to indicate an error. If *wordexp()* returns the value
 50947 WRDE_NOSPACE, then *pwordexp->we_wordc* and *pwordexp->we_wordv* shall be updated to
 50948 reflect any words that were successfully expanded. In other cases, they shall not be modified.

50949 The *wordfree()* function shall not return a value.

50950 ERRORS

50951 No errors are defined.

50952 EXAMPLES

50953 None.

50954 APPLICATION USAGE

50955 The *wordexp()* function is intended to be used by an application that wants to do all of the shell's
 50956 expansions on a word or words obtained from a user. For example, if the application prompts
 50957 for a filename (or list of filenames) and then uses *wordexp()* to process the input, the user could
 50958 respond with anything that would be valid as input to the shell.

50959 The WRDE_NOCMD flag is provided for applications that, for security or other reasons, want to
 50960 prevent a user from executing shell commands. Disallowing unquoted shell special characters
 50961 also prevents unwanted side effects, such as executing a command or writing a file.

50962 RATIONALE

50963 This function was included as an alternative to *glob()*. There had been continuing controversy
 50964 over exactly what features should be included in *glob()*. It is hoped that by providing *wordexp()*
 50965 (which provides all of the shell word expansions, but which may be slow to execute) and *glob()*
 50966 (which is faster, but which only performs pathname expansion, without tilde or parameter
 50967 expansion) this will satisfy the majority of applications.

50968 While *wordexp()* could be implemented entirely as a library routine, it is expected that most
 50969 implementations run a shell in a subprocess to do the expansion.

50970 Two different approaches have been proposed for how the required information might be
 50971 presented to the shell and the results returned. They are presented here as examples.

50972 One proposal is to extend the *echo* utility by adding a **-q** option. This option would cause *echo* to
 50973 add a backslash before each backslash and <blank> that occurs within an argument. The
 50974 *wordexp()* function could then invoke the shell as follows:

```
50975 (void) strcpy(buffer, "echo -q");
50976 (void) strcat(buffer, words);
50977 if ((flags & WRDE_SHOWERR) == 0)
```

```

50978         (void) strcat(buffer, "2>/dev/null");
50979         f = popen(buffer, "r");

```

50980 The *wordexp()* function would read the resulting output, remove unquoted backslashes, and
 50981 break into words at unquoted <blank>s. If the WRDE_NOCMD flag was set, *wordexp()* would
 50982 have to scan *words* before starting the subshell to make sure that there would be no command
 50983 substitution. In any case, it would have to scan *words* for unquoted special characters.

50984 Another proposal is to add the following options to *sh*:

50985 **-w wordlist**

50986 This option provides a wordlist expansion service to applications. The words in *wordlist*
 50987 shall be expanded and the following written to standard output:

- 50988 1. The count of the number of words after expansion, in decimal, followed by a null byte
- 50989 2. The number of bytes needed to represent the expanded words (not including null
 50990 separators), in decimal, followed by a null byte
- 50991 3. The expanded words, each terminated by a null byte

50992 If an error is encountered during word expansion, *sh* exits with a non-zero status after
 50993 writing the former to report any words successfully expanded

50994 **-P** Run in “protected” mode. If specified with the **-w** option, no command substitution shall
 50995 be performed.

50996 With these options, *wordexp()* could be implemented fairly simply by creating a subprocess
 50997 using *fork()* and executing *sh* using the line:

```

50998 execl(<shell path>, "sh", "-P", "-w", words, (char *)0);

```

50999 after directing standard error to **/dev/null**.

51000 It seemed objectionable for a library routine to write messages to standard error, unless
 51001 explicitly requested, so *wordexp()* is required to redirect standard error to **/dev/null** to ensure
 51002 that no messages are generated, even for commands executed for command substitution. The
 51003 WRDE_SHOWERR flag can be specified to request that error messages be written.

51004 The WRDE_REUSE flag allows the implementation to avoid the expense of freeing and
 51005 reallocating memory, if that is possible. A minimal implementation can call *wordfree()* when
 51006 WRDE_REUSE is set.

51007 FUTURE DIRECTIONS

51008 None.

51024 #include <wchar.h>

51025 int wprintf(const wchar_t *restrict *format*, ...);51026 **DESCRIPTION**51027 Refer to *fwprintf()*.

51028 **NAME**

51029 pwrite, write — write on a file

51030 **SYNOPSIS**

51031 #include <unistd.h>

```
51032 xsi ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
51033         off_t offset);
51034 ssize_t write(int fildes, const void *buf, size_t nbyte);
```

51035 **DESCRIPTION**

51036 The *write()* function shall attempt to write *nbyte* bytes from the buffer pointed to by *buf* to the
 51037 file associated with the open file descriptor, *fildes*.

51038 Before any action described below is taken, and if *nbyte* is zero and the file is a regular file, the
 51039 *write()* function may detect and return errors as described below. In the absence of errors, or if
 51040 error detection is not performed, the *write()* function shall return zero and have no other results.
 51041 If *nbyte* is zero and the file is not a regular file, the results are unspecified.

51042 On a regular file or other file capable of seeking, the actual writing of data shall proceed from the
 51043 position in the file indicated by the file offset associated with *fildes*. Before successful return
 51044 from *write()*, the file offset shall be incremented by the number of bytes actually written. On a
 51045 regular file, if this incremented file offset is greater than the length of the file, the length of the
 51046 file shall be set to this file offset.

51047 On a file not capable of seeking, writing shall always take place starting at the current position.
 51048 The value of a file offset associated with such a device is undefined.

51049 If the O_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file
 51050 prior to each write and no intervening file modification operation shall occur between changing
 51051 the file offset and the write operation.

51052 xsi If a *write()* requests that more bytes be written than there is room for (for example, the process'
 51053 file size limit or the physical end of a medium), only as many bytes as there is room for shall be
 51054 written. For example, suppose there is space for 20 bytes more in a file before reaching a limit. A
 51055 write of 512 bytes will return 20. The next write of a non-zero number of bytes would give a
 51056 failure return (except as noted below).

51057 xsi If the request would cause the file size to exceed the soft file size limit for the process and there
 51058 is no room for any bytes to be written, the request shall fail and the implementation shall
 51059 generate the SIGXFSZ signal for the thread.

51060 If *write()* is interrupted by a signal before it writes any data, it shall return -1 with *errno* set to
 51061 [EINTR].

51062 If *write()* is interrupted by a signal after it successfully writes some data, it shall return the
 51063 number of bytes written.

51064 If the value of *nbyte* is greater than {SSIZE_MAX}, the result is implementation-defined.

51065 After a *write()* to a regular file has successfully returned:

- 51066 • Any successful *read()* from each byte position in the file that was modified by that write shall
 51067 return the data specified by the *write()* for that position until such byte positions are again
 51068 modified.
- 51069 • Any subsequent successful *write()* to the same byte position in the file shall overwrite that
 51070 file data.

51071	Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the
51072	following exceptions:
51073	• There is no file offset associated with a pipe, hence each write request shall append to the
51074	end of the pipe.
51075	• Write requests of {PIPE_BUF} bytes or less shall not be interleaved with data from other
51076	processes doing writes on the same pipe. Writes of greater than {PIPE_BUF} bytes may have
51077	data interleaved, on arbitrary boundaries, with writes by other processes, whether or not the
51078	O_NONBLOCK flag of the file status flags is set.
51079	• If the O_NONBLOCK flag is clear, a write request may cause the thread to block, but on
51080	normal completion it shall return <i>nbyte</i> .
51081	• If the O_NONBLOCK flag is set, <i>write()</i> requests shall be handled differently, in the
51082	following ways:
51083	— The <i>write()</i> function shall not block the thread.
51084	— A write request for {PIPE_BUF} or fewer bytes shall have the following effect: if there is
51085	sufficient space available in the pipe, <i>write()</i> shall transfer all the data and return the
51086	number of bytes requested. Otherwise, <i>write()</i> shall transfer no data and return <i>-1</i> with
51087	<i>errno</i> set to [EAGAIN].
51088	— A write request for more than {PIPE_BUF} bytes shall cause one of the following:
51089	— When at least one byte can be written, transfer what it can and return the number of
51090	bytes written. When all data previously written to the pipe is read, it shall transfer at
51091	least {PIPE_BUF} bytes.
51092	— When no data can be written, transfer no data, and return <i>-1</i> with <i>errno</i> set to
51093	[EAGAIN].
51094	When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-
51095	blocking writes and cannot accept the data immediately:
51096	• If the O_NONBLOCK flag is clear, <i>write()</i> shall block the calling thread until the data can be
51097	accepted.
51098	• If the O_NONBLOCK flag is set, <i>write()</i> shall not block the thread. If some data can be
51099	written without blocking the thread, <i>write()</i> shall write what it can and return the number of
51100	bytes written. Otherwise, it shall return <i>-1</i> and set <i>errno</i> to [EAGAIN].
51101	Upon successful completion, where <i>nbyte</i> is greater than 0, <i>write()</i> shall mark for update the
51102	<i>st_ctime</i> and <i>st_mtime</i> fields of the file, and if the file is a regular file, the S_ISUID and S_ISGID
51103	bits of the file mode may be cleared.
51104	For regular files, no data transfer shall occur past the offset maximum established in the open
51105	file description associated with <i>fildes</i> .
51106	If <i>fildes</i> refers to a socket, <i>write()</i> shall be equivalent to <i>send()</i> with no flags set.
51107 SIO	If the O_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as
51108	defined by synchronized I/O data integrity completion.
51109	If the O_SYNC bit has been set, write I/O operations on the file descriptor shall complete as
51110	defined by synchronized I/O file integrity completion.
51111 SHM	If <i>fildes</i> refers to a shared memory object, the result of the <i>write()</i> function is unspecified.
51112 TYM	If <i>fildes</i> refers to a typed memory object, the result of the <i>write()</i> function is unspecified.

51113 XSR If *fildev* refers to a STREAM, the operation of *write()* shall be determined by the values of the
 51114 minimum and maximum *nbyte* range (packet size) accepted by the STREAM. These values are
 51115 determined by the topmost STREAM module. If *nbyte* falls within the packet size range, *nbyte*
 51116 bytes shall be written. If *nbyte* does not fall within the range and the minimum packet size value
 51117 is 0, *write()* shall break the buffer into maximum packet size segments prior to sending the data
 51118 downstream (the last segment may contain less than the maximum packet size). If *nbyte* does not
 51119 fall within the range and the minimum value is non-zero, *write()* shall fail with *errno* set to
 51120 [ERANGE]. Writing a zero-length buffer (*nbyte* is 0) to a STREAMS device sends 0 bytes with 0
 51121 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no
 51122 message and 0 is returned. The process may issue *I_SWROPT ioctl()* to enable zero-length
 51123 messages to be sent across the pipe or FIFO.

51124 When writing to a STREAM, data messages are created with a priority band of 0. When writing
 51125 to a STREAM that is not a pipe or FIFO:

51126 • If O_NONBLOCK is clear, and the STREAM cannot accept data (the STREAM write queue is
 51127 full due to internal flow control conditions), *write()* shall block until data can be accepted.

51128 • If O_NONBLOCK is set and the STREAM cannot accept data, *write()* shall return -1 and set
 51129 *errno* to [EAGAIN].

51130 • If O_NONBLOCK is set and part of the buffer has been written while a condition in which
 51131 the STREAM cannot accept additional data occurs, *write()* shall terminate and return the
 51132 number of bytes written.

51133 In addition, *write()* shall fail if the STREAM head has processed an asynchronous error before
 51134 the call. In this case, the value of *errno* does not reflect the result of *write()*, but reflects the prior
 51135 error.

51136 XSI The *pwrite()* function shall be equivalent to *write()*, except that it writes into a given position
 51137 without changing the file pointer. The first three arguments to *pwrite()* are the same as *write()*
 51138 with the addition of a fourth argument offset for the desired position inside the file.

51139 RETURN VALUE

51140 XSI Upon successful completion, *write()* and *pwrite()* shall return the number of bytes actually
 51141 written to the file associated with *fildev*. This number shall never be greater than *nbyte*.
 51142 Otherwise, -1 shall be returned and *errno* set to indicate the error.

51143 ERRORS

51144 XSI The *write()* and *pwrite()* functions shall fail if:

51145 [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the thread would be
 51146 delayed in the *write()* operation.

51147 [EBADF] The *fildev* argument is not a valid file descriptor open for writing.

51148 [EFBIG] An attempt was made to write a file that exceeds the implementation-defined
 51149 XSI maximum file size or the process' file size limit, and there was no room for
 51150 any bytes to be written.

51151 [EFBIG] The file is a regular file, *nbyte* is greater than 0, and the starting position is
 51152 greater than or equal to the offset maximum established in the open file
 51153 description associated with *fildev*.

51154 [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 51155 was transferred.

51156 [EIO] The process is a member of a background process group attempting to write
 51157 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor

51158		blocking SIGTTOU, and the process group of the process is orphaned. This
51159		error may also be returned under implementation-defined conditions.
51160	[ENOSPC]	There was no free space remaining on the device containing the file.
51161	[EPIPE]	An attempt is made to write to a pipe or FIFO that is not open for reading by
51162		any process, or that only has one end open. A SIGPIPE signal shall also be sent
51163		to the thread.
51164 XSR	[ERANGE]	The transfer request size was outside the range supported by the STREAMS
51165		file associated with <i>fildev</i> .
51166		The <i>write()</i> function shall fail if:
51167	[EAGAIN] or [EWOULDBLOCK]	
51168		The file descriptor is for a socket, is marked O_NONBLOCK, and write would
51169		block.
51170	[ECONNRESET]	A write was attempted on a socket that is not connected.
51171	[EPIPE]	A write was attempted on a socket that is shut down for writing, or is no
51172		longer connected. In the latter case, if the socket is of type SOCK_STREAM,
51173		the SIGPIPE signal is generated to the calling process.
51174 XSI		The <i>write()</i> and <i>pwrite()</i> functions may fail if:
51175 XSR	[EINVAL]	The STREAM or multiplexer referenced by <i>fildev</i> is linked (directly or
51176		indirectly) downstream from a multiplexer.
51177	[EIO]	A physical I/O error has occurred.
51178	[ENOBUFS]	Insufficient resources were available in the system to perform the operation.
51179	[ENXIO]	A request was made of a nonexistent device, or the request was outside the
51180		capabilities of the device.
51181 XSR	[ENXIO]	A hangup occurred on the STREAM being written to.
51182 XSR		A write to a STREAMS file may fail if an error message has been received at the STREAM head.
51183		In this case, <i>errno</i> is set to the value included in the error message.
51184		The <i>write()</i> function may fail if:
51185	[EACCES]	A write was attempted on a socket and the calling process does not have
51186		appropriate privileges.
51187	[ENETDOWN]	A write was attempted on a socket and the local network interface used to
51188		reach the destination is down.
51189	[ENETUNREACH]	
51190		A write was attempted on a socket and no route to the network is present.
51191 XSI		The <i>pwrite()</i> function shall fail and the file pointer remain unchanged if:
51192 XSI	[EINVAL]	The <i>offset</i> argument is invalid. The value is negative.
51193 XSI	[ESPIPE]	<i>fildev</i> is associated with a pipe or FIFO.

51194 **EXAMPLES**51195 **Writing from a Buffer**

51196 The following example writes data from the buffer pointed to by *buf* to the file associated with
 51197 the file descriptor *fd*.

```

51198 #include <sys/types.h>
51199 #include <string.h>
51200 ...
51201 char buf[20];
51202 size_t nbytes;
51203 ssize_t bytes_written;
51204 int fd;
51205 ...
51206 strcpy(buf, "This is a test\n");
51207 nbytes = strlen(buf);

51208 bytes_written = write(fd, buf, nbytes);
51209 ...

```

51210 **APPLICATION USAGE**

51211 None.

51212 **RATIONALE**

51213 See also the RATIONALE section in *read()*.

51214 An attempt to write to a pipe or FIFO has several major characteristics:

- 51215 • *Atomic/non-atomic*: A write is atomic if the whole amount written in one operation is not
 51216 interleaved with data from any other process. This is useful when there are multiple writers
 51217 sending data to a single reader. Applications need to know how large a write request can be
 51218 expected to be performed atomically. This maximum is called {PIPE_BUF}. This volume of
 51219 IEEE Std 1003.1-2001 does not say whether write requests for more than {PIPE_BUF} bytes
 51220 are atomic, but requires that writes of {PIPE_BUF} or fewer bytes shall be atomic.
- 51221 • *Blocking/immediate*: Blocking is only possible with O_NONBLOCK clear. If there is enough
 51222 space for all the data requested to be written immediately, the implementation should do so.
 51223 Otherwise, the process may block; that is, pause until enough space is available for writing.
 51224 The effective size of a pipe or FIFO (the maximum amount that can be written in one
 51225 operation without blocking) may vary dynamically, depending on the implementation, so it
 51226 is not possible to specify a fixed value for it.

- 51227 • *Complete/partial/deferred*: A write request:

```

51228 int fildes;
51229 size_t nbyte;
51230 ssize_t ret;
51231 char *buf;

```

```

51232 ret = write(fildes, buf, nbyte);

```

51233 may return:

51234 Complete *ret*=*nbyte*

51235 Partial *ret*<*nbyte*

51236 This shall never happen if *nbyte*≤{PIPE_BUF}. If it does happen (with
 51237 *nbyte*>{PIPE_BUF}), this volume of IEEE Std 1003.1-2001 does not guarantee

51238 atomicity, even if $ret \leq \{PIPE\_BUF\}$, because atomicity is guaranteed according
 51239 to the amount *requested*, not the amount *written*.

51240 Deferred: $ret = -1$, $errno = [EAGAIN]$

51241 This error indicates that a later request may succeed. It does not indicate that it
 51242 *shall* succeed, even if $nbyte \leq \{PIPE\_BUF\}$, because if no process reads from the
 51243 pipe or FIFO, the write never succeeds. An application could usefully count the
 51244 number of times $[EAGAIN]$ is caused by a particular value of
 51245 $nbyte > \{PIPE\_BUF\}$ and perhaps do later writes with a smaller value, on the
 51246 assumption that the effective size of the pipe may have decreased.

51247 Partial and deferred writes are only possible with $O\_NONBLOCK$ set.

51248 The relations of these properties are shown in the following tables:

51249

51250

51251

51252

51253

51254

Write to a Pipe or FIFO with $O\_NONBLOCK$ <i>clear</i>			
Immediately Writable:	None	Some	$nbyte$
$nbyte \leq \{PIPE\_BUF\}$	Atomic blocking $nbyte$	Atomic blocking $nbyte$	Atomic immediate $nbyte$
$nbyte > \{PIPE\_BUF\}$	Blocking $nbyte$	Blocking $nbyte$	Blocking $nbyte$

51255 If the $O\_NONBLOCK$ flag is clear, a write request shall block if the amount writable
 51256 immediately is less than that requested. If the flag is set (by $fctl()$), a write request shall never
 51257 block.

51258

51259

51260

51261

51262

51263

Write to a Pipe or FIFO with $O\_NONBLOCK$ <i>set</i>			
Immediately Writable:	None	Some	$nbyte$
$nbyte \leq \{PIPE\_BUF\}$	$-1, [EAGAIN]$	$-1, [EAGAIN]$	Atomic $nbyte$
$nbyte > \{PIPE\_BUF\}$	$-1, [EAGAIN]$	$<nbyte$ or $-1,$ [EAGAIN]	$\leq nbyte$ or $-1,$ [EAGAIN]

51264 There is no exception regarding partial writes when $O\_NONBLOCK$ is set. With the exception
 51265 of writing to an empty pipe, this volume of IEEE Std 1003.1-2001 does not specify exactly when a
 51266 partial write is performed since that would require specifying internal details of the
 51267 implementation. Every application should be prepared to handle partial writes when
 51268 $O\_NONBLOCK$ is set and the requested amount is greater than $\{PIPE\_BUF\}$, just as every
 51269 application should be prepared to handle partial writes on other kinds of file descriptors.

51270 The intent of forcing writing at least one byte if any can be written is to assure that each write
 51271 makes progress if there is any room in the pipe. If the pipe is empty, $\{PIPE\_BUF\}$ bytes must be
 51272 written; if not, at least some progress must have been made.

51273 Where this volume of IEEE Std 1003.1-2001 requires -1 to be returned and $errno$ set to
 51274 $[EAGAIN]$, most historical implementations return zero (with the O_NDELAY flag set, which is
 51275 the historical predecessor of $O\_NONBLOCK$, but is not itself in this volume of
 51276 IEEE Std 1003.1-2001). The error indications in this volume of IEEE Std 1003.1-2001 were chosen
 51277 so that an application can distinguish these cases from end-of-file. While $write()$ cannot receive
 51278 an indication of end-of-file, $read()$ can, and the two functions have similar return values. Also,
 51279 some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that
 51280 the reader should get an end-of-file indication; for those systems, a return value of zero from
 51281 $write()$ indicates a successful write of an end-of-file indication.

51282 Implementations are allowed, but not required, to perform error checking for *write()* requests of
51283 zero bytes.

51284 The concept of a {PIPE_MAX} limit (indicating the maximum number of bytes that can be
51285 written to a pipe in a single operation) was considered, but rejected, because this concept would
51286 unnecessarily limit application writing.

51287 See also the discussion of O_NONBLOCK in *read()*.

51288 Writes can be serialized with respect to other reads and writes. If a *read()* of file data can be
51289 proven (by any means) to occur after a *write()* of the data, it must reflect that *write()*, even if the
51290 calls are made by different processes. A similar requirement applies to multiple write operations
51291 to the same file position. This is needed to guarantee the propagation of data from *write()* calls
51292 to subsequent *read()* calls. This requirement is particularly significant for networked file
51293 systems, where some caching schemes violate these semantics.

51294 Note that this is specified in terms of *read()* and *write()*. The XSI extensions *readv()* and *writv()*
51295 also obey these semantics. A new “high-performance” write analog that did not follow these
51296 serialization requirements would also be permitted by this wording. This volume of
51297 IEEE Std 1003.1-2001 is also silent about any effects of application-level caching (such as that
51298 done by *stdio*).

51299 This volume of IEEE Std 1003.1-2001 does not specify the value of the file offset after an error is
51300 returned; there are too many cases. For programming errors, such as [EBADF], the concept is
51301 meaningless since no file is involved. For errors that are detected immediately, such as
51302 [EAGAIN], clearly the pointer should not change. After an interrupt or hardware error, however,
51303 an updated value would be very useful and is the behavior of many implementations.

51304 This volume of IEEE Std 1003.1-2001 does not specify behavior of concurrent writes to a file from
51305 multiple processes. Applications should use some form of concurrency control.

51306 **FUTURE DIRECTIONS**

51307 None.

51308 **SEE ALSO**

51309 *chmod()*, *creat()*, *dup()*, *fcntl()*, *getrlimit()*, *lseek()*, *open()*, *pipe()*, *ulimit()*, *writv()*, the Base

51311 **CHANGE HISTORY**

51312 First released in Issue 1. Derived from Issue 1 of the SVID.

51313 **Issue 5**

51314 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
51315 Threads Extension.

51316 Large File Summit extensions are added.

51317 The *pwrite()* function is added.

51318 **Issue 6**

51319 The DESCRIPTION states that the *write()* function does not block the thread. Previously this
51320 said “process” rather than “thread”.

51321 The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
51322 marked as part of the XSI STREAMS Option Group.

51323 The following new requirements on POSIX implementations derive from alignment with the
51324 Single UNIX Specification:

- 51325 • The DESCRIPTION now states that if `write()` is interrupted by a signal after it has
51326 successfully written some data, it returns the number of bytes written. In the POSIX.1-1988
51327 standard, it was optional whether `write()` returned the number of bytes written, or whether it
51328 returned `-1` with `errno` set to `[EINTR]`. This is a FIPS requirement.
- 51329 • The following changes are made to support large files:
- 51330 — For regular files, no data transfer occurs past the offset maximum established in the open
51331 file description associated with the *files*.
- 51332 — A second `[EFBIG]` error condition is added.
- 51333 • The `[EIO]` error condition is added.
- 51334 • The `[EPIPE]` error condition is added for when a pipe has only one end open.
- 51335 • The `[ENXIO]` optional error condition is added.
- 51336 Text referring to sockets is added to the DESCRIPTION.
- 51337 The following changes were made to align with the IEEE P1003.1a draft standard:
- 51338 • The effect of reading zero bytes is clarified.
- 51339 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
51340 `write()` results are unspecified for typed memory objects.
- 51341 The following error conditions are added for operations on sockets: `[EAGAIN]`,
51342 `[EWOULDBLOCK]`, `[ECONNRESET]`, `[ENOTCONN]`, and `[EPIPE]`.
- 51343 The `[EIO]` error is changed to “may fail”.
- 51344 The `[ENOBUFFS]` error is added for sockets.
- 51345 The following error conditions are added for operations on sockets: `[EACCES]`, `[ENETDOWN]`,
51346 and `[ENETUNREACH]`.
- 51347 The `writenv()` function is split out into a separate reference page.

51348 **NAME**

51349 writev — write a vector

51350 **SYNOPSIS**

51351 xSI #include <sys/uio.h>

51352 ssize_t writev(int *fildev*, const struct iovec **iov*, int *iovcnt*);

51353

51354 **DESCRIPTION**

51355 The *writev()* function shall be equivalent to *write()*, except as described below. The *writev()*
 51356 function shall gather output data from the *iovcnt* buffers specified by the members of the *iov*
 51357 array: *iov*[0], *iov*[1], ..., *iov*[*iovcnt*−1]. The *iovcnt* argument is valid if greater than 0 and less than
 51358 or equal to {IOV_MAX}, as defined in <limits.h>.

51359 Each *iovec* entry specifies the base address and length of an area in memory from which data
 51360 should be written. The *writev()* function shall always write a complete area before proceeding to
 51361 the next.

51362 If *fildev* refers to a regular file and all of the *iov_len* members in the array pointed to by *iov* are 0,
 51363 *writev()* shall return 0 and have no other effect. For other file types, the behavior is unspecified.

51364 If the sum of the *iov_len* values is greater than {SSIZE_MAX}, the operation shall fail and no data
 51365 shall be transferred.

51366 **RETURN VALUE**

51367 Upon successful completion, *writev()* shall return the number of bytes actually written.
 51368 Otherwise, it shall return a value of −1, the file-pointer shall remain unchanged, and *errno* shall
 51369 be set to indicate an error.

51370 **ERRORS**51371 Refer to *write()*.51372 In addition, the *writev()* function shall fail if:

51373 [EINVAL] The sum of the *iov_len* values in the *iov* array would overflow an **ssize_t**.

51374 The *writev()* function may fail and set *errno* to:

51375 [EINVAL] The *iovcnt* argument was less than or equal to 0, or greater than {IOV_MAX}.

51376 **EXAMPLES**51377 **Writing Data from an Array**

51378 The following example writes data from the buffers specified by members of the *iov* array to the
 51379 file associated with the file descriptor *fd*.

```
51380       #include <sys/types.h>
51381       #include <sys/uio.h>
51382       #include <unistd.h>
51383       ...
51384       ssize_t bytes_written;
51385       int fd;
51386       char *buf0 = "short string\n";
51387       char *buf1 = "This is a longer string\n";
51388       char *buf2 = "This is the longest string in this example\n";
51389       int iovcnt;
51390       struct iovec iov[3];
```

```
51391     iov[0].iov_base = buf0;
51392     iov[0].iov_len = strlen(buf0);
51393     iov[1].iov_base = buf1;
51394     iov[1].iov_len = strlen(buf1);
51395     iov[2].iov_base = buf2;
51396     iov[2].iov_len = strlen(buf2);
51397     ...
51398     iovcnt = sizeof(iov) / sizeof(struct iovec);

51399     bytes_written = writev(fd, iov, iovcnt);
51400     ...
```

51401 APPLICATION USAGE

51402 None.

51403 RATIONALE

51404 Refer to *write()*.

51405 FUTURE DIRECTIONS

51406 None.

51407 SEE ALSO

51408 *readv()*, *write()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**limits.h**>, <**sys/uio.h**>

51409 CHANGE HISTORY

51410 First released in Issue 4, Version 2.

51411 Issue 6

51412 Split out from the *write()* reference page.

51413 **NAME**

51414 wscanf — convert formatted wide-character input

51415 **SYNOPSIS**

51416 #include <stdio.h>

51417 #include <wchar.h>

51418 int wscanf(const wchar_t *restrict *format*, ...);51419 **DESCRIPTION**51420 Refer to *fwscanf()*.

51421 **NAME**

51422 y0, y1, yn — Bessel functions of the second kind

51423 **SYNOPSIS**

```

51424 xSI      #include <math.h>

51425          double y0(double x);
51426          double y1(double x);
51427          double yn(int n, double x);
51428

```

51429 **DESCRIPTION**

51430 The *y0()*, *y1()*, and *yn()* functions shall compute Bessel functions of *x* of the second kind of
 51431 orders 0, 1, and *n*, respectively.

51432 An application wishing to check for error situations should set *errno* to zero and call
 51433 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 51434 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 51435 zero, an error has occurred.

51436 **RETURN VALUE**

51437 Upon successful completion, these functions shall return the relevant Bessel value of *x* of the
 51438 second kind.

51439 If *x* is NaN, NaN shall be returned.

51440 If the *x* argument to these functions is negative, *-HUGE_VAL* or NaN shall be returned, and a
 51441 domain error may occur.

51442 If *x* is 0.0, *-HUGE_VAL* shall be returned and a range error may occur.

51443 If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

51444 If the correct result would cause overflow, *-HUGE_VAL* or 0.0 shall be returned and a range
 51445 error may occur.

51446 **ERRORS**

51447 These functions may fail if:

51448	Domain Error	The value of <i>x</i> is negative.
51449		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
51450		then <i>errno</i> shall be set to [EDOM]. If the integer expression (<i>math_errhandling</i>
51451		& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
51452		shall be raised.
51453	Range Error	The value of <i>x</i> is 0.0, or the correct result would cause overflow.
51454		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
51455		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
51456		(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the overflow
51457		floating-point exception shall be raised.
51458	Range Error	The value of <i>x</i> is too large in magnitude, or the correct result would cause
51459		underflow.
51460		If the integer expression (<i>math_errhandling</i> & MATH_ERRNO) is non-zero,
51461		then <i>errno</i> shall be set to [ERANGE]. If the integer expression
51462		(<i>math_errhandling</i> & MATH_ERREXCEPT) is non-zero, then the underflow
51463		floating-point exception shall be raised.

51464 **EXAMPLES**

51465 None.

51466 **APPLICATION USAGE**

51467 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
51468 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

51469 **RATIONALE**

51470 None.

51471 **FUTURE DIRECTIONS**

51472 None.

51473 **SEE ALSO**

51476 **CHANGE HISTORY**

51477 First released in Issue 1. Derived from Issue 1 of the SVID.

51478 **Issue 5**

51479 The DESCRIPTION is updated to indicate how an application should check for an error. This
51480 text was previously published in the APPLICATION USAGE section.

51481 **Issue 6**

51482 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

51483 The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling
51484 with the ISO / IEC 9899:1999 standard.

Abstract

This standard is simultaneously ISO/IEC 9945:2002, IEEE Std 1003.1-2001, and forms the core of the Single UNIX Specification, Version 3.

The IEEE Std 1003.1, 2003 Edition includes IEEE Std 1003.1-2001/Cor 1-2002 incorporated into IEEE Std 1003.1-2001 (base document). The Corrigendum addresses problems discovered since the approval of IEEE Std 1003.1-2001. These changes are mainly due to resolving integration issues raised by the merger of the base documents that were incorporated into IEEE Std 1003.1-2001, which is the single common revision to IEEE Std 1003.1[™]-1996, IEEE Std 1003.2[™]-1992, ISO/IEC 9945-1:1996, ISO/IEC 9945-2:1993, and the Base Specifications of The Open Group Single UNIX[®] Specification, Version 2.

This standard defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. This standard is intended to be used by both applications developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of this standard:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

This standard describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX[®]), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

All rights reserved. No part of this publication may be reproduced in any form, in an electronic retrieval system or otherwise, without prior written permission from both the IEEE and The Open Group.

Portions of this standard are derived with permission from copyrighted material owned by Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems, Inc.

Permissions

Authorization to photocopy portions of this standard for internal or personal use is granted provided that the appropriate fee is paid to the Copyright Clearance Center or the equivalent body outside of the U.S. Permission to make multiple copies for educational purposes in the U.S. requires agreement and a license fee to be paid to the Copyright Clearance Center.

Beyond these provisions, permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests to the copyright holders should be sent by email to austin-group-permissions@opengroup.org.

Feedback

This standard has been prepared by the Austin Group. Feedback relating to the material contained in this standard may be submitted using the Austin Group web site at <http://www.opengroup.org/austin/defectform.html>.

IEEE

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “AS IS”.

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of the IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with the IEEE.¹ Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE Standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

A patent holder has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates and non-discriminatory, reasonable terms and conditions to all applicants desiring to obtain such licenses. The IEEE makes no representation as to the reasonableness of rates and/or terms and conditions of the license agreements offered by patent holders. Further information may be obtained from the IEEE Standards Department.

Authorization to photocopy portions of any individual standard for internal or personal use is granted in the U.S. by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center.² Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact:

Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923, U.S.A., Tel.: +1 978 750 8400

Amendments, corrigenda, and interpretations for this standard, or information about the IEEE standards development process, may be found at <http://standards.ieee.org>.

Full catalog and ordering information on all IEEE publications is available from the IEEE Online Catalog & Store at <http://shop.ieee.org/store>.

1. For this standard, please send comments via the Austin Group as requested on page iii.

2. Please refer to the special provisions for this standard on page iii concerning permissions from both copyright holders and arrangements to cover photocopying and reproduction across the world, as well as by commercial organizations wishing to license the material for use in product documentation.

The Open Group

The Open Group, a vendor and technology-neutral consortium, is committed to delivering greater business efficiency by bringing together buyers and suppliers of information technology to lower the time, cost, and risks associated with integrating new technology across the enterprise.

The Open Group's mission is to offer all organizations concerned with open information infrastructures a forum to share knowledge, integrate open initiatives, and certify approved products and processes in a manner in which they continue to trust our impartiality.

In the global eCommerce world of today, no single economic entity can achieve independence while still ensuring interoperability. The assurance that products will interoperate with each other across differing systems and platforms is essential to the success of eCommerce and business workflow. The Open Group, with its proven testing and certification program, is the international guarantor of interoperability in the new century.

The Open Group provides opportunities to exchange information and shape the future of IT. The Open Group's members include some of the largest and most influential organizations in the world. The flexible structure of The Open Groups membership allows for almost any organization, no matter what their size, to join and have a voice in shaping the future of the IT world.

More information is available on The Open Group web site at <http://www.opengroup.org>.

The Open Group has over 15 years' experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification. The Open Group portfolio of test suites includes the *Westwood* family of tests for this standard and the associated certification program for Version 3 of the Single UNIX Specification, as well tests for CDE, CORBA, Motif, Linux, LDAP, POSIX.1, POSIX.2, POSIX Realtime, Sockets, UNIX, XPG4, XNFS, XTI, and X11. The Open Group test tools are essential for proper development and maintenance of standards-based products, ensuring conformance of products to industry-standard APIs, applications portability, and interoperability. In-depth testing identifies defects at the earliest possible point in the development cycle, saving costs in development and quality assurance.

More information is available at <http://www.opengroup.org/testing>.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at <http://www.opengroup.org/pubs>.

As with all *live* documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new *Version* indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it *replaces* the previous publication.
- A new *Issue* indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at <http://www.opengroup.org/corrigenda>.

Full catalog and ordering information on all Open Group publications is available at <http://www.opengroup.org/pubs>.

Foreword

Structure of the Standard

This standard was originally developed by the Austin Group, a joint working group of members of the IEEE, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1, as one of the four volumes of IEEE Std 1003.1-2001. The standard was approved by ISO and IEC and published in four parts, correlating to the original volumes.

A mapping of the parts to the volumes is shown below:

ISO/IEC 9945 Part	IEEE Std 1003.1 Volume	Description
9945-1	Base Definitions	Includes general terms, concepts, and interfaces common to all parts of ISO/IEC 9945, including utility conventions and C-language header definitions.
9945-2	System Interfaces	Includes definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery.
9945-3	Shell and Utilities	Includes definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs.
9945-4	Rationale	Includes extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of ISO/IEC 9945 and why features were included or discarded by the standard developers.

All four parts comprise the entire standard, and are intended to be used together to accommodate significant internal referencing among them. POSIX-conforming systems are required to support all four parts.

Introduction

Note: This introduction is not part of IEEE Std 1003.1-2001, Standard for Information Technology — Portable Operating System Interface (POSIX).

This standard has been jointly developed by the IEEE and The Open Group. It is simultaneously an IEEE Standard, an ISO/IEC Standard, and an Open Group Technical Standard.

The Austin Group

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.³ The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group has been to revise, combine, and update the following standards: ISO/IEC 9945-1, ISO/IEC 9945-2, IEEE Std 1003.1, IEEE Std 1003.2, and the Base Specifications of The Open Group Single UNIX Specification.

After two initial meetings, an agreement was signed in July 1999 between The Open Group and the Institute of Electrical and Electronics Engineers (IEEE), Inc., to formalize the project with the first draft of the revised specifications being made available at the same time. Under this agreement, The Open Group and IEEE agreed to share joint copyright of the resulting work. The Open Group has provided the chair and secretariat for the Austin Group.

The base document for the revision was The Open Group's Base volumes of its Single UNIX Specification, Version 2. These were selected since they were a superset of the existing POSIX.1 and POSIX.2 specifications and had some organizational aspects that would benefit the audience for the new revision.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group's Technical Standard designation, and an ISO/IEC designation. This set of specifications forms the core of the Single UNIX Specification, Version 3.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see <http://www.opengroup.org/austin>.

3. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

Background

The developers of this standard represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, this standard describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application writers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,⁴ an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

Audience

The intended audience for this standard is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

Purpose

Several principles guided the development of this standard:

- Application-Oriented

The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. This standard codifies the common, existing definition of the UNIX system.

- Interface, Not Implementation

This standard defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

4. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

- Source, Not Object, Portability

This standard has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. This standard does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

- The C Language

The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

- No Superuser, No System Administration

There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in this standard. This standard is also not concerned with hardware constraints or system maintenance.

- Minimal Interface, Minimally Defined

In keeping with the historical design principles of the UNIX system, the mandatory core facilities of this standard have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

- Broadly Implementable

The developers of this standard endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in this standard, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

When the original version of IEEE Std 1003.1 was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and the subsequent revisions and addenda to all of them have consolidated this consensus, and this revision reflects the significantly increased level of consensus arrived at since the original versions. The earlier standards and their modifications specified a number of areas where consensus had not been reached before, and these are now reflected in this revision. The authors of the original versions tried, as much as possible, to follow the principles below

when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories
2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

This revision tries to minimize the number of changes required to implementations which conform to the earlier versions of the approved standards to bring them into conformance with the current standard. Specifically, the scope of this work excluded doing any “new” work, but rather collecting into a single document what had been spread across a number of documents, and presenting it in what had been proven in practice to be a more effective way. Some changes to prior conforming implementations were unavoidable, primarily as a consequence of resolving conflicts found in prior revisions, or which became apparent when bringing the various pieces together.

However, since it references the 1999 version of the ISO C standard, and no longer supports “Common Usage C”, there are a number of unavoidable changes. Applications portability is similarly affected.

This standard is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of this standard. These need to be used with careful management to be able to adapt to future extensions of this standard and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

A goal of this standard was to minimize additional work for the developers of applications. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

This Standard

This standard defines the Portable Operating System Interface (POSIX) requirements and consists of the following volumes:

- Base Definitions
- Shell and Utilities (this volume)
- System Interfaces
- Rationale (Informative)

This Volume

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions in Chapter 4.
- Chapter 2 describes the command language used in POSIX-conformant systems.
- Chapter 3 describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- Chapter 4 consists of reference pages for all utilities available on POSIX-conformant systems.

Comprehensive references are available in the index.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as IEEE Std 1003.1-2001, which is technically identical to The Open Group Base Specifications, Issue 6.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in this standard.

Reference	Example	Notes
C-Language Data Structure	aiocb	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	long	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg1</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<sys/stat.h>	
C-Language Keyword	return	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	INET_ADDRSTRLEN	
C-Language Preprocessing Directive	#define	
Commands within a Utility	a, c	
Conversion Specification, Specifier / Modifier Character	%A, g, E	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	Hello, World	
Filename	/tmp	
Literal Character	'c', '\r', '\'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	[]	
Parameter	<i><directory pathname></i>	
Special Character	<i><newline></i>	3

Reference	Example	Notes
Symbolic Constant	<code>_POSIX_VDISABLE</code>	4
Symbolic Limit, Configuration Value	<code>{LINE_MAX}</code>	
Syntax	<code>#include <sys/stat.h></code>	5
User Input and Example Code	<code>echo Hello, World</code>	
Utility Name	<code>awk</code>	
Utility Operand	<code>file_name</code>	
Utility Option	<code>-c</code>	
Utility Option with Option-Argument	<code>-w width</code>	

Notes:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *fscanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, `'\'` (or any of the other sequences such as `''`) is the same as the C constant `'\\'` (or `'\''`).
3. The style selected for some of the special characters, such as `<newline>`, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters `<tab>` or `<newline>`.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, `" [ ] "`, are part of the syntax and do *not* indicate optional items. In syntax the `' | '` symbol is used to separate alternatives, and ellipses (`" . . . "`) are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.8.1 (on page 9).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- (a,b) means the range of all values from a to b , including neither a nor b .
- $[a,b]$ means the range of all values from a to b , including a and b .
- $[a,b)$ means the range of all values from a to b , including a , but not b .
- $(a,b]$ means the range of all values from a to b , including b , but not a .

Participants

IEEE Std 1003.1-2001 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22 WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair

Donald W. Cragun, Organizational Representative, IEEE PASC

Nicholas Stoughton, Organizational Representative, ISO/SC22 WG15

Mark Brown, Organizational Representative, The Open Group

Cathy Hughes, Technical Editor

Austin Group Technical Reviewers

Introduction

1.1 Scope

The scope of IEEE Std 1003.1-2001 is described in the Base Definitions volume of IEEE Std 1003.1-2001.

1.2 Conformance

Conformance requirements for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

1.3 Normative References

Normative references for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

1.4 Change History

Change history is described in the Rationale (Informative) volume of IEEE Std 1003.1-2001, and in the CHANGE HISTORY section of reference pages.

1.5 Terminology

This section appears in the Base Definitions volume of IEEE Std 1003.1-2001, but is repeated here for convenience:

For the purposes of IEEE Std 1003.1-2001, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std 1003.1-2001. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by IEEE Std 1003.1-2001 but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable

applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std 1003.1-2001. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std 1003.1-2001 which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std 1003.1-2001 which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.6 Definitions

Concepts and definitions are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

1.7 Relationship to Other Documents

1.7.1 System Interfaces

This subsection describes some of the features provided by the System Interfaces volume of IEEE Std 1003.1-2001 that are assumed to be globally available on all systems conforming to this volume of IEEE Std 1003.1-2001. This subsection does not attempt to detail all of the features defined in the System Interfaces volume of IEEE Std 1003.1-2001 that are required by all of the utilities defined in this volume of IEEE Std 1003.1-2001; the utility and function descriptions point out additional functionality required to provide the corresponding specific features needed by each.

The following subsections describe frequently used concepts. Many of these concepts are described in the Base Definitions volume of IEEE Std 1003.1-2001. Utility and function description statements override these defaults when appropriate.

1.7.1.1 Process Attributes

The following process attributes, as described in the System Interfaces volume of IEEE Std 1003.1-2001, are assumed to be supported for all processes in this volume of IEEE Std 1003.1-2001:

Controlling Terminal	Real Group ID
Current Working Directory	Real User ID
Effective Group ID	Root Directory
Effective User ID	Saved Set-Group-ID
File Descriptors	Saved Set-User-ID
File Mode Creation Mask	Session Membership
Process Group ID	Supplementary Group IDs
Process ID	

A conforming implementation may include additional process attributes.

1.7.1.2 Concurrent Execution of Processes

The following functionality of the *fork()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 shall be available on all systems conforming to this volume of IEEE Std 1003.1-2001:

1. Independent processes shall be capable of executing independently without either process terminating.
2. A process shall be able to create a new process with all of the attributes referenced in Section 1.7.1.1, determined according to the semantics of a call to the *fork()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 followed by a call in the child process to one of the *exec* functions defined in the System Interfaces volume of IEEE Std 1003.1-2001.

105 1.7.1.3 *File Access Permissions*

106 The file access control mechanism described by the Base Definitions volume of
 107 IEEE Std 1003.1-2001, Section 4.4, File Access Permissions shall apply to all files on an
 108 implementation conforming to this volume of IEEE Std 1003.1-2001.

109 1.7.1.4 *File Read, Write, and Creation*

110 If a file that does not exist is to be written, it shall be created as described below, unless the
 111 utility description states otherwise.

112 When a file that does not exist is created, the following features defined in the System Interfaces
 113 volume of IEEE Std 1003.1-2001 shall apply unless the utility or function description states
 114 otherwise:

- 115 1. The user ID of the file shall be set to the effective user ID of the calling process.
- 116 2. The group ID of the file shall be set to the effective group ID of the calling process or the
 117 group ID of the directory in which the file is being created.
- 118 3. If the file is a regular file, the permission bits of the file shall be set to:

119 S_IROTH | S_IWOTH | S_IRGRP | S_IWGRP | S_IRUSR | S_IWUSR

120 (see the description of *File Modes* in the Base Definitions volume of IEEE Std 1003.1-2001,
 121 Chapter 13, Headers, <**sys/stat.h**>) except that the bits specified by the file mode creation
 122 mask of the process shall be cleared. If the file is a directory, the permission bits shall be set
 123 to:

124 S_IRWXU | S_IRWXG | S_IRWXO

125 except that the bits specified by the file mode creation mask of the process shall be cleared.

- 126 4. The *st_atime*, *st_ctime*, and *st_mtime* fields of the file shall be updated as specified in the
 127 System Interfaces volume of IEEE Std 1003.1-2001, Section 2.5, Standard I/O Streams.
- 128 5. If the file is a directory, it shall be an empty directory; otherwise, the file shall have length
 129 zero.
- 130 6. If the file is a symbolic link, the effect shall be undefined unless the {POSIX2_SYMLINKS}
 131 variable is in effect for the directory in which the symbolic link would be created.
- 132 7. Unless otherwise specified, the file created shall be a regular file.

133 When an attempt is made to create a file that already exists, the utility shall take the action
 134 indicated in Table 1-1 (on page 5) corresponding to the type of the file the utility is trying to
 135 create and the type of the existing file, unless the utility description states otherwise.

Table 1-1 Actions when Creating a File that Already Exists

Existing Type	New Type											Function Creating New
	B	C	D	F	L	M	P	Q	R	S	T	
A <i>fattach()</i> -ed STREAM	F	F	F	F	F	—	—	—	OF	—	—	N / A
B Block Special	F	F	F	F	F	—	—	—	OF	—	—	<i>mknod()</i> **
C Character Special	F	F	F	F	F	—	—	—	OF	—	—	<i>mknod()</i> **
D Directory	F	F	F	F	F	—	—	—	F	—	—	<i>mkdir()</i>
F FIFO Special File	F	F	F	F	F	—	—	—	O	—	—	<i>mkfifo()</i>
L Symbolic Link	F	F	F	F	F	—	—	—	FL	—	—	<i>symlink()</i>
M Shared Memory	F	F	F	F	F	—	—	—	—	—	—	<i>shm_open()</i>
P Semaphore	F	F	F	F	F	—	—	—	—	—	—	<i>sem_open()</i>
Q Message Queue	F	F	F	F	F	—	—	—	—	—	—	<i>mq_open()</i>
R Regular File	F	F	F	F	F	—	—	—	RF	—	—	<i>open()</i>
S Socket	F	F	F	F	F	—	—	—	—	—	—	<i>bind()</i>
T Typed Memory	F	F	F	F	F	—	—	—	—	—	—	*

The following codes are used in Table 1-1:

F Fail. The attempt to create the new file shall fail and the utility shall either continue with its operation or exit immediately with a non-zero exit status, depending on the description of the utility.

FL Follow link. Unless otherwise specified, the symbolic link shall be followed as specified for pathname resolution, and the operation performed shall be as if the target of the symbolic link (after all resolution) had been named. If the target of the symbolic link does not exist, it shall be as if that nonexistent target had been named directly.

O Open FIFO. When attempting to create a regular file, and the existing file is a FIFO special file:

1. If the FIFO is not already open for reading, the attempt shall block until the FIFO is opened for reading.
2. Once the FIFO is open for reading, the utility shall open the FIFO for writing and continue with its operation.

OF The named file shall be opened with the consequences defined for that file type.

RF Regular file. When attempting to create a regular file, and the existing file is a regular file:

1. The user ID, group ID, and permission bits of the file shall not be changed.
2. The file shall be truncated to zero length.
3. The *st_ctime* and *st_mtime* fields shall be marked for update.

— The effect is implementation-defined unless specified by the utility description.

***** There is no portable way to create a file of this type.

****** Not portable.

When a file is to be appended, the file shall be opened in a manner equivalent to using the *O_APPEND* flag, without the *O_TRUNC* flag, in the *open()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001.

When a file is to be read or written, the file shall be opened with an access mode corresponding to the operation to be performed. If file access permissions deny access, the requested operation shall fail.

179 1.7.1.5 File Removal

180 When a directory that is the root directory or current working directory of any process is
 181 removed, the effect is implementation-defined. If file access permissions deny access, the
 182 requested operation shall fail. Otherwise, when a file is removed:

- 183 1. Its directory entry shall be removed from the file system.
- 184 2. The link count of the file shall be decremented.
- 185 3. If the file is an empty directory (see the Base Definitions volume of IEEE Std 1003.1-2001,
 186 Section 3.143, Empty Directory):
 - 187 a. If no process has the directory open, the space occupied by the directory shall be
 188 freed and the directory shall no longer be accessible.
 - 189 b. If one or more processes have the directory open, the directory contents shall be
 190 preserved until all references to the file have been closed.
- 191 4. If the file is a directory that is not empty, the *st_ctime* field shall be marked for update.
- 192 5. If the file is not a directory:
 - 193 a. If the link count becomes zero:
 - 194 i. If no process has the file open, the space occupied by the file shall be freed and
 195 the file shall no longer be accessible.
 - 196 ii. If one or more processes have the file open, the file contents shall be preserved
 197 until all references to the file have been closed.
 - 198 b. If the link count is not reduced to zero, the *st_ctime* field shall be marked for update.
- 199 6. The *st_ctime* and *st_mtime* fields of the containing directory shall be marked for update.

200 1.7.1.6 File Time Values

201 All files shall have the three time values described by the Base Definitions volume of
 202 IEEE Std 1003.1-2001, Section 4.7, File Times Update.

203 1.7.1.7 File Contents

204 When a reference is made to the contents of a file, *pathname*, this means the equivalent of all of
 205 the data placed in the space pointed to by *buf* when performing the *read()* function calls in the
 206 following operations defined in the System Interfaces volume of IEEE Std 1003.1-2001:

```
207 while (read (fildes, buf, nbytes) > 0)
208     ;
```

209 If the file is indicated by a pathname *pathname*, the file descriptor shall be determined by the
 210 equivalent of the following operation defined in the System Interfaces volume of
 211 IEEE Std 1003.1-2001:

```
212 fildes = open (pathname, O_RDONLY);
```

213 The value of *nbytes* in the above sequence is unspecified; if the file is of a type where the data
 214 returned by *read()* would vary with different values, the value shall be one that results in the
 215 most data being returned.

216 If the *read()* function calls would return an error, it is unspecified whether the contents of the file
 217 are considered to include any data from offsets in the file beyond where the error would be
 218 returned.

219 1.7.1.8 *Pathname Resolution*

220 The pathname resolution algorithm, described by the Base Definitions volume of
221 IEEE Std 1003.1-2001, Section 4.11, Pathname Resolution, shall be used by implementations
222 conforming to this volume of IEEE Std 1003.1-2001; see also the Base Definitions volume of
223 IEEE Std 1003.1-2001, Section 4.5, File Hierarchy.

224 1.7.1.9 *Changing the Current Working Directory*

225 When the current working directory (see the Base Definitions volume of IEEE Std 1003.1-2001,
226 Section 3.436, Working Directory) is to be changed, unless the utility or function description
227 states otherwise, the operation shall succeed unless a call to the *chdir()* function defined in the
228 System Interfaces volume of IEEE Std 1003.1-2001 would fail when invoked with the new
229 working directory pathname as its argument.

230 1.7.1.10 *Establish the Locale*

231 The functionality of the *setlocale()* function defined in the System Interfaces volume of
232 IEEE Std 1003.1-2001 shall be available on all systems conforming to this volume of
233 IEEE Std 1003.1-2001; that is, utilities that require the capability of establishing an international
234 operating environment shall be permitted to set the specified category of the international
235 environment.

236 1.7.1.11 *Actions Equivalent to Functions*

237 Some utility descriptions specify that a utility performs actions equivalent to a function defined
238 in the System Interfaces volume of IEEE Std 1003.1-2001. Such specifications require only that
239 the external effects be equivalent, not that any effect within the utility and visible only to the
240 utility be equivalent.

241 1.7.2 **Concepts Derived from the ISO C Standard**

242 Some of the standard utilities perform complex data manipulation using their own procedure
243 and arithmetic languages, as defined in their EXTENDED DESCRIPTION or OPERANDS
244 sections. Unless otherwise noted, the arithmetic and semantic concepts (precision, type
245 conversion, control flow, and so on) shall be equivalent to those defined in the ISO C standard,
246 as described in the following sections. Note that there is no requirement that the standard
247 utilities be implemented in any particular programming language.

248 1.7.2.1 *Arithmetic Precision and Operations*

249 Integer variables and constants, including the values of operands and option-arguments, used
250 by the standard utilities listed in this volume of IEEE Std 1003.1-2001 shall be implemented as
251 equivalent to the ISO C standard **signed long** data type; floating point shall be implemented as
252 equivalent to the ISO C standard **double** type. Conversions between types shall be as described
253 in the ISO C standard. All variables shall be initialized to zero if they are not otherwise assigned
254 by the input to the application.

255 Arithmetic operators and control flow keywords shall be implemented as equivalent to those in
256 the cited ISO C standard section, as listed in Table 1-2 (on page 8).

Table 1-2 Selected ISO C Standard Operators and Control Flow Keywords

Operation	ISO C Standard Equivalent Reference
()	Section 6.5.1, Primary Expressions
postfix ++ postfix --	Section 6.5.2, Postfix Operators
unary + unary - prefix ++ prefix -- ~ ! sizeof()	Section 6.5.3, Unary Operators
* / %	Section 6.5.5, Multiplicative Operators
+ -	Section 6.5.6, Additive Operators
<< >>	Section 6.5.7, Bitwise Shift Operators
<, <= >, >=	Section 6.5.8, Relational Operators
= = !=	Section 6.5.9, Equality Operators
&	Section 6.5.10, Bitwise AND Operator
^	Section 6.5.11, Bitwise Exclusive OR Operator
	Section 6.5.12, Bitwise Inclusive OR Operator
&&	Section 6.5.13, Logical AND Operator
	Section 6.5.14, Logical OR Operator
expr?expr:expr	Section 6.5.15, Conditional Operator
=, *=, /=, %=, +=, -= <<=, >>=, &=, ^=, =	Section 6.5.16, Assignment Operators
if () if () ... else switch ()	Section 6.8.4, Selection Statements
while () do ... while () for ()	Section 6.8.5, Iteration Statements
goto continue break return	Section 6.8.6, Jump Statements

The evaluation of arithmetic expressions shall be equivalent to that described in Section 6.5, Expressions, of the ISO C standard.

301 1.7.2.2 Mathematical Functions

302 Any mathematical functions with the same names as those in the following sections of the ISO C
303 standard:

- 304 • Section 7.12, Mathematics, `<math.h>`
- 305 • Section 7.20.2, Pseudo-Random Sequence Generation Functions

306 shall be implemented to return the results equivalent to those returned from a call to the
307 corresponding function described in the ISO C standard.

308 1.8 Portability

309 Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 and functions in
310 the System Interfaces volume of IEEE Std 1003.1-2001 describe functionality that might not be
311 fully portable to systems meeting the requirements for POSIX conformance (see the Base
312 Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance).

313 Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in
314 the margin identifies the nature of the option, extension, or warning (see Section 1.8.1). For
315 maximum portability, an application should avoid such functionality.

316 Unless the primary task of a utility is to produce textual material on its standard output,
317 application developers should not rely on the format or content of any such material that may be
318 produced. Where the primary task is to provide such material, but the output format is
319 incompletely specified, the description is marked with the OF margin code and shading.
320 Application developers are warned not to expect that the output of such an interface on one
321 system is any guide to its behavior on another system.

322 1.8.1 Codes

323 Codes and their meanings are listed in the Base Definitions volume of IEEE Std 1003.1-2001, but
324 are repeated here for convenience:

325 ADV **Advisory Information**

326 The functionality described is optional. The functionality described is also an extension to the
327 ISO C standard.

328 Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section.
329 Where additional semantics apply to a function, the material is identified by use of the ADV
330 margin legend.

331 AIO **Asynchronous Input and Output**

332 The functionality described is optional. The functionality described is also an extension to the
333 ISO C standard.

334 Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section.
335 Where additional semantics apply to a function, the material is identified by use of the AIO
336 margin legend.

337 BAR **Barriers**

338 The functionality described is optional. The functionality described is also an extension to the
339 ISO C standard.

340 Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section.
341 Where additional semantics apply to a function, the material is identified by use of the BAR
342 margin legend.

343	BE	Batch Environment Services and Utilities
344		The functionality described is optional.
345		Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section.
346		Where additional semantics apply to a utility, the material is identified by use of the BE margin
347		legend.
348	CD	C-Language Development Utilities
349		The functionality described is optional.
350		Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.
351		Where additional semantics apply to a utility, the material is identified by use of the CD margin
352		legend.
353	CPT	Process CPU-Time Clocks
354		The functionality described is optional. The functionality described is also an extension to the
355		ISO C standard.
356		Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.
357		Where additional semantics apply to a function, the material is identified by use of the CPT
358		margin legend.
359	CS	Clock Selection
360		The functionality described is optional. The functionality described is also an extension to the
361		ISO C standard.
362		Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section.
363		Where additional semantics apply to a function, the material is identified by use of the CS
364		margin legend.
365	CX	Extension to the ISO C standard
366		The functionality described is an extension to the ISO C standard. Application writers may make
367		use of an extension as it is supported on all IEEE Std 1003.1-2001-conforming systems.
368		With each function or header from the ISO C standard, a statement to the effect that “any
369		conflict is unintentional” is included. That is intended to refer to a direct conflict.
370		IEEE Std 1003.1-2001 acts in part as a profile of the ISO C standard, and it may choose to further
371		constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered
372		conflicts.
373		Where additional semantics apply to a function or header, the material is identified by use of the
374		CX margin legend.
375	FD	FORTTRAN Development Utilities
376		The functionality described is optional.
377		Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section.
378		Where additional semantics apply to a utility, the material is identified by use of the FD margin
379		legend.
380	FR	FORTTRAN Runtime Utilities
381		The functionality described is optional.
382		Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.
383		Where additional semantics apply to a utility, the material is identified by use of the FR margin
384		legend.
385	FSC	File Synchronization
386		The functionality described is optional. The functionality described is also an extension to the
387		ISO C standard.

388		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
389		Where additional semantics apply to a function, the material is identified by use of the FSC
390		margin legend.
391	IP6	IPV6
392		The functionality described is optional. The functionality described is also an extension to the
393		ISO C standard.
394		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
395		Where additional semantics apply to a function, the material is identified by use of the IP6
396		margin legend.
397	MC1	Advisory Information and either Memory Mapped Files or Shared Memory Objects
398		The functionality described is optional. The functionality described is also an extension to the
399		ISO C standard.
400		This is a shorthand notation for combinations of multiple option codes.
401		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
402		Where additional semantics apply to a function, the material is identified by use of the MC1
403		margin legend.
404		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
405		Notation.
406	MC2	Memory Mapped Files, Shared Memory Objects, or Memory Protection
407		The functionality described is optional. The functionality described is also an extension to the
408		ISO C standard.
409		This is a shorthand notation for combinations of multiple option codes.
410		Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section.
411		Where additional semantics apply to a function, the material is identified by use of the MC2
412		margin legend.
413		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
414		Notation.
415	MC3	Memory Mapped Files, Shared Memory Objects, or Typed Memory Objects
416		The functionality described is optional. The functionality described is also an extension to the
417		ISO C standard.
418		This is a shorthand notation for combinations of multiple option codes.
419		Where applicable, functions are marked with the MC3 margin legend in the SYNOPSIS section.
420		Where additional semantics apply to a function, the material is identified by use of the MC3
421		margin legend.
422		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
423		Notation.
424	MF	Memory Mapped Files
425		The functionality described is optional. The functionality described is also an extension to the
426		ISO C standard.
427		Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section.
428		Where additional semantics apply to a function, the material is identified by use of the MF
429		margin legend.
430	ML	Process Memory Locking
431		The functionality described is optional. The functionality described is also an extension to the

432		ISO C standard.
433		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
434		Where additional semantics apply to a function, the material is identified by use of the ML
435		margin legend.
436	MLR	Range Memory Locking
437		The functionality described is optional. The functionality described is also an extension to the
438		ISO C standard.
439		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
440		Where additional semantics apply to a function, the material is identified by use of the MLR
441		margin legend.
442	MON	Monotonic Clock
443		The functionality described is optional. The functionality described is also an extension to the
444		ISO C standard.
445		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
446		Where additional semantics apply to a function, the material is identified by use of the MON
447		margin legend.
448	MPR	Memory Protection
449		The functionality described is optional. The functionality described is also an extension to the
450		ISO C standard.
451		Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section.
452		Where additional semantics apply to a function, the material is identified by use of the MPR
453		margin legend.
454	MSG	Message Passing
455		The functionality described is optional. The functionality described is also an extension to the
456		ISO C standard.
457		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.
458		Where additional semantics apply to a function, the material is identified by use of the MSG
459		margin legend.
460	MX	IEC 60559 Floating-Point Option
461		The functionality described is optional. The functionality described is also an extension to the
462		ISO C standard.
463		Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.
464		Where additional semantics apply to a function, the material is identified by use of the MX
465		margin legend.
466	OB	Obsolescent
467		The functionality described may be withdrawn in a future version of this volume of
468		IEEE Std 1003.1-2001. Strictly Conforming POSIX Applications and Strictly Conforming XSI
469		Applications shall not use obsolescent features.
470		Where applicable, the material is identified by use of the OB margin legend.
471	OF	Output Format Incompletely Specified
472		The functionality described is an XSI extension. The format of the output produced by the utility
473		is not fully specified. It is therefore not possible to post-process this output in a consistent
474		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
475		Where applicable, the material is identified by use of the OF margin legend.

476	OH	Optional Header
477		In the SYNOPSIS section of some interfaces in the System Interfaces volume of
478		IEEE Std 1003.1-2001 an included header is marked as in the following example:
479	OH	<code>#include <sys/types.h></code>
480		<code>#include <grp.h></code>
481		<code>struct group *getgrnam(const char *name);</code>
482		The OH margin legend indicates that the marked header is not required on XSI-conformant
483		systems.
484	PIO	Prioritized Input and Output
485		The functionality described is optional. The functionality described is also an extension to the
486		ISO C standard.
487		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
488		Where additional semantics apply to a function, the material is identified by use of the PIO
489		margin legend.
490	PS	Process Scheduling
491		The functionality described is optional. The functionality described is also an extension to the
492		ISO C standard.
493		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
494		Where additional semantics apply to a function, the material is identified by use of the PS
495		margin legend.
496	RS	Raw Sockets
497		The functionality described is optional. The functionality described is also an extension to the
498		ISO C standard.
499		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
500		Where additional semantics apply to a function, the material is identified by use of the RS
501		margin legend.
502	RTS	Realtime Signals Extension
503		The functionality described is optional. The functionality described is also an extension to the
504		ISO C standard.
505		Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section.
506		Where additional semantics apply to a function, the material is identified by use of the RTS
507		margin legend.
508	SD	Software Development Utilities
509		The functionality described is optional.
510		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
511		Where additional semantics apply to a utility, the material is identified by use of the SD margin
512		legend.
513	SEM	Semaphores
514		The functionality described is optional. The functionality described is also an extension to the
515		ISO C standard.
516		Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section.
517		Where additional semantics apply to a function, the material is identified by use of the SEM
518		margin legend.
519	SHM	Shared Memory Objects
520		The functionality described is optional. The functionality described is also an extension to the

521 ISO C standard.

522 Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.

523 Where additional semantics apply to a function, the material is identified by use of the SHM

524 margin legend.

525 SIO **Synchronized Input and Output**

526 The functionality described is optional. The functionality described is also an extension to the

527 ISO C standard.

528 Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.

529 Where additional semantics apply to a function, the material is identified by use of the SIO

530 margin legend.

531 SPI **Spin Locks**

532 The functionality described is optional. The functionality described is also an extension to the

533 ISO C standard.

534 Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section.

535 Where additional semantics apply to a function, the material is identified by use of the SPI

536 margin legend.

537 SPN **Spawn**

538 The functionality described is optional. The functionality described is also an extension to the

539 ISO C standard.

540 Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.

541 Where additional semantics apply to a function, the material is identified by use of the SPN

542 margin legend.

543 SS **Process Sporadic Server**

544 The functionality described is optional. The functionality described is also an extension to the

545 ISO C standard.

546 Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.

547 Where additional semantics apply to a function, the material is identified by use of the SS

548 margin legend.

549 TCT **Thread CPU-Time Clocks**

550 The functionality described is optional. The functionality described is also an extension to the

551 ISO C standard.

552 Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.

553 Where additional semantics apply to a function, the material is identified by use of the TCT

554 margin legend.

555 TEF **Trace Event Filter**

556 The functionality described is optional. The functionality described is also an extension to the

557 ISO C standard.

558 Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.

559 Where additional semantics apply to a function, the material is identified by use of the TEF

560 margin legend.

561 THR **Threads**

562 The functionality described is optional. The functionality described is also an extension to the

563 ISO C standard.

564 Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section.

565 Where additional semantics apply to a function, the material is identified by use of the THR

566		margin legend.
567	TMO	Timeouts
568		The functionality described is optional. The functionality described is also an extension to the
569		ISO C standard.
570		Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section.
571		Where additional semantics apply to a function, the material is identified by use of the TMO
572		margin legend.
573	TMR	Timers
574		The functionality described is optional. The functionality described is also an extension to the
575		ISO C standard.
576		Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section.
577		Where additional semantics apply to a function, the material is identified by use of the TMR
578		margin legend.
579	TPI	Thread Priority Inheritance
580		The functionality described is optional. The functionality described is also an extension to the
581		ISO C standard.
582		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
583		Where additional semantics apply to a function, the material is identified by use of the TPI
584		margin legend.
585	TPP	Thread Priority Protection
586		The functionality described is optional. The functionality described is also an extension to the
587		ISO C standard.
588		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
589		Where additional semantics apply to a function, the material is identified by use of the TPP
590		margin legend.
591	TPS	Thread Execution Scheduling
592		The functionality described is optional. The functionality described is also an extension to the
593		ISO C standard.
594		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
595		Where additional semantics apply to a function, the material is identified by use of the TPS
596		margin legend.
597	TRC	Trace
598		The functionality described is optional. The functionality described is also an extension to the
599		ISO C standard.
600		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
601		Where additional semantics apply to a function, the material is identified by use of the TRC
602		margin legend.
603	TRI	Trace Inherit
604		The functionality described is optional. The functionality described is also an extension to the
605		ISO C standard.
606		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
607		Where additional semantics apply to a function, the material is identified by use of the TRI
608		margin legend.
609	TRL	Trace Log
610		The functionality described is optional. The functionality described is also an extension to the

611 ISO C standard.

612 Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.

613 Where additional semantics apply to a function, the material is identified by use of the TRL

614 margin legend.

615 TSA **Thread Stack Address Attribute**

616 The functionality described is optional. The functionality described is also an extension to the

617 ISO C standard.

618 Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.

619 Where additional semantics apply to a function, the material is identified by use of the TSA

620 margin legend.

621 TSF **Thread-Safe Functions**

622 The functionality described is optional. The functionality described is also an extension to the

623 ISO C standard.

624 Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section.

625 Where additional semantics apply to a function, the material is identified by use of the TSF

626 margin legend.

627 TSH **Thread Process-Shared Synchronization**

628 The functionality described is optional. The functionality described is also an extension to the

629 ISO C standard.

630 Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.

631 Where additional semantics apply to a function, the material is identified by use of the TSH

632 margin legend.

633 TSP **Thread Sporadic Server**

634 The functionality described is optional. The functionality described is also an extension to the

635 ISO C standard.

636 Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.

637 Where additional semantics apply to a function, the material is identified by use of the TSP

638 margin legend.

639 TSS **Thread Stack Size Attribute**

640 The functionality described is optional. The functionality described is also an extension to the

641 ISO C standard.

642 Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.

643 Where additional semantics apply to a function, the material is identified by use of the TSS

644 margin legend.

645 TYM **Typed Memory Objects**

646 The functionality described is optional. The functionality described is also an extension to the

647 ISO C standard.

648 Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.

649 Where additional semantics apply to a function, the material is identified by use of the TYM

650 margin legend.

651 UP **User Portability Utilities**

652 The functionality described is optional.

653 Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.

654 Where additional semantics apply to a utility, the material is identified by use of the UP margin

655 legend.

Extension

The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.439, XSI.

XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.9 Utility Limits

This section lists magnitude limitations imposed by a specific implementation. The braces notation, {LIMIT}, is used in this volume of IEEE Std 1003.1-2001 to indicate these values, but the braces are not part of the name.

Table 1-3 Utility Limit Minimum Values

Name	Description	Value
{POSIX2_BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	2 048
{POSIX2_BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	99
{POSIX2_BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	1 000
{POSIX2_COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the border_start keyword in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, <i>LC_COLLATE</i> .	2
{POSIX2_EXPR_NEST_MAX}	The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	32
{POSIX2_LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	2 048

Name	Description	Value
{POSIX2_RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3.6, BREs Matching Multiple Characters.	255

The values specified in Table 1-3 (on page 17) represent the lowest values conforming implementations shall provide and, consequently, the largest values on which an application can rely without further enquiries, as described below. These values shall be accessible to applications via the *getconf* utility (see *getconf* (on page 484)).

Implementations may provide more liberal, or less restrictive, values than shown in Table 1-3 (on page 17). These possibly more liberal values are accessible using the symbols in Table 1-4.

The *sysconf()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 or the *getconf* utility return the value of each symbol on each specific implementation. The value so retrieved is the largest, or most liberal, value that is available throughout the session lifetime, as determined at session creation. The literal names shown in the table apply only to the *getconf* utility; the high-level language binding describes the exact form of each name to be used by the interfaces in that binding.

All numeric limits defined by the System Interfaces volume of IEEE Std 1003.1-2001, such as {PATH_MAX}, shall also apply to this volume of IEEE Std 1003.1-2001. All the utilities defined by this volume of IEEE Std 1003.1-2001 are implicitly limited by these values, unless otherwise noted in the utility descriptions.

It is not guaranteed that the application can actually reach the specified limit of an implementation in any given case, or at all, as a lack of virtual memory or other resources may prevent this. The limit value indicates only that the implementation does not specifically impose any arbitrary, more restrictive limit.

Table 1-4 Symbolic Utility Limits

Name	Description	Minimum Value
{BC_BASE_MAX}	The maximum <i>obase</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_BASE_MAX}
{BC_DIM_MAX}	The maximum number of elements permitted in an array by the <i>bc</i> utility.	{POSIX2_BC_DIM_MAX}
{BC_SCALE_MAX}	The maximum <i>scale</i> value allowed by the <i>bc</i> utility.	{POSIX2_BC_SCALE_MAX}
{BC_STRING_MAX}	The maximum length of a string constant accepted by the <i>bc</i> utility.	{POSIX2_BC_STRING_MAX}
{COLL_WEIGHTS_MAX}	The maximum number of weights that can be assigned to an entry of the <i>LC_COLLATE</i> order keyword in the locale definition file; see the	{POSIX2_COLL_WEIGHTS_MAX}

Name	Description	Minimum Value
{EXPR_NEST_MAX}	order_start keyword in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, LC_COLLATE. The maximum number of expressions that can be nested within parentheses by the <i>expr</i> utility.	{POSIX2_EXPR_NEST_MAX}
{LINE_MAX}	Unless otherwise noted, the maximum length, in bytes, of the input line of a utility (either standard input or another file), when the utility is described as processing text files. The length includes room for the trailing <newline>.	{POSIX2_LINE_MAX}
{RE_DUP_MAX}	The maximum number of repeated occurrences of a BRE permitted when using the interval notation $\{m,n\}$; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3.6, BREs Matching Multiple Characters.	{POSIX2_RE_DUP_MAX}

The following value may be a constant within an implementation or may vary from one pathname to another.

{POSIX2_SYMLINKS}

When referring to a directory, the system supports the creation of symbolic links within that directory; for non-directory files, the meaning of {POSIX2_SYMLINKS} is undefined.

1.10 Grammar Conventions

Portions of this volume of IEEE Std 1003.1-2001 are expressed in terms of a special grammar notation. It is used to portray the complex syntax of certain program input. The grammar is based on the syntax used by the *yacc* utility. However, it does not represent fully functional *yacc* input, suitable for program use; the lexical processing and all semantic requirements are described only in textual form. The grammar is not based on source used in any traditional implementation and has not been tested with the semantic code that would normally be required to accompany it. Furthermore, there is no implication that the partial *yacc* code presented represents the most efficient, or only, means of supporting the complex syntax within the utility. Implementations may use other programming languages or algorithms, as long as the syntax supported is the same as that represented by the grammar.

The following typographical conventions are used in the grammar; they have no significance except to aid in reading.

- The identifiers for the reserved words of the language are shown with a leading capital letter. (These are terminals in the grammar; for example, **While**, **Case**.)
- The identifiers for terminals in the grammar are all named with uppercase letters and underscores; for example, **NEWLINE**, **ASSIGN_OP**, **NAME**.
- The identifiers for non-terminals are all lowercase.

1.11 Utility Description Defaults

This section describes all of the subsections used within the utility descriptions, including:

- Intended usage of the section
- Global defaults that affect all the standard utilities
- The meanings of notations used in this volume of IEEE Std 1003.1-2001 that are specific to individual utility sections

NAME

This section gives the name or names of the utility and briefly states its purpose.

SYNOPSIS

The SYNOPSIS section summarizes the syntax of the calling sequence for the utility, including options, option-arguments, and operands. Standards for utility naming are described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines; for describing the utility's arguments in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.1, Utility Argument Syntax.

DESCRIPTION

The DESCRIPTION section describes the actions of the utility. If the utility has a very complex set of subcommands or its own procedural language, an EXTENDED DESCRIPTION section is also provided. Most explanations of optional functionality are omitted here, as they are usually explained in the OPTIONS section.

As stated in Section 1.7.1.11 (on page 7), some functions are described in terms of equivalent functionality. When specific functions are cited, the implementation shall provide equivalent functionality including side effects associated with successful execution of the function. The treatment of errors and intermediate results from the individual functions cited is generally not specified by this volume of IEEE Std 1003.1-2001. See the utility's EXIT STATUS and CONSEQUENCES OF ERRORS sections for all actions associated with errors encountered by the utility.

OPTIONS

The OPTIONS section describes the utility options and option-arguments, and how they modify the actions of the utility. Standard utilities that have options either fully comply with the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines or describe all deviations. Apparent disagreements between functionality descriptions in the OPTIONS and DESCRIPTION (or EXTENDED DESCRIPTION) sections are always resolved in favor of the OPTIONS section.

Each OPTIONS section that uses the phrase “The ... utility shall conform to the Utility Syntax Guidelines ...” refers only to the use of the utility as specified by this volume of IEEE Std 1003.1-2001; implementation extensions should also conform to the guidelines, but may allow exceptions for historical practice.

Unless otherwise stated in the utility description, when given an option unrecognized by the implementation, or when a required option-argument is not provided, standard utilities shall issue a diagnostic message to standard error and exit with a non-zero exit status.

All utilities in this volume of IEEE Std 1003.1-2001 shall be capable of processing arguments using eight-bit transparency.

Default Behavior: When this section is listed as “None.”, it means that the implementation need not support any options. Standard utilities that do not accept options, but that do accept operands, shall recognize “--” as a first argument to be discarded.

The requirement for recognizing “--” is because conforming applications need a way to shield their operands from any arbitrary options that the implementation may provide as an extension. For example, if the standard utility *foo* is listed as taking no options, and the application needed to give it a pathname with a leading hyphen, it could safely do it as:

```
foo -- -myfile
```

and avoid any problems with **-m** used as an extension.

OPERANDS

The OPERANDS section describes the utility operands, and how they affect the actions of the utility. Apparent disagreements between functionality descriptions in the OPERANDS and DESCRIPTION (or EXTENDED DESCRIPTION) sections shall be resolved in favor of the OPERANDS section.

If an operand naming a file can be specified as ‘-’, which means to use the standard input instead of a named file, this is explicitly stated in this section. Unless otherwise stated, the use of multiple instances of ‘-’ to mean standard input in a single command produces unspecified results.

Unless otherwise stated, the standard utilities that accept operands shall process those operands in the order specified in the command line.

Default Behavior: When this section is listed as “None.”, it means that the implementation need not support any operands.

STDIN

The STDIN section describes the standard input of the utility. This section is frequently merely a reference to the following section, as many utilities treat standard input and input files in the same manner. Unless otherwise stated, all restrictions described in the INPUT FILES section shall apply to this section as well.

Use of a terminal for standard input can cause any of the standard utilities that read standard input to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

The specified standard input format of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of IEEE Std 1003.1-2001, except as provided by this volume of IEEE Std 1003.1-2001.

Default Behavior: When this section is listed as “Not used.”, it means that the standard input shall not be read when the utility is used as described by this volume of IEEE Std 1003.1-2001.

INPUT FILES

The INPUT FILES section describes the files, other than the standard input, used as input by the utility. It includes files named as operands and option-arguments as well as other files that are referred to, such as start-up and initialization files, databases, and so on. Commonly-used files are generally described in one place and cross-referenced by other utilities.

All utilities in this volume of IEEE Std 1003.1-2001 shall be capable of processing input files using eight-bit transparency.

When a standard utility reads a seekable input file and terminates without an error before it reaches end-of-file, the utility shall ensure that the file offset in the open file description is properly positioned just past the last byte processed by the utility. For files that are not seekable, the state of the file offset in the open file description for that file is unspecified. A conforming application shall not assume that the following three commands are equivalent:

```
tail -n +2 file
(sed -n 1q; cat) < file
cat file | (sed -n 1q; cat)
```

The second command is equivalent to the first only when the file is seekable. The third command leaves the file offset in the open file description in an unspecified state. Other utilities, such as *head*, *read*, and *sh*, have similar properties.

Some of the standard utilities, such as filters, process input files a line or a block at a time and have no restrictions on the maximum input file size. Some utilities may have size limitations that are not as obvious as file space or memory limitations. Such limitations should reflect resource limitations of some sort, not arbitrary limits set by implementors. Implementations shall document those utilities that are limited by constraints other than file system space, available memory, and other limits specifically cited by this volume of IEEE Std 1003.1-2001, and identify what the constraint is and indicate a way of estimating when the constraint would be reached. Similarly, some utilities descend the directory tree (recursively). Implementations shall also document any limits that they may have in descending the directory tree that are beyond limits cited by this volume of IEEE Std 1003.1-2001.

When an input file is described as a “text file”, the utility produces undefined results if given input that is not from a text file, unless otherwise stated. Some utilities (for example, *make*, *read*, *sh*) allow for continued input lines using an escaped <newline> convention; unless otherwise stated, the utility need not be able to accumulate more than {LINE_MAX} bytes from a set of multiple, continued input lines. Thus, for a conforming application the total of all the continued lines in a set cannot exceed {LINE_MAX}. If a utility using the escaped <newline> convention detects an end-of-file condition immediately after an escaped <newline>, the results are unspecified.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation for a description of this notation. The format description is intended to be sufficiently rigorous to allow other applications to generate these input files. However, since <blank>s can legitimately be included in some of the fields described by the standard utilities, particularly in locales other than the POSIX locale, this intent is not always realized.

Default Behavior: When this section is listed as “None.”, it means that no input files are required to be supplied when the utility is used as described by this volume of

IEEE Std 1003.1-2001.

ENVIRONMENT VARIABLES

The ENVIRONMENT VARIABLES section lists what variables affect the utility's execution.

The entire manner in which environment variables described in this volume of IEEE Std 1003.1-2001 affect the behavior of each utility is described in the ENVIRONMENT VARIABLES section for that utility, in conjunction with the global effects of the *LANG*, *LC_ALL*, and *NLSPATH* environment variables described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables. The existence or value of environment variables described in this volume of IEEE Std 1003.1-2001 shall not otherwise affect the specified behavior of the standard utilities. Any effects of the existence or value of environment variables not described by this volume of IEEE Std 1003.1-2001 upon the standard utilities are unspecified.

For those standard utilities that use environment variables as a means for selecting a utility to execute (such as *CC* in *make*), the string provided to the utility is subjected to the path search described for *PATH* in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

All utilities in this volume of IEEE Std 1003.1-2001 shall be capable of processing environment variable names and values using eight-bit transparency.

Default Behavior: When this section is listed as “None.”, it means that the behavior of the utility is not directly affected by environment variables described by this volume of IEEE Std 1003.1-2001 when the utility is used as described by this volume of IEEE Std 1003.1-2001.

ASYNCHRONOUS EVENTS

The ASYNCHRONOUS EVENTS section lists how the utility reacts to such events as signals and what signals are caught.

Default Behavior: When this section is listed as “Default.”, or it refers to “the standard action for all other signals; see Section 1.11 (on page 20)” it means that the action taken as a result of the signal shall be one of the following:

1. The action shall be that inherited from the parent according to the rules of inheritance of signal actions defined in the System Interfaces volume of IEEE Std 1003.1-2001.
2. When no action has been taken to change the default, the default action shall be that specified by the System Interfaces volume of IEEE Std 1003.1-2001.
3. The result of the utility's execution is as if default actions had been taken.

A utility is permitted to catch a signal, perform some additional processing (such as deleting temporary files), restore the default signal action (or action inherited from the parent process), and resignal itself.

STDOUT

The STDOUT section completely describes the standard output of the utility. This section is frequently merely a reference to the following section, OUTPUT FILES, because many utilities treat standard output and output files in the same manner.

Use of a terminal for standard output may cause any of the standard utilities that write standard output to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

Record formats are described in a notation similar to that used by the C-language function, *printf()*. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation for a description of this notation.

The specified standard output of the standard utilities shall not depend on the existence or value of the environment variables defined in this volume of IEEE Std 1003.1-2001, except as provided by this volume of IEEE Std 1003.1-2001.

Some of the standard utilities describe their output using the verb *display*, defined in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.132, Display. Output described in the STDOUT sections of such utilities may be produced using means other than standard output. When standard output is directed to a terminal, the output described shall be written directly to the terminal. Otherwise, the results are undefined.

Default Behavior: When this section is listed as “Not used.”, it means that the standard output shall not be written when the utility is used as described by this volume of IEEE Std 1003.1-2001.

STDERR

The STDERR section describes the standard error output of the utility. Only those messages that are purposely sent by the utility are described.

Use of a terminal for standard error may cause any of the standard utilities that write standard error output to stop when used in the background. For this reason, applications should not use interactive features in scripts to be placed in the background.

The format of diagnostic messages for most utilities is unspecified, but the language and cultural conventions of diagnostic and informative messages whose format is unspecified by this volume of IEEE Std 1003.1-2001 should be affected by the setting of *LC_MESSAGES* and *NLSPATH*.

The specified standard error output of standard utilities shall not depend on the existence or value of the environment variables defined in this volume of IEEE Std 1003.1-2001, except as provided by this volume of IEEE Std 1003.1-2001.

Default Behavior: When this section is listed as “The standard error shall be used only for diagnostic messages.”, it means that, unless otherwise stated, the diagnostic messages shall be sent to the standard error only when the exit status is non-zero and the utility is used as described by this volume of IEEE Std 1003.1-2001.

When this section is listed as “Not used.”, it means that the standard error shall not be used when the utility is used as described in this volume of IEEE Std 1003.1-2001.

OUTPUT FILES

The OUTPUT FILES section completely describes the files created or modified by the utility. Temporary or system files that are created for internal usage by this utility or other parts of the implementation (for example, spool, log, and audit files) are not described in this, or any, section. The utilities creating such files and the names of such files are unspecified. If applications are written to use temporary or intermediate files, they should use the *TMPDIR* environment variable, if it is set and represents an accessible directory, to select the location of temporary files.

Implementations shall ensure that temporary files, when used by the standard utilities, are named so that different utilities or multiple instances of the same utility can operate simultaneously without regard to their working directories, or any other process characteristic other than process ID. There are two exceptions to this rule:

1. Resources for temporary files other than the name space (for example, disk space, available directory entries, or number of processes allowed) are not guaranteed.
2. Certain standard utilities generate output files that are intended as input for other utilities (for example, *lex* generates **lex.yy.c**), and these cannot have unique names. These cases are explicitly identified in the descriptions of the respective utilities.

Any temporary file created by the implementation shall be removed by the implementation upon a utility's successful exit, exit because of errors, or before termination by any of the SIGHUP, SIGINT, or SIGTERM signals, unless specified otherwise by the utility description.

Receipt of the SIGQUIT signal should generally cause termination (unless in some debugging mode) that would bypass any attempted recovery actions.

Record formats are described in a notation similar to that used by the C-language function, *printf()*; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation for a description of this notation.

Default Behavior: When this section is listed as “None.”, it means that no files are created or modified as a consequence of direct action on the part of the utility when the utility is used as described by this volume of IEEE Std 1003.1-2001. However, the utility may create or modify system files, such as log files, that are outside the utility's normal execution environment.

EXTENDED DESCRIPTION

The EXTENDED DESCRIPTION section provides a place for describing the actions of very complicated utilities, such as text editors or language processors, which typically have elaborate command languages.

Default Behavior: When this section is listed as “None.”, no further description is necessary.

EXIT STATUS

The EXIT STATUS section describes the values the utility shall return to the calling program, or shell, and the conditions that cause these values to be returned. Usually, utilities return zero for successful completion and values greater than zero for various error conditions. If specific numeric values are listed in this section, the system shall use those values for the errors described. In some cases, status values are listed more loosely, such as >0. A strictly conforming application shall not rely on any specific value in the range shown and shall be prepared to receive any value in the range.

For example, a utility may list zero as a successful return, 1 as a failure for a specific reason, and >1 as “an error occurred”. In this case, unspecified conditions may cause a 2 or 3, or other value, to be returned. A conforming application should be written so that it tests for successful exit status values (zero in this case), rather than relying upon the single specific error value listed in this volume of IEEE Std 1003.1-2001. In that way, it has maximum portability, even on implementations with extensions.

Unspecified error conditions may be represented by specific values not listed in this volume of IEEE Std 1003.1-2001.

CONSEQUENCES OF ERRORS

The CONSEQUENCES OF ERRORS section describes the effects on the environment, file systems, process state, and so on, when error conditions occur. It does not describe error messages produced or exit status values used.

The many reasons for failure of a utility are generally not specified by the utility descriptions. Utilities may terminate prematurely if they encounter: invalid usage of options, arguments, or environment variables; invalid usage of the complex syntaxes expressed in EXTENDED DESCRIPTION sections; difficulties accessing, creating, reading, or writing files; or difficulties associated with the privileges of the process.

The following shall apply to each utility, unless otherwise stated:

- If the requested action cannot be performed on an operand representing a file, directory, user, process, and so on, the utility shall issue a diagnostic message to standard error and continue processing the next operand in sequence, but the final exit status shall be returned as non-zero.

For a utility that recursively traverses a file hierarchy (such as *find* or *chown -R*), if the requested action cannot be performed on a file or directory encountered in the hierarchy, the utility shall issue a diagnostic message to standard error and continue processing the remaining files in the hierarchy, but the final exit status shall be returned as non-zero.

- If the requested action characterized by an option or option-argument cannot be performed, the utility shall issue a diagnostic message to standard error and the exit status returned shall be non-zero.
- When an unrecoverable error condition is encountered, the utility shall exit with a non-zero exit status.
- A diagnostic message shall be written to standard error whenever an error condition occurs.

When a utility encounters an error condition several actions are possible, depending on the severity of the error and the state of the utility. Included in the possible actions of various utilities are: deletion of temporary or intermediate work files; deletion of incomplete files; validity checking of the file system or directory.

Default Behavior: When this section is listed as “Default.”, it means that any changes to the environment are unspecified.

APPLICATION USAGE

This section is informative.

The APPLICATION USAGE section gives advice to the application programmer or user about the way the utility should be used.

EXAMPLES

This section is informative.

The EXAMPLES section gives one or more examples of usage, where appropriate. In the event of conflict between an example and a normative part of the specification, the normative material is to be taken as correct.

In all examples, quoting has been used, showing how sample commands (utility names combined with arguments) could be passed correctly to a shell (see *sh*) or as a string to the *system()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001. Such quoting would not be used if the utility is invoked using one of the *exec* functions defined in the System Interfaces volume of IEEE Std 1003.1-2001.

RATIONALE

This section is informative.

1105 This section contains historical information concerning the contents of this volume of
 1106 IEEE Std 1003.1-2001 and why features were included or discarded by the standard
 1107 developers.

1108 **FUTURE DIRECTIONS**

1109 This section is informative.

1110 The FUTURE DIRECTIONS section should be used as a guide to current thinking; there
 1111 is not necessarily a commitment to implement all of these future directions in their
 1112 entirety.

1113 **SEE ALSO**

1114 This section is informative.

1115 The SEE ALSO section lists related entries.

1116 **CHANGE HISTORY**

1117 This section is informative.

1118 This section shows the derivation of the entry and any significant changes that have
 1119 been made to it.

1120 Certain of the standard utilities describe how they can invoke other utilities or applications, such
 1121 as by passing a command string to the command interpreter. The external influences (STDIN,
 1122 ENVIRONMENT VARIABLES, and so on) and external effects (STDOUT, CONSEQUENCES OF
 1123 ERRORS, and so on) of such invoked utilities are not described in the section concerning the
 1124 standard utility that invokes them.

1125 **1.12 Considerations for Utilities in Support of Files of Arbitrary Size**

1126 The following utilities support files of any size up to the maximum that can be created by the
 1127 implementation. This support includes correct writing of file size-related values (such as file
 1128 sizes and offsets, line numbers, and block counts) and correct interpretation of command line
 1129 arguments that contain such values.

1130 *basename* Return non-directory portion of pathname.

1131 *cat* Concatenate and print files.

1132 *cd* Change working directory.

1133 *chgrp* Change file group ownership.

1134 *chmod* Change file modes.

1135 *chown* Change file ownership.

1136 *cksum* Write file checksums and sizes.

1137 *cmp* Compare two files.

1138 *cp* Copy files.

1139 *dd* Convert and copy a file.

1140 *df* Report free disk space.

1141 *dirname* Return directory portion of pathname.

1142 *du* Estimate file space usage.

1143	<i>find</i>	Find files.
1144	<i>ln</i>	Link files.
1145	<i>ls</i>	List directory contents.
1146	<i>mkdir</i>	Make directories.
1147	<i>mv</i>	Move files.
1148	<i>pathchk</i>	Check pathnames.
1149	<i>pwd</i>	Return working directory name.
1150	<i>rm</i>	Remove directory entries.
1151	<i>rmdir</i>	Remove directories.
1152	<i>sh</i>	Shell, the standard command language interpreter.
1153	<i>sum</i>	Print checksum and block or byte count of a file.
1154	<i>test</i>	Evaluate expression.
1155	<i>touch</i>	Change file access and modification times.
1156	<i>ulimit</i>	Set or report file size limit.
1157	Exceptions to the requirement that utilities support files of any size up to the maximum are as follows:	
1158		
1159	1. Uses of files as command scripts, or for configuration or control, are exempt. For example,	
1160	it is not required that <i>sh</i> be able to read an arbitrarily large .profile .	
1161	2. Shell input and output redirection are exempt. For example, it is not required that the	
1162	redirections <i>sum</i> < <i>file</i> or <i>echo foo</i> > <i>file</i> succeed for an arbitrarily large existing file.	

1163 1.13 Built-In Utilities

1164 Any of the standard utilities may be implemented as regular built-in utilities within the
 1165 command language interpreter. This is usually done to increase the performance of frequently
 1166 used utilities or to achieve functionality that would be more difficult in a separate environment.
 1167 The utilities named in Table 1-5 are frequently provided in built-in form. All of the utilities
 1168 named in the table have special properties in terms of command search order within the shell, as
 1169 described in Section 2.9.1.1 (on page 48).

1170 **Table 1-5** Regular Built-In Utilities

1171	<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
1172	<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
1173	<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
1174	<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

1175 However, all of the standard utilities, including the regular built-ins in the table, but not the
 1176 special built-ins described in Section 2.14 (on page 64), shall be implemented in a manner so that
 1177 they can be accessed via the *exec* family of functions as defined in the System Interfaces volume
 1178 of IEEE Std 1003.1-2001 and can be invoked directly by those standard utilities that require it |
 1179 (*env*, *find*, *nice*, *nohup*, *time*, *xargs*).

Shell Command Language

1180

1181 This chapter contains the definition of the Shell Command Language.

1182 2.1 Shell Introduction

1183 The shell is a command language interpreter. This chapter describes the syntax of that command
 1184 language as it is used by the *sh* utility and the *system()* and *popen()* functions defined in the
 1185 System Interfaces volume of IEEE Std 1003.1-2001.

1186 The shell operates according to the following general overview of operations. The specific
 1187 details are included in the cited sections of this chapter.

- 1188 1. The shell reads its input from a file (see *sh*), from the `-c` option or from the *system()* and
 1189 *popen()* functions defined in the System Interfaces volume of IEEE Std 1003.1-2001. If the
 1190 first line of a file of shell commands starts with the characters "#!", the results are
 1191 unspecified.
- 1192 2. The shell breaks the input into tokens: words and operators; see Section 2.3 (on page 31).
- 1193 3. The shell parses the input into simple commands (see Section 2.9.1 (on page 47)) and
 1194 compound commands (see Section 2.9.4 (on page 52)).
- 1195 4. The shell performs various expansions (separately) on different parts of each command,
 1196 resulting in a list of pathnames and fields to be treated as a command and arguments; see
 1197 Section 2.6 (on page 36).
- 1198 5. The shell performs redirection (see Section 2.7 (on page 43)) and removes redirection
 1199 operators and their operands from the parameter list.
- 1200 6. The shell executes a function (see Section 2.9.5 (on page 54)), built-in (see Section 2.14 (on
 1201 page 64)), executable file, or script, giving the names of the arguments as positional
 1202 parameters numbered 1 to *n*, and the name of the command (or in the case of a function
 1203 within a script, the name of the script) as the positional parameter numbered 0 (see Section
 1204 2.9.1.1 (on page 48)).
- 1205 7. The shell optionally waits for the command to complete and collects the exit status (see
 1206 Section 2.8.2 (on page 46)).

2.2 Quoting

Quoting is used to remove the special meaning of certain characters or words to the shell. Quoting can be used to preserve the literal meaning of the special characters in the next paragraph, prevent reserved words from being recognized as such, and prevent parameter expansion and command substitution within here-document processing (see Section 2.7.4 (on page 44)).

The application shall quote the following characters if they are to represent themselves:

| & ; < > () \$ ' \ " ' <space> <tab> <newline>

and the following may need to be quoted under certain circumstances. That is, these characters may be special depending on conditions described elsewhere in this volume of IEEE Std 1003.1-2001:

* ? [# ~ = %

The various quoting mechanisms are the escape character, single-quotes, and double-quotes. The here-document represents another form of quoting; see Section 2.7.4 (on page 44).

2.2.1 Escape Character (Backslash)

A backslash that is not quoted shall preserve the literal value of the following character, with the exception of a <newline>. If a <newline> follows the backslash, the shell shall interpret this as line continuation. The backslash and <newline>s shall be removed before splitting the input into tokens. Since the escaped <newline> is removed entirely from the input and is not replaced by any white space, it cannot serve as a token separator.

2.2.2 Single-Quotes

Enclosing characters in single-quotes (' ') shall preserve the literal value of each character within the single-quotes. A single-quote cannot occur within single-quotes.

2.2.3 Double-Quotes

Enclosing characters in double-quotes (" ") shall preserve the literal value of all characters within the double-quotes, with the exception of the characters dollar sign, backquote, and backslash, as follows:

\$ The dollar sign shall retain its special meaning introducing parameter expansion (see Section 2.6.2 (on page 37)), a form of command substitution (see Section 2.6.3 (on page 40)), and arithmetic expansion (see Section 2.6.4 (on page 41)).

The input characters within the quoted string that are also enclosed between "\$ (" and the matching ') ' shall not be affected by the double-quotes, but rather shall define that command whose output replaces the "\$ (. . .) " when the word is expanded. The tokenizing rules in Section 2.3 (on page 31), not including the alias substitutions in Section 2.3.1 (on page 32), shall be applied recursively to find the matching ') ' .

Within the string of characters from an enclosed "\$ { " to the matching ' } ' , an even number of unescaped double-quotes or single-quotes, if any, shall occur. A preceding backslash character shall be used to escape a literal ' { ' or ' } ' . The rule in Section 2.6.2 (on page 37) shall be used to determine the matching ' } ' .

` The backquote shall retain its special meaning introducing the other form of command substitution (see Section 2.6.3 (on page 40)). The portion of the quoted string from the initial backquote and the characters up to the next backquote that is not preceded by a backslash,

1249 having escape characters removed, defines that command whose output replaces "`\ . . \`"
 1250 when the word is expanded. Either of the following cases produces undefined results:

- 1251 • A single-quoted or double-quoted string that begins, but does not end, within the
 1252 "`\ . . \`" sequence
- 1253 • A "`\ . . \`" sequence that begins, but does not end, within the same double-quoted
 1254 string

1255 \ The backslash shall retain its special meaning as an escape character (see Section 2.2.1 (on
 1256 page 30)) only when followed by one of the following characters when considered special:

1257 \$ \ " \ <newline>

1258 The application shall ensure that a double-quote is preceded by a backslash to be included
 1259 within double-quotes. The parameter '@' has special meaning inside double-quotes and is
 1260 described in Section 2.5.2 (on page 34).

1261 2.3 Token Recognition

1262 The shell shall read its input in terms of lines from a file, from a terminal in the case of an
 1263 interactive shell, or from a string in the case of `sh -c` or `system()`. The input lines can be of
 1264 unlimited length. These lines shall be parsed using two major modes: ordinary token recognition
 1265 and processing of here-documents.

1266 When an **io_here** token has been recognized by the grammar (see Section 2.10 (on page 55)), one
 1267 or more of the subsequent lines immediately following the next **NEWLINE** token form the body
 1268 of one or more here-documents and shall be parsed according to the rules of Section 2.7.4 (on
 1269 page 44).

1270 When it is not processing an **io_here**, the shell shall break its input into tokens by applying the
 1271 first applicable rule below to the next character in its input. The token shall be from the current
 1272 position in the input until a token is delimited according to one of the rules below; the characters
 1273 forming the token are exactly those in the input, including any quoting characters. If it is
 1274 indicated that a token is delimited, and no characters have been included in a token, processing
 1275 shall continue until an actual token is delimited.

- 1276 1. If the end of input is recognized, the current token shall be delimited. If there is no current
 1277 token, the end-of-input indicator shall be returned as the token.
- 1278 2. If the previous character was used as part of an operator and the current character is not
 1279 quoted and can be used with the current characters to form an operator, it shall be used as
 1280 part of that (operator) token.
- 1281 3. If the previous character was used as part of an operator and the current character cannot
 1282 be used with the current characters to form an operator, the operator containing the
 1283 previous character shall be delimited.
- 1284 4. If the current character is backslash, single-quote, or double-quote (`'\'`, `'\''`, or `'\"'`) and
 1285 it is not quoted, it shall affect quoting for subsequent characters up to the end of the quoted
 1286 text. The rules for quoting are as described in Section 2.2 (on page 30). During token
 1287 recognition no substitutions shall be actually performed, and the result token shall contain
 1288 exactly the characters that appear in the input (except for `<newline>` joining), unmodified,
 1289 including any embedded or enclosing quotes or substitution operators, between the quote
 1290 mark and the end of the quoted text. The token shall not be delimited by the end of the
 1291 quoted field.

5. If the current character is an unquoted '\$' or '\', the shell shall identify the start of any candidates for parameter expansion (Section 2.6.2 (on page 37)), command substitution (Section 2.6.3 (on page 40)), or arithmetic expansion (Section 2.6.4 (on page 41)) from their introductory unquoted character sequences: '\$' or "\${", "\$(" or '\', and "\$(", respectively. The shell shall read sufficient input to determine the end of the unit to be expanded (as explained in the cited sections). While processing the characters, if instances of expansions or quoting are found nested within the substitution, the shell shall recursively process them in the manner specified for the construct that is found. The characters found from the beginning of the substitution to its end, allowing for any recursion necessary to recognize embedded constructs, shall be included unmodified in the result token, including any embedded or enclosing substitution operators or quotes. The token shall not be delimited by the end of the substitution.
6. If the current character is not quoted and can be used as the first character of a new operator, the current token (if any) shall be delimited. The current character shall be used as the beginning of the next (operator) token.
7. If the current character is an unquoted <newline>, the current token shall be delimited.
8. If the current character is an unquoted <blank>, any token containing the previous character is delimited and the current character shall be discarded.
9. If the previous character was part of a word, the current character shall be appended to that word.
10. If the current character is a '#', it and all subsequent characters up to, but excluding, the next <newline> shall be discarded as a comment. The <newline> that ends the line is not considered part of the comment.
11. The current character is used as the start of a new word.

Once a token is delimited, it is categorized as required by the grammar in Section 2.10 (on page 55).

2.3.1 Alias Substitution

UP XSI The processing of aliases shall be supported on all XSI-conformant systems or if the system supports the User Portability Utilities option (and the rest of this section is not further shaded for these options).

After a token has been delimited, but before applying the grammatical rules in Section 2.10 (on page 55), a resulting word that is identified to be the command name word of a simple command shall be examined to determine whether it is an unquoted, valid alias name. However, reserved words in correct grammatical context shall not be candidates for alias substitution. A valid alias name (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.10, Alias Name) shall be one that has been defined by the *alias* utility and not subsequently undefined using *unalias*. Implementations also may provide predefined valid aliases that are in effect when the shell is invoked. To prevent infinite loops in recursive aliasing, if the shell is not currently processing an alias of the same name, the word shall be replaced by the value of the alias; otherwise, it shall not be replaced.

If the value of the alias replacing the word ends in a <blank>, the shell shall check the next command word for alias substitution; this process shall continue until a word is found that is not a valid alias or an alias value does not end in a <blank>.

When used as specified by this volume of IEEE Std 1003.1-2001, alias definitions shall not be inherited by separate invocations of the shell or by the utility execution environments invoked by the shell; see Section 2.12 (on page 61).

2.4 Reserved Words

Reserved words are words that have special meaning to the shell; see Section 2.9 (on page 47). The following words shall be recognized as reserved words:

!	do	esac	in
{	done	fi	then
}	elif	for	until
case	else	if	while

This recognition shall only occur when none of the characters is quoted and when the word is used as:

- The first word of a command
- The first word following one of the reserved words other than **case**, **for**, or **in**
- The third word in a **case** command (only **in** is valid in this case)
- The third word in a **for** command (only **in** and **do** are valid in this case)

See the grammar in Section 2.10 (on page 55).

The following words may be recognized as reserved words on some implementations (when none of the characters are quoted), causing unspecified results:

[[	]]	function	select

Words that are the concatenation of a name and a colon (':') are reserved; their use produces unspecified results.

2.5 Parameters and Variables

A parameter can be denoted by a name, a number, or one of the special characters listed in Section 2.5.2 (on page 34). A variable is a parameter denoted by a name.

A parameter is set if it has an assigned value (null is a valid value). Once a variable is set, it can only be unset by using the *unset* special built-in command.

2.5.1 Positional Parameters

A positional parameter is a parameter denoted by the decimal value represented by one or more digits, other than the single digit 0. The digits denoting the positional parameters shall always be interpreted as a decimal value, even if there is a leading zero. When a positional parameter with more than one digit is specified, the application shall enclose the digits in braces (see Section 2.6.2 (on page 37)). Positional parameters are initially assigned when the shell is invoked (see *sh*), temporarily replaced when a shell function is invoked (see Section 2.9.5 (on page 54)), and can be reassigned with the *set* special built-in command.

2.5.2 Special Parameters

Listed below are the special parameters and the values to which they shall expand. Only the values of the special parameters are listed; see Section 2.6 (on page 36) for a detailed summary of all the stages involved in expanding words.

@ Expands to the positional parameters, starting from one. When the expansion occurs within double-quotes, and where field splitting (see Section 2.6.5 (on page 42)) is performed, each positional parameter shall expand as a separate field, with the provision that the expansion of the first parameter shall still be joined with the beginning part of the original word (assuming that the expanded parameter was embedded within a word), and the expansion of the last parameter shall still be joined with the last part of the original word. If there are no positional parameters, the expansion of '@' shall generate zero fields, even when '@' is double-quoted.

***** Expands to the positional parameters, starting from one. When the expansion occurs within a double-quoted string (see Section 2.2.3 (on page 30)), it shall expand to a single field with the value of each parameter separated by the first character of the *IFS* variable, or by a <space> if *IFS* is unset. If *IFS* is set to a null string, this is not equivalent to unsetting it; its first character does not exist, so the parameter values are concatenated.

Expands to the decimal number of positional parameters. The command name (parameter 0) shall not be counted in the number given by '#' because it is a special parameter, not a positional parameter.

? Expands to the decimal exit status of the most recent pipeline (see Section 2.9.2 (on page 49)).

– (Hyphen.) Expands to the current option flags (the single-letter option names concatenated into a string) as specified on invocation, by the *set* special built-in command, or implicitly by the shell.

\$ Expands to the decimal process ID of the invoked shell. In a subshell (see Section 2.12 (on page 61)), '\$' shall expand to the same value as that of the current shell.

! Expands to the decimal process ID of the most recent background command (see Section 2.9.3 (on page 50)) executed from the current shell. (For example, background commands executed from subshells do not affect the value of "\$!" in the current shell environment.) For a pipeline, the process ID is that of the last command in the pipeline.

0 (Zero.) Expands to the name of the shell or shell script. See *sh* (on page 850) for a detailed description of how this name is derived.

See the description of the *IFS* variable in Section 2.5.3.

2.5.3 Shell Variables

Variables shall be initialized from the environment (as defined by the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables and the *exec* function in the System Interfaces volume of IEEE Std 1003.1-2001) and can be given new values with variable assignment commands. If a variable is initialized from the environment, it shall be marked for export immediately; see the *export* special built-in. New variables can be defined and initialized with variable assignments, with the *read* or *getopts* utilities, with the *name* parameter in a **for** loop, with the $\${name=word}$ expansion, or with other mechanisms provided as implementation extensions.

The following variables shall affect the execution of the shell:

1414	UP XSI	ENV	The processing of the <i>ENV</i> shell variable shall be supported on all XSI-conformant systems or if the system supports the User Portability Utilities option.
1415			
1416			
1417			This variable, when and only when an interactive shell is invoked, shall be
1418			subjected to parameter expansion (see Section 2.6.2 (on page 37)) by the shell
1419			and the resulting value shall be used as a pathname of a file containing shell
1420			commands to execute in the current environment. The file need not be
1421			executable. If the expanded value of <i>ENV</i> is not an absolute pathname, the
1422			results are unspecified. <i>ENV</i> shall be ignored if the user's real and effective
1423			user IDs or real and effective group IDs are different.
1424		HOME	The pathname of the user's home directory. The contents of <i>HOME</i> are used in
1425			tilde expansion (see Section 2.6.1 (on page 37)).
1426		IFS	(Input Field Separators.) A string treated as a list of characters that is used for
1427			field splitting and to split lines into fields with the <i>read</i> command. If <i>IFS</i> is not
1428			set, the shell shall behave as if the value of <i>IFS</i> is <space>, <tab>, and
1429			<newline>; see Section 2.6.5 (on page 42). Implementations may ignore the
1430			value of <i>IFS</i> in the environment at the time the shell is invoked, treating <i>IFS</i> as
1431			if it were not set.
1432		LANG	Provide a default value for the internationalization variables that are unset or
1433			null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
1434			Internationalization Variables for the precedence of internationalization
1435			variables used to determine the values of locale categories.)
1436		LC_ALL	The value of this variable overrides the <i>LC_*</i> variables and <i>LANG</i> , as described
1437			in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8,
1438			Environment Variables.
1439		LC_COLLATE	Determine the behavior of range expressions, equivalence classes, and multi-
1440			character collating elements within pattern matching.
1441		LC_CTYPE	Determine the interpretation of sequences of bytes of text data as characters
1442			(for example, single-byte as opposed to multi-byte characters), which
1443			characters are defined as letters (character class alpha) and <blank>s
1444			(character class blank), and the behavior of character classes within pattern
1445			matching. Changing the value of <i>LC_CTYPE</i> after the shell has started shall
1446			not affect the lexical processing of shell commands in the current shell
1447			execution environment or its subshells. Invoking a shell script or performing
1448			<i>exec sh</i> subjects the new shell to the changes in <i>LC_CTYPE</i> .
1449		LC_MESSAGES	Determine the language in which messages should be written.
1450		LINENO	Set by the shell to a decimal number representing the current sequential line
1451			number (numbered starting with 1) within a script or function before it
1452			executes each command. If the user unsets or resets <i>LINENO</i> , the variable may
1453			lose its special meaning for the life of the shell. If the shell is not currently
1454			executing a script or function, the value of <i>LINENO</i> is unspecified. This
1455			volume of IEEE Std 1003.1-2001 specifies the effects of the variable only for
1456			systems supporting the User Portability Utilities option.
1457	XSI	NLSPATH	Determine the location of message catalogs for the processing of
1458			<i>LC_MESSAGES</i> .
1459		PATH	A string formatted as described in the Base Definitions volume of
1460			IEEE Std 1003.1-2001, Chapter 8, Environment Variables, used to effect

1461		command interpretation; see Section 2.9.1.1 (on page 48).
1462	<i>PPID</i>	Set by the shell to the decimal process ID of the process that invoked this shell.
1463		In a subshell (see Section 2.12 (on page 61)), <i>PPID</i> shall be set to the same
1464		value as that of the parent of the current shell. For example, <i>echo \$PPID</i> and
1465		(<i>echo \$PPID</i>) would produce the same value. This volume of
1466		IEEE Std 1003.1-2001 specifies the effects of the variable only for systems
1467		supporting the User Portability Utilities option.
1468	<i>PS1</i>	Each time an interactive shell is ready to read a command, the value of this
1469		variable shall be subjected to parameter expansion and written to standard
1470		error. The default value shall be "\$ ". For users who have specific additional
1471		implementation-defined privileges, the default may be another,
1472		implementation-defined value. The shell shall replace each instance of the
1473		character '!' in <i>PS1</i> with the history file number of the next command to be
1474		typed. Escaping the '!' with another '!' (that is, "!!") shall place the literal
1475		character '!' in the prompt. This volume of IEEE Std 1003.1-2001 specifies
1476		the effects of the variable only for systems supporting the User Portability
1477		Utilities option.
1478	<i>PS2</i>	Each time the user enters a <newline> prior to completing a command line in
1479		an interactive shell, the value of this variable shall be subjected to parameter
1480		expansion and written to standard error. The default value is "> ". This
1481		volume of IEEE Std 1003.1-2001 specifies the effects of the variable only for
1482		systems supporting the User Portability Utilities option.
1483	<i>PS4</i>	When an execution trace (<i>set -x</i>) is being performed in an interactive shell,
1484		before each line in the execution trace, the value of this variable shall be
1485		subjected to parameter expansion and written to standard error. The default
1486		value is "+ ". This volume of IEEE Std 1003.1-2001 specifies the effects of the
1487		variable only for systems supporting the User Portability Utilities option.
1488	<i>PWD</i>	Set by the shell to be an absolute pathname of the current working directory,
1489		containing no components of type symbolic link, no components that are dot,
1490		and no components that are dot-dot when the shell is initialized. If an
1491		application sets or unsets the value of <i>PWD</i> , the behaviors of the <i>cd</i> and <i>pwd</i>
1492		utilities are unspecified.

1493 2.6 Word Expansions

1494 This section describes the various expansions that are performed on words. Not all expansions
1495 are performed on every word, as explained in the following sections.

1496 Tilde expansions, parameter expansions, command substitutions, arithmetic expansions, and
1497 quote removals that occur within a single word expand to a single field. It is only field splitting
1498 or pathname expansion that can create multiple fields from a single word. The single exception
1499 to this rule is the expansion of the special parameter '@' within double-quotes, as described in
1500 Section 2.5.2 (on page 34).

1501 The order of word expansion shall be as follows:

- 1502 1. Tilde expansion (see Section 2.6.1 (on page 37)), parameter expansion (see Section 2.6.2 (on
1503 page 37)), command substitution (see Section 2.6.3 (on page 40)), and arithmetic expansion
1504 (see Section 2.6.4 (on page 41)) shall be performed, beginning to end. See item 5 in Section
1505 2.3 (on page 31).

2. Field splitting (see Section 2.6.5 (on page 42)) shall be performed on the portions of the fields generated by step 1, unless *IFS* is null.
3. Pathname expansion (see Section 2.6.6 (on page 42)) shall be performed, unless *set -f* is in effect.
4. Quote removal (see Section 2.6.7 (on page 42)) shall always be performed last.

The expansions described in this section shall occur in the same shell environment as that in which the command is executed.

If the complete expansion appropriate for a word results in an empty field, that empty field shall be deleted from the list of fields that form the completely expanded command, unless the original word contained single-quote or double-quote characters.

The '\$' character is used to introduce parameter expansion, command substitution, or arithmetic evaluation. If an unquoted '\$' is followed by a character that is either not numeric, the name of one of the special parameters (see Section 2.5.2 (on page 34)), a valid first character of a variable name, a left curly brace ('{') or a left parenthesis, the result is unspecified.

2.6.1 Tilde Expansion

A “tilde-prefix” consists of an unquoted tilde character at the beginning of a word, followed by all of the characters preceding the first unquoted slash in the word, or all the characters in the word if there is no slash. In an assignment (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.21, Variable Assignment), multiple tilde-prefixes can be used: at the beginning of the word (that is, following the equal sign of the assignment), following any unquoted colon, or both. A tilde-prefix in an assignment is terminated by the first unquoted colon or slash. If none of the characters in the tilde-prefix are quoted, the characters in the tilde-prefix following the tilde are treated as a possible login name from the user database. A portable login name cannot contain characters outside the set given in the description of the *LOGNAME* environment variable in the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.3, Other Environment Variables. If the login name is null (that is, the tilde-prefix contains only the tilde), the tilde-prefix is replaced by the value of the variable *HOME*. If *HOME* is unset, the results are unspecified. Otherwise, the tilde-prefix shall be replaced by a pathname of the initial working directory associated with the login name obtained using the *getpwnam()* function as defined in the System Interfaces volume of IEEE Std 1003.1-2001. If the system does not recognize the login name, the results are undefined.

2.6.2 Parameter Expansion

The format for parameter expansion is as follows:

```
${expression}
```

where *expression* consists of all characters until the matching '}'. Any '}' escaped by a backslash or within a quoted string, and characters in embedded arithmetic expansions, command substitutions, and variable expansions, shall not be examined in determining the matching '}'.

The simplest form for parameter expansion is:

```
${parameter}
```

The value, if any, of *parameter* shall be substituted.

The parameter name or symbol can be enclosed in braces, which are optional except for positional parameters with more than one digit or when *parameter* is followed by a character that could be interpreted as part of the name. The matching closing brace shall be determined by

counting brace levels, skipping over enclosed quoted strings, and command substitutions.

If the parameter name or symbol is not enclosed in braces, the expansion shall use the longest valid name (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.230, Name), whether or not the symbol represented by that name exists.

If a parameter expansion occurs inside double-quotes:

- Pathname expansion shall not be performed on the results of the expansion.
- Field splitting shall not be performed on the results of the expansion, with the exception of '@'; see Section 2.5.2 (on page 34).

In addition, a parameter expansion can be modified by using one of the following formats. In each case that a value of *word* is needed (based on the state of *parameter*, as described below), *word* shall be subjected to tilde expansion, parameter expansion, command substitution, and arithmetic expansion. If *word* is not needed, it shall not be expanded. The '}' character that delimits the following parameter expansion modifications shall be determined as described previously in this section and in Section 2.2.3 (on page 30). (For example, `${foo-bar}xyz` would result in the expansion of **foo** followed by the string **xyz** if **foo** is set, else the string "barxyz").

`${parameter:-word}` **Use Default Values.** If *parameter* is unset or null, the expansion of *word* shall be substituted; otherwise, the value of *parameter* shall be substituted.

`${parameter:=word}` **Assign Default Values.** If *parameter* is unset or null, the expansion of *word* shall be assigned to *parameter*. In all cases, the final value of *parameter* shall be substituted. Only variables, not positional parameters or special parameters, can be assigned in this way.

`${parameter:?[word]}` **Indicate Error if Null or Unset.** If *parameter* is unset or null, the expansion of *word* (or a message indicating it is unset if *word* is omitted) shall be written to standard error and the shell exits with a non-zero exit status. Otherwise, the value of *parameter* shall be substituted. An interactive shell need not exit.

`${parameter:+word}` **Use Alternative Value.** If *parameter* is unset or null, null shall be substituted; otherwise, the expansion of *word* shall be substituted.

In the parameter expansions shown previously, use of the colon in the format shall result in a test for a parameter that is unset or null; omission of the colon shall result in a test for a parameter that is only unset. The following table summarizes the effect of the colon:

	<i>parameter</i> Set and Not Null	<i>parameter</i> Set But Null	<i>parameter</i> Unset
<code>\${parameter:-word}</code>	substitute <i>parameter</i>	substitute <i>word</i>	substitute <i>word</i>
<code>\${parameter-word}</code>	substitute <i>parameter</i>	substitute null	substitute <i>word</i>
<code>\${parameter:=word}</code>	substitute <i>parameter</i>	assign <i>word</i>	assign <i>word</i>
<code>\${parameter=word}</code>	substitute <i>parameter</i>	substitute null	assign <i>word</i>
<code>\${parameter:?word}</code>	substitute <i>parameter</i>	error, exit	error, exit
<code>\${parameter?word}</code>	substitute <i>parameter</i>	substitute null	error, exit
<code>\${parameter:+word}</code>	substitute <i>word</i>	substitute null	substitute null
<code>\${parameter+word}</code>	substitute <i>word</i>	substitute <i>word</i>	substitute null

In all cases shown with “substitute”, the expression is replaced with the value shown. In all cases shown with “assign”, *parameter* is assigned that value, which also replaces the expression.

1594 `${#parameter}` **String Length.** The length in characters of the value of *parameter* shall be
 1595 substituted. If *parameter* is `'*'` or `'@'`, the result of the expansion is
 1596 unspecified.

1597 The following four varieties of parameter expansion provide for substring processing. In each
 1598 case, pattern matching notation (see Section 2.13 (on page 62)), rather than regular expression
 1599 notation, shall be used to evaluate the patterns. If *parameter* is `'*'` or `'@'`, the result of the
 1600 expansion is unspecified. Enclosing the full parameter expansion string in double-quotes shall
 1601 not cause the following four varieties of pattern characters to be quoted, whereas quoting
 1602 characters within the braces shall have this effect.

1603 `${parameter%word}` **Remove Smallest Suffix Pattern.** The *word* shall be expanded to produce
 1604 a pattern. The parameter expansion shall then result in *parameter*, with the
 1605 smallest portion of the suffix matched by the *pattern* deleted.

1606 `${parameter%%word}` **Remove Largest Suffix Pattern.** The *word* shall be expanded to produce a
 1607 pattern. The parameter expansion shall then result in *parameter*, with the
 1608 largest portion of the suffix matched by the *pattern* deleted.

1609 `${parameter#word}` **Remove Smallest Prefix Pattern.** The *word* shall be expanded to produce
 1610 a pattern. The parameter expansion shall then result in *parameter*, with the
 1611 smallest portion of the prefix matched by the *pattern* deleted.

1612 `${parameter##word}` **Remove Largest Prefix Pattern.** The *word* shall be expanded to produce a
 1613 pattern. The parameter expansion shall then result in *parameter*, with the
 1614 largest portion of the prefix matched by the *pattern* deleted.

1615 Examples

1616 `${parameter:=word}`
 1617 In this example, *ls* is executed only if *x* is null or unset. (The `$(ls)` command substitution
 1618 notation is explained in Section 2.6.3 (on page 40).)

1619 `$ {x:-$(ls) }`

1620 `${parameter:=word}`
 1621 `unset X`
 1622 `echo ${X:=abc}`
 1623 `abc`

1624 `${parameter:?word}`
 1625 `unset posix`
 1626 `echo ${posix:?}`
 1627 `sh: posix: parameter null or not set`

1628 `${parameter:+word}`
 1629 `set a b c`
 1630 `echo ${3:+posix}`
 1631 `posix`

1632 `${#parameter}`
 1633 `HOME=/usr/posix`
 1634 `echo ${#HOME}`
 1635 `10`

1636 `${parameter%word}`
 1637 `x=file.c`
 1638 `echo ${x%.c}.o`

```

1639         file.o
1640     ${parameter%%word}
1641         x=posix/src/std
1642         echo ${x%*/}
1643         posix
1644     ${parameter#word}
1645         x=$HOME/src/cmd
1646         echo ${x#$HOME}
1647         /src/cmd
1648     ${parameter##word}
1649         x=/one/two/three
1650         echo ${x##*/}
1651         three

```

The double-quoting of patterns is different depending on where the double-quotes are placed:

```

1653 "$ {x#*} "    The asterisk is a pattern character.
1654 ${x#"*"}     The literal asterisk is quoted and not special.

```

2.6.3 Command Substitution

Command substitution allows the output of a command to be substituted in place of the command name itself. Command substitution shall occur when the command is enclosed as follows:

```
$ ( command )
```

or (backquoted version):

```
` command `
```

The shell shall expand the command substitution by executing *command* in a subshell environment (see Section 2.12 (on page 61)) and replacing the command substitution (the text of *command* plus the enclosing "\$ ()" or backquotes) with the standard output of the command, removing sequences of one or more <newline>s at the end of the substitution. Embedded <newline>s before the end of the output shall not be removed; however, they may be treated as field delimiters and eliminated during field splitting, depending on the value of *IFS* and quoting that is in effect.

Within the backquoted style of command substitution, backslash shall retain its literal meaning, except when followed by: '\$', '`', or '\`' (dollar sign, backquote, backslash). The search for the matching backquote shall be satisfied by the first backquote found without a preceding backslash; during this search, if a non-escaped backquote is encountered within a shell comment, a here-document, an embedded command substitution of the \$(*command*) form, or a quoted string, undefined results occur. A single-quoted or double-quoted string that begins, but does not end, within the "`...`" sequence produces undefined results.

With the \$(*command*) form, all characters following the open parenthesis to the matching closing parenthesis constitute the *command*. Any valid shell script can be used for *command*, except a script consisting solely of redirections which produces unspecified results.

The results of command substitution shall not be processed for further tilde expansion, parameter expansion, command substitution, or arithmetic expansion. If a command substitution occurs inside double-quotes, field splitting and pathname expansion shall not be performed on the results of the substitution.

Command substitution can be nested. To specify nesting within the backquoted version, the application shall precede the inner backquotes with backslashes, for example:

```
\`command\`
```

If the command substitution consists of a single subshell, such as:

```
$( (command) )
```

a conforming application shall separate the "\$(" and "(" into two tokens (that is, separate them with white space). This is required to avoid any ambiguities with arithmetic expansion.

2.6.4 Arithmetic Expansion

Arithmetic expansion provides a mechanism for evaluating an arithmetic expression and substituting its value. The format for arithmetic expansion shall be as follows:

```
$( (expression) )
```

The expression shall be treated as if it were in double-quotes, except that a double-quote inside the expression is not treated specially. The shell shall expand all tokens in the expression for parameter expansion, command substitution, and quote removal.

Next, the shell shall treat this as an arithmetic expression and substitute the value of the expression. The arithmetic expression shall be processed according to the rules given in Section 1.7.2.1 (on page 7), with the following exceptions:

- Only signed long integer arithmetic is required.
- Only the decimal-constant, octal-constant, and hexadecimal-constant constants specified in the ISO C standard, Section 6.4.4.1 are required to be recognized as constants.
- The `sizeof()` operator and the prefix and postfix "++" and "--" operators are not required.
- Selection, iteration, and jump statements are not supported.

As an extension, the shell may recognize arithmetic expressions beyond those listed. The shell may use a signed integer type with a rank larger than the rank of **signed long**. The shell may use a real-floating type instead of **signed long** as long as it does not affect the results in cases where there is no overflow. If the expression is invalid, the expansion fails and the shell shall write a message to standard error indicating the failure.

Examples

A simple example using arithmetic expansion:

```
# repeat a command 100 times
x=100
while [ $x -gt 0 ]
do
    command
    x=$((x-1))
done
```

1719 2.6.5 Field Splitting

1720 After parameter expansion (Section 2.6.2 (on page 37)), command substitution (Section 2.6.3 (on
1721 page 40)), and arithmetic expansion (Section 2.6.4 (on page 41)), the shell shall scan the results of
1722 expansions and substitutions that did not occur in double-quotes for field splitting and multiple
1723 fields can result.

1724 The shell shall treat each character of the *IFS* as a delimiter and use the delimiters to split the
1725 results of parameter expansion and command substitution into fields.

1726 1. If the value of *IFS* is a <space>, <tab>, and <newline>, or if it is unset, any sequence of
1727 <space>s, <tab>s, or <newline>s at the beginning or end of the input shall be ignored and
1728 any sequence of those characters within the input shall delimit a field. For example, the
1729 input:

1730 `<newline><space><tab>foo<tab><tab>bar<space>`

1731 yields two fields, **foo** and **bar**.

1732 2. If the value of *IFS* is null, no field splitting shall be performed.

1733 3. Otherwise, the following rules shall be applied in sequence. The term “*IFS* white space” is
1734 used to mean any sequence (zero or more instances) of white space characters that are in
1735 the *IFS* value (for example, if *IFS* contains <space>/<comma>/<tab>, any sequence of
1736 <space>s and <tab>s is considered *IFS* white space).

1737 a. *IFS* white space shall be ignored at the beginning and end of the input.

1738 b. Each occurrence in the input of an *IFS* character that is not *IFS* white space, along
1739 with any adjacent *IFS* white space, shall delimit a field, as described previously.

1740 c. Non-zero-length *IFS* white space shall delimit a field.

1741 2.6.6 Pathname Expansion

1742 After field splitting, if *set -f* is not in effect, each field in the resulting command line shall be
1743 expanded using the algorithm described in Section 2.13 (on page 62), qualified by the rules in
1744 Section 2.13.3 (on page 63).

1745 2.6.7 Quote Removal

1746 The quote characters: ‘\’, ‘\’, and ‘\’ (backslash, single-quote, double-quote) that were
1747 present in the original word shall be removed unless they have themselves been quoted.

2.7 Redirection

Redirection is used to open and close files for the current shell execution environment (see Section 2.12 (on page 61)) or for any command. Redirection operators can be used with numbers representing file descriptors (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.165, File Descriptor) as described below.

The overall format used for redirection is:

```
[n] redir-op word
```

The number *n* is an optional decimal number designating the file descriptor number; the application shall ensure it is delimited from any preceding text and immediately precede the redirection operator *redir-op*. If *n* is quoted, the number shall not be recognized as part of the redirection expression. For example:

```
echo \2>a
```

writes the character 2 into file **a**. If any part of *redir-op* is quoted, no redirection expression is recognized. For example:

```
echo 2\>a
```

writes the characters 2>a to standard output. The optional number, redirection operator, and *word* shall not appear in the arguments provided to the command to be executed (if any).

Open files are represented by decimal numbers starting with zero. The largest possible value is implementation-defined; however, all implementations shall support at least 0 to 9, inclusive, for use by the application. These numbers are called “file descriptors”. The values 0, 1, and 2 have special meaning and conventional uses and are implied by certain redirection operations; they are referred to as *standard input*, *standard output*, and *standard error*, respectively. Programs usually take their input from standard input, and write output on standard output. Error messages are usually written on standard error. The redirection operators can be preceded by one or more digits (with no intervening <blank>s allowed) to designate the file descriptor number.

If the redirection operator is "<<" or "<<–", the word that follows the redirection operator shall be subjected to quote removal; it is unspecified whether any of the other expansions occur. For the other redirection operators, the word that follows the redirection operator shall be subjected to tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal. Pathname expansion shall not be performed on the word by a non-interactive shell; an interactive shell may perform it, but shall do so only when the expansion would result in one word.

If more than one redirection operator is specified with a command, the order of evaluation is from beginning to end.

A failure to open or create a file shall cause a redirection to fail.

1784 2.7.1 Redirecting Input

1785 Input redirection shall cause the file whose name results from the expansion of *word* to be
 1786 opened for reading on the designated file descriptor, or standard input if the file descriptor is not
 1787 specified.

1788 The general format for redirecting input is:

1789 `[n] <word`

1790 where the optional *n* represents the file descriptor number. If the number is omitted, the
 1791 redirection shall refer to standard input (file descriptor 0).

1792 2.7.2 Redirecting Output

1793 The two general formats for redirecting output are:

1794 `[n] >word`

1795 `[n] >| word`

1796 where the optional *n* represents the file descriptor number. If the number is omitted, the
 1797 redirection shall refer to standard output (file descriptor 1).

1798 Output redirection using the '*>*' format shall fail if the *noclobber* option is set (see the
 1799 description of *set -C*) and the file named by the expansion of *word* exists and is a regular file.
 1800 Otherwise, redirection using the '*>*' or "*>|*" formats shall cause the file whose name results
 1801 from the expansion of *word* to be created and opened for output on the designated file
 1802 descriptor, or standard output if none is specified. If the file does not exist, it shall be created;
 1803 otherwise, it shall be truncated to be an empty file after being opened.

1804 2.7.3 Appending Redirected Output

1805 Appended output redirection shall cause the file whose name results from the expansion of
 1806 *word* to be opened for output on the designated file descriptor. The file is opened as if the *open()*
 1807 function as defined in the System Interfaces volume of IEEE Std 1003.1-2001 was called with the
 1808 *O_APPEND* flag. If the file does not exist, it shall be created.

1809 The general format for appending redirected output is as follows:

1810 `[n] >>word`

1811 where the optional *n* represents the file descriptor number. If the number is omitted, the
 1812 redirection refers to standard output (file descriptor 1).

1813 2.7.4 Here-Document

1814 The redirection operators "*<<*" and "*<<-*" both allow redirection of lines contained in a shell
 1815 input file, known as a "here-document", to the input of a command.

1816 The here-document shall be treated as a single word that begins after the next *<newline>* and
 1817 continues until there is a line containing only the delimiter and a *<newline>*, with no *<blank>*s in
 1818 between. Then the next here-document starts, if there is one. The format is as follows:

1819 `[n] <<word`
 1820 `here-document`
 1821 `delimiter`

1822 where the optional *n* represents the file descriptor number. If the number is omitted, the here-
 1823 document refers to standard input (file descriptor 0).

If any character in *word* is quoted, the delimiter shall be formed by performing quote removal on *word*, and the here-document lines shall not be expanded. Otherwise, the delimiter shall be the *word* itself.

If no characters in *word* are quoted, all lines of the here-document shall be expanded for parameter expansion, command substitution, and arithmetic expansion. In this case, the backslash in the input behaves as the backslash inside double-quotes (see Section 2.2.3 (on page 30)). However, the double-quote character (`"`) shall not be treated specially within a here-document, except when the double-quote appears within `"$ ( ) "`, `"` `"`, or `"${ } "`.

If the redirection symbol is `"<<-"`, all leading `<tab>`s shall be stripped from input lines and the line containing the trailing delimiter. If more than one `"<<"` or `"<<-"` operator is specified on a line, the here-document associated with the first operator shall be supplied first by the application and shall be read first by the shell.

Examples

An example of a here-document follows:

```
cat <<eof1; cat <<eof2
Hi,
eof1
Helene.
eof2
```

2.7.5 Duplicating an Input File Descriptor

The redirection operator:

```
[n] <&word
```

shall duplicate one input file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard input if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for input, a redirection error shall result; see Section 2.8.1 (on page 46). If *word* evaluates to `'-'`, file descriptor *n*, or standard input if *n* is not specified, shall be closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

2.7.6 Duplicating an Output File Descriptor

The redirection operator:

```
[n] >&word
```

shall duplicate one output file descriptor from another, or shall close one. If *word* evaluates to one or more digits, the file descriptor denoted by *n*, or standard output if *n* is not specified, shall be made to be a copy of the file descriptor denoted by *word*; if the digits in *word* do not represent a file descriptor already open for output, a redirection error shall result; see Section 2.8.1 (on page 46). If *word* evaluates to `'-'`, file descriptor *n*, or standard output if *n* is not specified, is closed. Attempts to close a file descriptor that is not open shall not constitute an error. If *word* evaluates to something else, the behavior is unspecified.

2.7.7 Open File Descriptors for Reading and Writing

The redirection operator:

`[n] <>word`

shall cause the file whose name is the expansion of *word* to be opened for both reading and writing on the file descriptor denoted by *n*, or standard input if *n* is not specified. If the file does not exist, it shall be created.

2.8 Exit Status and Errors

2.8.1 Consequences of Shell Errors

For a non-interactive shell, an error condition encountered by a special built-in (see Section 2.14 (on page 64)) or other type of utility shall cause the shell to write a diagnostic message to standard error and exit as shown in the following table:

Error	Special Built-In	Other Utilities
Shell language syntax error	Shall exit	Shall exit
Utility syntax error (option or operand error)	Shall exit	Shall not exit
Redirection error	Shall exit	Shall not exit
Variable assignment error	Shall exit	Shall not exit
Expansion error	Shall exit	Shall exit
Command not found	N / A	May exit
Dot script not found	Shall exit	N / A

An expansion error is one that occurs when the shell expansions defined in Section 2.6 (on page 36) are carried out (for example, "`${x!y}`", because '`!`' is not a valid operator); an implementation may treat these as syntax errors if it is able to detect them during tokenization, rather than during expansion.

If any of the errors shown as “shall exit” or “(may) exit” occur in a subshell, the subshell shall (respectively may) exit with a non-zero status, but the script containing the subshell shall not exit because of the error.

In all of the cases shown in the table, an interactive shell shall write a diagnostic message to standard error without exiting.

2.8.2 Exit Status for Commands

Each command has an exit status that can influence the behavior of other shell commands. The exit status of commands that are not utilities is documented in this section. The exit status of the standard utilities is documented in their respective sections.

If a command is not found, the exit status shall be 127. If the command name is found, but it is not an executable utility, the exit status shall be 126. Applications that invoke utilities without using the shell should use these exit status values to report similar errors.

If a command fails during word expansion or redirection, its exit status shall be greater than zero.

Internally, for purposes of deciding whether a command exits with a non-zero exit status, the shell shall recognize the entire status value retrieved for the command by the equivalent of the `wait()` function `WEXITSTATUS` macro (as defined in the System Interfaces volume of IEEE Std 1003.1-2001). When reporting the exit status with the special parameter '`?`', the shell

shall report the full eight bits of exit status available. The exit status of a command that terminated because it received a signal shall be reported as greater than 128.

2.9 Shell Commands

This section describes the basic structure of shell commands. The following command descriptions each describe a format of the command that is only used to aid the reader in recognizing the command type, and does not formally represent the syntax. Each description discusses the semantics of the command; for a formal definition of the command language, consult Section 2.10 (on page 55).

A *command* is one of the following:

- Simple command (see Section 2.9.1)
- Pipeline (see Section 2.9.2 (on page 49))
- List compound-list (see Section 2.9.3 (on page 50))
- Compound command (see Section 2.9.4 (on page 52))
- Function definition (see Section 2.9.5 (on page 54))

Unless otherwise stated, the exit status of a command shall be that of the last simple command executed by the command. There shall be no limit on the size of any shell command other than that imposed by the underlying system (memory constraints, {ARG_MAX}, and so on).

2.9.1 Simple Commands

A “simple command” is a sequence of optional variable assignments and redirections, in any sequence, optionally followed by words and redirections, terminated by a control operator.

When a given simple command is required to be executed (that is, when any conditional construct such as an AND-OR list or a **case** statement has not bypassed the simple command), the following expansions, assignments, and redirections shall all be performed from the beginning of the command text to the end:

1. The words that are recognized as variable assignments or redirections according to Section 2.10.2 (on page 56) are saved for processing in steps 3 and 4.
2. The words that are not variable assignments or redirections shall be expanded. If any fields remain following their expansion, the first field shall be considered the command name and remaining fields are the arguments for the command.
3. Redirections shall be performed as described in Section 2.7 (on page 43).
4. Each variable assignment shall be expanded for tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote removal prior to assigning the value.

In the preceding list, the order of steps 3 and 4 may be reversed for the processing of special built-in utilities; see Section 2.14 (on page 64).

If no command name results, variable assignments shall affect the current execution environment. Otherwise, the variable assignments shall be exported for the execution environment of the command and shall not affect the current execution environment (except for special built-ins). If any of the variable assignments attempt to assign a value to a read-only variable, a variable assignment error shall occur. See Section 2.8.1 (on page 46) for the consequences of these errors.

If there is no command name, any redirections shall be performed in a subshell environment; it is unspecified whether this subshell environment is the same one as that used for a command substitution within the command. (To affect the current execution environment, see the *exec* special built-in.) If any of the redirections performed in the current shell execution environment fail, the command shall immediately fail with an exit status greater than zero, and the shell shall write an error message indicating the failure. See Section 2.8.1 (on page 46) for the consequences of these failures on interactive and non-interactive shells.

If there is a command name, execution shall continue as described in Section 2.9.1.1. If there is no command name, but the command contained a command substitution, the command shall complete with the exit status of the last command substitution performed. Otherwise, the command shall complete with a zero exit status.

2.9.1.1 Command Search and Execution

If a simple command results in a command name and an optional list of arguments, the following actions shall be performed:

1. If the command name does not contain any slashes, the first successful step in the following sequence shall occur:
 - a. If the command name matches the name of a special built-in utility, that special built-in utility shall be invoked.
 - b. If the command name matches the name of a function known to this shell, the function shall be invoked as described in Section 2.9.5 (on page 54). If the implementation has provided a standard utility in the form of a function, it shall not be recognized at this point. It shall be invoked in conjunction with the path search in step 1d.
 - c. If the command name matches the name of a utility listed in the following table, that utility shall be invoked.

<i>alias</i>	<i>false</i>	<i>jobs</i>	<i>read</i>	<i>wait</i>
<i>bg</i>	<i>fc</i>	<i>kill</i>	<i>true</i>	
<i>cd</i>	<i>fg</i>	<i>newgrp</i>	<i>umask</i>	
<i>command</i>	<i>getopts</i>	<i>pwd</i>	<i>unalias</i>	

- d. Otherwise, the command shall be searched for using the *PATH* environment variable as described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables:

- i. If the search is successful:

- a. If the system has implemented the utility as a regular built-in or as a shell function, it shall be invoked at this point in the path search.
- b. Otherwise, the shell executes the utility in a separate utility environment (see Section 2.12 (on page 61)) with actions equivalent to calling the *execve()* function as defined in the System Interfaces volume of IEEE Std 1003.1-2001 with the *path* argument set to the pathname resulting from the search, *arg0* set to the command name, and the remaining arguments set to the operands, if any.

If the *execve()* function fails due to an error equivalent to the [ENOEXEC] error defined in the System Interfaces volume of IEEE Std 1003.1-2001, the shell shall execute a command equivalent to having a shell invoked with the command name as its first operand, with any remaining arguments

1990 passed to the new shell. If the executable file is not a text file, the shell
 1991 may bypass this command execution. In this case, it shall write an error
 1992 message, and shall return an exit status of 126.

1993 Once a utility has been searched for and found (either as a result of this specific
 1994 search or as part of an unspecified shell start-up activity), an implementation
 1995 may remember its location and need not search for the utility again unless the
 1996 *PATH* variable has been the subject of an assignment. If the remembered
 1997 location fails for a subsequent invocation, the shell shall repeat the search to
 1998 find the new location for the utility, if any.

1999 ii. If the search is unsuccessful, the command shall fail with an exit status of 127
 2000 and the shell shall write an error message.

2001 2. If the command name contains at least one slash, the shell shall execute the utility in a
 2002 separate utility environment with actions equivalent to calling the *execve()* function
 2003 defined in the System Interfaces volume of IEEE Std 1003.1-2001 with the *path* and *arg0*
 2004 arguments set to the command name, and the remaining arguments set to the operands, if
 2005 any.

2006 If the *execve()* function fails due to an error equivalent to the [ENOEXEC] error, the shell
 2007 shall execute a command equivalent to having a shell invoked with the command name as
 2008 its first operand, with any remaining arguments passed to the new shell. If the executable
 2009 file is not a text file, the shell may bypass this command execution. In this case, it shall
 2010 write an error message and shall return an exit status of 126.

2011 2.9.2 Pipelines

2012 A *pipeline* is a sequence of one or more commands separated by the control operator ' | '. The
 2013 standard output of all but the last command shall be connected to the standard input of the next
 2014 command.

2015 The format for a pipeline is:

2016 `[!] command1 [ | command2 ...]`

2017 The standard output of *command1* shall be connected to the standard input of *command2*. The
 2018 standard input, standard output, or both of a command shall be considered to be assigned by the
 2019 pipeline before any redirection specified by redirection operators that are part of the command
 2020 (see Section 2.7 (on page 43)).

2021 If the pipeline is not in the background (see Section 2.9.3.1 (on page 50)), the shell shall wait for
 2022 the last command specified in the pipeline to complete, and may also wait for all commands to
 2023 complete.

2024 Exit Status

2025 If the reserved word ! does not precede the pipeline, the exit status shall be the exit status of the
 2026 last command specified in the pipeline. Otherwise, the exit status shall be the logical NOT of the
 2027 exit status of the last command. That is, if the last command returns zero, the exit status shall be
 2028 1; if the last command returns greater than zero, the exit status shall be zero.

2029 **2.9.3 Lists**

2030 An *AND-OR list* is a sequence of one or more pipelines separated by the operators "&&" and
 2031 "|".

2032 A *list* is a sequence of one or more AND-OR lists separated by the operators ';' and '&' and
 2033 optionally terminated by ';', '&', or <newline>.

2034 The operators "&&" and "||" shall have equal precedence and shall be evaluated with left
 2035 associativity. For example, both of the following commands write solely **bar** to standard output:

```
2036     false && echo foo || echo bar
2037     true  || echo foo && echo bar
```

2038 A ';' or <newline> terminator shall cause the preceding AND-OR list to be executed
 2039 sequentially; an '&' shall cause asynchronous execution of the preceding AND-OR list.

2040 The term “compound-list” is derived from the grammar in Section 2.10 (on page 55); it is
 2041 equivalent to a sequence of *lists*, separated by <newline>s, that can be preceded or followed by
 2042 an arbitrary number of <newline>s.

2043 **Examples**

2044 The following is an example that illustrates <newline>s in compound-lists:

```
2045     while
2046     # a couple of <newline>s
2047     # a list
2048     date && who || ls; cat file
2049     # a couple of <newline>s
2050     # another list
2051     wc file > output & true
2052
2053     do
2054     # 2 lists
2055     ls
2056     cat file
2057     done
```

2057 **2.9.3.1 Asynchronous Lists**

2058 If a command is terminated by the control operator ampersand ('&'), the shell shall execute the
 2059 command asynchronously in a subshell. This means that the shell shall not wait for the
 2060 command to finish before executing the next command.

2061 The format for running a command in the background is:

```
2062     command1 & [command2 & ... ]
```

2063 The standard input for an asynchronous list, before any explicit redirections are performed, shall
 2064 be considered to be assigned to a file that has the same properties as **/dev/null**. If it is an
 2065 interactive shell, this need not happen. In all cases, explicit redirection of standard input shall
 2066 override this activity.

2067 When an element of an asynchronous list (the portion of the list ended by an ampersand, such as
 2068 *command1*, above) is started by the shell, the process ID of the last command in the asynchronous
 2069 list element shall become known in the current shell execution environment; see Section 2.12 (on
 2070 page 61). This process ID shall remain known until:

- 2071 1. The command terminates and the application waits for the process ID.
- 2072 2. Another asynchronous list invoked before "\$!" (corresponding to the previous
- 2073 asynchronous list) is expanded in the current execution environment.

2074 The implementation need not retain more than the {CHILD_MAX} most recent entries in its list

2075 of known process IDs in the current shell execution environment.

2076 **Exit Status**

2077 The exit status of an asynchronous list shall be zero.

2078 2.9.3.2 *Sequential Lists*

2079 Commands that are separated by a semicolon (' ; ') shall be executed sequentially.

2080 The format for executing commands sequentially shall be:

2081 `command1 [ ; command2 ] . . .`

2082 Each command shall be expanded and executed in the order specified.

2083 **Exit Status**

2084 The exit status of a sequential list shall be the exit status of the last command in the list.

2085 2.9.3.3 *AND Lists*

2086 The control operator "&&" denotes an AND list. The format shall be:

2087 `command1 [ && command2 ] . . .`

2088 First *command1* shall be executed. If its exit status is zero, *command2* shall be executed, and so on,

2089 until a command has a non-zero exit status or there are no more commands left to execute. The

2090 commands are expanded only if they are executed.

2091 **Exit Status**

2092 The exit status of an AND list shall be the exit status of the last command that is executed in the

2093 list.

2094 2.9.3.4 *OR Lists*

2095 The control operator " || " denotes an OR List. The format shall be:

2096 `command1 [ || command2 ] . . .`

2097 First, *command1* shall be executed. If its exit status is non-zero, *command2* shall be executed, and

2098 so on, until a command has a zero exit status or there are no more commands left to execute.

2099 **Exit Status**

2100 The exit status of an OR list shall be the exit status of the last command that is executed in the

2101 list.

2102 2.9.4 Compound Commands

2103 The shell has several programming constructs that are “compound commands”, which provide
 2104 control flow for commands. Each of these compound commands has a reserved word or control
 2105 operator at the beginning, and a corresponding terminator reserved word or operator at the end.
 2106 In addition, each can be followed by redirections on the same line as the terminator. Each
 2107 redirection shall apply to all the commands within the compound command that do not
 2108 explicitly override that redirection.

2109 2.9.4.1 Grouping Commands

2110 The format for grouping commands is as follows:

2111 (*compound-list*) Execute *compound-list* in a subshell environment; see Section 2.12 (on page
 2112 61). Variable assignments and built-in commands that affect the
 2113 environment shall not remain in effect after the list finishes.

2114 { *compound-list*; } Execute *compound-list* in the current process environment. The semicolon
 2115 shown here is an example of a control operator delimiting the } reserved
 2116 word. Other delimiters are possible, as shown in Section 2.10 (on page
 2117 55); a <newline> is frequently used.

2118 Exit Status

2119 The exit status of a grouping command shall be the exit status of *compound-list*.

2120 2.9.4.2 The for Loop

2121 The **for** loop shall execute a sequence of commands for each member in a list of *items*. The **for**
 2122 loop requires that the reserved words **do** and **done** be used to delimit the sequence of
 2123 commands.

2124 The format for the **for** loop is as follows:

```
2125     for name [ in [word ... ] ]
2126     do
2127         compound-list
2128     done
```

2129 First, the list of words following **in** shall be expanded to generate a list of items. Then, the
 2130 variable *name* shall be set to each item, in turn, and the *compound-list* executed each time. If no
 2131 items result from the expansion, the *compound-list* shall not be executed. Omitting:

```
2132     in word...
```

2133 shall be equivalent to:

```
2134     in "$@"
```

2135 Exit Status

2136 The exit status of a **for** command shall be the exit status of the last command that executes. If
 2137 there are no items, the exit status shall be zero.

2138 2.9.4.3 *Case Conditional Construct*

2139 The conditional construct **case** shall execute the *compound-list* corresponding to the first one of
 2140 several *patterns* (see Section 2.13 (on page 62)) that is matched by the string resulting from the
 2141 tilde expansion, parameter expansion, command substitution, arithmetic expansion, and quote
 2142 removal of the given word. The reserved word **in** shall denote the beginning of the patterns to be
 2143 matched. Multiple patterns with the same *compound-list* shall be delimited by the ' | ' symbol.
 2144 The control operator ') ' terminates a list of patterns corresponding to a given action. The
 2145 *compound-list* for each list of patterns, with the possible exception of the last, shall be terminated
 2146 with " ; ; ". The **case** construct terminates with the reserved word **esac** (**case** reversed).

2147 The format for the **case** construct is as follows:

```
2148     case word in
2149         [(]pattern1) compound-list;;
2150         [(]pattern[ | pattern] ... ) compound-list;;] ...
2151         [(]pattern[ | pattern] ... ) compound-list]
2152     esac
```

2153 The " ; ; " is optional for the last *compound-list*.

2154 In order from the beginning to the end of the **case** statement, each *pattern* that labels a
 2155 *compound-list* shall be subjected to tilde expansion, parameter expansion, command substitution,
 2156 and arithmetic expansion, and the result of these expansions shall be compared against the
 2157 expansion of *word*, according to the rules described in Section 2.13 (on page 62) (which also
 2158 describes the effect of quoting parts of the pattern). After the first match, no more patterns shall
 2159 be expanded, and the *compound-list* shall be executed. The order of expansion and comparison of
 2160 multiple *patterns* that label a *compound-list* statement is unspecified.

2161 **Exit Status**

2162 The exit status of **case** shall be zero if no patterns are matched. Otherwise, the exit status shall be
 2163 the exit status of the last command executed in the *compound-list*.

2164 2.9.4.4 *The if Conditional Construct*

2165 The **if** command shall execute a *compound-list* and use its exit status to determine whether to
 2166 execute another *compound-list*.

2167 The format for the **if** construct is as follows:

```
2168     if compound-list
2169     then
2170         compound-list
2171     [elif compound-list
2172     then
2173         compound-list] ...
2174     [else
2175         compound-list]
2176     fi
```

2177 The **if** *compound-list* shall be executed; if its exit status is zero, the **then** *compound-list* shall be
 2178 executed and the command shall complete. Otherwise, each **elif** *compound-list* shall be executed,
 2179 in turn, and if its exit status is zero, the **then** *compound-list* shall be executed and the command
 2180 shall complete. Otherwise, the **else** *compound-list* shall be executed.

2181 **Exit Status**

2182 The exit status of the **if** command shall be the exit status of the **then** or **else** *compound-list* that
 2183 was executed, or zero, if none was executed.

2184 2.9.4.5 *The while Loop*

2185 The **while** loop shall continuously execute one *compound-list* as long as another *compound-list* has
 2186 a zero exit status.

2187 The format of the **while** loop is as follows:

```
2188            while compound-list-1
2189            do
2190                compound-list-2
2191            done
```

2192 The *compound-list-1* shall be executed, and if it has a non-zero exit status, the **while** command
 2193 shall complete. Otherwise, the *compound-list-2* shall be executed, and the process shall repeat.

2194 **Exit Status**

2195 The exit status of the **while** loop shall be the exit status of the last *compound-list-2* executed, or
 2196 zero if none was executed.

2197 2.9.4.6 *The until Loop*

2198 The **until** loop shall continuously execute one *compound-list* as long as another *compound-list* has
 2199 a non-zero exit status.

2200 The format of the **until** loop is as follows:

```
2201            until compound-list-1
2202            do
2203                compound-list-2
2204            done
```

2205 The *compound-list-1* shall be executed, and if it has a zero exit status, the **until** command
 2206 completes. Otherwise, the *compound-list-2* shall be executed, and the process repeats.

2207 **Exit Status**

2208 The exit status of the **until** loop shall be the exit status of the last *compound-list-2* executed, or
 2209 zero if none was executed.

2210 2.9.5 **Function Definition Command**

2211 A function is a user-defined name that is used as a simple command to call a compound
 2212 command with new positional parameters. A function is defined with a “function definition
 2213 command”.

2214 The format of a function definition command is as follows:

```
2215            fname() compound-command[io-redirect ...]
```

2216 The function is named *fname*; the application shall ensure that it is a name (see the Base
 2217 Definitions volume of IEEE Std 1003.1-2001, Section 3.230, Name). An implementation may
 2218 allow other characters in a function name as an extension. The implementation shall maintain
 2219 separate name spaces for functions and variables.

2220 The argument *compound-command* represents a compound command, as described in Section
2221 2.9.4 (on page 52).

2222 When the function is declared, none of the expansions in Section 2.6 (on page 36) shall be
2223 performed on the text in *compound-command* or *io-redirect*; all expansions shall be performed as
2224 normal each time the function is called. Similarly, the optional *io-redirect* redirections and any
2225 variable assignments within *compound-command* shall be performed during the execution of the
2226 function itself, not the function definition. See Section 2.8.1 (on page 46) for the consequences of
2227 failures of these operations on interactive and non-interactive shells.

2228 When a function is executed, it shall have the syntax-error and variable-assignment properties
2229 described for special built-in utilities in the enumerated list at the beginning of Section 2.14 (on
2230 page 64).

2231 The *compound-command* shall be executed whenever the function name is specified as the name
2232 of a simple command (see Section 2.9.1.1 (on page 48)). The operands to the command
2233 temporarily shall become the positional parameters during the execution of the *compound-*
2234 *command*; the special parameter '#' also shall be changed to reflect the number of operands. The
2235 special parameter 0 shall be unchanged. When the function completes, the values of the
2236 positional parameters and the special parameter '#' shall be restored to the values they had
2237 before the function was executed. If the special built-in *return* is executed in the *compound-*
2238 *command*, the function completes and execution shall resume with the next command after the
2239 function call.

2240 **Exit Status**

2241 The exit status of a function definition shall be zero if the function was declared successfully;
2242 otherwise, it shall be greater than zero. The exit status of a function invocation shall be the exit
2243 status of the last command executed by the function.

2244 **2.10 Shell Grammar**

2245 The following grammar defines the Shell Command Language. This formal syntax shall take
2246 precedence over the preceding text syntax description.

2247 **2.10.1 Shell Grammar Lexical Conventions**

2248 The input language to the shell must be first recognized at the character level. The resulting
2249 tokens shall be classified by their immediate context according to the following rules (applied in
2250 order). These rules shall be used to determine what a “token” is that is subject to parsing at the
2251 token level. The rules for token recognition in Section 2.3 (on page 31) shall apply.

- 2252 1. A <newline> shall be returned as the token identifier **NEWLINE**.
- 2253 2. If the token is an operator, the token identifier for that operator shall result.
- 2254 3. If the string consists solely of digits and the delimiter character is one of '<' or '>', the
2255 token identifier **IO_NUMBER** shall be returned.
- 2256 4. Otherwise, the token identifier **TOKEN** results.

2257 Further distinction on **TOKEN** is context-dependent. It may be that the same **TOKEN** yields
2258 **WORD**, a **NAME**, an **ASSIGNMENT**, or one of the reserved words below, dependent upon the
2259 context. Some of the productions in the grammar below are annotated with a rule number from
2260 the following list. When a **TOKEN** is seen where one of those annotated productions could be
2261 used to reduce the symbol, the applicable rule shall be applied to convert the token identifier

type of the **TOKEN** to a token identifier acceptable at that point in the grammar. The reduction shall then proceed based upon the token identifier type yielded by the rule applied. When more than one rule applies, the highest numbered rule shall apply (which in turn may refer to another rule). (Note that except in rule 7, the presence of an '=' in the token has no effect.)

The **WORD** tokens shall have the word expansion rules applied to them immediately before the associated command is executed, not at the time the command is parsed.

2.10.2 Shell Grammar Rules

1. [Command Name]

When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word shall result. Otherwise, the token **WORD** shall be returned. Also, if the parser is in any state where only a reserved word could be the next correct token, proceed as above.

Note: Because at this point quote marks are retained in the token, quoted strings cannot be recognized as reserved words. This rule also implies that reserved words are not recognized except in certain positions in the input, such as after a <newline> or semicolon; the grammar presumes that if the reserved word is intended, it is properly delimited by the user, and does not attempt to reflect that requirement directly. Also note that line joining is done before tokenization, as described in Section 2.2.1 (on page 30), so escaped <newline>s are already removed at this point.

Rule 1 is not directly referenced in the grammar, but is referred to by other rules, or applies globally.

2. [Redirection to or from filename]

The expansions specified in Section 2.7 (on page 43) shall occur. As specified there, exactly one field can result (or the result is unspecified), and there are additional requirements on pathname expansion.

3. [Redirection from here-document]

Quote removal shall be applied to the word to determine the delimiter that is used to find the end of the here-document that begins after the next <newline>.

4. [Case statement termination]

When the **TOKEN** is exactly the reserved word **esac**, the token identifier for **esac** shall result. Otherwise, the token **WORD** shall be returned.

5. [NAME in for]

When the **TOKEN** meets the requirements for a name (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.230, Name), the token identifier **NAME** shall result. Otherwise, the token **WORD** shall be returned.

6. [Third word of for and case]

a. [case only]

When the **TOKEN** is exactly the reserved word **in**, the token identifier for **in** shall result. Otherwise, the token **WORD** shall be returned.

b. [for only]

When the **TOKEN** is exactly the reserved word **in** or **do**, the token identifier for **in** or **do** shall result, respectively. Otherwise, the token **WORD** shall be returned.

2303 (For a. and b.: As indicated in the grammar, a *linebreak* precedes the tokens **in** and **do**. If
 2304 <newline>s are present at the indicated location, it is the token after them that is treated in
 2305 this fashion.)

2306 7. [Assignment preceding command name]

2307 a. [When the first word]

2308 If the **TOKEN** does not contain the character '=', rule 1 is applied. Otherwise, 7b
 2309 shall be applied.

2310 b. [Not the first word]

2311 If the **TOKEN** contains the equal sign character:

2312 — If it begins with '=', the token **WORD** shall be returned.

2313 — If all the characters preceding '=' form a valid name (see the Base Definitions
 2314 volume of IEEE Std 1003.1-2001, Section 3.230, Name), the token
 2315 **ASSIGNMENT_WORD** shall be returned. (Quoted characters cannot participate
 2316 in forming a valid name.)

2317 — Otherwise, it is unspecified whether it is **ASSIGNMENT_WORD** or **WORD** that
 2318 is returned.

2319 Assignment to the **NAME** shall occur as specified in Section 2.9.1 (on page 47).

2320 8. [**NAME** in function]

2321 When the **TOKEN** is exactly a reserved word, the token identifier for that reserved word
 2322 shall result. Otherwise, when the **TOKEN** meets the requirements for a name, the token
 2323 identifier **NAME** shall result. Otherwise, rule 7 applies.

2324 9. [Body of function]

2325 Word expansion and assignment shall never occur, even when required by the rules above,
 2326 when this rule is being parsed. Each **TOKEN** that might either be expanded or have
 2327 assignment applied to it shall instead be returned as a single **WORD** consisting only of
 2328 characters that are exactly the token described in Section 2.3 (on page 31).

```

2512 2.11 Signals and Error Handling

2513 When a command is in an asynchronous list, the shell shall prevent SIGQUIT and SIGINT
 2514 signals from the keyboard from interrupting the command. Otherwise, signals shall have the
 2515 values inherited by the shell from its parent (see also the *trap* special built-in).

2516 When a signal for which a trap has been set is received while the shell is waiting for the
 2517 completion of a utility executing a foreground command, the trap associated with that signal
 2518 shall not be executed until after the foreground command has completed. When the shell is
 2519 waiting, by means of the *wait* utility, for asynchronous commands to complete, the reception of a
 2520 signal for which a trap has been set shall cause the *wait* utility to return immediately with an exit
 2521 status >128, immediately after which the trap associated with that signal shall be taken.

2522 If multiple signals are pending for the shell for which there are associated trap actions, the order
 2523 of execution of trap actions is unspecified.

2524 2.12 Shell Execution Environment

2525 A shell execution environment consists of the following:

- 2526 • Open files inherited upon invocation of the shell, plus open files controlled by *exec*
- 2527 • Working directory as set by *cd*
- 2528 • File creation mask set by *umask*
- 2529 • Current traps set by *trap*
- 2530 • Shell parameters that are set by variable assignment (see the *set* special built-in) or from the
 2531 System Interfaces volume of IEEE Std 1003.1-2001 environment inherited by the shell when it
 2532 begins (see the *export* special built-in)
- 2533 • Shell functions; see Section 2.9.5 (on page 54)
- 2534 • Options turned on at invocation or by *set*
- 2535 • Process IDs of the last commands in asynchronous lists known to this shell environment; see
 2536 Section 2.9.3.1 (on page 50)

- Shell aliases; see Section 2.3.1 (on page 32)

Utilities other than the special built-ins (see Section 2.14 (on page 64)) shall be invoked in a separate environment that consists of the following. The initial value of these objects shall be the same as that for the parent shell, except as noted below.

- Open files inherited on invocation of the shell, open files controlled by the *exec* special built-in plus any modifications, and additions specified by any redirections to the utility
- Current working directory
- File creation mask
- If the utility is a shell script, traps caught by the shell shall be set to the default values and traps ignored by the shell shall be set to be ignored by the utility; if the utility is not a shell script, the trap actions (default or ignore) shall be mapped into the appropriate signal handling actions for the utility
- Variables with the *export* attribute, along with those explicitly exported for the duration of the command, shall be passed to the utility environment variables

The environment of the shell process shall not be changed by the utility unless explicitly specified by the utility description (for example, *cd* and *umask*).

A subshell environment shall be created as a duplicate of the shell environment, except that signal traps set by that shell environment shall be set to the default values. Changes made to the subshell environment shall not affect the shell environment. Command substitution, commands that are grouped with parentheses, and asynchronous lists shall be executed in a subshell environment. Additionally, each command of a multi-command pipeline is in a subshell environment; as an extension, however, any or all commands in a pipeline may be executed in the current environment. All other commands shall be executed in the current shell environment.

2.13 Pattern Matching Notation

The pattern matching notation described in this section is used to specify patterns for matching strings in the shell. Historically, pattern matching notation is related to, but slightly different from, the regular expression notation described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular Expressions. For this reason, the description of the rules for this pattern matching notation are based on the description of regular expression notation, modified to include backslash escape processing.

2.13.1 Patterns Matching a Single Character

The following patterns matching a single character shall match a single character: ordinary characters, special pattern characters, and pattern bracket expressions. The pattern bracket expression also shall match a single collating element. A backslash character shall escape the following character. The escaping backslash shall be discarded.

An ordinary character is a pattern that shall match itself. It can be any character in the supported character set except for NUL, those special shell characters in Section 2.2 (on page 30) that require quoting, and the following three special pattern characters. Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. If any character (ordinary, shell special, or pattern special) is quoted, that pattern shall match the character itself. The shell special characters always require quoting.

2579 When unquoted and outside a bracket expression, the following three characters shall have
 2580 special meaning in the specification of patterns:

2581 ? A question-mark is a pattern that shall match any character.

2582 * An asterisk is a pattern that shall match multiple characters, as described in Section 2.13.2.

2583 [The open bracket shall introduce a pattern bracket expression.

2584 The description of basic regular expression bracket expressions in the Base Definitions volume
 2585 of IEEE Std 1003.1-2001, Section 9.3.5, RE Bracket Expression shall also apply to the pattern
 2586 bracket expression, except that the exclamation mark character ('!') shall replace the
 2587 circumflex character ('^') in its role in a “non-matching list” in the regular expression notation.
 2588 A bracket expression starting with an unquoted circumflex character produces unspecified
 2589 results.

2590 When pattern matching is used where shell quote removal is not performed (such as in the
 2591 argument to the *find -name* primary when *find* is being called using one of the *exec* functions as
 2592 defined in the System Interfaces volume of IEEE Std 1003.1-2001, or in the *pattern* argument to
 2593 the *fnmatch()* function), special characters can be escaped to remove their special meaning by
 2594 preceding them with a backslash character. This escaping backslash is discarded. The sequence
 2595 "\\\" represents one literal backslash. All of the requirements and effects of quoting on ordinary,
 2596 shell special, and special pattern characters shall apply to escaping in this context.

2597 **2.13.2 Patterns Matching Multiple Characters**

2598 The following rules are used to construct patterns matching multiple characters from patterns
 2599 matching a single character:

- 2600 1. The asterisk ('*') is a pattern that shall match any string, including the null string.
- 2601 2. The concatenation of patterns matching a single character is a valid pattern that shall
 2602 match the concatenation of the single characters or collating elements matched by each of
 2603 the concatenated patterns.
- 2604 3. The concatenation of one or more patterns matching a single character with one or more
 2605 asterisks is a valid pattern. In such patterns, each asterisk shall match a string of zero or
 2606 more characters, matching the greatest possible number of characters that still allows the
 2607 remainder of the pattern to match the string.

2608 **2.13.3 Patterns Used for Filename Expansion**

2609 The rules described so far in Section 2.13.1 (on page 62) and Section 2.13.2 are qualified by the
 2610 following rules that apply when pattern matching notation is used for filename expansion:

- 2611 1. The slash character in a pathname shall be explicitly matched by using one or more slashes
 2612 in the pattern; it shall neither be matched by the asterisk or question-mark special
 2613 characters nor by a bracket expression. Slashes in the pattern shall be identified before
 2614 bracket expressions; thus, a slash cannot be included in a pattern bracket expression used
 2615 for filename expansion. If a slash character is found following an unescaped open square
 2616 bracket character before a corresponding closing square bracket is found, the open bracket
 2617 shall be treated as an ordinary character. For example, the pattern "a[b/c]d" does not
 2618 match such pathnames as **abd** or **a/d**. It only matches a pathname of literally **a[b/c]d**.
- 2619 2. If a filename begins with a period ('.'), the period shall be explicitly matched by using a
 2620 period as the first character of the pattern or immediately following a slash character. The
 2621 leading period shall not be matched by:

- The asterisk or question-mark special characters
- A bracket expression containing a non-matching list, such as "[!a]", a range expression, such as "[%–0]", or a character class expression, such as "[[:punct:]]"

It is unspecified whether an explicit period in a bracket expression matching list, such as "[.abc]", can match a leading period in a filename.

3. Specified patterns shall be matched against existing filenames and pathnames, as appropriate. Each component that contains a pattern character shall require read permission in the directory containing that component. Any component, except the last, that does not contain a pattern character shall require search permission. For example, given the pattern:

```
/foo/bar/x*/bam
```

search permission is needed for directories `/` and `foo`, search and read permissions are needed for directory `bar`, and search permission is needed for each `x*` directory. If the pattern matches any existing filenames or pathnames, the pattern shall be replaced with those filenames and pathnames, sorted according to the collating sequence in effect in the current locale. If the pattern contains an invalid bracket expression or does not match any existing filenames or pathnames, the pattern string shall be left unchanged.

2.14 Special Built-In Utilities

The following “special built-in” utilities shall be supported in the shell command language. The output of each command, if any, shall be written to standard output, subject to the normal redirection and piping possible with all commands.

The term “built-in” implies that the shell can execute the utility directly and does not need to search for it. An implementation may choose to make any utility a built-in; however, the special built-in utilities described here differ from regular built-in utilities in two respects:

1. A syntax error in a special built-in utility may cause a shell executing that utility to abort, while a syntax error in a regular built-in utility shall not cause a shell executing that utility to abort. (See Section 2.8.1 (on page 46) for the consequences of errors on interactive and non-interactive shells.) If a special built-in utility encountering a syntax error does not abort the shell, its exit value shall be non-zero.
2. Variable assignments specified with special built-in utilities remain in effect after the built-in completes; this shall not be the case with a regular built-in or other utility.

The special built-in utilities in this section need not be provided in a manner accessible via the `exec` family of functions defined in the System Interfaces volume of IEEE Std 1003.1-2001.

Some of the special built-ins are described as conforming to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines. For those that are not, the requirement in Section 1.11 (on page 20) that “—” be recognized as a first argument to be discarded does not apply and a conforming application shall not use that argument.

2659 **NAME**

2660 break — exit from for, while, or until loop

2661 **SYNOPSIS**2662 break [*n*]2663 **DESCRIPTION**

2664 The *break* utility shall exit from the smallest enclosing **for**, **while**, or **until** loop, if any; or from the
 2665 *n*th enclosing loop if *n* is specified. The value of *n* is an unsigned decimal integer greater than or
 2666 equal to 1. The default shall be equivalent to *n*=1. If *n* is greater than the number of enclosing
 2667 loops, the outermost enclosing loop shall be exited. Execution shall continue with the command
 2668 immediately following the loop.

2669 **OPTIONS**

2670 None.

2671 **OPERANDS**

2672 See the DESCRIPTION.

2673 **STDIN**

2674 Not used.

2675 **INPUT FILES**

2676 None.

2677 **ENVIRONMENT VARIABLES**

2678 None.

2679 **ASYNCHRONOUS EVENTS**

2680 Default.

2681 **STDOUT**

2682 Not used.

2683 **STDERR**

2684 The standard error shall be used only for diagnostic messages.

2685 **OUTPUT FILES**

2686 None.

2687 **EXTENDED DESCRIPTION**

2688 None.

2689 **EXIT STATUS**

2690 0 Successful completion.

2691 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.2692 **CONSEQUENCES OF ERRORS**

2693 Default.

2694 APPLICATION USAGE

2695 None.

2696 EXAMPLES

```
2697       for i in * do
2698           if test -d "$i" then break fi done
```

2699 RATIONALE

2700 In early proposals, consideration was given to expanding the syntax of *break* and *continue* to refer
2701 to a label associated with the appropriate loop as a preferable alternative to the *n* method.
2702 However, this volume of IEEE Std 1003.1-2001 does reserve the name space of command names
2703 ending with a colon. It is anticipated that a future implementation could take advantage of this
2704 and provide something like:

```
2705       outofloop: for i in a b c d e
2706       do
2707           for j in 0 1 2 3 4 5 6 7 8 9
2708           do
2709               if test -r "${i}${j}"
2710               then break outofloop
2711               fi
2712           done
2713       done
```

2714 and that this might be standardized after implementation experience is achieved.

2715 FUTURE DIRECTIONS

2716 None.

2717 SEE ALSO

2718 Section 2.14 (on page 64)

2719 CHANGE HISTORY**2720 Issue 6**

2721 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
2722 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
2723 behavior is intended.

2724 **NAME**

2725 colon — null utility

2726 **SYNOPSIS**2727 : [*argument* ...]2728 **DESCRIPTION**

2729 This utility shall only expand command *arguments*. It is used when a command is needed, as in
2730 the **then** condition of an **if** command, but nothing is to be done by the command.

2731 **OPTIONS**

2732 None.

2733 **OPERANDS**

2734 See the DESCRIPTION. |

2735 **STDIN**

2736 Not used. |

2737 **INPUT FILES**

2738 None.

2739 **ENVIRONMENT VARIABLES**

2740 None.

2741 **ASYNCHRONOUS EVENTS**

2742 Default. |

2743 **STDOUT**

2744 Not used. |

2745 **STDERR**

2746 The standard error shall be used only for diagnostic messages. |

2747 **OUTPUT FILES**

2748 None.

2749 **EXTENDED DESCRIPTION**

2750 None.

2751 **EXIT STATUS**

2752 Zero.

2753 **CONSEQUENCES OF ERRORS**

2754 Default. |

2755 **APPLICATION USAGE**

2756 None.

2757 **EXAMPLES**

```
2758       : ${X=abc}  
2759       if       false  
2760       then     :  
2761       else     echo $X  
2762       fi  
2763       abc
```

2764 As with any of the special built-ins, the null utility can also have variable assignments and
2765 redirections associated with it, such as:

2766 `x=y : > z`

2767 which sets variable `x` to the value `y` (so that it persists after the null utility completes) and creates
2768 or truncates file `z`.

2769 **RATIONALE**

2770 None.

2771 **FUTURE DIRECTIONS**

2772 None.

2773 **SEE ALSO**

2774 Section 2.14 (on page 64)

2775 **CHANGE HISTORY**

2776 **Issue 6**

2777 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
2778 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
2779 behavior is intended.

2780 **NAME**

2781 continue — continue for, while, or until loop

2782 **SYNOPSIS**2783 continue [*n*]2784 **DESCRIPTION**

2785 The *continue* utility shall return to the top of the smallest enclosing **for**, **while**, or **until** loop, or to
 2786 the top of the *n*th enclosing loop, if *n* is specified. This involves repeating the condition list of a
 2787 **while** or **until** loop or performing the next assignment of a **for** loop, and re-executing the loop if
 2788 appropriate.

2789 The value of *n* is a decimal integer greater than or equal to 1. The default shall be equivalent to
 2790 *n*=1. If *n* is greater than the number of enclosing loops, the outermost enclosing loop shall be
 2791 used.

2792 **OPTIONS**

2793 None.

2794 **OPERANDS**

2795 See the DESCRIPTION.

2796 **STDIN**

2797 Not used.

2798 **INPUT FILES**

2799 None.

2800 **ENVIRONMENT VARIABLES**

2801 None.

2802 **ASYNCHRONOUS EVENTS**

2803 Default.

2804 **STDOUT**

2805 Not used.

2806 **STDERR**

2807 The standard error shall be used only for diagnostic messages.

2808 **OUTPUT FILES**

2809 None.

2810 **EXTENDED DESCRIPTION**

2811 None.

2812 **EXIT STATUS**

2813 0 Successful completion.

2814 >0 The *n* value was not an unsigned decimal integer greater than or equal to 1.2815 **CONSEQUENCES OF ERRORS**

2816 Default.

2817 **APPLICATION USAGE**

2818 None.

2819 **EXAMPLES**

```
2820       for i in *
2821       do
2822           if test -d "$i"
2823           then continue
2824           fi
2825           echo "\"$i\" \" is not a directory.
2826       done
```

2827 **RATIONALE**

2828 None.

2829 **FUTURE DIRECTIONS**

2830 None.

2831 **SEE ALSO**

2832 Section 2.14 (on page 64)

2833 **CHANGE HISTORY**2834 **Issue 6**

```
2835       IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
2836       sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
2837       behavior is intended.
```

2838	NAME		
2839		dot — execute commands in the current environment	
2840	SYNOPSIS		
2841		. <i>file</i>	
2842	DESCRIPTION		
2843		The shell shall execute commands from the <i>file</i> in the current environment.	
2844		If <i>file</i> does not contain a slash, the shell shall use the search path specified by <i>PATH</i> to find the	
2845		directory containing <i>file</i> . Unlike normal command search, however, the file searched for by the	
2846		<i>dot</i> utility need not be executable. If no readable file is found, a non-interactive shell shall abort;	
2847		an interactive shell shall write a diagnostic message to standard error, but this condition shall	
2848		not be considered a syntax error.	
2849	OPTIONS		
2850		None.	
2851	OPERANDS		
2852		See the DESCRIPTION.	
2853	STDIN		
2854		Not used.	
2855	INPUT FILES		
2856		See the DESCRIPTION.	
2857	ENVIRONMENT VARIABLES		
2858		See the DESCRIPTION.	
2859	ASYNCHRONOUS EVENTS		
2860		Default.	
2861	STDOUT		
2862		Not used.	
2863	STDERR		
2864		The standard error shall be used only for diagnostic messages.	
2865	OUTPUT FILES		
2866		None.	
2867	EXTENDED DESCRIPTION		
2868		None.	
2869	EXIT STATUS		
2870		Returns the value of the last command executed, or a zero exit status if no command is executed.	
2871	CONSEQUENCES OF ERRORS		
2872		Default.	

2873 **APPLICATION USAGE**

2874 None.

2875 **EXAMPLES**

2876 cat foobar

2877 **foo=hello bar=world**

2878 . foobar

2879 echo \$foo \$bar

2880 **hello world**2881 **RATIONALE**

2882 Some older implementations searched the current directory for the *file*, even if the value of *PATH*
2883 disallowed it. This behavior was omitted from this volume of IEEE Std 1003.1-2001 due to
2884 concerns about introducing the susceptibility to trojan horses that the user might be trying to
2885 avoid by leaving **dot** out of *PATH*.

2886 The KornShell version of *dot* takes optional arguments that are set to the positional parameters.

2887 This is a valid extension that allows a *dot* script to behave identically to a function.

2888 **FUTURE DIRECTIONS**

2889 None.

2890 **SEE ALSO**

2891 Section 2.14 (on page 64)

2892 **CHANGE HISTORY**2893 **Issue 6**

2894 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
2895 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
2896 behavior is intended.

2897 **NAME**

2898 eval — construct command by concatenating arguments

2899 **SYNOPSIS**2900 eval [*argument* ...]2901 **DESCRIPTION**2902 The *eval* utility shall construct a command by concatenating *arguments* together, separating each
2903 with a <space>. The constructed command shall be read and executed by the shell.2904 **OPTIONS**

2905 None.

2906 **OPERANDS**

2907 See the DESCRIPTION. |

2908 **STDIN**

2909 Not used. |

2910 **INPUT FILES**

2911 None.

2912 **ENVIRONMENT VARIABLES**

2913 None.

2914 **ASYNCHRONOUS EVENTS**

2915 Default. |

2916 **STDOUT**

2917 Not used. |

2918 **STDERR**

2919 The standard error shall be used only for diagnostic messages. |

2920 **OUTPUT FILES**

2921 None.

2922 **EXTENDED DESCRIPTION**

2923 None.

2924 **EXIT STATUS**2925 If there are no *arguments*, or only null arguments, *eval* shall return a zero exit status; otherwise, it
2926 shall return the exit status of the command defined by the string of concatenated *arguments*
2927 separated by <space>s.2928 **CONSEQUENCES OF ERRORS**

2929 Default. |

2930 **APPLICATION USAGE**

2931 None.

2932 **EXAMPLES**

2933 foo=10 x=foo

2934 y=' \$ ' \$x

2935 echo \$y

2936 \$foo

2937 eval y=' \$ ' \$x

2938 echo \$y

2939 10

2940 **RATIONALE**

2941 None.

2942 **FUTURE DIRECTIONS**

2943 None.

2944 **SEE ALSO**

2945 Section 2.14 (on page 64)

2946 **CHANGE HISTORY**2947 **Issue 6**

2948 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
2949 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
2950 behavior is intended.

2951 **NAME**

2952 exec — execute commands and open, close, or copy file descriptors

2953 **SYNOPSIS**2954 exec [*command* [*argument* ...]]2955 **DESCRIPTION**2956 The *exec* utility shall open, close, and/or copy file descriptors as specified by any redirections as
2957 part of the command.2958 If *exec* is specified without *command* or *arguments*, and any file descriptors with numbers greater
2959 than 2 are opened with associated redirection statements, it is unspecified whether those file
2960 descriptors remain open when the shell invokes another utility. Scripts concerned that child
2961 shells could misuse open file descriptors can always close them explicitly, as shown in one of the
2962 following examples.2963 If *exec* is specified with *command*, it shall replace the shell with *command* without creating a new
2964 process. If *arguments* are specified, they shall be arguments to *command*. Redirection affects the
2965 current shell execution environment.2966 **OPTIONS**

2967 None.

2968 **OPERANDS**

2969 See the DESCRIPTION. |

2970 **STDIN**

2971 Not used. |

2972 **INPUT FILES**

2973 None.

2974 **ENVIRONMENT VARIABLES**

2975 None.

2976 **ASYNCHRONOUS EVENTS**

2977 Default. |

2978 **STDOUT**

2979 Not used. |

2980 **STDERR**

2981 The standard error shall be used only for diagnostic messages. |

2982 **OUTPUT FILES**

2983 None.

2984 **EXTENDED DESCRIPTION**

2985 None.

2986 **EXIT STATUS**2987 If *command* is specified, *exec* shall not return to the shell; rather, the exit status of the process shall
2988 be the exit status of the program implementing *command*, which overlaid the shell. If *command* is
2989 not found, the exit status shall be 127. If *command* is found, but it is not an executable utility, the
2990 exit status shall be 126. If a redirection error occurs (see Section 2.8.1 (on page 46)), the shell shall
2991 exit with a value in the range 1–125. Otherwise, *exec* shall return a zero exit status.

2992 **CONSEQUENCES OF ERRORS**

2993 Default.

2994 **APPLICATION USAGE**

2995 None.

2996 **EXAMPLES**2997 Open *readfile* as file descriptor 3 for reading:2998 `exec 3< readfile`2999 Open *writefile* as file descriptor 4 for writing:3000 `exec 4> writefile`

3001 Make file descriptor 5 a copy of file descriptor 0:

3002 `exec 5<&0`

3003 Close file descriptor 3:

3004 `exec 3<&-`3005 Cat the file **maggie** by replacing the current shell with the *cat* utility:3006 `exec cat maggie`3007 **RATIONALE**

3008 Most historical implementations were not conformant in that:

3009 `foo=bar exec cmd`3010 did not pass **foo** to **cmd**.3011 **FUTURE DIRECTIONS**

3012 None.

3013 **SEE ALSO**

3014 Section 2.14 (on page 64)

3015 **CHANGE HISTORY**3016 **Issue 6**3017 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3018 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3019 behavior is intended.

3020 **NAME**

3021 exit — cause the shell to exit

3022 **SYNOPSIS**3023 exit [*n*]3024 **DESCRIPTION**

3025 The *exit* utility shall cause the shell to exit with the exit status specified by the unsigned decimal
 3026 integer *n*. If *n* is specified, but its value is not between 0 and 255 inclusively, the exit status is
 3027 undefined.

3028 A *trap* on **EXIT** shall be executed before the shell terminates, except when the *exit* utility is
 3029 invoked in that *trap* itself, in which case the shell shall exit immediately.

3030 **OPTIONS**

3031 None.

3032 **OPERANDS**

3033 See the DESCRIPTION. |

3034 **STDIN**

3035 Not used. |

3036 **INPUT FILES**

3037 None.

3038 **ENVIRONMENT VARIABLES**

3039 None.

3040 **ASYNCHRONOUS EVENTS**

3041 Default. |

3042 **STDOUT**

3043 Not used. |

3044 **STDERR**

3045 The standard error shall be used only for diagnostic messages. |

3046 **OUTPUT FILES**

3047 None.

3048 **EXTENDED DESCRIPTION**

3049 None.

3050 **EXIT STATUS**

3051 The exit status shall be *n*, if specified. Otherwise, the value shall be the exit value of the last
 3052 command executed, or zero if no command was executed. When *exit* is executed in a *trap* action,
 3053 the last command is considered to be the command that executed immediately preceding the
 3054 *trap* action.

3055 **CONSEQUENCES OF ERRORS**

3056 Default. |

3057 APPLICATION USAGE

3058 None.

3059 EXAMPLES

3060 Exit with a *true* value:

3061 exit 0

3062 Exit with a *false* value:

3063 exit 1

3064 RATIONALE

3065 As explained in other sections, certain exit status values have been reserved for special uses and
3066 should be used by applications only for those purposes:

3067 126 A file to be executed was found, but it was not an executable utility.

3068 127 A utility to be executed was not found.

3069 >128 A command was interrupted by a signal.

3070 FUTURE DIRECTIONS

3071 None.

3072 SEE ALSO

3073 Section 2.14 (on page 64)

3074 CHANGE HISTORY**3075 Issue 6**

3076 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3077 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3078 behavior is intended.

3079 **NAME**

3080 export — set the export attribute for variables

3081 **SYNOPSIS**

3082 export name [=word] . . .

3083 export -p

3084 **DESCRIPTION**

3085 The shell shall give the *export* attribute to the variables corresponding to the specified *names*,
 3086 which shall cause them to be in the environment of subsequently executed commands. If the
 3087 name of a variable is followed by =*word*, then the value of that variable shall be set to *word*.

3088 The *export* special built-in shall support the Base Definitions volume of IEEE Std 1003.1-2001,
 3089 Section 12.2, Utility Syntax Guidelines.

3090 When **-p** is specified, *export* shall write to the standard output the names and values of all
 3091 exported variables, in the following format:

3092 "export %s=%s\n", <name>, <value>

3093 if *name* is set, and:

3094 "export %s\n", <name>

3095 if *name* is unset.

3096 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 3097 reinput to the shell as commands that achieve the same exporting results, except:

- 3098 1. Read-only variables with values cannot be reset.
- 3099 2. Variables that were unset at the time they were output need not be reset to the unset state
 3100 if a value is assigned to the variable between the time the state was saved and the time at
 3101 which the saved output is reinput to the shell.

3102 When no arguments are given, the results are unspecified.

3103 **OPTIONS**

3104 See the DESCRIPTION.

3105 **OPERANDS**

3106 See the DESCRIPTION.

3107 **STDIN**

3108 Not used.

3109 **INPUT FILES**

3110 None.

3111 **ENVIRONMENT VARIABLES**

3112 None.

3113 **ASYNCHRONOUS EVENTS**

3114 Default.

3115 **STDOUT**

3116 See the DESCRIPTION.

3117 **STDERR**

3118 The standard error shall be used only for diagnostic messages.

3119 **OUTPUT FILES**

3120 None.

3121 **EXTENDED DESCRIPTION**

3122 None.

3123 **EXIT STATUS**

3124 Zero.

3125 **CONSEQUENCES OF ERRORS**

3126 Default.

3127 **APPLICATION USAGE**

3128 None.

3129 **EXAMPLES**

3130 Export *PWD* and *HOME* variables:

3131 `export PWD HOME`

3132 Set and export the *PATH* variable:

3133 `export PATH=/local/bin:$PATH`

3134 Save and restore all exported variables:

3135 `export -p > temp-file`

3136 `unset a lot of variables`

3137 `... processing`

3138 `. temp-file`

3139 **RATIONALE**

3140 Some historical shells use the no-argument case as the functional equivalent of what is required
 3141 here with **-p**. This feature was left unspecified because it is not historical practice in all shells,
 3142 and some scripts may rely on the now-unspecified results on their implementations. Attempts to
 3143 specify the **-p** output as the default case were unsuccessful in achieving consensus. The **-p**
 3144 option was added to allow portable access to the values that can be saved and then later restored
 3145 using; for example, a *dot* script.

3146 **FUTURE DIRECTIONS**

3147 None.

3148 **SEE ALSO**

3149 Section 2.14 (on page 64)

3150 **CHANGE HISTORY**3151 **Issue 6**

3152 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

3153 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 3154 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
 3155 behavior is intended.

3156 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/6 is applied, adding the following text to
 3157 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by
 3158 =word, then the value of that variable shall be set to word.”. The reason for this change is that the
 3159 SYNOPSIS for *export* includes:

3160 `export name [=word] . . .`

3161 but the meaning of the optional “=word” is never explained in the text.

3162 **NAME**

3163 readonly — set the readonly attribute for variables

3164 **SYNOPSIS**

3165 readonly name [=word] . . .

3166 readonly -p

3167 **DESCRIPTION**

3168 The variables whose *names* are specified shall be given the *readonly* attribute. The values of
 3169 variables with the *readonly* attribute cannot be changed by subsequent assignment, nor can those
 3170 variables be unset by the *unset* utility. If the name of a variable is followed by =*word*, then the
 3171 value of that variable shall be set to *word*.

3172 The *readonly* special built-in shall support the Base Definitions volume of IEEE Std 1003.1-2001,
 3173 Section 12.2, Utility Syntax Guidelines.

3174 When **-p** is specified, *readonly* writes to the standard output the names and values of all read-
 3175 only variables, in the following format:

3176 "readonly %s=%s\n", <name>, <value>

3177 if *name* is set, and

3178 "readonly %s\n", <name>

3179 if *name* is unset.

3180 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 3181 reinput to the shell as commands that achieve the same value and *readonly* attribute-setting
 3182 results in a shell execution environment in which:

- 3183 1. Variables with values at the time they were output do not have the *readonly* attribute set.
- 3184 2. Variables that were unset at the time they were output do not have a value at the time at
 3185 which the saved output is reinput to the shell.

3186 When no arguments are given, the results are unspecified.

3187 **OPTIONS**

3188 See the DESCRIPTION.

3189 **OPERANDS**

3190 See the DESCRIPTION.

3191 **STDIN**

3192 Not used.

3193 **INPUT FILES**

3194 None.

3195 **ENVIRONMENT VARIABLES**

3196 None.

3197 **ASYNCHRONOUS EVENTS**

3198 Default.

3199 **STDOUT**

3200 See the DESCRIPTION.

3201 STDERR

3202 The standard error shall be used only for diagnostic messages.

3203 OUTPUT FILES

3204 None.

3205 EXTENDED DESCRIPTION

3206 None.

3207 EXIT STATUS

3208 Zero.

3209 CONSEQUENCES OF ERRORS

3210 Default.

3211 APPLICATION USAGE

3212 None.

3213 EXAMPLES

3214 `readonly HOME PWD`

3215 RATIONALE

3216 Some historical shells preserve the *readonly* attribute across separate invocations. This volume of
3217 IEEE Std 1003.1-2001 allows this behavior, but does not require it.

3218 The `-p` option allows portable access to the values that can be saved and then later restored
3219 using, for example, a *dot* script. Also see the RATIONALE for *export* (on page 79) for a
3220 description of the no-argument and `-p` output cases and a related example.

3221 Read-only functions were considered, but they were omitted as not being historical practice or
3222 particularly useful. Furthermore, functions must not be read-only across invocations to preclude
3223 “spoofing” (spoofing is the term for the practice of creating a program that acts like a well-
3224 known utility with the intent of subverting the real intent of the user) of administrative or
3225 security-relevant (or security-conscious) shell scripts.

3226 FUTURE DIRECTIONS

3227 None.

3228 SEE ALSO

3229 Section 2.14 (on page 64)

3230 CHANGE HISTORY**3231 Issue 6**

3232 IEEE PASC Interpretation 1003.2 #203 is applied, clarifying the format when a variable is unset.

3233 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3234 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3235 behavior is intended.

3236 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/7 is applied, adding the following text to
3237 the end of the first paragraph of the DESCRIPTION: “If the name of a variable is followed by
3238 `=word`, then the value of that variable shall be set to *word*.”. The reason for this change is that the
3239 SYNOPSIS for *readonly* includes:

3240 `readonly name [=word] . . .`

3241 but the meaning of the optional “`=word`” is never explained in the text.

3242 **NAME**

3243 return — return from a function

3244 **SYNOPSIS**3245 return [*n*]3246 **DESCRIPTION**

3247 The *return* utility shall cause the shell to stop executing the current function or *dot* script. If the
 3248 shell is not currently executing a function or *dot* script, the results are unspecified.

3249 **OPTIONS**

3250 None.

3251 **OPERANDS**

3252 See the DESCRIPTION.

3253 **STDIN**

3254 Not used.

3255 **INPUT FILES**

3256 None.

3257 **ENVIRONMENT VARIABLES**

3258 None.

3259 **ASYNCHRONOUS EVENTS**

3260 Default.

3261 **STDOUT**

3262 Not used.

3263 **STDERR**

3264 The standard error shall be used only for diagnostic messages.

3265 **OUTPUT FILES**

3266 None.

3267 **EXTENDED DESCRIPTION**

3268 None.

3269 **EXIT STATUS**

3270 The value of the special parameter '*?*' shall be set to *n*, an unsigned decimal integer, or to the
 3271 exit status of the last command executed if *n* is not specified. If the value of *n* is greater than 255,
 3272 the results are undefined. When *return* is executed in a *trap* action, the last command is
 3273 considered to be the command that executed immediately preceding the *trap* action.

3274 **CONSEQUENCES OF ERRORS**

3275 Default.

3276 **APPLICATION USAGE**

3277 None.

3278 **EXAMPLES**

3279 None.

3280 **RATIONALE**

3281 The behavior of *return* when not in a function or *dot* script differs between the System V shell
 3282 and the KornShell. In the System V shell this is an error, whereas in the KornShell, the effect is
 3283 the same as *exit*.

3284 The results of returning a number greater than 255 are undefined because of differing practices
3285 in the various historical implementations. Some shells AND out all but the low-order 8 bits;
3286 others allow larger values, but not of unlimited size.

3287 See the discussion of appropriate exit status values under *exit* (on page 77).

3288 **FUTURE DIRECTIONS**

3289 None.

3290 **SEE ALSO**

3291 Section 2.14 (on page 64)

3292 **CHANGE HISTORY**

3293 **Issue 6**

3294 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3295 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3296 behavior is intended.

3297 **NAME**

3298 set — set or unset options and positional parameters

3299 **SYNOPSIS**3300 xSI set [-abCefmnuvx] [-h] [-o *option*] [*argument...*]3301 xSI set [+abCefmnuvx] [+h] [+o *option*] [*argument...*]3302 set -- [*argument...*]

3303 set -o

3304 set +o

3305 **DESCRIPTION**

3306 If no *options* or *arguments* are specified, *set* shall write the names and values of all shell variables
 3307 in the collation sequence of the current locale. Each *name* shall start on a separate line, using the
 3308 format:

3309 "%s=%s\n", <name>, <value>

3310 The *value* string shall be written with appropriate quoting; see the description of shell quoting in
 3311 Section 2.2 (on page 30). The output shall be suitable for reinput to the shell, setting or resetting,
 3312 as far as possible, the variables that are currently set; read-only variables cannot be reset.

3313 When options are specified, they shall set or unset attributes of the shell, as described below.
 3314 When *arguments* are specified, they cause positional parameters to be set or unset, as described
 3315 below. Setting or unsetting attributes and positional parameters are not necessarily related
 3316 actions, but they can be combined in a single invocation of *set*.

3317 The *set* special built-in shall support the Base Definitions volume of IEEE Std 1003.1-2001,
 3318 Section 12.2, Utility Syntax Guidelines except that options can be specified with either a leading
 3319 hyphen (meaning enable the option) or plus sign (meaning disable it) unless otherwise specified.

3320 Implementations shall support the options in the following list in both their hyphen and plus-
 3321 sign forms. These options can also be specified as options to *sh*.

3322 **-a** When this option is on, the *export* attribute shall be set for each variable to which an
 3323 assignment is performed; see the Base Definitions volume of IEEE Std 1003.1-2001, Section
 3324 4.21, Variable Assignment. If the assignment precedes a utility name in a command, the
 3325 *export* attribute shall not persist in the current execution environment after the utility
 3326 completes, with the exception that preceding one of the special built-in utilities causes the
 3327 *export* attribute to persist after the built-in has completed. If the assignment does not
 3328 precede a utility name in the command, or if the assignment is a result of the operation of
 3329 the *getopts* or *read* utilities, the *export* attribute shall persist until the variable is unset.

3330 **-b** This option shall be supported if the implementation supports the User Portability Utilities
 3331 option. It shall cause the shell to notify the user asynchronously of background job
 3332 completions. The following message is written to standard error:

3333 "[%d] %c %s%s\n", <job-number>, <current>, <status>, <job-name>

3334 where the fields shall be as follows:

3335 <current> The character '+' identifies the job that would be used as a default for
 3336 the *fg* or *bg* utilities; this job can also be specified using the *job_id* "%+" or
 3337 "%%". The character '-' identifies the job that would become the default
 3338 if the current default job were to exit; this job can also be specified using
 3339 the *job_id* "%-". For other jobs, this field is a <space>. At most one job
 3340 can be identified with '+' and at most one job can be identified with '-'.

3341		If there is any suspended job, then the current job shall be a suspended
3342		job. If there are at least two suspended jobs, then the previous job also
3343		shall be a suspended job.
3344	<job-number>	A number that can be used to identify the process group to the <i>wait</i> , <i>fg</i> , <i>bg</i> ,
3345		and <i>kill</i> utilities. Using these utilities, the job can be identified by
3346		prefixing the job number with ' <i>%</i> '.
3347	<status>	Unspecified.
3348	<job-name>	Unspecified.
3349		When the shell notifies the user a job has been completed, it may remove the job's process
3350		ID from the list of those known in the current shell execution environment; see Section
3351		2.9.3.1 (on page 50). Asynchronous notification shall not be enabled by default.
3352	-C	(Uppercase C.) Prevent existing files from being overwritten by the shell's '>' redirection
3353		operator (see Section 2.7.2 (on page 44)); the "> " redirection operator shall override this
3354		<i>noclobber</i> option for an individual file.
3355	-e	When this option is on, if a simple command fails for any of the reasons listed in Section
3356		2.8.1 (on page 46) or returns an exit status value >0, and is not part of the compound list
3357		following a while , until , or if keyword, and is not a part of an AND or OR list, and is not a
3358		pipeline preceded by the ! reserved word, then the shell shall immediately exit.
3359	-f	The shell shall disable pathname expansion.
3360	XSI -h	Locate and remember utilities invoked by functions as those functions are defined (the
3361		utilities are normally located when the function is executed).
3362	-m	This option shall be supported if the implementation supports the User Portability Utilities
3363		option. All jobs shall be run in their own process groups. Immediately before the shell issues
3364		a prompt after completion of the background job, a message reporting the exit status of the
3365		background job shall be written to standard error. If a foreground job stops, the shell shall
3366		write a message to standard error to that effect, formatted as described by the <i>jobs</i> utility. In
3367		addition, if a job changes status other than exiting (for example, if it stops for input or
3368		output or is stopped by a SIGSTOP signal), the shell shall write a similar message
3369		immediately prior to writing the next prompt. This option is enabled by default for
3370		interactive shells.
3371	-n	The shell shall read commands but does not execute them; this can be used to check for
3372		shell script syntax errors. An interactive shell may ignore this option.
3373	-o	Write the current settings of the options to standard output in an unspecified format.
3374	+o	Write the current option settings to standard output in a format that is suitable for reinput
3375		to the shell as commands that achieve the same options settings.
3376	-o option	
3377		This option is supported if the system supports the User Portability Utilities option. It shall
3378		set various options, many of which shall be equivalent to the single option letters. The
3379		following values of <i>option</i> shall be supported:
3380	<i>allexport</i>	Equivalent to -a .
3381	<i>errexit</i>	Equivalent to -e .
3382	<i>ignoreeof</i>	Prevent an interactive shell from exiting on end-of-file. This setting prevents
3383		accidental logouts when <control>-D is entered. A user shall explicitly <i>exit</i> to
3384		leave the interactive shell.

3385	<i>monitor</i>	Equivalent to -m . This option is supported if the system supports the User Portability Utilities option.
3386		
3387	<i>noclobber</i>	Equivalent to -C (uppercase C).
3388	<i>noglob</i>	Equivalent to -f .
3389	<i>noexec</i>	Equivalent to -n .
3390	<i>nolog</i>	Prevent the entry of function definitions into the command history; see Command History List (on page 854).
3391		
3392	<i>notify</i>	Equivalent to -b .
3393	<i>nounset</i>	Equivalent to -u .
3394	<i>verbose</i>	Equivalent to -v .
3395	<i>vi</i>	Allow shell command line editing using the built-in <i>vi</i> editor. Enabling <i>vi</i> mode shall disable any other command line editing mode provided as an implementation extension.
3396		
3397		
3398		It need not be possible to set <i>vi</i> mode on for certain block-mode terminals.
3399	<i>xtrace</i>	Equivalent to -x .
3400	-u	The shell shall write a message to standard error when it tries to expand a variable that is not set and immediately exit. An interactive shell shall not exit.
3401		
3402	-v	The shell shall write its input to standard error as it is read.
3403	-x	The shell shall write to standard error a trace for each command after it expands the command and before it executes it. It is unspecified whether the command that turns tracing off is traced.
3404		
3405		
3406		The default for all these options shall be off (unset) unless stated otherwise in the description of the option or unless the shell was invoked with them on; see <i>sh</i> .
3407		
3408		The remaining arguments shall be assigned in order to the positional parameters. The special parameter ' # ' shall be set to reflect the number of positional parameters. All positional parameters shall be unset before any new values are assigned.
3409		
3410		
3411		The special argument " -- " immediately following the <i>set</i> command name can be used to delimit the arguments if the first argument begins with ' + ' or ' - ', or to prevent inadvertent listing of all shell variables when there are no arguments. The command <i>set --</i> without <i>argument</i> shall unset all positional parameters and set the special parameter ' # ' to zero.
3412		
3413		
3414		
3415	OPTIONS	
3416		See the DESCRIPTION.
3417	OPERANDS	
3418		See the DESCRIPTION.
3419	STDIN	
3420		Not used.
3421	INPUT FILES	
3422		None.

3423 **ENVIRONMENT VARIABLES**

3424 None.

3425 **ASYNCHRONOUS EVENTS**

3426 Default.

3427 **STDOUT**

3428 See the DESCRIPTION.

3429 **STDERR**

3430 The standard error shall be used only for diagnostic messages.

3431 **OUTPUT FILES**

3432 None.

3433 **EXTENDED DESCRIPTION**

3434 None.

3435 **EXIT STATUS**

3436 Zero.

3437 **CONSEQUENCES OF ERRORS**

3438 Default.

3439 **APPLICATION USAGE**

3440 None.

3441 **EXAMPLES**

3442 Write out all variables and their values:

3443 `set`

3444 Set \$1, \$2, and \$3 and set "\$#" to 3:

3445 `set c a b`3446 Turn on the `-x` and `-v` options:3447 `set -xv`

3448 Unset all positional parameters:

3449 `set --`3450 Set \$1 to the value of `x`, even if it begins with `'-'` or `'+'`:3451 `set -- "$x"`3452 Set the positional parameters to the expansion of `x`, even if `x` expands with a leading `'-'` or `'+'`:3453 `set -- $x`3454 **RATIONALE**

3455 The `set --` form is listed specifically in the SYNOPSIS even though this usage is implied by the
 3456 Utility Syntax Guidelines. The explanation of this feature removes any ambiguity about whether
 3457 the `set --` form might be misinterpreted as being equivalent to `set` without any options or
 3458 arguments. The functionality of this form has been adopted from the KornShell. In System V, `set`
 3459 `--` only unsets parameters if there is at least one argument; the only way to unset all parameters
 3460 is to use `shift`. Using the KornShell version should not affect System V scripts because there
 3461 should be no reason to issue it without arguments deliberately; if it were issued as, for example:

3462 `set -- "$@"`

and there were in fact no arguments resulting from "\$@", unsetting the parameters would have no result.

The `set +` form in early proposals was omitted as being an unnecessary duplication of `set` alone and not widespread historical practice.

The `noclobber` option was changed to allow `set -C` as well as the `set -o noclobber` option. The single-letter version was added so that the historical "\$-" paradigm would not be broken; see Section 2.5.2 (on page 34).

The `-h` flag is related to command name hashing and is only required on XSI-conformant systems.

The following `set` flags were omitted intentionally with the following rationale:

-k The `-k` flag was originally added by the author of the Bourne shell to make it easier for users of pre-release versions of the shell. In early versions of the Bourne shell the construct `set name=value` had to be used to assign values to shell variables. The problem with `-k` is that the behavior affects parsing, virtually precluding writing any compilers. To explain the behavior of `-k`, it is necessary to describe the parsing algorithm, which is implementation-defined. For example:

```
set -k; echo name=value
```

and:

```
set -k
echo name=value
```

behave differently. The interaction with functions is even more complex. What is more, the `-k` flag is never needed, since the command line could have been reordered.

-t The `-t` flag is hard to specify and almost never used. The only known use could be done with here-documents. Moreover, the behavior with `ksh` and `sh` differs. The reference page says that it exits after reading and executing one command. What is one command? If the input is `date;date`, `sh` executes both `date` commands while `ksh` does only the first.

Consideration was given to rewriting `set` to simplify its confusing syntax. A specific suggestion was that the `unset` utility should be used to unset options instead of using the non-`getopt()`-able `+option` syntax. However, the conclusion was reached that the historical practice of using `+option` was satisfactory and that there was no compelling reason to modify such widespread historical practice.

The `-o` option was adopted from the KornShell to address user needs. In addition to its generally friendly interface, `-o` is needed to provide the `vi` command line editing mode, for which historical practice yields no single-letter option name. (Although it might have been possible to invent such a letter, it was recognized that other editing modes would be developed and `-o` provides ample name space for describing such extensions.)

Historical implementations are inconsistent in the format used for `-o` option status reporting. The `+o` format without an option-argument was added to allow portable access to the options that can be saved and then later restored using, for instance, a dot script.

Historically, `sh` did trace the command `set +x`, but `ksh` did not.

The `ignoreeof` setting prevents accidental logouts when the end-of-file character (typically `<control>-D`) is entered. A user shall explicitly `exit` to leave the interactive shell.

The `set -m` option was added to apply only to the UPE because it applies primarily to interactive use, not shell script applications.

3507 The ability to do asynchronous notification became available in the 1988 version of the
 3508 KornShell. To have it occur, the user had to issue the command:

3509 `trap "jobs -n" CLD`

3510 The C shell provides two different levels of an asynchronous notification capability. The
 3511 environment variable *notify* is analogous to what is done in *set -b* or *set -o notify*. When set, it
 3512 notifies the user immediately of background job completions. When unset, this capability is
 3513 turned off.

3514 The other notification ability comes through the built-in utility *notify*. The syntax is:

3515 `notify [%job ... ]`

3516 By issuing *notify* with no operands, it causes the C shell to notify the user asynchronously when
 3517 the state of the current job changes. If given operands, *notify* asynchronously informs the user of
 3518 changes in the states of the specified jobs.

3519 To add asynchronous notification to the POSIX shell, neither the KornShell extensions to *trap*,
 3520 nor the C shell *notify* environment variable seemed appropriate (*notify* is not a proper POSIX
 3521 environment variable name).

3522 The *set -b* option was selected as a compromise.

3523 The *notify* built-in was considered to have more functionality than was required for simple
 3524 asynchronous notification.

3525 **FUTURE DIRECTIONS**

3526 None.

3527 **SEE ALSO**

3528 Section 2.14 (on page 64)

3529 **CHANGE HISTORY**

3530 **Issue 6**

3531 The obsolescent *set* command name followed by *'-'* has been removed.

3532 The following new requirements on POSIX implementations derive from alignment with the
 3533 Single UNIX Specification:

- 3534 • The *nolog* option is added to *set -o*.

3535 IEEE PASC Interpretation 1003.2 #167 is applied, clarifying that the options default also takes
 3536 into account the description of the option.

3537 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
 3538 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
 3539 behavior is intended.

3540 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/8 is applied, changing the square brackets
 3541 in the example in RATIONALE to be in bold, which is the typeface used for optional items.

3542 NAME

3543 shift — shift positional parameters

3544 SYNOPSIS

3545 shift [n]

3546 DESCRIPTION

3547 The positional parameters shall be shifted. Positional parameter 1 shall be assigned the value of
 3548 parameter (1+n), parameter 2 shall be assigned the value of parameter (2+n), and so on. The
 3549 parameters represented by the numbers "\$#" down to "\$#-n+1" shall be unset, and the
 3550 parameter '#' is updated to reflect the new number of positional parameters.

3551 The value n shall be an unsigned decimal integer less than or equal to the value of the special
 3552 parameter '#'. If n is not given, it shall be assumed to be 1. If n is 0, the positional and special
 3553 parameters are not changed.

3554 OPTIONS

3555 None.

3556 OPERANDS

3594 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3595 behavior is intended.

3596 **NAME**

3597 times — write process times

3598 **SYNOPSIS**

3599 times

3600 **DESCRIPTION**

3601 The *times* utility shall write the accumulated user and system times for the shell and for all of its
 3602 child processes, in the following POSIX locale format:

```
3603       "%dm%fs %dm%fs\n%dm%fs %dm%fs\n", <shell user minutes>,
3604       <shell user seconds>, <shell system minutes>,
3605       <shell system seconds>, <children user minutes>,
3606       <children user seconds>, <children system minutes>,
3607       <children system seconds>
```

3608 The four pairs of times shall correspond to the members of the **<sys/times.h> tms** structure
 3609 (defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) as
 3610 returned by *times()*: *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime*, respectively.

3611 **OPTIONS**

3612 None.

3613 **OPERANDS**

3614 None.

3615 **STDIN**

3616 Not used.

3617 **INPUT FILES**

3618 None.

3619 **ENVIRONMENT VARIABLES**

3620 None.

3621 **ASYNCHRONOUS EVENTS**

3622 Default.

3623 **STDOUT**

3624 See the DESCRIPTION.

3625 **STDERR**

3626 The standard error shall be used only for diagnostic messages.

3627 **OUTPUT FILES**

3628 None.

3629 **EXTENDED DESCRIPTION**

3630 None.

3631 **EXIT STATUS**

3632 Zero.

3640 8m44.18s 1m43.23s

3641 **RATIONALE**3642 The *times* special built-in from the Single UNIX Specification is now required for all conforming
3643 shells.3644 **FUTURE DIRECTIONS**

3645 None.

3646 **SEE ALSO**

3647 Section 2.14 (on page 64)

3648 **CHANGE HISTORY**3649 **Issue 6**3650 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/9 is applied, changing text in the
3651 DESCRIPTION from: “Write the accumulated user and system times for the shell and for all of
3652 its child processes ...” to: “The *times* utility shall write the accumulated user and system times
3653 for the shell and for all of its child processes ...”.

3654 **NAME**

3655 trap — trap signals

3656 **SYNOPSIS**3657 trap [*action condition ...*]3658 **DESCRIPTION**

3659 If *action* is '-', the shell shall reset each *condition* to the default value. If *action* is null (""), the
 3660 shell shall ignore each specified *condition* if it arises. Otherwise, the argument *action* shall be read
 3661 and executed by the shell when one of the corresponding conditions arises. The action of *trap*
 3662 shall override a previous action (either default action or one explicitly set). The value of "\$?"
 3663 after the *trap* action completes shall be the value it had before *trap* was invoked.

3664 The condition can be EXIT, 0 (equivalent to EXIT), or a signal specified using a symbolic name,
 3665 without the SIG prefix, as listed in the tables of signal names in the <signal.h> header defined in
 3666 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers; for example, HUP,
 3667 INT, QUIT, TERM. Implementations may permit names with the SIG prefix or ignore case in
 3668 signal names as an extension. Setting a trap for SIGKILL or SIGSTOP produces undefined
 3669 results.

3670 The environment in which the shell executes a *trap* on EXIT shall be identical to the environment
 3671 immediately after the last command executed before the *trap* on EXIT was taken.

3672 Each time *trap* is invoked, the *action* argument shall be processed in a manner equivalent to:

3673 eval *action*

3674 Signals that were ignored on entry to a non-interactive shell cannot be trapped or reset, although
 3675 no error need be reported when attempting to do so. An interactive shell may reset or catch
 3676 signals ignored on entry. Traps shall remain in place for a given shell until explicitly changed
 3677 with another *trap* command.

3678 When a subshell is entered, traps that are not being ignored are set to the default actions. This
 3679 does not imply that the *trap* command cannot be used within the subshell to set new traps.

3680 The *trap* command with no arguments shall write to standard output a list of commands
 3681 associated with each condition. The format shall be:

3682 "trap -- %s %s ...\n", <action>, <condition> ...

3683 The shell shall format the output, including the proper use of quoting, so that it is suitable for
 3684 reinput to the shell as commands that achieve the same trapping results. For example:

```
3685 save_traps=$(trap)
3686 ...
3687 eval "$save_traps"
```

3688 XSI the following signal names:

3690 1 SIGHUP

3691 2 SIGINT

3692 3 SIGQUIT

3693 6 SIGABRT

3694 9 SIGKILL

3695 14 SIGALRM

3696	15	SIGTERM	
3697			
3698		The <i>trap</i> special built-in shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,	
3699		Section 12.2, Utility Syntax Guidelines.	
3700		OPTIONS	
3701		None.	
3702		OPERANDS	
3703		See the DESCRIPTION.	
3704		STDIN	
3705		Not used.	
3706		INPUT FILES	
3707		None.	
3708		ENVIRONMENT VARIABLES	
3709		None.	
3710		ASYNCHRONOUS EVENTS	
3711		Default.	
3712		STDOUT	
3713		See the DESCRIPTION.	
3714		STDERR	
3715		The standard error shall be used only for diagnostic messages.	
3716		OUTPUT FILES	
3717		None.	
3718		EXTENDED DESCRIPTION	
3719		None.	
3720		EXIT STATUS	
3721	XSI	If the trap name or number is invalid, a non-zero exit status shall be returned; otherwise, zero	
3722	XSI	shall be returned. For both interactive and non-interactive shells, invalid signal names or	
3723		numbers shall not be considered a syntax error and do not cause the shell to abort.	
3724		CONSEQUENCES OF ERRORS	
3725		Default.	
3726		APPLICATION USAGE	
3727		None.	
3728		EXAMPLES	
3729		Write out a list of all traps and actions:	
3730		trap	
3731		Set a trap so the <i>logout</i> utility in the directory referred to by the <i>HOME</i> environment variable	
3732		executes when the shell terminates:	
3733		trap '\$HOME/logout' EXIT	
3734		or:	
3735		trap '\$HOME/logout' 0	
3736		Unset traps on INT, QUIT, TERM, and EXIT:	

3737 trap - INT QUIT TERM EXIT

3738 **RATIONALE**

3739 Implementations may permit lowercase signal names as an extension. Implementations may
3740 also accept the names with the SIG prefix; no known historical shell does so. The *trap* and *kill*
3741 utilities in this volume of IEEE Std 1003.1-2001 are now consistent in their omission of the SIG
3742 prefix for signal names. Some *kill* implementations do not allow the prefix, and *kill -l* lists the
3743 signals without prefixes.

3744 Trapping SIGKILL or SIGSTOP is syntactically accepted by some historical implementations, but
3745 it has no effect. Portable POSIX applications cannot attempt to trap these signals.

3746 The output format is not historical practice. Since the output of historical *trap* commands is not
3747 portable (because numeric signal values are not portable) and had to change to become so, an
3748 opportunity was taken to format the output in a way that a shell script could use to save and
3749 then later reuse a trap if it wanted.

3750 The KornShell uses an **ERR** trap that is triggered whenever *set -e* would cause an exit. This is
3751 allowable as an extension, but was not mandated, as other shells have not used it.

3752 The text about the environment for the EXIT trap invalidates the behavior of some historical
3753 versions of interactive shells which, for example, close the standard input before executing a
3754 trap on 0. For example, in some historical interactive shell sessions the following trap on 0 would
3755 always print "--":

3756 trap 'read foo; echo "--\$foo--"' 0

3757 **FUTURE DIRECTIONS**

3758 None.

3759 **SEE ALSO**

3760 Section 2.14 (on page 64)

3761 **CHANGE HISTORY**

3762 **Issue 6**

3763 XSI-conforming implementations provide the mapping of signal names to numbers given above
3764 (previously this had been marked obsolescent). Other implementations need not provide this
3765 optional mapping.

3766 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3767 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3768 behavior is intended.

3769 **NAME**

3770 unset — unset values and attributes of variables and functions

3771 **SYNOPSIS**3772 unset [-fv] *name* ...3773 **DESCRIPTION**3774 Each variable or function specified by *name* shall be unset.3775 If **-v** is specified, *name* refers to a variable name and the shell shall unset it and remove it from
3776 the environment. Read-only variables cannot be unset.3777 If **-f** is specified, *name* refers to a function and the shell shall unset the function definition.3778 If neither **-f** nor **-v** is specified, *name* refers to a variable; if a variable by that name does not
3779 exist, it is unspecified whether a function by that name, if any, shall be unset.3780 Unsetting a variable or function that was not previously set shall not be considered an error and
3781 does not cause the shell to abort.3782 The *unset* special built-in shall support the Base Definitions volume of IEEE Std 1003.1-2001,
3783 Section 12.2, Utility Syntax Guidelines.

3784 Note that:

3785 VARIABLE=

3786 is not equivalent to an *unset* of **VARIABLE**; in the example, **VARIABLE** is set to ". Also, the
3787 variables that can be *unset* should not be misinterpreted to include the special parameters (see
3788 Section 2.5.2 (on page 34)).3789 **OPTIONS**

3790 See the DESCRIPTION. |

3791 **OPERANDS**

3792 See the DESCRIPTION. |

3793 **STDIN**

3794 Not used. |

3795 **INPUT FILES**

3796 None.

3797 **ENVIRONMENT VARIABLES**

3798 None.

3799 **ASYNCHRONOUS EVENTS**

3800 Default. |

3801 **STDOUT**

3802 Not used. |

3803 **STDERR**

3804 The standard error shall be used only for diagnostic messages. |

3805 **OUTPUT FILES**

3806 None.

3807 **EXTENDED DESCRIPTION**

3808 None.

3809 **EXIT STATUS**

- 3810 0 All *name* operands were successfully unset.
3811 >0 At least one *name* could not be unset.

3812 **CONSEQUENCES OF ERRORS**

- 3813 Default.

3814 **APPLICATION USAGE**

- 3815 None.

3816 **EXAMPLES**

- 3817 Unset *VISUAL* variable:
3818 unset -v *VISUAL*
3819 Unset the functions **foo** and **bar**:
3820 unset -f foo bar

3821 **RATIONALE**

- 3822 Consideration was given to omitting the **-f** option in favor of an *unfunction* utility, but the
3823 standard developers decided to retain historical practice.
3824 The **-v** option was introduced because System V historically used one name space for both
3825 variables and functions. When *unset* is used without options, System V historically unset either a
3826 function or a variable, and there was no confusion about which one was intended. A portable
3827 POSIX application can use *unset* without an option to unset a variable, but not a function; the **-f**
3828 option must be used.

3829 **FUTURE DIRECTIONS**

- 3830 None.

3831 **SEE ALSO**

- 3832 Section 2.14 (on page 64)

3833 **CHANGE HISTORY**3834 **Issue 6**

- 3835 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/5 is applied so that the reference page
3836 sections use terms as described in the Utility Description Defaults (Section 1.11). No change in
3837 behavior is intended.

Batch Environment Services

This chapter describes the services and utilities that shall be implemented on all systems that claim conformance to the Batch Environment Services and Utilities option. This functionality is dependent on support of this option (and the rest of this section is not further shaded for this option).

3.1 General Concepts

3.1.1 Batch Client-Server Interaction

Batch jobs are created and managed by batch servers. A batch client interacts with a batch server to access batch services on behalf of the user. In order to use batch services, a user must have access to a batch client.

A batch server is a computational entity, such as a daemon process, that provides batch services. Batch servers route, queue, modify, and execute batch jobs on behalf of batch clients.

The batch utilities described in this volume of IEEE Std 1003.1-2001 (and listed in Table 3-1) are clients of batch services; they allow users to perform actions on the job such as creating, modifying, and deleting batch jobs from a shell command line. Although these batch utilities may be said to accomplish certain services, they actually obtain services on behalf of a user by means of requests to batch servers.

Table 3-1 Batch Utilities

<i>qalter</i>	<i>qmove</i>	<i>qrls</i>	<i>qstat</i>
<i>qdel</i>	<i>qmsg</i>	<i>qselect</i>	<i>qsub</i>
<i>qhold</i>	<i>qrerun</i>	<i>qsig</i>	

Client-server interaction takes place by means of the batch requests defined in this chapter. Because direct access to batch jobs and queues is limited to batch servers, clients and servers of different implementations can interoperate, since dependencies on private structures for batch jobs and queues are limited to batch servers. Also, batch servers may be clients of other batch servers.

3.1.2 Batch Queues

Two types of batch queue are described: routing queues and execution queues. When a batch job is placed in a routing queue, it is a candidate for routing. A batch job is removed from routing queues under the following conditions:

- The batch job has been routed to another queue.
- The batch job has been deleted from the batch queue.
- The batch job has been aborted.

When a batch job is placed in an execution queue, it is a candidate for execution.

A batch job is removed from an execution queue under the following conditions:

- 3873 • The batch job has been executed and exited.
- 3874 • The batch job has been aborted.
- 3875 • The batch job has been deleted from the batch queue.
- 3876 • The batch job has been moved to another queue.

3877 Access to a batch queue is limited to the batch server that manages the batch queue. Clients
 3878 never access a batch queue or a batch job directly, either to read or write information; all client
 3879 access to batch queues or jobs takes place through batch servers.

3880 **3.1.3 Batch Job Creation**

3881 When a batch server creates a batch job on behalf of a client, it shall assign a batch job identifier
 3882 to the job. A batch job identifier consists of both a sequence number that is unique among the
 3883 sequence numbers issued by that server and the name of the server. Since the batch server name
 3884 is unique within a name space, the job identifier is likewise unique within the name space.

3885 The batch server that creates a batch job shall return the batch server-assigned job identifier to
 3886 the client that requested the job creation. If the batch server routes or moves the job to another
 3887 server, it sends the job identifier with the job. Once assigned, the job identifier of a batch job shall
 3888 never change.

3889 **3.1.4 Batch Job Tracking**

3890 Since a batch job may be moved after creation, the batch server name component of the job
 3891 identifier need not indicate the location of the job. An implementation may provide a batch job
 3892 tracking mechanism, in which case the user generally does not need to know the location of the
 3893 job. However, an implementation need not provide a batch job tracking mechanism, in which
 3894 case the user must find routed jobs by probing the possible destinations.

3895 **3.1.5 Batch Job Routing**

3896 To route a batch job, a batch server either moves the job to some other queue that is managed by
 3897 the batch server, or requests that some other batch server accept the job.

3898 Each routing queue has one or more queues to which it can route batch jobs. The batch server
 3899 administrator creates routing queues.

3900 A batch server may route a batch job from a routing queue to another routing queue. Batch
 3901 servers shall prevent or otherwise handle cases of circular routing paths. As a deferred service, a
 3902 batch server routes jobs from the routing queues that it manages. The algorithm by which a
 3903 batch server selects a batch queue to which to route a batch job is implementation-defined.

3904 A batch job need not be eligible for routing to all the batch queues fed by the routing queue from
 3905 which it is routed. A batch server that has been asked to accept the job may reject the request if
 3906 the job requires resources that are unavailable to that batch server, or if the client is not
 3907 authorized to access the batch server.

3908 Batch servers may route high-priority jobs before low-priority jobs, but, on other than
 3909 overloaded systems, the effect may be imperceptible to the user. If all the batch servers fed by a
 3910 routing queue reject requests to accept the job for reasons that are permanent, the batch server
 3911 that manages the job shall abort the job. If all or some rejections are temporary, the batch server
 3912 should try to route the job again at some later point.

3913 The reasons for rejecting a batch job are implementation-defined.

3914 The reasons for which the routing should be retried later and the reasons for which the job
3915 should be aborted are also implementation-defined.

3916 **3.1.6 Batch Job Execution**

3917 To execute a batch job is to create a session leader (a process) that runs the shell program
3918 indicated by the *Shell_Path* attribute of the job. The script shall be passed to the program as its
3919 standard input. An implementation may pass the script to the program by other
3920 implementation-defined means. At the time a batch job begins execution, it is defined to enter
3921 the RUNNING state. The primary program that is executed by a batch job is typically, though
3922 not necessarily, a shell program.

3923 A batch server shall execute eligible jobs as a deferred service—no client request is necessary
3924 once the batch job is created and eligible. However, the attributes of a batch job, such as the job
3925 hold type, may render the job ineligible. A batch server shall scan the execution queues that it
3926 manages for jobs that are eligible for execution. The algorithm by which the batch server selects
3927 eligible jobs for execution is implementation-defined.

3928 As part of creating the process for the batch job, the batch server shall open the standard output
3929 and standard error streams of the session.

3930 The attributes of a batch job may indicate that the batch server executing the job shall send mail
3931 to a list of users at the time it begins execution of the job.

3932 **3.1.7 Batch Job Exit**

3933 When the session leader of an executing job terminates, the job exits. As part of exiting a batch
3934 job, the batch server that manages the job shall remove the job from the batch queue in which it
3935 resides. The server shall transfer output files of the job to a location described by the attributes of
3936 the job.

3937 The attributes of a batch job may indicate that the batch server managing the job shall send mail
3938 to a list of users at the time the job exits.

3939 **3.1.8 Batch Job Abort**

3940 A batch server shall abort jobs for which a required deferred service cannot be performed. The
3941 attributes of a batch job may indicate that the batch server that aborts the job shall send mail to a
3942 list of users at the time it aborts the job.

3943 **3.1.9 Batch Authorization**

3944 Clients, such as the batch environment utilities (marked BE), access batch services by means of
3945 requests to one or more batch servers. To acquire the services of any given batch server, the user
3946 identifier under which the client runs must be authorized to use that batch server.

3947 The user with an associated user name that creates a batch job shall own the job and can perform
3948 actions such as read, modify, delete, and move.

3949 A user identifier of the same value at a different host need not be the same user. For example,
3950 user name *smith* at host **alpha** may or may not represent the same person as user name *smith* at
3951 host **beta**. Likewise, the same person may have access to different user names on different hosts.

3952 An implementation may optionally provide an authorization mechanism that permits one user
3953 name to access jobs under another user name.

3954 A process on a client host may be authorized to run processes under multiple user names at a
3955 batch server host. Where appropriate, the utilities defined in this volume of IEEE Std 1003.1-2001

3956 provide a means for a user to choose from among such user names when creating or modifying a
 3957 batch job.

3958 **3.1.10 Batch Administration**

3959 The processing of a batch job by a batch server is affected by the attributes of the job. The
 3960 processing of a batch job may also be affected by the attributes of the batch queue in which the
 3961 job resides and by the status of the batch server that manages the job. See also the Base
 3962 Definitions volume of IEEE Std 1003.1-2001, Chapter 3, Definitions for batch definitions.

3963 **3.1.11 Batch Notification**

3964 Whereas batch servers are persistent entities, clients are often transient. For example, the *qsub*
 3965 utility creates a batch job and exits. For this reason, batch servers notify users of batch job events
 3966 by sending mail to the user that owns the job, or to other designated users.

3967 **3.2 Batch Services**

3968 The presence of Batch Environment Services and Utilities option services is indicated by the
 3969 configuration variable POSIX2_PBS. A conforming batch server provides services as defined in
 3970 this section. |

3971 A batch server shall provide batch services in two ways:

- 3972 1. The batch server provides a service at the request of a client.
- 3973 2. The batch server provides a deferred service as a result of a change in conditions
 3974 monitored by the batch server.

3975 If a batch server cannot complete a request, it shall reject the request. If a batch server cannot
 3976 complete a deferred service for a batch job, the batch server shall abort the batch job. Table 3-2
 3977 (on page 105) is a summary of environment variables that shall be supported by an
 3978 implementation of the batch server and utilities.

Table 3-2 Environment Variable Summary

Variable	Description
<i>PBS_DPREFIX</i>	Defines the directive prefix (see <i>qsub</i>)
<i>PBS_ENVIRONMENT</i>	Batch Job is batch or interactive (see Section 3.2.2.1)
<i>PBS_JOBID</i>	The <i>job_identifier</i> attribute of job (see Section 3.2.3.8)
<i>PBS_JOBNAME</i>	The <i>job_name</i> attribute of job (see Section 3.2.3.8)
<i>PBS_O_HOME</i>	Defines the <i>HOME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_HOST</i>	Defines the host name of the batch client (see <i>qsub</i>)
<i>PBS_O_LANG</i>	Defines the <i>LANG</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_LOGNAME</i>	Defines the <i>LOGNAME</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_MAIL</i>	Defines the <i>MAIL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_PATH</i>	Defines the <i>PATH</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_QUEUE</i>	Defines the submit queue of the batch client (see <i>qsub</i>)
<i>PBS_O_SHELL</i>	Defines the <i>SHELL</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_TZ</i>	Defines the <i>TZ</i> of the batch client (see <i>qsub</i>)
<i>PBS_O_WORKDIR</i>	Defines the working directory of the batch client (see <i>qsub</i>)
<i>PBS_QUEUE</i>	Defines the initial execution queue (see Section 3.2.2.1)

3.2.1 Batch Job States

A batch job shall always be in one of the following states: QUEUED, RUNNING, HELD, WAITING, EXITING, or TRANSITING. The state of a batch job determines the types of requests that the batch server that manages the batch job can accept for the batch job. A batch server shall change the state of a batch job either in response to service requests from clients or as a result of deferred services, such as job execution or job routing.

A batch job that is in the QUEUED state resides in a queue but is still pending either execution or routing, depending on the queue type.

A batch server that queues a batch job in a routing queue shall put the batch job in the QUEUED state. A batch server that puts a batch job in an execution queue, but has not yet executed the batch job, shall put the batch job in the QUEUED state. A batch job that resides in an execution queue and is executing is defined to be in the RUNNING state. While a batch job is in the RUNNING state, a session leader is associated with the batch job.

A batch job that resides in an execution queue, but is ineligible to run because of a hold attribute, is defined to be in the HELD state.

A batch job that is not held, but must wait until a future date and time before executing, is defined to be in the WAITING state.

When the session leader associated with a running job exits, the batch job shall be placed in the EXITING state.

A batch job for which the session leader has terminated is defined to be in the EXITING state, and the batch server that manages such a batch job cannot accept job modification requests that affect the batch job. While a batch job is in the EXITING state, the batch server that manages the batch job is staging output files and notifying clients of job completion. Once a batch job has exited, it no longer exists as an object managed by a batch server.

A batch job that is being moved from a routing queue to another queue is defined to be in the TRANSITING state.

When a batch job in a routing queue has been selected to be moved to a new destination, then the batch job shall be in either the QUEUED state or the TRANSITING state, depending on the batch server implementation.

Batch jobs with either an *Execution_Time* attribute value set in the future or a *Hold_Types* attribute of value not equal to NO_HOLD, or both, may be routed or held in the routing queue. The treatment of jobs with the *Execution_Time* or *Hold_Types* attributes in a routing queue is implementation-defined.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has a *Hold_Types* attribute value of other than NO_HOLD, then the job should be in the HELD state.

Note: The effect of a hold upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold_Types* attribute value of NO_HOLD
- An *Execution_Time* attribute in the past

then the batch job shall be in the QUEUED state.

When a batch job in a routing queue has not been selected to be moved to a new destination and the batch job has:

- A *Hold_Types* attribute value of NO_HOLD
- An *Execution_Time* attribute in the future

then the batch job may be in the WAITING state.

Note: The effect of a future execution time upon a batch job in a routing queue is implementation-defined. The implementation should use the state that matches whether the batch job can route with a hold or not.

Table 3-3 (on page 107) describes the next state of a batch job, given the current state of the batch job and the type of request. Table 3-4 (on page 108) describes the response of a batch server to a request, given the current state of the batch job and the type of request.

3.2.2 Deferred Batch Services

This section describes the deferred services performed by batch servers: job execution, job routing, job exit, job abort, and the rerunning of jobs after a restart.

3.2.2.1 Batch Job Execution

To execute a batch job is to create a session leader (a process) that runs the shell program indicated by the *Shell_Path_List* attribute of the batch job. The script is passed to the program as its standard input. An implementation may pass the script to the program by other implementation-defined means. At the time a batch job begins execution, it is defined to enter the RUNNING state.

Table 3-3 Next State Table

Request Type	Current State						
	X	Q	R	H	W	E	T
<i>Queue Batch Job Request</i>	Q	e	e	e	e	e	e
<i>Modify Batch Job Request</i>	e	Q	R	H	W	e	T
<i>Delete Batch Job Request</i>	e	X	E	X	X	E	X
<i>Batch Job Message Request</i>	e	Q	R	H	W	E	T
<i>Rerun Batch Job Request</i>	e	e	Q	e	e	e	e
<i>Signal Batch Job Request</i>	e	e	R	H	W	e	e
<i>Batch Job Status Request</i>	e	Q	R	H	W	E	T
<i>Batch Queue Status Request</i>	X	Q	R	H	W	E	T
<i>Server Status Request</i>	X	Q	R	H	W	E	T
<i>Select Batch Jobs Request</i>	X	Q	R	H	W	E	T
<i>Move Batch Job Request</i>	e	Q	R	H	W	e	T
<i>Hold Batch Job Request</i>	e	H	R / H	H	H	e	T
<i>Release Batch Job Request</i>	e	Q	R	Q / W / H	W	e	T
<i>Server Shutdown Request</i>	X	Q	Q	H	W	E	T
<i>Locate Batch Job Request</i>	e	Q	R	H	W	E	T

Legend

X Nonexistent

Q QUEUED

R RUNNING

H HELD

W WAITING

E EXITING

T TRANSITING

e Error

A batch server that has an execution queue containing jobs is said to own the queue and manage the batch jobs in that queue. A batch server that has been started shall execute the batch jobs in the execution queues owned by the batch server. The batch server shall schedule for execution those jobs in the execution queues that are in the QUEUED state. The algorithm for scheduling jobs is implementation-defined.

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, an environment variable named *PBS_ENVIRONMENT*, the value of which is the string *PBS_BATCH* encoded in the portable character set.

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, an environment variable named *PBS_QUEUE*, the value of which is the name of the execution queue of the batch job encoded in the portable character set.

To rerun a batch job is to requeue a batch job that is currently executing and then kill the session leader of the executing job by sending a SIGKILL prior to completion; see Section 3.2.3.11 (on page 120). A batch server that reruns a batch job shall append the standard output and standard error files of the batch job to the corresponding files of the previous execution, if they exist, with appropriate annotation. If either file does not exist, that file shall be created as in normal execution.

Table 3-4 Results / Output Table

Request Type	Current State						
	X	Q	R	H	W	E	T
Queue Batch Job Request	O	e	e	e	e	e	e
Modify Batch Job Request	e	O	e	O	O	e	e

Locate Batch Job Request	e	O	O	O	O	O	O

Legend

O OK

e Error message

The execution of a batch job by a batch server shall be controlled by job, queue, and server attributes, as defined in this section.

Account_Name Attribute

Batch accounting is an optional feature of batch servers. If a batch server implements accounting, the statements in this section apply and the configuration variable `POSIX2_PBS_ACCOUNTING` shall be set to 1.

A batch server that executes a batch job shall charge the account named in the *Account_Name* attribute of the batch job for resources consumed by the batch job.

If the *Account_Name* attribute of the batch job is absent from the batch job attribute list or is altered while the batch job is in execution, the batch server action is implementation-defined.

Checkpoint Attribute

Batch checkpointing is an optional feature of batch servers. If a batch server implements checkpointing, the statements in this section apply and the configuration variable `POSIX2_PBS_CHECKPOINT` shall be set to 1.

There are two attributes associated with the checkpointing feature: *Checkpoint* and *Minimum_Cpu_Interval*. *Checkpoint* is a batch job attribute, while *Minimum_Cpu_Interval* is a queue attribute. An implementation that does not support checkpointing shall support the *Checkpoint* job attribute to the extent that the batch server shall maintain and pass this attribute to other servers.

The behavior of a batch server that executes a batch job for which the value of the *Checkpoint* attribute is `CHECKPOINT_UNSPECIFIED` is implementation-defined. A batch server that executes a batch job for which the value of the *Checkpoint* attribute is `NO_CHECKPOINT` shall

4147 not checkpoint the batch job.

4148 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
4149 CHECKPOINT_AT_SHUTDOWN shall checkpoint the batch job only when the batch server
4150 accepts a request to shut down during the time when the batch job is in the RUNNING state.

4151 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is
4152 CHECKPOINT_AT_MIN_CPU_INTERVAL shall checkpoint the batch job at the interval
4153 specified by the *Minimum_Cpu_Interval* attribute of the queue for which the batch job has been
4154 selected. The *Minimum_Cpu_Interval* attribute shall be specified in units of CPU minutes.

4155 A batch server that executes a batch job for which the value of the *Checkpoint* attribute is an
4156 unsigned integer shall checkpoint the batch job at an interval that is the value of either the
4157 *Checkpoint* attribute, or the *Minimum_Cpu_Interval* attribute of the queue for which the batch job
4158 has been selected, whichever is greater. Both intervals shall be in units of CPU minutes. When
4159 the *Minimum_Cpu_Interval* attribute is greater than the *Checkpoint* attribute, the batch job shall
4160 write a warning message to the standard error stream of the batch job.

4161 **Error_Path Attribute**

4162 The *Error_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*. When
4163 the *Join_Path* attribute of the batch job is set to the value FALSE and the *Keep_Files* attribute of
4164 the batch job does not contain the value KEEP_STD_ERROR, a batch server that executes a batch
4165 job shall perform one of the following actions:

- 4166 • Set the standard error stream of the session leader of the batch job to the path described by
4167 the value of the *Error_Path* attribute of the batch job.
- 4168 • Buffer the standard error of the session leader of the batch job until completion of the batch
4169 job, and when the batch job exits return the contents to the destination described by the value
4170 of the *Error_Path* attribute of the batch job.

4171 Applications shall not rely on having access to the standard error of a batch job prior to the
4172 completion of the batch job.

4173 When the *Error_Path* attribute does not specify a host name, then the batch server shall retain the
4174 standard error of the batch job on the host of execution.

4175 When the *Error_Path* attribute does specify a host name and the *Keep_Files* attribute does not
4176 contain the value KEEP_STD_ERROR, then the final destination of the standard error of the
4177 batch job shall be on the host whose host name is specified.

4178 If the path indicated by the value of the *Error_Path* attribute of the batch job is a relative path, the
4179 batch server shall expand the path relative to the home directory of the user on the host to which
4180 the file is being returned.

4181 When the batch server buffers the standard error of the batch job and the file cannot be opened
4182 for write upon completion of the batch job, then the server shall place the standard error in an
4183 implementation-defined location and notify the user of the location via mail. It shall be possible
4184 for the user to process this mail using the *mailx* utility.

4185 If a batch server that does not buffer the standard error cannot open the standard error path of
4186 the batch job for write access, then the batch server shall abort the batch job.

Execution_Time Attribute

A batch server shall not execute a batch job before the time represented by the value of the *Execution_Time* attribute of the batch job. The *Execution_Time* attribute is defined in seconds since the Epoch.

Hold_Types Attribute

A batch server shall support the following hold types:

- s Can be set or released by a user with at least a privilege level of batch administrator (SYSTEM).
- o Can be set or released by a user with at least a privilege level of batch operator (OPERATOR).
- u Can be set or released by the user with at least a privilege level of user, where the user is defined in the *Job_Owner* attribute (USER).
- n Indicates that none of the *Hold_Types* attributes are set (NO_HOLD).

An implementation may define other hold types. Any additional hold types, how they are specified, their internal representation, their behavior, and how they affect the behavior of other utilities are implementation-defined.

The value of the *Hold_Types* attribute shall be the union of the valid hold types ('s', 'o', 'u', and any implementation-defined hold types), or 'n'.

A batch server shall not execute a batch job if the *Hold_Types* attribute of the batch job has a value other than NO_HOLD. If the *Hold_Types* attribute of the batch job has a value other than NO_HOLD, the batch job shall be in the HELD state.

Job_Owner Attribute

The *Job_Owner* attribute consists of a pair of user name and host name values of the form:

username@hostname

A batch server that accepts a *Queue Batch Job Request* shall set the *Job_Owner* attribute to a string that is the *username@hostname* of the user who submitted the job.

Join_Path Attribute

A batch server that executes a batch job for which the value of the *Join_Path* attribute is TRUE shall ignore the value of the *Error_Path* attribute and merge the standard error of the batch job with the standard output of the batch job.

Keep_Files Attribute

A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes the value KEEP_STD_OUTPUT shall retain the standard output of the batch job on the host where execution occurs. The standard output shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for the standard output as defined under the **-o** option of the *qsub* utility. The *Output_Path* attribute is not modified.

A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes the value KEEP_STD_ERROR shall retain the standard error of the batch job on the host where execution occurs. The standard error shall be retained in the home directory of the user under whose user ID the batch job is executed and the filename shall be the default filename for

4228 standard error as defined under the `-e` option of the `qsub` utility. The *Error_Path* attribute is not
4229 modified.

4230 A batch server that executes a batch job for which the value of the *Keep_Files* attribute includes
4231 values other than `KEEP_STD_OUTPUT` and `KEEP_STD_ERROR` shall retain these other files on
4232 the host where execution occurs. These files (with implementation-defined names) shall be
4233 retained in the home directory of the user under whose user identifier the batch job is executed.

4234 **Mail_Points and Mail_Users Attributes**

4235 A batch server that executes a batch job for which one of the values of the *Mail_Points* attribute is
4236 the value `MAIL_AT_BEGINNING` shall send a mail message to each user account listed in the
4237 *Mail_Users* attribute of the batch job.

4238 The mail message shall contain at least the batch job identifier, queue, and server at which the
4239 batch job currently resides, and the *Job_Owner* attribute.

4240 **Output_Path Attribute**

4241 The *Output_Path* attribute of a running job cannot be changed by a *Modify Batch Job Request*.
4242 When the *Keep_Files* attribute of the batch job does not contain the value `KEEP_STD_OUTPUT`, a
4243 batch server that executes a batch job shall either:

4244 • Set the standard output stream of the session leader of the batch job to the destination
4245 described by the value of the *Output_Path* attribute of the batch job.

4246 or:

4247 • Buffer the standard output of the session leader of the batch job until completion of the batch
4248 job, and when the batch job exits return the contents to the destination described by the value
4249 of the *Output_Path* attribute of the batch job.

4250 When the *Output_Path* attribute does not specify a host name, then the batch server shall retain
4251 the standard output of the batch job on the host of execution.

4252 When the *Keep_Files* attribute does not contain the value `KEEP_STD_OUTPUT` and the
4253 *Output_Path* attribute does specify a host name, then the final destination of the standard output
4254 of the batch job shall be on the host specified.

4255 If the path specified in the *Output_Path* attribute of the batch job is a relative path, the batch
4256 server shall expand the path relative to the home directory of the user on the host to which the
4257 file is being returned.

4258 Whether or not the batch server buffers the standard output of the batch job until completion of
4259 the batch job is implementation-defined. Applications shall not rely on having access to the
4260 standard output of a batch job prior to the completion of the batch job.

4261 When the batch server does buffer the standard output of the batch job and the file cannot be
4262 opened for write upon completion of the batch job, then the batch server shall place the standard
4263 output in an implementation-defined location and notify the user of the location via mail. It shall
4264 be possible for the user to process this mail using the *mailx* utility.

4265 If a batch server that does not buffer the standard output cannot open the standard output path
4266 of the batch job for write access, then the batch server shall abort the batch job.

Priority Attribute

A batch server implementation may choose to preferentially execute a batch job based on the *Priority* attribute. The interpretation of the batch job *Priority* attribute by a batch server is implementation-defined. If an implementation uses the *Priority* attribute, it shall interpret larger values of the *Priority* attribute to mean the batch job shall be preferentially selected for execution.

Rerunable Attribute

A batch job that began execution but did not complete, because the batch server either shut down or terminated abnormally, shall be requeued if the *Rerunable* attribute of the batch job has the value TRUE.

If a batch job, which was requeued after beginning execution but prior to completion, has a valid checkpoint file and the batch server supports checkpointing, then the batch job shall be restarted from the last valid checkpoint.

If the batch job cannot be restarted from a checkpoint, then when a batch job has a *Rerunable* attribute value of TRUE and was requeued after beginning execution but prior to completion, the batch server shall place the batch job into execution at the beginning of the job.

When a batch job has a *Rerunable* attribute value other than TRUE and was requeued after beginning execution but prior to completion, and the batch job cannot be restarted from a checkpoint, then the batch server shall abort the batch job.

Resource_List Attribute

A batch server that executes a batch job shall establish the resource limits of the session leader of the batch job according to the values of the *Resource_List* attribute of the batch job. Resource limits shall be enforced by an implementation-defined method.

Shell_Path_List Attribute

The *Shell_Path_List* job attribute consists of a list of pairs of pathname and host name values. The host name component can be omitted, in which case the pathname serves as the default pathname when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *Shell_Path_List* attribute of the batch job, a pathname where the shell to execute the batch job shall be found. The batch server shall select the pathname, in order of preference, according to the following methods:

- Select the pathname that contains the name of the host on which the batch server is running.
- Select the pathname for which the host name has been omitted.
- Select the pathname for the login shell of the user under which the batch job is to execute.

If the shell path value selected is an invalid pathname, the batch server shall abort the batch job.

If the value of the selected pathname from the *Shell_Path_List* attribute of the batch job represents a partial path, the batch server shall expand the path relative to a path that is implementation-defined.

The batch server that executes the batch job shall execute the program that was selected from the *Shell_Path_List* attribute of the batch job. The batch server shall pass the path to the script of the batch job as the first argument to the shell program.

User_List Attribute

The *User_List* job attribute consists of a list of pairs of user name and host name values. The host name component can be omitted, in which case the user name serves as a default when a batch server cannot find the name of the host on which it is running in the list.

A batch server that executes a batch job shall select, from the value of the *User_List* attribute of the batch job, a user name under which to create the session leader. The server shall select the user name, in order of preference, according to the following methods:

- Select the user name of a value that contains the name of the host on which the batch server executes.
- Select the user name of a value for which the host name has been omitted.
- Select the user name from the *Job_Owner* attribute of the batch job.

Variable_List Attribute

A batch server that executes a batch job shall create, in the environment of the session leader of the batch job, each environment variable listed in the *Variable_List* attribute of the batch job, and set the value of each such environment variable to that of the corresponding variable in the variable list.

3.2.2.2 Batch Job Routing

To route a batch job is to select a queue from a list and move the batch job to that queue.

A batch server that has routing queues, which have been started, shall route the jobs in the routing queues owned by the batch server. A batch server may delay the routing of a batch job. The algorithm for selecting a batch job and the queue to which it will be routed is implementation-defined.

When a routing queue has multiple possible destinations specified, then the precedence of the destinations is implementation-defined.

A batch server that routes a batch job to a queue at another server shall move the batch job into the target queue with a *Queue Batch Job Request*.

If the target server rejects the *Queue Batch Job Request*, the routing server shall retry routing the batch job or abort the batch job. A batch server that retries failed routings shall provide a means for the batch administrator to specify the number of retries and the minimum period of time between retries. The means by which an administrator specifies the number of retries and the delay between retries is implementation-defined. When the number of retries specified by the batch administrator has been exhausted, the batch server shall abort the batch job and perform the functions of *Batch Job Exit*; see Section 3.2.2.3.

3.2.2.3 Batch Job Exit

For each job in the EXITING state, the batch server that exited the batch job shall perform the following deferred services in the order specified:

1. If buffering standard error, move that file into the location specified by the *Error_Path* attribute of the batch job.
2. If buffering standard output, move that file into the location specified by the *Output_Path* attribute of the batch job.
3. If the *Mail_Points* attribute of the batch job includes MAIL_AT_EXIT, send mail to the users listed in the *Mail_Users* attribute of the batch job. The mail message shall contain at least

4349 the batch job identifier, queue, and server at which the batch job currently resides, and the
 4350 *Job_Owner* attribute.

4351 4. Remove the batch job from the queue.

4352 If a batch server that buffers the standard error output cannot return the standard error file to
 4353 the standard error path at the time the batch job exits, the batch server shall do one of the
 4354 following:

- 4355 • Mail the standard error file to the batch job owner.
- 4356 • Save the standard error file and mail the location and name of the file where the standard
 4357 error is stored to the batch job owner.
- 4358 • Save the standard error file and notify the user by other implementation-defined means.

4359 If a batch server that buffers the standard output cannot return the standard output file to the
 4360 standard output path at the time the batch job exits, the batch server shall do one of the
 4361 following:

- 4362 • Mail the standard output file to the batch job owner.
- 4363 • Save the standard output file and mail the location and name of the file where the standard
 4364 output is stored to the batch job owner.
- 4365 • Save the standard output file and notify the user by other implementation-defined means.

4366 At the conclusion of job exit processing, the batch job is no longer managed by a batch server.

4367 3.2.2.4 *Batch Server Restart*

4368 A batch server that has been either shutdown or terminated abnormally, and has returned to
 4369 operation, is said to have “restarted”.

4370 Upon restarting, a batch server shall requeue those jobs managed by the batch server that were
 4371 in the RUNNING state at the time the batch server shut down and for which the *Rerunable*
 4372 attribute of the batch job has the value TRUE.

4373 Queues are defined to be non-volatile. A batch server shall store the content of queues that it
 4374 controls in such a way that server and system shutdowns do not erase the content of the queues.

4375 3.2.2.5 *Batch Job Abort*

4376 A batch server that cannot perform a deferred service for a batch job shall abort the batch job.

4377 A batch server that aborts a batch job shall perform the following services:

- 4378 • Delete the batch job from the queue in which it resides.
- 4379 • If the *Mail_Points* attribute of the batch job includes the value MAIL_AT_ABORT, send mail
 4380 to the users listed in the value of the *Mail_Users* attribute of the job. The mail message shall
 4381 contain at least the batch job identifier, queue, and server at which the batch job currently
 4382 resides, the *Job_Owner* attribute, and the reason for the abort.
- 4383 • If the batch job was in the RUNNING state, terminate the session leader of the executing job
 4384 by sending the session leader a SIGKILL, place the batch job in the EXITING state, and
 4385 perform the actions of *Batch Job Exit*.

3.2.3 Requested Batch Services

This section describes the services provided by batch servers in response to requests from clients. Table 3-5 summarizes the current set of batch service requests and for each gives its type (deferred or not) and whether it is an optional function.

Table 3-5 Batch Services Summary

Batch Service	Deferred	Optional
<i>Batch Job Execution</i>	Yes	No
<i>Batch Job Routing</i>	Yes	No
<i>Batch Job Exit</i>	Yes	No
<i>Batch Server Restart</i>	Yes	No
<i>Batch Job Abort</i>	Yes	No
<i>Delete Batch Job Request</i>	No	No
<i>Hold Batch Job Request</i>	No	No
<i>Batch Job Message Request</i>	No	Yes
<i>Batch Job Status Request</i>	No	No
<i>Locate Batch Job Request</i>	No	Yes
<i>Modify Batch Job Request</i>	No	No
<i>Move Batch Job Request</i>	No	No
<i>Queue Batch Job Request</i>	No	No
<i>Batch Queue Status Request</i>	No	No
<i>Release Batch Job Request</i>	No	No
<i>Rerun Batch Job Request</i>	No	No
<i>Select Batch Jobs Request</i>	No	No
<i>Server Shutdown Request</i>	No	No
<i>Server Status Request</i>	No	No
<i>Signal Batch Job Request</i>	No	No
<i>Track Batch Job Request</i>	No	Yes

If a request is rejected because the batch client is not authorized to perform the action, the batch server shall return the same status as when the batch job does not exist.

3.2.3.1 Delete Batch Job Request

A batch job is defined to have been deleted when it has been removed from the queue in which it resides and not instantiated in another queue. A client requests that the server that manages a batch job delete the batch job. Such a request is called a *Delete Batch Job Request*.

A batch server shall reject a *Delete Batch Job Request* if any of the following statements are true:

- The user of the batch client is not authorized to delete the designated job.
- The designated job is not managed by the batch server.
- The designated job is in a state inconsistent with the delete request.

A batch server may reject a *Delete Batch Job Request* for other implementation-defined reasons. The method used to determine whether the user of a client is authorized to perform the requested action is implementation-defined.

A batch server requested to delete a batch job shall delete the batch job if the batch job exists and is not in the EXITING state.

A batch server that deletes a batch job in the RUNNING state shall send a SIGKILL signal to the session leader of the batch job. It is implementation-defined whether additional signals are sent

4430 to the session leader of the job prior to sending the SIGKILL signal.

4431 A batch server that deletes a batch job in the RUNNING state shall place the batch job in the

4432 EXITING state after it has killed the session leader of the batch job and shall perform the actions

4433 of *Batch Job Exit*.

4434 3.2.3.2 *Hold Batch Job Request*

4435 A batch client can request that the batch server add one or more holds to a batch job. Such a

4436 request is called a *Hold Batch Job Request*.

4437 A batch server shall reject a *Hold Batch Job Request* if any of the following statements are true:

- 4438 • The batch server does not support one or more of the requested holds to be added to the
- 4439 batch job.
- 4440 • The user of the batch client is not authorized to add one or more of the requested holds to the
- 4441 batch job.
- 4442 • The batch server does not manage the specified job.
- 4443 • The designated job is in the EXITING state.

4444 A batch server may reject a *Hold Batch Job Request* for other implementation-defined reasons. The

4445 method used to determine whether the user of a client is authorized to perform the requested

4446 action is implementation-defined.

4447 A batch server that accepts a *Hold Batch Job Request* for a batch job in the RUNNING state shall

4448 place a hold on the batch job. The effects, if any, the hold will have on a batch job in the

4449 RUNNING state are implementation-defined.

4450 A batch server that accepts a *Hold Batch Job Request* shall add each type of hold listed in the *Hold*

4451 *Batch Job Request*, that is not already present, to the value of the *Hold_Types* attribute of the batch

4452 job.

4453 3.2.3.3 *Batch Job Message Request*

4454 *Batch Job Message Request* is an optional feature of batch servers. If an implementation supports

4455 *Batch Job Message Request*, the statements in this section apply and the configuration variable

4456 POSIX2_PBS_MESSAGE shall be set to 1.

4457 A batch client can request that a batch server write a message into certain output files of a batch

4458 job. Such a request is called a *Batch Job Message Request*.

4459 A batch server shall reject a *Batch Job Message Request* if any of the following statements are true:

- 4460 • The batch server does not support sending messages to jobs.
- 4461 • The user of the batch client is not authorized to post a message to the designated job.
- 4462 • The designated job does not exist on the batch server.
- 4463 • The designated job is not in the RUNNING state.

4464 A batch server may reject a *Batch Job Message Request* for other implementation-defined reasons.

4465 The method used to determine whether the user of a client is authorized to perform the

4466 requested action is implementation-defined.

4467 A batch server that accepts a *Batch Job Message Request* shall write the message sent by the batch

4468 client into the files indicated by the batch client.

4469 3.2.3.4 *Batch Job Status Request*

4470 A batch client can request that a batch server respond with the status and attributes of a batch
4471 job. Such a request is called a *Batch Job Status Request*.

4472 A batch server shall reject a *Batch Job Status Request* if any of the following statements are true:

- 4473 • The user of the batch client is not authorized to query the status of the designated job.
- 4474 • The designated job is not managed by the batch server.

4475 A batch server may reject a *Batch Job Status Request* for other implementation-defined reasons.
4476 The method used to determine whether the user of a client is authorized to perform the
4477 requested action is implementation-defined.

4478 A batch server that accepts a *Batch Job Status Request* shall return a *Batch Job Status Message* to the
4479 batch client.

4480 A batch server may return other information in response to a *Batch Job Status Request*.

4481 3.2.3.5 *Locate Batch Job Request*

4482 *Locate Batch Job Request* is an optional feature of batch servers. If an implementation supports
4483 *Locate Batch Job Request*, the statements in this section apply and the configuration variable
4484 POSIX2_PBS_LOCATE shall be set to 1.

4485 A batch client can ask a batch server to respond with the location of a batch job that was created
4486 by the batch server. Such a request is called a *Locate Batch Job Request*.

4487 A batch server that accepts a *Locate Batch Job Request* shall return a *Batch Job Location Message* to
4488 the batch client.

4489 A batch server may reject a *Locate Batch Job Request* for a batch job that was not created by that
4490 server.

4491 A batch server may reject a *Locate Batch Job Request* for a batch job that is no longer managed by
4492 that server; that is, for a batch job that is not in a queue owned by that server.

4493 A batch server may reject a *Locate Batch Job Request* for other implementation-defined reasons.

4494 3.2.3.6 *Modify Batch Job Request*

4495 Batch clients modify (alter) the attributes of a batch job by making a request to the server that
4496 manages the batch job. Such a request is called a *Modify Batch Job Request*.

4497 A batch server shall reject a *Modify Batch Job Request* if any of the following statements are true:

- 4498 • The user of the batch client is not authorized to make the requested modification to the batch
4499 job.
- 4500 • The designated job is not managed by the batch server.
- 4501 • The requested modification is inconsistent with the state of the batch job.
- 4502 • An unrecognized resource is requested for a batch job in an execution queue.

4503 A batch server may reject a *Modify Batch Job Request* for other implementation-defined reasons.
4504 The method used to determine whether the user of a client is authorized to perform the
4505 requested action is implementation-defined.

4506 A batch server that accepts a *Modify Batch Job Request* shall modify all the specified attributes of
4507 the batch job. A batch server that rejects a *Modify Batch Job Request* shall modify none of the
4508 attributes of the batch job.

4509 If the servicing by a batch server of an otherwise valid request would result in no change, then
 4510 the batch server shall indicate successful completion of the request.

4511 3.2.3.7 *Move Batch Job Request*

4512 A batch client can request that a batch server move a batch job to another destination. Such a
 4513 request is called a *Move Batch Job Request*.

4514 A batch server shall reject a *Move Batch Job Request* if any of the following statements are true:

- 4515 • The user of the batch client is not authorized to remove the designated job from the queue in
 4516 which the batch job resides.
- 4517 • The user of the batch client is not authorized to move the designated job to the destination.
- 4518 • The designated job is not managed by the batch server.
- 4519 • The designated job is in the EXITING state.
- 4520 • The destination is inaccessible.

4521 A batch server can reject a *Move Batch Job Request* for other implementation-defined reasons. The
 4522 method used to determine whether the user of a client is authorized to perform the requested
 4523 action is implementation-defined.

4524 A batch server that accepts a *Move Batch Job Request* shall perform the following services:

- 4525 • Queue the designated job at the destination.
- 4526 • Remove the designated job from the queue in which the batch job resides.

4527 If the destination resides on another batch server, the batch server shall queue the batch job at
 4528 the destination by sending a *Queue Batch Job Request* to the other server. If the *Queue Batch Job*
 4529 *Request* fails, the batch server shall reject the *Move Batch Job Request*. If the *Queue Batch Job Request*
 4530 succeeds, the batch server shall remove the batch job from its queue.

4531 The batch server shall not modify any attributes of the batch job.

4532 3.2.3.8 *Queue Batch Job Request*

4533 A batch queue is controlled by one and only one batch server. A batch server is said to own the
 4534 queues that it controls. Batch clients make requests of batch servers to have jobs queued. Such a
 4535 request is called a *Queue Batch Job Request*.

4536 A batch server requested to queue a batch job for which the queue is not specified shall select an
 4537 implementation-defined queue for the batch job. Such a queue is called the “default queue” of
 4538 the batch server. The implementation shall provide the means for a batch administrator to
 4539 specify the default queue. The queue, whether specified or defaulted, is called the “target
 4540 queue”.

4541 A batch server shall reject a *Queue Batch Job Request* if any of the following statements are true:

- 4542 • The client is not authorized to create a batch job in the target queue.
- 4543 • The request specifies a queue that does not exist on the batch server.
- 4544 • The target queue is an execution queue and the batch server cannot satisfy a resource
 4545 requirement of the batch job.
- 4546 • The target queue is an execution queue and an unrecognized resource is requested.
- 4547 • The target queue is an execution queue, the batch server does not support checkpointing, and
 4548 the value of the *Checkpoint* attribute of the batch job is not NO_CHECKPOINT.

- 4549 • The job requires access to a user identifier that the batch client is not authorized to access.
- 4550 A batch server may reject a *Queue Batch Job Request* for other implementation-defined reasons.
- 4551 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
- 4552 PBS_O_QUEUE value is missing from the value of the *Variable_List* attribute of the batch job
- 4553 shall add that variable to the list and set the value to the name of the target queue. Once set, no
- 4554 server shall change the value of PBS_O_QUEUE, even if the batch job is moved to another
- 4555 queue.
- 4556 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the PBS_JOBID
- 4557 value is missing from the value of the *Variable_List* attribute shall add that variable to the list and
- 4558 set the value to the batch job identifier assigned by the server in the format:
- 4559 sequence_number.server
- 4560 A batch server that accepts a *Queue Batch Job Request* for a batch job for which the
- 4561 PBS_JOBNAME value is missing from the value of the *Variable_List* attribute of the batch job
- 4562 shall add that variable to the list and set the value to the *Job_Name* attribute of the batch job.
- 4563 3.2.3.9 *Batch Queue Status Request*
- 4564 A batch client can request that a batch server respond with the status and attributes of a queue.
- 4565 Such a request is called a *Batch Queue Status Request*.
- 4566 A batch server shall reject a *Batch Queue Status Request* if any of the following statements are true:
- 4567 • The user of the batch client is not authorized to query the status of the designated queue.
- 4568 • The designated queue does not exist on the batch server.
- 4569 A batch server may reject a *Batch Queue Status Request* for other implementation-defined reasons.
- 4570 The method used to determine whether the user of a client is authorized to perform the
- 4571 requested action is implementation-defined.
- 4572 A batch server that accepts a *Batch Queue Status Request* shall return a *Batch Queue Status Reply* to
- 4573 the batch client.
- 4574 3.2.3.10 *Release Batch Job Request*
- 4575 A batch client can request that the server remove one or more holds from a batch job. Such a
- 4576 request is called a *Release Batch Job Request*.
- 4577 A batch server shall reject a *Release Batch Job Request* if any of the following statements are true:
- 4578 • The user of the batch client is not authorized to remove one or more of the requested holds
- 4579 from the batch job.
- 4580 • The batch server does not manage the specified job.
- 4581 A batch server may reject a *Release Batch Job Request* for other implementation-defined reasons.
- 4582 The method used to determine whether the user of a client is authorized to perform the
- 4583 requested action is implementation-defined.
- 4584 A batch server that accepts a *Release Batch Job Request* shall remove each type of hold listed in the
- 4585 *Release Batch Job Request*, that is present, from the value of the *Hold_Types* attribute of the batch
- 4586 job.

4587 3.2.3.11 *Rerun Batch Job Request*

4588 To rerun a batch job is to kill the session leader of the batch job and leave the batch job eligible
4589 for re-execution. A batch client can request that a batch server rerun a batch job. Such a request is
4590 called *Rerun Batch Job Request*.

4591 A batch server shall reject a *Rerun Batch Job Request* if any of the following statements are true:

- 4592 • The user of the batch client is not authorized to rerun the designated job.
- 4593 • The *Rerunable* attribute of the designated job has the value FALSE.
- 4594 • The designated job is not in the RUNNING state.
- 4595 • The batch server does not manage the designated job.

4596 A batch server may reject a *Rerun Batch Job Request* for other implementation-defined reasons.
4597 The method used to determine whether the user of a client is authorized to perform the
4598 requested action is implementation-defined.

4599 A batch server that rejects a *Rerun Batch Job Request* shall in no way modify the execution of the
4600 batch job.

4601 A batch server that accepts a request to rerun a batch job shall perform the following services:

- 4602 • Requeue the batch job in the execution queue in which it was executing.
- 4603 • Send a SIGKILL signal to the process group of the session leader of the batch job.

4604 An implementation may indicate to the batch job owner that the batch job has been rerun.
4605 Whether and how the batch job owner is notified that a batch job is rerun is implementation-
4606 defined.

4607 A batch server that reruns a batch job may send other implementation-defined signals to the
4608 session leader of the batch job prior to sending the SIGKILL signal.

4609 A batch server may preferentially select a rerun job for execution. Whether rerun jobs shall be
4610 selected for execution before other jobs is implementation-defined.

4611 3.2.3.12 *Select Batch Jobs Request*

4612 A batch client can request from a batch server a list of jobs managed by that server that match a
4613 list of selection criteria. Such a request is called a *Select Batch Jobs Request*. All the batch jobs
4614 managed by the batch server that receives the request are candidates for selection.

4615 A batch server that accepts a *Select Batch Jobs Request* shall return a list of zero or more job
4616 identifiers that correspond to jobs that meet the selection criteria.

4617 If the batch client is not authorized to query the status of a batch job, the batch server shall not
4618 select the batch job.

4619 3.2.3.13 *Server Shutdown Request*

4620 A batch server is defined to have shut down when it does not respond to requests from clients
4621 and does not perform deferred services for jobs. A batch client can request that a batch server
4622 shut down. Such a request is called a *Server Shutdown Request*.

4623 A batch server shall reject a *Server Shutdown Request* from a client that is not authorized to shut
4624 down the batch server. The method used to determine whether the user of a client is authorized
4625 to perform the requested action is implementation-defined.

4626 A batch server may reject a *Server Shutdown Request* for other implementation-defined reasons.
 4627 The reasons for which a *Server Shutdown Request* may be rejected are implementation-defined.

4628 At server shutdown, a batch server shall do, in order of preference, one of the following:

- 4629 • If checkpointing is implemented and the batch job is checkpointable, then checkpoint the
 4630 batch job and requeue it.
- 4631 • If the batch job is rerunnable, then requeue the batch job to be rerun (restarted from the
 4632 beginning).
- 4633 • Abort the batch job.

4634 3.2.3.14 *Server Status Request*

4635 A batch client can request that a batch server respond with the status and attributes of the batch
 4636 server. Such a request is called a *Server Status Request*.

4637 A batch server shall reject a *Server Status Request* if the following statement is true:

- 4638 • The user of the batch client is not authorized to query the status of the designated server.

4639 A batch server may reject a *Server Status Request* for other implementation-defined reasons. The
 4640 method used to determine whether the user of a client is authorized to perform the requested
 4641 action is implementation-defined.

4642 A batch server that accepts a *Server Status Request* shall return a *Server Status Reply* to the batch
 4643 client.

4644 3.2.3.15 *Signal Batch Job Request*

4645 A batch client can request that a batch server signal the session leader of a batch job. Such a
 4646 request is called a *Signal Batch Job Request*.

4647 A batch server shall reject a *Signal Batch Job Request* if any of the following statements are true:

- 4648 • The user of the batch client is not authorized to signal the batch job.
- 4649 • The job is not in the RUNNING state.
- 4650 • The batch server does not manage the designated job.
- 4651 • The requested signal is not supported by the implementation.

4652 A batch server may reject a *Signal Batch Job Request* for other implementation-defined reasons.
 4653 The method used to determine whether the user of a client is authorized to perform the
 4654 requested action is implementation-defined.

4655 A batch server that accepts a request to signal a batch job shall send the signal requested by the
 4656 batch client to the process group of the session leader of the batch job.

4657 3.2.3.16 *Track Batch Job Request*

4658 *Track Batch Job Request* is an optional feature of batch servers. If an implementation supports
 4659 *Track Batch Job Request*, the statements in this section apply and the configuration variable
 4660 POSIX2_PBS_TRACK shall be set to 1.

4661 *Track Batch Job Request* provides a method for tracking the current location of a batch job. Clients
 4662 may use the tracking information to determine the batch server that should receive a batch
 4663 server request.

4664 If *Track Batch Job Request* is supported by a batch server, then when the batch server queues a
 4665 batch job as a result of a *Queue Batch Job Request*, and the batch server is not the batch server that
 4666 created the batch job, the batch server shall send a *Track Batch Job Request* to the batch server that
 4667 created the job.

4668 If *Track Batch Job Request* is supported by a batch server, then the *Track Batch Job Request* may also
 4669 be sent to other servers as a backup to the primary server. The method by which backup servers
 4670 are specified is implementation-defined.

4671 If *Track Batch Job Request* is supported by a batch server that receives a *Track Batch Job Request*,
 4672 then the batch server shall record the current location of the batch job as contained in the
 4673 request.

4674 **3.3 Common Behavior for Batch Environment Utilities**

4675 **3.3.1 Batch Job Identifier**

4676 A utility shall recognize *job_identifiers* of the format:

4677 [sequence_number] [.server_name] [@server]

4678 where:

4679 *sequence_number* An integer that, when combined with *server_name*, provides a batch job
 4680 identifier that is unique within the batch system.

4681 *server_name* The name of the batch server to which the batch job was originally submitted.

4682 *server* The name of the batch server that is currently managing the batch job.

4683 If the application omits the batch *server_name* portion of a batch job identifier, a utility shall use
 4684 the name of a default batch server.

4685 If the application omits the batch *server* portion of a batch job identifier, a utility shall use:

- 4686 • The batch server indicated by *server_name*, if present
- 4687 • The name of the default batch server
- 4688 • The name of the batch server that is currently managing the batch job

4689 If only *@server* is specified, then the status of all jobs owned by the user on the requested server
 4690 is listed.

4691 The means by which a utility determines the default batch server is implementation-defined.

4692 If the application presents the batch *server* portion of a batch job identifier to a utility, the utility
 4693 shall send the request to the specified server.

4694 A strictly conforming application shall use the syntax described for the job identifier. Whenever
 4695 a batch job identifier is specified whose syntax is not recognized by an implementation, then a
 4696 message for each error that occurs shall be written to standard error and the utility shall exit
 4697 with an exit status greater than zero.

4698 When a batch job identifier is supplied as an argument to a batch utility and the *server_name*
 4699 portion of the batch job identifier is omitted, then the utility shall use the name of the default
 4700 batch server.

4701 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*
 4702 portion of the batch job identifier is omitted, then the utility shall use either:

- 4703 • The name of the default batch server
 - 4704 or:
 - 4705 • The name of the batch server that is currently managing the batch job
- 4706 When a batch job identifier is supplied as an argument to a batch utility and the batch *server*
 4707 portion of the batch job identifier is specified, then the utility shall send the required *Batch Server*
 4708 *Request* to the specified server.

4709 3.3.2 Destination

4710 The utility shall recognize a *destination* of the format:

4711 [queue] [@server]

4712 where:

4713 *queue* The name of a valid execution or routing queue at the batch server denoted by
 4714 @*server*, defined as a string of up to 15 alphanumeric characters in the portable
 4715 character set (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 6.1,
 4716 Portable Character Set) where the first character is alphabetic.

4717 *server* The name of a batch server, defined as a string of alphanumeric characters in the
 4718 portable character set.

4719 If the application omits the batch *server* portion of a destination, then the utility shall use either:

- 4720 • The name of the default batch server
- 4721 or:
- 4722 • The name of the batch server that is currently managing the batch job

4723 The means by which a utility determines the default batch server is implementation-defined.

4724 If the application omits the *queue* portion of a destination, then the utility shall use the name of
 4725 the default queue at the batch server chosen. The means by which a batch server determines its
 4726 default queue is implementation-defined. If a destination is specified in the *queue@server* form,
 4727 then the utility shall use the specified queue at the specified server.

4728 A strictly conforming application shall use the syntax described for a destination. Whenever a
 4729 destination is specified whose syntax is not recognized by an implementation, then a message
 4730 shall be written to standard error and the utility shall exit with an exit status greater than zero.

4731 3.3.3 Multiple Keyword-Value Pairs

4732 For each option that can have multiple keyword-value pair arguments, the following rules shall
 4733 apply. Examples of options that can have list-oriented option-arguments are **-u** *value@keyword*
 4734 and **-l** *keyword=value*.

- 4735 1. If a batch utility is presented with a list-oriented option-argument for which a keyword has
 4736 a corresponding value that begins with a single or double quote, then the utility shall stop
 4737 interpreting the input stream for delimiters until a second single or double quote,
 4738 respectively, is encountered. This feature allows some flexibility for a comma (',') or
 4739 equals sign ('=') to be part of the value string for a particular keyword; for example:

4740 keywd1='val1,val2',keywd2="val3,val4"

4741 **Note:** This may require the user to escape the quotes as in the following command:

4742 foo -xkeywd1=\'val1,val2\',keywd2=\"val3,val4\"

- 4743 2. If a batch server is presented with a list-oriented attribute that has a keyword that was
 4744 encountered earlier in the list, then the later entry for that keyword shall replace the earlier
 4745 entry.
- 4746 3. If a batch server is presented with a list-oriented attribute that has a keyword without any
 4747 corresponding value of the form *keyword=* or *@keyword* and the same keyword was
 4748 encountered earlier in the list, then the prior entry for that keyword shall be ignored by the
 4749 batch server.
- 4750 4. If a batch utility is expecting a list-oriented option-argument entry of the form
 4751 *keyword=value*, but is presented with an entry of the form *keyword* without any
 4752 corresponding *value*, then the entry shall be treated as though a default value of NULL was
 4753 assigned (that is, *keyword=NULL*) for entry parsing purposes. The utility shall include only
 4754 the keyword, not the NULL value, in the associated job attribute.
- 4755 5. If a batch utility is expecting a list-oriented option-argument entry of the form
 4756 *value@keyword*, but is presented with an entry of the form *value* without any corresponding
 4757 *keyword*, then the entry shall be treated as though a keyword of NULL was assigned (that
 4758 is, *value@NULL*) for entry parsing purposes. The utility shall include only the value, not
 4759 the NULL keyword, in the associated job attribute.
- 4760 6. A batch server shall accept a list-oriented attribute that has multiple occurrences of the
 4761 same keyword, interpreting the keywords, in order, with the last value encountered taking
 4762 precedence over prior instances of the same keyword. This rule allows, but does not
 4763 require, a batch utility to preprocess the attribute to remove duplicate keywords.
- 4764 7. If a batch utility is presented with multiple list-oriented option-arguments on the
 4765 command line or in script directives, or both, for a single option, then the utility shall
 4766 concatenate, in order, any command line keyword and value pairs to the end of any
 4767 directive keyword and value pairs separated by a single comma to produce a single string
 4768 that is an equivalent, valid option-argument. The resulting string shall be assigned to the
 4769 associated attribute of the batch job (after optionally removing duplicate entries as
 4770 described in item 6).

Utilities

4771

4772

This chapter contains the definitions of the utilities, as follows:

4773

- Mandatory utilities that are present on every conformant system

4774

4775

4776

- Optional utilities that are present only on systems supporting the associated option; see Section 1.8.1 (on page 9) for information on the options in this volume of IEEE Std 1003.1-2001

4777 **NAME**4778 admin — create and administer SCCS files (**DEVELOPMENT**)4779 **SYNOPSIS**4780 xSI admin -i[name] [-n] [-a login] [-d flag] [-e login] [-f flag] [-m mrlist]
4781 [-r rel] [-t[name] [-y[comment]]] newfile4782 admin -n[-a login] [-d flag] [-e login] [-f flag] [-m mrlist] [-t[name]]
4783 [-y[comment]] newfile ...

4784 admin [-a login] [-d flag] [-m mrlist] [-r rel] [-t[name]] file ...

4785 admin -h file ...

4786 admin -z file ...

4787

4788 **DESCRIPTION**4789 The *admin* utility shall create new SCCS files or change parameters of existing ones. If a named
4790 file does not exist, it shall be created, and its parameters shall be initialized according to the
4791 specified options. Parameters not initialized by an option shall be assigned a default value. If a
4792 named file does exist, parameters corresponding to specified options shall be changed, and other
4793 parameters shall be left as is.4794 All SCCS filenames supplied by the application shall be of the form *s.filename*. New SCCS files
4795 shall be given read-only permission mode. Write permission in the parent directory is required
4796 to create a file. All writing done by *admin* shall be to a temporary *x-file*, named *x.filename* (see *get*)
4797 created with read-only mode if *admin* is creating a new SCCS file, or created with the same mode
4798 as that of the SCCS file if the file already exists. After successful execution of *admin*, the SCCS file
4799 shall be removed (if it exists), and the *x-file* shall be renamed with the name of the SCCS file. This
4800 ensures that changes are made to the SCCS file only if no errors occur.4801 The *admin* utility shall also use a transient lock file (named *z.filename*), which is used to prevent
4802 simultaneous updates to the SCCS file; see *get*.4803 **OPTIONS**4804 The *admin* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section
4805 12.2, Utility Syntax Guidelines, except that the **-i**, **-t**, and **-y** options have optional option-
4806 arguments. These optional option-arguments shall not be presented as separate arguments. The
4807 following options are supported:4808 **-n** Create a new SCCS file. When **-n** is used without **-i**, the SCCS file shall be created
4809 with control information but without any file data.4810 **-i[name]** Specify the *name* of a file from which the text for a new SCCS file shall be taken.
4811 The text constitutes the first delta of the file (see the **-r** option for the delta
4812 numbering scheme). If the **-i** option is used, but the *name* option-argument is
4813 omitted, the text shall be obtained by reading the standard input. If this option is
4814 omitted, the SCCS file shall be created with control information but without any
4815 file data. The **-i** option implies the **-n** option.4816 **-r SID** Specify the SID of the initial delta to be inserted. This SID shall be a trunk SID; that
4817 is, the branch and sequence numbers shall be zero or missing. The level number is
4818 optional, and defaults to 1.4819 **-t[name]** Specify the *name* of a file from which descriptive text for the SCCS file shall be
4820 taken. In the case of existing SCCS files (neither **-i** nor **-n** is specified):

4821		• A -t option without a <i>name</i> option-argument shall cause the removal of
4822		descriptive text (if any) currently in the SCCS file.
4823		• A -t option with a <i>name</i> option-argument shall cause the text (if any) in the
4824		named file to replace the descriptive text (if any) currently in the SCCS file.
4825	-f flag	Specify a <i>flag</i> , and, possibly, a value for the <i>flag</i> , to be placed in the SCCS file.
4826		Several -f options may be supplied on a single <i>admin</i> command line.
4827		Implementations shall recognize the following flags and associated values:
4828	b	Allow use of the -b option on a <i>get</i> command to create branch deltas.
4829	cceil	Specify the highest release (that is, ceiling), a number less than or equal to
4830		9999, which may be retrieved by a <i>get</i> command for editing. The default
4831		value for an unspecified c flag shall be 9999.
4832	ffloor	Specify the lowest release (that is, floor), a number greater than 0 but less
4833		than 9999, which may be retrieved by a <i>get</i> command for editing. The
4834		default value for an unspecified f flag shall be 1.
4835	dSID	Specify the default delta number (SID) to be used by a <i>get</i> command.
4836	istr	Treat the “No ID keywords” message issued by <i>get</i> or <i>delta</i> as a fatal
4837		error. In the absence of this flag, the message is only a warning. The
4838		message is issued if no SCCS identification keywords (see <i>get</i>) are found
4839		in the text retrieved or stored in the SCCS file. If a value is supplied, the
4840		application shall ensure that the keywords exactly match the given string;
4841		however, the string shall contain a keyword, and no embedded
4842		<newline>s.
4843	j	Allow concurrent <i>get</i> commands for editing on the same SID of an SCCS
4844		file. This allows multiple concurrent updates to the same version of the
4845		SCCS file.
4846	l list	Specify a <i>list</i> of releases to which deltas can no longer be made (that is, <i>get</i>
4847		-e against one of these locked releases fails). Conforming applications
4848		shall use the following syntax to specify a <i>list</i> . Implementations may
4849		accept additional forms as an extension:
4850		<list> ::= a <range-list>
4851		<range-list> ::= <range> <range-list>, <range>
4852		<range> ::= <SID>
4853		The character <i>a</i> in the <i>list</i> shall be equivalent to specifying all releases for
4854		the named SCCS file. The non-terminal <SID> in range shall be the delta
4855		number of an existing delta associated with the SCCS file.
4856	n	Cause <i>delta</i> to create a null delta in each of those releases (if any) being
4857		skipped when a delta is made in a new release (for example, in making
4858		delta 5.1 after delta 2.7, releases 3 and 4 are skipped). These null deltas
4859		shall serve as anchor points so that branch deltas may later be created
4860		from them. The absence of this flag shall cause skipped releases to be
4861		nonexistent in the SCCS file, preventing branch deltas from being created
4862		from them in the future. During the initial creation of an SCCS file, the n
4863		flag may be ignored; that is, if the -r option is used to set the release
4864		number of the initial SID to a value greater than 1, null deltas need not be
4865		created for the “skipped” releases.

4866	qtext	Substitute user-definable <i>text</i> for all occurrences of the %Q% keyword in the SCCS file text retrieved by <i>get</i> .
4867		
4868	mmod	Specify the module name of the SCCS file substituted for all occurrences of the %M% keyword in the SCCS file text retrieved by <i>get</i> . If the m flag is not specified, the value assigned shall be the name of the SCCS file with the leading ' . ' removed.
4869		
4870		
4871		
4872	ttype	Specify the <i>type</i> of module in the SCCS file substituted for all occurrences of the %Y% keyword in the SCCS file text retrieved by <i>get</i> .
4873		
4874	vpgm	Cause <i>delta</i> to prompt for modification request (MR) numbers as the reason for creating a delta. The optional value specifies the name of an MR number validation program. (If this flag is set when creating an SCCS file, the application shall ensure that the m option is also used even if its value is null.)
4875		
4876		
4877		
4878		
4879	-d flag	Remove (delete) the specified <i>flag</i> from an SCCS file. Several -d options may be supplied on a single <i>admin</i> command. See the -f option for allowable <i>flag</i> names. (The l <i>list</i> flag gives a <i>list</i> of releases to be unlocked. See the -f option for further description of the l flag and the syntax of a <i>list</i> .)
4880		
4881		
4882		
4883	-a login	Specify a <i>login</i> name, or numerical group ID, to be added to the list of users who may make deltas (changes) to the SCCS file. A group ID shall be equivalent to specifying all <i>login</i> names common to that group ID. Several -a options may be used on a single <i>admin</i> command line. As many <i>logins</i> , or numerical group IDs, as desired may be on the list simultaneously. If the list of users is empty, then anyone may add deltas. If <i>login</i> or group ID is preceded by a ' ! ', the users so specified shall be denied permission to make deltas.
4884		
4885		
4886		
4887		
4888		
4889		
4890	-e login	Specify a <i>login</i> name, or numerical group ID, to be erased from the list of users allowed to make deltas (changes) to the SCCS file. Specifying a group ID is equivalent to specifying all <i>login</i> names common to that group ID. Several -e options may be used on a single <i>admin</i> command line.
4891		
4892		
4893		
4894	-y[comment]	Insert the <i>comment</i> text into the SCCS file as a comment for the initial delta in a manner identical to that of <i>delta</i> . In the POSIX locale, omission of the -y option shall result in a default comment line being inserted in the form:
4895		
4896		
4897		"date and time created %s %s by %s", <date>, <time>, <login>
4898		where <date> is expressed in the format of the <i>date</i> utility's %Y/%m/%d conversion specification, <time> in the format of the <i>date</i> utility's %T conversion specification format, and <login> is the login name of the user creating the file.
4899		
4900		
4901	-m mrlist	Insert the list of modification request (MR) numbers into the SCCS file as the reason for creating the initial delta in a manner identical to <i>delta</i> . The application shall ensure that the v flag is set and the MR numbers are validated if the v flag has a value (the name of an MR number validation program). A diagnostic message shall be written if the v flag is not set or MR validation fails.
4902		
4903		
4904		
4905		
4906	-h	Check the structure of the SCCS file and compare the newly computed checksum with the checksum that is stored in the SCCS file. If the newly computed checksum does not match the checksum in the SCCS file, a diagnostic message shall be written.
4907		
4908		
4909		
4910	-z	Recompute the SCCS file checksum and store it in the first line of the SCCS file (see the -h option above). Note that use of this option on a truly corrupted file may
4911		

4912 prevent future detection of the corruption.

4913 OPERANDS

4914 The following operands shall be supported:

4915 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *admin*
 4916 utility shall behave as though each file in the directory were specified as a named
 4917 file, except that non-SCCS files (last component of the pathname does not begin
 4918 with **s.**) and unreadable files shall be silently ignored.

4919 *newfile* A pathname of an SCCS file to be created.

4920 If exactly one *file* or *newfile* operand appears, and it is **'-'**, the standard input shall be read; each
 4921 line of the standard input shall be taken to be the name of an SCCS file to be processed. Non-
 4922 SCCS files and unreadable files shall be silently ignored.

4923 STDIN

4924 The standard input shall be a text file used only if **-i** is specified without an option-argument or
 4925 if a *file* or *newfile* operand is specified as **'-'**. If the first character of any standard input line is
 4926 <SOH> in the POSIX locale, the results are unspecified.

4927 INPUT FILES

4928 The existing SCCS files shall be text files of an unspecified format.

4929 The application shall ensure that the file named by the **-i** option's *name* option-argument shall be
 4930 a text file; if the first character of any line in this file is <SOH> in the POSIX locale, the results are
 4931 unspecified. If this file contains more than 99 999 lines, the number of lines recorded in the
 4932 header for this file shall be 99 999 for this delta.

4933 ENVIRONMENT VARIABLES

4934 The following environment variables shall affect the execution of *admin*:

4935 *LANG* Provide a default value for the internationalization variables that are unset or null.
 4936 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
 4937 Internationalization Variables for the precedence of internationalization variables
 4938 used to determine the values of locale categories.)

4939 *LC_ALL* If set to a non-empty string value, override the values of all the other
 4940 internationalization variables.

4941 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 4942 characters (for example, single-byte as opposed to multi-byte characters in
 4943 arguments and input files).

4944 *LC_MESSAGES*
 4945 Determine the locale that should be used to affect the format and contents of
 4946 diagnostic messages written to standard error and the contents of the default **-y**
 4947 comment.

4948 *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

4949 ASYNCHRONOUS EVENTS

4950 Default.

4951 STDOUT

4952 Not used.

4953 STDERR

4954 The standard error shall be used only for diagnostic messages.

4955 OUTPUT FILES

4956 Any SCCS files created shall be text files of an unspecified format. During processing of a *file*, a
4957 locking *z-file*, as described in *get* (on page 476), may be created and deleted.

4958 EXTENDED DESCRIPTION

4959 None.

4960 EXIT STATUS

4961 The following exit values shall be returned:

4962 0 Successful completion.

4963 >0 An error occurred.

4964 CONSEQUENCES OF ERRORS

4965 Default.

4966 APPLICATION USAGE

4967 It is recommended that directories containing SCCS files be writable by the owner only, and that
4968 SCCS files themselves be read-only. The mode of the directories should allow only the owner to
4969 modify SCCS files contained in the directories. The mode of the SCCS files prevents any
4970 modification at all except by SCCS commands.

4971 EXAMPLES

4972 None.

4973 RATIONALE

4974 None.

4975 FUTURE DIRECTIONS

4976 None.

4977 SEE ALSO

4979 CHANGE HISTORY

4980 First released in Issue 2.

4981 Issue 6

4982 The normative text is reworded to avoid use of the term “must” for application requirements.

4983 The normative text is reworded to emphasize the term “shall” for implementation requirements.

4984 The grammar is updated.

4985 The Open Group Base Resolution bwg2001-007 is applied, adding new text to the INPUT FILES
4986 section warning that the maximum lines recorded in the file is 99 999.

4987 The Open Group Base Resolution bwg2001-009 is applied, amending the description of the **-h**
4988 option.

4989 **NAME**

4990 alias — define or display aliases

4991 **SYNOPSIS**4992 UP alias [*alias-name*[=*string*] ...]

4993

4994 **DESCRIPTION**

4995 The *alias* utility shall create or redefine alias definitions or write the values of existing alias
 4996 definitions to standard output. An alias definition provides a string value that shall replace a
 4997 command name when it is encountered; see Section 2.3.1 (on page 32).

4998 An alias definition shall affect the current shell execution environment and the execution
 4999 environments of the subshells of the current shell. When used as specified by this volume of
 5000 IEEE Std 1003.1-2001, the alias definition shall not affect the parent process of the current shell
 5001 nor any utility environment invoked by the shell; see Section 2.12 (on page 61).

5002 **OPTIONS**

5003 None.

5004 **OPERANDS**

5005 The following operands shall be supported:

5006 *alias-name* Write the alias definition to standard output.5007 *alias-name=string*5008 Assign the value of *string* to the alias *alias-name*.

5009 If no operands are given, all alias definitions shall be written to standard output.

5010 **STDIN**

5011 Not used.

5012 **INPUT FILES**

5013 None.

5014 **ENVIRONMENT VARIABLES**5015 The following environment variables shall affect the execution of *alias*:

5016 *LANG* Provide a default value for the internationalization variables that are unset or null.
 5017 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
 5018 Internationalization Variables for the precedence of internationalization variables
 5019 used to determine the values of locale categories.)

5020 *LC_ALL* If set to a non-empty string value, override the values of all the other
 5021 internationalization variables.

5022 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 5023 characters (for example, single-byte as opposed to multi-byte characters in
 5024 arguments).

5025 *LC_MESSAGES*

5026 Determine the locale that should be used to affect the format and contents of
 5027 diagnostic messages written to standard error.

5028 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

5029 **ASYNCHRONOUS EVENTS**

5030 Default.

5031 **STDOUT**5032 The format for displaying aliases (when no operands or only *name* operands are specified) shall
5033 be:5034 "%s=%s\n", *name*, *value*5035 The *value* string shall be written with appropriate quoting so that it is suitable for reinput to the
5036 shell. See the description of shell quoting in Section 2.2 (on page 30).5037 **STDERR**

5038 The standard error shall be used only for diagnostic messages.

5039 **OUTPUT FILES**

5040 None.

5041 **EXTENDED DESCRIPTION**

5042 None.

5043 **EXIT STATUS**

5044 The following exit values shall be returned:

5045 0 Successful completion.

5046 >0 One of the *name* operands specified did not have an alias definition, or an error occurred.5047 **CONSEQUENCES OF ERRORS**

5048 Default.

5049 **APPLICATION USAGE**

5050 None.

5051 **EXAMPLES**5052 1. Change *ls* to give a columnated, more annotated output:5053 `alias ls="ls -CF"`

5054 2. Create a simple “redo” command to repeat previous entries in the command history file:

5055 `alias r='fc -s'`5056 3. Use 1K units for *du*:5057 `alias du=du\ -k`5058 4. Set up *nohup* so that it can deal with an argument that is itself an alias name:5059 `alias nohup="nohup "`5060 **RATIONALE**5061 The *alias* description is based on historical KornShell implementations. Known differences exist
5062 between that and the C shell. The KornShell version was adopted to be consistent with all the
5063 other KornShell features in this volume of IEEE Std 1003.1-2001, such as command line editing.5064 Since *alias* affects the current shell execution environment, it is generally provided as a shell
5065 regular built-in.5066 Historical versions of the KornShell have allowed aliases to be exported to scripts that are
5067 invoked by the same shell. This is triggered by the *alias -x* flag; it is allowed by this volume of
5068 IEEE Std 1003.1-2001 only when an explicit extension such as *-x* is used. The standard
5069 developers considered that aliases were of use primarily to interactive users and that they

5070 should normally not affect shell scripts called by those users; functions are available to such
5071 scripts.

5072 Historical versions of the KornShell had not written aliases in a quoted manner suitable for
5073 reentry to the shell, but this volume of IEEE Std 1003.1-2001 has made this a requirement for all
5074 similar output. Therefore, consistency with this volume of IEEE Std 1003.1-2001 was chosen over
5075 this detail of historical practice.

5076 **FUTURE DIRECTIONS**

5077 None.

5079 Section 2.9.5 (on page 54)

5080 **CHANGE HISTORY**

5081 First released in Issue 4.

5082 **Issue 6**

5083 This utility is marked as part of the User Portability Utilities option.

5084 The APPLICATION USAGE section is added.

5085 **NAME**

5086 ar — create and maintain library archives

5087 **SYNOPSIS**5088 SD ar -d[-v] *archive file ...*

5089

5090 XSI ar -m [-v] *archive file ...* |5091 ar -m -a[-v] *posname archive file ...* |5092 ar -m -b[-v] *posname archive file ...* |5093 ar -m -i[-v] *posname archive file ...* |

5094

5095 XSI ar -p[-v] [-s] *archive [file ...]*5096 XSI ar -q[-cv] *archive file ...*

5097

5098 ar -r[-cuv] *archive file ...* |5099 XSI ar -r -a[-cuv] *posname archive file ...* |5100 ar -r -b[-cuv] *posname archive file ...* |5101 ar -r -i[-cuv] *posname archive file ...* |

5102

5103 XSI ar -t[-v] [-s] *archive [file ...]* |5104 XSI ar -x[-v] [-sCT] *archive [file ...]*5105 **DESCRIPTION**5106 The *ar* utility is part of the Software Development Utilities option.

5107 The *ar* utility can be used to create and maintain groups of files combined into an archive. Once
 5108 an archive has been created, new files can be added, and existing files in an archive can be
 5109 extracted, deleted, or replaced. When an archive consists entirely of valid object files, the
 5110 implementation shall format the archive so that it is usable as a library for link editing (see *c99*
 5111 and *fort77*). When some of the archived files are not valid object files, the suitability of the
 5112 XSI archive for library use is undefined. If an archive consists entirely of printable files, the entire
 5113 archive shall be printable.

5114 When *ar* creates an archive, it creates administrative information indicating whether a symbol
 5115 table is present in the archive. When there is at least one object file that *ar* recognizes as such in
 5116 the archive, an archive symbol table shall be created in the archive and maintained by *ar*; it is
 5117 used by the link editor to search the archive. Whenever the *ar* utility is used to create or update
 5118 the contents of such an archive, the symbol table shall be rebuilt. The *-s* option shall force the
 5119 symbol table to be rebuilt.

5120 All *file* operands can be pathnames. However, files within archives shall be named by a filename,
 5121 which is the last component of the pathname used when the file was entered into the archive.
 5122 The comparison of *file* operands to the names of files in archives shall be performed by
 5123 comparing the last component of the operand to the name of the file in the archive.

5124 It is unspecified whether multiple files in the archive may be identically named. In the case of
 5125 XSI such files, however, each *file* and *posname* operand shall match only the first file in the archive
 5126 having a name that is the same as the last component of the operand.

5127 **OPTIONS**

5128 The *ar* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,
 5129 Utility Syntax Guidelines.

5130 The following options shall be supported:

- 5131 XSI **-a** Position new files in the archive after the file named by the *posname* operand.
- 5132 XSI **-b** Position new files in the archive before the file named by the *posname* operand.
- 5133 **-c** Suppress the diagnostic message that is written to standard error by default when
 5134 the archive *archive* is created.
- 5135 XSI **-C** Prevent extracted files from replacing like-named files in the file system. This
 5136 option is useful when **-T** is also used, to prevent truncated filenames from
 5137 replacing files with the same prefix.
- 5138 **-d** Delete one or more *files* from *archive*.
- 5139 XSI **-i** Position new files in the archive before the file in the archive named by the *posname*
 5140 operand (equivalent to **-b**).
- 5141 XSI **-m** Move the named files in the archive. The **-a**, **-b**, or **-i** options with the *posname*
 5142 operand indicate the position; otherwise, move the names files in the archive to the
 5143 end of the archive.
- 5144 **-p** Write the contents of the *files* in the archive named by *file* operands from *archive* to
 5145 the standard output. If no *file* operands are specified, the contents of all files in the
 5146 archive shall be written in the order of the archive.
- 5147 XSI **-q** Append the named files to the end of the archive. In this case *ar* does not check
 5148 whether the added files are already in the archive. This is useful to bypass the
 5149 searching otherwise done when creating a large archive piece by piece.
- 5150 **-r** Replace or add *files* to *archive*. If the archive named by *archive* does not exist, a
 5151 new archive shall be created and a diagnostic message shall be written to standard
 5152 error (unless the **-c** option is specified). If no *files* are specified and the *archive*
 5153 exists, the results are undefined. Files that replace existing files in the archive shall
 5154 not change the order of the archive. Files that do not replace existing files in the
 5155 XSI archive shall be appended to the archive unless a **-a**, **-b**, or **-i** option specifies
 5156 another position.
- 5157 XSI **-s** Force the regeneration of the archive symbol table even if *ar* is not invoked with an
 5158 option that modifies the archive contents. This option is useful to restore the
 5159 archive symbol table after it has been stripped; see *strip*.
- 5160 **-t** Write a table of contents of *archive* to the standard output. The files specified by the
 5161 *file* operands shall be included in the written list. If no *file* operands are specified,
 5162 all files in *archive* shall be included in the order of the archive.
- 5163 XSI **-T** Allow filename truncation of extracted files whose archive names are longer than
 5164 the file system can support. By default, extracting a file with a name that is too
 5165 long shall be an error; a diagnostic message shall be written and the file shall not
 5166 be extracted.
- 5167 **-u** Update older files in the archive. When used with the **-r** option, files in the archive
 5168 shall be replaced only if the corresponding *file* has a modification time that is at
 5169 least as new as the modification time of the file in the archive.

5170 **-v** Give verbose output. When used with the option characters **-d**, **-r**, or **-x**, write a
 5171 detailed file-by-file description of the archive creation and maintenance activity, as
 5172 described in the STDOUT section.

5173 When used with **-p**, write the name of the file in the archive to the standard output
 5174 before writing the file in the archive itself to the standard output, as described in
 5175 the STDOUT section.

5176 When used with **-t**, include a long listing of information about the files in the
 5177 archive, as described in the STDOUT section.

5178 **-x** Extract the files in the archive named by the *file* operands from *archive*. The
 5179 contents of the archive shall not be changed. If no *file* operands are given, all files
 5180 in the archive shall be extracted. The modification time of each file extracted shall
 5181 be set to the time the file is extracted from the archive.

5182 OPERANDS

5183 The following operands shall be supported:

5184 *archive* A pathname of the archive.

5185 *file* A pathname. Only the last component shall be used when comparing against the
 5186 names of files in the archive. If two or more *file* operands have the same last
 5187 pathname component (basename), the results are unspecified. The
 5188 implementation's archive format shall not truncate valid filenames of files added
 5189 to or replaced in the archive.

5190 xSI *posname* The name of a file in the archive, used for relative positioning; see options **-m** and
 5191 **-r**.

5192 STDIN

5193 Not used.

5194 INPUT FILES

5195 The archive named by *archive* shall be a file in the format created by *ar -r*.

5196 ENVIRONMENT VARIABLES

5197 The following environment variables shall affect the execution of *ar*:

5198 *LANG* Provide a default value for the internationalization variables that are unset or null.
 5199 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
 5200 Internationalization Variables for the precedence of internationalization variables
 5201 used to determine the values of locale categories.)

5202 *LC_ALL* If set to a non-empty string value, override the values of all the other
 5203 internationalization variables.

5204 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
 5205 characters (for example, single-byte as opposed to multi-byte characters in
 5206 arguments and input files).

5207 *LC_MESSAGES* Determine the locale that should be used to affect the format and contents of
 5208 diagnostic messages written to standard error.
 5209

5210 *LC_TIME* Determine the format and content for date and time strings written by *ar -tv*.

5211 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

5212 *TMPDIR* Determine the pathname that overrides the default directory for temporary files, if
 5213 any.

5214 *TZ* Determine the timezone used to calculate date and time strings written by *ar -tv*.
 5215 If *TZ* is unset or null, an unspecified default timezone shall be used.

5216 **ASYNCHRONOUS EVENTS**

5217 Default.

5218 **STDOUT**

5219 If the **-d** option is used with the **-v** option, the standard output format shall be:

5220 "d - %s\n", <file>

5221 where *file* is the operand specified on the command line.

5222 If the **-p** option is used with the **-v** option, *ar* shall precede the contents of each file with:

5223 "\n<%s>\n\n", <file>

5224 where *file* is the operand specified on the command line, if *file* operands were specified, and the
 5225 name of the file in the archive if they were not.

5226 If the **-r** option is used with the **-v** option:

- 5227 • If *file* is already in the archive, the standard output format shall be:

5228 "r - %s\n", <file>

5229 where <*file*> is the operand specified on the command line.

- 5230 • If *file* is not already in the archive, the standard output format shall be:

5231 "a - %s\n", <file>

5232 where <*file*> is the operand specified on the command line.

5233 If the **-t** option is used, *ar* shall write the names of the files in the archive to the standard output
 5234 in the format:

5235 "%s\n", <file>

5236 where *file* is the operand specified on the command line, if *file* operands were specified, or the
 5237 name of the file in the archive if they were not.

5238 If the **-t** option is used with the **-v** option, the standard output format shall be:

5239 "%s %u/%u %u %s %d %d:%d %d %s\n", <member mode>, <user ID>,
 5240 <group ID>, <number of bytes in member>,
 5241 <abbreviated month>, <day-of-month>, <hour>,
 5242 <minute>, <year>, <file>

5243 where:

5244 <*file*> Shall be the operand specified on the command line, if *file* operands were specified,
 5245 or the name of the file in the archive if they were not.

5246 <*member mode*>

5247 Shall be formatted the same as the <*file mode*> string defined in the STDOUT
 5248 section of *ls*, except that the first character, the <*entry type*>, is not used; the string
 5249 represents the file mode of the file in the archive at the time it was added to or
 5250 replaced in the archive.

5251 The following represent the last-modification time of a file when it was most recently added to
 5252 or replaced in the archive:

5253 <*abbreviated month*>
 5254 Equivalent to the format of the %b conversion specification format in *date*.

5255 <*day-of-month*>
 5256 Equivalent to the format of the %e conversion specification format in *date*.

5257 <*hour*> Equivalent to the format of the %H conversion specification format in *date*.

5258 <*minute*> Equivalent to the format of the %M conversion specification format in *date*.

5259 <*year*> Equivalent to the format of the %Y conversion specification format in *date*.

5260 When *LC_TIME* does not specify the POSIX locale, a different format and order of presentation
 5261 of these fields relative to each other may be used in a format appropriate in the specified locale.

5262 If the **-x** option is used with the **-v** option, the standard output format shall be:

5263 "x - %s\n", <*file*>

5264 where *file* is the operand specified on the command line, if *file* operands were specified, or the
 5265 name of the file in the archive if they were not.

5266 **STDERR**
 5267 The standard error shall be used only for diagnostic messages. The diagnostic message about
 5268 creating a new archive when **-c** is not specified shall not modify the exit status.

5269 **OUTPUT FILES**
 5270 Archives are files with unspecified formats.

5271 **EXTENDED DESCRIPTION**
 5272 None.

5273 **EXIT STATUS**
 5274 The following exit values shall be returned:
 5275 0 Successful completion.
 5276 >0 An error occurred.

5277 **CONSEQUENCES OF ERRORS**
 5278 Default.

5279 **APPLICATION USAGE**
 5280 None.

5281 **EXAMPLES**
 5282 None.

5283 **RATIONALE**
 5284 The archive format is not described. It is recognized that there are several known *ar* formats,
 5285 which are not compatible. The *ar* utility is included, however, to allow creation of archives that
 5286 are intended for use only on one machine. The archive is specified as a file, and it can be moved
 5287 as a file. This does allow an archive to be moved from one machine to another machine that uses
 5288 the same implementation of *ar*.

5289 Utilities such as *pax* (and its forebears *tar* and *cpio*) also provide portable “archives”. This is a not
 5290 a duplication; the *ar* utility is included to provide an interface primarily for *make* and the
 5291 compilers, based on a historical model.

5292 In historical implementations, the **-q** option (available on XSI-conforming systems) is known to
 5293 execute quickly because *ar* does not check on whether the added members are already in the
 5294 archive. This is useful to bypass the searching otherwise done when creating a large archive

5295 piece-by-piece. These remarks may but need not remain true for a brand new implementation of
5296 this utility; hence, these remarks have been moved into the RATIONALE.

5297 BSD implementations historically required applications to provide the **-s** option whenever the
5298 archive was supposed to contain a symbol table. As in this volume of IEEE Std 1003.1-2001,
5299 System V historically creates or updates an archive symbol table whenever an object file is
5300 removed from, added to, or updated in the archive.

5301 The OPERANDS section requires what might seem to be true without specifying it: the archive
5302 cannot truncate the filenames below {NAME_MAX}. Some historical implementations do so,
5303 however, causing unexpected results for the application. Therefore, this volume of
5304 IEEE Std 1003.1-2001 makes the requirement explicit to avoid misunderstandings.

5305 According to the System V documentation, the options **-dmpqrtx** are not required to begin with
5306 a hyphen ('-'). This volume of IEEE Std 1003.1-2001 requires that a conforming application use
5307 the leading hyphen.

5308 The archive format used by the 4.4 BSD implementation is documented in this RATIONALE as
5309 an example:

5310 A file created by *ar* begins with the “magic” string `!<arch>\n`. The rest of the archive is
5311 made up of objects, each of which is composed of a header for a file, a possible filename, and
5312 the file contents. The header is portable between machine architectures, and, if the file
5313 contents are printable, the archive is itself printable.

5314 The header is made up of six ASCII fields, followed by a two-character trailer. The fields are
5315 the object name (16 characters), the file last modification time (12 characters), the user and
5316 group IDs (each 6 characters), the file mode (8 characters), and the file size (10 characters). All
5317 numeric fields are in decimal, except for the file mode, which is in octal.

5318 The modification time is the file `st_mtime` field. The user and group IDs are the file `st_uid` and
5319 `st_gid` fields. The file mode is the file `st_mode` field. The file size is the file `st_size` field. The
5320 two-byte trailer is the string `"\n"`.

5321 Only the name field has any provision for overflow. If any filename is more than 16
5322 characters in length or contains an embedded space, the string `#1/` followed by the ASCII
5323 length of the name is written in the name field. The file size (stored in the archive header) is
5324 incremented by the length of the name. The name is then written immediately following the
5325 archive header.

5326 Any unused characters in any of these fields are written as `<space>s`. If any fields are their
5327 particular maximum number of characters in length, there is no separation between the
5328 fields.

5329 Objects in the archive are always an even number of bytes long; files that are an odd number
5330 of bytes long are padded with a `<newline>`, although the size in the header does not reflect
5331 this.

5332 The *ar* utility description requires that (when all its members are valid object files) *ar* produce an
5333 object code library, which the linkage editor can use to extract object modules. If the linkage
5334 editor needs a symbol table to permit random access to the archive, *ar* must provide it; however,
5335 *ar* does not require a symbol table.

5336 The BSD **-o** option was omitted. It is a rare conforming application that uses *ar* to extract object
5337 code from a library with concern for its modification time, since this can only be of importance
5338 to *make*. Hence, since this functionality is not deemed important for applications portability, the
5339 modification time of the extracted files is set to the current time.

5340 There is at least one known implementation (for a small computer) that can accommodate only
 5341 object files for that system, disallowing mixed object and other files. The ability to handle any
 5342 type of file is not only historical practice for most implementations, but is also a reasonable
 5343 expectation.

5344 Consideration was given to changing the output format of *ar -tv* to the same format as the
 5345 output of *ls -l*. This would have made parsing the output of *ar* the same as that of *ls*. This was
 5346 rejected in part because the current *ar* format is commonly used and changes would break
 5347 historical usage. Second, *ar* gives the user ID and group ID in numeric format separated by a
 5348 slash. Changing this to be the user name and group name would not be correct if the archive
 5349 were moved to a machine that contained a different user database. Since *ar* cannot know
 5350 whether the archive was generated on the same machine, it cannot tell what to report.

5351 The text on the *-ur* option combination is historical practice—since one filename can easily
 5352 represent two different files (for example, */a/foo* and */b/foo*), it is reasonable to replace the file in
 5353 the archive even when the modification time in the archive is identical to that in the file system.

5354 FUTURE DIRECTIONS

5355 None.

5356 SEE ALSO

5357 *c99*, *date*, *fort77*, *pax*, *strip* the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13,
 5358 Headers, *<unistd.h>* description of {POSIX_NO_TRUNC}

5359 CHANGE HISTORY

5360 First released in Issue 2.

5361 Issue 5

5362 The FUTURE DIRECTIONS section is added.

5363 Issue 6

5364 This utility is marked as part of the Software Development Utilities option.

5365 The STDOUT description is changed for the *-v* option to align with the IEEE P1003.2b draft
 5366 standard.

5367 The normative text is reworded to avoid use of the term “must” for application requirements.

5368 The *TZ* entry is added to the ENVIRONMENT VARIABLES section.

5369 IEEE PASC Interpretation 1003.2 #198 is applied, changing the description to consistently use
 5370 “file” to refer to a file in the file system hierarchy, “archive” to refer to the archive being
 5371 operated upon by the *ar* utility, and “file in the archive” to refer to a copy of a file that is
 5372 contained in the archive.

5373 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/10 is applied, making corrections to the
 5374 SYNOPSIS. The change was needed since the *-a*, *-b*, and *-i* options are mutually-exclusive, and
 5375 *posname* is required if any of these options is specified.

5376 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/11 is applied, correcting the description
 5377 of the two-byte trailer in RATIONALE which had missed out a backquote. The correct trailer is a
 5378 backquote followed by a <newline>.

5379 **NAME**

5380 asa — interpret carriage-control characters

5381 **SYNOPSIS**5382 FR asa [*file* ...]

5383

5384 **DESCRIPTION**5385 The *asa* utility shall write its input files to standard output, mapping carriage-control characters
5386 from the text files to line-printer control sequences in an implementation-defined manner.5387 The first character of every line shall be removed from the input, and the following actions are
5388 performed.

5389 If the character removed is:

5390 <space> The rest of the line is output without change.

5391 0 A <newline> is output, then the rest of the input line.

5392 1 One or more implementation-defined characters that causes an advance to the next
5393 page shall be output, followed by the rest of the input line.5394 + The <newline> of the previous line shall be replaced with one or more
5395 implementation-defined characters that causes printing to return to column position 1,
5396 followed by the rest of the input line. If the ' + ' is the first character in the input, it shall
5397 be equivalent to <space>.5398 The action of the *asa* utility is unspecified upon encountering any character other than those
5399 listed above as the first character in a line.5400 **OPTIONS**

5401 None.

5402 **OPERANDS**5403 *file* A pathname of a text file used for input. If no *file* operands are specified, the
5404 standard input shall be used.5405 **STDIN**5406 The standard input shall be used only if no *file* operands are specified; see the INPUT FILES
5407 section.5408 **INPUT FILES**

5409 The input files shall be text files.

5410 **ENVIRONMENT VARIABLES**5411 The following environment variables shall affect the execution of *asa*:5412 *LANG* Provide a default value for the internationalization variables that are unset or null.
5413 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
5414 Internationalization Variables for the precedence of internationalization variables
5415 used to determine the values of locale categories.)5416 *LC_ALL* If set to a non-empty string value, override the values of all the other
5417 internationalization variables.5418 *LC_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as
5419 characters (for example, single-byte as opposed to multi-byte characters in
5420 arguments and input files).

5421 *LC_MESSAGES*
 5422 Determine the locale that should be used to affect the format and contents of
 5423 diagnostic messages written to standard error.

5424 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC_MESSAGES*.

5425 **ASYNCHRONOUS EVENTS**
 5426 Default.

5427 **STDOUT**
 5428 The standard output shall be the text from the input file modified as described in the
 5429 DESCRIPTION section.

5430 **STDERR**
 5431 None.

5432 **OUTPUT FILES**
 5433 None.

5434 **EXTENDED DESCRIPTION**
 5435 None.

5436 **EXIT STATUS**
 5437 The following exit values shall be returned:
 5438 0 All input files were output successfully.
 5439 >0 An error occurred.

5440 **CONSEQUENCES OF ERRORS**
 5441 Default.

5442 **APPLICATION USAGE**
 5443 None.

5444 **EXAMPLES**

5445 1. The following command:
 5446 *asa file*
 5447 permits the viewing of *file* (created by a program using FORTRAN-style carriage-control
 5448 characters) on a terminal.

5449 2. The following command:
 5450 *a.out | asa | lp*
 5451 formats the FORTRAN output of **a.out** and directs it to the printer.

5452 **RATIONALE**
 5453 The *asa* utility is needed to map “standard” FORTRAN 77 output into a form acceptable to
 5454 contemporary printers. Usually, *asa* is used to pipe data to the *lp* utility; see *lp*.

5455 This utility is generally used only by FORTRAN programs. The standard developers decided to
 5456 retain *asa* to avoid breaking the historical large base of FORTRAN applications that put
 5457 carriage-control characters in their output files. There is no requirement that a system have a
 5458 FORTRAN compiler in order to run applications that need *asa*.

5459 Historical implementations have used an ASCII <form-feed> in response to a 1 and an ASCII
 5460 <carriage-return> in response to a '+'. It is suggested that implementations treat characters
 5461 other than 0, 1, and '+' as <space> in the absence of any compelling reason to do otherwise.
 5462 However, the action is listed here as “unspecified”, permitting an implementation to provide

5463 extensions to access fast multiple-line slewing and channel seeking in a non-portable manner.

5464 **FUTURE DIRECTIONS**

5465 None.

5466 **SEE ALSO**

5467 *fort77, lp*

5468 **CHANGE HISTORY**

5469 First released in Issue 4.

5470 **Issue 6**

5471 This utility is marked as part of the FORTRAN Runtime Utilities option.

5472 The normative text is reworded to avoid use of the term “must” for application requirements.

5473 **NAME**

5474 at — execute commands at a later time

5475 **SYNOPSIS**5476 UP at [-m] [-f *file*] [-q *queuenam*e] -t *time_arg*5477 at [-m] [-f *file*] [-q *queuenam*e] *timespec* ...5478 at -r *at_job_id* ...5479 at -l -q *queuenam*e5480 at -l [*at_job_id* ...]

5481

5482 **DESCRIPTION**5483 The *at* utility shall read commands from standard input and group them together as an *at-job*, to
5484 be executed at a later time.5485 The *at-job* shall be executed in a separate invocation of the shell, running in a separate process
5486 group with no controlling terminal, except that the environment variables, current working
5487 directory, file creation mask, and other implementation-defined execution-time attributes in
5488 effect when the *at* utility is executed shall be retained and used when the *at-job* is executed.5489 When the *at-job* is submitted, the *at_job_id* and scheduled time shall be written to standard error.
5490 The *at_job_id* is an identifier that shall be a string consisting solely of alphanumeric characters
5491 and the period character. The *at_job_id* shall be assigned by the system when the job is scheduled
5492 such that it uniquely identifies a particular job.5493 User notification and the processing of the job's standard output and standard error are
5494 described under the **-m** option.5495 XSI Users shall be permitted to use *at* if their name appears in the file **/usr/lib/cron/at.allow**. If that
5496 file does not exist, the file **/usr/lib/cron/at.deny** shall be checked to determine whether the user
5497 shall be denied access to *at*. If neither file exists, only a process with the appropriate privileges
5498 shall be allowed to submit a job. If only **at.deny** exists and is empty, global usage shall be
5499 permitted. The **at.allow** and **at.deny** files shall consist of one user name per line.5500 **OPTIONS**5501 The *at* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,
5502 Utility Syntax Guidelines.

5503 The following options shall be supported:

5504 **-f file** Specify the pathname of a file to be used as the source of the *at-job*, instead of
5505 standard input.5506 **-l** (The letter ell.) Report all jobs scheduled for the invoking user if no *at_job_id*
5507 operands are specified. If *at_job_ids* are specified, report only information for these
5508 jobs. The output shall be written to standard output.5509 **-m** Send mail to the invoking user after the *at-job* has run, announcing its completion.
5510 Standard output and standard error produced by the *at-job* shall be mailed to the
5511 user as well, unless redirected elsewhere. Mail shall be sent even if the job
5512 produces no output.5513 If **-m** is not used, the job's standard output and standard error shall be provided to
5514 the user by means of mail, unless they are redirected elsewhere; if there is no such
5515 output to provide, the implementation need not notify the user of the job's
5516 completion.

5517 **-q** *queue**name*
 5518 Specify in which queue to schedule a job for submission. When used with the **-l**
 5519 option, limit the search to that particular queue. By default, at-jobs shall be
 5520 scheduled in queue *a*. In contrast, queue *b* shall be reserved for batch jobs; see
 5521 *batch*. The meanings of all other *queue**names* are implementation-defined. If **-q** is
 5522 specified along with either of the **-t** *time_arg* or *timespec* arguments, the results are
 5523 unspecified.

5524 **-r** Remove the jobs with the specified *at_job_id* operands that were previously
 5525 scheduled by the *at* utility.

5526 **-t** *time_arg* Submit the job to be run at the time specified by the *time* option-argument, which
 5527 the application shall ensure has the format as specified by the *touch -t time* utility.

5528 OPERANDS

5529 The following operands shall be supported:

5530 *at_job_id* The name reported by a previous invocation of the *at* utility at the time the job was
 5531 scheduled.

5532 *timespec* Submit the job to be run at the date and time specified. All of the *timespec* operands
 5533 are interpreted as if they were separated by <space>s and concatenated, and shall
 5534 be parsed as described in the grammar at the end of this section. The date and time
 5535 shall be interpreted as being in the timezone of the user (as determined by the *TZ*
 5536 variable), unless a timezone name appears as part of *time*, below.

5537 In the POSIX locale, the following describes the three parts of the time
 5538 specification string. All of the values from the *LC_TIME* categories in the POSIX
 5539 locale shall be recognized in a case-insensitive manner.

5540 *time* The time can be specified as one, two, or four digits. One-digit and
 5541 two-digit numbers shall be taken to be hours; four-digit numbers to
 5542 be hours and minutes. The time can alternatively be specified as two
 5543 numbers separated by a colon, meaning *hour:minute*. An AM/PM
 5544 indication (one of the values from the **am_pm** keywords in the
 5545 *LC_TIME* locale category) can follow the time; otherwise, a 24-hour
 5546 clock time shall be understood. A timezone name can also follow to
 5547 further qualify the time. The acceptable timezone names are
 5548 implementation-defined, except that they shall be case-insensitive
 5549 and the string **utc** is supported to indicate the time is in Coordinated
 5550 Universal Time. In the POSIX locale, the *time* field can also be one of
 5551 the following tokens:

5552 **midnight** Indicates the time 12:00 am (00:00).

5553 **noon** Indicates the time 12:00 pm.

5554 **now** Indicates the current day and time. Invoking *at <now>*
 5555 shall submit an at-job for potentially immediate
 5556 execution (that is, subject only to unspecified
 5557 scheduling delays).

5558 *date* An optional *date* can be specified as either a month name (one of the
 5559 values from the **mon** or **abmon** keywords in the *LC_TIME* locale
 5560 category) followed by a day number (and possibly year number
 5561 preceded by a comma), or a day of the week (one of the values from
 5562 the **day** or **abday** keywords in the *LC_TIME* locale category). In the
 5563 POSIX locale, two special days shall be recognized:

5564 **today** Indicates the current day.

5565 **tomorrow** Indicates the day following the current day.

5566 If no *date* is given, **today** shall be assumed if the given time is greater
5567 than the current time, and **tomorrow** shall be assumed if it is less. If
5568 the given month is less than the current month (and no year is given),
5569 next year shall be assumed.

5570 *increment* The optional *increment* shall be a number preceded by a plus sign
5571 (' + ') and suffixed by one of the following: **minutes, hours, days,**
5572 **weeks, months, or years.** (The singular forms shall also be
5573 accepted.) The keyword **next** shall be equivalent to an increment
5574 number of +1. For example, the following are equivalent commands:

5575 at 2pm + 1 week
5576 at 2pm next week

5577 The following grammar describes the precise format of *timespec* in the POSIX locale. The general
5578 conventions for this style of grammar are described in Section 1.10 (on page 19). This formal
5579 syntax shall take precedence over the preceding text syntax description. The longest possible
5580 token or delimiter shall be recognized at a given point. When used in a *timespec*, white space
5581 shall also delimit tokens.

5582 %token hr24clock_hr_min
5583 %token hr24clock_hour
5584 /*
5585 An hr24clock_hr_min is a one, two, or four-digit number. A one-digit
5586 or two-digit number constitutes an hr24clock_hour. An hr24clock_hour
5587 may be any of the single digits [0,9], or may be double digits, ranging
5588 from [00,23]. If an hr24clock_hr_min is a four-digit number, the
5589 first two digits shall be a valid hr24clock_hour, while the last two
5590 represent the number of minutes, from [00,59].
5591 */

5685 STDIN

5686 The standard input shall be a text file consisting of commands acceptable to the shell command
 5687 language described in Chapter 2 (on page 29). The standard input shall only be used if no **-f file**
 5688 option is specified.

5689 INPUT FILES

5690 See the STDIN section.

5691 XSI The text files **/usr/lib/cron/at.allow** and **/usr/lib/cron/at.deny** shall contain zero or more user
 5692 names, one per line, of users who are, respectively, authorized or denied access to the *at* and
 5693 *batch* utilities.

5694 ENVIRONMENT VARIABLES

5695 The following environment variables shall affect the execution of *at*:

5696 **LANG** Provide a default value for the internationalization variables that are unset or null.
 5697 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
 5698 Internationalization Variables for the precedence of internationalization variables
 5699 used to determine the values of locale categories.)

5700 **LC_ALL** If set to a non-empty string value, override the values of all the other
 5701 internationalization variables.

5702 **LC_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as
 5703 characters (for example, single-byte as opposed to multi-byte characters in
 5704 arguments and input files).

5705 **LC_MESSAGES**

5706 Determine the locale that should be used to affect the format and contents of

5707 diagnostic messages written to standard error and informative messages written to
 5708 standard output.

5709 XSI **NLS_PATH** Determine the location of message catalogs for the processing of *LC_MESSAGES*.

5710 **LC_TIME** Determine the format and contents for date and time strings written and accepted
 5711 by *at*.

5712 **SHELL** Determine a name of a command interpreter to be used to invoke the *at*-job. If the
 5713 variable is unset or null, *sh* shall be used. If it is set to a value other than a name for
 5714 *sh*, the implementation shall do one of the following: use that shell; use *sh*; use the
 5715 login shell from the user database; or any of the preceding accompanied by a
 5716 warning diagnostic about which was chosen.

5717 **TZ** Determine the timezone. The job shall be submitted for execution at the time
 5718 specified by *timespec* or *-t time* relative to the timezone specified by the *TZ*
 5719 variable. If *timespec* specifies a timezone, it shall override *TZ*. If *timespec* does not
 5720 specify a timezone and *TZ* is unset or null, an unspecified default timezone shall
 5721 be used.

5722 **ASYNCHRONOUS EVENTS**

5723 Default.

5724 **STDOUT**

5725 When standard input is a terminal, prompts of unspecified format for each line of the user input
 5726 described in the STDIN section may be written to standard output.

5727 In the POSIX locale, the following shall be written to the standard output for each job when jobs
 5728 are listed in response to the *-l* option:

5729 "%s\t%s\n", *at_job_id*, *<date>*

5730 where *date* shall be equivalent in format to the output of:

5731 date +"%a %b %e %T %Y"

5732 The date and time written shall be adjusted so that they appear in the timezone of the user (as
 5733 determined by the *TZ* variable).

5734 **STDERR**

5735 In the POSIX locale, the following shall be written to standard error when a job has been
 5736 successfully submitted:

5737 "job %s at %s\n", *at_job_id*, *<date>*

5738 where *date* has the same format as that described in the STDOUT section. Neither this, nor
 5739 warning messages concerning the selection of the command interpreter, shall be considered a
 5740 diagnostic that changes the exit status.

5741 Diagnostic messages, if any, shall be written to standard error.

5742 **OUTPUT FILES**

5743 None.

5744 **EXTENDED DESCRIPTION**

5745 None.

5746 **EXIT STATUS**

5747 The following exit values shall be returned:

5748 0 The *at* utility successfully submitted, removed, or listed a job or jobs.

5749 >0 An error occurred.

5750 CONSEQUENCES OF ERRORS

5751 The job shall not be scheduled, removed, or listed.

5752 APPLICATION USAGE

5753 The format of the *at* command line shown here is guaranteed only for the POSIX locale. Other
5754 cultures may be supported with substantially different interfaces, although implementations are
5755 encouraged to provide comparable levels of functionality.

5756 Since the commands run in a separate shell invocation, running in a separate process group with
5757 no controlling terminal, open file descriptors, traps, and priority inherited from the invoking
5758 environment are lost.

5759 Some implementations do not allow substitution of different shells using *SHELL*. System V
5760 systems, for example, have used the login shell value for the user in */etc/passwd*. To select
5761 reliably another command interpreter, the user must include it as part of the script, such as:

```
5762       $ at 1800
5763       myshell myscript
5764       EOT
5765       job ... at ...
5766       $
```

5767 EXAMPLES

5768 1. This sequence can be used at a terminal:

```
5769           at -m 0730 tomorrow
5770           sort < file >outfile
5771           EOT
```

5772 2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a
5773 command procedure (the sequence of output redirection specifications is significant):

```
5774           at now + 1 hour <<!
5775           diff file1 file2 2>&1 >outfile | mailx mygroup
5776           !
```

5777 3. To have a job reschedule itself, *at* can be invoked from within the *at*-job. For example, this
5778 daily processing script named **my.daily** runs every day (although *crontab* is a more
5779 appropriate vehicle for such work):

```
5780           # my.daily runs every day
5781           daily processing
5782           at now tomorrow < my.daily
```

5783 4. The spacing of the three portions of the POSIX locale *timespec* is quite flexible as long as
5784 there are no ambiguities. Examples of various times and operand presentation include:

```
5785           at 0815am Jan 24
5786           at 8 :15amjan24
5787           at now "+ 1day"
5788           at 5 pm FRIday
5789           at '17
5790                utc+
5791                30minutes'
```

5792 **RATIONALE**

5793 The *at* utility reads from standard input the commands to be executed at a later time. It may be
 5794 useful to redirect standard output and standard error within the specified commands.

5795 The **-t** *time* option was added as a new capability to support an internationalized way of
 5796 specifying a time for execution of the submitted job.

5797 Early proposals added a “jobname” concept as a way of giving submitted jobs names that are
 5798 meaningful to the user submitting them. The historical, system-specified *at_job_id* gives no
 5799 indication of what the job is. Upon further reflection, it was decided that the benefit of this was
 5800 not worth the change in historical interface. The *at* functionality is useful in simple
 5801 environments, but in large or complex situations, the functionality provided by the Batch
 5802 Services option is more suitable.

5803 The **-q** option historically has been an undocumented option, used mainly by the *batch* utility.

5804 The System V **-m** option was added to provide a method for informing users that an at-job had
 5805 completed. Otherwise, users are only informed when output to standard error or standard
 5806 output are not redirected.

5807 The behavior of *at* **<now>** was changed in an early proposal from being unspecified to
 5808 submitting a job for potentially immediate execution. Historical BSD *at* implementations
 5809 support this. Historical System V implementations give an error in that case, but a change to the
 5810 System V versions should have no backwards-compatibility ramifications.

5811 On BSD-based systems, a **-u** *user* option has allowed those with appropriate privileges to access
 5812 the work of other users. Since this is primarily a system administration feature and is not
 5813 universally implemented, it has been omitted. Similarly, a specification for the output format for
 5814 a user with appropriate privileges viewing the queues of other users has been omitted.

5815 The **-f** *file* option from System V is used instead of the BSD method of using the last operand as
 5816 the pathname. The BSD method is ambiguous—does:

5817 `at 1200 friday`

5818 mean the same thing if there is a file named **friday** in the current directory?

5819 The *at_job_id* is composed of a limited character set in historical practice, and it is mandated here
 5820 to invalidate systems that might try using characters that require shell quoting or that could not
 5821 be easily parsed by shell scripts.

5822 The *at* utility varies between System V and BSD systems in the way timezones are used. On
 5823 System V systems, the *TZ* variable affects the at-job submission times and the times displayed
 5824 for the user. On BSD systems, *TZ* is not taken into account. The BSD behavior is easily achieved
 5825 with the current specification. If the user wishes to have the timezone default to that of the
 5826 system, they merely need to issue the *at* command immediately following an unsetting or null
 5827 assignment to *TZ*. For example:

5828 `TZ= at noon ...`

5829 gives the desired BSD result.

5830 While the yacc-like grammar specified in the OPERANDS section is lexically unambiguous with
 5831 respect to the digit strings, a lexical analyzer would probably be written to look for and return
 5832 digit strings in those cases. The parser could then check whether the digit string returned is a
 5833 valid *day_number*, *year_number*, and so on, based on the context.

5834 **FUTURE DIRECTIONS**

5835 None.

5836 **SEE ALSO**5837 *batch, crontab*5838 **CHANGE HISTORY**

5839 First released in Issue 2.

5840 **Issue 6**

5841 This utility is marked as part of the User Portability Utilities option.

5842 The following new requirements on POSIX implementations derive from alignment with the
5843 Single UNIX Specification:

- 5844
- If **-m** is not used, the job's standard output and standard error are provided to the user by
-
- 5845 mail.

5846 The effects of using the **-q** and **-t** options as defined in the IEEE P1003.2b draft standard are
5847 specified.

5848 The normative text is reworded to avoid use of the term “must” for application requirements.

5849 **NAME**

5850 awk — pattern scanning and processing language

5851 **SYNOPSIS**5852 awk [-F *ERE*] [-v *assignment*] ... *program* [*argument* ...]5853 awk [-F *ERE*] -f *progfile* ... [-v *assignment*] ... [*argument* ...]5854 **DESCRIPTION**

5855 The *awk* utility shall execute programs written in the *awk* programming language, which is
 5856 specialized for textual data manipulation. An *awk* program is a sequence of patterns and
 5857 corresponding actions. When input is read that matches a pattern, the action associated with
 5858 that pattern is carried out.

5859 Input shall be interpreted as a sequence of records. By default, a record is a line, less its
 5860 terminating <newline>, but this can be changed by using the **RS** built-in variable. Each record of
 5861 input shall be matched in turn against each pattern in the program. For each pattern matched,
 5862 the associated action shall be executed.

5863 The *awk* utility shall interpret each input record as a sequence of fields where, by default, a field
 5864 is a string of non-<blank>s. This default white-space field delimiter can be changed by using the
 5865 **FS** built-in variable or **-F *ERE***. The *awk* utility shall denote the first field in a record \$1, the
 5866 second \$2, and so on. The symbol \$0 shall refer to the entire record; setting any other field causes
 5867 the re-evaluation of \$0. Assigning to \$0 shall reset the values of all other fields and the **NF** built-
 5868 in variable.

5869 **OPTIONS**

5870 The *awk* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section
 5871 12.2, Utility Syntax Guidelines.

5872 The following options shall be supported:

5873 **-F *ERE*** Define the input field separator to be the extended regular expression *ERE*, before
 5874 any input is read; see **Regular Expressions** (on page 161).

5875 **-f *progfile*** Specify the pathname of the file *progfile* containing an *awk* program. If multiple
 5876 instances of this option are specified, the concatenation of the files specified as
 5877 *progfile* in the order specified shall be the *awk* program. The *awk* program can
 5878 alternatively be specified in the command line as a single argument.

5879 **-v *assignment*** The application shall ensure that the *assignment* argument is in the same form as an
 5880 *assignment* operand. The specified variable assignment shall occur prior to
 5881 executing the *awk* program, including the actions associated with **BEGIN** patterns
 5882 (if any). Multiple occurrences of this option can be specified.
 5883

5884 **OPERANDS**

5885 The following operands shall be supported:

5886 *program* If no **-f** option is specified, the first operand to *awk* shall be the text of the *awk*
 5887 program. The application shall supply the *program* operand as a single argument to
 5888 *awk*. If the text does not end in a <newline>, *awk* shall interpret the text as if it did.

5889 *argument* Either of the following two types of *argument* can be intermixed:

5890 *file* A pathname of a file that contains the input to be read, which is
 5891 matched against the set of patterns in the program. If no *file* operands
 5892 are specified, or if a *file* operand is '-', the standard input shall be
 5893 used.

5894 *assignment* An operand that begins with an underscore or alphabetic character
 5895 from the portable character set (see the table in the Base Definitions
 5896 volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set),
 5897 followed by a sequence of underscores, digits, and alphabets from
 5898 the portable character set, followed by the '=' character, shall
 5899 specify a variable assignment rather than a pathname. The
 5900 characters before the '=' represent the name of an *awk* variable; if
 5901 that name is an *awk* reserved word (see **Grammar** (on page 170)) the
 5902 behavior is undefined. The characters following the equal sign shall
 5903 be interpreted as if they appeared in the *awk* program preceded and
 5904 followed by a double-quote ('"') character, as a **STRING** token (see
 5905 **Grammar** (on page 170)), except that if the last character is an
 5906 unescaped backslash, it shall be interpreted as a literal backslash
 5907 rather than as the first character of the sequence "\". The variable
 5908 shall be assigned the value of that **STRING** token and, if
 5909 appropriate, shall be considered a *numeric string* (see **Expressions in**
 5910 **awk** (on page 156)), the variable shall also be assigned its numeric
 5911 value. Each such variable assignment shall occur just prior to the
 5912 processing of the following *file*, if any. Thus, an assignment before
 5913 the first *file* argument shall be executed after the **BEGIN** actions (if
 5914 any), while an assignment after the last *file* argument shall occur
 5915 before the **END** actions (if any). If there are no *file* arguments,
 5916 assignments shall be executed before processing the standard input.

5917 **STDIN**

5918 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-';
 5919 see the INPUT FILES section. If the *awk* program contains no actions and no patterns, but is
 5920 otherwise a valid *awk* program, standard input and any *file* operands shall not be read and *awk*
 5921 shall exit with a return status of zero.

5922 **INPUT FILES**

5923 Input files to the *awk* program from any of the following sources shall be text files:

- 5924 • Any *file* operands or their equivalents, achieved by modifying the *awk* variables **ARGV** and
- 5925 **ARGC**
- 5926 • Standard input in the absence of any *file* operands
- 5927 • Arguments to the **getline** function

5928 Whether the variable **RS** is set to a value other than a <newline> or not, for these files,
 5929 implementations shall support records terminated with the specified separator up to
 5930 {LINE_MAX} bytes and may support longer records.

5931 If **-f progfile** is specified, the application shall ensure that the files named by each of the *progfile*
 5932 option-arguments are text files and their concatenation, in the same order as they appear in the
 5933 arguments, is an *awk* program.

5934 **ENVIRONMENT VARIABLES**

5935 The following environment variables shall affect the execution of *awk*:

5936 **LANG** Provide a default value for the internationalization variables that are unset or null.
 5937 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,
 5938 Internationalization Variables for the precedence of internationalization variables
 5939 used to determine the values of locale categories.)

5940	<i>LC_ALL</i>	If set to a non-empty string value, override the values of all the other internationalization variables.
5941		
5942	<i>LC_COLLATE</i>	
5943		Determine the locale for the behavior of ranges, equivalence classes, and multi-character collating elements within regular expressions and in comparisons of string values.
5944		
5945		
5946	<i>LC_CTYPE</i>	Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files), the behavior of character classes within regular expressions, the identification of characters as letters, and the mapping of uppercase and lowercase characters for the toupper and tolower functions.
5947		
5948		
5949		
5950		
5951	<i>LC_MESSAGES</i>	
5952		Determine the locale that should be used to affect the format and contents of diagnostic messages written to standard error.
5953		
5954	<i>LC_NUMERIC</i>	
5955		Determine the radix character used when interpreting numeric input, performing conversions between numeric and string values, and formatting numeric output.
5956		Regardless of locale, the period character (the decimal-point character of the POSIX locale) is the decimal-point character recognized in processing <i>awk</i> programs (including assignments in command line arguments).
5957		
5958		
5959		
5960	XSI <i>NLSPATH</i>	Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .
5961	<i>PATH</i>	Determine the search path when looking for commands executed by <i>system(expr)</i> , or input and output pipes; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.
5962		
5963		
5964		In addition, all environment variables shall be visible via the <i>awk</i> variable ENVIRON .
5965	ASYNCHRONOUS EVENTS	
5966		Default.
5967	STDOUT	
5968		The nature of the output files depends on the <i>awk</i> program.
5969	STDERR	
5970		The standard error shall be used only for diagnostic messages.
5971	OUTPUT FILES	
5972		The nature of the output files depends on the <i>awk</i> program.
5973	EXTENDED DESCRIPTION	
5974	Overall Program Structure	
5975		An <i>awk</i> program is composed of pairs of the form:
5976		<i>pattern</i> { <i>action</i> }
5977		Either the pattern or the action (including the enclosing brace characters) can be omitted.
5978		A missing pattern shall match any record of input, and a missing action shall be equivalent to:
5979		{ <i>print</i> }
5980		Execution of the <i>awk</i> program shall start by first executing the actions associated with all BEGIN patterns in the order they occur in the program. Then each <i>file</i> operand (or standard input if no
5981		

files were specified) shall be processed in turn by reading data from the file until a record separator is seen (<newline> by default). Before the first reference to a field in the record is evaluated, the record shall be split into fields, according to the rules in **Regular Expressions** (on page 161), using the value of **FS** that was current at the time the record was read. Each pattern in the program then shall be evaluated in the order of occurrence, and the action associated with each pattern that matches the current record executed. The action for a matching pattern shall be executed before evaluating subsequent patterns. Finally, the actions associated with all **END** patterns shall be executed in the order they occur in the program.

Expressions in awk

Expressions describe computations used in *patterns* and *actions*. In the following table, valid expression operations are given in groups from highest precedence first to lowest precedence last, with equal-precedence operators grouped between horizontal lines. In expression evaluation, where the grammar is formally ambiguous, higher precedence operators shall be evaluated before lower precedence operators. In this table *expr*, *expr1*, *expr2*, and *expr3* represent any expression, while *lvalue* represents any entity that can be assigned to (that is, on the left side of an assignment operator). The precise syntax of expressions is given in **Grammar** (on page 170).

Table 4-1 Expressions in Decreasing Precedence in awk

Syntax	Name	Type of Result	Associativity
(<i>expr</i>)	Grouping	Type of <i>expr</i>	N / A
<i>\$expr</i>	Field reference	String	N / A
++ <i>lvalue</i>	Pre-increment	Numeric	N / A
-- <i>lvalue</i>	Pre-decrement	Numeric	N / A
<i>lvalue</i> ++	Post-increment	Numeric	N / A
<i>lvalue</i> --	Post-decrement	Numeric	N / A
<i>expr</i> ^ <i>expr</i>	Exponentiation	Numeric	Right
! <i>expr</i>	Logical not	Numeric	N / A
+ <i>expr</i>	Unary plus	Numeric	N / A
- <i>expr</i>	Unary minus	Numeric	N / A
<i>expr</i> * <i>expr</i>	Multiplication	Numeric	Left
<i>expr</i> / <i>expr</i>	Division	Numeric	Left
<i>expr</i> % <i>expr</i>	Modulus	Numeric	Left
<i>expr</i> + <i>expr</i>	Addition	Numeric	Left
<i>expr</i> - <i>expr</i>	Subtraction	Numeric	Left
<i>expr</i> <i>expr</i>	String concatenation	String	Left
<i>expr</i> < <i>expr</i>	Less than	Numeric	None
<i>expr</i> <= <i>expr</i>	Less than or equal to	Numeric	None
<i>expr</i> != <i>expr</i>	Not equal to	Numeric	None
<i>expr</i> == <i>expr</i>	Equal to	Numeric	None
<i>expr</i> > <i>expr</i>	Greater than	Numeric	None
<i>expr</i> >= <i>expr</i>	Greater than or equal to	Numeric	None

Syntax	Name	Type of Result	Associativity
<i>expr</i> ~ <i>expr</i>	ERE match	Numeric	None
<i>expr</i> !~ <i>expr</i>	ERE non-match	Numeric	None
<i>expr</i> in array	Array membership	Numeric	Left
(<i>index</i>) in array	Multi-dimension array membership	Numeric	Left
<i>expr</i> && <i>expr</i>	Logical AND	Numeric	Left
<i>expr</i> <i>expr</i>	Logical OR	Numeric	Left
<i>expr1</i> ? <i>expr2</i> : <i>expr3</i>	Conditional expression	Type of selected <i>expr2</i> or <i>expr3</i>	Right
<i>lvalue</i> ^= <i>expr</i>	Exponentiation assignment	Numeric	Right
<i>lvalue</i> %= <i>expr</i>	Modulus assignment	Numeric	Right
<i>lvalue</i> *= <i>expr</i>	Multiplication assignment	Numeric	Right
<i>lvalue</i> /= <i>expr</i>	Division assignment	Numeric	Right
<i>lvalue</i> += <i>expr</i>	Addition assignment	Numeric	Right
<i>lvalue</i> -= <i>expr</i>	Subtraction assignment	Numeric	Right
<i>lvalue</i> = <i>expr</i>	Assignment	Type of <i>expr</i>	Right

Each expression shall have either a string value, a numeric value, or both. Except as stated for specific contexts, the value of an expression shall be implicitly converted to the type needed for the context in which it is used. A string value shall be converted to a numeric value by the equivalent of the following calls to functions defined by the ISO C standard:

```
setlocale(LC_NUMERIC, "");
numeric_value = atof(string_value);
```

A numeric value that is exactly equal to the value of an integer (see Section 1.7.2 (on page 7)) shall be converted to a string by the equivalent of a call to the **sprintf** function (see **String Functions** (on page 167)) with the string "%d" as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. Any other numeric value shall be converted to a string by the equivalent of a call to the **sprintf** function with the value of the variable **CONVFMT** as the *fmt* argument and the numeric value being converted as the first and only *expr* argument. The result of the conversion is unspecified if the value of **CONVFMT** is not a floating-point format specification. This volume of IEEE Std 1003.1-2001 specifies no explicit conversions between numbers and strings. An application can force an expression to be treated as a number by adding zero to it, or can force it to be treated as a string by concatenating the null string (" ") to it.

A string value shall be considered a *numeric string* if it comes from one of the following:

1. Field variables
2. Input from the *getline()* function
3. **FILENAME**
4. **ARGV** array elements
5. **ENVIRON** array elements
6. Array elements created by the *split()* function
7. A command line variable assignment

8. Variable assignment from another numeric string variable

and after all the following conversions have been applied, the resulting string would lexically be recognized as a **NUMBER** token as described by the lexical conventions in **Grammar** (on page 170):

- All leading and trailing <blank>s are discarded.
- If the first non-<blank> is ' + ' or ' - ', it is discarded.
- Changing each occurrence of the decimal point character from the current locale to a period.

If a ' − ' character is ignored in the preceding description, the numeric value of the *numeric string* shall be the negation of the numeric value of the recognized **NUMBER** token. Otherwise, the numeric value of the *numeric string* shall be the numeric value of the recognized **NUMBER** token. Whether or not a string is a *numeric string* shall be relevant only in contexts where that term is used in this section.

When an expression is used in a Boolean context, if it has a numeric value, a value of zero shall be treated as false and any other value shall be treated as true. Otherwise, a string value of the null string shall be treated as false and any other value shall be treated as true. A Boolean context shall be one of the following:

- The first subexpression of a conditional expression
- An expression operated on by logical NOT, logical AND, or logical OR
- The second expression of a **for** statement
- The expression of an **if** statement
- The expression of the **while** clause in either a **while** or **do...while** statement
- An expression used as a pattern (as in Overall Program Structure)

All arithmetic shall follow the semantics of floating-point arithmetic as specified by the ISO C standard (see Section 1.7.2 (on page 7)).

The value of the expression:

```
expr1 ^ expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
pow(expr1, expr2)
```

The expression:

```
lvalue ^= expr
```

shall be equivalent to the ISO C standard expression:

```
lvalue = pow(lvalue, expr)
```

except that lvalue shall be evaluated only once. The value of the expression:

```
expr1 % expr2
```

shall be equivalent to the value returned by the ISO C standard function call:

```
fmod(expr1, expr2)
```

The expression:

```
lvalue %= expr
```

6105 shall be equivalent to the ISO C standard expression:

6106 `lvalue = fmod(lvalue, expr)`

6107 except that *lvalue* shall be evaluated only once.

6108 Variables and fields shall be set by the assignment statement:

6109 `lvalue = expression`

6110 and the type of *expression* shall determine the resulting variable type. The assignment includes
 6111 the arithmetic assignments ("*+=*", "*-=*", "**=*", "*/=*", "*%=*", "*^=*", "*++*", "*--*") all of which
 6112 shall produce a numeric result. The left-hand side of an assignment and the target of increment
 6113 and decrement operators can be one of a variable, an array with index, or a field selector.

6114 The *awk* language supplies arrays that are used for storing numbers or strings. Arrays need not
 6115 be declared. They shall initially be empty, and their sizes shall change dynamically. The
 6116 subscripts, or element identifiers, are strings, providing a type of associative array capability. An
 6117 array name followed by a subscript within square brackets can be used as an *lvalue* and thus as
 6118 an expression, as described in the grammar; see **Grammar** (on page 170). Unsubscripted array
 6119 names can be used in only the following contexts:

- 6120 • A parameter in a function definition or function call
- 6121 • The **NAME** token following any use of the keyword **in** as specified in the grammar (see
- 6122 **Grammar** (on page 170)); if the name used in this context is not an array name, the behavior
- 6123 is undefined

6124 A valid array *index* shall consist of one or more comma-separated expressions, similar to the way
 6125 in which multi-dimensional arrays are indexed in some programming languages. Because *awk*
 6126 arrays are really one-dimensional, such a comma-separated list shall be converted to a single
 6127 string by concatenating the string values of the separate expressions, each separated from the
 6128 other by the value of the **SUBSEP** variable. Thus, the following two index operations shall be
 6129 equivalent:

6130 `var[expr1, expr2, ... exprn]`

6131 `var[expr1 SUBSEP expr2 SUBSEP ... SUBSEP exprn]`

6132 The application shall ensure that a multi-dimensioned *index* used with the **in** operator is
 6133 parenthesized. The **in** operator, which tests for the existence of a particular array element, shall
 6134 not cause that element to exist. Any other reference to a nonexistent array element shall
 6135 automatically create it.

6136 Comparisons (with the '*<*', "*<=*", "*!=*", "*==*", '*>*', and "*>=*" operators) shall be made
 6137 numerically if both operands are numeric, if one is numeric and the other has a string value that
 6138 is a numeric string, or if one is numeric and the other has the uninitialized value. Otherwise,
 6139 operands shall be converted to strings as required and a string comparison shall be made using
 6140 the locale-specific collation sequence. The value of the comparison expression shall be 1 if the
 6141 relation is true, or 0 if the relation is false.

Variables and Special Variables

Variables can be used in an *awk* program by referencing them. With the exception of function parameters (see **User-Defined Functions** (on page 169)), they are not explicitly declared. Function parameter names shall be local to the function; all other variable names shall be global. The same name shall not be used as both a function parameter name and as the name of a function or a special *awk* variable. The same name shall not be used both as a variable name with global scope and as the name of a function. The same name shall not be used within the same scope both as a scalar variable and as an array. Uninitialized variables, including scalar variables, array elements, and field variables, shall have an uninitialized value. An uninitialized value shall have both a numeric value of zero and a string value of the empty string. Evaluation of variables with an uninitialized value, to either string or numeric, shall be determined by the context in which they are used.

Field variables shall be designated by a ' \$ ' followed by a number or numerical expression. The effect of the field number *expression* evaluating to anything other than a non-negative integer is unspecified; uninitialized variables or string values need not be converted to numeric values in this context. New field variables can be created by assigning a value to them. References to nonexistent fields (that is, fields after **\$NF**), shall evaluate to the uninitialized value. Such references shall not create new fields. However, assigning to a nonexistent field (for example, **\$(NF+2)=5**) shall increase the value of **NF**; create any intervening fields with the uninitialized value; and cause the value of **\$0** to be recomputed, with the fields being separated by the value of **OFS**. Each field variable shall have a string value or an uninitialized value when created. Field variables shall have the uninitialized value when created from **\$0** using **FS** and the variable does not contain any characters. If appropriate, the field variable shall be considered a numeric string (see **Expressions in awk** (on page 156)).

Implementations shall support the following other special variables that are set by *awk*:

- ARGC** The number of elements in the **ARGV** array.
- ARGV** An array of command line arguments, excluding options and the *program* argument, numbered from zero to **ARGC**-1.

The arguments in **ARGV** can be modified or added to; **ARGC** can be altered. As each input file ends, *awk* shall treat the next non-null element of **ARGV**, up to the current value of **ARGC**-1, inclusive, as the name of the next input file. Thus, setting an element of **ARGV** to null means that it shall not be treated as an input file. The name '-' indicates the standard input. If an argument matches the format of an *assignment* operand, this argument shall be treated as an *assignment* rather than a *file* argument.
- CONVFMT** The **printf** format for converting numbers to strings (except for output statements, where **OFMT** is used); "% . 6g" by default.
- ENVIRON** An array representing the value of the environment, as described in the *exec* functions defined in the System Interfaces volume of IEEE Std 1003.1-2001. The indices of the array shall be strings consisting of the names of the environment variables, and the value of each array element shall be a string consisting of the value of that variable. If appropriate, the environment variable shall be considered a *numeric string* (see **Expressions in awk** (on page 156)); the array element shall also have its numeric value.

In all cases where the behavior of *awk* is affected by environment variables (including the environment of any commands that *awk* executes via the **system** function or via pipeline redirections with the **print** statement, the **printf** statement, or the **getline** function), the environment used shall be the environment at the time

6190		<i>awk</i> began executing; it is implementation-defined whether any modification of
6191		ENVIRON affects this environment.
6192	FILENAME	A pathname of the current input file. Inside a BEGIN action the value is
6193		undefined. Inside an END action the value shall be the name of the last input file
6194		processed.
6195	FNR	The ordinal number of the current record in the current file. Inside a BEGIN action
6196		the value shall be zero. Inside an END action the value shall be the number of the
6197		last record processed in the last file processed.
6198	FS	Input field separator regular expression; a <space> by default.
6199	NF	The number of fields in the current record. Inside a BEGIN action, the use of NF is
6200		undefined unless a getline function without a <i>var</i> argument is executed
6201		previously. Inside an END action, NF shall retain the value it had for the last
6202		record read, unless a subsequent, redirected, getline function without a <i>var</i>
6203		argument is performed prior to entering the END action.
6204	NR	The ordinal number of the current record from the start of input. Inside a BEGIN
6205		action the value shall be zero. Inside an END action the value shall be the number
6206		of the last record processed.
6207	OFMT	The printf format for converting numbers to strings in output statements (see
6208		Output Statements (on page 165)); "%.6g" by default. The result of the
6209		conversion is unspecified if the value of OFMT is not a floating-point format
6210		specification.
6211	OFS	The print statement output field separation; <space> by default.
6212	ORS	The print statement output record separator; a <newline> by default.
6213	RLENGTH	The length of the string matched by the match function.
6214	RS	The first character of the string value of RS shall be the input record separator; a
6215		<newline> by default. If RS contains more than one character, the results are
6216		unspecified. If RS is null, then records are separated by sequences consisting of a
6217		<newline> plus one or more blank lines, leading or trailing blank lines shall not
6218		result in empty records at the beginning or end of the input, and a <newline> shall
6219		always be a field separator, no matter what the value of FS is.
6220	RSTART	The starting position of the string matched by the match function, numbering from
6221		1. This shall always be equivalent to the return value of the match function.
6222	SUBSEP	The subscript separator string for multi-dimensional arrays; the default value is
6223		implementation-defined.
6224	Regular Expressions	
6225	The <i>awk</i> utility shall make use of the extended regular expression notation (see the Base	
6226	Definitions volume of IEEE Std 1003.1-2001, Section 9.4, Extended Regular Expressions) except	
6227	that it shall allow the use of C-language conventions for escaping special characters within the	
6228	EREs, as specified in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5,	
6229	File Format Notation ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v') and the following	
6230	table; these escape sequences shall be recognized both inside and outside bracket expressions.	
6231	Note that records need not be separated by <newline>s and string constants can contain	
6232	<newline>s, so even the "\n" sequence is valid in <i>awk</i> EREs. Using a slash character within an	
6233	ERE requires the escaping shown in the following table.	

Table 4-2 Escape Sequences in *awk*

Escape Sequence	Description	Meaning
\ "	Backslash quotation-mark	Quotation-mark character
\ /	Backslash slash	Slash character
\ ddd	A backslash character followed by the longest sequence of one, two, or three octal-digit characters (01234567). If all of the digits are 0 (that is, representation of the NUL character), the behavior is undefined.	The character whose encoding is represented by the one, two, or three-digit octal integer. Multi-byte characters require multiple, concatenated escape sequences of this type, including the leading '\ ' for each byte.
\ c	A backslash character followed by any character not described in this table or in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').	Undefined

A regular expression can be matched against a specific field or string by using one of the two regular expression matching operators, '~' and '!~'. These operators shall interpret their right-hand operand as a regular expression and their left-hand operand as a string. If the regular expression matches the string, the '~' expression shall evaluate to a value of 1, and the '!~' expression shall evaluate to a value of 0. (The regular expression matching operation is as defined by the term *matched* in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.1, Regular Expression Definitions, where a match occurs on any part of the string unless the regular expression is limited with the circumflex or dollar sign special characters.) If the regular expression does not match the string, the '~' expression shall evaluate to a value of 0, and the '!~' expression shall evaluate to a value of 1. If the right-hand operand is any expression other than the lexical token **ERE**, the string value of the expression shall be interpreted as an extended regular expression, including the escape conventions described above. Note that these same escape conventions shall also be applied in determining the value of a string literal (the lexical token **STRING**), and thus shall be applied a second time when a string literal is used in this context.

When an **ERE** token appears as an expression in any context other than as the right-hand of the '~' or '!~' operator or as one of the built-in function arguments described below, the value of the resulting expression shall be the equivalent of:

```
$0 ~ /ere/
```

The *ere* argument to the **gsub**, **match**, **sub** functions, and the *fs* argument to the **split** function (see **String Functions** (on page 167)) shall be interpreted as extended regular expressions. These can be either **ERE** tokens or arbitrary expressions, and shall be interpreted in the same manner as the right-hand side of the '~' or '!~' operator.

An extended regular expression can be used to separate fields by using the **-F ERE** option or by assigning a string containing the expression to the built-in variable **FS**. The default value of the **FS** variable shall be a single <space>. The following describes **FS** behavior:

1. If **FS** is a null string, the behavior is unspecified.

- 6280 2. If **FS** is a single character:
- 6281 a. If **FS** is <space>, skip leading and trailing <blank>s; fields shall be delimited by sets
- 6282 of one or more <blank>s.
- 6283 b. Otherwise, if **FS** is any other character *c*, fields shall be delimited by each single
- 6284 occurrence of *c*.
- 6285 3. Otherwise, the string value of **FS** shall be considered to be an extended regular expression.
- 6286 Each occurrence of a sequence matching the extended regular expression shall delimit
- 6287 fields.

6288 Except for the '*~*' and '!~' operators, and in the **gsub**, **match**, **split**, and **sub** built-in functions,

6289 ERE matching shall be based on input records; that is, record separator characters (the first

6290 character of the value of the variable **RS**, <newline> by default) cannot be embedded in the

6291 expression, and no expression shall match the record separator character. If the record separator

6292 is not <newline>, <newline>s embedded in the expression can be matched. For the '*~*' and

6293 "!~" operators, and in those four built-in functions, ERE matching shall be based on text strings;

6294 that is, any character (including <newline> and the record separator) can be embedded in the

6295 pattern, and an appropriate pattern shall match any character. However, in all *awk* ERE

6296 matching, the use of one or more NUL characters in the pattern, input record, or text string

6297 produces undefined results.

6298 **Patterns**

6299 A *pattern* is any valid *expression*, a range specified by two expressions separated by a comma, or

6300 one of the two special patterns **BEGIN** or **END**.

6301 **Special Patterns**

6302 The *awk* utility shall recognize two special patterns, **BEGIN** and **END**. Each **BEGIN** pattern

6303 shall be matched once and its associated action executed before the first record of input is read

6304 (except possibly by use of the **getline** function—see **Input/Output and General Functions** (on

6305 page 168)—in a prior **BEGIN** action) and before command line assignment is done. Each **END**

6306 pattern shall be matched once and its associated action executed after the last record of input has

6307 been read. These two patterns shall have associated actions.

6308 **BEGIN** and **END** shall not combine with other patterns. Multiple **BEGIN** and **END** patterns

6309 shall be allowed. The actions associated with the **BEGIN** patterns shall be executed in the order

6310 specified in the program, as are the **END** actions. An **END** pattern can precede a **BEGIN** pattern

6311 in a program.

6312 If an *awk* program consists of only actions with the pattern **BEGIN**, and the **BEGIN** action

6313 contains no **getline** function, *awk* shall exit without reading its input when the last statement in

6314 the last **BEGIN** action is executed. If an *awk* program consists of only actions with the pattern

6315 **END** or only actions with the patterns **BEGIN** and **END**, the input shall be read before the

6316 statements in the **END** actions are executed.

Expression Patterns

An expression pattern shall be evaluated as if it were an expression in a Boolean context. If the result is true, the pattern shall be considered to match, and the associated action (if any) shall be executed. If the result is false, the action shall not be executed.

Pattern Ranges

A pattern range consists of two expressions separated by a comma; in this case, the action shall be performed for all records between a match of the first expression and the following match of the second expression, inclusive. At this point, the pattern range can be repeated starting at input records subsequent to the end of the matched range.

Actions

An action is a sequence of statements as shown in the grammar in **Grammar** (on page 170). Any single statement can be replaced by a statement list enclosed in braces. The application shall ensure that statements in a statement list are separated by <newline>s or semicolons. Statements in a statement list shall be executed sequentially in the order that they appear.

The *expression* acting as the conditional in an **if** statement shall be evaluated and if it is non-zero or non-null, the following statement shall be executed; otherwise, if **else** is present, the statement following the **else** shall be executed.

The **if**, **while**, **do...while**, **for**, **break**, and **continue** statements are based on the ISO C standard (see Section 1.7.2 (on page 7)), except that the Boolean expressions shall be treated as described in **Expressions in awk** (on page 156), and except in the case of:

```
for (variable in array)
```

which shall iterate, assigning each *index* of *array* to *variable* in an unspecified order. The results of adding new elements to *array* within such a **for** loop are undefined. If a **break** or **continue** statement occurs outside of a loop, the behavior is undefined.

The **delete** statement shall remove an individual array element. Thus, the following code deletes an entire array:

```
for (index in array)
    delete array[index]
```

The **next** statement shall cause all further processing of the current input record to be abandoned. The behavior is undefined if a **next** statement appears or is invoked in a **BEGIN** or **END** action.

The **exit** statement shall invoke all **END** actions in the order in which they occur in the program source and then terminate the program without reading further input. An **exit** statement inside an **END** action shall terminate the program without further execution of **END** actions. If an expression is specified in an **exit** statement, its numeric value shall be the exit status of *awk*, unless subsequent errors are encountered or a subsequent **exit** statement with an expression is executed.

Output Statements

Both **print** and **printf** statements shall write to standard output by default. The output shall be written to the location specified by *output_redirection* if one is supplied, as follows:

```
> expression
>> expression
| expression
```

In all cases, the *expression* shall be evaluated to produce a string that is used as a pathname into which to write (for '*>*' or '*>>*') or as a command to be executed (for '*|*'). Using the first two forms, if the file of that name is not currently open, it shall be opened, creating it if necessary and using the first form, truncating the file. The output then shall be appended to the file. As long as the file remains open, subsequent calls in which *expression* evaluates to the same string value shall simply append output to the file. The file remains open until the **close** function (see **Input/Output and General Functions** (on page 168)) is called with an expression that evaluates to the same string value.

The third form shall write output onto a stream piped to the input of a command. The stream shall be created if no stream is currently open with the value of *expression* as its command name. The stream created shall be equivalent to one created by a call to the *popen()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 with the value of *expression* as the *command* argument and a value of *w* as the *mode* argument. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall write output to the existing stream. The stream shall remain open until the **close** function (see **Input/Output and General Functions** (on page 168)) is called with an expression that evaluates to the same string value. At that time, the stream shall be closed as if by a call to the *pclose()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001.

As described in detail by the grammar in **Grammar** (on page 170), these output statements shall take a comma-separated list of *expressions* referred to in the grammar by the non-terminal symbols **expr_list**, **print_expr_list**, or **print_expr_list_opt**. This list is referred to here as the *expression list*, and each member is referred to as an *expression argument*.

The **print** statement shall write the value of each expression argument onto the indicated output stream separated by the current output field separator (see variable **OFS** above), and terminated by the output record separator (see variable **ORS** above). All expression arguments shall be taken as strings, being converted if necessary; this conversion shall be as described in **Expressions in awk** (on page 156), with the exception that the **printf** format in **OFMT** shall be used instead of the value in **CONVFMT**. An empty expression list shall stand for the whole input record (\$0).

The **printf** statement shall produce output based on a notation similar to the File Format Notation used to describe file formats in this volume of IEEE Std 1003.1-2001 (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation). Output shall be produced as specified with the first *expression* argument as the string *format* and subsequent *expression* arguments as the strings *arg1* to *argn*, inclusive, with the following exceptions:

1. The *format* shall be an actual character string rather than a graphical representation. Therefore, it cannot contain empty character positions. The *<space>* in the *format* string, in any context other than a *flag* of a conversion specification, shall be treated as an ordinary character that is copied to the output.
2. If the character set contains a '*Δ*' character and that character appears in the *format* string, it shall be treated as an ordinary character that is copied to the output.

3. The *escape sequences* beginning with a backslash character shall be treated as sequences of ordinary characters that are copied to the output. Note that these same sequences shall be interpreted lexically by *awk* when they appear in literal strings, but they shall not be treated specially by the **printf** statement.
4. A *field width* or *precision* can be specified as the ' * ' character instead of a digit string. In this case the next argument from the expression list shall be fetched and its numeric value taken as the field width or precision.
5. The implementation shall not precede or follow output from the d or u conversion specifier characters with <blank>s not specified by the *format* string.
6. The implementation shall not precede output from the o conversion specifier character with leading zeros not specified by the *format* string.
7. For the c conversion specifier character: if the argument has a numeric value, the character whose encoding is that value shall be output. If the value is zero or is not the encoding of any character in the character set, the behavior is undefined. If the argument does not have a numeric value, the first character of the string value shall be output; if the string does not contain any characters, the behavior is undefined.
8. For each conversion specification that consumes an argument, the next expression argument shall be evaluated. With the exception of the c conversion specifier character, the value shall be converted (according to the rules specified in **Expressions in awk** (on page 156)) to the appropriate type for the conversion specification.
9. If there are insufficient expression arguments to satisfy all the conversion specifications in the *format* string, the behavior is undefined.
10. If any character sequence in the *format* string begins with a ' % ' character, but does not form a valid conversion specification, the behavior is unspecified.

Both **print** and **printf** can output at least {LINE_MAX} bytes.

Functions

The *awk* language has a variety of built-in functions: arithmetic, string, input/output, and general.

Arithmetic Functions

The arithmetic functions, except for **int**, shall be based on the ISO C standard (see Section 1.7.2 (on page 7)). The behavior is undefined in cases where the ISO C standard specifies that an error be returned or that the behavior is undefined. Although the grammar (see **Grammar** (on page 170)) permits built-in functions to appear with no arguments or parentheses, unless the argument or parentheses are indicated as optional in the following list (by displaying them within the " [] " brackets), such use is undefined.

atan2 (<i>y</i> , <i>x</i>)	Return arctangent of <i>y</i> / <i>x</i> in radians in the range $[-\pi, \pi]$.
cos (<i>x</i>)	Return cosine of <i>x</i> , where <i>x</i> is in radians.
sin (<i>x</i>)	Return sine of <i>x</i> , where <i>x</i> is in radians.
exp (<i>x</i>)	Return the exponential function of <i>x</i> .
log (<i>x</i>)	Return the natural logarithm of <i>x</i> .
sqrt (<i>x</i>)	Return the square root of <i>x</i> .

6441 **int**(*x*) Return the argument truncated to an integer. Truncation shall be toward 0 when
 6442 $x > 0$.

6443 **rand**() Return a random number *n*, such that $0 \leq n < 1$.

6444 **srand**([*expr*]) Set the seed value for *rand* to *expr* or use the time of day if *expr* is omitted. The
 6445 previous seed value shall be returned.

6446 **String Functions**

6447 The string functions in the following list shall be supported. Although the grammar (see
 6448 **Grammar** (on page 170)) permits built-in functions to appear with no arguments or parentheses,
 6449 unless the argument or parentheses are indicated as optional in the following list (by displaying
 6450 them within the "[]" brackets), such use is undefined.

6451 **gsub**(*ere*, *repl* [, *in*])
 6452 Behave like **sub** (see below), except that it shall replace all occurrences of the
 6453 regular expression (like the *ed* utility global substitute) in \$0 or in the *in* argument,
 6454 when specified.

6455 **index**(*s*, *t*) Return the position, in characters, numbering from 1, in string *s* where string *t* first
 6456 occurs, or zero if it does not occur at all.

6457 **length**([*s*]) Return the length, in characters, of its argument taken as a string, or of the whole
 6458 record, \$0, if there is no argument.

6459 **match**(*s*, *ere*) Return the position, in characters, numbering from 1, in string *s* where the
 6460 extended regular expression *ere* occurs, or zero if it does not occur at all. RSTART
 6461 shall be set to the starting position (which is the same as the returned value), zero
 6462 if no match is found; RLENGTH shall be set to the length of the matched string, -1
 6463 if no match is found.

6464 **split**(*s*, *a* [, *fs*])
 6465 Split the string *s* into array elements *a*[1], *a*[2], ..., *a*[*n*], and return *n*. All elements
 6466 of the array shall be deleted before the split is performed. The separation shall be
 6467 done with the ERE *fs* or with the field separator **FS** if *fs* is not given. Each array
 6468 element shall have a string value when created and, if appropriate, the array
 6469 element shall be considered a numeric string (see **Expressions in awk** (on page
 6470 156)). The effect of a null string as the value of *fs* is unspecified.

6471 **sprintf**(*fmt*, *expr*, *expr*, ...)
 6472 Format the expressions according to the **printf** format given by *fmt* and return the
 6473 resulting string.

6474 **sub**(*ere*, *repl* [, *in*])
 6475 Substitute the string *repl* in place of the first instance of the extended regular
 6476 expression *ERE* in string *in* and return the number of substitutions. An ampersand
 6477 ('&') appearing in the string *repl* shall be replaced by the string from *in* that
 6478 matches the ERE. An ampersand preceded with a backslash ('\') shall be
 6479 interpreted as the literal ampersand character. An occurrence of two consecutive
 6480 backslashes shall be interpreted as just a single literal backslash character. Any
 6481 other occurrence of a backslash (for example, preceding any other character) shall
 6482 be treated as a literal backslash character. Note that if *repl* is a string literal (the
 6483 lexical token **STRING**; see **Grammar** (on page 170)), the handling of the
 6484 ampersand character occurs after any lexical processing, including any lexical
 6485 backslash escape sequence processing. If *in* is specified and it is not an lvalue (see
 6486 **Expressions in awk** (on page 156)), the behavior is undefined. If *in* is omitted, *awk*

6487		shall use the current record (\$0) in its place.
6488	substr (<i>s</i> , <i>m</i> [, <i>n</i>])	
6489		Return the at most <i>n</i> -character substring of <i>s</i> that begins at position <i>m</i> , numbering
6490		from 1. If <i>n</i> is omitted, or if <i>n</i> specifies more characters than are left in the string,
6491		the length of the substring shall be limited by the length of the string <i>s</i> .
6492	tolower (<i>s</i>)	Return a string based on the string <i>s</i> . Each character in <i>s</i> that is an uppercase letter
6493		specified to have a tolower mapping by the <i>LC_CTYPE</i> category of the current
6494		locale shall be replaced in the returned string by the lowercase letter specified by
6495		the mapping. Other characters in <i>s</i> shall be unchanged in the returned string.
6496	toupper (<i>s</i>)	Return a string based on the string <i>s</i> . Each character in <i>s</i> that is a lowercase letter
6497		specified to have a toupper mapping by the <i>LC_CTYPE</i> category of the current
6498		locale is replaced in the returned string by the uppercase letter specified by the
6499		mapping. Other characters in <i>s</i> are unchanged in the returned string.
6500		All of the preceding functions that take <i>ERE</i> as a parameter expect a pattern or a string valued
6501		expression that is a regular expression as defined in Regular Expressions (on page 161).
6502	Input/Output and General Functions	
6503	The input/output and general functions are:	
6504	close (<i>expression</i>)	
6505		Close the file or pipe opened by a print or printf statement or a call to getline with
6506		the same string-valued <i>expression</i> . The limit on the number of open <i>expression</i>
6507		arguments is implementation-defined. If the close was successful, the function
6508		shall return zero; otherwise, it shall return non-zero.
6509	<i>expression</i> getline [<i>var</i>]	
6510		Read a record of input from a stream piped from the output of a command. The
6511		stream shall be created if no stream is currently open with the value of <i>expression</i> as
6512		its command name. The stream created shall be equivalent to one created by a call
6513		to the <i>popen</i> () function with the value of <i>expression</i> as the <i>command</i> argument and a
6514		value of <i>r</i> as the <i>mode</i> argument. As long as the stream remains open, subsequent
6515		calls in which <i>expression</i> evaluates to the same string value shall read subsequent
6516		records from the stream. The stream shall remain open until the close function is
6517		called with an expression that evaluates to the same string value. At that time, the
6518		stream shall be closed as if by a call to the <i>pclose</i> () function. If <i>var</i> is omitted, \$0
6519		and NF shall be set; otherwise, <i>var</i> shall be set and, if appropriate, it shall be
6520		considered a numeric string (see Expressions in awk (on page 156)).
6521		The getline operator can form ambiguous constructs when there are
6522		unparenthesized operators (including concatenate) to the left of the ' ' (to the
6523		beginning of the expression containing getline). In the context of the '\$'
6524		operator, ' ' shall behave as if it had a lower precedence than '\$'. The result of
6525		evaluating other operators is unspecified, and conforming applications shall
6526		parenthesize properly all such usages.
6527	getline	Set \$0 to the next input record from the current input file. This form of getline shall
6528		set the NF , NR , and FNR variables.
6529	getline <i>var</i>	Set variable <i>var</i> to the next input record from the current input file and, if
6530		appropriate, <i>var</i> shall be considered a numeric string (see Expressions in awk (on
6531		page 156)). This form of getline shall set the FNR and NR variables.

getline [*var*] < *expression*

Read the next record of input from a named file. The *expression* shall be evaluated to produce a string that is used as a pathname. If the file of that name is not currently open, it shall be opened. As long as the stream remains open, subsequent calls in which *expression* evaluates to the same string value shall read subsequent records from the file. The file shall remain open until the **close** function is called with an expression that evaluates to the same string value. If *var* is omitted, \$0 and **NF** shall be set; otherwise, *var* shall be set and, if appropriate, it shall be considered a numeric string (see **Expressions in awk** (on page 156)).

The **getline** operator can form ambiguous constructs when there are unparenthesized binary operators (including concatenate) to the right of the '<' (up to the end of the expression containing the **getline**). The result of evaluating such a construct is unspecified, and conforming applications shall parenthesize properly all such usages.

system(*expression*)

Execute the command given by *expression* in a manner equivalent to the *system()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 and return the exit status of the command.

All forms of **getline** shall return 1 for successful input, zero for end-of-file, and -1 for an error.

Where strings are used as the name of a file or pipeline, the application shall ensure that the strings are textually identical. The terminology “same string value” implies that “equivalent strings”, even those that differ only by <space>s, represent different files.

User-Defined Functions

The *awk* language also provides user-defined functions. Such functions can be defined as:

```
function name([parameter, ...]) { statements }
```

A function can be referred to anywhere in an *awk* program; in particular, its use can precede its definition. The scope of a function is global.

Function parameters, if present, can be either scalars or arrays; the behavior is undefined if an array name is passed as a parameter that the function uses as a scalar, or if a scalar expression is passed as a parameter that the function uses as an array. Function parameters shall be passed by value if scalar and by reference if array name.

The number of parameters in the function definition need not match the number of parameters in the function call. Excess formal parameters can be used as local variables. If fewer arguments are supplied in a function call than are in the function definition, the extra parameters that are used in the function body as scalars shall evaluate to the uninitialized value until they are otherwise initialized, and the extra parameters that are used in the function body as arrays shall be treated as uninitialized arrays where each element evaluates to the uninitialized value until otherwise initialized.

When invoking a function, no white space can be placed between the function name and the opening parenthesis. Function calls can be nested and recursive calls can be made upon functions. Upon return from any nested or recursive function call, the values of all of the calling function's parameters shall be unchanged, except for array parameters passed by reference. The **return** statement can be used to return a value. If a **return** statement appears outside of a function definition, the behavior is undefined.

In the function definition, <newline>s shall be optional before the opening brace and after the closing brace. Function definitions can appear anywhere in the program where a *pattern-action*

6578 pair is allowed.

6579 Grammar

6580 The grammar in this section and the lexical conventions in the following section shall together
 6581 describe the syntax for *awk* programs. The general conventions for this style of grammar are
 6582 described in Section 1.10 (on page 19). A valid program can be represented as the non-terminal
 6583 symbol *program* in the grammar. This formal syntax shall take precedence over the preceding
 6584 text syntax description.

```

This grammar has several ambiguities that shall be resolved as follows:

- Operator precedence and associativity shall be as described in Table 4-1 (on page 156).
- In case of ambiguity, an **else** shall be associated with the most immediately preceding **if** that would satisfy the grammar.
- In some contexts, a slash ('/') that is used to surround an ERE could also be the division operator. This shall be resolved in such a way that wherever the division operator could appear, a slash is assumed to be the division operator. (There is no unary division operator.)

One convention that might not be obvious from the formal grammar is where <newline>s are acceptable. There are several obvious placements such as terminating a statement, and a backslash can be used to escape <newline>s between any lexical tokens. In addition, <newline>s without backslashes can follow a comma, an open brace, logical AND operator ("&&"), logical OR operator ("||"), the **do** keyword, the **else** keyword, and the closing parenthesis of an **if**, **for**, or **while** statement. For example:

```
{ print $1,
    $2 }
```

Lexical Conventions

The lexical conventions for *awk* programs, with respect to the preceding grammar, shall be as follows:

1. Except as noted, *awk* shall recognize the longest possible token or delimiter beginning at a given point.
2. A comment shall consist of any characters beginning with the number sign character and terminated by, but excluding the next occurrence of, a <newline>. Comments shall have no effect, except to delimit lexical tokens.
3. The <newline> shall be recognized as the token **NEWLINE**.
4. A backslash character immediately followed by a <newline> shall have no effect.
5. The token **STRING** shall represent a string constant. A string constant shall begin with the character ' '. Within a string constant, a backslash character shall be considered to begin an escape sequence as specified in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation ('\', '\a', '\b', '\f', '\n', '\r', '\t', '\v'). In addition, the escape sequences in Table 4-2 (on page 162) shall be recognized. A <newline> shall not occur within a string constant. A string constant shall be terminated by the first unescaped occurrence of the character ' ' after the one that begins the string constant. The value of the string shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting ' ' characters.
6. The token **ERE** represents an extended regular expression constant. An ERE constant shall begin with the slash character. Within an ERE constant, a backslash character shall be considered to begin an escape sequence as specified in the table in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 5, File Format Notation. In addition, the escape sequences in Table 4-2 (on page 162) shall be recognized. The application shall ensure that a <newline> does not occur within an ERE constant. An ERE constant shall be terminated by the first unescaped occurrence of the slash character after the one that begins the ERE constant. The extended regular expression represented by the ERE constant shall be the sequence of all unescaped characters and values of escape sequences between, but not including, the two delimiting slash characters.

7. A <blank> shall have no effect, except to delimit lexical tokens or within **STRING** or **ERE** tokens.

8. The token **NUMBER** shall represent a numeric constant. Its form and numeric value shall be equivalent to either of the tokens **floating-constant** or **integer-constant** as specified by the ISO C standard, with the following exceptions:

- An integer constant cannot begin with 0x or include the hexadecimal digits 'a', 'b', 'c', 'd', 'e', 'f', 'A', 'B', 'C', 'D', 'E', or 'F'.
- The value of an integer constant beginning with 0 shall be taken in decimal rather than octal.
- An integer constant cannot include a suffix ('u', 'U', 'l', or 'L').
- A floating constant cannot include a suffix ('f', 'F', 'l', or 'L').

If the value is too large or too small to be representable (see Section 1.7.2 (on page 7)), the behavior is undefined.

9. A sequence of underscores, digits, and alphabetic characters from the portable character set (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 6.1, Portable Character Set), beginning with an underscore or alphabetic, shall be considered a word.
10. The following words are keywords that shall be recognized as individual tokens; the name of the token is the same as the keyword:

BEGIN	delete	END	function	in	printf
break	do	exit	getline	next	return
continue	else	for	if	print	while

11. The following words are names of built-in functions and shall be recognized as the token **BUILTIN_FUNC_NAME**:

atan2	gsub	log	split	sub	toupper
close	index	match	sprintf	substr	
cos	int	rand	sqrt	system	
exp	length	sin	srand	tolower	

The above-listed keywords and names of built-in functions are considered reserved words.

12. The token **NAME** shall consist of a word that is not a keyword or a name of a built-in function and is not followed immediately (without any delimiters) by the ' (' character.
13. The token **FUNC_NAME** shall consist of a word that is not a keyword or a name of a built-in function, followed immediately (without any delimiters) by the ' (' character. The ' (' character shall not be included as part of the token.
14. The following two-character sequences shall be recognized as the named tokens:

Token Name	Sequence	Token Name	Sequence
ADD_ASSIGN	+=	NO_MATCH	!~
SUB_ASSIGN	-=	EQ	==
MUL_ASSIGN	*=	LE	<=
DIV_ASSIGN	/=	GE	>=
MOD_ASSIGN	%=	NE	!=
POW_ASSIGN	^=	INCR	++
OR	 	DECR	--
AND	&&	APPEND	>>

6956 15. The following single characters shall be recognized as tokens whose names are the
6957 character:

6958 <newline> { } () [] , ; + - * % ^ ! > < | ? : ~ \$ =

6959 There is a lexical ambiguity between the token **ERE** and the tokens **'/'** and **DIV_ASSIGN**.
6960 When an input sequence begins with a slash character in any syntactic context where the token
6961 **'/'** or **DIV_ASSIGN** could appear as the next token in a valid program, the longer of those two
6962 tokens that can be recognized shall be recognized. In any other syntactic context where the token
6963 **ERE** could appear as the next token in a valid program, the token **ERE** shall be recognized.

6964 EXIT STATUS

6965 The following exit values shall be returned:

6966 0 All input files were processed successfully.

6967 >0 An error occurred.

6968 The exit status can be altered within the program by using an **exit** expression.

6969 CONSEQUENCES OF ERRORS

6970 If any *file* operand is specified and the named file cannot be accessed, *awk* shall write a
6971 diagnostic message to standard error and terminate without any further action.

6972 If the program specified by either the *program* operand or a *progfile* operand is not a valid *awk*
6973 program (as specified in the EXTENDED DESCRIPTION section), the behavior is undefined.

6974 APPLICATION USAGE

6975 The **index**, **length**, **match**, and **substr** functions should not be confused with similar functions in
6976 the ISO C standard; the *awk* versions deal with characters, while the ISO C standard deals with
6977 bytes.

6978 Because the concatenation operation is represented by adjacent expressions rather than an
6979 explicit operator, it is often necessary to use parentheses to enforce the proper evaluation
6980 precedence.

6981 EXAMPLES

6982 The *awk* program specified in the command line is most easily specified within single-quotes (for
6983 example, *'program'*) for applications using *sh*, because *awk* programs commonly contain
6984 characters that are special to the shell, including double-quotes. In the cases where an *awk*
6985 program contains single-quote characters, it is usually easiest to specify most of the program as
6986 strings within single-quotes concatenated by the shell with quoted single-quote characters. For
6987 example:

6988 `awk '/'\''/' { print "quote:", $0 }`

6989 prints all lines from the standard input containing a single-quote character, prefixed with *quote:*.

6990 The following are examples of simple *awk* programs:

6991 1. Write to the standard output all input lines for which field 3 is greater than 5:

6992 `$3 > 5`

6993 2. Write every tenth line:

6994 `(NR % 10) == 0`

6995 3. Write any line with a substring matching the regular expression:

6996 `/(G|D)(2[0-9][[:alpha:]]*)/`

```

6997      4. Print any line with a substring containing a 'G' or 'D', followed by a sequence of digits
6998      and characters. This example uses character classes digit and alpha to match language-
6999      independent digit and alphabetic characters respectively:
7000      /(G|D)([[:digit:][:alpha:]]*)/
7001
7002      5. Write any line in which the second field matches the regular expression and the fourth
7003      field does not:
7004      $2 ~ /xyz/ && $4 !~ /xyz/
7005
7006      6. Write any line in which the second field contains a backslash:
7007      $2 ~ /\\"/>

```

```

7036     }
7037 18. Write the path prefixes contained in the PATH environment variable, one per line:
7038     BEGIN {
7039         n = split (ENVIRON["PATH"], path, ":")
7040         for (i = 1; i <= n; ++i)
7041             print path[i]
7042     }
7043 19. If there is a file named input containing page headers of the form:
7044     Page #
7045     and a file named program that contains:
7046     /Page/    { $2 = n++; }
7047              { print }
7048     then the command line:
7049     awk -f program n=5 input
7050     prints the file input, filling in page numbers starting at 5.

```

7051 RATIONALE

7052 This description is based on the new *awk*, “*nawk*”, (see the referenced *The AWK Programming*
 7053 *Language*), which introduced a number of new features to the historical *awk*:

- 7054 1. New keywords: **delete**, **do**, **function**, **return**
 - 7055 2. New built-in functions: **atan2**, **close**, **cos**, **gsub**, **match**, **rand**, **sin**, **srand**, **sub**, **system**
 - 7056 3. New predefined variables: **FNR**, **ARGC**, **ARGV**, **RSTART**, **RLENGTH**, **SUBSEP**
 - 7057 4. New expression operators: **?**, **:**, **,**, **^**
 - 7058 5. The **FS** variable and the third argument to **split**, now treated as extended regular
 7059 expressions.
 - 7060 6. The operator precedence, changed to more closely match the C language. Two examples
 7061 of code that operate differently are:
- ```

7062 while (n /= 10 > 1) ...
7063 if (!"wk" ~ /bwk/) ...

```

7064 Several features have been added based on newer implementations of *awk*:

- 7065 • Multiple instances of **-f progfile** are permitted.
- 7066 • The new option **-v assignment**.
- 7067 • The new predefined variable **ENVIRON**.
- 7068 • New built-in functions **toupper** and **tolower**.
- 7069 • More formatting capabilities are added to **printf** to match the ISO C standard.

7070 The overall *awk* syntax has always been based on the C language, with a few features from the  
 7071 shell command language and other sources. Because of this, it is not completely compatible with  
 7072 any other language, which has caused confusion for some users. It is not the intent of the  
 7073 standard developers to address such issues. A few relatively minor changes toward making the  
 7074 language more compatible with the ISO C standard were made; most of these changes are based  
 7075 on similar changes in recent implementations, as described above. There remain several C-

language conventions that are not in *awk*. One of the notable ones is the comma operator, which is commonly used to specify multiple expressions in the C language **for** statement. Also, there are various places where *awk* is more restrictive than the C language regarding the type of expression that can be used in a given context. These limitations are due to the different features that the *awk* language does provide.

Regular expressions in *awk* have been extended somewhat from historical implementations to make them a pure superset of extended regular expressions, as defined by IEEE Std 1003.1-2001 (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.4, Extended Regular Expressions). The main extensions are internationalization features and interval expressions. Historical implementations of *awk* have long supported backslash escape sequences as an extension to extended regular expressions, and this extension has been retained despite inconsistency with other utilities. The number of escape sequences recognized in both extended regular expressions and strings has varied (generally increasing with time) among implementations. The set specified by IEEE Std 1003.1-2001 includes most sequences known to be supported by popular implementations and by the ISO C standard. One sequence that is not supported is hexadecimal value escapes beginning with `'\x'`. This would allow values expressed in more than 9 bits to be used within *awk* as in the ISO C standard. However, because this syntax has a non-deterministic length, it does not permit the subsequent character to be a hexadecimal digit. This limitation can be dealt with in the C language by the use of lexical string concatenation. In the *awk* language, concatenation could also be a solution for strings, but not for extended regular expressions (either lexical ERE tokens or strings used dynamically as regular expressions). Because of this limitation, the feature has not been added to IEEE Std 1003.1-2001.

When a string variable is used in a context where an extended regular expression normally appears (where the lexical token ERE is used in the grammar) the string does not contain the literal slashes.

Some versions of *awk* allow the form:

```
func name(args, ...) { statements }
```

This has been deprecated by the authors of the language, who asked that it not be specified.

Historical implementations of *awk* produce an error if a **next** statement is executed in a **BEGIN** action, and cause *awk* to terminate if a **next** statement is executed in an **END** action. This behavior has not been documented, and it was not believed that it was necessary to standardize it.

The specification of conversions between string and numeric values is much more detailed than in the documentation of historical implementations or in the referenced *The AWK Programming Language*. Although most of the behavior is designed to be intuitive, the details are necessary to ensure compatible behavior from different implementations. This is especially important in relational expressions since the types of the operands determine whether a string or numeric comparison is performed. From the perspective of an application writer, it is usually sufficient to expect intuitive behavior and to force conversions (by adding zero or concatenating a null string) when the type of an expression does not obviously match what is needed. The intent has been to specify historical practice in almost all cases. The one exception is that, in historical implementations, variables and constants maintain both string and numeric values after their original value is converted by any use. This means that referencing a variable or constant can have unexpected side effects. For example, with historical implementations the following program:

```
{
 a = "+2"
 b = 2
```

```

7124 if (NR % 2)
7125 c = a + b
7126 if (a == b)
7127 print "numeric comparison"
7128 else
7129 print "string comparison"
7130 }

```

7131 would perform a numeric comparison (and output numeric comparison) for each odd-  
 7132 numbered line, but perform a string comparison (and output string comparison) for each even-  
 7133 numbered line. IEEE Std 1003.1-2001 ensures that comparisons will be numeric if necessary.  
 7134 With historical implementations, the following program:

```

7135 BEGIN {
7136 OFMT = "%e"
7137 print 3.14
7138 OFMT = "%f"
7139 print 3.14
7140 }

```

7141 would output "3.140000e+00" twice, because in the second **print** statement the constant  
 7142 "3.14" would have a string value from the previous conversion. IEEE Std 1003.1-2001 requires  
 7143 that the output of the second **print** statement be "3.140000". The behavior of historical  
 7144 implementations was seen as too unintuitive and unpredictable.

7145 It was pointed out that with the rules contained in early drafts, the following script would print  
 7146 nothing:

```

7147 BEGIN {
7148 y[1.5] = 1
7149 OFMT = "%e"
7150 print y[1.5]
7151 }

```

7152 Therefore, a new variable, **CONVFMT**, was introduced. The **OFMT** variable is now restricted to  
 7153 affecting output conversions of numbers to strings and **CONVFMT** is used for internal  
 7154 conversions, such as comparisons or array indexing. The default value is the same as that for  
 7155 **OFMT**, so unless a program changes **CONVFMT** (which no historical program would do), it  
 7156 will receive the historical behavior associated with internal string conversions.

7157 The POSIX *awk* lexical and syntactic conventions are specified more formally than in other  
 7158 sources. Again the intent has been to specify historical practice. One convention that may not be  
 7159 obvious from the formal grammar as in other verbal descriptions is where <newline>s are  
 7160 acceptable. There are several obvious placements such as terminating a statement, and a  
 7161 backslash can be used to escape <newline>s between any lexical tokens. In addition, <newline>s  
 7162 without backslashes can follow a comma, an open brace, a logical AND operator ("&&"), a  
 7163 logical OR operator ("||"), the **do** keyword, the **else** keyword, and the closing parenthesis of an  
 7164 **if**, **for**, or **while** statement. For example:

```

7165 { print $1,
7166 $2 }

```

7167 The requirement that *awk* add a trailing <newline> to the program argument text is to simplify  
 7168 the grammar, making it match a text file in form. There is no way for an application or test suite  
 7169 to determine whether a literal <newline> is added or whether *awk* simply acts as if it did.

IEEE Std 1003.1-2001 requires several changes from historical implementations in order to support internationalization. Probably the most subtle of these is the use of the decimal-point character, defined by the *LC\_NUMERIC* category of the locale, in representations of floating-point numbers. This locale-specific character is used in recognizing numeric input, in converting between strings and numeric values, and in formatting output. However, regardless of locale, the period character (the decimal-point character of the POSIX locale) is the decimal-point character recognized in processing *awk* programs (including assignments in command line arguments). This is essentially the same convention as the one used in the ISO C standard. The difference is that the C language includes the *setlocale()* function, which permits an application to modify its locale. Because of this capability, a C application begins executing with its locale set to the C locale, and only executes in the environment-specified locale after an explicit call to *setlocale()*. However, adding such an elaborate new feature to the *awk* language was seen as inappropriate for IEEE Std 1003.1-2001. It is possible to execute an *awk* program explicitly in any desired locale by setting the environment in the shell.

The undefined behavior resulting from NULs in extended regular expressions allows future extensions for the GNU *gawk* program to process binary data.

The behavior in the case of invalid *awk* programs (including lexical, syntactic, and semantic errors) is undefined because it was considered overly limiting on implementations to specify. In most cases such errors can be expected to produce a diagnostic and a non-zero exit status. However, some implementations may choose to extend the language in ways that make use of certain invalid constructs. Other invalid constructs might be deemed worthy of a warning, but otherwise cause some reasonable behavior. Still other constructs may be very difficult to detect in some implementations. Also, different implementations might detect a given error during an initial parsing of the program (before reading any input files) while others might detect it when executing the program after reading some input. Implementors should be aware that diagnosing errors as early as possible and producing useful diagnostics can ease debugging of applications, and thus make an implementation more usable.

The unspecified behavior from using multi-character **RS** values is to allow possible future extensions based on extended regular expressions used for record separators. Historical implementations take the first character of the string and ignore the others.

Unspecified behavior when *split(string,array,<null>)* is used is to allow a proposed future extension that would split up a string into an array of individual characters.

In the context of the **getline** function, equally good arguments for different precedences of the **|** and **<** operators can be made. Historical practice has been that:

```
getline < "a" "b"
```

is parsed as:

```
(getline < "a") "b"
```

although many would argue that the intent was that the file **ab** should be read. However:

```
getline < "x" + 1
```

parses as:

```
getline < ("x" + 1)
```

Similar problems occur with the **|** version of **getline**, particularly in combination with **\$**. For example:

```
$"echo hi" | getline
```

(This situation is particularly problematic when used in a **print** statement, where the **|getline** part might be a redirection of the **print**.)

Since in most cases such constructs are not (or at least should not) be used (because they have a natural ambiguity for which there is no conventional parsing), the meaning of these constructs has been made explicitly unspecified. (The effect is that a conforming application that runs into the problem must parenthesize to resolve the ambiguity.) There appeared to be few if any actual uses of such constructs.

Grammars can be written that would cause an error under these circumstances. Where backwards-compatibility is not a large consideration, implementors may wish to use such grammars.

Some historical implementations have allowed some built-in functions to be called without an argument list, the result being a default argument list chosen in some “reasonable” way. Use of **length** as a synonym for **length(\$0)** is the only one of these forms that is thought to be widely known or widely used; this particular form is documented in various places (for example, most historical *awk* reference pages, although not in the referenced *The AWK Programming Language*) as legitimate practice. With this exception, default argument lists have always been undocumented and vaguely defined, and it is not at all clear how (or if) they should be generalized to user-defined functions. They add no useful functionality and preclude possible future extensions that might need to name functions without calling them. Not standardizing them seems the simplest course. The standard developers considered that **length** merited special treatment, however, since it has been documented in the past and sees possibly substantial use in historical programs. Accordingly, this usage has been made legitimate, but Issue 5 removed the obsolescent marking for XSI-conforming implementations and many otherwise conforming applications depend on this feature.

In **sub** and **gsub**, if *repl* is a string literal (the lexical token **STRING**), then two consecutive backslash characters should be used in the string to ensure a single backslash will precede the ampersand when the resultant string is passed to the function. (For example, to specify one literal ampersand in the replacement string, use **gsub(ERE, "\\&")**.)

Historically the only special character in the *repl* argument of **sub** and **gsub** string functions was the ampersand (**&**) character and preceding it with the backslash character was used to turn off its special meaning.

The description in the ISO POSIX-2:1993 standard introduced behavior such that the backslash character was another special character and it was unspecified whether there were any other special characters. This description introduced several portability problems, some of which are described below, and so it has been replaced with the more historical description. Some of the problems include:

- Historically, to create the replacement string, a script could use **gsub(ERE, "\\&")**, but with the ISO POSIX-2:1993 standard wording, it was necessary to use **gsub(ERE, "\\&&")**. Backslash characters are doubled here because all string literals are subject to lexical analysis, which would reduce each pair of backslash characters to a single backslash before being passed to **gsub**.
- Since it was unspecified what the special characters were, for portable scripts to guarantee that characters are printed literally, each character had to be preceded with a backslash. (For example, a portable script had to use **gsub(ERE, "\\h\\i")** to produce a replacement string of "hi".)

The description for comparisons in the ISO POSIX-2:1993 standard did not properly describe historical practice because of the way numeric strings are compared as numbers. The current rules cause the following code:

```

7262 if (0 == "000")
7263 print "strange, but true"
7264 else
7265 print "not true"

```

7266 to do a numeric comparison, causing the **if** to succeed. It should be intuitively obvious that this  
 7267 is incorrect behavior, and indeed, no historical implementation of *awk* actually behaves this way.

7268 To fix this problem, the definition of *numeric string* was enhanced to include only those values  
 7269 obtained from specific circumstances (mostly external sources) where it is not possible to  
 7270 determine unambiguously whether the value is intended to be a string or a numeric.

7271 Variables that are assigned to a numeric string shall also be treated as a numeric string. (For  
 7272 example, the notion of a numeric string can be propagated across assignments.) In comparisons,  
 7273 all variables having the uninitialized value are to be treated as a numeric operand evaluating to  
 7274 the numeric value zero.

7275 Uninitialized variables include all types of variables including scalars, array elements, and fields.  
 7276 The definition of an uninitialized value in **Variables and Special Variables** (on page 160) is  
 7277 necessary to describe the value placed on uninitialized variables and on fields that are valid (for  
 7278 example, **< \$NF**) but have no characters in them and to describe how these variables are to be  
 7279 used in comparisons. A valid field, such as **\$1**, that has no characters in it can be obtained from  
 7280 an input line of "\t\t" when **FS='\t'**. Historically, the comparison (**\$1<10**) was done  
 7281 numerically after evaluating **\$1** to the value zero.

7282 The phrase "... also shall have the numeric value of the numeric string" was removed from  
 7283 several sections of the ISO POSIX-2:1993 standard because it specifies an unnecessary  
 7284 implementation detail. It is not necessary for IEEE Std 1003.1-2001 to specify that these objects be  
 7285 assigned two different values. It is only necessary to specify that these objects may evaluate to  
 7286 two different values depending on context.

7287 The description of numeric string processing is based on the behavior of the *atof()* function in  
 7288 the ISO C standard. While it is not a requirement for an implementation to use this function,  
 7289 many historical implementations of *awk* do. In the ISO C standard, floating-point constants use a  
 7290 period as a decimal point character for the language itself, independent of the current locale, but  
 7291 the *atof()* function and the associated *strtod()* function use the decimal point character of the  
 7292 current locale when converting strings to numeric values. Similarly in *awk*, floating-point  
 7293 constants in an *awk* script use a period independent of the locale, but input strings use the  
 7294 decimal point character of the locale.

## 7300 CHANGE HISTORY

7301 First released in Issue 2.

### 7302 Issue 5

7303 The FUTURE DIRECTIONS section is added.

### 7304 Issue 6

7305 The *awk* utility is aligned with the IEEE P1003.2b draft standard.

7306 The normative text is reworded to avoid use of the term "must" for application requirements.

7307 IEEE PASC Interpretation 1003.2 #211 is applied, adding the sentence “An occurrence of two  
7308 consecutive backslashes shall be interpreted as just a single literal backslash character.” into the  
7309 description of the **sub** string function.

7310 **NAME**

7311       basename — return non-directory portion of a pathname

7312 **SYNOPSIS**7313       basename *string* [*suffix*]7314 **DESCRIPTION**

7315       The *string* operand shall be treated as a pathname, as defined in the Base Definitions volume of  
 7316       IEEE Std 1003.1-2001, Section 3.266, Pathname. The string *string* shall be converted to the  
 7317       filename corresponding to the last pathname component in *string* and then the suffix string  
 7318       *suffix*, if present, shall be removed. This shall be done by performing actions equivalent to the  
 7319       following steps in order:

- 7320           1. If *string* is a null string, it is unspecified whether the resulting string is ' . ' or a null string.  
 7321           In either case, skip steps 2 through 6.
- 7322           2. If *string* is "//", it is implementation-defined whether steps 3 to 6 are skipped or  
 7323           processed.
- 7324           3. If *string* consists entirely of slash characters, *string* shall be set to a single slash character. In  
 7325           this case, skip steps 4 to 6.
- 7326           4. If there are any trailing slash characters in *string*, they shall be removed.
- 7327           5. If there are any slash characters remaining in *string*, the prefix of *string* up to and including  
 7328           the last slash character in *string* shall be removed.
- 7329           6. If the *suffix* operand is present, is not identical to the characters remaining in *string*, and is  
 7330           identical to a suffix of the characters remaining in *string*, the suffix *suffix* shall be removed  
 7331           from *string*. Otherwise, *string* is not modified by this step. It shall not be considered an  
 7332           error if *suffix* is not found in *string*.

7333       The resulting string shall be written to standard output.

7334 **OPTIONS**

7335       None.

7336 **OPERANDS**

7337       The following operands shall be supported:

7338       *string*       A string.7339       *suffix*       A string.7340 **STDIN**

7341       Not used.

7342 **INPUT FILES**

7343       None.

7344 **ENVIRONMENT VARIABLES**7345       The following environment variables shall affect the execution of *basename*:

7346       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 7347       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 7348       Internationalization Variables for the precedence of internationalization variables  
 7349       used to determine the values of locale categories.)

7350       *LC\_ALL*      If set to a non-empty string value, override the values of all the other  
 7351       internationalization variables.

7352 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
7353 characters (for example, single-byte as opposed to multi-byte characters in  
7354 arguments).

7355 *LC\_MESSAGES*  
7356 Determine the locale that should be used to affect the format and contents of  
7357 diagnostic messages written to standard error.

7358 xSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

7359 **ASYNCHRONOUS EVENTS**  
7360 Default.

7361 **STDOUT**  
7362 The *basename* utility shall write a line to the standard output in the following format:  
7363 "%s\n", <resulting string>

7364 **STDERR**  
7365 The standard error shall be used only for diagnostic messages.

7366 **OUTPUT FILES**  
7367 None.

7368 **EXTENDED DESCRIPTION**  
7369 None.

7370 **EXIT STATUS**  
7371 The following exit values shall be returned:  
7372 0 Successful completion.  
7373 >0 An error occurred.

7374 **CONSEQUENCES OF ERRORS**  
7375 Default.

7376 **APPLICATION USAGE**  
7377 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
7378 with two slash characters. Therefore, applications shall not arbitrarily add slashes to the  
7379 beginning of a pathname unless they can ensure that there are more or less than two or are  
7380 prepared to deal with the implementation-defined consequences.

7381 **EXAMPLES**  
7382 If the string *string* is a valid pathname:  
7383 \$(basename "*string*")  
7384 produces a filename that could be used to open the file named by *string* in the directory returned  
7385 by:  
7386 \$(dirname "*string*")  
7387 If the string *string* is not a valid pathname, the same algorithm is used, but the result need not be  
7388 a valid filename. The *basename* utility is not expected to make any judgements about the validity  
7389 of *string* as a pathname; it just follows the specified algorithm to produce a result string.  
7390 The following shell script compiles */usr/src/cmd/cat.c* and moves the output to a file named **cat**  
7391 in the current directory when invoked with the argument */usr/src/cmd/cat* or with the argument  
7392 */usr/src/cmd/cat.c*:

```
7393 c99 $(dirname "$1")/$(basename "$1" .c).c
7394 mv a.out $(basename "$1" .c)
```

**7395 RATIONALE**

7396 The behaviors of *basename* and *dirname* have been coordinated so that when *string* is a valid  
7397 pathname:

7398 `$(basename "string")`

7399 would be a valid filename for the file in the directory:

7400 `$(dirname "string")`

7401 This would not work for the early proposal versions of these utilities due to the way it specified  
7402 handling of trailing slashes.

7403 Since the definition of *pathname* specifies implementation-defined behavior for pathnames  
7404 starting with two slash characters, this volume of IEEE Std 1003.1-2001 specifies similar  
7405 implementation-defined behavior for the *basename* and *dirname* utilities.

**7406 FUTURE DIRECTIONS**

7407 None.

**7408 SEE ALSO**

7409 Section 2.5 (on page 33), *dirname*

**7410 CHANGE HISTORY**

7411 First released in Issue 2.

**7412 Issue 6**

7413 IEEE PASC Interpretation 1003.2 #164 is applied.

7414 The normative text is reworded to avoid use of the term “must” for application requirements.

7415 **NAME**

7416 batch — schedule commands to be executed in a batch queue

7417 **SYNOPSIS**7418 UP *batch*

7419

7420 **DESCRIPTION**7421 The *batch* utility shall read commands from standard input and schedule them for execution in a  
7422 batch queue. It shall be the equivalent of the command:

7423 at -q b -m now

7424 where queue *b* is a special *at* queue, specifically for batch jobs. Batch jobs shall be submitted to  
7425 the batch queue with no time constraints and shall be run by the system using algorithms, based  
7426 on unspecified factors, that may vary with each invocation of *batch*.7427 XSI Users shall be permitted to use *batch* if their name appears in the file **/usr/lib/cron/at.allow**. If  
7428 that file does not exist, the file **/usr/lib/cron/at.deny** shall be checked to determine whether the  
7429 user shall be denied access to *batch*. If neither file exists, only a process with the appropriate  
7430 privileges shall be allowed to submit a job. If only **at.deny** exists and is empty, global usage shall  
7431 be permitted. The **at.allow** and **at.deny** files shall consist of one user name per line.7432 **OPTIONS**

7433 None.

7434 **OPERANDS**

7435 None.

7436 **STDIN**7437 The standard input shall be a text file consisting of commands acceptable to the shell command  
7438 language described in Chapter 2 (on page 29).7439 **INPUT FILES**7440 XSI The text files **/usr/lib/cron/at.allow** and **/usr/lib/cron/at.deny** shall contain zero or more user  
7441 names, one per line, of users who are, respectively, authorized or denied access to the *at* and  
7442 *batch* utilities.7443 **ENVIRONMENT VARIABLES**7444 The following environment variables shall affect the execution of *batch*:7445 **LANG** Provide a default value for the internationalization variables that are unset or null.  
7446 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
7447 Internationalization Variables for the precedence of internationalization variables  
7448 used to determine the values of locale categories.)7449 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
7450 internationalization variables.7451 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
7452 characters (for example, single-byte as opposed to multi-byte characters in  
7453 arguments and input files).7454 **LC\_MESSAGES**7455 Determine the locale that should be used to affect the format and contents of  
7456 diagnostic messages written to standard error and informative messages written to  
7457 standard output.7458 **LC\_TIME** Determine the format and contents for date and time strings written by *batch*.

|      |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7459 | XSI | <b>NLSPATH</b>                | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                                                                                                                                                                                                                                                                                                                            |
| 7460 |     | <b>SHELL</b>                  | Determine the name of a command interpreter to be used to invoke the at-job. If the variable is unset or null, <i>sh</i> shall be used. If it is set to a value other than a name for <i>sh</i> , the implementation shall do one of the following: use that shell; use <i>sh</i> ; use the login shell from the user database; any of the preceding accompanied by a warning diagnostic about which was chosen. |
| 7461 |     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 7492 |     |                               | >0 An error occurred.                                                                                                                                                                                                                                                                                                                                                                                            |
| 7493 |     | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 7494 |     |                               | The job shall not be scheduled.                                                                                                                                                                                                                                                                                                                                                                                  |

**APPLICATION USAGE**

It may be useful to redirect standard output within the specified commands.

**EXAMPLES**

1. This sequence can be used at a terminal:

```
batch
sort < file >outfile
EOT
```

2. This sequence, which demonstrates redirecting standard error to a pipe, is useful in a command procedure (the sequence of output redirection specifications is significant):

```
batch <<
! diff file1 file2 2>&1 >outfile | mailx mygroup
!
```

**RATIONALE**

Early proposals described *batch* in a manner totally separated from *at*, even though the historical model treated it almost as a synonym for *at* **-qb**. A number of features were added to list and control batch work separately from those in *at*. Upon further reflection, it was decided that the benefit of this did not merit the change to the historical interface.

The **-m** option was included on the equivalent *at* command because it is historical practice to mail results to the submitter, even if all job-produced output is redirected. As explained in the RATIONALE for *at*, the **now** keyword submits the job for immediate execution (after scheduling delays), despite some historical systems where *at* **now** would have been considered an error.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

*at*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

This utility is marked as part of the User Portability Utilities option.

The NAME is changed to align with the IEEE P1003.2b draft standard.

The normative text is reworded to avoid use of the term “must” for application requirements.

7526 **NAME**

7527       bc — arbitrary-precision arithmetic language

7528 **SYNOPSIS**7529       bc [-l] [*file* ...]7530 **DESCRIPTION**

7531       The *bc* utility shall implement an arbitrary precision calculator. It shall take input from any files  
 7532       given, then read from the standard input. If the standard input and standard output to *bc* are  
 7533       attached to a terminal, the invocation of *bc* shall be considered to be *interactive*, causing  
 7534       behavioral constraints described in the following sections.

7535 **OPTIONS**

7536       The *bc* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 7537       Utility Syntax Guidelines.

7538       The following option shall be supported:

7539       **-l**           (The letter ell.) Define the math functions and initialize *scale* to 20, instead of the  
 7540       default zero; see the EXTENDED DESCRIPTION section.

7541 **OPERANDS**

7542       The following operand shall be supported:

7543       *file*           A pathname of a text file containing *bc* program statements. After all *files* have  
 7544       been read, *bc* shall read the standard input.

7545 **STDIN**

7546       See the INPUT FILES section.

7547 **INPUT FILES**

7548       Input files shall be text files containing a sequence of comments, statements, and function  
 7549       definitions that shall be executed as they are read.

7550 **ENVIRONMENT VARIABLES**7551       The following environment variables shall affect the execution of *bc*:

7552       **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 7553       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 7554       Internationalization Variables for the precedence of internationalization variables  
 7555       used to determine the values of locale categories.)

7556       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 7557       internationalization variables.

7558       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
 7559       characters (for example, single-byte as opposed to multi-byte characters in  
 7560       arguments and input files).

7561       **LC\_MESSAGES**

7562       Determine the locale that should be used to affect the format and contents of  
 7563       diagnostic messages written to standard error.

7564       **NSI**       **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

7565 **ASYNCHRONOUS EVENTS**

7566       Default.

7567 **STDOUT**

7568       The output of the *bc* utility shall be controlled by the program read, and consist of zero or more  
 7569       lines containing the value of all executed expressions without assignments. The radix and  
 7570       precision of the output shall be controlled by the values of the **obase** and **scale** variables; see the  
 7571       EXTENDED DESCRIPTION section.

7572 **STDERR**

7573       The standard error shall be used only for diagnostic messages.

7574 **OUTPUT FILES**

7575       None.

7576 **EXTENDED DESCRIPTION**7577       **Grammar**

7578       The grammar in this section and the lexical conventions in the following section shall together  
 7579       describe the syntax for *bc* programs. The general conventions for this style of grammar are  
 7580       described in Section 1.10 (on page 19). A valid program can be represented as the non-terminal  
 7581       symbol **program** in the grammar. This formal syntax shall take precedence over the text syntax  
 7582       description.

#### 7684 Lexical Conventions in bc

7685 The lexical conventions for *bc* programs, with respect to the preceding grammar, shall be as  
 7686 follows:

- 7687 1. Except as noted, *bc* shall recognize the longest possible token or delimiter beginning at a  
 7688 given point.
- 7689 2. A comment shall consist of any characters beginning with the two adjacent characters  
 7690 `"/*"` and terminated by the next occurrence of the two adjacent characters `"*/"`.  
 7691 Comments shall have no effect except to delimit lexical tokens.
- 7692 3. The <newline> shall be recognized as the token **NEWLINE**.
- 7693 4. The token **STRING** shall represent a string constant; it shall consist of any characters  
 7694 beginning with the double-quote character (`"`) and terminated by another occurrence of  
 7695 the double-quote character. The value of the string is the sequence of all characters  
 7696 between, but not including, the two double-quote characters. All characters shall be taken  
 7697 literally from the input, and there is no way to specify a string containing a double-quote  
 7698 character. The length of the value of each string shall be limited to {BC\_STRING\_MAX}  
 7699 bytes.
- 7700 5. A <blank> shall have no effect except as an ordinary character if it appears within a  
 7701 **STRING** token, or to delimit a lexical token other than **STRING**.

6. The combination of a backslash character immediately followed by a <newline> shall have no effect other than to delimit lexical tokens with the following exceptions:

- It shall be interpreted as the character sequence "\<newline>" in **STRING** tokens.
- It shall be ignored as part of a multi-line **NUMBER** token.

7. The token **NUMBER** shall represent a numeric constant. It shall be recognized by the following grammar:

```

NUMBER : integer
 | '.' integer
 | integer '.'
 | integer '.' integer
 ;

integer : digit
 | integer digit
 ;

digit : 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7
 | 8 | 9 | A | B | C | D | E | F
 ;

```

8. The value of a **NUMBER** token shall be interpreted as a numeral in the base specified by the value of the internal register **ibase** (described below). Each of the **digit** characters shall have the value from 0 to 15 in the order listed here, and the period character shall represent the radix point. The behavior is undefined if digits greater than or equal to the value of **ibase** appear in the token. However, note the exception for single-digit values being assigned to **ibase** and **obase** themselves, in **Operations in bc** (on page 198).

9. The following keywords shall be recognized as tokens:

|               |              |               |               |              |
|---------------|--------------|---------------|---------------|--------------|
| <b>auto</b>   | <b>ibase</b> | <b>length</b> | <b>return</b> | <b>while</b> |
| <b>break</b>  | <b>if</b>    | <b>obase</b>  | <b>scale</b>  |              |
| <b>define</b> | <b>for</b>   | <b>quit</b>   | <b>sqrt</b>   |              |

10. Any of the following characters occurring anywhere except within a keyword shall be recognized as the token **LETTER**:

a b c d e f g h i j k l m n o p q r s t u v w x y z

11. The following single-character and two-character sequences shall be recognized as the token **ASSIGN\_OP**:

=   +=   -=   \*=   /=   %=   ^=

12. If an '=' character, as the beginning of a token, is followed by a '-' character with no intervening delimiter, the behavior is undefined.

13. The following single-characters shall be recognized as the token **MUL\_OP**:

\*   /   %

14. The following single-character and two-character sequences shall be recognized as the token **REL\_OP**:

==   <=   >=   !=   <   >

15. The following two-character sequences shall be recognized as the token **INCR\_DECR**:

- 7743            ++    --
- 7744        16. The following single characters shall be recognized as tokens whose names are the
- 7745            character:
- 7746            <newline> ( ) , + - ; [ ] ^ { }
- 7747        17. The token **EOF** is returned when the end of input is reached.

## 7748        **Operations in bc**

7749        There are three kinds of identifiers: ordinary identifiers, array identifiers, and function

7750        identifiers. All three types consist of single lowercase letters. Array identifiers shall be followed

7751        by square brackets (" [ ] "). An array subscript is required except in an argument or auto list.

7752        Arrays are singly dimensioned and can contain up to {BC\_DIM\_MAX} elements. Indexing shall

7753        begin at zero so an array is indexed from 0 to {BC\_DIM\_MAX}-1. Subscripts shall be truncated

7754        to integers. The application shall ensure that function identifiers are followed by parentheses,

7755        possibly enclosing arguments. The three types of identifiers do not conflict.

7756        The following table summarizes the rules for precedence and associativity of all operators.

7757        Operators on the same line shall have the same precedence; rows are in order of decreasing

7758        precedence.

7759                            **Table 4-3** Operators in *bc*

| Operator                  | Associativity |
|---------------------------|---------------|
| ++, --                    | N/A           |
| unary -                   | N/A           |
| ^                         | Right to left |
| *, /, %                   | Left to right |
| +, binary -               | Left to right |
| =, +=, -=, *=, /=, %=, ^= | Right to left |
| ==, <=, >=, !=, <, >      | None          |

7768        Each expression or named expression has a *scale*, which is the number of decimal digits that

7769        shall be maintained as the fractional portion of the expression.

7770        *Named expressions* are places where values are stored. Named expressions shall be valid on the

7771        left side of an assignment. The value of a named expression shall be the value stored in the place

7772        named. Simple identifiers and array elements are named expressions; they have an initial value

7773        of zero and an initial scale of zero.

7774        The internal registers **scale**, **ibase**, and **obase** are all named expressions. The scale of an

7775        expression consisting of the name of one of these registers shall be zero; values assigned to any

7776        of these registers are truncated to integers. The **scale** register shall contain a global value used in

7777        computing the scale of expressions (as described below). The value of the register **scale** is

7778        limited to  $0 \leq \text{scale} \leq \{\text{BC\_SCALE\_MAX}\}$  and shall have a default value of zero. The **ibase** and

7779        **obase** registers are the input and output number radix, respectively. The value of **ibase** shall be

7780        limited to:

$$7781 \quad 2 \leq \text{ibase} \leq 16$$

7782        The value of **obase** shall be limited to:

$$7783 \quad 2 \leq \text{obase} \leq \{\text{BC\_BASE\_MAX}\}$$

7784        When either **ibase** or **obase** is assigned a single **digit** value from the list in **Lexical Conventions**

7785        **in bc** (on page 196), the value shall be assumed in hexadecimal. (For example, **ibase=A** sets to

base ten, regardless of the current **ibase** value.) Otherwise, the behavior is undefined when digits greater than or equal to the value of **ibase** appear in the input. Both **ibase** and **obase** shall have initial values of 10.

Internal computations shall be conducted as if in decimal, regardless of the input and output bases, to the specified number of decimal digits. When an exact result is not achieved (for example, **scale**=0; 3.2/1), the result shall be truncated.

For all values of **obase** specified by this volume of IEEE Std 1003.1-2001, *bc* shall output numeric values by performing each of the following steps in order:

1. If the value is less than zero, a hyphen ('-') character shall be output.
2. One of the following is output, depending on the numerical value:
  - If the absolute value of the numerical value is greater than or equal to one, the integer portion of the value shall be output as a series of digits appropriate to **obase** (as described below), most significant digit first. The most significant non-zero digit shall be output next, followed by each successively less significant digit.
  - If the absolute value of the numerical value is less than one but greater than zero and the scale of the numerical value is greater than zero, it is unspecified whether the character 0 is output.
  - If the numerical value is zero, the character 0 shall be output.
3. If the scale of the value is greater than zero and the numeric value is not zero, a period character shall be output, followed by a series of digits appropriate to **obase** (as described below) representing the most significant portion of the fractional part of the value. If *s* represents the scale of the value being output, the number of digits output shall be *s* if **obase** is 10, less than or equal to *s* if **obase** is greater than 10, or greater than or equal to *s* if **obase** is less than 10. For **obase** values other than 10, this should be the number of digits needed to represent a precision of  $10^s$ .

For **obase** values from 2 to 16, valid digits are the first **obase** of the single characters:

0 1 2 3 4 5 6 7 8 9 A B C D E F

which represent the values zero to 15, inclusive, respectively.

For bases greater than 16, each digit shall be written as a separate multi-digit decimal number. Each digit except the most significant fractional digit shall be preceded by a single <space>. For bases from 17 to 100, *bc* shall write two-digit decimal numbers; for bases from 101 to 1000, three-digit decimal strings, and so on. For example, the decimal number 1 024 in base 25 would be written as:

Δ01Δ15Δ24

and in base 125, as:

Δ008Δ024

Very large numbers shall be split across lines with 70 characters per line in the POSIX locale; other locales may split at different character boundaries. Lines that are continued shall end with a backslash ('\').

A function call shall consist of a function name followed by parentheses containing a comma-separated list of expressions, which are the function arguments. A whole array passed as an argument shall be specified by the array name followed by empty square brackets. All function arguments shall be passed by value. As a result, changes made to the formal parameters shall have no effect on the actual arguments. If the function terminates by executing a **return**

7830 statement, the value of the function shall be the value of the expression in the parentheses of the  
 7831 **return** statement or shall be zero if no expression is provided or if there is no **return** statement.

7832 The result of **sqrt**(*expression*) shall be the square root of the expression. The result shall be  
 7833 truncated in the least significant decimal place. The scale of the result shall be the scale of the  
 7834 expression or the value of **scale**, whichever is larger.

7835 The result of **length**(*expression*) shall be the total number of significant decimal digits in the  
 7836 expression. The scale of the result shall be zero.

7837 The result of **scale**(*expression*) shall be the scale of the expression. The scale of the result shall be  
 7838 zero.

7839 A numeric constant shall be an expression. The scale shall be the number of digits that follow the  
 7840 radix point in the input representing the constant, or zero if no radix point appears.

7841 The sequence ( *expression* ) shall be an expression with the same value and scale as *expression*.  
 7842 The parentheses can be used to alter the normal precedence.

7843 The semantics of the unary and binary operators are as follows:

7844 *-expression*  
 7845 The result shall be the negative of the *expression*. The scale of the result shall be the scale of  
 7846 *expression*.

7847 The unary increment and decrement operators shall not modify the scale of the named  
 7848 expression upon which they operate. The scale of the result shall be the scale of that named  
 7849 expression.

7850 *++named-expression*  
 7851 The named expression shall be incremented by one. The result shall be the value of the  
 7852 named expression after incrementing.

7853 *--named-expression*  
 7854 The named expression shall be decremented by one. The result shall be the value of the  
 7855 named expression after decrementing.

7856 *named-expression++*  
 7857 The named expression shall be incremented by one. The result shall be the value of the  
 7858 named expression before incrementing.

7859 *named-expression--*  
 7860 The named expression shall be decremented by one. The result shall be the value of the  
 7861 named expression before decrementing.

7862 The exponentiation operator, circumflex ( *' ^ '* ), shall bind right to left.

7863 *expression^expression*  
 7864 The result shall be the first *expression* raised to the power of the second *expression*. If the  
 7865 second expression is not an integer, the behavior is undefined. If *a* is the scale of the left  
 7866 expression and *b* is the absolute value of the right expression, the scale of the result shall be:  
 7867 if *b* >= 0 min(*a* \* *b*, max(scale, *a*)) if *b* < 0 scale

7868 The multiplicative operators ( *' \* '*, *' / '*, *' % '* ) shall bind left to right.

7869 *expression\*expression*  
 7870 The result shall be the product of the two expressions. If *a* and *b* are the scales of the two  
 7871 expressions, then the scale of the result shall be:

7872           `min(a+b,max(scale,a,b))`

7873           *expression / expression*  
 7874           The result shall be the quotient of the two expressions. The scale of the result shall be the  
 7875           value of **scale**.

7876           *expression % expression*  
 7877           For expressions *a* and *b*, *a % b* shall be evaluated equivalent to the steps:

7878           1. Compute *a / b* to current scale.  
 7879           2. Use the result to compute:

7880           `a - (a / b) * b`  
 7881           to scale:  
 7882           `max(scale + scale(b), scale(a))`

7883           The scale of the result shall be:  
 7884           `max(scale + scale(b), scale(a))`

7885           When **scale** is zero, the '`%`' operator is the mathematical remainder operator.

7886           The additive operators ('`+`', '`-`') shall bind left to right.

7887           *expression + expression*  
 7888           The result shall be the sum of the two expressions. The scale of the result shall be the  
 7889           maximum of the scales of the expressions.

7890           *expression - expression*  
 7891           The result shall be the difference of the two expressions. The scale of the result shall be the  
 7892           maximum of the scales of the expressions.

7893           The assignment operators ('`=`', '`+=`', '`-=`', '`*=`', '`/=`', '`%=`', '`^=`') shall bind right to left.

7894           *named-expression = expression*  
 7895           This expression shall result in assigning the value of the expression on the right to the  
 7896           named expression on the left. The scale of both the named expression and the result shall be  
 7897           the scale of *expression*.

7898           The compound assignment forms:

7899           *named-expression <operator>= expression*  
 7900           shall be equivalent to:  
 7901           *named-expression = named-expression <operator> expression*  
 7902           except that the *named-expression* shall be evaluated only once.

7903           Unlike all other operators, the relational operators ('`<`', '`>`', '`<=`', '`>=`', '`==`', '`!=`') shall be  
 7904           only valid as the object of an **if**, **while**, or inside a **for** statement.

7905           *expression1 < expression2*  
 7906           The relation shall be true if the value of *expression1* is strictly less than the value of  
 7907           *expression2*.

7908           *expression1 > expression2*  
 7909           The relation shall be true if the value of *expression1* is strictly greater than the value of  
 7910           *expression2*.

7911 *expression1* <= *expression2*  
 7912     The relation shall be true if the value of *expression1* is less than or equal to the value of  
 7913     *expression2*.

7914 *expression1* >= *expression2*  
 7915     The relation shall be true if the value of *expression1* is greater than or equal to the value of  
 7916     *expression2*.

7917 *expression1* = *expression2*  
 7918     The relation shall be true if the values of *expression1* and *expression2* are equal.

7919 *expression1* != *expression2*  
 7920     The relation shall be true if the values of *expression1* and *expression2* are unequal.

7921 There are only two storage classes in **bc**: global and automatic (local). Only identifiers that are  
 7922 local to a function need be declared with the **auto** command. The arguments to a function shall  
 7923 be local to the function. All other identifiers are assumed to be global and available to all  
 7924 functions. All identifiers, global and local, have initial values of zero. Identifiers declared as auto  
 7925 shall be allocated on entry to the function and released on returning from the function. They  
 7926 therefore do not retain values between function calls. Auto arrays shall be specified by the array  
 7927 name followed by empty square brackets. On entry to a function, the old values of the names  
 7928 that appear as parameters and as automatic variables shall be pushed onto a stack. Until the  
 7929 function returns, reference to these names shall refer only to the new values.

7930 References to any of these names from other functions that are called from this function also  
 7931 refer to the new value until one of those functions uses the same name for a local variable.

7932 When a statement is an expression, unless the main operator is an assignment, execution of the  
 7933 statement shall write the value of the expression followed by a <newline>.

7934 When a statement is a string, execution of the statement shall write the value of the string.

7935 Statements separated by semicolons or <newline>s shall be executed sequentially. In an  
 7936 interactive invocation of **bc**, each time a <newline> is read that satisfies the grammatical  
 7937 production:

7938 `input_item : semicolon_list NEWLINE`

7939 the sequential list of statements making up the **semicolon\_list** shall be executed immediately  
 7940 and any output produced by that execution shall be written without any delay due to buffering.

7941 In an **if** statement (**if**(*relation*) *statement*), the *statement* shall be executed if the relation is true.

7942 The **while** statement (**while**(*relation*) *statement*) implements a loop in which the *relation* is tested;  
 7943 each time the *relation* is true, the *statement* shall be executed and the *relation* retested. When the  
 7944 *relation* is false, execution shall resume after *statement*.

7945 A **for** statement (**for**(*expression*; *relation*; *expression*) *statement*) shall be the same as:

7946 *first-expression*  
 7947 while (*relation*) {  
 7948     *statement*  
 7949     *last-expression*  
 7950 }

7951 The application shall ensure that all three expressions are present.

7952 The **break** statement shall cause termination of a **for** or **while** statement.

7953 The **auto** statement (**auto** *identifier* [*identifier*] ...) shall cause the values of the identifiers to be  
 7954 pushed down. The identifiers can be ordinary identifiers or array identifiers. Array identifiers

7955 shall be specified by following the array name by empty square brackets. The application shall  
 7956 ensure that the **auto** statement is the first statement in a function definition.

7957 A **define** statement:

```
7958 define LETTER (opt_parameter_list) {
7959 opt_auto_define_list
7960 statement_list
7961 }
```

7962 defines a function named **LETTER**. If a function named **LETTER** was previously defined, the  
 7963 **define** statement shall replace the previous definition. The expression:

```
7964 LETTER (opt_argument_list)
```

7965 shall invoke the function named **LETTER**. The behavior is undefined if the number of  
 7966 arguments in the invocation does not match the number of parameters in the definition.  
 7967 Functions shall be defined before they are invoked. A function shall be considered to be defined  
 7968 within its own body, so recursive calls are valid. The values of numeric constants within a  
 7969 function shall be interpreted in the base specified by the value of the **ibase** register when the  
 7970 function is invoked.

7971 The **return** statements (**return** and **return(expression)**) shall cause termination of a function,  
 7972 popping of its auto variables, and specification of the result of the function. The first form shall  
 7973 be equivalent to **return(0)**. The value and scale of the result returned by the function shall be the  
 7974 value and scale of the expression returned.

7975 The **quit** statement (**quit**) shall stop execution of a *bc* program at the point where the statement  
 7976 occurs in the input, even if it occurs in a function definition, or in an **if**, **for**, or **while** statement.

7977 The following functions shall be defined when the **-l** option is specified:

```
7978 s(expression)
7979 Sine of argument in radians.
```

```
7980 c(expression)
7981 Cosine of argument in radians.
```

```
7982 a(expression)
7983 Arctangent of argument.
```

```
7984 l(expression)
7985 Natural logarithm of argument.
```

```
7986 e(expression)
7987 Exponential function of argument.
```

```
7988 j(expression, expression)
7989 Bessel function of integer order.
```

7990 The scale of the result returned by these functions shall be the value of the **scale** register at the  
 7991 time the function is invoked. The value of the **scale** register after these functions have completed  
 7992 their execution shall be the same value it had upon invocation. The behavior is undefined if any  
 7993 of these functions is invoked with an argument outside the domain of the mathematical  
 7994 function.

## 7995 EXIT STATUS

7996 The following exit values shall be returned:

```
7997 0 All input files were processed successfully.
```

7998            *unspecified*    An error occurred.

## 7999 CONSEQUENCES OF ERRORS

8000            If any *file* operand is specified and the named file cannot be accessed, *bc* shall write a diagnostic message to standard error and terminate without any further action.

8002            In an interactive invocation of *bc*, the utility should print an error message and recover following any error in the input. In a non-interactive invocation of *bc*, invalid input causes undefined behavior.

## 8005 APPLICATION USAGE

8006            Automatic variables in *bc* do not work in exactly the same way as in either C or PL/1.

8007            For historical reasons, the exit status from *bc* cannot be relied upon to indicate that an error has occurred. Returning zero after an error is possible. Therefore, *bc* should be used primarily by interactive users (who can react to error messages) or by application programs that can somehow validate the answers returned as not including error messages.

8011            The *bc* utility always uses the period (‘.’) character to represent a radix point, regardless of any decimal-point character specified as part of the current locale. In languages like C or *awk*, the period character is used in program source, so it can be portable and unambiguous, while the locale-specific character is used in input and output. Because there is no distinction between source and input in *bc*, this arrangement would not be possible. Using the locale-specific character in *bc*’s input would introduce ambiguities into the language; consider the following example in a locale with a comma as the decimal-point character:

```
8018 define f(a,b) {
8019 ...
8020 }
8021 ...
8022 f(1,2,3)
```

8023            Because of such ambiguities, the period character is used in input. Having input follow different conventions from output would be confusing in either pipeline usage or interactive usage, so the period is also used in output.

## 8026 EXAMPLES

8027            In the shell, the following assigns an approximation of the first ten digits of ‘ $\pi$ ’ to the variable *x*:

```
8029 x=$(printf "%s\n" 'scale = 10; 104348/33215' | bc)
```

8030            The following *bc* program prints the same approximation of ‘ $\pi$ ’, with a label, to standard output:

```
8032 scale = 10
8033 "pi equals "
8034 104348 / 33215
```

8035            The following defines a function to compute an approximate value of the exponential function (note that such a function is predefined if the **-l** option is specified):

```
8037 scale = 20
8038 define e(x) {
8039 auto a, b, c, i, s
8040 a = 1
8041 b = 1
8042 s = 1
```

```

8043 for (i = 1; 1 == 1; i++) {
8044 a = a*x
8045 b = b*i
8046 c = a/b
8047 if (c == 0) {
8048 return(s)
8049 }
8050 s = s+c
8051 }
8052 }

```

8053 The following prints approximate values of the exponential function of the first ten integers:

```

8054 for (i = 1; i <= 10; ++i) {
8055 e(i)
8056 }

```

#### 8057 **RATIONALE**

8058 The *bc* utility is implemented historically as a front-end processor for *dc*; *dc* was not selected to  
8059 be part of this volume of IEEE Std 1003.1-2001 because *bc* was thought to have a more intuitive  
8060 programmatic interface. Current implementations that implement *bc* using *dc* are expected to be  
8061 compliant.

8062 The exit status for error conditions has been left unspecified for several reasons:

- 8063 • The *bc* utility is used in both interactive and non-interactive situations. Different exit codes  
8064 may be appropriate for the two uses.
- 8065 • It is unclear when a non-zero exit should be given; divide-by-zero, undefined functions, and  
8066 syntax errors are all possibilities.
- 8067 • It is not clear what utility the exit status has.
- 8068 • In the 4.3 BSD, System V, and Ninth Edition implementations, *bc* works in conjunction with  
8069 *dc*. The *dc* utility is the parent, *bc* is the child. This was done to cleanly terminate *bc* if *dc*  
8070 aborted.

8071 The decision to have *bc* exit upon encountering an inaccessible input file is based on the belief  
8072 that *bc file1 file2* is used most often when at least *file1* contains data/function  
8073 declarations/initializations. Having *bc* continue with prerequisite files missing is probably not  
8074 useful. There is no implication in the CONSEQUENCES OF ERRORS section that *bc* must check  
8075 all its files for accessibility before opening any of them.

8076 There was considerable debate on the appropriateness of the language accepted by *bc*. Several  
8077 reviewers preferred to see either a pure subset of the C language or some changes to make the  
8078 language more compatible with C. While the *bc* language has some obvious similarities to C, it  
8079 has never claimed to be compatible with any version of C. An interpreter for a subset of C might  
8080 be a very worthwhile utility, and it could potentially make *bc* obsolete. However, no such utility  
8081 is known in historical practice, and it was not within the scope of this volume of  
8082 IEEE Std 1003.1-2001 to define such a language and utility. If and when they are defined, it may  
8083 be appropriate to include them in a future version of IEEE Std 1003.1. This left the following  
8084 alternatives:

- 8085 1. Exclude any calculator language from this volume of IEEE Std 1003.1-2001.

8086 The consensus of the standard developers was that a simple programmatic calculator  
8087 language is very useful for both applications and interactive users. The only arguments for  
8088 excluding any calculator were that it would become obsolete if and when a C-compatible

one emerged, or that the absence would encourage the development of such a C-compatible one. These arguments did not sufficiently address the needs of current application writers.

2. Standardize the historical *dc*, possibly with minor modifications.

The consensus of the standard developers was that *dc* is a fundamentally less usable language and that that would be far too severe a penalty for avoiding the issue of being similar to but incompatible with C.

3. Standardize the historical *bc*, possibly with minor modifications.

This was the approach taken. Most of the proponents of changing the language would not have been satisfied until most or all of the incompatibilities with C were resolved. Since most of the changes considered most desirable would break historical applications and require significant modification to historical implementations, almost no modifications were made. The one significant modification that was made was the replacement of the historical *bc* assignment operators "=", and so on, with the more modern "+=", and so on. The older versions are considered to be fundamentally flawed because of the lexical ambiguity in uses like *a*==1.

In order to permit implementations to deal with backwards-compatibility as they see fit, the behavior of this one ambiguous construct was made undefined. (At least three implementations have been known to support this change already, so the degree of change involved should not be great.)

The '%' operator is the mathematical remainder operator when **scale** is zero. The behavior of this operator for other values of **scale** is from historical implementations of *bc*, and has been maintained for the sake of historical applications despite its non-intuitive nature.

Historical implementations permit setting **ibase** and **obase** to a broader range of values. This includes values less than 2, which were not seen as sufficiently useful to standardize. These implementations do not interpret input properly for values of **ibase** that are greater than 16. This is because numeric constants are recognized syntactically, rather than lexically, as described in this volume of IEEE Std 1003.1-2001. They are built from lexical tokens of single hexadecimal digits and periods. Since <blank>s between tokens are not visible at the syntactic level, it is not possible to recognize the multi-digit "digits" used in the higher bases properly. The ability to recognize input in these bases was not considered useful enough to require modifying these implementations. Note that the recognition of numeric constants at the syntactic level is not a problem with conformance to this volume of IEEE Std 1003.1-2001, as it does not impact the behavior of conforming applications (and correct *bc* programs). Historical implementations also accept input with all of the digits '0'-'9' and 'A'-'F' regardless of the value of **ibase**; since digits with value greater than or equal to **ibase** are not really appropriate, the behavior when they appear is undefined, except for the common case of:

```
ibase=8;
/* Process in octal base. */
...
ibase=A
/* Restore decimal base. */
```

In some historical implementations, if the expression to be written is an uninitialized array element, a leading <space> and/or up to four leading 0 characters may be output before the character zero. This behavior is considered a bug; it is unlikely that any currently conforming application relies on:

8135           echo 'b[3]' | bc

8136           returning 00000 rather than 0.

8137           Exact calculation of the number of fractional digits to output for a given value in a base other  
8138           than 10 can be computationally expensive. Historical implementations use a faster  
8139           approximation, and this is permitted. Note that the requirements apply only to values of **obase**  
8140           that this volume of IEEE Std 1003.1-2001 requires implementations to support (in particular, not  
8141           to 1, 0, or negative bases, if an implementation supports them as an extension).

8142           Historical implementations of *bc* did not allow array parameters to be passed as the last  
8143           parameter to a function. New implementations are encouraged to remove this restriction even  
8144           though it is not required by the grammar.

8145   **FUTURE DIRECTIONS**

8146           None.

8147   **SEE ALSO**

8148           Section 1.10 (on page 19), *awk*

8149   **CHANGE HISTORY**

8150           First released in Issue 4.

8151   **Issue 5**

8152           The FUTURE DIRECTIONS section is added.

8153   **Issue 6**

8154           Updated to align with the IEEE P1003.2b draft standard, which included resolution of several  
8155           interpretations of the ISO POSIX-2: 1993 standard.

8156           The normative text is reworded to avoid use of the term “must” for application requirements.

8157 **NAME**

8158           bg — run jobs in the background

8159 **SYNOPSIS**8160 UP       bg [*job\_id* ...]

8161

8162 **DESCRIPTION**

8163           If job control is enabled (see the description of *set -m*), the *bg* utility shall resume suspended jobs  
 8164           from the current environment (see Section 2.12 (on page 61)) by running them as background  
 8165           jobs. If the job specified by *job\_id* is already a running background job, the *bg* utility shall have no  
 8166           effect and shall exit successfully.

8167           Using *bg* to place a job into the background shall cause its process ID to become “known in the  
 8168           current shell execution environment”, as if it had been started as an asynchronous list; see  
 8169           Section 2.9.3.1 (on page 50).

8170 **OPTIONS**

8171           None.

8172 **OPERANDS**

8173           The following operand shall be supported:

8174           *job\_id*       Specify the job to be resumed as a background job. If no *job\_id* operand is given,  
 8175                           the most recently suspended job shall be used. The format of *job\_id* is described in  
 8176                           the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.203, Job Control Job  
 8177                           ID.

8178 **STDIN**

8179           Not used.

8180 **INPUT FILES**

8181           None.

8182 **ENVIRONMENT VARIABLES**8183           The following environment variables shall affect the execution of *bg*:

8184           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 8185                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 8186                           Internationalization Variables for the precedence of internationalization variables  
 8187                           used to determine the values of locale categories.)

8188           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 8189                           internationalization variables.

8190           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 8191                           characters (for example, single-byte as opposed to multi-byte characters in  
 8192                           arguments).

8193           *LC\_MESSAGES*

8194                           Determine the locale that should be used to affect the format and contents of  
 8195                           diagnostic messages written to standard error.

8196 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.8197 **ASYNCHRONOUS EVENTS**

8198           Default.

**8199 STDOUT**

8200 The output of *bg* shall consist of a line in the format:

8201 " [%d] %s\n", <job-number>, <command>

8202 where the fields are as follows:

8203 <job-number> A number that can be used to identify the job to the *wait*, *fg*, and *kill* utilities. Using  
8204 these utilities, the job can be identified by prefixing the job number with ' % '.

8205 <command> The associated command that was given to the shell.

**8206 STDERR**

8207 The standard error shall be used only for diagnostic messages.

**8208 OUTPUT FILES**

8209 None.

**8210 EXTENDED DESCRIPTION**

8211 None.

**8212 EXIT STATUS**

8213 The following exit values shall be returned:

8214 0 Successful completion.

8215 >0 An error occurred.

**8216 CONSEQUENCES OF ERRORS**

8217 If job control is disabled, the *bg* utility shall exit with an error and no job shall be placed in the  
8218 background.

**8219 APPLICATION USAGE**

8220 A job is generally suspended by typing the SUSP character (<control>-Z on most systems); see  
8221 the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface. At  
8222 that point, *bg* can put the job into the background. This is most effective when the job is  
8223 expecting no terminal input and its output has been redirected to non-terminal files. A  
8224 background job can be forced to stop when it has terminal output by issuing the command:

8225 `stty tostop`

8226 A background job can be stopped with the command:

8227 `kill -s stop job ID`

8228 The *bg* utility does not work as expected when it is operating in its own utility execution  
8229 environment because that environment has no suspended jobs. In the following examples:

8230 ... | xargs bg  
8231 (bg)

8232 each *bg* operates in a different environment and does not share its parent shell's understanding  
8233 of jobs. For this reason, *bg* is generally implemented as a shell regular built-in.

**8234 EXAMPLES**

8235 None.

**8236 RATIONALE**

8237 The extensions to the shell specified in this volume of IEEE Std 1003.1-2001 have mostly been  
8238 based on features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs*  
8239 are also based on the KornShell. The standard developers examined the characteristics of the C  
8240 shell versions of these utilities and found that differences exist. Despite widespread use of the C

8241 shell, the KornShell versions were selected for this volume of IEEE Std 1003.1-2001 to maintain a  
8242 degree of uniformity with the rest of the KornShell features selected (such as the very popular  
8243 command line editing features).

8244 The *bg* utility is expected to wrap its output if the output exceeds the number of display  
8245 columns.

8246 **FUTURE DIRECTIONS**

8247 None.

8248 **SEE ALSO**

8249 Section 2.9.3.1 (on page 50), *fg*, *kill*, *jobs*, *wait*

8250 **CHANGE HISTORY**

8251 First released in Issue 4.

8252 **Issue 6**

8253 This utility is marked as part of the User Portability Utilities option.

8254 The JC margin marker on the SYNOPSIS is removed since support for Job Control is mandatory  
8255 in this issue. This is a FIPS requirement.

8256 **NAME**

8257 c99 — compile standard C programs

8258 **SYNOPSIS**

```
8259 CD c99 [-c] [-D name[=value]] ... [-E] [-g] [-I directory] ... [-L directory]
8260 ... [-o outfile] [-Ooptlevel] [-s] [-U name] ... operand ...
8261
```

8262 **DESCRIPTION**

8263 The *c99* utility is an interface to the standard C compilation system; it shall accept source code  
 8264 conforming to the ISO C standard. The system conceptually consists of a compiler and link  
 8265 editor. The files referenced by *operands* shall be compiled and linked to produce an executable  
 8266 file. (It is unspecified whether the linking occurs entirely within the operation of *c99*; some  
 8267 implementations may produce objects that are not fully resolved until the file is executed.)

8268 If the **-c** option is specified, for all pathname operands of the form *file.c*, the files:

8269 \$(basename *pathname* .c) .o

8270 shall be created as the result of successful compilation. If the **-c** option is not specified, it is  
 8271 unspecified whether such *.o* files are created or deleted for the *file.c* operands.

8272 If there are no options that prevent link editing (such as **-c** or **-E**), and all operands compile and  
 8273 link without error, the resulting executable file shall be written according to the **-o outfile** option  
 8274 (if present) or to the file **a.out**.

8275 The executable file shall be created as specified in Section 1.7.1.4 (on page 4), except that the file  
 8276 permission bits shall be set to:

8277 S\_IRWXO | S\_IRWXG | S\_IRWXU

8278 and the bits specified by the *umask* of the process shall be cleared.

8279 **OPTIONS**

8280 The *c99* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 8281 12.2, Utility Syntax Guidelines, except that:

- 8282 • The **-I library** operands have the format of options, but their position within a list of  
 8283 operands affects the order in which libraries are searched.
- 8284 • The order of specifying the **-I** and **-L** options is significant.
- 8285 • Conforming applications shall specify each option separately; that is, grouping option letters  
 8286 (for example, **-cO**) need not be recognized by all implementations.

8287 The following options shall be supported:

8288 **-c** Suppress the link-edit phase of the compilation, and do not remove any object files  
 8289 that are produced.

8290 **-g** Produce symbolic information in the object or executable files; the nature of this  
 8291 information is unspecified, and may be modified by implementation-defined  
 8292 interactions with other options.

8293 **-s** Produce object or executable files, or both, from which symbolic and other  
 8294 information not required for proper execution using the *exec* family defined in the  
 8295 System Interfaces volume of IEEE Std 1003.1-2001 has been removed (stripped). If  
 8296 both **-g** and **-s** options are present, the action taken is unspecified.

8297 **-o outfile** Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
 8298 produced. If the **-o** option is present with **-c** or **-E**, the result is unspecified.

- 8299       **-D** *name*[=*value*]  
 8300           Define *name* as if by a C-language **#define** directive. If no *=value* is given, a value of  
 8301           1 shall be used. The **-D** option has lower precedence than the **-U** option. That is, if  
 8302           *name* is used in both a **-U** and a **-D** option, *name* shall be undefined regardless of  
 8303           the order of the options. Additional implementation-defined *names* may be  
 8304           provided by the compiler. Implementations shall support at least 2 048 bytes of **-D**  
 8305           definitions and 256 *names*.
- 8306       **-E**           Copy C-language source files to standard output, expanding all preprocessor  
 8307           directives; no compilation shall be performed. If any operand is not a text file, the  
 8308           effects are unspecified.
- 8309       **-I** *directory*   Change the algorithm for searching for headers whose names are not absolute  
 8310           pathnames to look in the directory named by the *directory* pathname before  
 8311           looking in the usual places. Thus, headers whose names are enclosed in double-  
 8312           quotes (" ") shall be searched for first in the directory of the file with the **#include**  
 8313           line, then in directories named in **-I** options, and last in the usual places. For  
 8314           headers whose names are enclosed in angle brackets ("**<**" "**>**"), the header shall be  
 8315           searched for only in directories named in **-I** options and then in the usual places.  
 8316           Directories named in **-I** options shall be searched in the order specified.  
 8317           Implementations shall support at least ten instances of this option in a single c99  
 8318           command invocation.
- 8319       **-L** *directory*   Change the algorithm of searching for the libraries named in the **-l** objects to look  
 8320           in the directory named by the *directory* pathname before looking in the usual  
 8321           places. Directories named in **-L** options shall be searched in the order specified.  
 8322           Implementations shall support at least ten instances of this option in a single c99  
 8323           command invocation. If a directory specified by a **-L** option contains files named  
 8324           **libc.a**, **libm.a**, **libl.a**, or **liby.a**, the results are unspecified.
- 8325       **-O** *optlevel*   Specify the level of code optimization. If the *optlevel* option-argument is the digit  
 8326           '0', all special code optimizations shall be disabled. If it is the digit '1', the  
 8327           nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
 8328           the system's default optimization is unspecified. It is unspecified whether code  
 8329           generated in the presence of the **-O 0** option is the same as that generated when  
 8330           **-O** is omitted. Other *optlevel* values may be supported.
- 8331       **-U** *name*       Remove any initial definition of *name*.
- 8332       Multiple instances of the **-D**, **-I**, **-U**, and **-L** options can be specified.

## 8333 OPERANDS

- 8334       An *operand* is either in the form of a pathname or the form **-l** *library*. The application shall  
 8335       ensure that at least one operand of the pathname form is specified. The following operands shall  
 8336       be supported:
- 8337       *file.c*       A C-language source file to be compiled and optionally linked. The application  
 8338       shall ensure that the operand is of this form if the **-c** option is used.
- 8339       *file.a*       A library of object files typically produced by the *ar* utility, and passed directly to  
 8340       the link editor. Implementations may recognize implementation-defined suffixes  
 8341       other than **.a** as denoting object file libraries.
- 8342       *file.o*       An object file produced by c99 **-c** and passed directly to the link editor.  
 8343       Implementations may recognize implementation-defined suffixes other than **.o** as  
 8344       denoting object files.

8345           The processing of other files is implementation-defined.

8346           *-l library*   (The letter ell.) Search the library named:

8347                       *liblibrary.a*

8348           A library shall be searched when its name is encountered, so the placement of a *-l*

8349           operand is significant. Several standard libraries can be specified in this manner, as

8350           described in the EXTENDED DESCRIPTION section. Implementations may

8351           recognize implementation-defined suffixes other than *.a* as denoting libraries.

8352   **STDIN**

8353           Not used.

8354   **INPUT FILES**

8355           The input file shall be one of the following: a text file containing a C-language source program,

8356           an object file in the format produced by *c99 -c*, or a library of object files, in the format produced

8357           by archiving zero or more object files, using *ar*. Implementations may supply additional utilities

8358           that produce files in these formats. Additional input file formats are implementation-defined.

8359   **ENVIRONMENT VARIABLES**

8360           The following environment variables shall affect the execution of *c99*:

8361           *LANG*       Provide a default value for the internationalization variables that are unset or null.

8362                       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,

8363                       Internationalization Variables for the precedence of internationalization variables

8364                       used to determine the values of locale categories.)

8365           *LC\_ALL*     If set to a non-empty string value, override the values of all the other

8366                       internationalization variables.

8367           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as

8368                       characters (for example, single-byte as opposed to multi-byte characters in

8369                       arguments and input files).

8370           *LC\_MESSAGES*

8371                       Determine the locale that should be used to affect the format and contents of

8372                       diagnostic messages written to standard error.

8373   XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

8374           *TMPDIR*     Provide a pathname that should override the default directory for temporary files,

8375   XSI           if any. On XSI-conforming systems, provide a pathname that shall override the

8376                       default directory for temporary files, if any.

8377   **ASYNCHRONOUS EVENTS**

8378           Default.

8379   **STDOUT**

8380           If more than one *file* operand ending in *.c* (or possibly other unspecified suffixes) is given, for

8381           each such file:

8382           "*%s:\n*", *<file>*

8383           may be written. These messages, if written, shall precede the processing of each input file; they

8384           shall not be written to the standard output if they are written to the standard error, as described

8385           in the STDERR section.

8386           If the *-E* option is specified, the standard output shall be a text file that represents the results of

8387           the preprocessing stage of the language; it may contain extra information appropriate for

8388           subsequent compilation passes.

8389 **STDERR**

8390 The standard error shall be used only for diagnostic messages. If more than one *file* operand  
 8391 ending in **.c** (or possibly other unspecified suffixes) is given, for each such file:

8392 "%s:\n", <*file*>

8393 may be written to allow identification of the diagnostic and warning messages with the  
 8394 appropriate input file. These messages, if written, shall precede the processing of each input file;  
 8395 they shall not be written to the standard error if they are written to the standard output, as  
 8396 described in the STDOUT section.

8397 This utility may produce warning messages about certain conditions that do not warrant  
 8398 returning an error (non-zero) exit value.

8399 **OUTPUT FILES**

8400 Object files or executable files or both are produced in unspecified formats.

8401 **EXTENDED DESCRIPTION**8402 **Standard Libraries**

8403 The c99 utility shall recognize the following **-l** operands for standard libraries:

8404 **-l c** This operand shall make visible all functions referenced in the System Interfaces  
 8405 volume of IEEE Std 1003.1-2001, with the possible exception of those functions  
 8406 listed as residing in <**aio.h**>, <**arpa/inet.h**>, <**complex.h**>, <**fenv.h**>, <**math.h**>, |  
 8407 <**mqueue.h**>, <**netdb.h**>, <**netinet/in.h**>, <**pthread.h**>, <**sched.h**>,  
 8408 <**semaphore.h**>, <**spawn.h**>, <**sys/socket.h**>, *pthread\_kill()*, and *pthread\_sigmask()*  
 8409 in <**signal.h**>, <**trace.h**>, functions marked as extensions other than as part of the  
 8410 MF or MPR extensions in <**sys/mman.h**>, functions marked as ADV in <**fcntl.h**>,  
 8411 and functions marked as CS, CPT, and TMR in <**time.h**>. This operand shall not  
 8412 be required to be present to cause a search of this library.

8413 **-l l** This operand shall make visible all functions required by the C-language output of  
 8414 *lex* that are not made available through the **-l c** operand.

8415 **-l pthread** This operand shall make visible all functions referenced in <**pthread.h**> and  
 8416 *pthread\_kill()* and *pthread\_sigmask()* referenced in <**signal.h**>. An implementation  
 8417 may search this library in the absence of this operand.

8418 **-l m** This operand shall make visible all functions referenced in <**math.h**>, |  
 8419 <**complex.h**>, and <**fenv.h**>. An implementation may search this library in the  
 8420 absence of this operand.

8421 **-l rt** This operand shall make visible all functions referenced in <**aio.h**>, <**mqueue.h**>,  
 8422 <**sched.h**>, <**semaphore.h**>, and <**spawn.h**>, functions marked as extensions other  
 8423 than as part of the MF or MPR extensions in <**sys/mman.h**>, functions marked as  
 8424 ADV in <**fcntl.h**>, and functions marked as CS, CPT, and TMR in <**time.h**>. An  
 8425 implementation may search this library in the absence of this operand.

8426 **-l trace** This operand shall make visible all functions referenced in <**trace.h**>. An  
 8427 implementation may search this library in the absence of this operand.

8428 **-l xnet** This operand makes visible all functions referenced in <**arpa/inet.h**>, <**netdb.h**>,  
 8429 <**netinet/in.h**>, and <**sys/socket.h**>. An implementation may search this library in  
 8430 the absence of this operand.

8431 **-l y** This operand shall make visible all functions required by the C-language output of  
 8432 *yacc* that are not made available through the **-l c** operand.

In the absence of options that inhibit invocation of the link editor, such as **-c** or **-E**, the **c99** utility shall cause the equivalent of a **-l c** operand to be passed to the link editor as the last **-l** operand, causing it to be searched after all other object files and libraries are loaded.

It is unspecified whether the libraries **libc.a**, **libm.a**, **librt.a**, **libpthread.a**, **libl.a**, **liby.a**, or **libxnet.a** exist as regular files. The implementation may accept as **-l** operands names of objects that do not exist as regular files.

## External Symbols

The C compiler and link editor shall support the significance of external symbols up to a length of at least 31 bytes; the action taken upon encountering symbols exceeding the implementation-defined maximum symbol length is unspecified.

The compiler and link editor shall support a minimum of 511 external symbols per source or object file, and a minimum of 4095 external symbols in total. A diagnostic message shall be written to the standard output if the implementation-defined limit is exceeded; other actions are unspecified.

## Programming Environments

All implementations shall support one of the following programming environments as a default. Implementations may support more than one of the following programming environments. Applications can use *sysconf()* or *getconf* to determine which programming environments are supported.

**Table 4-4** Programming Environments: Type Sizes

| Programming Environment<br><i>getconf</i> Name | Bits in<br>int | Bits in<br>long | Bits in<br>pointer | Bits in<br>off_t |
|------------------------------------------------|----------------|-----------------|--------------------|------------------|
| _POSIX_V6_ILP32_OFF32                          | 32             | 32              | 32                 | 32               |
| _POSIX_V6_ILP32_OFFBIG                         | 32             | 32              | 32                 | ≥64              |
| _POSIX_V6_LP64_OFF64                           | 32             | 64              | 64                 | 64               |
| _POSIX_V6_LPBIG_OFFBIG                         | ≥32            | ≥64             | ≥64                | ≥64              |

All implementations shall support one or more environments where the widths of the following types are no greater than the width of type **long**:

**blksize\_t**, **cc\_t**, **mode\_t**, **nfds\_t**, **pid\_t**, **ptrdiff\_t**, **size\_t**, **speed\_t**, **ssize\_t**, **suseconds\_t**, **tcflag\_t**, **useconds\_t**, **wchar\_t**, **wint\_t**

The executable files created when these environments are selected shall be in a proper format for execution by the *exec* family of functions. Each environment may be one of the ones in Table 4-4, or it may be another environment. The names for the environments that meet this requirement shall be output by a *getconf* command using the **\_POSIX\_V6\_WIDTH\_RESTRICTED\_ENVS** argument. If more than one environment meets the requirement, the names of all such environments shall be output on separate lines. Any of these names can then be used in a subsequent *getconf* command to obtain the flags specific to that environment with the following suffixes added as appropriate:

**\_CFLAGS** To get the C compiler flags.

**\_LDFLAGS** To get the linker/loader flags.

**\_LIBS** To get the libraries.

This requirement may be removed in a future version of IEEE Std 1003.1.

When this utility processes a file containing a function called *main()*, it shall be defined with a return type equivalent to **int**. Using return from the initial call to *main()* shall be equivalent (other than with respect to language scope issues) to calling *exit()* with the returned value. Reaching the end of the initial call to *main()* shall be equivalent to calling *exit(0)*. The implementation shall not declare a prototype for this function.

Implementations provide configuration strings for C compiler flags, linker/loader flags, and libraries for each supported environment. When an application needs to use a specific programming environment rather than the implementation default programming environment while compiling, the application shall first verify that the implementation supports the desired environment. If the desired programming environment is supported, the application shall then invoke *c99* with the appropriate C compiler flags as the first options for the compile, the appropriate linker/loader flags after any other options but before any operands, and the appropriate libraries at the end of the operands.

Conforming applications shall not attempt to link together object files compiled for different programming models. Applications shall also be aware that binary data placed in shared memory or in files might not be recognized by applications built for other programming models.

**Table 4-5** Programming Environments: *c99* and *cc* Arguments

| Programming Environment<br><i>getconf</i> Name | Use                                                    | <i>c99</i> and <i>cc</i> Arguments<br><i>getconf</i> Name                                   |
|------------------------------------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------|
| _POSIX_V6_ILP32_OFF32                          | C Compiler Flags<br>Linker / Loader Flags<br>Libraries | POSIX_V6_ILP32_OFF32_CFLAGS<br>POSIX_V6_ILP32_OFF32_LDFLAGS<br>POSIX_V6_ILP32_OFF32_LIBS    |
| _POSIX_V6_ILP32_OFFBIG                         | C Compiler Flags<br>Linker / Loader Flags<br>Libraries | POSIX_V6_ILP32_OFFBIG_CFLAGS<br>POSIX_V6_ILP32_OFFBIG_LDFLAGS<br>POSIX_V6_ILP32_OFFBIG_LIBS |
| _POSIX_V6_LP64_OFF64                           | C Compiler Flags<br>Linker / Loader Flags<br>Libraries | POSIX_V6_LP64_OFF64_CFLAGS<br>POSIX_V6_LP64_OFF64_LDFLAGS<br>POSIX_V6_LP64_OFF64_LIBS       |
| _POSIX_V6_LPBIG_OFFBIG                         | C Compiler Flags<br>Linker / Loader Flags<br>Libraries | POSIX_V6_LPBIG_OFFBIG_CFLAGS<br>POSIX_V6_LPBIG_OFFBIG_LDFLAGS<br>POSIX_V6_LPBIG_OFFBIG_LIBS |

## EXIT STATUS

The following exit values shall be returned:

0 Successful compilation or link edit.

>0 An error occurred.

## CONSEQUENCES OF ERRORS

When *c99* encounters a compilation error that causes an object file not to be created, it shall write a diagnostic to standard error and continue to compile other source code operands, but it shall not perform the link phase and return a non-zero exit status. If the link edit is unsuccessful, a diagnostic message shall be written to standard error and *c99* exits with a non-zero status. A conforming application shall rely on the exit status of *c99*, rather than on the existence or mode of the executable file.

8517 **APPLICATION USAGE**

8518 Since the **c99** utility usually creates files in the current directory during the compilation process,  
 8519 it is typically necessary to run the **c99** utility in a directory in which a file can be created.

8520 On systems providing POSIX Conformance (see the Base Definitions volume of  
 8521 IEEE Std 1003.1-2001, Chapter 2, Conformance), **c99** is required only with the C-Language  
 8522 Development option; XSI-conformant systems always provide **c99**.

8523 Some historical implementations have created **.o** files when **-c** is not specified and more than  
 8524 one source file is given. Since this area is left unspecified, the application cannot rely on **.o** files  
 8525 being created, but it also must be prepared for any related **.o** files that already exist being deleted  
 8526 at the completion of the link edit.

8527 Some historical implementations have permitted **-L** options to be interspersed with **-l** operands  
 8528 on the command line. For an application to compile consistently on systems that do not behave  
 8529 like this, it is necessary for a conforming application to supply all **-L** options before any of the **-l**  
 8530 options.

8531 There is the possible implication that if a user supplies versions of the standard functions (before  
 8532 they would be encountered by an implicit **-l c** or explicit **-l m**), that those versions would be  
 8533 used in place of the standard versions. There are various reasons this might not be true  
 8534 (functions defined as macros, manipulations for clean name space, and so on), so the existence of  
 8535 files named in the same manner as the standard libraries within the **-L** directories is explicitly  
 8536 stated to produce unspecified behavior.

8537 All of the functions specified in the System Interfaces volume of IEEE Std 1003.1-2001 may be  
 8538 made visible by implementations when the Standard C Library is searched. Conforming  
 8539 applications must explicitly request searching the other standard libraries when functions made  
 8540 visible by those libraries are used.

8541 **EXAMPLES**

8542 1. The following usage example compiles **foo.c** and creates the executable file **foo**:

8543 `c99 -o foo foo.c`

8544 The following usage example compiles **foo.c** and creates the object file **foo.o**:

8545 `c99 -c foo.c`

8546 The following usage example compiles **foo.c** and creates the executable file **a.out**:

8547 `c99 foo.c`

8548 The following usage example compiles **foo.c**, links it with **bar.o**, and creates the executable  
 8549 file **a.out**. It may also create and leave **foo.o**:

8550 `c99 foo.c bar.o`

8551 2. The following example shows how an application using threads interfaces can test for  
 8552 support of and use a programming environment supporting 32-bit **int**, **long**, and **pointer**  
 8553 types and an **off\_t** type using at least 64 bits:

```
8554 if [$(getconf _POSIX_V6_ILP32_OFFBIG) != "-1"]
8555 then
8556 c99 $(getconf POSIX_V6_ILP32_OFFBIG_CFLAGS) -D_XOPEN_SOURCE=600 \
8557 $(getconf POSIX_V6_ILP32_OFFBIG_LDFLAGS) foo.c -o foo \
8558 $(getconf POSIX_V6_ILP32_OFFBIG_LIBS) -l pthread
8559 else
8560 echo ILP32_OFFBIG programming environment not supported
```

```

8561 exit 1
8562 fi

```

3. The following examples clarify the use and interactions of **-L** options and **-l** operands.

Consider the case in which module **a.c** calls function *f()* in library **libQ.a**, and module **b.c** calls function *g()* in library **libp.a**. Assume that both libraries reside in **/a/b/c**. The command line to compile and link in the desired way is:

```

8567 c99 -L /a/b/c main.o a.c -l Q b.c -l p

```

In this case the **-l Q** operand need only precede the first **-l p** operand, since both **libQ.a** and **libp.a** reside in the same directory.

Multiple **-L** operands can be used when library name collisions occur. Building on the previous example, suppose that the user wants to use a new **libp.a**, in **/a/a/a**, but still wants *f()* from **/a/b/c/libQ.a**:

```

8573 c99 -L /a/a/a -L /a/b/c main.o a.c -l Q b.c -l p

```

In this example, the linker searches the **-L** options in the order specified, and finds **/a/a/a/libp.a** before **/a/b/c/libp.a** when resolving references for **b.c**. The order of the **-l** operands is still important, however.

4. The following example shows how an application can use a programming environment where the widths of the following types:

```

8579 blksize_t, cc_t, mode_t, nfd_t, pid_t, ptrdiff_t, size_t, speed_t, ssize_t, suseconds_t,
8580 tcflag_t, useconds_t, wchar_t, wint_t

```

are no greater than the width of type **long**:

```

8582 # First choose one of the listed environments ...
8583 # ... if there are no additional constraints, the first one will do:
8584 CENV=$(getconf _POSIX_V6_WIDTH_RESTRICTED_ENVS | head -n 1)
8585 # ... or, if an environment that supports large files is preferred,
8586 # look for names that contain "OFF64" or "OFFBIG". (This chooses
8587 # the last one in the list if none match.)
8588 for CENV in $(getconf _POSIX_V6_WIDTH_RESTRICTED_ENVS)
8589 do
8590 case $CENV in
8591 *OFF64*|*OFFBIG*) break ;;
8592 esac
8593 done
8594 # The chosen environment name can now be used like this:
8595 c99 $(getconf ${CENV}_CFLAGS) -D _POSIX_C_SOURCE=200112L \
8596 $(getconf ${CENV}_LDFLAGS) foo.c -o foo \
8597 $(getconf ${CENV}_LIBS)

```

## 8598 RATIONALE

8599 The **c99** utility is based on the **c89** utility originally introduced in the ISO POSIX-2: 1993 standard.

8600 Some of the changes from **c89** include the modification to the contents of the Standard Libraries  
8601 section to account for new headers and options; for example, **<spawn.h>** added to the **-l rt**  
8602 operand, and the **-l trace** operand added for the Tracing functions.

8603 **FUTURE DIRECTIONS**

8604       None.

8605 **SEE ALSO**

8606       Section 1.7.1.4 (on page 4), *ar*, *getconf*, *make*, *nm*, *strip*, *umask*, the System Interfaces volume of  
8607       IEEE Std 1003.1-2001, *exec*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001,  
8608       Chapter 13, Headers

8609 **CHANGE HISTORY**

8610       First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

8611       IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/12 is applied, correcting the EXTENDED |  
8612       DESCRIPTION of **-l c** and **-l m**. Previously, the text did not take into account the presence of |  
8613       the c99 math headers. |

8614       IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/13 is applied, changing the reference to |  
8615       the **libxnet** library to **libxnet.a**. |

8616 **NAME**

8617 cal — print a calendar

8618 **SYNOPSIS**8619 xSI cal *[[month] year ]*

8620

8621 **DESCRIPTION**

8622 The *cal* utility shall write a calendar to standard output using the Julian calendar for dates from  
 8623 January 1, 1 through September 2, 1752 and the Gregorian calendar for dates from September 14,  
 8624 1752 through December 31, 9999 as though the Gregorian calendar had been adopted on  
 8625 September 14, 1752.

8626 **OPTIONS**

8627 None.

8628 **OPERANDS**

8629 The following operands shall be supported:

8630 *month* Specify the month to be displayed, represented as a decimal integer from 1  
 8631 (January) to 12 (December). The default shall be the current month.

8632 *year* Specify the year for which the calendar is displayed, represented as a decimal  
 8633 integer from 1 to 9999. The default shall be the current year.

8634 **STDIN**

8635 Not used.

8636 **INPUT FILES**

8637 None.

8638 **ENVIRONMENT VARIABLES**8639 The following environment variables shall affect the execution of *cal*:

8640 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 8641 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 8642 Internationalization Variables for the precedence of internationalization variables  
 8643 used to determine the values of locale categories.)

8644 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 8645 internationalization variables.

8646 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 8647 characters (for example, single-byte as opposed to multi-byte characters in  
 8648 arguments).

8649 *LC\_MESSAGES*

8650 Determine the locale that should be used to affect the format and contents of  
 8651 diagnostic messages written to standard error, and informative messages written  
 8652 to standard output.

8653 *LC\_TIME* Determine the format and contents of the calendar.

8654 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

8655 *TZ* Determine the timezone used to calculate the value of the current month.

**8656 ASYNCHRONOUS EVENTS**

8657 Default.

**8658 STDOUT**

8659 The standard output shall be used to display the calendar, in an unspecified format.

**8660 STDERR**

8661 The standard error shall be used only for diagnostic messages.

**8662 OUTPUT FILES**

8663 None.

**8664 EXTENDED DESCRIPTION**

8665 None.

**8666 EXIT STATUS**

8667 The following exit values shall be returned:

8668 0 Successful completion.

8669 >0 An error occurred.

**8670 CONSEQUENCES OF ERRORS**

8671 Default.

**8672 APPLICATION USAGE**

8673 Note that:

8674 cal 83

8675 refers to A.D. 83, not 1983.

**8676 EXAMPLES**

8677 None.

**8678 RATIONALE**

8679 None.

**8680 FUTURE DIRECTIONS**

8681 A future version of IEEE Std 1003.1-2001 may support locale-specific recognition of the date of  
8682 adoption of the Gregorian calendar.

**8683 SEE ALSO**

8684 None.

**8685 CHANGE HISTORY**

8686 First released in Issue 2.

**8687 Issue 6**

8688 The DESCRIPTION is updated to allow for traditional behavior for years before the adoption of  
8689 the Gregorian calendar.

8690 **NAME**

8691           cat — concatenate and print files

8692 **SYNOPSIS**8693           cat [-u] [*file* ...]8694 **DESCRIPTION**8695           The *cat* utility shall read files in sequence and shall write their contents to the standard output in  
8696           the same sequence.8697 **OPTIONS**8698           The *cat* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
8699           Utility Syntax Guidelines.

8700           The following option shall be supported:

8701           -u           Write bytes from the input file to the standard output without delay as each is  
8702                           read.8703 **OPERANDS**

8704           The following operand shall be supported:

8705           *file*           A pathname of an input file. If no *file* operands are specified, the standard input  
8706                           shall be used. If a *file* is '-', the *cat* utility shall read from the standard input at  
8707                           that point in the sequence. The *cat* utility shall not close and reopen standard input  
8708                           when it is referenced in this way, but shall accept multiple occurrences of '-' as a  
8709                           *file* operand.8710 **STDIN**8711           The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '-'.  
8712           See the INPUT FILES section.8713 **INPUT FILES**

8714           The input files can be any file type.

8715 **ENVIRONMENT VARIABLES**8716           The following environment variables shall affect the execution of *cat*:8717           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
8718                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
8719                           Internationalization Variables for the precedence of internationalization variables  
8720                           used to determine the values of locale categories.)8721           *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
8722                           internationalization variables.8723           *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
8724                           characters (for example, single-byte as opposed to multi-byte characters in  
8725                           arguments).8726           *LC\_MESSAGES*   Determine the locale that should be used to affect the format and contents of  
8727                           diagnostic messages written to standard error.  
87288729 *XSI*           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.8730 **ASYNCHRONOUS EVENTS**

8731           Default.

**8732 STDOUT**

8733       The standard output shall contain the sequence of bytes read from the input files. Nothing else  
8734       shall be written to the standard output.

**8735 STDERR**

8736       The standard error shall be used only for diagnostic messages.

**8737 OUTPUT FILES**

8738       None.

**8739 EXTENDED DESCRIPTION**

8740       None.

**8741 EXIT STATUS**

8742       The following exit values shall be returned:

8743       0   All input files were output successfully.

8744       >0  An error occurred.

**8745 CONSEQUENCES OF ERRORS**

8746       Default.

**8747 APPLICATION USAGE**

8748       The **-u** option has value in prototyping non-blocking reads from FIFOs. The intent is to support  
8749       the following sequence:

8750       mkfifo foo

8751       cat -u foo > /dev/tty13 &

8752       cat -u > foo

8753       It is unspecified whether standard output is or is not buffered in the default case. This is  
8754       sometimes of interest when standard output is associated with a terminal, since buffering may  
8755       delay the output. The presence of the **-u** option guarantees that unbuffered I/O is available. It is  
8756       implementation-defined whether the *cat* utility buffers output if the **-u** option is not specified.  
8757       Traditionally, the **-u** option is implemented using the equivalent of the *setvbuf()* function  
8758       defined in the System Interfaces volume of IEEE Std 1003.1-2001.

**8759 EXAMPLES**

8760       The following command:

8761       cat myfile

8762       writes the contents of the file **myfile** to standard output.

8763       The following command:

8764       cat doc1 doc2 > doc.all

8765       concatenates the files **doc1** and **doc2** and writes the result to **doc.all**.

8766       Because of the shell language mechanism used to perform output redirection, a command such  
8767       as this:

8768       cat doc doc.end > doc

8769       causes the original data in **doc** to be lost.

8770       The command:

8771       cat start - middle - end > file

when standard input is a terminal, gets two arbitrary pieces of input from the terminal with a single invocation of *cat*. Note, however, that if standard input is a regular file, this would be equivalent to the command:

```
cat start - middle /dev/null end > file
```

because the entire contents of the file would be consumed by *cat* the first time '-' was used as a file operand and an end-of-file condition would be detected immediately when '-' was referenced the second time.

#### 8779 RATIONALE

Historical versions of the *cat* utility include the options **-e**, **-t**, and **-v**, which permit the ends of lines, <tab>s, and invisible characters, respectively, to be rendered visible in the output. The standard developers omitted these options because they provide too fine a degree of control over what is made visible, and similar output can be obtained using a command such as:

```
sed -n -e 's/$/$/ ' -e l pathname
```

The **-s** option was omitted because it corresponds to different functions in BSD and System V-based systems. The BSD **-s** option to squeeze blank lines can be accomplished by the shell script shown in the following example:

```
sed -n '
Write non-empty lines.
./ {
 p
 d
}
Write a single empty line, then look for more empty lines.
/^$/ p
Get next line, discard the held <newline> (empty line),
and look for more empty lines.
:Empty
/^$/ {
 N
 s/./ /
 b Empty
}
Write the non-empty line before going back to search
for the first in a set of empty lines.
p
'
```

The System V **-s** option to silence error messages can be accomplished by redirecting the standard error. Note that the BSD documentation for *cat* uses the term "blank line" to mean the same as the POSIX "empty line": a line consisting only of a <newline>.

The BSD **-n** option was omitted because similar functionality can be obtained from the **-n** option of the *pr* utility.

#### 8813 FUTURE DIRECTIONS

8814 None.

8817 **CHANGE HISTORY**

8818 First released in Issue 2.

8819 **NAME**

8820           cd — change the working directory

8821 **SYNOPSIS**8822           cd [-L | -P] [*directory*]

8823           cd -

8824 **DESCRIPTION**

8825           The *cd* utility shall change the working directory of the current shell execution environment (see  
 8826           Section 2.12 (on page 61)) by executing the following steps in sequence. (In the following steps,  
 8827           the symbol **curpath** represents an intermediate value used to simplify the description of the  
 8828           algorithm used by *cd*. There is no requirement that **curpath** be made visible to the application.)

- 8829           1. If no *directory* operand is given and the *HOME* environment variable is empty or  
 8830           undefined, the default behavior is implementation-defined and no further steps shall be  
 8831           taken.
- 8832           2. If no *directory* operand is given and the *HOME* environment variable is set to a non-empty  
 8833           value, the *cd* utility shall behave as if the directory named in the *HOME* environment  
 8834           variable was specified as the *directory* operand.
- 8835           3. If the *directory* operand begins with a slash character, set **curpath** to the operand and  
 8836           proceed to step 7.
- 8837           4. If the first component of the *directory* operand is dot or dot-dot, proceed to step 6.
- 8838           5. Starting with the first pathname in the colon-separated pathnames of *CDPATH* (see the  
 8839           ENVIRONMENT VARIABLES section) if the pathname is non-null, test if the  
 8840           concatenation of that pathname, a slash character, and the *directory* operand names a  
 8841           directory. If the pathname is null, test if the concatenation of dot, a slash character, and the  
 8842           operand names a directory. In either case, if the resulting string names an existing  
 8843           directory, set **curpath** to that string and proceed to step 7. Otherwise, repeat this step with  
 8844           the next pathname in *CDPATH* until all pathnames have been tested.
- 8845           6. Set **curpath** to the string formed by the concatenation of the value of *PWD*, a slash  
 8846           character, and the operand.
- 8847           7. If the **-P** option is in effect, the *cd* utility shall perform actions equivalent to the *chdir()*  
 8848           function, called with **curpath** as the *path* argument. If these actions succeed, the *PWD*  
 8849           environment variable shall be set to an absolute pathname for the current working  
 8850           directory and shall not contain filename components that, in the context of pathname  
 8851           resolution, refer to a file of type symbolic link. If there is insufficient permission on the new  
 8852           directory, or on any parent of that directory, to determine the current working directory,  
 8853           the value of the *PWD* environment variable is unspecified. If the actions equivalent to  
 8854           *chdir()* fail for any reason, the *cd* utility shall display an appropriate error message and not  
 8855           alter the *PWD* environment variable. Whether the actions equivalent to *chdir()* succeed or  
 8856           fail, no further steps shall be taken.
- 8857           8. The **curpath** value shall then be converted to canonical form as follows, considering each  
 8858           component from beginning to end, in sequence:
  - 8859           a. Dot components and any slashes that separate them from the next component shall  
 8860           be deleted.
  - 8861           b. For each dot-dot component, if there is a preceding component and it is neither root  
 8862           nor dot-dot, the preceding component, all slashes separating the preceding  
 8863           component from dot-dot, dot-dot and all slashes separating dot-dot from the  
 8864           following component shall be deleted.

8865 c. An implementation may further simplify **curpath** by removing any trailing slash  
 8866 characters that are not also leading slashes, replacing multiple non-leading  
 8867 consecutive slashes with a single slash, and replacing three or more leading slashes  
 8868 with a single slash. If, as a result of this canonicalization, the **curpath** variable is null,  
 8869 no further steps shall be taken.

8870 9. The *cd* utility shall then perform actions equivalent to the *chdir()* function called with  
 8871 **curpath** as the *path* argument. If these actions failed for any reason, the *cd* utility shall  
 8872 display an appropriate error message and no further steps shall be taken. The *PWD*  
 8873 environment variable shall be set to **curpath**.

8874 If, during the execution of the above steps, the *PWD* environment variable is changed, the  
 8875 *OLDPWD* environment variable shall also be changed to the value of the old working directory  
 8876 (that is the current working directory immediately prior to the call to *cd*).

## 8877 OPTIONS

8878 The *cd* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 8879 Utility Syntax Guidelines.

8880 The following options shall be supported by the implementation:

8881 **-L** Handle the operand dot-dot logically; symbolic link components shall not be  
 8882 resolved before dot-dot components are processed (see steps 8. and 9. in the  
 8883 DESCRIPTION).

8884 **-P** Handle the operand dot-dot physically; symbolic link components shall be  
 8885 resolved before dot-dot components are processed (see step 7. in the  
 8886 DESCRIPTION).

8887 If both **-L** and **-P** options are specified, the last of these options shall be used and all others  
 8888 ignored. If neither **-L** nor **-P** is specified, the operand shall be handled dot-dot logically; see the  
 8889 DESCRIPTION.

## 8890 OPERANDS

8891 The following operands shall be supported:

8892 *directory* An absolute or relative pathname of the directory that shall become the new  
 8893 working directory. The interpretation of a relative pathname by *cd* depends on the  
 8894 **-L** option and the *CDPATH* and *PWD* environment variables. If *directory* is an  
 8895 empty string, the results are unspecified.

8896 **-** When a hyphen is used as the operand, this shall be equivalent to the command:  
 8897 `cd "$OLDPWD" && pwd`  
 8898 which changes to the previous working directory and then writes its name.

## 8899 STDIN

8900 Not used.

## 8901 INPUT FILES

8902 None.

## 8903 ENVIRONMENT VARIABLES

8904 The following environment variables shall affect the execution of *cd*:

8905 *CDPATH* A colon-separated list of pathnames that refer to directories. The *cd* utility shall use  
 8906 this list in its attempt to change the directory, as described in the DESCRIPTION.  
 8907 An empty string in place of a directory pathname represents the current directory.  
 8908 If *CDPATH* is not set, it shall be treated as if it were an empty string.

|      |                               |                                                                                                              |
|------|-------------------------------|--------------------------------------------------------------------------------------------------------------|
| 8909 | <i>HOME</i>                   | The name of the directory, used when no <i>directory</i> operand is specified.                               |
| 8910 | <i>LANG</i>                   | Provide a default value for the internationalization variables that are unset or null.                       |
| 8911 |                               | (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,                                       |
| 8912 |                               | Internationalization Variables for the precedence of internationalization variables                          |
| 8913 |                               | used to determine the values of locale categories.)                                                          |
| 8914 | <i>LC_ALL</i>                 | If set to a non-empty string value, override the values of all the other                                     |
| 8915 |                               | internationalization variables.                                                                              |
| 8916 | <i>LC_CTYPE</i>               | Determine the locale for the interpretation of sequences of bytes of text data as                            |
| 8917 |                               | characters (for example, single-byte as opposed to multi-byte characters in                                  |
| 8918 |                               | arguments).                                                                                                  |
| 8919 | <i>LC_MESSAGES</i>            |                                                                                                              |
| 8920 |                               | Determine the locale that should be used to affect the format and contents of                                |
| 8921 |                               | diagnostic messages written to standard error.                                                               |
| 8922 | XSI <i>NLSPATH</i>            | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                        |
| 8923 | <i>OLDPWD</i>                 | A pathname of the previous working directory, used by <i>cd -</i> .                                          |
| 8924 | <i>PWD</i>                    | This variable shall be set as specified in the DESCRIPTION. If an application sets                           |
| 8925 |                               | or unsets the value of <i>PWD</i> , the behavior of <i>cd</i> is unspecified.                                |
| 8926 | <b>ASYNCHRONOUS EVENTS</b>    |                                                                                                              |
| 8927 |                               | Default.                                                                                                     |
| 8928 | <b>STDOUT</b>                 |                                                                                                              |
| 8929 |                               | If a non-empty directory name from <i>CDPATH</i> is used, or if <i>cd -</i> is used, an absolute pathname of |
| 8930 |                               | the new working directory shall be written to the standard output as follows:                                |
| 8931 |                               | <code>"%s\n", &lt;new directory&gt;</code>                                                                   |
| 8932 |                               | Otherwise, there shall be no output.                                                                         |
| 8933 | <b>STDERR</b>                 |                                                                                                              |
| 8934 |                               | The standard error shall be used only for diagnostic messages.                                               |
| 8935 | <b>OUTPUT FILES</b>           |                                                                                                              |
| 8936 |                               | None.                                                                                                        |
| 8937 | <b>EXTENDED DESCRIPTION</b>   |                                                                                                              |
| 8938 |                               | None.                                                                                                        |
| 8939 | <b>EXIT STATUS</b>            |                                                                                                              |
| 8940 |                               | The following exit values shall be returned:                                                                 |
| 8941 | 0                             | The directory was successfully changed.                                                                      |
| 8942 | >0                            | An error occurred.                                                                                           |
| 8943 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                              |
| 8944 |                               | The working directory shall remain unchanged.                                                                |

**APPLICATION USAGE**

Since *cd* affects the current shell execution environment, it is always provided as a shell regular built-in. If it is called in a subshell or separate utility execution environment, such as one of the following:

```
(cd /tmp)
nohup cd
find . -exec cd {} \;
```

it does not affect the working directory of the caller's environment.

The user must have execute (search) permission in *directory* in order to change to it.

**EXAMPLES**

None.

**RATIONALE**

The use of the *CDPATH* was introduced in the System V shell. Its use is analogous to the use of the *PATH* variable in the shell. The BSD C shell used a shell parameter *cdpath* for this purpose.

A common extension when *HOME* is undefined is to get the login directory from the user database for the invoking user. This does not occur on System V implementations.

Some historical shells, such as the KornShell, took special actions when the directory name contained a dot-dot component, selecting the logical parent of the directory, rather than the actual parent directory; that is, it moved up one level toward the '/' in the pathname, remembering what the user typed, rather than performing the equivalent of:

```
chdir("../");
```

In such a shell, the following commands would not necessarily produce equivalent output for all directories:

```
cd .. && ls ls ..
```

This behavior is now the default. It is not consistent with the definition of dot-dot in most historical practice; that is, while this behavior has been optionally available in the KornShell, other shells have historically not supported this functionality. The logical pathname is stored in the *PWD* environment variable when the *cd* utility completes and this value is used to construct the next directory name if *cd* is invoked with the *-L* option.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

Section 2.12 (on page 61), *pwd*, the System Interfaces volume of IEEE Std 1003.1-2001, *chdir()*

**CHANGE HISTORY**

First released in Issue 2.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The *cd* – operand, *PWD*, and *OLDPWD* are added.

The *-L* and *-P* options are added to align with the IEEE P1003.2b draft standard. This also includes the introduction of a new description to include the effect of these options.

8986 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/14 is applied, changing the SYNOPSIS to |  
8987 make it clear that the **-L** and **-P** options are mutually-exclusive. |

8988 **NAME**8989 cflow — generate a C-language flowgraph (**DEVELOPMENT**)8990 **SYNOPSIS**

```
8991 xSI cflow [-r] [-d num] [-D name[=def]] ... [-i incl] [-I dir] ...
8992 [-U dir] ... file ...
```

8993

8994 **DESCRIPTION**

8995 The *cflow* utility shall analyze a collection of object files or assembler, C-language, *lex*, or *yacc*  
 8996 source files, and attempt to build a graph, written to standard output, charting the external  
 8997 references.

8998 **OPTIONS**

8999 The *cflow* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 9000 12.2, Utility Syntax Guidelines, except that the order of the **-D**, **-I**, and **-U** options (which are  
 9001 identical to their interpretation by *c99*) is significant.

9002 The following options shall be supported:

9003 **-d num** Indicate the depth at which the flowgraph is cut off. The application shall ensure  
 9004 that the argument *num* is a decimal integer. By default this is a very large number  
 9005 (typically greater than 32 000). Attempts to set the cut-off depth to a non-positive  
 9006 integer shall be ignored.

9007 **-i incl** Increase the number of included symbols. The *incl* option-argument is one of the  
 9008 following characters:

9009 *x* Include external and static data symbols. The default shall be to include only  
 9010 functions in the flowgraph.

9011 *\_* (Underscore) Include names that begin with an underscore. The default shall  
 9012 be to exclude these functions (and data if **-i x** is used).

9013 **-r** Reverse the caller: callee relationship, producing an inverted listing showing the  
 9014 callers of each function. The listing shall also be sorted in lexicographical order by  
 9015 callee.

9016 **OPERANDS**

9017 The following operand is supported:

9018 *file* The pathname of a file for which a graph is to be generated. Filenames suffixed by  
 9019 **.l** shall be taken to be *lex* input, **.y** as *yacc* input, **.c** as *c99* input, and **.i** as the  
 9020 output of *c99 -E*. Such files shall be processed as appropriate, determined by their  
 9021 suffix.

9022 Files suffixed by **.s** (conventionally assembler source) may have more limited  
 9023 information extracted from them.

9024 **STDIN**

9025 Not used.

9026 **INPUT FILES**

9027 The input files shall be object files or assembler, C-language, *lex*, or *yacc* source files.

9028 **ENVIRONMENT VARIABLES**

9029 The following environment variables shall affect the execution of *cflow*:

9030 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 9031 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,

9032 Internationalization Variables for the precedence of internationalization variables  
 9033 used to determine the values of locale categories.)

9034 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 9035 internationalization variables.

9036 *LC\_COLLATE*  
 9037 Determine the locale for the ordering of the output when the *-r* option is used.

9038 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 9039 characters (for example, single-byte as opposed to multi-byte characters in  
 9040 arguments and input files).

9041 *LC\_MESSAGES*  
 9042 Determine the locale that should be used to affect the format and contents of  
 9043 diagnostic messages written to standard error.

9044 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

9045 **ASYNCHRONOUS EVENTS**  
 9046 Default.

9047 **STDOUT**  
 9048 The flowgraph written to standard output shall be formatted as follows:  
 9049 "%d %s:%s\n", <reference number>, <global>, <definition>

9050 Each line of output begins with a reference (that is, line) number, followed by indentation of at  
 9051 least one column position per level. This is followed by the name of the global, a colon, and its  
 9052 definition. Normally globals are only functions not defined as an external or beginning with an  
 9053 underscore; see the **OPTIONS** section for the *-i* inclusion option. For information extracted from  
 9054 C-language source, the definition consists of an abstract type declaration (for example, **char \***)  
 9055 and, delimited by angle brackets, the name of the source file and the line number where the  
 9056 definition was found. Definitions extracted from object files indicate the filename and location  
 9057 counter under which the symbol appeared (for example, *text*).

9058 Once a definition of a name has been written, subsequent references to that name contain only  
 9059 the reference number of the line where the definition can be found. For undefined references,  
 9060 only "< >" shall be written.

9061 **STDERR**  
 9062 The standard error shall be used only for diagnostic messages.

9063 **OUTPUT FILES**  
 9064 None.

9065 **EXTENDED DESCRIPTION**  
 9066 None.

9067 **EXIT STATUS**  
 9068 The following exit values shall be returned:  
 9069 0 Successful completion.  
 9070 >0 An error occurred.

9071 **CONSEQUENCES OF ERRORS**  
 9072 Default.

**9073 APPLICATION USAGE**

9074 Files produced by *lex* and *yacc* cause the reordering of line number declarations, and this can  
9075 confuse *cflow*. To obtain proper results, the input of *yacc* or *lex* must be directed to *cflow*.

**9076 EXAMPLES**

9077 Given the following in **file.c**:

```
9078 int i;
9079 int f();
9080 int g();
9081 int h();
9082 int
9083 main()
9084 {
9085 f();
9086 g();
9087 f();
9088 }
9089 int
9090 f()
9091 {
9092 i = h();
9093 }
```

9094 The command:

9095 `cflow -i x file.c`

9096 produces the output:

```
9097 1 main: int(), <file.c 6>
9098 2 f: int(), <file.c 13>
9099 3 h: <>
9100 4 i: int, <file.c 1>
9101 5 g: <>
```

**9102 RATIONALE**

9103 None.

**9104 FUTURE DIRECTIONS**

9105 None.

**9106 SEE ALSO**

9107 *c99*, *lex*, *yacc*

**9108 CHANGE HISTORY**

9109 First released in Issue 2.

**9110 Issue 6**

9111 The normative text is reworded to avoid use of the term “must” for application requirements.

9112 **NAME**

9113 chgrp — change the file group ownership

9114 **SYNOPSIS**9115 chgrp [-hR] *group file ...* |9116 chgrp -R [-H | -L | -P ] *group file ...* |9117 **DESCRIPTION**9118 The *chgrp* utility shall set the group ID of the file named by each *file* operand to the group ID  
9119 specified by the *group* operand.9120 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
9121 directory trees specified by the *file* operands, the *chgrp* utility shall perform actions equivalent to  
9122 the *chown()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001, called  
9123 with the following arguments:

- 9124 • The *file* operand shall be used as the *path* argument.
- 9125 • The user ID of the file shall be used as the *owner* argument.
- 9126 • The specified group ID shall be used as the *group* argument.

9127 Unless *chgrp* is invoked by a process with appropriate privileges, the set-user-ID and set-group-  
9128 ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and set-  
9129 group-ID bits of other file types may be cleared.9130 **OPTIONS**9131 The *chgrp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
9132 12.2, Utility Syntax Guidelines.

9133 The following options shall be supported by the implementation:

- 9134 **-h** If the system supports group IDs for symbolic links, for each *file* operand that  
9135 names a file of type symbolic link, *chgrp* shall attempt to set the group ID of the  
9136 symbolic link instead of the file referenced by the symbolic link. If the system does  
9137 not support group IDs for symbolic links, for each *file* operand that names a file of  
9138 type symbolic link, *chgrp* shall do nothing more with the current file and shall go  
9139 on to any remaining files.
- 9140 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
9141 is specified on the command line, *chgrp* shall change the group of the directory  
9142 referenced by the symbolic link and all files in the file hierarchy below it.
- 9143 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
9144 is specified on the command line or encountered during the traversal of a file  
9145 hierarchy, *chgrp* shall change the group of the directory referenced by the symbolic  
9146 link and all files in the file hierarchy below it.
- 9147 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
9148 or encountered during the traversal of a file hierarchy, *chgrp* shall change the  
9149 group ID of the symbolic link if the system supports this operation. The *chgrp*  
9150 utility shall not follow the symbolic link to any other part of the file hierarchy.
- 9151 **-R** Recursively change file group IDs. For each *file* operand that names a directory,  
9152 *chgrp* shall change the group of the directory and all files in the file hierarchy below  
9153 it. Unless a **-H**, **-L**, or **-P** option is specified, it is unspecified which of these  
9154 options will be used as the default.

9155 Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be  
 9156 considered an error. The last option specified shall determine the behavior of the utility.

## 9157 OPERANDS

9158 The following operands shall be supported:

9159 *group* A group name from the group database or a numeric group ID. Either specifies a  
 9160 group ID to be given to each file named by one of the *file* operands. If a numeric  
 9161 *group* operand exists in the group database as a group name, the group ID number  
 9162 associated with that group name is used as the group ID.

9163 *file* A pathname of a file whose group ID is to be modified.

## 9164 STDIN

9165 Not used.

## 9166 INPUT FILES

9167 None.

## 9168 ENVIRONMENT VARIABLES

9169 The following environment variables shall affect the execution of *chgrp*:

9170 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 9171 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 9172 Internationalization Variables for the precedence of internationalization variables  
 9173 used to determine the values of locale categories.)

9174 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 9175 internationalization variables.

9176 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 9177 characters (for example, single-byte as opposed to multi-byte characters in  
 9178 arguments).

9179 *LC\_MESSAGES*

9180 Determine the locale that should be used to affect the format and contents of  
 9181 diagnostic messages written to standard error.

9182 *NSI* *NLS\_PATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 9183 ASYNCHRONOUS EVENTS

9184 Default.

## 9185 STDOUT

9186 Not used.

## 9187 STDERR

9188 The standard error shall be used only for diagnostic messages.

## 9189 OUTPUT FILES

9190 None.

## 9191 EXTENDED DESCRIPTION

9192 None.

## 9193 EXIT STATUS

9194 The following exit values shall be returned:

9195 0 The utility executed successfully and all requested changes were made.

9196 >0 An error occurred.

9197 **CONSEQUENCES OF ERRORS**

9198 Default.

9199 **APPLICATION USAGE**9200 Only the owner of a file or the user with appropriate privileges may change the owner or group  
9201 of a file.9202 Some implementations restrict the use of *chgrp* to a user with appropriate privileges when the  
9203 *group* specified is not the effective group ID or one of the supplementary group IDs of the calling  
9204 process.9205 **EXAMPLES**

9206 None.

9207 **RATIONALE**9208 The System V and BSD versions use different exit status codes. Some implementations used the  
9209 exit status as a count of the number of errors that occurred; this practice is unworkable since it  
9210 can overflow the range of valid exit status values. The standard developers chose to mask these  
9211 by specifying only 0 and >0 as exit values.9212 The functionality of *chgrp* is described substantially through references to *chown()*. In this way,  
9213 there is no duplication of effort required for describing the interactions of permissions, multiple  
9214 groups, and so on.9215 **FUTURE DIRECTIONS**

9216 None.

9217 **SEE ALSO**9218 *chmod*, *chown*, the System Interfaces volume of IEEE Std 1003.1-2001, *chown()*9219 **CHANGE HISTORY**

9220 First released in Issue 2.

9221 **Issue 6**9222 New options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
9223 options affect the processing of symbolic links.9224 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
9225 section to “Default.”.9226 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/15 is applied, changing the SYNOPSIS to  
9227 make it clear that **-h** and **-R** are optional. |

9228 **NAME**

9229           chmod — change the file modes

9230 **SYNOPSIS**9231           chmod [-R] *mode file ...*9232 **DESCRIPTION**9233           The *chmod* utility shall change any or all of the file mode bits of the file named by each *file*  
9234           operand in the way specified by the *mode* operand.9235           It is implementation-defined whether and how the *chmod* utility affects any alternate or  
9236           additional file access control mechanism (see the Base Definitions volume of  
9237           IEEE Std 1003.1-2001, Section 4.4, File Access Permissions) being used for the specified file.9238           Only a process whose effective user ID matches the user ID of the file, or a process with the  
9239           appropriate privileges, shall be permitted to change the file mode bits of a file.9240 **OPTIONS**9241           The *chmod* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
9242           12.2, Utility Syntax Guidelines.

9243           The following option shall be supported:

9244           **-R**           Recursively change file mode bits. For each *file* operand that names a directory,  
9245           *chmod* shall change the file mode bits of the directory and all files in the file  
9246           hierarchy below it.9247 **OPERANDS**

9248           The following operands shall be supported:

9249           *mode*           Represents the change to be made to the file mode bits of each file named by one of  
9250           the *file* operands; see the EXTENDED DESCRIPTION section.9251           *file*           A pathname of a file whose file mode bits shall be modified.9252 **STDIN**

9253           Not used.

9254 **INPUT FILES**

9255           None.

9256 **ENVIRONMENT VARIABLES**9257           The following environment variables shall affect the execution of *chmod*:9258           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
9259           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
9260           Internationalization Variables for the precedence of internationalization variables  
9261           used to determine the values of locale categories.)9262           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
9263           internationalization variables.9264           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
9265           characters (for example, single-byte as opposed to multi-byte characters in  
9266           arguments).9267           **LC\_MESSAGES**9268                           Determine the locale that should be used to affect the format and contents of  
9269           diagnostic messages written to standard error.

9270 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

9271 **ASYNCHRONOUS EVENTS**

9272 Default.

9273 **STDOUT**

9274 Not used.

9275 **STDERR**

9276 The standard error shall be used only for diagnostic messages.

9277 **OUTPUT FILES**

9278 None.

9279 **EXTENDED DESCRIPTION**

9280 The *mode* operand shall be either a *symbolic\_mode* expression or a non-negative octal integer. The

9281 *symbolic\_mode* form is described by the grammar later in this section.

9282 Each **clause** shall specify an operation to be performed on the current file mode bits of each *file*.

9283 The operations shall be performed on each *file* in the order in which the **clauses** are specified.

9284 The **who** symbols **u**, **g**, and **o** shall specify the *user*, *group*, and *other* parts of the file mode bits,

9285 respectively. A **who** consisting of the symbol **a** shall be equivalent to **ugo**.

9286 The **perm** symbols **r**, **w**, and **x** represent the *read*, *write*, and *execute/search* portions of file mode

9287 bits, respectively. The **perm** symbol **s** shall represent the *set-user-ID-on-execution* (when **who**

9288 contains or implies **u**) and *set-group-ID-on-execution* (when **who** contains or implies **g**) bits.

9289 The **perm** symbol **X** shall represent the execute/search portion of the file mode bits if the file is a

9290 directory or if the current (unmodified) file mode bits have at least one of the execute bits

9291 (S\_IXUSR, S\_IXGRP, or S\_IXOTH) set. It shall be ignored if the file is not a directory and none of

9292 the execute bits are set in the current file mode bits.

9293 The **permcop** symbols **u**, **g**, and **o** shall represent the current permissions associated with the

9294 user, group, and other parts of the file mode bits, respectively. For the remainder of this section,

9295 **perm** refers to the non-terminals **perm** and **permcop** in the grammar.

9296 If multiple **actionlists** are grouped with a single **wholist** in the grammar, each **actionlist** shall be

9297 applied in the order specified with that **wholist**. The *op* symbols shall represent the operation

9298 performed, as follows:

9299 + If **perm** is not specified, the '+' operation shall not change the file mode bits.

9300 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and

9301 other permissions, except for those with corresponding bits in the file mode creation mask

9302 of the invoking process, shall be set.

9303 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

9304 – If **perm** is not specified, the '-' operation shall not change the file mode bits.

9305 If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and

9306 other permissions, except for those with corresponding bits in the file mode creation mask

9307 of the invoking process, shall be cleared.

9308 Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be

9309 cleared.

9310 = Clear the file mode bits specified by the **who** value, or, if no **who** value is specified, all of the

9311 file mode bits specified in this volume of IEEE Std 1003.1-2001.

If **perm** is not specified, the '=' operation shall make no further modifications to the file mode bits.

If **who** is not specified, the file mode bits represented by **perm** for the owner, group, and other permissions, except for those with corresponding bits in the file mode creation mask of the invoking process, shall be set.

Otherwise, the file mode bits represented by the specified **who** and **perm** values shall be set.

When using the symbolic mode form on a regular file, it is implementation-defined whether or not:

- Requests to set the set-user-ID-on-execution or set-group-ID-on-execution bit when all execute bits are currently clear and none are being set are ignored.
- Requests to clear all execute bits also clear the set-user-ID-on-execution and set-group-ID-on-execution bits.
- Requests to clear the set-user-ID-on-execution or set-group-ID-on-execution bits when all execute bits are currently clear are ignored. However, if the command `ls -l file` writes an `s` in the position indicating that the set-user-ID-on-execution or set-group-ID-on-execution is set, the commands `chmod u-s file` or `chmod g-s file`, respectively, shall not be ignored.

When using the symbolic mode form on other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

If the **who** symbol **o** is used in conjunction with the **perm** symbol **s** with no other **who** symbols being specified, the set-user-ID-on-execution and set-group-ID-on-execution bits shall not be modified. It shall not be an error to specify the **who** symbol **o** in conjunction with the **perm** symbol **s**.

The **perm** symbol **t** shall specify the `S_ISVTX` bit. When used with a file of type directory, it can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these combinations is unspecified. The effect when using the **perm** symbol **t** with any file type other than directory is unspecified.

For an octal integer *mode* operand, the file mode bits shall be set absolutely.

For each bit set in the octal number, the corresponding file permission bit shown in the following table shall be set; all other file permission bits shall be cleared. For regular files, for each bit set in the octal number corresponding to the set-user-ID-on-execution or the set-group-ID-on-execution, bits shown in the following table shall be set; if these bits are not set in the octal number, they are cleared. For other file types, it is implementation-defined whether or not requests to set or clear the set-user-ID-on-execution or set-group-ID-on-execution bits are honored.

| Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit | Octal | Mode Bit |
|-------|----------|-------|----------|-------|----------|-------|----------|
| 4000  | S_ISUID  | 0400  | S_IRUSR  | 0040  | S_IRGRP  | 0004  | S_IROTH  |
| 2000  | S_ISGID  | 0200  | S_IWUSR  | 0020  | S_IWGRP  | 0002  | S_IWOTH  |
| 1000  | S_ISVTX  | 0100  | S_IXUSR  | 0010  | S_IXGRP  | 0001  | S_IXOTH  |

When bits are set in the octal number other than those listed in the table above, the behavior is unspecified.

9354 **Grammar for chmod**

9355 The grammar and lexical conventions in this section describe the syntax for the *symbolic\_mode*  
 9356 operand. The general conventions for this style of grammar are described in Section 1.10 (on  
 9357 page 19). A valid *symbolic\_mode* can be represented as the non-terminal symbol *symbolic\_mode* in  
 9358 the grammar. This formal syntax shall take precedence over the preceding text syntax  
 9359 description.

9360 The lexical processing is based entirely on single characters. Implementations need not allow  
 9361 <blank>s within the single argument being processed.

9362 %start symbolic\_mode  
 9363 %%

9364 symbolic\_mode : clause  
 9365 | symbolic\_mode ',' clause  
 9366 ;

9367 clause : actionlist  
 9368 | wholist actionlist  
 9369 ;

9370 wholist : who  
 9371 | wholist who  
 9372 ;

9373 who : 'u' | 'g' | 'o' | 'a'  
 9374 ;

9375 actionlist : action  
 9376 | actionlist action  
 9377 ;

9378 action : op  
 9379 | op permlist  
 9380 | op permcopy  
 9381 ;

9382 permcopy : 'u' | 'g' | 'o'  
 9383 ;

9384 op : '+' | '-' | '='  
 9385 ;

9386 permlist : perm  
 9387 | perm permlist  
 9388 ;

9389 xSI perm : 'r' | 'w' | 'x' | 'X' | 's' | 't'  
 9390 ;

9391 **EXIT STATUS**

9392 The following exit values shall be returned:

9393 0 The utility executed successfully and all requested changes were made.

9394 >0 An error occurred.

9395 **CONSEQUENCES OF ERRORS**

9396 Default.

9397 **APPLICATION USAGE**

9398 Some implementations of the *chmod* utility change the mode of a directory before the files in the  
 9399 directory when performing a recursive (**-R** option) change; others change the directory mode  
 9400 after the files in the directory. If an application tries to remove read or search permission for a  
 9401 file hierarchy, the removal attempt fails if the directory is changed first; on the other hand, trying  
 9402 to re-enable permissions to a restricted hierarchy fails if directories are changed last. Users  
 9403 should not try to make a hierarchy inaccessible to themselves.

9404 Some implementations of *chmod* never used the process' *umask* when changing modes; systems  
 9405 conformant with this volume of IEEE Std 1003.1-2001 do so when **who** is not specified. Note the  
 9406 difference between:

9407 `chmod a-w file`

9408 which removes all write permissions, and:

9409 `chmod -- -w file`

9410 which removes write permissions that would be allowed if **file** was created with the same  
 9411 *umask*.

9412 Conforming applications should never assume that they know how the set-user-ID and set-  
 9413 group-ID bits on directories are interpreted.

9414 **EXAMPLES**

| Mode         | Results                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------|
| <i>a+=</i>   | Equivalent to <i>a+,a=</i> ; clears all file mode bits.                                            |
| <i>go+-w</i> | Equivalent to <i>go+,go-w</i> ; clears group and other write bits.                                 |
| <i>g=o-w</i> | Equivalent to <i>g=o,g-w</i> ; sets group bit to match other bits and then clears group write bit. |
| <i>g-r+w</i> | Equivalent to <i>g-r,g+w</i> ; clears group read bit and sets group write bit.                     |
| <i>uo=g</i>  | Sets owner bits to match group bits and sets other bits to match group bits.                       |

9425 **RATIONALE**

9426 The functionality of *chmod* is described substantially through references to concepts defined in  
 9427 the System Interfaces volume of IEEE Std 1003.1-2001. In this way, there is less duplication of  
 9428 effort required for describing the interactions of permissions. However, the behavior of this  
 9429 utility is not described in terms of the *chmod()* function from the System Interfaces volume of  
 9430 IEEE Std 1003.1-2001 because that specification requires certain side effects upon alternate file  
 9431 access control mechanisms that might not be appropriate, depending on the implementation.

9432 Implementations that support mandatory file and record locking as specified by the 1984  
 9433 /usr/group standard historically used the combination of set-group-ID bit set and group  
 9434 execute bit clear to indicate mandatory locking. This condition is usually set or cleared with the  
 9435 symbolic mode **perm** symbol **l** instead of the **perm** symbols **s** and **x** so that the mandatory  
 9436 locking mode is not changed without explicit indication that that was what the user intended.  
 9437 Therefore, the details on how the implementation treats these conditions must be defined in the  
 9438 documentation. This volume of IEEE Std 1003.1-2001 does not require mandatory locking (nor  
 9439 does the System Interfaces volume of IEEE Std 1003.1-2001), but does allow it as an extension.  
 9440 However, this volume of IEEE Std 1003.1-2001 does require that the *ls* and *chmod* utilities work

consistently in this area. If *ls -l file* indicates that the set-group-ID bit is set, *chmod g-s file* must clear it (assuming appropriate privileges exist to change modes).

The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. This problem is avoided here by specifying only 0 and >0 as exit values.

The System Interfaces volume of IEEE Std 1003.1-2001 indicates that implementation-defined restrictions may cause the S\_ISUID and S\_ISGID bits to be ignored. This volume of IEEE Std 1003.1-2001 allows the *chmod* utility to choose to modify these bits before calling *chmod()* (or some function providing equivalent capabilities) for non-regular files. Among other things, this allows implementations that use the set-user-ID and set-group-ID bits on directories to enable extended features to handle these extensions in an intelligent manner.

The **X perm** symbol was adopted from BSD-based systems because it provides commonly desired functionality when doing recursive (**-R** option) modifications. Similar functionality is not provided by the *find* utility. Historical BSD versions of *chmod*, however, only supported **X** with *op+*; it has been extended in this volume of IEEE Std 1003.1-2001 because it is also useful with *op=*. (It has also been added for *op-* even though it duplicates **x**, in this case, because it is intuitive and easier to explain.)

The grammar was extended with the *permcop* non-terminal to allow historical-practice forms of symbolic modes like **o=u-g** (that is, set the “other” permissions to the permissions of “owner” minus the permissions of “group”).

#### 9466 CHANGE HISTORY

9467 First released in Issue 2.

#### 9468 Issue 6

9469 The following new requirements on POSIX implementations derive from alignment with the  
9470 Single UNIX Specification:

- 9471 • Octal modes have been kept and made mandatory despite being marked obsolescent in the  
9472 ISO POSIX-2: 1993 standard.

9473 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
9474 section to “Default.”.

9475 The Open Group Base Resolution bwg2001-010 is applied, adding the description of the  
9476 S\_ISVTX bit and the **t perm** symbol as an XSI extension.

9477 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/16 is applied, changing the XSI shaded  
9478 text in the EXTENDED DESCRIPTION from:

9479 “The **perm** symbol **t** shall specify the S\_ISVTX bit and shall apply to directories only. The  
9480 effect when using it with any other file type is unspecified. It can be used with the **who**  
9481 symbols **o**, **a**, or with no **who** symbol. It shall not be an error to specify a **who** symbol of **u** or  
9482 **g** in conjunction with the **perm** symbol **t**; it shall be ignored for **u** and **g**.”

9483 to:

9484            “The **perm** symbol **t** shall specify the S\_ISVTX bit. When used with a file of type directory, it  
9485            can be used with the **who** symbol **a**, or with no **who** symbol. It shall not be an error to specify  
9486            a **who** symbol of **u**, **g**, or **o** in conjunction with the **perm** symbol **t**, but the meaning of these  
9487            combinations is unspecified. The effect when using the **perm** symbol **t** with any file type  
9488            other than directory is unspecified.”

9489            This change is to permit historical behavior.

9490 **NAME**

9491 chown — change the file ownership

9492 **SYNOPSIS**

9493 chown [-hR] owner[:group] file ... |

9494 chown -R [-H | -L | -P ] owner[:group] file ... |

9495 **DESCRIPTION**9496 The *chown* utility shall set the user ID of the file named by each *file* operand to the user ID  
9497 specified by the *owner* operand.9498 For each *file* operand, or, if the **-R** option is used, each file encountered while walking the  
9499 directory trees specified by the *file* operands, the *chown* utility shall perform actions equivalent to  
9500 the *chown()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001, called  
9501 with the following arguments:

- 9502 1. The *file* operand shall be used as the *path* argument.
- 9503 2. The user ID indicated by the *owner* portion of the first operand shall be used as the *owner*  
9504 argument.
- 9505 3. If the *group* portion of the first operand is given, the group ID indicated by it shall be used  
9506 as the *group* argument; otherwise, the group ownership shall not be changed.

9507 Unless *chown* is invoked by a process with appropriate privileges, the set-user-ID and set-  
9508 group-ID bits of a regular file shall be cleared upon successful completion; the set-user-ID and  
9509 set-group-ID bits of other file types may be cleared.9510 **OPTIONS**9511 The *chown* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
9512 12.2, Utility Syntax Guidelines.

9513 The following options shall be supported by the implementation:

9514 **-h** If the system supports user IDs for symbolic links, for each *file* operand that names  
9515 a file of type symbolic link, *chown* shall attempt to set the user ID of the symbolic  
9516 link. If the system supports group IDs for symbolic links, and a group ID was  
9517 specified, for each *file* operand that names a file of type symbolic link, *chown* shall  
9518 attempt to set the group ID of the symbolic link. If the system does not support  
9519 user or group IDs for symbolic links, for each *file* operand that names a file of type  
9520 symbolic link, *chown* shall do nothing more with the current file and shall go on to  
9521 any remaining files.

9522 **-H** If the **-R** option is specified and a symbolic link referencing a file of type directory  
9523 is specified on the command line, *chown* shall change the user ID (and group ID, if  
9524 specified) of the directory referenced by the symbolic link and all files in the file  
9525 hierarchy below it.

9526 **-L** If the **-R** option is specified and a symbolic link referencing a file of type directory  
9527 is specified on the command line or encountered during the traversal of a file  
9528 hierarchy, *chown* shall change the user ID (and group ID, if specified) of the  
9529 directory referenced by the symbolic link and all files in the file hierarchy below it.

9530 **-P** If the **-R** option is specified and a symbolic link is specified on the command line  
9531 or encountered during the traversal of a file hierarchy, *chown* shall change the  
9532 owner ID (and group ID, if specified) of the symbolic link if the system supports  
9533 this operation. The *chown* utility shall not follow the symbolic link to any other  
9534 part of the file hierarchy.

9535           **-R**           Recursively change file user and group IDs. For each *file* operand that names a  
 9536           directory, *chown* shall change the user ID (and group ID, if specified) of the  
 9537           directory and all files in the file hierarchy below it. Unless a **-H**, **-L**, or **-P** option is  
 9538           specified, it is unspecified which of these options will be used as the default.

9539           Specifying more than one of the mutually-exclusive options **-H**, **-L**, and **-P** shall not be  
 9540           considered an error. The last option specified shall determine the behavior of the utility.

#### 9541 **OPERANDS**

9542           The following operands shall be supported:

9543           **owner[:group]** A user ID and optional group ID to be assigned to *file*. The *owner* portion of this  
 9544           operand shall be a user name from the user database or a numeric user ID. Either  
 9545           specifies a user ID which shall be given to each file named by one of the *file*  
 9546           operands. If a numeric *owner* operand exists in the user database as a user name,  
 9547           the user ID number associated with that user name shall be used as the user ID.  
 9548           Similarly, if the *group* portion of this operand is present, it shall be a group name  
 9549           from the group database or a numeric group ID. Either specifies a group ID which  
 9550           shall be given to each file. If a numeric group operand exists in the group database  
 9551           as a group name, the group ID number associated with that group name shall be  
 9552           used as the group ID.

9553           *file*           A pathname of a file whose user ID is to be modified.

#### 9554 **STDIN**

9555           Not used.

#### 9556 **INPUT FILES**

9557           None.

#### 9558 **ENVIRONMENT VARIABLES**

9559           The following environment variables shall affect the execution of *chown*:

9560           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 9561           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 9562           Internationalization Variables for the precedence of internationalization variables  
 9563           used to determine the values of locale categories.)

9564           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
 9565           internationalization variables.

9566           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 9567           characters (for example, single-byte as opposed to multi-byte characters in  
 9568           arguments).

9569           **LC\_MESSAGES**

9570                               Determine the locale that should be used to affect the format and contents of  
 9571           diagnostic messages written to standard error.

9572   XSI       **NLSPATH**       Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

#### 9573 **ASYNCHRONOUS EVENTS**

9574           Default.

#### 9575 **STDOUT**

9576           Not used.

9577 **STDERR**

9578           The standard error shall be used only for diagnostic messages.

9579 **OUTPUT FILES**

9580           None.

9581 **EXTENDED DESCRIPTION**

9582           None.

9583 **EXIT STATUS**

9584           The following exit values shall be returned:

9585           0   The utility executed successfully and all requested changes were made.

9586           >0   An error occurred.

9587 **CONSEQUENCES OF ERRORS**

9588           Default.

9589 **APPLICATION USAGE**

9590           Only the owner of a file or the user with appropriate privileges may change the owner or group of a file.

9592           Some implementations restrict the use of *chown* to a user with appropriate privileges.

9593 **EXAMPLES**

9594           None.

9595 **RATIONALE**

9596           The System V and BSD versions use different exit status codes. Some implementations used the exit status as a count of the number of errors that occurred; this practice is unworkable since it can overflow the range of valid exit status values. These are masked by specifying only 0 and >0 as exit values.

9600           The functionality of *chown* is described substantially through references to functions in the System Interfaces volume of IEEE Std 1003.1-2001. In this way, there is no duplication of effort required for describing the interactions of permissions, multiple groups, and so on.

9603           The 4.3 BSD method of specifying both owner and group was included in this volume of IEEE Std 1003.1-2001 because:

9605           • There are cases where the desired end condition could not be achieved using the *chgrp* and *chown* (that only changed the user ID) utilities. (If the current owner is not a member of the desired group and the desired owner is not a member of the current group, the *chown()* function could fail unless both owner and group are changed at the same time.)

9609           • Even if they could be changed independently, in cases where both are being changed, there is a 100% performance penalty caused by being forced to invoke both utilities.

9611           The BSD syntax *user[group]* was changed to *user[:group]* in this volume of IEEE Std 1003.1-2001 because the period is a valid character in login names (as specified by the Base Definitions volume of IEEE Std 1003.1-2001, login names consist of characters in the portable filename character set). The colon character was chosen as the replacement for the period character because it would never be allowed as a character in a user name or group name on historical implementations.

9617           The **-R** option is considered by some observers as an undesirable departure from the historical UNIX system tools approach; since a tool, *find*, already exists to recurse over directories, there seemed to be no good reason to require other tools to have to duplicate that functionality. However, the **-R** option was deemed an important user convenience, is far more efficient than

9621 forking a separate process for each element of the directory hierarchy, and is in widespread  
9622 historical use.

9623 **FUTURE DIRECTIONS**

9624 None.

9625 **SEE ALSO**

9626 *chmod*, *chgrp*, the System Interfaces volume of IEEE Std 1003.1-2001, *chown()*

9627 **CHANGE HISTORY**

9628 First released in Issue 2.

9629 **Issue 6**

9630 New options **-h**, **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
9631 options affect the processing of symbolic links.

9632 The normative text is reworded to avoid use of the term “must” for application requirements.

9633 IEEE PASC Interpretation 1003.2 #172 is applied, changing the CONSEQUENCES OF ERRORS  
9634 section to “Default.”.

9635 The “otherwise, ...” text in item 3. of the DESCRIPTION is changed to “otherwise, the group  
9636 ownership shall not be changed”.

9637 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/17 is applied, changing the SYNOPSIS to  
9638 make it clear that **-h** and **-R** are optional. |

9639 **NAME**

9640 cksum — write file checksums and sizes

9641 **SYNOPSIS**9642 cksum [*file* ...]9643 **DESCRIPTION**

9644 The *cksum* utility shall calculate and write to standard output a cyclic redundancy check (CRC)  
 9645 for each input file, and also write to standard output the number of octets in each file. The CRC  
 9646 used is based on the polynomial used for CRC error checking in the ISO/IEC 8802-3:1996  
 9647 standard (Ethernet).

9648 The encoding for the CRC checksum is defined by the generating polynomial:

$$9649 G(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$$

9650 Mathematically, the CRC value corresponding to a given file shall be defined by the following  
 9651 procedure:

- 9652 1. The *n* bits to be evaluated are considered to be the coefficients of a mod 2 polynomial *M*(*x*)  
 9653 of degree *n*−1. These *n* bits are the bits from the file, with the most significant bit being the  
 9654 most significant bit of the first octet of the file and the last bit being the least significant bit  
 9655 of the last octet, padded with zero bits (if necessary) to achieve an integral number of  
 9656 octets, followed by one or more octets representing the length of the file as a binary value,  
 9657 least significant octet first. The smallest number of octets capable of representing this  
 9658 integer shall be used.
- 9659 2. *M*(*x*) is multiplied by  $x^{32}$  (that is, shifted left 32 bits) and divided by *G*(*x*) using mod 2  
 9660 division, producing a remainder *R*(*x*) of degree ≤ 31.
- 9661 3. The coefficients of *R*(*x*) are considered to be a 32-bit sequence.
- 9662 4. The bit sequence is complemented and the result is the CRC.

9663 **OPTIONS**

9664 None.

9665 **OPERANDS**

9666 The following operand shall be supported:

9667 *file* A pathname of a file to be checked. If no *file* operands are specified, the standard  
 9668 input shall be used.

9669 **STDIN**

9670 The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 9671 section.

9672 **INPUT FILES**

9673 The input files can be any file type.

9674 **ENVIRONMENT VARIABLES**9675 The following environment variables shall affect the execution of *cksum*:

9676 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 9677 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 9678 Internationalization Variables for the precedence of internationalization variables  
 9679 used to determine the values of locale categories.)

9680 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 9681 internationalization variables.

9682            *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 9683                                   characters (for example, single-byte as opposed to multi-byte characters in  
 9684                                   arguments).

9685            *LC\_MESSAGES*  
 9686                                   Determine the locale that should be used to affect the format and contents of  
 9687                                   diagnostic messages written to standard error.

9688   *XSI*        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

9689   **ASYNCHRONOUS EVENTS**  
 9690                   Default.

9691   **STDOUT**  
 9692                   For each file processed successfully, the *cksum* utility shall write in the following format:  
 9693                   "%u %d %s\n", <checksum>, <# of octets>, <pathname>  
 9694                   If no *file* operand was specified, the pathname and its leading <space> shall be omitted.

9695   **STDERR**  
 9696                   The standard error shall be used only for diagnostic messages.

9697   **OUTPUT FILES**  
 9698                   None.

9699   **EXTENDED DESCRIPTION**  
 9700                   None.

9701   **EXIT STATUS**  
 9702                   The following exit values shall be returned:  
 9703                   0   All files were processed successfully.  
 9704                   >0   An error occurred.

9705   **CONSEQUENCES OF ERRORS**  
 9706                   Default.

9707   **APPLICATION USAGE**  
 9708                   The *cksum* utility is typically used to quickly compare a suspect file against a trusted version of  
 9709                   the same, such as to ensure that files transmitted over noisy media arrive intact. However, this  
 9710                   comparison cannot be considered cryptographically secure. The chances of a damaged file  
 9711                   producing the same CRC as the original are small; deliberate deception is difficult, but probably  
 9712                   not impossible.

9713                   Although input files to *cksum* can be any type, the results need not be what would be expected  
 9714                   on character special device files or on file types not described by the System Interfaces volume of  
 9715                   IEEE Std 1003.1-2001. Since this volume of IEEE Std 1003.1-2001 does not specify the block size  
 9716                   used when doing input, checksums of character special files need not process all of the data in  
 9717                   those files.

9718                   The algorithm is expressed in terms of a bitstream divided into octets. If a file is transmitted  
 9719                   between two systems and undergoes any data transformation (such as changing little-endian  
 9720                   byte ordering to big-endian), identical CRC values cannot be expected. Implementations  
 9721                   performing such transformations may extend *cksum* to handle such situations.

9722 **EXAMPLES**

9723       None.

9724 **RATIONALE**

9725       The following C-language program can be used as a model to describe the algorithm. It assumes  
 9726       that a **char** is one octet. It also assumes that the entire file is available for one pass through the  
 9727       function. This was done for simplicity in demonstrating the algorithm, rather than as an  
 9728       implementation model.

```

9729 static unsigned long crctab[] = {

9801 }

```

The historical practice of writing the number of “blocks” has been changed to writing the number of octets, since the latter is not only more useful, but also since historical implementations have not been consistent in defining what a “block” meant. Octets are used instead of bytes because bytes can differ in size between systems.

The algorithm used was selected to increase the operational robustness of *cksum*. Neither the System V nor BSD *sum* algorithm was selected. Since each of these was different and each was the default behavior on those systems, no realistic compromise was available if either were selected—some set of historical applications would break. Therefore, the name was changed to *cksum*. Although the historical *sum* commands will probably continue to be provided for many years, programs designed for portability across systems should use the new name.

The algorithm selected is based on that used by the ISO/IEC 8802-3:1996 standard (Ethernet) for the frame check sequence field. The algorithm used does not match the technical definition of a *checksum*; the term is used for historical reasons. The length of the file is included in the CRC calculation because this parallels inclusion of a length field by Ethernet in its CRC, but also because it guards against inadvertent collisions between files that begin with different series of zero octets. The chance that two different files produce identical CRCs is much greater when their lengths are not considered. Keeping the length and the checksum of the file itself separate would yield a slightly more robust algorithm, but historical usage has always been that a single number (the checksum as printed) represents the signature of the file. It was decided that

9821 historical usage was the more important consideration.

9822 Early proposals contained modifications to the Ethernet algorithm that involved extracting table  
9823 values whenever an intermediate result became zero. This was demonstrated to be less robust  
9824 than the current method and mathematically difficult to describe or justify.

9825 The calculation used is identical to that given in pseudo-code in the referenced Sarwate article.  
9826 The pseudo-code rendition is:

```
9827 X ← 0; Y ← 0;
9828 for i ← m -1 step -1 until 0 do
9829 begin
9830 T ← X(1) ^ A[i];
9831 X(1) ← X(0); X(0) ← Y(1); Y(1) ← Y(0); Y(0) ← 0;
9832 comment: f[T] and f'[T] denote the T-th words in the
9833 table f and f' ;
9834 X ← X ^ f[T]; Y ← Y ^ f'[T];
9835 end
```

9836 The pseudo-code is reproduced exactly as given; however, note that in the case of *cksum*, **A[i]**  
9837 represents a byte of the file, the words **X** and **Y** are treated as a single 32-bit value, and the tables  
9838 **f** and **f'** are a single table containing 32-bit values.

9839 The referenced Sarwate article also discusses generating the table.

9840 **FUTURE DIRECTIONS**

9841 None.

9842 **SEE ALSO**

9843 None.

9844 **CHANGE HISTORY**

9845 First released in Issue 4.

9846 **NAME**

9847 cmp — compare two files

9848 **SYNOPSIS**9849 cmp [ -l | -s ] *file1 file2*9850 **DESCRIPTION**

9851 The *cmp* utility shall compare two files. The *cmp* utility shall write no output if the files are the  
 9852 same. Under default options, if they differ, it shall write to standard output the byte and line  
 9853 number at which the first difference occurred. Bytes and lines shall be numbered beginning with  
 9854 1.

9855 **OPTIONS**

9856 The *cmp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 9857 12.2, Utility Syntax Guidelines.

9858 The following options shall be supported:

9859 **-l** (Lowercase ell.) Write the byte number (decimal) and the differing bytes (octal) for  
 9860 each difference.

9861 **-s** Write nothing for differing files; return exit status only.

9862 **OPERANDS**

9863 The following operands shall be supported:

9864 *file1* A pathname of the first file to be compared. If *file1* is '-', the standard input shall  
 9865 be used.

9866 *file2* A pathname of the second file to be compared. If *file2* is '-', the standard input  
 9867 shall be used.

9868 If both *file1* and *file2* refer to standard input or refer to the same FIFO special, block special, or  
 9869 character special file, the results are undefined.

9870 **STDIN**

9871 The standard input shall be used only if the *file1* or *file2* operand refers to standard input. See the  
 9872 INPUT FILES section.

9873 **INPUT FILES**

9874 The input files can be any file type.

9875 **ENVIRONMENT VARIABLES**

9876 The following environment variables shall affect the execution of *cmp*:

9877 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 9878 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 9879 Internationalization Variables for the precedence of internationalization variables  
 9880 used to determine the values of locale categories.)

9881 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 9882 internationalization variables.

9883 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 9884 characters (for example, single-byte as opposed to multi-byte characters in  
 9885 arguments).

9886 **LC\_MESSAGES**

9887 Determine the locale that should be used to affect the format and contents of  
 9888 diagnostic messages written to standard error and informative messages written to  
 9889 standard output.

9890 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 9891 ASYNCHRONOUS EVENTS

9892 Default.

## 9893 STDOUT

9894 In the POSIX locale, results of the comparison shall be written to standard output. When no  
9895 options are used, the format shall be:

9896 "%s %s differ: char %d, line %d\n", *file1*, *file2*,  
9897 <byte number>, <line number>

9898 When the **-I** option is used, the format shall be:

9899 "%d %o %o\n", <byte number>, <differing byte>,  
9900 <differing byte>

9901 for each byte that differs. The first <differing byte> number is from *file1* while the second is from  
9902 *file2*. In both cases, <byte number> shall be relative to the beginning of the file, beginning with 1.

9903 No output shall be written to standard output when the **-s** option is used.

## 9904 STDERR

9905 The standard error shall be used only for diagnostic messages. If *file1* and *file2* are identical for  
9906 the entire length of the shorter file, in the POSIX locale the following diagnostic message shall be  
9907 written, unless the **-s** option is specified:

9908 "cmp: EOF on %s%s\n", <name of shorter file>, <additional info>

9909 The <additional info> field shall either be null or a string that starts with a <blank> and contains  
9910 no <newline>s. Some implementations report on the number of lines in this case.

## 9911 OUTPUT FILES

9912 None.

## 9913 EXTENDED DESCRIPTION

9914 None.

## 9915 EXIT STATUS

9916 The following exit values shall be returned:

9917 0 The files are identical.

9918 1 The files are different; this includes the case where one file is identical to the first part of the  
9919 other.

9920 >1 An error occurred.

## 9921 CONSEQUENCES OF ERRORS

9922 Default.

## 9923 APPLICATION USAGE

9924 Although input files to *cmp* can be any type, the results might not be what would be expected on  
9925 character special device files or on file types not described by the System Interfaces volume of  
9926 IEEE Std 1003.1-2001. Since this volume of IEEE Std 1003.1-2001 does not specify the block size  
9927 used when doing input, comparisons of character special files need not compare all of the data  
9928 in those files.

9929 For files which are not text files, line numbers simply reflect the presence of a <newline>,  
9930 without any implication that the file is organized into lines.

9931 **EXAMPLES**

9932       None.

9933 **RATIONALE**

9934       The global language in Section 1.11 (on page 20) indicates that using two mutually-exclusive  
9935       options together produces unspecified results. Some System V implementations consider the  
9936       option usage:

9937       `cmp -l -s ...`

9938       to be an error. They also treat:

9939       `cmp -s -l ...`

9940       as if no options were specified. Both of these behaviors are considered bugs, but are allowed.

9941       The word **char** in the standard output format comes from historical usage, even though it is  
9942       actually a byte number. When *cmp* is supported in other locales, implementations are  
9943       encouraged to use the word *byte* or its equivalent in another language. Users should not  
9944       interpret this difference to indicate that the functionality of the utility changed between locales.

9945       Some implementations report on the number of lines in the identical-but-shorter file case. This is  
9946       allowed by the inclusion of the *<additional info>* fields in the output format. The restriction on  
9947       having a leading *<blank>* and no *<newline>*s is to make parsing for the filename easier. It is  
9948       recognized that some filenames containing white-space characters make parsing difficult  
9949       anyway, but the restriction does aid programs used on systems where the names are  
9950       predominantly well behaved.

9951 **FUTURE DIRECTIONS**

9952       None.

9953 **SEE ALSO**9954       *comm*, *diff*9955 **CHANGE HISTORY**

9956       First released in Issue 2.

9957 **NAME**

9958           comm — select or reject lines common to two files

9959 **SYNOPSIS**9960           comm [-123] *file1 file2*9961 **DESCRIPTION**

9962           The *comm* utility shall read *file1* and *file2*, which should be ordered in the current collating sequence, and produce three text columns as output: lines only in *file1*, lines only in *file2*, and lines in both files.

9965           If the lines in both files are not ordered according to the collating sequence of the current locale, the results are unspecified.

9967 **OPTIONS**

9968           The *comm* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines.

9970           The following options shall be supported:

9971           -1           Suppress the output column of lines unique to *file1*.

9972           -2           Suppress the output column of lines unique to *file2*.

9973           -3           Suppress the output column of lines duplicated in *file1* and *file2*.

9974 **OPERANDS**

9975           The following operands shall be supported:

9976           *file1*       A pathname of the first file to be compared. If *file1* is '-', the standard input shall be used.

9978           *file2*       A pathname of the second file to be compared. If *file2* is '-', the standard input shall be used.

9980           If both *file1* and *file2* refer to standard input or to the same FIFO special, block special, or character special file, the results are undefined.

9982 **STDIN**

9983           The standard input shall be used only if one of the *file1* or *file2* operands refers to standard input. See the INPUT FILES section.

9985 **INPUT FILES**

9986           The input files shall be text files.

9987 **ENVIRONMENT VARIABLES**

9988           The following environment variables shall affect the execution of *comm*:

9989           *LANG*       Provide a default value for the internationalization variables that are unset or null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables for the precedence of internationalization variables used to determine the values of locale categories.)

9993           *LC\_ALL*     If set to a non-empty string value, override the values of all the other internationalization variables.

9995           *LC\_COLLATE* Determine the locale for the collating sequence *comm* expects to have been used when the input files were sorted.

9998           *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in

10000 arguments and input files).

10001 **LC\_MESSAGES**

10002 Determine the locale that should be used to affect the format and contents of

10003 diagnostic messages written to standard error.

10004 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

10005 **ASYNCHRONOUS EVENTS**

10006 Default.

10007 **STDOUT**

10008 The *comm* utility shall produce output depending on the options selected. If the **-1**, **-2**, and **-3**

10009 options are all selected, *comm* shall write nothing to standard output.

10010 If the **-1** option is not selected, lines contained only in *file1* shall be written using the format:

10011 "%s\n", <line in file1>

10012 If the **-2** option is not selected, lines contained only in *file2* are written using the format:

10013 "%s%s\n", <lead>, <line in file2>

10014 where the string <lead> is as follows:

10015 <tab> The **-1** option is not selected.

10016 null string The **-1** option is selected.

10017 If the **-3** option is not selected, lines contained in both files shall be written using the format:

10018 "%s%s\n", <lead>, <line in both>

10019 where the string <lead> is as follows:

10020 <tab><tab> Neither the **-1** nor the **-2** option is selected.

10021 <tab> Exactly one of the **-1** and **-2** options is selected.

10022 null string Both the **-1** and **-2** options are selected.

10023 If the input files were ordered according to the collating sequence of the current locale, the lines

10024 written shall be in the collating sequence of the original lines.

10025 **STDERR**

10026 The standard error shall be used only for diagnostic messages.

10027 **OUTPUT FILES**

10028 None.

10029 **EXTENDED DESCRIPTION**

10030 None.

10031 **EXIT STATUS**

10032 The following exit values shall be returned:

10033 0 All input files were successfully output as specified.

10034 >0 An error occurred.

10035 **CONSEQUENCES OF ERRORS**

10036 Default.

**10037 APPLICATION USAGE**

10038 If the input files are not properly presorted, the output of *comm* might not be useful.

**10039 EXAMPLES**

10040 If a file named **xcu** contains a sorted list of the utilities in this volume of IEEE Std 1003.1-2001, a  
10041 file named **xpg3** contains a sorted list of the utilities specified in the X/Open Portability Guide,  
10042 Issue 3, and a file named **svid89** contains a sorted list of the utilities in the System V Interface  
10043 Definition Third Edition:

10044 `comm -23 xcu xpg3 | comm -23 - svid89`

10045 would print a list of utilities in this volume of IEEE Std 1003.1-2001 not specified by either of the  
10046 other documents:

10047 `comm -12 xcu xpg3 | comm -12 - svid89`

10048 would print a list of utilities specified by all three documents, and:

10049 `comm -12 xpg3 svid89 | comm -23 - xcu`

10050 would print a list of utilities specified by both XPG3 and the SVID, but not specified in this  
10051 volume of IEEE Std 1003.1-2001.

**10058 CHANGE HISTORY**

10059 First released in Issue 2.

**10060 Issue 6**

10061 The normative text is reworded to avoid use of the term “must” for application requirements.

10062 **NAME**10063        `command` — execute a simple command10064 **SYNOPSIS**10065        `command` [`-p`] *command\_name* [*argument* ...]10066 UP     `command` [`-v` | `-V`] *command\_name*

10067

10068 **DESCRIPTION**10069        The *command* utility shall cause the shell to treat the arguments as a simple command,  
10070        suppressing the shell function lookup that is described in Section 2.9.1.1 (on page 48), item 1b.10071        If the *command\_name* is the same as the name of one of the special built-in utilities, the special  
10072        properties in the enumerated list at the beginning of Section 2.14 (on page 64) shall not occur. In  
10073        every other respect, if *command\_name* is not the name of a function, the effect of *command* (with  
10074        no options) shall be the same as omitting *command*.10075        On systems supporting the User Portability Utilities option, the *command* utility also shall  
10076        provide information concerning how a command name is interpreted by the shell; see `-v` and  
10077        `-V`.10078 **OPTIONS**10079        The *command* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
10080        Section 12.2, Utility Syntax Guidelines.

10081        The following options shall be supported:

10082        `-p`        Perform the command search using a default value for *PATH* that is guaranteed to  
10083        find all of the standard utilities.10084        `-v`        (On systems supporting the User Portability Utilities option.) Write a string to  
10085        standard output that indicates the pathname or command that will be used by the  
10086        shell, in the current shell execution environment (see Section 2.12 (on page 61)), to  
10087        invoke *command\_name*, but do not invoke *command\_name*.10088                • Utilities, regular built-in utilities, *command\_names* including a slash character,  
10089                and any implementation-defined functions that are found using the *PATH*  
10090                variable (as described in Section 2.9.1.1 (on page 48)), shall be written as  
10091                absolute pathnames.10092                • Shell functions, special built-in utilities, regular built-in utilities not associated  
10093                with a *PATH* search, and shell reserved words shall be written as just their  
10094                names.

10095                • An alias shall be written as a command line that represents its alias definition.

10096                • Otherwise, no output shall be written and the exit status shall reflect that the  
10097                name was not found.10098        `-V`        (On systems supporting the User Portability Utilities option.) Write a string to  
10099        standard output that indicates how the name given in the *command\_name* operand  
10100        will be interpreted by the shell, in the current shell execution environment (see  
10101        Section 2.12 (on page 61)), but do not invoke *command\_name*. Although the format  
10102        of this string is unspecified, it shall indicate in which of the following categories  
10103        *command\_name* falls and shall include the information stated:10104                • Utilities, regular built-in utilities, and any implementation-defined functions  
10105                that are found using the *PATH* variable (as described in Section 2.9.1.1 (on page  
10106                48)), shall be identified as such and include the absolute pathname in the string.

- 10107 • Other shell functions shall be identified as functions.
- 10108 • Aliases shall be identified as aliases and their definitions included in the string.
- 10109 • Special built-in utilities shall be identified as special built-in utilities.
- 10110 • Regular built-in utilities not associated with a *PATH* search shall be identified
- 10111 as regular built-in utilities. (The term “regular” need not be used.)
- 10112 • Shell reserved words shall be identified as reserved words.

**10113 OPERANDS**

10114 The following operands shall be supported:

10115 *argument* One of the strings treated as an argument to *command\_name*.

10116 *command\_name*

10117 The name of a utility or a special built-in utility.

**10118 STDIN**

10119 Not used.

**10120 INPUT FILES**

10121 None.

**10122 ENVIRONMENT VARIABLES**

10123 The following environment variables shall affect the execution of *command*:

10124 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 10125 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 10126 Internationalization Variables for the precedence of internationalization variables  
 10127 used to determine the values of locale categories.)

10128 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 10129 internationalization variables.

10130 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 10131 characters (for example, single-byte as opposed to multi-byte characters in  
 10132 arguments).

10133 *LC\_MESSAGES*

10134 Determine the locale that should be used to affect the format and contents of  
 10135 diagnostic messages written to standard error and informative messages written to  
 10136 standard output.

10137 *XS1* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

10138 *PATH* Determine the search path used during the command search described in Section  
 10139 2.9.1.1 (on page 48), except as described under the **-p** option.

**10140 ASYNCHRONOUS EVENTS**

10141 Default.

**10142 STDOUT**

10143 When the **-v** option is specified, standard output shall be formatted as:

10144 "%s\n", *<pathname or command>*

10145 When the **-V** option is specified, standard output shall be formatted as:

10146 "%s\n", *<unspecified>*

10147 **STDERR**

10148       The standard error shall be used only for diagnostic messages.

10149 **OUTPUT FILES**

10150       None.

10151 **EXTENDED DESCRIPTION**

10152       None.

10153 **EXIT STATUS**

10154       When the **-v** or **-V** options are specified, the following exit values shall be returned:

10155       0   Successful completion.

10156       >0   The *command\_name* could not be found or an error occurred.

10157       Otherwise, the following exit values shall be returned:

10158       126   The utility specified by *command\_name* was found but could not be invoked.

10159       127   An error occurred in the *command* utility or the utility specified by *command\_name* could not  
10160       be found.

10161       Otherwise, the exit status of *command* shall be that of the simple command specified by the  
10162       arguments to *command*.

10163 **CONSEQUENCES OF ERRORS**

10164       Default.

10165 **APPLICATION USAGE**

10166       The order for command search allows functions to override regular built-ins and path searches.  
10167       This utility is necessary to allow functions that have the same name as a utility to call the utility  
10168       (instead of a recursive call to the function).

10169       The system default path is available using *getconf*; however, since *getconf* may need to have the  
10170       *PATH* set up before it can be called itself, the following can be used:

10171       `command -p getconf _CS_PATH`

10172       There are some advantages to suppressing the special characteristics of special built-ins on  
10173       occasion. For example:

10174       `command exec > unwritable-file`

10175       does not cause a non-interactive script to abort, so that the output status can be checked by the  
10176       script.

10177       The *command*, *env*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if an  
10178       error occurs so that applications can distinguish “failure to find a utility” from “invoked utility  
10179       exited with an error indication”. The value 127 was chosen because it is not commonly used for  
10180       other meanings; most utilities use small values for “normal error conditions” and the values  
10181       above 128 can be confused with termination due to receipt of a signal. The value 126 was chosen  
10182       in a similar manner to indicate that the utility could be found, but not invoked. Some scripts  
10183       produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
10184       between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
10185       *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
10186       any other reason.

10187       Since the **-v** and **-V** options of *command* produce output in relation to the current shell execution  
10188       environment, *command* is generally provided as a shell regular built-in. If it is called in a subshell  
10189       or separate utility execution environment, such as one of the following:

```

10190 (PATH=foo command -v)
10191 nohup command -v

```

10192 it does not necessarily produce correct results. For example, when called with *nohup* or an *exec*  
 10193 function, in a separate utility execution environment, most implementations are not able to  
 10194 identify aliases, functions, or special built-ins.

10195 Two types of regular built-ins could be encountered on a system and these are described  
 10196 separately by *command*. The description of command search in Section 2.9.1.1 (on page 48)  
 10197 allows for a standard utility to be implemented as a regular built-in as long as it is found in the  
 10198 appropriate place in a *PATH* search. So, for example, *command -v true* might yield **/bin/true** or  
 10199 some similar pathname. Other implementation-defined utilities that are not defined by this  
 10200 volume of IEEE Std 1003.1-2001 might exist only as built-ins and have no pathname associated  
 10201 with them. These produce output identified as (regular) built-ins. Applications encountering  
 10202 these are not able to count on *execing* them, using them with *nohup*, overriding them with a  
 10203 different *PATH*, and so on.

#### 10204 EXAMPLES

- 10205 1. Make a version of *cd* that always prints out the new working directory exactly once:

```

10206 cd() {
10207 command cd "$@" >/dev/null
10208 pwd
10209 }

```

- 10210 2. Start off a “secure shell script” in which the script avoids being spoofed by its parent:

```

10211 IFS='
10212 '
10213 # The preceding value should be <space><tab><newline>.
10214 # Set IFS to its default value.

10215 \unalias -a
10216 # Unset all possible aliases.
10217 # Note that unalias is escaped to prevent an alias
10218 # being used for unalias.

10219 unset -f command
10220 # Ensure command is not a user function.

10221 PATH="$ (command -p getconf _CS_PATH) :$PATH"
10222 # Put on a reliable PATH prefix.

10223 ...

```

10224 At this point, given correct permissions on the directories called by *PATH*, the script has  
 10225 the ability to ensure that any utility it calls is the intended one. It is being very cautious  
 10226 because it assumes that implementation extensions may be present that would allow user  
 10227 functions to exist when it is invoked; this capability is not specified by this volume of  
 10228 IEEE Std 1003.1-2001, but it is not prohibited as an extension. For example, the *ENV*  
 10229 variable precedes the invocation of the script with a user start-up script. Such a script  
 10230 could define functions to spoof the application.

#### 10231 RATIONALE

10232 Since *command* is a regular built-in utility it is always found prior to the *PATH* search.

10233 There is nothing in the description of *command* that implies the command line is parsed any  
 10234 differently from that of any other simple command. For example:

10235 `command a | b ; c`

10236 is not parsed in any special way that causes ' | ' or ' ; ' to be treated other than a pipe operator  
10237 or semicolon or that prevents function lookup on **b** or **c**.

10238 The *command* utility is somewhat similar to the Eighth Edition shell *builtin* command, but since  
10239 *command* also goes to the file system to search for utilities, the name *builtin* would not be  
10240 intuitive.

10241 The *command* utility is most likely to be provided as a regular built-in. It is not listed as a special  
10242 built-in for the following reasons:

- 10243 • The removal of exportable functions made the special precedence of a special built-in  
10244 unnecessary.
- 10245 • A special built-in has special properties (see Section 2.14 (on page 64)) that were  
10246 inappropriate for invoking other utilities. For example, two commands such as:

10247 `date > unwritable-file`

10248 `command date > unwritable-file`

10249 would have entirely different results; in a non-interactive script, the former would continue  
10250 to execute the next command, the latter would abort. Introducing this semantic difference  
10251 along with suppressing functions was seen to be non-intuitive.

10252 The **-p** option is present because it is useful to be able to ensure a safe path search that finds all  
10253 the standard utilities. This search might not be identical to the one that occurs through one of the  
10254 *exec* functions (as defined in the System Interfaces volume of IEEE Std 1003.1-2001) when *PATH*  
10255 is unset. At the very least, this feature is required to allow the script to access the correct version  
10256 of *getconf* so that the value of the default path can be accurately retrieved.

10257 The *command* **-v** and **-V** options were added to satisfy requirements from users that are  
10258 currently accomplished by three different historical utilities: *type* in the System V shell, *whence* in  
10259 the KornShell, and *which* in the C shell. Since there is no historical agreement on how and what  
10260 to accomplish here, the POSIX *command* utility was enhanced and the historical utilities were left  
10261 unmodified. The C shell *which* merely conducts a path search. The KornShell *whence* is more  
10262 elaborate—in addition to the categories required by POSIX, it also reports on tracked aliases,  
10263 exported aliases, and undefined functions.

10264 The output format of **-V** was left mostly unspecified because human users are its only audience.  
10265 Applications should not be written to care about this information; they can use the output of **-v**  
10266 to differentiate between various types of commands, but the additional information that may be  
10267 emitted by the more verbose **-V** is not needed and should not be arbitrarily constrained in its  
10268 verbosity or localization for application parsing reasons.

#### 10269 **FUTURE DIRECTIONS**

10270 None.

#### 10271 **SEE ALSO**

10272 Section 2.9.1.1 (on page 48), Section 2.12 (on page 61), Section 2.14 (on page 64), *sh*, *type*, the

#### 10274 **CHANGE HISTORY**

10275 First released in Issue 4.

10276 **NAME**

10277           compress — compress data

10278 **SYNOPSIS**10279 xSI       compress [-fv] [-b *bits*] [*file* ...]10280           compress [-cfv] [-b *bits*] [*file*]

10281

10282 **DESCRIPTION**

10283       The *compress* utility shall attempt to reduce the size of the named files by using adaptive  
 10284       Lempel-Ziv coding algorithm.

10285       **Note:**       Lempel-Ziv is US Patent 4464650, issued to William Eastman, Abraham Lempel, Jacob Ziv,  
 10286       Martin Cohn on August 7th, 1984, and assigned to Sperry Corporation.

10287       Lempel-Ziv-Welch compression is covered by US Patent 4558302, issued to Terry A. Welch on  
 10288       December 10th, 1985, and assigned to Sperry Corporation.

10289       On systems not supporting adaptive Lempel-Ziv coding algorithm, the input files shall not be  
 10290       changed and an error value greater than two shall be returned. Except when the output is to the  
 10291       standard output, each file shall be replaced by one with the extension **.Z**. If the invoking process  
 10292       has appropriate privileges, the ownership, modes, access time, and modification time of the  
 10293       original file are preserved. If appending the **.Z** to the filename would make the name exceed  
 10294       {NAME\_MAX} bytes, the command shall fail. If no files are specified, the standard input shall be  
 10295       compressed to the standard output.

10296 **OPTIONS**

10297       The *compress* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001,  
 10298       Section 12.2, Utility Syntax Guidelines.

10299       The following options shall be supported:

10300       **-b bits**       Specify the maximum number of bits to use in a code. For a conforming  
 10301       application, the *bits* argument shall be:

10302               9 <= *bits* <= 14

10303       The implementation may allow *bits* values of greater than 14. The default is 14, 15,  
 10304       or 16.

10305       **-c**           Cause *compress* to write to the standard output; the input file is not changed, and  
 10306       no **.Z** files are created.

10307       **-f**           Force compression of *file*, even if it does not actually reduce the size of the file, or if  
 10308       the corresponding *file.Z* file already exists. If the **-f** option is not given, and the  
 10309       process is not running in the background, the user is prompted as to whether an  
 10310       existing *file.Z* file should be overwritten.

10311       **-v**           Write the percentage reduction of each file to standard error.

10312 **OPERANDS**

10313       The following operand shall be supported:

10314       *file*        A pathname of a file to be compressed.

10315 **STDIN**

10316       The standard input shall be used only if no *file* operands are specified, or if a *file* operand is **'-'**.

10317 **INPUT FILES**

10318       If *file* operands are specified, the input files contain the data to be compressed.

10319 **ENVIRONMENT VARIABLES**

10320       The following environment variables shall affect the execution of *compress*:

10321       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 10322                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 10323                   Internationalization Variables for the precedence of internationalization variables  
 10324                   used to determine the values of locale categories.)

10325       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 10326                   internationalization variables.

10327       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 10328                   characters (for example, single-byte as opposed to multi-byte characters in  
 10329                   arguments).

10330       *LC\_MESSAGES*  
 10331                   Determine the locale that should be used to affect the format and contents of  
 10332                   diagnostic messages written to standard error.

10333       *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

10334 **ASYNCHRONOUS EVENTS**

10335       Default.

10336 **STDOUT**

10337       If no *file* operands are specified, or if a *file* operand is '-', or if the *-c* option is specified, the  
 10338       standard output contains the compressed output.

10339 **STDERR**

10340       The standard error shall be used only for diagnostic and prompt messages and the output from  
 10341       *-v*.

10342 **OUTPUT FILES**

10343       The output files shall contain the compressed output. The format of compressed files is  
 10344       unspecified and interchange of such files between implementations (including access via  
 10345       unspecified file sharing mechanisms) is not required by IEEE Std 1003.1-2001.

10346 **EXTENDED DESCRIPTION**

10347       None.

10348 **EXIT STATUS**

10349       The following exit values shall be returned:

- 10350       0   Successful completion.
- 10351       1   An error occurred.
- 10352       2   One or more files were not compressed because they would have increased in size (and the  
 10353       *-f* option was not specified).
- 10354       >2   An error occurred.

10355 **CONSEQUENCES OF ERRORS**

10356       The input file shall remain unmodified.

10357 **APPLICATION USAGE**

10358       The amount of compression obtained depends on the size of the input, the number of *bits* per  
10359       code, and the distribution of common substrings. Typically, text such as source code or English  
10360       is reduced by 50-60%. Compression is generally much better than that achieved by Huffman  
10361       coding or adaptive Huffman coding (*compact*), and takes less time to compute.

10362       Although *compress* strictly follows the default actions upon receipt of a signal or when an error  
10363       occurs, some unexpected results may occur. In some implementations it is likely that a partially  
10364       compressed file is left in place, alongside its uncompressed input file. Since the general  
10365       operation of *compress* is to delete the uncompressed file only after the *.Z* file has been  
10366       successfully filled, an application should always carefully check the exit status of *compress* before  
10367       arbitrarily deleting files that have like-named neighbors with *.Z* suffixes.

10368       The limit of 14 on the *bits* option-argument is to achieve portability to all systems (within the  
10369       restrictions imposed by the lack of an explicit published file format). Some implementations  
10370       based on 16-bit architectures cannot support 15 or 16-bit uncompression.

10371 **EXAMPLES**

10372       None.

10373 **RATIONALE**

10374       None.

10375 **FUTURE DIRECTIONS**

10376       None.

10377 **SEE ALSO**

10379 **CHANGE HISTORY**

10380       First released in Issue 4.

10381 **Issue 6**

10382       The normative text is reworded to avoid use of the term “must” for application requirements.

10383       An error case is added for systems not supporting adaptive Lempel-Ziv coding.

10384 **NAME**

10385 cp — copy files

10386 **SYNOPSIS**10387 cp [-fip] *source\_file target\_file*10388 cp [-fip] *source\_file ... target*10389 cp -R [-H | -L | -P] [-fip] *source\_file ... target*10390 OB cp -r [-H | -L | -P] [-fip] *source\_file ... target*10391 **DESCRIPTION**

10392 The first synopsis form is denoted by two operands, neither of which are existing files of type  
 10393 directory. The *cp* utility shall copy the contents of *source\_file* (or, if *source\_file* is a file of type  
 10394 symbolic link, the contents of the file referenced by *source\_file*) to the destination path named by  
 10395 *target\_file*.

10396 The second synopsis form is denoted by two or more operands where the **-R** or **-r** options are  
 10397 not specified and the first synopsis form is not applicable. It shall be an error if any *source\_file* is a  
 10398 file of type directory, if *target* does not exist, or if *target* is a file of a type defined by the System  
 10399 Interfaces volume of IEEE Std 1003.1-2001, but is not a file of type directory. The *cp* utility shall  
 10400 copy the contents of each *source\_file* (or, if *source\_file* is a file of type symbolic link, the contents  
 10401 of the file referenced by *source\_file*) to the destination path named by the concatenation of *target*,  
 10402 a slash character, and the last component of *source\_file*.

10403 The third and fourth synopsis forms are denoted by two or more operands where the **-R** or **-r**  
 10404 options are specified. The *cp* utility shall copy each file in the file hierarchy rooted in each  
 10405 *source\_file* to a destination path named as follows:

- 10406 • If *target* exists and is a file of type directory, the name of the corresponding destination path  
 10407 for each file in the file hierarchy shall be the concatenation of *target*, a slash character, and the  
 10408 pathname of the file relative to the directory containing *source\_file*.
- 10409 • If *target* does not exist and two operands are specified, the name of the corresponding  
 10410 destination path for *source\_file* shall be *target*; the name of the corresponding destination path  
 10411 for all other files in the file hierarchy shall be the concatenation of *target*, a slash character,  
 10412 and the pathname of the file relative to *source\_file*.

10413 It shall be an error if *target* does not exist and more than two operands are specified, or if *target*  
 10414 exists and is a file of a type defined by the System Interfaces volume of IEEE Std 1003.1-2001, but  
 10415 is not a file of type directory.

10416 In the following description, the term *dest\_file* refers to the file named by the destination path.  
 10417 The term *source\_file* refers to the file that is being copied, whether specified as an operand or a  
 10418 file in a file hierarchy rooted in a *source\_file* operand. If *source\_file* is a file of type symbolic link:

- 10419 • If neither the **-R** nor **-r** options were specified, *cp* shall take actions based on the type and  
 10420 contents of the file referenced by the symbolic link, and not by the symbolic link itself.
- 10421 • If the **-R** option was specified:
  - 10422 — If none of the options **-H**, **-L**, nor **-P** were specified, it is unspecified which of **-H**, **-L**, or  
 10423 **-P** will be used as a default.
  - 10424 — If the **-H** option was specified, *cp* shall take actions based on the type and contents of the  
 10425 file referenced by any symbolic link specified as a *source\_file* operand.
  - 10426 — If the **-L** option was specified, *cp* shall take actions based on the type and contents of the  
 10427 file referenced by any symbolic link specified as a *source\_file* operand or any symbolic

10428 links encountered during traversal of a file hierarchy.

10429 — If the **-P** option was specified, *cp* shall copy any symbolic link specified as a *source\_file*  
 10430 operand and any symbolic links encountered during traversal of a file hierarchy, and shall  
 10431 not follow any symbolic links.

10432 • If the **-r** option was specified, the behavior is implementation-defined.

10433 For each *source\_file*, the following steps shall be taken:

10434 1. If *source\_file* references the same file as *dest\_file*, *cp* may write a diagnostic message to  
 10435 standard error; it shall do nothing more with *source\_file* and shall go on to any remaining  
 10436 files.

10437 2. If *source\_file* is of type directory, the following steps shall be taken:

10438 a. If neither the **-R** or **-r** options were specified, *cp* shall write a diagnostic message to  
 10439 standard error, do nothing more with *source\_file*, and go on to any remaining files.

10440 b. If *source\_file* was not specified as an operand and *source\_file* is dot or dot-dot, *cp* shall  
 10441 do nothing more with *source\_file* and go on to any remaining files.

10442 c. If *dest\_file* exists and it is a file type not specified by the System Interfaces volume of  
 10443 IEEE Std 1003.1-2001, the behavior is implementation-defined.

10444 d. If *dest\_file* exists and it is not of type directory, *cp* shall write a diagnostic message to  
 10445 standard error, do nothing more with *source\_file* or any files below *source\_file* in the  
 10446 file hierarchy, and go on to any remaining files.

10447 e. If the directory *dest\_file* does not exist, it shall be created with file permission bits set  
 10448 to the same value as those of *source\_file*, modified by the file creation mask of the  
 10449 user if the **-p** option was not specified, and then bitwise-inclusively OR'ed with  
 10450 S\_IRWXU. If *dest\_file* cannot be created, *cp* shall write a diagnostic message to  
 10451 standard error, do nothing more with *source\_file*, and go on to any remaining files. It  
 10452 is unspecified if *cp* attempts to copy files in the file hierarchy rooted in *source\_file*.

10453 f. The files in the directory *source\_file* shall be copied to the directory *dest\_file*, taking  
 10454 the four steps (1 to 4) listed here with the files as *source\_files*.

10455 g. If *dest\_file* was created, its file permission bits shall be changed (if necessary) to be the  
 10456 same as those of *source\_file*, modified by the file creation mask of the user if the **-p**  
 10457 option was not specified.

10458 h. The *cp* utility shall do nothing more with *source\_file* and go on to any remaining files.

10459 3. If *source\_file* is of type regular file, the following steps shall be taken:

10460 a. If *dest\_file* exists, the following steps shall be taken:

10461 i. If the **-i** option is in effect, the *cp* utility shall write a prompt to the standard  
 10462 error and read a line from the standard input. If the response is not affirmative,  
 10463 *cp* shall do nothing more with *source\_file* and go on to any remaining files.

10464 ii. A file descriptor for *dest\_file* shall be obtained by performing actions equivalent  
 10465 to the *open()* function defined in the System Interfaces volume of  
 10466 IEEE Std 1003.1-2001 called using *dest\_file* as the *path* argument, and the  
 10467 bitwise-inclusive OR of O\_WRONLY and O\_TRUNC as the *oflag* argument.

10468 iii. If the attempt to obtain a file descriptor fails and the **-f** option is in effect, *cp*  
 10469 shall attempt to remove the file by performing actions equivalent to the  
 10470 *unlink()* function defined in the System Interfaces volume of

10471 IEEE Std 1003.1-2001 called using *dest\_file* as the *path* argument. If this attempt  
 10472 succeeds, *cp* shall continue with step 3b.

10473 b. If *dest\_file* does not exist, a file descriptor shall be obtained by performing actions  
 10474 equivalent to the *open()* function defined in the System Interfaces volume of  
 10475 IEEE Std 1003.1-2001 called using *dest\_file* as the *path* argument, and the bitwise-  
 10476 inclusive OR of *O\_WRONLY* and *O\_CREAT* as the *oflag* argument. The file  
 10477 permission bits of *source\_file* shall be the *mode* argument.

10478 c. If the attempt to obtain a file descriptor fails, *cp* shall write a diagnostic message to  
 10479 standard error, do nothing more with *source\_file*, and go on to any remaining files.

10480 d. The contents of *source\_file* shall be written to the file descriptor. Any write errors  
 10481 shall cause *cp* to write a diagnostic message to standard error and continue to step 3e.

10482 e. The file descriptor shall be closed.

10483 f. The *cp* utility shall do nothing more with *source\_file*. If a write error occurred in step  
 10484 3d, it is unspecified if *cp* continues with any remaining files. If no write error  
 10485 occurred in step 3d, *cp* shall go on to any remaining files.

10486 4. Otherwise, the following steps shall be taken:

10487 a. If the **-r** option was specified, the behavior is implementation-defined.

10488 b. If the **-R** option was specified, the following steps shall be taken:

10489 i. The *dest\_file* shall be created with the same file type as *source\_file*.

10490 ii. If *source\_file* is a file of type FIFO, the file permission bits shall be the same as  
 10491 those of *source\_file*, modified by the file creation mask of the user if the **-p**  
 10492 option was not specified. Otherwise, the permissions, owner ID, and group ID  
 10493 of *dest\_file* are implementation-defined.

10494 If this creation fails for any reason, *cp* shall write a diagnostic message to  
 10495 standard error, do nothing more with *source\_file*, and go on to any remaining  
 10496 files.

10497 iii. If *source\_file* is a file of type symbolic link, the pathname contained in *dest\_file*  
 10498 shall be the same as the pathname contained in *source\_file*.

10499 If this fails for any reason, *cp* shall write a diagnostic message to standard error,  
 10500 do nothing more with *source\_file*, and go on to any remaining files.

10501 If the implementation provides additional or alternate access control mechanisms (see the Base  
 10502 Definitions volume of IEEE Std 1003.1-2001, Section 4.4, File Access Permissions), their effect on  
 10503 copies of files is implementation-defined.

10504 **OPTIONS**

10505 The *cp* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 10506 Utility Syntax Guidelines.

10507 The following options shall be supported:

10508 **-f** If a file descriptor for a destination file cannot be obtained, as described in step  
 10509 3.a.ii., attempt to unlink the destination file and proceed.

10510 **-H** Take actions based on the type and contents of the file referenced by any symbolic  
 10511 link specified as a *source\_file* operand.

10512 **-i** Write a prompt to standard error before copying to any existing destination file. If  
 10513 the response from the standard input is affirmative, the copy shall be attempted;

|       |                              |                                                                                                                                                                                                                                                                                                       |
|-------|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10514 |                              | otherwise, it shall not.                                                                                                                                                                                                                                                                              |
| 10515 | <b>-L</b>                    | Take actions based on the type and contents of the file referenced by any symbolic link specified as a <i>source_file</i> operand or any symbolic links encountered during traversal of a file hierarchy.                                                                                             |
| 10516 |                              |                                                                                                                                                                                                                                                                                                       |
| 10517 |                              |                                                                                                                                                                                                                                                                                                       |
| 10518 | <b>-P</b>                    | Take actions on any symbolic link specified as a <i>source_file</i> operand or any symbolic link encountered during traversal of a file hierarchy.                                                                                                                                                    |
| 10519 |                              |                                                                                                                                                                                                                                                                                                       |
| 10520 | <b>-p</b>                    | Duplicate the following characteristics of each source file in the corresponding destination file:                                                                                                                                                                                                    |
| 10521 |                              |                                                                                                                                                                                                                                                                                                       |
| 10522 |                              | 1. The time of last data modification and time of last access. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.                                                                                                                                |
| 10523 |                              |                                                                                                                                                                                                                                                                                                       |
| 10524 |                              | 2. The user ID and group ID. If this duplication fails for any reason, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.                                                                                                                                             |
| 10525 |                              |                                                                                                                                                                                                                                                                                                       |
| 10526 |                              | 3. The file permission bits and the S_ISUID and S_ISGID bits. Other, implementation-defined, bits may be duplicated as well. If this duplication fails for any reason, <i>cp</i> shall write a diagnostic message to standard error.                                                                  |
| 10527 |                              |                                                                                                                                                                                                                                                                                                       |
| 10528 |                              |                                                                                                                                                                                                                                                                                                       |
| 10529 |                              | If the user ID or the group ID cannot be duplicated, the file permission bits S_ISUID and S_ISGID shall be cleared. If these bits are present in the source file but are not duplicated in the destination file, it is unspecified whether <i>cp</i> writes a diagnostic message to standard error.   |
| 10530 |                              |                                                                                                                                                                                                                                                                                                       |

| 10585 |                               | The following exit values shall be returned:                                                                                                                                                                                                                                                                                                             |
| 10586 | 0                             | All files were copied successfully.                                                                                                                                                                                                                                                                                                                      |
| 10587 | >0                            | An error occurred.                                                                                                                                                                                                                                                                                                                                       |
| 10588 | <b>CONSEQUENCES OF ERRORS</b> |                                                                                                                                                                                                                                                                                                                                                          |
| 10589 |                               | If <b>cp</b> is prematurely terminated by a signal or error, files or file hierarchies may be only partially copied and files and directories may have incorrect permissions or access and modification times.                                                                                                                                           |
| 10590 |                               |                                                                                                                                                                                                                                                                                                                                                          |
| 10591 |                               |                                                                                                                                                                                                                                                                                                                                                          |

10592 **APPLICATION USAGE**

10593 The difference between **-R** and **-r** is in the treatment by *cp* of file types other than regular and  
 10594 directory. The original **-r** flag, for historic reasons, does not handle special files any differently  
 10595 from regular files, but always reads the file and copies its contents. This has obvious problems in  
 10596 the presence of special file types; for example, character devices, FIFOs, and sockets. The **-R**  
 10597 option is intended to recreate the file hierarchy and the **-r** option supports historical practice. It  
 10598 was anticipated that a future version of this volume of IEEE Std 1003.1-2001 would deprecate the  
 10599 **-r** option, and for that reason, there has been no attempt to fix its behavior with respect to FIFOs  
 10600 or other file types where copying the file is clearly wrong. However, some implementations  
 10601 support **-r** with the same abilities as the **-R** defined in this volume of IEEE Std 1003.1-2001. To  
 10602 accommodate them as well as systems that do not, the differences between **-r** and **-R** are  
 10603 implementation-defined. Implementations may make them identical. The **-r** option is marked  
 10604 obsolescent.

10605 The set-user-ID and set-group-ID bits are explicitly cleared when files are created. This is to  
 10606 prevent users from creating programs that are set-user-ID or set-group-ID to them when  
 10607 copying files or to make set-user-ID or set-group-ID files accessible to new groups of users. For  
 10608 example, if a file is set-user-ID and the copy has a different group ID than the source, a new  
 10609 group of users has execute permission to a set-user-ID program than did previously. In  
 10610 particular, this is a problem for superusers copying users' trees.

10611 **EXAMPLES**

10612 None.

10613 **RATIONALE**

10614 The **-i** option exists on BSD systems, giving applications and users a way to avoid accidentally  
 10615 removing files when copying. Although the 4.3 BSD version does not prompt if the standard  
 10616 input is not a terminal, the standard developers decided that use of **-i** is a request for interaction,  
 10617 so when the destination path exists, the utility takes instructions from whatever responds on  
 10618 standard input.

10619 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 10620 contents of prompts are specified because implementations may desire more descriptive  
 10621 prompts than those used on historical implementations. Therefore, an application using the **-i**  
 10622 option relies on the system to provide the most suitable dialog directly with the user, based on  
 10623 the behavior specified.

10624 The **-p** option is historical practice on BSD systems, duplicating the time of last data  
 10625 modification and time of last access. This volume of IEEE Std 1003.1-2001 extends it to preserve  
 10626 the user and group IDs, as well as the file permissions. This requirement has obvious problems  
 10627 in that the directories are almost certainly modified after being copied. This volume of  
 10628 IEEE Std 1003.1-2001 requires that the modification times be preserved. The statement that the  
 10629 order in which the characteristics are duplicated is unspecified is to permit implementations to  
 10630 provide the maximum amount of security for the user. Implementations should take into  
 10631 account the obvious security issues involved in setting the owner, group, and mode in the  
 10632 wrong order or creating files with an owner, group, or mode different from the final value.

10633 It is unspecified whether *cp* writes diagnostic messages when the user and group IDs cannot be  
 10634 set due to the widespread practice of users using **-p** to duplicate some portion of the file  
 10635 characteristics, indifferent to the duplication of others. Historic implementations only write  
 10636 diagnostic messages on errors other than [EPERM].

10637 The **-r** option is historical practice on BSD and BSD-derived systems, copying file hierarchies as  
 10638 opposed to single files. This functionality is used heavily in historical applications, and its loss  
 10639 would significantly decrease consensus. The **-R** option was added as a close synonym to the **-r**  
 10640 option, selected for consistency with all other options in this volume of IEEE Std 1003.1-2001 that

10641 do recursive directory descent.

10642 When a failure occurs during the copying of a file hierarchy, *cp* is required to attempt to copy  
10643 files that are on the same level in the hierarchy or above the file where the failure occurred. It is  
10644 unspecified if *cp* shall attempt to copy files below the file where the failure occurred (which  
10645 cannot succeed in any case).

10646 Permissions, owners, and groups of created special file types have been deliberately left as  
10647 implementation-defined. This is to allow systems to satisfy special requirements (for example,  
10648 allowing users to create character special devices, but requiring them to be owned by a certain  
10649 group). In general, it is strongly suggested that the permissions, owner, and group be the same  
10650 as if the user had run the historical *mknod*, *ln*, or other utility to create the file. It is also probable  
10651 that additional privileges are required to create block, character, or other implementation-  
10652 defined special file types.

10653 Additionally, the **-p** option explicitly requires that all set-user-ID and set-group-ID permissions  
10654 be discarded if any of the owner or group IDs cannot be set. This is to keep users from  
10655 unintentionally giving away special privilege when copying programs.

10656 When creating regular files, historical versions of *cp* use the mode of the source file as modified  
10657 by the file mode creation mask. Other choices would have been to use the mode of the source file  
10658 unmodified by the creation mask or to use the same mode as would be given to a new file  
10659 created by the user (plus the execution bits of the source file) and then modify it by the file mode  
10660 creation mask. In the absence of any strong reason to change historic practice, it was in large part  
10661 retained.

10662 When creating directories, historical versions of *cp* use the mode of the source directory, plus  
10663 read, write, and search bits for the owner, as modified by the file mode creation mask. This is  
10664 done so that *cp* can copy trees where the user has read permission, but the owner does not. A  
10665 side effect is that if the file creation mask denies the owner permissions, *cp* fails. Also, once the  
10666 copy is done, historical versions of *cp* set the permissions on the created directory to be the same  
10667 as the source directory, unmodified by the file creation mask.

10668 This behavior has been modified so that *cp* is always able to create the contents of the directory,  
10669 regardless of the file creation mask. After the copy is done, the permissions are set to be the same  
10670 as the source directory, as modified by the file creation mask. This latter change from historical  
10671 behavior is to prevent users from accidentally creating directories with permissions beyond  
10672 those they would normally set and for consistency with the behavior of *cp* in creating files.

10673 It is not a requirement that *cp* detect attempts to copy a file to itself; however, implementations  
10674 are strongly encouraged to do so. Historical implementations have detected the attempt in most  
10675 cases.

10676 There are two methods of copying subtrees in this volume of IEEE Std 1003.1-2001. The other  
10677 method is described as part of the *pax* utility (see *pax*). Both methods are historical practice. The  
10678 *cp* utility provides a simpler, more intuitive interface, while *pax* offers a finer granularity of  
10679 control. Each provides additional functionality to the other; in particular, *pax* maintains the  
10680 hard-link structure of the hierarchy, while *cp* does not. It is the intention of the standard  
10681 developers that the results be similar (using appropriate option combinations in both utilities).  
10682 The results are not required to be identical; there seemed insufficient gain to applications to  
10683 balance the difficulty of implementations having to guarantee that the results would be exactly  
10684 identical.

10685 The wording allowing *cp* to copy a directory to implementation-defined file types not specified  
10686 by the System Interfaces volume of IEEE Std 1003.1-2001 is provided so that implementations  
10687 supporting symbolic links are not required to prohibit copying directories to symbolic links.  
10688 Other extensions to the System Interfaces volume of IEEE Std 1003.1-2001 file types may need to

10689            use this loophole as well.

10690 **FUTURE DIRECTIONS**

10691            The **-r** option may be removed; use **-R** instead.

10692 **SEE ALSO**

10694 **CHANGE HISTORY**

10695            First released in Issue 2.

10696 **Issue 6**

10697            The **-r** option is marked obsolescent.

10698            The new options **-H**, **-L**, and **-P** are added to align with the IEEE P1003.2b draft standard. These  
10699            options affect the processing of symbolic links.

10700            IEEE PASC Interpretation 1003.2 #194 is applied, adding a description of the **-P** option.

10701            IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/18 is applied, correcting an error in the |  
10702            SEE ALSO section. |

10703 **NAME**

10704 crontab — schedule periodic background work

10705 **SYNOPSIS**10706 UP crontab [*file*]10707 crontab [ *-e* | *-l* | *-r* ]

10708

10709 **DESCRIPTION**

10710 The *crontab* utility shall create, replace, or edit a user's crontab entry; a crontab entry is a list of  
 10711 commands and the times at which they shall be executed. The new crontab entry can be input by  
 10712 specifying *file* or input from standard input if no *file* operand is specified, or by using an editor, if  
 10713 *-e* is specified.

10714 Upon execution of a command from a crontab entry, the implementation shall supply a default  
 10715 environment, defining at least the following environment variables:

10716 *HOME* A pathname of the user's home directory.

10717 *LOGNAME* The user's login name.

10718 *PATH* A string representing a search path guaranteed to find all of the standard utilities.

10719 *SHELL* A pathname of the command interpreter. When *crontab* is invoked as specified by  
 10720 this volume of IEEE Std 1003.1-2001, the value shall be a pathname for *sh*.

10721 The values of these variables when *crontab* is invoked as specified by this volume of  
 10722 IEEE Std 1003.1-2001 shall not affect the default values provided when the scheduled command  
 10723 is run.

10724 If standard output and standard error are not redirected by commands executed from the  
 10725 crontab entry, any generated output or errors shall be mailed, via an implementation-defined  
 10726 method, to the user.

10727 XSI Users shall be permitted to use *crontab* if their names appear in the file */usr/lib/cron/cron.allow*.  
 10728 If that file does not exist, the file */usr/lib/cron/cron.deny* shall be checked to determine whether  
 10729 the user shall be denied access to *crontab*. If neither file exists, only a process with appropriate  
 10730 privileges shall be allowed to submit a job. If only *cron.deny* exists and is empty, global usage  
 10731 shall be permitted. The *cron.allow* and *cron.deny* files shall consist of one user name per line.

10732 **OPTIONS**

10733 The *crontab* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 10734 12.2, Utility Syntax Guidelines.

10735 The following options shall be supported:

10736 *-e* Edit a copy of the invoking user's crontab entry, or create an empty entry to edit if  
 10737 the crontab entry does not exist. When editing is complete, the entry shall be  
 10738 installed as the user's crontab entry.

10739 *-l* (The letter ell.) List the invoking user's crontab entry.

10740 *-r* Remove the invoking user's crontab entry.

10741 **OPERANDS**

10742 The following operand shall be supported:

10743 *file* The pathname of a file that contains specifications, in the format defined in the  
 10744 INPUT FILES section, for crontab entries.

10745 **STDIN**

10746 See the INPUT FILES section.

10747 **INPUT FILES**

10748 In the POSIX locale, the user or application shall ensure that a crontab entry is a text file  
 10749 consisting of lines of six fields each. The fields shall be separated by <blank>s. The first five  
 10750 fields shall be integer patterns that specify the following:

- 10751 1. Minute [0,59]
- 10752 2. Hour [0,23]
- 10753 3. Day of the month [1,31]
- 10754 4. Month of the year [1,12]
- 10755 5. Day of the week ([0,6] with 0=Sunday)

10756 Each of these patterns can be either an asterisk (meaning all valid values), an element, or a list of  
 10757 elements separated by commas. An element shall be either a number or two numbers separated  
 10758 by a hyphen (meaning an inclusive range). The specification of days can be made by two fields  
 10759 (day of the month and day of the week). If month, day of month, and day of week are all  
 10760 asterisks, every day shall be matched. If either the month or day of month is specified as an  
 10761 element or list, but the day of week is an asterisk, the month and day of month fields shall  
 10762 specify the days that match. If both month and day of month are specified as an asterisk, but day  
 10763 of week is an element or list, then only the specified days of the week match. Finally, if either the  
 10764 month or day of month is specified as an element or list, and the day of week is also specified as  
 10765 an element or list, then any day matching either the month and day of month, or the day of  
 10766 week, shall be matched.

10767 The sixth field of a line in a crontab entry is a string that shall be executed by *sh* at the specified  
 10768 times. A percent sign character in this field shall be translated to a <newline>. Any character  
 10769 preceded by a backslash (including the '%') shall cause that character to be treated literally.  
 10770 Only the first line (up to a '%' or end-of-line) of the command field shall be executed by the  
 10771 command interpreter. The other lines shall be made available to the command as standard input.

10772 Blank lines and those whose first non-<blank> is '#' shall be ignored.

10773 XSI The text files **/usr/lib/cron/cron.allow** and **/usr/lib/cron/cron.deny** shall contain zero or more  
 10774 user names, one per line, of users who are, respectively, authorized or denied access to the  
 10775 service underlying the *crontab* utility.

10776 **ENVIRONMENT VARIABLES**

10777 The following environment variables shall affect the execution of *crontab*:

- |                                  |                 |                                                                                                                                                                                                                                                                                                       |
|----------------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10778<br>10779                   | <b>EDITOR</b>   | Determine the editor to be invoked when the <b>-e</b> option is specified. The default editor shall be <i>vi</i> .                                                                                                                                                                                    |
| 10780<br>10781<br>10782<br>10783 | <b>LANG</b>     | Provide a default value for the internationalization variables that are unset or null. (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables for the precedence of internationalization variables used to determine the values of locale categories.) |
| 10784<br>10785                   | <b>LC_ALL</b>   | If set to a non-empty string value, override the values of all the other internationalization variables.                                                                                                                                                                                              |
| 10786<br>10787<br>10788          | <b>LC_CTYPE</b> | Determine the locale for the interpretation of sequences of bytes of text data as characters (for example, single-byte as opposed to multi-byte characters in arguments and input files).                                                                                                             |

10789 **LC\_MESSAGES**  
 10790 Determine the locale that should be used to affect the format and contents of  
 10791 diagnostic messages written to standard error.

10792 xsi **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

10793 **ASYNCHRONOUS EVENTS**  
 10794 Default.

10795 **STDOUT**  
 10796 If the **-I** option is specified, the crontab entry shall be written to the standard output.

10797 **STDERR**  
 10798 The standard error shall be used only for diagnostic messages.

10799 **OUTPUT FILES**  
 10800 None.

10801 **EXTENDED DESCRIPTION**  
 10802 None.

10803 **EXIT STATUS**  
 10804 The following exit values shall be returned:  
 10805 0 Successful completion.  
 10806 >0 An error occurred.

10807 **CONSEQUENCES OF ERRORS**  
 10808 The user's crontab entry is not submitted, removed, edited, or listed.

10809 **APPLICATION USAGE**  
 10810 The format of the crontab entry shown here is guaranteed only for the POSIX locale. Other  
 10811 cultures may be supported with substantially different interfaces, although implementations are  
 10812 encouraged to provide comparable levels of functionality.

10813 The default settings of the *HOME*, *LOGNAME*, *PATH*, and *SHELL* variables that are given to the  
 10814 scheduled job are not affected by the settings of those variables when *crontab* is run; as stated,  
 10815 they are defaults. The text about "invoked as specified by this volume of IEEE Std 1003.1-2001"  
 10816 means that the implementation may provide extensions that allow these variables to be affected  
 10817 at runtime, but that the user has to take explicit action in order to access the extension, such as  
 10818 give a new option flag or modify the format of the crontab entry.

10819 A typical user error is to type only *crontab*; this causes the system to wait for the new crontab  
 10820 entry on standard input. If end-of-file is typed (generally <control>-D), the crontab entry is  
 10821 replaced by an empty file. In this case, the user should type the interrupt character, which  
 10822 prevents the crontab entry from being replaced.

10823 **EXAMPLES**

10824 1. Clean up **core** files every weekday morning at 3:15 am:  
 10825 15 3 \* \* 1-5 find \$HOME -name core 2>/dev/null | xargs rm -f

10826 2. Mail a birthday greeting:  
 10827 0 12 14 2 \* mailx john%Happy Birthday!%Time for lunch.

10828 3. As an example of specifying the two types of days:  
 10829 0 0 1,15 \* 1

10830 would run a command on the first and fifteenth of each month, as well as on every  
10831 Monday. To specify days by only one field, the other field should be set to '\*'; for  
10832 example:

10833 0 0 \* \* 1

10834 would run a command only on Mondays.

#### 10835 **RATIONALE**

10836 All references to a *cron* daemon and to *cron files* have been omitted. Although historical  
10837 implementations have used this arrangement, there is no reason to limit future implementations.

10838 This description of *crontab* is designed to support only users with normal privileges. The format  
10839 of the input is based on the System V *crontab*; however, there is no requirement here that the  
10840 actual system database used by the *cron* daemon (or a similar mechanism) use this format  
10841 internally. For example, systems derived from BSD are likely to have an additional field  
10842 appended that indicates the user identity to be used when the job is submitted.

10843 The **-e** option was adopted from the SVID as a user convenience, although it does not exist in all  
10844 historical implementations.

#### 10845 **FUTURE DIRECTIONS**

10846 None.

#### 10847 **SEE ALSO**

10848 *at*

#### 10849 **CHANGE HISTORY**

10850 First released in Issue 2.

#### 10851 **Issue 6**

10852 This utility is marked as part of the User Portability Utilities option.

10853 The normative text is reworded to avoid use of the term “must” for application requirements.

10854 **NAME**

10855           csplit — split files based on context

10856 **SYNOPSIS**10857 UP       csplit [-ks] [-f *prefix*] [-n *number*] *file* *arg1* ...*argn*

10858

10859 **DESCRIPTION**

10860       The *csplit* utility shall read the file named by the *file* operand, write all or part of that file into  
 10861       other files as directed by the *arg* operands, and write the sizes of the files.

10862 **OPTIONS**

10863       The *csplit* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 10864       12.2, Utility Syntax Guidelines.

10865       The following options shall be supported:

10866       **-f** *prefix*     Name the created files *prefix00*, *prefix01*, ..., *prefixn*. The default is **xx00** ... **xxn**. If  
 10867       the *prefix* argument would create a filename exceeding {NAME\_MAX} bytes, an  
 10868       error shall result, *csplit* shall exit with a diagnostic message, and no files shall be  
 10869       created.

10870       **-k**            Leave previously created files intact. By default, *csplit* shall remove created files if  
 10871       an error occurs.

10872       **-n** *number*    Use *number* decimal digits to form filenames for the file pieces. The default shall be  
 10873       2.

10874       **-s**            Suppress the output of file size messages.

10875 **OPERANDS**

10876       The following operands shall be supported:

10877       *file*           The pathname of a text file to be split. If *file* is '-', the standard input shall be  
 10878       used.

10879       The operands *arg1* ... *argn* can be a combination of the following:

10880       /*rexp*/[*offset*]

10881       A file shall be created using the content of the lines from the current line up to, but  
 10882       not including, the line that results from the evaluation of the regular expression  
 10883       with *offset*, if any, applied. The regular expression *rexp* shall follow the rules for  
 10884       basic regular expressions described in the Base Definitions volume of  
 10885       IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions. The application shall  
 10886       use the sequence "\/" to specify a slash character within the *rexp*. The optional  
 10887       offset shall be a positive or negative integer value representing a number of lines.  
 10888       A positive integer value can be preceded by '+'. If the selection of lines from an  
 10889       *offset* expression of this type would create a file with zero lines, or one with greater  
 10890       than the number of lines left in the input file, the results are unspecified. After the  
 10891       section is created, the current line shall be set to the line that results from the  
 10892       evaluation of the regular expression with any offset applied. If the current line is  
 10893       the first line in the file and a regular expression operation has not yet been  
 10894       performed, the pattern match of *rexp* shall be applied from the current line to the  
 10895       end of the file. Otherwise, the pattern match of *rexp* shall be applied from the line  
 10896       following the current line to the end of the file.

10897       %*rexp*%[*offset*]

10898       Equivalent to /*rexp*/[*offset*], except that no file shall be created for the selected  
 10899       section of the input file. The application shall use the sequence "\%" to specify a

10900                   percent-sign character within the *rexp*.

10901           *line\_no*    Create a file from the current line up to (but not including) the line number *line\_no*.  
 10902                   Lines in the file shall be numbered starting at one. The current line becomes  
 10903                   *line\_no*.

10904           {*num*}       Repeat operand. This operand can follow any of the operands described  
 10905                   previously. If it follows a *rexp* type operand, that operand shall be applied *num*  
 10906                   more times. If it follows a *line\_no* operand, the file shall be split every *line\_no* lines,  
 10907                   *num* times, from that point.

10908           An error shall be reported if an operand does not reference a line between the current position  
 10909           and the end of the file.

10910 **STDIN**

10911           See the INPUT FILES section.

10912 **INPUT FILES**

10913           The input file shall be a text file.

10914 **ENVIRONMENT VARIABLES**

10915           The following environment variables shall affect the execution of *csplit*:

10916           *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 10917                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 10918                   Internationalization Variables for the precedence of internationalization variables  
 10919                   used to determine the values of locale categories.)

10920           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 10921                   internationalization variables.

10922           *LC\_COLLATE*

10923                   Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 10924                   character collating elements within regular expressions.

10925           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 10926                   characters (for example, single-byte as opposed to multi-byte characters in  
 10927                   arguments and input files) and the behavior of character classes within regular  
 10928                   expressions.

10929           *LC\_MESSAGES*

10930                   Determine the locale that should be used to affect the format and contents of  
 10931                   diagnostic messages written to standard error.

10932 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

10933 **ASYNCHRONOUS EVENTS**

10934           If the **-k** option is specified, created files shall be retained. Otherwise, the default action occurs.

10935 **STDOUT**

10936           Unless the **-s** option is used, the standard output shall consist of one line per file created, with a  
 10937           format as follows:

10938           "%d\n", <file size in bytes>

10939 **STDERR**

10940           The standard error shall be used only for diagnostic messages.

10941 **OUTPUT FILES**

10942 The output files shall contain portions of the original input file; otherwise, unchanged.

10943 **EXTENDED DESCRIPTION**

10944 None.

10945 **EXIT STATUS**

10946 The following exit values shall be returned:

10947 0 Successful completion.

10948 >0 An error occurred.

10949 **CONSEQUENCES OF ERRORS**

10950 By default, created files shall be removed if an error occurs. When the **-k** option is specified,  
10951 created files shall not be removed if an error occurs.

10952 **APPLICATION USAGE**

10953 None.

10954 **EXAMPLES**

10955 1. This example creates four files, **cobol00** ... **cobol03**:

10956 `csplit -f cobol file '/procedure division/' /par5./ /par16./`

10957 After editing the split files, they can be recombined as follows:

10958 `cat cobol0[0-3] > file`

10959 Note that this example overwrites the original file.

10960 2. This example would split the file after the first 99 lines, and every 100 lines thereafter, up  
10961 to 9999 lines; this is because lines in the file are numbered from 1 rather than zero, for  
10962 historical reasons:

10963 `csplit -k file 100 {99}`

10964 3. Assuming that **prog.c** follows the C-language coding convention of ending routines with a  
10965 `'}'` at the beginning of the line, this example creates a file containing each separate C  
10966 routine (up to 21) in **prog.c**:

10967 `csplit -k prog.c '%main(%' '/^}/+1' {20}`

10968 **RATIONALE**

10969 The **-n** option was added to extend the range of filenames that could be handled.

10970 Consideration was given to adding a **-a** flag to use the alphabetic filename generation used by  
10971 the historical *split* utility, but the functionality added by the **-n** option was deemed to make  
10972 alphabetic naming unnecessary.

10973 **FUTURE DIRECTIONS**

10974 None.

10975 **SEE ALSO**

10976 *sed*, *split*

10977 **CHANGE HISTORY**

10978 First released in Issue 2.

10979 **Issue 5**

10980 The FUTURE DIRECTIONS section is added.

10981 **Issue 6**

10982 This utility is marked as part of the User Portability Utilities option.

10983 The APPLICATION USAGE section is added.

10984 The description of regular expression operands is changed to align with the IEEE P1003.2b draft  
10985 standard.

10986 The normative text is reworded to avoid use of the term “must” for application requirements.

10987 **NAME**10988           ctags — create a tags file (**DEVELOPMENT**, **FORTTRAN**)10989 **SYNOPSIS**10990 UP       ctags [-a] [-f *tagsfile*] *pathname* ...10991           ctags -x *pathname* ...

10992

10993 **DESCRIPTION**

10994       The *ctags* utility shall be provided on systems that support the User Portability Utilities option,  
 10995       the Software Development Utilities option, and either or both of the C-Language Development  
 10996       Utilities option and FORTRAN Development Utilities option. On other systems, it is optional.

10997       The *ctags* utility shall write a *tagsfile* or an index of objects from C-language or FORTRAN source  
 10998       files specified by the *pathname* operands. The *tagsfile* shall list the locators of language-specific  
 10999       objects within the source files. A locator consists of a name, *pathname*, and either a search  
 11000       pattern or a line number that can be used in searching for the object definition. The objects that  
 11001       shall be recognized are specified in the EXTENDED DESCRIPTION section.

11002 **OPTIONS**

11003       The *ctags* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 11004       12.2, Utility Syntax Guidelines.

11005       The following options shall be supported:

11006       **-a**           Append to *tagsfile*.

11007       **-f *tagsfile***   Write the object locator lists into *tagsfile* instead of the default file named **tags** in  
 11008       the current directory.

11009       **-x**           Produce a list of object names, the line number, and filename in which each is  
 11010       defined, as well as the text of that line, and write this to the standard output. A  
 11011       *tagsfile* shall not be created when **-x** is specified.

11012 **OPERANDS**

11013       The following *pathname* operands are supported:

11014       ***file.c***       Files with basenames ending with the **.c** suffix shall be treated as C-language  
 11015       source code. Such files that are not valid input to *c99* produce unspecified results.

11016       ***file.h***       Files with basenames ending with the **.h** suffix shall be treated as C-language  
 11017       source code. Such files that are not valid input to *c99* produce unspecified results.

11018       ***file.f***       Files with basenames ending with the **.f** suffix shall be treated as FORTRAN-  
 11019       language source code. Such files that are not valid input to *fort77* produce  
 11020       unspecified results.

11021       The handling of other files is implementation-defined.

11022 **STDIN**

11023       See the INPUT FILES section.

11024 **INPUT FILES**

11025       The input files shall be text files containing source code in the language indicated by the operand  
 11026       filename suffixes.

11027 **ENVIRONMENT VARIABLES**

11028 The following environment variables shall affect the execution of *ctags*:

11029 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 11030 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 11031 Internationalization Variables for the precedence of internationalization variables  
 11032 used to determine the values of locale categories.)

11033 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 11034 internationalization variables.

11035 *LC\_COLLATE*  
 11036 Determine the order in which output is sorted for the *-x* option. The POSIX locale  
 11037 determines the order in which the *tagsfile* is written.

11038 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 11039 characters (for example, single-byte as opposed to multi-byte characters in  
 11040 arguments and input files). When processing C-language source code, if the locale  
 11041 is not compatible with the C locale described by the ISO C standard, the results are  
 11042 unspecified.

11043 *LC\_MESSAGES*  
 11044 Determine the locale that should be used to affect the format and contents of  
 11045 diagnostic messages written to standard error.

11046 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

11047 **ASYNCHRONOUS EVENTS**

11048 Default.

11049 **STDOUT**

11050 The list of object name information produced by the *-x* option shall be written to standard  
 11051 output in the following format:

11052 "%s %d %s %s", *<object-name>*, *<line-number>*, *<filename>*, *<text>*

11053 where *<text>* is the text of line *<line-number>* of file *<filename>*.

11054 **STDERR**

11055 The standard error shall be used only for diagnostic messages.

11056 **OUTPUT FILES**

11057 When the *-x* option is not specified, the format of the output file shall be:

11058 "%s\t%s\t/%s/\n", *<identifier>*, *<filename>*, *<pattern>*

11059 where *<pattern>* is a search pattern that could be used by an editor to find the defining instance  
 11060 of *<identifier>* in *<filename>* (where *defining instance* is indicated by the declarations listed in the  
 11061 EXTENDED DESCRIPTION).

11062 An optional circumflex ('^') can be added as a prefix to *<pattern>*, and an optional dollar sign  
 11063 can be appended to *<pattern>* to indicate that the pattern is anchored to the beginning (end) of a  
 11064 line of text. Any slash or backslash characters in *<pattern>* shall be preceded by a backslash  
 11065 character. The anchoring circumflex, dollar sign, and escaping backslash characters shall not be  
 11066 considered part of the search pattern. All other characters in the search pattern shall be  
 11067 considered literal characters.

11068 An alternative format is:

11069 "%s\t%s\t%s?\n", <identifier>, <filename>, <pattern>

11070 which is identical to the first format except that slashes in <pattern> shall not be preceded by  
 11071 escaping backslash characters, and question mark characters in <pattern> shall be preceded by  
 11072 backslash characters.

11073 A second alternative format is:

11074 "%s\t%s\t%d\n", <identifier>, <filename>, <lineno>

11075 where <lineno> is a decimal line number that could be used by an editor to find <identifier> in  
 11076 <filename>.

11077 Neither alternative format shall be produced by *ctags* when it is used as described by  
 11078 IEEE Std 1003.1-2001, but the standard utilities that process tags files shall be able to process  
 11079 those formats as well as the first format.

11080 In any of these formats, the file shall be sorted by identifier, based on the collation sequence in  
 11081 the POSIX locale.

11082 **EXTENDED DESCRIPTION**

11083 If the operand identifies C-language source, the *ctags* utility shall attempt to produce an output  
 11084 line for each of the following objects:

- 11085 • Function definitions
- 11086 • Type definitions
- 11087 • Macros with arguments

11088 It may also produce output for any of the following objects:

- 11089 • Function prototypes
- 11090 • Structures
- 11091 • Unions
- 11092 • Global variable definitions
- 11093 • Enumeration types
- 11094 • Macros without arguments
- 11095 • **#define** statements
- 11096 • **#line** statements

11097 Any **#if** and **#ifdef** statements shall produce no output. The tag **main** is treated specially in C  
 11098 programs. The tag formed shall be created by prefixing **M** to the name of the file, with the  
 11099 trailing **.c**, and leading pathname components (if any) removed.

11100 On systems that do not support the C-Language Development Utilities option, *ctags* produces  
 11101 unspecified results for C-language source code files. It should write to standard error a message  
 11102 identifying this condition and cause a non-zero exit status to be produced.

11103 If the operand identifies FORTRAN source, the *ctags* utility shall produce an output line for each  
 11104 function definition. It may also produce output for any of the following objects:

- 11105 • Subroutine definitions
- 11106 • COMMON statements

- 11107           • PARAMETER statements
- 11108           • DATA and BLOCK DATA statements
- 11109           • Statement numbers
- 11110           On systems that do not support the FORTRAN Development Utilities option, *ctags* produces
- 11111           unspecified results for FORTRAN source code files. It should write to standard error a message
- 11112           identifying this condition and cause a non-zero exit status to be produced.
- 11113           It is implementation-defined what other objects (including duplicate identifiers) produce output.
- 11114 **EXIT STATUS**
- 11115           The following exit values shall be returned:
- 11116           0   Successful completion.
- 11117           >0  An error occurred.
- 11118 **CONSEQUENCES OF ERRORS**
- 11119           Default.
- 11120 **APPLICATION USAGE**
- 11121           The output with **-x** is meant to be a simple index that can be written out as an off-line readable
- 11122           function index. If the input files to *ctags* (such as **.c** files) were not created using the same locale
- 11123           as that in effect when *ctags* **-x** is run, results might not be as expected.
- 11124           The description of C-language processing says “attempts to” because the C language can be
- 11125           greatly confused, especially through the use of **#defines**, and this utility would be of no use if
- 11126           the real C preprocessor were run to identify them. The output from *ctags* may be fooled and
- 11127           incorrect for various constructs.
- 11128 **EXAMPLES**
- 11129           None.
- 11130 **RATIONALE**
- 11131           The option list was significantly reduced from that provided by historical implementations. The
- 11132           **-F** option was omitted as redundant, since it is the default. The **-B** option was omitted as being
- 11133           of very limited usefulness. The **-t** option was omitted since the recognition of **typedefs** is now
- 11134           required for C source files. The **-u** option was omitted because the update function was judged
- 11135           to be not only inefficient, but also rarely needed.
- 11136           An early proposal included a **-w** option to suppress warning diagnostics. Since the types of such
- 11137           diagnostics could not be described, the option was omitted as being not useful.
- 11138           The text for *LC\_CTYPE* about compatibility with the C locale acknowledges that the ISO C
- 11139           standard imposes requirements on the locale used to process C source. This could easily be a
- 11140           superset of that known as “the C locale” by way of implementation extensions, or one of a few
- 11141           alternative locales for systems supporting different codesets. No statement is made for
- 11142           FORTRAN because the ANSI X3.9-1978 standard (FORTRAN 77) does not (yet) define a similar
- 11143           locale concept. However, a general rule in this volume of IEEE Std 1003.1-2001 is that any time
- 11144           that locales do not match (preparing a file for one locale and processing it in another), the results
- 11145           are suspect.
- 11146           The collation sequence of the tags file is not affected by *LC\_COLLATE* because it is typically not
- 11147           used by human readers, but only by programs such as *vi* to locate the tag within the source files.
- 11148           Using the POSIX locale eliminates some of the problems of coordinating locales between the
- 11149           *ctags* file creator and the *vi* file reader.

Historically, the tags file has been used only by *ex* and *vi*. However, the format of the tags file has been published to encourage other programs to use the tags in new ways. The format allows either patterns or line numbers to find the identifiers because the historical *vi* recognizes either. The *ctags* utility does not produce the format using line numbers because it is not useful following any source file changes that add or delete lines. The documented search patterns match historical practice. It should be noted that literal leading circumflex or trailing dollar-sign characters in the search pattern will only behave correctly if anchored to the beginning of the line or end of the line by an additional circumflex or dollar-sign character.

Historical implementations also understand the objects used by the languages Pascal and sometimes LISP, and they understand the C source output by *lex* and *yacc*. The *ctags* utility is not required to accommodate these languages, although implementors are encouraged to do so.

The following historical option was not specified, as *vgrind* is not included in this volume of IEEE Std 1003.1-2001:

**-v** If the **-v** flag is given, an index of the form expected by *vgrind* is produced on the standard output. This listing contains the function name, filename, and page number (assuming 64-line pages). Since the output is sorted into lexicographic order, it may be desired to run the output through *sort -f*. Sample use:

```
ctags -v files | sort -f > index vgrind -x index
```

The special treatment of the tag **main** makes the use of *ctags* practical in directories with more than one program.

#### 11170 FUTURE DIRECTIONS

11171 None.

#### 11172 SEE ALSO

11173 *c99*, *fort77*, *vi*

#### 11174 CHANGE HISTORY

11175 First released in Issue 4.

#### 11176 Issue 5

11177 The FUTURE DIRECTIONS section is added.

#### 11178 Issue 6

11179 This utility is marked as part of the User Portability Utilities option.

11180 The OUTPUT FILES section is changed to align with the IEEE P1003.2b draft standard.

11181 The normative text is reworded to avoid use of the term “must” for application requirements.

11182 IEEE PASC Interpretation 1003.2 #168 is applied, changing “create” to “write” in the  
11183 DESCRIPTION.

11184 **NAME**

11185           cut — cut out selected fields of each line of a file

11186 **SYNOPSIS**11187           cut -b *list* [-n] [*file* ...]11188           cut -c *list* [*file* ...]11189           cut -f *list* [-d *delim*] [-s] [*file* ...]11190 **DESCRIPTION**

11191           The *cut* utility shall cut out bytes (**-b** option), characters (**-c** option), or character-delimited fields  
 11192           (**-f** option) from each line in one or more files, concatenate them, and write them to standard  
 11193           output.

11194 **OPTIONS**

11195           The *cut* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 11196           12.2, Utility Syntax Guidelines.

11197           The application shall ensure that the option-argument *list* (see options **-b**, **-c**, and **-f** below) is a  
 11198           comma-separated list or <blank>-separated list of positive numbers and ranges. Ranges can be  
 11199           in three forms. The first is two positive numbers separated by a hyphen (*low-high*), which  
 11200           represents all fields from the first number to the second number. The second is a positive  
 11201           number preceded by a hyphen (*-high*), which represents all fields from field number 1 to that  
 11202           number. The third is a positive number followed by a hyphen (*low-*), which represents that  
 11203           number to the last field, inclusive. The elements in *list* can be repeated, can overlap, and can be  
 11204           specified in any order, but the bytes, characters, or fields selected shall be written in the order of  
 11205           the input data. If an element appears in the selection list more than once, it shall be written  
 11206           exactly once.

11207           The following options shall be supported:

11208           **-b list**       Cut based on a *list* of bytes. Each selected byte shall be output unless the **-n** option  
 11209                           is also specified. It shall not be an error to select bytes not present in the input line.

11210           **-c list**       Cut based on a *list* of characters. Each selected character shall be output. It shall  
 11211                           not be an error to select characters not present in the input line.

11212           **-d delim**     Set the field delimiter to the character *delim*. The default is the <tab>.

11213           **-f list**       Cut based on a *list* of fields, assumed to be separated in the file by a delimiter  
 11214                           character (see **-d**). Each selected field shall be output. Output fields shall be  
 11215                           separated by a single occurrence of the field delimiter character. Lines with no field  
 11216                           delimiters shall be passed through intact, unless **-s** is specified. It shall not be an  
 11217                           error to select fields not present in the input line.

11218           **-n**           Do not split characters. When specified with the **-b** option, each element in *list* of  
 11219                           the form *low-high* (hyphen-separated numbers) shall be modified as follows:

- 11220                       • If the byte selected by *low* is not the first byte of a character, *low* shall be  
 11221                       decremented to select the first byte of the character originally selected by *low*.  
 11222                       If the byte selected by *high* is not the last byte of a character, *high* shall be  
 11223                       decremented to select the last byte of the character prior to the character  
 11224                       originally selected by *high*, or zero if there is no prior character. If the resulting  
 11225                       range element has *high* equal to zero or *low* greater than *high*, the list element  
 11226                       shall be dropped from *list* for that input line without causing an error.

11227           Each element in *list* of the form *low-* shall be treated as above with *high* set to the  
 11228           number of bytes in the current line, not including the terminating <newline>. Each

11229 element in *list* of the form *–high* shall be treated as above with *low* set to 1. Each  
 11230 element in *list* of the form *num* (a single number) shall be treated as above with *low*  
 11231 set to *num* and *high* set to *num*.

11232 **–s** Suppress lines with no delimiter characters, when used with the **–f** option. Unless  
 11233 specified, lines with no delimiters shall be passed through untouched.

#### 11234 OPERANDS

11235 The following operand shall be supported:

11236 *file* A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 11237 '–', the standard input shall be used.

#### 11238 STDIN

11239 The standard input shall be used only if no *file* operands are specified, or if a *file* operand is '–'.  
 11240 See the INPUT FILES section.

#### 11241 INPUT FILES

11242 The input files shall be text files, except that line lengths shall be unlimited.

#### 11243 ENVIRONMENT VARIABLES

11244 The following environment variables shall affect the execution of *cut*:

11245 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 11246 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 11247 Internationalization Variables for the precedence of internationalization variables  
 11248 used to determine the values of locale categories.)

11249 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 11250 internationalization variables.

11251 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 11252 characters (for example, single-byte as opposed to multi-byte characters in  
 11253 arguments and input files).

11254 *LC\_MESSAGES*  
 11255 Determine the locale that should be used to affect the format and contents of  
 11256 diagnostic messages written to standard error.

11257 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

#### 11258 ASYNCHRONOUS EVENTS

11259 Default.

#### 11260 STDOUT

11261 The *cut* utility output shall be a concatenation of the selected bytes, characters, or fields (one of  
 11262 the following):

11263 "%s\n", <concatenation of bytes>

11264 "%s\n", <concatenation of characters>

11265 "%s\n", <concatenation of fields and field delimiters>

#### 11266 STDERR

11267 The standard error shall be used only for diagnostic messages.

#### 11268 OUTPUT FILES

11269 None.

11270 **EXTENDED DESCRIPTION**

11271 None.

11272 **EXIT STATUS**

11273 The following exit values shall be returned:

11274 0 All input files were output successfully.

11275 &gt;0 An error occurred.

11276 **CONSEQUENCES OF ERRORS**

11277 Default.

11278 **APPLICATION USAGE**

11279 Earlier versions of the *cut* utility worked in an environment where bytes and characters were  
 11280 considered equivalent (modulo <backspace> and <tab> processing in some implementations). In  
 11281 the extended world of multi-byte characters, the new **-b** option has been added. The **-n** option  
 11282 (used with **-b**) allows it to be used to act on bytes rounded to character boundaries. The  
 11283 algorithm specified for **-n** guarantees that:

11284 `cut -b 1-500 -n file > file1`11285 `cut -b 501- -n file > file2`

11286 ends up with all the characters in **file** appearing exactly once in **file1** or **file2**. (There is,  
 11287 however, a <newline> in both **file1** and **file2** for each <newline> in **file**.)

11288 **EXAMPLES**

11289 Examples of the option qualifier list:

11290 1,4,7 Select the first, fourth, and seventh bytes, characters, or fields and field delimiters.

11291 1-3,8 Equivalent to 1,2,3,8.

11292 -5,10 Equivalent to 1,2,3,4,5,10.

11293 3- Equivalent to third to last, inclusive.

11294 The *low-high* forms are not always equivalent when used with **-b** and **-n** and multi-byte  
 11295 characters; see the description of **-n**.

11296 The following command:

11297 `cut -d : -f 1,6 /etc/passwd`

11298 reads the System V password file (user database) and produces lines of the form:

11299 `<user ID>:<home directory>`

11300 Most utilities in this volume of IEEE Std 1003.1-2001 work on text files. The *cut* utility can be  
 11301 used to turn files with arbitrary line lengths into a set of text files containing the same data. The  
 11302 *paste* utility can be used to create (or recreate) files with arbitrary line lengths. For example, if **file**  
 11303 contains long lines:

11304 `cut -b 1-500 -n file > file1`11305 `cut -b 501- -n file > file2`

11306 creates **file1** (a text file) with lines no longer than 500 bytes (plus the <newline>) and **file2** that  
 11307 contains the remainder of the data from **file**. (Note that **file2** is not a text file if there are lines in  
 11308 **file** that are longer than 500 + {LINE\_MAX} bytes.) The original file can be recreated from **file1**  
 11309 and **file2** using the command:

11310 `paste -d "\0" file1 file2 > file`

11311 **RATIONALE**

11312 Some historical implementations do not count <backspace>s in determining character counts  
 11313 with the **-c** option. This may be useful for using *cut* for processing *nroff* output. It was  
 11314 deliberately decided not to have the **-c** option treat either <backspace>s or <tab>s in any special  
 11315 fashion. The *fold* utility does treat these characters specially.

11316 Unlike other utilities, some historical implementations of *cut* exit after not finding an input file,  
 11317 rather than continuing to process the remaining *file* operands. This behavior is prohibited by this  
 11318 volume of IEEE Std 1003.1-2001, where only the exit status is affected by this problem.

11319 The behavior of *cut* when provided with either mutually-exclusive options or options that do  
 11320 not work logically together has been deliberately left unspecified in favor of global wording in  
 11321 Section 1.11 (on page 20).

11322 The OPTIONS section was changed in response to IEEE PASC Interpretation 1003.2 #149. The  
 11323 change represents historical practice on all known systems. The original standard was  
 11324 ambiguous on the nature of the output.

11325 The *list* option-arguments are historically used to select the portions of the line to be written, but  
 11326 do not affect the order of the data. For example:

11327 `echo abcdefghi | cut -c6,2,4-7,1`

11328 yields "abdefg".

11329 A proposal to enhance *cut* with the following option:

11330 **-o** Preserve the selected field order. When this option is specified, each byte, character, or field  
 11331 (or ranges of such) shall be written in the order specified by the *list* option-argument, even if  
 11332 this requires multiple outputs of the same bytes, characters, or fields.

11333 was rejected because this type of enhancement is outside the scope of the IEEE P1003.2b draft  
 11334 standard.

11335 **FUTURE DIRECTIONS**

11336 None.

11337 **SEE ALSO**

11338 *grep*, *paste*, Section 2.5 (on page 33)

11339 **CHANGE HISTORY**

11340 First released in Issue 2.

11341 **Issue 6**

11342 The OPTIONS section is changed to align with the IEEE P1003.2b draft standard.

11343 The normative text is reworded to avoid use of the term “must” for application requirements.

11344 **NAME**11345 cxref — generate a C-language program cross-reference table (**DEVELOPMENT**)11346 **SYNOPSIS**

```
11347 xsi cxref [-cs] [-o file] [-w num] [-D name[=def]]... [-I dir]...
11348 [-U name]... file ...
```

11349

11350 **DESCRIPTION**

11351 The *cxref* utility shall analyze a collection of C-language *files* and attempt to build a cross-  
 11352 reference table. Information from **#define** lines shall be included in the symbol table. A sorted  
 11353 listing shall be written to standard output of all symbols (auto, static, and global) in each *file*  
 11354 separately, or with the **-c** option, in combination. Each symbol shall contain an asterisk before  
 11355 the declaring reference.

11356 **OPTIONS**

11357 The *cxref* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 11358 12.2, Utility Syntax Guidelines, except that the order of the **-D**, **-I**, and **-U** options (which are  
 11359 identical to their interpretation by *c99*) is significant. The following options shall be supported:

|       |                |                                                                                         |
|-------|----------------|-----------------------------------------------------------------------------------------|
| 11360 | <b>-c</b>      | Write a combined cross-reference of all input files.                                    |
| 11361 | <b>-s</b>      | Operate silently; do not print input filenames.                                         |
| 11362 | <b>-o file</b> | Direct output to named <i>file</i> .                                                    |
| 11363 | <b>-w num</b>  | Format output no wider than <i>num</i> (decimal) columns. This option defaults to 80 if |
| 11364 |                | <i>num</i> is not specified or is less than 51.                                         |
| 11365 | <b>-D</b>      | Equivalent to <i>c99</i> .                                                              |
| 11366 | <b>-I</b>      | Equivalent to <i>c99</i> .                                                              |
| 11367 | <b>-U</b>      | Equivalent to <i>c99</i> .                                                              |

11368 **OPERANDS**

11369 The following operand shall be supported:

|       |             |                                         |
|-------|-------------|-----------------------------------------|
| 11370 | <i>file</i> | A pathname of a C-language source file. |
|-------|-------------|-----------------------------------------|

11371 **STDIN**

11372 Not used.

11373 **INPUT FILES**

11374 The input files are C-language source files.

11375 **ENVIRONMENT VARIABLES**

11376 The following environment variables shall affect the execution of *cxref*:

|       |                   |                                                                                                                                                                                                                                                                                                                            |
|-------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11377 | <b>LANG</b>       | Provide a default value for the internationalization variables that are unset or null.<br>(See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,<br>11378 Internationalization Variables for the precedence of internationalization variables<br>11379 used to determine the values of locale categories.) |
| 11381 | <b>LC_ALL</b>     | If set to a non-empty string value, override the values of all the other<br>11382 internationalization variables.                                                                                                                                                                                                          |
| 11383 | <b>LC_COLLATE</b> |                                                                                                                                                                                                                                                                                                                            |
| 11384 |                   | Determine the locale for the ordering of the output.                                                                                                                                                                                                                                                                       |
| 11385 | <b>LC_CTYPE</b>   | Determine the locale for the interpretation of sequences of bytes of text data as<br>11386 characters (for example, single-byte as opposed to multi-byte characters in                                                                                                                                                     |

11387 arguments and input files).

11388 **LC\_MESSAGES**

11389 Determine the locale that should be used to affect the format and contents of

11390 diagnostic messages written to standard error.

11391 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

11392 **ASYNCHRONOUS EVENTS**

11393 Default.

11394 **STDOUT**

11395 The standard output shall be used for the cross-reference listing, unless the **-o** option is used to

11396 select a different output file.

11397 The format of standard output is unspecified, except that the following information shall be

11398 included:

- 11399 • If the **-c** option is not specified, each portion of the listing shall start with the name of the
- 11400 input file on a separate line.
- 11401 • The name line shall be followed by a sorted list of symbols, each with its associated location
- 11402 pathname, the name of the function in which it appears (if it is not a function name itself),
- 11403 and line number references.
- 11404 • Each line number may be preceded by an asterisk (**'\*'**) flag, meaning that this is the
- 11405 declaring reference. Other single-character flags, with implementation-defined meanings,
- 11406 may be included.

11407 **STDERR**

11408 The standard error shall be used only for diagnostic messages.

11409 **OUTPUT FILES**

11410 The output file named by the **-o** option shall be used instead of standard output.

11411 **EXTENDED DESCRIPTION**

11412 None.

11413 **EXIT STATUS**

11414 The following exit values shall be returned:

- 11415 0 Successful completion.
- 11416 >0 An error occurred.

11417 **CONSEQUENCES OF ERRORS**

11418 Default.

11419 **APPLICATION USAGE**

11420 None.

11421 **EXAMPLES**

11422 None.

11423 **RATIONALE**

11424 None.

11425 **FUTURE DIRECTIONS**

11426 None.

11427 **SEE ALSO**11428 *c99*11429 **CHANGE HISTORY**

11430 First released in Issue 2.

11431 **Issue 5**11432 In the SYNOPSIS, [**-U** *dir*] is changed to [**-U** *name*].11433 **Issue 6**

11434 The APPLICATION USAGE section is added.

11435 **NAME**

11436           date — write the date and time

11437 **SYNOPSIS**11438           date [-u] [+*format*]11439 xSI       date [-u] *mmddhhmm* [*cc* *yy*]

11440

11441 **DESCRIPTION**

11442 xSI       The *date* utility shall write the date and time to standard output or attempt to set the system date  
 11443           and time. By default, the current date and time shall be written. If an operand beginning with  
 11444           '+' is specified, the output format of *date* shall be controlled by the conversion specifications  
 11445           and other text in the operand.

11446 **OPTIONS**

11447           The *date* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 11448           12.2, Utility Syntax Guidelines.

11449           The following option shall be supported:

11450           **-u**       Perform operations as if the *TZ* environment variable was set to the string "UTC0",  
 11451                       or its equivalent historical value of "GMT0". Otherwise, *date* shall use the  
 11452                       timezone indicated by the *TZ* environment variable or the system default if that  
 11453                       variable is unset or null.

11454 **OPERANDS**

11455           The following operands shall be supported:

11456           **+format**   When the format is specified, each conversion specifier shall be replaced in the  
 11457                       standard output by its corresponding value. All other characters shall be copied to  
 11458                       the output without change. The output shall always be terminated with a  
 11459                       <newline>.

11460           **Conversion Specifications**

|       |    |                                                                          |
|-------|----|--------------------------------------------------------------------------|
| 11461 | %a | Locale's abbreviated weekday name.                                       |
| 11462 | %A | Locale's full weekday name.                                              |
| 11463 | %b | Locale's abbreviated month name.                                         |
| 11464 | %B | Locale's full month name.                                                |
| 11465 | %c | Locale's appropriate date and time representation.                       |
| 11466 | %C | Century (a year divided by 100 and truncated to an integer) as a decimal |
| 11467 |    | number [00,99].                                                          |
| 11468 | %d | Day of the month as a decimal number [01,31].                            |
| 11469 | %D | Date in the format <i>mm/dd/yy</i> .                                     |
| 11470 | %e | Day of the month as a decimal number [1,31] in a two-digit field with    |
| 11471 |    | leading space character fill.                                            |
| 11472 | %h | A synonym for %b.                                                        |
| 11473 | %H | Hour (24-hour clock) as a decimal number [00,23].                        |
| 11474 | %I | Hour (12-hour clock) as a decimal number [01,12].                        |

|       |    |                                                                              |
|-------|----|------------------------------------------------------------------------------|
| 11475 | %j | Day of the year as a decimal number [001,366].                               |
| 11476 | %m | Month as a decimal number [01,12].                                           |
| 11477 | %M | Minute as a decimal number [00,59].                                          |
| 11478 | %n | A <newline>.                                                                 |
| 11479 | %p | Locale's equivalent of either AM or PM.                                      |
| 11480 | %r | 12-hour clock time [01,12] using the AM/PM notation; in the POSIX            |
| 11481 |    | locale, this shall be equivalent to %I:%M:%S %p.                             |
| 11482 | %S | Seconds as a decimal number [00,60].                                         |
| 11483 | %t | A <tab>.                                                                     |
| 11484 | %T | 24-hour clock time [00,23] in the format <i>HH:MM:SS</i> .                   |
| 11485 | %u | Weekday as a decimal number [1,7] (1=Monday).                                |
| 11486 | %U | Week of the year (Sunday as the first day of the week) as a decimal          |
| 11487 |    | number [00,53]. All days in a new year preceding the first Sunday shall be   |
| 11488 |    | considered to be in week 0.                                                  |
| 11489 | %V | Week of the year (Monday as the first day of the week) as a decimal          |
| 11490 |    | number [01,53]. If the week containing January 1 has four or more days in    |
| 11491 |    | the new year, then it shall be considered week 1; otherwise, it shall be the |
| 11492 |    | last week of the previous year, and the next week shall be week 1.           |
| 11493 | %w | Weekday as a decimal number [0,6] (0=Sunday).                                |
| 11494 | %W | Week of the year (Monday as the first day of the week) as a decimal          |
| 11495 |    | number [00,53]. All days in a new year preceding the first Monday shall      |
| 11496 |    | be considered to be in week 0.                                               |
| 11497 | %x | Locale's appropriate date representation.                                    |
| 11498 | %X | Locale's appropriate time representation.                                    |
| 11499 | %y | Year within century [00,99].                                                 |
| 11500 | %Y | Year with century as a decimal number.                                       |
| 11501 | %Z | Timezone name, or no characters if no timezone is determinable.              |
| 11502 | %% | A percent sign character.                                                    |

11503 See the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5, *LC\_TIME*  
 11504 for the conversion specifier values in the POSIX locale.

#### 11505 **Modified Conversion Specifications**

11506 Some conversion specifiers can be modified by the *E* and *O* modifier characters to  
 11507 indicate a different format or specification as specified in the *LC\_TIME* locale  
 11508 description (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5,  
 11509 *LC\_TIME*). If the corresponding keyword (see **era**, **era\_year**, **era\_d\_fmt**, and  
 11510 **alt\_digits** in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5,  
 11511 *LC\_TIME*) is not specified or not supported for the current locale, the unmodified  
 11512 conversion specifier value shall be used.

11513 %Ec      Locale's alternative appropriate date and time representation.

|       |     |                                                                                                                                           |
|-------|-----|-------------------------------------------------------------------------------------------------------------------------------------------|
| 11514 | %EC | The name of the base year (period) in the locale's alternative representation.                                                            |
| 11515 |     |                                                                                                                                           |
| 11516 | %Ex | Locale's alternative date representation.                                                                                                 |
| 11517 | %EX | Locale's alternative time representation.                                                                                                 |
| 11518 | %Ey | Offset from %EC (year only) in the locale's alternative representation.                                                                   |
| 11519 | %EY | Full alternative year representation.                                                                                                     |
| 11520 | %Od | Day of month using the locale's alternative numeric symbols.                                                                              |
| 11521 | %Oe | Day of month using the locale's alternative numeric symbols.                                                                              |
| 11522 | %OH | Hour (24-hour clock) using the locale's alternative numeric symbols.                                                                      |
| 11523 | %OI | Hour (12-hour clock) using the locale's alternative numeric symbols.                                                                      |
| 11524 | %Om | Month using the locale's alternative numeric symbols.                                                                                     |
| 11525 | %OM | Minutes using the locale's alternative numeric symbols.                                                                                   |
| 11526 | %OS | Seconds using the locale's alternative numeric symbols.                                                                                   |
| 11527 | %Ou | Weekday as a number in the locale's alternative representation (Monday = 1).                                                              |
| 11528 |     |                                                                                                                                           |
| 11529 | %OU | Week number of the year (Sunday as the first day of the week) using the locale's alternative numeric symbols.                             |
| 11530 |     |                                                                                                                                           |
| 11531 | %OV | Week number of the year (Monday as the first day of the week, rules corresponding to %V), using the locale's alternative numeric symbols. |
| 11532 |     |                                                                                                                                           |
| 11533 | %Ow | Weekday as a number in the locale's alternative representation (Sunday = 0).                                                              |
| 11534 |     |                                                                                                                                           |
| 11535 | %OW | Week number of the year (Monday as the first day of the week) using the locale's alternative numeric symbols.                             |
| 11536 |     |                                                                                                                                           |
| 11537 | %Oy | Year (offset from %C) in alternative representation.                                                                                      |

|       |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 11539 |     | Attempt to set the system date and time from the value given in the operand. This is only possible if the user has appropriate privileges and the system permits the setting of the system date and time. The first <i>mm</i> is the month (number); <i>dd</i> is the day (number); <i>hh</i> is the hour (number, 24-hour system); the second <i>mm</i> is the minute (number); <i>cc</i> is the century and is the first two digits of the year (this is optional); <i>yy</i> is the last two digits of the year and is optional. If century is not specified, then values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive. The current year is the default if <i>yy</i> is omitted. |
| 11540 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11541 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11542 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11543 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11544 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11545 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11546 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11547 |     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|       |              |                                                                                                                                                                                                     |
|-------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11548 | <b>Note:</b> | It is expected that in a future version of IEEE Std 1003.1-2001 the default century inferred from a 2-digit year will change. (This would apply to all commands accepting a 2-digit year as input.) |
| 11549 |              |                                                                                                                                                                                                     |
| 11550 |              |                                                                                                                                                                                                     |

|       |              |
|-------|--------------|
| 11551 | <b>STDIN</b> |
| 11552 | Not used.    |

11553 **INPUT FILES**

11554       None.

11555 **ENVIRONMENT VARIABLES**11556       The following environment variables shall affect the execution of *date*:

11557       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 11558                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 11559                   Internationalization Variables for the precedence of internationalization variables  
 11560                   used to determine the values of locale categories.)

11561       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 11562                   internationalization variables.

11563       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 11564                   characters (for example, single-byte as opposed to multi-byte characters in  
 11565                   arguments).

11566       *LC\_MESSAGES*       Determine the locale that should be used to affect the format and contents of  
 11567                   diagnostic messages written to standard error.  
 11568

11569       *LC\_TIME*     Determine the format and contents of date and time strings written by *date*.

11570 xsi       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

11571       *TZ*           Determine the timezone in which the time and date are written, unless the *-u*  
 11572                   option is specified. If the *TZ* variable is unset or null and *-u* is not specified, an  
 11573                   unspecified system default timezone is used.

11574 **ASYNCHRONOUS EVENTS**

11575       Default.

11576 **STDOUT**

11577       When no formatting operand is specified, the output in the POSIX locale shall be equivalent to  
 11578       specifying:

11579       date "+%a %b %e %H:%M:%S %Z %Y"

11580 **STDERR**

11581       The standard error shall be used only for diagnostic messages.

11582 **OUTPUT FILES**

11583       None.

11584 **EXTENDED DESCRIPTION**

11585       None.

11586 **EXIT STATUS**

11587       The following exit values shall be returned:

11588       0   The date was written successfully.

11589       >0   An error occurred.

11590 **CONSEQUENCES OF ERRORS**

11591       Default.

11592 **APPLICATION USAGE**

11593 Conversion specifiers are of unspecified format when not in the POSIX locale. Some of them can  
 11594 contain <newline>s in some locales, so it may be difficult to use the format shown in standard  
 11595 output for parsing the output of *date* in those locales.

11596 The range of values for %S extends from 0 to 60 seconds to accommodate the occasional leap  
 11597 second.

11598 Although certain of the conversion specifiers in the POSIX locale (such as the name of the  
 11599 month) are shown with initial capital letters, this need not be the case in other locales. Programs  
 11600 using these fields may need to adjust the capitalization if the output is going to be used at the  
 11601 beginning of a sentence.

11602 The date string formatting capabilities are intended for use in Gregorian-style calendars,  
 11603 possibly with a different starting year (or years). The %x and %c conversion specifications,  
 11604 however, are intended for local representation; these may be based on a different, non-Gregorian  
 11605 calendar.

11606 The %C conversion specification was introduced to allow a fallback for the %EC (alternative year  
 11607 format base year); it can be viewed as the base of the current subdivision in the Gregorian  
 11608 calendar. The century number is calculated as the year divided by 100 and truncated to an  
 11609 integer; it should not be confused with the use of ordinal numbers for centuries (for example,  
 11610 “twenty-first century”). Both the %Ey and %y can then be viewed as the offset from %EC and %C,  
 11611 respectively.

11612 The E and O modifiers modify the traditional conversion specifiers, so that they can always be  
 11613 used, even if the implementation (or the current locale) does not support the modifier.

11614 The E modifier supports alternative date formats, such as the Japanese Emperor’s Era, as long as  
 11615 these are based on the Gregorian calendar system. Extending the E modifiers to other date  
 11616 elements may provide an implementation-defined extension capable of supporting other  
 11617 calendar systems, especially in combination with the O modifier.

11618 The O modifier supports time and date formats using the locale’s alternative numerical symbols,  
 11619 such as Kanji or Hindi digits or ordinal number representation.

11620 Non-European locales, whether they use Latin digits in computational items or not, often have  
 11621 local forms of the digits for use in date formats. This is not totally unknown even in Europe; a  
 11622 variant of dates uses Roman numerals for the months: the third day of September 1991 would be  
 11623 written as 3.IX.1991. In Japan, Kanji digits are regularly used for dates; in Arabic-speaking  
 11624 countries, Hindi digits are used. The %d, %e, %H, %I, %m, %S, %U, %w, %W, and %y conversion  
 11625 specifications always return the date and time field in Latin digits (that is, 0 to 9). The %O  
 11626 modifier was introduced to support the use for display purposes of non-Latin digits. In the  
 11627 *LC\_TIME* category in *localedef*, the optional **alt\_digits** keyword is intended for this purpose. As  
 11628 an example, assume the following (partial) *localedef* source:

```
11629 alt_digits "";"I";"II";"III";"IV";"V";"VI";"VII";"VIII" \
11630 "IX";"X";"XI";"XII"
11631 d_fmt "%e.%Om.%Y"
```

11632 With the above date, the command:

```
11633 date "+%x"
```

11634 would yield 3.IX.1991. With the same **d\_fmt**, but without the **alt\_digits**, the command would  
 11635 yield 3.9.1991.

11636 **EXAMPLES**

11637 1. The following are input/output examples of *date* used at arbitrary times in the POSIX  
11638 locale:

```
11639 $ date
11640 Tue Jun 26 09:58:10 PDT 1990

11641 $ date "+DATE: %m/%d/%Y%nTIME: %H:%M:%S"
11642 DATE: 11/02/91
11643 TIME: 13:36:16
```

```
11644 $ date "+TIME: %r"
11645 TIME: 01:36:32 PM
```

11646 2. Examples for Denmark, where the default date and time format is %a %d %b %Y %T %Z:

```
11647 $ LANG=da_DK.iso_8859-1 date
11648 ons 02 okt 1991 15:03:32 CET

11649 $ LANG=da_DK.iso_8859-1 \
11650 date "+DATO: %A den %e. %B %Y%nKLOKKEN: %H:%M:%S"
11651 DATO: onsdag den 2. oktober 1991
11652 KLOKKEN: 15:03:56
```

11653 3. Examples for Germany, where the default date and time format is %a %d.%h.%Y, %T %Z:

```
11654 $ LANG=De_DE.88591 date
11655 Mi 02.Okt.1991, 15:01:21 MEZ

11656 $ LANG=De_DE.88591 date "+DATUM: %A, %d. %B %Y%nZEIT: %H:%M:%S"
11657 DATUM: Mittwoch, 02. Oktober 1991
11658 ZEIT: 15:02:02
```

11659 4. Examples for France, where the default date and time format is %a %d %h %Y %Z %T:

```
11660 $ LANG=Fr_FR.88591 date
11661 Mer 02 oct 1991 MET 15:03:32

11662 $ LANG=Fr_FR.88591 date "+JOUR: %A %d %B %Y%nHEURE: %H:%M:%S"
11663 JOUR: Mercredi 02 octobre 1991
11664 HEURE: 15:03:56
```

11665 **RATIONALE**

11666 Some of the new options for formatting are from the ISO C standard. The **-u** option was  
11667 introduced to allow portable access to Coordinated Universal Time (UTC). The string "GMT0" is  
11668 allowed as an equivalent *TZ* value to be compatible with all of the systems using the BSD  
11669 implementation, where this option originated.

11670 The %e format conversion specification (adopted from System V) was added because the ISO C  
11671 standard conversion specifications did not provide any way to produce the historical default  
11672 *date* output during the first nine days of any month.

11673 There are two varieties of day and week numbering supported (in addition to any others created  
11674 with the locale-dependent %E and %O modifier characters):

- 11675 • The historical variety in which Sunday is the first day of the week and the weekdays
- 11676 preceding the first Sunday of the year are considered week 0. These are represented by %w
- 11677 and %U. A variant of this is %W, using Monday as the first day of the week, but still referring
- 11678 to week 0. This view of the calendar was retained because so many historical applications
- 11679 depend on it and the ISO C standard *strftime()* function, on which many *date*

11680 implementations are based, was defined in this way.

11681 • The international standard, based on the ISO 8601:2000 standard where Monday is the first  
 11682 weekday and the algorithm for the first week number is more complex: If the week (Monday  
 11683 to Sunday) containing January 1 has four or more days in the new year, then it is week 1;  
 11684 otherwise, it is week 53 of the previous year, and the next week is week 1. These are  
 11685 represented by the new conversion specifications %u and %V, added as a result of  
 11686 international comments.

11687 **FUTURE DIRECTIONS**

11688 None.

11691 **CHANGE HISTORY**

11692 First released in Issue 2.

11693 **Issue 5**

11694 Changes are made for Year 2000 alignment.

11695 **Issue 6**

11696 The following new requirements on POSIX implementations derive from alignment with the  
 11697 Single UNIX Specification:

11698 • The %EX modified conversion specification is added. |

11699 The Open Group Corrigendum U048/2 is applied, correcting the examples.

11700 The DESCRIPTION is updated to refer to conversion specifications, instead of field descriptors  
 11701 for consistency with the *LC\_TIME* category.

11702 A clarification is made such that the current year is the default if the yy argument is omitted  
 11703 when setting the system date and time.

11704 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/19 is applied, correcting the CHANGE |  
 11705 HISTORY section. |

11706 **NAME**

11707 dd — convert and copy a file

11708 **SYNOPSIS**11709 dd [*operand* ...]11710 **DESCRIPTION**

11711 The *dd* utility shall copy the specified input file to the specified output file with possible  
 11712 conversions using specific input and output block sizes. It shall read the input one block at a  
 11713 time, using the specified input block size; it shall then process the block of data actually  
 11714 returned, which could be smaller than the requested block size. It shall apply any conversions  
 11715 that have been specified and write the resulting data to the output in blocks of the specified  
 11716 output block size. If the **bs=expr** operand is specified and no conversions other than **sync**,  
 11717 **noerror**, or **notrunc** are requested, the data returned from each input block shall be written as a  
 11718 separate output block; if the read returns less than a full block and the **sync** conversion is not  
 11719 specified, the resulting output block shall be the same size as the input block. If the **bs=expr**  
 11720 operand is not specified, or a conversion other than **sync**, **noerror**, or **notrunc** is requested, the  
 11721 input shall be processed and collected into full-sized output blocks until the end of the input is  
 11722 reached.

11723 The processing order shall be as follows:

- 11724 1. An input block is read.
- 11725 2. If the input block is shorter than the specified input block size and the **sync** conversion is  
 11726 specified, null bytes shall be appended to the input data up to the specified size. (If either  
 11727 **block** or **unblock** is also specified, <space>s shall be appended instead of null bytes.) The  
 11728 remaining conversions and output shall include the pad characters as if they had been read  
 11729 from the input.
- 11730 3. If the **bs=expr** operand is specified and no conversion other than **sync** or **noerror** is  
 11731 requested, the resulting data shall be written to the output as a single block, and the  
 11732 remaining steps are omitted.
- 11733 4. If the **swab** conversion is specified, each pair of input data bytes shall be swapped. If there  
 11734 is an odd number of bytes in the input block, the last byte in the input record shall not be  
 11735 swapped.
- 11736 5. Any remaining conversions (**block**, **unblock**, **lcase**, and **ucase**) shall be performed. These  
 11737 conversions shall operate on the input data independently of the input blocking; an input  
 11738 or output fixed-length record may span block boundaries.
- 11739 6. The data resulting from input or conversion or both shall be aggregated into output blocks  
 11740 of the specified size. After the end of input is reached, any remaining output shall be  
 11741 written as a block without padding if **conv=sync** is not specified; thus, the final output  
 11742 block may be shorter than the output block size.

11743 **OPTIONS**

11744 None.

11745 **OPERANDS**

11746 All of the operands shall be processed before any input is read. The following operands shall be  
 11747 supported:

- |       |                |                                                                                                     |
|-------|----------------|-----------------------------------------------------------------------------------------------------|
| 11748 | <b>if=file</b> | Specify the input pathname; the default is standard input.                                          |
| 11749 | <b>of=file</b> | Specify the output pathname; the default is standard output. If the <b>seek=expr</b>                |
| 11750 |                | conversion is not also specified, the output file shall be truncated before the copy                |
| 11751 |                | begins if an explicit <b>of=file</b> operand is specified, unless <b>conv=notrunc</b> is specified. |

|           |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11752     |                               | If <b>seek=expr</b> is specified, but <b>conv=notrunc</b> is not, the effect of the copy shall be to preserve the blocks in the output file over which <i>dd</i> seeks, but no other portion of the output file shall be preserved. (If the size of the seek plus the size of the input file is less than the previous size of the output file, the output file shall be shortened by the copy.)                                                                                                                                                                                                                                               |
| 11753     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11754     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11755     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11756     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 11757     | <b>ibs=expr</b>               | Specify the input block size, in bytes, by <i>expr</i> (default is 512).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 11758     | <b>obs=expr</b>               | Specify the output block size, in bytes, by <i>expr</i> (default is 512).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 11759     | <b>bs=expr</b>                | Set both input and output block sizes to <i>expr</i> bytes, superseding <b>ibs=</b> and <b>obs=</b> . If no conversion other than <b>sync</b> , <b>noerror</b> , and <b>notrunc</b> is specified, each input block shall be copied to the output as a single block without aggregating short blocks.                                                                                                                                                                                                                                                                                                                                           |
| 11760     |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 11786     |                               | The <b>ascii</b> , <b>ebcdic</b> , and <b>ibm</b> values are mutually-exclusive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 11787     | <b>block</b>                  | Treat the input as a sequence of <newline>-terminated or end-of-file-terminated variable-length records independent of the input block boundaries. Each record shall be converted to a record with a fixed length specified by the conversion block size. Any <newline> shall be removed from the input line; <space>s shall be appended to lines that are shorter than their conversion block size to fill the block. Lines that are longer than the conversion block size shall be truncated to the largest number of characters that fit into that size; the number of truncated lines shall be reported (see the STDERR section).          |

| 0260 |     |     |     |     |     |     |     |     |
| 0270 |     |     |     |     |     |     |     |     |
| 0300 |     |     |     |     |     |     |     |     |
| 0310 |     |     |     |     |     |     |     |     |
| 0320 |     |     |     |     |     |     |     |     |
| 0330 |     |     |     |     |     |     |     |     |
| 0340 |     |     |     |     |     |     |     |     |
| 0350 |     |     |     |     |     |     |     |     |
| 0360 |     |     |     |     |     |     |     |     |
| 0370 |     |     |     |     |     |     |     |     |

11845 **STDIN**

11846 If no **if=** operand is specified, the standard input shall be used. See the INPUT FILES section.

11847 **INPUT FILES**

11848 The input file can be any file type.

11849 **ENVIRONMENT VARIABLES**

11850 The following environment variables shall affect the execution of *dd*:

11851 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 11852 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 11853 Internationalization Variables for the precedence of internationalization variables  
 11854 used to determine the values of locale categories.)

11855 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 11856 internationalization variables.

11857 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 11858 characters (for example, single-byte as opposed to multi-byte characters in  
 11859 arguments and input files), the classification of characters as uppercase or  
 11860 lowercase, and the mapping of characters from one case to the other.

11861 *LC\_MESSAGES*

11862 Determine the locale that should be used to affect the format and contents of  
 11863 diagnostic messages written to standard error and informative messages written to  
 11864 standard output.

11865 *XS1* *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

11866 **ASYNCHRONOUS EVENTS**

11867 For SIGINT, the *dd* utility shall interrupt its current processing, write status information to  
 11868 standard error, and exit as though terminated by SIGINT. It shall take the standard action for all  
 11869 other signals; see the ASYNCHRONOUS EVENTS section in Section 1.11 (on page 20).

11870 **STDOUT**

11871 If no **of=** operand is specified, the standard output shall be used. The nature of the output  
 11872 depends on the operands selected.

11873 **STDERR**

11874 On completion, *dd* shall write the number of input and output blocks to standard error. In the  
 11875 POSIX locale the following formats shall be used:

11876 "%u+%u records in\n", <number of whole input blocks>,  
 11877 <number of partial input blocks>

11878 "%u+%u records out\n", <number of whole output blocks>,  
 11879 <number of partial output blocks>

11880 A partial input block is one for which *read()* returned less than the input block size. A partial  
 11881 output block is one that was written with fewer bytes than specified by the output block size.

11882 In addition, when there is at least one truncated block, the number of truncated blocks shall be  
 11883 written to standard error. In the POSIX locale, the format shall be:

11884 "%u truncated %s\n", <number of truncated blocks>, "record" (if  
 11885 <number of truncated blocks> is one) "records" (otherwise)

11886 Diagnostic messages may also be written to standard error.

11887 **OUTPUT FILES**

11888 If the **of=** operand is used, the output shall be the same as described in the STDOUT section.

11889 **EXTENDED DESCRIPTION**

11890 None.

11891 **EXIT STATUS**

11892 The following exit values shall be returned:

11893 0 The input file was copied successfully.

11894 >0 An error occurred.

11895 **CONSEQUENCES OF ERRORS**

11896 If an input error is detected and the **noerror** conversion has not been specified, any partial  
 11897 output block shall be written to the output file, a diagnostic message shall be written, and the  
 11898 copy operation shall be discontinued. If some other error is detected, a diagnostic message shall  
 11899 be written and the copy operation shall be discontinued.

11900 **APPLICATION USAGE**

11901 The input and output block size can be specified to take advantage of raw physical I/O.

11902 There are many different versions of the EBCDIC codesets. The ASCII and EBCDIC conversions  
 11903 specified for the *dd* utility perform conversions for the version specified by the tables.

11904 **EXAMPLES**

11905 The following command:

11906 `dd if=/dev/rmt0h of=/dev/rmt1h`

11907 copies from tape drive 0 to tape drive 1, using a common historical device naming convention.

11908 The following command:

11909 `dd ibs=10 skip=1`

11910 strips the first 10 bytes from standard input.

11911 This example reads an EBCDIC tape blocked ten 80-byte EBCDIC card images per block into the  
 11912 ASCII file **x**:

11913 `dd if=/dev/tape of=x ibs=800 cbs=80 conv=ascii,lcase`

11914 **RATIONALE**

11915 The OPTIONS section is listed as “None” because there are no options recognized by historical  
 11916 *dd* utilities. Certainly, many of the operands could have been designed to use the Utility Syntax  
 11917 Guidelines, which would have resulted in the classic hyphenated option letters. In this version  
 11918 of this volume of IEEE Std 1003.1-2001, *dd* retains its curious JCL-like syntax due to the large  
 11919 number of applications that depend on the historical implementation.

11920 A suggested implementation technique for **conv=noerror, sync** is to zero (or <space>-fill, if  
 11921 **blocking** or **unblocking**) the input buffer before each read and to write the contents of the input  
 11922 buffer to the output even after an error. In this manner, any data transferred to the input buffer  
 11923 before the error was detected is preserved. Another point is that a failed read on a regular file or  
 11924 a disk generally does not increment the file offset, and *dd* must then seek past the block on which  
 11925 the error occurred; otherwise, the input error occurs repetitively. When the input is a magnetic  
 11926 tape, however, the tape normally has passed the block containing the error when the error is  
 11927 reported, and thus no seek is necessary.

11928 The default **ibs=** and **obs=** sizes are specified as 512 bytes because there are historical (largely  
 11929 portable) scripts that assume these values. If they were left unspecified, unusual results could

- 11930 occur if an implementation chose an odd block size.
- 11931 Historical implementations of *dd* used *creat()* when processing **of=file**. This makes the **seek=**  
 11932 operand unusable except on special files. The **conv=notrunc** feature was added because more  
 11933 recent BSD-based implementations use *open()* (without *O\_TRUNC*) instead of *creat()*, but they  
 11934 fail to delete output file contents after the data copied.
- 11935 The *w* multiplier (historically meaning *word*), is used in System V to mean 2 and in 4.2 BSD to  
 11936 mean 4. Since *word* is inherently non-portable, its use is not supported by this volume of  
 11937 IEEE Std 1003.1-2001.
- 11938 Standard EBCDIC does not have the characters ' [ ' and ' ] '. The values used in the table are  
 11939 taken from a common print train that does contain them. Other than those characters, the print  
 11940 train values are not filled in, but appear to provide some of the motivation for the historical  
 11941 choice of translations reflected here.
- 11942 The Standard EBCDIC table provides a 1:1 translation for all 256 bytes.
- 11943 The IBM EBCDIC table does not provide such a translation. The marked cells in the tables differ  
 11944 in such a way that:
- 11945 1. EBCDIC 0112 ( ' ¢ ' ) and 0152 (broken pipe) do not appear in the table.
  - 11946 2. EBCDIC 0137 ( ' ¬ ' ) translates to/from ASCII 0236 ( ' ^ ' ). In the standard table, EBCDIC  
 11947 0232 (no graphic) is used.
  - 11948 3. EBCDIC 0241 ( ' ~ ' ) translates to/from ASCII 0176 ( ' ~ ' ). In the standard table, EBCDIC  
 11949 0137 ( ' ¬ ' ) is used.
  - 11950 4. 0255 ( ' [ ' ) and 0275 ( ' ] ' ) appear twice, once in the same place as for the standard table  
 11951 and once in place of 0112 ( ' ¢ ' ) and 0241 ( ' ~ ' ).
- 11952 In net result:
- 11953 EBCDIC 0275 ( ' ] ' ) displaced EBCDIC 0241 ( ' ~ ' ) in cell 0345.
- 11954 That displaced EBCDIC 0137 ( ' ¬ ' ) in cell 0176.
- 11955 That displaced EBCDIC 0232 (no graphic) in cell 0136.
- 11956 That replaced EBCDIC 0152 (broken pipe) in cell 0313.
- 11957 EBCDIC 0255 ( ' [ ' ) replaced EBCDIC 0112 ( ' ¢ ' ).
- 11958 This translation, however, reflects historical practice that (ASCII) ' ~ ' and ' ¬ ' were often  
 11959 mapped to each other, as were ' [ ' and ' ¢ ' ; and ' ] ' and (EBCDIC) ' ~ ' .
- 11960 The **cbs** operand is required if any of the **ascii**, **ebcdic**, or **ibm** operands are specified. For the  
 11961 **ascii** operand, the input is handled as described for the **unblock** operand except that characters  
 11962 are converted to ASCII before the trailing <space>s are deleted. For the **ebcdic** and **ibm**  
 11963 operands, the input is handled as described for the **block** operand except that the characters are  
 11964 converted to EBCDIC or IBM EBCDIC after the trailing <space>s are added.
- 11965 The **block** and **unblock** keywords are from historical BSD practice.
- 11966 The consistent use of the word **record** in standard error messages matches most historical  
 11967 practice. An earlier version of System V used **block**, but this has been updated in more recent  
 11968 releases.
- 11969 Early proposals only allowed two numbers separated by **x** to be used in a product when  
 11970 specifying **bs=**, **cbs=**, **ibs=**, and **obs=** sizes. This was changed to reflect the historical practice of  
 11971 allowing multiple numbers in the product as provided by Version 7 and all releases of System V

- 11972 and BSD.
- 11973 A change to the **swab** conversion is required to match historical practice and is the result of IEEE  
11974 PASC Interpretations 1003.2 #03 and #04, submitted for the ISO POSIX-2: 1993 standard.
- 11975 A change to the handling of SIGINT is required to match historical practice and is the result of  
11976 IEEE PASC Interpretation 1003.2 #06 submitted for the ISO POSIX-2: 1993 standard.
- 11977 **FUTURE DIRECTIONS**
- 11978 None.
- 11979 **SEE ALSO**
- 11980 Section 1.11 (on page 20), *sed*, *tr*
- 11981 **CHANGE HISTORY**
- 11982 First released in Issue 2.
- 11983 **Issue 5**
- 11984 The second paragraph of the **cbs=** description is reworded and marked EX.
- 11985 The FUTURE DIRECTIONS section is added.
- 11986 **Issue 6**
- 11987 Changes are made to **swab** conversion and SIGINT handling to align with the IEEE P1003.2b  
11988 draft standard.
- 11989 The normative text is reworded to avoid use of the term “must” for application requirements.
- 11990 IEEE PASC Interpretation 1003.2 #209 is applied, clarifying the interaction between *dd of=file* and  
11991 **conv=notrunc**.

11992 **NAME**11993           delta — make a delta (change) to an SCCS file (**DEVELOPMENT**)11994 **SYNOPSIS**11995 xsi       delta [-nps] [-g *list*] [-m *mrlist*] [-r *SID*] [-y[*comment*]] *file...*

11996

11997 **DESCRIPTION**

11998       The *delta* utility shall be used to permanently introduce into the named SCCS files changes that  
 11999       were made to the files retrieved by *get* (called the *g-files*, or generated files).

12000 **OPTIONS**

12001       The *delta* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 12002       12.2, Utility Syntax Guidelines, except that the **-y** option has an optional option-argument. This  
 12003       optional option-argument shall not be presented as a separate argument.

12004       The following options shall be supported:

12005       **-r *SID***       Uniquely identify which delta is to be made to the SCCS file. The use of this option  
 12006       shall be necessary only if two or more outstanding *get* commands for editing (*get*  
 12007       **-e**) on the same SCCS file were done by the same person (login name). The *SID*  
 12008       value specified with the **-r** option can be either the *SID* specified on the *get*  
 12009       command line or the *SID* to be made as reported by the *get* utility; see *get* (on page  
 12010       476).

12011       **-s**            Suppress the report to standard output of the activity associated with each *file*.  
 12012       See the **STDOUT** section.

12013       **-n**            Specify retention of the edited *g-file* (normally removed at completion of delta  
 12014       processing).

12015       **-g *list***       Specify a *list* (see *get* for the definition of *list*) of deltas that shall be ignored when  
 12016       the file is accessed at the change level (*SID*) created by this delta.

12017       **-m *mrlist***   Specify a modification request (MR) number that the application shall supply as  
 12018       the reason for creating the new delta. This shall be used if the SCCS file has the **v**  
 12019       flag set; see *admin*.

12020       If **-m** is not used and **'-'** is not specified as a file argument, and the standard  
 12021       input is a terminal, the prompt described in the **STDOUT** section shall be written  
 12022       to standard output before the standard input is read; if the standard input is not a  
 12023       terminal, no prompt shall be issued.

12024       MRs in a list shall be separated by <blank>s or escaped <newline>s. An  
 12025       unescape <newline> shall terminate the MR list. The escape character is  
 12026       <backslash>.

12027       If the **v** flag has a value, it shall be taken to be the name of a program which  
 12028       validates the correctness of the MR numbers. If a non-zero exit status is returned  
 12029       from the MR number validation program, the *delta* utility shall terminate. (It is  
 12030       assumed that the MR numbers were not all valid.)

12031       **-y[*comment*]** Describe the reason for making the delta. The *comment* shall be an arbitrary group  
 12032       of lines that would meet the definition of a text file. Implementations shall support  
 12033       *comments* from zero to 512 bytes and may support longer values. A null string  
 12034       (specified as either **-y**, **-y" "**, or in response to a prompt for a comment) shall be  
 12035       considered a valid *comment*.

12036 If **-y** is not specified and **'-'** is not specified as a file argument, and the standard  
 12037 input is a terminal, the prompt described in the STDOUT section shall be written  
 12038 to standard output before the standard input is read; if the standard input is not a  
 12039 terminal, no prompt shall be issued. An unescaped **<newline>** shall terminate the  
 12040 comment text. The escape character is **<backslash>**.

12041 The **-y** option shall be required if the *file* operand is specified as **'-'**.

12042 **-p** Write (to standard output) the SCCS file differences before and after the delta is  
 12043 applied in *diff* format; see *diff*.

#### 12044 OPERANDS

12045 The following operand shall be supported:

12046 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *delta*  
 12047 utility shall behave as though each file in the directory were specified as a named  
 12048 file, except that non-SCCS files (last component of the pathname does not begin  
 12049 with **s.**) and unreadable files shall be silently ignored.

12050 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 12051 each line of the standard input shall be taken to be the name of an SCCS file to be  
 12052 processed. Non-SCCS files and unreadable files shall be silently ignored.

#### 12053 STDIN

12054 The standard input shall be a text file used only in the following cases:

- 12055 • To read an *mrlist* or a *comment* (see the **-m** and **-y** options).
- 12056 • A *file* operand shall be specified as **'-'**. In this case, the **-y** option must be used to specify  
 12057 the comment, and if the SCCS file has the **v** flag set, the **-m** option must also be used to  
 12058 specify the MR list.

#### 12059 INPUT FILES

12060 Input files shall be text files whose data is to be included in the SCCS files. If the first character of  
 12061 any line of an input file is **<SOH>** in the POSIX locale, the results are unspecified. If this file  
 12062 contains more than 99 999 lines, the number of lines recorded in the header for this file shall be  
 12063 99 999 for this delta.

#### 12064 ENVIRONMENT VARIABLES

12065 The following environment variables shall affect the execution of *delta*:

12066 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 12067 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12068 Internationalization Variables for the precedence of internationalization variables  
 12069 used to determine the values of locale categories.)

12070 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 12071 internationalization variables.

12072 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 12073 characters (for example, single-byte as opposed to multi-byte characters in  
 12074 arguments and input files).

12075 **LC\_MESSAGES**

12076 Determine the locale that should be used to affect the format and contents of  
 12077 diagnostic messages written to standard error, and informative messages written  
 12078 to standard output.

12079 **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

12080 **TZ** Determine the timezone in which the time and date are written in the SCCS file. If  
 12081 the *TZ* variable is unset or NULL, an unspecified system default timezone is used.

## 12082 **ASYNCHRONOUS EVENTS**

12083 If SIGINT is caught, temporary files shall be cleaned up and *delta* shall exit with a non-zero exit  
 12084 code. The standard action shall be taken for all other signals; see Section 1.11 (on page 20).

## 12085 **STDOUT**

12086 The standard output shall be used only for the following messages in the POSIX locale:

- 12087 • Prompts (see the *-m* and *-y* options) in the following formats:

12088 "MRs? "

12089 "comments? "

12090 The MR prompt, if written, shall always precede the comments prompt.

- 12091 • A report of each file's activities (unless the *-s* option is specified) in the following format:

12092 "%s\n%d inserted\n%d deleted\n%d unchanged\n", *<New SID>*,  
 12093 *<number of lines inserted>*, *<number of lines deleted>*,  
 12094 *<number of lines unchanged>*

## 12095 **STDERR**

12096 The standard error shall be used only for diagnostic messages.

## 12097 **OUTPUT FILES**

12098 Any SCCS files updated shall be files of an unspecified format.

## 12099 **EXTENDED DESCRIPTION**

### 12100 **System Date and Time**

12101 When a *delta* is added to an SCCS file, the system date and time shall be recorded for the new  
 12102 delta. If a *get* is performed using an SCCS file with a date recorded apparently in the future, the  
 12103 behavior is unspecified.

## 12104 **EXIT STATUS**

12105 The following exit values shall be returned:

12106 0 Successful completion.

12107 >0 An error occurred.

## 12108 **CONSEQUENCES OF ERRORS**

12109 Default.

## 12110 **APPLICATION USAGE**

12111 Problems can arise if the system date and time have been modified (for example, put forward  
 12112 and then back again, or unsynchronized clocks across a network) and can also arise when  
 12113 different values of the *TZ* environment variable are used.

12114 Problems of a similar nature can also arise for the operation of the *get* utility, which records the  
 12115 date and time in the file body.

## 12116 **EXAMPLES**

12117 None.

12118 **RATIONALE**

12119 None.

12120 **FUTURE DIRECTIONS**

12121 None.

12122 **SEE ALSO**12123 Section 1.11 (on page 20), *admin*, *diff*, *get*, *prs*, *rm del*12124 **CHANGE HISTORY**

12125 First released in Issue 2.

12126 **Issue 5**

12127 The output format description in the STDOUT section is corrected.

12128 **Issue 6**

12129 The APPLICATION USAGE section is added.

12130 The normative text is reworded to avoid use of the term “must” for application requirements.

12131 The Open Group Base Resolution bwg2001-007 is applied as follows:

- 12132 • The use of ‘-’ as a file argument is clarified.
- 12133 • The use of STDIN is added.
- 12134 • The ASYNCHRONOUS EVENTS section is updated to remove the implicit requirement that
- 12135 implementations re-signal themselves when catching a normally fatal signal.
- 12136 • New text is added to the INPUT FILES section warning that the maximum lines recorded in
- 12137 the file is 99 999.

12138 New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
12139 regarding how the system date and time may be taken into account, and the TZ environment  
12140 variable is added to the ENVIRONMENT VARIABLES section as per The Open Group Base  
12141 Resolution bwg2001-007.

12142 **NAME**

12143           df — report free disk space

12144 **SYNOPSIS**12145 UP XSI   df [-k] [-P|-t] [*file...*]

12146

12147 **DESCRIPTION**

12148 XSI       The *df* utility shall write the amount of available space and file slots for file systems on which the  
 12149           invoking user has appropriate read access. File systems shall be specified by the *file* operands;  
 12150           when none are specified, information shall be written for all file systems. The format of the  
 12151           default output from *df* is unspecified, but all space figures are reported in 512-byte units, unless  
 12152           the **-k** option is specified. This output shall contain at least the file system names, amount of  
 12153 XSI       available space on each of these file systems, and the number of free file slots, or *inodes*,  
 12154           available; when **-t** is specified, the output shall contain the total allocated space as well.

12155 **OPTIONS**

12156           The *df* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 12157           Utility Syntax Guidelines.

12158           The following options shall be supported:

12159           **-k**           Use 1024-byte units, instead of the default 512-byte units, when writing space  
 12160                           figures.

12161           **-P**           Produce output in the format described in the STDOUT section.

12162 XSI       **-t**           Include total allocated-space figures in the output.

12163 **OPERANDS**

12164           The following operand shall be supported:

12165           *file*           A pathname of a file within the hierarchy of the desired file system. If a file other  
 12166 XSI       than a FIFO, a regular file, a directory, or a special file representing the device  
 12167           containing the file system (for example, **/dev/dsk/0s1**) is specified, the results are  
 12168           unspecified. Otherwise, *df* shall write the amount of free space in the file system  
 12169           containing the specified *file* operand.

12170 **STDIN**

12171           Not used.

12172 **INPUT FILES**

12173           None.

12174 **ENVIRONMENT VARIABLES**

12175           The following environment variables shall affect the execution of *df*:

12176           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 12177                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12178                           Internationalization Variables for the precedence of internationalization variables  
 12179                           used to determine the values of locale categories.)

12180           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
 12181                           internationalization variables.

12182           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 12183                           characters (for example, single-byte as opposed to multi-byte characters in  
 12184                           arguments).

12185 **LC\_MESSAGES**  
 12186 Determine the locale that should be used to affect the format and contents of  
 12187 diagnostic messages written to standard error and informative messages written to  
 12188 standard output.

12189 xSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

12190 **ASYNCHRONOUS EVENTS**  
 12191 Default.

12192 **STDOUT**  
 12193 When both the **-k** and **-P** options are specified, the following header line shall be written (in the  
 12194 POSIX locale):  
 12195 "Filesystem 1024-blocks Used Available Capacity Mounted on\n"  
 12196 When the **-P** option is specified without the **-k** option, the following header line shall be written  
 12197 (in the POSIX locale):  
 12198 "Filesystem 512-blocks Used Available Capacity Mounted on\n"  
 12199 The implementation may adjust the spacing of the header line and the individual data lines so  
 12200 that the information is presented in orderly columns.  
 12201 The remaining output with **-P** shall consist of one line of information for each specified file  
 12202 system. These lines shall be formatted as follows:  
 12203 "%s %d %d %d %d%% %s\n", <file system name>, <total space>,  
 12204 <space used>, <space free>, <percentage used>,  
 12205 <file system root>  
 12206 In the following list, all quantities expressed in 512-byte units (1 024-byte when **-k** is specified)  
 12207 shall be rounded up to the next higher unit. The fields are:  
 12208 <file system name>  
 12209 The name of the file system, in an implementation-defined format.  
 12210 <total space> The total size of the file system in 512-byte units. The exact meaning of this figure  
 12211 is implementation-defined, but should include <space used>, <space free>, plus any  
 12212 space reserved by the system not normally available to a user.  
 12213 <space used> The total amount of space allocated to existing files in the file system, in 512-byte  
 12214 units.  
 12215 <space free> The total amount of space available within the file system for the creation of new  
 12216 files by unprivileged users, in 512-byte units. When this figure is less than or equal  
 12217 to zero, it shall not be possible to create any new files on the file system without  
 12218 first deleting others, unless the process has appropriate privileges. The figure  
 12219 written may be less than zero.  
 12220 <percentage used>  
 12221 The percentage of the normally available space that is currently allocated to all  
 12222 files on the file system. This shall be calculated using the fraction:  
 12223 <space used>/ ( <space used>+ <space free> )  
 12224 expressed as a percentage. This percentage may be greater than 100 if <space free>  
 12225 is less than zero. The percentage value shall be expressed as a positive integer,  
 12226 with any fractional result causing it to be rounded to the next highest integer.

12227 <file system root>

12228 The directory below which the file system hierarchy appears.

12229 xsi The output format is unspecified when **-t** is used.

## 12230 **STDERR**

12231 The standard error shall be used only for diagnostic messages.

## 12232 **OUTPUT FILES**

12233 None.

## 12234 **EXTENDED DESCRIPTION**

12235 None.

## 12236 **EXIT STATUS**

12237 The following exit values shall be returned:

12238 0 Successful completion.

12239 >0 An error occurred.

## 12240 **CONSEQUENCES OF ERRORS**

12241 Default.

## 12242 **APPLICATION USAGE**

12243 On most systems, the “name of the file system, in an implementation-defined format” is the  
12244 special file on which the file system is mounted.

12245 On large file systems, the calculation specified for percentage used can create huge rounding  
12246 errors.

## 12247 **EXAMPLES**

12248 1. The following example writes portable information about the **/usr** file system:

12249 `df -P /usr`

12250 2. Assuming that **/usr/src** is part of the **/usr** file system, the following produces the same  
12251 output as the previous example:

12252 `df -P /usr/src`

## 12253 **RATIONALE**

12254 The behavior of *df* with the **-P** option is the default action of the 4.2 BSD *df* utility. The uppercase  
12255 **-P** was selected to avoid collision with a known industry extension using **-p**.

12256 Historical *df* implementations vary considerably in their default output. It was therefore  
12257 necessary to describe the default output in a loose manner to accommodate all known historical  
12258 implementations and to add a portable option (**-P**) to provide information in a portable format.

12259 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
12260 utilities in this volume of IEEE Std 1003.1-2001. This does not mandate that the file system itself  
12261 be based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed  
12262 by the standard developers that 512 bytes was the best default unit because of its complete  
12263 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
12264 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the  
12265 more logical 1024-byte quantity can easily alias *df* to *df -k* without breaking many historical  
12266 scripts relying on the 512-byte units.

12267 It was suggested that *df* and the various related utilities be modified to access a **BLOCKSIZE**  
12268 environment variable to achieve consistency and user acceptance. Since this is not historical  
12269 practice on any system, it is left as a possible area for system extensions and will be re-evaluated

12270 in a future version if it is widely implemented.

12271 **FUTURE DIRECTIONS**

12272 None.

12273 **SEE ALSO**

12274 *find*

12275 **CHANGE HISTORY**

12276 First released in Issue 2.

12277 **Issue 6**

12278 This utility is marked as part of the User Portability Utilities option.

12279 **NAME**

12280 diff — compare two files

12281 **SYNOPSIS**12282 diff [-c | -e | -f | -C *n*] [-br] *file1 file2*12283 **DESCRIPTION**

12284 The *diff* utility shall compare the contents of *file1* and *file2* and write to standard output a list of  
 12285 changes necessary to convert *file1* into *file2*. This list should be minimal. No output shall be  
 12286 produced if the files are identical.

12287 **OPTIONS**

12288 The *diff* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 12289 12.2, Utility Syntax Guidelines.

12290 The following options shall be supported:

12291 **-b** Cause any amount of white space at the end of a line to be treated as a single  
 12292 <newline> (that is, the white-space characters preceding the <newline> are  
 12293 ignored) and other strings of white-space characters, not including <newline>s, to  
 12294 compare equal.

12295 **-c** Produce output in a form that provides three lines of context.

12296 **-C *n*** Produce output in a form that provides *n* lines of context (where *n* shall be  
 12297 interpreted as a positive decimal integer).

12298 **-e** Produce output in a form suitable as input for the *ed* utility, which can then be  
 12299 used to convert *file1* into *file2*.

12300 **-f** Produce output in an alternative form, similar in format to **-e**, but not intended to  
 12301 be suitable as input for the *ed* utility, and in the opposite order.

12302 **-r** Apply *diff* recursively to files and directories of the same name when *file1* and *file2*  
 12303 are both directories.

12304 **OPERANDS**

12305 The following operands shall be supported:

12306 *file1, file2* A pathname of a file to be compared. If either the *file1* or *file2* operand is '-', the  
 12307 standard input shall be used in its place.

12308 If both *file1* and *file2* are directories, *diff* shall not compare block special files, character special  
 12309 files, or FIFO special files to any files and shall not compare regular files to directories. Further  
 12310 details are as specified in **Diff Directory Comparison Format** (on page 320). The behavior of *diff*  
 12311 on other file types is implementation-defined when found in directories.

12312 If only one of *file1* and *file2* is a directory, *diff* shall be applied to the non-directory file and the file  
 12313 contained in the directory file with a filename that is the same as the last component of the non-  
 12314 directory file.

12315 **STDIN**

12316 The standard input shall be used only if one of the *file1* or *file2* operands references standard  
 12317 input. See the INPUT FILES section.

12318 **INPUT FILES**

12319 The input files may be of any type.

12320 **ENVIRONMENT VARIABLES**

12321 The following environment variables shall affect the execution of *diff*:

12322 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 12323 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12324 Internationalization Variables for the precedence of internationalization variables  
 12325 used to determine the values of locale categories.)

12326 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 12327 internationalization variables.

12328 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 12329 characters (for example, single-byte as opposed to multi-byte characters in  
 12330 arguments and input files).

12331 *LC\_MESSAGES*  
 12332 Determine the locale that should be used to affect the format and contents of  
 12333 diagnostic messages written to standard error and informative messages written to  
 12334 standard output.

12335 *LC\_TIME* Determine the locale for affecting the format of file timestamps written with the  
 12336 *-C* and *-c* options.

12337 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

12338 *TZ* Determine the timezone used for calculating file timestamps written with the *-C*  
 12339 and *-c* options. If *TZ* is unset or null, an unspecified default timezone shall be  
 12340 used.

12341 **ASYNCHRONOUS EVENTS**

12342 Default.

12343 **STDOUT**12344 **Diff Directory Comparison Format**

12345 If both *file1* and *file2* are directories, the following output formats shall be used.

12346 In the POSIX locale, each file that is present in only one directory shall be reported using the  
 12347 following format:

12348 "Only in %s: %s\n", <directory pathname>, <filename>

12349 In the POSIX locale, subdirectories that are common to the two directories may be reported with  
 12350 the following format:

12351 "Common subdirectories: %s and %s\n", <directory1 pathname>,  
 12352 <directory2 pathname>

12353 For each file common to the two directories if the two files are not to be compared, the following  
 12354 format shall be used in the POSIX locale:

12355 "File %s is a %s while file %s is a %s\n", <directory1 pathname>,  
 12356 <file type of directory1 pathname>, <directory2 pathname>,  
 12357 <file type of directory2 pathname>

12358 For each file common to the two directories, if the files are compared and are identical, no output  
 12359 shall be written. If the two files differ, the following format is written:

12360 "diff %s %s %s\n", <diff\_options>, <filename1>, <filename2>

12361 where *<diff\_options>* are the options as specified on the command line.

12362 All directory pathnames listed in this section shall be relative to the original command line  
 12363 arguments. All other names of files listed in this section shall be filenames (pathname  
 12364 components).

12365 **Diff Binary Output Format**

12366 In the POSIX locale, if one or both of the files being compared are not text files, an unspecified  
 12367 format shall be used that contains the pathnames of two files being compared and the string  
 12368 "differ".

12369 If both files being compared are text files, depending on the options specified, one of the  
 12370 following formats shall be used to write the differences.

12371 **Diff Default Output Format**

12372 The default (without **-e**, **-f**, **-c**, or **-C** options) *diff* utility output shall contain lines of these  
 12373 forms:

12374 "%da%d\n", <num1>, <num2>

12375 "%da%d,%d\n", <num1>, <num2>, <num3>

12376 "%dd%d\n", <num1>, <num2>

12377 "%d,%dd%d\n", <num1>, <num2>, <num3>

12378 "%dc%d\n", <num1>, <num2>

12379 "%d,%dc%d\n", <num1>, <num2>, <num3>

12380 "%dc%d,%d\n", <num1>, <num2>, <num3>

12381 "%d,%dc%d,%d\n", <num1>, <num2>, <num3>, <num4>

12382 These lines resemble *ed* subcommands to convert *file1* into *file2*. The line numbers before the  
 12383 action letters shall pertain to *file1*; those after shall pertain to *file2*. Thus, by exchanging *a* for *d*  
 12384 and reading the line in reverse order, one can also determine how to convert *file2* into *file1*. As in  
 12385 *ed*, identical pairs (where *num1*= *num2*) are abbreviated as a single number.

12386 Following each of these lines, *diff* shall write to standard output all lines affected in the first file  
 12387 using the format:

12388 "<Δ%s", <line>

12389 and all lines affected in the second file using the format:

12390 ">Δ%s", <line>

12391 If there are lines affected in both *file1* and *file2* (as with the **c** subcommand), the changes are  
 12392 separated with a line consisting of three hyphens:

12393 "---\n"

**Diff -e Output Format**

With the **-e** option, a script shall be produced that shall, when provided as input to *ed*, along with an appended **w** (write) command, convert *file1* into *file2*. Only the **a** (append), **c** (change), **d** (delete), **i** (insert), and **s** (substitute) commands of *ed* shall be used in this script. Text lines, except those consisting of the single character period ( *'.'* ), shall be output as they appear in the file.

**Diff -f Output Format**

With the **-f** option, an alternative format of script shall be produced. It is similar to that produced by **-e**, with the following differences:

1. It is expressed in reverse sequence; the output of **-e** orders changes from the end of the file to the beginning; the **-f** from beginning to end.
2. The command form *<lines> <command-letter>* used by **-e** is reversed. For example, *10c* with **-e** would be *c10* with **-f**.
3. The form used for ranges of line numbers is *<space>-separated*, rather than comma-separated.

**Diff -c or -C Output Format**

With the **-c** or **-C** option, the output format shall consist of affected lines along with surrounding lines of context. The affected lines shall show which ones need to be deleted or changed in *file1*, and those added from *file2*. With the **-c** option, three lines of context, if available, shall be written before and after the affected lines. With the **-C** option, the user can specify how many lines of context are written. The exact format follows.

The name and last modification time of each file shall be output in the following format:

```
**** %s %s\n", file1, <file1 timestamp>
---- %s %s\n", file2, <file2 timestamp>
```

Each *<file>* field shall be the pathname of the corresponding file being compared. The pathname written for standard input is unspecified.

In the POSIX locale, each *<timestamp>* field shall be equivalent to the output from the following command:

```
date "+%a %b %e %T %Y"
```

without the trailing *<newline>*, executed at the time of last modification of the corresponding file (or the current time, if the file is standard input).

Then, the following output formats shall be applied for every set of changes.

First, a line shall be written in the following format:

```
*****\n"
```

Next, the range of lines in *file1* shall be written in the following format if the range contains two or more lines:

```
**** %d,%d ****\n", <beginning line number>, <ending line number>
```

and the following format otherwise:

```
**** %d ****\n", <ending line number>
```

12433 The ending line number of an empty range shall be the number of the preceding line, or 0 if the  
 12434 range is at the start of the file.

12435 Next, the affected lines along with lines of context (unaffected lines) shall be written. Unaffected  
 12436 lines shall be written in the following format:

12437 " $\Delta\Delta\%$ s", <unaffected\_line>

12438 Deleted lines shall be written as:

12439 " $-\Delta\%$ s", <deleted\_line>

12440 Changed lines shall be written as:

12441 " $!\Delta\%$ s", <changed\_line>

12442 Next, the range of lines in *file2* shall be written in the following format if the range contains two  
 12443 or more lines:

12444 "--- %d,%d ----\n", <beginning line number>, <ending line number>

12445 and the following format otherwise:

12446 "--- %d ----\n", <ending line number>

12447 Then, lines of context and changed lines shall be written as described in the previous formats.  
 12448 Lines added from *file2* shall be written in the following format:

12449 "+ $\Delta\%$ s", <added\_line>

#### 12450 **STDERR**

12451 The standard error shall be used only for diagnostic messages.

#### 12452 **OUTPUT FILES**

12453 None.

#### 12454 **EXTENDED DESCRIPTION**

12455 None.

#### 12456 **EXIT STATUS**

12457 The following exit values shall be returned:

12458 0 No differences were found.

12459 1 Differences were found.

12460 >1 An error occurred.

#### 12461 **CONSEQUENCES OF ERRORS**

12462 Default.

#### 12463 **APPLICATION USAGE**

12464 If lines at the end of a file are changed and other lines are added, *diff* output may show this as a  
 12465 delete and add, as a change, or as a change and add; *diff* is not expected to know which  
 12466 happened and users should not care about the difference in output as long as it clearly shows the  
 12467 differences between the files.

#### 12468 **EXAMPLES**

12469 If **dir1** is a directory containing a directory named **x**, **dir2** is a directory containing a directory  
 12470 named **x**, **dir1/x** and **dir2/x** both contain files named **date.out**, and **dir2/x** contains a file named **y**,  
 12471 the command:

12472 `diff -r dir1 dir2`

```

12473 could produce output similar to:
12474 Common subdirectories: dir1/x and dir2/x
12475 Only in dir2/x: y
12476 diff -r dir1/x/date.out dir2/x/date.out
12477 1c1
12478 < Mon Jul 2 13:12:16 PDT 1990
12479 ---
12480 > Tue Jun 19 21:41:39 PDT 1990

```

#### 12481 RATIONALE

12482 The **-h** option was omitted because it was insufficiently specified and does not add to  
 12483 applications portability.

12484 Historical implementations employ algorithms that do not always produce a minimum list of  
 12485 differences; the current language about making every effort is the best this volume of  
 12486 IEEE Std 1003.1-2001 can do, as there is no metric that could be employed to judge the quality of  
 12487 implementations against any and all file contents. The statement “This list should be minimal”  
 12488 clearly implies that implementations are not expected to provide the following output when  
 12489 comparing two 100-line files that differ in only one character on a single line:

```

12490 1,100c1,100
12491 all 100 lines from file1 preceded with "< "
12492 ---
12493 all 100 lines from file2 preceded with "> "

```

12494 The “Only in” messages required when the **-r** option is specified are not used by most historical  
 12495 implementations if the **-e** option is also specified. It is required here because it provides useful  
 12496 information that must be provided to update a target directory hierarchy to match a source  
 12497 hierarchy. The “Common subdirectories” messages are written by System V and 4.3 BSD when  
 12498 the **-r** option is specified. They are allowed here but are not required because they are reporting  
 12499 on something that is the same, not reporting a difference, and are not needed to update a target  
 12500 hierarchy.

12501 The **-c** option, which writes output in a format using lines of context, has been included. The  
 12502 format is useful for a variety of reasons, among them being much improved readability and the  
 12503 ability to understand difference changes when the target file has line numbers that differ from  
 12504 another similar, but slightly different, copy. The *patch* utility is most valuable when working  
 12505 with difference listings using the context format. The BSD version of **-c** takes an optional  
 12506 argument specifying the amount of context. Rather than overloading **-c** and breaking the Utility  
 12507 Syntax Guidelines for *diff*, the standard developers decided to add a separate option for  
 12508 specifying a context diff with a specified amount of context (**-C**). Also, the format for context  
 12509 *diffs* was extended slightly in 4.3 BSD to allow multiple changes that are within context lines  
 12510 from each other to be merged together. The output format contains an additional four asterisks  
 12511 after the range of affected lines in the first filename. This was to provide a flag for old programs  
 12512 (like old versions of *patch*) that only understand the old context format. The version of context  
 12513 described here does not require that multiple changes within context lines be merged, but it does  
 12514 not prohibit it either. The extension is upwards-compatible, so any vendors that wish to retain  
 12515 the old version of *diff* can do so by adding the extra four asterisks (that is, utilities that currently  
 12516 use *diff* and understand the new merged format will also understand the old unmerged format,  
 12517 but not *vice versa*).

12518 The substitute command was added as an additional format for the **-e** option. This was added to  
 12519 provide implementations with a way to fix the classic “dot alone on a line” bug present in many  
 12520 versions of *diff*. Since many implementations have fixed this bug, the standard developers  
 12521 decided not to standardize broken behavior, but rather to provide the necessary tool for fixing

12522 the bug. One way to fix this bug is to output two periods whenever a lone period is needed, then  
 12523 terminate the append command with a period, and then use the substitute command to convert  
 12524 the two periods into one period.

12525 The BSD-derived *-r* option was added to provide a mechanism for using *diff* to compare two file  
 12526 system trees. This behavior is useful, is standard practice on all BSD-derived systems, and is not  
 12527 easily reproducible with the *find* utility.

12528 The requirement that *diff* not compare files in some circumstances, even though they have the  
 12529 same name, is based on the actual output of historical implementations. The message specified  
 12530 here is already in use when a directory is being compared to a non-directory. It is extended here  
 12531 to preclude the problems arising from running into FIFOs and other files that would cause *diff* to  
 12532 hang waiting for input with no indication to the user that *diff* was hung. In most common usage,  
 12533 *diff -r* should indicate differences in the file hierarchies, not the difference of contents of devices  
 12534 pointed to by the hierarchies.

12535 Many early implementations of *diff* require seekable files. Since the System Interfaces volume of  
 12536 IEEE Std 1003.1-2001 supports named pipes, the standard developers decided that such a  
 12537 restriction was unreasonable. Note also that the allowed filename – almost always refers to a  
 12538 pipe.

12539 No directory search order is specified for *diff*. The historical ordering is, in fact, not optimal, in  
 12540 that it prints out all of the differences at the current level, including the statements about all  
 12541 common subdirectories before recursing into those subdirectories.

12542 The message:

12543 "diff %s %s %s\n", <diff\_options>, <filename1>, <filename2>

12544 does not vary by locale because it is the representation of a command, not an English sentence.

#### 12545 **FUTURE DIRECTIONS**

12546 None.

#### 12547 **SEE ALSO**

12548 *cmp, comm, ed, find*

#### 12549 **CHANGE HISTORY**

12550 First released in Issue 2.

#### 12551 **Issue 5**

12552 The FUTURE DIRECTIONS section is added.

#### 12553 **Issue 6**

12554 The following new requirements on POSIX implementations derive from alignment with the  
 12555 Single UNIX Specification:

- 12556 • The *-f* option is added.

12557 The output format for *-c* or *-C* format is changed to align with changes to the IEEE P1003.2b  
 12558 draft standard resulting from IEEE PASC Interpretation 1003.2 #71.

12559 The normative text is reworded to avoid use of the term “must” for application requirements.

12560 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/20 is applied, changing the STDOUT  
 12561 section. This changes the specification of *diff -c* so that it agrees with existing practice when  
 12562 contexts contain zero lines or one line.

12563 **NAME**

12564           dirname — return the directory portion of a pathname

12565 **SYNOPSIS**12566           dirname *string*12567 **DESCRIPTION**

12568           The *string* operand shall be treated as a pathname, as defined in the Base Definitions volume of  
 12569           IEEE Std 1003.1-2001, Section 3.266, Pathname. The string *string* shall be converted to the name  
 12570           of the directory containing the filename corresponding to the last pathname component in  
 12571           *string*, performing actions equivalent to the following steps in order:

- 12572           1. If *string* is //, skip steps 2 to 5.
- 12573           2. If *string* consists entirely of slash characters, *string* shall be set to a single slash character. In  
 12574           this case, skip steps 3 to 8.
- 12575           3. If there are any trailing slash characters in *string*, they shall be removed.
- 12576           4. If there are no slash characters remaining in *string*, *string* shall be set to a single period  
 12577           character. In this case, skip steps 5 to 8.
- 12578           5. If there are any trailing non-slash characters in *string*, they shall be removed.
- 12579           6. If the remaining *string* is //, it is implementation-defined whether steps 7 and 8 are skipped  
 12580           or processed.
- 12581           7. If there are any trailing slash characters in *string*, they shall be removed.
- 12582           8. If the remaining *string* is empty, *string* shall be set to a single slash character.

12583           The resulting string shall be written to standard output.

12584 **OPTIONS**

12585           None.

12586 **OPERANDS**

12587           The following operand shall be supported:

12588           *string*           A string.12589 **STDIN**

12590           Not used.

12591 **INPUT FILES**

12592           None.

12593 **ENVIRONMENT VARIABLES**12594           The following environment variables shall affect the execution of *dirname*:

12595           *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 12596           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12597           Internationalization Variables for the precedence of internationalization variables  
 12598           used to determine the values of locale categories.)

12599           *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 12600           internationalization variables.

12601           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 12602           characters (for example, single-byte as opposed to multi-byte characters in  
 12603           arguments).

12604 **LC\_MESSAGES**

12605 Determine the locale that should be used to affect the format and contents of  
 12606 diagnostic messages written to standard error.

12607 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

12608 **ASYNCHRONOUS EVENTS**

12609 Default.

12610 **STDOUT**

12611 The *dirname* utility shall write a line to the standard output in the following format:

12612 "%s\n", <resulting string>

12613 **STDERR**

12614 The standard error shall be used only for diagnostic messages.

12615 **OUTPUT FILES**

12616 None.

12617 **EXTENDED DESCRIPTION**

12618 None.

12619 **EXIT STATUS**

12620 The following exit values shall be returned:

12621 0 Successful completion.

12622 >0 An error occurred.

12623 **CONSEQUENCES OF ERRORS**

12624 Default.

12625 **APPLICATION USAGE**

12626 The definition of *pathname* specifies implementation-defined behavior for pathnames starting  
 12627 with two slash characters. Therefore, applications shall not arbitrarily add slashes to the  
 12628 beginning of a pathname unless they can ensure that there are more or less than two or are  
 12629 prepared to deal with the implementation-defined consequences.

12630 **EXAMPLES**

| Command                 | Results     |
|-------------------------|-------------|
| <i>dirname</i> /        | /           |
| <i>dirname</i> //       | / or //     |
| <i>dirname</i> /a/b/    | /a          |
| <i>dirname</i> //a//b// | //a         |
| <i>dirname</i>          | Unspecified |
| <i>dirname</i> a        | .( \$? = 0) |
| <i>dirname</i> ""       | .( \$? = 0) |
| <i>dirname</i> /a       | /           |
| <i>dirname</i> /a/b     | /a          |
| <i>dirname</i> a/b      | a           |

12642 **RATIONALE**

12643 The *dirname* utility originated in System III. It has evolved through the System V releases to a  
 12644 version that matches the requirements specified in this description in System V Release 3. 4.3  
 12645 BSD and earlier versions did not include *dirname*.

12646 The behaviors of *basename* and *dirname* in this volume of IEEE Std 1003.1-2001 have been  
 12647 coordinated so that when *string* is a valid pathname:

12648           \$(basename "*string*")

12649           would be a valid filename for the file in the directory:

12650           \$(dirname "*string*")

12651           This would not work for the versions of these utilities in early proposals due to the way  
12652           processing of trailing slashes was specified. Consideration was given to leaving processing  
12653           unspecified if there were trailing slashes, but this cannot be done; the Base Definitions volume of  
12654           IEEE Std 1003.1-2001, Section 3.266, Pathname allows trailing slashes. The *basename* and *dirname*  
12655           utilities have to specify consistent handling for all valid pathnames.

12656 **FUTURE DIRECTIONS**

12657           None.

12658 **SEE ALSO**

12659           *basename*, Section 2.5 (on page 33)

12660 **CHANGE HISTORY**

12661           First released in Issue 2.

12662 **NAME**

12663           du — estimate file space usage

12664 **SYNOPSIS**12665 UP       du [-a | -s] [-kx] [-H | -L] [*file* ...]

12666

12667 **DESCRIPTION**

12668       By default, the *du* utility shall write to standard output the size of the file space allocated to, and  
 12669       the size of the file space allocated to each subdirectory of, the file hierarchy rooted in each of the  
 12670       specified files. By default, when a symbolic link is encountered on the command line or in the  
 12671       file hierarchy, *du* shall count the size of the symbolic link (rather than the file referenced by the  
 12672       link), and shall not follow the link to another portion of the file hierarchy. The size of the file  
 12673       space allocated to a file of type directory shall be defined as the sum total of space allocated to  
 12674       all files in the file hierarchy rooted in the directory plus the space allocated to the directory itself.

12675       When *du* cannot *stat()* files or *stat()* or read directories, it shall report an error condition and the  
 12676       final exit status is affected. Files with multiple links shall be counted and written for only one  
 12677       entry. The directory entry that is selected in the report is unspecified. By default, file sizes shall  
 12678       be written in 512-byte units, rounded up to the next 512-byte unit.

12679 **OPTIONS**

12680       The *du* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 12681       Utility Syntax Guidelines.

12682       The following options shall be supported:

12683       **-a**           In addition to the default output, report the size of each file not of type directory in  
 12684       the file hierarchy rooted in the specified file. Regardless of the presence of the **-a**  
 12685       option, non-directories given as *file* operands shall always be listed.

12686       **-H**           If a symbolic link is specified on the command line, *du* shall count the size of the  
 12687       file or file hierarchy referenced by the link.

12688       **-k**           Write the files sizes in units of 1 024 bytes, rather than the default 512-byte units.

12689       **-L**           If a symbolic link is specified on the command line or encountered during the  
 12690       traversal of a file hierarchy, *du* shall count the size of the file or file hierarchy  
 12691       referenced by the link.

12692       **-s**           Instead of the default output, report only the total sum for each of the specified  
 12693       files.

12694       **-x**           When evaluating file sizes, evaluate only those files that have the same device as  
 12695       the file specified by the *file* operand.

12696       Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 12697       an error. The last option specified shall determine the behavior of the utility.

12698 **OPERANDS**

12699       The following operand shall be supported:

12700       *file*        The pathname of a file whose size is to be written. If no *file* is specified, the current  
 12701       directory shall be used.

12702 **STDIN**

12703       Not used.

12704 **INPUT FILES**

12705       None.

12706 **ENVIRONMENT VARIABLES**12707       The following environment variables shall affect the execution of *du*:

12708       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
 12709                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12710                   Internationalization Variables for the precedence of internationalization variables  
 12711                   used to determine the values of locale categories.)

12712       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 12713                   internationalization variables.

12714       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 12715                   characters (for example, single-byte as opposed to multi-byte characters in  
 12716                   arguments).

12717       *LC\_MESSAGES*  
 12718                   Determine the locale that should be used to affect the format and contents of  
 12719                   diagnostic messages written to standard error.

12720 xsi       *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

12721 **ASYNCHRONOUS EVENTS**

12722       Default.

12723 **STDOUT**

12724       The output from *du* shall consist of the amount of space allocated to a file and the name of the  
 12725       file, in the following format:

12726       "%d %s\n", <size>, <pathname>

12727 **STDERR**

12728       The standard error shall be used only for diagnostic messages.

12729 **OUTPUT FILES**

12730       None.

12731 **EXTENDED DESCRIPTION**

12732       None.

12733 **EXIT STATUS**

12734       The following exit values shall be returned:

12735       0   Successful completion.

12736       >0   An error occurred.

12737 **CONSEQUENCES OF ERRORS**

12738       Default.

12739 **APPLICATION USAGE**

12740 None.

12741 **EXAMPLES**

12742 None.

12743 **RATIONALE**

12744 The use of 512-byte units is historical practice and maintains compatibility with *ls* and other  
12745 utilities in this volume of IEEE Std 1003.1-2001. This does not mandate that the file system itself  
12746 be based on 512-byte blocks. The **-k** option was added as a compromise measure. It was agreed  
12747 by the standard developers that 512 bytes was the best default unit because of its complete  
12748 historical consistency on System V (*versus* the mixed 512/1024-byte usage on BSD systems), and  
12749 that a **-k** option to switch to 1024-byte units was a good compromise. Users who prefer the  
12750 1024-byte quantity can easily alias *du* to *du -k* without breaking the many historical scripts  
12751 relying on the 512-byte units.

12752 The **-b** option was added to an early proposal to provide a resolution to the situation where  
12753 System V and BSD systems give figures for file sizes in *blocks*, which is an implementation-  
12754 defined concept. (In common usage, the block size is 512 bytes for System V and 1024 bytes for  
12755 BSD systems.) However, **-b** was later deleted, since the default was eventually decided as 512-  
12756 byte units.

12757 Historical file systems provided no way to obtain exact figures for the space allocation given to  
12758 files. There are two known areas of inaccuracies in historical file systems: cases of *indirect blocks*  
12759 being used by the file system or *sparse* files yielding incorrectly high values. An indirect block is  
12760 space used by the file system in the storage of the file, but that need not be counted in the space  
12761 allocated to the file. A *sparse* file is one in which an *lseek()* call has been made to a position  
12762 beyond the end of the file and data has subsequently been written at that point. A file system  
12763 need not allocate all the intervening zero-filled blocks to such a file. It is up to the  
12764 implementation to define exactly how accurate its methods are.

12765 The **-a** and **-s** options were mutually-exclusive in the original version of *du*. The POSIX Shell  
12766 and Utilities description is implied by the language in the SVID where **-s** is described as causing  
12767 “only the grand total” to be reported. Some systems may produce output for **-sa**, but a Strictly  
12768 Conforming POSIX Shell and Utilities Application cannot use that combination.

12769 The **-a** and **-s** options were adopted from the SVID except that the System V behavior of not  
12770 listing non-directories explicitly given as operands, unless the **-a** option is specified, was  
12771 considered a bug; the BSD-based behavior (report for all operands) is mandated. The default  
12772 behavior of *du* in the SVID with regard to reporting the failure to read files (it produces no  
12773 messages) was considered counter-intuitive, and thus it was specified that the POSIX Shell and  
12774 Utilities default behavior shall be to produce such messages. These messages can be turned off  
12775 with shell redirection to achieve the System V behavior.

12776 The **-x** option is historical practice on recent BSD systems. It has been adopted by this volume of  
12777 IEEE Std 1003.1-2001 because there was no other historical method of limiting the *du* search to a  
12778 single file hierarchy. This limitation of the search is necessary to make it possible to obtain file  
12779 space usage information about a file system on which other file systems are mounted, without  
12780 having to resort to a lengthy *find* and *awk* script.

12781 **FUTURE DIRECTIONS**

12782 None.

12783 **SEE ALSO**

12784 *ls*, the System Interfaces volume of IEEE Std 1003.1-2001, *stat()*

12785 **CHANGE HISTORY**

12786 First released in Issue 2.

12787 **Issue 6**

12788 This utility is marked as part of the User Portability Utilities option.

12789 The APPLICATION USAGE section is added.

12790 The obsolescent **-r** option has been removed.

12791 The Open Group Corrigendum U025/3 is applied. The *du* utility is reinstated, as it had  
12792 incorrectly been marked LEGACY in Issue 5.

12793 The **-H** and **-L** options for symbolic links are added as described in the IEEE P1003.2b draft  
12794 standard.

12795 **NAME**

12796       echo — write arguments to standard output

12797 **SYNOPSIS**12798       echo [*string* ...]12799 **DESCRIPTION**12800       The *echo* utility writes its arguments to standard output, followed by a <newline>. If there are  
12801       no arguments, only the <newline> is written.12802 **OPTIONS**12803       The *echo* utility shall not recognize the "--" argument in the manner specified by Guideline 10  
12804       of the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines;  
12805       "--" shall be recognized as a string operand.

12806       Implementations shall not support any options.

12807 **OPERANDS**

12808       The following operands shall be supported:

12809       *string*       A string to be written to standard output. If the first operand is **-n**, or if any of the  
12810       operands contain a backslash ('\\') character, the results are implementation-  
12811       defined.12812 XSI               On XSI-conformant systems, if the first operand is **-n**, it shall be treated as a string,  
12813                       not an option. The following character sequences shall be recognized on XSI-  
12814                       conformant systems within any of the arguments:

12815                       \\a       Write an &lt;alert&gt;.

12816                       \\b       Write a &lt;backspace&gt;.

12817                       \\c       Suppress the <newline> that otherwise follows the final argument in the  
12818                       output. All characters following the '\\c' in the arguments shall be  
12819                       ignored.

12820                       \\f       Write a &lt;form-feed&gt;.

12821                       \\n       Write a &lt;newline&gt;.

12822                       \\r       Write a &lt;carriage-return&gt;.

12823                       \\t       Write a &lt;tab&gt;.

12824                       \\v       Write a &lt;vertical-tab&gt;.

12825                       \\       Write a backslash character.

12826                       \\0*num*   Write an 8-bit value that is the zero, one, two, or three-digit octal number  
12827                       *num*.

12828

12829 **STDIN**

12830       Not used.

12831 **INPUT FILES**

12832       None.

12833 **ENVIRONMENT VARIABLES**12834       The following environment variables shall affect the execution of *echo*:12835       *LANG*       Provide a default value for the internationalization variables that are unset or null.  
12836       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,

12837 Internationalization Variables for the precedence of internationalization variables  
 12838 used to determine the values of locale categories.)

12839 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 12840 internationalization variables.

12841 XSI **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 12842 characters (for example, single-byte as opposed to multi-byte characters in  
 12843 arguments).

12844 **LC\_MESSAGES**  
 12845 Determine the locale that should be used to affect the format and contents of  
 12846 diagnostic messages written to standard error.

12847 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 12848 ASYNCHRONOUS EVENTS

12849 Default.

## 12850 STDOUT

12851 The *echo* utility arguments shall be separated by single <space>s and a <newline> shall follow  
 12852 XSI the last argument. Output transformations shall occur based on the escape sequences in the  
 12853 input. See the OPERANDS section.

## 12854 STDERR

12855 The standard error shall be used only for diagnostic messages.

## 12856 OUTPUT FILES

12857 None.

## 12858 EXTENDED DESCRIPTION

12859 None.

## 12860 EXIT STATUS

12861 The following exit values shall be returned:

12862 0 Successful completion.

12863 >0 An error occurred.

## 12864 CONSEQUENCES OF ERRORS

12865 Default.

## 12866 APPLICATION USAGE

12867 It is not possible to use *echo* portably across all POSIX systems unless both **-n** (as the first  
 12868 argument) and escape sequences are omitted.

12869 The *printf* utility can be used portably to emulate any of the traditional behaviors of the *echo*  
 12870 utility as follows (assuming that *IFS* has its standard value or is unset):

12871 • The historic System V *echo* and the requirements on XSI implementations in this volume of  
 12872 IEEE Std 1003.1-2001 are equivalent to:

12873 `printf "%b\n" "$@"`

12874 • The BSD *echo* is equivalent to:

12875 `if [ "X$1" = "X-n" ]`

12876 `then`

12877 `shift`

12878 `printf "%s" "$@"`

12879 `else`

```
12880 printf "%s\n" "$*"
12881 fi
```

12882 New applications are encouraged to use *printf* instead of *echo*.

#### 12883 **EXAMPLES**

12884 None.

#### 12885 **RATIONALE**

12886 The *echo* utility has not been made obsolescent because of its extremely widespread use in  
 12887 historical applications. Conforming applications that wish to do prompting without <newline>s  
 12888 or that could possibly be expecting to echo a **-n**, should use the *printf* utility derived from the  
 12889 Ninth Edition system.

12890 As specified, *echo* writes its arguments in the simplest of ways. The two different historical  
 12891 versions of *echo* vary in fatally incompatible ways.

12892 The BSD *echo* checks the first argument for the string **-n** which causes it to suppress the  
 12893 <newline> that would otherwise follow the final argument in the output.

12894 The System V *echo* does not support any options, but allows escape sequences within its  
 12895 operands, as described for XSI implementations in the OPERANDS section.

12896 The *echo* utility does not support Utility Syntax Guideline 10 because historical applications  
 12897 depend on *echo* to echo *all* of its arguments, except for the **-n** option in the BSD version.

#### 12898 **FUTURE DIRECTIONS**

12899 None.

#### 12900 **SEE ALSO**

12901 *printf*

#### 12902 **CHANGE HISTORY**

12903 First released in Issue 2.

#### 12904 **Issue 5**

12905 In the OPTIONS section, the last sentence is changed to indicate that implementations “do not”  
 12906 support any options; in the previous issue this said “need not”.

#### 12907 **Issue 6**

12908 The following new requirements on POSIX implementations derive from alignment with the  
 12909 Single UNIX Specification:

- 12910 • A set of character sequences is defined as *string* operands.
- 12911 • *LC\_CTYPE* is added to the list of environment variables affecting *echo*.
- 12912 • In the OPTIONS section, implementations shall not support any options.

12913 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/21 is applied, so that the *echo* utility can  
 12914 accommodate historical BSD behavior.

12915 **NAME**

12916       ed — edit text

12917 **SYNOPSIS**12918       ed [-p *string*] [-s] [*file*]12919 **DESCRIPTION**

12920       The *ed* utility is a line-oriented text editor that uses two modes: *command mode* and *input mode*.  
 12921       In command mode the input characters shall be interpreted as commands, and in input mode  
 12922       they shall be interpreted as text. See the EXTENDED DESCRIPTION section.

12923 **OPTIONS**

12924       The *ed* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 12925       Utility Syntax Guidelines.

12926       The following options shall be supported:

12927       -p *string*     Use *string* as the prompt string when in command mode. By default, there shall be  
 12928       no prompt string.

12929       -s             Suppress the writing of byte counts by **e**, **E**, **r**, and **w** commands and of the '!'  
 12930       prompt after a !*command*.

12931 **OPERANDS**

12932       The following operand shall be supported:

12933       *file*           If the *file* argument is given, *ed* shall simulate an **e** command on the file named by  
 12934       the pathname, *file*, before accepting commands from the standard input. If the *file*  
 12935       operand is '-', the results are unspecified.

12936 **STDIN**

12937       The standard input shall be a text file consisting of commands, as described in the EXTENDED  
 12938       DESCRIPTION section.

12939 **INPUT FILES**

12940       The input files shall be text files.

12941 **ENVIRONMENT VARIABLES**

12942       The following environment variables shall affect the execution of *ed*:

12943       HOME           Determine the pathname of the user's home directory.

12944       LANG           Provide a default value for the internationalization variables that are unset or null.  
 12945       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 12946       Internationalization Variables for the precedence of internationalization variables  
 12947       used to determine the values of locale categories.)

12948       LC\_ALL          If set to a non-empty string value, override the values of all the other  
 12949       internationalization variables.

12950       LC\_COLLATE     Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 12951       character collating elements within regular expressions.  
 12952

12953       LC\_CTYPE       Determine the locale for the interpretation of sequences of bytes of text data as  
 12954       characters (for example, single-byte as opposed to multi-byte characters in  
 12955       arguments and input files) and the behavior of character classes within regular  
 12956       expressions.

12957       LC\_MESSAGES    Determine the locale that should be used to affect the format and contents of  
 12958

12959 diagnostic messages written to standard error and informative messages written to  
12960 standard output.

12961 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 12962 ASYNCHRONOUS EVENTS

12963 The *ed* utility shall take the standard action for all signals (see the ASYNCHRONOUS EVENTS  
12964 section in Section 1.11 (on page 20)) with the following exceptions:

12965 SIGINT The *ed* utility shall interrupt its current activity, write the string "?\n" to standard  
12966 output, and return to command mode (see the EXTENDED DESCRIPTION  
12967 section).

12968 SIGHUP If the buffer is not empty and has changed since the last write, the *ed* utility shall  
12969 attempt to write a copy of the buffer in a file. First, the file named **ed.hup** in the  
12970 current directory shall be used; if that fails, the file named **ed.hup** in the directory  
12971 named by the *HOME* environment variable shall be used. In any case, the *ed* utility  
12972 shall exit without returning to command mode.

12973 SIGQUIT The *ed* utility shall ignore this event.

## 12974 STDOUT

12975 Various editing commands and the prompting feature (see **-p**) write to standard output, as  
12976 described in the EXTENDED DESCRIPTION section.

## 12977 STDERR

12978 The standard error shall be used only for diagnostic messages.

## 12979 OUTPUT FILES

12980 The output files shall be text files whose formats are dependent on the editing commands given.

## 12981 EXTENDED DESCRIPTION

12982 The *ed* utility shall operate on a copy of the file it is editing; changes made to the copy shall have  
12983 no effect on the file until a **w** (write) command is given. The copy of the text is called the *buffer*.

12984 Commands to *ed* have a simple and regular structure: zero, one, or two *addresses* followed by a  
12985 single-character *command*, possibly followed by parameters to that command. These addresses  
12986 specify one or more lines in the buffer. Every command that requires addresses has default  
12987 addresses, so that the addresses very often can be omitted. If the **-p** option is specified, the  
12988 prompt string shall be written to standard output before each command is read.

12989 In general, only one command can appear on a line. Certain commands allow text to be input.  
12990 This text is placed in the appropriate place in the buffer. While *ed* is accepting text, it is said to be  
12991 in *input mode*. In this mode, no commands shall be recognized; all input is merely collected.  
12992 Input mode is terminated by entering a line consisting of two characters: a period ( **.** )  
12993 followed by a <newline>. This line is not considered part of the input text.

## 12994 Regular Expressions in ed

12995 The *ed* utility shall support basic regular expressions, as described in the Base Definitions  
12996 volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions. Since regular  
12997 expressions in *ed* are always matched against single lines (excluding the terminating  
12998 <newline>s), never against any larger section of text, there is no way for a regular expression to  
12999 match a <newline>.

13000 A null RE shall be equivalent to the last RE encountered.

13001 Regular expressions are used in addresses to specify lines, and in some commands (for example,  
13002 the **s** substitute command) to specify portions of a line to be substituted.

## 13003 **Addresses in ed**

13004 Addressing in *ed* relates to the current line. Generally, the current line is the last line affected by a  
 13005 command. The current line number is the address of the current line. If the edit buffer is not  
 13006 empty, the initial value for the current line shall be the last line in the edit buffer; otherwise, zero.

13007 Addresses shall be constructed as follows:

- 13008 1. The period character ( ' . ' ) shall address the current line.
- 13009 2. The dollar sign character ( ' \$ ' ) shall address the last line of the edit buffer.
- 13010 3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
- 13011 4. The apostrophe-x character pair ( " ' x " ) shall address the line marked with the mark name  
 13012 character *x*, which shall be a lowercase letter from the portable character set. It shall be an  
 13013 error if the character has not been set to mark a line or if the line that was marked is not  
 13014 currently present in the edit buffer.
- 13015 5. A BRE enclosed by slash characters ( ' / ' ) shall address the first line found by searching  
 13016 forwards from the line following the current line toward the end of the edit buffer and  
 13017 stopping at the first line for which the line excluding the terminating <newline> matches  
 13018 the BRE. The BRE consisting of a null BRE delimited by a pair of slash characters shall  
 13019 address the next line for which the line excluding the terminating <newline> matches the  
 13020 last BRE encountered. In addition, the second slash can be omitted at the end of a  
 13021 command line. Within the BRE, a backslash-slash pair ( " \ / " ) shall represent a literal slash  
 13022 instead of the BRE delimiter. If necessary, the search shall wrap around to the beginning of  
 13023 the buffer and continue up to and including the current line, so that the entire buffer is  
 13024 searched.
- 13025 6. A BRE enclosed by question-mark characters ( ' ? ' ) shall address the first line found by  
 13026 searching backwards from the line preceding the current line toward the beginning of the  
 13027 edit buffer and stopping at the first line for which the line excluding the terminating  
 13028 <newline> matches the BRE. The BRE consisting of a null BRE delimited by a pair of  
 13029 question-mark characters ( " ? ? " ) shall address the previous line for which the line  
 13030 excluding the terminating <newline> matches the last BRE encountered. In addition, the  
 13031 second question-mark can be omitted at the end of a command line. Within the BRE, a  
 13032 backslash-question-mark pair ( " \ ? " ) shall represent a literal question mark instead of the  
 13033 BRE delimiter. If necessary, the search shall wrap around to the end of the buffer and  
 13034 continue up to and including the current line, so that the entire buffer is searched.
- 13035 7. A plus-sign ( ' + ' ) or hyphen character ( ' - ' ) followed by a decimal number shall address  
 13036 the current line plus or minus the number. A plus-sign or hyphen character not followed  
 13037 by a decimal number shall address the current line plus or minus 1.

13038 Addresses can be followed by zero or more address offsets, optionally <blank>-separated.  
 13039 Address offsets are constructed as follows:

- 13040 • A plus-sign or hyphen character followed by a decimal number shall add or subtract,  
 13041 respectively, the indicated number of lines to or from the address. A plus-sign or hyphen  
 13042 character not followed by a decimal number shall add or subtract 1 to or from the address.
- 13043 • A decimal number shall add the indicated number of lines to the address.

13044 It shall not be an error for an intermediate address value to be less than zero or greater than the  
 13045 last line in the edit buffer. It shall be an error for the final address value to be less than zero or  
 13046 greater than the last line in the edit buffer. It shall be an error if a search for a BRE fails to find a  
 13047 matching line.

13048 Commands accept zero, one, or two addresses. If more than the required number of addresses  
 13049 are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more  
 13050 than the required number of addresses are provided to a command, the addresses specified first  
 13051 shall be evaluated and then discarded until the maximum number of valid addresses remain, for  
 13052 the specified command.

13053 Addresses shall be separated from each other by a comma (',' ) or semicolon character (';' ).  
 13054 In the case of a semicolon separator, the current line ('.' ) shall be set to the first address, and  
 13055 only then will the second address be calculated. This feature can be used to determine the  
 13056 starting line for forwards and backwards searches; see rules 5. and 6.

13057 Addresses can be omitted on either side of the comma or semicolon separator, in which case the  
 13058 resulting address pairs shall be as follows:

| Specified | Resulting   |
|-----------|-------------|
| ,         | 1 , \$      |
| , addr    | 1 , addr    |
| addr ,    | addr , addr |
| ;         | . ; \$      |
| ; addr    | . ; addr    |
| addr ;    | addr ; addr |

13066 Any <blank>s included between addresses, address separators, or address offsets shall be  
 13067 ignored.

#### 13068 Commands in ed

13069 In the following list of *ed* commands, the default addresses are shown in parentheses. The  
 13070 number of addresses shown in the default shall be the number expected by the command. The  
 13071 parentheses are not part of the address; they show that the given addresses are the default.

13072 It is generally invalid for more than one command to appear on a line. However, any command  
 13073 (except **e**, **E**, **f**, **q**, **Q**, **r**, **w**, and **!**) can be suffixed by the letter **l**, **n**, or **p**; in which case, except for  
 13074 the **l**, **n**, and **p** commands, the command shall be executed and then the new current line shall be  
 13075 written as described below under the **l**, **n**, and **p** commands. When an **l**, **n**, or **p** suffix is used  
 13076 with an **l**, **n**, or **p** command, the command shall write to standard output as described below, but  
 13077 it is unspecified whether the suffix writes the current line again in the requested format or  
 13078 whether the suffix has no effect. For example, the **pl** command (base **p** command with an **l**  
 13079 suffix) shall either write just the current line or write it twice—once as specified for **p** and once  
 13080 as specified for **l**. Also, the **g**, **G**, **v**, and **V** commands shall take a command as a parameter.

13081 Each address component can be preceded by zero or more <blank>s. The command letter can be  
 13082 preceded by zero or more <blank>s. If a suffix letter (**l**, **n**, or **p**) is given, the application shall  
 13083 ensure that it immediately follows the command.

13084 The **e**, **E**, **f**, **r**, and **w** commands shall take an optional *file* parameter, separated from the  
 13085 command letter by one or more <blank>s.

13086 If changes have been made in the buffer since the last **w** command that wrote the entire buffer,  
 13087 *ed* shall warn the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands.  
 13088 The *ed* utility shall write the string:

13089 "?\n"

13090 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to  
 13091 standard output and shall continue in command mode with the current line number unchanged.  
 13092 If the **e** or **q** command is repeated with no intervening command, it shall take effect.

13093 If a terminal disconnect is detected:

13094 • If the buffer is not empty and has changed since the last write, the *ed* utility shall attempt to  
13095 write a copy of the buffer to a file named **ed.hup** in the current directory. If this write fails, *ed*  
13096 shall attempt to write a copy of the buffer to a filename **ed.hup** in the directory named by the  
13097 *HOME* environment variable. If both these attempts fail, *ed* shall exit without saving the  
13098 buffer.

13099 • The *ed* utility shall not write the file to the currently remembered pathname or return to  
13100 command mode, and shall terminate with a non-zero exit status.

13101 If an end-of-file is detected on standard input:

13102 • If the *ed* utility is in input mode, *ed* shall terminate input mode and return to command mode.  
13103 It is unspecified if any partially entered lines (that is, input text without a terminating  
13104 <newline>) are discarded from the input text.

13105 • If the *ed* utility is in command mode, it shall act as if a **q** command had been entered.

13106 If the closing delimiter of an RE or of a replacement string (for example, ' / ') in a **g**, **G**, **s**, **v**, or **V**  
13107 command would be the last character before a <newline>, that delimiter can be omitted, in  
13108 which case the addressed line shall be written. For example, the following pairs of commands  
13109 are equivalent:

```
13110 s/s1/s2 s/s1/s2/p
13111 g/s1 g/s1/p
13112 ?s1 ?s1?
```

13113 If an invalid command is entered, *ed* shall write the string:

13114 "?\n"

13115 (followed by an explanatory message if *help mode* has been enabled via the **H** command) to  
13116 standard output and shall continue in command mode with the current line number unchanged.

## 13117 Append Command

13118 Synopsis:     ( . ) a  
13119                 <text>  
13120                 .

13121 The **a** command shall read the given text and append it after the addressed line; the current line  
13122 number shall become the address of the last inserted line or, if there were none, the addressed  
13123 line. Address 0 shall be valid for this command; it shall cause the appended text to be placed at  
13124 the beginning of the buffer.

## 13125 Change Command

13126 Synopsis:     ( . , . ) c  
13127                 <text>  
13128                 .

13129 The **c** command shall delete the addressed lines, then accept input text that replaces these lines;  
13130 the current line shall be set to the address of the last line input; or, if there were none, at the line  
13131 after the last line deleted; if the lines deleted were originally at the end of the buffer, the current  
13132 line number shall be set to the address of the new last line; if no lines remain in the buffer, the  
13133 current line number shall be set to zero. Address 0 shall be valid for this command; it shall be  
13134 interpreted as if address 1 were specified.

**Delete Command**

Synopsis:     (.,.)d

The **d** command shall delete the addressed lines from the buffer. The address of the line after the last line deleted shall become the current line number; if the lines deleted were originally at the end of the buffer, the current line number shall be set to the address of the new last line; if no lines remain in the buffer, the current line number shall be set to zero.

**Edit Command**

Synopsis:     e [*file*]

The **e** command shall delete the entire contents of the buffer and then read in the file named by the pathname *file*. The current line number shall be set to the address of the last line of the buffer. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **f** command). The number of bytes read shall be written to standard output, unless the **—s** option was specified, in the following format:

"%d\n", <number of bytes read>

The name *file* shall be remembered for possible use as a default pathname in subsequent **e**, **E**, **r**, and **w** commands. If *file* is replaced by '!', the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current *file*. All marks shall be discarded upon the completion of a successful **e** command. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

**Edit Without Checking Command**

Synopsis:     E [*file*]

The **E** command shall possess all properties and restrictions of the **e** command except that the editor shall not check to see whether any changes have been made to the buffer since the last **w** command.

**Filename Command**

Synopsis:     f [*file*]

If *file* is given, the **f** command shall change the currently remembered pathname to *file*; whether the name is changed or not, it shall then write the (possibly new) currently remembered pathname to the standard output in the following format:

"%s\n", <pathname>

The current line number shall be unchanged.

**Global Command**

Synopsis:     (1,\$)g/RE/command list

In the **g** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, going sequentially from the beginning of the file to the end of the file, the given *command list* shall be executed for each marked line, with the current line number set to the address of that line. Any line modified by the *command list* shall be unmarked. When the **g** command completes, the current line number shall have the value assigned by the last command in the *command list*. If there were no matching lines, the current line number shall not be changed. A single command or the first of a list of commands

shall appear on the same line as the global command. All lines of a multi-line list except the last line shall be ended with a backslash preceding the terminating <newline>; the **a**, **i**, and **c** commands and associated input are permitted. The ' . ' terminating input mode can be omitted if it would be the last line of the *command list*. An empty *command list* shall be equivalent to the **p** command. The use of the **g**, **G**, **v**, **V**, and **!** commands in the *command list* produces undefined results. Any character other than <space> or <newline> can be used instead of a slash to delimit the RE. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a backslash.

### Interactive Global Command

*Synopsis:* (1, \$)G/RE/

In the **G** command, the first step shall be to mark every line for which the line excluding the terminating <newline> matches the given RE. Then, for every such line, that line shall be written, the current line number shall be set to the address of that line, and any one command (other than one of the **a**, **c**, **i**, **g**, **G**, **v**, and **V** commands) shall be read and executed. A <newline> shall act as a null command (causing no action to be taken on the current line); an '&' shall cause the re-execution of the most recent non-null command executed within the current invocation of **G**. Note that the commands input as part of the execution of the **G** command can address and affect any lines in the buffer. Any line modified by the command shall be unmarked. The final value of the current line number shall be the value set by the last command successfully executed. (Note that the last command successfully executed shall be the **G** command itself if a command fails or the null command is specified.) If there were no matching lines, the current line number shall not be changed. The **G** command can be terminated by a SIGINT signal. Any character other than <space> or <newline> can be used instead of a slash to delimit the RE and the replacement. Within the RE, the RE delimiter itself can be used as a literal character if it is preceded by a backslash.

### Help Command

*Synopsis:* h

The **h** command shall write a short message to standard output that explains the reason for the most recent '?' notification. The current line number shall be unchanged.

### Help-Mode Command

*Synopsis:* H

The **H** command shall cause *ed* to enter a mode in which help messages (see the **h** command) shall be written to standard output for all subsequent '?' notifications. The **H** command alternately shall turn this mode on and off; it is initially off. If the help-mode is being turned on, the **H** command also explains the previous '?' notification, if there was one. The current line number shall be unchanged.

### Insert Command

*Synopsis:* (.)i  
<text>  
.

The **i** command shall insert the given text before the addressed line; the current line is set to the last inserted line or, if there was none, to the addressed line. This command differs from the **a** command only in the placement of the input text. Address 0 shall be valid for this command; it shall be interpreted as if address 1 were specified.

13220 **Join Command**13221 *Synopsis:* ( . , .+1 ) j

13222 The **j** command shall join contiguous lines by removing the appropriate <newline>s. If exactly  
 13223 one address is given, this command shall do nothing. If lines are joined, the current line number  
 13224 shall be set to the address of the joined line; otherwise, the current line number shall be  
 13225 unchanged.

13226 **Mark Command**13227 *Synopsis:* ( . ) kx

13228 The **k** command shall mark the addressed line with name x, which the application shall ensure is  
 13229 a lowercase letter from the portable character set. The address "x" shall then refer to this line;  
 13230 the current line number shall be unchanged.

13231 **List Command**13232 *Synopsis:* ( . , . ) l

13233 The **l** command shall write to standard output the addressed lines in a visually unambiguous  
 13234 form. The characters listed in the Base Definitions volume of IEEE Std 1003.1-2001, Table 5-1,  
 13235 Escape Sequences and Associated Actions ('\\', '\a', '\b', '\f', '\r', '\t', '\v') shall  
 13236 be written as the corresponding escape sequence; the '\n' in that table is not applicable. Non-  
 13237 printable characters not in the table shall be written as one three-digit octal number (with a  
 13238 preceding backslash character) for each byte in the character (most significant byte first). If the  
 13239 size of a byte on the system is greater than nine bits, the format used for non-printable characters  
 13240 is implementation-defined.

13241 Long lines shall be folded, with the point of folding indicated by <newline> preceded by a  
 13242 backslash; the length at which folding occurs is unspecified, but should be appropriate for the  
 13243 output device. The end of each line shall be marked with a '\$', and '\$' characters within the  
 13244 text shall be written with a preceding backslash. An **l** command can be appended to any other  
 13245 command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**. The current line number shall be set to the address of  
 13246 the last line written.

13247 **Move Command**13248 *Synopsis:* ( . , . ) maddress

13249 The **m** command shall reposition the addressed lines after the line addressed by *address*.  
 13250 Address 0 shall be valid for *address* and cause the addressed lines to be moved to the beginning  
 13251 of the buffer. It shall be an error if address *address* falls within the range of moved lines. The  
 13252 current line number shall be set to the address of the last line moved.

13253 **Number Command**13254 *Synopsis:* ( . , . ) n

13255 The **n** command shall write to standard output the addressed lines, preceding each line by its  
 13256 line number and a <tab>; the current line number shall be set to the address of the last line  
 13257 written. The **n** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

**Print Command**

Synopsis: ( , . ) p

The **p** command shall write to standard output the addressed lines; the current line number shall be set to the address of the last line written. The **p** command can be appended to any command other than **e**, **E**, **f**, **q**, **Q**, **r**, **w**, or **!**.

**Prompt Command**

Synopsis: P

The **P** command shall cause *ed* to prompt with an asterisk ( **' \* '** ) (or *string*, if **-p** is specified) for all subsequent commands. The **P** command alternatively shall turn this mode on and off; it shall be initially on if the **-p** option is specified; otherwise, off. The current line number shall be unchanged.

**Quit Command**

Synopsis: q

The **q** command shall cause *ed* to exit. If the buffer has changed since the last time the entire buffer was written, the user shall be warned, as described previously.

**Quit Without Checking Command**

Synopsis: Q

The **Q** command shall cause *ed* to exit without checking whether changes have been made in the buffer since the last **w** command.

**Read Command**

Synopsis: ( \$ ) r [ *file* ]

The **r** command shall read in the file named by the pathname *file* and append it after the addressed line. If no *file* argument is given, the currently remembered pathname, if any, shall be used (see the **e** and **f** commands). The currently remembered pathname shall not be changed unless there is no remembered pathname. Address 0 shall be valid for **r** and shall cause the file to be read at the beginning of the buffer. If the read is successful, and **-s** was not specified, the number of bytes read shall be written to standard output in the following format:

```
"%d\n", <number of bytes read>
```

The current line number shall be set to the address of the last line read in. If *file* is replaced by **' ! '**, the rest of the line shall be taken to be a shell command line whose output is to be read. Such a shell command line shall not be remembered as the current pathname.

**Substitute Command**

Synopsis: ( , . ) s / *RE* / *replacement* / *flags*

The **s** command shall search each addressed line for an occurrence of the specified *RE* and replace either the first or all (non-overlapped) matched strings with the *replacement*; see the following description of the **g** suffix. It is an error if the substitution fails on every addressed line. Any character other than *<space>* or *<newline>* can be used instead of a slash to delimit the *RE* and the replacement. Within the *RE*, the *RE* delimiter itself can be used as a literal character if it is preceded by a backslash. The current line shall be set to the address of the last line on which a substitution occurred.

13298 An ampersand ('&') appearing in the *replacement* shall be replaced by the string matching the  
 13299 RE on the current line. The special meaning of '&' in this context can be suppressed by  
 13300 preceding it by backslash. As a more general feature, the characters '\n', where *n* is a digit,  
 13301 shall be replaced by the text matched by the corresponding back-reference expression. When the  
 13302 character '%' is the only character in the *replacement*, the *replacement* used in the most recent  
 13303 substitute command shall be used as the *replacement* in the current substitute command; if there  
 13304 was no previous substitute command, the use of '%' in this manner shall be an error. The '%'   
 13305 shall lose its special meaning when it is in a replacement string of more than one character or is  
 13306 preceded by a backslash. For each backslash ('\') encountered in scanning *replacement* from  
 13307 beginning to end, the following character shall lose its special meaning (if any). It is unspecified  
 13308 what special meaning is given to any character other than '&', '\', '%', or digits.

13309 A line can be split by substituting a <newline> into it. The application shall ensure it escapes the  
 13310 <newline> in the *replacement* by preceding it by backslash. Such substitution cannot be done as  
 13311 part of a **g** or **v** command list. The current line number shall be set to the address of the last line  
 13312 on which a substitution is performed. If no substitution is performed, the current line number  
 13313 shall be unchanged. If a line is split, a substitution shall be considered to have been performed  
 13314 on each of the new lines for the purpose of determining the new current line number. A  
 13315 substitution shall be considered to have been performed even if the replacement string is  
 13316 identical to the string that it replaces.

13317 The application shall ensure that the value of *flags* is zero or more of:

13318 *count* Substitute for the *count*th occurrence only of the RE found on each addressed line.

13319 **g** Globally substitute for all non-overlapping instances of the RE rather than just the first  
 13320 one. If both **g** and *count* are specified, the results are unspecified.

13321 **l** Write to standard output the final line in which a substitution was made. The line shall  
 13322 be written in the format specified for the **l** command.

13323 **n** Write to standard output the final line in which a substitution was made. The line shall  
 13324 be written in the format specified for the **n** command.

13325 **p** Write to standard output the final line in which a substitution was made. The line shall  
 13326 be written in the format specified for the **p** command.

## 13327 Copy Command

13328 *Synopsis:* (.,.)*taddress*

13329 The **t** command shall be equivalent to the **m** command, except that a copy of the addressed lines  
 13330 shall be placed after address *address* (which can be 0); the current line number shall be set to the  
 13331 address of the last line added.

## 13332 Undo Command

13333 *Synopsis:* u

13334 The **u** command shall nullify the effect of the most recent command that modified anything in  
 13335 the buffer, namely the most recent **a**, **c**, **d**, **g**, **i**, **j**, **m**, **r**, **s**, **t**, **u**, **v**, **G**, or **V** command. All changes  
 13336 made to the buffer by a **g**, **G**, **v**, or **V** global command shall be undone as a single change; if no  
 13337 changes were made by the global command (such as with **g**/RE/**p**), the **u** command shall have  
 13338 no effect. The current line number shall be set to the value it had immediately before the  
 13339 command being undone started.

**Global Non-Matched Command**

*Synopsis:* (1,\$)v/RE/command list

This command shall be equivalent to the global command **g** except that the lines that are marked during the first step shall be those for which the line excluding the terminating <newline> does not match the RE.

**Interactive Global Not-Matched Command**

*Synopsis:* (1,\$)V/RE/

This command shall be equivalent to the interactive global command **G** except that the lines that are marked during the first step shall be those for which the line excluding the terminating <newline> does not match the RE.

**Write Command**

*Synopsis:* (1,\$)w [file]

The **w** command shall write the addressed lines into the file named by the pathname *file*. The command shall create the file, if it does not exist, or shall replace the contents of the existing file. The currently remembered pathname shall not be changed unless there is no remembered pathname. If no pathname is given, the currently remembered pathname, if any, shall be used (see the **e** and **f** commands); the current line number shall be unchanged. If the command is successful, the number of bytes written shall be written to standard output, unless the **-s** option was specified, in the following format:

"%d\n", <number of bytes written>

If *file* begins with '!', the rest of the line shall be taken to be a shell command line whose standard input shall be the addressed lines. Such a shell command line shall not be remembered as the current pathname. This usage of the write command with '!' shall not be considered as a "last **w** command that wrote the entire buffer", as described previously; thus, this alone shall not prevent the warning to the user if an attempt is made to destroy the editor buffer via the **e** or **q** commands.

**Line Number Command**

*Synopsis:* (\$)=

The line number of the addressed line shall be written to standard output in the following format:

"%d\n", <line number>

The current line number shall be unchanged by this command.

**Shell Escape Command**

*Synopsis:* !command

The remainder of the line after the '!' shall be sent to the command interpreter to be interpreted as a shell command line. Within the text of that shell command line, the unescaped character '%' shall be replaced with the remembered pathname; if a '!' appears as the first character of the command, it shall be replaced with the text of the previous shell command executed via '!'. Thus, "!!" shall repeat the previous !command. If any replacements of '%' or '!' are performed, the modified line shall be written to the standard output before *command* is executed. The ! command shall write:

13381 "!\n"

13382 to standard output upon completion, unless the **-s** option is specified. The current line number  
13383 shall be unchanged.

#### 13384 **Null Command**

13385 *Synopsis:* ( . +1 )

13386 An address alone on a line shall cause the addressed line to be written. A <newline> alone shall  
13387 be equivalent to "+1p". The current line number shall be set to the address of the written line.

#### 13388 **EXIT STATUS**

13389 The following exit values shall be returned:

13390 0 Successful completion without any file or command errors.

13391 >0 An error occurred.

#### 13392 **CONSEQUENCES OF ERRORS**

13393 When an error in the input script is encountered, or when an error is detected that is a  
13394 consequence of the data (not) present in the file or due to an external condition such as a read or  
13395 write error:

13396 • If the standard input is a terminal device file, all input shall be flushed, and a new command  
13397 read.

13398 • If the standard input is a regular file, *ed* shall terminate with a non-zero exit status.

#### 13399 **APPLICATION USAGE**

13400 Because of the extremely terse nature of the default error messages, the prudent script writer  
13401 begins the *ed* input commands with an **H** command, so that if any errors do occur at least some  
13402 clue as to the cause is made available.

13403 In previous versions, an obsolescent **-** option was described. This is no longer specified.  
13404 Applications should use the **-s** option. Using **-** as a *file* operand now produces unspecified  
13405 results. This allows implementations to continue to support the former required behavior.

#### 13406 **EXAMPLES**

13407 None.

#### 13408 **RATIONALE**

13409 The initial description of this utility was adapted from the SVID. It contains some features not  
13410 found in Version 7 or BSD-derived systems. Some of the differences between the POSIX and  
13411 BSD *ed* utilities include, but need not be limited to:

13412 • The BSD **-** option does not suppress the '!' prompt after a **!** command.

13413 • BSD does not support the special meanings of the '%' and '!' characters within a **!**  
13414 command.

13415 • BSD does not support the *addresses* ';' and ', '.

13416 • BSD allows the command/suffix pairs **pp**, **ll**, and so on, which are unspecified in this volume  
13417 of IEEE Std 1003.1-2001.

13418 • BSD does not support the '!' character part of the **e**, **r**, or **w** commands.

13419 • A failed **g** command in BSD sets the line number to the last line searched if there are no  
13420 matches.

- BSD does not default the *command list* to the **p** command.
- BSD does not support the **G**, **h**, **H**, **n**, or **V** commands.
- On BSD, if there is no inserted text, the insert command changes the current line to the referenced line -1; that is, the line before the specified line.
- On BSD, the *join* command with only a single address changes the current line to that address.
- BSD does not support the **P** command; moreover, in BSD it is synonymous with the **p** command.
- BSD does not support the *undo* of the commands **j**, **m**, **r**, **s**, or **t**.
- The Version 7 *ed* command **W**, and the BSD *ed* commands **W**, **wq**, and **z** are not present in this volume of IEEE Std 1003.1-2001.

The **-s** option was added to allow the functionality of the now withdrawn **-** option in a manner compatible with the Utility Syntax Guidelines.

In early proposals there was a limit, {ED\_FILE\_MAX}, that described the historical limitations of some *ed* utilities in their handling of large files; some of these have had problems with files larger than 100 000 bytes. It was this limitation that prompted much of the desire to include a *split* command in this volume of IEEE Std 1003.1-2001. Since this limit was removed, this volume of IEEE Std 1003.1-2001 requires that implementations document the file size limits imposed by *ed* in the conformance document. The limit {ED\_LINE\_MAX} was also removed; therefore, the global limit {LINE\_MAX} is used for input and output lines.

The manner in which the **l** command writes non-printable characters was changed to avoid the historical backspace-overstrike method. On video display terminals, the overstrike is ambiguous because most terminals simply replace overstruck characters, making the **l** format not useful for its intended purpose of unambiguously understanding the content of the line. The historical backslash escapes were also ambiguous. (The string "a\0011" could represent a line containing those six characters or a line containing the three characters 'a', a byte with a binary value of 1, and a 1.) In the format required here, a backslash appearing in the line is written as "\\ " so that the output is truly unambiguous. The method of marking the ends of lines was adopted from the *ex* editor and is required for any line ending in <space>s; the '\$' is placed on all lines so that a real '\$' at the end of a line cannot be misinterpreted.

Systems with bytes too large to fit into three octal digits must devise other means of displaying non-printable characters. Consideration was given to requiring that the number of octal digits be large enough to hold a byte, but this seemed to be too confusing for applications on the vast majority of systems where three digits are adequate. It would be theoretically possible for the application to use the *getconf* utility to find out the CHAR\_BIT value and deal with such an algorithm; however, there is really no portable way that an application can use the octal values of the bytes across various coded character sets, so the additional specification was not worthwhile.

The description of how a NUL is written was removed. The NUL character cannot be in text files, and this volume of IEEE Std 1003.1-2001 should not dictate behavior in the case of undefined, erroneous input.

Unlike some of the other editing utilities, the filenames accepted by the **E**, **e**, **R**, and **r** commands are not patterns.

Early proposals stated that the **-p** option worked only when standard input was associated with a terminal device. This has been changed to conform to historical implementations, thereby allowing applications to interpose themselves between a user and the *ed* utility.

13467 The form of the substitute command that uses the **n** suffix was limited in some historical  
 13468 documentation (where this was described incorrectly as “backreferencing”). This limit has been  
 13469 omitted because there is no reason why an editor processing lines of {LINE\_MAX} length should  
 13470 have this restriction. The command **s/x/X/2047** should be able to substitute the 2047th  
 13471 occurrence of ‘x’ on a line.

13472 The use of printing commands with printing suffixes (such as **pn**, **lp**, and so on) was made  
 13473 unspecified because BSD-based systems allow this, whereas System V does not.

13474 Some BSD-based systems exit immediately upon receipt of end-of-file if all of the lines in the file  
 13475 have been deleted. Since this volume of IEEE Std 1003.1-2001 refers to the **q** command in this  
 13476 instance, such behavior is not allowed.

13477 Some historical implementations returned exit status zero even if command errors had occurred;  
 13478 this is not allowed by this volume of IEEE Std 1003.1-2001.

13479 Some historical implementations contained a bug that allowed a single period to be entered in  
 13480 input mode as <backslash> <period> <newline>. This is not allowed by *ed* because there is no  
 13481 description of escaping any of the characters in input mode; backslashes are entered into the  
 13482 buffer exactly as typed. The typical method of entering a single period has been to precede it  
 13483 with another character and then use the substitute command to delete that character.

13484 It is difficult under some modes of some versions of historical operating system terminal drivers  
 13485 to distinguish between an end-of-file condition and terminal disconnect. IEEE Std 1003.1-2001  
 13486 does not require implementations to distinguish between the two situations, which permits  
 13487 historical implementations of the *ed* utility on historical platforms to conform. Implementations  
 13488 are encouraged to distinguish between the two, if possible, and take appropriate action on  
 13489 terminal disconnect.

13490 Historically, *ed* accepted a zero address for the **a** and **r** commands in order to insert text at the  
 13491 start of the edit buffer. When the buffer was empty the command **.=** returned zero. IEEE Std  
 13492 1003.1-2001 requires conformance to historical practice.

13493 For consistency with the **a** and **r** commands and better user functionality, the **i** and **c** commands  
 13494 must also accept an address of 0, in which case **0i** is treated as **1i** and likewise for the **c**  
 13495 command.

13496 All of the following are valid addresses:

13497     +++               Three lines after the current line.

13498     /*pattern*/-       One line before the next occurrence of pattern.

13499     -2                Two lines before the current line.

13500     3 ---- 2          Line one (note the intermediate negative address).

13501     1 2 3            Line six.

13502 Any number of addresses can be provided to commands taking addresses; for example,  
 13503 "1,2,3,4,5p" prints lines 4 and 5, because two is the greatest valid number of addresses  
 13504 accepted by the **print** command. This, in combination with the semicolon delimiter, permits  
 13505 users to create commands based on ordered patterns in the file. For example, the command  
 13506 "3;/foo/;+2p" will display the first line after line 3 that contains the pattern *foo*, plus the next  
 13507 two lines. Note that the address "3;" must still be evaluated before being discarded, because  
 13508 the search origin for the "/foo/" command depends on this.

13509 Historically, *ed* disallowed address chains, as discussed above, consisting solely of comma or  
 13510 semicolon separators; for example, ",,," or ";;;" were considered an error. For consistency of  
 13511 address specification, this restriction is removed. The following table lists some of the address

13512 forms now possible:

| Address | Addr1 | Addr2 | Status     | Comment               |
|---------|-------|-------|------------|-----------------------|
| 7,      | 7     | 7     | Historical | Valid, but erroneous. |
| 7,5,    | 5     | 5     | Historical |                       |
| 7,5,9   | 5     | 9     | Historical |                       |
| 7,9     | 7     | 9     | Historical |                       |
| 7,+     | 7     | 8     | Historical |                       |
| ,       | 1     | \$    | Historical |                       |
| ,7      | 1     | 7     | Extension  |                       |
| ,,      | \$    | \$    | Extension  |                       |
| ,;      | \$    | \$    | Extension  |                       |
| 7;      | 7     | 7     | Historical |                       |
| 7;5;    | 5     | 5     | Historical |                       |
| 7;5;9   | 5     | 9     | Historical |                       |
| 7;5,9   | 5     | 9     | Historical |                       |
| 7;\$;4  | \$    | 4     | Historical |                       |
| 7;9     | 7     | 9     | Historical |                       |
| 7;+     | 7     | 8     | Historical |                       |
| ;       | .     | \$    | Historical |                       |
| ;7      | .     | 7     | Extension  |                       |
| ;;      | \$    | \$    | Extension  |                       |
| ;;,     | \$    | \$    | Extension  |                       |

13534 Historically, values could be added to addresses by including them after one or more <blank>s;  
 13535 for example, "3 – 5p" wrote the seventh line of the file, and "/f00/ 5" was the same as  
 13536 "5 /f00/". However, only absolute values could be added; for example, "5 /f00/" was an  
 13537 error. IEEE Std 1003.1-2001 requires conformance to historical practice.

13538 Historically, *ed* accepted the '^' character as an address, in which case it was identical to the  
 13539 hyphen character. IEEE Std 1003.1-2001 does not require or prohibit this behavior.

#### 13540 FUTURE DIRECTIONS

13541 None.

#### 13542 SEE ALSO

13543 Section 1.11 (on page 20), *ex*, *sed*, *sh*, *vi*

#### 13544 CHANGE HISTORY

13545 First released in Issue 2.

#### 13546 Issue 5

13547 In the OPTIONS section, the meaning of –s and – is clarified.

13548 A second FUTURE DIRECTION is added.

#### 13549 Issue 6

13550 The obsolescent single-minus form is removed.

13551 A second APPLICATION USAGE note is added.

13552 The Open Group Corrigendum U025/2 is applied, correcting the description of the Edit section.

13553 The *ed* utility is updated to align with the IEEE P1003.2b draft standard. This includes addition of  
 13554 the treatment of the SIGQUIT signal, changes to *ed* addressing, and changes to processing when  
 13555 end-of-file is detected and when terminal disconnect is detected.

|       |                                                                                                          |  |
|-------|----------------------------------------------------------------------------------------------------------|--|
| 13556 | The normative text is reworded to avoid use of the term “must” for application requirements.             |  |
| 13557 | IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/22 is applied, adding the text: “Any line             |  |
| 13558 | modified by the <i>command list</i> shall be unmarked.” to the <b>G</b> command. This change corresponds |  |
| 13559 | to a similar change made to the <b>g</b> command in the first version of IEEE Std 1003.1-2001.           |  |

13560 **NAME**

13561       env — set the environment for command invocation

13562 **SYNOPSIS**13563       env [-i] [*name=value*]... [*utility* [*argument...*]]13564 **DESCRIPTION**13565       The *env* utility shall obtain the current environment, modify it according to its arguments, then  
13566       invoke the utility named by the *utility* operand with the modified environment.13567       Optional arguments shall be passed to *utility*.13568       If no *utility* operand is specified, the resulting environment shall be written to the standard  
13569       output, with one *name=value* pair per line.13570 **OPTIONS**13571       The *env* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
13572       12.2, Utility Syntax Guidelines.

13573       The following options shall be supported:

13574       -**i**           Invoke *utility* with exactly the environment specified by the arguments; the  
13575       inherited environment shall be ignored completely.13576 **OPERANDS**

13577       The following operands shall be supported:

13578       *name=value*   Arguments of the form *name=value* shall modify the execution environment, and  
13579       shall be placed into the inherited environment before the *utility* is invoked.13580       *utility*       The name of the utility to be invoked. If the *utility* operand names any of the  
13581       special built-in utilities in Section 2.14 (on page 64), the results are undefined.13582       *argument*    A string to pass as an argument for the invoked utility.13583 **STDIN**

13584       Not used.

13585 **INPUT FILES**

13586       None.

13587 **ENVIRONMENT VARIABLES**13588       The following environment variables shall affect the execution of *env*:13589       **LANG**        Provide a default value for the internationalization variables that are unset or null.  
13590       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
13591       Internationalization Variables for the precedence of internationalization variables  
13592       used to determine the values of locale categories.)13593       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
13594       internationalization variables.13595       **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
13596       characters (for example, single-byte as opposed to multi-byte characters in  
13597       arguments).13598       **LC\_MESSAGES**13599       Determine the locale that should be used to affect the format and contents of  
13600       diagnostic messages written to standard error.13601 **XS1**       **NLS\_PATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

13602            *PATH*            Determine the location of the *utility*, as described in the Base Definitions volume of  
 13603                                IEEE Std 1003.1-2001, Chapter 8, Environment Variables. If *PATH* is specified as a  
 13604                                *name=value* operand to *env*, the *value* given shall be used in the search for *utility*.

#### 13605 **ASYNCHRONOUS EVENTS**

13606            Default.

#### 13607 **STDOUT**

13608            If no *utility* operand is specified, each *name=value* pair in the resulting environment shall be  
 13609                                written in the form:

13610            "%s=%s\n", <*name*>, <*value*>

13611            If the *utility* operand is specified, the *env* utility shall not write to standard output.

#### 13612 **STDERR**

13613            The standard error shall be used only for diagnostic messages.

#### 13614 **OUTPUT FILES**

13615            None.

#### 13616 **EXTENDED DESCRIPTION**

13617            None.

#### 13618 **EXIT STATUS**

13619            If *utility* is invoked, the exit status of *env* shall be the exit status of *utility*; otherwise, the *env*  
 13620                                utility shall exit with one of the following values:

13621            0        The *env* utility completed successfully.

13622            1–125    An error occurred in the *env* utility.

13623            126     The utility specified by *utility* was found but could not be invoked.

13624            127     The utility specified by *utility* could not be found.

#### 13625 **CONSEQUENCES OF ERRORS**

13626            Default.

#### 13627 **APPLICATION USAGE**

13628            The *command*, *env*, *nice*, *nohup*, *time*, and *xargs* utilities have been specified to use exit code 127 if  
 13629                                an error occurs so that applications can distinguish “failure to find a utility” from “invoked  
 13630                                utility exited with an error indication”. The value 127 was chosen because it is not commonly  
 13631                                used for other meanings; most utilities use small values for “normal error conditions” and the  
 13632                                values above 128 can be confused with termination due to receipt of a signal. The value 126 was  
 13633                                chosen in a similar manner to indicate that the utility could be found, but not invoked. Some  
 13634                                scripts produce meaningful error messages differentiating the 126 and 127 cases. The distinction  
 13635                                between exit codes 126 and 127 is based on KornShell practice that uses 127 when all attempts to  
 13636                                *exec* the utility fail with [ENOENT], and uses 126 when any attempt to *exec* the utility fails for  
 13637                                any other reason.

13638            Historical implementations of the *env* utility use the *execvp()* or *execlp()* functions defined in the  
 13639                                System Interfaces volume of IEEE Std 1003.1-2001 to invoke the specified utility; this provides  
 13640                                better performance and keeps users from having to escape characters with special meaning to  
 13641                                the shell. Therefore, shell functions, special built-ins, and built-ins that are only provided by the  
 13642                                shell are not found.

**13643 EXAMPLES**

13644       The following command:

13645       env -i PATH=/mybin mygrep xyz myfile

13646       invokes the command *mygrep* with a new *PATH* value as the only entry in its environment. In  
13647       this case, *PATH* is used to locate *mygrep*, which then must reside in **/mybin**.

**13648 RATIONALE**

13649       As with all other utilities that invoke other utilities, this volume of IEEE Std 1003.1-2001 only  
13650       specifies what *env* does with standard input, standard output, standard error, input files, and  
13651       output files. If a utility is executed, it is not constrained by the specification of input and output  
13652       by *env*.

13653       The **-i** option was added to allow the functionality of the withdrawn **-** option in a manner  
13654       compatible with the Utility Syntax Guidelines.

13655       Some have suggested that *env* is redundant since the same effect is achieved by:

13656       name=value ... utility [ argument ... ]

13657       The example is equivalent to *env* when an environment variable is being added to the  
13658       environment of the command, but not when the environment is being set to the given value.

13659       The *env* utility also writes out the current environment if invoked without arguments. There is  
13660       sufficient functionality beyond what the example provides to justify inclusion of *env*.

**13661 FUTURE DIRECTIONS**

13662       None.

**13663 SEE ALSO**

13664       Section 2.5 (on page 33), Section 2.14 (on page 64)

**13665 CHANGE HISTORY**

13666       First released in Issue 2.

13667 **NAME**

13668        ex — text editor

13669 **SYNOPSIS**13670 UP        ex [-rR] [-s | -v] [-c *command*] [-t *tagstring*] [-w *size*] [*file* ...]

13671

13672 **DESCRIPTION**

13673        The *ex* utility is a line-oriented text editor. There are two other modes of the editor—open and  
 13674        visual—in which screen-oriented editing is available. This is described more fully by the *ex* **open**  
 13675        and **visual** commands and in *vi*.

13676        This section uses the term *edit buffer* to describe the current working text. No specific  
 13677        implementation is implied by this term. All editing changes are performed on the edit buffer,  
 13678        and no changes to it shall affect any file until an editor command writes the file.

13679        Certain terminals do not have all the capabilities necessary to support the complete *ex* definition,  
 13680        such as the full-screen editing commands (*visual mode* or *open mode*). When these commands  
 13681        cannot be supported on such terminals, this condition shall not produce an error message such  
 13682        as “not an editor command” or report a syntax error. The implementation may either accept the  
 13683        commands and produce results on the screen that are the result of an unsuccessful attempt to  
 13684        meet the requirements of this volume of IEEE Std 1003.1-2001 or report an error describing the  
 13685        terminal-related deficiency.

13686 **OPTIONS**

13687        The *ex* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 13688        Utility Syntax Guidelines.

13689        The following options shall be supported:

13690        **-c *command*** Specify an initial command to be executed in the first edit buffer loaded from an  
 13691        existing file (see the EXTENDED DESCRIPTION section). Implementations may  
 13692        support more than a single **-c** option. In such implementations, the specified  
 13693        commands shall be executed in the order specified on the command line.

13694        **-r** Recover the named files (see the EXTENDED DESCRIPTION section). Recovery  
 13695        information for a file shall be saved during an editor or system crash (for example,  
 13696        when the editor is terminated by a signal which the editor can catch), or after the  
 13697        use of an *ex* **preserve** command.

13698        A *crash* in this context is an unexpected failure of the system or utility that requires  
 13699        restarting the failed system or utility. A system crash implies that any utilities  
 13700        running at the time also crash. In the case of an editor or system crash, the number  
 13701        of changes to the edit buffer (since the most recent **preserve** command) that will be  
 13702        recovered is unspecified.

13703        If no *file* operands are given and the **-t** option is not specified, all other options, the  
 13704        *EXINIT* variable, and any **.exrc** files shall be ignored; a list of all recoverable files  
 13705        available to the invoking user shall be written, and the editor shall exit normally  
 13706        without further action.

13707        **-R** Set **readonly** edit option.

13708        **-s** Prepare *ex* for batch use by taking the following actions:

- 13709           • Suppress writing prompts and informational (but not diagnostic) messages.
- 13710           • Ignore the value of *TERM* and any implementation default terminal type and
- 13711           assume the terminal is a type incapable of supporting open or visual modes;

|       |                              |                                                                                                                |
|-------|------------------------------|----------------------------------------------------------------------------------------------------------------|
| 13712 |                              | see the <b>visual</b> command and the description of <i>vi</i> .                                               |
| 13713 |                              | • Suppress the use of the <i>EXINIT</i> environment variable and the reading of any                            |
| 13714 |                              | <b>.exrc</b> file; see the EXTENDED DESCRIPTION section.                                                       |
| 13715 |                              | • Suppress autoindentation, ignoring the value of the <b>autoindent</b> edit option.                           |
| 13716 | <b>-t tagstring</b>          | Edit the file containing the specified <i>tagstring</i> ; see <i>ctags</i> . The tags feature                  |
| 13717 |                              | represented by <b>-t tagstring</b> and the <b>tag</b> command is optional. It shall be provided                |
| 13718 |                              | on any system that also provides a conforming implementation of <i>ctags</i> ; otherwise,                      |
| 13719 |                              | the use of <b>-t</b> produces undefined results. On any system, it shall be an error to                        |
| 13720 |                              | specify more than a single <b>-t</b> option.                                                                   |
| 13721 | <b>-v</b>                    | Begin in visual mode (see <i>vi</i> ).                                                                         |
| 13722 | <b>-w size</b>               | Set the value of the <i>window</i> editor option to <i>size</i> .                                              |
| 13723 | <b>OPERANDS</b>              |                                                                                                                |
| 13724 |                              | The following operand shall be supported:                                                                      |
| 13725 | <i>file</i>                  | A pathname of a file to be edited.                                                                             |
| 13726 | <b>STDIN</b>                 |                                                                                                                |
| 13727 |                              | The standard input consists of a series of commands and input text, as described in the                        |
| 13728 |                              | EXTENDED DESCRIPTION section. The implementation may limit each line of standard input                         |
| 13729 |                              | to a length of { <i>LINE_MAX</i> }.                                                                            |
| 13730 |                              | If the standard input is not a terminal device, it shall be as if the <b>-s</b> option had been specified.     |
| 13731 |                              | If a read from the standard input returns an error, or if the editor detects an end-of-file condition          |
| 13732 |                              | from the standard input, it shall be equivalent to a SIGHUP asynchronous event.                                |
| 13733 | <b>INPUT FILES</b>           |                                                                                                                |
| 13734 |                              | Input files shall be text files or files that would be text files except for an incomplete last line that      |
| 13735 |                              | is not longer than { <i>LINE_MAX</i> }-1 bytes in length and contains no NUL characters. By default,           |
| 13736 |                              | any incomplete last line shall be treated as if it had a trailing <newline>. The editing of other              |
| 13737 |                              | forms of files may optionally be allowed by <i>ex</i> implementations.                                         |
| 13738 |                              | The <b>.exrc</b> files and source files shall be text files consisting of <i>ex</i> commands; see the EXTENDED |
| 13739 |                              | DESCRIPTION section.                                                                                           |
| 13740 |                              | By default, the editor shall read lines from the files to be edited without interpreting any of those          |
| 13741 |                              | lines as any form of editor command.                                                                           |
| 13742 | <b>ENVIRONMENT VARIABLES</b> |                                                                                                                |
| 13743 |                              | The following environment variables shall affect the execution of <i>ex</i> :                                  |
| 13744 | <b>COLUMNS</b>               | Override the system-selected horizontal screen size. See the Base Definitions                                  |
| 13745 |                              | volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables for valid values                              |
| 13746 |                              | and results when it is unset or null.                                                                          |
| 13747 | <b>EXINIT</b>                | Determine a list of <i>ex</i> commands that are executed on editor start-up. See the                           |
| 13748 |                              | EXTENDED DESCRIPTION section for more details of the initialization phase.                                     |
| 13749 | <b>HOME</b>                  | Determine a pathname of a directory that shall be searched for an editor start-up                              |
| 13750 |                              | file named <b>.exrc</b> ; see the EXTENDED DESCRIPTION section.                                                |
| 13751 | <b>LANG</b>                  | Provide a default value for the internationalization variables that are unset or null.                         |
| 13752 |                              | (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,                                         |

| 13784 |                                                                                                              | A complete write is a write of the entire contents of the edit buffer to a file of a type other than a terminal device, or the saving of the edit buffer caused by the user executing the <i>ex</i> <b>preserve</b> command. Writing the contents of the edit buffer to a temporary file that will be removed when the editor exits shall not be considered a complete write.                     |
| 13785 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13786 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13787 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13788 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13789 | The following actions shall be taken upon receipt of signals:                                                |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13790 | <i>SIGINT</i>                                                                                                | If the standard input is not a terminal device, <i>ex</i> shall not write the file or return to command or text input mode, and shall exit with a non-zero exit status.                                                                                                                                                                                                                           |
| 13791 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13792 |                                                                                                              | Otherwise, if executing an open or visual text input mode command, <i>ex</i> in receipt of <i>SIGINT</i> shall behave identically to its receipt of the <ESC> character.                                                                                                                                                                                                                          |
| 13793 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13794 |                                                                                                              | Otherwise:                                                                                                                                                                                                                                                                                                                                                                                        |
| 13795 |                                                                                                              | 1. If executing an <i>ex</i> text input mode command, all input lines that have been completely entered shall be resolved into the edit buffer, and any partially entered line shall be discarded.                                                                                                                                                                                                |
| 13796 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |
| 13797 |                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                   |

- 13798                   2. If there is a currently executing command, it shall be aborted and a message  
13799                   displayed. Unless otherwise specified by the *ex* or *vi* command descriptions,  
13800                   it is unspecified whether any lines modified by the executing command  
13801                   appear modified, or as they were before being modified by the executing  
13802                   command, in the buffer.
- 13803                   If the currently executing command was a motion command, its associated  
13804                   command shall be discarded.
- 13805                   3. If in open or visual command mode, the terminal shall be alerted.
- 13806                   4. The editor shall then return to command mode.
- 13807           SIGCONT   The screen shall be refreshed if in open or visual mode.
- 13808           SIGHUP    If the edit buffer has been modified since the last complete write, *ex* shall attempt  
13809           to save the edit buffer so that it can be recovered later using the **-r** option or the *ex*  
13810           **recover** command. The editor shall not write the file or return to command or text  
13811           input mode, and shall terminate with a non-zero exit status.
- 13812           SIGTERM   Refer to SIGHUP.
- 13813           The action taken for all other signals is unspecified.
- 13814   **STDOUT**
- 13815           The standard output shall be used only for writing prompts to the user, for informational  
13816           messages, and for writing lines from the file.
- 13817   **STDERR**
- 13818           The standard error shall be used only for diagnostic messages.
- 13819   **OUTPUT FILES**
- 13820           The output from *ex* shall be text files.
- 13821   **EXTENDED DESCRIPTION**
- 13822           Only the *ex* mode of the editor is described in this section. See *vi* for additional editing  
13823           capabilities available in *ex*.
- 13824           When an error occurs, *ex* shall write a message. If the terminal supports a standout mode (such  
13825           as inverse video), the message shall be written in standout mode. If the terminal does not  
13826           support a standout mode, and the edit option **errorbells** is set, an alert action shall precede the  
13827           error message.
- 13828           By default, *ex* shall start in command mode, which shall be indicated by a **:** prompt; see the  
13829           **prompt** command. Text input mode can be entered by the **append**, **insert**, or **change** commands;  
13830           it can be exited (and command mode re-entered) by typing a period ( **.** ) alone at the beginning  
13831           of a line.
- 13832   **Initialization in ex and vi**
- 13833           The following symbols are used in this and following sections to specify locations in the edit  
13834           buffer:
- 13835           *alternate and current pathnames*
- 13836           Two pathnames, named *current* and *alternate*, are maintained by the editor. Any *ex*  
13837           commands that take filenames as arguments shall set them as follows:
- 13838           1. If a *file* argument is specified to the *ex* **edit**, **ex**, or **recover** commands, or if an *ex* **tag**  
13839           command replaces the contents of the edit buffer.

- 13840                   a. If the command replaces the contents of the edit buffer, the current pathname  
13841                   shall be set to the *file* argument or the file indicated by the tag, and the alternate  
13842                   pathname shall be set to the previous value of the current pathname.
- 13843                   b. Otherwise, the alternate pathname shall be set to the *file* argument.
- 13844           2. If a *file* argument is specified to the **ex next** command:
- 13845                   a. If the command replaces the contents of the edit buffer, the current pathname  
13846                   shall be set to the first *file* argument, and the alternate pathname shall be set to  
13847                   the previous value of the current pathname.
- 13848           3. If a *file* argument is specified to the **ex file** command, the current pathname shall be set  
13849           to the *file* argument, and the alternate pathname shall be set to the previous value of  
13850           the current pathname.
- 13851           4. If a *file* argument is specified to the **ex read** and **write** commands (that is, when  
13852           reading or writing a file, and not to the program named by the **shell** edit option), or a  
13853           *file* argument is specified to the **ex xit** command:
- 13854                   a. If the current pathname has no value, the current pathname shall be set to the *file*  
13855                   argument.
- 13856                   b. Otherwise, the alternate pathname shall be set to the *file* argument.

13857           If the alternate pathname is set to the previous value of the current pathname when the  
13858           current pathname had no previous value, then the alternate pathname shall have no value  
13859           as a result.

#### 13860 *current line*

13861           The line of the edit buffer referenced by the cursor. Each command description specifies the  
13862           current line after the command has been executed, as the *current line value*. When the edit  
13863           buffer contains no lines, the current line shall be zero; see **Addressing in ex** (on page 361).

#### 13864 *current column*

13865           The current display line column occupied by the cursor. (The columns shall be numbered  
13866           beginning at 1.) Each command description specifies the current column after the command  
13867           has been executed, as the *current column value*. This column is an *ideal* column that is  
13868           remembered over the lifetime of the editor. The actual display line column upon which the  
13869           cursor rests may be different from the current column; see the cursor positioning discussion  
13870           in **Command Descriptions in vi** (on page 988).

#### 13871 *set to non-<blank>*

13872           A description for a current column value, meaning that the current column shall be set to  
13873           the last display line column on which is displayed any part of the first non-<blank> of the  
13874           line. If the line has no non-<blank> non-<newline>s, the current column shall be set to the  
13875           last display line column on which is displayed any part of the last non-<newline> in the  
13876           line. If the line is empty, the current column shall be set to column position 1.

13877           The length of lines in the edit buffer may be limited to {LINE\_MAX} bytes. In open and visual  
13878           mode, the length of lines in the edit buffer may be limited to the number of characters that will  
13879           fit in the display. If either limit is exceeded during editing, an error message shall be written. If  
13880           either limit is exceeded by a line read in from a file, an error message shall be written and the  
13881           edit session may be terminated.

13882           If the editor stops running due to any reason other than a user command, and the edit buffer has  
13883           been modified since the last complete write, it shall be equivalent to a SIGHUP asynchronous  
13884           event. If the system crashes, it shall be equivalent to a SIGHUP asynchronous event.

During initialization (before the first file is copied into the edit buffer or any user commands from the terminal are processed) the following shall occur:

1. If the environment variable *EXINIT* is set, the editor shall execute the *ex* commands contained in that variable.
2. If the *EXINIT* variable is not set, and all of the following are true:
  - a. The *HOME* environment variable is not null and not empty.
  - b. The file **.exrc** in the directory referred to by the *HOME* environment variable:
    1. Exists
    2. Is owned by the same user ID as the real user ID of the process or the process has appropriate privileges
    3. Is not writable by anyone other than the owner

the editor shall execute the *ex* commands contained in that file.

3. If and only if all of the following are true:
  - a. The current directory is not referred to by the *HOME* environment variable.
  - b. A command in the *EXINIT* environment variable or a command in the **.exrc** file in the directory referred to by the *HOME* environment variable sets the editor option **exrc**.
  - c. The **.exrc** file in the current directory:
    1. Exists
    2. Is owned by the same user ID as the real user ID of the process, or by one of a set of implementation-defined user IDs
    3. Is not writable by anyone other than the owner

the editor shall attempt to execute the *ex* commands contained in that file.

Lines in any **.exrc** file that are blank lines shall be ignored. If any **.exrc** file exists, but is not read for ownership or permission reasons, it shall be an error.

After the *EXINIT* variable and any **.exrc** files are processed, the first file specified by the user shall be edited, as follows:

1. If the user specified the **-t** option, the effect shall be as if the *ex* **tag** command was entered with the specified argument, with the exception that if tag processing does not result in a file to edit, the effect shall be as described in step 3. below.
2. Otherwise, if the user specified any command line *file* arguments, the effect shall be as if the *ex* **edit** command was entered with the first of those arguments as its *file* argument.
3. Otherwise, the effect shall be as if the *ex* **edit** command was entered with a nonexistent filename as its *file* argument. It is unspecified whether this action shall set the current pathname. In an implementation where this action does not set the current pathname, any editor command using the current pathname shall fail until an editor command sets the current pathname.

If the **-r** option was specified, the first time a file in the initial argument list or a file specified by the **-t** option is edited, if recovery information has previously been saved about it, that information shall be recovered and the editor shall behave as if the contents of the edit buffer have already been modified. If there are multiple instances of the file to be recovered, the one most recently saved shall be recovered, and an informational message that there are previous

versions of the file that can be recovered shall be written. If no recovery information about a file is available, an informational message to this effect shall be written, and the edit shall proceed as usual.

If the **-c** option was specified, the first time a file that already exists (including a file that might not exist but for which recovery information is available, when the **-r** option is specified) replaces or initializes the contents of the edit buffer, the current line shall be set to the last line of the edit buffer, the current column shall be set to non-<blank>, and the *ex* commands specified with the **-c** option shall be executed. In this case, the current line and current column shall not be set as described for the command associated with the replacement or initialization of the edit buffer contents. However, if the **-t** option or a **tag** command is associated with this action, the **-c** option commands shall be executed and then the movement to the tag shall be performed.

The current argument list shall initially be set to the filenames specified by the user on the command line. If no filenames are specified by the user, the current argument list shall be empty. If the **-t** option was specified, it is unspecified whether any filename resulting from tag processing shall be prepended to the current argument list. In the case where the filename is added as a prefix to the current argument list, the current argument list reference shall be set to that filename. In the case where the filename is not added as a prefix to the current argument list, the current argument list reference shall logically be located before the first of the filenames specified on the command line (for example, a subsequent *ex* **next** command shall edit the first filename from the command line). If the **-t** option was not specified, the current argument list reference shall be to the first of the filenames on the command line.

### Addressing in *ex*

Addressing in *ex* relates to the current line and the current column; the address of a line is its 1-based line number, the address of a column is its 1-based count from the beginning of the line. Generally, the current line is the last line affected by a command. The current line number is the address of the current line. In each command description, the effect of the command on the current line number and the current column is described.

Addresses are constructed as follows:

1. The character **'.'** (period) shall address the current line.
2. The character **'\$'** shall address the last line of the edit buffer.
3. The positive decimal number *n* shall address the *n*th line of the edit buffer.
4. The address **"'x"** refers to the line marked with the mark name character **'x'**, which shall be a lowercase letter from the portable character set or one of the characters **'\''** or **'\'''**. It shall be an error if the line that was marked is not currently present in the edit buffer or the mark has not been set. Lines can be marked with the *ex* **mark** or **k** commands, or the *vi* **m** command.
5. A regular expression enclosed by slashes (**'/'**) shall address the first line found by searching forwards from the line following the current line toward the end of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. As stated in **Regular Expressions in *ex*** (on page 391), an address consisting of a null regular expression delimited by slashes **"/"** shall address the next line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second slash can be omitted at the end of a command line. If the **wrapsan** edit option is set, the search shall wrap around to the beginning of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence **"\"** shall represent a literal slash instead of the regular expression delimiter.

6. A regular expression enclosed in question marks ('?') shall address the first line found by searching backwards from the line preceding the current line toward the beginning of the edit buffer and stopping at the first line for which the line excluding the terminating <newline> matches the regular expression. An address consisting of a null regular expression delimited by question marks "?? " shall address the previous line for which the line excluding the terminating <newline> matches the last regular expression encountered. In addition, the second question mark can be omitted at the end of a command line. If the **wrapsan** edit option is set, the search shall wrap around from the beginning of the edit buffer to the end of the edit buffer and continue up to and including the current line, so that the entire edit buffer is searched. Within the regular expression, the sequence "\?" shall represent a literal question mark instead of the RE delimiter.

7. A plus sign ('+') or a minus sign ('-') followed by a decimal number shall address the current line plus or minus the number. A '+' or '-' not followed by a decimal number shall address the current line plus or minus 1.

Addresses can be followed by zero or more address offsets, optionally <blank>-separated. Address offsets are constructed as follows:

1. A '+' or '-' immediately followed by a decimal number shall add (subtract) the indicated number of lines to (from) the address. A '+' or '-' not followed by a decimal number shall add (subtract) 1 to (from) the address.
2. A decimal number shall add the indicated number of lines to the address.

It shall not be an error for an intermediate address value to be less than zero or greater than the last line in the edit buffer. It shall be an error for the final address value to be less than zero or greater than the last line in the edit buffer.

Commands take zero, one, or two addresses; see the descriptions of *1addr* and *2addr* in **Command Descriptions in ex** (on page 368). If more than the required number of addresses are provided to a command that requires zero addresses, it shall be an error. Otherwise, if more than the required number of addresses are provided to a command, the addresses specified first shall be evaluated and then discarded until the maximum number of valid addresses remain.

Addresses shall be separated from each other by a comma (',') or a semicolon(';'). If no address is specified before or after a comma or semicolon separator, it shall be as if the address of the current line was specified before or after the separator. In the case of a semicolon separator, the current line ('.') shall be set to the first address, and only then will the next address be calculated. This feature can be used to determine the starting line for forwards and backwards searches (see rules 5. and 6.).

A percent sign('%') shall be equivalent to entering the two addresses "1, \$".

Any delimiting <blank>s between addresses, address separators, or address offsets shall be discarded.

### Command Line Parsing in ex

The following symbol is used in this and following sections to describe parsing behavior:

*escape* If a character is referred to as “backslash-escaped” or “<control>-V-escaped,” it shall mean that the character acquired or lost a special meaning by virtue of being preceded, respectively, by a backslash or <control>-V character. Unless otherwise specified, the escaping character shall be discarded at that time and shall not be further considered for any purpose.

14017 Command-line parsing shall be done in the following steps. For each step, characters already  
 14018 evaluated shall be ignored; that is, the phrase “leading character” refers to the next character  
 14019 that has not yet been evaluated.

- 14020 1. Leading colon characters shall be skipped.
- 14021 2. Leading <blank>s shall be skipped.
- 14022 3. If the leading character is a double-quote character, the characters up to and including the  
 14023 next non-backslash-escaped <newline> shall be discarded, and any subsequent characters  
 14024 shall be parsed as a separate command.
- 14025 4. Leading characters that can be interpreted as addresses shall be evaluated; see **Addressing**  
 14026 **in ex** (on page 361).
- 14027 5. Leading <blank>s shall be skipped.
- 14028 6. If the next character is a vertical-line character or a <newline>:
  - 14029 a. If the next character is a <newline>:
    - 14030 1. If *ex* is in open or visual mode, the current line shall be set to the last address  
 14031 specified, if any.
    - 14032 2. Otherwise, if the last command was terminated by a vertical-line character, no  
 14033 action shall be taken; for example, the command "||<newline>" shall  
 14034 execute two implied commands, not three.
    - 14035 3. Otherwise, step 6.b. shall apply.
  - 14036 b. Otherwise, the implied command shall be the **print** command. The last **#**, **p**, and **l**  
 14037 flags specified to any *ex* command shall be remembered and shall apply to this  
 14038 implied command. Executing the *ex* **number**, **print**, or **list** command shall set the  
 14039 remembered flags to **#**, nothing, and **l**, respectively, plus any other flags specified for  
 14040 that execution of the **number**, **print**, or **list** command.  
  
 14041 If *ex* is not currently performing a **global** or **v** command, and no address or count is  
 14042 specified, the current line shall be incremented by 1 before the command is executed.  
 14043 If incrementing the current line would result in an address past the last line in the  
 14044 edit buffer, the command shall fail, and the increment shall not happen.
  - 14045 c. The <newline> or vertical-line character shall be discarded and any subsequent  
 14046 characters shall be parsed as a separate command.
- 14047 7. The command name shall be comprised of the next character (if the character is not  
 14048 alphabetic), or the next character and any subsequent alphabetic characters (if the  
 14049 character is alphabetic), with the following exceptions:
  - 14050 a. Commands that consist of any prefix of the characters in the command name **delete**,  
 14051 followed immediately by any of the characters 'l', 'p', '+', '-', or '#' shall be  
 14052 interpreted as a **delete** command, followed by a <blank>, followed by the characters  
 14053 that were not part of the prefix of the **delete** command. The maximum number of  
 14054 characters shall be matched to the command name **delete**; for example, "del" shall  
 14055 not be treated as "de" followed by the flag **l**.
  - 14056 b. Commands that consist of the character 'k', followed by a character that can be  
 14057 used as the name of a mark, shall be equivalent to the mark command followed by a  
 14058 <blank>, followed by the character that followed the 'k'.
  - 14059 c. Commands that consist of the character 's', followed by characters that could be  
 14060 interpreted as valid options to the **s** command, shall be the equivalent of the **s**

14061 command, without any pattern or replacement values, followed by a <blank>,  
14062 followed by the characters after the 's'.

- 14063 8. The command name shall be matched against the possible command names, and a  
14064 command name that contains a prefix matching the characters specified by the user shall  
14065 be the executed command. In the case of commands where the characters specified by the  
14066 user could be ambiguous, the executed command shall be as follows:

|       |           |               |           |              |           |              |
|-------|-----------|---------------|-----------|--------------|-----------|--------------|
| 14067 | <b>a</b>  | <b>append</b> | <b>n</b>  | <b>next</b>  | <b>t</b>  | <b>t</b>     |
| 14068 | <b>c</b>  | <b>change</b> | <b>p</b>  | <b>print</b> | <b>u</b>  | <b>undo</b>  |
| 14069 | <b>ch</b> | <b>change</b> | <b>pr</b> | <b>print</b> | <b>un</b> | <b>undo</b>  |
| 14070 | <b>e</b>  | <b>edit</b>   | <b>r</b>  | <b>read</b>  | <b>v</b>  | <b>v</b>     |
| 14071 | <b>m</b>  | <b>move</b>   | <b>re</b> | <b>read</b>  | <b>w</b>  | <b>write</b> |
| 14072 | <b>ma</b> | <b>mark</b>   | <b>s</b>  | <b>s</b>     |           |              |

14073 Implementation extensions with names causing similar ambiguities shall not be checked  
14074 for a match until all possible matches for commands specified by IEEE Std 1003.1-2001  
14075 have been checked.

- 14076 9. If the command is a **!** command, or if the command is a **read** command followed by zero  
14077 or more <blank>s and a **!**, or if the command is a **write** command followed by one or more  
14078 <blank>s and a **!**, the rest of the command shall include all characters up to a non-  
14079 backslash-escaped <newline>. The <newline> shall be discarded and any subsequent  
14080 characters shall be parsed as a separate *ex* command.

- 14081 10. Otherwise, if the command is an **edit**, **ex**, or **next** command, or a **visual** command while in  
14082 open or visual mode, the next part of the command shall be parsed as follows:

- 14083 a. Any '!' character immediately following the command shall be skipped and be part  
14084 of the command.
- 14085 b. Any leading <blank>s shall be skipped and be part of the command.
- 14086 c. If the next character is a '+', characters up to the first non-backslash-escaped  
14087 <newline> or non-backslash-escaped <blank> shall be skipped and be part of the  
14088 command.
- 14089 d. The rest of the command shall be determined by the steps specified in paragraph 12.

- 14090 11. Otherwise, if the command is a **global**, **open**, **s**, or **v** command, the next part of the  
14091 command shall be parsed as follows:

- 14092 a. Any leading <blank>s shall be skipped and be part of the command.
- 14093 b. If the next character is not an alphanumeric, double-quote, <newline>, backslash, or  
14094 vertical-line character:
- 14095 1. The next character shall be used as a command delimiter.
- 14096 2. If the command is a **global**, **open**, or **v** command, characters up to the first  
14097 non-backslash-escaped <newline>, or first non-backslash-escaped delimiter  
14098 character, shall be skipped and be part of the command.
- 14099 3. If the command is an **s** command, characters up to the first non-backslash-  
14100 escaped <newline>, or second non-backslash-escaped delimiter character, shall  
14101 be skipped and be part of the command.
- 14102 c. If the command is a **global** or **v** command, characters up to the first non-backslash-  
14103 escaped <newline> shall be skipped and be part of the command.

14104 d. Otherwise, the rest of the command shall be determined by the steps specified in  
14105 paragraph 12.

14106 12. Otherwise:

14107 a. If the command was a **map**, **unmap**, **abbreviate**, or **unabbreviate** command,  
14108 characters up to the first non-`<control>-V`-escaped `<newline>`, vertical-line, or  
14109 double-quote character shall be skipped and be part of the command.

14110 b. Otherwise, characters up to the first non-backslash-escaped `<newline>`, vertical-line,  
14111 or double-quote character shall be skipped and be part of the command.

14112 c. If the command was an **append**, **change**, or **insert** command, and the step 12.b.  
14113 ended at a vertical-line character, any subsequent characters, up to the next non-  
14114 backslash-escaped `<newline>` shall be used as input text to the command.

14115 d. If the command was ended by a double-quote character, all subsequent characters,  
14116 up to the next non-backslash-escaped `<newline>`, shall be discarded.

14117 e. The terminating `<newline>` or vertical-line character shall be discarded and any  
14118 subsequent characters shall be parsed as a separate *ex* command.

14119 Command arguments shall be parsed as described by the Synopsis and Description of each  
14120 individual *ex* command. This parsing shall not be `<blank>`-sensitive, except for the `!` argument,  
14121 which must follow the command name without intervening `<blank>`s, and where it would  
14122 otherwise be ambiguous. For example, *count* and *flag* arguments need not be `<blank>`-separated  
14123 because `"d22p"` is not ambiguous, but *file* arguments to the *ex* **next** command must be  
14124 separated by one or more `<blank>`s. Any `<blank>` in command arguments for the **abbreviate**,  
14125 **unabbreviate**, **map**, and **unmap** commands can be `<control>-V`-escaped, in which case the  
14126 `<blank>` shall not be used as an argument delimiter. Any `<blank>` in the command argument for  
14127 any other command can be backslash-escaped, in which case that `<blank>` shall not be used as  
14128 an argument delimiter.

14129 Within command arguments for the **abbreviate**, **unabbreviate**, **map**, and **unmap** commands,  
14130 any character can be `<control>-V`-escaped. All such escaped characters shall be treated literally  
14131 and shall have no special meaning. Within command arguments for all other *ex* commands that  
14132 are not regular expressions or replacement strings, any character that would otherwise have a  
14133 special meaning can be backslash-escaped. Escaped characters shall be treated literally, without  
14134 special meaning as shell expansion characters or `'!'`, `'%'`, and `'#'` expansion characters. See  
14135 **Regular Expressions in ex** (on page 391) and **Replacement Strings in ex** (on page 391) for  
14136 descriptions of command arguments that are regular expressions or replacement strings.

14137 Non-backslash-escaped `'%'` characters appearing in *file* arguments to any *ex* command shall be  
14138 replaced by the current pathname; unescaped `'#'` characters shall be replaced by the alternate  
14139 pathname. It shall be an error if `'%'` or `'#'` characters appear unescaped in an argument and  
14140 their corresponding values are not set.

14141 Non-backslash-escaped `'!'` characters in the arguments to either the *ex* `!` command or the open  
14142 and visual mode `!` command, or in the arguments to the *ex* **read** command, where the first non-  
14143 `<blank>` after the command name is a `'!'` character, or in the arguments to the *ex* **write**  
14144 command where the command name is followed by one or more `<blank>`s and the first non-  
14145 `<blank>` after the command name is a `'!'` character, shall be replaced with the arguments to the  
14146 last of those three commands as they appeared after all unescaped `'%'`, `'#'`, and `'!'` characters  
14147 were replaced. It shall be an error if `'!'` characters appear unescaped in one of these commands  
14148 and there has been no previous execution of one of these commands.

14149 If an error occurs during the parsing or execution of an *ex* command:

- An informational message to this effect shall be written. Execution of the *ex* command shall stop, and the cursor (for example, the current line and column) shall not be further modified.
- If the *ex* command resulted from a map expansion, all characters from that map expansion shall be discarded, except as otherwise specified by the **map** command.
- Otherwise, if the *ex* command resulted from the processing of an *EXINIT* environment variable, a **.exrc** file, a **:source** command, a **-c** option, or a **+command** specified to an *ex* **edit**, **ex**, **next**, or **visual** command, no further commands from the source of the commands shall be executed.
- Otherwise, if the *ex* command resulted from the execution of a buffer or a **global** or **v** command, no further commands caused by the execution of the buffer or the **global** or **v** command shall be executed.
- Otherwise, if the *ex* command was not terminated by a <newline>, all characters up to and including the next non-backslash-escaped <newline> shall be discarded.

### Input Editing in ex

The following symbol is used in this and the following sections to specify command actions:

*word*            In the POSIX locale, a word consists of a maximal sequence of letters, digits, and underscores, delimited at both ends by characters other than letters, digits, or underscores, or by the beginning or end of a line or the edit buffer.

When accepting input characters from the user, in either *ex* command mode or *ex* text input mode, *ex* shall enable canonical mode input processing, as defined in the System Interfaces volume of IEEE Std 1003.1-2001.

If in *ex* text input mode:

1. If the **number** edit option is set, *ex* shall prompt for input using the line number that would be assigned to the line if it is entered, in the format specified for the *ex* **number** command.
2. If the **autoindent** edit option is set, *ex* shall prompt for input using **autoindent** characters, as described by the **autoindent** edit option. **autoindent** characters shall follow the line number, if any.

If in *ex* command mode:

1. If the **prompt** edit option is set, input shall be prompted for using a single ' : ' character; otherwise, there shall be no prompt.

The input characters in the following sections shall have the following effects on the input line.

### Scroll

*Synopsis:*    *eof*

See the description of the *stty eof* character in *stty*.

If in *ex* command mode:

If the *eof* character is the first character entered on the line, the line shall be evaluated as if it contained two characters: a <control>-D and a <newline>.

Otherwise, the *eof* character shall have no special meaning.

14188 If in *ex* text input mode:

14189 If the cursor follows an **autoindent** character, the **autoindent** characters in the line shall be  
 14190 modified so that a part of the next text input character will be displayed on the first column  
 14191 in the line after the previous **shiftwidth** edit option column boundary, and the user shall be  
 14192 prompted again for input for the same line.

14193 Otherwise, if the cursor follows a '0', which follows an **autoindent** character, and the '0'  
 14194 was the previous text input character, the '0' and all **autoindent** characters in the line shall  
 14195 be discarded, and the user shall be prompted again for input for the same line.

14196 Otherwise, if the cursor follows a '^', which follows an **autoindent** character, and the '^'  
 14197 was the previous text input character, the '^' and all **autoindent** characters in the line shall  
 14198 be discarded, and the user shall be prompted again for input for the same line. In addition,  
 14199 the **autoindent** level for the next input line shall be derived from the same line from which  
 14200 the **autoindent** level for the current input line was derived.

14201 Otherwise, if there are no **autoindent** or text input characters in the line, the *eof* character  
 14202 shall be discarded.

14203 Otherwise, the *eof* character shall have no special meaning.

14204 **<newline>**

14205 *Synopsis:* <newline>  
 14206 <control>-J

14207 If in *ex* command mode:

14208 Cause the command line to be parsed; <control>-J shall be mapped to the <newline> for this  
 14209 purpose.

14210 If in *ex* text input mode:

14211 Terminate the current line. If there are no characters other than **autoindent** characters on the  
 14212 line, all characters on the line shall be discarded.

14213 Prompt for text input on a new line after the current line. If the **autoindent** edit option is set,  
 14214 an appropriate number of **autoindent** characters shall be added as a prefix to the line as  
 14215 described by the *ex* **autoindent** edit option.

14216 **<backslash>**

14217 *Synopsis:* <backslash>

14218 Allow the entry of a subsequent <newline> or <control>-J as a literal character, removing any  
 14219 special meaning that it may have to the editor during text input mode. The backslash character  
 14220 shall be retained and evaluated when the command line is parsed, or retained and included  
 14221 when the input text becomes part of the edit buffer.

|       |                                   |                                                                                                                                                |
|-------|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 14222 | <b>&lt;control&gt;-V</b>          |                                                                                                                                                |
| 14223 | <i>Synopsis:</i>                  | <control>-V                                                                                                                                    |
| 14224 |                                   | Allow the entry of any subsequent character as a literal character, removing any special meaning                                               |
| 14225 |                                   | that it may have to the editor during text input mode. The <control>-V character shall be                                                      |
| 14226 |                                   | discarded before the command line is parsed or the input text becomes part of the edit buffer.                                                 |
| 14227 |                                   | If the “literal next” functionality is performed by the underlying system, it is implementation-                                               |
| 14228 |                                   | defined whether a character other than <control>-V performs this function.                                                                     |
| 14229 | <b>&lt;control&gt;-W</b>          |                                                                                                                                                |
| 14230 | <i>Synopsis:</i>                  | <control>-W                                                                                                                                    |
| 14231 |                                   | Discard the <control>-W, and the word previous to it in the input line, including any <blank>s                                                 |
| 14232 |                                   | following the word and preceding the <control>-W. If the “word erase” functionality is                                                         |
| 14233 |                                   | performed by the underlying system, it is implementation-defined whether a character other                                                     |
| 14234 |                                   | than <control>-W performs this function.                                                                                                       |
| 14235 | <b>Command Descriptions in ex</b> |                                                                                                                                                |
| 14236 |                                   | The following symbols are used in this section to represent command modifiers. Some of these                                                   |
| 14237 |                                   | modifiers can be omitted, in which case the specified defaults shall be used.                                                                  |
| 14238 | <i>1addr</i>                      | A single line address, given in any of the forms described in <b>Addressing in ex</b> (on                                                      |
| 14239 |                                   | page 361); the default shall be the current line ( ' . ' ), unless otherwise specified.                                                        |
| 14240 |                                   | If the line address is zero, it shall be an error, unless otherwise specified in the                                                           |
| 14241 |                                   | following command descriptions.                                                                                                                |
| 14242 |                                   | If the edit buffer is empty, and the address is specified with a command other than                                                            |
| 14243 |                                   | <b>=</b> , <b>append</b> , <b>insert</b> , <b>open</b> , <b>put</b> , <b>read</b> , or <b>visual</b> , or the address is not zero, it shall be |
| 14244 |                                   | an error.                                                                                                                                      |
| 14245 | <i>2addr</i>                      | Two addresses specifying an inclusive range of lines. If no addresses are specified,                                                           |
| 14246 |                                   | the default for <i>2addr</i> shall be the current line only ( " . , . " ), unless otherwise                                                    |
| 14247 |                                   | specified in the following command descriptions. If one address is specified, <i>2addr</i>                                                     |
| 14248 |                                   | shall specify that line only, unless otherwise specified in the following command                                                              |
| 14249 |                                   | descriptions.                                                                                                                                  |
| 14250 |                                   | It shall be an error if the first address is greater than the second address.                                                                  |
| 14251 |                                   | If the edit buffer is empty, and the two addresses are specified with a command                                                                |
| 14252 |                                   | other than the <b>!</b> , <b>write</b> , <b>wq</b> , or <b>xit</b> commands, or either address is not zero, it shall                           |
| 14253 |                                   | be an error.                                                                                                                                   |
| 14254 | <i>count</i>                      | A positive decimal number. If <i>count</i> is specified, it shall be equivalent to specifying                                                  |
| 14255 |                                   | an additional address to the command, unless otherwise specified by the following                                                              |
| 14256 |                                   | command descriptions. The additional address shall be equal to the last address                                                                |
| 14257 |                                   | specified to the command (either explicitly or by default) plus <i>count</i> −1.                                                               |
| 14258 |                                   | If this would result in an address greater than the last line of the edit buffer, it shall                                                     |
| 14259 |                                   | be corrected to equal the last line of the edit buffer.                                                                                        |
| 14260 | <i>flags</i>                      | One or more of the characters ' + ', ' − ', ' # ', ' p ', or ' l ' (ell). The flag characters                                                  |
| 14261 |                                   | can be <blank>-separated, and in any order or combination. The characters ' # ',                                                               |
| 14262 |                                   | ' p ', and ' l ' shall cause lines to be written in the format specified by the <b>print</b>                                                   |
| 14263 |                                   | command with the specified <i>flags</i> .                                                                                                      |

|       |               |                                                                                                                                                                                           |
|-------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14264 |               | The lines to be written are as follows:                                                                                                                                                   |
| 14265 |               | 1. All edit buffer lines written during the execution of the <i>ex</i> <b>&amp;</b> , <b>~</b> , <b>list</b> , <b>number</b> ,                                                            |
| 14266 |               | <b>open</b> , <b>print</b> , <b>s</b> , <b>visual</b> , and <b>z</b> commands shall be written as specified by <i>flags</i> .                                                             |
| 14267 |               | 2. After the completion of an <i>ex</i> command with a flag as an argument, the                                                                                                           |
| 14268 |               | current line shall be written as specified by <i>flags</i> , unless the current line was                                                                                                  |
| 14269 |               | the last line written by the command.                                                                                                                                                     |
| 14270 |               | The characters '+' and '-' cause the value of the current line after the execution                                                                                                        |
| 14271 |               | of the <i>ex</i> command to be adjusted by the offset address as described in <b>Addressing</b>                                                                                           |
| 14272 |               | <b>in ex</b> (on page 361). This adjustment shall occur before the current line is written                                                                                                |
| 14273 |               | as described in 2. above.                                                                                                                                                                 |
| 14274 |               | The default for <i>flags</i> shall be none.                                                                                                                                               |
| 14275 | <i>buffer</i> | One of a number of named areas for holding text. The named buffers are specified                                                                                                          |
| 14276 |               | by the alphanumeric characters of the POSIX locale. There shall also be one                                                                                                               |
| 14277 |               | "unnamed" buffer. When no buffer is specified for editor commands that use a                                                                                                              |
| 14278 |               | buffer, the unnamed buffer shall be used. Commands that store text into buffers                                                                                                           |
| 14279 |               | shall store the text as it was before the command took effect, and shall store text                                                                                                       |
| 14280 |               | occurring earlier in the file before text occurring later in the file, regardless of how                                                                                                  |
| 14281 |               | the text region was specified. Commands that store text into buffers shall store the                                                                                                      |
| 14282 |               | text into the unnamed buffer as well as any specified buffer.                                                                                                                             |
| 14283 |               | In <i>ex</i> commands, buffer names are specified as the name by itself. In open or visual                                                                                                |
| 14284 |               | mode commands the name is preceded by a double quote (' ') character.                                                                                                                     |
| 14285 |               | If the specified buffer name is an uppercase character, and the buffer contents are                                                                                                       |
| 14286 |               | to be modified, the buffer shall be appended to rather than being overwritten. If                                                                                                         |
| 14287 |               | the buffer is not being modified, specifying the buffer name in lowercase and                                                                                                             |
| 14288 |               | uppercase shall have identical results.                                                                                                                                                   |
| 14289 |               | There shall also be buffers named by the numbers 1 through 9. In open and visual                                                                                                          |
| 14290 |               | mode, if a region of text including characters from more than a single line is being                                                                                                      |
| 14291 |               | modified by the <i>vi</i> <b>c</b> or <b>d</b> commands, the motion character associated with the <b>c</b> or                                                                             |
| 14292 |               | <b>d</b> commands specifies that the buffer text shall be in line mode, or the commands                                                                                                   |
| 14293 |               | <b>%</b> , <b>'</b> , <b>/</b> , <b>?</b> , <b>(</b> , <b>)</b> , <b>N</b> , <b>n</b> , <b>{</b> , or <b>}</b> are used to define a region of text for the <b>c</b> or <b>d</b> commands, |
| 14294 |               | the contents of buffers 1 through 8 shall be moved into the buffer named by the                                                                                                           |
| 14295 |               | next numerically greater value, the contents of buffer 9 shall be discarded, and the                                                                                                      |
| 14296 |               | region of text shall be copied into buffer 1. This shall be in addition to copying the                                                                                                    |
| 14297 |               | text into a user-specified buffer or unnamed buffer, or both. Numeric buffers can                                                                                                         |
| 14298 |               | be specified as a source buffer for open and visual mode commands; however,                                                                                                               |
| 14299 |               | specifying a numeric buffer as the write target of an open or visual mode                                                                                                                 |
| 14300 |               | command shall have unspecified results.                                                                                                                                                   |
| 14301 |               | The text of each buffer shall have the characteristic of being in either line or                                                                                                          |
| 14302 |               | character mode. Appending text to a non-empty buffer shall set the mode to match                                                                                                          |
| 14303 |               | the characteristic of the text being appended. Appending text to a buffer shall                                                                                                           |
| 14304 |               | cause the creation of at least one additional line in the buffer. All text stored into                                                                                                    |
| 14305 |               | buffers by <i>ex</i> commands shall be in line mode. The <i>ex</i> commands that use buffers                                                                                              |
| 14306 |               | as the source of text specify individually how buffers of different modes are                                                                                                             |
| 14307 |               | handled. Each open or visual mode command that uses buffers for any purpose                                                                                                               |
| 14308 |               | specifies individually the mode of the text stored into the buffer and how buffers                                                                                                        |
| 14309 |               | of different modes are handled.                                                                                                                                                           |

14310 *file* Command text used to derive a pathname. The default shall be the current  
 14311 pathname, as defined previously, in which case, if no current pathname has yet  
 14312 been established it shall be an error, except where specifically noted in the  
 14313 individual command descriptions that follow. If the command text contains any of  
 14314 the characters '~', '{', '[', '\*', '?', '\$', '\', ' ', ' ', ' ', and '\', it shall be  
 14315 subjected to the process of “shell expansions”, as described below; if more than a  
 14316 single pathname results and the command expects only one, it shall be an error.

14317 The process of shell expansions in the editor shall be done as follows. The *ex* utility  
 14318 shall pass two arguments to the program named by the shell edit option; the first  
 14319 shall be **-c**, and the second shall be the string "echo" and the command text as a  
 14320 single argument. The standard output and standard error of that command shall  
 14321 replace the command text.

14322 **!** A character that can be appended to the command name to modify its operation,  
 14323 as detailed in the individual command descriptions. With the exception of the *ex*  
 14324 **read**, **write**, and **!** commands, the '!' character shall only act as a modifier if there  
 14325 are no <blank>s between it and the command name.

14326 *remembered search direction*

14327 The *vi* commands **N** and **n** begin searching in a forwards or backwards direction in  
 14328 the edit buffer based on a remembered search direction, which is initially unset,  
 14329 and is set by the *ex* **global**, **v**, **s**, and **tag** commands, and the *vi* **/** and **?** commands.

## 14330 **Abbreviate**

14331 *Synopsis:* **ab**[*breviate*] [*lhs rhs*]

14332 If *lhs* and *rhs* are not specified, write the current list of abbreviations and do nothing more.

14333 Implementations may restrict the set of characters accepted in *lhs* or *rh*, except that printable  
 14334 characters and <blank>s shall not be restricted. Additional restrictions shall be implementation-  
 14335 defined.

14336 In both *lhs* and *rhs*, any character may be escaped with a <control>-V, in which case the  
 14337 character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be  
 14338 discarded.

14339 In open and visual text input mode, if a non-word or <ESC> character that is not escaped by a  
 14340 <control>-V character is entered after a word character, a check shall be made for a set of  
 14341 characters matching *lhs*, in the text input entered during this command. If it is found, the effect  
 14342 shall be as if *rhs* was entered instead of *lhs*.

14343 The set of characters that are checked is defined as follows:

- 14344 1. If there are no characters inserted before the word and non-word or <ESC> characters that  
 14345 triggered the check, the set of characters shall consist of the word character.
- 14346 2. If the character inserted before the word and non-word or <ESC> characters that triggered  
 14347 the check is a word character, the set of characters shall consist of the characters inserted  
 14348 immediately before the triggering characters that are word characters, plus the triggering  
 14349 word character.
- 14350 3. If the character inserted before the word and non-word or <ESC> characters that triggered  
 14351 the check is not a word character, the set of characters shall consist of the characters that  
 14352 were inserted before the triggering characters that are neither <blank>s nor word  
 14353 characters, plus the triggering word character.

14354 It is unspecified whether the *lhs* argument entered for the *ex* **abbreviate** and **unabbreviate**  
 14355 commands is replaced in this fashion. Regardless of whether or not the replacement occurs, the  
 14356 effect of the command shall be as if the replacement had not occurred.

14357 *Current line*: Unchanged.

14358 *Current column*: Unchanged.

## 14359 **Append**

14360 *Synopsis*:     [*laddr*] a[ppend] [!]

14361 Enter *ex* text input mode; the input text shall be placed after the specified line. If line zero is  
 14362 specified, the text shall be placed at the beginning of the edit buffer.

14363 This command shall be affected by the **number** and **autoindent** edit options; following the  
 14364 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
 14365 duration of this command only.

14366 *Current line*: Set to the last input line; if no lines were input, set to the specified line, or to the  
 14367 first line of the edit buffer if a line of zero was specified, or zero if the edit buffer is empty.

14368 *Current column*: Set to non-<blank>.

## 14369 **Arguments**

14370 *Synopsis*:     ar[gs]

14371 Write the current argument list, with the current argument-list entry, if any, between '[' and  
 14372 ']' characters.

14373 *Current line*: Unchanged.

14374 *Current column*: Unchanged.

## 14375 **Change**

14376 *Synopsis*:     [*2addr*] c[hange] [!] [*count*]

14377 Enter *ex* text input mode; the input text shall replace the specified lines. The specified lines shall  
 14378 be copied into the unnamed buffer, which shall become a line mode buffer.

14379 This command shall be affected by the **number** and **autoindent** edit options; following the  
 14380 command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
 14381 duration of this command only.

14382 *Current line*: Set to the last input line; if no lines were input, set to the line before the first  
 14383 address, or to the first line of the edit buffer if there are no lines preceding the first address, or to  
 14384 zero if the edit buffer is empty.

14385 *Current column*: Set to non-<blank>.

**Change Directory**

Synopsis:    chd[ir] [!] [*directory*]  
               cd[!] [*directory*]

Change the current working directory to *directory*.

If no *directory* argument is specified, and the *HOME* environment variable is set to a non-null and non-empty value, *directory* shall default to the value named in the *HOME* environment variable. If the *HOME* environment variable is empty or is undefined, the default value of *directory* is implementation-defined.

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, and the current pathname does not begin with a '/', it shall be an error.

*Current line*: Unchanged.

*Current column*: Unchanged.

**Copy**

Synopsis:    [2*addr*] co[py] 1*addr* [*flags*]  
               [2*addr*] t 1*addr* [*flags*]

Copy the specified lines after the specified destination line; line zero specifies that the lines shall be placed at the beginning of the edit buffer.

*Current line*: Set to the last line copied.

*Current column*: Set to non-<blank>.

**Delete**

Synopsis:    [2*addr*] d[elete] [*buffer*] [*count*] [*flags*]

Delete the specified lines into a buffer (defaulting to the unnamed buffer), which shall become a line-mode buffer.

Flags can immediately follow the command name; see **Command Line Parsing in ex** (on page 362).

*Current line*: Set to the line following the deleted lines, or to the last line in the edit buffer if that line is past the end of the edit buffer, or to zero if the edit buffer is empty.

*Current column*: Set to non-<blank>.

**Edit**

Synopsis:    e[dit] [!] [+*command*] [*file*]  
               ex[!] [+*command*] [*file*]

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error.

If *file* is specified, replace the current contents of the edit buffer with the current contents of *file*, and set the current pathname to *file*. If *file* is not specified, replace the current contents of the edit buffer with the current contents of the file named by the current pathname. If for any reason the current contents of the file cannot be accessed, the edit buffer shall be empty.

The +*command* option shall be <blank>-delimited; <blank>s within +*command* can be escaped by preceding them with a backslash character. The +*command* shall be interpreted as an *ex* command immediately after the contents of the edit buffer have been replaced and the current

14426 line and column have been set.

14427 If the edit buffer is empty:

14428 *Current line*: Set to 0.

14429 *Current column*: Set to 1.

14430 Otherwise, if executed while in *ex* command mode or if the *+command* argument is specified:

14431 *Current line*: Set to the last line of the edit buffer.

14432 *Current column*: Set to non-<blank>.

14433 Otherwise, if *file* is omitted or results in the current pathname:

14434 *Current line*: Set to the first line of the edit buffer.

14435 *Current column*: Set to non-<blank>.

14436 Otherwise, if *file* is the same as the last file edited, the line and column shall be set as follows; if

14437 the file was previously edited, the line and column may be set as follows:

14438 *Current line*: Set to the last value held when that file was last edited. If this value is not a valid

14439 line in the new edit buffer, set to the first line of the edit buffer.

14440 *Current column*: If the current line was set to the last value held when the file was last edited, set

14441 to the last value held when the file was last edited. Otherwise, or if the last value is not a valid

14442 column in the new edit buffer, set to non-<blank>.

14443 Otherwise:

14444 *Current line*: Set to the first line of the edit buffer.

14445 *Current column*: Set to non-<blank>.

14446 **File**

14447 *Synopsis:*     f [*ile*] [*file*]

14448 If a *file* argument is specified, the alternate pathname shall be set to the current pathname, and

14449 the current pathname shall be set to *file*.

14450 Write an informational message. If the file has a current pathname, it shall be included in this

14451 message; otherwise, the message shall indicate that there is no current pathname. If the edit

14452 buffer contains lines, the current line number and the number of lines in the edit buffer shall be

14453 included in this message; otherwise, the message shall indicate that the edit buffer is empty. If

14454 the edit buffer has been modified since the last complete write, this fact shall be included in this

14455 message. If the **readonly** edit option is set, this fact shall be included in this message. The

14456 message may contain other unspecified information.

14457 *Current line*: Unchanged.

14458 *Current column*: Unchanged.

**Global**

Synopsis:     [2addr] g[lobal] /pattern/ [commands]  
               [2addr] v /pattern/ [commands]

The optional '!' character after the **global** command shall be the same as executing the **v** command.

If *pattern* is empty (for example, "//") or not specified, the last regular expression used in the editor command shall be used as the *pattern*. The *pattern* can be delimited by slashes (shown in the Synopsis), as well as any non-alphanumeric or non-<blank> other than backslash, vertical line, double quote, or <newline>.

If no lines are specified, the lines shall default to the entire file.

The **global** and **v** commands are logically two-pass operations. First, mark the lines within the specified lines for which the line excluding the terminating <newline> matches (**global**) or does not match (**v** or **global!**) the specified pattern. Second, execute the *ex* commands given by *commands*, with the current line ('.') set to each marked line. If an error occurs during this process, or the contents of the edit buffer are replaced (for example, by the *ex* **:edit** command) an error message shall be written and no more commands resulting from the execution of this command shall be processed.

Multiple *ex* commands can be specified by entering multiple commands on a single line using a vertical line to delimit them, or one per line, by escaping each <newline> with a backslash.

If no commands are specified:

1. If in *ex* command mode, it shall be as if the **print** command were specified.
2. Otherwise, no command shall be executed.

For the **append**, **change**, and **insert** commands, the input text shall be included as part of the command, and the terminating period can be omitted if the command ends the list of commands. The **open** and **visual** commands can be specified as one of the commands, in which case each marked line shall cause the editor to enter open or visual mode. If open or visual mode is exited using the *vi* **Q** command, the current line shall be set to the next marked line, and open or visual mode reentered, until the list of marked lines is exhausted.

The **global**, **v**, and **undo** commands cannot be used in *commands*. Marked lines may be deleted by commands executed for lines occurring earlier in the file than the marked lines. In this case, no commands shall be executed for the deleted lines.

If the remembered search direction is not set, the **global** and **v** commands shall set it to forward.

The **autoprint** and **autoindent** edit options shall be inhibited for the duration of the **g** or **v** command.

*Current line*: If no commands executed, set to the last marked line. Otherwise, as specified for the executed *ex* commands.

*Current column*: If no commands are executed, set to non-<blank>; otherwise, as specified for the individual *ex* commands.

14497      **Insert**14498      *Synopsis:*      [*laddr*] i[nsert] [!]14499      Enter *ex* text input mode; the input text shall be placed before the specified line. If the line is zero  
14500      or 1, the text shall be placed at the beginning of the edit buffer.14501      This command shall be affected by the **number** and **autoindent** edit options; following the  
14502      command name with '!' shall cause the **autoindent** edit option setting to be toggled for the  
14503      duration of this command only.14504      *Current line:* Set to the last input line; if no lines were input, set to the line before the specified  
14505      line, or to the first line of the edit buffer if there are no lines preceding the specified line, or zero  
14506      if the edit buffer is empty.14507      *Current column:* Set to non-<blank>.14508      **Join**14509      *Synopsis:*      [*2addr*] j[oin] [!] [*count*] [*flags*]14510      If *count* is specified:14511          If no address was specified, the **join** command shall behave as if *2addr* were the current line  
14512          and the current line plus *count* (.,. + *count*).14513          If one address was specified, the **join** command shall behave as if *2addr* were the specified  
14514          address and the specified address plus *count* (*addr*,*addr* + *count*).14515          If two addresses were specified, the **join** command shall behave as if an additional address,  
14516          equal to the last address plus *count* - 1 (*addr1*,*addr2*,*addr2* + *count* - 1), was specified.14517          If this would result in a second address greater than the last line of the edit buffer, it shall be  
14518          corrected to be equal to the last line of the edit buffer.14519      If no *count* is specified:14520          If no address was specified, the **join** command shall behave as if *2addr* were the current line  
14521          and the next line (.,. + 1).14522          If one address was specified, the **join** command shall behave as if *2addr* were the specified  
14523          address and the next line (*addr*,*addr* + 1).14524      Join the text from the specified lines together into a single line, which shall replace the specified  
14525      lines.14526      If a '!' character is appended to the command name, the **join** shall be without modification of  
14527      any line, independent of the current locale.14528      Otherwise, in the POSIX locale, set the current line to the first of the specified lines, and then, for  
14529      each subsequent line, proceed as follows:

- 14530          1. Discard leading <space>s from the line to be joined.
- 14531          2. If the line to be joined is now empty, delete it, and skip steps 3 through 5.
- 14532          3. If the current line ends in a <blank>, or the first character of the line to be joined is a ' ) ' character, join the lines without further modification.
- 14533          4. If the last character of the current line is a ' . ' , join the lines with two <space>s between them.
- 14534          5.
- 14535          6.

14536 5. Otherwise, join the lines with a single <space> between them.

14537 *Current line*: Set to the first line specified.

14538 *Current column*: Set to non-<blank>.

## 14539 **List**

14540 *Synopsis*: [2addr] l[ist] [count] [flags]

14541 This command shall be equivalent to the *ex* command:

14542 [2addr] p[rint] [count] l[flags]

14543 See **Print** (on page 380).

## 14544 **Map**

14545 *Synopsis*: map[!] [lhs rhs]

14546 If *lhs* and *rhs* are not specified:

- 14547 1. If '!' is specified, write the current list of text input mode maps.
- 14548 2. Otherwise, write the current list of command mode maps.
- 14549 3. Do nothing more.

14550 Implementations may restrict the set of characters accepted in *lhs* or *rhs*, except that printable  
 14551 characters and <blank>s shall not be restricted. Additional restrictions shall be implementation-  
 14552 defined. In both *lhs* and *rhs*, any character can be escaped with a <control>-V, in which case the  
 14553 character shall not be used to delimit *lhs* from *rhs*, and the escaping <control>-V shall be  
 14554 discarded.

14555 If the character '!' is appended to the **map** command name, the mapping shall be effective  
 14556 during open or visual text input mode rather than **open** or **visual** command mode. This allows  
 14557 *lhs* to have two different **map** definitions at the same time: one for command mode and one for  
 14558 text input mode.

14559 For command mode mappings:

14560 When the *lhs* is entered as any part of a *vi* command in open or visual mode (but not as part  
 14561 of the arguments to the command), the action shall be as if the corresponding *rhs* had been  
 14562 entered.

14563 If any character in the command, other than the first, is escaped using a <control>-V  
 14564 character, that character shall not be part of a match to an *lhs*.

14565 It is unspecified whether implementations shall support **map** commands where the *lhs* is  
 14566 more than a single character in length, where the first character of the *lhs* is printable.

14567 If *lhs* contains more than one character and the first character is '#', followed by a sequence  
 14568 of digits corresponding to a numbered function key, then when this function key is typed it  
 14569 shall be mapped to *rhs*. Characters other than digits following a '#' character also represent  
 14570 the function key named by the characters in the *lhs* following the '#' and may be mapped to  
 14571 *rhs*. It is unspecified how function keys are named or what function keys are supported.

14572 For text input mode mappings:

- 14573 When the *lhs* is entered as any part of text entered in open or visual text input modes, the  
14574 action shall be as if the corresponding *rhs* had been entered.
- 14575 If any character in the input text is escaped using a <control>-V character, that character shall  
14576 not be part of a match to an *lhs*.
- 14577 It is unspecified whether the *lhs* text entered for subsequent **map** or **unmap** commands is  
14578 replaced with the *rhs* text for the purposes of the screen display; regardless of whether or not  
14579 the display appears as if the corresponding *rhs* text was entered, the effect of the command  
14580 shall be as if the *lhs* text was entered.
- 14581 If only part of the *lhs* is entered, it is unspecified how long the editor will wait for additional,  
14582 possibly matching characters before treating the already entered characters as not matching the  
14583 *lhs*.
- 14584 The *rhs* characters shall themselves be subject to remapping, unless otherwise specified by the  
14585 **remap** edit option, except that if the characters in *lhs* occur as prefix characters in *rhs*, those  
14586 characters shall not be remapped.
- 14587 On block-mode terminals, the mapping need not occur immediately (for example, it may occur  
14588 after the terminal transmits a group of characters to the system), but it shall achieve the same  
14589 results as if it occurred immediately.
- 14590 *Current line*: Unchanged.
- 14591 *Current column*: Unchanged.
- 14592 **Mark**
- 14593 *Synopsis:*     [*laddr*] ma[*rk*] *character*  
14594               [*laddr*] k *character*
- 14595 Implementations shall support *character* values of a single lowercase letter of the POSIX locale  
14596 and the characters ' ' and ' '; support of other characters is implementation-defined.
- 14597 If executing the vi **m** command, set the specified mark to the current line and 1-based numbered  
14598 character referenced by the current column, if any; otherwise, column position 1.
- 14599 Otherwise, set the specified mark to the specified line and 1-based numbered first non-<blank>  
14600 non-<newline> in the line, if any; otherwise, the last non-<newline> in the line, if any; otherwise,  
14601 column position 1.
- 14602 The mark shall remain associated with the line until the mark is reset or the line is deleted. If a  
14603 deleted line is restored by a subsequent **undo** command, any marks previously associated with  
14604 the line, which have not been reset, shall be restored as well. Any use of a mark not associated  
14605 with a current line in the edit buffer shall be an error.
- 14606 The marks ' and ' shall be set as described previously, immediately before the following events  
14607 occur in the editor:
- 14608     1. The use of ' \$ ' as an *ex* address
  - 14609     2. The use of a positive decimal number as an *ex* address
  - 14610     3. The use of a search command as an *ex* address
  - 14611     4. The use of a mark reference as an *ex* address
  - 14612     5. The use of the following open and visual mode commands: <control>-], %, (, ), [, ], {, }
  - 14613     6. The use of the following open and visual mode commands: ', **G**, **H**, **L**, **M**, **z** if the current  
14614 line will change as a result of the command

7. The use of the open and visual mode commands: */*, *?*, **N**, *'*, **n** if the current line or column will change as a result of the command

8. The use of the ex mode commands: **z**, **undo**, **global**, **v**

For rules 1., 2., 3., and 4., the *'* and *'* marks shall not be set if the ex command is parsed as specified by rule 6.a. in **Command Line Parsing in ex** (on page 362).

For rules 5., 6., and 7., the *'* and *'* marks shall not be set if the commands are used as motion commands in open and visual mode.

For rules 1., 2., 3., 4., 5., 6., 7., and 8., the *'* and *'* marks shall not be set if the command fails.

The *'* and *'* marks shall be set as described previously, each time the contents of the edit buffer are replaced (including the editing of the initial buffer), if in open or visual mode, or if in **ex** mode and the edit buffer is not empty, before any commands or movements (including commands or movements specified by the **-c** or **-t** options or the **+command** argument) are executed on the edit buffer. If in open or visual mode, the marks shall be set as if executing the **vi m** command; otherwise, as if executing the ex **mark** command.

When changing from **ex** mode to open or visual mode, if the *'* and *'* marks are not already set, the *'* and *'* marks shall be set as described previously.

*Current line*: Unchanged.

*Current column*: Unchanged.

## Move

*Synopsis*:     [2addr] m[ove] 1addr [flags]

Move the specified lines after the specified destination line. A destination of line zero specifies that the lines shall be placed at the beginning of the edit buffer. It shall be an error if the destination line is within the range of lines to be moved.

*Current line*: Set to the last of the moved lines.

*Current column*: Set to non-<blank>.

## Next

*Synopsis*:     n[ext] [!] [+command] [file ...]

If no *' ! '* is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

If one or more files is specified:

1. Set the argument list to the specified filenames.
2. Set the current argument list reference to be the first entry in the argument list.
3. Set the current pathname to the first filename specified.

Otherwise:

1. It shall be an error if there are no more filenames in the argument list after the filename currently referenced.
2. Set the current pathname and the current argument list reference to the filename after the filename currently referenced in the argument list.

14654 Replace the contents of the edit buffer with the contents of the file named by the current  
 14655 pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be  
 14656 empty.

14657 This command shall be affected by the **autowrite** and **writeany** edit options.

14658 The *+command* option shall be <blank>-delimited; <blank>s can be escaped by preceding them  
 14659 with a backslash character. The *+command* shall be interpreted as an *ex* command immediately  
 14660 after the contents of the edit buffer have been replaced and the current line and column have  
 14661 been set.

14662 *Current line*: Set as described for the **edit** command.

14663 *Current column*: Set as described for the **edit** command.

## 14664 **Number**

14665 *Synopsis:*     [2addr] nu[mber] [count] [flags]  
 14666                 [2addr] #[count] [flags]

14667 These commands shall be equivalent to the *ex* command:

14668     [2addr] p[rint] [count] #[flags]

14669 See **Print** (on page 380).

## 14670 **Open**

14671 *Synopsis:*     [1addr] o[pen] /pattern/ [flags]

14672 This command need not be supported on block-mode terminals or terminals with insufficient  
 14673 capabilities. If standard input, standard output, or standard error are not terminal devices, the  
 14674 results are unspecified.

14675 Enter open mode.

14676 The trailing delimiter can be omitted from *pattern* at the end of the command line. If *pattern* is  
 14677 empty (for example, " // ") or not specified, the last regular expression used in the editor shall be  
 14678 used as the pattern. The pattern can be delimited by slashes (shown in the Synopsis), as well as  
 14679 any alphanumeric, or non-<blank> other than backslash, vertical line, double quote, or  
 14680 <newline>.

14681 *Current line*: Set to the specified line.

14682 *Current column*: Set to non-<blank>.

## 14683 **Preserve**

14684 *Synopsis:*     pre[serve]

14685 Save the edit buffer in a form that can later be recovered by using the **-r** option or by using the *ex*  
 14686 **recover** command. After the file has been preserved, a mail message shall be sent to the user.  
 14687 This message shall be readable by invoking the *mailx* utility. The message shall contain the name  
 14688 of the file, the time of preservation, and an *ex* command that could be used to recover the file.  
 14689 Additional information may be included in the mail message.

14690 *Current line*: Unchanged.

14691 *Current column*: Unchanged.

**Print**

*Synopsis:*     [2addr] p[rint] [count] [flags]

Write the addressed lines. The behavior is unspecified if the number of columns on the display is less than the number of columns required to write any single character in the lines being written.

Non-printable characters, except for the <tab>, shall be written as implementation-defined multi-character sequences.

If the # flag is specified or the **number** edit option is set, each line shall be preceded by its line number in the following format:

"%6dΔΔ", <line number>

If the **l** flag is specified or the **list** edit option is set:

1. The characters listed in the Base Definitions volume of IEEE Std 1003.1-2001, Table 5-1, Escape Sequences and Associated Actions shall be written as the corresponding escape sequence.
2. Non-printable characters not in the Base Definitions volume of IEEE Std 1003.1-2001, Table 5-1, Escape Sequences and Associated Actions shall be written as one three-digit octal number (with a preceding backslash) for each byte in the character (most significant byte first). If the size of a byte on the system is greater than 9 bits, the format used for non-printable characters is implementation-defined.
3. The end of each line shall be marked with a '\$', and literal '\$' characters within the line shall be written with a preceding backslash.

Long lines shall be folded; the length at which folding occurs is unspecified, but should be appropriate for the output terminal, considering the number of columns of the terminal.

If a line is folded, and the **l** flag is not specified and the **list** edit option is not set, it is unspecified whether a multi-column character at the folding position is separated; it shall not be discarded.

*Current line:* Set to the last written line.

*Current column:* Unchanged if the current line is unchanged; otherwise, set to non-<blank>.

**Put**

*Synopsis:*     [laddr] pu[t] [buffer]

Append text from the specified buffer (by default, the unnamed buffer) to the specified line; line zero specifies that the text shall be placed at the beginning of the edit buffer. Each portion of a line in the buffer shall become a new line in the edit buffer, regardless of the mode of the buffer.

*Current line:* Set to the last line entered into the edit buffer.

*Current column:* Set to non-<blank>.

**Quit**

*Synopsis:*     q[uit] [!]

If no '!' is appended to the command name:

1. If the edit buffer has been modified since the last complete write, it shall be an error.
2. If there are filenames in the argument list after the filename currently referenced, and the last command was not a **quit**, **wq**, **xit**, or **ZZ** (see **Exit** (on page 1022)) command, it shall be an error.

14732 Otherwise, terminate the editing session.

## 14733 **Read**

14734 *Synopsis:*     `[laddr] r[ead] [!] [file]`

14735 If '!' is not the first non-`<blank>` to follow the command name, a copy of the specified file shall  
 14736 be appended into the edit buffer after the specified line; line zero specifies that the copy shall be  
 14737 placed at the beginning of the edit buffer. The number of lines and bytes read shall be written. If  
 14738 no *file* is named, the current pathname shall be the default. If there is no current pathname, then  
 14739 *file* shall become the current pathname. If there is no current pathname or *file* operand, it shall be  
 14740 an error. Specifying a *file* that is not of type regular shall have unspecified results.

14741 Otherwise, if *file* is preceded by '!', the rest of the line after the '!' shall have '%', '#', and  
 14742 '!' characters expanded as described in **Command Line Parsing in ex** (on page 362).

14743 The *ex* utility shall then pass two arguments to the program named by the shell edit option; the  
 14744 first shall be `-c` and the second shall be the expanded arguments to the **read** command as a  
 14745 single argument. The standard input of the program shall be set to the standard input of the *ex*  
 14746 program when it was invoked. The standard error and standard output of the program shall be  
 14747 appended into the edit buffer after the specified line.

14748 Each line in the copied file or program output (as delimited by `<newline>`s or the end of the file  
 14749 or output if it is not immediately preceded by a `<newline>`), shall be a separate line in the edit  
 14750 buffer. Any occurrences of `<carriage-return>` and `<newline>` pairs in the output shall be treated  
 14751 as single `<newline>`s.

14752 The special meaning of the '!' following the **read** command can be overridden by escaping it  
 14753 with a backslash character.

14754 *Current line:* If no lines are added to the edit buffer, unchanged. Otherwise, if in open or visual  
 14755 mode, set to the first line entered into the edit buffer. Otherwise, set to the last line entered into  
 14756 the edit buffer.

14757 *Current column:* Set to non-`<blank>`.

## 14758 **Recover**

14759 *Synopsis:*     `rec[over] [!] file`

14760 If no '!' is appended to the command name, and the edit buffer has been modified since the  
 14761 last complete write, it shall be an error.

14762 If no *file* operand is specified, then the current pathname shall be used. If there is no current  
 14763 pathname or *file* operand, it shall be an error.

14764 If no recovery information has previously been saved about *file*, the **recover** command shall  
 14765 behave identically to the **edit** command, and an informational message to this effect shall be  
 14766 written.

14767 Otherwise, set the current pathname to *file*, and replace the current contents of the edit buffer  
 14768 with the recovered contents of *file*. If there are multiple instances of the file to be recovered, the  
 14769 one most recently saved shall be recovered, and an informational message that there are  
 14770 previous versions of the file that can be recovered shall be written. The editor shall behave as if  
 14771 the contents of the edit buffer have already been modified.

14772 *Current file:* Set as described for the **edit** command.

14773 *Current column:* Set as described for the **edit** command.

**Rewind**

*Synopsis:*     rew[ind] [!]

If no '!' is appended to the command name, and the edit buffer has been modified since the last complete write, it shall be an error, unless the file is successfully written as specified by the **autowrite** option.

If the argument list is empty, it shall be an error.

The current argument list reference and the current pathname shall be set to the first filename in the argument list.

Replace the contents of the edit buffer with the contents of the file named by the current pathname. If for any reason the contents of the file cannot be accessed, the edit buffer shall be empty.

This command shall be affected by the **autowrite** and **writeany** edit options.

*Current line:* Set as described for the **edit** command.

*Current column:* Set as described for the **edit** command.

**Set**

*Synopsis:*     se[t] [option[=*value*]] ... [nooption ...] [option? ...] [all]

When no arguments are specified, write the value of the **term** edit option and those options whose values have been changed from the default settings; when the argument *all* is specified, write all of the option values.

Giving an option name followed by the character '?' shall cause the current value of that option to be written. The '?' can be separated from the option name by zero or more <blank>s. The '?' shall be necessary only for Boolean valued options. Boolean options can be given values by the form **set option** to turn them on or **set nooption** to turn them off; string and numeric options can be assigned by the form **set option=value**. Any <blank>s in strings can be included as is by preceding each <blank> with an escaping backslash. More than one option can be set or listed by a single set command by specifying multiple arguments, each separated from the next by one or more <blank>s.

See **Edit Options in ex** (on page 392) for details about specific options.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Shell**

*Synopsis:*     sh[ell]

Invoke the program named in the **shell** edit option with the single argument **-i** (interactive mode). Editing shall be resumed when the program exits.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Source**

*Synopsis:*     `so[urce] file`

Read and execute *ex* commands from *file*. Lines in the file that are blank lines shall be ignored.

*Current line:* As specified for the individual *ex* commands.

*Current column:* As specified for the individual *ex* commands.

**Substitute**

*Synopsis:*     `[2addr] s[substitute] [/pattern/repl/[options] [count] [flags]]`  
                   `[2addr] &[options] [count] [flags]`  
                   `[2addr] ~[options] [count] [flags]`

Replace the first instance of the pattern *pattern* by the string *repl* on each specified line. (See **Regular Expressions in ex** (on page 391) and **Replacement Strings in ex** (on page 391).) Any non-alphabetic, non-`<blank>` delimiter other than `'\'`, `'|'`, double quote, or `<newline>` can be used instead of `'/'`. Backslash characters can be used to escape delimiters, backslash characters, and other special characters.

The trailing delimiter can be omitted from *pattern* or from *repl* at the end of the command line. If both *pattern* and *repl* are not specified or are empty (for example, `"/"/`), the last **s** command shall be repeated. If only *pattern* is not specified or is empty, the last regular expression used in the editor shall be used as the pattern. If only *repl* is not specified or is empty, the pattern shall be replaced by nothing. If the entire replacement pattern is `'%'`, the last replacement pattern to an **s** command shall be used.

Entering a `<carriage-return>` in *repl* (which requires an escaping backslash in *ex* mode and an escaping `<control>-V` in open or *vi* mode) shall split the line at that point, creating a new line in the edit buffer. The `<carriage-return>` shall be discarded.

If *options* includes the letter `'g'` (**global**), all non-overlapping instances of the pattern in the line shall be replaced.

If *options* includes the letter `'c'` (**confirm**), then before each substitution the line shall be written; the written line shall reflect all previous substitutions. On the following line, `<space>s` shall be written beneath the characters from the line that are before the *pattern* to be replaced, and `'^'` characters written beneath the characters included in the *pattern* to be replaced. The *ex* utility shall then wait for a response from the user. An affirmative response shall cause the substitution to be done, while any other input shall not make the substitution. An affirmative response shall consist of a line with the affirmative response (as defined by the current locale) at the beginning of the line. This line shall be subject to editing in the same way as the *ex* command line.

If interrupted (see the ASYNCHRONOUS EVENTS section), any modifications confirmed by the user shall be preserved in the edit buffer after the interrupt.

If the remembered search direction is not set, the **s** command shall set it to forward.

In the second Synopsis, the **&** command shall repeat the previous substitution, as if the **&** command were replaced by:

`s/pattern/repl/`

where *pattern* and *repl* are as specified in the previous **s**, **&**, or **~** command.

In the third Synopsis, the **~** command shall repeat the previous substitution, as if the `'~'` were replaced by:

14852 *s/pattern/repl/*

14853 where *pattern* shall be the last regular expression specified to the editor, and *repl* shall be from  
14854 the previous substitution (including **&** and **~**) command.

14855 These commands shall be affected by the *LC\_MESSAGES* environment variable.

14856 *Current line*: Set to the last line in which a substitution occurred, or, unchanged if no  
14857 substitution occurred.

14858 *Current column*: Set to non-<blank>.

## 14859 **Suspend**

14860 *Synopsis:*     su [spend] [!]  
14861               st [op] [!]

14862 Allow control to return to the invoking process; *ex* shall suspend itself as if it had received the  
14863 SIGTSTP signal. The suspension shall occur only if job control is enabled in the invoking shell  
14864 (see the description of *set -m*).

14865 These commands shall be affected by the **autowrite** and **writeany** edit options.

14866 The current **susp** character (see *stty*) shall be equivalent to the **suspend** command.

## 14867 **Tag**

14868 *Synopsis:*     ta [g] [!] *tagstring*

14869 The results are unspecified if the format of a tags file is not as specified by the *ctags* utility (see  
14870 *ctags*) description.

14871 The **tag** command shall search for *tagstring* in the tag files referred to by the **tag** edit option, in  
14872 the order they are specified, until a reference to *tagstring* is found. Files shall be searched from  
14873 beginning to end. If no reference is found, it shall be an error and an error message to this effect  
14874 shall be written. If the reference is not found, or if an error occurs while processing a file referred  
14875 to in the **tag** edit option, it shall be an error, and an error message shall be written at the first  
14876 occurrence of such an error.

14877 Otherwise, if the tags file contained a pattern, the pattern shall be treated as a regular expression  
14878 used in the editor; for example, for the purposes of the **s** command.

14879 If the *tagstring* is in a file with a different name than the current pathname, set the current  
14880 pathname to the name of that file, and replace the contents of the edit buffer with the contents of  
14881 that file. In this case, if no '!' is appended to the command name, and the edit buffer has been  
14882 modified since the last complete write, it shall be an error, unless the file is successfully written  
14883 as specified by the **autowrite** option.

14884 This command shall be affected by the **autowrite**, **tag**, **taglength**, and **writeany** edit options.

14885 *Current line*: If the tags file contained a line number, set to that line number. If the line number is  
14886 larger than the last line in the edit buffer, an error message shall be written and the current line  
14887 shall be set as specified for the **edit** command.

14888 If the tags file contained a pattern, set to the first occurrence of the pattern in the file. If no  
14889 matching pattern is found, an error message shall be written and the current line shall be set as  
14890 specified for the **edit** command.

14891 *Current column*: If the tags file contained a line-number reference and that line-number was not  
14892 larger than the last line in the edit buffer, or if the tags file contained a pattern and that pattern  
14893 was found, set to non-<blank>. Otherwise, set as specified for the **edit** command.

**Unabbreviate**

*Synopsis:*     una[bbrev] lhs

If *lhs* is not an entry in the current list of abbreviations (see **Abbreviate** (on page 370)), it shall be an error. Otherwise, delete *lhs* from the list of abbreviations.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Undo**

*Synopsis:*     u[ndo]

Reverse the changes made by the last command that modified the contents of the edit buffer, including **undo**. For this purpose, the **global**, **v**, **open**, and **visual** commands, and commands resulting from buffer executions and mapped character expansions, are considered single commands.

If no action that can be undone preceded the **undo** command, it shall be an error.

If the **undo** command restores lines that were marked, the mark shall also be restored unless it was reset subsequent to the deletion of the lines.

*Current line:*

1. If lines are added or changed in the file, set to the first line added or changed.
2. Set to the line before the first line deleted, if it exists.
3. Set to 1 if the edit buffer is not empty.
4. Set to zero.

*Current column:* Set to non-<blank>.

**Unmap**

*Synopsis:*     unm[ap] [!] lhs

If '!' is appended to the command name, and if *lhs* is not an entry in the list of text input mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of text input mode map definitions.

If no '!' is appended to the command name, and if *lhs* is not an entry in the list of command mode map definitions, it shall be an error. Otherwise, delete *lhs* from the list of command mode map definitions.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Version**

*Synopsis:*     ve[rsion]

Write a message containing version information for the editor. The format of the message is unspecified.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Visual**

*Synopsis:*     [*laddr*] vi[*sual*] [*type*] [*count*] [*flags*]

If *ex* is currently in open or visual mode, the Synopsis and behavior of the visual command shall be the same as the **edit** command, as specified by **Edit** (on page 372).

Otherwise, this command need not be supported on block-mode terminals or terminals with insufficient capabilities. If standard input, standard output, or standard error are not terminal devices, the results are unspecified.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window** (on page 398)). If the '^' type character was also specified, the **window** edit option shall be set before being used by the type character.

Enter visual mode. If *type* is not specified, it shall be as if a *type* of '+' was specified. The *type* shall cause the following effects:

- + Place the beginning of the specified line at the top of the display.
- Place the end of the specified line at the bottom of the display.
- . Place the beginning of the specified line in the middle of the display.
- ^ If the specified line is less than or equal to the value of the **window** edit option, set the line to 1; otherwise, decrement the line by the value of the **window** edit option minus 1. Place the beginning of this line as close to the bottom of the displayed lines as possible, while still displaying the value of the **window** edit option number of lines.

*Current line:* Set to the specified line.

*Current column:* Set to non-<blank>.

**Write**

*Synopsis:*     [*2addr*] w[*rite*] [!] [>>] [*file*]  
                   [*2addr*] w[*rite*] [!] [*file*]  
                   [*2addr*] wq[!] [>>] [*file*]

If no lines are specified, the lines shall default to the entire file.

The command **wq** shall be equivalent to a **write** command followed by a **quit** command; **wq!** shall be equivalent to **write!** followed by **quit**. In both cases, if the **write** command fails, the **quit** shall not be attempted.

If the command name is not followed by one or more <blank>s, or *file* is not preceded by a '!' character, the **write** shall be to a file.

1. If the >> argument is specified, and the file already exists, the lines shall be appended to the file instead of replacing its contents. If the >> argument is specified, and the file does not already exist, it is unspecified whether the write shall proceed as if the >> argument had not been specified or if the write shall fail.
2. If the **readonly** edit option is set (see **readonly** (on page 395)), the **write** shall fail.
3. If *file* is specified, and is not the current pathname, and the file exists, the **write** shall fail.
4. If *file* is not specified, the current pathname shall be used. If there is no current pathname, the **write** command shall fail.
5. If the current pathname is used, and the current pathname has been changed by the **file** or **read** commands, and the file exists, the **write** shall fail. If the **write** is successful,

14972 subsequent **writes** shall not fail for this reason (unless the current pathname is changed  
14973 again).

14974 6. If the whole edit buffer is not being written, and the file to be written exists, the **write** shall  
14975 fail.

14976 For rules 1., 2., 4., and 5., the **write** can be forced by appending the character **'!'** to the  
14977 command name.

14978 For rules 2., 4., and 5., the **write** can be forced by setting the **writeany** edit option.

14979 Additional, implementation-defined tests may cause the **write** to fail.

14980 If the edit buffer is empty, a file without any contents shall be written.

14981 An informational message shall be written noting the number of lines and bytes written.

14982 Otherwise, if the command is followed by one or more <blank>s, and the file is preceded by  
14983 **'!'**, the rest of the line after the **'!'** shall have **'%'**, **'#'**, and **'!'** characters expanded as  
14984 described in **Command Line Parsing in ex** (on page 362).

14985 The *ex* utility shall then pass two arguments to the program named by the **shell** edit option; the  
14986 first shall be **-c** and the second shall be the expanded arguments to the **write** command as a  
14987 single argument. The specified lines shall be written to the standard input of the command. The  
14988 standard error and standard output of the program, if any, shall be written as described for the  
14989 **print** command. If the last character in that output is not a <newline>, a <newline> shall be  
14990 written at the end of the output.

14991 The special meaning of the **'!'** following the **write** command can be overridden by escaping it  
14992 with a backslash character.

14993 *Current line:* Unchanged.

14994 *Current column:* Unchanged.

## 14995 **Write and Exit**

14996 *Synopsis:*     [2addr] x[it] [!] [file]

14997 If the edit buffer has not been modified since the last complete **write**, **xit** shall be equivalent to  
14998 the **quit** command, or if a **'!'** is appended to the command name, to **quit!**.

14999 Otherwise, **xit** shall be equivalent to the **wq** command, or if a **'!'** is appended to the command  
15000 name, to **wq!**.

15001 *Current line:* Unchanged.

15002 *Current column:* Unchanged.

## 15003 **Yank**

15004 *Synopsis:*     [2addr] ya[nk] [buffer] [count]

15005 Copy the specified lines to the specified buffer (by default, the unnamed buffer), which shall  
15006 become a line-mode buffer.

15007 *Current line:* Unchanged.

15008 *Current column:* Unchanged.

**Adjust Window**

*Synopsis:*     [*laddr*] *z*[!][*type* ...][*count*][*flags*]

If no line is specified, the current line shall be the default; if *type* is omitted as well, the current line value shall first be incremented by 1. If incrementing the current line would cause it to be greater than the last line in the edit buffer, it shall be an error.

If there are <blank>s between the *type* argument and the preceding **z** command name or optional '!' character, it shall be an error.

If *count* is specified, the value of the **window** edit option shall be set to *count* (as described in **window** (on page 398)). If *count* is omitted, it shall default to 2 times the value of the **scroll** edit option, or if ! was specified, the number of lines in the display minus 1.

If *type* is omitted, then *count* lines starting with the specified line shall be written. Otherwise, *count* lines starting with the line specified by the *type* argument shall be written.

The *type* argument shall change the lines to be written. The possible values of *type* are as follows:

- The specified line shall be decremented by the following value:

$((\text{number of ``-'' characters}) \times \text{count}) - 1$

If the calculation would result in a number less than 1, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

- + The specified line shall be incremented by the following value:

$((\text{number of ``+'' characters}) - 1) \times \text{count} + 1$

If the calculation would result in a number greater than the last line in the edit buffer, it shall be an error. Write lines from the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit buffer has been written.

- =, . If more than a single '.' or '=' is specified, it shall be an error. The following steps shall be taken:

1. If *count* is zero, nothing shall be written.
2. Write as many of the *N* lines before the current line in the edit buffer as exist. If *count* or '!' was specified, *N* shall be:

$(\text{count} - 1) / 2$

Otherwise, *N* shall be:

$(\text{count} - 3) / 2$

If *N* is a number less than 3, no lines shall be written.

3. If '=' was specified as the type character, write a line consisting of the smaller of the number of columns in the display divided by two, or 40 '-' characters.
4. Write the current line.
5. Repeat step 3.
6. Write as many of the *N* lines after the current line in the edit buffer as exist. *N* shall be defined as in step 2. If *N* is a number less than 3, no lines shall be written. If *count* is less than 3, no lines shall be written.

15048        ^    The specified line shall be decremented by the following value:

15049         $((\text{number of ``^'' characters}) + 1) \times \text{count} - 1$

15050        If the calculation would result in a number less than 1, it shall be an error. Write lines from

15051        the edit buffer, starting at the new value of line, until *count* lines or the last line in the edit

15052        buffer has been written.

15053        *Current line*: Set to the last line written, unless the type is =, in which case, set to the specified

15054        line.

15055        *Current column*: Set to non-<blank>.

15056        **Escape**

15057        *Synopsis*:        ! *command*

15058                       [*addr*] ! *command*

15059        The contents of the line after the '!' shall have '%', '#', and '!' characters expanded as

15060        described in **Command Line Parsing in ex** (on page 362). If the expansion causes the text of the

15061        line to change, it shall be redisplayed, preceded by a single '!' character.

15062        The *ex* utility shall execute the program named by the **shell** edit option. It shall pass two

15063        arguments to the program; the first shall be **-c**, and the second shall be the expanded arguments

15064        to the ! command as a single argument.

15065        If no lines are specified, the standard input, standard output, and standard error of the program

15066        shall be set to the standard input, standard output, and standard error of the *ex* program when it

15067        was invoked. In addition, a warning message shall be written if the edit buffer has been

15068        modified since the last complete write, and the **warn** edit option is set.

15069        If lines are specified, they shall be passed to the program as standard input, and the standard

15070        output and standard error of the program shall replace those lines in the edit buffer. Each line in

15071        the program output (as delimited by <newline>s or the end of the output if it is not immediately

15072        preceded by a <newline>), shall be a separate line in the edit buffer. Any occurrences of

15073        <carriage-return> and <newline> pairs in the output shall be treated as single <newline>s. The

15074        specified lines shall be copied into the unnamed buffer before they are replaced, and the

15075        unnamed buffer shall become a line-mode buffer.

15076        If in *ex* mode, a single '!' character shall be written when the program completes.

15077        This command shall be affected by the **shell** and **warn** edit options. If no lines are specified, this

15078        command shall be affected by the **autowrite** and **writeany** edit options. If lines are specified, this

15079        command shall be affected by the **autoprint** edit option.

15080        *Current line*:

15081               1. If no lines are specified, unchanged.

15082               2. Otherwise, set to the last line read in, if any lines are read in.

15083               3. Otherwise, set to the line before the first line of the lines specified, if that line exists.

15084               4. Otherwise, set to the first line of the edit buffer if the edit buffer is not empty.

15085               5. Otherwise, set to zero.

15086        *Current column*: If no lines are specified, unchanged. Otherwise, set to non-<blank>.

**Shift Left**

*Synopsis:*     [2addr] <[< ...] [count] [flags]

Shift the specified lines to the start of the line; the number of column positions to be shifted shall be the number of command characters times the value of the **shiftwidth** edit option. Only leading <blank>s shall be deleted or changed into other <blank>s in shifting; other characters shall not be affected.

Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode buffer.

This command shall be affected by the **autoprint** edit option.

*Current line:* Set to the last line in the lines specified.

*Current column:* Set to non-<blank>.

**Shift Right**

*Synopsis:*     [2addr] >[> ...] [count] [flags]

Shift the specified lines away from the start of the line; the number of column positions to be shifted shall be the number of command characters times the value of the **shiftwidth** edit option. The shift shall be accomplished by adding <blank>s as a prefix to the line or changing leading <blank>s into other <blank>s. Empty lines shall not be changed.

Lines to be shifted shall be copied into the unnamed buffer, which shall become a line-mode buffer.

This command shall be affected by the **autoprint** edit option.

*Current line:* Set to the last line in the lines specified.

*Current column:* Set to non-<blank>.

**<control>-D**

*Synopsis:*     <control>-D

Write the next *n* lines, where *n* is the minimum of the values of the **scroll** edit option and the number of lines after the current line in the edit buffer. If the current line is the last line of the edit buffer it shall be an error.

*Current line:* Set to the last line written.

*Current column:* Set to non-<blank>.

**Write Line Number**

*Synopsis:*     [1addr] = [flags]

If *line* is not specified, it shall default to the last line in the edit buffer. Write the line number of the specified line.

*Current line:* Unchanged.

*Current column:* Unchanged.

**Execute**

Synopsis:     [2addr] @ *buffer*  
               [2addr] \* *buffer*

If no buffer is specified or is specified as '@' or '\*', the last buffer executed shall be used. If no previous buffer has been executed, it shall be an error.

For each line specified by the addresses, set the current line ('.') to the specified line, and execute the contents of the named *buffer* (as they were at the time the @ command was executed) as *ex* commands. For each line of a line-mode buffer, and all but the last line of a character-mode buffer, the *ex* command parser shall behave as if the line was terminated by a <newline>.

If an error occurs during this process, or a line specified by the addresses does not exist when the current line would be set to it, or more than a single line was specified by the addresses, and the contents of the edit buffer are replaced (for example, by the *ex* :**edit** command) an error message shall be written, and no more commands resulting from the execution of this command shall be processed.

*Current line*: As specified for the individual *ex* commands.

*Current column*: As specified for the individual *ex* commands.

**Regular Expressions in ex**

The *ex* utility shall support regular expressions that are a superset of the basic regular expressions described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions. A null regular expression ("/") shall be equivalent to the last regular expression encountered.

Regular expressions can be used in addresses to specify lines and, in some commands (for example, the **substitute** command), to specify portions of a line to be substituted.

The following constructs can be used to enhance the basic regular expressions:

\< Match the beginning of a *word*. (See the definition of *word* at the beginning of **Command Descriptions in ex** (on page 368).)

\> Match the end of a *word*.

~ Match the replacement part of the last **substitute** command. The tilde ('~') character can be escaped in a regular expression to become a normal character with no special meaning. The backslash shall be discarded.

When the editor option **magic** is not set, the only characters with special meanings shall be '^' at the beginning of a pattern, '\$' at the end of a pattern, and '\'. The characters '.', '\*', '[', and '~' shall be treated as ordinary characters unless preceded by a '\'; when preceded by a '\' they shall regain their special meaning, or in the case of backslash, be handled as a single backslash. Backslashes used to escape other characters shall be discarded.

**Replacement Strings in ex**

The character '&' ('\&' if the editor option **magic** is not set) in the replacement string shall stand for the text matched by the pattern to be replaced. The character '~' ('\~' if **magic** is not set) shall be replaced by the replacement part of the previous **substitute** command. The sequence '\n', where *n* is an integer, shall be replaced by the text matched by the pattern enclosed in the *n*th set of parentheses '\(' and '\)'.

The strings '\l', '\u', '\L', and '\U' can be used to modify the case of elements in the replacement string (using the '\&' or "\"digit) notation. The string '\l' ('\u') shall cause

15165 the character that follows to be converted to lowercase (uppercase). The string '`\L`' ('`\U`')  
 15166 shall cause all characters subsequent to it to be converted to lowercase (uppercase) as they are  
 15167 inserted by the substitution until the string '`\e`' or '`\E`', or the end of the replacement string,  
 15168 is encountered.

15169 Otherwise, any character following a backslash shall be treated as that literal character, and the  
 15170 escaping backslash shall be discarded.

15171 An example of case conversion with the **s** command is as follows:

```
15172 :p
15173 The cat sat on the mat.
15174 :s/\<.at\>/\u&/gp
15175 The Cat Sat on the Mat.
15176 :s/S\ (. *\) M/S\U\1\eM/p
15177 The Cat SAT ON THE Mat.
```

## 15178 Edit Options in ex

15179 The *ex* utility has a number of options that modify its behavior. These options have default  
 15180 settings, which can be changed using the **set** command.

15181 Options are Boolean unless otherwise specified.

### 15182 **autoindent, ai**

15183 [Default *unset*]

15184 If **autoindent** is set, each line in input mode shall be indented (using first as many `<tab>`s as  
 15185 possible, as determined by the editor option **tabstop**, and then using `<space>`s) to align with  
 15186 another line, as follows:

- 15187 1. If in open or visual mode and the text input is part of a line-oriented command (see the  
 15188 EXTENDED DESCRIPTION in *vi*), align to the first column.
- 15189 2. Otherwise, if in open or visual mode, indentation for each line shall be set as follows:
  - 15190 a. If a line was previously inserted as part of this command, it shall be set to the  
 15191 indentation of the last inserted line by default, or as otherwise specified for the  
 15192 `<control>-D` character in **Input Mode Commands in vi** (on page 1022).
  - 15193 b. Otherwise, it shall be set to the indentation of the previous current line, if any;  
 15194 otherwise, to the first column.
- 15195 3. For the *ex* **a**, **i**, and **c** commands, indentation for each line shall be set as follows:
  - 15196 a. If a line was previously inserted as part of this command, it shall be set to the  
 15197 indentation of the last inserted line by default, or as otherwise specified for the *eof*  
 15198 character in **Scroll** (on page 366).
  - 15199 b. Otherwise, if the command is the *ex* **a** command, it shall be set to the line appended  
 15200 after, if any; otherwise to the first column.
  - 15201 c. Otherwise, if the command is the *ex* **i** command, it shall be set to the line inserted  
 15202 before, if any; otherwise to the first column.
  - 15203 d. Otherwise, if the command is the *ex* **c** command, it shall be set to the indentation of  
 15204 the line replaced.

15205      **autoprint, ap**15206      [Default *set*]

15207      If **autoprint** is set, the current line shall be written after each **ex** command that modifies the  
 15208      contents of the current edit buffer, and after each **tag** command for which the tag search pattern  
 15209      was found or tag line number was valid, unless:

- 15210          1. The command was executed while in open or visual mode.
- 15211          2. The command was executed as part of a **global** or **v** command or **@** buffer execution.
- 15212          3. The command was the form of the **read** command that reads a file into the edit buffer.
- 15213          4. The command was the **append**, **change**, or **insert** command.
- 15214          5. The command was not terminated by a <newline>.
- 15215          6. The current line shall be written by a flag specified to the command; for example, **delete #**  
 15216          shall write the current line as specified for the flag modifier to the **delete** command, and  
 15217          not as specified by the **autoprint** edit option.

15218      **autowrite, aw**15219      [Default *unset*]

15220      If **autowrite** is set, and the edit buffer has been modified since it was last completely written to  
 15221      any file, the contents of the edit buffer shall be written as if the **ex write** command had been  
 15222      specified without arguments, before each command affected by the **autowrite** edit option is  
 15223      executed. Appending the character '!' to the command name of any of the **ex** commands  
 15224      except '!' shall prevent the write. If the write fails, it shall be an error and the command shall  
 15225      not be executed.

15226      **beautify, bf**15227 xSI      [Default *unset*]

15228      If **beautify** is set, all non-printable characters, other than <tab>s, <newline>s, and <form-feed>s,  
 15229      shall be discarded from text read in from files.

15230      **directory, dir**15231      [Default *implementation-defined*]

15232      The value of this option specifies the directory in which the editor buffer is to be placed. If this  
 15233      directory is not writable by the user, the editor shall quit.

15234      **edcompatible, ed**15235      [Default *unset*]

15236      Causes the presence of **g** and **c** suffixes on substitute commands to be remembered, and toggled  
 15237      by repeating the suffixes.

|       |                                                                                                                                        |
|-------|----------------------------------------------------------------------------------------------------------------------------------------|
| 15238 | <b>errorbells, eb</b>                                                                                                                  |
| 15239 | [Default <i>unset</i> ]                                                                                                                |
| 15240 | If the editor is in <b>ex</b> mode, and the terminal does not support a standout mode (such as inverse                                 |
| 15241 | video), and <b>errorbells</b> is set, error messages shall be preceded by alerting the terminal.                                       |
| 15242 | <b>exrc</b>                                                                                                                            |
| 15243 | [Default <i>unset</i> ]                                                                                                                |
| 15244 | If <b>exrc</b> is set, <i>ex</i> shall access any <b>.exrc</b> file in the current directory, as described in <b>Initialization in</b> |
| 15245 | <b>ex and vi</b> (on page 358). If <b>exrc</b> is not set, <i>ex</i> shall ignore any <b>.exrc</b> file in the current directory       |
| 15246 | during initialization, unless the current directory is that named by the <i>HOME</i> environment                                       |
| 15247 | variable.                                                                                                                              |
| 15248 | <b>ignorecase, ic</b>                                                                                                                  |
| 15249 | [Default <i>unset</i> ]                                                                                                                |
| 15250 | If <b>ignorecase</b> is set, characters that have uppercase and lowercase representations shall have                                   |
| 15251 | those representations considered as equivalent for purposes of regular expression comparison.                                          |
| 15252 | The <b>ignorecase</b> edit option shall affect all remembered regular expressions; for example,                                        |
| 15253 | unsetting the <b>ignorecase</b> edit option shall cause a subsequent <b>vi n</b> command to search for the                             |
| 15254 | last basic regular expression in a case-sensitive fashion.                                                                             |
| 15255 | <b>list</b>                                                                                                                            |
| 15256 | [Default <i>unset</i> ]                                                                                                                |
| 15257 | If <b>list</b> is set, edit buffer lines written while in <i>ex</i> command mode shall be written as specified for                     |
| 15258 | the <b>print</b> command with the <b>l</b> flag specified. In open or visual mode, each edit buffer line shall                         |
| 15259 | be displayed as specified for the <i>ex</i> <b>print</b> command with the <b>l</b> flag specified. In open or visual                   |
| 15260 | text input mode, when the cursor does not rest on any character in the line, it shall rest on the                                      |
| 15261 | ' <b>\$</b> ' marking the end of the line.                                                                                             |
| 15262 | <b>magic</b>                                                                                                                           |
| 15263 | [Default <i>set</i> ]                                                                                                                  |
| 15264 | If <b>magic</b> is set, modify the interpretation of characters in regular expressions and substitution                                |
| 15265 | replacement strings (see <b>Regular Expressions in ex</b> (on page 391) and <b>Replacement Strings in</b>                              |
| 15266 | <b>ex</b> (on page 391)).                                                                                                              |
| 15267 | <b>mesg</b>                                                                                                                            |
| 15268 | [Default <i>set</i> ]                                                                                                                  |
| 15269 | If <b>mesg</b> is set, the permission for others to use the <b>write</b> or <b>talk</b> commands to write to the                       |
| 15270 | terminal shall be turned on while in open or visual mode. The shell-level command <i>mesg n</i> shall                                  |
| 15271 | take precedence over any setting of the <i>ex</i> <b>mesg</b> option; that is, if <b>mesg y</b> was issued before the                  |
| 15272 | editor started (or in a shell escape), such as:                                                                                        |
| 15273 | :! <b>mesg y</b>                                                                                                                       |
| 15274 | the <b>mesg</b> option in <i>ex</i> shall suppress incoming messages, but the <b>mesg</b> option shall not enable                      |
| 15275 | incoming messages if <b>mesg n</b> was issued.                                                                                         |

## 15276 **number, nu**

15277 [Default *unset*]

15278 If **number** is set, edit buffer lines written while in *ex* command mode shall be written with line  
 15279 numbers, in the format specified by the **print** command with the **#** flag specified. In *ex* text input  
 15280 mode, each line shall be preceded by the line number it will have in the file.

15281 In open or visual mode, each edit buffer line shall be displayed with a preceding line number, in  
 15282 the format specified by the *ex* **print** command with the **#** flag specified. This line number shall  
 15283 not be considered part of the line for the purposes of evaluating the current column; that is,  
 15284 column position 1 shall be the first column position after the format specified by the **print**  
 15285 command.

## 15286 **paragraphs, para**

15287 [Default in the POSIX locale `IPLPPPQPP LIpplpipbp`]

15288 The **paragraphs** edit option shall define additional paragraph boundaries for the open and visual  
 15289 mode commands. The **paragraphs** edit option can be set to a character string consisting of zero  
 15290 or more character pairs. It shall be an error to set it to an odd number of characters.

## 15291 **prompt**

15292 [Default *set*]

15293 If **prompt** is set, *ex* command mode input shall be prompted for with a colon (`:`); when unset,  
 15294 no prompt shall be written.

## 15295 **readonly**

15296 [Default *see text*]

15297 If the **readonly** edit option is set, read-only mode shall be enabled (see **Write** (on page 386)). The  
 15298 **readonly** edit option shall be initialized to set if either of the following conditions are true:

- 15299 • The command-line option `-R` was specified.
- 15300 • Performing actions equivalent to the `access()` function called with the following arguments  
 15301 indicates that the file lacks write permission:
  - 15302 1. The current pathname is used as the *path* argument.
  - 15303 2. The constant **W\_OK** is used as the *amode* argument.

15304 The **readonly** edit option may be initialized to set for other, implementation-defined reasons.  
 15305 The **readonly** edit option shall not be initialized to unset based on any special privileges of the  
 15306 user or process. The **readonly** edit option shall be reinitialized each time that the contents of the  
 15307 edit buffer are replaced (for example, by an **edit** or **next** command) unless the user has explicitly  
 15308 set it, in which case it shall remain set until the user explicitly unsets it. Once unset, it shall again  
 15309 be reinitialized each time that the contents of the edit buffer are replaced.

|       |                                                                                                                                                         |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15310 | <b>redraw</b>                                                                                                                                           |
| 15311 | [Default <i>unset</i> ]                                                                                                                                 |
| 15312 | The editor simulates an intelligent terminal on a dumb terminal. (Since this is likely to require a                                                     |
| 15313 | large amount of output to the terminal, it is useful only at high transmission speeds.)                                                                 |
| 15314 | <b>remap</b>                                                                                                                                            |
| 15315 | [Default <i>set</i> ]                                                                                                                                   |
| 15316 | If <b>remap</b> is set, map translation shall allow for maps defined in terms of other maps; translation                                                |
| 15317 | shall continue until a final product is obtained. If unset, only a one-step translation shall be done.                                                  |
| 15318 | <b>report</b>                                                                                                                                           |
| 15319 | [Default 5]                                                                                                                                             |
| 15320 | The value of this <b>report</b> edit option specifies what number of lines being added, copied, deleted,                                                |
| 15321 | or modified in the edit buffer will cause an informational message to be written to the user. The                                                       |
| 15322 | following conditions shall cause an informational message. The message shall contain the                                                                |
| 15323 | number of lines added, copied, deleted, or modified, but is otherwise unspecified.                                                                      |
| 15324 | • An <i>ex</i> or <i>vi</i> editor command, other than <b>open</b> , <b>undo</b> , or <b>visual</b> , that modifies at least the value                  |
| 15325 | of the <b>report</b> edit option number of lines, and which is not part of an <i>ex</i> <b>global</b> or <b>v</b>                                       |
| 15326 | command, or <i>ex</i> or <i>vi</i> buffer execution, shall cause an informational message to be written.                                                |
| 15327 | • An <i>ex</i> <b>yank</b> or <i>vi</i> <b>y</b> or <b>Y</b> command, that copies at least the value of the <b>report</b> edit option plus              |
| 15328 | 1 number of lines, and which is not part of an <i>ex</i> <b>global</b> or <b>v</b> command, or <i>ex</i> or <i>vi</i> buffer                            |
| 15329 | execution, shall cause an informational message to be written.                                                                                          |
| 15330 | • An <i>ex</i> <b>global</b> , <b>v</b> , <b>open</b> , <b>undo</b> , or <b>visual</b> command or <i>ex</i> or <i>vi</i> buffer execution, that adds or |
| 15331 | deletes a total of at least the value of the <b>report</b> edit option number of lines, and which is not                                                |
| 15332 | part of an <i>ex</i> <b>global</b> or <b>v</b> command, or <i>ex</i> or <i>vi</i> buffer execution, shall cause an informational                        |
| 15333 | message to be written. (For example, if 3 lines were added and 8 lines deleted during an <i>ex</i>                                                      |
| 15334 | <b>visual</b> command, 5 would be the number compared against the <b>report</b> edit option after the                                                   |
| 15335 | command completed.)                                                                                                                                     |
| 15336 | <b>scroll, scr</b>                                                                                                                                      |
| 15337 | [Default (number of lines in the display −1)/2]                                                                                                         |
| 15338 | The value of the <b>scroll</b> edit option shall determine the number of lines scrolled by the <i>ex</i>                                                |
| 15339 | <control>-D and <b>z</b> commands. For the <i>vi</i> <control>-D and <control>-U commands, it shall be the                                              |
| 15340 | initial number of lines to scroll when no previous <control>-D or <control>-U command has                                                               |
| 15341 | been executed.                                                                                                                                          |
| 15342 | <b>sections</b>                                                                                                                                         |
| 15343 | [Default in the POSIX locale <code>NHSHH HUnhsh</code> ]                                                                                                |
| 15344 | The <b>sections</b> edit option shall define additional section boundaries for the open and visual mode                                                 |
| 15345 | commands. The <b>sections</b> edit option can be set to a character string consisting of zero or more                                                   |
| 15346 | character pairs; it shall be an error to set it to an odd number of characters.                                                                         |

**15347 shell, sh**

15348 [Default from the environment variable *SHELL*]

15349 The value of this option shall be a string. The default shall be taken from the *SHELL*  
15350 environment variable. If the *SHELL* environment variable is null or empty, the *sh* (see *sh*) utility  
15351 shall be the default.

**15352 shiftwidth, sw**

15353 [Default 8]

15354 The value of this option shall give the width in columns of an indentation level used during  
15355 autoindentation and by the shift commands (< and >).

**15356 showmatch, sm**

15357 [Default *unset*]

15358 The functionality described for the **showmatch** edit option need not be supported on block-  
15359 mode terminals or terminals with insufficient capabilities.

15360 If **showmatch** is set, in open or visual mode, when a ' ' or '}' is typed, if the matching ' ( ' or  
15361 ' { ' is currently visible on the display, the matching ' ( ' or ' { ' shall be flagged moving the  
15362 cursor to its location for an unspecified amount of time.

**15363 showmode**

15364 [Default *unset*]

15365 If **showmode** is set, in open or visual mode, the current mode that the editor is in shall be  
15366 displayed on the last line of the display. Command mode and text input mode shall be  
15367 differentiated; other unspecified modes and implementation-defined information may be  
15368 displayed.

**15369 slowopen**

15370 [Default *unset*]

15371 If **slowopen** is set during open and visual text input modes, the editor shall not update portions  
15372 of the display other than those display line columns that display the characters entered by the  
15373 user (see **Input Mode Commands in vi** (on page 1022)).

**15374 tabstop, ts**

15375 [Default 8]

15376 The value of this edit option shall specify the column boundary used by a <tab> in the display  
15377 (see **autoprint, ap** (on page 393) and **Input Mode Commands in vi** (on page 1022)).

**15378 taglength, tl**

15379 [Default zero]

15380 The value of this edit option shall specify the maximum number of characters that are  
15381 considered significant in the user-specified tag name and in the tag name from the tags file. If the  
15382 value is zero, all characters in both tag names shall be significant.

15383       **tags**  
15384       [Default *see text*]  
15385       The value of this edit option shall be a string of <blank>-delimited pathnames of files used by  
15386       the **tag** command. The default value is unspecified.

15387       **term**  
15388       [Default from the environment variable *TERM*]  
15389       The value of this edit option shall be a string. The default shall be taken from the *TERM* variable  
15390       in the environment. If the *TERM* environment variable is empty or null, the default is  
15391       unspecified. The editor shall use the value of this edit option to determine the type of the display  
15392       device.  
15393       The results are unspecified if the user changes the value of the term edit option after editor  
15394       initialization.

15395       **terse**  
15396       [Default *unset*]  
15397       If **terse** is set, error messages may be less verbose. However, except for this caveat, error  
15398       messages are unspecified. Furthermore, not all error messages need change for different settings  
15399       of this option.

15400       **warn**  
15401       [Default *set*]  
15402       If **warn** is set, and the contents of the edit buffer have been modified since they were last  
15403       completely written, the editor shall write a warning message before certain ! commands (see  
15404       **Escape** (on page 389)).

15405       **window**  
15406       [Default *see text*]  
15407       A value used in open and visual mode, by the <control>-B and <control>-F commands, and, in  
15408       visual mode, to specify the number of lines displayed when the screen is repainted.  
15409       If the **-w** command-line option is not specified, the default value shall be set to the value of the  
15410       *LINES* environment variable. If the *LINES* environment variable is empty or null, the default  
15411       shall be the number of lines in the display minus 1.  
15412       Setting the **window** edit option to zero or to a value greater than the number of lines in the  
15413       display minus 1 (either explicitly or based on the **-w** option or the *LINES* environment variable)  
15414       shall cause the **window** edit option to be set to the number of lines in the display minus 1.  
15415       The baud rate of the terminal line may change the default in an implementation-defined manner.

## 15416 **wrapmargin, wm**

15417 [Default 0]

15418 If the value of this edit option is zero, it shall have no effect.

15419 If not in the POSIX locale, the effect of this edit option is implementation-defined.

15420 Otherwise, it shall specify a number of columns from the ending margin of the terminal.

15421 During open and visual text input modes, for each character for which any part of the character  
15422 is displayed in a column that is less than **wrapmargin** columns from the ending margin of the  
15423 display line, the editor shall behave as follows:

15424 1. If the character triggering this event is a <blank>, it, and all immediately preceding  
15425 <blank>s on the current line entered during the execution of the current text input  
15426 command, shall be discarded, and the editor shall behave as if the user had entered a single  
15427 <newline> instead. In addition, if the next user-entered character is a <space>, it shall be  
15428 discarded as well.

15429 2. Otherwise, if there are one or more <blank>s on the current line immediately preceding the  
15430 last group of inserted non-<blank>s which was entered during the execution of the current  
15431 text input command, the <blank>s shall be replaced as if the user had entered a single  
15432 <newline> instead.

15433 If the **autoindent** edit option is set, and the events described in 1. or 2. are performed, any  
15434 <blank>s at or after the cursor in the current line shall be discarded.

15435 The ending margin shall be determined by the system or overridden by the user, as described for  
15436 **COLUMNS** in the ENVIRONMENT VARIABLES section and the Base Definitions volume of  
15437 IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

## 15438 **wrapscan, ws**

15439 [Default set]

15440 If **wrapscan** is set, searches (the *ex* / or ? addresses, or open and visual mode /, ?, **N**, and **n**  
15441 commands) shall wrap around the beginning or end of the edit buffer; when unset, searches  
15442 shall stop at the beginning or end of the edit buffer.

## 15443 **writeany, wa**

15444 [Default unset]

15445 If **writeany** is set, some of the checks performed when executing the *ex* **write** commands shall be  
15446 inhibited, as described in editor option **autowrite**.

## 15447 **EXIT STATUS**

15448 The following exit values shall be returned:

15449 0 Successful completion.

15450 >0 An error occurred.

## 15451 **CONSEQUENCES OF ERRORS**

15452 When any error is encountered and the standard input is not a terminal device file, *ex* shall not  
15453 write the file or return to command or text input mode, and shall terminate with a non-zero exit  
15454 status.

15455 Otherwise, when an unrecoverable error is encountered, it shall be equivalent to a SIGHUP  
15456 asynchronous event.

15457 Otherwise, when an error is encountered, the editor shall behave as specified in **Command Line**  
 15458 **Parsing in ex** (on page 362).

#### 15459 APPLICATION USAGE

15460 If a SIGSEGV signal is received while *ex* is saving a file, the file might not be successfully saved.

15461 The **next** command can accept more than one file, so usage such as:

15462 `next `ls [abc]*``

15463 is valid; it would not be valid for the **edit** or **read** commands, for example, because they expect  
 15464 only one file and unspecified results occur.

#### 15465 EXAMPLES

15466 None.

#### 15467 RATIONALE

15468 The *ex/vi* specification is based on the historical practice found in the 4 BSD and System V  
 15469 implementations of *ex* and *vi*. A freely redistributable implementation of *ex/vi*, which is  
 15470 tracking IEEE Std 1003.1-2001 fairly closely, and demonstrates the intended changes between  
 15471 historical implementations and IEEE Std 1003.1-2001, may be obtained by anonymous FTP from:

15472 `ftp://ftp.rdg.opengroup.org/pub/mirrors/nvi`

15473 A *restricted editor* (both the historical *red* utility and modifications to *ex*) were considered and  
 15474 rejected for inclusion. Neither option provided the level of security that users might expect.

15475 It is recognized that *ex* visual mode and related features would be difficult, if not impossible, to  
 15476 implement satisfactorily on a block-mode terminal, or a terminal without any form of cursor  
 15477 addressing; thus, it is not a mandatory requirement that such features should work on all  
 15478 terminals. It is the intention, however, that an *ex* implementation should provide the full set of  
 15479 capabilities on all terminals capable of supporting them.

#### 15480 Options

15481 The **-c** replacement for **+command** was inspired by the **-e** option of *sed*. Historically, all such  
 15482 commands (see **edit** and **next** as well) were executed from the last line of the edit buffer. This  
 15483 meant, for example, that **"/pattern"** would fail unless the **wrapsan** option was set.  
 15484 IEEE Std 1003.1-2001 requires conformance to historical practice. Historically, some  
 15485 implementations restricted the *ex* commands that could be listed as part of the command line  
 15486 arguments. For consistency, IEEE Std 1003.1-2001 does not permit these restrictions.

15487 In historical implementations of the editor, the **-R** option (and the **readonly** edit option) only  
 15488 prevented overwriting of files; appending to files was still permitted, mapping loosely into the  
 15489 *csh* **noclobber** variable. Some implementations, however, have not followed this semantic, and  
 15490 **readonly** does not permit appending either. IEEE Std 1003.1-2001 follows the latter practice,  
 15491 believing that it is a more obvious and intuitive meaning of **readonly**.

15492 The **-s** option suppresses all interactive user feedback and is useful for editing scripts in batch  
 15493 jobs. The list of specific effects is historical practice. The terminal type "incapable of supporting  
 15494 open and visual modes" has historically been named "dumb".

15495 The **-t** option was required because the *ctags* utility appears in IEEE Std 1003.1-2001 and the  
 15496 option is available in all historical implementations of *ex*.

15497 Historically, the *ex* and *vi* utilities accepted a **-x** option, which did encryption based on the  
 15498 algorithm found in the historical *crypt* utility. The **-x** option for encryption, and the associated  
 15499 *crypt* utility, were omitted because the algorithm used was not specifiable and the export control  
 15500 laws of some nations make it difficult to export cryptographic technology. In addition, it did not

15501 historically provide the level of security that users might expect.

### 15502 **Standard Input**

15503 An end-of-file condition is not equivalent to an end-of-file character. A common end-of-file  
15504 character, <control>-D, is historically an *ex* command.

15505 There was no maximum line length in historical implementations of *ex*. Specifically, as it was  
15506 parsed in chunks, the addresses had a different maximum length than the filenames. Further, the  
15507 maximum line buffer size was declared as BUFSIZ, which was different lengths on different  
15508 systems. This version selected the value of {LINE\_MAX} to impose a reasonable restriction on  
15509 portable usage of *ex* and to aid test suite writers in their development of realistic tests that  
15510 exercise this limit.

### 15511 **Input Files**

15512 It was an explicit decision by the standard developers that a <newline> be added to any file  
15513 lacking one. It was believed that this feature of *ex* and *vi* was relied on by users in order to make  
15514 text files lacking a trailing <newline> more portable. It is recognized that this will require a  
15515 user-specified option or extension for implementations that permit *ex* and *vi* to edit files of type  
15516 other than text if such files are not otherwise identified by the system. It was agreed that the  
15517 ability to edit files of arbitrary type can be useful, but it was not considered necessary to  
15518 mandate that an *ex* or *vi* implementation be required to handle files other than text files.

15519 The paragraph in the INPUT FILES section, “By default, ...”, is intended to close a long-standing  
15520 security problem in *ex* and *vi*; that of the “modeline” or “modelines” edit option. This feature  
15521 allows any line in the first or last five lines of the file containing the strings "*ex*:" or "*vi*:"  
15522 (and, apparently, "*ei*:" or "*vx*:") to be a line containing editor commands, and *ex* interprets all  
15523 the text up to the next ':' or <newline> as a command. Consider the consequences, for  
15524 example, of an unsuspecting user using *ex* or *vi* as the editor when replying to a mail message in  
15525 which a line such as:

15526 *ex*:! rm -rf :

15527 appeared in the signature lines. The standard developers believed strongly that an editor should  
15528 not by default interpret any lines of a file. Vendors are strongly urged to delete this feature from  
15529 their implementations of *ex* and *vi*.

### 15530 **Asynchronous Events**

15531 The intention of the phrase “complete write” is that the entire edit buffer be written to stable  
15532 storage. The note regarding temporary files is intended for implementations that use temporary  
15533 files to back edit buffers unnamed by the user.

15534 Historically, SIGQUIT was ignored by *ex*, but was the equivalent of the **Q** command in visual  
15535 mode; that is, it exited visual mode and entered *ex* mode. IEEE Std 1003.1-2001 permits, but does  
15536 not require, this behavior. Historically, SIGINT was often used by *vi* users to terminate text  
15537 input mode (<control>-C is often easier to enter than <ESC>). Some implementations of *vi*  
15538 alerted the terminal on this event, and some did not. IEEE Std 1003.1-2001 requires that SIGINT  
15539 behave identically to <ESC>, and that the terminal not be alerted.

15540 Historically, suspending the *ex* editor during text input mode was similar to SIGINT, as  
15541 completed lines were retained, but any partial line discarded, and the editor returned to  
15542 command mode. IEEE Std 1003.1-2001 is silent on this issue; implementations are encouraged to  
15543 follow historical practice, where possible.

Historically, the *vi* editor did not treat SIGTSTP as an asynchronous event, and it was therefore impossible to suspend the editor in visual text input mode. There are two major reasons for this. The first is that SIGTSTP is a broadcast signal on UNIX systems, and the chain of events where the shell *execs* an application that then *execs vi* usually caused confusion for the terminal state if SIGTSTP was delivered to the process group in the default manner. The second was that most implementations of the UNIX *curses* package are not reentrant, and the receipt of SIGTSTP at the wrong time will cause them to crash. IEEE Std 1003.1-2001 is silent on this issue; implementations are encouraged to treat suspension as an asynchronous event if possible.

Historically, modifications to the edit buffer made before SIGINT interrupted an operation were retained; that is, anywhere from zero to all of the lines to be modified might have been modified by the time the SIGINT arrived. These changes were not discarded by the arrival of SIGINT. IEEE Std 1003.1-2001 permits this behavior, noting that the **undo** command is required to be able to undo these partially completed commands.

The action taken for signals other than SIGINT, SIGCONT, SIGHUP, and SIGTERM is unspecified because some implementations attempt to save the edit buffer in a useful state when other signals are received.

### Standard Error

For *ex/vi*, diagnostic messages are those messages reported as a result of a failed attempt to invoke *ex* or *vi*, such as invalid options or insufficient resources, or an abnormal termination condition. Diagnostic messages should not be confused with the error messages generated by inappropriate or illegal user commands.

### Initialization in *ex* and *vi*

If an *ex* command (other than **cd**, **chdir**, or **source**) has a filename argument, one or both of the alternate and current pathnames will be set. Informally, they are set as follows:

1. If the *ex* command is one that replaces the contents of the edit buffer, and it succeeds, the current pathname will be set to the filename argument (the first filename argument in the case of the **next** command) and the alternate pathname will be set to the previous current pathname, if there was one.
2. In the case of the file read/write forms of the **read** and **write** commands, if there is no current pathname, the current pathname will be set to the filename argument.
3. Otherwise, the alternate pathname will be set to the filename argument.

For example, **:edit foo** and **:recover foo**, when successful, set the current pathname, and, if there was a previous current pathname, the alternate pathname. The commands **:write**, **!command**, and **:edit** set neither the current or alternate pathnames. If the **:edit foo** command were to fail for some reason, the alternate pathname would be set. The **read** and **write** commands set the alternate pathname to their *file* argument, unless the current pathname is not set, in which case they set the current pathname to their *file* arguments. The alternate pathname was not historically set by the **:source** command. IEEE Std 1003.1-2001 requires conformance to historical practice. Implementations adding commands that take filenames as arguments are encouraged to set the alternate pathname as described here.

Historically, *ex* and *vi* read the **.exrc** file in the *\$HOME* directory twice, if the editor was executed in the *\$HOME* directory. IEEE Std 1003.1-2001 prohibits this behavior.

Historically, the 4 BSD *ex* and *vi* read the *\$HOME* and local **.exrc** files if they were owned by the real ID of the user, or the **sourceany** option was set, regardless of other considerations. This was a security problem because it is possible to put normal UNIX system commands inside a **.exrc**

15589 file. IEEE Std 1003.1-2001 does not specify the **sourceany** option, and historical implementations  
15590 are encouraged to delete it.

15591 The **.exrc** files must be owned by the real ID of the user, and not writable by anyone other than  
15592 the owner. The appropriate privileges exception is intended to permit users to acquire special  
15593 privileges, but continue to use the **.exrc** files in their home directories.

15594 System V Release 3.2 and later *vi* implementations added the option **[no]exrc**. The behavior is  
15595 that local **.exrc** files are read-only if the **exrc** option is set. The default for the **exrc** option was off,  
15596 so by default, local **.exrc** files were not read. The problem this was intended to solve was that  
15597 System V permitted users to give away files, so there is no possible ownership or writeability  
15598 test to ensure that the file is safe. This is still a security problem on systems where users can give  
15599 away files, but there is nothing additional that IEEE Std 1003.1-2001 can do. The  
15600 implementation-defined exception is intended to permit groups to have local **.exrc** files that are  
15601 shared by users, by creating pseudo-users to own the shared files.

15602 IEEE Std 1003.1-2001 does not mention system-wide *ex* and *vi* start-up files. While they exist in  
15603 several implementations of *ex* and *vi*, they are not present in any implementations considered  
15604 historical practice by IEEE Std 1003.1-2001. Implementations that have such files should use  
15605 them only if they are owned by the real user ID or an appropriate user (for example, root on  
15606 UNIX systems) and if they are not writable by any user other than their owner. System-wide  
15607 start-up files should be read before the *EXINIT* variable, **\$HOME/.exrc**, or local **.exrc** files are  
15608 evaluated.

15609 Historically, any *ex* command could be entered in the *EXINIT* variable or the **.exrc** file, although  
15610 ones requiring that the edit buffer already contain lines of text generally caused historical  
15611 implementations of the editor to drop **core**. IEEE Std 1003.1-2001 requires that any *ex* command  
15612 be permitted in the *EXINIT* variable and **.exrc** files, for simplicity of specification and  
15613 consistency, although many of them will obviously fail under many circumstances.

15614 The initialization of the contents of the edit buffer uses the phrase “the effect shall be” with  
15615 regard to various *ex* commands. The intent of this phrase is that edit buffer contents loaded  
15616 during the initialization phase not be lost; that is, loading the edit buffer should fail if the **.exrc**  
15617 file read in the contents of a file and did not subsequently write the edit buffer. An additional  
15618 intent of this phrase is to specify that the initial current line and column is set as specified for the  
15619 individual *ex* commands.

15620 Historically, the **-t** option behaved as if the tag search were a **+command**; that is, it was executed  
15621 from the last line of the file specified by the tag. This resulted in the search failing if the pattern  
15622 was a forward search pattern and the **wrapscan** edit option was not set. IEEE Std 1003.1-2001  
15623 does not permit this behavior, requiring that the search for the tag pattern be performed on the  
15624 entire file, and, if not found, that the current line be set to a more reasonable location in the file.

15625 Historically, the empty edit buffer presented for editing when a file was not specified by the user  
15626 was unnamed. This is permitted by IEEE Std 1003.1-2001; however, implementations are  
15627 encouraged to provide users a temporary filename for this buffer because it permits them the  
15628 use of *ex* commands that use the current pathname during temporary edit sessions.

15629 Historically, the file specified using the **-t** option was not part of the current argument list. This  
15630 practice is permitted by IEEE Std 1003.1-2001; however, implementations are encouraged to  
15631 include its name in the current argument list for consistency.

15632 Historically, the **-c** command was generally not executed until a file that already exists was  
15633 edited. IEEE Std 1003.1-2001 requires conformance to this historical practice. Commands that  
15634 could cause the **-c** command to be executed include the *ex* commands **edit**, **next**, **recover**,  
15635 **rewind**, and **tag**, and the *vi* commands **<control>-^** and **<control>-J**. Historically, reading a file  
15636 into an edit buffer did not cause the **-c** command to be executed (even though it might set the

current pathname) with the exception that it did cause the `-c` command to be executed if: the editor was in *ex* mode, the edit buffer had no current pathname, the edit buffer was empty, and no read commands had yet been attempted. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

Historically, the `-r` option was the same as a normal edit session if there was no recovery information available for the file. This allowed users to enter:

```
vi -r *.c
```

and recover whatever files were recoverable. In some implementations, recovery was attempted only on the first file named, and the file was not entered into the argument list; in others, recovery was attempted for each file named. In addition, some historical implementations ignored `-r` if `-t` was specified or did not support command line *file* arguments with the `-t` option. For consistency and simplicity of specification, IEEE Std 1003.1-2001 disallows these special cases, and requires that recovery be attempted the first time each file is edited.

Historically, *vi* initialized the ‘ and ’ marks, but *ex* did not. This meant that if the first command in *ex* mode was **visual** or if an *ex* command was executed first (for example, *vi* +10 *file*), *vi* was entered without the marks being initialized. Because the standard developers believed the marks to be generally useful, and for consistency and simplicity of specification, IEEE Std 1003.1-2001 requires that they always be initialized if in open or visual mode, or if in *ex* mode and the edit buffer is not empty. Not initializing it in *ex* mode if the edit buffer is empty is historical practice; however, it has always been possible to set (and use) marks in empty edit buffers in open and visual mode edit sessions.

## Addressing

Historically, *ex* and *vi* accepted the additional addressing forms ‘\/' and ‘\?’. They were equivalent to “//” and “??”, respectively. They are not required by IEEE Std 1003.1-2001, mostly because nobody can remember whether they ever did anything different historically.

Historically, *ex* and *vi* permitted an address of zero for several commands, and permitted the % address in empty files for others. For consistency, IEEE Std 1003.1-2001 requires support for the former in the few commands where it makes sense, and disallows it otherwise. In addition, because IEEE Std 1003.1-2001 requires that % be logically equivalent to “1,\$”, it is also supported where it makes sense and disallowed otherwise.

Historically, the % address could not be followed by further addresses. For consistency and simplicity of specification, IEEE Std 1003.1-2001 requires that additional addresses be supported.

All of the following are valid *addresses*:

```
+++ Three lines after the current line.
/re/- One line before the next occurrence of re.
-2 Two lines before the current line.
3 ---- 2 Line one (note intermediate negative address).
1 2 3 Line six.
```

Any number of addresses can be provided to commands taking addresses; for example, “1,2,3,4,5p” prints lines 4 and 5, because two is the greatest valid number of addresses accepted by the **print** command. This, in combination with the semicolon delimiter, permits users to create commands based on ordered patterns in the file. For example, the command **3/foo/+2print** will display the first line after line 3 that contains the pattern *foo*, plus the next two lines. Note that the address **3**; must be evaluated before being discarded because the search

origin for the **/foo/** command depends on this.

Historically, values could be added to addresses by including them after one or more <blank>s; for example, **3 – 5p** wrote the seventh line of the file, and **/foo/ 5** was the same as **/foo/+5**. However, only absolute values could be added; for example, **5 /foo/** was an error. IEEE Std 1003.1-2001 requires conformance to historical practice. Address offsets are separately specified from addresses because they could historically be provided to visual mode search commands.

Historically, any missing addresses defaulted to the current line. This was true for leading and trailing comma-delimited addresses, and for trailing semicolon-delimited addresses. For consistency, IEEE Std 1003.1-2001 requires it for leading semicolon addresses as well.

Historically, *ex* and *vi* accepted the '^' character as both an address and as a flag offset for commands. In both cases it was identical to the '-' character. IEEE Std 1003.1-2001 does not require or prohibit this behavior.

Historically, the enhancements to basic regular expressions could be used in addressing; for example, '~', '\<', and '\>'. IEEE Std 1003.1-2001 requires conformance to historical practice; that is, that regular expression usage be consistent, and that regular expression enhancements be supported wherever regular expressions are used.

### Command Line Parsing in ex

Historical *ex* command parsing was even more complex than that described here. IEEE Std 1003.1-2001 requires the subset of the command parsing that the standard developers believed was documented and that users could reasonably be expected to use in a portable fashion, and that was historically consistent between implementations. (The discarded functionality is obscure, at best.) Historical implementations will require changes in order to comply with IEEE Std 1003.1-2001; however, users are not expected to notice any of these changes. Most of the complexity in *ex* parsing is to handle three special termination cases:

1. The **!**, **global**, **v**, and the filter versions of the **read** and **write** commands are delimited by <newline>s (they can contain vertical-line characters that are usually shell pipes).
2. The **ex**, **edit**, **next**, and **visual** in open and visual mode commands all take *ex* commands, optionally containing vertical-line characters, as their first arguments.
3. The **s** command takes a regular expression as its first argument, and uses the delimiting characters to delimit the command.

Historically, vertical-line characters in the *+command* argument of the **ex**, **edit**, **next**, **vi**, and **visual** commands, and in the *pattern* and *replacement* parts of the **s** command, did not delimit the command, and in the filter cases for **read** and **write**, and the **!**, **global**, and **v** commands, they did not delimit the command at all. For example, the following commands are all valid:

```
:edit +25 | s/abc/ABC/ file.c
:s/ | /PIPE/
:read !spell % | columnate
:global/pattern/p | l
:s/a/b/ | s/c/d | set
```

Historically, empty or <blank> filled lines in **.exrc** files and **sourced** files (as well as *EXINIT* variables and *ex* command scripts) were treated as default commands; that is, **print** commands. IEEE Std 1003.1-2001 specifically requires that they be ignored when encountered in **.exrc** and **sourced** files to eliminate a common source of new user error.

Historically, *ex* commands with multiple adjacent (or <blank>-separated) vertical lines were handled oddly when executed from *ex* mode. For example, the command `||| <carriage-return>`, when the cursor was on line 1, displayed lines 2, 3, and 5 of the file. In addition, the command `|` would only display the line after the next line, instead of the next two lines. The former worked more logically when executed from *vi* mode, and displayed lines 2, 3, and 4. IEEE Std 1003.1-2001 requires the *vi* behavior; that is, a single default command and line number increment for each command separator, and trailing <newline>s after vertical-line separators are discarded.

Historically, *ex* permitted a single extra colon as a leading command character; for example, `:g/pattern/:p` was a valid command. IEEE Std 1003.1-2001 generalizes this to require that any number of leading colon characters be stripped.

Historically, any prefix of the **delete** command could be followed without intervening <blank>s by a flag character because in the command `d p`, *p* is interpreted as the buffer *p*. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the **k** command could be followed by the mark name without intervening <blank>s. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the **s** command could be immediately followed by flag and option characters; for example, `s/e/E/|s|sgc3p` was a valid command. However, flag characters could not stand alone; for example, the commands **sp** and **s l** would fail, while the command **sgp** and **s gl** would succeed. (Obviously, the '#' flag character was used as a delimiter character if it followed the command.) Another issue was that option characters had to precede flag characters even when the command was fully specified; for example, the command `s/e/E/pg` would fail, while the command `s/e/E/gp` would succeed. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the first command name that had a prefix matching the input from the user was the executed command; for example, **ve**, **ver**, and **vers** all executed the **version** command. Commands were in a specific order, however, so that **a** matched **append**, not **abbreviate**. IEEE Std 1003.1-2001 requires conformance to historical practice. The restriction on command search order for implementations with extensions is to avoid the addition of commands such that the historical prefixes would fail to work portably.

Historical implementations of *ex* and *vi* did not correctly handle multiple *ex* commands, separated by vertical-line characters, that entered or exited visual mode or the editor. Because implementations of *vi* exist that do not exhibit this failure mode, IEEE Std 1003.1-2001 does not permit it.

The requirement that alphabetic command names consist of all following alphabetic characters up to the next non-alphabetic character means that alphabetic command names must be separated from their arguments by one or more non-alphabetic characters, normally a <blank> or '!' character, except as specified for the exceptions, the **delete**, **k**, and **s** commands.

Historically, the repeated execution of the *ex* default **print** commands (<control>-D, *eof*, <newline>, <carriage-return>) erased any prompting character and displayed the next lines without scrolling the terminal; that is, immediately below any previously displayed lines. This provided a cleaner presentation of the lines in the file for the user. IEEE Std 1003.1-2001 does not require this behavior because it may be impossible in some situations; however, implementations are strongly encouraged to provide this semantic if possible.

Historically, it was possible to change files in the middle of a command, and have the rest of the command executed in the new file; for example:

```
15771 :edit +25 file.c | s/abc/ABC/ | 1
```

15772 was a valid command, and the substitution was attempted in the newly edited file.  
 15773 IEEE Std 1003.1-2001 requires conformance to historical practice. The following commands are  
 15774 examples that exercise the **ex** parser:

```
15775 echo 'foo | bar' > file1; echo 'foo/bar' > file2;
```

```
15776 vi
```

```
15777 :edit +1 | s/|/PIPE/ | w file1 | e file2 | 1 | s/\/SLASH/ | wq
```

15778 Historically, there was no protection in editor implementations to avoid **ex** **global**, **v**, **@**, or **\***  
 15779 commands changing edit buffers during execution of their associated commands. Because this  
 15780 would almost invariably result in catastrophic failure of the editor, and implementations exist  
 15781 that do exhibit these problems, IEEE Std 1003.1-2001 requires that changing the edit buffer  
 15782 during a **global** or **v** command, or during a **@** or **\*** command for which there will be more than a  
 15783 single execution, be an error. Implementations supporting multiple edit buffers simultaneously  
 15784 are strongly encouraged to apply the same semantics to switching between buffers as well.

15785 The **ex** command quoting required by IEEE Std 1003.1-2001 is a superset of the quoting in  
 15786 historical implementations of the editor. For example, it was not historically possible to escape a  
 15787 <blank> in a filename; for example, **:edit foo\\\ bar** would report that too many filenames had  
 15788 been entered for the edit command, and there was no method of escaping a <blank> in the first  
 15789 argument of an **edit**, **ex**, **next**, or **visual** command at all. IEEE Std 1003.1-2001 extends historical  
 15790 practice, requiring that quoting behavior be made consistent across all **ex** commands, except for  
 15791 the **map**, **unmap**, **abbreviate**, and **unabbreviate** commands, which historically used <control>-V  
 15792 instead of backslashes for quoting. For those four commands, IEEE Std 1003.1-2001 requires  
 15793 conformance to historical practice.

15794 Backslash quoting in **ex** is non-intuitive. Backslash escapes are ignored unless they escape a  
 15795 special character; for example, when performing *file* argument expansion, the string "\\%" is  
 15796 equivalent to '\%', not "\<current pathname>". This can be confusing for users because  
 15797 backslash is usually one of the characters that causes shell expansion to be performed, and  
 15798 therefore shell quoting rules must be taken into consideration. Generally, quoting characters are  
 15799 only considered if they escape a special character, and a quoting character must be provided for  
 15800 each layer of parsing for which the character is special. As another example, only a single  
 15801 backslash is necessary for the '\1' sequence in substitute replacement patterns, because the  
 15802 character '1' is not special to any parsing layer above it.

15803 <control>-V quoting in **ex** is slightly different from backslash quoting. In the four commands  
 15804 where <control>-V quoting applies (**abbreviate**, **unabbreviate**, **map**, and **unmap**), any character  
 15805 may be escaped by a <control>-V whether it would have a special meaning or not.  
 15806 IEEE Std 1003.1-2001 requires conformance to historical practice.

15807 Historical implementations of the editor did not require delimiters within character classes to be  
 15808 escaped; for example, the command **:s/[//** on the string "xxx/yyy" would delete the '/' from  
 15809 the string. IEEE Std 1003.1-2001 disallows this historical practice for consistency and because it  
 15810 places a large burden on implementations by requiring that knowledge of regular expressions be  
 15811 built into the editor parser.

15812 Historically, quoting <newline>s in **ex** commands was handled inconsistently. In most cases, the  
 15813 <newline> always terminated the command, regardless of any preceding escape character,  
 15814 because backslash characters did not escape <newline>s for most **ex** commands. However, some  
 15815 **ex** commands (for example, **s**, **map**, and **abbreviation**) permitted <newline>s to be escaped  
 15816 (although in the case of **map** and **abbreviation**, <control>-V characters escaped them instead of  
 15817 backslashes). This was true in not only the command line, but also **.exrc** and **sourced** files. For  
 15818 example, the command:

15819 map = foo<control-V><newline>bar

15820 would succeed, although it was sometimes difficult to get the <control>-V and the inserted  
 15821 <newline> passed to the *ex* parser. For consistency and simplicity of specification,  
 15822 IEEE Std 1003.1-2001 requires that it be possible to escape <newline>s in *ex* commands at all  
 15823 times, using backslashes for most *ex* commands, and using <control>-V characters for the **map**  
 15824 and **abbreviation** commands. For example, the command **print**<newline>**list** is required to be  
 15825 parsed as the single command **print**<newline>**list**. While this differs from historical practice,  
 15826 IEEE Std 1003.1-2001 developers believed it unlikely that any script or user depended on the  
 15827 historical behavior.

15828 Historically, an error in a command specified using the **-c** option did not cause the rest of the **-c**  
 15829 commands to be discarded. IEEE Std 1003.1-2001 disallows this for consistency with mapped  
 15830 keys, the **@**, **global**, **source**, and **v** commands, the *EXINIT* environment variable, and the **.exrc**  
 15831 files.

### 15832 **Input Editing in *ex***

15833 One of the common uses of the historical *ex* editor is over slow network connections. Editors  
 15834 that run in canonical mode can require far less traffic to and from, and far less processing on, the  
 15835 host machine, as well as more easily supporting block-mode terminals. For these reasons,  
 15836 IEEE Std 1003.1-2001 requires that *ex* be implemented using canonical mode input processing, as  
 15837 was done historically.

15838 IEEE Std 1003.1-2001 does not require the historical 4 BSD input editing characters “word erase”  
 15839 or “literal next”. For this reason, it is unspecified how they are handled by *ex*, although they  
 15840 must have the required effect. Implementations that resolve them after the line has been ended  
 15841 using a <newline> or <control>-M character, and implementations that rely on the underlying  
 15842 system terminal support for this processing, are both conforming. Implementations are strongly  
 15843 urged to use the underlying system functionality, if at all possible, for compatibility with other  
 15844 system text input interfaces.

15845 Historically, when the *eof* character was used to decrement the **autoindent** level, the cursor  
 15846 moved to display the new end of the **autoindent** characters, but did not move the cursor to a  
 15847 new line, nor did it erase the <control>-D character from the line. IEEE Std 1003.1-2001 does not  
 15848 specify that the cursor remain on the same line or that the rest of the line is erased; however,  
 15849 implementations are strongly encouraged to provide the best possible user interface; that is, the  
 15850 cursor should remain on the same line, and any <control>-D character on the line should be  
 15851 erased.

15852 IEEE Std 1003.1-2001 does not require the historical 4 BSD input editing character “reprint”,  
 15853 traditionally <control>-R, which redisplayed the current input from the user. For this reason,  
 15854 and because the functionality cannot be implemented after the line has been terminated by the  
 15855 user, IEEE Std 1003.1-2001 makes no requirements about this functionality. Implementations are  
 15856 strongly urged to make this historical functionality available, if possible.

15857 Historically, <control>-Q did not perform a literal next function in *ex*, as it did in *vi*.  
 15858 IEEE Std 1003.1-2001 requires conformance to historical practice to avoid breaking historical *ex*  
 15859 scripts and **.exrc** files.

**eof**

Whether the *eof* character immediately modifies the **autoindent** characters in the prompt is left unspecified so that implementations can conform in the presence of systems that do not support this functionality. Implementations are encouraged to modify the line and redisplay it immediately, if possible.

The specification of the handling of the *eof* character differs from historical practice only in that *eof* characters are not discarded if they follow normal characters in the text input. Historically, they were always discarded.

**Command Descriptions in ex**

Historically, several commands (for example, **global**, **v**, **visual**, **s**, **write**, **wq**, **yank**, **!**, **<**, **>**, **&**, and **↵**) were executable in empty files (that is, the default address(es) were 0), or permitted explicit addresses of 0 (for example, 0 was a valid address, or 0,0 was a valid range). Addresses of 0, or command execution in an empty file, make sense only for commands that add new text to the edit buffer or write commands (because users may wish to write empty files). IEEE Std 1003.1-2001 requires this behavior for such commands and disallows it otherwise, for consistency and simplicity of specification.

A count to an *ex* command has been historically corrected to be no greater than the last line in a file; for example, in a five-line file, the command **1,6print** would fail, but the command **1print300** would succeed. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the use of flags in *ex* commands could be obscure. General historical practice was as described by IEEE Std 1003.1-2001, but there were some special cases. For instance, the **list**, **number**, and **print** commands ignored trailing address offsets; for example, **3p +++#** would display line 3, and 3 would be the current line after the execution of the command. The **open** and **visual** commands ignored both the trailing offsets and the trailing flags. Also, flags specified to the **open** and **visual** commands interacted badly with the **list** edit option, and setting and then unsetting it during the open/visual session would cause *vi* to stop displaying lines in the specified format. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit any of these exceptions to the general rule.

IEEE Std 1003.1-2001 uses the word *copy* in several places when discussing buffers. This is not intended to imply implementation.

Historically, *ex* users could not specify numeric buffers because of the ambiguity this would cause; for example, in the command **3 delete 2**, it is unclear whether 2 is a buffer name or a *count*. IEEE Std 1003.1-2001 requires conformance to historical practice by default, but does not preclude extensions.

Historically, the contents of the unnamed buffer were frequently discarded after commands that did not explicitly affect it; for example, when using the **edit** command to switch files. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

The *ex* utility did not historically have access to the numeric buffers, and, furthermore, deleting lines in *ex* did not modify their contents. For example, if, after doing a delete in *vi*, the user switched to *ex*, did another delete, and then switched back to *vi*, the contents of the numeric buffers would not have changed. IEEE Std 1003.1-2001 requires conformance to historical practice. Numeric buffers are described in the *ex* utility in order to confine the description of buffers to a single location in IEEE Std 1003.1-2001.

The metacharacters that trigger shell expansion in *file* arguments match historical practice, as does the method for doing shell expansion. Implementations wishing to provide users with the flexibility to alter the set of metacharacters are encouraged to provide a **shellmeta** string edit

15906 option.

15907 Historically, *ex* commands executed from *vi* refreshed the screen when it did not strictly need to  
 15908 do so; for example, `!date > /dev/null` does not require a screen refresh because the output of the  
 15909 UNIX *date* command requires only a single line of the screen. IEEE Std 1003.1-2001 requires that  
 15910 the screen be refreshed if it has been overwritten, but makes no requirements as to how an  
 15911 implementation should make that determination. Implementations may prompt and refresh the  
 15912 screen regardless.

### 15913 **Abbreviate**

15914 Historical practice was that characters that were entered as part of an abbreviation replacement  
 15915 were subject to **map** expansions, the **showmatch** edit option, further abbreviation expansions,  
 15916 and so on; that is, they were logically pushed onto the terminal input queue, and were not a  
 15917 simple replacement. IEEE Std 1003.1-2001 requires conformance to historical practice. Historical  
 15918 practice was that whenever a non-word character (that had not been escaped by a `<control>-V`)  
 15919 was entered after a word character, *vi* would check for abbreviations. The check was based on  
 15920 the type of the character entered before the word character of the word/non-word pair that  
 15921 triggered the check. The word character of the word/non-word pair that triggered the check and  
 15922 all characters entered before the trigger pair that were of that type were included in the check,  
 15923 with the exception of `<blank>s`, which always delimited the abbreviation.

15924 This means that, for the abbreviation to work, the *lhs* must end with a word character, there can  
 15925 be no transitions from word to non-word characters (or *vice versa*) other than between the last  
 15926 and next-to-last characters in the *lhs*, and there can be no `<blank>s` in the *lhs*. In addition,  
 15927 because of the historical quoting rules, it was impossible to enter a literal `<control>-V` in the *lhs*.  
 15928 IEEE Std 1003.1-2001 requires conformance to historical practice. Historical implementations did  
 15929 not inform users when abbreviations that could never be used were entered; implementations  
 15930 are strongly encouraged to do so.

15931 For example, the following abbreviations will work:

```
15932 :ab (p REPLACE
15933 :ab p REPLACE
15934 :ab ((p REPLACE
```

15935 The following abbreviations will not work:

```
15936 :ab (REPLACE
15937 :ab (pp REPLACE
```

15938 Historical practice is that words on the *vi* colon command line were subject to abbreviation  
 15939 expansion, including the arguments to the **abbrev** (and more interestingly) the **unabbrev**  
 15940 command. Because there are implementations that do not do abbreviation expansion for the first  
 15941 argument to those commands, this is permitted, but not required, by IEEE Std 1003.1-2001.  
 15942 However, the following sequence:

```
15943 :ab foo bar
15944 :ab foo baz
```

15945 resulted in the addition of an abbreviation of "baz" for the string "bar" in historical *ex/vi*, and  
 15946 the sequence:

```
15947 :ab foo1 bar
15948 :ab foo2 bar
15949 :unabbreviate foo2
```

15950 deleted the abbreviation "foo1", not "foo2". These behaviors are not permitted by  
 15951 IEEE Std 1003.1-2001 because they clearly violate the expectations of the user.

15952 It was historical practice that <control>-V, not backslash, characters be interpreted as escaping  
 15953 subsequent characters in the **abbreviate** command. IEEE Std 1003.1-2001 requires conformance  
 15954 to historical practice; however, it should be noted that an abbreviation containing a <blank> will  
 15955 never work.

## 15956 **Append**

15957 Historically, any text following a vertical-line command separator after an **append**, **change**, or  
 15958 **insert** command became part of the insert text. For example, in the command:

15959 :g/pattern/append|stuff1

15960 a line containing the text "stuff1" would be appended to each line matching pattern. It was  
 15961 also historically valid to enter:

15962 :append|stuff1

15963 stuff2

15964 .

15965 and the text on the *ex* command line would be appended along with the text inserted after it.  
 15966 There was an historical bug, however, that the user had to enter two terminating lines (the ' .'   
 15967 lines) to terminate text input mode in this case. IEEE Std 1003.1-2001 requires conformance to  
 15968 historical practice, but disallows the historical need for multiple terminating lines.

## 15969 **Change**

15970 See the RATIONALE for the **append** command. Historical practice for cursor positioning after  
 15971 the change command when no text is input, is as described in IEEE Std 1003.1-2001. However,  
 15972 one System V implementation is known to have been modified such that the cursor is positioned  
 15973 on the first address specified, and not on the line before the first address. IEEE Std 1003.1-2001  
 15974 disallows this modification for consistency.

15975 Historically, the **change** command did not support buffer arguments, although some  
 15976 implementations allow the specification of an optional buffer. This behavior is neither required  
 15977 nor disallowed by IEEE Std 1003.1-2001.

## 15978 **Change Directory**

15979 A common extension in *ex* implementations is to use the elements of a **cdpath** edit option as  
 15980 prefix directories for *path* arguments to **chdir** that are relative pathnames and that do not have  
 15981 ' .' or " ." as their first component. Elements in the **cdpath** edit option are colon-separated.  
 15982 The initial value of the **cdpath** edit option is the value of the shell *CDPATH* environment  
 15983 variable. This feature was not included in IEEE Std 1003.1-2001 because it does not exist in any  
 15984 of the implementations considered historical practice.

## 15985 **Copy**

15986 Historical implementations of *ex* permitted copies to lines inside of the specified range; for  
 15987 example, **:2,5copy3** was a valid command. IEEE Std 1003.1-2001 requires conformance to  
 15988 historical practice.

## 15989 Delete

15990 IEEE Std 1003.1-2001 requires support for the historical parsing of a **delete** command followed  
15991 by flags, without any intervening <blank>s. For example:

15992 **1dp** Deletes the first line and prints the line that was second.

15993 **1delep** As for **1dp**.

15994 **1d** Deletes the first line, saving it in buffer *p*.

15995 **1d p1l** (Pee-one-ell.) Deletes the first line, saving it in buffer *p*, and listing the line that was  
15996 second.

## 15997 Edit

15998 Historically, any *ex* command could be entered as a *+command* argument to the **edit** command,  
15999 although some (for example, **insert** and **append**) were known to confuse historical  
16000 implementations. For consistency and simplicity of specification, IEEE Std 1003.1-2001 requires  
16001 that any command be supported as an argument to the **edit** command.

16002 Historically, the command argument was executed with the current line set to the last line of the  
16003 file, regardless of whether the **edit** command was executed from visual mode or not.  
16004 IEEE Std 1003.1-2001 requires conformance to historical practice.

16005 Historically, the *+command* specified to the **edit** and **next** commands was delimited by the first  
16006 <blank>, and there was no way to quote them. For consistency, IEEE Std 1003.1-2001 requires  
16007 that the usual *ex* backslash quoting be provided.

16008 Historically, specifying the *+command* argument to the edit command required a filename to be  
16009 specified as well; for example, **:edit +100** would always fail. For consistency and simplicity of  
16010 specification, IEEE Std 1003.1-2001 does not permit this usage to fail for that reason.

16011 Historically, only the cursor position of the last file edited was remembered by the editor.  
16012 IEEE Std 1003.1-2001 requires that this be supported; however, implementations are permitted to  
16013 remember and restore the cursor position for any file previously edited.

## 16014 File

16015 Historical versions of the *ex* editor **file** command displayed a current line and number of lines in  
16016 the edit buffer of 0 when the file was empty, while the *vi* <control>-G command displayed a  
16017 current line and number of lines in the edit buffer of 1 in the same situation.  
16018 IEEE Std 1003.1-2001 does not permit this discrepancy, instead requiring that a message be  
16019 displayed indicating that the file is empty.

## 16020 Global

16021 The two-pass operation of the **global** and **v** commands is not intended to imply implementation,  
16022 only the required result of the operation.

16023 The current line and column are set as specified for the individual *ex* commands. This  
16024 requirement is cumulative; that is, the current line and column must track across all the  
16025 commands executed by the **global** or **v** commands.

**Insert**

See the RATIONALE for the **append** command.

Historically, **insert** could not be used with an address of zero; that is, not when the edit buffer was empty. IEEE Std 1003.1-2001 requires that this command behave consistently with the **append** command.

**Join**

The action of the **join** command in relation to the special characters is only defined for the POSIX locale because the correct amount of white space after a period varies; in Japanese none is required, in French only a single space, and so on.

**List**

The historical output of the **list** command was potentially ambiguous. The standard developers believed correcting this to be more important than adhering to historical practice, and IEEE Std 1003.1-2001 requires unambiguous output.

**Map**

Historically, command mode maps only applied to command names; for example, if the character 'x' was mapped to 'y', the command **fx** searched for the 'x' character, not the 'y' character. IEEE Std 1003.1-2001 requires this behavior. Historically, entering <control>-V as the first character of a **vi** command was an error. Several implementations have extended the semantics of **vi** such that <control>-V means that the subsequent command character is not mapped. This is permitted, but not required, by IEEE Std 1003.1-2001. Regardless, using <control>-V to escape the second or later character in a sequence of characters that might match a **map** command, or any character in text input mode, is historical practice, and stops the entered keys from matching a map. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historical implementations permitted digits to be used as a **map** command *lhs*, but then ignored the map. IEEE Std 1003.1-2001 requires that the mapped digits not be ignored.

The historical implementation of the **map** command did not permit **map** commands that were more than a single character in length if the first character was printable. This behavior is permitted, but not required, by IEEE Std 1003.1-2001.

Historically, mapped characters were remapped unless the **remap** edit option was not set, or the prefix of the mapped characters matched the mapping characters; for example, in the **map**:

```
:map ab abcd
```

the characters "ab" were used as is and were not remapped, but the characters "cd" were mapped if appropriate. This can cause infinite loops in the **vi** mapping mechanisms. IEEE Std 1003.1-2001 requires conformance to historical practice, and that such loops be interruptible.

Text input maps had the same problems with expanding the *lhs* for the **ex map!** and **unmap!** command as did the **ex abbreviate** and **unabbreviate** commands. See the RATIONALE for the **ex abbreviate** command. IEEE Std 1003.1-2001 requires similar modification of some historical practice for the **map** and **unmap** commands, as described for the **abbreviate** and **unabbreviate** commands.

Historically, **maps** that were subsets of other **maps** behaved differently depending on the order in which they were defined. For example:

```
16068 :map! ab short
16069 :map! abc long
```

16070 would always translate the characters "ab" to "short", regardless of how fast the characters  
16071 "abc" were entered. If the entry order was reversed:

```
16072 :map! abc long
16073 :map! ab short
```

16074 the characters "ab" would cause the editor to pause, waiting for the completing 'c' character,  
16075 and the characters might never be mapped to "short". For consistency and simplicity of  
16076 specification, IEEE Std 1003.1-2001 requires that the shortest match be used at all times.

16077 The length of time the editor spends waiting for the characters to complete the *lhs* is unspecified  
16078 because the timing capabilities of systems are often inexact and variable, and it may depend on  
16079 other factors such as the speed of the connection. The time should be long enough for the user to  
16080 be able to complete the sequence, but not long enough for the user to have to wait. Some  
16081 implementations of *vi* have added a **keytime** option, which permits users to set the number of  
16082 0,1 seconds the editor waits for the completing characters. Because mapped terminal function  
16083 and cursor keys tend to start with an <ESC> character, and <ESC> is the key ending *vi* text input  
16084 mode, **maps** starting with <ESC> characters are generally exempted from this timeout period,  
16085 or, at least timed out differently.

## 16086 Mark

16087 Historically, users were able to set the "previous context" marks explicitly. In addition, the *ex*  
16088 commands " and " and the *vi* commands ", ", ", and " all referred to the same mark. In addition,  
16089 the previous context marks were not set if the command, with which the address setting the  
16090 mark was associated, failed. IEEE Std 1003.1-2001 requires conformance to historical practice.  
16091 Historically, if marked lines were deleted, the mark was also deleted, but would reappear if the  
16092 change was undone. IEEE Std 1003.1-2001 requires conformance to historical practice.

16093 The description of the special events that set the ' and ' marks matches historical practice. For  
16094 example, historically the command */a,/b/* did not set the ' and ' marks, but the command  
16095 */a,/b/delete* did.

## 16096 Next

16097 Historically, any *ex* command could be entered as a *+command* argument to the **next** command,  
16098 although some (for example, **insert** and **append**) were known to confuse historical  
16099 implementations. IEEE Std 1003.1-2001 requires that any command be permitted and that it  
16100 behave as specified. The **next** command can accept more than one file, so usage such as:

```
16101 next `ls [abc] `
```

16102 is valid; it need not be valid for the **edit** or **read** commands, for example, because they expect  
16103 only one filename.

16104 Historically, the **next** command behaved differently from the **:rewind** command in that it  
16105 ignored the force flag if the **autowrite** flag was set. For consistency, IEEE Std 1003.1-2001 does  
16106 not permit this behavior.

16107 Historically, the **next** command positioned the cursor as if the file had never been edited before,  
16108 regardless. IEEE Std 1003.1-2001 does not permit this behavior, for consistency with the **edit**  
16109 command.

16110 Implementations wanting to provide a counterpart to the **next** command that edited the  
16111 previous file have used the command **prev[ious]**, which takes no *file* argument.

16112 IEEE Std 1003.1-2001 does not require this command.

### 16113 **Open**

16114 Historically, the **open** command would fail if the **open** edit option was not set.  
 16115 IEEE Std 1003.1-2001 does not mention the **open** edit option and does not require this behavior.  
 16116 Some historical implementations do not permit entering open mode from open or visual mode,  
 16117 only from **ex** mode. For consistency, IEEE Std 1003.1-2001 does not permit this behavior.

16118 Historically, entering open mode from the command line (that is, **vi +open**) resulted in  
 16119 anomalous behaviors; for example, the **ex** file and **set** commands, and the **vi** command  
 16120 <control>-G did not work. For consistency, IEEE Std 1003.1-2001 does not permit this behavior.

16121 Historically, the **open** command only permitted ' / ' characters to be used as the search pattern  
 16122 delimiter. For consistency, IEEE Std 1003.1-2001 requires that the search delimiters used by the **s**,  
 16123 **global**, and **v** commands be accepted as well.

### 16124 **Preserve**

16125 The **preserve** command does not historically cause the file to be considered unmodified for the  
 16126 purposes of future commands that may exit the editor. IEEE Std 1003.1-2001 requires  
 16127 conformance to historical practice.

16128 Historical documentation stated that mail was not sent to the user when preserve was executed;  
 16129 however, historical implementations did send mail in this case. IEEE Std 1003.1-2001 requires  
 16130 conformance to the historical implementations.

### 16131 **Print**

16132 The writing of NUL by the **print** command is not specified as a special case because the standard  
 16133 developers did not want to require **ex** to support NUL characters. Historically, characters were  
 16134 displayed using the ARPA standard mappings, which are as follows:

- 16135 1. Printable characters are left alone.
- 16136 2. Control characters less than \177 are represented as ' ^ ' followed by the character offset  
 16137 from the ' @ ' character in the ASCII map; for example, \007 is represented as ' ^G '.
- 16138 3. \177 is represented as ' ^ ' followed by ' ? '.

16139 The display of characters having their eighth bit set was less standard. Existing implementations  
 16140 use hex (0x00), octal (\000), and a meta-bit display. (The latter displayed bytes that had their  
 16141 eighth bit set as the two characters "M-" followed by the seven-bit display as described above.)  
 16142 The latter probably has the best claim to historical practice because it was used for the **-v** option  
 16143 of 4 BSD and 4 BSD-derived versions of the **cat** utility since 1980.

16144 No specific display format is required by IEEE Std 1003.1-2001.

16145 Explicit dependence on the ASCII character set has been avoided where possible, hence the use  
 16146 of the phrase an "implementation-defined multi-character sequence" for the display of non-  
 16147 printable characters in preference to the historical usage of, for instance, " ^I " for the <tab>.  
 16148 Implementations are encouraged to conform to historical practice in the absence of any strong  
 16149 reason to diverge.

16150 Historically, all **ex** commands beginning with the letter ' p ' could be entered using capitalized  
 16151 versions of the commands; for example, **P[rint]**, **Pre[serve]**, and **Pu[t]** were all valid command  
 16152 names. IEEE Std 1003.1-2001 permits, but does not require, this historical practice because  
 16153 capital forms of the commands are used by some implementations for other purposes.

16154 **Put**

16155 Historically, an **ex put** command, executed from open or visual mode, was the same as the open  
16156 or visual mode **P** command, if the buffer was named and was cut in character mode, and the  
16157 same as the **p** command if the buffer was named and cut in line mode. If the unnamed buffer  
16158 was the source of the text, the entire line from which the text was taken was usually **put**, and the  
16159 buffer was handled as if in line mode, but it was possible to get extremely anomalous behavior.  
16160 In addition, using the **Q** command to switch into **ex** mode, and then doing a **put** often resulted in  
16161 errors as well, such as appending text that was unrelated to the (supposed) contents of the  
16162 buffer. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit  
16163 these behaviors. All **ex put** commands are required to operate in line mode, and the contents of  
16164 the buffers are not altered by changing the mode of the editor.

16165 **Read**

16166 Historically, an **ex read** command executed from open or visual mode, executed in an empty file,  
16167 left an empty line as the first line of the file. For consistency and simplicity of specification,  
16168 IEEE Std 1003.1-2001 does not permit this behavior. Historically, a **read** in open or visual mode  
16169 from a program left the cursor at the last line read in, not the first. For consistency,  
16170 IEEE Std 1003.1-2001 does not permit this behavior.

16171 Historical implementations of **ex** were unable to undo **read** commands that read from the output  
16172 of a program. For consistency, IEEE Std 1003.1-2001 does not permit this behavior.

16173 Historically, the **ex** and **vi** message after a successful **read** or **write** command specified  
16174 “characters”, not “bytes”. IEEE Std 1003.1-2001 requires that the number of bytes be displayed,  
16175 not the number of characters, because it may be difficult in multi-byte implementations to  
16176 determine the number of characters read. Implementations are encouraged to clarify the  
16177 message displayed to the user.

16178 Historically, reads were not permitted on files other than type regular, except that FIFO files  
16179 could be read (probably only because they did not exist when **ex** and **vi** were originally written).  
16180 Because the historical **ex** evaluated **read!** and **read !** equivalently, there can be no optional way  
16181 to force the read. IEEE Std 1003.1-2001 permits, but does not require, this behavior.

16182 **Recover**

16183 Some historical implementations of the editor permitted users to recover the edit buffer contents  
16184 from a previous edit session, and then exit without saving those contents (or explicitly  
16185 discarding them). The intent of IEEE Std 1003.1-2001 in requiring that the edit buffer be treated  
16186 as already modified is to prevent this user error.

16187 **Rewind**

16188 Historical implementations supported the **rewind** command when the user was editing the first  
16189 file in the list; that is, the file that the **rewind** command would edit. IEEE Std 1003.1-2001  
16190 requires conformance to historical practice.

**Substitute**

Historically, *ex* accepted an **r** option to the **s** command. The effect of the **r** option was to use the last regular expression used in any command as the pattern, the same as the **~** command. The **r** option is not required by IEEE Std 1003.1-2001. Historically, the **c** and **g** options were toggled; for example, the command **:s/abc/def/** was the same as **s/abc/def/ccccgggg**. For simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

The tilde command is often used to replace the last search RE. For example, in the sequence:

```
s/red/blue/
/green
~
```

the **~** command is equivalent to:

```
s/green/blue/
```

Historically, *ex* accepted all of the following forms:

```
s/abc/def/
s/abc/def
s/abc/
s/abc
```

IEEE Std 1003.1-2001 requires conformance to this historical practice.

The **s** command presumes that the **^** character only occupies a single column in the display. Much of the *ex* and *vi* specification presumes that the **<space>** only occupies a single column in the display. There are no known character sets for which this is not true.

Historically, the final column position for the substitute commands was based on previous column movements; a search for a pattern followed by a substitution would leave the column position unchanged, while a **0** command followed by a substitution would change the column position to the first non-**<blank>**. For consistency and simplicity of specification, IEEE Std 1003.1-2001 requires that the final column position always be set to the first non-**<blank>**.

**Set**

Historical implementations redisplayed all of the options for each occurrence of the **all** keyword. IEEE Std 1003.1-2001 permits, but does not require, this behavior.

**Tag**

No requirement is made as to where *ex* and *vi* shall look for the file referenced by the tag entry. Historical practice has been to look for the path found in the **tags** file, based on the current directory. A useful extension found in some implementations is to look based on the directory containing the tags file that held the entry, as well. No requirement is made as to which reference for the tag in the tags file is used. This is deliberate, in order to permit extensions such as multiple entries in a tags file for a tag.

Because users often specify many different tags files, some of which need not be relevant or exist at any particular time, IEEE Std 1003.1-2001 requires that error messages about problem tags files be displayed only if the requested tag is not found, and then, only once for each time that the **tag** edit option is changed.

The requirement that the current edit buffer be unmodified is only necessary if the file indicated by the tag entry is not the same as the current file (as defined by the current pathname).

Historically, the file would be reloaded if the filename had changed, as well as if the filename was different from the current pathname. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior, requiring that the name be the only factor in the decision.

Historically, *vi* only searched for tags in the current file from the current cursor to the end of the file, and therefore, if the **wrapscan** option was not set, tags occurring before the current cursor were not found. IEEE Std 1003.1-2001 considers this a bug, and implementations are required to search for the first occurrence in the file, regardless.

#### 16242 **Undo**

The **undo** description deliberately uses the word “modified”. The **undo** command is not intended to undo commands that replace the contents of the edit buffer, such as **edit**, **next**, **tag**, or **recover**.

Cursor positioning after the **undo** command was inconsistent in the historical *vi*, sometimes attempting to restore the original cursor position (**global**, **undo**, and **v** commands), and sometimes, in the presence of maps, placing the cursor on the last line added or changed instead of the first. IEEE Std 1003.1-2001 requires a simplified behavior for consistency and simplicity of specification.

#### 16251 **Version**

The **version** command cannot be exactly specified since there is no widely-accepted definition of what the version information should contain. Implementations are encouraged to do something reasonably intelligent.

#### 16255 **Write**

Historically, the *ex* and *vi* message after a successful **read** or **write** command specified “characters”, not “bytes”. IEEE Std 1003.1-2001 requires that the number of bytes be displayed, not the number of characters because it may be difficult in multi-byte implementations to determine the number of characters written. Implementations are encouraged to clarify the message displayed to the user.

Implementation-defined tests are permitted so that implementations can make additional checks; for example, for locks or file modification times.

Historically, attempting to append to a nonexistent file caused an error. It has been left unspecified in IEEE Std 1003.1-2001 to permit implementations to let the **write** succeed, so that the append semantics are similar to those of the historical *csh*.

Historical *vi* permitted empty edit buffers to be written. However, since the way *vi* got around dealing with “empty” files was to always have a line in the edit buffer, no matter what, it wrote them as files of a single, empty line. IEEE Std 1003.1-2001 does not permit this behavior.

Historically, *ex* restored standard output and standard error to their values as of when *ex* was invoked, before writes to programs were performed. This could disturb the terminal configuration as well as be a security issue for some terminals. IEEE Std 1003.1-2001 does not permit this, requiring that the program output be captured and displayed as if by the *ex* **print** command.

**Adjust Window**

Historically, the line count was set to the value of the **scroll** option if the type character was end-of-file. This feature was broken on most historical implementations long ago, however, and is not documented anywhere. For this reason, IEEE Std 1003.1-2001 is resolutely silent.

Historically, the **z** command was <blank>-sensitive and **z +** and **z -** did different things than **z+** and **z-** because the type could not be distinguished from a flag. (The commands **z .** and **z =** were historically invalid.) IEEE Std 1003.1-2001 requires conformance to this historical practice.

Historically, the **z** command was further <blank>-sensitive in that the *count* could not be <blank>-delimited; for example, the commands **z= 5** and **z- 5** were also invalid. Because the *count* is not ambiguous with respect to either the type character or the flags, this is not permitted by IEEE Std 1003.1-2001.

**Escape**

Historically, *ex* filter commands only read the standard output of the commands, letting standard error appear on the terminal as usual. The *vi* utility, however, read both standard output and standard error. IEEE Std 1003.1-2001 requires the latter behavior for both *ex* and *vi*, for consistency.

**Shift Left and Shift Right**

Historically, it was possible to add shift characters to increase the effect of the command; for example, <<< outdented (or >>> indented) the lines 3 levels of indentation instead of the default 1. IEEE Std 1003.1-2001 requires conformance to historical practice.

**<control>-D**

Historically, the <control>-D command erased the prompt, providing the user with an unbroken presentation of lines from the edit buffer. This is not required by IEEE Std 1003.1-2001; implementations are encouraged to provide it if possible. Historically, the <control>-D command took, and then ignored, a *count*. IEEE Std 1003.1-2001 does not permit this behavior.

**Write Line Number**

Historically, the *ex* = command, when executed in *ex* mode in an empty edit buffer, reported 0, and from open or visual mode, reported 1. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

**Execute**

Historically, *ex* did not correctly handle the inclusion of text input commands (that is, **append**, **insert**, and **change**) in executed buffers. IEEE Std 1003.1-2001 does not permit this exclusion for consistency.

Historically, the logical contents of the buffer being executed did not change if the buffer itself were modified by the commands being executed; that is, buffer execution did not support self-modifying code. IEEE Std 1003.1-2001 requires conformance to historical practice.

Historically, the @ command took a range of lines, and the @ buffer was executed once per line, with the current line ( ' . ' ) set to each specified line. IEEE Std 1003.1-2001 requires conformance to historical practice.

Some historical implementations did not notice if errors occurred during buffer execution. This, coupled with the ability to specify a range of lines for the *ex* @ command, makes it trivial to cause them to drop **core**. IEEE Std 1003.1-2001 requires that implementations stop buffer

16316 execution if any error occurs, if the specified line doesn't exist, or if the contents of the edit buffer  
16317 itself are replaced (for example, the buffer executes the **ex :edit** command).

## 16318 **Regular Expressions in ex**

16319 Historical practice is that the characters in the replacement part of the last **s** command—that is,  
16320 those matched by entering a '~' in the regular expression—were not further expanded by the  
16321 regular expression engine. So, if the characters contained the string "a.," they would match  
16322 'a' followed by ".," and not 'a' followed by any character. IEEE Std 1003.1-2001 requires  
16323 conformance to historical practice.

## 16324 **Edit Options in ex**

16325 The following paragraphs describe the historical behavior of some edit options that were not, for  
16326 whatever reason, included in IEEE Std 1003.1-2001. Implementations are strongly encouraged to  
16327 only use these names if the functionality described here is fully supported.

16328 **extended** The **extended** edit option has been used in some implementations of *vi* to provide  
16329 extended regular expressions instead of basic regular expressions. This option was  
16330 omitted from IEEE Std 1003.1-2001 because it is not widespread historical practice.

16331 **flash** The **flash** edit option historically caused the screen to flash instead of beeping on  
16332 error. This option was omitted from IEEE Std 1003.1-2001 because it is not found in  
16333 some historical implementations.

16334 **hardtabs** The **hardtabs** edit option historically defined the number of columns between  
16335 hardware tab settings. This option was omitted from IEEE Std 1003.1-2001 because  
16336 it was believed to no longer be generally useful.

16337 **modeline** The **modeline** (sometimes named **modelines**) edit option historically caused *ex* or  
16338 *vi* to read the five first and last lines of the file for editor commands. This option is  
16339 a security problem, and vendors are strongly encouraged to delete it from  
16340 historical implementations.

16341 **open** The **open** edit option historically disallowed the *ex* **open** and **visual** commands.  
16342 This edit option was omitted because these commands are required by  
16343 IEEE Std 1003.1-2001.

16344 **optimize** The **optimize** edit option historically expedited text throughput by setting the  
16345 terminal to not do automatic <carriage-return>s when printing more than one  
16346 logical line of output. This option was omitted from IEEE Std 1003.1-2001 because  
16347 it was intended for terminals without addressable cursors, which are rarely, if ever,  
16348 still used.

16349 **ruler** The **ruler** edit option has been used in some implementations of *vi* to present a  
16350 current row/column ruler for the user. This option was omitted from  
16351 IEEE Std 1003.1-2001 because it is not widespread historical practice.

16352 **sourceany** The **sourceany** edit option historically caused *ex* or *vi* to source start-up files that  
16353 were owned by users other than the user running the editor. This option is a  
16354 security problem, and vendors are strongly encouraged to remove it from their  
16355 implementations.

16356 **timeout** The **timeout** edit option historically enabled the (now standard) feature of only  
16357 waiting for a short period before returning keys that could be part of a macro. This  
16358 feature was omitted from IEEE Std 1003.1-2001 because its behavior is now  
16359 standard, it is not widely useful, and it was rarely documented.

|       |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 16360 | <b>verbose</b>        | The <b>verbose</b> edit option has been used in some implementations of <i>vi</i> to cause <i>vi</i> to output error messages for common errors; for example, attempting to move the cursor past the beginning or end of the line instead of only alerting the screen. (The historical <i>vi</i> only alerted the terminal and presented no message for such errors. The historical editor option <b>terse</b> did not select when to present error messages, it only made existing error messages more or less verbose.) This option was omitted from IEEE Std 1003.1-2001 because it is not widespread historical practice; however, implementors are encouraged to use it if they wish to provide error messages for naive users. |
| 16361 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16362 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16363 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16364 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16365 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16366 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16367 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 16369 | <b>wraplen</b>        | The <b>wraplen</b> edit option has been used in some implementations of <i>vi</i> to specify an automatic margin measured from the left margin instead of from the right margin. This is useful when multiple screen sizes are being used to edit a single file. This option was omitted from IEEE Std 1003.1-2001 because it is not widespread historical practice; however, implementors are encouraged to use it if they add this functionality.                                                                                                                                                                                                                                                                                  |

| 16393 |                       | Historical implementations of case-insensitive matching (the <b>ignorecase</b> edit option) lead to counterintuitive situations when uppercase characters were used in range expressions. Historically, the process was as follows:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Take a line of text from the edit buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 16397 |                       | 2. Convert uppercase to lowercase in text line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16398 |                       | 3. Convert uppercase to lowercase in regular expressions, except in character class specifications.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 16399 |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 16400 |                       | 4. Match regular expressions against text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 16401 |                       | This would mean that, with <b>ignorecase</b> in effect, the text:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

16402 The cat sat on the mat  
 16403 would be matched by  
 16404 /^the/  
 16405 but not by:  
 16406 /^ [A-Z] he/

16407 For consistency with other commands implementing regular expressions, IEEE Std 1003.1-2001  
 16408 does not permit this behavior.

#### 16409 **paragraphs, para**

16410 The ISO POSIX-2:1993 standard made the default **paragraphs** and **sections** edit options  
 16411 implementation-defined, arguing they were historically oriented to the UNIX system *troff* text  
 16412 formatter, and a “portable user” could use the { }, [[, ]], (, and ) commands in open or visual  
 16413 mode and have the cursor stop in unexpected places. IEEE Std 1003.1-2001 specifies their values  
 16414 in the POSIX locale because the unusual grouping (they only work when grouped into two  
 16415 characters at a time) means that they cannot be used for general-purpose movement, regardless.

#### 16416 **readonly**

16417 Implementations are encouraged to provide the best possible information to the user as to the  
 16418 read-only status of the file, with the exception that they should not consider the current special  
 16419 privileges of the process. This provides users with a safety net because they must force the  
 16420 overwrite of read-only files, even when running with additional privileges.

16421 The **readonly** edit option specification largely conforms to historical practice. The only  
 16422 difference is that historical implementations did not notice that the user had set the **readonly**  
 16423 edit option in cases where the file was already marked read-only for some reason, and would  
 16424 therefore reinitialize the **readonly** edit option the next time the contents of the edit buffer were  
 16425 replaced. This behavior is disallowed by IEEE Std 1003.1-2001.

#### 16426 **report**

16427 The requirement that lines copied to a buffer interact differently than deleted lines is historical  
 16428 practice. For example, if the **report** edit option is set to 3, deleting 3 lines will cause a report to be  
 16429 written, but 4 lines must be copied before a report is written.

16430 The requirement that the *ex* **global**, **v**, **open**, **undo**, and **visual** commands present reports based  
 16431 on the total number of lines added or deleted during the command execution, and that  
 16432 commands executed by the **global** and **v** commands not present reports, is historical practice.  
 16433 IEEE Std 1003.1-2001 extends historical practice by requiring that buffer execution be treated  
 16434 similarly. The reasons for this are two-fold. Historically, only the report by the last command  
 16435 executed from the buffer would be seen by the user, as each new report would overwrite the  
 16436 last. In addition, the standard developers believed that buffer execution had more in common  
 16437 with **global** and **v** commands than it did with other *ex* commands, and should behave similarly,  
 16438 for consistency and simplicity of specification.

**showmatch, sm**

The length of time the cursor spends on the matching character is unspecified because the timing capabilities of systems are often inexact and variable. The time should be long enough for the user to notice, but not long enough for the user to become annoyed. Some implementations of *vi* have added a **matchtime** option that permits users to set the number of 0,1 second intervals the cursor pauses on the matching character.

**showmode**

The **showmode** option has been used in some historical implementations of *ex* and *vi* to display the current editing mode when in open or visual mode. The editing modes have generally included “command” and “input”, and sometimes other modes such as “replace” and “change”. The string was usually displayed on the bottom line of the screen at the far right-hand corner. In addition, a preceding ‘\*’ character often denoted whether the contents of the edit buffer had been modified. The latter display has sometimes been part of the **showmode** option, and sometimes based on another option. This option was not available in the 4 BSD historical implementation of *vi*, but was viewed as generally useful, particularly to novice users, and is required by IEEE Std 1003.1-2001.

The **smd** shorthand for the **showmode** option was not present in all historical implementations of the editor. IEEE Std 1003.1-2001 requires it, for consistency.

Not all historical implementations of the editor displayed a mode string for command mode, differentiating command mode from text input mode by the absence of a mode string. IEEE Std 1003.1-2001 permits this behavior for consistency with historical practice, but implementations are encouraged to provide a display string for both modes.

**slowopen**

Historically the **slowopen** option was automatically set if the terminal baud rate was less than 1 200 baud, or if the baud rate was 1 200 baud and the **redraw** option was not set. The **slowopen** option had two effects. First, when inserting characters in the middle of a line, characters after the cursor would not be pushed ahead, but would appear to be overwritten. Second, when creating a new line of text, lines after the current line would not be scrolled down, but would appear to be overwritten. In both cases, ending text input mode would cause the screen to be refreshed to match the actual contents of the edit buffer. Finally, terminals that were sufficiently intelligent caused the editor to ignore the **slowopen** option. IEEE Std 1003.1-2001 permits most historical behavior, extending historical practice to require **slowopen** behaviors if the edit option is set by the user.

**tags**

The default path for tags files is left unspecified as implementations may have their own **tags** implementations that do not correspond to the historical ones. The default **tags** option value should probably at least include the file **./tags**.

**term**

Historical implementations of *ex* and *vi* ignored changes to the **term** edit option after the initial terminal information was loaded. This is permitted by IEEE Std 1003.1-2001; however, implementations are encouraged to permit the user to modify their terminal type at any time.

**terse**

Historically, the **terse** edit option optionally provided a shorter, less descriptive error message, for some error messages. This is permitted, but not required, by IEEE Std 1003.1-2001. Historically, most common visual mode errors (for example, trying to move the cursor past the end of a line) did not result in an error message, but simply alerted the terminal. Implementations wishing to provide messages for novice users are urged to do so based on the **edit** option **verbose**, and not **terse**.

**window**

In historical implementations, the default for the **window** edit option was based on the baud rate as follows:

1. If the baud rate was less than 1200, the **edit** option **w300** set the window value; for example, the line:

```
set w300=12
```

would set the window option to 12 if the baud rate was less than 1200.

2. If the baud rate was equal to 1200, the **edit** option **w1200** set the window value.
3. If the baud rate was greater than 1200, the **edit** option **w9600** set the window value.

The **w300**, **w1200**, and **w9600** options do not appear in IEEE Std 1003.1-2001 because of their dependence on specific baud rates.

In historical implementations, the size of the window displayed by various commands was related to, but not necessarily the same as, the **window** edit option. For example, the size of the window was set by the *ex* command **visual 10**, but it did not change the value of the **window** edit option. However, changing the value of the **window** edit option did change the number of lines that were displayed when the screen was repainted. IEEE Std 1003.1-2001 does not permit this behavior in the interests of consistency and simplicity of specification, and requires that all commands that change the number of lines that are displayed do it by setting the value of the **window** edit option.

**wrapmargin, wm**

Historically, the **wrapmargin** option did not affect maps inserting characters that also had associated *counts*; for example **:map K 5aABC DEF**. Unfortunately, there are widely used maps that depend on this behavior. For consistency and simplicity of specification, IEEE Std 1003.1-2001 does not permit this behavior.

Historically, **wrapmargin** was calculated using the column display width of all characters on the screen. For example, an implementation using "^I" to represent <tab>s when the **list** edit option was set, where '^' and 'I' each took up a single column on the screen, would calculate the **wrapmargin** based on a value of 2 for each <tab>. The **number** edit option similarly changed the effective length of the line as well. IEEE Std 1003.1-2001 requires conformance to historical practice.

16517 **FUTURE DIRECTIONS**

16518 None.

16519 **SEE ALSO**

16522 **CHANGE HISTORY**

16523 First released in Issue 2.

16524 **Issue 5**

16525 The FUTURE DIRECTIONS section is added.

16526 **Issue 6**

16527 This utility is marked as part of the User Portability Utilities option.

16528 The obsolescent SYNOPSIS is removed, removing the *+command* and *-* options.

16529 The following new requirements on POSIX implementations derive from alignment with the  
16530 Single UNIX Specification:

16531 • In the **map** command description, the sequence *#digit* is added.

16532 • The **directory**, **edcompatible**, **redraw**, and **slowopen** edit options are added.

16533 The *ex* utility is extensively changed for alignment with the IEEE P1003.2b draft standard. This  
16534 includes changes as a result of the IEEE PASC Interpretations 1003.2 #31, #38, #49, #50, #51, #52,  
16535 #55, #56, #57, #61, #62, #63, #64, #65, and #78.

16536 The **-I** option is removed.

16537 IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/23 is applied, correcting a URL.

16538 **NAME**

16539           expand — convert tabs to spaces

16540 **SYNOPSIS**16541 UP       expand [-t *tablist*] [*file* ...]

16542

16543 **DESCRIPTION**

16544       The *expand* utility shall write files or the standard input to the standard output with <tab>s  
 16545       replaced with one or more <space>s needed to pad to the next tab stop. Any <backspace>s shall  
 16546       be copied to the output and cause the column position count for tab stop calculations to be  
 16547       decremented; the column position count shall not be decremented below zero.

16548 **OPTIONS**

16549       The *expand* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 16550       12.2, Utility Syntax Guidelines.

16551       The following option shall be supported:

16552       -t *tablist*   Specify the tab stops. The application shall ensure that the argument *tablist*  
 16553       consists of either a single positive decimal integer or a list of tabstops. If a single  
 16554       number is given, tabs shall be set that number of column positions apart instead of  
 16555       the default 8.

16556       If a list of tabstops is given, the application shall ensure that it consists of a list of  
 16557       two or more positive decimal integers, separated by <blank>s or commas, in  
 16558       ascending order. The tabs shall be set at those specific column positions. Each tab  
 16559       stop *N* shall be an integer value greater than zero, and the list is in strictly  
 16560       ascending order. This is taken to mean that, from the start of a line of output,  
 16561       tabbing to position *N* shall cause the next character output to be in the (*N*+1)th  
 16562       column position on that line.

16563       In the event of *expand* having to process a <tab> at a position beyond the last of  
 16564       those specified in a multiple tab-stop list, the <tab> shall be replaced by a single  
 16565       <space> in the output.

16566 **OPERANDS**

16567       The following operand shall be supported:

16568       *file*           The pathname of a text file to be used as input.

16569 **STDIN**

16570       See the INPUT FILES section.

16571 **INPUT FILES**

16572       Input files shall be text files.

16573 **ENVIRONMENT VARIABLES**

16574       The following environment variables shall affect the execution of *expand*:

16575       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 16576       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 16577       Internationalization Variables for the precedence of internationalization variables  
 16578       used to determine the values of locale categories.)

16579       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 16580       internationalization variables.

16581       *LC\_CTYPE*       Determine the locale for the interpretation of sequences of bytes of text data as  
 16582       characters (for example, single-byte as opposed to multi-byte characters in

16583 arguments and input files), the processing of <tab>s and <space>s, and for the  
 16584 determination of the width in column positions each character would occupy on  
 16585 an output device.

16586 **LC\_MESSAGES**

16587 Determine the locale that should be used to affect the format and contents of  
 16588 diagnostic messages written to standard error.

16589 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

16590 **ASYNCHRONOUS EVENTS**

16591 Default.

16592 **STDOUT**

16593 The standard output shall be equivalent to the input files with <tab>s converted into the  
 16594 appropriate number of <space>s.

16595 **STDERR**

16596 The standard error shall be used only for diagnostic messages.

16597 **OUTPUT FILES**

16598 None.

16599 **EXTENDED DESCRIPTION**

16600 None.

16601 **EXIT STATUS**

16602 The following exit values shall be returned:

16603 0 Successful completion

16604 >0 An error occurred.

16605 **CONSEQUENCES OF ERRORS**

16606 The *expand* utility shall terminate with an error message and non-zero exit status upon  
 16607 encountering difficulties accessing one of the *file* operands.

16608 **APPLICATION USAGE**

16609 None.

16610 **EXAMPLES**

16611 None.

16612 **RATIONALE**

16613 The *expand* utility is useful for preprocessing text files (before sorting, looking at specific  
 16614 columns, and so on) that contain <tab>s.

16615 See the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.103, Column Position.

16616 The *tablist* option-argument consists of integers in ascending order. Utility Syntax Guideline 8  
 16617 mandates that *expand* shall accept the integers (within the single argument) separated using  
 16618 either commas or <blank>s.

16619 **FUTURE DIRECTIONS**

16620 None.

16621 **SEE ALSO**

16622 *tabs*, *unexpand*

16623 **CHANGE HISTORY**

16624 First released in Issue 4.

16625 **Issue 6**

16626 This utility is marked as part of the User Portability Utilities option.

16627 The APPLICATION USAGE section is added.

16628 The obsolescent SYNOPSIS is removed.

16629 The *LC\_CTYPE* environment variable description is updated to align with the IEEE P1003.2b  
16630 draft standard.

16631 The normative text is reworded to avoid use of the term “must” for application requirements.

16632 **NAME**16633        *expr* — evaluate arguments as an expression16634 **SYNOPSIS**16635        *expr operand*16636 **DESCRIPTION**16637        The *expr* utility shall evaluate an expression and write the result to standard output.16638 **OPTIONS**

16639        None.

16640 **OPERANDS**

16641        The single expression evaluated by *expr* shall be formed from the operands, as described in the  
 16642        EXTENDED DESCRIPTION section. The application shall ensure that each of the expression  
 16643        operator symbols:

16644        ( ) | &amp; = &gt; &gt;= &lt; &lt;= != + - \* / % :

16645        and the symbols *integer* and *string* in the table are provided as separate arguments to *expr*.16646 **STDIN**

16647        Not used.

16648 **INPUT FILES**

16649        None.

16650 **ENVIRONMENT VARIABLES**16651        The following environment variables shall affect the execution of *expr*:

16652        *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 16653        (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 16654        Internationalization Variables for the precedence of internationalization variables  
 16655        used to determine the values of locale categories.)

16656        *LC\_ALL*        If set to a non-empty string value, override the values of all the other  
 16657        internationalization variables.

16658        *LC\_COLLATE*    Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 16659        character collating elements within regular expressions and by the string  
 16660        comparison operators.  
 16661

16662        *LC\_CTYPE*    Determine the locale for the interpretation of sequences of bytes of text data as  
 16663        characters (for example, single-byte as opposed to multi-byte characters in  
 16664        arguments) and the behavior of character classes within regular expressions.

16665        *LC\_MESSAGES*    Determine the locale that should be used to affect the format and contents of  
 16666        diagnostic messages written to standard error.  
 16667

16668 *XSI*        *NLSPATH*    Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

16669 **ASYNCHRONOUS EVENTS**

16670        Default.

16671 **STDOUT**

16672        The *expr* utility shall evaluate the expression and write the result, followed by a <newline>, to  
 16673        standard output.

16674 **STDERR**

16675 The standard error shall be used only for diagnostic messages.

16676 **OUTPUT FILES**

16677 None.

16678 **EXTENDED DESCRIPTION**

16679 The formation of the expression to be evaluated is shown in the following table. The symbols  
 16680 *expr*, *expr1*, and *expr2* represent expressions formed from *integer* and *string* symbols and the  
 16681 expression operator symbols (all separate arguments) by recursive application of the constructs  
 16682 described in the table. The expressions are listed in order of increasing precedence, with equal-  
 16683 precedence operators grouped between horizontal lines. All of the operators shall be left-  
 16684 associative.

| Expression                                                                                                                                                                                | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>expr1</i>   <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if it is neither null nor zero; otherwise, returns the evaluation of <i>expr2</i> if it is not null; otherwise, zero.                                                                                                                                                                                                                                               |
| <i>expr1</i> & <i>expr2</i>                                                                                                                                                               | Returns the evaluation of <i>expr1</i> if neither expression evaluates to null or zero; otherwise, returns zero.                                                                                                                                                                                                                                                                                           |

| <i>expr1</i> : <i>expr2</i>                                                                                                                                                               | Matching expression; see below.                                                                                                                                                                                                                                                                                                                                                                            |
| ( <i>expr</i> )                                                                                                                                                                           | Grouping symbols. Any expression can be placed within parentheses. Parentheses can be nested to a depth of {EXPR_NEST_MAX}.                                                                                                                                                                                                                                                                                |
| <i>integer</i><br><i>string</i>                                                                                                                                                           | An argument consisting only of an (optional) unary minus followed by digits.<br>A string argument; see below.                                                                                                                                                                                                                                                                                              |

**Matching Expression**

The `' : '` matching operator shall compare the string resulting from the evaluation of *expr1* with the regular expression pattern resulting from the evaluation of *expr2*. Regular expression syntax shall be that defined in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions, except that all patterns are anchored to the beginning of the string (that is, only sequences starting at the first character of a string are matched by the regular expression) and, therefore, it is unspecified whether `' ^ '` is a special character in that context. Usually, the matching operator shall return a string representing the number of characters matched (`' 0 '` on failure). Alternatively, if the pattern contains at least one regular expression subexpression `" [ \ ( . . . \ ) ] "`, the string corresponding to `" \1 "` shall be returned.

**String Operand**

A string argument is an argument that cannot be identified as an *integer* argument or as one of the expression operator symbols shown in the OPERANDS section.

The use of string arguments **length**, **substr**, **index**, or **match** produces unspecified results.

**EXIT STATUS**

The following exit values shall be returned:

- 0 The *expression* evaluates to neither null nor zero.
- 1 The *expression* evaluates to null or zero.
- 2 Invalid *expression*.
- >2 An error occurred.

**CONSEQUENCES OF ERRORS**

Default.

**APPLICATION USAGE**

After argument processing by the shell, *expr* is not required to be able to tell the difference between an operator and an operand except by the value. If `"$a"` is `' = '`, the command:

```
expr $a = ' = '
```

looks like:

```
expr = = =
```

as the arguments are passed to *expr* (and they all may be taken as the `' = '` operator). The following works reliably:

```
expr X$a = X=
```

Also note that this volume of IEEE Std 1003.1-2001 permits implementations to extend utilities. The *expr* utility permits the integer arguments to be preceded with a unary minus. This means that an integer argument could look like an option. Therefore, the conforming application must employ the `"--"` construct of Guideline 10 of the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines to protect its operands if there is any chance the first operand might be a negative integer (or any string with a leading minus).

**EXAMPLES**

The *expr* utility has a rather difficult syntax:

- Many of the operators are also shell control operators or reserved words, so they have to be escaped on the command line.

- Each part of the expression is composed of separate arguments, so liberal usage of <blank>s is required. For example:

| Invalid                       | Valid                              |
|-------------------------------|------------------------------------|
| <code>expr 1+2</code>         | <code>expr 1 + 2</code>            |
| <code>expr "1 + 2"</code>     | <code>expr 1 + 2</code>            |
| <code>expr 1 + (2 * 3)</code> | <code>expr 1 + \( 2 \* 3 \)</code> |

In many cases, the arithmetic and string features provided as part of the shell command language are easier to use than their equivalents in *expr*. Newly written scripts should avoid *expr* in favor of the new features within the shell; see Section 2.5 (on page 33) and Section 2.6.4 (on page 41).

The following command:

```
a=$(expr $a + 1)
```

adds 1 to the variable *a*.

The following command, for "*\$a*" equal to either **/usr/abc/file** or just **file**:

```
expr $a : '.*\/(.*\)' \| $a
```

returns the last segment of a pathname (that is, **file**). Applications should avoid the character **'/'** used alone as an argument; *expr* may interpret it as the division operator.

The following command:

```
expr "//$a" : '.*\/(.*\)'
```

is a better representation of the previous example. The addition of the **"//"** characters eliminates any ambiguity about the division operator and simplifies the whole expression. Also note that pathnames may contain characters contained in the *IFS* variable and should be quoted to avoid having "*\$a*" expand into multiple arguments.

The following command:

```
expr "$VAR" : '.*'
```

returns the number of characters in *VAR*.

#### RATIONALE

In an early proposal, EREs were used in the matching expression syntax. This was changed to BREs to avoid breaking historical applications.

The use of a leading circumflex in the BRE is unspecified because many historical implementations have treated it as a special character, despite their system documentation. For example:

```
expr foo : ^foo expr ^foo : ^foo
```

return 3 and 0, respectively, on those systems; their documentation would imply the reverse. Thus, the anchoring condition is left unspecified to avoid breaking historical scripts relying on this undocumented feature.

#### FUTURE DIRECTIONS

None.

16848 **Issue 6**

16849 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/24 is applied, changing the STDERR  
16850 section from “None.” to “Not used.” for alignment with Section 1.11 (on page 20).

16851 **NAME**

16852       fc — process the command history list

16853 **SYNOPSIS**16854 UP       fc [-r] [-e *editor*] [*first* [*last*]]16855       fc -l [-nr] [*first* [*last*]]16856       fc -s [*old=new*] [*first*]

16857

16858 **DESCRIPTION**16859       The *fc* utility shall list, or shall edit and re-execute, commands previously entered to an  
16860       interactive *sh*.

16861       The command history list shall reference commands by number. The first number in the list is  
 16862       selected arbitrarily. The relationship of a number to its command shall not change except when  
 16863       the user logs in and no other process is accessing the list, at which time the system may reset the  
 16864       numbering to start the oldest retained command at another number (usually 1). When the  
 16865       number reaches an implementation-defined upper limit, which shall be no smaller than the  
 16866       value in *HISTSIZE* or 32 767 (whichever is greater), the shell may wrap the numbers, starting the  
 16867       next command with a lower number (usually 1). However, despite this optional wrapping of  
 16868       numbers, *fc* shall maintain the time-ordering sequence of the commands. For example, if four  
 16869       commands in sequence are given the numbers 32 766, 32 767, 1 (wrapped), and 2 as they are  
 16870       executed, command 32 767 is considered the command previous to 1, even though its number is  
 16871       higher.

16872       When commands are edited (when the **-l** option is not specified), the resulting lines shall be  
 16873       entered at the end of the history list and then re-executed by *sh*. The *fc* command that caused the  
 16874       editing shall not be entered into the history list. If the editor returns a non-zero exit status, this  
 16875       shall suppress the entry into the history list and the command re-execution. Any command line  
 16876       variable assignments or redirection operators used with *fc* shall affect both the *fc* command itself  
 16877       as well as the command that results; for example:

16878       fc -s -- -l 2 &gt;/dev/null

16879       reinvokes the previous command, suppressing standard error for both *fc* and the previous  
 16880       command.

16881 **OPTIONS**

16882       The *fc* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 16883       Utility Syntax Guidelines.

16884       The following options shall be supported:

16885       **-e editor**     Use the editor named by *editor* to edit the commands. The *editor* string is a utility  
 16886       name, subject to search via the *PATH* variable (see the Base Definitions volume of  
 16887       IEEE Std 1003.1-2001, Chapter 8, Environment Variables). The value in the *FCEDIT*  
 16888       variable shall be used as a default when **-e** is not specified. If *FCEDIT* is null or  
 16889       unset, *ed* shall be used as the editor.

16890       **-l**           (The letter ell.) List the commands rather than invoking an editor on them. The  
 16891       commands shall be written in the sequence indicated by the *first* and *last* operands,  
 16892       as affected by **-r**, with each command preceded by the command number.

16893       **-n**           Suppress command numbers when listing with **-l**.

16894       **-r**           Reverse the order of the commands listed (with **-l**) or edited (with neither **-l** nor  
 16895       **-s**).

16896            **-s**            Re-execute the command without invoking an editor.

## 16897 OPERANDS

16898            The following operands shall be supported:

16899            *first, last*        Select the commands to list or edit. The number of previous commands that can be  
16900                                accessed shall be determined by the value of the *HISTSIZE* variable. The value of  
16901                                *first* or *last* or both shall be one of the following:

16902                                **[+]***number*        A positive number representing a command number; command  
16903                                numbers can be displayed with the **-l** option.

16904                                **-***number*            A negative decimal number representing the command that was  
16905                                executed *number* of commands previously. For example, **-1** is the  
16906                                immediately previous command.

16907                                *string*            A string indicating the most recently entered command that begins  
16908                                with that string. If the *old=new* operand is not also specified with **-s**,  
16909                                the string form of the *first* operand cannot contain an embedded  
16910                                equal sign.

16911            When the synopsis form with **-s** is used:

- 16912                                • If *first* is omitted, the previous command shall be used.

16913            For the synopsis forms without **-s**:

- 16914                                • If *last* is omitted, *last* shall default to the previous command when **-l** is  
16915                                specified; otherwise, it shall default to *first*.

- 16916                                • If *first* and *last* are both omitted, the previous 16 commands shall be listed or  
16917                                the previous single command shall be edited (based on the **-l** option).

- 16918                                • If *first* and *last* are both present, all of the commands from *first* to *last* shall be  
16919                                edited (without **-l**) or listed (with **-l**). Editing multiple commands shall be  
16920                                accomplished by presenting to the editor all of the commands at one time, each  
16921                                command starting on a new line. If *first* represents a newer command than *last*,  
16922                                the commands shall be listed or edited in reverse sequence, equivalent to using  
16923                                **-r**. For example, the following commands on the first line are equivalent to the  
16924                                corresponding commands on the second:

```
16925 fc -r 10 20 fc 30 40
16926 fc 20 10 fc -r 40 30
```

- 16927                                • When a range of commands is used, it shall not be an error to specify *first* or *last*  
16928                                values that are not in the history list; *fc* shall substitute the value representing  
16929                                the oldest or newest command in the list, as appropriate. For example, if there  
16930                                are only ten commands in the history list, numbered 1 to 10:

```
16931 fc -l
16932 fc 1 99
```

16933                                shall list and edit, respectively, all ten commands.

16934            *old=new*            Replace the first occurrence of string *old* in the commands to be re-executed by the  
16935                                string *new*.

16936 **STDIN**

16937 Not used.

16938 **INPUT FILES**

16939 None.

16940 **ENVIRONMENT VARIABLES**16941 The following environment variables shall affect the execution of *fc*:

16942 *FCEDIT* This variable, when expanded by the shell, shall determine the default value for  
 16943 the **-e** *editor* option's *editor* option-argument. If *FCEDIT* is null or unset, *ed* shall be  
 16944 used as the editor.

16945 *HISTFILE* Determine a pathname naming a command history file. If the *HISTFILE* variable is  
 16946 not set, the shell may attempt to access or create a file **.sh\_history** in the directory  
 16947 referred to by the *HOME* environment variable. If the shell cannot obtain both read  
 16948 and write access to, or create, the history file, it shall use an unspecified  
 16949 mechanism that allows the history to operate properly. (References to history  
 16950 “file” in this section shall be understood to mean this unspecified mechanism in  
 16951 such cases.) An implementation may choose to access this variable only when  
 16952 initializing the history file; this initialization shall occur when *fc* or *sh* first attempt  
 16953 to retrieve entries from, or add entries to, the file, as the result of commands issued  
 16954 by the user, the file named by the *ENV* variable, or implementation-defined system  
 16955 start-up files. In some historical shells, the history file is initialized just after the  
 16956 *ENV* file has been processed. Therefore, it is implementation-defined whether  
 16957 changes made to *HISTFILE* after the history file has been initialized are effective.  
 16958 Implementations may choose to disable the history list mechanism for users with  
 16959 appropriate privileges who do not set *HISTFILE*; the specific circumstances under  
 16960 which this occurs are implementation-defined. If more than one instance of the  
 16961 shell is using the same history file, it is unspecified how updates to the history file  
 16962 from those shells interact. As entries are deleted from the history file, they shall be  
 16963 deleted oldest first. It is unspecified when history file entries are physically  
 16964 removed from the history file.

16965 *HISTSIZE* Determine a decimal number representing the limit to the number of previous  
 16966 commands that are accessible. If this variable is unset, an unspecified default  
 16967 greater than or equal to 128 shall be used. The maximum number of commands in  
 16968 the history list is unspecified, but shall be at least 128. An implementation may  
 16969 choose to access this variable only when initializing the history file, as described  
 16970 under *HISTFILE*. Therefore, it is unspecified whether changes made to *HISTSIZE*  
 16971 after the history file has been initialized are effective.

16972 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 16973 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 16974 Internationalization Variables for the precedence of internationalization variables  
 16975 used to determine the values of locale categories.)

16976 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 16977 internationalization variables.

16978 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 16979 characters (for example, single-byte as opposed to multi-byte characters in  
 16980 arguments and input files).

16981 *LC\_MESSAGES*

16982 Determine the locale that should be used to affect the format and contents of  
 16983 diagnostic messages written to standard error.

16984 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 16985 ASYNCHRONOUS EVENTS

16986 Default.

## 16987 STDOUT

16988 When the **-l** option is used to list commands, the format of each command in the list shall be as follows:

16990 "%d\t%s\n", <line number>, <command>

16991 If both the **-l** and **-n** options are specified, the format of each command shall be:

16992 "\t%s\n", <command>

16993 If the <command> consists of more than one line, the lines after the first shall be displayed as:

16994 "\t%s\n", <continued-command>

## 16995 STDERR

16996 The standard error shall be used only for diagnostic messages.

## 16997 OUTPUT FILES

16998 None.

## 16999 EXTENDED DESCRIPTION

17000 None.

## 17001 EXIT STATUS

17002 The following exit values shall be returned:

17003 0 Successful completion of the listing.

17004 >0 An error occurred.

17005 Otherwise, the exit status shall be that of the commands executed by *fc*.

## 17006 CONSEQUENCES OF ERRORS

17007 Default.

## 17008 APPLICATION USAGE

17009 Since editors sometimes use file descriptors as integral parts of their editing, redirecting their file descriptors as part of the *fc* command can produce unexpected results. For example, if *vi* is the *FCEDIT* editor, the command:

17012 *fc -s | more*

17013 does not work correctly on many systems.

17014 Users on windowing systems may want to have separate history files for each window by setting *HISTFILE* as follows:

17016 *HISTFILE=\$HOME/.sh\_hist\$\$*

## 17017 EXAMPLES

17018 None.

## 17019 RATIONALE

17020 This utility is based on the *fc* built-in of the KornShell.

17021 An early proposal specified the **-e** option as [**-e editor [old= new ]**], which is not historical practice. Historical practice in *fc* of either [**-e editor**] or [**-e - [old= new ]**] is acceptable, but not both together. To clarify this, a new option **-s** was introduced replacing the [**-e -**]. This resolves the conflict and makes *fc* conform to the Utility Syntax Guidelines.

17025 **HISTFILE** Some implementations of the KornShell check for the superuser and do not create  
 17026 a history file unless *HISTFILE* is set. This is done primarily to avoid creating  
 17027 unlinked files in the root file system when logging in during single-user mode.  
 17028 *HISTFILE* must be set for the superuser to have history.

17029 **HISTSIZE** Needed to limit the size of history files. It is the intent of the standard developers  
 17030 that when two shells share the same history file, commands that are entered in one  
 17031 shell shall be accessible by the other shell. Because of the difficulties of  
 17032 synchronization over a network, the exact nature of the interaction is unspecified.

17033 The initialization process for the history file can be dependent on the system start-up files, in  
 17034 that they may contain commands that effectively preempt the settings the user has for *HISTFILE*  
 17035 and *HISTSIZE*. For example, function definition commands are recorded in the history file. If the  
 17036 system administrator includes function definitions in some system start-up file called before the  
 17037 *ENV* file, the history file is initialized before the user can influence its characteristics. In some  
 17038 historical shells, the history file is initialized just after the *ENV* file has been processed. Because  
 17039 of these situations, the text requires the initialization process to be implementation-defined.

17040 Consideration was given to omitting the *fc* utility in favor of the command line editing feature in  
 17041 *sh*. For example, in *vi* editing mode, typing "<ESC> v" is equivalent to:

17042 EDITOR=vi fc

17043 However, the *fc* utility allows the user the flexibility to edit multiple commands simultaneously  
 17044 (such as *fc* 10 20) and to use editors other than those supported by *sh* for command line editing.

17045 In the KornShell, the alias **r** ("re-do") is preset to *fc -e* (equivalent to the POSIX *fc -s*). This is  
 17046 probably an easier command name to remember than *fc* ("fix command"), but it does not meet  
 17047 the Utility Syntax Guidelines. Renaming *fc* to *hist* or *redo* was considered, but since this  
 17048 description closely matches historical KornShell practice already, such a renaming was seen as  
 17049 gratuitous. Users are free to create aliases whenever odd historical names such as *fc*, *awk*, *cat*,  
 17050 *grep*, or *yacc* are standardized by POSIX.

17051 Command numbers have no ordering effects; they are like serial numbers. The **-r** option and  
 17052 **-number** operand address the sequence of command execution, regardless of serial numbers. So,  
 17053 for example, if the command number wrapped back to 1 at some arbitrary point, there would be  
 17054 no ambiguity associated with traversing the wrap point. For example, if the command history  
 17055 were:

17056 32766: echo 1  
 17057 32767: echo 2  
 17058 1: echo 3

17059 the number **-2** refers to command 32 767 because it is the second previous command, regardless  
 17060 of serial number.

17061 **FUTURE DIRECTIONS**

17062 None.

17063 **SEE ALSO**

17064 *sh*

17065 **CHANGE HISTORY**

17066 First released in Issue 4.

17067 **Issue 5**

17068 The FUTURE DIRECTIONS section is added.

17069 **Issue 6**

17070 This utility is marked as part of the User Portability Utilities option.

17071 In the ENVIRONMENT VARIABLES section, the text “user’s home directory” is updated to  
17072 “directory referred to by the *HOME* environment variable”.

17073 **NAME**

17074           fg — run jobs in the foreground

17075 **SYNOPSIS**17076 UP       fg [*job\_id*]

17077

17078 **DESCRIPTION**

17079           If job control is enabled (see the description of *set -m*), the *fg* utility shall move a background job  
 17080           from the current environment (see Section 2.12 (on page 61)) into the foreground.

17081           Using *fg* to place a job into the foreground shall remove its process ID from the list of those  
 17082           “known in the current shell execution environment”; see Section 2.9.3.1 (on page 50).

17083 **OPTIONS**

17084           None.

17085 **OPERANDS**

17086           The following operand shall be supported:

17087           *job\_id*       Specify the job to be run as a foreground job. If no *job\_id* operand is given, the  
 17088                           *job\_id* for the job that was most recently suspended, placed in the background, or  
 17089                           run as a background job shall be used. The format of *job\_id* is described in the Base  
 17090                           Definitions volume of IEEE Std 1003.1-2001, Section 3.203, Job Control Job ID.

17091 **STDIN**

17092           Not used.

17093 **INPUT FILES**

17094           None.

17095 **ENVIRONMENT VARIABLES**17096           The following environment variables shall affect the execution of *fg*:

17097           *LANG*        Provide a default value for the internationalization variables that are unset or null.  
 17098                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 17099                           Internationalization Variables for the precedence of internationalization variables  
 17100                           used to determine the values of locale categories.)

17101           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
 17102                           internationalization variables.

17103           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 17104                           characters (for example, single-byte as opposed to multi-byte characters in  
 17105                           arguments).

17106           *LC\_MESSAGES*

17107                           Determine the locale that should be used to affect the format and contents of  
 17108                           diagnostic messages written to standard error.

17109 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.17110 **ASYNCHRONOUS EVENTS**

17111           Default.

17112 **STDOUT**17113           The *fg* utility shall write the command line of the job to standard output in the following format:17114           "%s\n", <*command*>

**17115 STDERR**

17116 The standard error shall be used only for diagnostic messages.

**17117 OUTPUT FILES**

17118 None.

**17119 EXTENDED DESCRIPTION**

17120 None.

**17121 EXIT STATUS**

17122 The following exit values shall be returned:

17123 0 Successful completion.

17124 >0 An error occurred.

**17125 CONSEQUENCES OF ERRORS**

17126 If job control is disabled, the *fg* utility shall exit with an error and no job shall be placed in the foreground.

**17128 APPLICATION USAGE**

17129 The *fg* utility does not work as expected when it is operating in its own utility execution environment because that environment has no applicable jobs to manipulate. See the APPLICATION USAGE section for *bg*. For this reason, *fg* is generally implemented as a shell regular built-in.

**17133 EXAMPLES**

17134 None.

**17135 RATIONALE**

17136 The extensions to the shell specified in this volume of IEEE Std 1003.1-2001 have mostly been based on features provided by the KornShell. The job control features provided by *bg*, *fg*, and *jobs* are also based on the KornShell. The standard developers examined the characteristics of the C shell versions of these utilities and found that differences exist. Despite widespread use of the C shell, the KornShell versions were selected for this volume of IEEE Std 1003.1-2001 to maintain a degree of uniformity with the rest of the KornShell features selected (such as the very popular command line editing features).

**17143 FUTURE DIRECTIONS**

17144 None.

**17145 SEE ALSO**

17146 Section 2.9.3.1 (on page 50), Section 2.12 (on page 61), *bg*, *kill*, *jobs*, *wait*

**17147 CHANGE HISTORY**

17148 First released in Issue 4.

**17149 Issue 6**

17150 This utility is marked as part of the User Portability Utilities option.

17151 The APPLICATION USAGE section is added.

17152 The JC marking is removed from the SYNOPSIS since job control is mandatory in this issue.

17153 **NAME**

17154 file — determine file type

17155 **SYNOPSIS**17156 UP file [-dh] [-M *file*] [-m *file*] *file* ...17157 file -i [-h] *file* ...

17158

17159 **DESCRIPTION**

17160 The *file* utility shall perform a series of tests in sequence on each specified *file* in an attempt to  
 17161 classify it:

- 17162 1. If *file* does not exist, cannot be read, or its file status could not be determined, the output  
 17163 shall indicate that the file was processed, but that its type could not be determined.
- 17164 2. If the file is not a regular file, its file type shall be identified. The file types directory, FIFO,  
 17165 socket, block special, and character special shall be identified as such. Other  
 17166 implementation-defined file types may also be identified. If *file* is a symbolic link, by  
 17167 default the link shall be resolved and *file* shall test the type of file referenced by the  
 17168 symbolic link. (See the **-h** and **-i** options below.)
- 17169 3. If the length of *file* is zero, it shall be identified as an empty file.
- 17170 4. The *file* utility shall examine an initial segment of *file* and shall make a guess at identifying  
 17171 its contents based on position-sensitive tests. (The answer is not guaranteed to be correct;  
 17172 see the **-d**, **-M**, and **-m** options below.)
- 17173 5. The *file* utility shall examine *file* and make a guess at identifying its contents based on  
 17174 context-sensitive default system tests. (The answer is not guaranteed to be correct.)
- 17175 6. The file shall be identified as a data file.

17176 If *file* does not exist, cannot be read, or its file status could not be determined, the output shall  
 17177 indicate that the file was processed, but that its type could not be determined.

17178 If *file* is a symbolic link, by default the link shall be resolved and *file* shall test the type of file  
 17179 referenced by the symbolic link.

17180 **OPTIONS**

17181 The *file* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 17182 Utility Syntax Guidelines, except that the order of the **-m**, **-d**, and **-M** options shall be  
 17183 significant.

17184 The following options shall be supported by the implementation:

- |       |                       |                                                                                                       |
|-------|-----------------------|-------------------------------------------------------------------------------------------------------|
| 17185 | <b>-d</b>             | Apply any position-sensitive default system tests and context-sensitive default                       |
| 17186 |                       | system tests to the file. This is the default if no <b>-M</b> or <b>-m</b> option is specified.       |
| 17187 | <b>-h</b>             | When a symbolic link is encountered, identify the file as a symbolic link. If <b>-h</b> is            |
| 17188 |                       | not specified and <i>file</i> is a symbolic link that refers to a nonexistent file, <i>file</i> shall |
| 17189 |                       | identify the file as a symbolic link, as if <b>-h</b> had been specified.                             |
| 17190 | <b>-i</b>             | If a file is a regular file, do not attempt to classify the type of the file further, but             |
| 17191 |                       | identify the file as specified in the STDOUT section.                                                 |
| 17192 | <b>-M <i>file</i></b> | Specify the name of a file containing position-sensitive tests that shall be applied to               |
| 17193 |                       | a file in order to classify it (see the EXTENDED DESCRIPTION). No position-                           |
| 17194 |                       | sensitive default system tests nor context-sensitive default system tests shall be                    |
| 17195 |                       | applied unless the <b>-d</b> option is also specified.                                                |

17196        **-m file**        Specify the name of a file containing position-sensitive tests that shall be applied to  
 17197                                a file in order to classify it (see the EXTENDED DESCRIPTION).

17198        If the **-m** option is specified without specifying the **-d** option or the **-M** option, position-  
 17199        sensitive default system tests shall be applied after the position-sensitive tests specified by the  
 17200        **-m** option. If the **-M** option is specified with the **-d** option, the **-m** option, or both, or the **-m**  
 17201        option is specified with the **-d** option, the concatenation of the position-sensitive tests specified  
 17202        by these options shall be applied in the order specified by the appearance of these options. If a  
 17203        **-M** or **-m file** option-argument is **-**, the results are unspecified.

#### 17204 OPERANDS

17205        The following operand shall be supported:

17206        **file**                A pathname of a file to be tested.

#### 17207 STDIN

17208        Not used.

#### 17209 INPUT FILES

17210        The *file* can be any file type.

#### 17211 ENVIRONMENT VARIABLES

17212        The following environment variables shall affect the execution of *file*:

17213        **LANG**                Provide a default value for the internationalization variables that are unset or null.  
 17214                                (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 17215                                Internationalization Variables for the precedence of internationalization variables  
 17216                                used to determine the values of locale categories.)

17217        **LC\_ALL**              If set to a non-empty string value, override the values of all the other  
 17218                                internationalization variables.

17219        **LC\_CTYPE**            Determine the locale for the interpretation of sequences of bytes of text data as  
 17220                                characters (for example, single-byte as opposed to multi-byte characters in  
 17221                                arguments and input files).

17222        **LC\_MESSAGES**

17223                                Determine the locale that should be used to affect the format and contents of  
 17224                                diagnostic messages written to standard error and informative messages written to  
 17225                                standard output.

17226 xsi        **NLSPATH**            Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

#### 17227 ASYNCHRONOUS EVENTS

17228        Default.

#### 17229 STDOUT

17230        In the POSIX locale, the following format shall be used to identify each operand, *file* specified:

17231        "%s: %s\n", <file>, <type>

17232        The values for <type> are unspecified, except that in the POSIX locale, if *file* is identified as one  
 17233        of the types listed in the following table, <type> shall contain (but is not limited to) the  
 17234        corresponding string, unless the file is identified by a position-sensitive test specified by a **-M** or  
 17235        **-m** option. Each space shown in the strings shall be exactly one <space>.

Table 4-8 File Utility Output Strings

| If <i>file</i> is:                                           | <type> shall contain the string: | Notes |
|--------------------------------------------------------------|----------------------------------|-------|
| Nonexistent                                                  | cannot open                      |       |
| Block special                                                | block special                    | 1     |
| Character special                                            | character special                | 1     |
| Directory                                                    | directory                        | 1     |
| FIFO                                                         | fifo                             | 1     |
| Socket                                                       | socket                           | 1     |
| Symbolic link                                                | symbolic link to                 | 1     |
| Regular file                                                 | regular file                     | 1,2   |
| Empty regular file                                           | empty                            | 3     |
| Regular file that cannot be read                             | cannot open                      | 3     |
| Executable binary                                            | executable                       | 4,6   |
| <i>ar</i> archive library (see <i>ar</i> )                   | archive                          | 4,6   |
| Extended <i>cpio</i> format (see <i>pax</i> )                | cpio archive                     | 4,6   |
| Extended <i>tar</i> format (see <b>ustar</b> in <i>pax</i> ) | tar archive                      | 4,6   |
| Shell script                                                 | commands text                    | 5,6   |
| C-language source                                            | c program text                   | 5,6   |
| FORTRAN source                                               | fortran program text             | 5,6   |
| Regular file whose type cannot be determined                 | data                             |       |

**Notes:**

1. This is a file type test.
2. This test is applied only if the **-i** option is specified.
3. This test is applied only if the **-i** option is not specified.
4. This is a position-sensitive default system test.
5. This is a context-sensitive default system test.
6. Position-sensitive default system tests and context-sensitive default system tests are not applied if the **-M** option is specified unless the **-d** option is also specified.

In the POSIX locale, if *file* is identified as a symbolic link (see the **-h** option), the following alternative output format shall be used:

"%s: %s %s\n", <file>, <type>, <contents of link>"

If the file named by the *file* operand does not exist, cannot be read, or the type of the file named by the *file* operand cannot be determined, this shall not be considered an error that affects the exit status.

**STDERR**

The standard error shall be used only for diagnostic messages.

**OUTPUT FILES**

None.

**EXTENDED DESCRIPTION**

A file specified as an option-argument to the **-m** or **-M** options shall contain one position-sensitive test per line, which shall be applied to the file. If the test succeeds, the message field of the line shall be printed and no further tests shall be applied, with the exception that tests on immediately following lines beginning with a single ' > ' character shall be applied.

|       |               |                                                                                                                     |
|-------|---------------|---------------------------------------------------------------------------------------------------------------------|
| 17280 |               | Each line shall be composed of the following four <blank>-separated fields:                                         |
| 17281 | <i>offset</i> | An unsigned number (optionally preceded by a single ' <i>&gt;</i> ' character) specifying                           |
| 17282 |               | the <i>offset</i> , in bytes, of the value in the file that is to be compared against the <i>value</i>              |
| 17283 |               | field of the line. If the file is shorter than the specified offset, the test shall fail.                           |
| 17284 |               | If the <i>offset</i> begins with the character ' <i>&gt;</i> ', the test contained in the line shall not be         |
| 17285 |               | applied to the file unless the test on the last line for which the <i>offset</i> did not begin                      |
| 17286 |               | with a ' <i>&gt;</i> ' was successful. By default, the <i>offset</i> shall be interpreted as an unsigned            |
| 17287 |               | decimal number. With a leading 0x or 0X, the <i>offset</i> shall be interpreted as a                                |
| 17288 |               | hexadecimal number; otherwise, with a leading 0, the <i>offset</i> shall be interpreted as                          |
| 17289 |               | an octal number.                                                                                                    |
| 17290 | <i>type</i>   | The type of the value in the file to be tested. The type shall consist of the type                                  |
| 17291 |               | specification characters c, d, f, s, and u, specifying character, signed decimal,                                   |
| 17292 |               | floating point, string, and unsigned decimal, respectively.                                                         |
| 17293 |               | The <i>type</i> string shall be interpreted as the bytes from the file starting at the                              |
| 17294 |               | specified <i>offset</i> and including the same number of bytes specified by the <i>value</i> field.                 |
| 17295 |               | If insufficient bytes remain in the file past the <i>offset</i> to match the <i>value</i> field, the test           |
| 17296 |               | shall fail.                                                                                                         |
| 17297 |               | The type specification characters d, f, and u can be followed by an optional                                        |
| 17298 |               | unsigned decimal integer that specifies the number of bytes represented by the                                      |
| 17299 |               | type. The type specification character f can be followed by an optional F, D, or L,                                 |
| 17300 |               | indicating that the value is of type <b>float</b> , <b>double</b> , or <b>long double</b> , respectively. The       |
| 17301 |               | type specification characters d and u can be followed by an optional C, S, I, or L,                                 |
| 17302 |               | indicating that the value is of type <b>char</b> , <b>short</b> , <b>int</b> , or <b>long</b> , respectively.       |
| 17303 |               | The default number of bytes represented by the type specifiers d, f, and u shall                                    |
| 17304 |               | correspond to their respective C-language types as follows. If the system claims                                    |
| 17305 |               | conformance to the C-Language Development Utilities option, those specifiers                                        |
| 17306 |               | shall correspond to the default sizes used in the c99 utility. Otherwise, the default                               |
| 17307 |               | sizes shall be implementation-defined.                                                                              |
| 17308 |               | For the type specifier characters d and u, the default number of bytes shall                                        |
| 17309 |               | correspond to the size of a basic integer type of the implementation. For these                                     |
| 17310 |               | specifier characters, the implementation shall support values of the optional                                       |
| 17311 |               | number of bytes to be converted corresponding to the number of bytes in the C-                                      |
| 17312 |               | language types <b>char</b> , <b>short</b> , <b>int</b> , or <b>long</b> . These numbers can also be specified by an |
| 17313 |               | application as the characters C, S, I, and L, respectively. The byte order used when                                |
| 17314 |               | interpreting numeric values is implementation-defined, but shall correspond to the                                  |
| 17315 |               | order in which a constant of the corresponding type is stored in memory on the                                      |
| 17316 |               | system.                                                                                                             |
| 17317 |               | For the type specifier f, the default number of bytes shall correspond to the                                       |
| 17318 |               | number of bytes in the basic double precision floating-point data type of the                                       |
| 17319 |               | underlying implementation. The implementation shall support values of the                                           |
| 17320 |               | optional number of bytes to be converted corresponding to the number of bytes in                                    |
| 17321 |               | the C-language types <b>float</b> , <b>double</b> , and <b>long double</b> . These numbers can also be              |
| 17322 |               | specified by an application as the characters F, D, and L, respectively.                                            |
| 17323 |               | All type specifiers, except for s, can be followed by a mask specifier of the form                                  |
| 17324 |               | &number. The mask value shall be AND'ed with the value of the input file before                                     |
| 17325 |               | the comparison with the <i>value</i> field of the line is made. By default, the mask shall                          |
| 17326 |               | be interpreted as an unsigned decimal number. With a leading 0x or 0X, the mask                                     |
| 17327 |               | shall be interpreted as an unsigned hexadecimal number; otherwise, with a leading                                   |

|       |                    |                                                                                                                  |
|-------|--------------------|------------------------------------------------------------------------------------------------------------------|
| 17328 |                    | 0, the mask shall be interpreted as an unsigned octal number.                                                    |
| 17329 |                    | The strings <b>byte</b> , <b>short</b> , <b>long</b> , and <b>string</b> shall also be supported as type fields, |
| 17330 |                    | being interpreted as dC, dS, dL, and s, respectively.                                                            |
| 17331 | <i>value</i>       | The <i>value</i> to be compared with the value from the file.                                                    |
| 17332 |                    | If the specifier from the type field is s or <b>string</b> , then interpret the value as a string.               |
| 17333 |                    | Otherwise, interpret it as a number. If the value is a string, then the test shall                               |
| 17334 |                    | succeed only when a string value exactly matches the bytes from the file.                                        |
| 17335 |                    | If the <i>value</i> is a string, it can contain the following sequences:                                         |
| 17336 | <i>\character</i>  | The backslash-escape sequences as specified in the Base                                                          |
| 17337 |                    | Definitions volume of IEEE Std 1003.1-2001, Table 5-1, Escape                                                    |
| 17338 |                    | Sequences and Associated Actions ('\\', '\a', '\b', '\f',                                                        |
| 17339 |                    | '\n', '\r', '\t', '\v'). The results of using any other                                                          |
| 17340 |                    | character, other than an octal digit, following the backslash are                                                |
| 17341 |                    | unspecified.                                                                                                     |
| 17342 | <i>\octal</i>      | Octal sequences that can be used to represent characters with                                                    |
| 17343 |                    | specific coded values. An octal sequence shall consist of a                                                      |
| 17344 |                    | backslash followed by the longest sequence of one, two, or three                                                 |
| 17345 |                    | octal-digit characters (01234567). If the size of a byte on the                                                  |
| 17346 |                    | system is greater than 9 bits, the valid escape sequence used to                                                 |
| 17347 |                    | represent a byte is implementation-defined.                                                                      |
| 17348 |                    | By default, any value that is not a string shall be interpreted as a signed decimal                              |
| 17349 |                    | number. Any such value, with a leading 0x or 0X, shall be interpreted as an                                      |
| 17350 |                    | unsigned hexadecimal number; otherwise, with a leading zero, the value shall be                                  |
| 17351 |                    | interpreted as an unsigned octal number.                                                                         |
| 17352 |                    | If the value is not a string, it can be preceded by a character indicating the                                   |
| 17353 |                    | comparison to be performed. Permissible characters and the comparisons they                                      |
| 17354 |                    | specify are as follows:                                                                                          |
| 17355 | =                  | The test shall succeed if the value from the file equals the <i>value</i> field.                                 |
| 17356 | <                  | The test shall succeed if the value from the file is less than the <i>value</i> field.                           |
| 17357 | >                  | The test shall succeed if the value from the file is greater than the <i>value</i> field.                        |
| 17358 | &                  | The test shall succeed if all of the set bits in the <i>value</i> field are set in the value                     |
| 17359 |                    | from the file.                                                                                                   |
| 17360 | ^                  | The test shall succeed if at least one of the set bits in the <i>value</i> field is not set in                   |
| 17361 |                    | the value from the file.                                                                                         |
| 17362 | x                  | The test shall succeed if the file is large enough to contain a value of the type                                |
| 17363 |                    | specified starting at the offset specified.                                                                      |
| 17364 | <i>message</i>     | The <i>message</i> to be printed if the test succeeds. The <i>message</i> shall be interpreted                   |
| 17365 |                    | using the notation for the <i>printf</i> formatting specification; see <i>printf</i> . If the <i>value</i>       |
| 17366 |                    | field was a string, then the value from the file shall be the argument for the <i>printf</i>                     |
| 17367 |                    | formatting specification; otherwise, the value from the file shall be the argument.                              |
| 17368 | <b>EXIT STATUS</b> |                                                                                                                  |
| 17369 |                    | The following exit values shall be returned:                                                                     |
| 17370 | 0                  | Successful completion.                                                                                           |

17371 >0 An error occurred.

## 17372 CONSEQUENCES OF ERRORS

17373 Default.

## 17374 APPLICATION USAGE

17375 The *file* utility can only be required to guess at many of the file types because only exhaustive  
17376 testing can determine some types with certainty. For example, binary data on some  
17377 implementations might match the initial segment of an executable or a *tar* archive.

17378 Note that the table indicates that the output contains the stated string. Systems may add text  
17379 before or after the string. For executables, as an example, the machine architecture and various  
17380 facts about how the file was link-edited may be included. Note also that on systems that  
17381 recognize shell script files starting with "#!" as executable files, these may be identified as  
17382 executable binary files rather than as shell scripts.

## 17383 EXAMPLES

17384 Determine whether an argument is a binary executable file:

```
17385 file "$1" | grep -Fq executable &&
17386 printf "%s is executable.\n" "$1"
```

## 17387 RATIONALE

17388 The **-f** option was omitted because the same effect can (and should) be obtained using the *xargs*  
17389 utility.

17390 Historical versions of the *file* utility attempt to identify the following types of files: symbolic link,  
17391 directory, character special, block special, socket, *tar* archive, *cpio* archive, SCCS archive, archive  
17392 library, empty, *compress* output, *pack* output, binary data, C source, FORTRAN source, assembler  
17393 source, *nroff*/*troff*/*eqn*/*tbl* source *troff* output, shell script, C shell script, English text, ASCII text,  
17394 various executables, APL workspace, compiled terminfo entries, and CURSES screen images.  
17395 Only those types that are reasonably well specified in POSIX or are directly related to POSIX  
17396 utilities are listed in the table.

17397 Historical systems have used a “magic file” named **/etc/magic** to help identify file types. Because  
17398 it is generally useful for users and scripts to be able to identify special file types, the **-m** flag and  
17399 a portable format for user-created magic files has been specified. No requirement is made that an  
17400 implementation of *file* use this method of identifying files, only that users be permitted to add  
17401 their own classifying tests.

17402 In addition, three options have been added to historical practice. The **-d** flag has been added to  
17403 permit users to cause their tests to follow any default system tests. The **-i** flag has been added to  
17404 permit users to test portably for regular files in shell scripts. The **-M** flag has been added to  
17405 permit users to ignore any default system tests.

17406 The IEEE Std 1003.1-2001 description of default system tests and the interaction between the **-d**,  
17407 **-M**, and **-m** options did not clearly indicate that there were two types of “default system tests”.  
17408 The “position-sensitive tests” determine file types by looking for certain string or binary values  
17409 at specific offsets in the file being examined. These position-sensitive tests were implemented in  
17410 historical systems using the magic file described above. Some of these tests are now built into  
17411 the *file* utility itself on some implementations so the output can provide more detail than can be  
17412 provided by magic files. For example, a magic file can easily identify a **core** file on most  
17413 implementations, but cannot name the program file that dropped the core. A magic file could  
17414 produce output such as:

```
17415 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1
```

17416 but by building the test into the *file* utility, you could get output such as: |

17417 /home/dwc/core: ELF 32-bit MSB core file SPARC Version 1, from 'testprog'|

17418 These extended built-in tests are still to be treated as position-sensitive default system tests even |

17419 if they are not listed in **/etc/magic** or any other magic file. |

17420 The context-sensitive default system tests were always built into the *file* utility. These tests |

17421 looked for language constructs in text files trying to identify shell scripts, C, FORTRAN, and |

17422 other computer language source files, and even plain text files. With the addition of the **-m** and |

17423 **-M** options the distinction between position-sensitive and context-sensitive default system tests |

17424 became important because the order of testing is important. The context-sensitive system |

17425 default tests should never be applied before any position-sensitive tests even if the **-d** option is |

17426 specified before a **-m** option or **-M** option due to the high probability that the context-sensitive |

17427 system default tests will incorrectly identify arbitrary text files as text files before position- |

17428 sensitive tests specified by the **-m** or **-M** option would be applied to give a more accurate |

17429 identification. |

17430 Leaving the meaning of **-M** – and **-m** – unspecified allows an existing prototype of these |

17431 options to continue to work in a backwards-compatible manner. (In that implementation, **-M** – |

17432 was roughly equivalent to **-d** in IEEE Std 1003.1-2001.) |

17433 The historical **-c** option was omitted as not particularly useful to users or portable shell scripts. |

17434 In addition, a reasonable implementation of the *file* utility would report any errors found each |

17435 time the magic file is read. |

17436 The historical format of the magic file was the same as that specified by the Rationale in the |

17437 ISO POSIX-2:1993 standard for the *offset*, *value*, and *message* fields; however, it used less precise |

17438 type fields than the format specified by the current normative text. The new type field values are |

17439 a superset of the historical ones. |

17440 The following is an example magic file: |

|       |    |           |                     |                                    |
|-------|----|-----------|---------------------|------------------------------------|
| 17441 | 0  | short     | 070707              | cpio archive                       |
| 17442 | 0  | short     | 0143561             | Byte-swapped cpio archive          |
| 17443 | 0  | string    | 070707              | ASCII cpio archive                 |
| 17444 | 0  | long      | 0177555             | Very old archive                   |
| 17445 | 0  | short     | 0177545             | Old archive                        |
| 17446 | 0  | short     | 017437              | Old packed data                    |
| 17447 | 0  | string    | \037\036            | Packed data                        |
| 17448 | 0  | string    | \377\037            | Compacted data                     |
| 17449 | 0  | string    | \037\235            | Compressed data                    |
| 17450 | >2 | byte&0x80 | >0                  | Block compressed                   |
| 17451 | >2 | byte&0x1f | x                   | %d bits                            |
| 17452 | 0  | string    | \032\001            | Compiled Terminfo Entry            |
| 17453 | 0  | short     | 0433                | Curses screen image                |
| 17454 | 0  | short     | 0434                | Curses screen image                |
| 17455 | 0  | string    | <ar>                | System V Release 1 archive         |
| 17456 | 0  | string    | !<arch>\n___.SYMDEF | Archive random library             |
| 17457 | 0  | string    | !<arch>             | Archive                            |
| 17458 | 0  | string    | ARF_BEGARF          | PHIGS clear text archive           |
| 17459 | 0  | long      | 0x137A2950          | Scalable OpenFont binary           |
| 17460 | 0  | long      | 0x137A2951          | Encrypted scalable OpenFont binary |

17461 The use of a basic integer data type is intended to allow the implementation to choose a word |

17462 size commonly used by applications on that architecture. |

17463 **FUTURE DIRECTIONS**

17464       None.

17465 **SEE ALSO**17466       *ar, ls, pax*17467 **CHANGE HISTORY**

17468       First released in Issue 4.

17469 **Issue 6**

17470       This utility is marked as part of the User Portability Utilities option.

17471       Options and an EXTENDED DESCRIPTION are added as specified in the IEEE P1003.2b draft  
17472       standard.

17473       IEEE PASC Interpretations 1003.2 #192 and #178 are applied.

17474       IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/25 is applied, making major changes to  
17475       address ambiguities raised in defect reports.17476       IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/26 is applied, making it clear in the  
17477       OPTIONS section that the **-m**, **-d**, and **-M** options do not comply with Guideline 11 of the  
17478       Utility Syntax Guidelines.

17479 **NAME**

17480 find — find files

17481 **SYNOPSIS**17482 find [-H | -L] *path* ... [*operand\_expression* ...]17483 **DESCRIPTION**

17484 The *find* utility shall recursively descend the directory hierarchy from each file specified by *path*,  
 17485 evaluating a Boolean expression composed of the primaries described in the OPERANDS section  
 17486 for each file encountered.

17487 The *find* utility shall be able to descend to arbitrary depths in a file hierarchy and shall not fail  
 17488 due to path length limitations (unless a *path* operand specified by the application exceeds  
 17489 {PATH\_MAX} requirements).

17490 The *find* utility shall detect infinite loops; that is, entering a previously visited directory that is an  
 17491 ancestor of the last file encountered. When it detects an infinite loop, *find* shall write a  
 17492 diagnostic message to standard error and shall either recover its position in the hierarchy or  
 17493 terminate.

17494 **OPTIONS**

17495 The *find* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 17496 12.2, Utility Syntax Guidelines.

17497 The following options shall be supported by the implementation:

17498 **-H** Cause the file information and file type evaluated for each symbolic link  
 17499 encountered on the command line to be those of the file referenced by the link, and  
 17500 not the link itself. If the referenced file does not exist, the file information and type  
 17501 shall be for the link itself. File information for all symbolic links not on the  
 17502 command line shall be that of the link itself.

17503 **-L** Cause the file information and file type evaluated for each symbolic link to be  
 17504 those of the file referenced by the link, and not the link itself.

17505 Specifying more than one of the mutually-exclusive options **-H** and **-L** shall not be considered  
 17506 an error. The last option specified shall determine the behavior of the utility.

17507 **OPERANDS**

17508 The following operands shall be supported:

17509 The *path* operand is a pathname of a starting point in the directory hierarchy.

17510 The first argument that starts with a '-', or is a '!' or a '(', and all subsequent arguments  
 17511 shall be interpreted as an *expression* made up of the following primaries and operators. In the  
 17512 descriptions, wherever *n* is used as a primary argument, it shall be interpreted as a decimal  
 17513 integer optionally preceded by a plus ('+') or minus ('-') sign, as follows:

17514 **+n** More than *n*.

17515 **n** Exactly *n*.

17516 **-n** Less than *n*.

17517 The following primaries shall be supported:

17518 **-name** *pattern*

17519 The primary shall evaluate as true if the basename of the filename being examined  
 17520 matches *pattern* using the pattern matching notation described in Section 2.13 (on  
 17521 page 62).

| 17537 |                      | The <i>mode</i> argument is used to represent file mode bits. It shall be identical in format to the <i>symbolic_mode</i> operand described in <i>chmod</i> , and shall be interpreted as follows. To start, a template shall be assumed with all file mode bits cleared. An <i>op</i> symbol of '+' shall set the appropriate mode bits in the template; '-' shall clear the appropriate bits; '=' shall set the appropriate mode bits, without regard to the contents of process' file mode creation mask. The <i>op</i> symbol of '-' cannot be the first character of <i>mode</i> ; this avoids ambiguity with the optional leading hyphen. Since the initial mode is all bits off, there are not any symbolic modes that need to use '-' as the first character. |

| 17565 |                      | The primary shall evaluate as true if the file belongs to the group <i>gname</i> . If <i>gname</i> is a decimal integer and the <i>getgrnam()</i> (or equivalent) function does not return a valid group name, <i>gname</i> shall be interpreted as a group ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 17566 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 17567 |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

17568       **–size** *n*[*c*]     The primary shall evaluate as true if the file size in bytes, divided by 512 and  
 17569                             rounded up to the next integer, is *n*. If *n* is followed by the character '*c*', the size  
 17570                             shall be in bytes.

17571       **–atime** *n*       The primary shall evaluate as true if the file access time subtracted from the  
 17572                             initialization time, divided by 86 400 (with any remainder discarded), is *n*.

17573       **–ctime** *n*       The primary shall evaluate as true if the time of last change of file status  
 17574                             information subtracted from the initialization time, divided by 86 400 (with any  
 17575                             remainder discarded), is *n*.

17576       **–mtime** *n*       The primary shall evaluate as true if the file modification time subtracted from the  
 17577                             initialization time, divided by 86 400 (with any remainder discarded), is *n*.

17578       **–exec** *utility\_name* [*argument* ...];  
 17579       **–exec** *utility\_name* [*argument* ...] {} +  
 17580                             The end of the primary expression shall be punctuated by a semicolon or by a plus  
 17581                             sign. Only a plus sign that follows an argument containing the two characters  
 17582                             "{}" shall punctuate the end of the primary expression. Other uses of the plus  
 17583                             sign shall not be treated as special.

17584                             If the primary expression is punctuated by a semicolon, the utility *utility\_name*  
 17585                             shall be invoked once for each pathname and the primary shall evaluate as true if  
 17586                             the utility returns a zero value as exit status. A *utility\_name* or *argument* containing  
 17587                             only the two characters "{}" shall be replaced by the current pathname.

17588                             If the primary expression is punctuated by a plus sign, the primary shall always  
 17589                             evaluate as true, and the pathnames for which the primary is evaluated shall be  
 17590                             aggregated into sets. The utility *utility\_name* shall be invoked once for each set of  
 17591                             aggregated pathnames. Each invocation shall begin after the last pathname in the  
 17592                             set is aggregated, and shall be completed before the *find* utility exits and before the  
 17593                             first pathname in the next set (if any) is aggregated for this primary, but it is  
 17594                             otherwise unspecified whether the invocation occurs before, during, or after the  
 17595                             evaluations of other primaries. If any invocation returns a non-zero value as exit  
 17596                             status, the *find* utility shall return a non-zero exit status. An argument containing  
 17597                             only the two characters "{}" shall be replaced by the set of aggregated  
 17598                             pathnames, with each pathname passed as a separate argument to the invoked  
 17599                             utility in the same order that it was aggregated. The size of any set of two or more  
 17600                             pathnames shall be limited such that execution of the utility does not cause the  
 17601                             system's {ARG\_MAX} limit to be exceeded. If more than one argument containing  
 17602                             only the two characters "{}" is present, the behavior is unspecified.

17603                             If a *utility\_name* or *argument* string contains the two characters "{}", but not just  
 17604                             the two characters "{}", it is implementation-defined whether *find* replaces those  
 17605                             two characters or uses the string without change. The current directory for the  
 17606                             invocation of *utility\_name* shall be the same as the current directory when the *find*  
 17607                             utility was started. If the *utility\_name* names any of the special built-in utilities (see  
 17608                             Section 2.14 (on page 64)), the results are undefined.

17609       **–ok** *utility\_name* [*argument* ...];  
 17610                             The **–ok** primary shall be equivalent to **–exec**, except that the use of a plus sign to  
 17611                             punctuate the end of the primary expression need not be supported, and *find* shall  
 17612                             request affirmation of the invocation of *utility\_name* using the current file as an  
 17613                             argument by writing to standard error as described in the STDERR section. If the  
 17614                             response on standard input is affirmative, the utility shall be invoked. Otherwise,  
 17615                             the command shall not be invoked and the value of the **–ok** operand shall be false.

17616       **-print**       The primary shall always evaluate as true; it shall cause the current pathname to  
17617                   be written to standard output.

17618       **-newer file**   The primary shall evaluate as true if the modification time of the current file is  
17619                   more recent than the modification time of the file named by the pathname *file*.

17620       **-depth**       The primary shall always evaluate as true; it shall cause descent of the directory  
17621                   hierarchy to be done so that all entries in a directory are acted on before the  
17622                   directory itself. If a **-depth** primary is not specified, all entries in a directory shall  
17623                   be acted on after the directory itself. If any **-depth** primary is specified, it shall  
17624                   apply to the entire expression even if the **-depth** primary would not normally be  
17625                   evaluated.

17626       The primaries can be combined using the following operators (in order of decreasing  
17627       precedence):

17628       (*expression*)   True if *expression* is true.

17629       !*expression*   Negation of a primary; the unary NOT operator.

17630       *expression* [**-a**] *expression*  
17631                   Conjunction of primaries; the AND operator is implied by the juxtaposition of two  
17632                   primaries or made explicit by the optional **-a** operator. The second expression  
17633                   shall not be evaluated if the first expression is false.

17634       *expression* **-o** *expression*  
17635                   Alternation of primaries; the OR operator. The second expression shall not be  
17636                   evaluated if the first expression is true.

17637       If no *expression* is present, **-print** shall be used as the expression. Otherwise, if the given  
17638       expression does not contain any of the primaries **-exec**, **-ok**, or **-print**, the given expression shall  
17639       be effectively replaced by:

17640       (*given\_expression*) **-print**

17641       The **-user**, **-group**, and **-newer** primaries each shall evaluate their respective arguments only  
17642       once.

17643       **STDIN**  
17644       If the **-ok** primary is used, the response shall be read from the standard input. An entire line  
17645       shall be read as the response. Otherwise, the standard input shall not be used.

17646       **INPUT FILES**  
17647       None.

17648       **ENVIRONMENT VARIABLES**  
17649       The following environment variables shall affect the execution of *find*:

17650       **LANG**       Provide a default value for the internationalization variables that are unset or null.  
17651                   (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
17652                   Internationalization Variables for the precedence of internationalization variables  
17653                   used to determine the values of locale categories.)

17654       **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
17655                   internationalization variables.

17656       **LC\_COLLATE**  
17657                   Determine the locale for the behavior of ranges, equivalence classes, and multi-  
17658                   character collating elements used in the pattern matching notation for the **-n**  
17659                   option and in the extended regular expression defined for the **yesexpr** locale

17660 keyword in the *LC\_MESSAGES* category.

17661 *LC\_CTYPE* This variable determines the locale for the interpretation of sequences of bytes of  
 17662 text data as characters (for example, single-byte as opposed to multi-byte  
 17663 characters in arguments), the behavior of character classes within the pattern  
 17664 matching notation used for the **-n** option, and the behavior of character classes  
 17665 within regular expressions used in the extended regular expression defined for the  
 17666 **yesexpr** locale keyword in the *LC\_MESSAGES* category.

17667 *LC\_MESSAGES*  
 17668 Determine the locale for the processing of affirmative responses that should be  
 17669 used to affect the format and contents of diagnostic messages written to standard  
 17670 error.

17671 XSI *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

17672 *PATH* Determine the location of the *utility\_name* for the **-exec** and **-ok** primaries, as  
 17673 described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8,  
 17674 Environment Variables.

17675 **ASYNCHRONOUS EVENTS**

17676 Default.

17677 **STDOUT**

17678 The **-print** primary shall cause the current pathnames to be written to standard output. The  
 17679 format shall be:

17680 "%s\n", <path>

17681 **STDERR**

17682 The **-ok** primary shall write a prompt to standard error containing at least the *utility\_name* to be  
 17683 invoked and the current pathname. In the POSIX locale, the last non-<blank> in the prompt shall  
 17684 be ' ? '. The exact format used is unspecified.

17685 Otherwise, the standard error shall be used only for diagnostic messages.

17686 **OUTPUT FILES**

17687 None.

17688 **EXTENDED DESCRIPTION**

17689 None.

17690 **EXIT STATUS**

17691 The following exit values shall be returned:

17692 0 All *path* operands were traversed successfully.

17693 >0 An error occurred.

17694 **CONSEQUENCES OF ERRORS**

17695 Default.

17696 **APPLICATION USAGE**

17697 When used in operands, pattern matching notation, semicolons, opening parentheses, and  
 17698 closing parentheses are special to the shell and must be quoted (see Section 2.2 (on page 30)).

17699 The bit that is traditionally used for sticky (historically 01000) is specified in the **-perm** primary  
 17700 using the octal number argument form. Since this bit is not defined by this volume of  
 17701 IEEE Std 1003.1-2001, applications must not assume that it actually refers to the traditional  
 17702 sticky bit.

17703 **EXAMPLES**

17704 1. The following commands are equivalent:

```
17705 find .
17706 find . -print
```

17707 They both write out the entire directory hierarchy from the current directory.

17708 2. The following command:

```
17709 find / \(-name tmp -o -name '*.xx' \) -atime +7 -exec rm {} \;
```

17710 removes all files named **tmp** or ending in **.xx** that have not been accessed for seven or more  
 17711 24-hour periods.

17712 3. The following command:

```
17713 find . -perm -o+w,+s
```

17714 prints (**-print** is assumed) the names of all files in or below the current directory, with all  
 17715 of the file permission bits **S\_ISUID**, **S\_ISGID**, and **S\_IWOTH** set.

17716 4. The following command:

```
17717 find . -name SCCS -prune -o -print
```

17718 recursively prints pathnames of all files in the current directory and below, but skips  
 17719 directories named **SCCS** and files in them.

17720 5. The following command:

```
17721 find . -print -name SCCS -prune
```

17722 behaves as in the previous example, but prints the names of the **SCCS** directories.

17723 6. The following command is roughly equivalent to the **-nt** extension to *test*:

```
17724 if [-n "$(find file1 -prune -newer file2)"]; then
17725 printf %s\n "file1 is newer than file2"
17726 fi
```

17727 7. The descriptions of **-atime**, **-ctime**, and **-mtime** use the terminology *n* “86400 second  
 17728 periods (days)”. For example, a file accessed at 23:59 is selected by:

```
17729 find . -atime -1 -print
```

17730 at 00:01 the next day (less than 24 hours later, not more than one day ago); the midnight  
 17731 boundary between days has no effect on the 24-hour calculation.

17732 **RATIONALE**

17733 The **-a** operator was retained as an optional operator for compatibility with historical shell  
 17734 scripts, even though it is redundant with expression concatenation.

17735 The descriptions of the `'-'` modifier on the *mode* and *onum* arguments to the `-perm` primary  
 17736 agree with historical practice on BSD and System V implementations. System V and BSD  
 17737 documentation both describe it in terms of checking additional bits; in fact, it uses the same bits,  
 17738 but checks for having at least all of the matching bits set instead of having exactly the matching  
 17739 bits set.

17740 The exact format of the interactive prompts is unspecified. Only the general nature of the  
 17741 contents of prompts are specified because:

- 17742 • Implementations may desire more descriptive prompts than those used on historical  
 17743 implementations.
- 17744 • Since the historical prompt strings do not terminate with `<newline>`s, there is no portable  
 17745 way for another program to interact with the prompts of this utility via pipes.

17746 Therefore, an application using this prompting option relies on the system to provide the most  
 17747 suitable dialog directly with the user, based on the general guidelines specified.

17748 The `-name` file operand was changed to use the shell pattern matching notation so that *find* is  
 17749 consistent with other utilities using pattern matching.

17750 The `-size` operand refers to the size of a file, rather than the number of blocks it may occupy in  
 17751 the file system. The intent is that the *st\_size* field defined in the System Interfaces volume of  
 17752 IEEE Std 1003.1-2001 should be used, not the *st\_blocks* found in historical implementations. There  
 17753 are at least two reasons for this:

- 17754 1. In both System V and BSD, *find* only uses *st\_size* in size calculations for the operands  
 17755 specified by this volume of IEEE Std 1003.1-2001. (BSD uses *st\_blocks* only when processing  
 17756 the `-ls` primary.)
- 17757 2. Users usually think of file size in terms of bytes, which is also the unit used by the *ls* utility  
 17758 for the output from the `-l` option. (In both System V and BSD, *ls* uses *st\_size* for the `-l`  
 17759 option size field and uses *st\_blocks* for the *ls -s* calculations. This volume of  
 17760 IEEE Std 1003.1-2001 does not specify *ls -s*.)

17761 The descriptions of `-atime`, `-ctime`, and `-mtime` were changed from the SVID description of *n*  
 17762 “days” to “24-hour periods”. The description is also different in terms of the exact timeframe for  
 17763 the *n* case (*versus* the `+n` or `-n`), but it matches all known historical implementations. It refers to  
 17764 one 86 400 second period in the past, not any time from the beginning of that period to the  
 17765 current time. For example, `-atime 3` is true if the file was accessed any time in the period from 72  
 17766 hours to 48 hours ago.

17767 Historical implementations do not modify `"{}"` when it appears as a substring of an `-exec` or  
 17768 `-ok utility_name` or argument string. There have been numerous user requests for this extension,  
 17769 so this volume of IEEE Std 1003.1-2001 allows the desired behavior. At least one recent  
 17770 implementation does support this feature, but encountered several problems in managing  
 17771 memory allocation and dealing with multiple occurrences of `"{}"` in a string while it was being  
 17772 developed, so it is not yet required behavior.

17773 Assuming the presence of `-print` was added to correct a historical pitfall that plagues novice  
 17774 users, it is entirely upwards-compatible from the historical System V *find* utility. In its simplest  
 17775 form (*find directory*), it could be confused with the historical BSD fast *find*. The BSD developers  
 17776 agreed that adding `-print` as a default expression was the correct decision and have added the  
 17777 fast *find* functionality within a new utility called *locate*.

17778 Historically, the `-L` option was implemented using the primary `-follow`. The `-H` and `-L` options  
 17779 were added for two reasons. First, they offer a finer granularity of control and consistency with  
 17780 other programs that walk file hierarchies. Second, the `-follow` primary always evaluated to true.

As they were historically really global variables that took effect before the traversal began, some valid expressions had unexpected results. An example is the expression **-print -o -follow**. Because **-print** always evaluates to true, the standard order of evaluation implies that **-follow** would never be evaluated. This was never the case. Historical practice for the **-follow** primary, however, is not consistent. Some implementations always follow symbolic links on the command line whether **-follow** is specified or not. Others follow symbolic links on the command line only if **-follow** is specified. Both behaviors are provided by the **-H** and **-L** options, but scripts using the current **-follow** primary would be broken if the **-follow** option is specified to work either way.

Since the **-L** option resolves all symbolic links and the **-type l** primary is true for symbolic links that still exist after symbolic links have been resolved, the command:

```
find -L . -type l
```

prints a list of symbolic links reachable from the current directory that do not resolve to accessible files.

A feature of SVR4's *find* utility was the **-exec** primary's + terminator. This allowed filenames containing special characters (especially <newline>s) to be grouped together without the problems that occur if such filenames are piped to *xargs*. Other implementations have added other ways to get around this problem, notably a **-print0** primary that wrote filenames with a null byte terminator. This was considered here, but not adopted. Using a null terminator meant that any utility that was going to process *find*'s **-print0** output had to add a new option to parse the null terminators it would now be reading.

The "**-exec ... {} +**" syntax adopted was a result of IEEE PASC Interpretation 1003.2 #210. It should be noted that this is an incompatible change to the ISO/IEC 9899:1999 standard. For example, the following command prints all files with a '-' after their name if they are regular files, and a '+' otherwise:

```
find / -type f -exec echo {} - ';' -o -exec echo {} + ';' ;
```

The change invalidates usage like this. Even though the previous standard stated that this usage would work, in practice many did not support it and the standard developers felt it better to now state that this was not allowable.

## 17810 FUTURE DIRECTIONS

17811 None.

## 17815 CHANGE HISTORY

17816 First released in Issue 2.

## 17817 Issue 5

17818 The FUTURE DIRECTIONS section is added.

## 17819 Issue 6

17820 The following new requirements on POSIX implementations derive from alignment with the  
17821 Single UNIX Specification:

- 17822 • The **-perm [-]onum** primary is supported.

17823 The *find* utility is aligned with the IEEE P1003.2b draft standard, to include processing of  
17824 symbolic links and changes to the description of the **atime**, **ctime**, and **mtime** operands.

17825

IEEE PASC Interpretation 1003.2 #210 is applied, extending the **—exec** operand.

17826 **NAME**

17827       fold — filter for folding lines

17828 **SYNOPSIS**17829       fold [-bs] [-w *width*] [*file*...]17830 **DESCRIPTION**

17831       The *fold* utility is a filter that shall fold lines from its input files, breaking the lines to have a  
 17832       maximum of *width* column positions (or bytes, if the **-b** option is specified). Lines shall be  
 17833       broken by the insertion of a <newline> such that each output line (referred to later in this section  
 17834       as a *segment*) is the maximum width possible that does not exceed the specified number of  
 17835       column positions (or bytes). A line shall not be broken in the middle of a character. The behavior  
 17836       is undefined if *width* is less than the number of columns any single character in the input would  
 17837       occupy.

17838       If the <carriage-return>s, <backspace>s, or <tab>s are encountered in the input, and the **-b**  
 17839       option is not specified, they shall be treated specially:

17840       <backspace> The current count of line width shall be decremented by one, although the count  
 17841       never shall become negative. The *fold* utility shall not insert a <newline>  
 17842       immediately before or after any <backspace>.

17843       <carriage-return>

17844               The current count of line width shall be set to zero. The *fold* utility shall not insert a  
 17845       <newline> immediately before or after any <carriage-return>.

17846       <tab>       Each <tab> encountered shall advance the column position pointer to the next tab  
 17847       stop. Tab stops shall be at each column position *n* such that *n* modulo 8 equals 1.

17848 **OPTIONS**

17849       The *fold* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 17850       12.2, Utility Syntax Guidelines.

17851       The following options shall be supported:

17852       **-b**       Count *width* in bytes rather than column positions.

17853       **-s**       If a segment of a line contains a <blank> within the first *width* column positions (or  
 17854       bytes), break the line after the last such <blank> meeting the width constraints. If  
 17855       there is no <blank> meeting the requirements, the **-s** option shall have no effect for  
 17856       that output segment of the input line.

17857       **-w width**   Specify the maximum line length, in column positions (or bytes if **-b** is specified).  
 17858       The results are unspecified if *width* is not a positive decimal number. The default  
 17859       value shall be 80.

17860 **OPERANDS**

17861       The following operand shall be supported:

17862       *file*       A pathname of a text file to be folded. If no *file* operands are specified, the standard  
 17863       input shall be used.

17864 **STDIN**

17865       The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 17866       section.

17867 **INPUT FILES**

17868        If the **-b** option is specified, the input files shall be text files except that the lines are not limited  
 17869        to {LINE\_MAX} bytes in length. If the **-b** option is not specified, the input files shall be text files.

17870 **ENVIRONMENT VARIABLES**

17871        The following environment variables shall affect the execution of *fold*:

17872        **LANG**        Provide a default value for the internationalization variables that are unset or null.  
 17873                        (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 17874                        Internationalization Variables for the precedence of internationalization variables  
 17875                        used to determine the values of locale categories.)

17876        **LC\_ALL**       If set to a non-empty string value, override the values of all the other  
 17877                        internationalization variables.

17878        **LC\_CTYPE**    Determine the locale for the interpretation of sequences of bytes of text data as  
 17879                        characters (for example, single-byte as opposed to multi-byte characters in  
 17880                        arguments and input files), and for the determination of the width in column  
 17881                        positions each character would occupy on a constant-width font output device.

17882        **LC\_MESSAGES**  
 17883                        Determine the locale that should be used to affect the format and contents of  
 17884                        diagnostic messages written to standard error.

17885 **XSI**        **NLSPATH**    Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

17886 **ASYNCHRONOUS EVENTS**

17887        Default.

17888 **STDOUT**

17889        The standard output shall be a file containing a sequence of characters whose order shall be  
 17890        preserved from the input files, possibly with inserted <newline>s.

17891 **STDERR**

17892        The standard error shall be used only for diagnostic messages.

17893 **OUTPUT FILES**

17894        None.

17895 **EXTENDED DESCRIPTION**

17896        None.

17897 **EXIT STATUS**

17898        The following exit values shall be returned:

17899        0    All input files were processed successfully.

17900        >0   An error occurred.

17901 **CONSEQUENCES OF ERRORS**

17902        Default.

**17903 APPLICATION USAGE**

17904 The *cut* and *fold* utilities can be used to create text files out of files with arbitrary line lengths. The  
17905 *cut* utility should be used when the number of lines (or records) needs to remain constant. The  
17906 *fold* utility should be used when the contents of long lines need to be kept contiguous.

17907 The *fold* utility is frequently used to send text files to printers that truncate, rather than fold, lines  
17908 wider than the printer is able to print (usually 80 or 132 column positions).

**17909 EXAMPLES**

17910 An example invocation that submits a file of possibly long lines to the printer (under the  
17911 assumption that the user knows the line width of the printer to be assigned by *lp*):

17912 `fold -w 132 bigfile | lp`

**17913 RATIONALE**

17914 Although terminal input in canonical processing mode requires the erase character (frequently  
17915 set to <backspace>) to erase the previous character (not byte or column position), terminal  
17916 output is not buffered and is extremely difficult, if not impossible, to parse correctly; the  
17917 interpretation depends entirely on the physical device that actually displays/prints/stores the  
17918 output. In all known internationalized implementations, the utilities producing output for mixed  
17919 column-width output assume that a <backspace> backs up one column position and outputs  
17920 enough <backspace>s to return to the start of the character when <backspace> is used to  
17921 provide local line motions to support underlining and emboldening operations. Since *fold*  
17922 without the **-b** option is dealing with these same constraints, <backspace> is always treated as  
17923 backing up one column position rather than backing up one character.

17924 Historical versions of the *fold* utility assumed 1 byte was one character and occupied one column  
17925 position when written out. This is no longer always true. Since the most common usage of *fold* is  
17926 believed to be folding long lines for output to limited-length output devices, this capability was  
17927 preserved as the default case. The **-b** option was added so that applications could *fold* files with  
17928 arbitrary length lines into text files that could then be processed by the standard utilities. Note  
17929 that although the width for the **-b** option is in bytes, a line is never split in the middle of a  
17930 character. (It is unspecified what happens if a width is specified that is too small to hold a single  
17931 character found in the input followed by a <newline>.)

17932 The tab stops are hardcoded to be every eighth column to meet historical practice. No new  
17933 method of specifying other tab stops was invented.

**17934 FUTURE DIRECTIONS**

17935 None.

**17936 SEE ALSO**

17937 *cut*

**17938 CHANGE HISTORY**

17939 First released in Issue 4.

**17940 Issue 6**

17941 The normative text is reworded to avoid use of the term “must” for application requirements.

17942 **NAME**17943 fort77 — FORTRAN compiler (**FORTTRAN**)17944 **SYNOPSIS**

```
17945 FD fort77 [-c] [-g] [-L directory]... [-O optlevel] [-o outfile] [-s] [-w]
17946 operand...
```

17947

17948 **DESCRIPTION**

17949 The *fort77* utility is the interface to the FORTRAN compilation system; it shall accept the full  
 17950 FORTRAN-77 language defined by the ANSI X3.9-1978 standard. The system conceptually  
 17951 consists of a compiler and link editor. The files referenced by *operands* are compiled and linked  
 17952 to produce an executable file. It is unspecified whether the linking occurs entirely within the  
 17953 operation of *fort77*; some implementations may produce objects that are not fully resolved until  
 17954 the file is executed.

17955 If the **-c** option is present, for all pathname operands of the form *file.f*, the files:

17956 \$(basename *pathname.f*) .o

17957 shall be created or overwritten as the result of successful compilation. If the **-c** option is not  
 17958 specified, it is unspecified whether such **.o** files are created or deleted for the *file.f* operands.

17959 If there are no options that prevent link editing (such as **-c**) and all operands compile and link  
 17960 without error, the resulting executable file shall be written into the file named by the **-o** option  
 17961 (if present) or to the file **a.out**. The executable file shall be created as specified in the System  
 17962 Interfaces volume of IEEE Std 1003.1-2001, except that the file permissions shall be set to:

17963 S\_IRWXO | S\_IRWXG | S\_IRWXU

17964 and that the bits specified by the *umask* of the process shall be cleared.

17965 **OPTIONS**

17966 The *fort77* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 17967 12.2, Utility Syntax Guidelines, except that:

- 17968 • The **-l** *library* operands have the format of options, but their position within a list of  
 17969 operands affects the order in which libraries are searched.
- 17970 • The order of specifying the multiple **-L** options is significant.
- 17971 • Conforming applications shall specify each option separately; that is, grouping option letters  
 17972 (for example, **-cg**) need not be recognized by all implementations.

17973 The following options shall be supported:

17974 **-c** Suppress the link-edit phase of the compilation, and do not remove any object files  
 17975 that are produced.

17976 **-g** Produce symbolic information in the object or executable files; the nature of this  
 17977 information is unspecified, and may be modified by implementation-defined  
 17978 interactions with other options.

17979 **-s** Produce object or executable files, or both, from which symbolic and other  
 17980 information not required for proper execution using the *exec* family of functions  
 17981 defined in the System Interfaces volume of IEEE Std 1003.1-2001 has been removed  
 17982 (stripped). If both **-g** and **-s** options are present, the action taken is unspecified.

17983 **-o** *outfile* Use the pathname *outfile*, instead of the default **a.out**, for the executable file  
 17984 produced. If the **-o** option is present with **-c**, the result is unspecified.

17985        **-L** *directory*    Change the algorithm of searching for the libraries named in **-I** operands to look in  
 17986                            the directory named by the *directory* pathname before looking in the usual places.  
 17987                            Directories named in **-L** options shall be searched in the specified order. At least  
 17988                            ten instances of this option shall be supported in a single *fort77* command  
 17989                            invocation. If a directory specified by a **-L** option contains a file named **libf.a**, the  
 17990                            results are unspecified.

17991        **-O** *optlevel*    Specify the level of code optimization. If the *optlevel* option-argument is the digit  
 17992                            '0', all special code optimizations shall be disabled. If it is the digit '1', the  
 17993                            nature of the optimization is unspecified. If the **-O** option is omitted, the nature of  
 17994                            the system's default optimization is unspecified. It is unspecified whether code  
 17995                            generated in the presence of the **-O 0** option is the same as that generated when  
 17996                            **-O** is omitted. Other *optlevel* values may be supported.

17997        **-w**                Suppress warnings.

17998        Multiple instances of **-L** options can be specified.

## 17999 OPERANDS

18000        An *operand* is either in the form of a pathname or the form **-I library**. At least one operand of the  
 18001        pathname form shall be specified. The following operands shall be supported:

18002        *file.f*            The pathname of a FORTRAN source file to be compiled and optionally passed to  
 18003                            the link editor. The filename operand shall be of this form if the **-c** option is used.

18004        *file.a*            A library of object files typically produced by *ar*, and passed directly to the link  
 18005                            editor. Implementations may recognize implementation-defined suffixes other  
 18006                            than **.a** as denoting object file libraries.

18007        *file.o*            An object file produced by *fort77 -c* and passed directly to the link editor.  
 18008                            Implementations may recognize implementation-defined suffixes other than **.o** as  
 18009                            denoting object files.

18010        The processing of other files is implementation-defined.

18011        **-I library**        (The letter ell.) Search the library named:

18012                            *liblibrary.a*

18013                            A library is searched when its name is encountered, so the placement of a **-I**  
 18014                            operand is significant. Several standard libraries can be specified in this manner, as  
 18015                            described in the EXTENDED DESCRIPTION section. Implementations may  
 18016                            recognize implementation-defined suffixes other than **.a** as denoting libraries.

## 18017 STDIN

18018        Not used.

## 18019 INPUT FILES

18020        The input file shall be one of the following: a text file containing FORTRAN source code; an  
 18021        object file in the format produced by *fort77 -c*; or a library of object files, in the format produced  
 18022        by archiving zero or more object files, using *ar*. Implementations may supply additional utilities  
 18023        that produce files in these formats. Additional input files are implementation-defined.

18024        A <tab> encountered within the first six characters on a line of source code shall cause the  
 18025        compiler to interpret the following character as if it were the seventh character on the line (that  
 18026        is, in column 7).

18027 **ENVIRONMENT VARIABLES**

18028 The following environment variables shall affect the execution of *fort77*:

18029 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 18030 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 18031 Internationalization Variables for the precedence of internationalization variables  
 18032 used to determine the values of locale categories.)

18033 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 18034 internationalization variables.

18035 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 18036 characters (for example, single-byte as opposed to multi-byte characters in  
 18037 arguments and input files).

18038 **LC\_MESSAGES**  
 18039 Determine the locale that should be used to affect the format and contents of  
 18040 diagnostic messages written to standard error.

18041 **XLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

18042 **TMPDIR** Determine the pathname that should override the default directory for temporary  
 18043 files, if any.

18044 **ASYNCHRONOUS EVENTS**

18045 Default.

18046 **STDOUT**

18047 Not used.

18048 **STDERR**

18049 The standard error shall be used only for diagnostic messages. If more than one *file* operand  
 18050 ending in *.f* (or possibly other unspecified suffixes) is given, for each such file:

18051 "%s:\n", <*file*>

18052 may be written to allow identification of the diagnostic message with the appropriate input file.

18053 This utility may produce warning messages about certain conditions that do not warrant  
 18054 returning an error (non-zero) exit value.

18055 **OUTPUT FILES**

18056 Object files, listing files, and executable files shall be produced in unspecified formats.

18057 **EXTENDED DESCRIPTION**18058 **Standard Libraries**

18059 The *fort77* utility shall recognize the following **-l** operand for the standard library:

18060 **-l f** This library contains all functions referenced in the ANSI X3.9-1978 standard. This  
 18061 operand shall not be required to be present to cause a search of this library.

18062 In the absence of options that inhibit invocation of the link editor, such as **-c**, the *fort77* utility  
 18063 shall cause the equivalent of a **-l f** operand to be passed to the link editor as the last **-l** operand,  
 18064 causing it to be searched after all other object files and libraries are loaded.

18065 It is unspecified whether the library **libf.a** exists as a regular file. The implementation may  
 18066 accept as **-l** operands names of objects that do not exist as regular files.

**18067 External Symbols**

18068 The FORTRAN compiler and link editor shall support the significance of external symbols up to  
18069 a length of at least 31 bytes; case folding is permitted. The action taken upon encountering  
18070 symbols exceeding the implementation-defined maximum symbol length is unspecified.

18071 The compiler and link editor shall support a minimum of 511 external symbols per source or  
18072 object file, and a minimum of 4095 external symbols total. A diagnostic message is written to  
18073 standard output if the implementation-defined limit is exceeded; other actions are unspecified.

**18074 EXIT STATUS**

18075 The following exit values shall be returned:

18076 0 Successful compilation or link edit.

18077 >0 An error occurred.

**18078 CONSEQUENCES OF ERRORS**

18079 When *fort77* encounters a compilation error, it shall write a diagnostic to standard error and  
18080 continue to compile other source code operands. It shall return a non-zero exit status, but it is  
18081 implementation-defined whether an object module is created. If the link edit is unsuccessful, a  
18082 diagnostic message shall be written to standard error, and *fort77* shall exit with a non-zero  
18083 status.

**18084 APPLICATION USAGE**

18085 None.

**18086 EXAMPLES**

18087 The following usage example compiles **xyz.f** and creates the executable file **foo**:

18088 `fort77 -o foo xyz.f`

18089 The following example compiles **xyz.f** and creates the object file **xyz.o**:

18090 `fort77 -c xyz.f`

18091 The following example compiles **xyz.f** and creates the executable file **a.out**:

18092 `fort77 xyz.f`

18093 The following example compiles **xyz.f**, links it with **b.o**, and creates the executable **a.out**:

18094 `fort77 xyz.f b.o`

**18095 RATIONALE**

18096 The name of this utility was chosen as *fort77* to parallel the renaming of the C compiler. The  
18097 name *f77* was not chosen to avoid problems with historical implementations. The  
18098 ANSI X3.9-1978 standard was selected as a normative reference because the ISO/IEC version of  
18099 FORTRAN-77 has been superseded by the ISO/IEC 1539:1990 standard (Fortran-90).

18100 The file inclusion and symbol definition **#define** mechanisms used by the *c99* utility were not  
18101 included in this volume of IEEE Std 1003.1-2001—even though they are commonly  
18102 implemented—since there is no requirement that the FORTRAN compiler use the C  
18103 preprocessor.

18104 The **—onetrip** option was not included in this volume of IEEE Std 1003.1-2001, even though many  
18105 historical compilers support it, because it is derived from FORTRAN-66; it is an anachronism  
18106 that should not be perpetuated.

18107 Some implementations produce compilation listings. This aspect of FORTRAN has been left  
18108 unspecified because there was controversy concerning the various methods proposed for  
18109 implementing it: a **—V** option overlapped with historical vendor practice and a naming

18110 convention of creating files with **.I** suffixes collided with historical *lex* file naming practice.

18111 There is no **-I** option in this version of this volume of IEEE Std 1003.1-2001 to specify a directory  
18112 for file inclusion. An **INCLUDE** directive has been a part of the Fortran-90 discussions, but an  
18113 interface supporting that standard is not in the current scope.

18114 It is noted that many FORTRAN compilers produce an object module even when compilation  
18115 errors occur; during a subsequent compilation, the compiler may patch the object module rather  
18116 than recompiling all the code. Consequently, it is left to the implementor whether or not an  
18117 object file is created.

18118 A reference to MIL-STD-1753 was removed from an early proposal in response to a request from  
18119 the POSIX FORTRAN-binding standard developers. It was not the intention of the standard  
18120 developers to require certification of the FORTRAN compiler, and IEEE Std 1003.9-1992 does not  
18121 specify the military standard or any special preprocessing requirements. Furthermore, use of  
18122 that document would have been inappropriate for an international standard.

18123 The specification of optimization has been subject to changes through early proposals. At one  
18124 time, **-O** and **-N** were Booleans: optimize and do not optimize (with an unspecified default).  
18125 Some historical practice led this to be changed to:

18126 **-O 0** No optimization.

18127 **-O 1** Some level of optimization.

18128 **-O n** Other, unspecified levels of optimization.

18129 It is not always clear whether “good code generation” is the same thing as optimization. Simple  
18130 optimizations of local actions do not usually affect the semantics of a program. The **-O 0** option  
18131 has been included to accommodate the very particular nature of scientific calculations in a  
18132 highly optimized environment; compilers make errors. Some degree of optimization is expected,  
18133 even if it is not documented here, and the ability to shut it off completely could be important  
18134 when porting an application. An implementation may treat **-O 0** as “do less than normal” if it  
18135 wishes, but this is only meaningful if any of the operations it performs can affect the semantics  
18136 of a program. It is highly dependent on the implementation whether doing less than normal is  
18137 logical. It is not the intent of the **-O 0** option to ask for inefficient code generation, but rather to  
18138 assure that any semantically visible optimization is suppressed.

18139 The specification of standard library access is consistent with the C compiler specification.  
18140 Implementations are not required to have **/usr/lib/libf.a**, as many historical implementations do,  
18141 but if not they are required to recognize **f** as a token.

18142 External symbol size limits are in normative text; conforming applications need to know these  
18143 limits. However, the minimum maximum symbol length should be taken as a constraint on a  
18144 conforming application, not on an implementation, and consequently the action taken for a  
18145 symbol exceeding the limit is unspecified. The minimum size for the external symbol table was  
18146 added for similar reasons.

18147 The CONSEQUENCES OF ERRORS section clearly specifies the behavior of the compiler when  
18148 compilation or link-edit errors occur. The behavior of several historical implementations was  
18149 examined, and the choice was made to be silent on the status of the executable, or **a.out**, file in  
18150 the face of compiler or linker errors. If a linker writes the executable file, then links it on disk  
18151 with *lseek()*s and *write()*s, the partially linked executable file can be left on disk and its execute  
18152 bits turned off if the link edit fails. However, if the linker links the image in memory before  
18153 writing the file to disk, it need not touch the executable file (if it already exists) because the link  
18154 edit fails. Since both approaches are historical practice, a conforming application shall rely on  
18155 the exit status of *fort77*, rather than on the existence or mode of the executable file.

18156 The **-g** and **-s** options are not specified as mutually-exclusive. Historically these two options  
18157 have been mutually-exclusive, but because both are so loosely specified, it seemed appropriate  
18158 to leave their interaction unspecified.

18159 The requirement that conforming applications specify compiler options separately is to reserve  
18160 the multi-character option name space for vendor-specific compiler options, which are known to  
18161 exist in many historical implementations. Implementations are not required to recognize, for  
18162 example, **-gc** as if it were **-g -c**; nor are they forbidden from doing so. The SYNOPSIS shows all  
18163 of the options separately to highlight this requirement on applications.

18164 Echoing filenames to standard error is considered a diagnostic message because it would  
18165 otherwise be difficult to associate an error message with the erring file. They are described with  
18166 “may” to allow implementations to use other methods of identifying files and to parallel the  
18167 description in *c99*.

#### 18168 **FUTURE DIRECTIONS**

18169 A compilation system based on the ISO/IEC 1539:1990 standard (Fortran-90) may be considered  
18170 for a future version; it may have a different utility name from *fort77*.

#### 18171 **SEE ALSO**

18172 *ar*, *asa*, *c99*, *umask*, the System Interfaces volume of IEEE Std 1003.1-2001, *exec*

#### 18173 **CHANGE HISTORY**

18174 First released in Issue 4.

#### 18175 **Issue 6**

18176 This utility is marked as part of the FORTRAN Development Utilities option.

18177 The normative text is reworded to avoid use of the term “must” for application requirements.

18178 **NAME**

18179 fuser — list process IDs of all processes that have one or more files open

18180 **SYNOPSIS**

18181 xSI fuser [ -cfu ] file ...

18182

18183 **DESCRIPTION**

18184 The *fuser* utility shall write to standard output the process IDs of processes running on the local  
 18185 system that have one or more named files open. For block special devices, all processes using  
 18186 any file on that device are listed.

18187 The *fuser* utility shall write to standard error additional information about the named files  
 18188 indicating how the file is being used.

18189 Any output for processes running on remote systems that have a named file open is unspecified.

18190 A user may need appropriate privilege to invoke the *fuser* utility.

18191 **OPTIONS**

18192 The *fuser* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 18193 12.2, Utility Syntax Guidelines.

18194 The following options shall be supported:

18195 **-c** The file is treated as a mount point and the utility shall report on any files open in  
 18196 the file system.

18197 **-f** The report shall be only for the named files.

18198 **-u** The user name, in parentheses, associated with each process ID written to standard  
 18199 output shall be written to standard error.

18200 **OPERANDS**

18201 The following operand shall be supported:

18202 *file* A pathname on which the file or file system is to be reported.

18203 **STDIN**

18204 Not used.

18205 **INPUT FILES**

18206 The user database.

18207 **ENVIRONMENT VARIABLES**

18208 The following environment variables shall affect the execution of *fuser*:

18209 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 18210 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 18211 Internationalization Variables for the precedence of internationalization variables  
 18212 used to determine the values of locale categories.)

18213 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 18214 internationalization variables.

18215 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 18216 characters (for example, single-byte as opposed to multi-byte characters in  
 18217 arguments).

18218 **LC\_MESSAGES**

18219 Determine the locale that should be used to affect the format and contents of  
 18220 diagnostic messages written to standard error.

- 18221 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 18222 **ASYNCHRONOUS EVENTS**
- 18223 Default.
- 18224 **STDOUT**
- 18225 The *fuser* utility shall write the process ID for each process using each file given as an operand to
- 18226 standard output in the following format:
- 18227 "%d", <*process\_id*>
- 18228 **STDERR**
- 18229 The *fuser* utility shall write diagnostic messages to standard error.
- 18230 The *fuser* utility also shall write the following to standard error:
- 18231 • The pathname of each named file is written followed immediately by a colon.
- 18232 • For each process ID written to standard output, the character 'c' shall be written to
- 18233 standard error if the process is using the file as its current directory and the character 'r'
- 18234 shall be written to standard error if the process is using the file as its root directory.
- 18235 Implementations may write other alphabetic characters to indicate other uses of files.
- 18236 • When the *-u* option is specified, characters indicating the use of the file shall be followed
- 18237 immediately by the user name, in parentheses, corresponding to the process' real user ID. If
- 18238 the user name cannot be resolved from the process' real user ID, the process' real user ID
- 18239 shall be written instead of the user name.
- 18240 When standard output and standard error are directed to the same file, the output shall be
- 18241 interleaved so that the filename appears at the start of each line, followed by the process ID and
- 18242 characters indicating the use of the file. Then, if the *-u* option is specified, the user name or user
- 18243 ID for each process using that file shall be written.
- 18244 A <newline> shall be written to standard error after the last output described above for each *file*
- 18245 operand.
- 18246 **OUTPUT FILES**
- 18247 None.
- 18248 **EXTENDED DESCRIPTION**
- 18249 None.
- 18250 **EXIT STATUS**
- 18251 The following exit values shall be returned:
- 18252 0 Successful completion.
- 18253 >0 An error occurred.
- 18254 **CONSEQUENCES OF ERRORS**
- 18255 Default.

18256 **APPLICATION USAGE**

18257           None.

18258 **EXAMPLES**

18259           The command:

18260           `fuser -fu .`

18261           writes to standard output the process IDs of processes that are using the current directory and

18262           writes to standard error an indication of how those processes are using the directory and the

18263           user names associated with the processes that are using the current directory.

18264 **RATIONALE**18265           The definition of the *fuser* utility follows existing practice.18266 **FUTURE DIRECTIONS**

18267           None.

18268 **SEE ALSO**

18269           None.

18270 **CHANGE HISTORY**

18271           First released in Issue 5.

18272 **NAME**

18273 gencat — generate a formatted message catalog

18274 **SYNOPSIS**18275 xSI gencat *catfile* *msgfile*...

18276

18277 **DESCRIPTION**

18278 The *gencat* utility shall merge the message text source file *msgfile* into a formatted message  
 18279 catalog *catfile*. The file *catfile* shall be created if it does not already exist. If *catfile* does exist, its  
 18280 messages shall be included in the new *catfile*. If set and message numbers collide, the new  
 18281 message text defined in *msgfile* shall replace the old message text currently contained in *catfile*.

18282 **OPTIONS**

18283 None.

18284 **OPERANDS**

18285 The following operands shall be supported:

18286 *catfile* A pathname of the formatted message catalog. If '-' is specified, standard output  
 18287 shall be used. The format of the message catalog produced is unspecified.

18288 *msgfile* A pathname of a message text source file. If '-' is specified for an instance of  
 18289 *msgfile*, standard input shall be used. The format of message text source files is  
 18290 defined in the EXTENDED DESCRIPTION section.

18291 **STDIN**18292 The standard input shall not be used unless a *msgfile* operand is specified as '-'.18293 **INPUT FILES**

18294 The input files shall be text files.

18295 **ENVIRONMENT VARIABLES**18296 The following environment variables shall affect the execution of *gencat*:

18297 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 18298 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 18299 Internationalization Variables for the precedence of internationalization variables  
 18300 used to determine the values of locale categories.)

18301 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 18302 internationalization variables.

18303 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 18304 characters (for example, single-byte as opposed to multi-byte characters in  
 18305 arguments and input files).

18306 *LC\_MESSAGES*

18307 Determine the locale that should be used to affect the format and contents of  
 18308 diagnostic messages written to standard error.

18309 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

18310 **ASYNCHRONOUS EVENTS**

18311 Default.

18312 **STDOUT**18313 The standard output shall not be used unless the *catfile* operand is specified as '-'.

18314 **STDERR**

18315 The standard error shall be used only for diagnostic messages.

18316 **OUTPUT FILES**

18317 None.

18318 **EXTENDED DESCRIPTION**

18319 The content of a message text file shall be in the format defined as follows. Note that the fields of  
 18320 a message text source line are separated by a single <blank>. Any other <blank>s are considered  
 18321 to be part of the subsequent field.

18322 **\$set** *n comment*

18323 This line specifies the set identifier of the following messages until the next **\$set** or  
 18324 end-of-file appears. The *n* denotes the set identifier, which is defined as a number  
 18325 in the range [1, {NL\_SETMAX}] (see the <limits.h> header defined in the Base  
 18326 Definitions volume of IEEE Std 1003.1-2001). The application shall ensure that set  
 18327 identifiers are presented in ascending order within a single source file, but need  
 18328 not be contiguous. Any string following the set identifier shall be treated as a  
 18329 comment. If no **\$set** directive is specified in a message text source file, all messages  
 18330 shall be located in an implementation-defined default message set NL\_SETD (see  
 18331 the <nl\_types.h> header defined in the Base Definitions volume of  
 18332 IEEE Std 1003.1-2001).

18333 **\$delset** *n comment*

18334 This line deletes message set *n* from an existing message catalog. The *n* denotes the  
 18335 set number [1, {NL\_SETMAX}]. Any string following the set number shall be  
 18336 treated as a comment.

18337 **\$comment** A line beginning with ' \$ ' followed by a <blank> shall be treated as a comment.

18338 *m message-text*

18339 The *m* denotes the message identifier, which is defined as a number in the range [1,  
 18340 {NL\_MSGMAX}] (see the <limits.h> header). The *message-text* shall be stored in the  
 18341 message catalog with the set identifier specified by the last **\$set** directive, and with  
 18342 message identifier *m*. If the *message-text* is empty, and a <blank> field separator is  
 18343 present, an empty string shall be stored in the message catalog. If a message source  
 18344 line has a message number, but neither a field separator nor *message-text*, the  
 18345 existing message with that number (if any) shall be deleted from the catalog. The  
 18346 application shall ensure that message identifiers are in ascending order within a  
 18347 single set, but need not be contiguous. The application shall ensure that the length  
 18348 of *message-text* is in the range [0, {NL\_TEXTMAX}] (see the <limits.h> header).

18349 **\$quote** *n* This line specifies an optional quote character *c*, which can be used to surround  
 18350 *message-text* so that trailing spaces or null (empty) messages are visible in a  
 18351 message source line. By default, or if an empty **\$quote** directive is supplied, no  
 18352 quoting of *message-text* shall be recognized.

18353 Empty lines in a message text source file shall be ignored. The effects of lines starting with any  
 18354 character other than those defined above are implementation-defined.

18355 Text strings can contain the special characters and escape sequences defined in the following  
 18356 table:

18357  
18358  
18359  
18360  
18361  
18362  
18363  
18364  
18365  
18366

| Description       | Symbol | Sequence |
|-------------------|--------|----------|
| <newline>         | NL(LF) | \n       |
| Horizontal-tab    | HT     | \t       |
| <vertical-tab>    | VT     | \v       |
| <backspace>       | BS     | \b       |
| <carriage-return> | CR     | \r       |
| <form-feed>       | FF     | \f       |
| Backslash         | \      | \\       |
| Bit pattern       | ddd    | \ddd     |

18367 The escape sequence "\ddd" consists of backslash followed by one, two, or three octal digits,  
18368 which shall be taken to specify the value of the desired character. If the character following a  
18369 backslash is not one of those specified, the backslash shall be ignored.

18370 Backslash ('\'') followed by a <newline> is also used to continue a string on the following line.  
18371 Thus, the following two lines describe a single message string:

18372 1 This line continues \  
18373 to the next line

18374 which shall be equivalent to:

18375 1 This line continues to the next line

#### 18376 EXIT STATUS

18377 The following exit values shall be returned:

18378 0 Successful completion.

18379 >0 An error occurred.

#### 18380 CONSEQUENCES OF ERRORS

18381 Default.

#### 18382 APPLICATION USAGE

18383 Message catalogs produced by *gencat* are binary encoded, meaning that their portability cannot  
18384 be guaranteed between different types of machine. Thus, just as C programs need to be  
18385 recompiled for each type of machine, so message catalogs must be recreated via *gencat*.

#### 18386 EXAMPLES

18387 None.

#### 18388 RATIONALE

18389 None.

#### 18390 FUTURE DIRECTIONS

18391 None.

#### 18392 SEE ALSO

18393 *iconv*, the Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <nl\_types.h>

#### 18394 CHANGE HISTORY

18395 First released in Issue 3.

#### 18396 Issue 6

18397 The normative text is reworded to avoid use of the term “must” for application requirements.

18398 **NAME**18399       get — get a version of an SCCS file (**DEVELOPMENT**)18400 **SYNOPSIS**18401 xSI       get [-begkmnlPst] [-c *cutoff*] [-i *list*] [-r *SID*] [-x *list*] *file...*

18402

18403 **DESCRIPTION**18404       The *get* utility shall generate a text file from each named SCCS *file* according to the specifications  
18405       given by its options.18406       The generated text shall normally be written into a file called the **g-file** whose name is derived  
18407       from the SCCS filename by simply removing the leading "s.". 18408 **OPTIONS**18409       The *get* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
18410       Utility Syntax Guidelines.

18411       The following options shall be supported:

18412       **-r *SID***       Indicate the SCCS Identification String (SID) of the version (delta) of an SCCS file  
18413       to be retrieved. The table shows, for the most useful cases, what version of an  
18414       SCCS file is retrieved (as well as the SID of the version to be eventually created by  
18415       *delta* if the **-e** option is also used), as a function of the SID specified.18416       **-c *cutoff***       Indicate the *cutoff* date-time, in the form:

18417               YY[MM[DD[HH[MM[SS]]]]]

18418       For the YY component, values in the range [69,99] shall refer to years 1969 to 1999  
18419       inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive.18420       **Note:**       It is expected that in a future version of IEEE Std 1003.1-2001 the default  
18421       century inferred from a 2-digit year will change. (This would apply to all  
18422       commands accepting a 2-digit year as input.)18423       No changes (deltas) to the SCCS file that were created after the specified *cutoff*  
18424       date-time shall be included in the generated text file. Units omitted from the date-  
18425       time default to their maximum possible values; for example, **-c** 7502 is equivalent  
18426       to **-c** 750228235959.18427       Any number of non-numeric characters may separate the various 2-digit pieces of  
18428       the *cutoff* date-time. This feature allows the user to specify a *cutoff* date in the form:  
18429       **-c** "77/2/2 9:22:25".18430       **-e**       Indicate that the *get* is for the purpose of editing or making a change (delta) to the  
18431       SCCS file via a subsequent use of *delta*. The **-e** option used in a *get* for a particular  
18432       version (SID) of the SCCS file shall prevent further *get* commands from editing on  
18433       the same SID until *delta* is executed or the **j** (joint edit) flag is set in the SCCS file.  
18434       Concurrent use of *get* **-e** for different SIDs is always allowed.18435       If the **g-file** generated by *get* with a **-e** option is accidentally ruined in the process  
18436       of editing, it may be regenerated by re-executing the *get* command with the **-k**  
18437       option in place of the **-e** option.18438       SCCS file protection specified via the ceiling, floor, and authorized user list stored  
18439       in the SCCS file shall be enforced when the **-e** option is used.18440       **-b**       Use with the **-e** option to indicate that the new delta should have an SID in a new  
18441       branch as shown in the table below. This option shall be ignored if the **b** flag is not  
18442       present in the file or if the retrieved delta is not a leaf delta. (A leaf delta is one that

18443 has no successors on the SCCS file tree.)

18444 **Note:** A branch delta may always be created from a non-leaf delta.

18445 **-i list** Indicate a *list* of deltas to be included (forced to be applied) in the creation of the  
 18446 generated file. The *list* has the following syntax:

18447 `<list> ::= <range> | <list> , <range>`  
 18448 `<range> ::= SID | SID - SID`

18449 SID, the SCCS Identification of a delta, may be in any form shown in the “SID  
 18450 Specified” column of the table in the EXTENDED DESCRIPTION section, except  
 18451 that the result of supplying a partial SID is unspecified. A diagnostic message shall  
 18452 be written if the first SID in the range is not an ancestor of the second SID in the  
 18453 range.

18454 **-x list** Indicate a *list* of deltas to be excluded (forced not to be applied) in the creation of  
 18455 the generated file. See the **-i** option for the *list* format.

18456 **-k** Suppress replacement of identification keywords (see below) in the retrieved text  
 18457 by their value. The **-k** option shall be implied by the **-e** option.

18458 **-l** Write a delta summary into an **l-file**.

18459 **-L** Write a delta summary to standard output. All informative output that normally is  
 18460 written to standard output shall be written to standard error instead, unless the **-s**  
 18461 option is used, in which case it shall be suppressed.

18462 **-p** Write the text retrieved from the SCCS file to the standard output. No **g-file** shall  
 18463 be created. All informative output that normally goes to the standard output shall  
 18464 go to standard error instead, unless the **-s** option is used, in which case it shall  
 18465 disappear.

18466 **-s** Suppress all informative output normally written to standard output. However,  
 18467 fatal error messages (which shall always be written to the standard error) shall  
 18468 remain unaffected.

18469 **-m** Precede each text line retrieved from the SCCS file by the SID of the delta that  
 18470 inserted the text line in the SCCS file. The format shall be:

18471 `"%s\t%s", <SID>, <text line>`

18472 **-n** Precede each generated text line with the **%M%** identification keyword value (see  
 18473 below). The format shall be:

18474 `"%s\t%s", <%M% value>, <text line>`

18475 When both the **-m** and **-n** options are used, the `<text line>` shall be replaced by the  
 18476 **-m** option-generated format.

18477 **-g** Suppress the actual retrieval of text from the SCCS file. It is primarily used to  
 18478 generate an **l-file**, or to verify the existence of a particular SID.

18479 **-t** Use to access the most recently created (top) delta in a given release (for example,  
 18480 **-r 1**), or release and level (for example, **-r 1.2**).

## 18481 OPERANDS

18482 The following operands shall be supported:

18483 *file* A pathname of an existing SCCS file or a directory. If *file* is a directory, the *get*  
 18484 utility shall behave as though each file in the directory were specified as a named  
 18485 file, except that non-SCCS files (last component of the pathname does not begin

18486 with **s**.) and unreadable files shall be silently ignored.

18487 If exactly one *file* operand appears, and it is **'-'**, the standard input shall be read;  
 18488 each line of the standard input is taken to be the name of an SCCS file to be  
 18489 processed. Non-SCCS files and unreadable files shall be silently ignored.

18490 **STDIN**

18491 The standard input shall be a text file used only if the *file* operand is specified as **'-'**. Each line  
 18492 of the text file shall be interpreted as an SCCS pathname.

18493 **INPUT FILES**

18494 The SCCS files shall be files of an unspecified format.

18495 **ENVIRONMENT VARIABLES**

18496 The following environment variables shall affect the execution of *get*:

18497 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 18498 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 18499 Internationalization Variables for the precedence of internationalization variables  
 18500 used to determine the values of locale categories.)

18501 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 18502 internationalization variables.

18503 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 18504 characters (for example, single-byte as opposed to multi-byte characters in  
 18505 arguments and input files).

18506 **LC\_MESSAGES**

18507 Determine the locale that should be used to affect the format and contents of  
 18508 diagnostic messages written to standard error, and informative messages written  
 18509 to standard output (or standard error, if the **-p** option is used).

18510 **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

18511 **TZ** Determine the timezone in which the times and dates written in the SCCS file are  
 18512 evaluated. If the *TZ* variable is unset or NULL, an unspecified system default  
 18513 timezone is used.

18514 **ASYNCHRONOUS EVENTS**

18515 Default.

18516 **STDOUT**

18517 For each file processed, *get* shall write to standard output the SID being accessed and the number  
 18518 of lines retrieved from the SCCS file, in the following format:

18519 **"%s\n%d lines\n", <SID>, <number of lines>**

18520 If the **-e** option is used, the SID of the delta to be made shall appear after the SID accessed and  
 18521 before the number of lines generated, in the POSIX locale:

18522 **"%s\nnew delta %s\n%d lines\n", <SID accessed>,  
 18523 <SID to be made>, <number of lines>**

18524 If there is more than one named file or if a directory or standard input is named, each pathname  
 18525 shall be written before each of the lines shown in one of the preceding formats:

18526 **"\n%s:\n", <pathname>**

18527 If the **-L** option is used, a delta summary shall be written following the format specified below  
 18528 for **l-files**.

18529 If the **-i** option is used, included deltas shall be listed following the notation, in the POSIX locale:

18530 "Included:\n"

18531 If the **-x** option is used, excluded deltas shall be listed following the notation, in the POSIX

18532 locale:

18533 "Excluded:\n"

18534 If the **-p** or **-L** options are specified, the standard output shall consist of the text retrieved from

18535 the SCCS file.

18536 **STDERR**

18537 The standard error shall be used only for diagnostic messages, except if the **-p** or **-L** options are

18538 specified, it shall include all informative messages normally sent to standard output.

18539 **OUTPUT FILES**

18540 Several auxiliary files may be created by *get*. These files are known generically as the **g-file**, **l-**

18541 **file**, **p-file**, and **z-file**. The letter before the hyphen is called the *tag*. An auxiliary filename shall

18542 be formed from the SCCS filename: the application shall ensure that the last component of all

18543 SCCS filenames is of the form **s.module-name**; the auxiliary files shall be named by replacing the

18544 leading **s** with the tag. The **g-file** shall be an exception to this scheme: the **g-file** is named by

18545 removing the **s.** prefix. For example, for **s.xyz.c**, the auxiliary filenames would be **xyz.c**, **l.xyz.c**,

18546 **p.xyz.c**, and **z.xyz.c**, respectively.

18547 The **g-file**, which contains the generated text, shall be created in the current directory (unless the

18548 **-p** option is used). A **g-file** shall be created in all cases, whether or not any lines of text were

18549 generated by the *get*. It shall be owned by the real user. If the **-k** option is used or implied, the

18550 **g-file** shall be writable by the owner only (read-only for everyone else); otherwise, it shall be

18551 read-only. Only the real user need have write permission in the current directory.

18552 The **l-file** shall contain a table showing which deltas were applied in generating the retrieved

18553 text. The **l-file** shall be created in the current directory if the **-l** option is used; it shall be read-

18554 only and it is owned by the real user. Only the real user need have write permission in the

18555 current directory.

18556 Lines in the **l-file** shall have the following format:

18557 "%c%c%cΔ%s\t%sΔ%s\n", <code1>, <code2>, <code3>,

18558 <SID>, <date-time>, <login>

18559 where the entries are:

18560 <code1> A <space> if the delta was applied; ' \* ' otherwise.

18561 <code2> A <space> if the delta was applied or was not applied and ignored; ' \* ' if the delta

18562 was not applied and was not ignored.

18563 <code3> A character indicating a special reason why the delta was or was not applied:

18564 **I** Included.

18565 **X** Excluded.

18566 **C** Cut off (by a **-c** option).

18567 <date-time> Date and time (using the format of the *date* utility's %Y/%m/%d %T conversion

18568 specification format) of creation.

18569 <login> Login name of person who created *delta*.

18570 The comments and MR data shall follow on subsequent lines, indented one <tab>. A blank line  
 18571 shall terminate each entry.

18572 The **p-file** shall be used to pass information resulting from a *get* with a **-e** option along to *delta*.  
 18573 Its contents shall also be used to prevent a subsequent execution of *get* with a **-e** option for the  
 18574 same SID until *delta* is executed or the joint edit flag, **j**, is set in the SCCS file. The **p-file** shall be  
 18575 created in the directory containing the SCCS file and the application shall ensure that the  
 18576 effective user has write permission in that directory. It shall be writable by owner only, and  
 18577 owned by the effective user. Each line in the **p-file** shall have the following format:

18578 "%sΔ%sΔ%sΔ%s%s\n", <g-file SID>,  
 18579 <SID of new delta>, <login-name of real user>,  
 18580 <date-time>, <i-value>, <x-value>

18581 where <i-value> uses the format " " if no **-i** option was specified, and shall use the format:

18582 "Δ-i%s", <-i option option-argument>

18583 if a **-i** option was specified and <x-value> uses the format " " if no **-x** option was specified, and  
 18584 shall use the format:

18585 "Δ-x%s", <-x option option-argument>

18586 if a **-x** option was specified. There can be an arbitrary number of lines in the **p-file** at any time;  
 18587 no two lines shall have the same new delta SID.

18588 The **z-file** shall serve as a lock-out mechanism against simultaneous updates. Its contents shall  
 18589 be the binary process ID of the command (that is, *get*) that created it. The **z-file** shall be created  
 18590 in the directory containing the SCCS file for the duration of *get*. The same protection restrictions  
 18591 as those for the **p-file** shall apply for the **z-file**. The **z-file** shall be created read-only.

| R.L.B                                       | yes                | No branch successor                         | R.L.B.mS      | R.L.(mB+1).1               |
| R.L.B.S                                     | no                 | No branch successor                         | R.L.B.S       | R.L.B.(S+1)                |
| R.L.B.S                                     | yes                | No branch successor                         | R.L.B.S       | R.L.(mB+1).1               |
| R.L.B.S                                     | –                  | Branch successor                            | R.L.B.S       | R.L.(mB+1).1               |

18615

18616

18617

18618

18619

18620

\* R, L, B, and S are the release, level, branch, and sequence components of the SID, respectively; m means maximum. Thus, for example, R.mL means “the maximum level number within release R”; R.L.(mB+1).1 means “the first sequence number on the new branch (that is, maximum branch number plus one) of level L within release R”. Note that if the SID specified is of the form R.L, R.L.B, or R.L.B.S, each of the specified components shall exist.

18621

\*\* hR is the highest existing release that is lower than the specified, nonexistent, release R.

18622

\*\*\* This is used to force creation of the first delta in a new release.

18623

18624

† The –b option is effective only if the b flag is present in the file. An entry of ‘–’ means “irrelevant”.

18625

18626

18627

‡ This case applies if the d (default SID) flag is not present in the file. If the d flag is present in the file, then the SID obtained from the d flag is interpreted as if it had been specified on the command line. Thus, one of the other cases in this table applies.

18628 **System Date and Time**

18629 When a **g-file** is generated, the creation time of deltas in the SCCS file may be taken into  
 18630 account. If any of these times are apparently in the future, the behavior is unspecified.

18631 **Identification Keywords**

18632 Identifying information shall be inserted into the text retrieved from the SCCS file by replacing  
 18633 identification keywords with their value wherever they occur. The following keywords may be  
 18634 used in the text stored in an SCCS file:

|       |            |                                                                                               |
|-------|------------|-----------------------------------------------------------------------------------------------|
| 18635 | <b>%M%</b> | Module name: either the value of the <b>m</b> flag in the file, or if absent, the name of the |
| 18636 |            | SCCS file with the leading <b>s.</b> removed.                                                 |
| 18637 | <b>%I%</b> | SCCS identification (SID) ( <b>%R%.%L%</b> or <b>%R%.%L%.%B%.%S%</b> ) of the retrieved       |
| 18638 |            | text.                                                                                         |
| 18639 | <b>%R%</b> | Release.                                                                                      |
| 18640 | <b>%L%</b> | Level.                                                                                        |
| 18641 | <b>%B%</b> | Branch.                                                                                       |
| 18642 | <b>%S%</b> | Sequence.                                                                                     |
| 18643 | <b>%D%</b> | Current date ( <i>YY/MM/DD</i> ).                                                             |
| 18644 | <b>%H%</b> | Current date ( <i>MM/DD/YY</i> ).                                                             |
| 18645 | <b>%T%</b> | Current time ( <i>HH:MM:SS</i> ).                                                             |
| 18646 | <b>%E%</b> | Date newest applied delta was created ( <i>YY/MM/DD</i> ).                                    |
| 18647 | <b>%G%</b> | Date newest applied delta was created ( <i>MM/DD/YY</i> ).                                    |
| 18648 | <b>%U%</b> | Time newest applied delta was created ( <i>HH:MM:SS</i> ).                                    |
| 18649 | <b>%Y%</b> | Module type: value of the <b>t</b> flag in the SCCS file.                                     |
| 18650 | <b>%F%</b> | SCCS filename.                                                                                |
| 18651 | <b>%P%</b> | SCCS absolute pathname.                                                                       |
| 18652 | <b>%Q%</b> | The value of the <b>q</b> flag in the file.                                                   |
| 18653 | <b>%C%</b> | Current line number. This keyword is intended for identifying messages output by              |
| 18654 |            | the program, such as “this should not have happened” type errors. It is not                   |
| 18655 |            | intended to be used on every line to provide sequence numbers.                                |
| 18656 | <b>%Z%</b> | The four-character string "@(#)" recognizable by <i>what</i> .                                |
| 18657 | <b>%W%</b> | A shorthand notation for constructing <i>what</i> strings:                                    |
| 18658 |            | <code>%W%=%Z%%M%&lt;tab&gt;%I%</code>                                                         |
| 18659 | <b>%A%</b> | Another shorthand notation for constructing <i>what</i> strings:                              |
| 18660 |            | <code>%A%=%Z%%Y%%M%%I%%Z%</code>                                                              |

18661 **EXIT STATUS**

18662 The following exit values shall be returned:

18663     0   Successful completion.

18664     >0   An error occurred.

18665 **CONSEQUENCES OF ERRORS**

18666 Default.

18667 **APPLICATION USAGE**

18668 Problems can arise if the system date and time have been modified (for example, put forward  
 18669 and then back again, or unsynchronized clocks across a network) and can also arise when  
 18670 different values of the *TZ* environment variable are used.

18671 Problems of a similar nature can also arise for the operation of the *delta* utility, which compares  
 18672 the previous file body against the working file as part of its normal operation.

18673 **EXAMPLES**

18674 None.

18675 **RATIONALE**

18676 None.

18677 **FUTURE DIRECTIONS**18678 The **-lp** option may be withdrawn in a future version.18679 **SEE ALSO**18680 *admin, delta, prs, what*18681 **CHANGE HISTORY**

18682 First released in Issue 2.

18683 **Issue 5**

18684 A correction is made to the first format string in STDOUT.

18685 The interpretation of the *YY* component of the **-c cutoff** argument is noted.18686 **Issue 6**18687 The obsolescent SYNOPSIS is removed, removing the **-lp** option.

18688 The normative text is reworded to avoid use of the term “must” for application requirements.

18689 The Open Group Corrigendum U025/5 is applied, correcting text in the OPTIONS section.

18690 The Open Group Corrigendum U048/1 is applied.

18691 The Open Group Interpretation PIN4C.00014 is applied.

18692 The Open Group Base Resolution bwg2001-007 is applied as follows:

18693 • The EXTENDED DESCRIPTION section is updated to make partial SID handling  
 18694 unspecified, reflecting common usage, and to clarify SID ranges.

18695 • New text is added to the EXTENDED DESCRIPTION and APPLICATION USAGE sections  
 18696 regarding how the system date and time may be taken into account.

18697 • The *TZ* environment variable is added to the ENVIRONMENT VARIABLES section.

18698 **NAME**

18699       getconf — get configuration values

18700 **SYNOPSIS**18701       getconf [ -v specification ] *system\_var*18702       getconf [ -v specification ] *path\_var* *pathname*18703 **DESCRIPTION**18704       In the first synopsis form, the *getconf* utility shall write to the standard output the value of the  
18705       variable specified by the *system\_var* operand.18706       In the second synopsis form, the *getconf* utility shall write to the standard output the value of the  
18707       variable specified by the *path\_var* operand for the path specified by the *pathname* operand.18708       The value of each configuration variable shall be determined as if it were obtained by calling the  
18709       function from which it is defined to be available by this volume of IEEE Std 1003.1-2001 or by the  
18710       System Interfaces volume of IEEE Std 1003.1-2001 (see the OPERANDS section). The value shall  
18711       reflect conditions in the current operating environment.18712 **OPTIONS**18713       The *getconf* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
18714       12.2, Utility Syntax Guidelines.

18715       The following option shall be supported:

18716       -v *specification*18717               Indicate a specific specification and version for which configuration variables shall  
18718               be determined. If this option is not specified, the values returned correspond to an  
18719               implementation default conforming compilation environment.

18720       If the command:

18721       getconf \_POSIX\_V6\_ILP32\_OFF32

18722       does not write "-1\n" or "undefined\n" to standard output, then commands of  
18723       the form:

18724       getconf -v POSIX\_V6\_ILP32\_OFF32 ...

18725       determine values for configuration variables corresponding to the  
18726       POSIX\_V6\_ILP32\_OFF32 compilation environment specified in c99, the  
18727       EXTENDED DESCRIPTION.

18728       If the command:

18729       getconf \_POSIX\_V6\_ILP32\_OFFBIG

18730       does not write "-1\n" or "undefined\n" to standard output, then commands of  
18731       the form:

18732       getconf -v POSIX\_V6\_ILP32\_OFFBIG ...

18733       determine values for configuration variables corresponding to the  
18734       POSIX\_V6\_ILP32\_OFFBIG compilation environment specified in c99, the  
18735       EXTENDED DESCRIPTION.

18736       If the command:

18737       getconf \_POSIX\_V6\_LP64\_OFF64

18738       does not write "-1\n" or "undefined\n" to standard output, then commands of  
18739       the form:

18740 `getconf -v POSIX_V6_LP64_OFF64 ...`

18741 determine values for configuration variables corresponding to the

18742 `POSIX_V6_LP64_OFF64` compilation environment specified in `c99`, the

18743 EXTENDED DESCRIPTION.

18744 If the command:

18745 `getconf _POSIX_V6_LPBIG_OFFBIG`

18746 does not write `"-1\n"` or `"undefined\n"` to standard output, then commands of

18747 the form:

18748 `getconf -v POSIX_V6_LPBIG_OFFBIG ...`

18749 determine values for configuration variables corresponding to the

18750 `POSIX_V6_LPBIG_OFFBIG` compilation environment specified in `c99`, the

18751 EXTENDED DESCRIPTION.

## 18752 OPERANDS

18753 The following operands shall be supported:

18754 *path\_var* A name of a configuration variable. All of the variables in the Variable column of  
 18755 the table in the DESCRIPTION of the *fpathconf()* function defined in the System  
 18756 Interfaces volume of IEEE Std 1003.1-2001, without the enclosing braces, shall be  
 18757 supported. The implementation may add other local variables.

18758 *pathname* A pathname for which the variable specified by *path\_var* is to be determined.

18759 *system\_var* A name of a configuration variable. All of the following variables shall be  
 18760 supported:

- The names in the Variable column of the table in the DESCRIPTION of the  
 18761 *sysconf()* function in the System Interfaces volume of IEEE Std 1003.1-2001,  
 18762 except for the entries corresponding to `_SC_CLK_TCK`,  
 18763 `_SC_GETGR_R_SIZE_MAX`, and `_SC_GETPW_R_SIZE_MAX`, without the  
 18764 enclosing braces.  
 18765

18766 For compatibility with earlier versions, the following variable names shall also  
 18767 be supported:

18768 `POSIX2_C_BIND`  
 18769 `POSIX2_C_DEV`  
 18770 `POSIX2_CHAR_TERM`  
 18771 `POSIX2_FORT_DEV`  
 18772 `POSIX2_FORT_RUN`  
 18773 `POSIX2_LOCALEDEF`  
 18774 `POSIX2_SW_DEV`  
 18775 `POSIX2_UPE`  
 18776 `POSIX2_VERSION`

18777 and shall be equivalent to the same name prefixed with an underscore. This  
 18778 requirement may be removed in a future version.

- The names of the symbolic constants used as the *name* argument of the *confstr()*  
 18779 function in the System Interfaces volume of IEEE Std 1003.1-2001, without the  
 18780 `_CS_` prefix.  
 18781

- The names of the symbolic constants listed under the headings “Maximum  
 18782 Values” and “Minimum Values” in the description of the **<limits.h>** header in  
 18783

|       |                              |                                                                                                          |  |
|-------|------------------------------|----------------------------------------------------------------------------------------------------------|--|
| 18784 |                              | the Base Definitions volume of IEEE Std 1003.1-2001, without the enclosing                               |  |

| 18796 |                              | and shall be equivalent to the same name prefixed with an underscore. This                               |  |
| 18797 |                              | requirement may be removed in a future version.                                                          |  |
| 18798 |                              | The implementation may add other local values.                                                           |  |
| 18799 | <b>STDIN</b>                 |                                                                                                          |  |
| 18800 |                              | Not used.                                                                                                |  |
| 18801 | <b>INPUT FILES</b>           |                                                                                                          |  |
| 18802 |                              | None.                                                                                                    |  |
| 18803 | <b>ENVIRONMENT VARIABLES</b> |                                                                                                          |  |
| 18804 |                              | The following environment variables shall affect the execution of <i>getconf</i> :                       |  |
| 18805 | <i>LANG</i>                  | Provide a default value for the internationalization variables that are unset or null.                   |  |
| 18806 |                              | (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,                                   |  |
| 18807 |                              | Internationalization Variables for the precedence of internationalization variables                      |  |
| 18808 |                              | used to determine the values of locale categories.)                                                      |  |
| 18809 | <i>LC_ALL</i>                | If set to a non-empty string value, override the values of all the other                                 |  |
| 18810 |                              | internationalization variables.                                                                          |  |
| 18811 | <i>LC_CTYPE</i>              | Determine the locale for the interpretation of sequences of bytes of text data as                        |  |
| 18812 |                              | characters (for example, single-byte as opposed to multi-byte characters in                              |  |
| 18813 |                              | arguments).                                                                                              |  |
| 18814 | <i>LC_MESSAGES</i>           |                                                                                                          |  |
| 18815 |                              | Determine the locale that should be used to affect the format and contents of                            |  |
| 18816 |                              | diagnostic messages written to standard error.                                                           |  |
| 18817 | XSI <i>NLSPATH</i>           | Determine the location of message catalogs for the processing of <i>LC_MESSAGES</i> .                    |  |
| 18818 | <b>ASYNCHRONOUS EVENTS</b>   |                                                                                                          |  |
| 18819 |                              | Default.                                                                                                 |  |
| 18820 | <b>STDOUT</b>                |                                                                                                          |  |
| 18821 |                              | If the specified variable is defined on the system and its value is described to be available from       |  |
| 18822 |                              | the <i>confstr()</i> function defined in the System Interfaces volume of IEEE Std 1003.1-2001, its value |  |
| 18823 |                              | shall be written in the following format:                                                                |  |
| 18824 |                              | "%s\n", <value>                                                                                          |  |
| 18825 |                              | Otherwise, if the specified variable is defined on the system, its value shall be written in the         |  |
| 18826 |                              | following format:                                                                                        |  |

```

18827 "%d\n", <value>
18828 If the specified variable is valid, but is undefined on the system, getconf shall write using the
18829 following format:
18830 "undefined\n"
18831 If the variable name is invalid or an error occurs, nothing shall be written to standard output.
18832 STDERR
18833 The standard error shall be used only for diagnostic messages.
18834 OUTPUT FILES
18835 None.
18836 EXTENDED DESCRIPTION
18837 None.
18838 EXIT STATUS
18839 The following exit values shall be returned:
18840 0 The specified variable is valid and information about its current state was written
18841 successfully.
18842 >0 An error occurred.
18843 CONSEQUENCES OF ERRORS
18844 Default.
18845 APPLICATION USAGE
18846 None.
18847 EXAMPLES
18848 The following example illustrates the value of {NGROUPS_MAX}:
18849 getconf NGROUPS_MAX
18850 The following example illustrates the value of {NAME_MAX} for a specific directory:
18851 getconf NAME_MAX /usr
18852 The following example shows how to deal more carefully with results that might be unspecified:
18853 if value=$(getconf PATH_MAX /usr); then
18854 if ["$value" = "undefined"]; then
18855 echo PATH_MAX in /usr is infinite.
18856 else
18857 echo PATH_MAX in /usr is $value.
18858 fi
18859 else
18860 echo Error in getconf.
18861 fi
18862 Note that:
18863 sysconf(_SC_POSIX_C_BIND) ;
18864 and:
18865 system("getconf POSIX2_C_BIND") ;
18866 in a C program could give different answers. The sysconf() call supplies a value that corresponds
18867 to the conditions when the program was either compiled or executed, depending on the

```

18868 implementation; the *system()* call to *getconf* always supplies a value corresponding to conditions  
 18869 when the program is executed.

#### 18870 RATIONALE

18871 The original need for this utility, and for the *confstr()* function, was to provide a way of finding  
 18872 the configuration-defined default value for the *PATH* environment variable. Since *PATH* can be  
 18873 modified by the user to include directories that could contain utilities replacing the standard  
 18874 utilities, shell scripts need a way to determine the system-supplied *PATH* environment variable  
 18875 value that contains the correct search path for the standard utilities. It was later suggested that  
 18876 access to the other variables described in this volume of IEEE Std 1003.1-2001 could also be  
 18877 useful to applications.

18878 This functionality of *getconf* would not be adequately subsumed by another command such as:

18879 `grep var /etc/conf`

18880 because such a strategy would provide correct values for neither those variables that can vary at  
 18881 runtime, nor those that can vary depending on the path.

18882 Early proposal versions of *getconf* specified exit status 1 when the specified variable was valid,  
 18883 but not defined on the system. The output string "undefined" is now used to specify this case  
 18884 with exit code 0 because so many things depend on an exit code of zero when an invoked utility  
 18885 is successful.

#### 18886 FUTURE DIRECTIONS

18887 None.

#### 18891 CHANGE HISTORY

18892 First released in Issue 4.

#### 18893 Issue 5

18894 In the OPERANDS section:

- 18895 • {NL\_MAX} is changed to {NL\_NMAX}.
- 18896 • Entries beginning NL\_ are deleted from the list of standard configuration variables.
- 18897 • The list of variables previously marked UX is merged with the list marked EX.
- 18898 • Operands are added to support new Option Groups.
- 18899 • Operands are added so that *getconf* can determine supported programming environments.

#### 18900 Issue 6

18901 The Open Group Corrigendum U029/4 is applied, correcting the example command in the last  
 18902 paragraph of the OPTIONS section.

18903 The following new requirements on POSIX implementations derive from alignment with the  
 18904 Single UNIX Specification:

- 18905 • Operands are added to determine supported programming environments.

18906 This reference page is updated for alignment with the ISO/IEC 9899:1999 standard. Specifically,  
 18907 new macros for *c99* programming environments are introduced.

18908 XSI marked *system\_var* (XBS5\_\*) values are marked LEGACY.

18911 **NAME**

18912       getopts — parse utility options

18913 **SYNOPSIS**18914       getopts *optstring name* [*arg...*]18915 **DESCRIPTION**

18916       The *getopts* utility shall retrieve options and option-arguments from a list of parameters. It shall  
 18917       support the Utility Syntax Guidelines 3 to 10, inclusive, described in the Base Definitions volume  
 18918       of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines.

18919       Each time it is invoked, the *getopts* utility shall place the value of the next option in the shell  
 18920       variable specified by the *name* operand and the index of the next argument to be processed in the  
 18921       shell variable *OPTIND*. Whenever the shell is invoked, *OPTIND* shall be initialized to 1.

18922       When the option requires an option-argument, the *getopts* utility shall place it in the shell  
 18923       variable *OPTARG*. If no option was found, or if the option that was found does not have an  
 18924       option-argument, *OPTARG* shall be unset.

18925       If an option character not contained in the *optstring* operand is found where an option character  
 18926       is expected, the shell variable specified by *name* shall be set to the question-mark ('?') character.  
 18927       In this case, if the first character in *optstring* is a colon (':'), the shell variable *OPTARG* shall be  
 18928       set to the option character found, but no output shall be written to standard error; otherwise, the  
 18929       shell variable *OPTARG* shall be unset and a diagnostic message shall be written to standard  
 18930       error. This condition shall be considered to be an error detected in the way arguments were  
 18931       presented to the invoking application, but shall not be an error in *getopts* processing.

18932       If an option-argument is missing:

- 18933       • If the first character of *optstring* is a colon, the shell variable specified by *name* shall be set to  
 18934       the colon character and the shell variable *OPTARG* shall be set to the option character found.
- 18935       • Otherwise, the shell variable specified by *name* shall be set to the question-mark character,  
 18936       the shell variable *OPTARG* shall be unset, and a diagnostic message shall be written to  
 18937       standard error. This condition shall be considered to be an error detected in the way  
 18938       arguments were presented to the invoking application, but shall not be an error in *getopts*  
 18939       processing; a diagnostic message shall be written as stated, but the exit status shall be zero.

18940       When the end of options is encountered, the *getopts* utility shall exit with a return value greater  
 18941       than zero; the shell variable *OPTIND* shall be set to the index of the first non-option-argument,  
 18942       where the first "--" argument is considered to be an option-argument if there are no other  
 18943       non-option-arguments appearing before it, or the value "\$#+1" if there are no non-option-  
 18944       arguments; the *name* variable shall be set to the question-mark character. Any of the following  
 18945       shall identify the end of options: the special option "--", finding an argument that does not  
 18946       begin with a '-', or encountering an error.

18947       The shell variables *OPTIND* and *OPTARG* shall be local to the caller of *getopts* and shall not be  
 18948       exported by default.

18949       The shell variable specified by the *name* operand, *OPTIND*, and *OPTARG* shall affect the current  
 18950       shell execution environment; see Section 2.12 (on page 61).

18951       If the application sets *OPTIND* to the value 1, a new set of parameters can be used: either the  
 18952       current positional parameters or new *arg* values. Any other attempt to invoke *getopts* multiple  
 18953       times in a single shell execution environment with parameters (positional parameters or *arg*  
 18954       operands) that are not the same in all invocations, or with an *OPTIND* value modified to be a  
 18955       value other than 1, produces unspecified results.

18956 **OPTIONS**

18957       None.

18958 **OPERANDS**

18959       The following operands shall be supported:

18960       *optstring*     A string containing the option characters recognized by the utility invoking *getopts*.  
 18961                       If a character is followed by a colon, the option shall be expected to have an  
 18962                       argument, which should be supplied as a separate argument. Applications should  
 18963                       specify an option character and its option-argument as separate arguments, but  
 18964                       *getopts* shall interpret the characters following an option character requiring  
 18965                       arguments as an argument whether or not this is done. An explicit null option-  
 18966                       argument need not be recognized if it is not supplied as a separate argument when  
 18967                       *getopts* is invoked. (See also the *getopt()* function defined in the System Interfaces  
 18968                       volume of IEEE Std 1003.1-2001.) The characters question-mark and colon shall not  
 18969                       be used as option characters by an application. The use of other option characters  
 18970                       that are not alphanumeric produces unspecified results. If the option-argument is  
 18971                       not supplied as a separate argument from the option character, the value in  
 18972                       *OPTARG* shall be stripped of the option character and the *'-'*. The first character  
 18973                       in *optstring* determines how *getopts* behaves if an option character is not known or  
 18974                       an option-argument is missing.

18975       *name*         The name of a shell variable that shall be set by the *getopts* utility to the option  
 18976                       character that was found.

18977       The *getopts* utility by default shall parse positional parameters passed to the invoking shell  
 18978       procedure. If *args* are given, they shall be parsed instead of the positional parameters.

18979 **STDIN**

18980       Not used.

18981 **INPUT FILES**

18982       None.

18983 **ENVIRONMENT VARIABLES**18984       The following environment variables shall affect the execution of *getopts*:

18985       *LANG*         Provide a default value for the internationalization variables that are unset or null.  
 18986                       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 18987                       Internationalization Variables for the precedence of internationalization variables  
 18988                       used to determine the values of locale categories.)

18989       *LC\_ALL*       If set to a non-empty string value, override the values of all the other  
 18990                       internationalization variables.

18991       *LC\_CTYPE*     Determine the locale for the interpretation of sequences of bytes of text data as  
 18992                       characters (for example, single-byte as opposed to multi-byte characters in  
 18993                       arguments and input files).

18994       *LC\_MESSAGES*

18995                       Determine the locale that should be used to affect the format and contents of  
 18996                       diagnostic messages written to standard error.

18997 XSI     *NLSPATH*     Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

18998       *OPTIND*       This variable shall be used by the *getopts* utility as the index of the next argument  
 18999                       to be processed.

19000 **ASYNCHRONOUS EVENTS**

19001 Default.

19002 **STDOUT**

19003 Not used.

19004 **STDERR**

19005 Whenever an error is detected and the first character in the *optstring* operand is not a colon  
 19006 (' : '), a diagnostic message shall be written to standard error with the following information in  
 19007 an unspecified format:

19008 • The invoking program name shall be identified in the message. The invoking program name  
 19009 shall be the value of the shell special parameter 0 (see Section 2.5.2 (on page 34)) at the time  
 19010 the *getopts* utility is invoked. A name equivalent to:

19011 `basename "$0"`

19012 may be used.

19013 • If an option is found that was not specified in *optstring*, this error is identified and the invalid  
 19014 option character shall be identified in the message.

19015 • If an option requiring an option-argument is found, but an option-argument is not found,  
 19016 this error shall be identified and the invalid option character shall be identified in the  
 19017 message.

19018 **OUTPUT FILES**

19019 None.

19020 **EXTENDED DESCRIPTION**

19021 None.

19022 **EXIT STATUS**

19023 The following exit values shall be returned:

19024 `0` An option, specified or unspecified by *optstring*, was found.19025 `>0` The end of options was encountered or an error occurred.19026 **CONSEQUENCES OF ERRORS**

19027 Default.

19028 **APPLICATION USAGE**

19029 Since *getopts* affects the current shell execution environment, it is generally provided as a shell  
 19030 regular built-in. If it is called in a subshell or separate utility execution environment, such as one  
 19031 of the following:

19032 `(getopts abc value "$@")`19033 `nohup getopts ...`19034 `find . -exec getopts ... \;`

19035 it does not affect the shell variables in the caller's environment.

19036 Note that shell functions share *OPTIND* with the calling shell even though the positional  
 19037 parameters are changed. If the calling shell and any of its functions uses *getopts* to parse  
 19038 arguments, the results are unspecified.

19039 **EXAMPLES**

19040 The following example script parses and displays its arguments:

19041 `aflag=`19042 `bflag=`

```

19043 while getopts ab: name
19044 do
19045 case $name in
19046 a) aflag=1;;
19047 b) bflag=1
19048 bval="$OPTARG";;
19049 ?) printf "Usage: %s: [-a] [-b value] args\n" $0
19050 exit 2;;
19051 esac
19052 done
19053 if [! -z "$aflag"]; then
19054 printf "Option -a specified\n"
19055 fi
19056 if [! -z "$bflag"]; then
19057 printf 'Option -b "%s" specified\n' "$bval"
19058 fi
19059 shift $(($OPTIND - 1))
19060 printf "Remaining arguments are: %s\n" "$*"

```

#### 19061 RATIONALE

19062 The *getopts* utility was chosen in preference to the System V *getopt* utility because *getopts* handles  
 19063 option-arguments containing <blank>s.

19064 The *OPTARG* variable is not mentioned in the ENVIRONMENT VARIABLES section because it  
 19065 does not affect the execution of *getopts*; it is one of the few “output-only” variables used by the  
 19066 standard utilities.

19067 The colon is not allowed as an option character because that is not historical behavior, and it  
 19068 violates the Utility Syntax Guidelines. The colon is now specified to behave as in the KornShell  
 19069 version of the *getopts* utility; when used as the first character in the *optstring* operand, it disables  
 19070 diagnostics concerning missing option-arguments and unexpected option characters. This  
 19071 replaces the use of the *OPTERR* variable that was specified in an early proposal.

19072 The formats of the diagnostic messages produced by the *getopts* utility and the *getopt()* function  
 19073 are not fully specified because implementations with superior (“friendlier”) formats objected to  
 19074 the formats used by some historical implementations. The standard developers considered it  
 19075 important that the information in the messages used be uniform between *getopts* and *getopt()*.  
 19076 Exact duplication of the messages might not be possible, particularly if a utility is built on  
 19077 another system that has a different *getopt()* function, but the messages must have specific  
 19078 information included so that the program name, invalid option character, and type of error can  
 19079 be distinguished by a user.

19080 Only a rare application program intercepts a *getopts* standard error message and wants to parse  
 19081 it. Therefore, implementations are free to choose the most usable messages they can devise. The  
 19082 following formats are used by many historical implementations:

```

19083 "%s: illegal option -- %c\n", <program name>, <option character>
19084 "%s: option requires an argument -- %c\n", <program name>, \
19085 <option character>

```

19086 Historical shells with built-in versions of *getopt()* or *getopts* have used different formats,  
 19087 frequently not even indicating the option character found in error.

19088 **FUTURE DIRECTIONS**

19089           None.

19090 **SEE ALSO**19091           Section 2.5.2 (on page 34), the System Interfaces volume of IEEE Std 1003.1-2001, *getopt()*19092 **CHANGE HISTORY**

19093           First released in Issue 4.

19094 **Issue 6**

19095           The normative text is reworded to avoid use of the term “must” for application requirements.

19096 **NAME**19097 `grep` — search a file for a pattern19098 **SYNOPSIS**19099 `grep [-E | -F] [-c | -l | -q] [-insvx] -e pattern_list...`  
19100 `[-f pattern_file] ... [file...]`19101 `grep [-E | -F] [-c | -l | -q] [-insvx] [-e pattern_list]...`  
19102 `-f pattern_file ... [file...]`19103 `grep [-E | -F] [-c | -l | -q] [-insvx] pattern_list [file...]`19104 **DESCRIPTION**

19105 The *grep* utility shall search the input files, selecting lines matching one or more patterns; the  
 19106 types of patterns are controlled by the options specified. The patterns are specified by the **-e**  
 19107 option, **-f** option, or the *pattern\_list* operand. The *pattern\_list*'s value shall consist of one or more  
 19108 patterns separated by <newline>s; the *pattern\_file*'s contents shall consist of one or more  
 19109 patterns terminated by <newline>. By default, an input line shall be selected if any pattern,  
 19110 treated as an entire basic regular expression (BRE) as described in the Base Definitions volume of  
 19111 IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions, matches any part of the line  
 19112 excluding the terminating <newline>; a null BRE shall match every line. By default, each selected  
 19113 input line shall be written to the standard output.

19114 Regular expression matching shall be based on text lines. Since a <newline> separates or  
 19115 terminates patterns (see the **-e** and **-f** options below), regular expressions cannot contain a  
 19116 <newline>. Similarly, since patterns are matched against individual lines (excluding the  
 19117 terminating <newline>s) of the input, there is no way for a pattern to match a <newline> found  
 19118 in the input.

19119 **OPTIONS**

19120 The *grep* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 19121 12.2, Utility Syntax Guidelines.

19122 The following options shall be supported:

19123 **-E** Match using extended regular expressions. Treat each pattern specified as an ERE,  
 19124 as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.4,  
 19125 Extended Regular Expressions. If any entire ERE pattern matches some part of an  
 19126 input line excluding the terminating <newline>, the line shall be matched. A null  
 19127 ERE shall match every line.

19128 **-F** Match using fixed strings. Treat each pattern specified as a string instead of a  
 19129 regular expression. If an input line contains any of the patterns as a contiguous  
 19130 sequence of bytes, the line shall be matched. A null string shall match every line.

19131 **-c** Write only a count of selected lines to standard output.

19132 **-e *pattern\_list***

19133 Specify one or more patterns to be used during the search for input. The  
 19134 application shall ensure that patterns in *pattern\_list* are separated by a <newline>.  
 19135 A null pattern can be specified by two adjacent <newline>s in *pattern\_list*. Unless  
 19136 the **-E** or **-F** option is also specified, each pattern shall be treated as a BRE, as  
 19137 described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic  
 19138 Regular Expressions. Multiple **-e** and **-f** options shall be accepted by the *grep*  
 19139 utility. All of the specified patterns shall be used when matching lines, but the  
 19140 order of evaluation is unspecified.

19141       **-f** *pattern\_file*  
 19142           Read one or more patterns from the file named by the pathname *pattern\_file*.  
 19143           Patterns in *pattern\_file* shall be terminated by a <newline>. A null pattern can be  
 19144           specified by an empty line in *pattern\_file*. Unless the **-E** or **-F** option is also  
 19145           specified, each pattern shall be treated as a BRE, as described in the Base  
 19146           Definitions volume of IEEE Std 1003.1-2001, Section 9.3, Basic Regular Expressions.

19147       **-i**           Perform pattern matching in searches without regard to case; see the Base  
 19148           Definitions volume of IEEE Std 1003.1-2001, Section 9.2, Regular Expression  
 19149           General Requirements.

19150       **-l**           (The letter ell.) Write only the names of files containing selected lines to standard  
 19151           output. Pathnames shall be written once per file searched. If the standard input is  
 19152           searched, a pathname of "(standard input)" shall be written, in the POSIX  
 19153           locale. In other locales, "standard input" may be replaced by something more  
 19154           appropriate in those locales.

19155       **-n**           Precede each output line by its relative line number in the file, each file starting at  
 19156           line 1. The line number counter shall be reset for each file processed.

19157       **-q**           Quiet. Nothing shall be written to the standard output, regardless of matching  
 19158           lines. Exit with zero status if an input line is selected.

19159       **-s**           Suppress the error messages ordinarily written for nonexistent or unreadable files.  
 19160           Other error messages shall not be suppressed.

19161       **-v**           Select lines not matching any of the specified patterns. If the **-v** option is not  
 19162           specified, selected lines shall be those that match any of the specified patterns.

19163       **-x**           Consider only input lines that use all characters in the line excluding the  
 19164           terminating <newline> to match an entire fixed string or regular expression to be  
 19165           matching lines.

## 19166 OPERANDS

19167       The following operands shall be supported:

19168       *pattern\_list*   Specify one or more patterns to be used during the search for input. This operand  
 19169           shall be treated as if it were specified as **-e** *pattern\_list*.

19170       *file*           A pathname of a file to be searched for the patterns. If no *file* operands are  
 19171           specified, the standard input shall be used.

## 19172 STDIN

19173       The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
 19174       section.

## 19175 INPUT FILES

19176       The input files shall be text files.

## 19177 ENVIRONMENT VARIABLES

19178       The following environment variables shall affect the execution of *grep*:

19179       *LANG*           Provide a default value for the internationalization variables that are unset or null.  
 19180           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 19181           Internationalization Variables for the precedence of internationalization variables  
 19182           used to determine the values of locale categories.)

19183       *LC\_ALL*          If set to a non-empty string value, override the values of all the other  
 19184           internationalization variables.

19185 **LC\_COLLATE**  
 19186 Determine the locale for the behavior of ranges, equivalence classes, and multi-  
 19187 character collating elements within regular expressions.

19188 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
 19189 characters (for example, single-byte as opposed to multi-byte characters in  
 19190 arguments and input files) and the behavior of character classes within regular  
 19191 expressions.

19192 **LC\_MESSAGES**  
 19193 Determine the locale that should be used to affect the format and contents of  
 19194 diagnostic messages written to standard error.

19195 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

19196 **ASYNCHRONOUS EVENTS**  
 19197 Default.

19198 **STDOUT**  
 19199 If the **-l** option is in effect, and the **-q** option is not, the following shall be written for each file  
 19200 containing at least one selected input line:  
 19201 "%s\n", <file>  
 19202 Otherwise, if more than one *file* argument appears, and **-q** is not specified, the *grep* utility shall  
 19203 prefix each output line by:  
 19204 "%s: ", <file>  
 19205 The remainder of each output line shall depend on the other options specified:  
 19206 • If the **-c** option is in effect, the remainder of each output line shall contain:  
 19207 "%d\n", <count>  
 19208 • Otherwise, if **-c** is not in effect and the **-n** option is in effect, the following shall be written to  
 19209 standard output:  
 19210 "%d: ", <line number>  
 19211 • Finally, the following shall be written to standard output:  
 19212 "%s", <selected-line contents>

19213 **STDERR**  
 19214 The standard error shall be used only for diagnostic messages.

19215 **OUTPUT FILES**  
 19216 None.

19217 **EXTENDED DESCRIPTION**  
 19218 None.

19219 **EXIT STATUS**  
 19220 The following exit values shall be returned:  
 19221 0 One or more lines were selected.  
 19222 1 No lines were selected.  
 19223 >1 An error occurred.

19224 **CONSEQUENCES OF ERRORS**

19225 If the **-q** option is specified, the exit status shall be zero if an input line is selected, even if an  
 19226 error was detected. Otherwise, default actions shall be performed.

19227 **APPLICATION USAGE**

19228 Care should be taken when using characters in *pattern\_list* that may also be meaningful to the  
 19229 command interpreter. It is safest to enclose the entire *pattern\_list* argument in single quotes:

19230 '...'

19231 The **-e** *pattern\_list* option has the same effect as the *pattern\_list* operand, but is useful when  
 19232 *pattern\_list* begins with the hyphen delimiter. It is also useful when it is more convenient to  
 19233 provide multiple patterns as separate arguments.

19234 Multiple **-e** and **-f** options are accepted and *grep* uses all of the patterns it is given while  
 19235 matching input text lines. (Note that the order of evaluation is not specified. If an  
 19236 implementation finds a null string as a pattern, it is allowed to use that pattern first, matching  
 19237 every line, and effectively ignore any other patterns.)

19238 The **-q** option provides a means of easily determining whether or not a pattern (or string) exists  
 19239 in a group of files. When searching several files, it provides a performance improvement  
 19240 (because it can quit as soon as it finds the first match) and requires less care by the user in  
 19241 choosing the set of files to supply as arguments (because it exits zero if it finds a match even if  
 19242 *grep* detected an access or read error on earlier *file* operands).

19243 **EXAMPLES**

19244 1. To find all uses of the word "Posix" (in any case) in file **text.mm** and write with line  
 19245 numbers:

19246 `grep -i -n posix text.mm`

19247 2. To find all empty lines in the standard input:

19248 `grep ^$`

19249 or:

19250 `grep -v .`

19251 3. Both of the following commands print all lines containing strings "abc" or "def" or both:

19252 `grep -E 'abc|def'`

19253 `grep -F 'abc`

19254 `def'`

19255 4. Both of the following commands print all lines matching exactly "abc" or "def":

19256 `grep -E '^abc$|^def$'`

19257 `grep -F -x 'abc`

19258 `def'`

19259 **RATIONALE**

19260 This *grep* has been enhanced in an upwards-compatible way to provide the exact functionality of  
 19261 the historical *egrep* and *fgrep* commands as well. It was the clear intention of the standard  
 19262 developers to consolidate the three *greps* into a single command.

19263 The old *egrep* and *fgrep* commands are likely to be supported for many years to come as  
 19264 implementation extensions, allowing historical applications to operate unmodified.

- 19265 Historical implementations usually silently ignored all but one of multiply-specified **-e** and **-f**  
19266 options, but were not consistent as to which specification was actually used.
- 19267 The **-b** option was omitted from the OPTIONS section because block numbers are  
19268 implementation-defined.
- 19269 The System V restriction on using **-** to mean standard input was omitted.
- 19270 A definition of action taken when given a null BRE or ERE is specified. This is an error condition  
19271 in some historical implementations.
- 19272 The **-I** option previously indicated that its use was undefined when no files were explicitly  
19273 named. This behavior was historical and placed an unnecessary restriction on future  
19274 implementations. It has been removed.
- 19275 The historical BSD *grep* **-s** option practice is easily duplicated by redirecting standard output to  
19276 **/dev/null**. The **-s** option required here is from System V.
- 19277 The **-x** option, historically available only with *fgrep*, is available here for all of the non-  
19278 obsolescent versions.
- 19279 **FUTURE DIRECTIONS**
- 19280 None.
- 19281 **SEE ALSO**
- 19282 *sed*
- 19283 **CHANGE HISTORY**
- 19284 First released in Issue 2.
- 19285 **Issue 6**
- 19286 The Open Group Corrigendum U029/5 is applied, correcting the SYNOPSIS.
- 19287 The normative text is reworded to avoid use of the term “must” for application requirements.
- 19288 IEEE Std 1003.1-2001/Cor 1-2002, item XCU/TC1/D6/28 is applied, correcting the examples |  
19289 using the *grep* **-F** option which did not match the normative description of the **-F** option. |

19290 **NAME**

19291 hash — remember or report utility locations

19292 **SYNOPSIS**19293 xSI hash [*utility...*]

19294 hash -r

19295

19296 **DESCRIPTION**

19297 The *hash* utility shall affect the way the current shell environment remembers the locations of  
 19298 utilities found as described in Section 2.9.1.1 (on page 48). Depending on the arguments  
 19299 specified, it shall add utility locations to its list of remembered locations or it shall purge the  
 19300 contents of the list. When no arguments are specified, it shall report on the contents of the list.

19301 Utilities provided as built-ins to the shell shall not be reported by *hash*.

19302 **OPTIONS**

19303 The *hash* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 19304 12.2, Utility Syntax Guidelines.

19305 The following option shall be supported:

19306 -r Forget all previously remembered utility locations.

19307 **OPERANDS**

19308 The following operand shall be supported:

19309 *utility* The name of a utility to be searched for and added to the list of remembered  
 19310 locations. If *utility* contains one or more slashes, the results are unspecified.

19311 **STDIN**

19312 Not used.

19313 **INPUT FILES**

19314 None.

19315 **ENVIRONMENT VARIABLES**

19316 The following environment variables shall affect the execution of *hash*:

19317 *LANG* Provide a default value for the internationalization variables that are unset or null.  
 19318 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 19319 Internationalization Variables for the precedence of internationalization variables  
 19320 used to determine the values of locale categories.)

19321 *LC\_ALL* If set to a non-empty string value, override the values of all the other  
 19322 internationalization variables.

19323 *LC\_CTYPE* Determine the locale for the interpretation of sequences of bytes of text data as  
 19324 characters (for example, single-byte as opposed to multi-byte characters in  
 19325 arguments).

19326 *LC\_MESSAGES*

19327 Determine the locale that should be used to affect the format and contents of  
 19328 diagnostic messages written to standard error.

19329 *NLSPATH* Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

19330 *PATH* Determine the location of *utility*, as described in the Base Definitions volume of  
 19331 IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

**19332 ASYNCHRONOUS EVENTS**

19333 Default.

**19334 STDOUT**

19335 The standard output of *hash* shall be used when no arguments are specified. Its format is  
19336 unspecified, but includes the pathname of each utility in the list of remembered locations for the  
19337 current shell environment. This list shall consist of those utilities named in previous *hash*  
19338 invocations that have been invoked, and may contain those invoked and found through the  
19339 normal command search process.

**19340 STDERR**

19341 The standard error shall be used only for diagnostic messages.

**19342 OUTPUT FILES**

19343 None.

**19344 EXTENDED DESCRIPTION**

19345 None.

**19346 EXIT STATUS**

19347 The following exit values shall be returned:

19348 0 Successful completion.

19349 >0 An error occurred.

**19350 CONSEQUENCES OF ERRORS**

19351 Default.

**19352 APPLICATION USAGE**

19353 Since *hash* affects the current shell execution environment, it is always provided as a shell  
19354 regular built-in. If it is called in a separate utility execution environment, such as one of the  
19355 following:

19356 `nohup hash -r`  
19357 `find . -type f | xargs hash`

19358 it does not affect the command search process of the caller's environment.

19359 The *hash* utility may be implemented as an alias—for example, *alias -t -*, in which case utilities  
19360 found through normal command search are not listed by the *hash* command.

19361 The effects of *hash -r* can also be achieved portably by resetting the value of *PATH*; in the  
19362 simplest form, this can be:

19363 `PATH="$PATH"`

19364 The use of *hash* with *utility* names is unnecessary for most applications, but may provide a  
19365 performance improvement on a few implementations; normally, the hashing process is included  
19366 by default.

**19367 EXAMPLES**

19368 None.

**19369 RATIONALE**

19370 None.

**19371 FUTURE DIRECTIONS**

19372 None.

19373 **SEE ALSO**

19374           Section 2.9.1.1 (on page 48)

19375 **CHANGE HISTORY**

19376           First released in Issue 2.

19377 **NAME**

19378           head — copy the first part of files

19379 **SYNOPSIS**19380           head [-n *number*] [*file...*]19381 **DESCRIPTION**19382           The *head* utility shall copy its input files to the standard output, ending the output for each file at  
19383           a designated point.19384           Copying shall end at the point in each input file indicated by the **-n *number*** option. The option-  
19385           argument *number* shall be counted in units of lines.19386 **OPTIONS**19387           The *head* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
19388           12.2, Utility Syntax Guidelines.

19389           The following option shall be supported:

19390           **-n *number***   The first *number* lines of each input file shall be copied to standard output. The  
19391           application shall ensure that the *number* option-argument is a positive decimal  
19392           integer.19393           When a file contains less than *number* lines, it shall be copied to standard output in its entirety.  
19394           This shall not be an error.19395           If no options are specified, *head* shall act as if **-n 10** had been specified.19396 **OPERANDS**

19397           The following operand shall be supported:

19398           *file*           A pathname of an input file. If no *file* operands are specified, the standard input  
19399           shall be used.19400 **STDIN**19401           The standard input shall be used only if no *file* operands are specified. See the INPUT FILES  
19402           section.19403 **INPUT FILES**

19404           Input files shall be text files, but the line length is not restricted to {LINE\_MAX} bytes.

19405 **ENVIRONMENT VARIABLES**19406           The following environment variables shall affect the execution of *head*:19407           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
19408           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
19409           Internationalization Variables for the precedence of internationalization variables  
19410           used to determine the values of locale categories.)19411           **LC\_ALL**          If set to a non-empty string value, override the values of all the other  
19412           internationalization variables.19413           **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
19414           characters (for example, single-byte as opposed to multi-byte characters in  
19415           arguments and input files).19416           **LC\_MESSAGES**19417           Determine the locale that should be used to affect the format and contents of  
19418           diagnostic messages written to standard error.

19419 XSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 19420 ASYNCHRONOUS EVENTS

19421 Default.

## 19422 STDOUT

19423 The standard output shall contain designated portions of the input files.

19424 If multiple *file* operands are specified, *head* shall precede the output for each with the header:

19425 `"\n==> %s <==\n", <pathname>`

19426 except that the first header written shall not include the initial <newline>.

## 19427 STDERR

19428 The standard error shall be used only for diagnostic messages.

## 19429 OUTPUT FILES

19430 None.

## 19431 EXTENDED DESCRIPTION

19432 None.

## 19433 EXIT STATUS

19434 The following exit values shall be returned:

19435 0 Successful completion.

19436 >0 An error occurred.

## 19437 CONSEQUENCES OF ERRORS

19438 Default.

## 19439 APPLICATION USAGE

19440 The obsolescent *–number* form is withdrawn in this version. Applications should use the *–n*  
19441 *number* option.

## 19442 EXAMPLES

19443 To write the first ten lines of all files (except those with a leading period) in the directory:

19444 `head *`

## 19445 RATIONALE

19446 Although it is possible to simulate *head* with *sed* 10q for a single file, the standard developers  
19447 decided that the popularity of *head* on historical BSD systems warranted its inclusion alongside  
19448 *tail*.

19449 This standard version of *head* follows the Utility Syntax Guidelines. The *–n* option was added to  
19450 this new interface so that *head* and *tail* would be more logically related.

19451 There is no *–c* option (as there is in *tail*) because it is not historical practice and because other  
19452 utilities in this volume of IEEE Std 1003.1-2001 provide similar functionality.

## 19453 FUTURE DIRECTIONS

19454 None.

## 19455 SEE ALSO

19456 *sed*, *tail*

19457 **CHANGE HISTORY**

19458 First released in Issue 4.

19459 **Issue 6**

19460 The obsolescent **–number** form is withdrawn.

19461 The normative text is reworded to avoid use of the term “must” for application requirements.

19462 The DESCRIPTION is updated to clarify that when a file contains less than the number of lines  
19463 requested, the entire file is copied to standard output.

19464 **NAME**

19465 iconv — codeset conversion

19466 **SYNOPSIS**19467 iconv [-cs] -f *frommap* -t *tomap* [*file* ...] |19468 iconv -f *fromcode* [-cs] [-t *tocode* [*file* ...]] |19469 iconv -t *tocode* [-cs] [-f *fromcode*] [*file* ...] |

19470 iconv -l |

19471 **DESCRIPTION**

19472 The *iconv* utility shall convert the encoding of characters in *file* from one codeset to another and  
 19473 write the results to standard output.

19474 When the options indicate that charmap files are used to specify the codesets (see **OPTIONS**),  
 19475 the codeset conversion shall be accomplished by performing a logical join on the symbolic  
 19476 character names in the two charmaps. The implementation need not support the use of charmap  
 19477 files for codeset conversion unless the POSIX2\_LOCALEDEF symbol is defined on the system.

19478 **OPTIONS**

19479 The *iconv* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 19480 12.2, Utility Syntax Guidelines.

19481 The following options shall be supported:

19482 **-c** Omit any characters that are invalid in the codeset of the input file from the |  
 19483 output. When **-c** is not used, the results of encountering invalid characters in the |  
 19484 input stream (either those that are not characters in the codeset of the input file or |  
 19485 that have no corresponding character in the codeset of the output file) shall be |  
 19486 specified in the system documentation. The presence or absence of **-c** shall not |  
 19487 affect the exit status of *iconv*. |

19488 **-f** *fromcodeset* |  
 19489 Identify the codeset of the input file. The implementation shall recognize the |  
 19490 following two forms of the *fromcodeset* option-argument: |

19491 *fromcode* The *fromcode* option-argument must not contain a slash character. It |  
 19492 shall be interpreted as the name of one of the codeset descriptions |  
 19493 provided by the implementation in an unspecified format. Valid |  
 19494 values of *fromcode* are implementation-defined. |

19495 *frommap* The *frommap* option-argument must contain a slash character. It shall |  
 19496 be interpreted as the pathname of a charmap file as defined in the |  
 19497 Base Definitions volume of IEEE Std 1003.1-2001, Section 6.4,  
 19498 Character Set Description File. If the pathname does not represent a  
 19499 valid, readable charmap file, the results are undefined. |

19500 If this option is omitted, the codeset of the current locale shall be used. |

19501 **-l** Write all supported *fromcode* and *tocode* values to standard output in an unspecified  
 19502 format.

19503 **-s** Suppress any messages written to standard error concerning invalid characters.  
 19504 When **-s** is not used, the results of encountering invalid characters in the input  
 19505 stream (either those that are not valid characters in the codeset of the input file or  
 19506 that have no corresponding character in the codeset of the output file) shall be  
 19507 specified in the system documentation. The presence or absence of **-s** shall not  
 19508 affect the exit status of *iconv*. |

19509        **-t tocodeset**   Identify the codeset to be used for the output file. The implementation shall  
 19510                            recognize the following two forms of the *tocodeset* option-argument:  
 19511                            *tocode*        The semantics shall be equivalent to the **-f fromcode** option.  
 19512                            *tomap*         The semantics shall be equivalent to the *tomap* option.  
 19513                            If this option is omitted, the codeset of the current locale shall be used.  
 19514        If either **-f** or **-t** represents a charmap file, but the other does not (or is omitted), or both **-f** and  
 19515        **-t** are omitted, the results are undefined.

#### 19516 **OPERANDS**

19517        The following operand shall be supported:

19518        *file*            A pathname of an input file. If no *file* operands are specified, or if a *file* operand is  
 19519                            ' - ', the standard input shall be used.

#### 19520 **STDIN**

19521        The standard input shall be used only if no *file* operands are specified, or if a *file* operand is ' - '.

#### 19522 **INPUT FILES**

19523        The input file shall be a text file.

#### 19524 **ENVIRONMENT VARIABLES**

19525        The following environment variables shall affect the execution of *iconv*:

19526        **LANG**            Provide a default value for the internationalization variables that are unset or null.  
 19527                            (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 19528                            Internationalization Variables for the precedence of internationalization variables  
 19529                            used to determine the values of locale categories.)

19530        **LC\_ALL**         If set to a non-empty string value, override the values of all the other  
 19531                            internationalization variables.

19532        **LC\_CTYPE**       Determine the locale for the interpretation of sequences of bytes of text data as  
 19533                            characters (for example, single-byte as opposed to multi-byte characters in  
 19534                            arguments). During translation of the file, this variable is superseded by the use of  
 19535                            the *fromcode* option-argument.

19536        **LC\_MESSAGES**     Determine the locale that should be used to affect the format and contents of  
 19537                            diagnostic messages written to standard error.  
 19538

19539 **XSI**        **NLSPATH**     Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

#### 19540 **ASYNCHRONOUS EVENTS**

19541        Default.

#### 19542 **STDOUT**

19543        When the **-I** option is used, the standard output shall contain all supported *fromcode* and *tocode*  
 19544        values, written in an unspecified format.

19545        When the **-I** option is not used, the standard output shall contain the sequence of characters  
 19546        read from the input files, translated to the specified codeset. Nothing else shall be written to the  
 19547        standard output.

#### 19548 **STDERR**

19549        The standard error shall be used only for diagnostic messages.

19550 **OUTPUT FILES**

19551       None.

19552 **EXTENDED DESCRIPTION**

19553       None.

19554 **EXIT STATUS**

19555       The following exit values shall be returned:

19556       0   Successful completion.

19557       &gt;0   An error occurred.

19558 **CONSEQUENCES OF ERRORS**

19559       Default.

19560 **APPLICATION USAGE**

19561       The user must ensure that both charmap files use the same symbolic names for characters the  
 19562       two codesets have in common.

19563 **EXAMPLES**

19564       The following example converts the contents of file **mail.x400** from the ISO/IEC 6937:1994  
 19565       standard codeset to the ISO/IEC 8859-1:1998 standard codeset, and stores the results in file  
 19566       **mail.local**:

19567       iconv -f IS6937 -t IS8859 mail.x400 &gt; mail.local

19568 **RATIONALE**

19569       The *iconv* utility can be used portably only when the user provides two charmap files as option-  
 19570       arguments. This is because a single charmap provided by the user cannot reliably be joined with  
 19571       the names in a system-provided character set description. The valid values for *fromcode* and  
 19572       *toencode* are implementation-defined and do not have to have any relation to the charmap  
 19573       mechanisms. As an aid to interactive users, the **-l** option was adopted from the Plan 9 operating  
 19574       system. It writes information concerning these implementation-defined values. The format is  
 19575       unspecified because there are many possible useful formats that could be chosen, such as a  
 19576       matrix of valid combinations of *fromcode* and *toencode*. The **-l** option is not intended for shell script  
 19577       usage; conforming applications will have to use charmaps.

19578 **FUTURE DIRECTIONS**

19579       None.

19580 **SEE ALSO**19581       *gencat*19582 **CHANGE HISTORY**

19583       First released in Issue 3.

19584 **Issue 6**

19585       This utility has been rewritten to align with the IEEE P1003.2b draft standard. Specifically, the  
 19586       ability to use charmap files for conversion has been added.

19587       IEEE Std 1003.1-2001 / Cor 1-2002, item XCU/TC1/D6/29 is applied, making changes to address  
 19588       inconsistencies with the *iconv()* function in the System Interfaces volume of  
 19589       IEEE Std 1003.1-2001.

19590 **NAME**

19591           id — return user identity

19592 **SYNOPSIS**19593           id [*user*]19594           id -G[-n] [*user*]19595           id -g[-nr] [*user*]19596           id -u[-nr] [*user*]19597 **DESCRIPTION**

19598           If no *user* operand is provided, the *id* utility shall write the user and group IDs and the  
 19599           corresponding user and group names of the invoking process to standard output. If the effective  
 19600           and real IDs do not match, both shall be written. If multiple groups are supported by the  
 19601           underlying system (see the description of {NGROUPS\_MAX} in the System Interfaces volume of  
 19602           IEEE Std 1003.1-2001), the supplementary group affiliations of the invoking process shall also be  
 19603           written.

19604           If a *user* operand is provided and the process has the appropriate privileges, the user and group  
 19605           IDs of the selected user shall be written. In this case, effective IDs shall be assumed to be  
 19606           identical to real IDs. If the selected user has more than one allowable group membership listed  
 19607           in the group database, these shall be written in the same manner as the supplementary groups  
 19608           described in the preceding paragraph.

19609 **OPTIONS**

19610           The *id* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 19611           Utility Syntax Guidelines.

19612           The following options shall be supported:

19613           **-G**           Output all different group IDs (effective, real, and supplementary) only, using the  
 19614           format "%u\n". If there is more than one distinct group affiliation, output each  
 19615           such affiliation, using the format " %u", before the <newline> is output.

19616           **-g**           Output only the effective group ID, using the format "%u\n".

19617           **-n**           Output the name in the format "%s" instead of the numeric ID using the format  
 19618           "%u".

19619           **-r**           Output the real ID instead of the effective ID.

19620           **-u**           Output only the effective user ID, using the format "%u\n".

19621 **OPERANDS**

19622           The following operand shall be supported:

19623           *user*           The login name for which information is to be written.

19624 **STDIN**

19625           Not used.

19626 **INPUT FILES**

19627           None.

19628 **ENVIRONMENT VARIABLES**

19629           The following environment variables shall affect the execution of *id*:

19630           **LANG**           Provide a default value for the internationalization variables that are unset or null.  
 19631           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 19632           Internationalization Variables for the precedence of internationalization variables

19633                   used to determine the values of locale categories.)

19634       *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
19635                   internationalization variables.

19636       *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
19637                   characters (for example, single-byte as opposed to multi-byte characters in  
19638                   arguments).

19639       *LC\_MESSAGES*  
19640                   Determine the locale that should be used to affect the format and contents of  
19641                   diagnostic messages written to standard error and informative messages written to  
19642                   standard output.

19643 XSI       *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

19644 **ASYNCHRONOUS EVENTS**

19645       Default.

19646 **STDOUT**

19647       The following formats shall be used when the *LC\_MESSAGES* locale category specifies the  
19648       POSIX locale. In other locales, the strings *uid*, *gid*, *euid*, *egid*, and *groups* may be replaced with  
19649       more appropriate strings corresponding to the locale.

19650       "uid=%u(%s) gid=%u(%s)\n", <real user ID>, <user-name>,  
19651        <real group ID>, <group-name>

19652       If the effective and real user IDs do not match, the following shall be inserted immediately  
19653       before the '\n' character in the previous format:

19654       " euid=%u(%s) "

19655       with the following arguments added at the end of the argument list:

19656       <effective user ID>, <effective user-name>

19657       If the effective and real group IDs do not match, the following shall be inserted directly before  
19658       the '\n' character in the format string (and after any addition resulting from the effective and  
19659       real user IDs not matching):

19660       " egid=%u(%s) "

19661       with the following arguments added at the end of the argument list:

19662       <effective group-ID>, <effective group name>

19663       If the process has supplementary group affiliations or the selected user is allowed to belong to  
19664       multiple groups, the first shall be added directly before the <newline> in the format string:

19665       " groups=%u(%s) "

19666       with the following arguments added at the end of the argument list:

19667       <supplementary group ID>, <supplementary group name>

19668       and the necessary number of the following added after that for any remaining supplementary  
19669       group IDs:

19670       ", %u(%s) "

19671       and the necessary number of the following arguments added at the end of the argument list:

19672       <supplementary group ID>, <supplementary group name>

19673 If any of the user ID, group ID, effective user ID, effective group ID, or supplementary /multiple  
19674 group IDs cannot be mapped by the system into printable user or group names, the  
19675 corresponding " (%s) " and *name* argument shall be omitted from the corresponding format  
19676 string.

19677 When any of the options are specified, the output format shall be as described in the OPTIONS  
19678 section.

#### 19679 **STDERR**

19680 The standard error shall be used only for diagnostic messages.

#### 19681 **OUTPUT FILES**

19682 None.

#### 19683 **EXTENDED DESCRIPTION**

19684 None.

#### 19685 **EXIT STATUS**

19686 The following exit values shall be returned:

19687 0 Successful completion.

19688 >0 An error occurred.

#### 19689 **CONSEQUENCES OF ERRORS**

19690 Default.

#### 19691 **APPLICATION USAGE**

19692 Output produced by the **-G** option and by the default case could potentially produce very long  
19693 lines on systems that support large numbers of supplementary groups. (On systems with user  
19694 and group IDs that are 32-bit integers and with group names with a maximum of 8 bytes per  
19695 name, 93 supplementary groups plus distinct effective and real group and user IDs could  
19696 theoretically overflow the 2048-byte {LINE\_MAX} text file line limit on the default output case.  
19697 It would take about 186 supplementary groups to overflow the 2048-byte barrier using *id -G*).  
19698 This is not expected to be a problem in practice, but in cases where it is a concern, applications  
19699 should consider using *fold -s* before postprocessing the output of *id*.

#### 19700 **EXAMPLES**

19701 None.

#### 19702 **RATIONALE**

19703 The functionality provided by the 4 BSD *groups* utility can be simulated using:

19704 `id -Gn [ user ]`

19705 The 4 BSD command *groups* was considered, but it was not included because it did not provide  
19706 the functionality of the *id* utility of the SVID. Also, it was thought that it would be easier to  
19707 modify *id* to provide the additional functionality necessary to systems with multiple groups  
19708 than to invent another command.

19709 The options **-u**, **-g**, **-n**, and **-r** were added to ease the use of *id* with shell commands  
19710 substitution. Without these options it is necessary to use some preprocessor such as *sed* to select  
19711 the desired piece of information. Since output such as that produced by:

19712 `id -u -n`

19713 is frequently wanted, it seemed desirable to add the options.

19714 **FUTURE DIRECTIONS**

19715       None.

19716 **SEE ALSO**19717       *fold*, *logname*, *who*, the System Interfaces volume of IEEE Std 1003.1-2001, *getgid()*, *getgroups()*,  
19718       *getuid()*19719 **CHANGE HISTORY**

19720       First released in Issue 2.

19721 **NAME**

19722 ipcrm — remove an XSI message queue, semaphore set, or shared memory segment identifier

19723 **SYNOPSIS**

```
19724 xsi ipcrm [-q msgid | -Q msgkey | -s semid | -S semkey |
19725 -m shmid | -M shmkey] ...
19726
```

19727 **DESCRIPTION**

19728 The *ipcrm* utility shall remove zero or more message queues, semaphore sets, or shared memory  
 19729 segments. The interprocess communication facilities to be removed are specified by the options.

19730 Only a user with appropriate privilege shall be allowed to remove an interprocess  
 19731 communication facility that was not created by or owned by the user invoking *ipcrm*.

19732 **OPTIONS**

19733 The *ipcrm* facility supports the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 19734 Utility Syntax Guidelines.

19735 The following options shall be supported:

19736 **-q msgid** Remove the message queue identifier *msgid* from the system and destroy the  
 19737 message queue and data structure associated with it.

19738 **-m shmid** Remove the shared memory identifier *shmid* from the system. The shared memory  
 19739 segment and data structure associated with it shall be destroyed after the last  
 19740 detach.

19741 **-s semid** Remove the semaphore identifier *semid* from the system and destroy the set of  
 19742 semaphores and data structure associated with it.

19743 **-Q msgkey** Remove the message queue identifier, created with key *msgkey*, from the system  
 19744 and destroy the message queue and data structure associated with it.

19745 **-M shmkey** Remove the shared memory identifier, created with key *shmkey*, from the system.  
 19746 The shared memory segment and data structure associated with it shall be  
 19747 destroyed after the last detach.

19748 **-S semkey** Remove the semaphore identifier, created with key *semkey*, from the system and  
 19749 destroy the set of semaphores and data structure associated with it.

19750 **OPERANDS**

19751 None.

19752 **STDIN**

19753 Not used.

19754 **INPUT FILES**

19755 None.

19756 **ENVIRONMENT VARIABLES**

19757 The following environment variables shall affect the execution of *ipcrm*:

19758 **LANG** Provide a default value for the internationalization variables that are unset or null.  
 19759 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
 19760 Internationalization Variables for the precedence of internationalization variables  
 19761 used to determine the values of locale categories.)

19762 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
 19763 internationalization variables.

19764        *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
 19765                           characters (for example, single-byte as opposed to multi-byte characters in  
 19766                           arguments).

19767        *LC\_MESSAGES*  
 19768                           Determine the locale that should be used to affect the format and contents of  
 19769                           diagnostic messages written to standard error.

19770        *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

19771 **ASYNCHRONOUS EVENTS**  
 19772        Default.

19773 **STDOUT**  
 19774        Not used.

19775 **STDERR**  
 19776        The standard error shall be used only for diagnostic messages.

19777 **OUTPUT FILES**  
 19778        None.

19779 **EXTENDED DESCRIPTION**  
 19780        None.

19781 **EXIT STATUS**  
 19782        The following exit values shall be returned:  
 19783        0   Successful completion.  
 19784        >0   An error occurred.

19785 **CONSEQUENCES OF ERRORS**  
 19786        Default.

19787 **APPLICATION USAGE**  
 19788        None.

19789 **EXAMPLES**  
 19790        None.

19791 **RATIONALE**  
 19792        None.

19793 **FUTURE DIRECTIONS**  
 19794        None.

19795 **SEE ALSO**  
 19796        *ipcs*, the System Interfaces volume of IEEE Std 1003.1-2001, *msgctl()*, *semctl()*, *shmctl()*

19797 **CHANGE HISTORY**  
 19798        First released in Issue 5.

19799 **NAME**19800 `ipcs` — report XSI interprocess communication facilities status19801 **SYNOPSIS**19802 xsi `ipcs [-qms] [-a | -bcopt]`

19803

19804 **DESCRIPTION**19805 The *ipcs* utility shall write information about active interprocess communication facilities.

19806 Without options, information shall be written in short format for message queues, shared  
 19807 memory segments, and semaphore sets that are currently active in the system. Otherwise, the  
 19808 information that is displayed is controlled by the options specified.

19809 **OPTIONS**

19810 The *ipcs* facility supports the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2,  
 19811 Utility Syntax Guidelines.

19812 The *ipcs* utility accepts the following options:19813 **-q** Write information about active message queues.19814 **-m** Write information about active shared memory segments.19815 **-s** Write information about active semaphore sets.

19816 If **-q**, **-m**, or **-s** are specified, only information about those facilities shall be written. If none of  
 19817 these three are specified, information about all three shall be written subject to the following  
 19818 options:

19819 **-a** Use all print options. (This is a shorthand notation for **-b**, **-c**, **-o**, **-p**, and **-t**.)

19820 **-b** Write information on maximum allowable size. (Maximum number of bytes in  
 19821 messages on queue for message queues, size of segments for shared memory, and  
 19822 number of semaphores in each set for semaphores.)

19823 **-c** Write creator's user name and group name; see below.

19824 **-o** Write information on outstanding usage. (Number of messages on queue and total  
 19825 number of bytes in messages on queue for message queues, and number of  
 19826 processes attached to shared memory segments.)

19827 **-p** Write process number information. (Process ID of the last process to send a  
 19828 message and process ID of the last process to receive a message on message  
 19829 queues, process ID of the creating process, and process ID of the last process to  
 19830 attach or detach on shared memory segments.)

19831 **-t** Write time information. (Time of the last control operation that changed the access  
 19832 permissions for all facilities, time of the last *msgsnd()* and *msgrcv()* operations on  
 19833 message queues, time of the last *shmat()* and *shmdt()* operations on shared  
 19834 memory, and time of the last *semop()* operation on semaphores.)

19835 **OPERANDS**

19836 None.

19837 **STDIN**

19838 Not used.

19839 **INPUT FILES**

- 19840           • The group database
- 19841           • The user database

19842 **ENVIRONMENT VARIABLES**

19843           The following environment variables shall affect the execution of *ipcs*:

- 19844           *LANG*       Provide a default value for the internationalization variables that are unset or null.  
19845                       (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
19846                       Internationalization Variables for the precedence of internationalization variables  
19847                       used to determine the values of locale categories.)
- 19848           *LC\_ALL*     If set to a non-empty string value, override the values of all the other  
19849                       internationalization variables.
- 19850           *LC\_CTYPE*   Determine the locale for the interpretation of sequences of bytes of text data as  
19851                       characters (for example, single-byte as opposed to multi-byte characters in  
19852                       arguments).
- 19853           *LC\_MESSAGES*  
19854                       Determine the locale that should be used to affect the format and contents of  
19855                       diagnostic messages written to standard error.
- 19856           *NLSPATH*   Determine the location of message catalogs for the processing of *LC\_MESSAGES*.
- 19857           *TZ*         Determine the timezone for the date and time strings written by *ipcs*. If *TZ* is unset  
19858                       or null, an unspecified default timezone shall be used.

19859 **ASYNCHRONOUS EVENTS**

19860           Default.

19861 **STDOUT**

19862           An introductory line shall be written with the format:

19863           "IPC status from %s as of %s\n", <source>, <date>

19864           where <source> indicates the source used to gather the statistics and <date> is the information  
19865           that would be produced by the *date* command when invoked in the POSIX locale.

19866           The *ipcs* utility then shall create up to three reports depending upon the *-q*, *-m*, and *-s* options.  
19867           The first report shall indicate the status of message queues, the second report shall indicate the  
19868           status of shared memory segments, and the third report shall indicate the status of semaphore  
19869           sets.

19870           If the corresponding facility is not installed or has not been used since the last reboot, then the  
19871           report shall be written out in the format:

19872           "%s facility not in system.\n", <facility>

19873           where <facility> is *Message Queue*, *Shared Memory*, or *Semaphore*, as appropriate. If the facility has  
19874           been installed and has been used since the last reboot, column headings separated by one or  
19875           more spaces and followed by a <newline> shall be written as indicated below followed by the  
19876           facility name written out using the format:

19877           "%s:\n", <facility>

19878           where <facility> is *Message Queues*, *Shared Memory*, or *Semaphores*, as appropriate. On the second  
19879           and third reports the column headings need not be written if the last column headings written  
19880           already provide column headings for all information in that report.

|       |                                                                                                   |              |                                                                                                     |
|-------|---------------------------------------------------------------------------------------------------|--------------|-----------------------------------------------------------------------------------------------------|
| 19881 | The column headings provided in the first column below and the meaning of the information in      |              |                                                                                                     |
| 19882 | those columns shall be given in order below; the letters in parentheses indicate the options that |              |                                                                                                     |
| 19883 | shall cause the corresponding column to appear; “all” means that the column shall always          |              |                                                                                                     |
| 19884 | appear. Each column is separated by one or more <space>s. Note that these options only            |              |                                                                                                     |
| 19885 | determine what information is provided for each report; they do not determine which reports       |              |                                                                                                     |

20053 **NAME**20054           *jobs* — display status of jobs in the current session20055 **SYNOPSIS**20056 UP       *jobs* [-l | -p] [*job\_id*...]

20057

20058 **DESCRIPTION**20059           The *jobs* utility shall display the status of jobs that were started in the current shell environment;  
20060           see Section 2.12 (on page 61).20061           When *jobs* reports the termination status of a job, the shell shall remove its process ID from the  
20062           list of those “known in the current shell execution environment”; see Section 2.9.3.1 (on page  
20063           50).20064 **OPTIONS**20065           The *jobs* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
20066           12.2, Utility Syntax Guidelines.

20067           The following options shall be supported:

20068           **-l**           (The letter ell.) Provide more information about each job listed. This information  
20069                           shall include the job number, current job, process group ID, state, and the  
20070                           command that formed the job.20071           **-p**           Display only the process IDs for the process group leaders of the selected jobs.20072           By default, the *jobs* utility shall display the status of all stopped jobs, running background jobs  
20073           and all jobs whose status has changed and have not been reported by the shell.20074 **OPERANDS**

20075           The following operand shall be supported:

20076           *job\_id*       Specifies the jobs for which the status is to be displayed. If no *job\_id* is given, the  
20077                           status information for all jobs shall be displayed. The format of *job\_id* is described  
20078                           in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.203, Job Control  
20079                           Job ID.20080 **STDIN**

20081           Not used.

20082 **INPUT FILES**

20083           None.

20084 **ENVIRONMENT VARIABLES**20085           The following environment variables shall affect the execution of *jobs*:20086           **LANG**       Provide a default value for the internationalization variables that are unset or null.  
20087                           (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
20088                           Internationalization Variables for the precedence of internationalization variables  
20089                           used to determine the values of locale categories.)20090           **LC\_ALL**     If set to a non-empty string value, override the values of all the other  
20091                           internationalization variables.20092           **LC\_CTYPE**   Determine the locale for the interpretation of sequences of bytes of text data as  
20093                           characters (for example, single-byte as opposed to multi-byte characters in  
20094                           arguments).20095           **LC\_MESSAGES**

20096                           Determine the locale that should be used to affect the format and contents of

20097 diagnostic messages written to standard error and informative messages written to  
 20098 standard output.

20099 xSI **NLSPATH** Determine the location of message catalogs for the processing of *LC\_MESSAGES*.

## 20100 ASYNCHRONOUS EVENTS

20101 Default.

## 20102 STDOUT

20103 If the **-p** option is specified, the output shall consist of one line for each process ID:

20104 "%d\n", <process ID>

20105 Otherwise, if the **-l** option is not specified, the output shall be a series of lines of the form:

20106 "[%d] %c %s %s\n", <job-number>, <current>, <state>, <command>

20107 where the fields shall be as follows:

20108 <current> The character '+' identifies the job that would be used as a default for the *fg* or *bg*  
 20109 utilities; this job can also be specified using the *job\_id* %+ or "%%". The character  
 20110 '-' identifies the job that would become the default if the current default job were  
 20111 to exit; this job can also be specified using the *job\_id* %-. For other jobs, this field is  
 20112 a <space>. At most one job can be identified with '+' and at most one job can be  
 20113 identified with '-'. If there is any suspended job, then the current job shall be a  
 20114 suspended job. If there are at least two suspended jobs, then the previous job also  
 20115 shall be a suspended job.

20116 <job-number> A number that can be used to identify the process group to the *wait*, *fg*, *bg*, and *kill*  
 20117 utilities. Using these utilities, the job can be identified by prefixing the job number  
 20118 with '% '.

20119 <state> One of the following strings (in the POSIX locale):

20120 **Running** Indicates that the job has not been suspended by a signal and has not  
 20121 exited.

20122 **Done** Indicates that the job completed and returned exit status zero.

20123 **Done(code)** Indicates that the job completed normally and that it exited with the  
 20124 specified non-zero exit status, *code*, expressed as a decimal number.

20125 **Stopped** Indicates that the job was suspended by the SIGTSTP signal.

20126 **Stopped (SIGTSTP)**

20127 Indicates that the job was suspended by the SIGTSTP signal.

20128 **Stopped (SIGSTOP)**

20129 Indicates that the job was suspended by the SIGSTOP signal.

20130 **Stopped (SIGTTIN)**

20131 Indicates that the job was suspended by the SIGTTIN signal.

20132 **Stopped (SIGTTOU)**

20133 Indicates that the job was suspended by the SIGTTOU signal.

20134 The implementation may substitute the string **Suspended** in place of **Stopped**. If  
 20135 the job was terminated by a signal, the format of <state> is unspecified, but it shall  
 20136 be visibly distinct from all of the other <state> formats shown here and shall  
 20137 indicate the name or description of the signal causing the termination.

20138           <*command*>   The associated command that was given to the shell.

20139           If the **-I** option is specified, a field containing the process group ID shall be inserted before the  
20140           <*state*> field. Also, more processes in a process group may be output on separate lines, using  
20141           only the process ID and <*command*> fields.

#### 20142 **STDERR**

20143           The standard error shall be used only for diagnostic messages.

#### 20144 **OUTPUT FILES**

20145           None.

#### 20146 **EXTENDED DESCRIPTION**

20147           None.

#### 20148 **EXIT STATUS**

20149           The following exit values shall be returned:

20150           0   Successful completion.

20151           >0   An error occurred.

#### 20152 **CONSEQUENCES OF ERRORS**

20153           Default.

#### 20154 **APPLICATION USAGE**

20155           The **-p** option is the only portable way to find out the process group of a job because different  
20156           implementations have different strategies for defining the process group of the job. Usage such  
20157           as *\$(jobs -p)* provides a way of referring to the process group of the job in an implementation-  
20158           independent way.

20159           The *jobs* utility does not work as expected when it is operating in its own utility execution  
20160           environment because that environment has no applicable jobs to manipulate. See the  
20161           APPLICATION USAGE section for *bg*. For this reason, *jobs* is generally implemented as a shell  
20162           regular built-in.

#### 20163 **EXAMPLES**

20164           None.

#### 20165 **RATIONALE**

20166           Both "%%" and "%+" are used to refer to the current job. Both forms are of equal validity—the  
20167           "%" mirroring "\$\$" and "%+" mirroring the output of *jobs*. Both forms reflect historical  
20168           practice of the KornShell and the C shell with job control.

20169           The job control features provided by *bg*, *fg*, and *jobs* are based on the KornShell. The standard  
20170           developers examined the characteristics of the C shell versions of these utilities and found that  
20171           differences exist. Despite widespread use of the C shell, the KornShell versions were selected for  
20172           this volume of IEEE Std 1003.1-2001 to maintain a degree of uniformity with the rest of the  
20173           KornShell features selected (such as the very popular command line editing features).

20174           The *jobs* utility is not dependent on the job control option, as are the seemingly related *bg* and *fg*  
20175           utilities because *jobs* is useful for examining background jobs, regardless of the condition of job  
20176           control. When the user has invoked a *set +m* command and job control has been turned off, *jobs*  
20177           can still be used to examine the background jobs associated with that current session. Similarly,  
20178           *kill* can then be used to kill background jobs with *kill% <background job number>*.

20179           The output for terminated jobs is left unspecified to accommodate various historical systems.  
20180           The following formats have been witnessed:

20181 1. **Killed**(*signal name*)

20182 2. *signal name*

20183 3. *signal name*(**coredump**)

20184 4. *signal description* – **core dumped**

20185 Most users should be able to understand these formats, although it means that applications have  
20186 trouble parsing them.

20187 The calculation of job IDs was not described since this would suggest an implementation, which  
20188 may impose unnecessary restrictions.

20189 In an early proposal, a **-n** option was included to “Display the status of jobs that have changed,  
20190 exited, or stopped since the last status report”. It was removed because the shell always writes  
20191 any changed status of jobs before each prompt.

20192 **FUTURE DIRECTIONS**

20193 None.

20194 **SEE ALSO**

20195 Section 2.12 (on page 61), *bg*, *fg*, *kill*, *wait*

20196 **CHANGE HISTORY**

20197 First released in Issue 4.

20198 **Issue 6**

20199 This utility is marked as part of the User Portability Utilities option.

20200 The JC shading is removed as job control is mandatory in this issue.

20201 **NAME**

20202           join — relational database operator

20203 **SYNOPSIS**

20204           join [-a *file\_number* | -v *file\_number*] [-e *string*] [-o *list*] [-t *char*]  
 20205                   [-1 *field*] [-2 *field*] *file1 file2*

20206 **DESCRIPTION**

20207           The *join* utility shall perform an equality join on the files *file1* and *file2*. The joined files shall be  
 20208           written to the standard output.

20209           The join field is a field in each file on which the files are compared. The *join* utility shall write  
 20210           one line in the output for each pair of lines in *file1* and *file2* that have identical join fields. The  
 20211           output line by default shall consist of the join field, then the remaining fields from *file1*, then the  
 20212           remaining fields from *file2*. This format can be changed by using the -o option (see below). The  
 20213           -a option can be used to add unmatched lines to the output. The -v option can be used to output  
 20214           only unmatched lines.

20215           The files *file1* and *file2* shall be ordered in the collating sequence of sort -b on the fields on which  
 20216           they shall be joined, by default the first in each line. All selected output shall be written in the  
 20217           same collating sequence.

20218           The default input field separators shall be <blank>s. In this case, multiple separators shall count  
 20219           as one field separator, and leading separators shall be ignored. The default output field separator  
 20220           shall be a <space>.

20221           The field separator and collating sequence can be changed by using the -t option (see below).

20222           If the same key appears more than once in either file, all combinations of the set of remaining  
 20223           fields in *file1* and the set of remaining fields in *file2* are output in the order of the lines  
 20224           encountered.

20225           If the input files are not in the appropriate collating sequence, the results are unspecified.

20226 **OPTIONS**

20227           The *join* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
 20228           12.2, Utility Syntax Guidelines.

20229           The following options shall be supported:

20230           -a *file\_number*

20231                   Produce a line for each unpairable line in file *file\_number*, where *file\_number* is 1 or  
 20232                   2, in addition to the default output. If both -a1 and -a2 are specified, all unpairable  
 20233                   lines shall be output.

20234           -e *string*       Replace empty output fields in the list selected by -o with the string *string*.

20235           -o *list*         Construct the output line to comprise the fields specified in *list*, each element of  
 20236                   which shall have one of the following two forms:

20237                   1. *file\_number.field*, where *file\_number* is a file number and *field* is a decimal  
 20238                   integer field number

20239                   2. 0 (zero), representing the join field

20240           The elements of *list* shall be either comma-separated or <blank>-separated, as  
 20241           specified in Guideline 8 of the Base Definitions volume of IEEE Std 1003.1-2001,  
 20242           Section 12.2, Utility Syntax Guidelines. The fields specified by *list* shall be written  
 20243           for all selected output lines. Fields selected by *list* that do not appear in the input  
 20244           shall be treated as empty output fields. (See the -e option.) Only specifically

20245 requested fields shall be written. The application shall ensure that *list* is a single  
20246 command line argument.

20247 **-t char** Use character *char* as a separator, for both input and output. Every appearance of  
20248 *char* in a line shall be significant. When this option is specified, the collating  
20249 sequence shall be the same as *sort* without the **-b** option.

20250 **-v file\_number**  
20251 Instead of the default output, produce a line only for each unpairable line in  
20252 *file\_number*, where *file\_number* is 1 or 2. If both **-v1** and **-v2** are specified, all  
20253 unpairable lines shall be output.

20254 **-1 field** Join on the *field*th field of file 1. Fields are decimal integers starting with 1.

20255 **-2 field** Join on the *field*th field of file 2. Fields are decimal integers starting with 1.

## 20256 OPERANDS

20257 The following operands shall be supported:

20258 *file1, file2* A pathname of a file to be joined. If either of the *file1* or *file2* operands is '-', the  
20259 standard input shall be used in its place.

## 20260 STDIN

20261 The standard input shall be used only if the *file1* or *file2* operand is '-'. See the INPUT FILES  
20262 section.

## 20263 INPUT FILES

20264 The input files shall be text files.

## 20265 ENVIRONMENT VARIABLES

20266 The following environment variables shall affect the execution of *join*:

20267 **LANG** Provide a default value for the internationalization variables that are unset or null.  
20268 (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,  
20269 Internationalization Variables for the precedence of internationalization variables  
20270 used to determine the values of locale categories.)

20271 **LC\_ALL** If set to a non-empty string value, override the values of all the other  
20272 internationalization variables.

20273 **LC\_COLLATE**  
20274 Determine the locale of the collating sequence *join* expects to have been used when  
20275 the input files were sorted.

20276 **LC\_CTYPE** Determine the locale for the interpretation of sequences of bytes of text data as  
20277 characters (for example, single-byte as opposed to multi-byte characters in  
20278 arguments and input files).

20279 **LC\_MESSAGES**  
20280 Determine the locale that should be used to affect the format and contents of  
20281 diagnostic messages written to standard error.

20282 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

## 20283 ASYNCHRONOUS EVENTS

20284 Default.

20285 **STDOUT**

20286 The *join* utility output shall be a concatenation of selected character fields. When the **-o** option  
 20287 is not specified, the output shall be:

20288 "%s%s%s\n", <join field>, <other file1 fields>,  
 20289 <other file2 fields>

20290 If the join field is not the first field in a file, the <other file fields> for that file shall be:

20291 <fields preceding join field>, <fields following join field>

20292 When the **-o** option is specified, the output format shall be:

20293 "%s\n", <concatenation of fields>

20294 where the concatenation of fields is described by the **-o** option, above.

20295 For either format, each field (except the last) shall be written with its trailing separator character.  
 20296 If the separator is the default (<blank>s), a single <space> shall be written after each field  
 20297 (except the last).

20298 **STDERR**

20299 The standard error shall be used only for diagnostic messages.

20300 **OUTPUT FILES**

20301 None.

20302 **EXTENDED DESCRIPTION**

20303 None.

20304 **EXIT STATUS**

20305 The following exit values shall be returned:

20306 0 All input files were output successfully.

20307 >0 An error occurred.

20308 **CONSEQUENCES OF ERRORS**

20309 Default.

20310 **APPLICATION USAGE**

20311 Pathnames consisting of numeric digits or of the form *string.string* should not be specified  
 20312 directly following the **-o** list.

20313 **EXAMPLES**

20314 The **-o 0** field essentially selects the union of the join fields. For example, given file **phone**:

|       |         |                 |
|-------|---------|-----------------|
| 20315 | !Name   | Phone Number    |
| 20316 | Don     | +1 123-456-7890 |
| 20317 | Hal     | +1 234-567-8901 |
| 20318 | Yasushi | +2 345-678-9012 |

20319 and file **fax**:

|       |         |                 |
|-------|---------|-----------------|
| 20320 | !Name   | Fax Number      |
| 20321 | Don     | +1 123-456-7899 |
| 20322 | Keith   | +1 456-789-0122 |
| 20323 | Yasushi | +2 345-678-9011 |

20324 (where the large expanses of white space are meant to each represent a single <tab>), the  
 20325 command:

20326 `join -t "<tab>" -a 1 -a 2 -e '(unknown)' -o 0,1.2,2.2 phone fax`  
 20327 would produce:

| 20328 | !Name   | Phone Number    | Fax Number      |
|-------|---------|-----------------|-----------------|
| 20329 | Don     | +1 123-456-7890 | +1 123-456-7899 |
| 20330 | Hal     | +1 234-567-8901 | (unknown)       |
| 20331 | Keith   | (unknown)       | +1 456-789-0122 |
| 20332 | Yasushi | +2 345-678-9012 | +2 345-678-9011 |

20333 Multiple instances of the same key will produce combinatorial results. The following:

20334 fa:  
 20335     a x  
 20336     a y  
 20337     a z  
 20338 fb:  
 20339     a p

20340 will produce:

20341 a x p  
 20342 a y p  
 20343 a z p

20344 And the following:

20345 fa:  
 20346     a b c  
 20347     a d e  
 20348 fb:  
 20349     a w x  
 20350     a y z  
 20351     a o p

20352 will produce:

20353 a b c w x  
 20354 a b c y z  
 20355 a b c o p  
 20356 a d e w x  
 20357 a d e y z  
 20358 a d e o p

#### 20359 RATIONALE

20360 The `-e` option is only effective when used with `-o` because, unless specific fields are identified  
 20361 using `-o`, *join* is not aware of what fields might be empty. The exception to this is the join field,  
 20362 but identifying an empty join field with the `-e` string is not historical practice and some scripts  
 20363 might break if this were changed.

20364 The 0 field in the `-o` list was adopted from the Tenth Edition version of *join* to satisfy  
 20365 international objections that the *join* in the base documents does not support the “full join” or  
 20366 “outer join” described in relational database literature. Although it has been possible to include  
 20367 a join field in the output (by default, or by field number using `-o`), the join field could not be  
 20368 included for an unpaired line selected by `-a`. The `-o 0` field essentially selects the union of the  
 20369 join fields.

20370 This sort of outer join was not possible with the *join* commands in the base documents. The `-o 0`  
 20371 field was chosen because it is an upwards-compatible change for applications. An alternative

20372 was considered: have the join field represent the union of the fields in the files (where they are  
20373 identical for matched lines, and one or both are null for unmatched lines). This was not adopted  
20374 because it would break some historical applications.

20375 The ability to specify *file2* as – is not historical practice; it was added for completeness.

20376 The –v option is not historical practice, but was considered necessary because it permitted the  
20377 writing of *only* those lines that do not match on the join field, as opposed to the –a option, which  
20378 prints both lines that do and do not match. This additional facility is parallel with the –v option  
20379 of *grep*.

20380 Some historical implementations have been encountered where a blank line in one of the input  
20381 files was considered to be the end of the file; the description in this volume of  
20382 IEEE Std 1003.1-2001 does not cite this as an allowable case.

#### 20383 **FUTURE DIRECTIONS**

20384 None.

#### 20385 **SEE ALSO**

20386 *awk, comm, sort, uniq*

#### 20387 **CHANGE HISTORY**

20388 First released in Issue 2.

#### 20389 **Issue 6**

20390 The obsolescent –j options and the multi-argument –o option are withdrawn in this issue.

20391 The normative text is reworded to avoid use of the term “must” for application requirements.

20392 **NAME**

20393       kill — terminate or signal processes

20394 **SYNOPSIS**20395       kill -s *signal\_name* *pid* ...20396       kill -l [*exit\_status*]20397 xSI     kill [-*signal\_name*] *pid* ...20398       kill [-*signal\_number*] *pid* ...

20399

20400 **DESCRIPTION**20401       The *kill* utility shall send a signal to the process or processes specified by each *pid* operand.20402       For each *pid* operand, the *kill* utility shall perform actions equivalent to the *kill()* function  
20403       defined in the System Interfaces volume of IEEE Std 1003.1-2001 called with the following  
20404       arguments:

- 20405       • The value of the *pid* operand shall be used as the *pid* argument.
- 20406       • The *sig* argument is the value specified by the -s option, -*signal\_number* option, or the
- 20407        -*signal\_name* option, or by SIGTERM, if none of these options is specified.

20408 **OPTIONS**

20409       The *kill* utility shall conform to the Base Definitions volume of IEEE Std 1003.1-2001, Section  
20410 xSI     12.2, Utility Syntax Guidelines, except that in the last two SYNOPSIS forms, the -*signal\_number*  
20411       and -*signal\_name* options are usually more than a single character.

20412       The following options shall be supported:

20413       -l       (The letter ell.) Write all values of *signal\_name* supported by the implementation, if  
20414       no operand is given. If an *exit\_status* operand is given and it is a value of the ' ? '   
20415       shell special parameter (see Section 2.5.2 (on page 34) and *wait*) corresponding to a  
20416       process that was terminated by a signal, the *signal\_name* corresponding to the  
20417       signal that terminated the process shall be written. If an *exit\_status* operand is  
20418       given and it is the unsigned decimal integer value of a signal number, the  
20419       *signal\_name* (the symbolic constant name without the **SIG** prefix defined in the  
20420       Base Definitions volume of IEEE Std 1003.1-2001) corresponding to that signal  
20421       shall be written. Otherwise, the results are unspecified.

20422       -s *signal\_name*

20423       Specify the signal to send, using one of the symbolic names defined in the  
20424       <**signal.h**> header. Values of *signal\_name* shall be recognized in a case-independent  
20425       fashion, without the **SIG** prefix. In addition, the symbolic name 0 shall be  
20426       recognized, representing the signal value zero. The corresponding signal shall be  
20427       sent instead of SIGTERM.

20428 xSI     -*signal\_name*20429       Equivalent to -s *signal\_name*.20430 xSI     -*signal\_number*

20431       Specify a non-negative decimal integer, *signal\_number*, representing the signal to  
20432       be used instead of SIGTERM, as the *sig* argument in the effective call to *kill()*. The  
20433       correspondence between integer values and the *sig* value used is shown in the  
20434       following list.

20435       The effects of specifying any *signal\_number* other than those listed below are  
20436       undefined.

|       |                                                                                                 |         |  |
|-------|-------------------------------------------------------------------------------------------------|---------|--|
| 20437 | 0                                                                                               | 0       |  |
| 20438 | 1                                                                                               | SIGHUP  |  |
| 20439 | 2                                                                                               | SIGINT  |  |
| 20440 | 3                                                                                               | SIGQUIT |  |
| 20441 | 6                                                                                               | SIGABRT |  |
| 20442 | 9                                                                                               | SIGKILL |  |
| 20443 | 14                                                                                              | SIGALRM |  |
| 20444 | 15                                                                                              | SIGTERM |  |
| 20445 | If the first argument is a negative integer, it shall be interpreted as a <i>-signal_number</i> |         |  |
| 20446 | option, not as a negative <i>pid</i> operand specifying a process group.                        |         |  |

#### 20447 OPERANDS

20448 The following operands shall be supported:

|       |                    |                                                                                              |
|-------|--------------------|----------------------------------------------------------------------------------------------|
| 20449 | <i>pid</i>         | One of the following:                                                                        |
| 20450 |                    | 1. A decimal integer specifying a process or process group to be signaled. The               |
| 20451 |                    | process or processes selected by positive, negative, and zero values of the <i>pid</i>       |
| 20452 |                    | operand shall be as described for the <i>kill()</i> function. If process number 0 is         |
| 20453 |                    | specified, all processes in the current process group shall be signaled. For the             |
| 20454 |                    | effects of negative <i>pid</i> numbers, see the <i>kill()</i> function defined in the System |
| 20455 |                    | Interfaces volume of IEEE Std 1003.1-2001. If the first <i>pid</i> operand is negative,      |
| 20456 |                    | it should be preceded by "--" to keep it from being interpreted as an option.                |
| 20457 |                    | 2. A job control job ID (see the Base Definitions volume of IEEE Std 1003.1-2001,            |
| 20458 |                    | Section 3.203, Job Control Job ID) that identifies a background process group                |
| 20459 |                    | to be signaled. The job control job ID notation is applicable only for                       |
| 20460 |                    | invocations of <i>kill</i> in the current shell execution environment; see Section 2.12      |
| 20461 |                    | (on page 61).                                                                                |
| 20462 | <i>exit_status</i> | A decimal integer specifying a signal number or the exit status of a process                 |
| 20463 |                    | terminated by a signal.                                                                      |

#### 20464 STDIN

20465 Not used.

#### 20466 INPUT FILES

20467 None.

#### 20468 ENVIRONMENT VARIABLES

20469 The following environment variables shall affect the execution of *kill*:

|       |                 |                                                                                        |
|-------|-----------------|----------------------------------------------------------------------------------------|
| 20470 | <i>LANG</i>     | Provide a default value for the internationalization variables that are unset or null. |
| 20471 |                 | (See the Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2,                 |
| 20472 |                 | Internationalization Variables for the precedence of internationalization variables    |
| 20473 |                 | used to determine the values of locale categories.)                                    |
| 20474 | <i>LC_ALL</i>   | If set to a non-empty string value, override the values of all the other               |
| 20475 |                 | internationalization variables.                                                        |
| 20476 | <i>LC_CTYPE</i> | Determine the locale for the interpretation of sequences of bytes of text data as      |
| 20477 |                 | characters (for example, single-byte as opposed to multi-byte characters in            |
| 20478 |                 | arguments).                                                                            |

20479 **LC\_MESSAGES**  
 20480 Determine the locale that should be used to affect the format and contents of  
 20481 diagnostic messages written to standard error.

20482 XSI **NLSPATH** Determine the location of message catalogs for the processing of **LC\_MESSAGES**.

20483 **ASYNCHRONOUS EVENTS**  
 20484 Default.

20485 **STDOUT**  
 20486 When the **-l** option is not specified, the standard output shall not be used.

20487 When the **-l** option is specified, the symbolic name of each signal shall be written in the  
 20488 following format:  
 20489 "%s%c", <signal\_name>, <separator>  
 20490 where the <signal\_name> is in uppercase, without the **SIG** prefix, and the <separator> shall be  
 20491 either a <newline> or a <space>. For the last signal written, <separator> shall be a <newline>.

20492 When both the **-l** option and *exit\_status* operand are specified, the symbolic name of the  
 20493 corresponding signal shall be written in the following format:  
 20494 "%s\n", <signal\_name>

20495 **STDERR**  
 20496 The standard error shall be used only for diagnostic messages.

20497 **OUTPUT FILES**  
 20498 None.

20499 **EXTENDED DESCRIPTION**  
 20500 None.

20501 **EXIT STATUS**  
 20502 The following exit values shall be returned:  
 20503 0 At least one matching process was found for each *pid* operand, and the specified signal was  
 20504 successfully processed for at least one matching process.  
 20505 >0 An error occurred.

20506 **CONSEQUENCES OF ERRORS**  
 20507 Default.

20508 **APPLICATION USAGE**  
 20509 Process numbers can be found by using *ps*.

20510 The job control job ID notation is not required to work as expected when *kill* is operating in its  
 20511 own utility execution environment. In either of the following examples:  
 20512 nohup kill %1 &  
 20513 system("kill %1");  
 20514 the *kill* operates in a different environment and does not share the shell's understanding of job  
 20515 numbers.

20516 **EXAMPLES**  
 20517 Any of the commands:  
 20518 kill -9 100 -165  
 20519 kill -s kill 100 -165  
 20520 kill -s KILL 100 -165

20521 sends the SIGKILL signal to the process whose process ID is 100 and to all processes whose  
 20522 process group ID is 165, assuming the sending process has permission to send that signal to the  
 20523 specified processes, and that they exist.

20524 The System Interfaces volume of IEEE Std 1003.1-2001 and this volume of IEEE Std 1003.1-2001  
 20525 do not require specific signal numbers for any *signal\_names*. Even the *-signal\_number* option
