Abstract

This standard is simultaneously ISO/IEC 9945:2002, IEEE Std 1003.1-2001, and forms the core of the Single UNIX Specification, Version 3.

The IEEE Std 1003.1, 2003 Edition includes IEEE Std 1003.1-2001/Cor 1-2002 incorporated into IEEE Std 1003.1-2001 (base document). The Corrigendum addresses problems discovered since the approval of IEEE Std 1003.1-2001. These changes are mainly due to resolving integration issues raised by the merger of the base documents that were incorporated into IEEE Std 1003.1-2001, which is the single common revision to IEEE Std 1003.1[™]-1996, IEEE Std 1003.2[™]-1992, ISO/IEC 9945-1:1996, ISO/IEC 9945-2:1993, and the Base Specifications of The Open Group Single UNIX[®] Specification, Version 2.

This standard defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. This standard is intended to be used by both applications developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of this standard:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

This standard describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX[®]), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

Portions of this standard are derived with permission from copyrighted material owned by Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems, Inc.

Permissions

Authorization to photocopy portions of this standard for internal or personal use is granted provided that the appropriate fee is paid to the Copyright Clearance Center or the equivalent body outside of the U.S. Permission to make multiple copies for educational purposes in the U.S. requires agreement and a license fee to be paid to the Copyright Clearance Center.

Beyond these provisions, permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests to the copyright holders should be sent by email to austin-group-permissions@opengroup.org.

Feedback

This standard has been prepared by the Austin Group. Feedback relating to the material contained in this standard may be submitted using the Austin Group web site at <http://www.opengroup.org/austin/defectform.html>.

IEEE

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “AS IS”.

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of the IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with the IEEE.¹ Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE Standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

A patent holder has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates and non-discriminatory, reasonable terms and conditions to all applicants desiring to obtain such licenses. The IEEE makes no representation as to the reasonableness of rates and/or terms and conditions of the license agreements offered by patent holders. Further information may be obtained from the IEEE Standards Department.

Authorization to photocopy portions of any individual standard for internal or personal use is granted in the U.S. by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center.² Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact:

Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923, U.S.A., Tel.: +1 978 750 8400

Amendments, corrigenda, and interpretations for this standard, or information about the IEEE standards development process, may be found at <http://standards.ieee.org>.

Full catalog and ordering information on all IEEE publications is available from the IEEE Online Catalog & Store at <http://shop.ieee.org/store>.

1. For this standard, please send comments via the Austin Group as requested on page iii.

2. Please refer to the special provisions for this standard on page iii concerning permissions from both copyright holders and arrangements to cover photocopying and reproduction across the world, as well as by commercial organizations wishing to license the material for use in product documentation.

The Open Group

The Open Group, a vendor and technology-neutral consortium, is committed to delivering greater business efficiency by bringing together buyers and suppliers of information technology to lower the time, cost, and risks associated with integrating new technology across the enterprise.

The Open Group's mission is to offer all organizations concerned with open information infrastructures a forum to share knowledge, integrate open initiatives, and certify approved products and processes in a manner in which they continue to trust our impartiality.

In the global eCommerce world of today, no single economic entity can achieve independence while still ensuring interoperability. The assurance that products will interoperate with each other across differing systems and platforms is essential to the success of eCommerce and business workflow. The Open Group, with its proven testing and certification program, is the international guarantor of interoperability in the new century.

The Open Group provides opportunities to exchange information and shape the future of IT. The Open Group's members include some of the largest and most influential organizations in the world. The flexible structure of The Open Groups membership allows for almost any organization, no matter what their size, to join and have a voice in shaping the future of the IT world.

More information is available on The Open Group web site at <http://www.opengroup.org>.

The Open Group has over 15 years' experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification. The Open Group portfolio of test suites includes the *Westwood* family of tests for this standard and the associated certification program for Version 3 of the Single UNIX Specification, as well tests for CDE, CORBA, Motif, Linux, LDAP, POSIX.1, POSIX.2, POSIX Realtime, Sockets, UNIX, XPG4, XNFS, XTI, and X11. The Open Group test tools are essential for proper development and maintenance of standards-based products, ensuring conformance of products to industry-standard APIs, applications portability, and interoperability. In-depth testing identifies defects at the earliest possible point in the development cycle, saving costs in development and quality assurance.

More information is available at <http://www.opengroup.org/testing>.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at <http://www.opengroup.org/pubs>.

As with all *live* documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new *Version* indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it *replaces* the previous publication.
- A new *Issue* indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at <http://www.opengroup.org/corrigenda>.

Full catalog and ordering information on all Open Group publications is available at <http://www.opengroup.org/pubs>.

Foreword

Structure of the Standard

This standard was originally developed by the Austin Group, a joint working group of members of the IEEE, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1, as one of the four volumes of IEEE Std 1003.1-2001. The standard was approved by ISO and IEC and published in four parts, correlating to the original volumes.

A mapping of the parts to the volumes is shown below:

ISO/IEC 9945 Part	IEEE Std 1003.1 Volume	Description
9945-1	Base Definitions	Includes general terms, concepts, and interfaces common to all parts of ISO/IEC 9945, including utility conventions and C-language header definitions.
9945-2	System Interfaces	Includes definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery.
9945-3	Shell and Utilities	Includes definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs.
9945-4	Rationale	Includes extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of ISO/IEC 9945 and why features were included or discarded by the standard developers.

All four parts comprise the entire standard, and are intended to be used together to accommodate significant internal referencing among them. POSIX-conforming systems are required to support all four parts.

Introduction

Note: This introduction is not part of IEEE Std 1003.1-2001, Standard for Information Technology — Portable Operating System Interface (POSIX).

This standard has been jointly developed by the IEEE and The Open Group. It is simultaneously an IEEE Standard, an ISO/IEC Standard, and an Open Group Technical Standard.

The Austin Group

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.³ The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group has been to revise, combine, and update the following standards: ISO/IEC 9945-1, ISO/IEC 9945-2, IEEE Std 1003.1, IEEE Std 1003.2, and the Base Specifications of The Open Group Single UNIX Specification.

After two initial meetings, an agreement was signed in July 1999 between The Open Group and the Institute of Electrical and Electronics Engineers (IEEE), Inc., to formalize the project with the first draft of the revised specifications being made available at the same time. Under this agreement, The Open Group and IEEE agreed to share joint copyright of the resulting work. The Open Group has provided the chair and secretariat for the Austin Group.

The base document for the revision was The Open Group's Base volumes of its Single UNIX Specification, Version 2. These were selected since they were a superset of the existing POSIX.1 and POSIX.2 specifications and had some organizational aspects that would benefit the audience for the new revision.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group's Technical Standard designation, and an ISO/IEC designation. This set of specifications forms the core of the Single UNIX Specification, Version 3.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see <http://www.opengroup.org/austin>.

3. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

Background

The developers of this standard represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, this standard describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application writers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,⁴ an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

Audience

The intended audience for this standard is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

Purpose

Several principles guided the development of this standard:

- Application-Oriented

The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. This standard codifies the common, existing definition of the UNIX system.

- Interface, Not Implementation

This standard defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

4. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

- Source, Not Object, Portability

This standard has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. This standard does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

- The C Language

The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

- No Superuser, No System Administration

There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in this standard. This standard is also not concerned with hardware constraints or system maintenance.

- Minimal Interface, Minimally Defined

In keeping with the historical design principles of the UNIX system, the mandatory core facilities of this standard have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

- Broadly Implementable

The developers of this standard endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in this standard, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

When the original version of IEEE Std 1003.1 was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and the subsequent revisions and addenda to all of them have consolidated this consensus, and this revision reflects the significantly increased level of consensus arrived at since the original versions. The earlier standards and their modifications specified a number of areas where consensus had not been reached before, and these are now reflected in this revision. The authors of the original versions tried, as much as possible, to follow the principles below

when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories
2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

This revision tries to minimize the number of changes required to implementations which conform to the earlier versions of the approved standards to bring them into conformance with the current standard. Specifically, the scope of this work excluded doing any “new” work, but rather collecting into a single document what had been spread across a number of documents, and presenting it in what had been proven in practice to be a more effective way. Some changes to prior conforming implementations were unavoidable, primarily as a consequence of resolving conflicts found in prior revisions, or which became apparent when bringing the various pieces together.

However, since it references the 1999 version of the ISO C standard, and no longer supports “Common Usage C”, there are a number of unavoidable changes. Applications portability is similarly affected.

This standard is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of this standard. These need to be used with careful management to be able to adapt to future extensions of this standard and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

A goal of this standard was to minimize additional work for the developers of applications. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

This Standard

This standard defines the Portable Operating System Interface (POSIX) requirements and consists of the following volumes:

- Base Definitions (this volume)
- Shell and Utilities
- System Interfaces
- Rationale (Informative)

This Volume

The Base Definitions volume provides common definitions for this standard, therefore readers should be familiar with it before using the other volumes.

This volume is structured as follows:

- Chapter 1 is an introduction.
- Chapter 2 defines the conformance requirements.
- Chapter 3 defines general terms used.
- Chapter 4 describes general concepts used.
- Chapter 5 describes the notation used to specify file input and output formats in this volume and the Shell and Utilities volume.
- Chapter 6 describes the portable character set and the process of character set definition.
- Chapter 7 describes the syntax for defining internationalization locales as well as the POSIX locale provided on all systems.
- Chapter 8 describes the use of environment variables for internationalization and other purposes.
- Chapter 9 describes the syntax of pattern matching using regular expressions employed by many utilities and matched by the *regcomp()* and *regex()* functions.
- Chapter 10 describes files and devices found on all systems.
- Chapter 11 describes the asynchronous terminal interface for many of the functions in the System Interfaces volume and the *stty* utility in the Shell and Utilities volume.
- Chapter 12 describes the policies for command line argument construction and parsing.
- Chapter 13 defines the contents of headers which declare constants, macros, and data structures that are needed by programs using the services provided by the System Interfaces volume.

Comprehensive references are available in the index.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as IEEE Std 1003.1-2001, which is technically identical to The Open Group Base Specifications, Issue 6.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in this standard.

Reference	Example	Notes
C-Language Data Structure	aio	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	long	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	

Reference	Example	Notes
C-Language Function Argument	<i>arg1</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<sys/stat.h>	
C-Language Keyword	return	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	INET_ADDRSTRLEN	
C-Language Preprocessing Directive	#define	
Commands within a Utility	a, c	
Conversion Specification, Specifier / Modifier Character	%A, g, E	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	Hello, World	
Filename	/tmp	
Literal Character	'c', '\r', '\'	2
Literal String	"abcde"	2
Optional Items in Utility Syntax	[]	
Parameter	<directory pathname>	
Special Character	<newline>	3
Symbolic Constant	_POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	#include <sys/stat.h>	
User Input and Example Code	echo Hello, World	5
Utility Name	<i>awk</i>	
Utility Operand	<i>file_name</i>	
Utility Option	-c	
Utility Option with Option-Argument	-w width	

Notes:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *fscanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, `'\'` (or any of the other sequences such as `''`) is the same as the C constant `'\\'` (or `'\'`).
3. The style selected for some of the special characters, such as `<newline>`, matches the form of the input given to the *localedef* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters `<tab>` or `<newline>`.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, `" [] "`, are part of the syntax and do *not* indicate optional items. In syntax the `' | '` symbol is used to separate alternatives, and ellipses (`" . . . "`) are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.5.1 (on page 6).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- (a,b) means the range of all values from a to b , including neither a nor b .
- $[a,b]$ means the range of all values from a to b , including a and b .
- $[a,b)$ means the range of all values from a to b , including a , but not b .
- $(a,b]$ means the range of all values from a to b , including b , but not a .

Note: A symbolic limit beginning with POSIX is treated differently, depending on context. In a C-language header, the symbol `POSIXstring` (where *string* may contain underscores) is represented by the C identifier `_POSIXstring`, with a leading underscore required to prevent ISO C standard name space pollution. However, in other contexts, such as languages other than C, the leading underscore is not used because this requirement does not exist.

Participants

IEEE Std 1003.1-2001 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22 WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair

Donald W. Cragun, Organizational Representative, IEEE PASC

Nicholas Stoughton, Organizational Representative, ISO/SC22 WG15

Mark Brown, Organizational Representative, The Open Group

Cathy Hughes, Technical Editor

Austin Group Technical Reviewers

Peter Anvin	Michael Gonzalez	Sandra O'Donnell
Bouazza Bachar	Joseph M. Gwinn	Frank Prindle
Theodore P. Baker	Jon Hitchcock	Curtis Royster Jr.
Walter Briscoe	Yvette Ho Sang	Glen Seeds
Mark Brown	Cathy Hughes	Keld Jorn Simonsen
Dave Butenhof	Lowell G. Johnson	Raja Srinivasan
Geoff Clare	Andrew Josey	Nicholas Stoughton
Donald W. Cragun	Michael Kavanaugh	Donn S. Terry
Lee Damico	David Korn	Fred Tydeman
Ulrich Drepper	Marc Aurele La France	Peter Van Der Veen
Paul Eggert	Jim Meyering	James Youngman
Joanna Farley	Gary Miller	Jim Zepeda
Clive D.W. Feather	Finnbarr P. Murphy	Jason Zions
Andrew Gollan	Joseph S. Myers	

Austin Group Working Group Members

Harold C. Adams	Michael Gonzalez	Sandra O'Donnell
Peter Anvin	Karen D. Gordon	Frank Prindle
Pierre-Jean Arcos	Joseph M. Gwinn	Francois Riche
Jay Ashford	Steven A. Haaser	John D. Riley
Bouazza Bachar	Charles E. Hammons	Andrew K. Roach
Theodore P. Baker	Chris J. Harding	Helmut Roth
Robert Barned	Barry Hedquist	Jaideep Roy
Joel Berman	Vincent E. Henley	Curtis Royster Jr.
David J. Blackwood	Karl Heubaum	Stephen C. Schwarm
Shirley Bockstahler-Brandt	Jon Hitchcock	Glen Seeds
James Bottomley	Yvette Ho Sang	Richard Seibel
Walter Briscoe	Niklas Holsti	David L. Shroads Jr.
Andries Brouwer	Thomas Hosmer	W. Olin Sibert
Mark Brown	Cathy Hughes	Keld Jorn Simonsen
Eric W. Burger	Jim D. Isaak	Curtis Smith
Alan Burns	Lowell G. Johnson	Raja Srinivasan
Andries Brouwer	Michael B. Jones	Nicholas Stoughton
Dave Butenhof	Andrew Josey	Marc J. Teller
Keith Chow	Michael J. Karels	Donn S. Terry
Geoff Clare	Michael Kavanaugh	Fred Tydeman
Donald W. Cragun	David Korn	Mark-Rene Uchida
Lee Damico	Steven Kramer	Scott A. Valcourt
Juan Antonio De La Puente	Thomas M. Kurihara	Peter Van Der Veen
Ming De Zhou	Marc Aurele La France	Michael W. Vannier
Steven J. Dovich	C. Douglass Locke	Eric Vought
Richard P. Draves	Nick Maclaren	Frederick N. Webb
Ulrich Drepper	Roger J. Martin	Paul A.T. Wolfgang
Paul Eggert	Craig H. Meyer	Garrett A. Wollman
Philip H. Enslow	Jim Meyering	James Youngman
Joanna Farley	Gary Miller	Oren Yuen
Clive D.W. Feather	Finnbarr P. Murphy	Janusz Zalewski
Pete Forman	Joseph S. Myers	Jim Zepeda
Mark Funkenhauser	John Napier	Jason Zions
Lois Goldthwaite	Peter E. Obermayer	
Andrew Gollan	James T. Oblinger	

The Open Group

When The Open Group approved the Base Specifications, Issue 6 on 12 September 2001, the membership of The Open Group Base Working Group was as follows:

Andrew Josey, Chair

Finnbarr P. Murphy, Vice-Chair

Mark Brown, Austin Group Liaison

Cathy Hughes, Technical Editor

Base Working Group Members

Bouazza Bachar

Mark Brown

Dave Butenhof

Donald W. Cragun

Larry Dwyer

Joanna Farley

Andrew Gollan

Karen D. Gordon

Gary Miller

Finnbarr P. Murphy

Frank Prindle

Andrew K. Roach

Curtis Royster Jr.

Nicholas Stoughton

Kenjiro Tsuji

IEEE

When the IEEE Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, the membership of the committees was as follows:

Portable Applications Standards Committee (PASC)

Lowell G. Johnson, Chair
Joseph M. Gwinn, Vice-Chair
Jay Ashford, Functional Chair
Andrew Josey, Functional Chair
Curtis Royster Jr., Functional Chair
Nicholas Stoughton, Secretary

Balloting Committee

The following members of the balloting committee voted on IEEE Std 1003.1-2001. Balloters may have voted for approval, disapproval, or abstention:

Harold C. Adams	Steven A. Haaser	Frank Prindle
Pierre-Jean Arcos	Charles E. Hammons	Francois Riche
Jay Ashford	Chris J. Harding	John D. Riley
Theodore P. Baker	Barry Hedquist	Andrew K. Roach
Robert Barned	Vincent E. Henley	Helmut Roth
David J. Blackwood	Karl Heubaum	Jaideep Roy
Shirley Bockstahler-Brandt	Niklas Holsti	Curtis Royster Jr.
James Bottomley	Thomas Hosmer	Stephen C. Schwarm
Mark Brown	Jim D. Isaak	Richard Seibel
Eric W. Burger	Lowell G. Johnson	David L. Shroads Jr.
Alan Burns	Michael B. Jones	W. Olin Sibert
Dave Butenhof	Andrew Josey	Keld Jorn Simonsen
Keith Chow	Michael J. Karels	Nicholas Stoughton
Donald W. Cragun	Steven Kramer	Donn S. Terry
Juan Antonio De La Puente	Thomas M. Kurihara	Mark-Rene Uchida
Ming De Zhou	C. Douglass Locke	Scott A. Valcourt
Steven J. Dovich	Roger J. Martin	Michael W. Vannier
Richard P. Draves	Craig H. Meyer	Frederick N. Webb
Philip H. Enslow	Finnbarr P. Murphy	Paul A.T. Wolfgang
Michael Gonzalez	John Napier	Oren Yuen
Karen D. Gordon	Peter E. Obermayer	Janusz Zalewski
Joseph M. Gwinn	James T. Oblinger	

The following organizational representative voted on this standard:

Andrew Josey, X/Open Company Ltd.

IEEE-SA Standards Board

When the IEEE-SA Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, it had the following membership:

Donald N. Heirman, Chair

James T. Carlo, Vice-Chair

Judith Gorman, Secretary

Satish K. Aggarwal

Mark D. Bowman

Gary R. Engmann

Harold E. Epstein

H. Landis Floyd

Jay Forster*

Howard M. Frazier

Ruben D. Garzon

James H. Gurney

Richard J. Holleman

Lowell G. Johnson

Robert J. Kennelly

Joseph L. Koepfinger*

Peter H. Lips

L. Bruce McClung

Daleep C. Mohla

James W. Moore

Robert F. Munzner

Ronald C. Petersen

Gerald H. Peterson

John B. Posey

Gary S. Robinson

Akio Tojo

Donald W. Zipse

Also included are the following non-voting IEEE-SA Standards Board liaisons:

Alan Cookson, NIST Representative

Donald R. Volzka, TAB Representative

Yvette Ho Sang, **Don Messina**, **Savoula Amanatidis**, IEEE Project Editors

* Member Emeritus

IEEE Std 1003.1-2001/Cor 1-2002 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/IEC JTC 1/SC22/WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair

Donald W. Cragun, Organizational Representative, IEEE PASC

Nicholas Stoughton, Organizational Representative, ISO/IEC JTC 1/SC22/WG15

Mark Brown, Organizational Representative, The Open Group

Trademarks

The following information is given for the convenience of users of this standard and does not constitute endorsement of these products by The Open Group or the IEEE. There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

1003.1[™] is a trademark of the Institute of Electrical and Electronic Engineers, Inc.

AIX[®] is a registered trademark of IBM Corporation.

AT&T[®] is a registered trademark of AT&T in the U.S.A. and other countries.

BSD[™] is a trademark of the University of California, Berkeley, U.S.A.

Hewlett-Packard[®], HP[®], and HP-UX[®] are registered trademarks of Hewlett-Packard Company.

IBM[®] is a registered trademark of International Business Machines Corporation.

The Open Group and Boundaryless Information Flow are trademarks and UNIX is a registered trademark of The Open Group in the United States and other countries. All other trademarks are the property of their respective owners.

POSIX[®] is a registered trademark of the Institute of Electrical and Electronic Engineers, Inc.

Sun[®] and Sun Microsystems[®] are registered trademarks of Sun Microsystems, Inc.

/usr/group[®] is a registered trademark of UniForum, the International Network of UNIX System Users.

Acknowledgements

The contributions of the following organizations to the development of IEEE Std 1003.1-2001 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation.
- The SC22 WG14 Committees.

This standard was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO SC22 WG15.

MSE Working Draft

Working draft of ISO/IEC 9899:1990/Add3:Draft, Addendum 3 — Multibyte Support Extensions (MSE) as documented in the ISO Working Paper SC22/WG14/N205 dated 31 March 1992.

POSIX.0: 1995

IEEE Std 1003.0-1995, IEEE Guide to the POSIX Open System Environment (OSE) (identical to ISO/IEC TR 14252).

POSIX.1: 1988

IEEE Std 1003.1-1988, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language].

POSIX.1: 1990

IEEE Std 1003.1-1990, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) [C Language].

POSIX.1a

P1003.1a, Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — (C Language) Amendment.

POSIX.1d: 1999

IEEE Std 1003.1d-1999, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 4: Additional Realtime Extensions [C Language].

POSIX.1g: 2000

IEEE Std 1003.1g-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 6: Protocol-Independent Interfaces (PII).

POSIX.1j: 2000

IEEE Std 1003.1j-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 5: Advanced Realtime Extensions [C Language].

POSIX.1q: 2000

IEEE Std 1003.1q-2000, IEEE Standard for Information Technology — Portable Operating System Interface (POSIX) — Part 1: System Application Program Interface (API) — Amendment 7: Tracing [C Language].

POSIX.2b

Introduction

1.1 Scope

IEEE Std 1003.1-2001 defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. It is intended to be used by both applications developers and system implementors.

IEEE Std 1003.1-2001 comprises four major components (each in an associated volume):

1. General terms, concepts, and interfaces common to all volumes of IEEE Std 1003.1-2001, including utility conventions and C-language header definitions, are included in the Base Definitions volume of IEEE Std 1003.1-2001.
2. Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume of IEEE Std 1003.1-2001.
3. Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume of IEEE Std 1003.1-2001.
4. Extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of IEEE Std 1003.1-2001 and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume of IEEE Std 1003.1-2001.

The following areas are outside of the scope of IEEE Std 1003.1-2001:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

IEEE Std 1003.1-2001 describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

The facilities provided in IEEE Std 1003.1-2001 are drawn from the following base documents:

- IEEE Std 1003.1-1996 (POSIX-1) (incorporating IEEE Std 1003.1-1990, 1003.1b-1993, 1003.1c-1995, and 1003.1i-1995)
- The following amendments to the POSIX.1-1990 standard:
 - IEEE P1003.1a draft standard (Additional System Services)
 - IEEE Std 1003.1d-1999 (Additional Realtime Extensions)

- IEEE Std 1003.1g-2000 (Protocol-Independent Interfaces (PII))
- IEEE Std 1003.1j-2000 (Advanced Realtime Extensions)
- IEEE Std 1003.1q-2000 (Tracing)
- IEEE Std 1003.2-1992 (POSIX-2) (includes IEEE Std 1003.2a-1992)
- The following amendments to the ISO POSIX-2: 1993 standard:
 - IEEE P1003.2b draft standard (Additional Utilities)
 - IEEE Std 1003.2d-1994 (Batch Environment)
- Open Group Technical Standard, February 1997, System Interface Definitions, Issue 5 (XBD5) (ISBN: 1-85912-186-1, C605)
- Open Group Technical Standard, February 1997, Commands and Utilities, Issue 5 (XCU5) (ISBN: 1-85912-191-8, C604)
- Open Group Technical Standard, February 1997, System Interfaces and Headers, Issue 5 (XSH5) (in 2 Volumes) (ISBN: 1-85912-181-0, C606)
- Note:** XBD5, XCU5, and XSH5 are collectively referred to as the *Base Specifications*.
- Open Group Technical Standard, January 2000, Networking Services, Issue 5.2 (XNS5.2) (ISBN: 1-85912-241-8, C808)
- ISO / IEC 9899: 1999, Programming Languages — C.

IEEE Std 1003.1-2001 uses the Base Specifications as its organizational basis and adds the following additional functionality to them, drawn from the base documents above:

- Normative text from the ISO POSIX-1: 1996 standard and the ISO POSIX-2: 1993 standard not included in the Base Specifications
- The amendments to the POSIX.1-1990 standard and the ISO POSIX-2: 1993 standard listed above, except for parts of IEEE Std 1003.1g-2000
- Portability Considerations
- Additional rationale and notes

The following features, marked legacy or obsolescent in the base documents, are not carried forward into IEEE Std 1003.1-2001. Other features from the base documents marked legacy or obsolescent are carried forward unless otherwise noted.

From XSH5, the following legacy interfaces, headers, and external variables are not carried forward:

```
advance(), brk(), chroot(), compile(), cuserid(), gamma(), getdtablesize(), getpagesize(), getpass(),
getw(), putw(), re_comp(), re_exec(), regcmp(), regex(), sbrk(), sigstack(), step(), ttyslot(),
valloc(), wait3(), <re_comp.h>, <regexp.h>, <varargs.h>, loc1, __loc1, loc2, locs
```

From XCU5, the following legacy utilities are not carried forward:

```
calendar, cancel, cc, col, cpio, cu, dircmp, dis, egrep, fgrep, line, lint, lpstat, mail, pack, pcat, pg, spell,
sum, tar, unpack, uulog, uuname, uupick, uuto
```

In addition, legacy features within non-legacy reference pages (for example, headers) are not carried forward.

From the ISO POSIX-1: 1996 standard, the following obsolescent features are not carried forward:

78	Page 112, CLK_TCK
79	Page 197 <i>tcgetattr()</i> rate returned option
80	From the ISO POSIX-2: 1993 standard, obsolescent features within the following pages are not
81	carried forward:
82	Page 75, zero-length prefix within <i>PATH</i>
83	Page 156, 159 <i>set</i>
84	Page 178, <i>awk</i> , use of no argument and no parentheses with length
85	Page 259, <i>ed</i>
86	Page 272, <i>env</i>
87	Page 282, <i>find</i> perm [<i>-</i>]onum
88	Page 295-296, <i>egrep</i>
89	Page 299-300, <i>head</i>
90	Page 305-306, <i>join</i>
91	Page 309-310, <i>kill</i>
92	Page 431-433, 435-436, <i>sort</i>
93	Page 444-445, <i>tail</i>
94	Page 453, 455-456, <i>touch</i>
95	Page 464-465, <i>tty</i>
96	Page 472, <i>uniq</i>
97	Page 515-516, <i>ex</i>
98	Page 542-543, <i>expand</i>
99	Page 563-565, <i>more</i>
100	Page 574-576, <i>newgrp</i>
101	Page 578, <i>nice</i>
102	Page 594-596, <i>renice</i>
103	Page 597-598, <i>split</i>
104	Page 600-601, <i>strings</i>
105	Page 624-625, <i>vi</i>
106	Page 693, <i>lex</i>
107	The <i>c89</i> utility (which specified a compiler for the C Language specified by the
108	ISO/IEC 9899: 1990 standard) has been replaced by a <i>c99</i> utility (which specifies a compiler for
109	the C Language specified by the ISO/IEC 9899: 1999 standard).
110	From XSH5, text marked OH (Optional Header) has been reviewed on a case-by-case basis and
111	removed where appropriate. The XCU5 text marked OF (Output Format Incompletely Specified)
112	and UN (Possibly Unsupportable Feature) has been reviewed on a case-by-case basis and
113	removed where appropriate.
114	For the networking interfaces, the base document is the XNS, Issue 5.2 specification. The
115	following parts of the XNS, Issue 5.2 specification are out of scope and not included in
116	IEEE Std 1003.1-2001:
117	• Part 3 (XTI)
118	• Part 4 (Appendixes)
119	Since there is much duplication between the XNS, Issue 5.2 specification and
120	IEEE Std 1003.1g-2000, material only from the following sections of IEEE Std 1003.1g-2000 has
121	been included:
122	• General terms related to sockets (Section 2.2.2)
123	• Socket concepts (Sections 5.1 through 5.3, inclusive)

- The *pselect()* function (Sections 6.2.2.1 and 6.2.3)
- The *socketmark()* function (Section 5.4.13)
- The **<sys/select.h>** header (Section 6.2)

Emphasis is placed on standardizing existing practice for existing users, with changes and additions limited to correcting deficiencies in the following areas:

- Issues raised by IEEE or ISO / IEC Interpretations against IEEE Std 1003.1 and IEEE Std 1003.2
- Issues raised in corrigenda for the Base Specifications and working group resolutions from The Open Group
- Corrigenda and resolutions passed by The Open Group for the XNS, Issue 5.2 specification
- Changes to make the text self-consistent with the additional material merged
- A reorganization of the options in order to facilitate profiling, both for smaller profiles such as IEEE Std 1003.13, and larger profiles such as the Single UNIX Specification
- Alignment with the ISO / IEC 9899: 1999 standard

1.2 Conformance

Conformance requirements for IEEE Std 1003.1-2001 are defined in Chapter 2 (on page 17).

1.3 Normative References

The following standards contain provisions which, through references in IEEE Std 1003.1-2001, constitute provisions of IEEE Std 1003.1-2001. At the time of publication, the editions indicated were valid. All standards are subject to revision, and parties to agreements based on IEEE Std 1003.1-2001 are encouraged to investigate the possibility of applying the most recent editions of the standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards.

167 1.4 Terminology

168 For the purposes of IEEE Std 1003.1-2001, the following terminology definitions apply:

169 **can**

170 Describes a permissible optional feature or behavior available to the user or application. The
 171 feature or behavior is mandatory for an implementation that conforms to
 172 IEEE Std 1003.1-2001. An application can rely on the existence of the feature or behavior.

173 **implementation-defined**

174 Describes a value or behavior that is not defined by IEEE Std 1003.1-2001 but is selected by
 175 an implementor. The value or behavior may vary among implementations that conform to
 176 IEEE Std 1003.1-2001. An application should not rely on the existence of the value or
 177 behavior. An application that relies on such a value or behavior cannot be assured to be
 178 portable across conforming implementations.

179 The implementor shall document such a value or behavior so that it can be used correctly
 180 by an application.

181 **legacy**

182 Describes a feature or behavior that is being retained for compatibility with older
 183 applications, but which has limitations which make it inappropriate for developing portable
 184 applications. New applications should use alternative means of obtaining equivalent
 185 functionality.

186 **may**

187 Describes a feature or behavior that is optional for an implementation that conforms to
 188 IEEE Std 1003.1-2001. An application should not rely on the existence of the feature or
 189 behavior. An application that relies on such a feature or behavior cannot be assured to be
 190 portable across conforming implementations.

191 To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

192 **shall**

193 For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or
 194 behavior that is mandatory. An application can rely on the existence of the feature or
 195 behavior.

196 For an application or user, describes a behavior that is mandatory.

197 **should**

198 For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or
 199 behavior that is recommended but not mandatory. An application should not rely on the
 200 existence of the feature or behavior. An application that relies on such a feature or behavior
 201 cannot be assured to be portable across conforming implementations.

202 For an application, describes a feature or behavior that is recommended programming
 203 practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std 1003.1-2001 which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std 1003.1-2001 which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.5 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 and functions in the System Interfaces volume of IEEE Std 1003.1-2001 describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.5.1). For maximum portability, an application should avoid such functionality.

Unless the primary task of a utility is to produce textual material on its standard output, application developers should not rely on the format or content of any such material that may be produced. Where the primary task is to provide such material, but the output format is incompletely specified, the description is marked with the OF margin code and shading. Application developers are warned not to expect that the output of such an interface on one system is any guide to its behavior on another system.

1.5.1 Codes

The codes and their meanings are as follows. See also Section 1.5.2 (on page 14).

ADV

Advisory Information

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO

Asynchronous Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

246	BAR	Barriers
247		The functionality described is optional. The functionality described is also an extension to the
248		ISO C standard.
249		Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section.
250		Where additional semantics apply to a function, the material is identified by use of the BAR
251		margin legend.
252	BE	Batch Environment Services and Utilities
253		The functionality described is optional.
254		Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section.
255		Where additional semantics apply to a utility, the material is identified by use of the BE margin
256		legend.
257	CD	C-Language Development Utilities
258		The functionality described is optional.
259		Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.
260		Where additional semantics apply to a utility, the material is identified by use of the CD margin
261		legend.
262	CPT	Process CPU-Time Clocks
263		The functionality described is optional. The functionality described is also an extension to the
264		ISO C standard.
265		Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.
266		Where additional semantics apply to a function, the material is identified by use of the CPT
267		margin legend.
268	CS	Clock Selection
269		The functionality described is optional. The functionality described is also an extension to the
270		ISO C standard.
271		Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section.
272		Where additional semantics apply to a function, the material is identified by use of the CS
273		margin legend.
274	CX	Extension to the ISO C standard
275		The functionality described is an extension to the ISO C standard. Application writers may make
276		use of an extension as it is supported on all IEEE Std 1003.1-2001-conforming systems.
277		With each function or header from the ISO C standard, a statement to the effect that “any
278		conflict is unintentional” is included. That is intended to refer to a direct conflict.
279		IEEE Std 1003.1-2001 acts in part as a profile of the ISO C standard, and it may choose to further
280		constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered
281		conflicts.
282		Where additional semantics apply to a function or header, the material is identified by use of the
283		CX margin legend.
284	FD	FORTTRAN Development Utilities
285		The functionality described is optional.
286		Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section.
287		Where additional semantics apply to a utility, the material is identified by use of the FD margin
288		legend.
289	FR	FORTTRAN Runtime Utilities
290		The functionality described is optional.

291		Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.
292		Where additional semantics apply to a utility, the material is identified by use of the FR margin
293		legend.
294	FSC	File Synchronization
295		The functionality described is optional. The functionality described is also an extension to the
296		ISO C standard.
297		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
298		Where additional semantics apply to a function, the material is identified by use of the FSC
299		margin legend.
300	IP6	IPV6
301		The functionality described is optional. The functionality described is also an extension to the
302		ISO C standard.
303		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
304		Where additional semantics apply to a function, the material is identified by use of the IP6
305		margin legend.
306	MC1	Advisory Information and either Memory Mapped Files or Shared Memory Objects
307		The functionality described is optional. The functionality described is also an extension to the
308		ISO C standard.
309		This is a shorthand notation for combinations of multiple option codes.
310		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
311		Where additional semantics apply to a function, the material is identified by use of the MC1
312		margin legend.
313		Refer to Section 1.5.2 (on page 14).
314	MC2	Memory Mapped Files, Shared Memory Objects, or Memory Protection
315		The functionality described is optional. The functionality described is also an extension to the
316		ISO C standard.
317		This is a shorthand notation for combinations of multiple option codes.
318		Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section.
319		Where additional semantics apply to a function, the material is identified by use of the MC2
320		margin legend.
321		Refer to Section 1.5.2 (on page 14).
322	MC3	Memory Mapped Files, Shared Memory Objects, or Typed Memory Objects
323		The functionality described is optional. The functionality described is also an extension to the
324		ISO C standard.
325		This is a shorthand notation for combinations of multiple option codes.
326		Where applicable, functions are marked with the MC3 margin legend in the SYNOPSIS section.
327		Where additional semantics apply to a function, the material is identified by use of the MC3
328		margin legend.
329		Refer to Section 1.5.2 (on page 14).
330	MF	Memory Mapped Files
331		The functionality described is optional. The functionality described is also an extension to the
332		ISO C standard.

333 Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section.
 334 Where additional semantics apply to a function, the material is identified by use of the MF
 335 margin legend.

336 ML **Process Memory Locking**
 337 The functionality described is optional. The functionality described is also an extension to the
 338 ISO C standard.

339 Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
 340 Where additional semantics apply to a function, the material is identified by use of the ML
 341 margin legend.

342 MLR **Range Memory Locking**
 343 The functionality described is optional. The functionality described is also an extension to the
 344 ISO C standard.

345 Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
 346 Where additional semantics apply to a function, the material is identified by use of the MLR
 347 margin legend.

348 MON **Monotonic Clock**
 349 The functionality described is optional. The functionality described is also an extension to the
 350 ISO C standard.

351 Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
 352 Where additional semantics apply to a function, the material is identified by use of the MON
 353 margin legend.

354 MPR **Memory Protection**
 355 The functionality described is optional. The functionality described is also an extension to the
 356 ISO C standard.

357 Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section.
 358 Where additional semantics apply to a function, the material is identified by use of the MPR
 359 margin legend.

360 MSG **Message Passing**
 361 The functionality described is optional. The functionality described is also an extension to the
 362 ISO C standard.

363 Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.
 364 Where additional semantics apply to a function, the material is identified by use of the MSG
 365 margin legend.

366 MX **IEC 60559 Floating-Point Option**
 367 The functionality described is optional. The functionality described is also an extension to the
 368 ISO C standard.

369 Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.
 370 Where additional semantics apply to a function, the material is identified by use of the MX
 371 margin legend.

372 OB **Obsolescent**
 373 The functionality described may be withdrawn in a future version of this volume of
 374 IEEE Std 1003.1-2001. Strictly Conforming POSIX Applications and Strictly Conforming XSI
 375 Applications shall not use obsolescent features.

376 Where applicable, the material is identified by use of the OB margin legend.

377	OF	Output Format Incompletely Specified
378		The functionality described is an XSI extension. The format of the output produced by the utility
379		is not fully specified. It is therefore not possible to post-process this output in a consistent
380		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
381		Where applicable, the material is identified by use of the OF margin legend.
382	OH	Optional Header
383		In the SYNOPSIS section of some interfaces in the System Interfaces volume of
384		IEEE Std 1003.1-2001 an included header is marked as in the following example:
385	OH	<code>#include <sys/types.h></code>
386		<code>#include <grp.h></code>
387		<code>struct group *getgrnam(const char *name);</code>
388		The OH margin legend indicates that the marked header is not required on XSI-conformant
389		systems.
390	PIO	Prioritized Input and Output
391		The functionality described is optional. The functionality described is also an extension to the
392		ISO C standard.
393		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
394		Where additional semantics apply to a function, the material is identified by use of the PIO
395		margin legend.
396	PS	Process Scheduling
397		The functionality described is optional. The functionality described is also an extension to the
398		ISO C standard.
399		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
400		Where additional semantics apply to a function, the material is identified by use of the PS
401		margin legend.
402	RS	Raw Sockets
403		The functionality described is optional. The functionality described is also an extension to the
404		ISO C standard.
405		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
406		Where additional semantics apply to a function, the material is identified by use of the RS
407		margin legend.
408	RTS	Realtime Signals Extension
409		The functionality described is optional. The functionality described is also an extension to the
410		ISO C standard.
411		Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section.
412		Where additional semantics apply to a function, the material is identified by use of the RTS
413		margin legend.
414	SD	Software Development Utilities
415		The functionality described is optional.
416		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
417		Where additional semantics apply to a utility, the material is identified by use of the SD margin
418		legend.
419	SEM	Semaphores
420		The functionality described is optional. The functionality described is also an extension to the
421		ISO C standard.

422		Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section.
423		Where additional semantics apply to a function, the material is identified by use of the SEM
424		margin legend.
425	SHM	Shared Memory Objects
426		The functionality described is optional. The functionality described is also an extension to the
427		ISO C standard.
428		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
429		Where additional semantics apply to a function, the material is identified by use of the SHM
430		margin legend.
431	SIO	Synchronized Input and Output
432		The functionality described is optional. The functionality described is also an extension to the
433		ISO C standard.
434		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
435		Where additional semantics apply to a function, the material is identified by use of the SIO
436		margin legend.
437	SPI	Spin Locks
438		The functionality described is optional. The functionality described is also an extension to the
439		ISO C standard.
440		Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section.
441		Where additional semantics apply to a function, the material is identified by use of the SPI
442		margin legend.
443	SPN	Spawn
444		The functionality described is optional. The functionality described is also an extension to the
445		ISO C standard.
446		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
447		Where additional semantics apply to a function, the material is identified by use of the SPN
448		margin legend.
449	SS	Process Sporadic Server
450		The functionality described is optional. The functionality described is also an extension to the
451		ISO C standard.
452		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
453		Where additional semantics apply to a function, the material is identified by use of the SS
454		margin legend.
455	TCT	Thread CPU-Time Clocks
456		The functionality described is optional. The functionality described is also an extension to the
457		ISO C standard.
458		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.
459		Where additional semantics apply to a function, the material is identified by use of the TCT
460		margin legend.
461	TEF	Trace Event Filter
462		The functionality described is optional. The functionality described is also an extension to the
463		ISO C standard.
464		Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.
465		Where additional semantics apply to a function, the material is identified by use of the TEF
466		margin legend.

467	THR	Threads
468		The functionality described is optional. The functionality described is also an extension to the
469		ISO C standard.
470		Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section.
471		Where additional semantics apply to a function, the material is identified by use of the THR
472		margin legend.
473	TMO	Timeouts
474		The functionality described is optional. The functionality described is also an extension to the
475		ISO C standard.
476		Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section.
477		Where additional semantics apply to a function, the material is identified by use of the TMO
478		margin legend.
479	TMR	Timers
480		The functionality described is optional. The functionality described is also an extension to the
481		ISO C standard.
482		Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section.
483		Where additional semantics apply to a function, the material is identified by use of the TMR
484		margin legend.
485	TPI	Thread Priority Inheritance
486		The functionality described is optional. The functionality described is also an extension to the
487		ISO C standard.
488		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
489		Where additional semantics apply to a function, the material is identified by use of the TPI
490		margin legend.
491	TPP	Thread Priority Protection
492		The functionality described is optional. The functionality described is also an extension to the
493		ISO C standard.
494		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
495		Where additional semantics apply to a function, the material is identified by use of the TPP
496		margin legend.
497	TPS	Thread Execution Scheduling
498		The functionality described is optional. The functionality described is also an extension to the
499		ISO C standard.
500		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
501		Where additional semantics apply to a function, the material is identified by use of the TPS
502		margin legend.
503	TRC	Trace
504		The functionality described is optional. The functionality described is also an extension to the
505		ISO C standard.
506		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
507		Where additional semantics apply to a function, the material is identified by use of the TRC
508		margin legend.
509	TRI	Trace Inherit
510		The functionality described is optional. The functionality described is also an extension to the
511		ISO C standard.

512		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
513		Where additional semantics apply to a function, the material is identified by use of the TRI
514		margin legend.
515	TRL	Trace Log
516		The functionality described is optional. The functionality described is also an extension to the
517		ISO C standard.
518		Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.
519		Where additional semantics apply to a function, the material is identified by use of the TRL
520		margin legend.
521	TSA	Thread Stack Address Attribute
522		The functionality described is optional. The functionality described is also an extension to the
523		ISO C standard.
524		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
525		Where additional semantics apply to a function, the material is identified by use of the TSA
526		margin legend.
527	TSF	Thread-Safe Functions
528		The functionality described is optional. The functionality described is also an extension to the
529		ISO C standard.
530		Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section.
531		Where additional semantics apply to a function, the material is identified by use of the TSF
532		margin legend.
533	TSH	Thread Process-Shared Synchronization
534		The functionality described is optional. The functionality described is also an extension to the
535		ISO C standard.
536		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
537		Where additional semantics apply to a function, the material is identified by use of the TSH
538		margin legend.
539	TSP	Thread Sporadic Server
540		The functionality described is optional. The functionality described is also an extension to the
541		ISO C standard.
542		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
543		Where additional semantics apply to a function, the material is identified by use of the TSP
544		margin legend.
545	TSS	Thread Stack Size Attribute
546		The functionality described is optional. The functionality described is also an extension to the
547		ISO C standard.
548		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
549		Where additional semantics apply to a function, the material is identified by use of the TSS
550		margin legend.
551	TYM	Typed Memory Objects
552		The functionality described is optional. The functionality described is also an extension to the
553		ISO C standard.
554		Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section.
555		Where additional semantics apply to a function, the material is identified by use of the TYM
556		margin legend.

557 UP User Portability Utilities

558 The functionality described is optional.

559 Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section.
560 Where additional semantics apply to a utility, the material is identified by use of the UP margin
561 legend.

562 XSI Extension

563 The functionality described is an XSI extension. Functionality marked XSI is also an extension to
564 the ISO C standard. Application writers may confidently make use of an extension on all
565 systems supporting the X/Open System Interfaces Extension.

566 If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that
567 reference page is an extension. See Section 2.1.4 (on page 21).

568 XSR XSI STREAMS

569 The functionality described is optional. The functionality described is also an extension to the
570 ISO C standard.

571 Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section.
572 Where additional semantics apply to a function, the material is identified by use of the XSR
573 margin legend.

574 1.5.2 Margin Code Notation

575 Some of the functionality described in IEEE Std 1003.1-2001 depends on support of more than
576 one option, or independently may depend on several options. The following notation for margin
577 codes is used to denote the following cases.

578 A Feature Dependent on One or Two Options

579 In this case, margin codes have a <space> separator; for example:

580 MF This feature requires support for only the Memory Mapped Files option.

581 MF SHM This feature requires support for both the Memory Mapped Files and the Shared Memory
582 Objects options; that is, an application which uses this feature is portable only between
583 implementations that provide both options.

584 A Feature Dependent on Either of the Options Denoted

585 In this case, margin codes have a ' | ' separator to denote the logical OR; for example:

586 MF|SHM This feature is dependent on support for either the Memory Mapped Files option or the Shared
587 Memory Objects option; that is, an application which uses this feature is portable between
588 implementations that provide any (or all) of the options.

589 A Feature Dependent on More than Two Options

590 The following shorthand notations are used:

591 MC1 The MC1 margin code is shorthand for ADV (MF|SHM). Features which are shaded with this
592 margin code require support of the Advisory Information option and either the Memory
593 Mapped Files or Shared Memory Objects option.

594 MC2 The MC2 margin code is shorthand for MF|SHM|MPR. Features which are shaded with this
595 margin code require support of either the Memory Mapped Files, Shared Memory Objects, or
596 Memory Protection options.

597 MC3 The MC3 margin code is shorthand for MF|SHM|TYM. Features which are shaded with this |
598 margin code require support of either the Memory Mapped Files, Shared Memory Objects, or |
599 Typed Memory Objects options. |

600 **Large Sections Dependent on an Option**

601 Where large sections of text are dependent on support for an option, a lead-in text block is
602 provided and shaded accordingly; for example:

603 TRC This section describes extensions to support tracing of user applications. This functionality is
604 dependent on support of the Trace option (and the rest of this section is not further shaded for
605 this option).

2.1 Implementation Conformance

2.1.1 Requirements

A *conforming implementation* shall meet all of the following criteria:

1. The system shall support all utilities, functions, and facilities defined within IEEE Std 1003.1-2001 that are required for POSIX conformance (see Section 2.1.3 (on page 18)). These interfaces shall support the functional behavior described herein.
2. The system may support one or more options as described under Section 2.1.5 (on page 22). When an implementation claims that an option is supported, all of its constituent parts shall be provided.
3. The system may support the X/Open System Interface Extension (XSI) as described under Section 2.1.4 (on page 21).
4. The system may provide additional utilities, functions, or facilities not required by IEEE Std 1003.1-2001. Non-standard extensions of the utilities, functions, or facilities specified in IEEE Std 1003.1-2001 should be identified as such in the system documentation. Non-standard extensions, when used, may change the behavior of utilities, functions, or facilities defined by IEEE Std 1003.1-2001. The conformance document shall define an environment in which an application can be run with the behavior specified by IEEE Std 1003.1-2001. In no case shall such an environment require modification of a Strictly Conforming POSIX Application (see Section 2.2.1 (on page 31)).

2.1.2 Documentation

A conformance document with the following information shall be available for an implementation claiming conformance to IEEE Std 1003.1-2001. The conformance document shall have the same structure as IEEE Std 1003.1-2001, with the information presented in the appropriate sections and subsections. Sections and subsections that consist solely of subordinate section titles, with no other information, are not required. The conformance document shall not contain information about extended facilities or capabilities outside the scope of IEEE Std 1003.1-2001.

The conformance document shall contain a statement that indicates the full name, number, and date of the standard that applies. The conformance document may also list international software standards that are available for use by a Conforming POSIX Application. Applicable characteristics where documentation is required by one of these standards, or by standards of government bodies, may also be included.

The conformance document shall describe the limit values found in the headers **<limits.h>** (on page 249) and **<unistd.h>** (on page 400), stating values, the conditions under which those values may change, and the limits of such variations, if any.

The conformance document shall describe the behavior of the implementation for all implementation-defined features defined in IEEE Std 1003.1-2001. This requirement shall be met by listing these features and providing either a specific reference to the system documentation or providing full syntax and semantics of these features. When the value or behavior in the

implementation is designed to be variable or customized on each instantiation of the system, the implementation provider shall document the nature and permissible ranges of this variation.

The conformance document may specify the behavior of the implementation for those features where IEEE Std 1003.1-2001 states that implementations may vary or where features are identified as undefined or unspecified.

The conformance document shall not contain documentation other than that specified in the preceding paragraphs except where such documentation is specifically allowed or required by other provisions of IEEE Std 1003.1-2001.

The phrases “shall document” or “shall be documented” in IEEE Std 1003.1-2001 mean that documentation of the feature shall appear in the conformance document, as described previously, unless there is an explicit reference in the conformance document to show where the information can be found in the system documentation.

The system documentation should also contain the information found in the conformance document.

2.1.3 POSIX Conformance

A conforming implementation shall meet the following criteria for POSIX conformance.

2.1.3.1 POSIX System Interfaces

- The system shall support all the mandatory functions and headers defined in IEEE Std 1003.1-2001, and shall set the symbolic constant `_POSIX_VERSION` to the value 200112L.
- Although all implementations conforming to IEEE Std 1003.1-2001 support all the features described below, there may be system-dependent or file system-dependent configuration procedures that can remove or modify any or all of these features. Such configurations should not be made if strict compliance is required.

The following symbolic constants shall either be undefined or defined with a value other than `-1`. If a constant is undefined, an application should use the `sysconf()`, `pathconf()`, or `fpathconf()` functions, or the `getconf` utility, to determine which features are present on the system at that time or for the particular pathname in question.

— `_POSIX_CHOWN_RESTRICTED`

The use of `chown()` is restricted to a process with appropriate privileges, and to changing the group ID of a file only to the effective group ID of the process or to one of its supplementary group IDs.

— `_POSIX_NO_TRUNC`

Pathname components longer than `{NAME_MAX}` generate an error.

- The following symbolic constants shall be defined as follows:
 - `_POSIX_JOB_CONTROL` shall have a value greater than zero.
 - `_POSIX_SAVED_IDS` shall have a value greater than zero.
 - `_POSIX_VDISABLE` shall have a value other than `-1`.

Note: The symbols above represent historical options that are no longer allowed as options, but are retained here for backwards-compatibility of applications.

- 686 • The system may support one or more options (see Section 2.1.6 (on page 28)) denoted by the
687 following symbolic constants:
- 688 — _POSIX_ADVISORY_INFO
689 — _POSIX_ASYNCHRONOUS_IO
690 — _POSIX_BARRIERS
691 — _POSIX_CLOCK_SELECTION
692 — _POSIX_CPUTIME
693 — _POSIX_FSYNC
694 — _POSIX_IPV6
695 — _POSIX_MAPPED_FILES
696 — _POSIX_MEMLOCK
697 — _POSIX_MEMLOCK_RANGE
698 — _POSIX_MEMORY_PROTECTION
699 — _POSIX_MESSAGE_PASSING
700 — _POSIX_MONOTONIC_CLOCK
701 — _POSIX_PRIORITIZED_IO
702 — _POSIX_PRIORITY_SCHEDULING
703 — _POSIX_RAW_SOCKETS
704 — _POSIX_REALTIME_SIGNALS
705 — _POSIX_SEMAPHORES
706 — _POSIX_SHARED_MEMORY_OBJECTS
707 — _POSIX_SPAWN
708 — _POSIX_SPIN_LOCKS
709 — _POSIX_SPORADIC_SERVER
710 — _POSIX_SYNCHRONIZED_IO
711 — _POSIX_THREAD_ATTR_STACKADDR
712 — _POSIX_THREAD_CPUTIME
713 — _POSIX_THREAD_ATTR_STACKSIZE
714 — _POSIX_THREAD_PRIO_INHERIT
715 — _POSIX_THREAD_PRIO_PROTECT
716 — _POSIX_THREAD_PRIORITY_SCHEDULING
717 — _POSIX_THREAD_PROCESS_SHARED
718 — _POSIX_THREAD_SAFE_FUNCTIONS
719 — _POSIX_THREAD_SPORADIC_SERVER
720 — _POSIX_THREADS

721	—	_POSIX_TIMEOUTS
722	—	_POSIX_TIMERS
723	—	_POSIX_TRACE
724	—	_POSIX_TRACE_EVENT_FILTER
725	—	_POSIX_TRACE_INHERIT
726	—	_POSIX_TRACE_LOG
727	—	_POSIX_TYPED_MEMORY_OBJECTS
728	If any of the symbolic constants _POSIX_TRACE_EVENT_FILTER, _POSIX_TRACE_LOG, or	
729	_POSIX_TRACE_INHERIT is defined to have a value other than -1, then the symbolic	
730	constant _POSIX_TRACE shall also be defined to have a value other than -1.	
731	XSI	• The system may support the XSI extensions (see Section 2.1.5.2 (on page 24)) denoted by the
732		following symbolic constants:
733	—	_XOPEN_CRYPT
734	—	_XOPEN_LEGACY
735	—	_XOPEN_REALTIME
736	—	_XOPEN_REALTIME_THREADS
737	—	_XOPEN_UNIX
738	2.1.3.2	<i>POSIX Shell and Utilities</i>
739	•	The system shall provide all the mandatory utilities in the Shell and Utilities volume of
740		IEEE Std 1003.1-2001 with all the functional behavior described therein.
741	•	The system shall support the Large File capabilities described in the Shell and Utilities
742		volume of IEEE Std 1003.1-2001.
743	•	The system may support one or more options (see Section 2.1.6 (on page 28)) denoted by the
744		following symbolic constants. (The literal names below apply to the <i>getconf</i> utility.)
745	—	POSIX2_C_DEV
746	—	POSIX2_CHAR_TERM
747	—	POSIX2_FORT_DEV
748	—	POSIX2_FORT_RUN
749	—	POSIX2_LOCALEDEF
750	—	POSIX2_PBS
751	—	POSIX2_PBS_ACCOUNTING
752	—	POSIX2_PBS_LOCATE
753	—	POSIX2_PBS_MESSAGE
754	—	POSIX2_PBS_TRACK
755	—	POSIX2_SW_DEV
756	—	POSIX2_UPE

- The system may support the XSI extensions (see Section 2.1.4).

Additional language bindings and development utility options may be provided in other related standards or in a future version of IEEE Std 1003.1-2001. In the former case, additional symbolic constants of the same general form as shown in this subsection should be defined by the related standard document and made available to the application without requiring IEEE Std 1003.1-2001 to be updated.

2.1.4 XSI Conformance

XSI This section describes the criteria for implementations conforming to the XSI extension (see Section 3.439 (on page 96)). This functionality is dependent on the support of the XSI extension (and the rest of this section is not further shaded).

IEEE Std 1003.1-2001 describes utilities, functions, and facilities offered to application programs by the X/Open System Interface (XSI). An XSI-conforming implementation shall meet the criteria for POSIX conformance and the following requirements.

2.1.4.1 XSI System Interfaces

- The system shall support all the functions and headers defined in IEEE Std 1003.1-2001 as part of the XSI extension denoted by the symbolic constant `_XOPEN_UNIX` and any extensions marked with the XSI extension marking (see Section 1.5.1 (on page 6)).
- The system shall support the `mmap()`, `munmap()`, and `msync()` functions.
- The system shall support the following options defined within IEEE Std 1003.1-2001 (see Section 2.1.6 (on page 28)):
 - `_POSIX_FSYNC`
 - `_POSIX_MAPPED_FILES`
 - `_POSIX_MEMORY_PROTECTION`
 - `_POSIX_THREAD_ATTR_STACKADDR`
 - `_POSIX_THREAD_ATTR_STACKSIZE`
 - `_POSIX_THREAD_PROCESS_SHARED`
 - `_POSIX_THREAD_SAFE_FUNCTIONS`
 - `_POSIX_THREADS`
- The system may support the following XSI Option Groups (see Section 2.1.5.2 (on page 24)) defined within IEEE Std 1003.1-2001:
 - Encryption
 - Realtime
 - Advanced Realtime
 - Realtime Threads
 - Advanced Realtime Threads
 - Tracing
 - XSI STREAMS
 - Legacy

2.1.4.2 XSI Shell and Utilities Conformance

- The system shall support all the utilities defined in the Shell and Utilities volume of IEEE Std 1003.1-2001 as part of the XSI extension denoted by the XSI marking in the SYNOPSIS section, and any extensions marked with the XSI extension marking (see Section 1.5.1 (on page 6)) within the text.
 - The system shall support the User Portability Utilities option.
 - The system shall support creation of locales (see Chapter 7 (on page 123)).
 - The C-language Development utility `c99` shall be supported.
 - The XSI Development Utilities option may be supported. It consists of the following software development utilities:
- | | | | | |
|--------------------|--------------------|---------------------|--------------------|--|
| <code>admin</code> | <code>delta</code> | <code>prs</code> | <code>unget</code> | |
| <code>cflow</code> | <code>get</code> | <code>rm del</code> | <code>val</code> | |
| <code>ctags</code> | <code>m4</code> | <code>sact</code> | <code>what</code> | |
| <code>cxref</code> | <code>nm</code> | <code>sccs</code> | | |
- Within the utilities that are provided, functionality marked by the code OF (see Section 1.5.1 (on page 6)) need not be provided.

2.1.5 Option Groups

An Option Group is a group of related functions or options defined within the System Interfaces volume of IEEE Std 1003.1-2001.

If an implementation supports an Option Group, then the system shall support the functional behavior described herein.

If an implementation does not support an Option Group, then the system need not support the functional behavior described herein.

2.1.5.1 Subprofiling Considerations

Profiling standards supporting functional requirements less than that required in IEEE Std 1003.1-2001 may subset both mandatory and optional functionality required for POSIX Conformance (see Section 2.1.3 (on page 18)) or XSI Conformance (see Section 2.1.4 (on page 21)). Such profiles shall organize the subsets into Subprofiling Option Groups.

The Rationale (Informative) volume of IEEE Std 1003.1-2001, Appendix E, Subprofiling Considerations (Informative) describes a representative set of such Subprofiling Option Groups for use by profiles applicable to specialized realtime systems. IEEE Std 1003.1-2001 does not require that the presence of Subprofiling Option Groups be testable at compile-time (as symbols defined in any header) or at runtime (via `sysconf()` or `getconf()`).

A Subprofiling Option Group may provide basic system functionality that other Subprofiling Option Groups and other options depend upon.³ If a profile of IEEE Std 1003.1-2001 does not

3. As an example, the File System profiling option group provides underlying support for pathname resolution and file creation which are needed by any interface in IEEE Std 1003.1-2001 that parses a *path* argument. If a profile requires support for the Device Input and Output profiling option group but does not require support for the File System profiling option group, the profile must specify how pathname resolution is to behave in that profile, how the `O_CREAT` flag to `open()` is to be handled (and the use of the character 'a' in the *mode* argument of `open()` when a filename argument names a file that does not exist), and specify lots of other details.

require an implementation to provide a Subprofiling Option Group that provides features utilized by a required Subprofiling Option Group (or option),⁴ the profile shall specify⁵ all of the following:

- Restricted or altered behavior of interfaces defined in IEEE Std 1003.1-2001 that may differ on an implementation of the profile
- Additional behaviors that may produce undefined or unspecified results
- Additional implementation-defined behavior that implementations shall be required to document in the profile's conformance document

if any of the above is a result of the profile not requiring an interface required by IEEE Std 1003.1-2001.

The following additional rules shall apply to all profiles of IEEE Std 1003.1-2001:

- Any application that conforms to that profile shall also conform to IEEE Std 1003.1-2001 (that is, a profile shall not require restricted, altered, or extended behaviors of an implementation of IEEE Std 1003.1-2001).
- Profiles are permitted to add additional requirements to the limits defined in **<limits.h>** and **<stdint.h>**, subject to the following:
 - For the limits in **<limits.h>** and **<stdint.h>**:
 - If the limit is specified as having a fixed value, it shall not be changed by a profile.
 - If a limit is specified as having a minimum or maximum acceptable value, it may be changed by a profile as follows:
 - A profile may increase a minimum acceptable value, but shall not make a minimum acceptable value smaller.
 - A profile may reduce a maximum acceptable value, but shall not make a maximum acceptable value larger.
 - A profile shall not change a limit specified as having a minimum or maximum value into a limit specified as having a fixed value.
 - A profile shall not create new limits.
 - Any implementation that conforms to IEEE Std 1003.1-2001 (including all options and extended limits required by the profile) shall also conform to that profile.

4. As an example, IEEE Std 1003.1-2001 requires that implementations claiming to support the Range Memory Locking option also support the Process Memory Locking option. A profile could require that the Range Memory Locking option had to be supplied without requiring that the Process Memory Locking option be supplied as long as the profile specifies everything an application writer or system implementor would have to know to build an application or implementation conforming to the profile.

5. Note that the profile could just specify that any use of the features not specified by the profile would produce undefined or unspecified results.

873 2.1.5.2 XSI Option Groups

874 xsi This section describes Option Groups to support the definition of XSI conformance within the
 875 System Interfaces volume of IEEE Std 1003.1-2001. This functionality is dependent on the
 876 support of the XSI extension (and the rest of this section is not further shaded).

877 The following Option Groups are defined.

878 **Encryption**

879 The Encryption Option Group is denoted by the symbolic constant `_XOPEN_CRYPT`. It includes
 880 the following functions:

881 `crypt()`, `encrypt()`, `setkey()`

882 These functions are marked CRYPT.

883 Due to export restrictions on the decoding algorithm in some countries, implementations may be
 884 restricted in making these functions available. All the functions in the Encryption Option Group
 885 may therefore return `[ENOSYS]` or, alternatively, `encrypt()` shall return `[ENOSYS]` for the
 886 decryption operation.

887 An implementation that claims conformance to this Option Group shall set `_XOPEN_CRYPT` to
 888 a value other than `-1`.

889 **Realtime**

890 The Realtime Option Group is denoted by the symbolic constant `_XOPEN_REALTIME`.

891 This Option Group includes a set of realtime functions drawn from options within
 892 IEEE Std 1003.1-2001 (see Section 2.1.6 (on page 28)).

893 Where entire functions are included in the Option Group, the NAME section is marked with
 894 REALTIME. Where additional semantics have been added to existing pages, the new material is
 895 identified by use of the appropriate margin legend for the underlying option defined within
 896 IEEE Std 1003.1-2001.

897 An implementation that claims conformance to this Option Group shall set
 898 `_XOPEN_REALTIME` to a value other than `-1`.

899 This Option Group consists of the set of the following options from within IEEE Std 1003.1-2001
 900 (see Section 2.1.6 (on page 28)):

901 `_POSIX_ASYNCHRONOUS_IO`
 902 `_POSIX_FSYNC`
 903 `_POSIX_MAPPED_FILES`
 904 `_POSIX_MEMLOCK`
 905 `_POSIX_MEMLOCK_RANGE`
 906 `_POSIX_MEMORY_PROTECTION`
 907 `_POSIX_MESSAGE_PASSING`
 908 `_POSIX_PRIORITIZED_IO`
 909 `_POSIX_PRIORITY_SCHEDULING`
 910 `_POSIX_REALTIME_SIGNALS`
 911 `_POSIX_SEMAPHORES`
 912 `_POSIX_SHARED_MEMORY_OBJECTS`
 913 `_POSIX_SYNCHRONIZED_IO`
 914 `_POSIX_TIMERS`

If the symbolic constant `_XOPEN_REALTIME` is defined to have a value other than `-1`, then the following symbolic constants shall be defined by the implementation to have the value 200112L:

```

_POSIX_ASYNCHRONOUS_IO
_POSIX_MEMLOCK
_POSIX_MEMLOCK_RANGE
_POSIX_MESSAGE_PASSING
_POSIX_PRIORITY_SCHEDULING
_POSIX_REALTIME_SIGNALS
_POSIX_SEMAPHORES
_POSIX_SHARED_MEMORY_OBJECTS
_POSIX_SYNCHRONIZED_IO
_POSIX_TIMERS

```

The functionality associated with `_POSIX_MAPPED_FILES`, `_POSIX_MEMORY_PROTECTION`, and `_POSIX_FSYNC` is always supported on XSI-conformant systems.

Support of `_POSIX_PRIORITIZED_IO` on XSI-conformant systems is optional. If this functionality is supported, then `_POSIX_PRIORITIZED_IO` shall be set to a value other than `-1`. Otherwise, it shall be undefined.

If `_POSIX_PRIORITIZED_IO` is supported, then asynchronous I/O operations performed by `aio_read()`, `aio_write()`, and `lio_listio()` shall be submitted at a priority equal to the scheduling priority of the process minus `aiocbp->aio_reqprio`. The implementation shall also document for which files I/O prioritization is supported.

Advanced Realtime

An implementation that claims conformance to this Option Group shall also support the Realtime Option Group.

Where entire functions are included in the Option Group, the NAME section is marked with **ADVANCED REALTIME**. Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-2001.

This Option Group consists of the set of the following options from within IEEE Std 1003.1-2001 (see Section 2.1.6 (on page 28)):

```

_POSIX_ADVISORY_INFO
_POSIX_CLOCK_SELECTION
_POSIX_CPUTIME
_POSIX_MONOTONIC_CLOCK
_POSIX_SPAWN
_POSIX_SPORADIC_SERVER
_POSIX_TIMEOUTS
_POSIX_TYPED_MEMORY_OBJECTS

```

If the implementation supports the Advanced Realtime Option Group, then the following symbolic constants shall be defined by the implementation to have the value 200112L:

955 _POSIX_ADVISORY_INFO
 956 _POSIX_CLOCK_SELECTION
 957 _POSIX_CPUTIME
 958 _POSIX_MONOTONIC_CLOCK
 959 _POSIX_SPAWN
 960 _POSIX_SPORADIC_SERVER
 961 _POSIX_TIMEOUTS
 962 _POSIX_TYPED_MEMORY_OBJECTS

963 If the symbolic constant `_POSIX_SPORADIC_SERVER` is defined, then the symbolic constant
 964 `_POSIX_PRIORITY_SCHEDULING` shall also be defined by the implementation to have the
 965 value 200112L.

966 If the symbolic constant `_POSIX_CPUTIME` is defined, then the symbolic constant
 967 `_POSIX_TIMERS` shall also be defined by the implementation to have the value 200112L.

968 If the symbolic constant `_POSIX_MONOTONIC_CLOCK` is defined, then the symbolic constant
 969 `_POSIX_TIMERS` shall also be defined by the implementation to have the value 200112L.

970 If the symbolic constant `_POSIX_CLOCK_SELECTION` is defined, then the symbolic constant
 971 `_POSIX_TIMERS` shall also be defined by the implementation to have the value 200112L.

972 **Realtime Threads**

973 The Realtime Threads Option Group is denoted by the symbolic constant
 974 `_XOPEN_REALTIME_THREADS`.

975 This Option Group consists of the set of the following options from within IEEE Std 1003.1-2001
 976 (see Section 2.1.6 (on page 28)):

977 _POSIX_THREAD_PRIO_INHERIT
 978 _POSIX_THREAD_PRIO_PROTECT
 979 _POSIX_THREAD_PRIORITY_SCHEDULING

980 Where applicable, whole pages are marked `REALTIME THREADS`, together with the
 981 appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 6)).

982 An implementation that claims conformance to this Option Group shall set
 983 `_XOPEN_REALTIME_THREADS` to a value other than `-1`.

984 If the symbol `_XOPEN_REALTIME_THREADS` is defined to have a value other than `-1`, then the
 985 following options shall also be defined by the implementation to have the value 200112L:

986 _POSIX_THREAD_PRIO_INHERIT
 987 _POSIX_THREAD_PRIO_PROTECT
 988 _POSIX_THREAD_PRIORITY_SCHEDULING

989 **Advanced Realtime Threads**

990 An implementation that claims conformance to this Option Group shall also support the
 991 Realtime Threads Option Group.

992 Where entire functions are included in the Option Group, the NAME section is marked with
 993 `ADVANCED REALTIME THREADS`. Where additional semantics have been added to existing
 994 pages, the new material is identified by use of the appropriate margin legend for the underlying
 995 option defined within IEEE Std 1003.1-2001.

996 This Option Group consists of the set of the following options from within IEEE Std 1003.1-2001
 997 (see Section 2.1.6 (on page 28)):

998 _POSIX_BARRIERS
 999 _POSIX_SPIN_LOCKS
 1000 _POSIX_THREAD_CPUTIME
 1001 _POSIX_THREAD_SPORADIC_SERVER

1002 If the symbolic constant _POSIX_THREAD_SPORADIC_SERVER is defined to have the value
 1003 200112L, then the symbolic constant _POSIX_THREAD_PRIORITY_SCHEDULING shall also be
 1004 defined by the implementation to have the value 200112L.

1005 If the symbolic constant _POSIX_THREAD_CPUTIME is defined to have the value 200112L,
 1006 then the symbolic constant _POSIX_TIMERS shall also be defined by the implementation to have
 1007 the value 200112L.

1008 If the symbolic constant _POSIX_BARRIERS is defined to have the value 200112L, then the
 1009 symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also
 1010 be defined by the implementation to have the value 200112L.

1011 If the symbolic constant _POSIX_SPIN_LOCKS is defined to have the value 200112L, then the
 1012 symbolic constants _POSIX_THREADS and _POSIX_THREAD_SAFE_FUNCTIONS shall also
 1013 be defined by the implementation to have the value 200112L.

1014 If the implementation supports the Advanced Realtime Threads Option Group, then the
 1015 following symbolic constants shall be defined by the implementation to have the value 200112L:

1016 _POSIX_BARRIERS
 1017 _POSIX_SPIN_LOCKS
 1018 _POSIX_THREAD_CPUTIME
 1019 _POSIX_THREAD_SPORADIC_SERVER

1020 **Tracing**

1021 This Option Group includes a set of tracing functions drawn from options within
 1022 IEEE Std 1003.1-2001 (see Section 2.1.6 (on page 28)).

1023 Where entire functions are included in the Option Group, the NAME section is marked with
 1024 TRACING. Where additional semantics have been added to existing pages, the new material is
 1025 identified by use of the appropriate margin legend for the underlying option defined within
 1026 IEEE Std 1003.1-2001.

1027 This Option Group consists of the set of the following options from within IEEE Std 1003.1-2001
 1028 (see Section 2.1.6 (on page 28)):

1029 _POSIX_TRACE
 1030 _POSIX_TRACE_EVENT_FILTER
 1031 _POSIX_TRACE_LOG
 1032 _POSIX_TRACE_INHERIT

1033 If the implementation supports the Tracing Option Group, then the following symbolic
 1034 constants shall be defined by the implementation to have the value 200112L:

1035 _POSIX_TRACE
 1036 _POSIX_TRACE_EVENT_FILTER
 1037 _POSIX_TRACE_LOG
 1038 _POSIX_TRACE_INHERIT

XSI STREAMS

The XSI STREAMS Option Group is denoted by the symbolic constant `_XOPEN_STREAMS`.

This Option Group includes functionality related to STREAMS, a uniform mechanism for implementing networking services and other character-based I/O as described in the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.6, STREAMS.

It includes the following functions:

fattach(), *fdetach()*, *getmsg()*, *getpmsg()*, *ioctl()*, *isastream()*, *putmsg()*, *putpmsg()*

and the `<stropts.h>` header.

Where applicable, whole pages are marked STREAMS, together with the appropriate option margin legend for the SYNOPSIS section (see Section 1.5.1 (on page 6)). Where additional semantics have been added to existing pages, the new material is identified by use of the appropriate margin legend for the underlying option defined within IEEE Std 1003.1-2001.

An implementation that claims conformance to this Option Group shall set `_XOPEN_STREAMS` to a value other than `-1`.

Legacy

The Legacy Option Group is denoted by the symbolic constant `_XOPEN_LEGACY`.

The Legacy Option Group includes the functions and headers which were mandatory in previous versions of IEEE Std 1003.1-2001 but are optional in this version.

These functions and headers are retained in IEEE Std 1003.1-2001 because of their widespread use. Application writers should not rely on the existence of these functions or headers in new applications, but should follow the migration path detailed in the APPLICATION USAGE sections of the relevant pages.

Various factors may have contributed to the decision to mark a function or header LEGACY. In all cases, the specific reasons for the withdrawal of a function or header are documented on the relevant pages.

Once a function or header is marked LEGACY, no modifications are made to the specifications of such functions or headers other than to the APPLICATION USAGE sections of the relevant pages.

The functions and headers which form this Option Group are as follows:

bcmp(), *bcopy()*, *bzero()*, *ecvt()*, *fcvt()*, *ftime()*, *gcvt()*, *getwd()*, *index()*, *mktemp()*, *rindex()*, *utimes()*, *wcs wcs()*

An implementation that claims conformance to this Option Group shall set `_XOPEN_LEGACY` to a value other than `-1`.

2.1.6 Options

The symbolic constants defined in `<unistd.h>`, **Constants for Options and Option Groups** (on page 400) reflect implementation options for IEEE Std 1003.1-2001. These symbols can be used by the application to determine which optional facilities are present on the implementation. The *sysconf()* function defined in the System Interfaces volume of IEEE Std 1003.1-2001 or the *getconf* utility defined in the Shell and Utilities volume of IEEE Std 1003.1-2001 can be used to retrieve the value of each symbol on each specific implementation to determine whether the option is supported.

1080		Where an option is not supported, the associated utilities, functions, or facilities need not be
1081		present.
1082		Margin codes are defined for each option (see Section 1.5.1 (on page 6)).
1083	2.1.6.1	<i>System Interfaces</i>
1084		Refer to <unistd.h>, Constants for Options and Option Groups (on page 400) for the list of
1085		options.
1086	2.1.6.2	<i>Shell and Utilities</i>
1087		Each of these symbols shall be considered valid names by the implementation. Refer to
1088		<unistd.h>, Constants for Options and Option Groups (on page 400).
1089		The literal names shown below apply only to the <i>getconf</i> utility.
1090	CD	POSIX2_C_DEV
1091		The system supports the C-Language Development Utilities option.
1092		The utilities in the C-Language Development Utilities option are used for the development
1093		of C-language applications, including compilation or translation of C source code and
1094		complex program generators for simple lexical tasks and processing of context-free
1095		grammars.
1096		The utilities listed below may be provided by a conforming system; however, any system
1097		claiming conformance to the C-Language Development Utilities option shall provide all of
1098		the utilities listed.
1099		<i>c99</i>
1100		<i>lex</i>
1101		<i>yacc</i>
1102		POSIX2_CHAR_TERM
1103		The system supports the Terminal Characteristics option. This value need not be present on
1104		a system not supporting the User Portability Utilities option.
1105		Where applicable, the dependency is noted within the description of the utility.
1106		This option applies only to systems supporting the User Portability Utilities option. If
1107		supported, then the system supports at least one terminal type capable of all operations
1108		described in IEEE Std 1003.1-2001; see Section 10.2 (on page 185).
1109	FD	POSIX2_FORT_DEV
1110		The system supports the FORTRAN Development Utilities option.
1111		The <i>fort77</i> FORTRAN compiler is the only utility in the FORTRAN Development Utilities
1112		option. This is used for the development of FORTRAN language applications, including
1113		compilation or translation of FORTRAN source code.
1114		The <i>fort77</i> utility may be provided by a conforming system; however, any system claiming
1115		conformance to the FORTRAN Development Utilities option shall provide the <i>fort77</i> utility.
1116	FR	POSIX2_FORT_RUN
1117		The system supports the FORTRAN Runtime Utilities option.
1118		The <i>asa</i> utility is the only utility in the FORTRAN Runtime Utilities option.
1119		The <i>asa</i> utility may be provided by a conforming system; however, any system claiming
1120		conformance to the FORTRAN Runtime Utilities option shall provide the <i>asa</i> utility.

1121		POSIX2_LOCALEDEF
1122		The system supports the Locale Creation Utilities option.
1123		If supported, the system supports the creation of locales as described in the <i>localedef</i> utility.
1124		The <i>localedef</i> utility may be provided by a conforming system; however, any system
1125		claiming conformance to the Locale Creation Utilities option shall provide the <i>localedef</i>
1126		utility.
1127	BE	POSIX2_PBS
1128		The system supports the Batch Environment Services and Utilities option (see the Shell and
1129		Utilities volume of IEEE Std 1003.1-2001, Chapter 3, Batch Environment Services).
1130		Note: The Batch Environment Services and Utilities option is a combination of mandatory and
1131		optional batch services and utilities. The POSIX_PBS symbolic constant implies the
1132		system supports all the mandatory batch services and utilities.
1133		POSIX2_PBS_ACCOUNTING
1134		The system supports the Batch Accounting option.
1135		POSIX2_PBS_CHECKPOINT
1136		The system supports the Batch Checkpoint/Restart option.
1137		POSIX2_PBS_LOCATE
1138		The system supports the Locate Batch Job Request option.
1139		POSIX2_PBS_MESSAGE
1140		The system supports the Batch Job Message Request option.
1141		POSIX2_PBS_TRACK
1142		The system supports the Track Batch Job Request option.
1143	SD	POSIX2_SW_DEV
1144		The system supports the Software Development Utilities option.
1145		The utilities in the Software Development Utilities option are used for the development of
1146		applications, including compilation or translation of source code, the creation and
1147		maintenance of library archives, and the maintenance of groups of inter-dependent
1148		programs.
1149		The utilities listed below may be provided by the conforming system; however, any system
1150		claiming conformance to the Software Development Utilities option shall provide all of the
1151		utilities listed here.
1152		<i>ar</i>
1153		<i>make</i>
1154		<i>nm</i>
1155		<i>strip</i>
1156	UP	POSIX2_UPE
1157		The system supports the User Portability Utilities option.
1158		The utilities in the User Portability Utilities option shall be implemented on all systems that
1159		claim conformance to this option. Certain utilities are noted as having features that cannot
1160		be implemented on all terminal types; if the POSIX2_CHAR_TERM option is supported, the
1161		system shall support all such features on at least one terminal type; see Section 10.2 (on
1162		page 185).
1163		Some of the utilities are required only on systems that also support the Software
1164		Development Utilities option, or the character-at-a-time terminal option (see Section 10.2
1165		(on page 185)); such utilities have this noted in their DESCRIPTION sections. All of the

1166 other utilities listed are required only on systems that claim conformance to the User
1167 Portability Utilities option.

1168	<i>alias</i>	<i>expand</i>	<i>nm</i>	<i>unalias</i>
1169	<i>at</i>	<i>fc</i>	<i>patch</i>	<i>unexpand</i>
1170	<i>batch</i>	<i>fg</i>	<i>ps</i>	<i>uudecode</i>
1171	<i>bg</i>	<i>file</i>	<i>renice</i>	<i>uuencode</i>
1172	<i>crontab</i>	<i>jobs</i>	<i>split</i>	<i>vi</i>
1173	<i>split</i>	<i>man</i>	<i>strings</i>	<i>who</i>
1174	<i>ctags</i>	<i>mesg</i>	<i>tabs</i>	<i>write</i>
1175	<i>df</i>	<i>more</i>	<i>talk</i>	
1176	<i>du</i>	<i>newgrp</i>	<i>time</i>	
1177	<i>ex</i>	<i>nice</i>	<i>tput</i>	

1178 2.2 Application Conformance

1179 All applications claiming conformance to IEEE Std 1003.1-2001 shall use only language-
1180 dependent services for the C programming language described in Section 2.3 (on page 33), shall
1181 use only the utilities and facilities defined in the Shell and Utilities volume of
1182 IEEE Std 1003.1-2001, and shall fall within one of the following categories.

1183 2.2.1 Strictly Conforming POSIX Application

1184 A Strictly Conforming POSIX Application is an application that requires only the facilities
1185 described in IEEE Std 1003.1-2001. Such an application:

- 1186 1. Shall accept any implementation behavior that results from actions it takes in areas
1187 described in IEEE Std 1003.1-2001 as *implementation-defined* or *unspecified*, or where
1188 IEEE Std 1003.1-2001 indicates that implementations may vary
- 1189 2. Shall not perform any actions that are described as producing *undefined* results
- 1190 3. For symbolic constants, shall accept any value in the range permitted by
1191 IEEE Std 1003.1-2001, but shall not rely on any value in the range being greater than the
1192 minimums listed or being less than the maximums listed in IEEE Std 1003.1-2001
- 1193 4. Shall not use facilities designated as *obsolescent*
- 1194 5. Is required to tolerate and permitted to adapt to the presence or absence of optional
1195 facilities whose availability is indicated by Section 2.1.3 (on page 18)
- 1196 6. For the C programming language, shall not produce any output dependent on any
1197 behavior described in the ISO/IEC 9899:1999 standard as *unspecified*, *undefined*, or
1198 *implementation-defined*, unless the System Interfaces volume of IEEE Std 1003.1-2001
1199 specifies the behavior
- 1200 7. For the C programming language, shall not exceed any minimum implementation limit
1201 defined in the ISO/IEC 9899:1999 standard, unless the System Interfaces volume of
1202 IEEE Std 1003.1-2001 specifies a higher minimum implementation limit
- 1203 8. For the C programming language, shall define `_POSIX_C_SOURCE` to be 200112L before
1204 any header is included

1205 Within IEEE Std 1003.1-2001, any restrictions placed upon a Conforming POSIX Application
1206 shall restrict a Strictly Conforming POSIX Application.

1207 2.2.2 Conforming POSIX Application

1208 2.2.2.1 ISO/IEC Conforming POSIX Application

1209 An ISO/IEC Conforming POSIX Application is an application that uses only the facilities
1210 described in IEEE Std 1003.1-2001 and approved Conforming Language bindings for any ISO or
1211 IEC standard. Such an application shall include a statement of conformance that documents all
1212 options and limit dependencies, and all other ISO or IEC standards used.

1213 2.2.2.2 <National Body> Conforming POSIX Application

1214 A <National Body> Conforming POSIX Application differs from an ISO/IEC Conforming
1215 POSIX Application in that it also may use specific standards of a single ISO/IEC member body
1216 referred to here as <National Body>. Such an application shall include a statement of
1217 conformance that documents all options and limit dependencies, and all other <National Body>
1218 standards used.

1219 2.2.3 Conforming POSIX Application Using Extensions

1220 A Conforming POSIX Application Using Extensions is an application that differs from a
1221 Conforming POSIX Application only in that it uses non-standard facilities that are consistent
1222 with IEEE Std 1003.1-2001. Such an application shall fully document its requirements for these
1223 extended facilities, in addition to the documentation required of a Conforming POSIX
1224 Application. A Conforming POSIX Application Using Extensions shall be either an ISO/IEC
1225 Conforming POSIX Application Using Extensions or a <National Body> Conforming POSIX
1226 Application Using Extensions (see Section 2.2.2.1 and Section 2.2.2.2).

1227 2.2.4 Strictly Conforming XSI Application

1228 A Strictly Conforming XSI Application is an application that requires only the facilities described
1229 in IEEE Std 1003.1-2001. Such an application:

- 1230 1. Shall accept any implementation behavior that results from actions it takes in areas
1231 described in IEEE Std 1003.1-2001 as *implementation-defined* or *unspecified*, or where
1232 IEEE Std 1003.1-2001 indicates that implementations may vary
- 1233 2. Shall not perform any actions that are described as producing *undefined* results
- 1234 3. For symbolic constants, shall accept any value in the range permitted by
1235 IEEE Std 1003.1-2001, but shall not rely on any value in the range being greater than the
1236 minimums listed or being less than the maximums listed in IEEE Std 1003.1-2001
- 1237 4. Shall not use facilities designated as *obsolescent*
- 1238 5. Is required to tolerate and permitted to adapt to the presence or absence of optional
1239 facilities whose availability is indicated by Section 2.1.4 (on page 21)
- 1240 6. For the C programming language, shall not produce any output dependent on any
1241 behavior described in the ISO C standard as *unspecified*, *undefined*, or *implementation-*
1242 *defined*, unless the System Interfaces volume of IEEE Std 1003.1-2001 specifies the behavior
- 1243 7. For the C programming language, shall not exceed any minimum implementation limit
1244 defined in the ISO C standard, unless the System Interfaces volume of
1245 IEEE Std 1003.1-2001 specifies a higher minimum implementation limit
- 1246 8. For the C programming language, shall define `_XOPEN_SOURCE` to be 600 before any
1247 header is included

1248 Within IEEE Std 1003.1-2001, any restrictions placed upon a Conforming POSIX Application
1249 shall restrict a Strictly Conforming XSI Application.

1250 **2.2.5 Conforming XSI Application Using Extensions**

1251 A Conforming XSI Application Using Extensions is an application that differs from a Strictly
1252 Conforming XSI Application only in that it uses non-standard facilities that are consistent with
1253 IEEE Std 1003.1-2001. Such an application shall fully document its requirements for these
1254 extended facilities, in addition to the documentation required of a Strictly Conforming XSI
1255 Application.

1256 **2.3 Language-Dependent Services for the C Programming Language**

1257 Implementors seeking to claim conformance using the ISO C standard shall claim POSIX
1258 conformance as described in Section 2.1.3 (on page 18).

1259 **2.4 Other Language-Related Specifications**

1260 IEEE Std 1003.1-2001 is currently specified in terms of the shell command language and ISO C.
1261 Bindings to other programming languages are being developed.

1262 If conformance to IEEE Std 1003.1-2001 is claimed for implementation of any programming
1263 language, the implementation of that language shall support the use of external symbols distinct
1264 to at least 31 bytes in length in the source program text. (That is, identifiers that differ at or
1265 before the thirty-first byte shall be distinct.) If a national or international standard governing a
1266 language defines a maximum length that is less than this value, the language-defined maximum
1267 shall be supported. External symbols that differ only by case shall be distinct when the character
1268 set in use distinguishes uppercase and lowercase characters and the language permits (or
1269 requires) uppercase and lowercase characters to be distinct in external symbols.

Definitions

1271

1272 For the purposes of IEEE Std 1003.1-2001, the terms and definitions given in Chapter 3 apply.

1273 **Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and
1274 definitions given in this chapter are used elsewhere in text related to extensions and options,
1275 they are shaded as appropriate.

1276 3.1 Abortive Release

1277 An abrupt termination of a network connection that may result in the loss of data.

1278 3.2 Absolute Pathname

1279 A pathname beginning with a single or more than two slashes; see also Section 3.266 (on page
1280 72).

1281 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

1282 3.3 Access Mode

1283 A particular form of access permitted to a file.

1284 3.4 Additional File Access Control Mechanism

1285 An implementation-defined mechanism that is layered upon the access control mechanisms
1286 defined here, but which do not grant permissions beyond those defined herein, although they
1287 may further restrict them.

1288 **Note:** File Access Permissions are defined in detail in Section 4.4 (on page 99).

1289 3.5 Address Space

1290 The memory locations that can be referenced by a process or the threads of a process.

1291 3.6 Advisory Information

1292 An interface that advises the implementation on (portable) application behavior so that it can
1293 optimize the system.

1294 3.7 Affirmative Response

1295 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
1296 keyword **yesexpr**, matching an extended regular expression in the current locale.

1297 **Note:** The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 152).

1298 3.8 Alert

1299 To cause the user's terminal to give some audible or visual indication that an error or some other
1300 event has occurred. When the standard output is directed to a terminal device, the method for
1301 alerting the terminal user is unspecified. When the standard output is not directed to a terminal
1302 device, the alert is accomplished by writing the <alert> to standard output (unless the utility
1303 description indicates that the use of standard output produces undefined results in this case).

1304 3.9 Alert Character (<alert>)

1305 A character that in the output stream should cause a terminal to alert its user via a visual or
1306 audible notification. It is the character designated by '`\a`' in the C language. It is unspecified
1307 whether this character is the exact sequence transmitted to an output device by the system to
1308 accomplish the alert function.

1309 3.10 Alias Name

1310 In the shell command language, a word consisting solely of underscores, digits, and alphabets
1311 from the portable character set and any of the following characters: '`!`', '`%`', '`'`', '`,`', '`@`'.

1312 Implementations may allow other characters within alias names as an extension.

1313 **Note:** The Portable Character Set is defined in detail in Section 6.1 (on page 115).

1314 3.11 Alignment

1315 A requirement that objects of a particular type be located on storage boundaries with addresses
1316 that are particular multiples of a byte address.

1317 **Note:** See also the ISO C standard, Section B3.

1318 3.12 Alternate File Access Control Mechanism

1319 An implementation-defined mechanism that is independent of the access control mechanisms
1320 defined herein, and which if enabled on a file may either restrict or extend the permissions of a
1321 given user. IEEE Std 1003.1-2001 defines when such mechanisms can be enabled and when they
1322 are disabled.

1323 **Note:** File Access Permissions are defined in detail in Section 4.4 (on page 99).

1324 **3.13 Alternate Signal Stack**

1325 Memory associated with a thread, established upon request by the implementation for a thread,
1326 separate from the thread signal stack, in which signal handlers responding to signals sent to that
1327 thread may be executed.

1328 **3.14 Ancillary Data**

1329 Protocol-specific, local system-specific, or optional information. The information can be both
1330 local or end-to-end significant, header information, part of a data portion, protocol-specific, and
1331 implementation or system-specific.

1332 **3.15 Angle Brackets**

1333 The characters '`<`' (left-angle-bracket) and '`>`' (right-angle-bracket). When used in the phrase
1334 “enclosed in angle brackets”, the symbol '`<`' immediately precedes the object to be enclosed,
1335 and '`>`' immediately follows it. When describing these characters in the portable character set,
1336 the names `<less-than-sign>` and `<greater-than-sign>` are used.

1337 **3.16 Application**

1338 A computer program that performs some desired function.

1339 **3.17 Application Address**

1340 Endpoint address of a specific application.

1341 **3.18 Application Program Interface (API)**

1342 The definition of syntax and semantics for providing computer system services.

1343 **3.19 Appropriate Privileges**

1344 An implementation-defined means of associating privileges with a process with regard to the
1345 function calls, function call options, and the commands that need special privileges. There may
1346 be zero or more such means. These means (or lack thereof) are described in the conformance
1347 document.

1348 **Note:** Function calls are defined in the System Interfaces volume of IEEE Std 1003.1-2001, and
1349 commands are defined in the Shell and Utilities volume of IEEE Std 1003.1-2001.

1350 **3.20 Argument**

1351 In the shell command language, a parameter passed to a utility as the equivalent of a single
1352 string in the *argv* array created by one of the *exec* functions. An argument is one of the options,
1353 option-arguments, or operands following the command name.

1354 **Note:** The Utility Argument Syntax is defined in detail in Section 12.1 (on page 201) and the Shell and
1355 Utilities volume of IEEE Std 1003.1-2001, Section 2.9.1.1, Command Search and Execution.

1356 In the C language, an expression in a function call expression or a sequence of preprocessing
1357 tokens in a function-like macro invocation.

1358 **3.21 Arm (a Timer)**

1359 To start a timer measuring the passage of time, enabling notifying a process when the specified
1360 time or time interval has passed.

1361 **3.22 Asterisk**

1362 The character ' * '.

1363 **3.23 Async-Cancel-Safe Function**

1364 A function that may be safely invoked by an application while the asynchronous form of
1365 cancellation is enabled. No function is async-cancel-safe unless explicitly described as such. |

1366 **3.24 Asynchronous Events**

1367 Events that occur independently of the execution of the application.

1368 **3.25 Asynchronous Input and Output**

1369 A functionality enhancement to allow an application process to queue data input and output
1370 commands with asynchronous notification of completion.

1371 **3.26 Async-Signal-Safe Function**

1372 A function that may be invoked, without restriction, from signal-catching functions. No function
1373 is async-signal-safe unless explicitly described as such.

1374 **3.27 Asynchronously-Generated Signal**

1375 A signal that is not attributable to a specific thread. Examples are signals sent via *kill()*, signals
1376 sent from the keyboard, and signals delivered to process groups. Being asynchronous is a
1377 property of how the signal was generated and not a property of the signal number. All signals
1378 may be generated asynchronously.

1379 **Note:** The *kill()* function is defined in detail in the System Interfaces volume of IEEE Std 1003.1-2001.

1380 **3.28 Asynchronous I/O Completion**

1381 For an asynchronous read or write operation, when a corresponding synchronous read or write
1382 would have completed and when any associated status fields have been updated.

1383 **3.29 Asynchronous I/O Operation**

1384 An I/O operation that does not of itself cause the thread requesting the I/O to be blocked from
1385 further use of the processor.

1386 This implies that the process and the I/O operation may be running concurrently.

1387 **3.30 Authentication**

1388 The process of validating a user or process to verify that the user or process is not a counterfeit.

1389 **3.31 Authorization**

1390 The process of verifying that a user or process has permission to use a resource in the manner
1391 requested.

1392 To ensure security, the user or process would also need to be authenticated before granting
1393 access.

1394 **3.32 Background Job**

1395 See *Background Process Group* in Section 3.34.

1396 **3.33 Background Process**

1397 A process that is a member of a background process group.

1398 **3.34 Background Process Group (or Background Job)**

1399 Any process group, other than a foreground process group, that is a member of a session that
1400 has established a connection with a controlling terminal.

1401 **3.35 Backquote**

1402 The character ' ` ', also known as a grave accent.

1403 **3.36 Backslash**

1404 The character ' \ ', also known as a reverse solidus.

1405 **3.37 Backspace Character (<backspace>)**

1406 A character that, in the output stream, should cause printing (or displaying) to occur one column
1407 position previous to the position about to be printed. If the position about to be printed is at the
1408 beginning of the current line, the behavior is unspecified. It is the character designated by ' \b '
1409 in the C language. It is unspecified whether this character is the exact sequence transmitted to an
1410 output device by the system to accomplish the backspace function. The <backspace> defined
1411 here is not necessarily the ERASE special character.

1412 **Note:** Special Characters are defined in detail in Section 11.1.9 (on page 191).

1413 **3.38 Barrier**

1414 A synchronization object that allows multiple threads to synchronize at a particular point in
1415 their execution.

1416 **3.39 Base Character**

1417 One of the set of characters defined in the Latin alphabet. In Western European languages other
1418 than English, these characters are commonly used with diacritical marks (accents, cedilla, and so
1419 on) to extend the range of characters in an alphabet.

1420 **3.40 Basename**

1421 The final, or only, filename in a pathname.

1422 **3.41 Basic Regular Expression (BRE)**

1423 A regular expression (see Section 3.316 (on page 79)) used by the majority of utilities that select
1424 strings from a set of character strings.

1425 **Note:** Basic Regular Expressions are described in detail in Section 9.3 (on page 171).

1426 **3.42 Batch Access List**

1427 A list of user IDs and group IDs of those users and groups authorized to place batch jobs in a
1428 batch queue.

1429 A batch access list is associated with a batch queue. A batch server uses the batch access list of a
1430 batch queue as one of the criteria in deciding to put a batch job in a batch queue.

1431 **3.43 Batch Administrator**

1432 A user that is authorized to modify all the attributes of queues and jobs and to change the status
1433 of a batch server.

1434 **3.44 Batch Client**

1435 A computational entity that utilizes batch services by making requests of batch servers.
1436 Batch clients often provide the means by which users access batch services, although a batch
1437 server may act as a batch client by virtue of making requests of another batch server.

1438 **3.45 Batch Destination**

1439 The batch server in a batch system to which a batch job should be sent for processing.
1440 Acceptance of a batch job at a batch destination is the responsibility of a receiving batch server.
1441 A batch destination may consist of a batch server-specific portion, a network-wide portion, or
1442 both. The batch server-specific portion is referred to as the “batch queue”. The network-wide
1443 portion is referred to as a “batch server name”.

1444 **3.46 Batch Destination Identifier**

1445 A string that identifies a specific batch destination.
1446 A string of characters in the portable character set used to specify a particular batch destination.
1447 **Note:** The Portable Character Set is defined in detail in Section 6.1 (on page 115).

1448 **3.47 Batch Directive**

1449 A line from a file that is interpreted by the batch server. The line is usually in the form of a
1450 comment and is an additional means of passing options to the *qsub* utility.
1451 **Note:** The *qsub* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001.

1452 **3.48 Batch Job**

1453 A set of computational tasks for a computing system.
1454 Batch jobs are managed by batch servers.
1455 Once created, a batch job may be executing or pending execution. A batch job that is executing
1456 has an associated session leader (a process) that initiates and monitors the computational tasks
1457 of the batch job.

1458 **3.49 Batch Job Attribute**

1459 A named data type whose value affects the processing of a batch job.

1460 The values of the attributes of a batch job affect the processing of that job by the batch server
1461 that manages the batch job.

1462 **3.50 Batch Job Identifier**

1463 A unique name for a batch job. A name that is unique among all other batch job identifiers in a
1464 batch system and that identifies the batch server to which the batch job was originally
1465 submitted.

1466 **3.51 Batch Job Name**

1467 A label that is an attribute of a batch job. The batch job name is not necessarily unique.

1468 **3.52 Batch Job Owner**

1469 The *username@hostname* of the user submitting the batch job, where *username* is a user name (see
1470 also Section 3.426 (on page 94)) and *hostname* is a network host name.

1471 **3.53 Batch Job Priority**

1472 A value specified by the user that may be used by an implementation to determine the order in
1473 which batch jobs are selected to be executed. Job priority has a numeric value in the range –1 024
1474 to 1 023.

1475 **Note:** The batch job priority is not the execution priority (nice value) of the batch job.

1476 **3.54 Batch Job State**

1477 An attribute of a batch job which determines the types of requests that the batch server that
1478 manages the batch job can accept for the batch job. Valid states include QUEUED, RUNNING,
1479 HELD, WAITING, EXITING, and TRANSITING.

1480 **3.55 Batch Name Service**

1481 A service that assigns batch names that are unique within the batch name space, and that can
1482 translate a unique batch name into the location of the named batch entity.

1483 **3.56 Batch Name Space**

1484 The environment within which a batch name is known to be unique.

1485 **3.57 Batch Node**

1486 A host containing part or all of a batch system.

1487 A batch node is a host meeting at least one of the following conditions:

- 1488 • Capable of executing a batch client
- 1489 • Contains a routing batch queue
- 1490 • Contains an execution batch queue

1491 **3.58 Batch Operator**

1492 A user that is authorized to modify some, but not all, of the attributes of jobs and queues, and
1493 may change the status of the batch server.

1494 **3.59 Batch Queue**

1495 A manageable object that represents a set of batch jobs and is managed by a single batch server.

1496 **Note:** A set of batch jobs is called a batch queue largely for historical reasons. Jobs are selected from
1497 the batch queue for execution based on attributes such as priority, resource requirements, and
1498 hold conditions.

1499 See also the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 3.1.2, Batch Queues.

1500 **3.60 Batch Queue Attribute**

1501 A named data type whose value affects the processing of all batch jobs that are members of the
1502 batch queue.

1503 A batch queue has attributes that affect the processing of batch jobs that are members of the
1504 batch queue.

1505 **3.61 Batch Queue Position**

1506 The place, relative to other jobs in the batch queue, occupied by a particular job in a batch queue.
1507 This is defined in part by submission time and priority; see also Section 3.62.

1508 **3.62 Batch Queue Priority**

1509 The maximum job priority allowed for any batch job in a given batch queue.

1510 The batch queue priority is set and may be changed by users with appropriate privilege. The
1511 priority is bounded in an implementation-defined manner.

1512 **3.63 Batch Rerunability**

1513 An attribute of a batch job indicating that it may be rerun after an abnormal termination from
1514 the beginning without affecting the validity of the results.

1515 3.64 Batch Restart

1516 The action of resuming the processing of a batch job from the point of the last checkpoint.
1517 Typically, this is done if the batch job has been interrupted because of a system failure.

1518 3.65 Batch Server

1519 A computational entity that provides batch services.

1520 3.66 Batch Server Name

1521 A string of characters in the portable character set used to specify a particular server in a
1522 network.

1523 **Note:** The Portable Character Set is defined in detail in Section 6.1 (on page 115).

1524 3.67 Batch Service

1525 Computational and organizational services performed by a batch system on behalf of batch jobs.

1526 Batch services are of two types: requested and deferred.

1527 **Note:** Batch Services are listed in the Shell and Utilities volume of IEEE Std 1003.1-2001, Table 3-5,
1528 Batch Services Summary.

1529 3.68 Batch Service Request

1530 A solicitation of services from a batch client to a batch server.

1531 A batch service request may entail the exchange of any number of messages between the batch
1532 client and the batch server.

1533 When naming specific types of service requests, the term “request” is qualified by the type of
1534 request, as in *Queue Batch Job Request* and *Delete Batch Job Request*.

1535 3.69 Batch Submission

1536 The process by which a batch client requests that a batch server create a batch job via a *Queue Job*
1537 *Request* to perform a specified computational task.

1538 3.70 Batch System

1539 A collection of one or more batch servers.

1540 **3.71 Batch Target User**

1541 The name of a user on the batch destination batch server.

1542 The target user is the user name under whose account the batch job is to execute on the
1543 destination batch server.

1544 **3.72 Batch User**

1545 A user who is authorized to make use of batch services.

1546 **3.73 Bind**

1547 The process of assigning a network address to an endpoint.

1548 **3.74 Blank Character (<blank>)**

1549 One of the characters that belong to the **blank** character class as defined via the *LC_CTYPE*
1550 category in the current locale. In the POSIX locale, a <blank> is either a <tab> or a <space>.

1551 **3.75 Blank Line**

1552 A line consisting solely of zero or more <blank>s terminated by a <newline>; see also Section
1553 3.144 (on page 55).

1554 **3.76 Blocked Process (or Thread)**

1555 A process (or thread) that is waiting for some condition (other than the availability of a
1556 processor) to be satisfied before it can continue execution.

1557 **3.77 Blocking**

1558 A property of an open file description that causes function calls associated with it to wait for the
1559 requested action to be performed before returning.

1560 **3.78 Block-Mode Terminal**

1561 A terminal device operating in a mode incapable of the character-at-a-time input and output
1562 operations described by some of the standard utilities.

1563 **Note:** Output Devices and Terminal Types are defined in detail in Section 10.2 (on page 185).

1564 3.79 Block Special File

1565 A file that refers to a device. A block special file is normally distinguished from a character
 1566 special file by providing access to the device in a manner such that the hardware characteristics
 1567 of the device are not visible.

1568 3.80 Braces

1569 The characters ' { ' (left brace) and ' } ' (right brace), also known as curly braces. When used in
 1570 the phrase “enclosed in (curly) braces” the symbol ' { ' immediately precedes the object to be
 1571 enclosed, and ' } ' immediately follows it. When describing these characters in the portable
 1572 character set, the names <left-brace> and <right-brace> are used.

1573 3.81 Brackets

1574 The characters ' [' (left-bracket) and '] ' (right-bracket), also known as square brackets. When
 1575 used in the phrase “enclosed in (square) brackets” the symbol ' [' immediately precedes the
 1576 object to be enclosed, and '] ' immediately follows it. When describing these characters in the
 1577 portable character set, the names <left-square-bracket> and <right-square-bracket> are used.

1578 3.82 Broadcast

1579 The transfer of data from one endpoint to several endpoints, as described in RFC 919 and
 1580 RFC 922.

1581 3.83 Built-In Utility (or Built-In)

1582 A utility implemented within a shell. The utilities referred to as special built-ins have special
 1583 qualities. Unless qualified, the term “built-in” includes the special built-in utilities. Regular
 1584 built-ins are not required to be actually built into the shell on the implementation, but they do
 1585 have special command-search qualities.

1586 **Note:** Special Built-In Utilities are defined in detail in the Shell and Utilities volume of
 1587 IEEE Std 1003.1-2001, Section 2.14, Special Built-In Utilities.

1588 Regular Built-In Utilities are defined in detail in the Shell and Utilities volume of
 1589 IEEE Std 1003.1-2001, Section 2.9.1.1, Command Search and Execution.

1590 3.84 Byte

1591 An individually addressable unit of data storage that is exactly an octet, used to store a character
 1592 or a portion of a character; see also Section 3.87 (on page 47). A byte is composed of a
 1593 contiguous sequence of 8 bits. The least significant bit is called the “low-order” bit; the most
 1594 significant is called the “high-order” bit.

1595 **Note:** The definition of byte from the ISO C standard is broader than the above and might
 1596 accommodate hardware architectures with different sized addressable units than octets.

1597 3.85 Byte Input/Output Functions

1598 The functions that perform byte-oriented input from streams or byte-oriented output to streams:
 1599 *fgetc()*, *fgets()*, *fprintf()*, *fputc()*, *fputs()*, *fread()*, *fscanf()*, *fwrite()*, *getc()*, *getchar()*, *gets()*, *printf()*,
 1600 *putc()*, *putchar()*, *puts()*, *scanf()*, *ungetc()*, *vfprintf()*, and *vprintf()*.

1601 **Note:** Functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-2001.

1602 3.86 Carriage-Return Character (<carriage-return>)

1603 A character that in the output stream indicates that printing should start at the beginning of the
 1604 same physical line in which the <carriage-return> occurred. It is the character designated by
 1605 ‘\r’ in the C language. It is unspecified whether this character is the exact sequence
 1606 transmitted to an output device by the system to accomplish the movement to the beginning of
 1607 the line.

1608 3.87 Character

1609 A sequence of one or more bytes representing a single graphic symbol or control code.

1610 **Note:** This term corresponds to the ISO C standard term multi-byte character, where a single-byte
 1611 character is a special case of a multi-byte character. Unlike the usage in the ISO C standard,
 1612 *character* here has no necessary relationship with storage space, and *byte* is used when storage
 1613 space is discussed.

1614 See the definition of the portable character set in Section 6.1 (on page 115) for a further
 1615 explanation of the graphical representations of (abstract) characters, as opposed to character
 1616 encodings.

1617 3.88 Character Array

1618 An array of elements of type **char**.

1619 3.89 Character Class

1620 A named set of characters sharing an attribute associated with the name of the class. The classes
 1621 and the characters that they contain are dependent on the value of the *LC_CTYPE* category in the
 1622 current locale.

1623 **Note:** The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 126).

1624 3.90 Character Set

1625 A finite set of different characters used for the representation, organization, or control of data.

1626 **3.91 Character Special File**

1627 A file that refers to a device. One specific type of character special file is a terminal device file.

1628 **Note:** The General Terminal Interface is defined in detail in Chapter 11 (on page 187).

1629 **3.92 Character String**

1630 A contiguous sequence of characters terminated by and including the first null byte.

1631 **3.93 Child Process**

1632 A new process created (by *fork()*, *posix_spawn()*, or *posix_spawnnp()*) by a given process. A child
1633 process remains the child of the creating process as long as both processes continue to exist.

1634 **Note:** The *fork()*, *posix_spawn()*, and *posix_spawnnp()* functions are defined in detail in the System
1635 Interfaces volume of IEEE Std 1003.1-2001.

1636 **3.94 Circumflex**

1637 The character '^'.

1638 **3.95 Clock**

1639 A software or hardware object that can be used to measure the apparent or actual passage of
1640 time.

1641 The current value of the time measured by a clock can be queried and, possibly, set to a value
1642 within the legal range of the clock.

1643 **3.96 Clock Jump**

1644 The difference between two successive distinct values of a clock, as observed from the
1645 application via one of the “get time” operations.

1646 **3.97 Clock Tick**

1647 An interval of time; an implementation-defined number of these occur each second. Clock ticks
1648 are one of the units that may be used to express a value found in type **clock_t**.

1649 **3.98 Coded Character Set**

1650 A set of unambiguous rules that establishes a character set and the one-to-one relationship
1651 between each character of the set and its bit representation.

1652 3.99 Codeset

1653 The result of applying rules that map a numeric code value to each element of a character set. An
1654 element of a character set may be related to more than one numeric code value but the reverse is
1655 not true. However, for state-dependent encodings the relationship between numeric code values
1656 and elements of a character set may be further controlled by state information. The character set
1657 may contain fewer elements than the total number of possible numeric code values; that is, some
1658 code values may be unassigned.

1659 **Note:** Character Encoding is defined in detail in Section 6.2 (on page 118).

1660 3.100 Collating Element

1661 The smallest entity used to determine the logical ordering of character or wide-character strings;
1662 see also Section 3.102. A collating element consists of either a single character, or two or more
1663 characters collating as a single entity. The value of the *LC_COLLATE* category in the current
1664 locale determines the current set of collating elements.

1665 3.101 Collation

1666 The logical ordering of character or wide-character strings according to defined precedence
1667 rules. These rules identify a collation sequence between the collating elements, and such
1668 additional rules that can be used to order strings consisting of multiple collating elements.

1669 3.102 Collation Sequence

1670 The relative order of collating elements as determined by the setting of the *LC_COLLATE*
1671 category in the current locale. The collation sequence is used for sorting and is determined from
1672 the collating weights assigned to each collating element. In the absence of weights, the collation
1673 sequence is the order in which collating elements are specified between **order_start** and
1674 **order_end** keywords in the *LC_COLLATE* category.

1675 Multi-level sorting is accomplished by assigning elements one or more collation weights, up to
1676 the limit {*COLL_WEIGHTS_MAX*}. On each level, elements may be given the same weight (at
1677 the primary level, called an equivalence class; see also Section 3.150 (on page 55)) or be omitted
1678 from the sequence. Strings that collate equally using the first assigned weight (primary ordering)
1679 are then compared using the next assigned weight (secondary ordering), and so on.

1680 **Note:** {*COLL_WEIGHTS_MAX*} is defined in detail in **<limits.h>**.

1681 3.103 Column Position

1682 A unit of horizontal measure related to characters in a line.

1683 It is assumed that each character in a character set has an intrinsic column width independent of
1684 any output device. Each printable character in the portable character set has a column width of
1685 one. The standard utilities, when used as described in IEEE Std 1003.1-2001, assume that all
1686 characters have integral column widths. The column width of a character is not necessarily
1687 related to the internal representation of the character (numbers of bits or bytes).

1688 The column position of a character in a line is defined as one plus the sum of the column widths
1689 of the preceding characters in the line. Column positions are numbered starting from 1.

1690 **3.104 Command**

1691 A directive to the shell to perform a particular task.

1692 **Note:** Shell Commands are defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001,
1693 Section 2.9, Shell Commands.

1694 **3.105 Command Language Interpreter**

1695 An interface that interprets sequences of text input as commands. It may operate on an input
1696 stream or it may interactively prompt and read commands from a terminal. It is possible for
1697 applications to invoke utilities through a number of interfaces, which are collectively considered
1698 to act as command interpreters. The most obvious of these are the *sh* utility and the *system()*
1699 function, although *popen()* and the various forms of *exec* may also be considered to behave as
1700 interpreters.

1701 **Note:** The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001.

1702 The *system()*, *popen()*, and *exec* functions are defined in detail in the System Interfaces volume
1703 of IEEE Std 1003.1-2001.

1704 **3.106 Composite Graphic Symbol**

1705 A graphic symbol consisting of a combination of two or more other graphic symbols in a single
1706 character position, such as a diacritical mark and a base character.

1707 **3.107 Condition Variable**

1708 A synchronization object which allows a thread to suspend execution, repeatedly, until some
1709 associated predicate becomes true. A thread whose execution is suspended on a condition
1710 variable is said to be blocked on the condition variable.

1711 **3.108 Connection**

1712 An association established between two or more endpoints for the transfer of data

1713 **3.109 Connection Mode**

1714 The transfer of data in the context of a connection; see also Section 3.110.

1715 **3.110 Connectionless Mode**

1716 The transfer of data other than in the context of a connection; see also Section 3.109 and Section
1717 3.123 (on page 52).

1718 **3.111 Control Character**

1719 A character, other than a graphic character, that affects the recording, processing, transmission,
1720 or interpretation of text.

1721 **3.112 Control Operator**

1722 In the shell command language, a token that performs a control function. It is one of the
1723 following symbols:

1724 & && () ; ;; newline | ||

1725 The end-of-input indicator used internally by the shell is also considered a control operator.

1726 **Note:** Token Recognition is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001,
1727 Section 2.3, Token Recognition.

1728 **3.113 Controlling Process**

1729 The session leader that established the connection to the controlling terminal. If the terminal
1730 subsequently ceases to be a controlling terminal for this session, the session leader ceases to be
1731 the controlling process.

1732 **3.114 Controlling Terminal**

1733 A terminal that is associated with a session. Each session may have at most one controlling
1734 terminal associated with it, and a controlling terminal is associated with exactly one session.
1735 Certain input sequences from the controlling terminal cause signals to be sent to all processes in
1736 the process group associated with the controlling terminal.

1737 **Note:** The General Terminal Interface is defined in detail in Chapter 11 (on page 187).

1738 **3.115 Conversion Descriptor**

1739 A per-process unique value used to identify an open codeset conversion.

1740 **3.116 Core File**

1741 A file of unspecified format that may be generated when a process terminates abnormally.

1742 **3.117 CPU Time (Execution Time)**

1743 The time spent executing a process or thread, including the time spent executing system services
1744 on behalf of that process or thread. If the Threads option is supported, then the value of the
1745 CPU-time clock for a process is implementation-defined. With this definition the sum of all the
1746 execution times of all the threads in a process might not equal the process execution time, even
1747 in a single-threaded process, because implementations may differ in how they account for time
1748 during context switches or for other reasons.

1749 3.118 CPU-Time Clock

1750 A clock that measures the execution time of a particular process or thread.

1751 3.119 CPU-Time Timer

1752 A timer attached to a CPU-time clock.

1753 3.120 Current Job

1754 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities. There
1755 is at most one current job; see also Section 3.203 (on page 63).

1756 3.121 Current Working Directory

1757 See *Working Directory* in Section 3.436 (on page 96).

1758 3.122 Cursor Position

1759 The line and column position on the screen denoted by the terminal's cursor.

1760 3.123 Datagram

1761 A unit of data transferred from one endpoint to another in connectionless mode service.

1762 3.124 Data Segment

1763 Memory associated with a process, that can contain dynamically allocated data.

1764 3.125 Deferred Batch Service

1765 A service that is performed as a result of events that are asynchronous with respect to requests.

1766 **Note:** Once a batch job has been created, it is subject to deferred services.

1767 3.126 Device

1768 A computer peripheral or an object that appears to the application as such.

1769 3.127 Device ID

1770 A non-negative integer used to identify a device.

1771 3.128 Directory

1772 A file that contains directory entries. No two directory entries in the same directory have the
1773 same name.

1774 3.129 Directory Entry (or Link)

1775 An object that associates a filename with a file. Several directory entries can associate names
1776 with the same file.

1777 3.130 Directory Stream

1778 A sequence of all the directory entries in a particular directory. An open directory stream may be
1779 implemented using a file descriptor.

1780 3.131 Disarm (a Timer)

1781 To stop a timer from measuring the passage of time, disabling any future process notifications
1782 (until the timer is armed again).

1783 3.132 Display

1784 To output to the user's terminal. If the output is not directed to a terminal, the results are
1785 undefined.

1786 3.133 Display Line

1787 A line of text on a physical device or an emulation thereof. Such a line will have a maximum
1788 number of characters which can be presented.

1789 **Note:** This may also be written as “line on the display”.

1790 3.134 Dollar Sign

1791 The character ' \$ '.

1792 3.135 Dot

1793 In the context of naming files, the filename consisting of a single dot character (' . ').

1794 **Note:** In the context of shell special built-in utilities, see *dot* in the Shell and Utilities volume of
1795 IEEE Std 1003.1-2001, Section 2.14, Special Built-In Utilities.

1796 Pathname Resolution is defined in detail in Section 4.11 (on page 102).

1797 3.136 Dot-Dot

1798 The filename consisting solely of two dot characters (" . . ").

1799 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

1800 3.137 Double-Quote

1801 The character ' " ', also known as quotation-mark.

1802 **Note:** The “double” adjective in this term refers to the two strokes in the character glyph.
1803 IEEE Std 1003.1-2001 never uses the term “double-quote” to refer to two apostrophes or
1804 quotation marks.

1805 3.138 Downshifting

1806 The conversion of an uppercase character that has a single-character lowercase representation
1807 into this lowercase representation.

1808 3.139 Driver

1809 A module that controls data transferred to and received from devices.

1810 **Note:** Drivers are traditionally written to be a part of the system implementation, although they are
1811 frequently written separately from the writing of the implementation. A driver may contain
1812 processor-specific code, and therefore be non-portable.

1813 3.140 Effective Group ID

1814 An attribute of a process that is used in determining various permissions, including file access
1815 permissions; see also Section 3.188 (on page 61).

1816 3.141 Effective User ID

1817 An attribute of a process that is used in determining various permissions, including file access
1818 permissions; see also Section 3.425 (on page 94).

1819 3.142 Eight-Bit Transparency

1820 The ability of a software component to process 8-bit characters without modifying or utilizing
1821 any part of the character in a way that is inconsistent with the rules of the current coded
1822 character set.

1823 3.143 Empty Directory

1824 A directory that contains, at most, directory entries for dot and dot-dot, and has exactly one link
1825 to it, in dot-dot. No other links to the directory may exist. It is unspecified whether an
1826 implementation can ever consider the root directory to be empty.

1827 3.144 Empty Line

1828 A line consisting of only a <newline>; see also Section 3.75 (on page 45).

1829 3.145 Empty String (or Null String)

1830 A string whose first byte is a null byte.

1831 3.146 Empty Wide-Character String

1832 A wide-character string whose first element is a null wide-character code.

1833 3.147 Encoding Rule

1834 The rules used to convert between wide-character codes and multi-byte character codes.

1835 **Note:** Stream Orientation and Encoding Rules are defined in detail in the System Interfaces volume
1836 of IEEE Std 1003.1-2001, Section 2.5.2, Stream Orientation and Encoding Rules.

1837 3.148 Entire Regular Expression

1838 The concatenated set of one or more basic regular expressions or extended regular expressions
1839 that make up the pattern specified for string selection.

1840 **Note:** Regular Expressions are defined in detail in Chapter 9 (on page 169).

1841 3.149 Epoch

1842 The time zero hours, zero minutes, zero seconds, on January 1, 1970 Coordinated Universal Time
1843 (UTC).

1844 **Note:** See also Seconds Since the Epoch defined in Section 4.14 (on page 104).

1845 3.150 Equivalence Class

1846 A set of collating elements with the same primary collation weight.

1847 Elements in an equivalence class are typically elements that naturally group together, such as all
1848 accented letters based on the same base letter.

1849 The collation order of elements within an equivalence class is determined by the weights
1850 assigned on any subsequent levels after the primary weight.

1851 3.151 Era

1852 A locale-specific method for counting and displaying years.

1853 **Note:** The *LC_TIME* category is defined in detail in Section 7.3.5 (on page 147).

1854 **3.152 Event Management**

1855 The mechanism that enables applications to register for and be made aware of external events
1856 such as data becoming available for reading.

1857 **3.153 Executable File**

1858 A regular file acceptable as a new process image file by the equivalent of the *exec* family of
1859 functions, and thus usable as one form of a utility. The standard utilities described as compilers
1860 can produce executable files, but other unspecified methods of producing executable files may
1861 also be provided. The internal format of an executable file is unspecified, but a conforming
1862 application cannot assume an executable file is a text file.

1863 **3.154 Execute**

1864 To perform command search and execution actions, as defined in the Shell and Utilities volume
1865 of IEEE Std 1003.1-2001; see also Section 3.200 (on page 62).

1866 **Note:** Command Search and Execution is defined in detail in the Shell and Utilities volume of
1867 IEEE Std 1003.1-2001, Section 2.9.1.1, Command Search and Execution.

1868 **3.155 Execution Time**

1869 See *CPU Time* in Section 3.117 (on page 51).

1870 **3.156 Execution Time Monitoring**

1871 A set of execution time monitoring primitives that allow online measuring of thread and process
1872 execution times.

1873 **3.157 Expand**

1874 In the shell command language, when not qualified, the act of applying word expansions.

1875 **Note:** Word Expansions are defined in detail in the Shell and Utilities volume of
1876 IEEE Std 1003.1-2001, Section 2.6, Word Expansions.

1877 **3.158 Extended Regular Expression (ERE)**

1878 A regular expression (see also Section 3.316 (on page 79)) that is an alternative to the Basic
1879 Regular Expression using a more extensive syntax, occasionally used by some utilities.

1880 **Note:** Extended Regular Expressions are described in detail in Section 9.4 (on page 175).

1881 **3.159 Extended Security Controls**

1882 Implementation-defined security controls allowed by the file access permission and appropriate
1883 privilege (see also Section 3.19 (on page 37)) mechanisms, through which an implementation can
1884 support different security policies from those described in IEEE Std 1003.1-2001.

1885 **Note:** See also Extended Security Controls defined in Section 4.3 (on page 99).

1886 File Access Permissions are defined in detail in Section 4.4 (on page 99).

1887 **3.160 Feature Test Macro**

1888 A macro used to determine whether a particular set of features is included from a header.

1889 **Note:** See also the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.2, The Compilation
1890 Environment.

1891 **3.161 Field**

1892 In the shell command language, a unit of text that is the result of parameter expansion,
1893 arithmetic expansion, command substitution, or field splitting. During command processing, the
1894 resulting fields are used as the command name and its arguments.

1895 **Note:** Parameter Expansion is defined in detail in the Shell and Utilities volume of
1896 IEEE Std 1003.1-2001, Section 2.6.2, Parameter Expansion.

1897 Arithmetic Expansion is defined in detail in the Shell and Utilities volume of
1898 IEEE Std 1003.1-2001, Section 2.6.4, Arithmetic Expansion.

1899 Command Substitution is defined in detail in the Shell and Utilities volume of
1900 IEEE Std 1003.1-2001, Section 2.6.3, Command Substitution.

1901 Field Splitting is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001,
1902 Section 2.6.5, Field Splitting.

1903 For further information on command processing, see the Shell and Utilities volume of
1904 IEEE Std 1003.1-2001, Section 2.9.1, Simple Commands.

1905 **3.162 FIFO Special File (or FIFO)**

1906 A type of file with the property that data written to such a file is read on a first-in-first-out basis.

1907 **Note:** Other characteristics of FIFOs are described in the System Interfaces volume of
1908 IEEE Std 1003.1-2001, *lseek()*, *open()*, *read()*, and *write()*.

1909 **3.163 File**

1910 An object that can be written to, or read from, or both. A file has certain attributes, including
1911 access permissions and type. File types include regular file, character special file, block special
1912 file, FIFO special file, symbolic link, socket, and directory. Other types of files may be supported
1913 by the implementation.

1914 **3.164 File Description**

1915 See *Open File Description* in Section 3.253 (on page 70).

1916 **3.165 File Descriptor**

1917 A per-process unique, non-negative integer used to identify an open file for the purpose of file
 1918 access. The value of a file descriptor is from zero to {OPEN_MAX}. A process can have no more
 1919 than {OPEN_MAX} file descriptors open simultaneously. File descriptors may also be used to
 1920 implement message catalog descriptors and directory streams; see also Section 3.253 (on page
 1921 70).

1922 **Note:** {OPEN_MAX} is defined in detail in **<limits.h>**.

1923 **3.166 File Group Class**

1924 The property of a file indicating access permissions for a process related to the group
 1925 identification of a process. A process is in the file group class of a file if the process is not in the
 1926 file owner class and if the effective group ID or one of the supplementary group IDs of the
 1927 process matches the group ID associated with the file. Other members of the class may be
 1928 implementation-defined.

1929 **3.167 File Mode**

1930 An object containing the file mode bits and file type of a file.

1931 **Note:** File mode bits and file types are defined in detail in **<sys/stat.h>**.

1932 **3.168 File Mode Bits**

1933 A file's file permission bits: set-user-ID-on-execution bit (S_ISUID), set-group-ID-on-execution
 1934 bit (S_ISGID), and, on directories, the restricted deletion flag bit (S_ISVTX).

1935 **Note:** File Mode Bits are defined in detail in **<sys/stat.h>**.

1936 **3.169 Filename**

1937 A name consisting of 1 to {NAME_MAX} bytes used to name a file. The characters composing
 1938 the name may be selected from the set of all character values excluding the slash character and
 1939 the null byte. The filenames dot and dot-dot have special meaning. A filename is sometimes
 1940 referred to as a “pathname component”.

1941 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

1942 **3.170 Filename Portability**

1943 Filenames should be constructed from the portable filename character set because the use of
 1944 other characters can be confusing or ambiguous in certain contexts. (For example, the use of a
 1945 colon (':') in a pathname could cause ambiguity if that pathname were included in a *PATH*
 1946 definition.)

1947 3.171 File Offset

1948 The byte position in the file where the next I/O operation begins. Each open file description
1949 associated with a regular file, block special file, or directory has a file offset. A character special
1950 file that does not refer to a terminal device may have a file offset. There is no file offset specified
1951 for a pipe or FIFO.

1952 3.172 File Other Class

1953 The property of a file indicating access permissions for a process related to the user and group
1954 identification of a process. A process is in the file other class of a file if the process is not in the
1955 file owner class or file group class.

1956 3.173 File Owner Class

1957 The property of a file indicating access permissions for a process related to the user
1958 identification of a process. A process is in the file owner class of a file if the effective user ID of
1959 the process matches the user ID of the file.

1960 3.174 File Permission Bits

1961 Information about a file that is used, along with other information, to determine whether a
1962 process has read, write, or execute/search permission to a file. The bits are divided into three
1963 parts: owner, group, and other. Each part is used with the corresponding file class of processes.
1964 These bits are contained in the file mode.

1965 **Note:** File modes are defined in detail in <sys/stat.h>.

1966 File Access Permissions are defined in detail in Section 4.4 (on page 99).

1967 3.175 File Serial Number

1968 A per-file system unique identifier for a file.

1969 3.176 File System

1970 A collection of files and certain of their attributes. It provides a name space for file serial
1971 numbers referring to those files.

1972 3.177 File Type

1973 See *File* in Section 3.163 (on page 57).

1974 **3.178 Filter**

1975 A command whose operation consists of reading data from standard input or a list of input files
 1976 and writing data to standard output. Typically, its function is to perform some transformation
 1977 on the data stream.

1978 **3.179 First Open (of a File)**

1979 When a process opens a file that is not currently an open file within any process.

1980 **3.180 Flow Control**

1981 The mechanism employed by a communications provider that constrains a sending entity to
 1982 wait until the receiving entities can safely receive additional data without loss.

1983 **3.181 Foreground Job**

1984 See *Foreground Process Group* in Section 3.183.

1985 **3.182 Foreground Process**

1986 A process that is a member of a foreground process group.

1987 **3.183 Foreground Process Group (or Foreground Job)**

1988 A process group whose member processes have certain privileges, denied to processes in
 1989 background process groups, when accessing their controlling terminal. Each session that has
 1990 established a connection with a controlling terminal has at most one process group of the session
 1991 as the foreground process group of that controlling terminal.

1992 **Note:** The General Terminal Interface is defined in detail in Chapter 11.

1993 **3.184 Foreground Process Group ID**

1994 The process group ID of the foreground process group.

1995 **3.185 Form-Feed Character (<form-feed>)**

1996 A character that in the output stream indicates that printing should start on the next page of an
 1997 output device. It is the character designated by ' \f ' in the C language. If the <form-feed> is not
 1998 the first character of an output line, the result is unspecified. It is unspecified whether this
 1999 character is the exact sequence transmitted to an output device by the system to accomplish the
 2000 movement to the next page.

2001 **3.186 Graphic Character**

2002 A member of the **graph** character class of the current locale.

2003 **Note:** The **graph** character class is defined in detail in Section 7.3.1 (on page 126).

2004 **3.187 Group Database**

2005 A system database of implementation-defined format that contains at least the following
2006 information for each group ID:

- 2007 • Group name
- 2008 • Numerical group ID
- 2009 • List of users allowed in the group

2010 The list of users allowed in the group is used by the *newgrp* utility.

2011 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001.

2012 **3.188 Group ID**

2013 A non-negative integer, which can be contained in an object of type **gid_t**, that is used to identify
2014 a group of system users. Each system user is a member of at least one group. When the identity
2015 of a group is associated with a process, a group ID value is referred to as a real group ID, an
2016 effective group ID, one of the supplementary group IDs, or a saved set-group-ID.

2017 **3.189 Group Name**

2018 A string that is used to identify a group; see also Section 3.187. To be portable across conforming
2019 systems, the value is composed of characters from the portable filename character set. The
2020 hyphen should not be used as the first character of a portable group name.

2021 **3.190 Hard Limit**

2022 A system resource limitation that may be reset to a lesser or greater limit by a privileged process.
2023 A non-privileged process is restricted to only lowering its hard limit.

2024 **3.191 Hard Link**

2025 The relationship between two directory entries that represent the same file; see also Section 3.129
2026 (on page 53). The result of an execution of the *ln* utility (without the *-s* option) or the *link()*
2027 function. This term is contrasted against symbolic link; see also Section 3.372 (on page 86).

2028 **3.192 Home Directory**

2029 The directory specified by the *HOME* environment variable.

2030 3.193 Host Byte Order

2031 The arrangement of bytes in any integer type when using a specific machine architecture.

2032 **Note:** Two common methods of byte ordering are big-endian and little-endian. Big-endian is a
2033 format for storage of binary data in which the most significant byte is placed first, with the rest
2034 in descending order. Little-endian is a format for storage or transmission of binary data in
2035 which the least significant byte is placed first, with the rest in ascending order. See also Section
2036 4.8 (on page 101).

2037 3.194 Incomplete Line

2038 A sequence of one or more non-`<newline>`s at the end of the file.

2039 3.195 Inf

2040 A value representing +infinity or a value representing –infinity that can be stored in a floating
2041 type. Not all systems support the Inf values.

2042 3.196 Instrumented Application

2043 An application that contains at least one call to the trace point function `posix_trace_event()`. Each
2044 process of an instrumented application has a mapping of trace event names to trace event type
2045 identifiers. This mapping is used by the trace stream that is created for that process.

2046 3.197 Interactive Shell

2047 A processing mode of the shell that is suitable for direct user interaction.

2048 3.198 Internationalization

2049 The provision within a computer program of the capability of making itself adaptable to the
2050 requirements of different native languages, local customs, and coded character sets.

2051 3.199 Interprocess Communication

2052 A functionality enhancement to add a high-performance, deterministic interprocess
2053 communication facility for local communication.

2054 3.200 Invoke

2055 To perform command search and execution actions, except that searching for shell functions and
2056 special built-in utilities is suppressed; see also Section 3.154 (on page 56).

2057 **Note:** Command Search and Execution is defined in detail in the Shell and Utilities volume of
2058 IEEE Std 1003.1-2001, Section 2.9.1.1, Command Search and Execution.

2059 **3.201 Job**

2060 A set of processes, comprising a shell pipeline, and any processes descended from it, that are all
 2061 in the same process group.

2062 **Note:** See also the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.9.2, Pipelines.

2063 **3.202 Job Control**

2064 A facility that allows users selectively to stop (suspend) the execution of processes and continue
 2065 (resume) their execution at a later point. The user typically employs this facility via the
 2066 interactive interface jointly supplied by the terminal I/O driver and a command interpreter.

2067 **3.203 Job Control Job ID**

2068 A handle that is used to refer to a job. The job control job ID can be any of the forms shown in the
 2069 following table:

2070 **Table 3-1** Job Control Job ID Formats

2071 2072	Job Control Job ID	Meaning
2073	%%	Current job.
2074	%+	Current job.
2075	%-	Previous job.
2076	% <i>n</i>	Job number <i>n</i> .
2077	% <i>string</i>	Job whose command begins with <i>string</i> .
2078	%? <i>string</i>	Job whose command contains <i>string</i> .

2079 **3.204 Last Close (of a File)**

2080 When a process closes a file, resulting in the file not being an open file within any process.

2081 **3.205 Line**

2082 A sequence of zero or more non-`<newline>`s plus a terminating `<newline>`.

2083 **3.206 Linger**

2084 A period of time before terminating a connection, to allow outstanding data to be transferred.

2085 **3.207 Link**

2086 See *Directory Entry* in Section 3.129 (on page 53).

2087 3.208 Link Count

2088 The number of directory entries that refer to a particular file.

2089 3.209 Local Customs

2090 The conventions of a geographical area or territory for such things as date, time, and currency
2091 formats.

2092 3.210 Local Interprocess Communication (Local IPC)

2093 The transfer of data between processes in the same system.

2094 3.211 Locale

2095 The definition of the subset of a user's environment that depends on language and cultural
2096 conventions.

2097 **Note:** Locales are defined in detail in Chapter 7 (on page 123).

2098 3.212 Localization

2099 The process of establishing information within a computer system specific to the operation of
2100 particular native languages, local customs, and coded character sets.

2101 3.213 Login

2102 The unspecified activity by which a user gains access to the system. Each login is associated
2103 with exactly one login name.

2104 3.214 Login Name

2105 A user name that is associated with a login.

2106 3.215 Map

2107 To create an association between a page-aligned range of the address space of a process and
2108 some memory object, such that a reference to an address in that range of the address space
2109 results in a reference to the associated memory object. The mapped memory object is not
2110 necessarily memory-resident.

2111 **3.216 Marked Message**

2112 A STREAMS message on which a certain flag is set. Marking a message gives the application
2113 protocol-specific information. An application can use *ioctl()* to determine whether a given
2114 message is marked.

2115 **Note:** The *ioctl()* function is defined in detail in the System Interfaces volume of
2116 IEEE Std 1003.1-2001.

2117 **3.217 Matched**

2118 A state applying to a sequence of zero or more characters when the characters in the sequence
2119 correspond to a sequence of characters defined by a basic regular expression or extended regular
2120 expression pattern.

2121 **Note:** Regular Expressions are defined in detail in Chapter 9 (on page 169).

2122 **3.218 Memory Mapped Files**

2123 A facility to allow applications to access files as part of the address space.

2124 **3.219 Memory Object**

2125 One of:

- 2126 • A file (see Section 3.163 (on page 57))
- 2127 • A shared memory object (see Section 3.340 (on page 82))
- 2128 • A typed memory object (see Section 3.418 (on page 93))

2129 When used in conjunction with *mmap()*, a memory object appears in the address space of the
2130 calling process.

2131 **Note:** The *mmap()* function is defined in detail in the System Interfaces volume of
2132 IEEE Std 1003.1-2001.

2133 **3.220 Memory-Resident**

2134 The process of managing the implementation in such a way as to provide an upper bound on
2135 memory access times.

2136 **3.221 Message**

2137 In the context of programmatic message passing, information that can be transferred between
2138 processes or threads by being added to and removed from a message queue. A message consists
2139 of a fixed-size message buffer.

2140 **3.222 Message Catalog**

2141 In the context of providing natural language messages to the user, a file or storage area
2142 containing program messages, command prompts, and responses to prompts for a particular
2143 native language, territory, and codeset.

2144 **3.223 Message Catalog Descriptor**

2145 In the context of providing natural language messages to the user, a per-process unique value
2146 used to identify an open message catalog. A message catalog descriptor may be implemented
2147 using a file descriptor.

2148 **3.224 Message Queue**

2149 In the context of programmatic message passing, an object to which messages can be added and
2150 removed. Messages may be removed in the order in which they were added or in priority order.

2151 **3.225 Mode**

2152 A collection of attributes that specifies a file's type and its access permissions.

2153 **Note:** File Access Permissions are defined in detail in Section 4.4 (on page 99).

2154 **3.226 Monotonic Clock**

2155 A clock whose value cannot be set via *clock_settime()* and which cannot have negative clock
2156 jumps.

2157 **3.227 Mount Point**

2158 Either the system root directory or a directory for which the *st_dev* field of structure **stat** differs
2159 from that of its parent directory.

2160 **Note:** The **stat** structure is defined in detail in `<sys/stat.h>`.

2161 **3.228 Multi-Character Collating Element**

2162 A sequence of two or more characters that collate as an entity. For example, in some coded
2163 character sets, an accented character is represented by a non-spacing accent, followed by the
2164 letter. Other examples are the Spanish elements *ch* and *ll*.

2165 **3.229 Mutex**

2166 A synchronization object used to allow multiple threads to serialize their access to shared data.
2167 The name derives from the capability it provides; namely, mutual-exclusion. The thread that has
2168 locked a mutex becomes its owner and remains the owner until that same thread unlocks the
2169 mutex.

2170 3.230 Name

2171 In the shell command language, a word consisting solely of underscores, digits, and alphabetic
2172 from the portable character set. The first character of a name is not a digit.

2173 **Note:** The Portable Character Set is defined in detail in Section 6.1 (on page 115).

2174 3.231 Named STREAM

2175 A STREAMS-based file descriptor that is attached to a name in the file system name space. All
2176 subsequent operations on the named STREAM act on the STREAM that was associated with the
2177 file descriptor until the name is disassociated from the STREAM.

2178 3.232 NaN (Not a Number)

2179 A set of values that may be stored in a floating type but that are neither Inf nor valid floating-
2180 point numbers. Not all systems support NaN values.

2181 3.233 Native Language

2182 A computer user's spoken or written language, such as American English, British English,
2183 Danish, Dutch, French, German, Italian, Japanese, Norwegian, or Swedish.

2184 3.234 Negative Response

2185 An input string that matches one of the responses acceptable to the *LC_MESSAGES* category
2186 keyword **noexpr**, matching an extended regular expression in the current locale.

2187 **Note:** The *LC_MESSAGES* category is defined in detail in Section 7.3.6 (on page 152).

2188 3.235 Network

2189 A collection of interconnected hosts.

2190 **Note:** The term “network” in IEEE Std 1003.1-2001 is used to refer to the network of hosts. The term
2191 “batch system” is used to refer to the network of batch servers.

2192 3.236 Network Address

2193 A network-visible identifier used to designate specific endpoints in a network. Specific
2194 endpoints on host systems have addresses, and host systems may also have addresses.

2195 **3.237 Network Byte Order**

2196 The way of representing any integer type such that, when transmitted over a network via a
2197 network endpoint, the **int** type is transmitted as an appropriate number of octets with the most
2198 significant octet first, followed by any other octets in descending order of significance.

2199 **Note:** This order is more commonly known as big-endian ordering. See also Section 4.8 (on page 101).

2200 **3.238 Newline Character (<newline>)**

2201 A character that in the output stream indicates that printing should start at the beginning of the
2202 next line. It is the character designated by '`\n`' in the C language. It is unspecified whether this
2203 character is the exact sequence transmitted to an output device by the system to accomplish the
2204 movement to the next line.

2205 **3.239 Nice Value**

2206 A number used as advice to the system to alter process scheduling. Numerically smaller values
2207 give a process additional preference when scheduling a process to run. Numerically larger
2208 values reduce the preference and make a process less likely to run. Typically, a process with a
2209 smaller nice value runs to completion more quickly than an equivalent process with a higher
2210 nice value. The symbol {NZERO} specifies the default nice value of the system.

2211 **3.240 Non-Blocking**

2212 A property of an open file description that causes function calls involving it to return without
2213 delay when it is detected that the requested action associated with the function call cannot be
2214 completed without unknown delay.

2215 **Note:** The exact semantics are dependent on the type of file associated with the open file description.
2216 For data reads from devices such as ttys and FIFOs, this property causes the read to return
2217 immediately when no data was available. Similarly, for writes, it causes the call to return
2218 immediately when the thread would otherwise be delayed in the write operation; for example,
2219 because no space was available. For networking, it causes functions not to await protocol
2220 events (for example, acknowledgements) to occur. See also the System Interfaces volume of
2221 IEEE Std 1003.1-2001, Section 2.10.7, Socket I/O Mode.

2222 **3.241 Non-Spacing Characters**

2223 A character, such as a character representing a diacritical mark in the ISO/IEC 6937:1994
2224 standard coded character set, which is used in combination with other characters to form
2225 composite graphic symbols.

2226 **3.242 NUL**

2227 A character with all bits set to zero.

2228 3.243 Null Byte

2229 A byte with all bits set to zero.

2230 3.244 Null Pointer

2231 The value that is obtained by converting the number 0 into a pointer; for example, **(void *) 0**. The
2232 C language guarantees that this value does not match that of any legitimate pointer, so it is used
2233 by many functions that return pointers to indicate an error.

2234 3.245 Null String

2235 See *Empty String* in Section 3.145 (on page 55).

2236 3.246 Null Wide-Character Code

2237 A wide-character code with all bits set to zero.

2238 3.247 Number Sign

2239 The character ' # ', also known as hash sign.

2240 3.248 Object File

2241 A regular file containing the output of a compiler, formatted as input to a linkage editor for
2242 linking with other object files into an executable form. The methods of linking are unspecified
2243 and may involve the dynamic linking of objects at runtime. The internal format of an object file
2244 is unspecified, but a conforming application cannot assume an object file is a text file.

2245 3.249 Octet

2246 Unit of data representation that consists of eight contiguous bits.

2247 3.250 Offset Maximum

2248 An attribute of an open file description representing the largest value that can be used as a file
2249 offset.

2250 3.251 Opaque Address

2251 An address such that the entity making use of it requires no details about its contents or format.

2252 3.252 Open File

2253 A file that is currently associated with a file descriptor.

2254 3.253 Open File Description

2255 A record of how a process or group of processes is accessing a file. Each file descriptor refers to
2256 exactly one open file description, but an open file description can be referred to by more than
2257 one file descriptor. The file offset, file status, and file access modes are attributes of an open file
2258 description.

2259 3.254 Operand

2260 An argument to a command that is generally used as an object supplying information to a utility
2261 necessary to complete its processing. Operands generally follow the options in a command line.

2262 **Note:** Utility Argument Syntax is defined in detail in Section 12.1 (on page 201).

2263 3.255 Operator

2264 In the shell command language, either a control operator or a redirection operator.

2265 3.256 Option

2266 An argument to a command that is generally used to specify changes in the utility's default
2267 behavior.

2268 **Note:** Utility Argument Syntax is defined in detail in Section 12.1 (on page 201).

2269 3.257 Option-Argument

2270 A parameter that follows certain options. In some cases an option-argument is included within
2271 the same argument string as the option—in most cases it is the next argument.

2272 **Note:** Utility Argument Syntax is defined in detail in Section 12.1 (on page 201).

2273 3.258 Orientation

2274 A stream has one of three orientations: unoriented, byte-oriented, or wide-oriented.

2275 **Note:** For further information, see the System Interfaces volume of IEEE Std 1003.1-2001, Section
2276 2.5.2, Stream Orientation and Encoding Rules.

2277 3.259 Orphaned Process Group

2278 A process group in which the parent of every member is either itself a member of the group or is
2279 not a member of the group's session.

2280 3.260 Page

- 2281 The granularity of process memory mapping or locking.
- 2282 Physical memory and memory objects can be mapped into the address space of a process on
- 2283 page boundaries and in integral multiples of pages. Process address space can be locked into
- 2284 memory (made memory-resident) on page boundaries and in integral multiples of pages.

2285 3.261 Page Size

- 2286 The size, in bytes, of the system unit of memory allocation, protection, and mapping. On systems
- 2287 that have segment rather than page-based memory architectures, the term “page” means a
- 2288 segment.

2289 3.262 Parameter

- 2290 In the shell command language, an entity that stores values. There are three types of parameters:
- 2291 variables (named parameters), positional parameters, and special parameters. Parameter
- 2292 expansion is accomplished by introducing a parameter with the ‘\$’ character.
- 2293 **Note:** See also the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.5, Parameters and
- 2294 Variables.
- 2295 In the C language, an object declared as part of a function declaration or definition that acquires
- 2296 a value on entry to the function, or an identifier following the macro name in a function-like
- 2297 macro definition.

2298 3.263 Parent Directory

- 2299 When discussing a given directory, the directory that both contains a directory entry for the
- 2300 given directory and is represented by the pathname dot-dot in the given directory.
- 2301 When discussing other types of files, a directory containing a directory entry for the file under
- 2302 discussion.
- 2303 This concept does not apply to dot and dot-dot.

2304 3.264 Parent Process

- 2305 The process which created (or inherited) the process under discussion.

2306 3.265 Parent Process ID

- 2307 An attribute of a new process identifying the parent of the process. The parent process ID of a
- 2308 process is the process ID of its creator, for the lifetime of the creator. After the creator’s lifetime
- 2309 has ended, the parent process ID is the process ID of an implementation-defined system process.

2310 **3.266 Pathname**

2311 A character string that is used to identify a file. In the context of IEEE Std 1003.1-2001, a
2312 pathname consists of, at most, {PATH_MAX} bytes, including the terminating null byte. It has an
2313 optional beginning slash, followed by zero or more filenames separated by slashes. A pathname
2314 may optionally contain one or more trailing slashes. Multiple successive slashes are considered
2315 to be the same as one slash.

2316 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

2317 **3.267 Pathname Component**

2318 See *Filename* in Section 3.169 (on page 58).

2319 **3.268 Path Prefix**

2320 A pathname, with an optional ending slash, that refers to a directory.

2321 **3.269 Pattern**

2322 A sequence of characters used either with regular expression notation or for pathname
2323 expansion, as a means of selecting various character strings or pathnames, respectively.

2324 **Note:** Regular Expressions are defined in detail in Chapter 9 (on page 169).

2325 See also the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.6, Pathname
2326 Expansion.

2327 The syntaxes of the two types of patterns are similar, but not identical; IEEE Std 1003.1-2001
2328 always indicates the type of pattern being referred to in the immediate context of the use of the
2329 term.

2330 **3.270 Period**

2331 The character ' . '. The term “period” is contrasted with dot (see also Section 3.135 (on page
2332 53)), which is used to describe a specific directory entry.

2333 **3.271 Permissions**

2334 Attributes of an object that determine the privilege necessary to access or manipulate the object.

2335 **Note:** File Access Permissions are defined in detail in Section 4.4 (on page 99).

2336 **3.272 Persistence**

2337 A mode for semaphores, shared memory, and message queues requiring that the object and its
2338 state (including data, if any) are preserved after the object is no longer referenced by any process.

2339 Persistence of an object does not imply that the state of the object is maintained across a system
2340 crash or a system reboot.

2341 **3.273 Pipe**

2342 An object accessed by one of the pair of file descriptors created by the *pipe()* function. Once
 2343 created, the file descriptors can be used to manipulate it, and it behaves identically to a FIFO
 2344 special file when accessed in this way. It has no name in the file hierarchy.

2345 **Note:** The *pipe()* function is defined in detail in the System Interfaces volume of
 2346 IEEE Std 1003.1-2001.

2347 **3.274 Polling**

2348 A scheduling scheme whereby the local process periodically checks until the pre-specified
 2349 events (for example, read, write) have occurred.

2350 **3.275 Portable Character Set**

2351 The collection of characters that are required to be present in all locales supported by
 2352 conforming systems.

2353 **Note:** The Portable Character Set is defined in detail in Section 6.1 (on page 115).

2354 This term is contrasted against the smaller portable filename character set; see also Section 3.276.

2355 **3.276 Portable Filename Character Set**

2356 The set of characters from which portable filenames are constructed.

2357 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
 2358 a b c d e f g h i j k l m n o p q r s t u v w x y z
 2359 0 1 2 3 4 5 6 7 8 9 . _ -

2360 The last three characters are the period, underscore, and hyphen characters, respectively.

2361 **3.277 Positional Parameter**

2362 In the shell command language, a parameter denoted by a single digit or one or more digits in
 2363 curly braces.

2364 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
 2365 2.5.1, Positional Parameters.

2366 **3.278 Preallocation**

2367 The reservation of resources in a system for a particular use.

2368 Preallocation does not imply that the resources are immediately allocated to that use, but merely
 2369 indicates that they are guaranteed to be available in bounded time when needed.

2370 3.279 Preempted Process (or Thread)

2371 A running thread whose execution is suspended due to another thread becoming runnable at a
2372 higher priority.

2373 3.280 Previous Job

2374 In the context of job control, the job that will be used as the default for the *fg* or *bg* utilities if the
2375 current job exits. There is at most one previous job; see also Section 3.203 (on page 63).

2376 3.281 Printable Character

2377 One of the characters included in the **print** character classification of the *LC_CTYPE* category in
2378 the current locale.

2379 **Note:** The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 126).

2380 3.282 Printable File

2381 A text file consisting only of the characters included in the **print** and **space** character
2382 classifications of the *LC_CTYPE* category and the <backspace>, all in the current locale.

2383 **Note:** The *LC_CTYPE* category is defined in detail in Section 7.3.1 (on page 126).

2384 3.283 Priority

2385 A non-negative integer associated with processes or threads whose value is constrained to a
2386 range defined by the applicable scheduling policy. Numerically higher values represent higher
2387 priorities.

2388 3.284 Priority Band

2389 The queuing order applied to normal priority STREAMS messages. High priority STREAMS
2390 messages are not grouped by priority bands. The only differentiation made by the STREAMS
2391 mechanism is between zero and non-zero bands, but specific protocol modules may differentiate
2392 between priority bands.

2393 3.285 Priority Inversion

2394 A condition in which a thread that is not voluntarily suspended (waiting for an event or time
2395 delay) is not running while a lower priority thread is running. Such blocking of the higher
2396 priority thread is often caused by contention for a shared resource.

2397 3.286 Priority Scheduling

2398 A performance and determinism improvement facility to allow applications to determine the
2399 order in which threads that are ready to run are granted access to processor resources.

2400 3.287 Priority-Based Scheduling

2401 Scheduling in which the selection of a running thread is determined by the priorities of the
2402 runnable processes or threads.

2403 3.288 Privilege

2404 See *Appropriate Privileges* in Section 3.19 (on page 37).

2405 3.289 Process

2406 An address space with one or more threads executing within that address space, and the
2407 required system resources for those threads.

2408 **Note:** Many of the system resources defined by IEEE Std 1003.1-2001 are shared among all of the
2409 threads within a process. These include the process ID, the parent process ID, process group ID,
2410 session membership, real, effective, and saved set-user-ID, real, effective, and saved set-group-
2411 ID, supplementary group IDs, current working directory, root directory, file mode creation
2412 mask, and file descriptors.

2413 3.290 Process Group

2414 A collection of processes that permits the signaling of related processes. Each process in the
2415 system is a member of a process group that is identified by a process group ID. A newly created
2416 process joins the process group of its creator.

2417 3.291 Process Group ID

2418 The unique positive integer identifier representing a process group during its lifetime.

2419 **Note:** See also Process Group ID Reuse defined in Section 4.12 (on page 103).

2420 3.292 Process Group Leader

2421 A process whose process ID is the same as its process group ID.

2422 3.293 Process Group Lifetime

2423 A period of time that begins when a process group is created and ends when the last remaining
2424 process in the group leaves the group, due either to the end of the last process' lifetime or to the
2425 last remaining process calling the *setsid()* or *setpgid()* functions.

2426 **Note:** The *setsid()* and *setpgid()* functions are defined in detail in the System Interfaces volume of
2427 IEEE Std 1003.1-2001.

2428 **3.294 Process ID**

2429 The unique positive integer identifier representing a process during its lifetime.

2430 **Note:** See also Process ID Reuse defined in Section 4.12 (on page 103).

2431 **3.295 Process Lifetime**

2432 The period of time that begins when a process is created and ends when its process ID is
 2433 returned to the system. After a process is created with a *fork()* function, it is considered active.
 2434 At least one thread of control and address space exist until it terminates. It then enters an
 2435 inactive state where certain resources may be returned to the system, although some resources,
 2436 such as the process ID, are still in use. When another process executes a *wait()*, *waitid()*, or
 2437 *waitpid()* function for an inactive process, the remaining resources are returned to the system.
 2438 The last resource to be returned to the system is the process ID. At this time, the lifetime of the
 2439 process ends.

2440 **Note:** The *fork()*, *wait()*, *waitid()*, and *waitpid()* functions are defined in detail in the System
 2441 Interfaces volume of IEEE Std 1003.1-2001.

2442 **3.296 Process Memory Locking**

2443 A performance improvement facility to bind application programs into the high-performance
 2444 random access memory of a computer system. This avoids potential latencies introduced by the
 2445 operating system in storing parts of a program that were not recently referenced on secondary
 2446 memory devices.

2447 **3.297 Process Termination**

2448 There are two kinds of process termination:

- 2449 1. Normal termination occurs by a return from *main()* or when requested with the *exit()* or
 2450 *_exit()* functions.
- 2451 2. Abnormal termination occurs when requested by the *abort()* function or when some
 2452 signals are received.

2453 **Note:** The *_exit()*, *abort()*, and *exit()* functions are defined in detail in the System Interfaces volume
 2454 of IEEE Std 1003.1-2001.

2455 **3.298 Process-To-Process Communication**

2456 The transfer of data between processes.

2457 **3.299 Process Virtual Time**

2458 The measurement of time in units elapsed by the system clock while a process is executing.

2459 3.300 Program

2460 A prepared sequence of instructions to the system to accomplish a defined task. The term
2461 “program” in IEEE Std 1003.1-2001 encompasses applications written in the Shell Command
2462 Language, complex utility input languages (for example, *awk*, *lex*, *sed*, and so on), and high-level
2463 languages.

2464 3.301 Protocol

2465 A set of semantic and syntactic rules for exchanging information.

2466 3.302 Pseudo-Terminal

2467 A facility that provides an interface that is identical to the terminal subsystem. A pseudo-
2468 terminal is composed of two devices: the “master device” and a “slave device”. The slave device
2469 provides processes with an interface that is identical to the terminal interface, although there
2470 need not be hardware behind that interface. Anything written on the master device is presented
2471 to the slave as an input and anything written on the slave device is presented as an input on the
2472 master side.

2473 3.303 Radix Character

2474 The character that separates the integer part of a number from the fractional part.

2475 3.304 Read-Only File System

2476 A file system that has implementation-defined characteristics restricting modifications.

2477 **Note:** File Times Update is described in detail in Section 4.7 (on page 100).

2478 3.305 Read-Write Lock

2479 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous
2480 read-only access to data while allowing only one thread to have write access at any given time.
2481 They are typically used to protect data that is read-only more frequently than it is changed.

2482 Read-write locks can be used to synchronize threads in the current process and other processes if
2483 they are allocated in memory that is writable and shared among the cooperating processes and
2484 have been initialized for this behavior.

2485 3.306 Real Group ID

2486 The attribute of a process that, at the time of process creation, identifies the group of the user
2487 who created the process; see also Section 3.188 (on page 61).

2488 **3.307 Real Time**

2489 Time measured as total units elapsed by the system clock without regard to which thread is
2490 executing.

2491 **3.308 Realtime Signal Extension**

2492 A determinism improvement facility to enable asynchronous signal notifications to an
2493 application to be queued without impacting compatibility with the existing signal functions.

2494 **3.309 Real User ID**

2495 The attribute of a process that, at the time of process creation, identifies the user who created the
2496 process; see also Section 3.425 (on page 94).

2497 **3.310 Record**

2498 A collection of related data units or words which is treated as a unit.

2499 **3.311 Redirection**

2500 In the shell command language, a method of associating files with the input or output of
2501 commands.

2502 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.7,
2503 Redirection.

2504 **3.312 Redirection Operator**

2505 In the shell command language, a token that performs a redirection function. It is one of the
2506 following symbols:

2507 < > >| << >> <& >& <<- <>

2508 **3.313 Reentrant Function**

2509 A function whose effect, when called by two or more threads, is guaranteed to be as if the
2510 threads each executed the function one after another in an undefined order, even if the actual
2511 execution is interleaved.

2512 **3.314 Referenced Shared Memory Object**

2513 A shared memory object that is open or has one or more mappings defined on it.

2514 3.315 Refresh

2515 To ensure that the information on the user's terminal screen is up-to-date.

2516 3.316 Regular Expression

2517 A pattern that selects specific strings from a set of character strings.

2518 **Note:** Regular Expressions are described in detail in Chapter 9 (on page 169).

2519 3.317 Region

2520 In the context of the address space of a process, a sequence of addresses.

2521 In the context of a file, a sequence of offsets.

2522 3.318 Regular File

2523 A file that is a randomly accessible sequence of bytes, with no further structure imposed by the
2524 system.

2525 3.319 Relative Pathname

2526 A pathname not beginning with a slash.

2527 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

2528 3.320 Relocatable File

2529 A file holding code or data suitable for linking with other object files to create an executable or a
2530 shared object file.

2531 3.321 Relocation

2532 The process of connecting symbolic references with symbolic definitions. For example, when a
2533 program calls a function, the associated call instruction transfers control to the proper
2534 destination address at execution.

2535 3.322 Requested Batch Service

2536 A service that is either rejected or performed prior to a response from the service to the
2537 requester.

2538 3.323 (Time) Resolution

2539 The minimum time interval that a clock can measure or whose passage a timer can detect.

2540 3.324 Root Directory

2541 A directory, associated with a process, that is used in pathname resolution for pathnames that
2542 begin with a slash.

2543 3.325 Runnable Process (or Thread)

2544 A thread that is capable of being a running thread, but for which no processor is available.

2545 3.326 Running Process (or Thread)

2546 A thread currently executing on a processor. On multi-processor systems there may be more
2547 than one such thread in a system at a time.

2548 3.327 Saved Resource Limits

2549 An attribute of a process that provides some flexibility in the handling of unrepresentable
2550 resource limits, as described in the *exec* family of functions and *setrlimit()*.

2551 **Note:** The *exec* and *setrlimit()* functions are defined in detail in the System Interfaces volume of
2552 IEEE Std 1003.1-2001.

2553 3.328 Saved Set-Group-ID

2554 An attribute of a process that allows some flexibility in the assignment of the effective group ID
2555 attribute, as described in the *exec* family of functions and *setgid()*.

2556 **Note:** The *exec* and *setgid()* functions are defined in detail in the System Interfaces volume of
2557 IEEE Std 1003.1-2001.

2558 3.329 Saved Set-User-ID

2559 An attribute of a process that allows some flexibility in the assignment of the effective user ID
2560 attribute, as described in the *exec* family of functions and *setuid()*.

2561 **Note:** The *exec* and *setuid()* functions are defined in detail in the System Interfaces volume of
2562 IEEE Std 1003.1-2001.

2563 3.330 Scheduling

2564 The application of a policy to select a runnable process or thread to become a running process or
2565 thread, or to alter one or more of the thread lists.

2566 3.331 Scheduling Allocation Domain

2567 The set of processors on which an individual thread can be scheduled at any given time.

2568 **3.332 Scheduling Contention Scope**

2569 A property of a thread that defines the set of threads against which that thread competes for
2570 resources.

2571 For example, in a scheduling decision, threads sharing scheduling contention scope compete for
2572 processor resources. In IEEE Std 1003.1-2001, a thread has scheduling contention scope of either
2573 PTHREAD_SCOPE_SYSTEM or PTHREAD_SCOPE_PROCESS.

2574 **3.333 Scheduling Policy**

2575 A set of rules that is used to determine the order of execution of processes or threads to achieve
2576 some goal.

2577 **Note:** Scheduling Policy is defined in detail in Section 4.13 (on page 103).

2578 **3.334 Screen**

2579 A rectangular region of columns and lines on a terminal display. A screen may be a portion of a
2580 physical display device or may occupy the entire physical area of the display device.

2581 **3.335 Scroll**

2582 To move the representation of data vertically or horizontally relative to the terminal screen.
2583 There are two types of scrolling:

- 2584 1. The cursor moves with the data.
- 2585 2. The cursor remains stationary while the data moves.

2586 **3.336 Semaphore**

2587 A minimum synchronization primitive to serve as a basis for more complex synchronization
2588 mechanisms to be defined by the application program.

2589 **Note:** Semaphores are defined in detail in Section 4.15 (on page 104).

2590 **3.337 Session**

2591 A collection of process groups established for job control purposes. Each process group is a
2592 member of a session. A process is considered to be a member of the session of which its process
2593 group is a member. A newly created process joins the session of its creator. A process can alter
2594 its session membership; see *setsid()*. There can be multiple process groups in the same session.

2595 **Note:** The *setsid()* function is defined in detail in the System Interfaces volume of
2596 IEEE Std 1003.1-2001.

2597 3.338 Session Leader

2598 A process that has created a session.

2599 **Note:** For further information, see the *setsid()* function defined in the System Interfaces volume of
2600 IEEE Std 1003.1-2001.

2601 3.339 Session Lifetime

2602 The period between when a session is created and the end of the lifetime of all the process
2603 groups that remain as members of the session.

2604 3.340 Shared Memory Object

2605 An object that represents memory that can be mapped concurrently into the address space of
2606 more than one process.

2607 3.341 Shell

2608 A program that interprets sequences of text input as commands. It may operate on an input
2609 stream or it may interactively prompt and read commands from a terminal.

2610 3.342 Shell, the

2611 The Shell Command Language Interpreter; a specific instance of a shell.

2612 **Note:** For further information, see the *sh* utility defined in the Shell and Utilities volume of
2613 IEEE Std 1003.1-2001.

2614 3.343 Shell Script

2615 A file containing shell commands. If the file is made executable, it can be executed by specifying
2616 its name as a simple command. Execution of a shell script causes a shell to execute the
2617 commands within the script. Alternatively, a shell can be requested to execute the commands in
2618 a shell script by specifying the name of the shell script as the operand to the *sh* utility.

2619 **Note:** Simple Commands are defined in detail in the Shell and Utilities volume of
2620 IEEE Std 1003.1-2001, Section 2.9.1, Simple Commands.

2621 The *sh* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001.

2622 3.344 Signal

2623 A mechanism by which a process or thread may be notified of, or affected by, an event occurring
2624 in the system. Examples of such events include hardware exceptions and specific actions by
2625 processes. The term signal is also used to refer to the event itself.

2626 3.345 Signal Stack

2627 Memory established for a thread, in which signal handlers catching signals sent to that thread
2628 are executed.

2629 3.346 Single-Quote

2630 The character ' ' , also known as apostrophe.

2631 3.347 Slash

2632 The character ' / ' , also known as solidus.

2633 3.348 Socket

2634 A file of a particular type that is used as a communications endpoint for process-to-process
2635 communication as described in the System Interfaces volume of IEEE Std 1003.1-2001.

2636 3.349 Socket Address

2637 An address associated with a socket or remote endpoint, including an address family identifier
2638 and addressing information specific to that address family. The address may include multiple
2639 parts, such as a network address associated with a host system and an identifier for a specific
2640 endpoint.

2641 3.350 Soft Limit

2642 A resource limitation established for each process that the process may set to any value less than
2643 or equal to the hard limit.

2644 3.351 Source Code

2645 When dealing with the Shell Command Language, input to the command language interpreter.
2646 The term “shell script” is synonymous with this meaning.

2647 When dealing with an ISO/IEC-conforming programming language, source code is input to a
2648 compiler conforming to that ISO/IEC standard.

2649 Source code also refers to the input statements prepared for the following standard utilities:
2650 *awk, bc, ed, lex, localedef, make, sed, and yacc.*

2651 Source code can also refer to a collection of sources meeting any or all of these meanings.

2652 **Note:** The *awk, bc, ed, lex, localedef, make, sed, and yacc* utilities are defined in detail in the Shell and
2653 Utilities volume of IEEE Std 1003.1-2001.

2654 **3.352 Space Character (<space>)**

2655 The character defined in the portable character set as <space>. The <space> is a member of the
 2656 **space** character class of the current locale, but represents the single character, and not all of the
 2657 possible members of the class; see also Section 3.431 (on page 95).

2658 **3.353 Spawn**

2659 A process creation primitive useful for systems that have difficulty with *fork()* and as an efficient
 2660 replacement for *fork()/exec*.

2661 **3.354 Special Built-In**

2662 See *Built-In Utility* in Section 3.83 (on page 46).

2663 **3.355 Special Parameter**

2664 In the shell command language, a parameter named by a single character from the following list:

2665 * @ # ? ! - \$ 0

2666 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
 2667 2.5.2, Special Parameters.

2668 **3.356 Spin Lock**

2669 A synchronization object used to allow multiple threads to serialize their access to shared data.

2670 **3.357 Sporadic Server**

2671 A scheduling policy for threads and processes that reserves a certain amount of execution
 2672 capacity for processing aperiodic events at a given priority level.

2673 **3.358 Standard Error**

2674 An output stream usually intended to be used for diagnostic messages.

2675 **3.359 Standard Input**

2676 An input stream usually intended to be used for primary data input.

2677 **3.360 Standard Output**

2678 An output stream usually intended to be used for primary data output.

2679 **3.361 Standard Utilities**

2680 The utilities described in the Shell and Utilities volume of IEEE Std 1003.1-2001.

2681 **3.362 Stream**

2682 Appearing in lowercase, a stream is a file access object that allows access to an ordered sequence
2683 of characters, as described by the ISO C standard. Such objects can be created by the *fdopen()*,
2684 *fopen()*, or *popen()* functions, and are associated with a file descriptor. A stream provides the
2685 additional services of user-selectable buffering and formatted input and output; see also Section
2686 3.363.

2687 **Note:** For further information, see the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.5,
2688 Standard I/O Streams.

2689 The *fdopen()*, *fopen()*, or *popen()* functions are defined in detail in the System Interfaces volume
2690 of IEEE Std 1003.1-2001.

2691 **3.363 STREAM**

2692 Appearing in uppercase, STREAM refers to a full-duplex connection between a process and an
2693 open device or pseudo-device. It optionally includes one or more intermediate processing
2694 modules that are interposed between the process end of the STREAM and the device driver (or
2695 pseudo-device driver) end of the STREAM; see also Section 3.362.

2696 **Note:** For further information, see the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.6,
2697 STREAMS.

2698 **3.364 STREAM End**

2699 The STREAM end is the driver end of the STREAM and is also known as the downstream end of
2700 the STREAM.

2701 **3.365 STREAM Head**

2702 The STREAM head is the beginning of the STREAM and is at the boundary between the system
2703 and the application process. This is also known as the upstream end of the STREAM.

2704 **3.366 STREAMS Multiplexor**

2705 A driver with multiple STREAMS connected to it. Multiplexing with STREAMS connected above
2706 is referred to as N-to-1, or “upper multiplexing”. Multiplexing with STREAMS connected below
2707 is referred to as 1-to-N or “lower multiplexing”.

2708 **3.367 String**

2709 A contiguous sequence of bytes terminated by and including the first null byte.

2710 3.368 Subshell

2711 A shell execution environment, distinguished from the main or current shell execution
2712 environment.

2713 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.12,
2714 Shell Execution Environment.

2715 3.369 Successfully Transferred

2716 For a write operation to a regular file, when the system ensures that all data written is readable
2717 on any subsequent open of the file (even one that follows a system or power failure) in the
2718 absence of a failure of the physical storage medium.

2719 For a read operation, when an image of the data on the physical storage medium is available to
2720 the requesting process.

2721 3.370 Supplementary Group ID

2722 An attribute of a process used in determining file access permissions. A process has up to
2723 {NGROUPS_MAX} supplementary group IDs in addition to the effective group ID. The
2724 supplementary group IDs of a process are set to the supplementary group IDs of the parent
2725 process when the process is created.

2726 3.371 Suspended Job

2727 A job that has received a SIGSTOP, SIGTSTP, SIGTTIN, or SIGTTOU signal that caused the
2728 process group to stop. A suspended job is a background job, but a background job is not
2729 necessarily a suspended job.

2730 3.372 Symbolic Link

2731 A type of file with the property that when the file is encountered during pathname resolution, a
2732 string stored by the file is used to modify the pathname resolution. The stored string has a length
2733 of {SYMLINK_MAX} bytes or fewer.

2734 **Note:** Pathname Resolution is defined in detail in Section 4.11 (on page 102).

2735 3.373 Synchronized Input and Output

2736 A determinism and robustness improvement mechanism to enhance the data input and output
2737 mechanisms, so that an application can ensure that the data being manipulated is physically
2738 present on secondary mass storage devices.

2739 3.374 Synchronized I/O Completion

2740 The state of an I/O operation that has either been successfully transferred or diagnosed as
2741 unsuccessful.

2742 **3.375 Synchronized I/O Data Integrity Completion**

2743 For read, when the operation has been completed or diagnosed if unsuccessful. The read is
2744 complete only when an image of the data has been successfully transferred to the requesting
2745 process. If there were any pending write requests affecting the data to be read at the time that
2746 the synchronized read operation was requested, these write requests are successfully transferred
2747 prior to reading the data.

2748 For write, when the operation has been completed or diagnosed if unsuccessful. The write is
2749 complete only when the data specified in the write request is successfully transferred and all file
2750 system information required to retrieve the data is successfully transferred.

2751 File attributes that are not necessary for data retrieval (access time, modification time, status
2752 change time) need not be successfully transferred prior to returning to the calling process.

2753 **3.376 Synchronized I/O File Integrity Completion**

2754 Identical to a synchronized I/O data integrity completion with the addition that all file attributes
2755 relative to the I/O operation (including access time, modification time, status change time) are
2756 successfully transferred prior to returning to the calling process.

2757 **3.377 Synchronized I/O Operation**

2758 An I/O operation performed on a file that provides the application assurance of the integrity of
2759 its data and files.

2760 **3.378 Synchronous I/O Operation**

2761 An I/O operation that causes the thread requesting the I/O to be blocked from further use of the
2762 processor until that I/O operation completes.

2763 **Note:** A synchronous I/O operation does not imply synchronized I/O data integrity completion or
2764 synchronized I/O file integrity completion.

2765 **3.379 Synchronously-Generated Signal**

2766 A signal that is attributable to a specific thread.

2767 For example, a thread executing an illegal instruction or touching invalid memory causes a
2768 synchronously-generated signal. Being synchronous is a property of how the signal was
2769 generated and not a property of the signal number.

2770 **3.380 System**

2771 An implementation of IEEE Std 1003.1-2001.

2772 3.381 System Crash

2773 An interval initiated by an unspecified circumstance that causes all processes (possibly other
2774 than special system processes) to be terminated in an undefined manner, after which any
2775 changes to the state and contents of files created or written to by an application prior to the
2776 interval are undefined, except as required elsewhere in IEEE Std 1003.1-2001.

2777 3.382 System Console

2778 An implementation-defined device that receives messages sent by the *syslog()* function, and the
2779 *fmtmsg()* function when the MM_CONSOLE flat is set.

2780 **Note:** The *syslog()* and *fmtmsg()* functions are defined in detail in the System Interfaces volume of
2781 IEEE Std 1003.1-2001.

2782 3.383 System Databases

2783 An implementation provides two system databases.

2784 The “group database” contains the following information for each group:

- 2785 1. Group name
- 2786 2. Numerical group ID
- 2787 3. List of all users allowed in the group

2788 The “user database” contains the following information for each user:

- 2789 1. User name
- 2790 2. Numerical user ID
- 2791 3. Numerical group ID
- 2792 4. Initial working directory
- 2793 5. Initial user program

2794 If the initial user program field is null, the system default is used. If the initial working directory
2795 field is null, the interpretation of that field is implementation-defined. These databases may
2796 contain other fields that are unspecified by IEEE Std 1003.1-2001.

2797 3.384 System Documentation

2798 All documentation provided with an implementation except for the conformance document.
2799 Electronically distributed documents for an implementation are considered part of the system
2800 documentation.

2801 3.385 System Process

2802 An implementation-defined object, other than a process executing an application, that has a
2803 process ID.

2804 3.386 System Reboot

2805 An implementation-defined sequence of events that may result in the loss of transitory data; that
2806 is, data that is not saved in permanent storage. For example, message queues, shared memory,
2807 semaphores, and processes.

2808 3.387 System Trace Event

2809 A trace event that is generated by the implementation, in response either to a system-initiated
2810 action or to an application-requested action, except for a call to *posix_trace_event()*. When
2811 supported by the implementation, a system-initiated action generates a process-independent
2812 system trace event and an application-requested action generates a process-dependent system
2813 trace event. For a system trace event not defined by IEEE Std 1003.1-2001, the associated trace
2814 event type identifier is derived from the implementation-defined name for this trace event, and
2815 the associated data is of implementation-defined content and length.

2816 3.388 System-Wide

2817 Pertaining to events occurring in all processes existing in an implementation at a given point in
2818 time.

2819 3.389 Tab Character (<tab>)

2820 A character that in the output stream indicates that printing or displaying should start at the
2821 next horizontal tabulation position on the current line. It is the character designated by '*\t*' in
2822 the C language. If the current position is at or past the last defined horizontal tabulation
2823 position, the behavior is unspecified. It is unspecified whether this character is the exact
2824 sequence transmitted to an output device by the system to accomplish the tabulation.

2825 3.390 Terminal (or Terminal Device)

2826 A character special file that obeys the specifications of the general terminal interface.

2827 **Note:** The General Terminal Interface is defined in detail in Chapter 11 (on page 187).

2828 3.391 Text Column

2829 A roughly rectangular block of characters capable of being laid out side-by-side next to other
2830 text columns on an output page or terminal screen. The widths of text columns are measured in
2831 column positions.

2832 3.392 Text File

2833 A file that contains characters organized into one or more lines. The lines do not contain NUL
 2834 characters and none can exceed {LINE_MAX} bytes in length, including the <newline>.
 2835 Although IEEE Std 1003.1-2001 does not distinguish between text files and binary files (see the
 2836 ISO C standard), many utilities only produce predictable or meaningful output when operating
 2837 on text files. The standard utilities that have such restrictions always specify “text files” in their
 2838 STDIN or INPUT FILES sections.

2839 3.393 Thread

2840 A single flow of control within a process. Each thread has its own thread ID, scheduling priority
 2841 and policy, *errno* value, thread-specific key/value bindings, and the required system resources to
 2842 support a flow of control. Anything whose address may be determined by a thread, including
 2843 but not limited to static variables, storage obtained via *malloc()*, directly addressable storage
 2844 obtained through implementation-defined functions, and automatic variables, are accessible to
 2845 all threads in the same process.

2846 **Note:** The *malloc()* function is defined in detail in the System Interfaces volume of
 2847 IEEE Std 1003.1-2001.

2848 3.394 Thread ID

2849 Each thread in a process is uniquely identified during its lifetime by a value of type **pthread_t**
 2850 called a thread ID.

2851 3.395 Thread List

2852 An ordered set of runnable threads that all have the same ordinal value for their priority.

2853 The ordering of threads on the list is determined by a scheduling policy or policies. The set of
 2854 thread lists includes all runnable threads in the system.

2855 3.396 Thread-Safe

2856 A function that may be safely invoked concurrently by multiple threads. Each function defined
 2857 in the System Interfaces volume of IEEE Std 1003.1-2001 is thread-safe unless explicitly stated
 2858 otherwise. Examples are any “pure” function, a function which holds a mutex locked while it is
 2859 accessing static storage, or objects shared among threads.

2860 3.397 Thread-Specific Data Key

2861 A process global handle of type **pthread_key_t** which is used for naming thread-specific data.

2862 Although the same key value may be used by different threads, the values bound to the key by
 2863 *pthread_setspecific()* and accessed by *pthread_getspecific()* are maintained on a per-thread basis
 2864 and persist for the life of the calling thread.

2865 **Note:** The *pthread_getspecific()* and *pthread_setspecific()* functions are defined in detail in the System
 2866 Interfaces volume of IEEE Std 1003.1-2001.

2867 **3.398 Tilde**

2868 The character '~'.

2869 **3.399 Timeouts**

2870 A method of limiting the length of time an interface will block; see also Section 3.76 (on page 45).

2871 **3.400 Timer**2872 A mechanism that can notify a thread when the time as measured by a particular clock has
2873 reached or passed a specified value, or when a specified amount of time has passed.2874 **3.401 Timer Overrun**2875 A condition that occurs each time a timer, for which there is already an expiration signal queued
2876 to the process, expires.2877 **3.402 Token**2878 In the shell command language, a sequence of characters that the shell considers as a single unit
2879 when reading input. A token is either an operator or a word.2880 **Note:** The rules for reading input are defined in detail in the Shell and Utilities volume of
2881 IEEE Std 1003.1-2001, Section 2.3, Token Recognition.2882 **3.403 Trace Analyzer Process**2883 A process that extracts trace events from a trace stream to retrieve information about the
2884 behavior of an application.2885 **3.404 Trace Controller Process**

2886 A process that creates a trace stream for tracing a process.

2887 **3.405 Trace Event**2888 A data object that represents an action executed by the system, and that is recorded in a trace
2889 stream.2890 **3.406 Trace Event Type**

2891 A data object type that defines a class of trace event.

2892 3.407 Trace Event Type Mapping

2893 A one-to-one mapping between trace event types and trace event names.

2894 3.408 Trace Filter

2895 A filter that allows the trace controller process to specify those trace event types that are to be
2896 ignored; that is, not generated.

2897 3.409 Trace Generation Version

2898 A data object that is an implementation-defined character string, generated by the trace system
2899 and describing the origin and version of the trace system.

2900 3.410 Trace Log

2901 The flushed image of a trace stream, if the trace stream is created with a trace log.

2902 3.411 Trace Point

2903 An action that may cause a trace event to be generated.

2904 3.412 Trace Stream

2905 An opaque object that contains trace events plus internal data needed to interpret those trace
2906 events.

2907 3.413 Trace Stream Identifier

2908 A handle to manage tracing operations in a trace stream.

2909 3.414 Trace System

2910 A system that allows both system and user trace events to be generated into a trace stream.
2911 These trace events can be retrieved later.

2912 3.415 Traced Process

2913 A process for which at least one trace stream has been created. A traced process is also called a
2914 target process.

2915 3.416 Tracing Status of a Trace Stream

2916 A status that describes the state of an active trace stream. The tracing status of a trace stream can
2917 be retrieved from the trace stream attributes. An active trace stream can be in one of two states:
2918 running or suspended.

2919 3.417 Typed Memory Name Space

2920 A system-wide name space that contains the names of the typed memory objects present in the
2921 system. It is configurable for a given implementation.

2922 3.418 Typed Memory Object

2923 A combination of a typed memory pool and a typed memory port. The entire contents of the
2924 pool are accessible from the port. The typed memory object is identified through a name that
2925 belongs to the typed memory name space.

2926 3.419 Typed Memory Pool

2927 An extent of memory with the same operational characteristics. Typed memory pools may be
2928 contained within each other.

2929 3.420 Typed Memory Port

2930 A hardware access path to one or more typed memory pools.

2931 3.421 Unbind

2932 Remove the association between a network address and an endpoint.

2933 3.422 Unit Data

2934 See *Datagram* in Section 3.123 (on page 52).

2935 3.423 Upshifting

2936 The conversion of a lowercase character that has a single-character uppercase representation
2937 into this uppercase representation.

2938 **3.424 User Database**

2939 A system database of implementation-defined format that contains at least the following
2940 information for each user ID:

- 2941 • User name
- 2942 • Numerical user ID
- 2943 • Initial numerical group ID
- 2944 • Initial working directory
- 2945 • Initial user program

2946 The initial numerical group ID is used by the *newgrp* utility. Any other circumstances under
2947 which the initial values are operative are implementation-defined.

2948 If the initial user program field is null, an implementation-defined program is used.

2949 If the initial working directory field is null, the interpretation of that field is implementation-
2950 defined.

2951 **Note:** The *newgrp* utility is defined in detail in the Shell and Utilities volume of IEEE Std 1003.1-2001.

2952 **3.425 User ID**

2953 A non-negative integer that is used to identify a system user. When the identity of a user is
2954 associated with a process, a user ID value is referred to as a real user ID, an effective user ID, or a
2955 saved set-user-ID.

2956 **3.426 User Name**

2957 A string that is used to identify a user; see also Section 3.424. To be portable across systems
2958 conforming to IEEE Std 1003.1-2001, the value is composed of characters from the portable
2959 filename character set. The hyphen should not be used as the first character of a portable user
2960 name.

2961 **3.427 User Trace Event**

2962 A trace event that is generated explicitly by the application as a result of a call to
2963 *posix_trace_event()*.

2964 **3.428 Utility**

2965 A program, excluding special built-in utilities provided as part of the Shell Command Language,
2966 that can be called by name from a shell to perform a specific task, or related set of tasks.

2967 **Note:** For further information on special built-in utilities, see the Shell and Utilities volume of
2968 IEEE Std 1003.1-2001, Section 2.14, Special Built-In Utilities.

2969 **3.429 Variable**

2970 In the shell command language, a named parameter.

2971 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.5,
2972 Parameters and Variables.

2973 **3.430 Vertical-Tab Character (<vertical-tab>)**

2974 A character that in the output stream indicates that printing should start at the next vertical
2975 tabulation position. It is the character designated by '`\v`' in the C language. If the current
2976 position is at or past the last defined vertical tabulation position, the behavior is unspecified. It is
2977 unspecified whether this character is the exact sequence transmitted to an output device by the
2978 system to accomplish the tabulation.

2979 **3.431 White Space**

2980 A sequence of one or more characters that belong to the **space** character class as defined via the
2981 `LC_CTYPE` category in the current locale.

2982 In the POSIX locale, white space consists of one or more `<blank>s` (`<space>s` and `<tab>s`),
2983 `<newline>s`, `<carriage-return>s`, `<form-feed>s`, and `<vertical-tab>s`.

2984 **3.432 Wide-Character Code (C Language)**

2985 An integer value corresponding to a single graphic symbol or control code.

2986 **Note:** C Language Wide-Character Codes are defined in detail in Section 6.3 (on page 119).

2987 **3.433 Wide-Character Input/Output Functions**

2988 The functions that perform wide-oriented input from streams or wide-oriented output to
2989 streams: `fgetwc()`, `fgetws()`, `fputwc()`, `fputws()`, `fwprintf()`, `fwscanf()`, `getwc()`, `getwchar()`, `putwc()`,
2990 `putwchar()`, `ungetwc()`, `vfwprintf()`, `vfwscanf()`, `vwprintf()`, `vwscanf()`, `wprintf()`, and `wscanf()`.

2991 **Note:** These functions are defined in detail in the System Interfaces volume of IEEE Std 1003.1-2001.

2992 **3.434 Wide-Character String**

2993 A contiguous sequence of wide-character codes terminated by and including the first null wide-
2994 character code.

2995 3.435 Word

2996 In the shell command language, a token other than an operator. In some cases a word is also a
2997 portion of a word token: in the various forms of parameter expansion, such as `${name-word}`, and
2998 variable assignment, such as `name=word`, the word is the portion of the token depicted by *word*.
2999 The concept of a word is no longer applicable following word expansions—only fields remain.

3000 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
3001 2.6.2, Parameter Expansion and the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
3002 2.6, Word Expansions.

3003 3.436 Working Directory (or Current Working Directory)

3004 A directory, associated with a process, that is used in pathname resolution for pathnames that
3005 do not begin with a slash.

3006 3.437 Worldwide Portability Interface

3007 Functions for handling characters in a codeset-independent manner.

3008 3.438 Write

3009 To output characters to a file, such as standard output or standard error. Unless otherwise
3010 stated, standard output is the default output destination for all uses of the term “write”; see the
3011 distinction between display and write in Section 3.132 (on page 53).

3012 3.439 XSI

3013 The X/Open System Interface is the core application programming interface for C and *sh*
3014 programming for systems conforming to the Single UNIX Specification. This is a superset of the
3015 mandatory requirements for conformance to IEEE Std 1003.1-2001.

3016 3.440 XSI-Conformant

3017 A system which allows an application to be built using a set of services that are consistent across
3018 all systems that conform to IEEE Std 1003.1-2001 and that support the XSI extension.

3019 **Note:** See also Chapter 2 (on page 17).

3020 3.441 Zombie Process

3021 A process that has terminated and that is deleted when its exit status has been reported to
3022 another process which is waiting for that process to terminate.

3023 **3.442** ± 0

3024 The algebraic sign provides additional information about any variable that has the value zero
3025 when the representation allows the sign to be determined.

General Concepts

3027

3028 For the purposes of IEEE Std 1003.1-2001, the general concepts given in Chapter 4 apply.

3029 **Note:** No shading to denote extensions or options occurs in this chapter. Where the terms and
 3030 definitions given in this chapter are used elsewhere in text related to extensions and options,
 3031 they are shaded as appropriate.

3032 4.1 Concurrent Execution

3033 Functions that suspend the execution of the calling thread shall not cause the execution of other
 3034 threads to be indefinitely suspended.

3035 4.2 Directory Protection

3036 If a directory is writable and the mode bit `S_ISVTX` is set on the directory, a process may remove
 3037 or rename files within that directory only if one or more of the following is true:

- 3038 • The effective user ID of the process is the same as that of the owner ID of the file.
- 3039 • The effective user ID of the process is the same as that of the owner ID of the directory.
- 3040 • The process has appropriate privileges.

3041 If the `S_ISVTX` bit is set on a non-directory file, the behavior is unspecified.

3042 4.3 Extended Security Controls

3043 An implementation may provide implementation-defined extended security controls (see
 3044 Section 3.159 (on page 57)). These permit an implementation to provide security mechanisms to
 3045 implement different security policies than those described in IEEE Std 1003.1-2001. These
 3046 mechanisms shall not alter or override the defined semantics of any of the interfaces in
 3047 IEEE Std 1003.1-2001.

3048 4.4 File Access Permissions

3049 The standard file access control mechanism uses the file permission bits, as described below.

3050 Implementations may provide *additional* or *alternate* file access control mechanisms, or both. An
 3051 additional access control mechanism shall only further restrict the access permissions defined by
 3052 the file permission bits. An alternate file access control mechanism shall:

- 3053 • Specify file permission bits for the file owner class, file group class, and file other class of that
 3054 file, corresponding to the access permissions.
- 3055 • Be enabled only by explicit user action, on a per-file basis by the file owner or a user with the
 3056 appropriate privilege.
- 3057 • Be disabled for a file after the file permission bits are changed for that file with `chmod()`. The
 3058 disabling of the alternate mechanism need not disable any additional mechanisms supported

3059 by an implementation.

3060 Whenever a process requests file access permission for read, write, or execute/search, if no
3061 additional mechanism denies access, access shall be determined as follows:

- 3062 • If a process has the appropriate privilege:
 - 3063 — If read, write, or directory search permission is requested, access shall be granted.
 - 3064 — If execute permission is requested, access shall be granted if execute permission is
3065 granted to at least one user by the file permission bits or by an alternate access control
3066 mechanism; otherwise, access shall be denied.
- 3067 • Otherwise:
 - 3068 — The file permission bits of a file contain read, write, and execute/search permissions for
3069 the file owner class, file group class, and file other class.
 - 3070 — Access shall be granted if an alternate access control mechanism is not enabled and the
3071 requested access permission bit is set for the class (file owner class, file group class, or file
3072 other class) to which the process belongs, or if an alternate access control mechanism is
3073 enabled and it allows the requested access; otherwise, access shall be denied.

3074 4.5 File Hierarchy

3075 Files in the system are organized in a hierarchical structure in which all of the non-terminal
3076 nodes are directories and all of the terminal nodes are any other type of file. Since multiple
3077 directory entries may refer to the same file, the hierarchy is properly described as a “directed
3078 graph”.

3079 4.6 Filenames

3080 For a filename to be portable across implementations conforming to IEEE Std 1003.1-2001, it
3081 shall consist only of the portable filename character set as defined in Section 3.276 (on page 73).

3082 The hyphen character shall not be used as the first character of a portable filename. Uppercase
3083 and lowercase letters shall retain their unique identities between conforming implementations.
3084 In the case of a portable pathname, the slash character may also be used.

3085 4.7 File Times Update

3086 Each file has three distinct associated time values: *st_atime*, *st_mtime*, and *st_ctime*. The *st_atime*
3087 field is associated with the times that the file data is accessed; *st_mtime* is associated with the
3088 times that the file data is modified; and *st_ctime* is associated with the times that the file status is
3089 changed. These values are returned in the file characteristics structure, as described in
3090 **<sys/stat.h>**.

3091 Each function or utility in IEEE Std 1003.1-2001 that reads or writes data or changes file status
3092 indicates which of the appropriate time-related fields shall be “marked for update”. If an
3093 implementation of such a function or utility marks for update a time-related field not specified
3094 by IEEE Std 1003.1-2001, this shall be documented, except that any changes caused by pathname
3095 resolution need not be documented. For the other functions or utilities in IEEE Std 1003.1-2001
3096 (those that are not explicitly required to read or write file data or change file status, but that in
3097 some implementations happen to do so), the effect is unspecified.

3098 An implementation may update fields that are marked for update immediately, or it may update
3099 such fields periodically. At an update point in time, any marked fields shall be set to the current
3100 time and the update marks shall be cleared. All fields that are marked for update shall be
3101 updated when the file ceases to be open by any process, or when a *stat()*, *fstat()*, or *lstat()* is
3102 performed on the file. Other times at which updates are done are unspecified. Marks for update,
3103 and updates themselves, are not done for files on read-only file systems; see Section 3.304 (on
3104 page 77).

3105 4.8 Host and Network Byte Orders

3106 When data is transmitted over the network, it is sent as a sequence of octets (8-bit unsigned
3107 values). If an entity (such as an address or a port number) can be larger than 8 bits, it needs to be
3108 stored in several octets. The convention is that all such values are stored with 8 bits in each octet,
3109 and with the first (lowest-addressed) octet holding the most-significant bits. This is called
3110 “network byte order”.

3111 Network byte order may not be convenient for processing actual values. For this, it is more
3112 sensible for values to be stored as ordinary integers. This is known as “host byte order”. In host
3113 byte order:

- 3114 • The most significant bit might not be stored in the first byte in address order.
- 3115 • Bits might not be allocated to bytes in any obvious order at all.

3116 8-bit values stored in **uint8_t** objects do not require conversion to or from host byte order, as
3117 they have the same representation. 16 and 32-bit values can be converted using the *htonl()*,
3118 *htons()*, *ntohl()*, and *ntohs()* functions. When reading data that is to be converted to host byte
3119 order, it should either be received directly into a **uint16_t** or **uint32_t** object or should be copied
3120 from an array of bytes using *memcpy()* or similar. Passing the data through other types could
3121 cause the byte order to be changed. Similar considerations apply when sending data.

3122 4.9 Measurement of Execution Time

3123 The mechanism used to measure execution time shall be implementation-defined. The
3124 implementation shall also define to whom the CPU time that is consumed by interrupt handlers
3125 and system services on behalf of the operating system will be charged. See Section 3.117 (on
3126 page 51).

4.10 Memory Synchronization

Applications shall ensure that access to any memory location by more than one thread of control (threads or processes) is restricted such that no thread of control can read or modify a memory location while another thread of control may be modifying it. Such access is restricted using functions that synchronize thread execution and also synchronize memory with respect to other threads. The following functions synchronize memory with respect to other threads:

<code>fork()</code>	<code>pthread_mutex_timedlock()</code>	<code>pthread_rwlock_tryrdlock()</code>
<code>pthread_barrier_wait()</code>	<code>pthread_mutex_trylock()</code>	<code>pthread_rwlock_trywrlock()</code>
<code>pthread_cond_broadcast()</code>	<code>pthread_mutex_unlock()</code>	<code>pthread_rwlock_unlock()</code>
<code>pthread_cond_signal()</code>	<code>pthread_spin_lock()</code>	<code>pthread_rwlock_wrlock()</code>
<code>pthread_cond_timedwait()</code>	<code>pthread_spin_trylock()</code>	<code>sem_post()</code>
<code>pthread_cond_wait()</code>	<code>pthread_spin_unlock()</code>	<code>sem_trywait()</code>
<code>pthread_create()</code>	<code>pthread_rwlock_rdlock()</code>	<code>sem_wait()</code>
<code>pthread_join()</code>	<code>pthread_rwlock_timedrdlock()</code>	<code>wait()</code>
<code>pthread_mutex_lock()</code>	<code>pthread_rwlock_timedwrlock()</code>	<code>waitpid()</code>

The `pthread_once()` function shall synchronize memory for the first call in each thread for a given **pthread_once_t** object.

Unless explicitly stated otherwise, if one of the above functions returns an error, it is unspecified whether the invocation causes memory to be synchronized.

Applications may allow more than one thread of control to read a memory location simultaneously.

4.11 Pathname Resolution

Pathname resolution is performed for a process to resolve a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

Each filename in the pathname is located in the directory specified by its predecessor (for example, in the pathname fragment **a/b**, file **b** is located in directory **a**). Pathname resolution shall fail if this cannot be accomplished. If the pathname begins with a slash, the predecessor of the first filename in the pathname shall be taken to be the root directory of the process (such pathnames are referred to as “absolute pathnames”). If the pathname does not begin with a slash, the predecessor of the first filename of the pathname shall be taken to be the current working directory of the process (such pathnames are referred to as “relative pathnames”).

The interpretation of a pathname component is dependent on the value of `{NAME_MAX}` and `_POSIX_NO_TRUNC` associated with the path prefix of that component. If any pathname component is longer than `{NAME_MAX}`, the implementation shall consider this an error.

A pathname that contains at least one non-slash character and that ends with one or more trailing slashes shall be resolved as if a single dot character (`'.'`) were appended to the pathname.

If a symbolic link is encountered during pathname resolution, the behavior shall depend on whether the pathname component is at the end of the pathname and on the function being performed. If all of the following are true, then pathname resolution is complete:

1. This is the last pathname component of the pathname.
2. The pathname has no trailing slash.

3169 3. The function is required to act on the symbolic link itself, or certain arguments direct that
3170 the function act on the symbolic link itself.

3171 In all other cases, the system shall prefix the remaining pathname, if any, with the contents of the
3172 symbolic link. If the combined length exceeds {PATH_MAX}, and the implementation considers
3173 this to be an error, *errno* shall be set to [ENAMETOOLONG] and an error indication shall be
3174 returned. Otherwise, the resolved pathname shall be the resolution of the pathname just created.
3175 If the resulting pathname does not begin with a slash, the predecessor of the first filename of the
3176 pathname is taken to be the directory containing the symbolic link.

3177 If the system detects a loop in the pathname resolution process, it shall set *errno* to [ELOOP] and
3178 return an error indication. The same may happen if during the resolution process more symbolic
3179 links were followed than the implementation allows. This implementation-defined limit shall
3180 not be smaller than {SYMLOOP_MAX}.

3181 The special filename dot shall refer to the directory specified by its predecessor. The special
3182 filename dot-dot shall refer to the parent directory of its predecessor directory. As a special case,
3183 in the root directory, dot-dot may refer to the root directory itself.

3184 A pathname consisting of a single slash shall resolve to the root directory of the process. A null
3185 pathname shall not be successfully resolved. A pathname that begins with two successive
3186 slashes may be interpreted in an implementation-defined manner, although more than two
3187 leading slashes shall be treated as a single slash.

3188 **4.12 Process ID Reuse**

3189 A process group ID shall not be reused by the system until the process group lifetime ends.

3190 A process ID shall not be reused by the system until the process lifetime ends. In addition, if
3191 there exists a process group whose process group ID is equal to that process ID, the process ID
3192 shall not be reused by the system until the process group lifetime ends. A process that is not a
3193 system process shall not have a process ID of 1.

3194 **4.13 Scheduling Policy**

3195 A scheduling policy affects process or thread ordering:

- 3196 • When a process or thread is a running thread and it becomes a blocked thread
- 3197 • When a process or thread is a running thread and it becomes a preempted thread
- 3198 • When a process or thread is a blocked thread and it becomes a runnable thread
- 3199 • When a running thread calls a function that can change the priority or scheduling policy of a
3200 process or thread
- 3201 • In other scheduling policy-defined circumstances

3202 Conforming implementations shall define the manner in which each of the scheduling policies
3203 may modify the priorities or otherwise affect the ordering of processes or threads at each of the
3204 occurrences listed above. Additionally, conforming implementations shall define in what other
3205 circumstances and in what manner each scheduling policy may modify the priorities or affect
3206 the ordering of processes or threads.

4.14 Seconds Since the Epoch

A value that approximates the number of seconds that have elapsed since the Epoch. A Coordinated Universal Time name (specified in terms of seconds (*tm_sec*), minutes (*tm_min*), hours (*tm_hour*), days since January 1 of the year (*tm_yday*), and calendar year minus 1900 (*tm_year*)) is related to a time represented as seconds since the Epoch, according to the expression below.

If the year is <1970 or the value is negative, the relationship is undefined. If the year is ≥1970 and the value is non-negative, the value is related to a Coordinated Universal Time name according to the C-language expression, where *tm_sec*, *tm_min*, *tm_hour*, *tm_yday*, and *tm_year* are all integer types:

$$tm\_sec + tm\_min*60 + tm\_hour*3600 + tm\_yday*86400 + \\ (tm\_year-70)*31536000 + ((tm\_year-69)/4)*86400 - \\ ((tm\_year-1)/100)*86400 + ((tm\_year+299)/400)*86400$$

The relationship between the actual time of day and the current value for seconds since the Epoch is unspecified.

How any changes to the value of seconds since the Epoch are made to align to a desired relationship with the current actual time are made is implementation-defined. As represented in seconds since the Epoch, each and every day shall be accounted for by exactly 86 400 seconds.

Note: The last three terms of the expression add in a day for each year that follows a leap year starting with the first leap year since the Epoch. The first term adds a day every 4 years starting in 1973, the second subtracts a day back out every 100 years starting in 2001, and the third adds a day back in every 400 years starting in 2001. The divisions in the formula are integer divisions; that is, the remainder is discarded leaving only the integer quotient.

4.15 Semaphore

A minimum synchronization primitive to serve as a basis for more complex synchronization mechanisms to be defined by the application program.

For the semaphores associated with the Semaphores option, a semaphore is represented as a shareable resource that has a non-negative integer value. When the value is zero, there is a (possibly empty) set of threads awaiting the availability of the semaphore.

For the semaphores associated with the X/Open System Interface Extension (XSI), a semaphore is a positive integer (0 through 32767). The *semget()* function can be called to create a set or array of semaphores. A semaphore set can contain one or more semaphores up to an implementation-defined value.

Semaphore Lock Operation

An operation that is applied to a semaphore. If, prior to the operation, the value of the semaphore is zero, the semaphore lock operation shall cause the calling thread to be blocked and added to the set of threads awaiting the semaphore; otherwise, the value shall be decremented.

3244 Semaphore Unlock Operation

3245 An operation that is applied to a semaphore. If, prior to the operation, there are any threads in
 3246 the set of threads awaiting the semaphore, then some thread from that set shall be removed from
 3247 the set and becomes unblocked; otherwise, the semaphore value shall be incremented.

3248 4.16 Thread-Safety

3249 Refer to the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.9, Threads.

3250 4.17 Tracing

3251 The trace system allows a traced process to have a selection of events created for it. Traces
 3252 consist of streams of trace event types.

3253 A trace event type is identified on the one hand by a trace event type name, also referenced as a
 3254 trace event name, and on the other hand by a trace event type identifier. A trace event name is a
 3255 human-readable string. A trace event type identifier is an opaque identifier used by the trace
 3256 system. There shall be a one-to-one relationship between trace event type identifiers and trace
 3257 event names for a given trace stream and also for a given traced process. The trace event type
 3258 identifier shall be generated automatically from a trace event name by the trace system either
 3259 when a trace controller process invokes *posix_trace_trid_eventid_open()* or when an instrumented
 3260 application process invokes *posix_trace_eventid_open()*. Trace event type identifiers are used to
 3261 filter trace event types, to allow interpretation of user data, and to identify the kind of trace point
 3262 that generated a trace event.

3263 Each trace event shall be of a particular trace event type, and associated with a trace event type
 3264 identifier. The execution of a trace point shall generate a trace event if a trace stream has been
 3265 created and started for the process that executed the trace point and if the corresponding trace
 3266 event type identifier is not ignored by filtering.

3267 A generated trace event shall be recorded in a trace stream, and optionally also in a trace log if a
 3268 trace log is associated with the trace stream, except that:

- 3269 • For a trace stream, if no resources are available for the event, the event is lost.
- 3270 • For a trace log, if no resources are available for the event, or a flush operation does not
 3271 succeed, the event is lost.

3272 A trace event recorded in an active trace stream may be retrieved by an application having the
 3273 appropriate privileges.

3274 A trace event recorded in a trace log may be retrieved by an application having the appropriate
 3275 privileges after opening the trace log as a pre-recorded trace stream, with the function
 3276 *posix_trace_open()*.

3277 When a trace event is reported it is possible to retrieve the following:

- 3278 • A trace event type identifier
- 3279 • A timestamp
- 3280 • The process ID of the traced process, if the trace event is process-dependent
- 3281 • Any optional trace event data including its length

- 3282 • If the Threads option is supported, the thread ID, if the trace event is process-dependent
- 3283 • The program address at which the trace point was invoked

3284 Trace events may be mapped from trace event types to trace event names. One such mapping
 3285 shall be associated with each trace stream. An active trace stream is associated with a traced
 3286 process, and also with its children if the Trace Inherit option is supported and also the
 3287 inheritance policy is set to `_POSIX_TRACE_INHERIT`. Therefore each traced process has a
 3288 mapping of the trace event names to trace event type identifiers that have been defined for that
 3289 process.

3290 Traces can be recorded into either trace streams or trace logs.

3291 The implementation and format of a trace stream are unspecified. A trace stream need not be
 3292 and generally is not persistent. A trace stream may be either active or pre-recorded:

- 3293 • An active trace stream is a trace stream that has been created and has not yet been shut
 3294 down. It can be of one of the two following classes:
 - 3295 1. An active trace stream without a trace log that was created with the *posix_trace_create()*
 3296 function
 - 3297 2. If the Trace Log option is supported, an active trace stream with a trace log that was
 3298 created with the *posix_trace_create_withlog()* function
- 3299 • A pre-recorded trace stream is a trace stream that was opened from a trace log object using
 3300 the *posix_trace_open()* function.

3301 An active trace stream can loop. This behavior means that when the resources allocated by the
 3302 trace system for the trace stream are exhausted, the trace system reuses the resources associated
 3303 with the oldest recorded trace events to record new trace events.

3304 If the Trace Log option is supported, an active trace stream with a trace log can be flushed. This
 3305 operation causes the trace system to write trace events from the trace stream to the associated
 3306 trace log, following the defined policies or using an explicit function call. After this operation,
 3307 the trace system may reuse the resources associated with the flushed trace events.

3308 An active trace stream with or without a trace log can be cleared. This operation shall cause all
 3309 the resources associated with this trace stream to be reinitialized. The trace stream shall behave
 3310 as if it was returning from its creation, except that the mapping of trace event type identifiers to
 3311 trace event names shall not be cleared. If a trace log was associated with this trace stream, the
 3312 trace log shall also be reinitialized.

3313 A trace log shall be recorded when the *posix_trace_shutdown()* operation is invoked or during
 3314 tracing, depending on the tracing strategy which is defined by a log policy. After the trace
 3315 stream has been shut down, the trace information can be retrieved from the associated trace log
 3316 using the same interface used to retrieve information from an active trace stream.

3317 For a traced process, if the Trace Inherit option is supported and the trace stream's inheritance
 3318 attribute is `_POSIX_TRACE_INHERIT`, the initial targeted traced process shall be traced together
 3319 with all of its future children. The *posix_pid* member of each trace event in a trace stream shall be
 3320 the process ID of the traced process.

3321 Each trace point may be an implementation-defined action such as a context switch, or an
 3322 application-programmed action such as a call to a specific operating system service (for
 3323 example, *fork()*) or a call to *posix_trace_event()*.

3324 Trace points may be filtered. The operation of the filter is to filter out (ignore) selected trace
 3325 events. By default, no trace events are filtered.

3326 The results of the tracing operations can be analyzed and monitored by a trace controller process
3327 or a trace analyzer process.

3328 Only the trace controller process has control of the trace stream it has created. The control of the
3329 operation of a trace stream is done using its corresponding trace stream identifier. The trace
3330 controller process is able to:

- 3331 • Initialize the attributes of a trace stream
- 3332 • Create the trace stream
- 3333 • Start and stop tracing
- 3334 • Know the mapping of the traced process
- 3335 • If the Trace Event Filter option is supported, filter the type of trace events to be recorded
- 3336 • Shut the trace stream down

3337 A traced process may also be a trace controller process. Only the trace controller process can
3338 control its trace stream(s). A trace stream created by a trace controller process shall be shut
3339 down if its controller process terminates or executes another file.

3340 A trace controller process may also be a trace analyzer process. Trace analysis can be done
3341 concurrently with the traced process or can be done off-line, in the same or in a different
3342 platform.

3343 **4.18 Treatment of Error Conditions for Mathematical Functions**

3344 For all the functions in the `<math.h>` header, an application wishing to check for error situations
3345 should set `errno` to 0 and call `feclearexcept(FE_ALL_EXCEPT)` before calling the function. On
3346 return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW |`
3347 `FE_UNDERFLOW)` is non-zero, an error has occurred.

3348 The following error conditions are defined for all functions in the `<math.h>` header.

3349 **4.18.1 Domain Error**

3350 A “domain error” shall occur if an input argument is outside the domain over which the
3351 mathematical function is defined. The description of each function lists any required domain
3352 errors; an implementation may define additional domain errors, provided that such errors are
3353 consistent with the mathematical definition of the function.

3354 On a domain error, the function shall return an implementation-defined value; if the integer
3355 expression `(math_errhandling & MATH_ERRNO)` is non-zero, `errno` shall be set to [EDOM]; if
3356 the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, the “invalid”
3357 floating-point exception shall be raised.

3358 **4.18.2 Pole Error**

3359 A “pole error” occurs if the mathematical result of the function is an exact infinity (for example,
3360 $\log(0.0)$).

3361 On a pole error, the function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or
3362 `HUGE_VALL` according to the return type, with the same sign as the correct value of the
3363 function; if the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero, *errno* shall
3364 be set to `[ERANGE]`; if the integer expression (`math_errhandling` & `MATH_ERREXCEPT`) is
3365 non-zero, the “divide-by-zero” floating-point exception shall be raised.

3366 **4.18.3 Range Error**

3367 A “range error” shall occur if the finite mathematical result of the function cannot be
3368 represented in an object of the specified type, due to extreme magnitude.

3369 **4.18.3.1 Result Overflows**

3370 A floating result overflows if the magnitude of the mathematical result is finite but so large that
3371 the mathematical result cannot be represented without extraordinary roundoff error in an object
3372 of the specified type. If a floating result overflows and default rounding is in effect, then the
3373 function shall return the value of the macro `HUGE_VAL`, `HUGE_VALF`, or `HUGE_VALL`
3374 according to the return type, with the same sign as the correct value of the function; if the integer
3375 expression (`math_errhandling` & `MATH_ERRNO`) is non-zero, *errno* shall be set to `[ERANGE]`; if
3376 the integer expression (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, the “overflow”
3377 floating-point exception shall be raised.

3378 **4.18.3.2 Result Underflows**

3379 The result underflows if the magnitude of the mathematical result is so small that the
3380 mathematical result cannot be represented, without extraordinary roundoff error, in an object of
3381 the specified type. If the result underflows, the function shall return an implementation-defined
3382 value whose magnitude is no greater than the smallest normalized positive number in the
3383 specified type; if the integer expression (`math_errhandling` & `MATH_ERRNO`) is non-zero,
3384 whether *errno* is set to `[ERANGE]` is implementation-defined; if the integer expression
3385 (`math_errhandling` & `MATH_ERREXCEPT`) is non-zero, whether the “underflow” floating-point
3386 exception is raised is implementation-defined.

3387 **4.19 Treatment of NaN Arguments for the Mathematical Functions**

3388 For functions called with a NaN argument, no errors shall occur and a NaN shall be returned,
3389 except where stated otherwise.

3390 If a function with one or more NaN arguments returns a NaN result, the result should be the
3391 same as one of the NaN arguments (after possible type conversion), except perhaps for the sign.

3392 On implementations that support the IEC 60559:1989 standard floating point, functions with
3393 signaling NaN argument(s) shall be treated as if the function were called with an argument that
3394 is a required domain error and shall return a quiet NaN result, except where stated otherwise.

3395 **Note:** The function might never see the signaling NaN, since it might trigger when the arguments are
3396 evaluated during the function call.

3397 On implementations that support the IEC 60559:1989 standard floating point, for those
3398 functions that do not have a documented domain error, the following shall apply:

3399 These functions shall fail if:

3400 Domain Error Any argument is a signaling NaN.

3401 Either, the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero and *errno*

3402 shall be set to [EDOM], or the integer expression (`math_errhandling & MATH_ERREXCEPT`)

3403 is non-zero and the invalid floating-point exception shall be raised.

3404 4.20 Utility

3405 A utility program shall be either an executable file, such as might be produced by a compiler or

3406 linker system from computer source code, or a file of shell source code, directly interpreted by

3407 the shell. The program may have been produced by the user, provided by the system

3408 implementor, or acquired from an independent distributor.

3409 The system may implement certain utilities as shell functions (see the Shell and Utilities volume

3410 of IEEE Std 1003.1-2001, Section 2.9.5, Function Definition Command) or built-in utilities, but

3411 only an application that is aware of the command search order described in the Shell and

3412 Utilities volume of IEEE Std 1003.1-2001, Section 2.9.1.1, Command Search and Execution or of

3413 performance characteristics can discern differences between the behavior of such a function or

3414 built-in utility and that of an executable file.

3415 4.21 Variable Assignment

3416 In the shell command language, a word consisting of the following parts:

3417 `varname=value`

3418 When used in a context where assignment is defined to occur and at no other time, the *value*

3419 (representing a word or field) shall be assigned as the value of the variable denoted by *varname*.

3420 **Note:** For further information, see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section

3421 2.9.1, Simple Commands.

3422 The *varname* and *value* parts shall meet the requirements for a name and a word, respectively,

3423 except that they are delimited by the embedded unquoted equals-sign, in addition to other

3424 delimiters.

3425 **Note:** Additional delimiters are described in the Shell and Utilities volume of IEEE Std 1003.1-2001,

3426 Section 2.3, Token Recognition.

3427 When a variable assignment is done, the variable shall be created if it did not already exist. If

3428 *value* is not specified, the variable shall be given a null value.

3429 **Note:** An alternative form of variable assignment:

3430 `symbol=value`

3431 (where *symbol* is a valid word delimited by an equals-sign, but not a valid name) produces

3432 unspecified results. The form `symbol=value` is used by the KornShell `name[expression]=value`

3433 syntax.

File Format Notation

3435

3436 The STDIN, STDOUT, STDERR, INPUT FILES, and OUTPUT FILES sections of the utility
 3437 descriptions use a syntax to describe the data organization within the files, when that
 3438 organization is not otherwise obvious. The syntax is similar to that used by the System Interfaces
 3439 volume of IEEE Std 1003.1-2001 *printf()* function, as described in this chapter. When used in
 3440 STDIN or INPUT FILES sections of the utility descriptions, this syntax describes the format that
 3441 could have been used to write the text to be read, not a format that could be used by the System
 3442 Interfaces volume of IEEE Std 1003.1-2001 *scanf()* function to read the input file.

3443 The description of an individual record is as follows:

3444 "*<format>*", [*<arg1>*, *<arg2>*, . . . , *<argn>*]

3445 The *format* is a character string that contains three types of objects defined below:

- 3446 1. *Characters* that are not “escape sequences” or “conversion specifications”, as described
 3447 below, shall be copied to the output.
- 3448 2. *Escape Sequences* represent non-graphic characters.
- 3449 3. *Conversion Specifications* specify the output format of each argument; see below.

3450 The following characters have the following special meaning in the format string:

3451 ' ' (An empty character position.) Represents one or more *<blank>*s.

3452 Δ Represents exactly one *<space>*.

3453 Table 5-1 lists escape sequences and associated actions on display devices capable of the action.

Table 5-1 Escape Sequences and Associated Actions

Escape Sequence	Represents Character	Terminal Action
'\\'	backslash	Print the character '\\ '.
'\a'	alert	Attempt to alert the user through audible or visible notification.
'\b'	backspace	Move the printing position to one column before the current position, unless the current position is the start of a line.
'\f'	form-feed	Move the printing position to the initial printing position of the next logical page.
'\n'	newline	Move the printing position to the start of the next line.
'\r'	carriage-return	Move the printing position to the start of the current line.
'\t'	tab	Move the printing position to the next tab position on the current line. If there are no more tab positions remaining on the line, the behavior is undefined.
'\v'	vertical-tab	Move the printing position to the start of the next vertical tab position. If there are no more vertical tab positions left on the page, the behavior is undefined.

Each conversion specification is introduced by the percent-sign character ('%'). After the character '%', the following shall appear in sequence:

flags Zero or more *flags*, in any order, that modify the meaning of the conversion specification.

field width An optional string of decimal digits to specify a minimum field width. For an output field, if the converted value has fewer bytes than the field width, it shall be padded on the left (or right, if the left-adjustment flag ('-'), described below, has been given) to the field width.

precision Gives the minimum number of digits to appear for the *d*, *o*, *i*, *u*, *x*, or *X* conversion specifiers (the field is padded with leading zeros), the number of digits to appear after the radix character for the *e* and *f* conversion specifiers, the maximum number of significant digits for the *g* conversion specifier; or the maximum number of bytes to be written from a string in the *s* conversion specifier. The precision shall take the form of a period ('.') followed by a decimal digit string; a null digit string is treated as zero.

conversion specifier characters

A conversion specifier character (see below) that indicates the type of conversion to be applied.

The *flag* characters and their meanings are:

– The result of the conversion shall be left-justified within the field.

– The result of a signed conversion shall always begin with a sign ('+' or '-').

<space> If the first character of a signed conversion is not a sign, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.

The value shall be converted to an alternative form. For *c*, *d*, *i*, *u*, and *s* conversion specifiers, the behavior is undefined. For the *o* conversion specifier, it shall increase the precision to force the first digit of the result to be a zero. For *x* or *X* conversion specifiers, a non-zero result has 0x or 0X prefixed to it, respectively. For

3499		e, E, f, g, and G conversion specifiers, the result shall always contain a radix character, even if no digits follow the radix character. For g and G conversion specifiers, trailing zeros shall not be removed from the result as they usually are.
3500		
3501		
3502	0	For d, i, o, u, x, X, e, E, f, g, and G conversion specifiers, leading zeros (following any indication of sign or base) shall be used to pad to the field width; no space padding is performed. If the '0' and '-' flags both appear, the '0' flag shall be ignored. For d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag shall be ignored. For other conversion specifiers, the behavior is undefined.
3503		
3504		
3505		
3506		
3507		
3508		Each conversion specifier character shall result in fetching zero or more arguments. The results
3509		are undefined if there are insufficient arguments for the format. If the format is exhausted while
3510		arguments remain, the excess arguments shall be ignored.
3511		The conversion specifiers and their meanings are:
3512	d,i,o,u,x,X	The integer argument shall be written as signed decimal (d or i), unsigned octal (o), unsigned decimal (u), or unsigned hexadecimal notation (x and X). The d and i specifiers shall convert to signed decimal in the style "[−] dddd". The x conversion specifier shall use the numbers and letters "0123456789abcdef" and the X conversion specifier shall use the numbers and letters "0123456789ABCDEF". The <i>precision</i> component of the argument shall specify the minimum number of digits to appear. If the value being converted can be represented in fewer digits than the specified minimum, it shall be expanded with leading zeros. The default precision shall be 1. The result of converting a zero value with a precision of 0 shall be no characters. If both the field width and precision are omitted, the implementation may precede, follow, or precede and follow numeric arguments of types d, i, and u with <blank>s; arguments of type o (octal) may be preceded with leading zeros.
3513		
3514		
3515		
3516		
3517		
3518		
3519		
3520		
3521		
3522		
3523		
3524		
3525	f	The floating-point number argument shall be written in decimal notation in the style "[−]ddd.ddd", where the number of digits after the radix character (shown here as a decimal point) shall be equal to the <i>precision</i> specification. The <i>LC_NUMERIC</i> locale category shall determine the radix character to use in this format. If the <i>precision</i> is omitted from the argument, six digits shall be written after the radix character; if the <i>precision</i> is explicitly 0, no radix character shall appear.
3526		
3527		
3528		
3529		
3530		
3531	e,E	The floating-point number argument shall be written in the style "[−]d.ddde±dd" (the symbol '±' indicates either a plus or minus sign), where there is one digit before the radix character (shown here as a decimal point) and the number of digits after it is equal to the precision. The <i>LC_NUMERIC</i> locale category shall determine the radix character to use in this format. When the precision is missing, six digits shall be written after the radix character; if the precision is 0, no radix character shall appear. The E conversion specifier shall produce a number with E instead of e introducing the exponent. The exponent shall always contain at least two digits. However, if the value to be written requires an exponent greater than two digits, additional exponent digits shall be written as necessary.
3532		
3533		
3534		
3535		
3536		
3537		
3538		
3539		
3540		
3541	g,G	The floating-point number argument shall be written in style f or e (or in style F or E in the case of a G conversion specifier), with the precision specifying the number of significant digits. The style used depends on the value converted: style e (or E) shall be used only if the exponent resulting from the conversion is less than −4 or greater than or equal to the precision. Trailing zeros are removed from the result. A radix character shall appear only if it is followed by a digit.
3542		
3543		
3544		
3545		
3546		

3547 c The integer argument shall be converted to an **unsigned char** and the resulting
3548 byte shall be written.

3549 s The argument shall be taken to be a string and bytes from the string shall be
3550 written until the end of the string or the number of bytes indicated by the *precision*
3551 specification of the argument is reached. If the precision is omitted from the
3552 argument, it shall be taken to be infinite, so all bytes up to the end of the string
3553 shall be written.

3554 % Write a ' % ' character; no argument is converted.

3555 In no case does a nonexistent or insufficient field width cause truncation of a field; if the result of
3556 a conversion is wider than the field width, the field is simply expanded to contain the conversion
3557 result. The term “field width” should not be confused with the term “precision” used in the
3558 description of %s.

3559 **Examples**

3560 To represent the output of a program that prints a date and time in the form Sunday, July 3,
3561 10:02, where *weekday* and *month* are strings:

3562 " %s, %s %d, %d: %.2d \n" <weekday>, <month>, <day>, <hour>, <min>

3563 To show ' π ' written to 5 decimal places:

3564 "pi = %.5f \n", <value of π >

3565 To show an input file format consisting of five colon-separated fields:

3566 " %s: %s: %s: %s: %s \n", <arg1>, <arg2>, <arg3>, <arg4>, <arg5>

Character Set

6.1 Portable Character Set

Conforming implementations shall support one or more coded character sets. Each supported locale shall include the *portable character set*, which is the set of symbolic names for characters in Table 6-1. This is used to describe characters within the text of IEEE Std 1003.1-2001. The first eight entries in Table 6-1 are defined in the ISO/IEC 6429:1992 standard and the rest of the characters are defined in the ISO/IEC 10646-1:2000 standard.

3693
3694

IEEE Std 1003.1-2001 uses character names other than the above, but only in an informative way; for example, in examples to illustrate the use of characters beyond the portable character set with the facilities of IEEE Std 1003.1-2001.

3695
3696
3697
3698
3699

Table 6-1 (on page 115) defines the characters in the portable character set and the corresponding symbolic character names used to identify each character in a character set description file. The table contains more than one symbolic character name for characters whose traditional name differs from the chosen name. Characters defined in Table 6-2 (on page 120) may also be used in character set description files.

3700
3701

IEEE Std 1003.1-2001 places only the following requirements on the encoded values of the characters in the portable character set:

3702
3703
3704
3705
3706

- If the encoded values associated with each member of the portable character set are not invariant across all locales supported by the implementation, if an application accesses any pair of locales where the character encodings differ, or accesses data from an application running in a locale which has different encodings from the application's current locale, the results are unspecified.

- 3707 • The encoded values associated with the digits 0 to 9 shall be such that the value of each
- 3708 character after 0 shall be one greater than the value of the previous character.
- 3709 • A null character, NUL, which has all bits set to zero, shall be in the set of characters.
- 3710 • The encoded values associated with the members of the portable character set are each
- 3711 represented in a single byte. Moreover, if the value is stored in an object of C-language type
- 3712 **char**, it is guaranteed to be positive (except the NUL, which is always zero).
- 3713 Conforming implementations shall support certain character and character set attributes, as
- 3714 defined in Section 7.2 (on page 124).

3715 6.2 Character Encoding

3716 The POSIX locale contains the characters in Table 6-1 (on page 115), which have the properties

3717 listed in Section 7.3.1 (on page 126). In other locales, the presence, meaning, and representation

3718 of any additional characters are locale-specific.

3719 In locales other than the POSIX locale, a character may have a state-dependent encoding. There

3720 are two types of these encodings:

- 3721 • A single-shift encoding (where each character not in the initial shift state is preceded by a
- 3722 shift code) can be defined if each shift-code and character sequence is considered a multi-
- 3723 byte character. This is done using the concatenated-constant format in a character set
- 3724 description file, as described in Section 6.4 (on page 119). If the implementation supports a
- 3725 character encoding of this type, all of the standard utilities in the Shell and Utilities volume of
- 3726 IEEE Std 1003.1-2001 shall support it. Use of a single-shift encoding with any of the functions
- 3727 in the System Interfaces volume of IEEE Std 1003.1-2001 that do not specifically mention the
- 3728 effects of state-dependent encoding is implementation-defined.
- 3729 • A locking-shift encoding (where the state of the character is determined by a shift code that
- 3730 may affect more than the single character following it) cannot be defined with the current
- 3731 character set description file format. Use of a locking-shift encoding with any of the standard
- 3732 utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 or with any of the functions
- 3733 in the System Interfaces volume of IEEE Std 1003.1-2001 that do not specifically mention the
- 3734 effects of state-dependent encoding is implementation-defined.

3735 While in the initial shift state, all characters in the portable character set shall retain their usual

3736 interpretation and shall not alter the shift state. The interpretation for subsequent bytes in the

3737 sequence shall be a function of the current shift state. A byte with all bits zero shall be

3738 interpreted as the null character independent of shift state. Thus a byte with all bits zero shall

3739 never occur in the second or subsequent bytes of a character.

3740 The maximum allowable number of bytes in a character in the current locale shall be indicated

3741 by {MB_CUR_MAX}, defined in the **<stdlib.h>** header and by the **<mb_cur_max>** value in a

3742 character set description file; see Section 6.4 (on page 119). The implementation's maximum

3743 number of bytes in a character shall be defined by the C-language macro {MB_LEN_MAX}.

6.3 C Language Wide-Character Codes

In the shell, the standard utilities are written so that the encodings of characters are described by the locale's *LC_CTYPE* definition (see Section 7.3.1 (on page 126)) and there is no differentiation between characters consisting of single octets (8-bit bytes) or multiple bytes. However, in the C language, a differentiation is made. To ease the handling of variable length characters, the C language has introduced the concept of wide-character codes.

All wide-character codes in a given process consist of an equal number of bits. This is in contrast to characters, which can consist of a variable number of bytes. The byte or byte sequence that represents a character can also be represented as a wide-character code. Wide-character codes thus provide a uniform size for manipulating text data. A wide-character code having all bits zero is the null wide-character code (see Section 3.246 (on page 69)), and terminates wide-character strings (see Section 3.432 (on page 95)). The wide-character value for each member of the portable character set shall equal its value when used as the lone character in an integer character constant. Wide-character codes for other characters are locale and implementation-defined. State shift bytes shall not have a wide-character code representation.

6.4 Character Set Description File

Implementations shall provide a character set description file for at least one coded character set supported by the implementation. These files are referred to elsewhere in IEEE Std 1003.1-2001 as *charmap* files. It is implementation-defined whether or not users or applications can provide additional character set description files.

IEEE Std 1003.1-2001 does not require that multiple character sets or codesets be supported. Although multiple *charmap* files are supported, it is the responsibility of the implementation to provide the file or files; if only one is provided, only that one is accessible using the *localedef* utility's *-f* option.

Each character set description file, except those that use the ISO/IEC 10646-1:2000 standard position values as the encoding values, shall define characteristics for the coded character set and the encoding for the characters specified in Table 6-1 (on page 115), and may define encoding for additional characters supported by the implementation. Other information about the coded character set may also be in the file. Coded character set character values shall be defined using symbolic character names followed by character encoding values.

Each symbolic name specified in Table 6-1 (on page 115) shall be included in the file and shall be mapped to a unique coding value, except as noted below. The glyphs '{', '}', '_', '-', '/', '\', '.', and '^' have more than one symbolic name; all symbolic names for each such glyph shall be included, each with identical encoding. If some or all of the control characters identified in Table 6-2 (on page 120) are supported by the implementation, the symbolic names and their corresponding encoding values shall be included in the file. Some of the encodings associated with the symbolic names in Table 6-2 (on page 120) may be the same as characters found in Table 6-1 (on page 115); both names shall be provided for each encoding.

Table 6-2 Control Character Set

<ACK>	<DC2>	<ENQ>	<FS>	<IS4>	<SOH>
<BEL>	<DC3>	<EOT>	<GS>	<LF>	<STX>
<BS>	<DC4>	<ESC>	<HT>	<NAK>	<SUB>
<CAN>	<DEL>	<ETB>	<IS1>	<RS>	<SYN>
<CR>	<DLE>	<ETX>	<IS2>	<SI>	<US>
<DC1>		<FF>	<IS3>	<SO>	<VT>

The following declarations can precede the character definitions. Each shall consist of the symbol shown in the following list, starting in column 1, including the surrounding brackets, followed by one or more <blank>s, followed by the value to be assigned to the symbol.

<code_set_name> The name of the coded character set for which the character set description file is defined. The characters of the name shall be taken from the set of characters with visible glyphs defined in Table 6-1 (on page 115).

<mb_cur_max> The maximum number of bytes in a multi-byte character. This shall default to 1.

<mb_cur_min> An unsigned positive integer value that defines the minimum number of bytes in a character for the encoded character set. On XSI-conformant systems, <mb_cur_min> shall always be 1.

<escape_char> The character used to indicate that the characters following shall be interpreted in a special way, as defined later in this section. This shall default to backslash (' \ '), which is the character used in all the following text and examples, unless otherwise noted.

<comment_char> The character that, when placed in column 1 of a charmap line, is used to indicate that the line shall be ignored. The default character shall be the number sign (' # ').

The character set mapping definitions shall be all the lines immediately following an identifier line containing the string "CHARMAP" starting in column 1, and preceding a trailer line containing the string "END CHARMAP" starting in column 1. Empty lines and lines containing a <comment_char> in the first column shall be ignored. Each non-comment line of the character set mapping definition (that is, between the "CHARMAP" and "END CHARMAP" lines of the file) shall be in either of two forms:

```
"%s %s %s\n", <symbolic-name>, <encoding>, <comments>
```

or:

```
"%s...%s %s %s\n", <symbolic-name>, <symbolic-name>,  
    <encoding>, <comments>
```

In the first format, the line in the character set mapping definition shall define a single symbolic name and a corresponding encoding. A symbolic name is one or more characters from the set shown with visible glyphs in Table 6-1 (on page 115), enclosed between angle brackets. A character following an escape character is interpreted as itself; for example, the sequence "<\\>>" represents the symbolic name "<\\>" enclosed between angle brackets.

In the second format, the line in the character set mapping definition shall define a range of one or more symbolic names. In this form, the symbolic names shall consist of zero or more non-numeric characters from the set shown with visible glyphs in Table 6-1 (on page 115), followed by an integer formed by one or more decimal digits. Both integers shall contain the same number of digits. The characters preceding the integer shall be identical in the two symbolic names, and

the integer formed by the digits in the second symbolic name shall be equal to or greater than the integer formed by the digits in the first name. This shall be interpreted as a series of symbolic names formed from the common part and each of the integers between the first and the second integer, inclusive. As an example, <j0101>...<j0104> is interpreted as the symbolic names <j0101>, <j0102>, <j0103>, and <j0104>, in that order.

A character set mapping definition line shall exist for all symbolic names specified in Table 6-1 (on page 115), and shall define the coded character value that corresponds to the character indicated in the table, or the coded character value that corresponds to the control character symbolic name. If the control characters commonly associated with the symbolic names in Table 6-2 (on page 120) are supported by the implementation, the symbolic name and the corresponding encoding value shall be included in the file. Additional unique symbolic names may be included. A coded character value can be represented by more than one symbolic name.

The encoding part is expressed as one (for single-byte character values) or more concatenated decimal, octal, or hexadecimal constants in the following formats:

```
%cd%u", <escape_char>, <decimal byte value>
%cx%x", <escape_char>, <hexadecimal byte value>
%c%o", <escape_char>, <octal byte value>
```

Decimal constants shall be represented by two or three decimal digits, preceded by the escape character and the lowercase letter 'd'; for example, "\d05", "\d97", or "\d143". Hexadecimal constants shall be represented by two hexadecimal digits, preceded by the escape character and the lowercase letter 'x'; for example, "\x05", "\x61", or "\x8f". Octal constants shall be represented by two or three octal digits, preceded by the escape character; for example, "\05", "\141", or "\217". In a portable charmap file, each constant represents an 8-bit byte. When constants are concatenated for multi-byte character values, they shall be of the same type, and interpreted in byte order from first to last with the least significant byte of the multi-byte character specified by the last constant. The manner in which these constants are represented in the character stored in the system is implementation-defined. (This notation was chosen for reasons of portability. There is no requirement that the internal representation in the computer memory be in this same order.) Omitting bytes from a multi-byte character definition produces undefined results.

In lines defining ranges of symbolic names, the encoded value shall be the value for the first symbolic name in the range (the symbolic name preceding the ellipsis). Subsequent symbolic names defined by the range shall have encoding values in increasing order. Bytes shall be treated as unsigned octets, and carry shall be propagated between the bytes as necessary to represent the range. For example, the line:

```
<j0101>...<j0104>  \d129\d254
```

is interpreted as:

```
<j0101>          \d129\d254
<j0102>          \d129\d255
<j0103>          \d130\d0
<j0104>          \d130\d1
```

The comment is optional.

The following declarations can follow the character set mapping definitions (after the "END CHARMAP" statement). Each shall consist of the keyword shown in the following list, starting in column 1, followed by the value(s) to be associated to the keyword, as defined below.

WIDTH An unsigned positive integer value defining the column width (see Section 3.103 (on page 49)) for the printable characters in the coded character set specified in

Table 6-1 (on page 115) and Table 6-2 (on page 120). Coded character set character values shall be defined using symbolic character names followed by column width values. Defining a character with more than one **WIDTH** produces undefined results. The **END WIDTH** keyword shall be used to terminate the **WIDTH** definitions. Specifying the width of a non-printable character in a **WIDTH** declaration produces undefined results.

WIDTH_DEFAULT

An unsigned positive integer value defining the default column width for any printable character not listed by one of the **WIDTH** keywords. If no **WIDTH_DEFAULT** keyword is included in the charmap, the default character width shall be 1.

Example

After the "END CHARMAP" statement, a syntax for a width definition would be:

```
WIDTH
<A> 1
<B> 1
<C>...<Z> 1
...
<foo1>...<foon> 2
...
END WIDTH
```

In this example, the numerical code point values represented by the symbols **<A>** and **** are assigned a width of 1. The code point values **<C>** to **<Z>** inclusive (**<C>**, **<D>**, **<E>**, and so on) are also assigned a width of 1. Using **<A>...<Z>** would have required fewer lines, but the alternative was shown to demonstrate flexibility. The keyword **WIDTH_DEFAULT** could have been added as appropriate.

6.4.1 State-Dependent Character Encodings

This section addresses the use of state-dependent character encodings (that is, those in which the encoding of a character is dependent on one or more shift codes that may precede it).

A single-shift encoding (where each character not in the initial shift state is preceded by a shift code) can be defined in the charmap format if each shift-code/character sequence is considered a multi-byte character, defined using the concatenated-constant format described in Section 6.4 (on page 119). If the implementation supports a character encoding of this type, all of the standard utilities shall support it. A locking-shift encoding (where the state of the character is determined by a shift code that may affect more than the single character following it) could be defined with an extension to the charmap format described in Section 6.4 (on page 119). If the implementation supports a character encoding of this type, any of the standard utilities that describe character (*versus* byte) or text-file manipulation shall have the following characteristics:

1. The utility shall process the statefully encoded data as a concatenation of state-independent characters. The presence of redundant locking shifts shall not affect the comparison of two statefully encoded strings.
2. A utility that divides, truncates, or extracts substrings from statefully encoded data shall produce output that contains locking shifts at the beginning or end of the resulting data, if appropriate, to retain correct state information.

3919

7.1 General

A locale is the definition of the subset of a user's environment that depends on language and cultural conventions. It is made up from one or more categories. Each category is identified by its name and controls specific aspects of the behavior of components of the system. Category names correspond to the following environment variable names:

LC_CTYPE Character classification and case conversion.

LC_COLLATE Collation order.

LC_MONETARY Monetary formatting.

LC_NUMERIC Numeric, non-monetary formatting.

LC_TIME Date and time formats.

LC_MESSAGES Formats of informative and diagnostic messages and interactive responses.

The standard utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 shall base their behavior on the current locale, as defined in the ENVIRONMENT VARIABLES section for each utility. The behavior of some of the C-language functions defined in the System Interfaces volume of IEEE Std 1003.1-2001 shall also be modified based on the current locale, as defined by the last call to *setlocale()*.

Locales other than those supplied by the implementation can be created via the *localedef* utility, provided that the *_POSIX2_LOCALEDEF* symbol is defined on the system. Even if *localedef* is not provided, all implementations conforming to the System Interfaces volume of IEEE Std 1003.1-2001 shall provide one or more locales that behave as described in this chapter. The input to the utility is described in Section 7.3 (on page 124). The value that is used to specify a locale when using environment variables shall be the string specified as the *name* operand to the *localedef* utility when the locale was created. The strings "C" and "POSIX" are reserved as identifiers for the POSIX locale (see Section 7.2 (on page 124)). When the value of a locale environment variable begins with a slash ('/'), it shall be interpreted as the pathname of the locale definition; the type of file (regular, directory, and so on) used to store the locale definition is implementation-defined. If the value does not begin with a slash, the mechanism used to locate the locale is implementation-defined.

If different character sets are used by the locale categories, the results achieved by an application utilizing these categories are undefined. Likewise, if different codesets are used for the data being processed by interfaces whose behavior is dependent on the current locale, or the codeset is different from the codeset assumed when the locale was created, the result is also undefined.

Applications can select the desired locale by invoking the *setlocale()* function (or equivalent) with the appropriate value. If the function is invoked with an empty string, such as:

```
setlocale(LC_ALL, "");
```

the value of the corresponding environment variable is used. If the environment variable is unset or is set to the empty string, the implementation shall set the appropriate environment as defined in Chapter 8 (on page 161).

7.2 POSIX Locale

Conforming systems shall provide a POSIX locale, also known as the C locale. The behavior of standard utilities and functions in the POSIX locale shall be as if the locale was defined via the *localedef* utility with input data from the POSIX locale tables in Section 7.3.

The tables in Section 7.3 describe the characteristics and behavior of the POSIX locale for data consisting entirely of characters from the portable character set and the control character set. For other characters, the behavior is unspecified. For C-language programs, the POSIX locale shall be the default locale when the *setlocale()* function is not called.

The POSIX locale can be specified by assigning to the appropriate environment variables the values "C" or "POSIX".

All implementations shall define a locale as the default locale, to be invoked when no environment variables are set, or set to the empty string. This default locale can be the POSIX locale or any other implementation-defined locale. Some implementations may provide facilities for local installation administrators to set the default locale, customizing it for each location. IEEE Std 1003.1-2001 does not require such a facility.

7.3 Locale Definition

The capability to specify additional locales to those provided by an implementation is optional, denoted by the `_POSIX2_LOCALEDEF` symbol. If the option is not supported, only implementation-supplied locales are available. Such locales shall be documented using the format specified in this section.

Locales can be described with the file format presented in this section. The file format is that accepted by the *localedef* utility. For the purposes of this section, the file is referred to as the "locale definition file", but no locales shall be affected by this file unless it is processed by *localedef* or some similar mechanism. Any requirements in this section imposed upon the utility shall apply to *localedef* or to any other similar utility used to install locale information using the locale definition file format described here.

The locale definition file shall contain one or more locale category source definitions, and shall not contain more than one definition for the same locale category. If the file contains source definitions for more than one category, implementation-defined categories, if present, shall appear after the categories defined by Section 7.1 (on page 123). A category source definition contains either the definition of a category or a **copy** directive. For a description of the **copy** directive, see *localedef*. In the event that some of the information for a locale category, as specified in this volume of IEEE Std 1003.1-2001, is missing from the locale source definition, the behavior of that category, if it is referenced, is unspecified.

A category source definition shall consist of a category header, a category body, and a category trailer. A category header shall consist of the character string naming of the category, beginning with the characters `LC_`. The category trailer shall consist of the string "END", followed by one or more <blank>s and the string used in the corresponding category header.

The category body shall consist of one or more lines of text. Each line shall contain an identifier, optionally followed by one or more operands. Identifiers shall be either keywords, identifying a particular locale element, or collating elements. In addition to the keywords defined in this volume of IEEE Std 1003.1-2001, the source can contain implementation-defined keywords. Each keyword within a locale shall have a unique name (that is, two categories cannot have a commonly-named keyword); no keyword shall start with the characters `LC_`. Identifiers shall be separated from the operands by one or more <blank>s.

Operands shall be characters, collating elements, or strings of characters. Strings shall be enclosed in double-quotes. Literal double-quotes within strings shall be preceded by the *<escape character>*, described below. When a keyword is followed by more than one operand, the operands shall be separated by semicolons; *<blank>*s shall be allowed both before and after a semicolon.

The first category header in the file can be preceded by a line modifying the comment character. It shall have the following format, starting in column 1:

```
"comment_char %c\n", <comment character>
```

The comment character shall default to the number sign ('#'). Blank lines and lines containing the *<comment character>* in the first position shall be ignored.

The first category header in the file can be preceded by a line modifying the escape character to be used in the file. It shall have the following format, starting in column 1:

```
"escape_char %c\n", <escape character>
```

The escape character shall default to backslash, which is the character used in all examples shown in this volume of IEEE Std 1003.1-2001.

A line can be continued by placing an escape character as the last character on the line; this continuation character shall be discarded from the input. Although the implementation need not accept any one portion of a continued line with a length exceeding {LINE_MAX} bytes, it shall place no limits on the accumulated length of the continued line. Comment lines shall not be continued on a subsequent line using an escaped *<newline>*.

Individual characters, characters in strings, and collating elements shall be represented using symbolic names, as defined below. In addition, characters can be represented using the characters themselves or as octal, hexadecimal, or decimal constants. When non-symbolic notation is used, the resultant locale definitions are in many cases not portable between systems. The left angle bracket ('<') is a reserved symbol, denoting the start of a symbolic name; when used to represent itself it shall be preceded by the escape character. The following rules apply to character representation:

1. A character can be represented via a symbolic name, enclosed within angle brackets '<' and '>'. The symbolic name, including the angle brackets, shall exactly match a symbolic name defined in the charmap file specified via the *localedef -f* option, and it shall be replaced by a character value determined from the value associated with the symbolic name in the charmap file. The use of a symbolic name not found in the charmap file shall constitute an error, unless the category is *LC_CTYPE* or *LC_COLLATE*, in which case it shall constitute a warning condition (see *localedef* for a description of actions resulting from errors and warnings). The specification of a symbolic name in a **collating-element** or **collating-symbol** section that duplicates a symbolic name in the charmap file (if present) shall be an error. Use of the escape character or a right angle bracket within a symbolic name is invalid unless the character is preceded by the escape character.

For example:

```
<c>;<c-cedilla> "<M><a><y>"
```

2. A character in the portable character set can be represented by the character itself, in which case the value of the character is implementation-defined. (Implementations may allow other characters to be represented as themselves, but such locale definitions are not portable.) Within a string, the double-quote character, the escape character, and the right angle bracket character shall be escaped (preceded by the escape character) to be interpreted as the character itself. Outside strings, the characters:

4049 , ; < > escape_char

4050 shall be escaped to be interpreted as the character itself.

4051 For example:

4052 c "May"

4053 3. A character can be represented as an octal constant. An octal constant shall be specified as
4054 the escape character followed by two or three octal digits. Each constant shall represent a
4055 byte value. Multi-byte values can be represented by concatenated constants specified in
4056 byte order with the last constant specifying the least significant byte of the character.

4057 For example:

4058 \143;\347;\143\150 "\115\141\171"

4059 4. A character can be represented as a hexadecimal constant. A hexadecimal constant shall be
4060 specified as the escape character followed by an 'x' followed by two hexadecimal digits.
4061 Each constant shall represent a byte value. Multi-byte values can be represented by
4062 concatenated constants specified in byte order with the last constant specifying the least
4063 significant byte of the character.

4064 For example:

4065 \x63;\xe7;\x63\x68 "\x4d\x61\x79"

4066 5. A character can be represented as a decimal constant. A decimal constant shall be specified
4067 as the escape character followed by a 'd' followed by two or three decimal digits. Each
4068 constant represents a byte value. Multi-byte values can be represented by concatenated
4069 constants specified in byte order with the last constant specifying the least significant byte
4070 of the character.

4071 For example:

4072 \d99;\d231;\d99\d104 "\d77\d97\d121"

4073 Implementations may accept single-digit octal, decimal, or hexadecimal constants following the
4074 escape character. Only characters existing in the character set for which the locale definition is
4075 created shall be specified, whether using symbolic names, the characters themselves, or octal,
4076 decimal, or hexadecimal constants. If a charmap file is present, only characters defined in the
4077 charmap can be specified using octal, decimal, or hexadecimal constants. Symbolic names not
4078 present in the charmap file can be specified and shall be ignored, as specified under item 1
4079 above.

4080 7.3.1 LC_CTYPE

4081 The *LC_CTYPE* category shall define character classification, case conversion, and other
4082 character attributes. In addition, a series of characters can be represented by three adjacent
4083 periods representing an ellipsis symbol ("..."). The ellipsis specification shall be interpreted as
4084 meaning that all values between the values preceding and following it represent valid
4085 characters. The ellipsis specification shall be valid only within a single encoded character set;
4086 that is, within a group of characters of the same size. An ellipsis shall be interpreted as including
4087 in the list all characters with an encoded value higher than the encoded value of the character
4088 preceding the ellipsis and lower than the encoded value of the character following the ellipsis.

4089 For example:

4090 \x30;...;\x39;

includes in the character class all characters with encoded values between the endpoints.

The following keywords shall be recognized. In the descriptions, the term “automatically included” means that it shall not be an error either to include or omit any of the referenced characters; the implementation provides them if missing (even if the entire keyword is missing) and accepts them silently if present. When the implementation automatically includes a missing character, it shall have an encoded value dependent on the charmap file in effect (see the description of the *localedef* **-f** option); otherwise, it shall have a value derived from an implementation-defined character mapping.

The character classes **digit**, **xdigit**, **lower**, **upper**, and **space** have a set of automatically included characters. These only need to be specified if the character values (that is, encoding) differ from the implementation default values. It is not possible to define a locale without these automatically included characters unless some implementation extension is used to prevent their inclusion. Such a definition would not be a proper superset of the C or POSIX locale and, thus, it might not be possible for conforming applications to work properly.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

upper Define characters to be classified as uppercase letters.

In the POSIX locale, the 26 uppercase letters shall be included:

A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The uppercase letters <A> to <Z>, as defined in Section 6.4 (on page 119) (the portable character set), are automatically included in this class.

lower Define characters to be classified as lowercase letters.

In the POSIX locale, the 26 lowercase letters shall be included:

a b c d e f g h i j k l m n o p q r s t u v w x y z

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. The lowercase letters <a> to <z> of the portable character set are automatically included in this class.

alpha Define characters to be classified as letters.

In the POSIX locale, all characters in the classes **upper** and **lower** shall be included.

In a locale definition file, no character specified for the keywords **cntrl**, **digit**, **punct**, or **space** shall be specified. Characters classified as either **upper** or **lower** are automatically included in this class.

digit Define the characters to be classified as numeric digits.

In the POSIX locale, only:

0 1 2 3 4 5 6 7 8 9

shall be included.

In a locale definition file, only the digits <zero>, <one>, <two>, <three>, <four>, <five>, <six>, <seven>, <eight>, and <nine> shall be specified, and in contiguous ascending sequence by numerical value. The digits <zero> to <nine> of the portable character set are automatically included in this class.

4134	alnum	Define characters to be classified as letters and numeric digits. Only the
4135		characters specified for the alpha and digit keywords shall be specified.
4136		Characters specified for the keywords alpha and digit are automatically
4137		included in this class.
4138	space	Define characters to be classified as white-space characters.
4139		In the POSIX locale, at a minimum, the <space>, <form-feed>, <newline>,
4140		<carriage-return>, <tab>, and <vertical-tab> shall be included.
4141		In a locale definition file, no character specified for the keywords upper ,
4142		lower , alpha , digit , graph , or xdigit shall be specified. The <space>, <form-
4143		feed>, <newline>, <carriage-return>, <tab>, and <vertical-tab> of the portable
4144		character set, and any characters included in the class blank are automatically
4145		included in this class.
4146	cntrl	Define characters to be classified as control characters.
4147		In the POSIX locale, no characters in classes alpha or print shall be included.
4148		In a locale definition file, no character specified for the keywords upper ,
4149		lower , alpha , digit , punct , graph , print , or xdigit shall be specified.
4150	punct	Define characters to be classified as punctuation characters.
4151		In the POSIX locale, neither the <space> nor any characters in classes alpha ,
4152		digit , or cntrl shall be included.
4153		In a locale definition file, no character specified for the keywords upper ,
4154		lower , alpha , digit , cntrl , xdigit , or as the <space> shall be specified.
4155	graph	Define characters to be classified as printable characters, not including the
4156		<space>.
4157		In the POSIX locale, all characters in classes alpha , digit , and punct shall be
4158		included; no characters in class cntrl shall be included.
4159		In a locale definition file, characters specified for the keywords upper , lower ,
4160		alpha , digit , xdigit , and punct are automatically included in this class. No
4161		character specified for the keyword cntrl shall be specified.
4162	print	Define characters to be classified as printable characters, including the
4163		<space>.
4164		In the POSIX locale, all characters in class graph shall be included; no
4165		characters in class cntrl shall be included.
4166		In a locale definition file, characters specified for the keywords upper , lower ,
4167		alpha , digit , xdigit , punct , graph , and the <space> are automatically included
4168		in this class. No character specified for the keyword cntrl shall be specified.
4169	xdigit	Define the characters to be classified as hexadecimal digits.
4170		In the POSIX locale, only:
4171		0 1 2 3 4 5 6 7 8 9 A B C D E F a b c d e f
4172		shall be included.
4173		In a locale definition file, only the characters defined for the class digit shall be
4174		specified, in contiguous ascending sequence by numerical value, followed by
4175		one or more sets of six characters representing the hexadecimal digits 10 to 15

4176		inclusive, with each set in ascending order (for example, <A>, , <C>, <D>, <E>, <F>, <a>, , <c>, <d>, <e>, <f>). The digits <zero> to <nine>, the
4177		uppercase letters <A> to <F>, and the lowercase letters <a> to <f> of the
4178		portable character set are automatically included in this class.
4179		
4180	blank	Define characters to be classified as <blank>s.
4181		In the POSIX locale, only the <space> and <tab> shall be included.
4182		In a locale definition file, the <space> and <tab> are automatically included in
4183		this class.
4184	charclass	Define one or more locale-specific character class names as strings separated
4185		by semicolons. Each named character class can then be defined subsequently
4186		in the <i>LC_CTYPE</i> definition. A character class name shall consist of at least
4187		one and at most {CHARCLASS_NAME_MAX} bytes of alphanumeric
4188		characters from the portable filename character set. The first character of a
4189		character class name shall not be a digit. The name shall not match any of the
4190		<i>LC_CTYPE</i> keywords defined in this volume of IEEE Std 1003.1-2001. Future
4191		revisions of IEEE Std 1003.1-2001 will not specify any <i>LC_CTYPE</i> keywords
4192		containing uppercase letters.
4193	<i>charclass-name</i>	Define characters to be classified as belonging to the named locale-specific
4194		character class. In the POSIX locale, locale-specific named character classes
4195		need not exist.
4196		If a class name is defined by a charclass keyword, but no characters are
4197		subsequently assigned to it, this is not an error; it represents a class without
4198		any characters belonging to it.
4199		The <i>charclass-name</i> can be used as the <i>property</i> argument to the <i>wctype()</i>
4200		function, in regular expression and shell pattern-matching bracket
4201		expressions, and by the <i>tr</i> command.
4202	toupper	Define the mapping of lowercase letters to uppercase letters.
4203		In the POSIX locale, at a minimum, the 26 lowercase characters:
4204		a b c d e f g h i j k l m n o p q r s t u v w x y z
4205		shall be mapped to the corresponding 26 uppercase characters:
4206		A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
4207		In a locale definition file, the operand shall consist of character pairs,
4208		separated by semicolons. The characters in each character pair shall be
4209		separated by a comma and the pair enclosed by parentheses. The first
4210		character in each pair is the lowercase letter, the second the corresponding
4211		uppercase letter. Only characters specified for the keywords lower and upper
4212		shall be specified. The lowercase letters <a> to <z>, and their corresponding
4213		uppercase letters <A> to <Z>, of the portable character set are automatically
4214		included in this mapping, but only when the toupper keyword is omitted
4215		from the locale definition.
4216	tolower	Define the mapping of uppercase letters to lowercase letters.
4217		In the POSIX locale, at a minimum, the 26 uppercase characters:
4218		A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

shall be mapped to the corresponding 26 lowercase characters:

a b c d e f g h i j k l m n o p q r s t u v w x y z

In a locale definition file, the operand shall consist of character pairs, separated by semicolons. The characters in each character pair shall be separated by a comma and the pair enclosed by parentheses. The first character in each pair is the uppercase letter, the second the corresponding lowercase letter. Only characters specified for the keywords **lower** and **upper** shall be specified. If the **tolower** keyword is omitted from the locale definition, the mapping is the reverse mapping of the one specified for **toupper**.

The following table shows the character class combinations allowed:

Table 7-1 Valid Character Class Combinations

In Class	Can Also Belong To										
	upper	lower	alpha	digit	space	cntrl	punct	graph	print	xdigit	blank
upper	—	—	A	x	x	x	x	A	A	—	x
lower	—	—	A	x	x	x	x	A	A	—	x
alpha	—	—		x	x	x	x	A	A	—	x
digit	x	x	x		x	x	x	A	A	A	x
space	x	x	x	x		—	*	*	*	x	—
cntrl	x	x	x	x	—		x	x	x	x	—
punct	x	x	x	x	—	x		A	A	x	—
graph	—	—	—	—	—	x	—		A	—	—
print	—	—	—	—	—	x	—	—		—	—
xdigit	—	—	—	—	x	x	x	A	A		x
blank	x	x	x	x	A	—	*	*	*	x	

Notes:

1. Explanation of codes:

A Automatically included; see text.

— Permitted.

x Mutually-exclusive.

* See note 2.

2. The <space>, which is part of the **space** and **blank** classes, cannot belong to **punct** or **graph**, but shall automatically belong to the **print** class. Other **space** or **blank** characters can be classified as any of **punct**, **graph**, or **print**.

7.3.1.1 LC_CTYPE Category in the POSIX Locale

The character classifications for the POSIX locale follow; the code listing depicts the *localedef* input, and the table represents the same information, sorted by character.

```
LC_CTYPE
# The following is the POSIX locale LC_CTYPE.
# "alpha" is by default "upper" and "lower"
# "alnum" is by definition "alpha" and "digit"
# "print" is by default "alnum", "punct", and the <space>
# "graph" is by default "alnum" and "punct"
#
upper    <A>;<B>;<C>;<D>;<E>;<F>;<G>;<H>;<I>;<J>;<K>;<L>;<M>;\
```

```

4263      <N>;<O>;<P>;<Q>;<R>;<S>;<T>;<U>;<V>;<W>;<X>;<Y>;<Z>
4264      #
4265      lower  <a>;<b>;<c>;<d>;<e>;<f>;<g>;<h>;<i>;<j>;<k>;<l>;<m>;\
4266             <n>;<o>;<p>;<q>;<r>;<s>;<t>;<u>;<v>;<w>;<x>;<y>;<z>
4267      #
4268      digit  <zero>;<one>;<two>;<three>;<four>;<five>;<six>;\
4269             <seven>;<eight>;<nine>
4270      #
4271      space  <tab>;<newline>;<vertical-tab>;<form-feed>;\
4272             <carriage-return>;<space>
4273      #
4274      cntrl  <alert>;<backspace>;<tab>;<newline>;<vertical-tab>;\
4275             <form-feed>;<carriage-return>;\
4276             <NUL>;<SOH>;<STX>;<ETX>;<EOT>;<ENQ>;<ACK>;<SO>;\
4277             <SI>;<DLE>;<DC1>;<DC2>;<DC3>;<DC4>;<NAK>;<SYN>;\
4278             <ETB>;<CAN>;<EM>;<SUB>;<ESC>;<IS4>;<IS3>;<IS2>;\
4279             <IS1>;<DEL>
4280      #
4281      punct  <exclamation-mark>;<quotation-mark>;<number-sign>;\

7.3.2 LC_COLLATE

The *LC_COLLATE* category provides a collation sequence definition for numerous utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 (*sort*, *uniq*, and so on), regular expression matching (see Chapter 9 (on page 169)), and the *strcoll()*, *strxfrm()*, *wscoll()*, and *wcsxfrm()* functions in the System Interfaces volume of IEEE Std 1003.1-2001.

A collation sequence definition shall define the relative order between collating elements (characters and multi-character collating elements) in the locale. This order is expressed in terms of collation values; that is, by assigning each element one or more collation values (also known as collation weights). This does not imply that implementations shall assign such values, but that ordering of strings using the resultant collation definition in the locale behaves as if such assignment is done and used in the collation process. At least the following capabilities are provided:

1. **Multi-character collating elements.** Specification of multi-character collating elements (that is, sequences of two or more characters to be collated as an entity).

2. **User-defined ordering of collating elements.** Each collating element shall be assigned a collation value defining its order in the character (or basic) collation sequence. This ordering is used by regular expressions and pattern matching and, unless collation weights are explicitly specified, also as the collation weight to be used in sorting.
3. **Multiple weights and equivalence classes.** Collating elements can be assigned one or more (up to the limit {COLL_WEIGHTS_MAX}, as defined in **<limits.h>**) collating weights for use in sorting. The first weight is hereafter referred to as the primary weight.
4. **One-to-many mapping.** A single character is mapped into a string of collating elements.
5. **Equivalence class definition.** Two or more collating elements have the same collation value (primary weight).
6. **Ordering by weights.** When two strings are compared to determine their relative order, the two strings are first broken up into a series of collating elements; the elements in each successive pair of elements are then compared according to the relative primary weights for the elements. If equal, and more than one weight has been assigned, then the pairs of collating elements are re-compared according to the relative subsequent weights, until either a pair of collating elements compare unequal or the weights are exhausted.

The following keywords shall be recognized in a collation sequence definition. They are described in detail in the following sections.

copy	Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.
collating-element	Define a collating-element symbol representing a multi-character collating element. This keyword is optional.
collating-symbol	Define a collating symbol for use in collation order statements. This keyword is optional.
order_start	Define collation rules. This statement shall be followed by one or more collation order statements, assigning character collation values and collation weights to collating elements.
order_end	Specify the end of the collation-order statements.

7.3.2.1 The collating-element Keyword

In addition to the collating elements in the character set, the **collating-element** keyword can be used to define multi-character collating elements. The syntax is as follows:

```
"collating-element %s from \"%s\"\\n", <collating-symbol>, <string>
```

The **<collating-symbol>** operand shall be a symbolic name, enclosed between angle brackets ('<' and '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any other symbolic name defined in this collation definition. The string operand is a string of two or more characters that collates as an entity. A **<collating-element>** defined via this keyword is only recognized with the **LC_COLLATE** category.

For example:

```
collating-element <ch> from "<c><h>"
collating-element <e-acute> from "<acute><e>"
collating-element <ll> from "ll"
```

4498 7.3.2.2 *The collating-symbol Keyword*

4499 This keyword shall be used to define symbols for use in collation sequence statements; that is,
 4500 between the **order_start** and the **order_end** keywords. The syntax is as follows:

4501 "collating-symbol %s\n", <collating-symbol>

4502 The <collating-symbol> shall be a symbolic name, enclosed between angle brackets ('<' and
 4503 '>'), and shall not duplicate any symbolic name in the current charmap file (if any), or any
 4504 other symbolic name defined in this collation definition. A <collating-symbol> defined via this
 4505 keyword is only recognized within the *LC_COLLATE* category.

4506 For example:

4507 collating-symbol <UPPER_CASE>

4508 collating-symbol <HIGH>

4509 The **collating-symbol** keyword defines a symbolic name that can be associated with a relative
 4510 position in the character order sequence. While such a symbolic name does not represent any
 4511 collating element, it can be used as a weight.

4512 7.3.2.3 *The order_start Keyword*

4513 The **order_start** keyword shall precede collation order entries and also define the number of
 4514 weights for this collation sequence definition and other collation rules. The syntax is as follows:

4515 "order_start %s;%s;...;%s\n", <sort-rules>, <sort-rules> ...

4516 The operands to the **order_start** keyword are optional. If present, the operands define rules to be
 4517 applied when strings are compared. The number of operands define how many weights each
 4518 element is assigned; if no operands are present, one **forward** operand is assumed. If present, the
 4519 first operand defines rules to be applied when comparing strings using the first (primary)
 4520 weight; the second when comparing strings using the second weight, and so on. Operands shall
 4521 be separated by semicolons (';'). Each operand shall consist of one or more collation
 4522 directives, separated by commas (','),. If the number of operands exceeds the
 4523 {COLL_WEIGHTS_MAX} limit, the utility shall issue a warning message. The following
 4524 directives shall be supported:

4525 **forward** Specifies that comparison operations for the weight level shall proceed from start
 4526 of string towards the end of string.

4527 **backward** Specifies that comparison operations for the weight level shall proceed from end of
 4528 string towards the beginning of string.

4529 **position** Specifies that comparison operations for the weight level shall consider the relative
 4530 position of elements in the strings not subject to **IGNORE**. The string containing
 4531 an element not subject to **IGNORE** after the fewest collating elements subject to
 4532 **IGNORE** from the start of the compare shall collate first. If both strings contain a
 4533 character not subject to **IGNORE** in the same relative position, the collating values
 4534 assigned to the elements shall determine the ordering. In case of equality,
 4535 subsequent characters not subject to **IGNORE** shall be considered in the same
 4536 manner.

4537 The directives **forward** and **backward** are mutually-exclusive.

4538 If no operands are specified, a single **forward** operand shall be assumed.

4539 For example:

4540 order_start forward;backward

4541 7.3.2.4 Collation Order

4542 The **order_start** keyword shall be followed by collating identifier entries. The syntax for the
4543 collating element entries is as follows:

4544 "%s %s;%s;...;%s\n", <collating-identifier>, <weight>, <weight>, ...

4545 Each *collating-identifier* shall consist of either a character (in any of the forms defined in Section
4546 7.3 (on page 124)), a <collating-element>, a <collating-symbol>, an ellipsis, or the special symbol
4547 **UNDEFINED**. The order in which collating elements are specified determines the character
4548 order sequence, such that each collating element shall compare less than the elements following
4549 it.

4550 A <collating-element> shall be used to specify multi-character collating elements, and indicates
4551 that the character sequence specified via the <collating-element> is to be collated as a unit and in
4552 the relative order specified by its place.

4553 A <collating-symbol> can be used to define a position in the relative order for use in weights. No
4554 weights shall be specified with a <collating-symbol>.

4555 The ellipsis symbol specifies that a sequence of characters shall collate according to their
4556 encoded character values. It shall be interpreted as indicating that all characters with a coded
4557 character set value higher than the value of the character in the preceding line, and lower than
4558 the coded character set value for the character in the following line, in the current coded
4559 character set, shall be placed in the character collation order between the previous and the
4560 following character in ascending order according to their coded character set values. An initial
4561 ellipsis shall be interpreted as if the preceding line specified the NUL character, and a trailing
4562 ellipsis as if the following line specified the highest coded character set value in the current
4563 coded character set. An ellipsis shall be treated as invalid if the preceding or following lines do
4564 not specify characters in the current coded character set. The use of the ellipsis symbol ties the
4565 definition to a specific coded character set and may preclude the definition from being portable
4566 between implementations.

4567 The symbol **UNDEFINED** shall be interpreted as including all coded character set values not
4568 specified explicitly or via the ellipsis symbol. Such characters shall be inserted in the character
4569 collation order at the point indicated by the symbol, and in ascending order according to their
4570 coded character set values. If no **UNDEFINED** symbol is specified, and the current coded
4571 character set contains characters not specified in this section, the utility shall issue a warning
4572 message and place such characters at the end of the character collation order.

4573 The optional operands for each collation-element shall be used to define the primary, secondary,
4574 or subsequent weights for the collating element. The first operand specifies the relative primary
4575 weight, the second the relative secondary weight, and so on. Two or more collation-elements can
4576 be assigned the same weight; they belong to the same “equivalence class” if they have the same
4577 primary weight. Collation shall behave as if, for each weight level, elements subject to **IGNORE**
4578 are removed, unless the **position** collation directive is specified for the corresponding level with
4579 the **order_start** keyword. Then each successive pair of elements shall be compared according to
4580 the relative weights for the elements. If the two strings compare equal, the process shall be
4581 repeated for the next weight level, up to the limit {COLL_WEIGHTS_MAX}.

4582 Weights shall be expressed as characters (in any of the forms specified in Section 7.3 (on page
4583 124)), <collating-symbol>s, <collating-element>s, an ellipsis, or the special symbol **IGNORE**. A
4584 single character, a <collating-symbol>, or a <collating-element> shall represent the relative position

in the character collating sequence of the character or symbol, rather than the character or characters themselves. Thus, rather than assigning absolute values to weights, a particular weight is expressed using the relative order value assigned to a collating element based on its order in the character collation sequence.

One-to-many mapping is indicated by specifying two or more concatenated characters or symbolic names. For example, if the `<eszt>` is given the string "`<s><s>`" as a weight, comparisons are performed as if all occurrences of the `<eszt>` are replaced by "`<s><s>`" (assuming that "`<s>`" has the collating weight "`<s>`"). If it is necessary to define `<eszt>` and "`<s><s>`" as an equivalence class, then a collating element must be defined for the string "`ss`".

All characters specified via an ellipsis shall by default be assigned unique weights, equal to the relative order of characters. Characters specified via an explicit or implicit **UNDEFINED** special symbol shall by default be assigned the same primary weight (that is, they belong to the same equivalence class). An ellipsis symbol as a weight shall be interpreted to mean that each character in the sequence shall have unique weights, equal to the relative order of their character in the character collation sequence. The use of the ellipsis as a weight shall be treated as an error if the collating element is neither an ellipsis nor the special symbol **UNDEFINED**.

The special keyword **IGNORE** as a weight shall indicate that when strings are compared using the weights at the level where **IGNORE** is specified, the collating element shall be ignored; that is, as if the string did not contain the collating element. In regular expressions and pattern matching, all characters that are subject to **IGNORE** in their primary weight form an equivalence class.

An empty operand shall be interpreted as the collating element itself.

For example, the order statement:

```
<a>      <a>;<a>
```

is equal to:

```
<a>
```

An ellipsis can be used as an operand if the collating element was an ellipsis, and shall be interpreted as the value of each character defined by the ellipsis.

The collation order as defined in this section affects the interpretation of bracket expressions in regular expressions (see Section 9.3.5 (on page 172)).

For example:

```

4616      order_start    forward;backward
4617      UNDEFINED      IGNORE;IGNORE
4618      <LOW>
4619      <space>         <LOW>;<space>
4620      ...             <LOW>;...
4621      <a>              <a>;<a>
4622      <a-acute>        <a>;<a-acute>
4623      <a-grave>        <a>;<a-grave>
4624      <A>              <a>;<A>
4625      <A-acute>        <a>;<A-acute>
4626      <A-grave>        <a>;<A-grave>
4627      <ch>             <ch>;<ch>
4628      <Ch>             <ch>;<Ch>
4629      <s>              <s>;<s>
4630      <eszet>          "<s><s>";"<eszet><eszet>"
4631      order_end

```

4632 This example is interpreted as follows:

- 4633 1. The **UNDEFINED** means that all characters not specified in this definition (explicitly or
4634 via the ellipsis) shall be ignored for collation purposes.
- 4635 2. All characters between <space> and 'a' shall have the same primary equivalence class
4636 and individual secondary weights based on their ordinal encoded values.
- 4637 3. All characters based on the uppercase or lowercase character 'a' belong to the same
4638 primary equivalence class.
- 4639 4. The multi-character collating element <ch> is represented by the collating symbol <ch>
4640 and belongs to the same primary equivalence class as the multi-character collating element
4641 <Ch>.

4642 7.3.2.5 The order_end Keyword

4643 The collating order entries shall be terminated with an **order_end** keyword.

4644 7.3.2.6 LC_COLLATE Category in the POSIX Locale

4645 The collation sequence definition of the POSIX locale follows; the code listing depicts the
4646 *localedef* input.

```

4647 LC_COLLATE
4648 # This is the POSIX locale definition for the LC_COLLATE category.
4649 # The order is the same as in the ASCII codeset.
4650 order_start forward
4651 <NUL>

4782 7.3.3 LC_MONETARY

4783 The *LC_MONETARY* category shall define the rules and symbols that are used to format
 4784 monetary numeric information.

4785 XSI This information is available through the *localeconv()* function and is used by the *strfmon()*
 4786 function.

4787 XSI Some of the information is also available in an alternative form via the *nl_langinfo()* function
 4788 (see CRNCYSTR in <langinfo.h>).

4789 The following items are defined in this category of the locale. The item names are the keywords
 4790 recognized by the *localedef* utility when defining a locale. They are also similar to the member
 4791 names of the **lconv** structure defined in <locale.h>; see <locale.h> for the exact symbols in the
 4792 header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the
 4793 empty string ("") for unspecified or size zero string items.

4794 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
 4795 Section 7.4 (on page 153). For some keywords, the strings can contain only integers. Keywords
 4796 that are not provided, string values set to the empty string (""), or integer keywords set to -1,
 4797 are used to indicate that the value is not available in the locale. The following keywords shall be
 4798 recognized:

4799 **copy** Specify the name of an existing locale which shall be used as the
 4800 definition of this category. If this keyword is specified, no other keyword
 4801 shall be specified.

4802 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4803 **int_curr_symbol** The international currency symbol. The operand shall be a four-character
 4804 string, with the first three characters containing the alphabetic
 4805 international currency symbol. The international currency symbol should
 4806 be chosen in accordance with those specified in the ISO 4217 standard.
 4807 The fourth character shall be the character used to separate the
 4808 international currency symbol from the monetary quantity.

4809 **currency_symbol** The string that shall be used as the local currency symbol.

4810 **mon_decimal_point** The operand is a string containing the symbol that shall be used as the
 4811 decimal delimiter (radix character) in monetary formatted quantities.

4812	mon_thousands_sep	The operand is a string containing the symbol that shall be used as a separator for groups of digits to the left of the decimal delimiter in formatted monetary quantities.
4813		
4814		
4815	mon_grouping	Define the size of each group of digits in formatted monetary quantities. The operand is a sequence of integers separated by semicolons. Each integer specifies the number of digits in each group, with the initial integer defining the size of the group immediately preceding the decimal delimiter, and the following integers defining the preceding groups. If the last integer is not <code>-1</code> , then the size of the previous group (if any) shall be repeatedly used for the remainder of the digits. If the last integer is <code>-1</code> , then no further grouping shall be performed.
4816		
4817		
4818		
4819		
4820		
4821		
4822		
4823	positive_sign	A string that shall be used to indicate a non-negative-valued formatted monetary quantity.
4824		
4825	negative_sign	A string that shall be used to indicate a negative-valued formatted monetary quantity.
4826		
4827	int_frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using int_curr_symbol .
4828		
4829		
4830	frac_digits	An integer representing the number of fractional digits (those to the right of the decimal delimiter) to be written in a formatted monetary quantity using currency_symbol .
4831		
4832		
4833	p_cs_precedes	An integer set to 1 if the currency_symbol precedes the value for a monetary quantity with a non-negative value, and set to 0 if the symbol succeeds the value.
4834		
4835		
4836	p_sep_by_space	An integer set to 0 if no space separates the currency_symbol from the value for a monetary quantity with a non-negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.
4837		
4838		
4839		
4840	n_cs_precedes	An integer set to 1 if the currency_symbol precedes the value for a monetary quantity with a negative value, and set to 0 if the symbol succeeds the value.
4841		
4842		
4843	n_sep_by_space	An integer set to 0 if no space separates the currency_symbol from the value for a monetary quantity with a negative value, set to 1 if a space separates the symbol from the value, and set to 2 if a space separates the symbol and the sign string, if adjacent.
4844		
4845		
4846		
4847	p_sign_posn	An integer set to a value indicating the positioning of the positive_sign for a monetary quantity with a non-negative value. The following integer values shall be recognized for int_n_sign_posn , int_p_sign_posn , n_sign_posn , and p_sign_posn :
4848		
4849		
4850		
4851		0 Parentheses enclose the quantity and the currency_symbol .
4852		1 The sign string precedes the quantity and the currency_symbol .
4853		2 The sign string succeeds the quantity and the currency_symbol .
4854		3 The sign string precedes the currency_symbol .
4855		4 The sign string succeeds the currency_symbol .

4856	n_sign_posn	An integer set to a value indicating the positioning of the negative_sign
4857		for a negative formatted monetary quantity.
4858	int_p_cs_precedes	An integer set to 1 if the int_curr_symbol precedes the value for a
4859		monetary quantity with a non-negative value, and set to 0 if the symbol
4860		succeeds the value.
4861	int_n_cs_precedes	An integer set to 1 if the int_curr_symbol precedes the value for a
4862		monetary quantity with a negative value, and set to 0 if the symbol
4863		succeeds the value.
4864	int_p_sep_by_space	An integer set to 0 if no space separates the int_curr_symbol from the
4865		value for a monetary quantity with a non-negative value, set to 1 if a
4866		space separates the symbol from the value, and set to 2 if a space
4867		separates the symbol and the sign string, if adjacent.
4868	int_n_sep_by_space	An integer set to 0 if no space separates the int_curr_symbol from the
4869		value for a monetary quantity with a negative value, set to 1 if a space
4870		separates the symbol from the value, and set to 2 if a space separates the
4871		symbol and the sign string, if adjacent.
4872	int_p_sign_posn	An integer set to a value indicating the positioning of the positive_sign
4873		for a positive monetary quantity formatted with the international format.
4874	int_n_sign_posn	An integer set to a value indicating the positioning of the negative_sign
4875		for a negative monetary quantity formatted with the international format.

4876 7.3.3.1 LC_MONETARY Category in the POSIX Locale

4877 The monetary formatting definitions for the POSIX locale follow; the code listing depicting the
 4878 xsl *localedef* input, the table representing the same information with the addition of *localeconv()* and
 4879 *nl_langinfo()* formats. All values are unspecified in the POSIX locale.

```

4880 LC_MONETARY

4930 XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension.
 4931 The entry N/A indicates that the value is not available in the POSIX locale.

4932 7.3.4 LC_NUMERIC

4933 The *LC_NUMERIC* category shall define the rules and symbols that are used to format non-
 4934 monetary numeric information. This information is available through the *localeconv()* function.

4935 XSI Some of the information is also available in an alternative form via the *nl_langinfo()* function.

4936 The following items are defined in this category of the locale. The item names are the keywords
 4937 recognized by the *localedef* utility when defining a locale. They are also similar to the member
 4938 names of the **lconv** structure defined in **<locale.h>**; see **<locale.h>** for the exact symbols in the
 4939 header. The *localeconv()* function returns {CHAR_MAX} for unspecified integer items and the
 4940 empty string (" ") for unspecified or size zero string items.

4941 In a locale definition file, the operands are strings, formatted as indicated by the grammar in
 4942 Section 7.4 (on page 153). For some keywords, the strings can only contain integers. Keywords
 4943 that are not provided, string values set to the empty string (" "), or integer keywords set to –1,
 4944 shall be used to indicate that the value is not available in the locale. The following keywords
 4945 shall be recognized:

4946 **copy** Specify the name of an existing locale which shall be used as the definition of
 4947 this category. If this keyword is specified, no other keyword shall be specified.

4948 **Note:** This is a *localedef* utility keyword, unavailable through *localeconv()*.

4949 **decimal_point** The operand is a string containing the symbol that shall be used as the
 4950 decimal delimiter (radix character) in numeric, non-monetary formatted
 4951 quantities. This keyword cannot be omitted and cannot be set to the empty
 4952 string. In contexts where standards limit the **decimal_point** to a single byte,
 4953 the result of specifying a multi-byte operand shall be unspecified.

4954 **thousands_sep** The operand is a string containing the symbol that shall be used as a separator
 4955 for groups of digits to the left of the decimal delimiter in numeric, non-
 4956 monetary formatted monetary quantities. In contexts where standards limit
 4957 the **thousands_sep** to a single byte, the result of specifying a multi-byte
 4958 operand shall be unspecified.

4959 **grouping** Define the size of each group of digits in formatted non-monetary quantities.
 4960 The operand is a sequence of integers separated by semicolons. Each integer
 4961 specifies the number of digits in each group, with the initial integer defining
 4962 the size of the group immediately preceding the decimal delimiter, and the
 4963 following integers defining the preceding groups. If the last integer is not -1,
 4964 then the size of the previous group (if any) shall be repeatedly used for the
 4965 remainder of the digits. If the last integer is -1, then no further grouping shall
 4966 be performed.

4967 7.3.4.1 LC_NUMERIC Category in the POSIX Locale

4968 The non-monetary numeric formatting definitions for the POSIX locale follow; the code listing
 4969 depicting the *localedef* input, the table representing the same information with the addition of
 4970 XSI *localeconv()* values, and *nl_langinfo()* constants.

```

4971 LC_NUMERIC
4972 # This is the POSIX locale definition for
4973 # the LC_NUMERIC category.
4974 #
4975 decimal_point      "<period>"
4976 thousands_sep      ""
4977 grouping           -1
4978 #
4979 END LC_NUMERIC

```

Item	langinfo Constant	POSIX Locale Value	localeconv() Value	localedef Value
decimal_point	RADIXCHAR	."	."	.
thousands_sep	THOUSEP	N/A	""	""
grouping	—	N/A	""	-1

4985 XSI In the preceding table, the **langinfo Constant** column represents an XSI-conforming extension.
 4986 The entry N/A indicates that the value is not available in the POSIX locale.

4987 7.3.5 LC_TIME

4988 The *LC_TIME* category shall define the interpretation of the conversion specifications supported
 4989 XSI by the *date* utility and shall affect the behavior of the *strftime()*, *wcsftime()*, *strptime()*, and
 4990 *nl_langinfo()* functions. Since the interfaces for C-language access and locale definition differ
 4991 significantly, they are described separately.

4992 7.3.5.1 LC_TIME Locale Definition

4993 In a locale definition, the following mandatory keywords shall be recognized:

4994	copy	Specify the name of an existing locale which shall be used as the definition of
4995		this category. If this keyword is specified, no other keyword shall be specified.
4996	abday	Define the abbreviated weekday names, corresponding to the %a conversion
4997		specification (conversion specification in the <i>strftime()</i> , <i>wcsftime()</i> , and
4998		<i>strptime()</i> functions). The operand shall consist of seven semicolon-separated
4999		strings, each surrounded by double-quotes. The first string shall be the
5000		abbreviated name of the day corresponding to Sunday, the second the
5001		abbreviated name of the day corresponding to Monday, and so on.
5002	day	Define the full weekday names, corresponding to the %A conversion
5003		specification. The operand shall consist of seven semicolon-separated strings,
5004		each surrounded by double-quotes. The first string is the full name of the day
5005		corresponding to Sunday, the second the full name of the day corresponding
5006		to Monday, and so on.
5007	abmon	Define the abbreviated month names, corresponding to the %b conversion
5008		specification. The operand shall consist of twelve semicolon-separated strings,
5009		each surrounded by double-quotes. The first string shall be the abbreviated
5010		name of the first month of the year (January), the second the abbreviated
5011		name of the second month, and so on.
5012	mon	Define the full month names, corresponding to the %B conversion
5013		specification. The operand shall consist of twelve semicolon-separated strings,
5014		each surrounded by double-quotes. The first string shall be the full name of
5015		the first month of the year (January), the second the full name of the second
5016		month, and so on.
5017	d_t_fmt	Define the appropriate date and time representation, corresponding to the %c
5018		conversion specification. The operand shall consist of a string containing any
5019		combination of characters and conversion specifications. In addition, the
5020		string can contain escape sequences defined in the table in Table 5-1 (on page
5021		112) ('\\', '\a', '\b', '\f', '\n', '\r', '\t', '\v').
5022	d_fmt	Define the appropriate date representation, corresponding to the %x
5023		conversion specification. The operand shall consist of a string containing any
5024		combination of characters and conversion specifications. In addition, the
5025		string can contain escape sequences defined in Table 5-1 (on page 112).
5026	t_fmt	Define the appropriate time representation, corresponding to the %X
5027		conversion specification. The operand shall consist of a string containing any
5028		combination of characters and conversion specifications. In addition, the
5029		string can contain escape sequences defined in Table 5-1 (on page 112).
5030	am_pm	Define the appropriate representation of the <i>ante-meridiem</i> and <i>post-meridiem</i>
5031		strings, corresponding to the %p conversion specification. The operand shall
5032		consist of two strings, separated by a semicolon, each surrounded by double-

5033		quotes. The first string shall represent the <i>ante-meridiem</i> designation, the last string the <i>post-meridiem</i> designation.
5034		
5035	t_fmt_ampm	Define the appropriate time representation in the 12-hour clock format with am_pm , corresponding to the %r conversion specification. The operand shall consist of a string and can contain any combination of characters and conversion specifications. If the string is empty, the 12-hour format is not supported in the locale.
5036		
5037		
5038		
5039		
5040	era	Define how years are counted and displayed for each era in a locale. The operand shall consist of semicolon-separated strings. Each string shall be an era description segment with the format:
5041		
5042		
5043		<i>direction:offset:start_date:end_date:era_name:era_format</i>
5044		according to the definitions below. There can be as many era description segments as are necessary to describe the different eras.
5045		
5046	Note:	The start of an era might not be the earliest point in the era—it may be the latest. For example, the Christian era BC starts on the day before January 1, AD 1, and increases with earlier time.
5047		
5048		
5049	<i>direction</i>	Either a '+' or a '-' character. The '+' character shall indicate that years closer to the <i>start_date</i> have lower numbers than those closer to the <i>end_date</i> . The '-' character shall indicate that years closer to the <i>start_date</i> have higher numbers than those closer to the <i>end_date</i> .
5050		
5051		
5052		
5053		
5054	<i>offset</i>	The number of the year closest to the <i>start_date</i> in the era, corresponding to the %Ey conversion specification.
5055		
5056	<i>start_date</i>	A date in the form yyyy/mm/dd, where yyyy, mm, and dd are the year, month, and day numbers respectively of the start of the era. Years prior to AD 1 shall be represented as negative numbers.
5057		
5058		
5059		
5060	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> , or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The value "+*" shall indicate that the ending date is the end of time.
5061		
5062		
5063		
5064	<i>era_name</i>	A string representing the name of the era, corresponding to the %EC conversion specification.
5065		
5066	<i>era_format</i>	A string for formatting the year in the era, corresponding to the %EY conversion specification.
5067		
5068	era_d_fmt	Define the format of the date in alternative era notation, corresponding to the %Ex conversion specification.
5069		
5070	era_t_fmt	Define the locale's appropriate alternative time format, corresponding to the %EX conversion specification.
5071		
5072	era_d_t_fmt	Define the locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
5073		
5074	alt_digits	Define alternative symbols for digits, corresponding to the %O modified conversion specification. The operand shall consist of semicolon-separated strings, each surrounded by double-quotes. The first string shall be the alternative symbol corresponding with zero, the second string the symbol
5075		
5076		
5077		

5078 corresponding with one, and so on. Up to 100 alternative symbol strings can
 5079 be specified. The %O modifier shall indicate that the string corresponding to
 5080 the value specified via the conversion specification shall be used instead of the
 5081 value.

5082 7.3.5.2 LC_TIME C-Language Access

5083 XSI This section describes extensions to access information in the *LC_TIME* category using the
 5084 *nl_langinfo()* function. This functionality is dependent on support of the XSI extension (and the
 5085 rest of this section is not further shaded for this option).

5086 The following constants used to identify items of *langinfo* data can be used as arguments to the
 5087 *nl_langinfo()* function to access information in the *LC_TIME* category. These constants are
 5088 defined in the **<langinfo.h>** header.

5089 ABDAY_x The abbreviated weekday names (for example, Sun), where *x* is a number from
 5090 1 to 7.

5091 DAY_x The full weekday names (for example, Sunday), where *x* is a number from 1 to
 5092 7.

5093 ABMON_x The abbreviated month names (for example, Jan), where *x* is a number from 1
 5094 to 12.

5095 MON_x The full month names (for example, January), where *x* is a number from 1 to
 5096 12.

5097 D_T_FMT The appropriate date and time representation.

5098 D_FMT The appropriate date representation.

5099 T_FMT The appropriate time representation.

5100 AM_STR The appropriate ante-meridiem affix.

5101 PM_STR The appropriate post-meridiem affix.

5102 T_FMT_AMPM The appropriate time representation in the 12-hour clock format with
 5103 AM_STR and PM_STR.

5104 ERA The era description segments, which describe how years are counted and
 5105 displayed for each era in a locale. Each era description segment shall have the
 5106 format:

5107 *direction:offset:start_date:end_date:era_name:era_format*

5108 according to the definitions below. There can be as many era description
 5109 segments as are necessary to describe the different eras. Era description
 5110 segments are separated by semicolons.

5111 *direction* Either a '+' or a '-' character. The '+' character shall indicate
 5112 that years closer to the *start_date* have lower numbers than those
 5113 closer to the *end_date*. The '-' character shall indicate that
 5114 years closer to the *start_date* have higher numbers than those
 5115 closer to the *end_date*.

5116 *offset* The number of the year closest to the *start_date* in the era.

5117 *start_date* A date in the form *yyyy/mm/dd*, where *yyyy*, *mm*, and *dd* are the
 5118 year, month, and day numbers respectively of the start of the
 5119 era. Years prior to AD 1 shall be represented as negative

5120		numbers.
5121	<i>end_date</i>	The ending date of the era, in the same format as the <i>start_date</i> ,
5122		or one of the two special values "-*" or "+*". The value "-*" shall indicate that the ending date is the beginning of time. The
5123		value "+*" shall indicate that the ending date is the end of time.
5124		
5125	<i>era_name</i>	The era, corresponding to the %EC conversion specification.
5126	<i>era_format</i>	The format of the year in the era, corresponding to the %EY conversion specification.
5127		
5128	ERA_D_FMT	The era date format.
5129	ERA_T_FMT	The locale's appropriate alternative time format, corresponding to the %EX conversion specification.
5130		
5131	ERA_D_T_FMT	The locale's appropriate alternative date and time format, corresponding to the %Ec conversion specification.
5132		
5133	ALT_DIGITS	The alternative symbols for digits, corresponding to the %O conversion specification modifier. The value consists of semicolon-separated symbols. The first is the alternative symbol corresponding to zero, the second is the symbol corresponding to one, and so on. Up to 100 alternative symbols may be specified.
5134		
5135		
5136		
5137		

5138 7.3.5.3 LC_TIME Category in the POSIX Locale

5139 The *LC_TIME* category definition of the POSIX locale follows; the code listing depicts the
 5140 *localedef* input; the table represents the same information with the addition of *localedef* keywords,
 5141 conversion specifiers used by the *date* utility and the *strftime()*, *wcsftime()*, and *strptime()*
 5142 XSI functions, and *nl_langinfo()* constants.

```

5143 LC_TIME
5144 # This is the POSIX locale definition for
5145 # the LC_TIME category.
5146 #
5147 # Abbreviated weekday names (%a)
5148 abday      "<S><u><n>"; "<M><o><n>"; "<T><u><e>"; "<W><e><d>"; \
5149            "<T><h><u>"; "<F><r><i>"; "<S><a><t>"
5150 #
5151 # Full weekday names (%A)
5152 day        "<S><u><n><d><a><y>"; "<M><o><n><d><a><y>"; \
5153            "<T><u><e><s><d><a><y>"; "<W><e><d><n><e><s><d><a><y>"; \
5154            "<T><h><u><r><s><d><a><y>"; "<F><r><i><d><a><y>"; \
5155            "<S><a><t><u><r><d><a><y>"
5156 #
5157 # Abbreviated month names (%b)
5158 abmon      "<J><a><n>"; "<F><e><b>"; "<M><a><r>"; \
5159            "<A><p><r>"; "<M><a><y>"; "<J><u><n>"; \
5160            "<J><u><l>"; "<A><u><g>"; "<S><e><p>"; \

In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension.

The entry N/A indicates the value is not available in the POSIX locale.

7.3.6 LC_MESSAGES

The *LC_MESSAGES* category shall define the format and values used by various utilities for affirmative and negative responses. This information is available through the *nl_langinfo()* function.

The message catalog used by the standard utilities and selected by the *catopen()* function shall be determined by the setting of *NLSPATH*; see Chapter 8 (on page 161). The *LC_MESSAGES* category can be specified as part of an *NLSPATH* substitution field.

The following keywords shall be recognized as part of the locale definition file.

copy Specify the name of an existing locale which shall be used as the definition of this category. If this keyword is specified, no other keyword shall be specified.

Note: This is a *localedef* keyword, unavailable through *nl_langinfo()*.

5262 **yesexpr** The operand consists of an extended regular expression (see Section 9.4 (on page
5263 175)) that describes the acceptable affirmative response to a question expecting an
5264 affirmative or negative response.

5265 **noexpr** The operand consists of an extended regular expression that describes the
5266 acceptable negative response to a question expecting an affirmative or negative
5267 response.

5268 7.3.6.1 *LC_MESSAGES Category in the POSIX Locale*

5269 The format and values for affirmative and negative responses of the POSIX locale follow; the
5270 XSI code listing depicting the *localedef* input, the table representing the same information with the
5271 addition of *nl_langinfo()* constants.

```
5272 LC_MESSAGES
5273 # This is the POSIX locale definition for
5274 # the LC_MESSAGES category.
5275 #
5276 yesexpr "<circumflex><left-square-bracket><y><Y><right-square-bracket>"
5277 #
5278 noexpr  "<circumflex><left-square-bracket><n><N><right-square-bracket>"
5279 #
5280 END LC_MESSAGES
```

5281	localedef Keyword	langinfo Constant	POSIX Locale Value
5282	yesexpr	YESEXPR	"^[yY]"
5283	noexpr	NOEXPR	"^[nN]"

5284 XSI In the preceding table, the **langinfo Constant** column represents an XSI-conformant extension.

5285 7.4 Locale Definition Grammar

5286 The grammar and lexical conventions in this section shall together describe the syntax for the
5287 locale definition source. The general conventions for this style of grammar are described in the
5288 Shell and Utilities volume of IEEE Std 1003.1-2001, Section 1.10, Grammar Conventions. The
5289 grammar shall take precedence over the text in this chapter.

5290 7.4.1 Locale Lexical Conventions

5291 The lexical conventions for the locale definition grammar are described in this section.

5292 The following tokens shall be processed (in addition to those string constants shown in the
5293 grammar):

5294	LOC_NAME	A string of characters representing the name of a locale.
5295	CHAR	Any single character.
5296	NUMBER	A decimal number, represented by one or more decimal digits.
5297	COLLSYMBOL	A symbolic name, enclosed between angle brackets. The string cannot duplicate any charmap symbol defined in the current charmap (if any), or a COLLELEMENT symbol.
5298		
5299		
5300	COLLELEMENT	A symbolic name, enclosed between angle brackets, which cannot duplicate either any charmap symbol or a COLLSYMBOL symbol.
5301		

5302	CHARCLASS	A string of alphanumeric characters from the portable character set, the first of which is not a digit, consisting of at least one and at most {CHARCLASS_NAME_MAX} bytes, and optionally surrounded by double-quotes.
5303		
5304		
5305		
5306	CHARSYMBOL	A symbolic name, enclosed between angle brackets, from the current charmap (if any).
5307		
5308	OCTAL_CHAR	One or more octal representations of the encoding of each byte in a single character. The octal representation consists of an escape character (normally a backslash) followed by two or more octal digits.
5309		
5310		
5311		
5312	HEX_CHAR	One or more hexadecimal representations of the encoding of each byte in a single character. The hexadecimal representation consists of an escape character followed by the constant <i>x</i> and two or more hexadecimal digits.
5313		
5314		
5315		
5316	DECIMAL_CHAR	One or more decimal representations of the encoding of each byte in a single character. The decimal representation consists of an escape character followed by a character 'd' and two or more decimal digits.
5317		
5318		
5319		
5320	ELLIPSIS	The string ". . .".
5321	EXTENDED_REG_EXP	An extended regular expression as defined in the grammar in Section 9.5 (on page 179).
5322		
5323	EOL	The line termination character <newline>.

5324 7.4.2 Locale Grammar

5325 This section presents the grammar for the locale definition.

5326	%token	LOC_NAME
5327	%token	CHAR
5328	%token	NUMBER
5329	%token	COLLSYMBOL COLLELEMENT

Environment Variables

5569

8.1 Environment Variable Definition

Environment variables defined in this chapter affect the operation of multiple utilities, functions, and applications. There are other environment variables that are of interest only to specific utilities. Environment variables that apply to a single utility only are defined as part of the utility description. See the ENVIRONMENT VARIABLES section of the utility descriptions in the Shell and Utilities volume of IEEE Std 1003.1-2001 for information on environment variable usage.

The value of an environment variable is a string of characters. For a C-language program, an array of strings called the environment shall be made available when a process begins. The array is pointed to by the external variable *environ*, which is defined as:

```
extern char **environ;
```

These strings have the form *name=value*; *names* shall not contain the character '='. For values to be portable across systems conforming to IEEE Std 1003.1-2001, the value shall be composed of characters from the portable character set (except NUL and as indicated below). There is no meaning associated with the order of strings in the environment. If more than one string in a process' environment has the same *name*, the consequences are undefined.

Environment variable names used by the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 consist solely of uppercase letters, digits, and the '_' (underscore) from the characters defined in Table 6-1 (on page 115) and do not begin with a digit. Other characters may be permitted by an implementation; applications shall tolerate the presence of such names. Uppercase and lowercase letters shall retain their unique identities and shall not be folded together. The name space of environment variable names containing lowercase letters is reserved for applications. Applications can define any environment variables with names from this name space without modifying the behavior of the standard utilities.

Note: Other applications may have difficulty dealing with environment variable names that start with a digit. For this reason, use of such names is not recommended anywhere.

The *values* that the environment variables may be assigned are not restricted except that they are considered to end with a null byte and the total space used to store the environment and the arguments to the process is limited to {ARG_MAX} bytes.

Other *name=value* pairs may be placed in the environment by, for example, calling any of the *setenv()*, *unsetenv()*, or *putenv()* functions, manipulating the *environ* variable, or by using *envp* arguments when creating a process; see *exec* in the System Interfaces volume of IEEE Std 1003.1-2001.

It is unwise to conflict with certain variables that are frequently exported by widely used command interpreters and applications:

5605	ARFLAGS	IFS	MAILPATH	PS1
5606	CC	LANG	MAILRC	PS2
5607	CDPATH	LC_ALL	MAKEFLAGS	PS3
5608	CFLAGS	LC_COLLATE	MAKESHELL	PS4
5609	CHARSET	LC_CTYPE	MANPATH	PWD
5610	COLUMNS	LC_MESSAGES	MBOX	RANDOM
5611	DATMSK	LC_MONETARY	MORE	SECONDS
5612	DEAD	LC_NUMERIC	MSGVERB	SHELL
5613	EDITOR	LC_TIME	NLSPATH	TERM
5614	ENV	LDFLAGS	NPROC	TERMCAP
5615	EXINIT	LEX	OLDPWD	TERMINFO
5616	FC	LFLAGS	OPTARG	TMPDIR
5617	FCEDIT	LINENO	OPTERR	TZ
5618	FFLAGS	LINES	OPTIND	USER
5619	GET	LISTER	PAGER	VISUAL
5620	GFLAGS	LOGNAME	PATH	YACC
5621	HISTFILE	LPDEST	PPID	YFLAGS
5622	HISTORY	MAIL	PRINTER	
5623	HISTSIZE	MAILCHECK	PROCLANG	
5624	HOME	MAILER	PROJECTDIR	

If the variables in the following two sections are present in the environment during the execution of an application or utility, they shall be given the meaning described below. Some are placed into the environment by the implementation at the time the user logs in; all can be added or changed by the user or any ancestor of the current process. The implementation adds or changes environment variables named in IEEE Std 1003.1-2001 only as specified in IEEE Std 1003.1-2001. If they are defined in the application's environment, the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 and the functions in the System Interfaces volume of IEEE Std 1003.1-2001 assume they have the specified meaning. Conforming applications shall not set these environment variables to have meanings other than as described. See *getenv()* and the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.12, Shell Execution Environment for methods of accessing these variables.

8.2 Internationalization Variables

This section describes environment variables that are relevant to the operation of internationalized interfaces described in IEEE Std 1003.1-2001.

Users may use the following environment variables to announce specific localization requirements to applications. Applications can retrieve this information using the *setlocale()* function to initialize the correct behavior of the internationalized interfaces. The descriptions of the internationalization environment variables describe the resulting behavior only when the application locale is initialized in this way. The use of the internationalization variables by utilities described in the Shell and Utilities volume of IEEE Std 1003.1-2001 is described in the ENVIRONMENT VARIABLES section for those utilities in addition to the global effects described in this section.

LANG This variable shall determine the locale category for native language, local customs, and coded character set in the absence of the *LC_ALL* and other *LC_** (*LC_COLLATE*, *LC_CTYPE*, *LC_MESSAGES*, *LC_MONETARY*, *LC_NUMERIC*, *LC_TIME*) environment variables. This can be used by applications to determine the language to use for error messages and instructions, collating sequences, date formats, and so on.

5653	<i>LC_ALL</i>	This variable shall determine the values for all locale categories. The value of the <i>LC_ALL</i> environment variable has precedence over any of the other environment variables starting with <i>LC_</i> (<i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> , <i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i>) and the <i>LANG</i> environment variable.
5654		
5655		
5656		
5657		
5658	<i>LC_COLLATE</i>	This variable shall determine the locale category for character collation. It determines collation information for regular expressions and sorting, including equivalence classes and multi-character collating elements, in various utilities and the <i>strcoll()</i> and <i>strxfrm()</i> functions. Additional semantics of this variable, if any, are implementation-defined.
5659		
5660		
5661		
5662		
5663	<i>LC_CTYPE</i>	This variable shall determine the locale category for character handling functions, such as <i>tolower()</i> , <i>toupper()</i> , and <i>isalpha()</i> . This environment variable determines the interpretation of sequences of bytes of text data as characters (for example, single as opposed to multi-byte characters), the classification of characters (for example, alpha, digit, graph), and the behavior of character classes. Additional semantics of this variable, if any, are implementation-defined.
5664		
5665		
5666		
5667		
5668		
5669		
5670	<i>LC_MESSAGES</i>	This variable shall determine the locale category for processing affirmative and negative responses and the language and cultural conventions in which messages should be written. It also affects the behavior of the <i>catopen()</i>
5671		
5672	XSI	function in determining the message catalog. Additional semantics of this
5673		variable, if any, are implementation-defined. The language and cultural
5674		conventions of diagnostic and informative messages whose format is
5675		unspecified by IEEE Std 1003.1-2001 should be affected by the setting of
5676		<i>LC_MESSAGES</i> .
5677		
5678	<i>LC_MONETARY</i>	This variable shall determine the locale category for monetary-related numeric
5679		formatting information. Additional semantics of this variable, if any, are
5680		implementation-defined.
5681	<i>LC_NUMERIC</i>	This variable shall determine the locale category for numeric formatting (for
5682		example, thousands separator and radix character) information in various
5683		utilities as well as the formatted I/O operations in <i>printf()</i> and <i>scanf()</i> and the
5684		string conversion functions in <i>strtod()</i> . Additional semantics of this variable,
5685		if any, are implementation-defined.
5686	<i>LC_TIME</i>	This variable shall determine the locale category for date and time formatting
5687		information. It affects the behavior of the time functions in <i>strftime()</i> .
5688		Additional semantics of this variable, if any, are implementation-defined.
5689	XSI	<i>NLSPATH</i> This variable shall contain a sequence of templates that the <i>catopen()</i> function
5690		uses when attempting to locate message catalogs. Each template consists of an
5691		optional prefix, one or more conversion specifications, a filename, and an
5692		optional suffix.
5693		For example:
5694		<code>NLSPATH="/system/nlslib/%N.cat"</code>
5695		defines that <i>catopen()</i> should look for all message catalogs in the directory
5696		/system/nlslib , where the catalog name should be constructed from the <i>name</i>
5697		parameter passed to <i>catopen()</i> (<i>%N</i>), with the suffix .cat .
5698		Conversion specifications consist of a ' <i>%</i> ' symbol, followed by a single-letter
5699		keyword. The following keywords are currently defined:

5700	%N	The value of the <i>name</i> parameter passed to <i>catopen()</i> .
5701	%L	The value of the <i>LC_MESSAGES</i> category.
5702	%l	The <i>language</i> element from the <i>LC_MESSAGES</i> category.
5703	%t	The <i>territory</i> element from the <i>LC_MESSAGES</i> category.
5704	%c	The <i>codeset</i> element from the <i>LC_MESSAGES</i> category.
5705	%%	A single ' <i>%</i> ' character.
5706	An empty string is substituted if the specified value is not currently defined.	
5707	The separators underscore (' <i>_</i> ') and period (' <i>.</i> ') are not included in the % <i>t</i>	
5708	and % <i>c</i> conversion specifications.	
5709	Templates defined in <i>NLSPATH</i> are separated by colons (' <i>:</i> '). A leading or	
5710	two adjacent colons " <i>:</i> :" is equivalent to specifying % <i>N</i> . For example:	
5711	<i>NLSPATH</i> =" :% <i>N</i> .cat :/nlslib/% <i>L</i> /% <i>N</i> .cat "	
5712	indicates to <i>catopen()</i> that it should look for the requested message catalog in	
5713	<i>name</i> , <i>name.cat</i> , and <i>/nlslib/category/name.cat</i> , where <i>category</i> is the value of the	
5714	<i>LC_MESSAGES</i> category of the current locale.	
5715	Users should not set the <i>NLSPATH</i> variable unless they have a specific reason	
5716	to override the default system path. Setting <i>NLSPATH</i> to override the default	
5717	system path produces undefined results in the standard utilities and in	
5718	applications with appropriate privileges.	
5719	XSI	The environment variables <i>LANG</i> , <i>LC_ALL</i> , <i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> ,
5720		<i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i> , and <i>NLSPATH</i> provide for the support of
5721		internationalized applications. The standard utilities shall make use of these environment
5722		variables as described in this section and the individual ENVIRONMENT VARIABLES sections
5723		for the utilities. If these variables specify locale categories that are not based upon the same
5724		underlying codeset, the results are unspecified.
5725	The values of locale categories shall be determined by a precedence order; the first condition met	
5726	below determines the value:	
5727	1. If the <i>LC_ALL</i> environment variable is defined and is not null, the value of <i>LC_ALL</i> shall be	
5728	used.	
5729	2. If the <i>LC_*</i> environment variable (<i>LC_COLLATE</i> , <i>LC_CTYPE</i> , <i>LC_MESSAGES</i> ,	
5730	<i>LC_MONETARY</i> , <i>LC_NUMERIC</i> , <i>LC_TIME</i>) is defined and is not null, the value of the	
5731	environment variable shall be used to initialize the category that corresponds to the	
5732	environment variable.	
5733	3. If the <i>LANG</i> environment variable is defined and is not null, the value of the <i>LANG</i>	
5734	environment variable shall be used.	
5735	4. If the <i>LANG</i> environment variable is not set or is set to the empty string, the	
5736	implementation-defined default locale shall be used.	
5737	If the locale value is " <i>C</i> " or " <i>POSIX</i> ", the <i>POSIX</i> locale shall be used and the standard utilities	
5738	behave in accordance with the rules in Section 7.2 (on page 124) for the associated category.	
5739	If the locale value begins with a slash, it shall be interpreted as the pathname of a file that was	
5740	created in the output format used by the <i>localedef</i> utility; see OUTPUT FILES under <i>localedef</i> .	
5741	Referencing such a pathname shall result in that locale being used for the indicated category.	

5742	XSI	If the locale value has the form:
5743		<code>language[_territory] [.codeset]</code>
5744		it refers to an implementation-provided locale, where settings of language, territory, and codeset
5745		are implementation-defined.
5746		<code>LC_COLLATE</code> , <code>LC_CTYPE</code> , <code>LC_MESSAGES</code> , <code>LC_MONETARY</code> , <code>LC_NUMERIC</code> , and <code>LC_TIME</code> are
5747		defined to accept an additional field <code>@modifier</code> , which allows the user to select a specific instance
5748		of localization data within a single category (for example, for selecting the dictionary as opposed
5749		to the character ordering of data). The syntax for these environment variables is thus defined as:
5750		<code>[language[_territory] [.codeset] [@modifier]]</code>
5751		For example, if a user wanted to interact with the system in French, but required to sort German
5752		text files, <code>LANG</code> and <code>LC_COLLATE</code> could be defined as:
5753		<code>LANG=Fr_FR</code>
5754		<code>LC_COLLATE=De_DE</code>
5755		This could be extended to select dictionary collation (say) by use of the <code>@modifier</code> field; for
5756		example:
5757		<code>LC_COLLATE=De_DE@dict</code>
5758		
5759		An implementation may support other formats.
5760		If the locale value is not recognized by the implementation, the behavior is unspecified.
5761		At runtime, these values are bound to a program's locale by calling the <code>setlocale()</code> function.
5762		Additional criteria for determining a valid locale name are implementation-defined.

5763 8.3 Other Environment Variables

5764	<code>COLUMNS</code>	This variable shall represent a decimal integer >0 used to indicate the user's
5765		preferred width in column positions for the terminal screen or window; see
5766		Section 3.103 (on page 49). If this variable is unset or null, the implementation
5767		determines the number of columns, appropriate for the terminal or window,
5768		in an unspecified manner. When <code>COLUMNS</code> is set, any terminal-width
5769		information implied by <code>TERM</code> is overridden. Users and conforming
5770		applications should not set <code>COLUMNS</code> unless they wish to override the
5771		system selection and produce output unrelated to the terminal characteristics.
5772		Users should not need to set this variable in the environment unless there is a
5773		specific reason to override the implementation's default behavior, such as to
5774		display data in an area arbitrarily smaller than the terminal or window.
5775	XSI	<code>DATEMSK</code> Indicates the pathname of the template file used by <code>getdate()</code> .
5776	<code>HOME</code>	The system shall initialize this variable at the time of login to be a pathname of
5777		the user's home directory. See <code><pwd.h></code> .
5778	<code>LINES</code>	This variable shall represent a decimal integer >0 used to indicate the user's
5779		preferred number of lines on a page or the vertical screen or window size in
5780		lines. A line in this case is a vertical measure large enough to hold the tallest
5781		character in the character set being displayed. If this variable is unset or null,
5782		the implementation determines the number of lines, appropriate for the

5783		terminal or window (size, terminal baud rate, and so on), in an unspecified manner. When <i>LINES</i> is set, any terminal-height information implied by <i>TERM</i> is overridden. Users and conforming applications should not set <i>LINES</i> unless they wish to override the system selection and produce output unrelated to the terminal characteristics.
5784		
5785		
5786		
5787		
5788		Users should not need to set this variable in the environment unless there is a specific reason to override the implementation's default behavior, such as to display data in an area arbitrarily smaller than the terminal or window.
5789		
5790		
5791	<i>LOGNAME</i>	The system shall initialize this variable at the time of login to be the user's login name. See <pwd.h> . For a value of <i>LOGNAME</i> to be portable across implementations of IEEE Std 1003.1-2001, the value should be composed of characters from the portable filename character set.
5792		
5793		
5794		
5795	XSI <i>MSGVERB</i>	Describes which message components shall be used in writing messages by <i>fmtmsg()</i> .
5796		
5797	<i>PATH</i>	This variable shall represent the sequence of path prefixes that certain functions and utilities apply in searching for an executable file known only by a filename. The prefixes shall be separated by a colon (' : '). When a non-zero-length prefix is applied to this filename, a slash shall be inserted between the prefix and the filename. A zero-length prefix is a legacy feature that indicates the current working directory. It appears as two adjacent colons (" : "), as an initial colon preceding the rest of the list, or as a trailing colon following the rest of the list. A strictly conforming application shall use an actual pathname (such as .) to represent the current working directory in <i>PATH</i> . The list shall be searched from beginning to end, applying the filename to each prefix, until an executable file with the specified name and appropriate execution permissions is found. If the pathname being sought contains a slash, the search through the path prefixes shall not be performed. If the pathname begins with a slash, the specified path is resolved (see Section 4.11 (on page 102)). If <i>PATH</i> is unset or is set to null, the path search is implementation-defined.
5798		
5799		
5800		
5801		
5802		
5803		
5804		
5805		
5806		
5807		
5808		
5809		
5810		
5811		
5812		
5813	<i>PWD</i>	This variable shall represent an absolute pathname of the current working directory. It shall not contain any filename components of dot or dot-dot. The value is set by the <i>cd</i> utility.
5814		
5815		
5816	<i>SHELL</i>	This variable shall represent a pathname of the user's preferred command language interpreter. If this interpreter does not conform to the Shell Command Language in the Shell and Utilities volume of IEEE Std 1003.1-2001, Chapter 2, Shell Command Language, utilities may behave differently from those described in IEEE Std 1003.1-2001.
5817		
5818		
5819		
5820		
5821	<i>TMPDIR</i>	This variable shall represent a pathname of a directory made available for programs that need a place to create temporary files.
5822		
5823	<i>TERM</i>	This variable shall represent the terminal type for which output is to be prepared. This information is used by utilities and application programs wishing to exploit special capabilities specific to a terminal. The format and allowable values of this environment variable are unspecified.
5824		
5825		
5826		
5827	<i>TZ</i>	This variable shall represent timezone information. The contents of the environment variable named <i>TZ</i> shall be used by the <i>ctime()</i> , <i>localtime()</i> , <i>strftime()</i> , <i>mktime()</i> , <i>ctime_r()</i> , and <i>localtime_r()</i> functions, and by various utilities, to override the default timezone. The value of <i>TZ</i> has one of the two
5828		
5829	TSF	
5830		

forms (spaces inserted for clarity):

:characters

or:

std offset dst offset, rule

If *TZ* is of the first format (that is, if the first character is a colon), the characters following the colon are handled in an implementation-defined manner.

The expanded format (for all *TZ*s whose value does not have a colon as the first character) is as follows:

stdoffset [dst [offset] [, start [/time] , end [/time]]]

Where:

std and *dst* Indicate no less than three, nor more than {TZNAME_MAX}, bytes that are the designation for the standard (*std*) or the alternative (*dst*—such as Daylight Savings Time) timezone. Only *std* is required; if *dst* is missing, then the alternative time does not apply in this locale.

Each of these fields may occur in either of two formats quoted or unquoted:

- In the quoted form, the first character shall be the less-than ('<') character and the last character shall be the greater-than ('>') character. All characters between these quoting characters shall be alphanumeric characters from the portable character set in the current locale, the plus-sign ('+') character, or the minus-sign ('-') character. The *std* and *dst* fields in this case shall not include the quoting characters.

- In the unquoted form, all characters in these fields shall be alphabetic characters from the portable character set in the current locale.

The interpretation of these fields is unspecified if either field is less than three bytes (except for the case when *dst* is missing), more than {TZNAME_MAX} bytes, or if they contain characters other than those specified.

offset Indicates the value added to the local time to arrive at Coordinated Universal Time. The *offset* has the form:

hh [: mm [: ss]]

The minutes (*mm*) and seconds (*ss*) are optional. The hour (*hh*) shall be required and may be a single digit. The *offset* following *std* shall be required. If no *offset* follows *dst*, the alternative time is assumed to be one hour ahead of standard time. One or more digits may be used; the value is always interpreted as a decimal number. The hour shall be between zero and 24, and the minutes (and seconds)—if present—between zero and 59. The result of using values outside of this range is unspecified. If preceded by a '-', the timezone shall be east of the Prime Meridian;

5876		otherwise, it shall be west (which may be indicated by an
5877		optional preceding ' + ').
5878	<i>rule</i>	Indicates when to change to and back from the alternative time.
5879		The <i>rule</i> has the form:
5880		<i>date</i> [/ <i>time</i>] , <i>date</i> [/ <i>time</i>]
5881		where the first <i>date</i> describes when the change from standard to
5882		alternative time occurs and the second <i>date</i> describes when the
5883		change back happens. Each <i>time</i> field describes when, in current
5884		local time, the change to the other time is made.
5885		The format of <i>date</i> is one of the following:
5886	<i>Jn</i>	The Julian day n ($1 \leq n \leq 365$). Leap days shall not be
5887		counted. That is, in all years—including leap years—
5888		February 28 is day 59 and March 1 is day 60. It is
5889		impossible to refer explicitly to the occasional February
5890		29.
5891	<i>n</i>	The zero-based Julian day ($0 \leq n \leq 365$). Leap days shall
5892		be counted, and it is possible to refer to February 29.
5893	<i>Mm.n.d</i>	The d 'th day ($0 \leq d \leq 6$) of week n of month m of the
5894		year ($1 \leq n \leq 5$, $1 \leq m \leq 12$, where week 5 means “the
5895		last d day in month m ” which may occur in either the
5896		fourth or the fifth week). Week 1 is the first week in
5897		which the d 'th day occurs. Day zero is Sunday.
5898		The <i>time</i> has the same format as <i>offset</i> except that no leading sign
5899		(' - ' or ' + ') is allowed. The default, if <i>time</i> is not given, shall be
5900		02:00:00.

Regular Expressions

Regular Expressions (REs) provide a mechanism to select specific strings from a set of character strings.

Regular expressions are a context-independent syntax that can represent a wide variety of character sets and character set orderings, where these character sets are interpreted according to the current locale. While many regular expressions can be interpreted differently depending on the current locale, many features, such as character class expressions, provide for contextual invariance across locales.

The Basic Regular Expression (BRE) notation and construction rules in Section 9.3 (on page 171) shall apply to most utilities supporting regular expressions. Some utilities, instead, support the Extended Regular Expressions (ERE) described in Section 9.4 (on page 175); any exceptions for both cases are noted in the descriptions of the specific utilities using regular expressions. Both BREs and EREs are supported by the Regular Expression Matching interface in the System Interfaces volume of IEEE Std 1003.1-2001 under *regcomp()*, *regex()*, and related functions.

9.1 Regular Expression Definitions

For the purposes of this section, the following definitions shall apply:

entire regular expression

The concatenated set of one or more BREs or EREs that make up the pattern specified for string selection.

matched

A sequence of zero or more characters shall be said to be matched by a BRE or ERE when the characters in the sequence correspond to a sequence of characters defined by the pattern.

Matching shall be based on the bit pattern used for encoding the character, not on the graphic representation of the character. This means that if a character set contains two or more encodings for a graphic symbol, or if the strings searched contain text encoded in more than one codeset, no attempt is made to search for any other representation of the encoded symbol. If that is required, the user can specify equivalence classes containing all variations of the desired graphic symbol.

The search for a matching sequence starts at the beginning of a string and stops when the first sequence matching the expression is found, where “first” is defined to mean “begins earliest in the string”. If the pattern permits a variable number of matching characters and thus there is more than one such sequence starting at that point, the longest such sequence is matched. For example, the BRE `"bb*"` matches the second to fourth characters of the string `"abbbc"`, and the ERE `"(wee|week)(knights|night)"` matches all ten characters of the string `"weeknights"`.

Consistent with the whole match being the longest of the leftmost matches, each subpattern, from left to right, shall match the longest possible string. For this purpose, a null string shall be considered to be longer than no match at all. For example, matching the BRE `"\(.*\)"` against `"abcdef"`, the subexpression `"(\1)"` is `"abcdef"`, and matching the BRE `"\ (a*\)"` against `"bc"`, the subexpression `"(\1)"` is the null string.

When a multi-character collating element in a bracket expression (see Section 9.3.5 (on page 172)) is involved, the longest sequence shall be measured in characters consumed from the string to be matched; that is, the collating element counts not as one element, but as the number of characters it matches.

BRE (ERE) matching a single character

A BRE or ERE that shall match either a single character or a single collating element.

Only a BRE or ERE of this type that includes a bracket expression (see Section 9.3.5 (on page 172)) can match a collating element.

BRE (ERE) matching multiple characters

A BRE or ERE that shall match a concatenation of single characters or collating elements.

Such a BRE or ERE is made up from a BRE (ERE) matching a single character and BRE (ERE) special characters.

invalid

This section uses the term “invalid” for certain constructs or conditions. Invalid REs shall cause the utility or function using the RE to generate an error condition. When invalid is not used, violations of the specified syntax or semantics for REs produce undefined results: this may entail an error, enabling an extended syntax for that RE, or using the construct in error as literal characters to be matched. For example, the BRE construct “`\{1,2,3\}`” does not comply with the grammar. A conforming application cannot rely on it producing an error nor matching the literal characters “`\{1,2,3\}`”.

9.2 Regular Expression General Requirements

The requirements in this section shall apply to both basic and extended regular expressions.

The use of regular expressions is generally associated with text processing. REs (BREs and EREs) operate on text strings; that is, zero or more characters followed by an end-of-string delimiter (typically NUL). Some utilities employing regular expressions limit the processing to lines; that is, zero or more characters followed by a <newline>. In the regular expression processing described in IEEE Std 1003.1-2001, the <newline> is regarded as an ordinary character and both a period and a non-matching list can match one. The Shell and Utilities volume of IEEE Std 1003.1-2001 specifies within the individual descriptions of those standard utilities employing regular expressions whether they permit matching of <newline>s; if not stated otherwise, the use of literal <newline>s or any escape sequence equivalent produces undefined results. Those utilities (like *grep*) that do not allow <newline>s to match are responsible for eliminating any <newline> from strings before matching against the RE. The *regcomp()* function in the System Interfaces volume of IEEE Std 1003.1-2001, however, can provide support for such processing without violating the rules of this section.

The interfaces specified in IEEE Std 1003.1-2001 do not permit the inclusion of a NUL character in an RE or in the string to be matched. If during the operation of a standard utility a NUL is included in the text designated to be matched, that NUL may designate the end of the text string for the purposes of matching.

When a standard utility or function that uses regular expressions specifies that pattern matching shall be performed without regard to the case (uppercase or lowercase) of either data or patterns, then when each character in the string is matched against the pattern, not only the character, but also its case counterpart (if any), shall be matched. This definition of case-insensitive processing is intended to allow matching of multi-character collating elements as well as characters, as each character in the string is matched using both its cases. For example, in

5987 a locale where "Ch" is a multi-character collating element and where a matching list expression
 5988 matches such elements, the RE "[.Ch.]" when matched against the string "char" is in
 5989 reality matched against "ch", "Ch", "cH", and "CH".

5990 The implementation shall support any regular expression that does not exceed 256 bytes in
 5991 length.

5992 **9.3 Basic Regular Expressions**

5993 **9.3.1 BREs Matching a Single Character or Collating Element**

5994 A BRE ordinary character, a special character preceded by a backslash, or a period shall match a
 5995 single character. A bracket expression shall match a single character or a single collating
 5996 element.

5997 **9.3.2 BRE Ordinary Characters**

5998 An ordinary character is a BRE that matches itself: any character in the supported character set,
 5999 except for the BRE special characters listed in Section 9.3.3.

6000 The interpretation of an ordinary character preceded by a backslash (' \ ') is undefined, except
 6001 for:

- 6002 • The characters ') ' , ' (' , ' { ' , and ' } '
- 6003 • The digits 1 to 9 inclusive (see Section 9.3.6 (on page 174))
- 6004 • A character inside a bracket expression

6005 **9.3.3 BRE Special Characters**

6006 A BRE special character has special properties in certain contexts. Outside those contexts, or
 6007 when preceded by a backslash, such a character is a BRE that matches the special character itself.
 6008 The BRE special characters and the contexts in which they have their special meaning are as
 6009 follows:

6010 . [\ The period, left-bracket, and backslash shall be special except when used in a bracket
 6011 expression (see Section 9.3.5 (on page 172)). An expression containing a ' [' that is not
 6012 preceded by a backslash and is not part of a bracket expression produces undefined
 6013 results.

6014 * The asterisk shall be special except when used:

- 6015 • In a bracket expression
- 6016 • As the first character of an entire BRE (after an initial ' ^ ', if any)
- 6017 • As the first character of a subexpression (after an initial ' ^ ', if any); see Section
 6018 9.3.6 (on page 174)

6019 ^ The circumflex shall be special when used as:

- 6020 • An anchor (see Section 9.3.8 (on page 175))
- 6021 • The first character of a bracket expression (see Section 9.3.5 (on page 172))

6022 \$ The dollar sign shall be special when used as an anchor.

6023 **9.3.4 Periods in BREs**

6024 A period (' . '), when used outside a bracket expression, is a BRE that shall match any character
 6025 in the supported character set except NUL.

6026 **9.3.5 RE Bracket Expression**

6027 A bracket expression (an expression enclosed in square brackets, "[] ") is an RE that shall match
 6028 a single collating element contained in the non-empty set of collating elements represented by
 6029 the bracket expression.

6030 The following rules and definitions apply to bracket expressions:

6031 1. A bracket expression is either a matching list expression or a non-matching list expression.
 6032 It consists of one or more expressions: collating elements, collating symbols, equivalence
 6033 classes, character classes, or range expressions. The right-bracket ('] ') shall lose its special
 6034 meaning and represent itself in a bracket expression if it occurs first in the list (after an
 6035 initial circumflex (' ^ '), if any). Otherwise, it shall terminate the bracket expression, unless
 6036 it appears in a collating symbol (such as "[.] ") or is the ending right-bracket for a
 6037 collating symbol, equivalence class, or character class. The special characters ' . ', ' * ',
 6038 ' [', and ' \ ' (period, asterisk, left-bracket, and backslash, respectively) shall lose their
 6039 special meaning within a bracket expression.

6040 The character sequences "[. ", "[= ", and "[: " (left-bracket followed by a period, equals-
 6041 sign, or colon) shall be special inside a bracket expression and are used to delimit collating
 6042 symbols, equivalence class expressions, and character class expressions. These symbols
 6043 shall be followed by a valid expression and the matching terminating sequence ".] ",
 6044 "=] ", or ":] ", as described in the following items.

6045 2. A matching list expression specifies a list that shall match any single-character collating
 6046 element in any of the expressions represented in the list. The first character in the list shall
 6047 not be the circumflex; for example, "[abc]" is an RE that matches any of the characters
 6048 'a', 'b', or 'c'. It is unspecified whether a matching list expression matches a multi-
 6049 character collating element that is matched by one of the expressions.

6050 3. A non-matching list expression begins with a circumflex (' ^ '), and specifies a list that
 6051 shall match any single-character collating element except for the expressions represented
 6052 in the list after the leading circumflex. For example, "[^abc]" is an RE that matches any
 6053 character except the characters 'a', 'b', or 'c'. It is unspecified whether a non-matching
 6054 list expression matches a multi-character collating element that is not matched by any of
 6055 the expressions. The circumflex shall have this special meaning only when it occurs first in
 6056 the list, immediately following the left-bracket.

6057 4. A collating symbol is a collating element enclosed within bracket-period ("[. " and ".] ")
 6058 delimiters. Collating elements are defined as described in Section 7.3.2.4 (on page 137).
 6059 Conforming applications shall represent multi-character collating elements as collating
 6060 symbols when it is necessary to distinguish them from a list of the individual characters
 6061 that make up the multi-character collating element. For example, if the string "ch" is a
 6062 collating element defined using the line:

```
6063 collating-element <ch-digraph> from "<c><h>"
```

6064 in the locale definition, the expression "[[.ch.]]" shall be treated as an RE containing
 6065 the collating symbol 'ch', while "[ch]" shall be treated as an RE matching 'c' or 'h'.
 6066 Collating symbols are recognized only inside bracket expressions. If the string is not a
 6067 collating element in the current locale, the expression is invalid.

5. An equivalence class expression shall represent the set of collating elements belonging to an equivalence class, as described in Section 7.3.2.4 (on page 137). Only primary equivalence classes shall be recognized. The class shall be expressed by enclosing any one of the collating elements in the equivalence class within bracket-equal (" [= " and " =] ") delimiters. For example, if 'a', 'à', and 'â' belong to the same equivalence class, then "[[=a=] b]", "[[=à=] b]", and "[[=â=] b]" are each equivalent to "[aââb]". If the collating element does not belong to an equivalence class, the equivalence class expression shall be treated as a collating symbol.

6. A character class expression shall represent the union of two sets:
- a. The set of single-character collating elements whose characters belong to the character class, as defined in the *LC_CTYPE* category in the current locale.
 - b. An unspecified set of multi-character collating elements.

All character classes specified in the current locale shall be recognized. A character class expression is expressed as a character class name enclosed within bracket-colon (" [: " and " :] ") delimiters.

The following character class expressions shall be supported in all locales:

[:alnum:]	[:cntrl:]	[:lower:]	[:space:]
[:alpha:]	[:digit:]	[:print:]	[:upper:]
[:blank:]	[:graph:]	[:punct:]	[:xdigit:]

In addition, character class expressions of the form:

[:name:]

are recognized in those locales where the *name* keyword has been given a **charclass** definition in the *LC_CTYPE* category.

7. In the POSIX locale, a range expression represents the set of collating elements that fall between two elements in the collation sequence, inclusive. In other locales, a range expression has unspecified behavior: strictly conforming applications shall not rely on whether the range expression is valid, or on the set of collating elements matched. A range expression shall be expressed as the starting point and the ending point separated by a hyphen ('-').

In the following, all examples assume the POSIX locale.

The starting range point and the ending range point shall be a collating element or collating symbol. An equivalence class expression used as a starting or ending point of a range expression produces unspecified results. An equivalence class can be used portably within a bracket expression, but only outside the range. If the represented set of collating elements is empty, it is unspecified whether the expression matches nothing, or is treated as invalid.

The interpretation of range expressions where the ending range point is also the starting range point of a subsequent range expression (for example, "[a-m-o]") is undefined.

The hyphen character shall be treated as itself if it occurs first (after an initial '^', if any) or last in the list, or as an ending range point in a range expression. As examples, the expressions "[-ac]" and "[ac -]" are equivalent and match any of the characters 'a', 'c', or '-'; "[^-ac]" and "[^ac -]" are equivalent and match any characters except 'a', 'c', or '-'; the expression "[%- -]" matches any of the characters between '%' and '-' inclusive; the expression "[-@]" matches any of the characters between '-' and '@' inclusive; and the expression "[a--@]" is either invalid or equivalent to '@',

6113 because the letter 'a' follows the symbol '-' in the POSIX locale. To use a hyphen as the
 6114 starting range point, it shall either come first in the bracket expression or be specified as a
 6115 collating symbol; for example, "[[.-]-0]", which matches either a right bracket or
 6116 any character or collating element that collates between hyphen and 0, inclusive.

6117 If a bracket expression specifies both '-' and ']', the ']' shall be placed first (after the
 6118 '^', if any) and the '-' last within the bracket expression.

6119 9.3.6 BREs Matching Multiple Characters

6120 The following rules can be used to construct BREs matching multiple characters from BREs
 6121 matching a single character:

- 6122 1. The concatenation of BREs shall match the concatenation of the strings matched by each
 6123 component of the BRE.
- 6124 2. A subexpression can be defined within a BRE by enclosing it between the character pairs
 6125 "\(" and "\)". Such a subexpression shall match whatever it would have matched
 6126 without the "\(" and "\)", except that anchoring within subexpressions is optional
 6127 behavior; see Section 9.3.8 (on page 175). Subexpressions can be arbitrarily nested.
- 6128 3. The back-reference expression '\n' shall match the same (possibly empty) string of
 6129 characters as was matched by a subexpression enclosed between "\(" and "\)"
 6130 preceding the '\n'. The character 'n' shall be a digit from 1 through 9, specifying the
 6131 *n*th subexpression (the one that begins with the *n*th "\(" from the beginning of the
 6132 pattern and ends with the corresponding paired "\)"). The expression is invalid if less
 6133 than *n* subexpressions precede the '\n'. For example, the expression "\(.*)\1\$" matches a line consisting of two adjacent appearances of the same string, and the expression "\(a\)*\1" fails to match 'a'. When the referenced subexpression matched more than one string, the back-referenced expression shall refer to the last matched string. If the subexpression referenced by the back-reference matches more than one string because of an asterisk ('*') or an interval expression (see item (5)), the back-reference shall match the last (rightmost) of these strings.
- 6140 4. When a BRE matching a single character, a subexpression, or a back-reference is followed
 6141 by the special character asterisk ('*'), together with that asterisk it shall match what zero
 6142 or more consecutive occurrences of the BRE would match. For example, "[ab]*" and
 6143 "[ab][ab]" are equivalent when matching the string "ab".
- 6144 5. When a BRE matching a single character, a subexpression, or a back-reference is followed
 6145 by an interval expression of the format "{m}", "{m,}", or "{m,n}", together
 6146 with that interval expression it shall match what repeated consecutive occurrences of the
 6147 BRE would match. The values of *m* and *n* are decimal integers in the range 0
 6148 $\leq m \leq n \leq \text{RE\_DUP\_MAX}$, where *m* specifies the exact or minimum number of occurrences
 6149 and *n* specifies the maximum number of occurrences. The expression "{m}" shall match
 6150 exactly *m* occurrences of the preceding BRE, "{m,}" shall match at least *m* occurrences,
 6151 and "{m,n}" shall match any number of occurrences between *m* and *n*, inclusive.

6152 For example, in the string "abababcccccd" the BRE "c\{3\}" is matched by
 6153 characters seven to nine, the BRE "\(ab\)\{4,\}" is not matched at all, and the BRE
 6154 "c\{1,3\}d" is matched by characters ten to thirteen.

6155 The behavior of multiple adjacent duplication symbols ('*' and intervals) produces undefined
 6156 results.

6157 A subexpression repeated by an asterisk ('*') or an interval expression shall not match a null
 6158 expression unless this is the only match for the repetition or it is necessary to satisfy the exact or

6159 minimum number of occurrences for the interval expression.

6160 9.3.7 BRE Precedence

6161 The order of precedence shall be as shown in the following table:

BRE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Subexpressions/back-references	\(\) \n
Single-character-BRE duplication	* \{m,n\}
Concatenation	
Anchoring	^ \$

6170 9.3.8 BRE Expression Anchoring

6171 A BRE can be limited to matching strings that begin or end a line; this is called “anchoring”. The
 6172 circumflex and dollar sign special characters shall be considered BRE anchors in the following
 6173 contexts:

- 6174 1. A circumflex ('^') shall be an anchor when used as the first character of an entire BRE.
 6175 The implementation may treat the circumflex as an anchor when used as the first character
 6176 of a subexpression. The circumflex shall anchor the expression (or optionally
 6177 subexpression) to the beginning of a string; only sequences starting at the first character of
 6178 a string shall be matched by the BRE. For example, the BRE "^ab" matches "ab" in the
 6179 string "abcdef", but fails to match in the string "cdefab". The BRE "\(^ab\)" may
 6180 match the former string. A portable BRE shall escape a leading circumflex in a
 6181 subexpression to match a literal circumflex.
- 6182 2. A dollar sign ('\$') shall be an anchor when used as the last character of an entire BRE.
 6183 The implementation may treat a dollar sign as an anchor when used as the last character of
 6184 a subexpression. The dollar sign shall anchor the expression (or optionally subexpression)
 6185 to the end of the string being matched; the dollar sign can be said to match the end-of-
 6186 string following the last character.
- 6187 3. A BRE anchored by both '^' and '\$' shall match only an entire string. For example, the
 6188 BRE "^abcdef\$" matches strings consisting only of "abcdef".

6189 9.4 Extended Regular Expressions

6190 The extended regular expression (ERE) notation and construction rules shall apply to utilities
 6191 defined as using extended regular expressions; any exceptions to the following rules are noted in
 6192 the descriptions of the specific utilities using EREs.

6193 **9.4.1 EREs Matching a Single Character or Collating Element**

6194 An ERE ordinary character, a special character preceded by a backslash, or a period shall match
 6195 a single character. A bracket expression shall match a single character or a single collating
 6196 element. An ERE matching a single character enclosed in parentheses shall match the same as
 6197 the ERE without parentheses would have matched.

6198 **9.4.2 ERE Ordinary Characters**

6199 An ordinary character is an ERE that matches itself. An ordinary character is any character in the
 6200 supported character set, except for the ERE special characters listed in Section 9.4.3. The
 6201 interpretation of an ordinary character preceded by a backslash (' \ ') is undefined.

6202 **9.4.3 ERE Special Characters**

6203 An ERE special character has special properties in certain contexts. Outside those contexts, or
 6204 when preceded by a backslash, such a character shall be an ERE that matches the special
 6205 character itself. The extended regular expression special characters and the contexts in which
 6206 they shall have their special meaning are as follows:

6207 . [\ (The period, left-bracket, backslash, and left-parenthesis shall be special except when
 6208 used in a bracket expression (see Section 9.3.5 (on page 172)). Outside a bracket
 6209 expression, a left-parenthesis immediately followed by a right-parenthesis produces
 6210 undefined results.

6211) The right-parenthesis shall be special when matched with a preceding left-parenthesis,
 6212 both outside a bracket expression.

6213 * + ? { The asterisk, plus-sign, question-mark, and left-brace shall be special except when used
 6214 in a bracket expression (see Section 9.3.5 (on page 172)). Any of the following uses
 6215 produce undefined results:

- 6216 • If these characters appear first in an ERE, or immediately following a vertical-line,
 6217 circumflex, or left-parenthesis
- 6218 • If a left-brace is not part of a valid interval expression (see Section 9.4.6 (on page
 6219 177))

6220 | The vertical-line is special except when used in a bracket expression (see Section 9.3.5
 6221 (on page 172)). A vertical-line appearing first or last in an ERE, or immediately
 6222 following a vertical-line or a left-parenthesis, or immediately preceding a right-
 6223 parenthesis, produces undefined results.

6224 ^ The circumflex shall be special when used as:

- 6225 • An anchor (see Section 9.4.9 (on page 178))
- 6226 • The first character of a bracket expression (see Section 9.3.5 (on page 172))

6227 \$ The dollar sign shall be special when used as an anchor.

6228 9.4.4 Periods in EREs

6229 A period ('.'), when used outside a bracket expression, is an ERE that shall match any
6230 character in the supported character set except NUL.

6231 9.4.5 ERE Bracket Expression

6232 The rules for ERE Bracket Expressions are the same as for Basic Regular Expressions; see Section
6233 9.3.5 (on page 172).

6234 9.4.6 EREs Matching Multiple Characters

6235 The following rules shall be used to construct EREs matching multiple characters from EREs
6236 matching a single character:

- 6237 1. A concatenation of EREs shall match the concatenation of the character sequences matched
6238 by each component of the ERE. A concatenation of EREs enclosed in parentheses shall
6239 match whatever the concatenation without the parentheses matches. For example, both the
6240 ERE "cd" and the ERE "(cd)" are matched by the third and fourth character of the string
6241 "abcdefabcdef".
- 6242 2. When an ERE matching a single character or an ERE enclosed in parentheses is followed by
6243 the special character plus-sign ('+'), together with that plus-sign it shall match what one
6244 or more consecutive occurrences of the ERE would match. For example, the ERE
6245 "b+(bc)" matches the fourth to seventh characters in the string "acabbbbcde". And,
6246 "[ab]+" and "[ab][ab]*" are equivalent.
- 6247 3. When an ERE matching a single character or an ERE enclosed in parentheses is followed by
6248 the special character asterisk ('*'), together with that asterisk it shall match what zero or
6249 more consecutive occurrences of the ERE would match. For example, the ERE "b*c"
6250 matches the first character in the string "cabbbbcde", and the ERE "b*cd" matches the
6251 third to seventh characters in the string "cabbbbcdebbbbbbcbdbc". And, "[ab]*" and
6252 "[ab][ab]" are equivalent when matching the string "ab".
- 6253 4. When an ERE matching a single character or an ERE enclosed in parentheses is followed by
6254 the special character question-mark ('?'), together with that question-mark it shall match
6255 what zero or one consecutive occurrences of the ERE would match. For example, the ERE
6256 "b?c" matches the second character in the string "acabbbbcde".
- 6257 5. When an ERE matching a single character or an ERE enclosed in parentheses is followed by
6258 an interval expression of the format "{m}", "{m,}", or "{m,n}", together with that
6259 interval expression it shall match what repeated consecutive occurrences of the ERE would
6260 match. The values of m and n are decimal integers in the range $0 \leq m \leq n \leq \{RE\_DUP\_MAX\}$,
6261 where m specifies the exact or minimum number of occurrences and n specifies the
6262 maximum number of occurrences. The expression "{m}" matches exactly m occurrences
6263 of the preceding ERE, "{m,}" matches at least m occurrences, and "{m,n}" matches any
6264 number of occurrences between m and n , inclusive.

6265 For example, in the string "abababcccccd" the ERE "c{3}" is matched by characters
6266 seven to nine and the ERE "(ab){2,}" is matched by characters one to six.

6267 The behavior of multiple adjacent duplication symbols ('+', '*', '?', and intervals) produces
6268 undefined results.

6269 An ERE matching a single character repeated by an '*', '?', or an interval expression shall not
6270 match a null expression unless this is the only match for the repetition or it is necessary to satisfy
6271 the exact or minimum number of occurrences for the interval expression.

6272 9.4.7 ERE Alternation

6273 Two EREs separated by the special character vertical-line ('|') shall match a string that is
 6274 matched by either. For example, the ERE "a (bc) | d" matches the string "abc" and the string
 6275 "ad". Single characters, or expressions matching single characters, separated by the vertical bar
 6276 and enclosed in parentheses, shall be treated as an ERE matching a single character.

6277 9.4.8 ERE Precedence

6278 The order of precedence shall be as shown in the following table:

ERE Precedence (from high to low)	
Collation-related bracket symbols	[==] [::] [..]
Escaped characters	\<special character>
Bracket expression	[]
Grouping	()
Single-character-ERE duplication	* + ? {m,n}
Concatenation	
Anchoring	^ \$
Alternation	

6288 For example, the ERE "abba|cde" matches either the string "abba" or the string "cde"
 6289 (rather than the string "abbade" or "abbcde", because concatenation has a higher order of
 6290 precedence than alternation).

6291 9.4.9 ERE Expression Anchoring

6292 An ERE can be limited to matching strings that begin or end a line; this is called "anchoring".
 6293 The circumflex and dollar sign special characters shall be considered ERE anchors when used
 6294 anywhere outside a bracket expression. This shall have the following effects:

- 6295 1. A circumflex ('^') outside a bracket expression shall anchor the expression or
 6296 subexpression it begins to the beginning of a string; such an expression or subexpression
 6297 can match only a sequence starting at the first character of a string. For example, the EREs
 6298 "^ab" and "(^ab)" match "ab" in the string "abcdef", but fail to match in the string
 6299 "cdefab", and the ERE "a^b" is valid, but can never match because the 'a' prevents the
 6300 expression "^b" from matching starting at the first character.
- 6301 2. A dollar sign ('\$') outside a bracket expression shall anchor the expression or
 6302 subexpression it ends to the end of a string; such an expression or subexpression can
 6303 match only a sequence ending at the last character of a string. For example, the EREs
 6304 "ef\$" and "(ef\$)" match "ef" in the string "abcdef", but fail to match in the string
 6305 "cdefab", and the ERE "e\$f" is valid, but can never match because the 'f' prevents the
 6306 expression "e\$" from matching ending at the last character.

6307 9.5 Regular Expression Grammar

6308 Grammars describing the syntax of both basic and extended regular expressions are presented in
6309 this section. The grammar takes precedence over the text. See the Shell and Utilities volume of
6310 IEEE Std 1003.1-2001, Section 1.10, Grammar Conventions.

6311 9.5.1 BRE/ERE Grammar Lexical Conventions

6312 The lexical conventions for regular expressions are as described in this section.

6313 Except as noted, the longest possible token or delimiter beginning at a given point is recognized.

6314 The following tokens are processed (in addition to those string constants shown in the
6315 grammar):

6316 **COLL_ELEM_SINGLE**

6317 Any single-character collating element, unless it is a **META_CHAR**.

6318 **COLL_ELEM_MULTI**

6319 Any multi-character collating element.

6320 **BACKREF**

6321 Applicable only to basic regular expressions. The character string
consisting of '****' followed by a single-digit numeral, '1' to '9'.

6322 **DUP_COUNT**

6323 Represents a numeric constant. It shall be an integer in the range 0
6324 $\leq \mathbf{DUP\_COUNT} \leq \{\mathbf{RE\_DUP\_MAX}\}$. This token is only recognized when
6325 the context of the grammar requires it. At all other times, digits not
preceded by '****' are treated as **ORD_CHAR**.

6326 **META_CHAR**

One of the characters:

6327 **^** When found first in a bracket expression

6328 **-** When found anywhere but first (after an initial '**^**', if any) or
6329 last in a bracket expression, or as the ending range point in a
6330 range expression

6331 **]** When found anywhere but first (after an initial '**^**', if any) in a
6332 bracket expression

6333 **L_ANCHOR**

6334 Applicable only to basic regular expressions. The character '**^**' when it
6335 appears as the first character of a basic regular expression and when not
6336 **QUOTED_CHAR**. The '**^**' may be recognized as an anchor elsewhere;
see Section 9.3.8 (on page 175).

6337 **ORD_CHAR**

A character, other than one of the special characters in **SPEC_CHAR**.

6338 **QUOTED_CHAR**

In a BRE, one of the character sequences:

6339 **\^** **\.** ***** **\[** **\\$** ****

6340 In an ERE, one of the character sequences:

6341 **\^** **\.** **\[** **\\$** **\(** **\)** ****

6342 ***** **\+** **\?** **\{** ****

6343 **R_ANCHOR**

6344 (Applicable only to basic regular expressions.) The character '**\$**' when it
6345 appears as the last character of a basic regular expression and when not
6346 **QUOTED_CHAR**. The '**\$**' may be recognized as an anchor elsewhere;
see Section 9.3.8 (on page 175).

6347 **SPEC_CHAR** For basic regular expressions, one of the following special characters:

6348 . Anywhere outside bracket expressions

6349 \ Anywhere outside bracket expressions

6350 [Anywhere outside bracket expressions

6351 ^ When used as an anchor (see Section 9.3.8 (on page 175)) or

6352 when first in a bracket expression

6353 \$ When used as an anchor

6354 * Anywhere except first in an entire RE, anywhere in a bracket

6355 expression, directly following "\(", directly following an

6356 anchoring '^'

6357 For extended regular expressions, shall be one of the following special

6358 characters found anywhere outside bracket expressions:

6359 ^ . [\$ () |

6360 * + ? { \

6361 (The close-parenthesis shall be considered special in this context only if

6362 matched with a preceding open-parenthesis.)

6363 9.5.2 RE and Bracket Expression Grammar

6364 This section presents the grammar for basic regular expressions, including the bracket

6365 expression grammar that is common to both BREs and EREs.

6366 %token ORD_CHAR QUOTED_CHAR DUP_COUNT

6367 %token BACKREF L_ANCHOR R_ANCHOR

6368 %token Back_open_paren Back_close_paren

6369 /* '\(' '\)' */

6370 %token Back_open_brace Back_close_brace

6433          | range_expression
6434          ;
6435 single_expression : end_range
6436          | character_class
6437          | equivalence_class
6438          ;
6439 range_expression : start_range end_range

```

```

6440         | start_range '-'
6441         ;
6442     start_range      : end_range '-'
6443     ;
6444     end_range        : COLL_ELEM_SINGLE
6445         | collating_symbol
6446     ;
6447     collating_symbol : Open_dot COLL_ELEM_SINGLE Dot_close
6448         | Open_dot COLL_ELEM_MULTI Dot_close
6449         | Open_dot META_CHAR Dot_close
6450     ;
6451     equivalence_class : Open_equal COLL_ELEM_SINGLE Equal_close
6452         | Open_equal COLL_ELEM_MULTI Equal_close
6453     ;
6454     character_class : Open_colon class_name Colon_close
6455     ;

```

6456 The BRE grammar does not permit **L_ANCHOR** or **R_ANCHOR** inside "\(" and "\)" (which
6457 implies that '^' and '\$' are ordinary characters). This reflects the semantic limits on the
6458 application, as noted in Section 9.3.8 (on page 175). Implementations are permitted to extend the
6459 language to interpret '^' and '\$' as anchors in these locations, and as such, conforming
6460 applications cannot use unescaped '^' and '\$' in positions inside "\(" and "\)" that might
6461 be interpreted as anchors.

6462 9.5.3 ERE Grammar

6463 This section presents the grammar for extended regular expressions, excluding the bracket
6464 expression grammar.

6465 **Note:** The bracket expression grammar and the associated **%token** lines are identical between BREs
6466 and EREs. It has been omitted from the ERE section to avoid unnecessary editorial duplication.

```

6467 %token  ORD_CHAR QUOTED_CHAR DUP_COUNT
6468 %start  extended_reg_exp
6469 %%
6470 /* -----
6471    Extended Regular Expression
6472    -----
6473 */
6474 extended_reg_exp      :                ERE_branch
6475         | extended_reg_exp '|' ERE_branch
6476     ;
6477 ERE_branch            :                ERE_expression
6478         | ERE_branch ERE_expression
6479     ;
6480 ERE_expression        : one_char_or_coll_elem_ERE
6481         | '^'
6482         | '$'
6483         | '(' extended_reg_exp ')'
6484         | ERE_expression ERE_dupl_symbol
6485     ;
6486 one_char_or_coll_elem_ERE : ORD_CHAR
6487         | QUOTED_CHAR
6488         | '.'

```

```

6489             | bracket_expression
6490             ;
6491 ERE_dupl_symbol : '*'
6492             | '+'
6493             | '?'
6494             | '{' DUP_COUNT '}'
6495             | '{' DUP_COUNT ',' '}'
6496             | '{' DUP_COUNT ',' DUP_COUNT '}'
6497             ;

```

6498 The ERE grammar does not permit several constructs that previous sections specify as having
 6499 undefined results:

- 6500 • **ORD_CHAR** preceded by '`\`'
- 6501 • One or more *ERE_dupl_symbols* appearing first in an ERE, or immediately following '`|`',
 6502 '`^`', or '`(`'
- 6503 • '`{`' not part of a valid *ERE_dupl_symbol*
- 6504 • '`|`' appearing first or last in an ERE, or immediately following '`|`' or '`(`', or immediately
 6505 preceding '`)`'

6506 Implementations are permitted to extend the language to allow these. Conforming applications
 6507 cannot use such constructs.

Directory Structure and Devices

6509

10.1 Directory Structure and Files

The following directories shall exist on conforming systems and conforming applications shall make use of them only as described. Strictly conforming applications shall not assume the ability to create files in any of these directories, unless specified below.

/ The root directory.

/dev Contains **/dev/console**, **/dev/null**, and **/dev/tty**, described below.

The following directory shall exist on conforming systems and shall be used as described:

/tmp A directory made available for applications that need a place to create temporary files. Applications shall be allowed to create files in this directory, but shall not assume that such files are preserved between invocations of the application.

The following files shall exist on conforming systems and shall be both readable and writable:

/dev/null An infinite data source and data sink. Data written to **/dev/null** shall be discarded. Reads from **/dev/null** shall always return end-of-file (EOF).

/dev/tty In each process, a synonym for the controlling terminal associated with the process group of that process, if any. It is useful for programs or shell procedures that wish to be sure of writing messages to or reading data from the terminal no matter how output has been redirected. It can also be used for applications that demand the name of a file for output, when typed output is desired and it is tiresome to find out what terminal is currently in use.

The following file shall exist on conforming systems and need not be readable or writable:

/dev/console The **/dev/console** file is a generic name given to the system console (see Section 3.382 (on page 88)). It is usually linked to an implementation-defined special file. It shall provide an interface to the system console conforming to the requirements of the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface.

10.2 Output Devices and Terminal Types

The utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 historically have been implemented on a wide range of terminal types, but a conforming implementation need not support all features of all utilities on every conceivable terminal. IEEE Std 1003.1-2001 states which features are optional for certain classes of terminals in the individual utility description sections. The implementation shall document which terminal types it supports and which of these features and utilities are not supported by each terminal.

When a feature or utility is not supported on a specific terminal type, as allowed by IEEE Std 1003.1-2001, and the implementation considers such a condition to be an error preventing use of the feature or utility, the implementation shall indicate such conditions through diagnostic messages or exit status values or both (as appropriate to the specific utility description) that inform the user that the terminal type lacks the appropriate capability.

IEEE Std 1003.1-2001 uses a notational convention based on historical practice that identifies some of the control characters defined in Section 7.3.1 (on page 126) in a manner easily remembered by users on many terminals. The correspondence between this “<control>-char” notation and the actual control characters is shown in the following table. When IEEE Std 1003.1-2001 refers to a character by its <control>-name, it is referring to the actual control character shown in the Value column of the table, which is not necessarily the exact control key sequence on all terminals. Some terminals have keyboards that do not allow the direct transmission of all the non-alphanumeric characters shown. In such cases, the system documentation shall describe which data sequences transmitted by the terminal are interpreted by the system as representing the special characters.

Table 10-1 Control Character Names

Name	Value	Symbolic Name	Name	Value	Symbolic Name
<control>-A	<SOH>	<SOH>	<control>-Q	<DC1>	<DC1>
<control>-B	<STX>	<STX>	<control>-R	<DC2>	<DC2>
<control>-C	<ETX>	<ETX>	<control>-S	<DC3>	<DC3>
<control>-D	<EOT>	<EOT>	<control>-T	<DC4>	<DC4>
<control>-E	<ENQ>	<ENQ>	<control>-U	<NAK>	<NAK>
<control>-F	<ACK>	<ACK>	<control>-V	<SYN>	<SYN>
<control>-G	<BEL>	<alert>	<control>-W	<ETB>	<ETB>
<control>-H	<BS>	<backspace>	<control>-X	<CAN>	<CAN>
<control>-I	<HT>	<tab>	<control>-Y		
<control>-J	<LF>	<linefeed>	<control>-Z	<SUB>	<SUB>
<control>-K	<VT>	<vertical-tab>	<control>-[	<ESC>	<ESC>
<control>-L	<FF>	<form-feed>	<control>-\ <control>-]	<FS>	<FS>
<control>-M	<CR>	<carriage-return>	<control>-^	<GS>	<GS>
<control>-N	<SO>	<SO>	<control>-_	<RS>	<RS>
<control>-O	<SI>	<SI>	<control>-?	<US>	<US>
<control>-P	<DLE>	<DLE>		<DEL>	<DEL>

Note: The notation uses uppercase letters for arbitrary editorial reasons. There is no implication that the keystrokes represent control-shift-letter sequences.

General Terminal Interface

This chapter describes a general terminal interface that shall be provided. It shall be supported on any asynchronous communications ports if the implementation provides them. It is implementation-defined whether it supports network connections or synchronous ports, or both.

11.1 Interface Characteristics

11.1.1 Opening a Terminal Device File

When a terminal device file is opened, it normally causes the thread to wait until a connection is established. In practice, application programs seldom open these files; they are opened by special programs and become an application's standard input, output, and error files.

As described in *open()*, opening a terminal device file with the *O_NONBLOCK* flag clear shall cause the thread to block until the terminal device is ready and available. If *CLOCAL* mode is not set, this means blocking until a connection is established. If *CLOCAL* mode is set in the terminal, or the *O_NONBLOCK* flag is specified in the *open()*, the *open()* function shall return a file descriptor without waiting for a connection to be established.

11.1.2 Process Groups

A terminal may have a foreground process group associated with it. This foreground process group plays a special role in handling signal-generating input characters, as discussed in Section 11.1.9 (on page 191).

A command interpreter process supporting job control can allocate the terminal to different jobs, or process groups, by placing related processes in a single process group and associating this process group with the terminal. A terminal's foreground process group may be set or examined by a process, assuming the permission requirements are met; see *tcgetpgrp()* and *tcsetpgrp()*. The terminal interface aids in this allocation by restricting access to the terminal by processes that are not in the current process group; see Section 11.1.4 (on page 188).

When there is no longer any process whose process ID or process group ID matches the foreground process group ID, the terminal shall have no foreground process group. It is unspecified whether the terminal has a foreground process group when there is a process whose process ID matches the foreground process group ID, but whose process group ID does not. No actions defined in IEEE Std 1003.1-2001, other than allocation of a controlling terminal or a successful call to *tcsetpgrp()*, shall cause a process group to become the foreground process group of the terminal.

6609 11.1.3 The Controlling Terminal

6610 A terminal may belong to a process as its controlling terminal. Each process of a session that has
 6611 a controlling terminal has the same controlling terminal. A terminal may be the controlling
 6612 terminal for at most one session. The controlling terminal for a session is allocated by the session
 6613 leader in an implementation-defined manner. If a session leader has no controlling terminal, and
 6614 opens a terminal device file that is not already associated with a session without using the
 6615 O_NOCTTY option (see *open()*), it is implementation-defined whether the terminal becomes the
 6616 controlling terminal of the session leader. If a process which is not a session leader opens a
 6617 terminal file, or the O_NOCTTY option is used on *open()*, then that terminal shall not become
 6618 the controlling terminal of the calling process. When a controlling terminal becomes associated
 6619 with a session, its foreground process group shall be set to the process group of the session
 6620 leader.

6621 The controlling terminal is inherited by a child process during a *fork()* function call. A process
 6622 relinquishes its controlling terminal when it creates a new session with the *setsid()* function;
 6623 other processes remaining in the old session that had this terminal as their controlling terminal
 6624 continue to have it. Upon the close of the last file descriptor in the system (whether or not it is in
 6625 the current session) associated with the controlling terminal, it is unspecified whether all
 6626 processes that had that terminal as their controlling terminal cease to have any controlling
 6627 terminal. Whether and how a session leader can reacquire a controlling terminal after the
 6628 controlling terminal has been relinquished in this fashion is unspecified. A process does not
 6629 relinquish its controlling terminal simply by closing all of its file descriptors associated with the
 6630 controlling terminal if other processes continue to have it open.

6631 When a controlling process terminates, the controlling terminal is dissociated from the current
 6632 session, allowing it to be acquired by a new session leader. Subsequent access to the terminal by
 6633 other processes in the earlier session may be denied, with attempts to access the terminal treated
 6634 as if a modem disconnect had been sensed.

6635 11.1.4 Terminal Access Control

6636 If a process is in the foreground process group of its controlling terminal, read operations shall
 6637 be allowed, as described in Section 11.1.5 (on page 189). Any attempts by a process in a
 6638 background process group to read from its controlling terminal cause its process group to be
 6639 sent a SIGTTIN signal unless one of the following special cases applies: if the reading process is
 6640 ignoring or blocking the SIGTTIN signal, or if the process group of the reading process is
 6641 orphaned, the *read()* shall return *-1*, with *errno* set to [EIO] and no signal shall be sent. The
 6642 default action of the SIGTTIN signal shall be to stop the process to which it is sent. See
 6643 **<signal.h>**.

6644 If a process is in the foreground process group of its controlling terminal, write operations shall
 6645 be allowed as described in Section 11.1.8 (on page 191). Attempts by a process in a background
 6646 process group to write to its controlling terminal shall cause the process group to be sent a
 6647 SIGTTOU signal unless one of the following special cases applies: if TOSTOP is not set, or if
 6648 TOSTOP is set and the process is ignoring or blocking the SIGTTOU signal, the process is
 6649 allowed to write to the terminal and the SIGTTOU signal is not sent. If TOSTOP is set, and the
 6650 process group of the writing process is orphaned, and the writing process is not ignoring or
 6651 blocking the SIGTTOU signal, the *write()* shall return *-1*, with *errno* set to [EIO] and no signal
 6652 shall be sent.

6653 Certain calls that set terminal parameters are treated in the same fashion as *write()*, except that
 6654 TOSTOP is ignored; that is, the effect is identical to that of terminal writes when TOSTOP is set
 6655 (see Section 11.2.5 (on page 197), *tcdrain()*, *tcflow()*, *tcflush()*, *tcsendbreak()*, *tcsetattr()*, and
 6656 *tcsetpgrp()*).

6657 11.1.5 Input Processing and Reading Data

6658 A terminal device associated with a terminal device file may operate in full-duplex mode, so that
 6659 data may arrive even while output is occurring. Each terminal device file has an input queue
 6660 associated with it, into which incoming data is stored by the system before being read by a
 6661 process. The system may impose a limit, {MAX_INPUT}, on the number of bytes that may be
 6662 stored in the input queue. The behavior of the system when this limit is exceeded is
 6663 implementation-defined.

6664 Two general kinds of input processing are available, determined by whether the terminal device
 6665 file is in canonical mode or non-canonical mode. These modes are described in Section 11.1.6 and
 6666 Section 11.1.7 (on page 190). Additionally, input characters are processed according to the *c_iflag*
 6667 (see Section 11.2.2 (on page 193)) and *c_lflag* (see Section 11.2.5 (on page 197)) fields. Such
 6668 processing can include “echoing”, which in general means transmitting input characters
 6669 immediately back to the terminal when they are received from the terminal. This is useful for
 6670 terminals that can operate in full-duplex mode.

6671 The manner in which data is provided to a process reading from a terminal device file is
 6672 dependent on whether the terminal file is in canonical or non-canonical mode, and on whether
 6673 or not the O_NONBLOCK flag is set by *open()* or *fcntl()*.

6674 If the O_NONBLOCK flag is clear, then the read request shall be blocked until data is available
 6675 or a signal has been received. If the O_NONBLOCK flag is set, then the read request shall be
 6676 completed, without blocking, in one of three ways:

- 6677 1. If there is enough data available to satisfy the entire request, the *read()* shall complete
 6678 successfully and shall return the number of bytes read.
- 6679 2. If there is not enough data available to satisfy the entire request, the *read()* shall complete
 6680 successfully, having read as much data as possible, and shall return the number of bytes it
 6681 was able to read.
- 6682 3. If there is no data available, the *read()* shall return -1, with *errno* set to [EAGAIN].

6683 When data is available depends on whether the input processing mode is canonical or non-
 6684 canonical. Section 11.1.6 and Section 11.1.7 (on page 190) describe each of these input processing
 6685 modes.

6686 11.1.6 Canonical Mode Input Processing

6687 In canonical mode input processing, terminal input is processed in units of lines. A line is
 6688 delimited by a newline character (NL), an end-of-file character (EOF), or an end-of-line (EOL)
 6689 character. See Section 11.1.9 (on page 191) for more information on EOF and EOL. This means
 6690 that a read request shall not return until an entire line has been typed or a signal has been
 6691 received. Also, no matter how many bytes are requested in the *read()* call, at most one line shall
 6692 be returned. It is not, however, necessary to read a whole line at once; any number of bytes, even
 6693 one, may be requested in a *read()* without losing information.

6694 If {MAX_CANON} is defined for this terminal device, it shall be a limit on the number of bytes
 6695 in a line. The behavior of the system when this limit is exceeded is implementation-defined. If
 6696 {MAX_CANON} is not defined, there shall be no such limit; see *pathconf()*.

6697 Erase and kill processing occur when either of two special characters, the ERASE and KILL
 6698 characters (see Section 11.1.9 (on page 191)), is received. This processing shall affect data in the
 6699 input queue that has not yet been delimited by an NL, EOF, or EOL character. This un-delimited
 6700 data makes up the current line. The ERASE character shall delete the last character in the current
 6701 line, if there is one. The KILL character shall delete all data in the current line, if there is any. The
 6702 ERASE and KILL characters shall have no effect if there is no data in the current line. The ERASE

6703 and KILL characters themselves shall not be placed in the input queue.

6704 **11.1.7 Non-Canonical Mode Input Processing**

6705 In non-canonical mode input processing, input bytes are not assembled into lines, and erase and
6706 kill processing shall not occur. The values of the MIN and TIME members of the *c_cc* array are
6707 used to determine how to process the bytes received. IEEE Std 1003.1-2001 does not specify
6708 whether the setting of O_NONBLOCK takes precedence over MIN or TIME settings. Therefore,
6709 if O_NONBLOCK is set, *read()* may return immediately, regardless of the setting of MIN or
6710 TIME. Also, if no data is available, *read()* may either return 0, or return -1 with *errno* set to
6711 [EAGAIN].

6712 MIN represents the minimum number of bytes that should be received when the *read()* function
6713 returns successfully. TIME is a timer of 0.1 second granularity that is used to time out bursty and
6714 short-term data transmissions. If MIN is greater than {MAX_INPUT}, the response to the request
6715 is undefined. The four possible values for MIN and TIME and their interactions are described
6716 below.

6717 **Case A: MIN>0, TIME>0**

6718 In case A, TIME serves as an inter-byte timer which shall be activated after the first byte is
6719 received. Since it is an inter-byte timer, it shall be reset after a byte is received. The interaction
6720 between MIN and TIME is as follows. As soon as one byte is received, the inter-byte timer shall
6721 be started. If MIN bytes are received before the inter-byte timer expires (remember that the timer
6722 is reset upon receipt of each byte), the read shall be satisfied. If the timer expires before MIN
6723 bytes are received, the characters received to that point shall be returned to the user. Note that if
6724 TIME expires at least one byte shall be returned because the timer would not have been enabled
6725 unless a byte was received. In this case (MIN>0, TIME>0) the read shall block until the MIN and
6726 TIME mechanisms are activated by the receipt of the first byte, or a signal is received. If data is in
6727 the buffer at the time of the *read()*, the result shall be as if data has been received immediately
6728 after the *read()*.

6729 **Case B: MIN>0, TIME=0**

6730 In case B, since the value of TIME is zero, the timer plays no role and only MIN is significant. A
6731 pending read shall not be satisfied until MIN bytes are received (that is, the pending read shall
6732 block until MIN bytes are received), or a signal is received. A program that uses case B to read
6733 record-based terminal I/O may block indefinitely in the read operation.

6734 **Case C: MIN=0, TIME>0**

6735 In case C, since MIN=0, TIME no longer represents an inter-byte timer. It now serves as a read
6736 timer that shall be activated as soon as the *read()* function is processed. A read shall be satisfied
6737 as soon as a single byte is received or the read timer expires. Note that in case C if the timer
6738 expires, no bytes shall be returned. If the timer does not expire, the only way the read can be
6739 satisfied is if a byte is received. If bytes are not received, the read shall not block indefinitely
6740 waiting for a byte; if no byte is received within TIME*0.1 seconds after the read is initiated, the
6741 *read()* shall return a value of zero, having read no data. If data is in the buffer at the time of the
6742 *read()*, the timer shall be started as if data has been received immediately after the *read()*.

6743 **Case D: MIN=0, TIME=0**

6744 The minimum of either the number of bytes requested or the number of bytes currently available
 6745 shall be returned without waiting for more bytes to be input. If no characters are available, *read()*
 6746 shall return a value of zero, having read no data.

6747 **11.1.8 Writing Data and Output Processing**

6748 When a process writes one or more bytes to a terminal device file, they are processed according
 6749 to the *c_oflag* field (see Section 11.2.3 (on page 194)). The implementation may provide a
 6750 buffering mechanism; as such, when a call to *write()* completes, all of the bytes written have
 6751 been scheduled for transmission to the device, but the transmission has not necessarily
 6752 completed. See *write()* for the effects of O_NONBLOCK on *write()*.

6753 **11.1.9 Special Characters**

6754 Certain characters have special functions on input or output or both. These functions are
 6755 summarized as follows:

6756 **INTR** Special character on input, which is recognized if the ISIG flag is set. Generates a
 6757 SIGINT signal which is sent to all processes in the foreground process group for which
 6758 the terminal is the controlling terminal. If ISIG is set, the INTR character shall be
 6759 discarded when processed.

6760 **QUIT** Special character on input, which is recognized if the ISIG flag is set. Generates a
 6761 SIGQUIT signal which is sent to all processes in the foreground process group for
 6762 which the terminal is the controlling terminal. If ISIG is set, the QUIT character shall be
 6763 discarded when processed.

6764 **ERASE** Special character on input, which is recognized if the ICANON flag is set. Erases the
 6765 last character in the current line; see Section 11.1.6 (on page 189). It shall not erase
 6766 beyond the start of a line, as delimited by an NL, EOF, or EOL character. If ICANON is
 6767 set, the ERASE character shall be discarded when processed.

6768 **KILL** Special character on input, which is recognized if the ICANON flag is set. Deletes the
 6769 entire line, as delimited by an NL, EOF, or EOL character. If ICANON is set, the KILL
 6770 character shall be discarded when processed.

6771 **EOF** Special character on input, which is recognized if the ICANON flag is set. When
 6772 received, all the bytes waiting to be read are immediately passed to the process without
 6773 waiting for a newline, and the EOF is discarded. Thus, if there are no bytes waiting
 6774 (that is, the EOF occurred at the beginning of a line), a byte count of zero shall be
 6775 returned from the *read()*, representing an end-of-file indication. If ICANON is set, the
 6776 EOF character shall be discarded when processed.

6777 **NL** Special character on input, which is recognized if the ICANON flag is set. It is the line
 6778 delimiter newline. It cannot be changed.

6779 **EOL** Special character on input, which is recognized if the ICANON flag is set. It is an
 6780 additional line delimiter, like NL.

6781 **SUSP** If the ISIG flag is set, receipt of the SUSP character shall cause a SIGTSTP signal to be
 6782 sent to all processes in the foreground process group for which the terminal is the
 6783 controlling terminal, and the SUSP character shall be discarded when processed.

6784 **STOP** Special character on both input and output, which is recognized if the IXON (output
 6785 control) or IXOFF (input control) flag is set. Can be used to suspend output
 6786 temporarily. It is useful with CRT terminals to prevent output from disappearing

6787 before it can be read. If IXON is set, the STOP character shall be discarded when
 6788 processed.

6789 **START** Special character on both input and output, which is recognized if the IXON (output
 6790 control) or IXOFF (input control) flag is set. Can be used to resume output that has
 6791 been suspended by a STOP character. If IXON is set, the START character shall be
 6792 discarded when processed.

6793 **CR** Special character on input, which is recognized if the ICANON flag is set; it is the
 6794 carriage-return character. When ICANON and ICRNL are set and IGNCR is not set,
 6795 this character shall be translated into an NL, and shall have the same effect as an NL
 6796 character.

6797 The NL and CR characters cannot be changed. It is implementation-defined whether the START
 6798 and STOP characters can be changed. The values for INTR, QUIT, ERASE, KILL, EOF, EOL, and
 6799 SUSP shall be changeable to suit individual tastes. Special character functions associated with
 6800 changeable special control characters can be disabled individually.

6801 If two or more special characters have the same value, the function performed when that
 6802 character is received is undefined.

6803 A special character is recognized not only by its value, but also by its context; for example, an
 6804 implementation may support multi-byte sequences that have a meaning different from the
 6805 meaning of the bytes when considered individually. Implementations may also support
 6806 additional single-byte functions. These implementation-defined multi-byte or single-byte
 6807 functions shall be recognized only if the IEXTEN flag is set; otherwise, data is received without
 6808 interpretation, except as required to recognize the special characters defined in this section.

6809 **XSI** If IEXTEN is set, the ERASE, KILL, and EOF characters can be escaped by a preceding ‘\’
 6810 character, in which case no special function shall occur.

6811 **11.1.10 Modem Disconnect**

6812 If a modem disconnect is detected by the terminal interface for a controlling terminal, and if
 6813 CLOCAL is not set in the *c_cflag* field for the terminal (see Section 11.2.4 (on page 196)), the
 6814 SIGHUP signal shall be sent to the controlling process for which the terminal is the controlling
 6815 terminal. Unless other arrangements have been made, this shall cause the controlling process to
 6816 terminate (see *exit()*). Any subsequent read from the terminal device shall return the value of
 6817 zero, indicating end-of-file; see *read()*. Thus, processes that read a terminal file and test for end-
 6818 of-file can terminate appropriately after a disconnect. If the EIO condition as specified in *read()*
 6819 also exists, it is unspecified whether on EOF condition or [EIO] is returned. Any subsequent
 6820 *write()* to the terminal device shall return -1, with *errno* set to [EIO], until the device is closed.

6821 **11.1.11 Closing a Terminal Device File**

6822 The last process to close a terminal device file shall cause any output to be sent to the device and
 6823 any input to be discarded. If HUPCL is set in the control modes and the communications port
 6824 supports a disconnect function, the terminal device shall perform a disconnect.

11.2 Parameters that Can be Set

11.2.1 The `termios` Structure

Routines that need to control certain terminal I/O characteristics shall do so by using the **termios** structure as defined in the `<termios.h>` header. The members of this structure include (but are not limited to):

Member Type	Array Size	Member Name	Description
tcflag_t	NCCS	<i>c_iflag</i>	Input modes.
tcflag_t		<i>c_oflag</i>	Output modes.
tcflag_t		<i>c_cflag</i>	Control modes.
tcflag_t		<i>c_lflag</i>	Local modes.
cc_t		<i>c_cc[]</i>	Control characters.

The types **tcflag_t** and **cc_t** are defined in the `<termios.h>` header. They shall be unsigned integer types.

11.2.2 Input Modes

Values of the *c_iflag* field describe the basic terminal input control, and are composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in `<termios.h>`:

Mask Name	Description
BRKINT	Signal interrupt on break.
ICRNL	Map CR to NL on input.
IGNBRK	Ignore break condition.
IGNCR	Ignore CR.
IGNPAR	Ignore characters with parity errors.
INLCR	Map NL to CR on input.
INPCK	Enable input parity check.
ISTRIP	Strip character.
IXANY	Enable any character to restart output.
IXOFF	Enable start/stop input control.
IXON	Enable start/stop output control.
PARMRK	Mark parity errors.

In the context of asynchronous serial data transmission, a break condition shall be defined as a sequence of zero-valued bits that continues for more than the time to send one byte. The entire sequence of zero-valued bits is interpreted as a single break condition, even if it continues for a time equivalent to more than one byte. In contexts other than asynchronous serial data transmission, the definition of a break condition is implementation-defined.

If IGNBRK is set, a break condition detected on input shall be ignored; that is, not put on the input queue and therefore not read by any process. If IGNBRK is not set and BRKINT is set, the break condition shall flush the input and output queues, and if the terminal is the controlling terminal of a foreground process group, the break condition shall generate a single SIGINT signal to that foreground process group. If neither IGNBRK nor BRKINT is set, a break condition shall be read as a single 0x00, or if PARMRK is set, as 0xff 0x00 0x00.

If IGNPAR is set, a byte with a framing or parity error (other than break) shall be ignored.

6869 If PARMRK is set, and IGNPAR is not set, a byte with a framing or parity error (other than
 6870 break) shall be given to the application as the three-byte sequence 0xff 0x00 X, where 0xff 0x00 is
 6871 a two-byte flag preceding each sequence and X is the data of the byte received in error. To avoid
 6872 ambiguity in this case, if ISTRIP is not set, a valid byte of 0xff is given to the application as 0xff
 6873 0xff. If neither PARMRK nor IGNPAR is set, a framing or parity error (other than break) shall be
 6874 given to the application as a single byte 0x00.

6875 If INPCK is set, input parity checking shall be enabled. If INPCK is not set, input parity checking
 6876 shall be disabled, allowing output parity generation without input parity errors. Note that
 6877 whether input parity checking is enabled or disabled is independent of whether parity detection
 6878 is enabled or disabled (see Section 11.2.4 (on page 196)). If parity detection is enabled but input
 6879 parity checking is disabled, the hardware to which the terminal is connected shall recognize the
 6880 parity bit, but the terminal special file shall not check whether or not this bit is correctly set.

6881 If ISTRIP is set, valid input bytes shall first be stripped to seven bits; otherwise, all eight bits
 6882 shall be processed.

6883 If INLCR is set, a received NL character shall be translated into a CR character. If IGNCR is set, a
 6884 received CR character shall be ignored (not read). If IGNCR is not set and ICRNL is set, a
 6885 received CR character shall be translated into an NL character.

6886 XSI If IXANY is set, any input character shall restart output that has been suspended.

6887 If IXON is set, start/stop output control shall be enabled. A received STOP character shall
 6888 suspend output and a received START character shall restart output. When IXON is set, START
 6889 and STOP characters are not read, but merely perform flow control functions. When IXON is not
 6890 set, the START and STOP characters shall be read.

6891 If IXOFF is set, start/stop input control shall be enabled. The system shall transmit STOP
 6892 characters, which are intended to cause the terminal device to stop transmitting data, as needed
 6893 to prevent the input queue from overflowing and causing implementation-defined behavior, and
 6894 shall transmit START characters, which are intended to cause the terminal device to resume
 6895 transmitting data, as soon as the device can continue transmitting data without risk of
 6896 overflowing the input queue. The precise conditions under which STOP and START characters
 6897 are transmitted are implementation-defined.

6898 The initial input control value after *open()* is implementation-defined.

6899 11.2.3 Output Modes

6900 The *c_oflag* field specifies the terminal interface's treatment of output, and is composed of the
 6901 bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
 6902 symbols in the following table are defined in **<termios.h>**:

6903
6904
6905
6906 XSI
6907
6908
6909
6910
6911
6912
6913
6914
6915
6916
6917
6918
6919
6920
6921
6922
6923
6924
6925
6926
6927
6928
6929
6930
6931
6932
6933

Mask Name	Description
OPOST	Perform output processing.
ONLCR	Map NL to CR-NL on output.
OCRNL	Map CR to NL on output.
ONOCR	No CR output at column 0.
ONLRET	NL performs CR function.
OFILL	Use fill characters for delay.
OFDEL	Fill is DEL, else NUL.
NLDLY	Select newline delays:
NL0	Newline character type 0.
NL1	Newline character type 1.
CRDLY	Select carriage-return delays:
CR0	Carriage-return delay type 0.
CR1	Carriage-return delay type 1.
CR2	Carriage-return delay type 2.
CR3	Carriage-return delay type 3.
TABDLY	Select horizontal-tab delays:
TAB0	Horizontal-tab delay type 0.
TAB1	Horizontal-tab delay type 1.
TAB2	Horizontal-tab delay type 2.
TAB3	Expand tabs to spaces.
BSDLY	Select backspace delays:
BS0	Backspace-delay type 0.
BS1	Backspace-delay type 1.
VTDLY	Select vertical-tab delays:
VT0	Vertical-tab delay type 0.
VT1	Vertical-tab delay type 1.
FFDLY	Select form-feed delays:
FF0	Form-feed delay type 0.
FF1	Form-feed delay type 1.

6934
6935
6936

If OPOST is set, output data shall be post-processed as described below, so that lines of text are modified to appear appropriately on the terminal device; otherwise, characters shall be transmitted without change.

6937 XSI
6938
6939
6940
6941
6942
6943

If ONLCR is set, the NL character shall be transmitted as the CR-NL character pair. If OCRNL is set, the CR character shall be transmitted as the NL character. If ONOCR is set, no CR character shall be transmitted when at column 0 (first position). If ONLRET is set, the NL character is assumed to do the carriage-return function; the column pointer shall be set to 0 and the delays specified for CR shall be used. Otherwise, the NL character is assumed to do just the line-feed function; the column pointer remains unchanged. The column pointer shall also be set to 0 if the CR character is actually transmitted.

6944
6945
6946
6947
6948

The delay bits specify how long transmission stops to allow for mechanical or other movement when certain characters are sent to the terminal. In all cases a value of 0 shall indicate no delay. If OFILL is set, fill characters shall be transmitted for delay instead of a timed delay. This is useful for high baud rate terminals which need only a minimal delay. If OFDEL is set, the fill character shall be DEL; otherwise, NUL.

6949

If a form-feed or vertical-tab delay is specified, it shall last for about 2 seconds.

6950
6951

Newline delay shall last about 0.10 seconds. If ONLRET is set, the carriage-return delays shall be used instead of the newline delays. If OFILL is set, two fill characters shall be transmitted.

Carriage-return delay type 1 shall be dependent on the current column position, type 2 shall be about 0.10 seconds, and type 3 shall be about 0.15 seconds. If OFILL is set, delay type 1 shall transmit two fill characters, and type 2 four fill characters.

Horizontal-tab delay type 1 shall be dependent on the current column position. Type 2 shall be about 0.10 seconds. Type 3 specifies that tabs shall be expanded into spaces. If OFILL is set, two fill characters shall be transmitted for any delay.

Backspace delay shall last about 0.05 seconds. If OFILL is set, one fill character shall be transmitted.

The actual delays depend on line speed and system load.

The initial output control value after *open()* is implementation-defined.

11.2.4 Control Modes

The *c_flag* field describes the hardware control of the terminal, and is composed of the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name symbols in this table are defined in **<termios.h>**; not all values specified are required to be supported by the underlying hardware:

Mask Name	Description
CLOCAL	Ignore modem status lines.
CREAD	Enable receiver.
CSIZE	Number of bits transmitted or received per byte:
CS5	5 bits
CS6	6 bits
CS7	7 bits
CS8	8 bits.
CSTOPB	Send two stop bits, else one.
HUPCL	Hang up on last close.
PARENB	Parity enable.
PARODD	Odd parity, else even.

In addition, the input and output baud rates are stored in the **termios** structure. The symbols in the following table are defined in **<termios.h>**. Not all values specified are required to be supported by the underlying hardware.

Name	Description	Name	Description
B0	Hang up	B600	600 baud
B50	50 baud	B1200	1200 baud
B75	75 baud	B1800	1800 baud
B110	110 baud	B2400	2400 baud
B134	134.5 baud	B4800	4800 baud
B150	150 baud	B9600	9600 baud
B200	200 baud	B19200	19200 baud
B300	300 baud	B38400	38400 baud

The following functions are provided for getting and setting the values of the input and output baud rates in the **termios** structure: *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, and *cfsetospeed()*. The effects on the terminal device shall not become effective and not all errors need be detected until the *tcsetattr()* function is successfully called.

The CSIZE bits shall specify the number of transmitted or received bits per byte. If ISTRIP is not set, the value of all the other bits is unspecified. If ISTRIP is set, the value of all but the 7 low-

6997 order bits shall be zero, but the value of any other bits beyond CSIZE is unspecified when read.
 6998 CSIZE shall not include the parity bit, if any. If CSTOPB is set, two stop bits shall be used;
 6999 otherwise, one stop bit. For example, at 110 baud, two stop bits are normally used.

7000 If CREAD is set, the receiver shall be enabled; otherwise, no characters shall be received.

7001 If PARENB is set, parity generation and detection shall be enabled and a parity bit is added to
 7002 each byte. If parity is enabled, PARODD shall specify odd parity if set; otherwise, even parity
 7003 shall be used.

7004 If HUPCL is set, the modem control lines for the port shall be lowered when the last process
 7005 with the port open closes the port or the process terminates. The modem connection shall be
 7006 broken.

7007 If CLOCAL is set, a connection shall not depend on the state of the modem status lines. If
 7008 CLOCAL is clear, the modem status lines shall be monitored.

7009 Under normal circumstances, a call to the *open()* function shall wait for the modem connection
 7010 to complete. However, if the O_NONBLOCK flag is set (see *open()*) or if CLOCAL has been set,
 7011 the *open()* function shall return immediately without waiting for the connection.

7012 If the object for which the control modes are set is not an asynchronous serial connection, some
 7013 of the modes may be ignored; for example, if an attempt is made to set the baud rate on a
 7014 network connection to a terminal on another host, the baud rate need not be set on the
 7015 connection between that terminal and the machine to which it is directly connected.

7016 The initial hardware control value after *open()* is implementation-defined.

7017 11.2.5 Local Modes

7018 The *c_lflag* field of the argument structure is used to control various functions. It is composed of
 7019 the bitwise-inclusive OR of the masks shown, which shall be bitwise-distinct. The mask name
 7020 symbols in this table are defined in **<termios.h>**; not all values specified are required to be
 7021 supported by the underlying hardware:

Mask Name	Description
ECHO	Enable echo.
ECHOE	Echo ERASE as an error correcting backspace.
ECHOK	Echo KILL.
ECHONL	Echo <newline>.
ICANON	Canonical input (erase and kill processing).
IEXTEN	Enable extended (implementation-defined) functions.
ISIG	Enable signals.
NOFLSH	Disable flush after interrupt, quit, or suspend.
TOSTOP	Send SIGTTOU for background output.

7033 If ECHO is set, input characters shall be echoed back to the terminal. If ECHO is clear, input
 7034 characters shall not be echoed.

7035 If ECHOE and ICANON are set, the ERASE character shall cause the terminal to erase, if
 7036 possible, the last character in the current line from the display. If there is no character to erase, an
 7037 implementation may echo an indication that this was the case, or do nothing.

7038 If ECHOK and ICANON are set, the KILL character shall either cause the terminal to erase the
 7039 line from the display or shall echo the newline character after the KILL character.

7040 If ECHONL and ICANON are set, the newline character shall be echoed even if ECHO is not set.

7041 If ICANON is set, canonical processing shall be enabled. This enables the erase and kill edit
7042 functions, and the assembly of input characters into lines delimited by NL, EOF, and EOL, as
7043 described in Section 11.1.6 (on page 189).

7044 If ICANON is not set, read requests shall be satisfied directly from the input queue. A read shall
7045 not be satisfied until at least MIN bytes have been received or the timeout value TIME expired
7046 between bytes. The time value represents tenths of a second. See Section 11.1.7 (on page 190) for
7047 more details.

7048 If IEXTEN is set, implementation-defined functions shall be recognized from the input data. It is
7049 implementation-defined how IEXTEN being set interacts with ICANON, ISIG, IXON, or IXOFF.
7050 If IEXTEN is not set, implementation-defined functions shall not be recognized and the
7051 corresponding input characters are processed as described for ICANON, ISIG, IXON, and
7052 IXOFF.

7053 If ISIG is set, each input character shall be checked against the special control characters INTR,
7054 QUIT, and SUSP. If an input character matches one of these control characters, the function
7055 associated with that character shall be performed. If ISIG is not set, no checking shall be done.
7056 Thus these special input functions are possible only if ISIG is set.

7057 If NOFLSH is set, the normal flush of the input and output queues associated with the INTR,
7058 QUIT, and SUSP characters shall not be done.

7059 If TOSTOP is set, the signal SIGTTOU shall be sent to the process group of a process that tries to
7060 write to its controlling terminal if it is not in the foreground process group for that terminal. This
7061 signal, by default, stops the members of the process group. Otherwise, the output generated by
7062 that process shall be output to the current output stream. Processes that are blocking or ignoring
7063 SIGTTOU signals are excepted and allowed to produce output, and the SIGTTOU signal shall
7064 not be sent.

7065 The initial local control value after *open()* is implementation-defined.

7066 11.2.6 Special Control Characters

7067 The special control character values shall be defined by the array *c_cc*. The subscript name and
7068 description for each element in both canonical and non-canonical modes are as follows:

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF	VINTR	EOF character
VEOL		EOL character
VERASE		ERASE character
VINTR		INTR character
VKILL		KILL character
	VMIN	MIN value
VQUIT	VQUIT	QUIT character
VSUSP	VSUSP	SUSP character
	VTIME	TIME value
VSTART	VSTART	START character
VSTOP	VSTOP	STOP character

The subscript values are unique, except that the VMIN and VTIME subscripts may have the same values as the VEOF and VEOL subscripts, respectively.

Implementations that do not support changing the START and STOP characters may ignore the character values in the `c_cc` array indexed by the VSTART and VSTOP subscripts when `tcsetattr()` is called, but shall return the value in use when `tcgetattr()` is called.

The initial values of all control characters are implementation-defined.

If the value of one of the changeable special control characters (see Section 11.1.9 (on page 191)) is `_POSIX_VDISABLE`, that function shall be disabled; that is, no input data is recognized as the disabled special character. If ICANON is not set, the value of `_POSIX_VDISABLE` has no special meaning for the VMIN and VTIME entries of the `c_cc` array.

7094

Utility Conventions

7095

12.1 Utility Argument Syntax

This section describes the argument syntax of the standard utilities and introduces terminology used throughout IEEE Std 1003.1-2001 for describing the arguments processed by the utilities.

Within IEEE Std 1003.1-2001, a special notation is used for describing the syntax of a utility's arguments. Unless otherwise noted, all utility descriptions use this notation, which is illustrated by this example (see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.9.1, Simple Commands):

```
utility_name [-a] [-b] [-c option_argument]
             [-d|-e] [-f option_argument] [operand...]
```

The notation used for the SYNOPSIS sections imposes requirements on the implementors of the standard utilities and provides a simple reference for the application developer or system user.

1. The utility in the example is named *utility_name*. It is followed by options, option-arguments, and operands. The arguments that consist of hyphens and single letters or digits, such as 'a', are known as "options" (or, historically, "flags"). Certain options are followed by an "option-argument", as shown with [-c option_argument]. The arguments following the last options and option-arguments are named "operands".
2. Option-arguments are sometimes shown separated from their options by <blank>s, sometimes directly adjacent. This reflects the situation that in some cases an option-argument is included within the same argument string as the option; in most cases it is the next argument. The Utility Syntax Guidelines in Section 12.2 (on page 203) require that the option be a separate argument from its option-argument, but there are some exceptions in IEEE Std 1003.1-2001 to ensure continued operation of historical applications:
 - a. If the SYNOPSIS of a standard utility shows a <space> between an option and option-argument (as with [-c option_argument] in the example), a conforming application shall use separate arguments for that option and its option-argument.
 - b. If a <space> is not shown (as with [-f option_argument] in the example), a conforming application shall place an option and its option-argument directly adjacent in the same argument string, without intervening <blank>s.
 - c. Notwithstanding the preceding requirements on conforming applications, a conforming implementation shall permit an application to specify options and option-arguments as a single argument or as separate arguments whether or not a <space> is shown on the synopsis line, except in those cases (marked with the XSI portability warning) where an option-argument is optional and no separation can be used.
 - d. A standard utility may also be implemented to operate correctly when the required separation into multiple arguments is violated by a non-conforming application.
3. Options are usually listed in alphabetical order unless this would make the utility description more confusing. There are no implied relationships between the options based upon the order in which they appear, unless otherwise stated in the OPTIONS section, or unless the exception in Guideline 11 of Section 12.2 (on page 203) applies. If an option that

does not have option-arguments is repeated, the results are undefined, unless otherwise stated.

4. Frequently, names of parameters that require substitution by actual values are shown with embedded underscores. Alternatively, parameters are shown as follows:

<parameter name>

The angle brackets are used for the symbolic grouping of a phrase representing a single parameter and conforming applications shall not include them in data submitted to the utility.

5. When a utility has only a few permissible options, they are sometimes shown individually, as in the example. Utilities with many flags generally show all of the individual flags (that do not take option-arguments) grouped, as in:

utility_name [-abcDxyz] [-p arg] [operand]

Utilities with very complex arguments may be shown as follows:

utility_name [options] [operands]

6. Unless otherwise specified, whenever an operand or option-argument is, or contains, a numeric value:

- The number is interpreted as a decimal integer.
- Numerals in the range 0 to 2 147 483 647 are syntactically recognized as numeric values.
- When the utility description states that it accepts negative numbers as operands or option-arguments, numerals in the range -2 147 483 647 to 2 147 483 647 are syntactically recognized as numeric values.
- Ranges greater than those listed here are allowed.

This does not mean that all numbers within the allowable range are necessarily semantically correct. A standard utility that accepts an option-argument or operand that is to be interpreted as a number, and for which a range of values smaller than that shown above is permitted by the IEEE Std 1003.1-2001, describes that smaller range along with the description of the option-argument or operand. If an error is generated, the utility's diagnostic message shall indicate that the value is out of the supported range, not that it is syntactically incorrect.

7. Arguments or option-arguments enclosed in the ' [' and '] ' notation are optional and can be omitted. Conforming applications shall not include the ' [' and '] ' symbols in data submitted to the utility.
8. Arguments separated by the ' | ' vertical bar notation are mutually-exclusive. Conforming applications shall not include the ' | ' symbol in data submitted to the utility. Alternatively, mutually-exclusive options and operands may be listed with multiple synopsis lines. For example:

*utility_name -d[-a] [-c option_argument] [operand...]
utility_name [-a] [-b] [operand...]*

When multiple synopsis lines are given for a utility, it is an indication that the utility has mutually-exclusive arguments. These mutually-exclusive arguments alter the functionality of the utility so that only certain other arguments are valid in combination with one of the mutually-exclusive arguments. Only one of the mutually-exclusive arguments is allowed for invocation of the utility. Unless otherwise stated in an accompanying OPTIONS section, the relationships between arguments depicted in the SYNOPSIS sections are

mandatory requirements placed on conforming applications. The use of conflicting mutually-exclusive arguments produces undefined results, unless a utility description specifies otherwise. When an option is shown without the ' [' and '] ' brackets, it means that option is required for that version of the SYNOPSIS. However, it is not required to be the first argument, as shown in the example above, unless otherwise stated.

9. Ellipses (" . . . ") are used to denote that one or more occurrences of an option or operand are allowed. When an option or an operand followed by ellipses is enclosed in brackets, zero or more options or operands can be specified. The forms:

```
utility_name -f option_argument... [operand...]
utility_name [-g option_argument]... [operand...]
```

indicate that multiple occurrences of the option and its option-argument preceding the ellipses are valid, with semantics as indicated in the OPTIONS section of the utility. (See also Guideline 11 in Section 12.2.) In the first example, each option-argument requires a preceding **-f** and at least one **-f option_argument** must be given.

10. When the synopsis line is too long to be printed on a single line in the Shell and Utilities volume of IEEE Std 1003.1-2001, the indented lines following the initial line are continuation lines. An actual use of the command would appear on a single logical line.

12.2 Utility Syntax Guidelines

The following guidelines are established for the naming of utilities and for the specification of options, option-arguments, and operands. The *getopt()* function in the System Interfaces volume of IEEE Std 1003.1-2001 assists utilities in handling options and operands that conform to these guidelines.

Operands and option-arguments can contain characters not specified in the portable character set.

The guidelines are intended to provide guidance to the authors of future utilities, such as those written specific to a local system or that are components of a larger application. Some of the standard utilities do not conform to all of these guidelines; in those cases, the OPTIONS sections describe the deviations.

Guideline 1: Utility names should be between two and nine characters, inclusive.

Guideline 2: Utility names should include lowercase letters (the **lower** character classification) and digits only from the portable character set.

Guideline 3: Each option name should be a single alphanumeric character (the **alnum** character classification) from the portable character set. The **-W** (capital-W) option shall be reserved for vendor options.

Multi-digit options should not be allowed.

Guideline 4: All options should be preceded by the **'-'** delimiter character.

Guideline 5: Options without option-arguments should be accepted when grouped behind one **'-'** delimiter.

Guideline 6: Each option and option-argument should be a separate argument, except as noted in Section 12.1 (on page 201), item (2).

Guideline 7: Option-arguments should not be optional.

7221	Guideline 8:	When multiple option-arguments are specified to follow a single option, they should be presented as a single argument, using commas within that argument or <blank>s within that argument to separate them.	
7222			
7223			
7224	Guideline 9:	All options should precede operands on the command line.	
7225	Guideline 10:	The argument -- should be accepted as a delimiter indicating the end of options. Any following arguments should be treated as operands, even if they begin with the '-' character. The -- argument should not be used as an option or as an operand.	
7226			
7227			
7228			
7229	Guideline 11:	The order of different options relative to one another should not matter, unless the options are documented as mutually-exclusive and such an option is documented to override any incompatible options preceding it. If an option that has option-arguments is repeated, the option and option-argument combinations should be interpreted in the order specified on the command line.	
7230			
7231			
7232			
7233			
7234			
7235	Guideline 12:	The order of operands may matter and position-related interpretations should be determined on a utility-specific basis.	
7236			
7237	Guideline 13:	For utilities that use operands to represent files to be opened for either reading or writing, the '-' operand should be used only to mean standard input (or standard output when it is clear from context that an output file is being specified).	
7238			
7239			
7240			
7241	The utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 that claim conformance to these guidelines shall conform completely to these guidelines as if these guidelines contained the term “shall” instead of “should”. On some implementations, the utilities accept usage in violation of these guidelines for backwards-compatibility as well as accepting the required form.		
7242			
7243			
7244			
7245	It is recommended that all future utilities and applications use these guidelines to enhance user portability. The fact that some historical utilities could not be changed (to avoid breaking existing applications) should not deter this future goal.		
7246			
7247			

Headers

7248

7249 This chapter describes the contents of headers.

7250 Headers contain function prototypes, the definition of symbolic constants, common structures,
 7251 preprocessor macros, and defined types. Each function in the System Interfaces volume of
 7252 IEEE Std 1003.1-2001 specifies the headers that an application shall include in order to use that
 7253 function. In most cases, only one header is required. These headers are present on an application
 7254 development system; they need not be present on the target execution system.

7255 13.1 Format of Entries

7256 The entries in this chapter are based on a common format as follows. The only sections relating
 7257 to conformance are the SYNOPSIS and DESCRIPTION.

7258 NAME

7259 This section gives the name or names of the entry and briefly states its purpose.

7260 SYNOPSIS

7261 This section summarizes the use of the entry being described.

7262 DESCRIPTION

7263 This section describes the functionality of the header.

7264 APPLICATION USAGE

7265 This section is informative.

7266 This section gives warnings and advice to application writers about the entry. In the
 7267 event of conflict between warnings and advice and a normative part of this volume of
 7268 IEEE Std 1003.1-2001, the normative material is to be taken as correct.

7269 RATIONALE

7270 This section is informative.

7271 This section contains historical information concerning the contents of this volume of
 7272 IEEE Std 1003.1-2001 and why features were included or discarded by the standard
 7273 developers.

7274 FUTURE DIRECTIONS

7275 This section is informative.

7276 This section provides comments which should be used as a guide to current thinking;
 7277 there is not necessarily a commitment to adopt these future directions.

7278 SEE ALSO

7279 This section is informative.

7280 This section gives references to related information.

7281 CHANGE HISTORY

7282 This section is informative.

7283 This section shows the derivation of the entry and any significant changes that have
 7284 been made to it.

7285 **NAME**7286 aio.h — asynchronous input and output (**REALTIME**)7287 **SYNOPSIS**

7288 AIO #include <aio.h>

7289

7290 **DESCRIPTION**7291 The <aio.h> header shall define the **aio** structure which shall include at least the following
7292 members:

7293	int	aio_fildes	File descriptor.
7294	off_t	aio_offset	File offset.
7295	volatile void	*aio_buf	Location of buffer.
7296	size_t	aio_nbytes	Length of transfer.
7297	int	aio_reqprio	Request priority offset.
7298	struct sigevent	aio_sigevent	Signal number and value.
7299	int	aio_lio_opcode	Operation to be performed.

7300 This header shall also include the following constants:

7301 AIO_ALLDONE A return value indicating that none of the requested operations could be
7302 canceled since they are already complete.7303 AIO_CANCELED A return value indicating that all requested operations have been
7304 canceled.

7305 AIO_NOTCANCELED

7306 A return value indicating that some of the requested operations could not
7307 be canceled since they are in progress.7308 LIO_NOP A *lio_listio()* element operation option indicating that no transfer is
7309 requested.7310 LIO_NOWAIT A *lio_listio()* synchronization operation indicating that the calling thread
7311 is to continue execution while the *lio_listio()* operation is being
7312 performed, and no notification is given when the operation is complete.7313 LIO_READ A *lio_listio()* element operation option requesting a read.7314 LIO_WAIT A *lio_listio()* synchronization operation indicating that the calling thread
7315 is to suspend until the *lio_listio()* operation is complete.7316 LIO_WRITE A *lio_listio()* element operation option requesting a write.7317 The following shall be declared as functions and may also be defined as macros. Function
7318 prototypes shall be provided.

```

7319 int      aio_cancel(int, struct aiocb *);
7320 int      aio_error(const struct aiocb *);
7321 int      aio_fsync(int, struct aiocb *);
7322 int      aio_read(struct aiocb *);
7323 ssize_t  aio_return(struct aiocb *);
7324 int      aio_suspend(const struct aiocb *const[], int,
7325                     const struct timespec *);
7326 int      aio_write(struct aiocb *);
7327 int      lio_listio(int, struct aiocb *restrict const[restrict], int,
7328                     struct sigevent *restrict);

```

7329 Inclusion of the <aio.h> header may make visible symbols defined in the headers <fcntl.h>,
7330 <signal.h>, <sys/types.h>, and <time.h>.

7331 **APPLICATION USAGE**

7332 None.

7333 **RATIONALE**

7334 None.

7335 **FUTURE DIRECTIONS**

7336 None.

7337 **SEE ALSO**

7338 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>, the System Interfaces volume of
7339 IEEE Std 1003.1-2001, *fsync()*, *lseek()*, *read()*, *write()*

7340 **CHANGE HISTORY**

7341 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

7342 **Issue 6**

7343 The <aio.h> header is marked as part of the Asynchronous Input and Output option.

7344 The description of the constants is expanded.

7345 The **restrict** keyword is added to the prototype for *lio_listio()*.

7346 **NAME**

7347 arpa/inet.h — definitions for internet operations

7348 **SYNOPSIS**

7349 #include <arpa/inet.h>

7350 **DESCRIPTION**7351 The **in_port_t** and **in_addr_t** types shall be defined as described in <netinet/in.h>.7352 The **in_addr** structure shall be defined as described in <netinet/in.h>.7353 IP6 The INET_ADDRSTRLEN and INET6_ADDRSTRLEN macros shall be defined as described in
7354 <netinet/in.h>.7355 The following shall either be declared as functions, defined as macros, or both. If functions are
7356 declared, function prototypes shall be provided.

7357 uint32_t htonl(uint32_t);

7358 uint16_t htons(uint16_t);

7359 uint32_t ntohl(uint32_t);

7360 uint16_t ntohs(uint16_t);

7361 The **uint32_t** and **uint16_t** types shall be defined as described in <inttypes.h>.7362 The following shall be declared as functions and may also be defined as macros. Function
7363 prototypes shall be provided.

7364 in_addr_t inet_addr(const char *);

7365 char *inet_ntoa(struct in_addr);

7366 const char *inet_ntop(int, const void *restrict, char *restrict,
7367 socklen_t);

7368 int inet_pton(int, const char *restrict, void *restrict);

7369 Inclusion of the <arpa/inet.h> header may also make visible all symbols from <netinet/in.h>
7370 and <inttypes.h>.7371 **APPLICATION USAGE**

7372 None.

7379 *inet_addr()*7380 **CHANGE HISTORY**

7381 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7382 The **restrict** keyword is added to the prototypes for *inet_ntop()* and *inet_pton()*.

7383 **NAME**

7384 assert.h — verify program assertion

7385 **SYNOPSIS**

7386 #include <assert.h>

7387 **DESCRIPTION**

7388 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 7389 conflict between the requirements described here and the ISO C standard is unintentional. This
 7390 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7391 The <assert.h> header shall define the *assert()* macro. It refers to the macro NDEBUG which is
 7392 not defined in the header. If NDEBUG is defined as a macro name before the inclusion of this
 7393 header, the *assert()* macro shall be defined simply as:

7394 #define assert(ignore) ((void) 0)

7395 Otherwise, the macro behaves as described in *assert()*.

7396 The *assert()* macro shall be redefined according to the current state of NDEBUG each time
 7397 <assert.h> is included.

7398 The *assert()* macro shall be implemented as a macro, not as a function. If the macro definition is
 7399 suppressed in order to access an actual function, the behavior is undefined.

7400 **APPLICATION USAGE**

7401 None.

7402 **RATIONALE**

7403 None.

7404 **FUTURE DIRECTIONS**

7405 None.

7406 **SEE ALSO**7407 The System Interfaces volume of IEEE Std 1003.1-2001, *assert()*7408 **CHANGE HISTORY**

7409 First released in Issue 1. Derived from Issue 1 of the SVID.

7410 **Issue 6**

7411 The definition of the *assert()* macro is changed for alignment with the ISO/IEC 9899:1999
 7412 standard.

7413 **NAME**

7414 complex.h — complex arithmetic

7415 **SYNOPSIS**

7416 #include <complex.h>

7417 **DESCRIPTION**

7418 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 7419 conflict between the requirements described here and the ISO C standard is unintentional. This
 7420 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7421 The <complex.h> header shall define the following macros:

7422 complex Expands to **_Complex**.

7423 **_Complex_I** Expands to a constant expression of type **const float _Complex**, with the
 7424 value of the imaginary unit (that is, a number i such that $i^2=-1$).

7425 imaginary Expands to **_Imaginary**.

7426 **_Imaginary_I** Expands to a constant expression of type **const float _Imaginary** with the
 7427 value of the imaginary unit.

7428 **I** Expands to either **_Imaginary_I** or **_Complex_I**. If **_Imaginary_I** is not defined,
 7429 **I** expands to **_Complex_I**.

7430 The macros **imaginary** and **_Imaginary_I** shall be defined if and only if the implementation
 7431 supports imaginary types.

7432 An application may undefine and then, perhaps, redefine the **complex**, **imaginary**, and **I** macros.

7433 The following shall be declared as functions and may also be defined as macros. Function
 7434 prototypes shall be provided.

7435	double	cabs(double complex);
7436	float	cabsf(float complex);
7437	long double	cabsl(long double complex);
7438	double complex	cacos(double complex);
7439	float complex	cacosf(float complex);
7440	double complex	cacosh(double complex);
7441	float complex	cacoshf(float complex);
7442	long double complex	cacoshl(long double complex);
7443	long double complex	cacosl(long double complex);
7444	double	carg(double complex);
7445	float	cargf(float complex);
7446	long double	cargl(long double complex);
7447	double complex	casin(double complex);
7448	float complex	casinf(float complex);
7449	double complex	casinh(double complex);
7450	float complex	casinhf(float complex);
7451	long double complex	casinhl(long double complex);
7452	long double complex	casinl(long double complex);
7453	double complex	catan(double complex);
7454	float complex	catanf(float complex);
7455	double complex	catanh(double complex);
7456	float complex	catanhf(float complex);
7457	long double complex	catanhl(long double complex);
7458	long double complex	catanl(long double complex);

```

7459     double complex      ccos(double complex);
7460     float complex       ccosf(float complex);
7461     double complex      ccosh(double complex);
7462     float complex       ccoshf(float complex);
7463     long double complex ccoshl(long double complex);
7464     long double complex ccosl(long double complex);
7465     double complex      cexp(double complex);
7466     float complex       cexpf(float complex);
7467     long double complex cexpl(long double complex);
7468     double              cimag(double complex);
7469     float              cimagf(float complex);
7470     long double        cimagl(long double complex);
7471     double complex      clog(double complex);
7472     float complex       clogf(float complex);
7473     long double complex clogl(long double complex);
7474     double complex      conj(double complex);
7475     float complex       conjf(float complex);
7476     long double complex conjl(long double complex);
7477     double complex      cpow(double complex, double complex);
7478     float complex       cpowf(float complex, float complex);
7479     long double complex cpowl(long double complex, long double complex);
7480     double complex      cproj(double complex);
7481     float complex       cprojf(float complex);
7482     long double complex cprojl(long double complex);
7483     double              creal(double complex);
7484     float              crealf(float complex);
7485     long double        creall(long double complex);
7486     double complex      csin(double complex);
7487     float complex       csinf(float complex);
7488     double complex      csinh(double complex);
7489     float complex       csinhf(float complex);
7490     long double complex csinhl(long double complex);
7491     long double complex csinl(long double complex);
7492     double complex      csqrt(double complex);
7493     float complex       csqrtf(float complex);
7494     long double complex csqrtl(long double complex);
7495     double complex      ctan(double complex);
7496     float complex       ctanf(float complex);
7497     double complex      ctanh(double complex);
7498     float complex       ctanhf(float complex);
7499     long double complex ctanhl(long double complex);
7500     long double complex ctanl(long double complex);

```

7501 APPLICATION USAGE

7502 Values are interpreted as radians, not degrees.

7503 RATIONALE

7504 The choice of *I* instead of *i* for the imaginary unit concedes to the widespread use of the
7505 identifier *i* for other purposes. The application can use a different identifier, say *j*, for the
7506 imaginary unit by following the inclusion of the <complex.h> header with:

```

7507     #undef I
7508     #define j _Imaginary_I

```

7509 An *I* suffix to designate imaginary constants is not required, as multiplication by *I* provides a
 7510 sufficiently convenient and more generally useful notation for imaginary terms. The
 7511 corresponding real type for the imaginary unit is **float**, so that use of *I* for algorithmic or
 7512 notational convenience will not result in widening types.

7513 On systems with imaginary types, the application has the ability to control whether use of the
 7514 macro `I` introduces an imaginary type, by explicitly defining `I` to be `_Imaginary_I` or `_Complex_I`.
 7515 Disallowing imaginary types is useful for some applications intended to run on implementations
 7516 without support for such types.

7517 The macro `_Imaginary_I` provides a test for whether imaginary types are supported.

7518 The `cis()` function ($\cos(x) + I\sin(x)$) was considered but rejected because its implementation is
 7519 easy and straightforward, even though some implementations could compute sine and cosine
 7520 more efficiently in tandem.

7521 FUTURE DIRECTIONS

7522 The following function names and the same names suffixed with *f* or *l* are reserved for future
 7523 use, and may be added to the declarations in the <complex.h> header.

7524	<code>cerf()</code>	<code>cexpm1()</code>	<code>clog2()</code>
7525	<code>cerfc()</code>	<code>clog10()</code>	<code>clgamma()</code>
7526	<code>cexp2()</code>	<code>clog1p()</code>	<code>ctgamma()</code>

7531 CHANGE HISTORY

7532 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

7533 **NAME**

7534 cpio.h — cpio archive values

7535 **SYNOPSIS**

7536 xSI #include <cpio.h>

7537

7538 **DESCRIPTION**

7539 Values needed by the *c_mode* field of the *cpio* archive format are described as follows:

7540

	Name	Description	Value (Octal)
7541			
7542	C_IRUSR	Read by owner.	0000400
7543	C_IWUSR	Write by owner.	0000200
7544	C_IXUSR	Execute by owner.	0000100
7545	C_IRGRP	Read by group.	0000040
7546	C_IWGRP	Write by group.	0000020
7547	C_IXGRP	Execute by group.	0000010
7548	C_IROTH	Read by others.	0000004
7549	C_IWOTH	Write by others.	0000002
7550	C_IXOTH	Execute by others.	0000001
7551	C_ISUID	Set user ID.	0004000
7552	C_ISGID	Set group ID.	0002000
7553	C_ISVTX	On directories, restricted deletion flag.	0001000
7554	C_ISDIR	Directory.	0040000
7555	C_ISFIFO	FIFO.	0010000
7556	C_ISREG	Regular file.	0100000
7557	C_ISBLK	Block special.	0060000
7558	C_ISCHR	Character special.	0020000
7559	C_ISCTG	Reserved.	0110000
7560	C_ISLNK	Symbolic link.	0120000
7561	C_ISSOCK	Socket.	0140000

7562 The header shall define the symbolic constant:

7563 MAGIC "070707"

7564 **APPLICATION USAGE**

7565 None.

7566 **RATIONALE**

7567 None.

7568 **FUTURE DIRECTIONS**

7569 None.

7570 **SEE ALSO**

7571 The Shell and Utilities volume of IEEE Std 1003.1-2001, *pax*

7572 **CHANGE HISTORY**

7573 First released in the Headers Interface, Issue 3 specification. Derived from the POSIX.1-1988
7574 standard.

7575 **Issue 6**

7576 The SEE ALSO is updated to refer to *pax*, since the *cpio* utility is not included in the Shell and
7577 Utilities volume of IEEE Std 1003.1-2001.

7578 **NAME**

7579 ctype.h — character types

7580 **SYNOPSIS**

7581 #include <ctype.h>

7582 **DESCRIPTION**

7583 CX Some of the functionality described on this reference page extends the ISO C standard.
 7584 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 7585 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 7586 symbols in this header.

7587 The following shall be declared as functions and may also be defined as macros. Function
 7588 prototypes shall be provided.

```

7589       int    isalnum(int);
7590       int    isalpha(int);
7591 XSI       int    isascii(int);
7592       int    isblank(int);
7593       int    iscntrl(int);
7594       int    isdigit(int);
7595       int    isgraph(int);
7596       int    islower(int);
7597       int    isprint(int);
7598       int    ispunct(int);
7599       int    isspace(int);
7600       int    isupper(int);
7601       int    isxdigit(int);
7602 XSI       int    toascii(int);
7603       int    tolower(int);
7604       int    toupper(int);

```

7605 The following are defined as macros:

```

7606 XSI       int    _toupper(int);
7607       int    _tolower(int);
7608

```

7609 **APPLICATION USAGE**

7610 None.

7611 **RATIONALE**

7612 None.

7613 **FUTURE DIRECTIONS**

7614 None.

7620 **CHANGE HISTORY**

7621 First released in Issue 1. Derived from Issue 1 of the SVID.

7622 **Issue 6**

7623 Extensions beyond the ISO C standard are marked.

7624 **NAME**

7625 dirent.h — format of directory entries

7626 **SYNOPSIS**

7627 #include <dirent.h>

7628 **DESCRIPTION**

7629 The internal format of directories is unspecified.

7630 The <**dirent.h**> header shall define the following type:7631 **DIR** A type representing a directory stream.7632 It shall also define the structure **dirent** which shall include the following members:

7633 XSI ino_t d_ino File serial number.

7634 char d_name[] Name of entry.

7635 XSI The type **ino_t** shall be defined as described in <**sys/types.h**>.7636 The character array *d_name* is of unspecified size, but the number of bytes preceding the
7637 terminating null byte shall not exceed {NAME_MAX}.7638 The following shall be declared as functions and may also be defined as macros. Function
7639 prototypes shall be provided.

7640 int closedir(DIR *);

7641 DIR *opendir(const char *);

7642 struct dirent *readdir(DIR *);

7643 TSF int readdir_r(DIR *restrict, struct dirent *restrict,
7644 struct dirent **restrict);

7645 void rewinddir(DIR *);

7646 XSI void seekdir(DIR *, long);

7647 long telldir(DIR *);

7648

7649 **APPLICATION USAGE**

7650 None.

7651 **RATIONALE**7652 Information similar to that in the <**dirent.h**> header is contained in a file <**sys/dir.h**> in 4.2 BSD
7653 and 4.3 BSD. The equivalent in these implementations of **struct dirent** from this volume of
7654 IEEE Std 1003.1-2001 is **struct direct**. The filename was changed because the name <**sys/dir.h**>
7655 was also used in earlier implementations to refer to definitions related to the older access
7656 method; this produced name conflicts. The name of the structure was changed because this
7657 volume of IEEE Std 1003.1-2001 does not completely define what is in the structure, so it could
7658 be different on some implementations from **struct direct**.7659 The name of an array of **char** of an unspecified size should not be used as an lvalue. Use of:

7660 sizeof(d_name)

7661 is incorrect; use:

7662 strlen(d_name)

7663 instead.

7664 The array of **char** *d_name* is not a fixed size. Implementations may need to declare **struct dirent**
7665 with an array size for *d_name* of 1, but the actual number of characters provided matches (or
7666 only slightly exceeds) the length of the filename.

7667 **FUTURE DIRECTIONS**

7668 None.

7669 **SEE ALSO**

7670 <**sys/types.h**>, the System Interfaces volume of IEEE Std 1003.1-2001, *closedir()*, *opendir()*,
7671 *readdir()*, *readdir_r()*, *rewinddir()*, *seekdir()*, *telldir()*

7672 **CHANGE HISTORY**

7673 First released in Issue 2.

7674 **Issue 5**

7675 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

7676 **Issue 6**7677 The Open Group Corrigendum U026/7 is applied, correcting the prototype for *readdir_r()*.7678 The **restrict** keyword is added to the prototype for *readdir_r()*.

7679 **NAME**

7680 dlfcn.h — dynamic linking

7681 **SYNOPSIS**

7682 xSI #include <dlfcn.h>

7683

7684 **DESCRIPTION**7685 The <dlfcn.h> header shall define at least the following macros for use in the construction of a
7686 *dlopen()* mode argument:

7687 RTLD_LAZY Relocations are performed at an implementation-defined time.

7688 RTLD_NOW Relocations are performed when the object is loaded.

7689 RTLD_GLOBAL All symbols are available for relocation processing of other modules.

7690 RTLD_LOCAL All symbols are not made available for relocation processing by other
7691 modules.7692 The following shall be declared as functions and may also be defined as macros. Function
7693 prototypes shall be provided.

7694 int dlclose(void *);

7695 char *dlerror(void);

7696 void *dlopen(const char *, int);

7697 void *dlsym(void *restrict, const char *restrict);

7698 **APPLICATION USAGE**

7699 None.

7700 **RATIONALE**

7701 None.

7702 **FUTURE DIRECTIONS**

7703 None.

7704 **SEE ALSO**7705 The System Interfaces volume of IEEE Std 1003.1-2001, *dlopen()*, *dlclose()*, *dlsym()*, *dlerror()*7706 **CHANGE HISTORY**

7707 First released in Issue 5.

7708 **Issue 6**7709 The **restrict** keyword is added to the prototype for *dlsym()*.

7710 **NAME**

7711 errno.h — system error numbers

7712 **SYNOPSIS**

7713 #include <errno.h>

7714 **DESCRIPTION**

7715 CX Some of the functionality described on this reference page extends the ISO C standard. Any
7716 conflict between the requirements described here and the ISO C standard is unintentional. This
7717 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7718 CX The ISO C standard only requires the symbols [EDOM], [EILSEQ], and [ERANGE] to be defined.

7719 The <errno.h> header shall provide a declaration for *errno* and give positive values for the
7720 following symbolic constants. Their values shall be unique except as noted below.

7721 [E2BIG] Argument list too long.

7722 [EACCES] Permission denied.

7723 [EADDRINUSE] Address in use.

7724 [EADDRNOTAVAIL] Address not available.

7725 [EAFNOSUPPORT] Address family not supported.

7726 [EAGAIN] Resource unavailable, try again (may be the same value as
7727 [EWOULDBLOCK]).

7728 [EALREADY] Connection already in progress.

7729 [EBADF] Bad file descriptor.

7730 [EBADMSG] Bad message.

7731 [EBUSY] Device or resource busy.

7732 [ECANCELED] Operation canceled.

7733 [ECHILD] No child processes.

7734 [ECONNABORTED] Connection aborted.

7735 [ECONNREFUSED] Connection refused.

7736 [ECONNRESET] Connection reset.

7737 [EDEADLK] Resource deadlock would occur.

7738 [EDESTADDRREQ] Destination address required.

7739 [EDOM] Mathematics argument out of domain of function.

7740 [EDQUOT] Reserved.

7741 [EEXIST] File exists.

7742 [EFAULT] Bad address.

7743 [EFBIG] File too large.

7744 [EHOSTUNREACH] Host is unreachable.

7745 [EIDRM] Identifier removed.

7746 [EILSEQ] Illegal byte sequence.

7747	[EINPROGRESS]	Operation in progress.
7748	[EINTR]	Interrupted function.
7749	[EINVAL]	Invalid argument.
7750	[EIO]	I/O error.
7751	[EISCONN]	Socket is connected.
7752	[EISDIR]	Is a directory.
7753	[ELOOP]	Too many levels of symbolic links.
7754	[EMFILE]	Too many open files.
7755	[EMLINK]	Too many links.
7756	[EMSGSIZE]	Message too large.
7757	[EMULTIHOP]	Reserved.
7758	[ENAMETOOLONG]	Filename too long.
7759	[ENETDOWN]	Network is down.
7760	[ENETRESET]	Connection aborted by network.
7761	[ENETUNREACH]	Network unreachable.
7762	[ENFILE]	Too many files open in system.
7763	[ENOBUFS]	No buffer space available.
7764	XSR [ENODATA]	No message is available on the STREAM head read queue.
7765	[ENODEV]	No such device.
7766	[ENOENT]	No such file or directory.
7767	[ENOEXEC]	Executable file format error.
7768	[ENOLCK]	No locks available.
7769	[ENOLINK]	Reserved.
7770	[ENOMEM]	Not enough space.
7771	[ENOMSG]	No message of the desired type.
7772	[ENOPROTOPT]	Protocol not available.
7773	[ENOSPC]	No space left on device.
7774	XSR [ENOSR]	No STREAM resources.
7775	XSR [ENOSTR]	Not a STREAM.
7776	[ENOSYS]	Function not supported.
7777	[ENOTCONN]	The socket is not connected.
7778	[ENOTDIR]	Not a directory.
7779	[ENOTEMPTY]	Directory not empty.
7780	[ENOTSOCK]	Not a socket.

7781	[ENOTSUP]	Not supported.
7782	[ENOTTY]	Inappropriate I/O control operation.
7783	[ENXIO]	No such device or address.
7784	[EOPNOTSUPP]	Operation not supported on socket.
7785	[EOVERFLOW]	Value too large to be stored in data type.
7786	[EPERM]	Operation not permitted.
7787	[EPIPE]	Broken pipe.
7788	[EPROTO]	Protocol error.
7789	[EPROTONOSUPPORT]	
7790		Protocol not supported.
7791	[EPROTOTYPE]	Protocol wrong type for socket.
7792	[ERANGE]	Result too large.
7793	[EROFS]	Read-only file system.
7794	[ESPIPE]	Invalid seek.
7795	[ESRCH]	No such process.
7796	[ESTALE]	Reserved.
7797	XSR [ETIME]	Stream <i>ioctl()</i> timeout.
7798	[ETIMEDOUT]	Connection timed out.
7799	[ETXTBSY]	Text file busy.
7800	[EWOULDBLOCK]	Operation would block (may be the same value as [EAGAIN]).
7801	[EXDEV]	Cross-device link.

7802 APPLICATION USAGE

7803 Additional error numbers may be defined on conforming systems; see the System Interfaces
7804 volume of IEEE Std 1003.1-2001.

7805 RATIONALE

7806 None.

7807 FUTURE DIRECTIONS

7808 None.

7809 SEE ALSO

7810 The System Interfaces volume of IEEE Std 1003.1-2001, Section 2.3, Error Numbers

7811 CHANGE HISTORY

7812 First released in Issue 1. Derived from Issue 1 of the SVID.

7813 Issue 5

7814 Updated for alignment with the POSIX Realtime Extension.

7815 Issue 6

7816 The following new requirements on POSIX implementations derive from alignment with the
7817 Single UNIX Specification:

- 7818 • The majority of the error conditions previously marked as extensions are now mandatory,
7819 except for the STREAMS-related error conditions.

7820 Values for *errno* are now required to be distinct positive values rather than non-zero values. This
7821 change is for alignment with the ISO/IEC 9899:1999 standard.

7822 **NAME**

7823 fcntl.h — file control options

7824 **SYNOPSIS**

7825 #include <fcntl.h>

7826 **DESCRIPTION**

7827 The <fcntl.h> header shall define the following requests and arguments for use by the functions
7828 *fcntl()* and *open()*.

7829 Values for *cmd* used by *fcntl()* (the following values are unique) are as follows:

- 7830 F_DUPFD Duplicate file descriptor.
- 7831 F_GETFD Get file descriptor flags.
- 7832 F_SETFD Set file descriptor flags.
- 7833 F_GETFL Get file status flags and file access modes.
- 7834 F_SETFL Set file status flags.
- 7835 F_GETLK Get record locking information.
- 7836 F_SETLK Set record locking information.
- 7837 F_SETLKW Set record locking information; wait if blocked.
- 7838 F_GETOWN Get process or process group ID to receive SIGURG signals.
- 7839 F_SETOWN Set process or process group ID to receive SIGURG signals.

7840 File descriptor flags used for *fcntl()* are as follows:

- 7841 FD_CLOEXEC Close the file descriptor upon execution of an *exec* family function.

7842 Values for *l_type* used for record locking with *fcntl()* (the following values are unique) are as
7843 follows:

- 7844 F_RDLCK Shared or read lock.
- 7845 F_UNLCK Unlock.
- 7846 F_WRLCK Exclusive or write lock.

7847 XSI The values used for *l_whence*, *SEEK_SET*, *SEEK_CUR*, and *SEEK_END* shall be defined as
7848 described in <unistd.h>.

7849 The following values are file creation flags and are used in the *oflag* value to *open()*. They shall
7850 be bitwise-distinct.

- 7851 O_CREAT Create file if it does not exist.
- 7852 O_EXCL Exclusive use flag.
- 7853 O_NOCTTY Do not assign controlling terminal.
- 7854 O_TRUNC Truncate flag.

7855 File status flags used for *open()* and *fcntl()* are as follows:

- 7856 O_APPEND Set append mode.
- 7857 SIO O_DSYNC Write according to synchronized I/O data integrity completion.
- 7858 O_NONBLOCK Non-blocking mode.

7859 SIO **O_RSYNC** Synchronized read I/O operations.

7860 **O_SYNC** Write according to synchronized I/O file integrity completion.

7861 Mask for use with file access modes is as follows:

7862 **O_ACCMODE** Mask for file access modes.

7863 File access modes used for *open()* and *fcntl()* are as follows:

7864 **O_RDONLY** Open for reading only.

7865 **O_RDWR** Open for reading and writing.

7866 **O_WRONLY** Open for writing only.

7867 XSI The symbolic names for file modes for use as values of **mode_t** shall be defined as described in
7868 <sys/stat.h>.

7869 ADV Values for *advice* used by *posix_fadvise()* are as follows:

7870 **POSIX_FADV_NORMAL**

7871 The application has no advice to give on its behavior with respect to the specified data. It is
7872 the default characteristic if no advice is given for an open file.

7873 **POSIX_FADV_SEQUENTIAL**

7874 The application expects to access the specified data sequentially from lower offsets to
7875 higher offsets.

7876 **POSIX_FADV_RANDOM**

7877 The application expects to access the specified data in a random order.

7878 **POSIX_FADV_WILLNEED**

7879 The application expects to access the specified data in the near future.

7880 **POSIX_FADV_DONTNEED**

7881 The application expects that it will not access the specified data in the near future.

7882 **POSIX_FADV_NOREUSE**

7883 The application expects to access the specified data once and then not reuse it thereafter.
7884

7885 The structure **lock** describes a file lock. It shall include the following members:

7886 **short l_type** Type of lock; **F_RDLCK**, **F_WRLCK**, **F_UNLCK**.

7887 **short l_whence** Flag for starting offset.

7888 **off_t l_start** Relative offset in bytes.

7889 **off_t l_len** Size; if 0 then until EOF.

7890 **pid_t l_pid** Process ID of the process holding the lock; returned with **F_GETLK**.

7891 The **mode_t**, **off_t**, and **pid_t** types shall be defined as described in <sys/types.h>.

7892 The following shall be declared as functions and may also be defined as macros. Function
7893 prototypes shall be provided.

7894 **int creat(const char *, mode_t);**

7895 **int fcntl(int, int, ...);**

7896 **int open(const char *, int, ...);**

7897 ADV **int posix_fadvise(int, off_t, size_t, int);**

7898 **int posix_fallocate(int, off_t, size_t);**
7899

7900 XSI Inclusion of the <fcntl.h> header may also make visible all symbols from <sys/stat.h> and
 7901 <unistd.h>.

7902 APPLICATION USAGE

7903 None.

7904 RATIONALE

7905 None.

7906 FUTURE DIRECTIONS

7907 None.

7908 SEE ALSO

7909 <sys/stat.h>, <sys/types.h>, <unistd.h>, the System Interfaces volume of IEEE Std 1003.1-2001,
 7910 *creat()*, *exec*, *fcntl()*, *open()*, *posix_fadvise()*, *posix_fallocate()*, *posix_madvise()*

7911 CHANGE HISTORY

7912 First released in Issue 1. Derived from Issue 1 of the SVID.

7913 Issue 5

7914 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

7915 Issue 6

7916 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 7917 • O_DSYNC and O_RSYNC are marked as part of the Synchronized Input and Output option.

7918 The following new requirements on POSIX implementations derive from alignment with the
 7919 Single UNIX Specification:

- 7920 • The definition of the **mode_t**, **off_t**, and **pid_t** types is mandated.

7921 The F_GETOWN and F_SETOWN values are added for sockets.

7922 The *posix_fadvise()*, *posix_fallocate()*, and *posix_madvise()* functions are added for alignment with
 7923 IEEE Std 1003.1d-1999.

7924 IEEE PASC Interpretation 1003.1 #102 is applied, moving the prototype for *posix_madvise()* to
 7925 <sys/mman.h>.

7926 **NAME**

7927 fenv.h — floating-point environment

7928 **SYNOPSIS**

7929 #include <fenv.h>

7930 **DESCRIPTION**

7931 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 7932 conflict between the requirements described here and the ISO C standard is unintentional. This
 7933 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7934 The <fenv.h> header shall define the following data types through **typedef**:

7935 **fenv_t** Represents the entire floating-point environment. The floating-point environment
 7936 refers collectively to any floating-point status flags and control modes supported
 7937 by the implementation.

7938 **fexcept_t** Represents the floating-point status flags collectively, including any status the
 7939 implementation associates with the flags. A floating-point status flag is a system
 7940 variable whose value is set (but never cleared) when a floating-point exception is
 7941 raised, which occurs as a side effect of exceptional floating-point arithmetic to
 7942 provide auxiliary information. A floating-point control mode is a system variable
 7943 whose value may be set by the user to affect the subsequent behavior of floating-
 7944 point arithmetic.

7945 The <fenv.h> header shall define the following constants if and only if the implementation
 7946 supports the floating-point exception by means of the floating-point functions *feclearexcept()*,
 7947 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, and *fetestexcept()*. Each expands to an integer
 7948 constant expression with values such that bitwise-inclusive ORs of all combinations of the
 7949 constants result in distinct values.

7950 FE_DIVBYZERO
 7951 FE_INEXACT
 7952 FE_INVALID
 7953 FE_OVERFLOW
 7954 FE_UNDERFLOW

7955 The <fenv.h> header shall define the following constant, which is simply the bitwise-inclusive
 7956 OR of all floating-point exception constants defined above:

7957 FE_ALL_EXCEPT

7958 The <fenv.h> header shall define the following constants if and only if the implementation
 7959 supports getting and setting the represented rounding direction by means of the *fegetround()*
 7960 and *fesetround()* functions. Each expands to an integer constant expression whose values are
 7961 distinct non-negative values.

7962 FE_DOWNWARD
 7963 FE_TONEAREST
 7964 FE_TOWARDZERO
 7965 FE_UPWARD

7966 The <fenv.h> header shall define the following constant, which represents the default floating-
 7967 point environment (that is, the one installed at program startup) and has type pointer to const-
 7968 qualified **fenv_t**. It can be used as an argument to the functions within the <fenv.h> header that
 7969 manage the floating-point environment.

7970 FE_DFL_ENV

7971 The following shall be declared as functions and may also be defined as macros. Function
7972 prototypes shall be provided.

```
7973 int feclearexcept(int);
7974 int fegetexceptflag(fexcept_t *, int);
7975 int feraiseexcept(int);
7976 int fesetexceptflag(const fexcept_t *, int);
7977 int fetestexcept(int);
7978 int fegetround(void);
7979 int fesetround(int);
7980 int fegetenv(fenv_t *);
7981 int feholdexcept(fenv_t *);
7982 int fesetenv(const fenv_t *);
7983 int feupdateenv(const fenv_t *);
```

7984 The FENV_ACCESS pragma provides a means to inform the implementation when an
7985 application might access the floating-point environment to test floating-point status flags or run
7986 under non-default floating-point control modes. The pragma shall occur either outside external
7987 declarations or preceding all explicit declarations and statements inside a compound statement.
7988 When outside external declarations, the pragma takes effect from its occurrence until another
7989 FENV_ACCESS pragma is encountered, or until the end of the translation unit. When inside a
7990 compound statement, the pragma takes effect from its occurrence until another FENV_ACCESS
7991 pragma is encountered (including within a nested compound statement), or until the end of the
7992 compound statement; at the end of a compound statement the state for the pragma is restored to
7993 its condition just before the compound statement. If this pragma is used in any other context, the
7994 behavior is undefined. If part of an application tests floating-point status flags, sets floating-
7995 point control modes, or runs under non-default mode settings, but was translated with the state
7996 for the FENV_ACCESS pragma off, the behavior is undefined. The default state (on or off) for
7997 the pragma is implementation-defined. (When execution passes from a part of the application
7998 translated with FENV_ACCESS off to a part translated with FENV_ACCESS on, the state of the
7999 floating-point status flags is unspecified and the floating-point control modes have their default
8000 settings.)

8001 APPLICATION USAGE

8002 This header is designed to support the floating-point exception status flags and directed-
8003 rounding control modes required by the IEC 60559:1989 standard, and other similar floating-
8004 point state information. Also it is designed to facilitate code portability among all systems.

8005 Certain application programming conventions support the intended model of use for the
8006 floating-point environment:

- 8007 • A function call does not alter its caller's floating-point control modes, clear its caller's
8008 floating-point status flags, nor depend on the state of its caller's floating-point status flags
8009 unless the function is so documented.
- 8010 • A function call is assumed to require default floating-point control modes, unless its
8011 documentation promises otherwise.
- 8012 • A function call is assumed to have the potential for raising floating-point exceptions, unless
8013 its documentation promises otherwise.

8014 With these conventions, an application can safely assume default floating-point control modes
8015 (or be unaware of them). The responsibilities associated with accessing the floating-point
8016 environment fall on the application that does so explicitly.

8017 Even though the rounding direction macros may expand to constants corresponding to the
8018 values of FLT_ROUNDS, they are not required to do so.

```

8019      For example:
8020      #include <fenv.h>
8021      void f(double x)
8022      {
8023          #pragma STDC FENV_ACCESS ON
8024          void g(double);
8025          void h(double);
8026          /* ... */
8027          g(x + 1);
8028          h(x + 1);
8029          /* ... */
8030      }

```

8031 If the function *g()* might depend on status flags set as a side effect of the first *x+1*, or if the
 8032 second *x+1* might depend on control modes set as a side effect of the call to function *g()*, then
 8033 the application shall contain an appropriately placed invocation as follows:

```

8034      #pragma STDC FENV_ACCESS ON

```

8035 RATIONALE

8036 The **fexcept_t** Type

8037 **fexcept_t** does not have to be an integer type. Its values must be obtained by a call to
 8038 *fegetexceptflag()*, and cannot be created by logical operations from the exception macros. An
 8039 implementation might simply implement **fexcept_t** as an **int** and use the representations
 8040 reflected by the exception macros, but is not required to; other representations might contain
 8041 extra information about the exceptions. **fexcept_t** might be a **struct** with a member for each
 8042 exception (that might hold the address of the first or last floating-point instruction that caused
 8043 that exception). The ISO/IEC 9899:1999 standard makes no claims about the internals of an
 8044 **fexcept_t**, and so the user cannot inspect it.

8045 Exception and Rounding Macros

8046 Macros corresponding to unsupported modes and rounding directions are not defined by the
 8047 implementation and must not be defined by the application. An application might use **#ifdef** to
 8048 test for this.

8049 FUTURE DIRECTIONS

8050 None.

8051 SEE ALSO

8052 The System Interfaces volume of IEEE Std 1003.1-2001, *feclearexcept()*, *fegetenv()*, *fegetexceptflag()*,

 8054 *feupdateenv()*

8055 CHANGE HISTORY

8056 First released in Issue 6. Included for alignment with the ISO/IEC 9899:1999 standard.

8057 The return types for *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fegetenv()*,
 8058 *fesetenv()*, and *feupdateenv()* are changed from **void** to **int** for alignment with the
 8059 ISO/IEC 9899:1999 standard, Defect Report 202.

8060 **NAME**

8061 float.h — floating types

8062 **SYNOPSIS**

8063 #include <float.h>

8064 **DESCRIPTION**

8065 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
8066 conflict between the requirements described here and the ISO C standard is unintentional. This
8067 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8068 The characteristics of floating types are defined in terms of a model that describes a
8069 representation of floating-point numbers and values that provide information about an
8070 implementation's floating-point arithmetic.

8071 The following parameters are used to define the model for each floating-point type:

8072 *s* Sign (± 1).

8073 *b* Base or radix of exponent representation (an integer > 1).

8074 *e* Exponent (an integer between a minimum $e_{\min}$ and a maximum $e_{\max}$).

8075 *p* Precision (the number of base-*b* digits in the significand).

8076 *f_k* Non-negative integers less than *b* (the significand digits).

8077 A floating-point number *x* is defined by the following model:

$$8078 \quad x = sb^e \sum_{k=1}^p f_k b^{-k}, \quad e_{\min} \leq e \leq e_{\max}$$

8079 In addition to normalized floating-point numbers ($f_1 > 0$ if $x \neq 0$), floating types may be able to
8080 contain other kinds of floating-point numbers, such as subnormal floating-point numbers ($x \neq 0$,
8081 $e = e_{\min}$, $f_1 = 0$) and unnormalized floating-point numbers ($x \neq 0$, $e > e_{\min}$, $f_1 = 0$), and values that are
8082 not floating-point numbers, such as infinities and NaNs. A NaN is an encoding signifying Not-
8083 a-Number. A *quiet NaN* propagates through almost every arithmetic operation without raising a
8084 floating-point exception; a *signaling NaN* generally raises a floating-point exception when
8085 occurring as an arithmetic operand.

8086 The accuracy of the floating-point operations ($' + '$, $' - '$, $' * '$, $' / '$) and of the library functions
8087 in <math.h> and <complex.h> that return floating-point results is implementation-defined. The
8088 implementation may state that the accuracy is unknown.

8089 All integer values in the <float.h> header, except FLT_ROUNDS, shall be constant expressions
8090 suitable for use in #if preprocessing directives; all floating values shall be constant expressions.
8091 All except DECIMAL_DIG, FLT_EVAL_METHOD, FLT_RADIX, and FLT_ROUNDS have
8092 separate names for all three floating-point types. The floating-point model representation is
8093 provided for all values except FLT_EVAL_METHOD and FLT_ROUNDS.

8094 The rounding mode for floating-point addition is characterized by the implementation-defined
8095 value of FLT_ROUNDS:

8096 -1 Indeterminable.

8097 0 Toward zero.

8098 1 To nearest.

8099 2 Toward positive infinity.

8100 3 Toward negative infinity.

8101 All other values for FLT_ROUND characterizes implementation-defined rounding behavior.

8102 The values of operations with floating operands and values subject to the usual arithmetic
8103 conversions and of floating constants are evaluated to a format whose range and precision may
8104 be greater than required by the type. The use of evaluation formats is characterized by the
8105 implementation-defined value of FLT_EVAL_METHOD:

8106 -1 Indeterminable.

8107 0 Evaluate all operations and constants just to the range and precision of the type.

8108 1 Evaluate operations and constants of type **float** and **double** to the range and precision of the
8109 **double** type; evaluate **long double** operations and constants to the range and precision of
8110 the **long double** type.

8111 2 Evaluate all operations and constants to the range and precision of the **long double** type.

8112 All other negative values for FLT_EVAL_METHOD characterize implementation-defined
8113 behavior.

8114 The values given in the following list shall be defined as constant expressions with
8115 implementation-defined values that are greater or equal in magnitude (absolute value) to those
8116 shown, with the same sign.

8117 • Radix of exponent representation, b .

8118 FLT_RADIX 2

8119 • Number of base-FLT_RADIX digits in the floating-point significand, p .

8120 FLT_MANT_DIG

8121 DBL_MANT_DIG

8122 LDBL_MANT_DIG

8123 • Number of decimal digits, n , such that any floating-point number in the widest supported
8124 floating type with $p_{\max}$ radix b digits can be rounded to a floating-point number with n
8125 decimal digits and back again without change to the value.

8126
$$\begin{cases} p_{\max} \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil 1 + p_{\max} \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8127 DECIMAL_DIG 10

8128 • Number of decimal digits, q , such that any floating-point number with q decimal digits can
8129 be rounded into a floating-point number with p radix b digits and back again without change
8130 to the q decimal digits.

8131
$$\begin{cases} p \log_{10} b & \text{if } b \text{ is a power of } 10 \\ \left\lceil (p - 1) \log_{10} b \right\rceil & \text{otherwise} \end{cases}$$

8132 FLT_DIG 6

8133 DBL_DIG 10

8134	LDBL_DIG	10
8135	• Minimum negative integer such that FLT_RADIX raised to that power minus 1 is a	
8136	normalized floating-point number, $e_{\min}$.	
8137	FLT_MIN_EXP	
8138	DBL_MIN_EXP	
8139	LDBL_MIN_EXP	
8140	• Minimum negative integer such that 10 raised to that power is in the range of normalized	
8141	floating-point numbers.	
8142	$\left\lceil \log_{10} b^{e_{\min} - 1} \right\rceil$	
8143	FLT_MIN_10_EXP	−37
8144	DBL_MIN_10_EXP	−37
8145	LDBL_MIN_10_EXP	−37
8146	• Maximum integer such that FLT_RADIX raised to that power minus 1 is a representable	
8147	finite floating-point number, $e_{\max}$.	
8148	FLT_MAX_EXP	
8149	DBL_MAX_EXP	
8150	LDBL_MAX_EXP	
8151	• Maximum integer such that 10 raised to that power is in the range of representable finite	
8152	floating-point numbers.	
8153	$\left\lceil \log_{10}((1 - b^{-p}) b^{e_{\max}}) \right\rceil$	
8154	FLT_MAX_10_EXP	+37
8155	DBL_MAX_10_EXP	+37
8156	LDBL_MAX_10_EXP	+37
8157	The values given in the following list shall be defined as constant expressions with	
8158	implementation-defined values that are greater than or equal to those shown:	
8159	• Maximum representable finite floating-point number.	
8160	$(1 - b^{-p}) b^{e_{\max}}$	
8161	FLT_MAX	1E+37
8162	DBL_MAX	1E+37
8163	LDBL_MAX	1E+37
8164	The values given in the following list shall be defined as constant expressions with	
8165	implementation-defined (positive) values that are less than or equal to those shown:	
8166	• The difference between 1 and the least value greater than 1 that is representable in the given	
8167	floating-point type, b^{1-p} .	
8168	FLT_EPSILON	1E−5
8169	DBL_EPSILON	1E−9

8170 LDBL_EPSILON 1E-9

8171 • Minimum normalized positive floating-point number, $b^{e_{\min}-1}$.

8172 FLT_MIN 1E-37

8173 DBL_MIN 1E-37

8174 LDBL_MIN 1E-37

8175 **APPLICATION USAGE**

8176 None.

8177 **RATIONALE**

8178 None.

8182 <complex.h>, <math.h>

8183 **CHANGE HISTORY**

8184 First released in Issue 4. Derived from the ISO C standard.

8185 **Issue 6**

8186 The description of the operations with floating-point values is updated for alignment with the
8187 ISO / IEC 9899:1999 standard.

8188 **NAME**

8189 fmtmsg.h — message display structures

8190 **SYNOPSIS**

8191 xSI #include <fmtmsg.h>

8192

8193 **DESCRIPTION**8194 The <fmtmsg.h> header shall define the following macros, which expand to constant integer
8195 expressions:

8196	MM_HARD	Source of the condition is hardware.
8197	MM_SOFT	Source of the condition is software.
8198	MM_FIRM	Source of the condition is firmware.
8199	MM_APPL	Condition detected by application.
8200	MM_UTIL	Condition detected by utility.
8201	MM_OPSYS	Condition detected by operating system.
8202	MM_RECOVER	Recoverable error.
8203	MM_NRECOV	Non-recoverable error.
8204	MM_HALT	Error causing application to halt.
8205	MM_ERROR	Application has encountered a non-fatal fault.
8206	MM_WARNING	Application has detected unusual non-error condition.
8207	MM_INFO	Informative message.
8208	MM_NOSEV	No severity level provided for the message.
8209	MM_PRINT	Display message on standard error.
8210	MM_CONSOLE	Display message on system console.

8211 The table below indicates the null values and identifiers for *fmtmsg()* arguments. The
8212 <fmtmsg.h> header shall define the macros in the **Identifier** column, which expand to constant
8213 expressions that expand to expressions of the type indicated in the **Type** column:

8214

8215

8216

8217

8218

8219

8220

8221

Argument	Type	Null-Value	Identifier
<i>label</i>	char *	(char*)0	MM_NULLLBL
<i>severity</i>	int	0	MM_NULLSEV
<i>class</i>	long	0L	MM_NULLMC
<i>text</i>	char *	(char*)0	MM_NULLTXT
<i>action</i>	char *	(char*)0	MM_NULLACT
<i>tag</i>	char *	(char*)0	MM_NULLTAG

8222 The <fmtmsg.h> header shall also define the following macros for use as return values for
8223 *fmtmsg()*:

8224	MM_OK	The function succeeded.
8225	MM_NOTOK	The function failed completely.
8226	MM_NOMSG	The function was unable to generate a message on standard error, but 8227 otherwise succeeded.

8228 MM_NOCON The function was unable to generate a console message, but otherwise
8229 succeeded.

8230 The following shall be declared as a function and may also be defined as a macro. A function
8231 prototype shall be provided.

8232 int fmtmsg(long, const char *, int,
8233 const char *, const char *, const char *);

8242 **CHANGE HISTORY**

8243 First released in Issue 4, Version 2.

8244 **NAME**

8245 fnmatch.h — filename-matching types

8246 **SYNOPSIS**

8247 #include <fnmatch.h>

8248 **DESCRIPTION**

8249 The <fnmatch.h> header shall define the following constants:

8250 FNM_NOMATCH The string does not match the specified pattern.

8251 FNM_PATHNAME Slash in *string* only matches slash in *pattern*.

8252 FNM_PERIOD Leading period in *string* must be exactly matched by period in *pattern*.

8253 FNM_NOESCAPE Disable backslash escaping.

8254 OB XSI FNM_NOSYS Reserved.

8255 The following shall be declared as a function and may also be defined as a macro. A function
8256 prototype shall be provided.

8257 int fnmatch(const char *, const char *, int);

8258 **APPLICATION USAGE**

8259 None.

8260 **RATIONALE**

8261 None.

8266 of IEEE Std 1003.1-2001

8267 **CHANGE HISTORY**

8268 First released in Issue 4. Derived from the ISO POSIX-2 standard.

8269 **Issue 6**

8270 The constant FNM_NOSYS is marked obsolescent.

8271 **NAME**

8272 ftw.h — file tree traversal

8273 **SYNOPSIS**

8274 xSI #include <ftw.h>

8275

8276 **DESCRIPTION**8277 The <ftw.h> header shall define the **FTW** structure that includes at least the following members:

8278 int base

8279 int level

8280 The <ftw.h> header shall define macros for use as values of the third argument to the
8281 application-supplied function that is passed as the second argument to *ftw()* and *nftw()*:

8282 FTW_F File.

8283 FTW_D Directory.

8284 FTW_DNR Directory without read permission.

8285 FTW_DP Directory with subdirectories visited.

8286 FTW_NS Unknown type; *stat()* failed.

8287 FTW_SL Symbolic link.

8288 FTW_SLN Symbolic link that names a nonexistent file.

8289 The <ftw.h> header shall define macros for use as values of the fourth argument to *nftw()*:8290 FTW_PHYS Physical walk, does not follow symbolic links. Otherwise, *nftw()* follows
8291 links but does not walk down any path that crosses itself.

8292 FTW_MOUNT The walk does not cross a mount point.

8293 FTW_DEPTH All subdirectories are visited before the directory itself.

8294 FTW_CHDIR The walk changes to each directory before reading it.

8295 The following shall be declared as functions and may also be defined as macros. Function
8296 prototypes shall be provided.8297 int ftw(const char *, int (*)(const char *, const struct stat *,
8298 int), int);8299 int nftw(const char *, int (*)(const char *, const struct stat *,
8300 int, struct FTW*), int, int);8301 The <ftw.h> header shall define the **stat** structure and the symbolic names for *st_mode* and the
8302 file type test macros as described in <sys/stat.h>.

8303 Inclusion of the <ftw.h> header may also make visible all symbols from <sys/stat.h>.

8304 **APPLICATION USAGE**

8305 None.

8306 **RATIONALE**

8307 None.

8308 **FUTURE DIRECTIONS**

8309 None.

8310 **SEE ALSO**

8311 <sys/stat.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *ftw()*, *nftw()*

8312 **CHANGE HISTORY**

8313 First released in Issue 1. Derived from Issue 1 of the SVID.

8314 **Issue 5**

8315 A description of FTW_DP is added.

8316 **NAME**

8317 glob.h — pathname pattern-matching types

8318 **SYNOPSIS**

8319 #include <glob.h>

8320 **DESCRIPTION**8321 The <glob.h> header shall define the structures and symbolic constants used by the *glob()*
8322 function.8323 The structure type **glob_t** shall contain at least the following members:8324 size_t gl_pathc Count of paths matched by *pattern*.

8325 char **gl_pathv Pointer to a list of matched pathnames.

8326 size_t gl_offs Slots to reserve at the beginning of *gl_pathv*.8327 The following constants shall be provided as values for the *flags* argument:

8328 GLOB_APPEND Append generated pathnames to those previously obtained.

8329 GLOB_DOOFFS Specify how many null pointers to add to the beginning of *gl_pathv*.8330 GLOB_ERR Cause *glob()* to return on error.8331 GLOB_MARK Each pathname that is a directory that matches *pattern* has a slash
8332 appended.8333 GLOB_NOCHECK If *pattern* does not match any pathname, then return a list consisting of
8334 only *pattern*.

8335 GLOB_NOESCAPE Disable backslash escaping.

8336 GLOB_NOSORT Do not sort the pathnames returned.

8337 The following constants shall be defined as error return values:

8338 GLOB_ABORTED The scan was stopped because GLOB_ERR was set or *(*errfunc)()*
8339 returned non-zero.8340 GLOB_NOMATCH The pattern does not match any existing pathname, and
8341 GLOB_NOCHECK was not set in *flags*.

8342 GLOB_NOSPACE An attempt to allocate memory failed.

8343 OB XSI GLOB_NOSYS Reserved.

8344 The following shall be declared as functions and may also be defined as macros. Function
8345 prototypes shall be provided.8346 int glob(const char *restrict, int, int (*)(const char *, int),
8347 glob_t *restrict);

8348 void globfree (glob_t *);

8349 The implementation may define additional macros or constants using names beginning with
8350 GLOB_.

8351 **APPLICATION USAGE**

8352 None.

8353 **RATIONALE**

8354 None.

8355 **FUTURE DIRECTIONS**

8356 None.

8357 **SEE ALSO**

8358 The System Interfaces volume of IEEE Std 1003.1-2001, *glob()*, the Shell and Utilities volume of
8359 IEEE Std 1003.1-2001

8360 **CHANGE HISTORY**

8361 First released in Issue 4. Derived from the ISO POSIX-2 standard.

8362 **Issue 6**8363 The **restrict** keyword is added to the prototype for *glob()*.

8364 The constant GLOB_NOSYS is marked obsolescent.

8365 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/8 is applied, correcting the *glob()* |
8366 prototype definition by removing the **restrict** qualifier from the function pointer argument. |

8367 **NAME**

8368 grp.h — group structure

8369 **SYNOPSIS**

8370 #include <grp.h>

8371 **DESCRIPTION**8372 The <grp.h> header shall declare the structure **group** which shall include the following
8373 members:

8374 char *gr_name The name of the group.
 8375 gid_t gr_gid Numerical group ID.
 8376 char **gr_mem Pointer to a null-terminated array of character
 8377 pointers to member names.

8378 The **gid_t** type shall be defined as described in <sys/types.h>.8379 The following shall be declared as functions and may also be defined as macros. Function
8380 prototypes shall be provided.

```

8381       struct group  *getgrgid(gid_t);
8382       struct group  *getgrnam(const char *);
8383 TSF       int        getgrgid_r(gid_t, struct group *, char *,
8384                               size_t, struct group **);
8385       int        getgrnam_r(const char *, struct group *, char *,
8386                               size_t, struct group **);
8387 XSI       struct group *getgrent(void);
8388       void       endgrent(void);
8389       void       setgrent(void);

```

8400 **CHANGE HISTORY**

8401 First released in Issue 1.

8402 **Issue 5**

8403 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

8404 **Issue 6**8405 The following new requirements on POSIX implementations derive from alignment with the
8406 Single UNIX Specification:

- 8407
 - The definition of **gid_t** is mandated.
 - The *getgrgid_r()* and *getgrnam_r()* functions are marked as part of the Thread-Safe Functions option.
- 8408
8409

8410 **NAME**

8411 iconv.h — codeset conversion facility

8412 **SYNOPSIS**

8413 XSI `#include <iconv.h>`

8414

8415 **DESCRIPTION**

8416 The <iconv.h> header shall define the following type:

8417 **iconv_t** Identifies the conversion from one codeset to another.

8418 The following shall be declared as functions and may also be defined as macros. Function
8419 prototypes shall be provided.

```
8420 iconv_t iconv_open(const char *, const char *);
8421 size_t iconv(iconv_t, char **restrict, size_t *restrict,
8422             char **restrict, size_t *restrict);
8423 int iconv_close(iconv_t);
```

8424 **APPLICATION USAGE**

8425 None.

8426 **RATIONALE**

8427 None.

8428 **FUTURE DIRECTIONS**

8429 None.

8430 **SEE ALSO**

8431 The System Interfaces volume of IEEE Std 1003.1-2001, *iconv()*, *iconv_close()*, *iconv_open()*

8432 **CHANGE HISTORY**

8433 First released in Issue 4.

8434 **Issue 6**

8435 The **restrict** keyword is added to the prototype for *iconv()*.

8436 **NAME**

8437 inttypes.h — fixed size integer types

8438 **SYNOPSIS**

8439 #include <inttypes.h>

8440 **DESCRIPTION**

8441 **CX** Some of the functionality described on this reference page extends the ISO C standard.
 8442 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 8443 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 8444 symbols in this header.

8445 The <inttypes.h> header shall include the <stdint.h> header.

8446 The <inttypes.h> header shall include a definition of at least the following type:

8447 **imaxdiv_t** Structure type that is the type of the value returned by the *imaxdiv()* function.

8448 The following macros shall be defined. Each expands to a character string literal containing a
 8449 conversion specifier, possibly modified by a length modifier, suitable for use within the *format*
 8450 argument of a formatted input/output function when converting the corresponding integer
 8451 type. These macros have the general form of PRI (character string literals for the *fprintf()* and
 8452 *fwprintf()* family of functions) or SCN (character string literals for the *fscanf()* and *fwscanf()*
 8453 family of functions), followed by the conversion specifier, followed by a name corresponding to
 8454 a similar type name in <stdint.h>. In these names, *N* represents the width of the type as
 8455 described in <stdint.h>. For example, *PRIdFAST32* can be used in a format string to print the
 8456 value of an integer of type **int_fast32_t**.

8457 The *fprintf()* macros for signed integers are:

8458	PRIdN	PRIdLEASTN	PRIdFASTN	PRIdMAX	PRIdPTR
8459	PRiN	PRiLEASTN	PRiFASTN	PRiMAX	PRiPTR

8460 The *fprintf()* macros for unsigned integers are:

8461	PRIoN	PRIoLEASTN	PRIoFASTN	PRIoMAX	PRIoPTR
8462	PRiN	PRiLEASTN	PRiFASTN	PRiMAX	PRiPTR
8463	PRIxN	PRIxLEASTN	PRIxFASTN	PRIxMAX	PRIxPTR
8464	PRIXN	PRIXLEASTN	PRIXFASTN	PRIXMAX	PRIXPTR

8465 The *fscanf()* macros for signed integers are:

8466	SCNdN	SCNdLEASTN	SCNdFASTN	SCNdMAX	SCNdPTR
8467	SCNiN	SCNiLEASTN	SCNiFASTN	SCNiMAX	SCNiPTR

8468 The *fscanf()* macros for unsigned integers are:

8469	SCNoN	SCNoLEASTN	SCNoFASTN	SCNoMAX	SCNoPTR
8470	SCNuN	SCNuLEASTN	SCNuFASTN	SCNuMAX	SCNuPTR
8471	SCNxN	SCNxLEASTN	SCNxFASTN	SCNxMAX	SCNxPTR

8472 For each type that the implementation provides in <stdint.h>, the corresponding *fprintf()* and
 8473 *fwprintf()* macros shall be defined and the corresponding *fscanf()* and *fwscanf()* macros shall be
 8474 defined unless the implementation does not have a suitable modifier for the type.

8475 The following shall be declared as functions and may also be defined as macros. Function
 8476 prototypes shall be provided.

```
8477 intmax_t imaxabs(intmax_t);
8478 imaxdiv_t imaxdiv(intmax_t, intmax_t);
8479 intmax_t strtoumax(const char *restrict, char **restrict, int);
```

```

8480     uintmax_t strtoumax(const char *restrict, char **restrict, int);
8481     intmax_t wcstoimax(const wchar_t *restrict, wchar_t **restrict, int);
8482     uintmax_t wcstoumax(const wchar_t *restrict, wchar_t **restrict, int);

```

8483 EXAMPLES

```

8484     #include <inttypes.h>
8485     #include <wchar.h>
8486     int main(void)
8487     {
8488         uintmax_t i = UINTMAX_MAX; // This type always exists.
8489         wprintf(L"The largest integer value is %020"
8490             PRIxMAX "\n", i);
8491         return 0;
8492     }

```

8493 APPLICATION USAGE

8494 The purpose of <inttypes.h> is to provide a set of integer types whose definitions are consistent
8495 across machines and independent of operating systems and other implementation
8496 idiosyncrasies. It defines, via **typedef**, integer types of various sizes. Implementations are free to
8497 **typedef** them as ISO C standard integer types or extensions that they support. Consistent use of
8498 this header will greatly increase the portability of applications across platforms.

8499 RATIONALE

8500 The ISO/IEC 9899:1990 standard specified that the language should support four signed and
8501 unsigned integer data types—**char**, **short**, **int**, and **long**—but placed very little requirement on
8502 their size other than that **int** and **short** be at least 16 bits and **long** be at least as long as **int** and
8503 not smaller than 32 bits. For 16-bit systems, most implementations assigned 8, 16, 16, and 32 bits
8504 to **char**, **short**, **int**, and **long**, respectively. For 32-bit systems, the common practice has been to
8505 assign 8, 16, 32, and 32 bits to these types. This difference in **int** size can create some problems
8506 for users who migrate from one system to another which assigns different sizes to integer types,
8507 because the ISO C standard integer promotion rule can produce silent changes unexpectedly.
8508 The need for defining an extended integer type increased with the introduction of 64-bit
8509 systems.

8510 FUTURE DIRECTIONS

8511 Macro names beginning with PRI or SCN followed by any lowercase letter or 'X' may be added
8512 to the macros defined in the <inttypes.h> header.

8515 CHANGE HISTORY

8516 First released in Issue 5.

8517 Issue 6

8518 The Open Group Base Resolution bwg97-006 is applied.

8519 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

8520 **NAME**

8521 iso646.h — alternative spellings

8522 **SYNOPSIS**

8523 #include <iso646.h>

8524 **DESCRIPTION**

8525 cx The functionality described on this reference page is aligned with the ISO C standard. Any
8526 conflict between the requirements described here and the ISO C standard is unintentional. This
8527 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8528 The **<iso646.h>** header shall define the following eleven macros (on the left) that expand to the
8529 corresponding tokens (on the right):

8530 and &&

8531 and_eq &=

8532 bitand &

8533 bitor |

8534 compl ~

8535 not !

8536 not_eq !=

8537 or | |

8538 or_eq |=

8539 xor ^

8540 xor_eq ^=

8549 **CHANGE HISTORY**

8550 First released in Issue 5. Derived from ISO/IEC 9899:1990/Amendment 1:1995 (E).

8551 **NAME**

8552 langinfo.h — language information constants

8553 **SYNOPSIS**

8554 xSI #include <langinfo.h>

8555

8556 **DESCRIPTION**

8557 The <langinfo.h> header contains the constants used to identify items of *langinfo* data (see
8558 *nl_langinfo()*). The type of the constant, **nl_item**, shall be defined as described in <nl_types.h>.

8559 The following constants shall be defined. The entries under **Category** indicate in which
8560 *setlocale()* category each item is defined.

8561

Constant	Category	Meaning
CODESET	LC_CTYPE	Codeset name.
D_T_FMT	LC_TIME	String for formatting date and time.
D_FMT	LC_TIME	Date format string.
T_FMT	LC_TIME	Time format string.
T_FMT_AMPM	LC_TIME	a.m. or p.m. time format string.
AM_STR	LC_TIME	Ante-meridiem affix.
PM_STR	LC_TIME	Post-meridiem affix.
DAY_1	LC_TIME	Name of the first day of the week (for example, Sunday).
DAY_2	LC_TIME	Name of the second day of the week (for example, Monday).
DAY_3	LC_TIME	Name of the third day of the week (for example, Tuesday).
DAY_4	LC_TIME	Name of the fourth day of the week (for example, Wednesday).
DAY_5	LC_TIME	Name of the fifth day of the week (for example, Thursday).
DAY_6	LC_TIME	Name of the sixth day of the week (for example, Friday).
DAY_7	LC_TIME	Name of the seventh day of the week (for example, Saturday).
ABDAY_1	LC_TIME	Abbreviated name of the first day of the week.
ABDAY_2	LC_TIME	Abbreviated name of the second day of the week.
ABDAY_3	LC_TIME	Abbreviated name of the third day of the week.
ABDAY_4	LC_TIME	Abbreviated name of the fourth day of the week.
ABDAY_5	LC_TIME	Abbreviated name of the fifth day of the week.
ABDAY_6	LC_TIME	Abbreviated name of the sixth day of the week.
ABDAY_7	LC_TIME	Abbreviated name of the seventh day of the week.
MON_1	LC_TIME	Name of the first month of the year.
MON_2	LC_TIME	Name of the second month.
MON_3	LC_TIME	Name of the third month.
MON_4	LC_TIME	Name of the fourth month.
MON_5	LC_TIME	Name of the fifth month.
MON_6	LC_TIME	Name of the sixth month.
MON_7	LC_TIME	Name of the seventh month.
MON_8	LC_TIME	Name of the eighth month.
MON_9	LC_TIME	Name of the ninth month.
MON_10	LC_TIME	Name of the tenth month.
MON_11	LC_TIME	Name of the eleventh month.
MON_12	LC_TIME	Name of the twelfth month.

8621

8622

8623

8624

8625

Constant	Category	Meaning
ABMON_1	LC_TIME	Abbreviated name of the first month.
ABMON_2	LC_TIME	Abbreviated name of the second month.
ABMON_3	LC_TIME	Abbreviated name of the third month.
ABMON_4	LC_TIME	Abbreviated name of the fourth month.
ABMON_5	LC_TIME	Abbreviated name of the fifth month.
ABMON_6	LC_TIME	Abbreviated name of the sixth month.
ABMON_7	LC_TIME	Abbreviated name of the seventh month.
ABMON_8	LC_TIME	Abbreviated name of the eighth month.
ABMON_9	LC_TIME	Abbreviated name of the ninth month.
ABMON_10	LC_TIME	Abbreviated name of the tenth month.
ABMON_11	LC_TIME	Abbreviated name of the eleventh month.
ABMON_12	LC_TIME	Abbreviated name of the twelfth month.
ERA	LC_TIME	Era description segments.
ERA_D_FMT	LC_TIME	Era date format string.
ERA_D_T_FMT	LC_TIME	Era date and time format string.
ERA_T_FMT	LC_TIME	Era time format string.
ALT_DIGITS	LC_TIME	Alternative symbols for digits.
RADIXCHAR	LC_NUMERIC	Radix character.
THOUSEP	LC_NUMERIC	Separator for thousands.
YESEXPR	LC_MESSAGES	Affirmative response expression.
NOEXPR	LC_MESSAGES	Negative response expression.
CRNCYSTR	LC_MONETARY	Local currency symbol, preceded by '–' if the symbol should appear before the value, '+' if the symbol should appear after the value, or '.' if the symbol should replace the radix character. If the local currency symbol is the empty string, implementations may return the empty string ("").

8626

8627

If the locale's values for **p_cs_precedes** and **n_cs_precedes** do not match, the value of *nl_langinfo*(CRNCYSTR) is unspecified.

8628

8629

The following shall be declared as a function and may also be defined as a macro. A function prototype shall be provided.

8630

```
char *nl_langinfo(nl_item);
```

8631

Inclusion of the <langinfo.h> header may also make visible all symbols from <nl_types.h>.

8632

APPLICATION USAGE

8633

8634

8635

8636

8637

Wherever possible, users are advised to use functions compatible with those in the ISO C standard to access items of *langinfo* data. In particular, the *strftime*() function should be used to access date and time information defined in category *LC_TIME*. The *localeconv*() function should be used to access information corresponding to *RADIXCHAR*, *THOUSEP*, and *CRNCYSTR*.

8638

8645 **CHANGE HISTORY**

8646 First released in Issue 2.

8647 **Issue 5**

8648 The constants YESSTR and NOSTR are marked LEGACY.

8649 **Issue 6**

8650 The constants YESSTR and NOSTR are removed.

8651 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/9 is applied, adding a sentence to
 8652 the“Meaning” column entry for the CRNCYSTR constant. This change is to accommodate
 8653 historic practice.

8654 **NAME**
8655 libgen.h — definitions for pattern matching functions

8656 **SYNOPSIS**
8657 xSI `#include <libgen.h>`
8658

8659 **DESCRIPTION**
8660 The following shall be declared as functions and may also be defined as macros. Function
8661 prototypes shall be provided.
8662 `char *basename(char *);`
8663 `char *dirname(char *);`

8664 **APPLICATION USAGE**
8665 None.

8666 **RATIONALE**
8667 None.

8668 **FUTURE DIRECTIONS**
8669 None.

8671 The System Interfaces volume of IEEE Std 1003.1-2001, *basename()*, *dirname()*

8672 **CHANGE HISTORY**
8673 First released in Issue 4, Version 2.

8674 **Issue 5**
8675 The function prototypes for *basename()* and *dirname()* are changed to indicate that the first
8676 argument is of type **char *** rather than **const char ***.

8677 **Issue 6**
8678 The **__loc1** symbol and the *regcmp()* and *regex()* functions are removed.

8679 **NAME**

8680 limits.h — implementation-defined constants

8681 **SYNOPSIS**

8682 #include <limits.h>

8683 **DESCRIPTION**

8684 CX Some of the functionality described on this reference page extends the ISO C standard.
8685 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
8686 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
8687 symbols in this header.

8688 CX Many of the symbols listed here are not defined by the ISO/IEC 9899:1999 standard. Such
8689 symbols are not shown as CX shaded.

8690 The <limits.h> header shall define various symbolic names. Different categories of names are
8691 described below.

8692 The names represent various limits on resources that the implementation imposes on
8693 applications.

8694 Implementations may choose any appropriate value for each limit, provided it is not more
8695 restrictive than the Minimum Acceptable Values listed below. Symbolic constant names
8696 beginning with _POSIX may be found in <unistd.h>.

8697 Applications should not assume any particular value for a limit. To achieve maximum
8698 portability, an application should not require more resource than the Minimum Acceptable
8699 Value quantity. However, an application wishing to avail itself of the full amount of a resource
8700 available on an implementation may make use of the value given in <limits.h> on that
8701 particular implementation, by using the symbolic names listed below. It should be noted,
8702 however, that many of the listed limits are not invariant, and at runtime, the value of the limit
8703 may differ from those given in this header, for the following reasons:

- 8704 • The limit is pathname-dependent.
- 8705 • The limit differs between the compile and runtime machines.

8706 For these reasons, an application may use the *fpathconf()*, *pathconf()*, and *sysconf()* functions to
8707 determine the actual value of a limit at runtime.

8708 The items in the list ending in _MIN give the most negative values that the mathematical types
8709 are guaranteed to be capable of representing. Numbers of a more negative value may be
8710 supported on some implementations, as indicated by the <limits.h> header on the
8711 implementation, but applications requiring such numbers are not guaranteed to be portable to
8712 all implementations. For positive constants ending in _MIN, this indicates the minimum
8713 acceptable value.

8714 **Runtime Invariant Values (Possibly Indeterminate)**

8715 A definition of one of the symbolic names in the following list shall be omitted from <limits.h>
8716 on specific implementations where the corresponding value is equal to or greater than the stated
8717 minimum, but is unspecified.

8718 This indetermination might depend on the amount of available memory space on a specific
8719 instance of a specific implementation. The actual value supported by a specific instance shall be
8720 provided by the *sysconf()* function.

8721 AIO {AIO_LISTIO_MAX}
8722 Maximum number of I/O operations in a single list I/O call supported by the

8723		implementation.
8724		Minimum Acceptable Value: {_POSIX_AIO_LISTIO_MAX}
8725	AIO	{AIO_MAX}
8726		Maximum number of outstanding asynchronous I/O operations supported by the
8727		implementation.
8728		Minimum Acceptable Value: {_POSIX_AIO_MAX}
8729	AIO	{AIO_PRIO_DELTA_MAX}
8730		The maximum amount by which a process can decrease its asynchronous I/O priority level
8731		from its own scheduling priority.
8732		Minimum Acceptable Value: 0
8733		{ARG_MAX}
8734		Maximum length of argument to the <i>exec</i> functions including environment data.
8735		Minimum Acceptable Value: {_POSIX_ARG_MAX}
8736	XSI	{ATEXIT_MAX}
8737		Maximum number of functions that may be registered with <i>atexit()</i> .
8738		Minimum Acceptable Value: 32
8739		{CHILD_MAX}
8740		Maximum number of simultaneous processes per real user ID.
8741		Minimum Acceptable Value: {_POSIX_CHILD_MAX}
8742	TMR	{DELAYTIMER_MAX}
8743		Maximum number of timer expiration overruns.
8744		Minimum Acceptable Value: {_POSIX_DELAYTIMER_MAX}
8745		{HOST_NAME_MAX}
8746		Maximum length of a host name (not including the terminating null) as returned from the
8747		<i>gethostname()</i> function.
8748		Minimum Acceptable Value: {_POSIX_HOST_NAME_MAX}
8749	XSI	{IOV_MAX}
8750		Maximum number of iovec structures that one process has available for use with <i>readv()</i> or
8751		<i>writev()</i> .
8752		Minimum Acceptable Value: {_XOPEN_IOV_MAX}
8753		{LOGIN_NAME_MAX}
8754		Maximum length of a login name.
8755		Minimum Acceptable Value: {_POSIX_LOGIN_NAME_MAX}
8756	MSG	{MQ_OPEN_MAX}
8757		The maximum number of open message queue descriptors a process may hold.
8758		Minimum Acceptable Value: {_POSIX_MQ_OPEN_MAX}
8759	MSG	{MQ_PRIO_MAX}
8760		The maximum number of message priorities supported by the implementation.
8761		Minimum Acceptable Value: {_POSIX_MQ_PRIO_MAX}
8762		{OPEN_MAX}
8763		Maximum number of files that one process can have open at any one time.
8764		Minimum Acceptable Value: {_POSIX_OPEN_MAX}
8765		{PAGESIZE}
8766		Size in bytes of a page.
8767		Minimum Acceptable Value: 1

8768	XSI	{PAGE_SIZE}
8769		Equivalent to {PAGESIZE}. If either {PAGESIZE} or {PAGE_SIZE} is defined, the other is
8770		defined with the same value.
8771	THR	{PTHREAD_DESTRUCTOR_ITERATIONS}
8772		Maximum number of attempts made to destroy a thread's thread-specific data values on
8773		thread exit.
8774		Minimum Acceptable Value: {_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
8775	THR	{PTHREAD_KEYS_MAX}
8776		Maximum number of data keys that can be created by a process.
8777		Minimum Acceptable Value: {_POSIX_THREAD_KEYS_MAX}
8778	THR	{PTHREAD_STACK_MIN}
8779		Minimum size in bytes of thread stack storage.
8780		Minimum Acceptable Value: 0
8781	THR	{PTHREAD_THREADS_MAX}
8782		Maximum number of threads that can be created per process.
8783		Minimum Acceptable Value: {_POSIX_THREAD_THREADS_MAX}
8784		{RE_DUP_MAX}
8785		The number of repeated occurrences of a BRE permitted by the <i>regex</i> (<i>c</i>) and <i>regcomp</i> (<i>c</i>)
8786		functions when using the interval notation <i>{(m,n)}</i> ; see Section 9.3.6 (on page 174).
8787		Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}
8788	RTS	{RTSIG_MAX}
8789		Maximum number of realtime signals reserved for application use in this implementation.
8790		Minimum Acceptable Value: {_POSIX_RTSIG_MAX}
8791	SEM	{SEM_NSEMS_MAX}
8792		Maximum number of semaphores that a process may have.
8793		Minimum Acceptable Value: {_POSIX_SEM_NSEMS_MAX}
8794	SEM	{SEM_VALUE_MAX}
8795		The maximum value a semaphore may have.
8796		Minimum Acceptable Value: {_POSIX_SEM_VALUE_MAX}
8797	RTS	{SIGQUEUE_MAX}
8798		Maximum number of queued signals that a process may send and have pending at the
8799		receiver(s) at any time.
8800		Minimum Acceptable Value: {_POSIX_SIGQUEUE_MAX}
8801	SS TSP	{SS_REPL_MAX}
8802		The maximum number of replenishment operations that may be simultaneously pending
8803		for a particular sporadic server scheduler.
8804		Minimum Acceptable Value: {_POSIX_SS_REPL_MAX}
8805		{STREAM_MAX}
8806		The number of streams that one process can have open at one time. If defined, it has the
8807		same value as {FOPEN_MAX} (see <stdio.h>).
8808		Minimum Acceptable Value: {_POSIX_STREAM_MAX}
8809		{SYMLOOP_MAX}
8810		Maximum number of symbolic links that can be reliably traversed in the resolution of a
8811		pathname in the absence of a loop.
8812		Minimum Acceptable Value: {_POSIX_SYMLOOP_MAX}

8813	TMR	{TIMER_MAX}
8814		Maximum number of timers per process supported by the implementation.
8815		Minimum Acceptable Value: {_POSIX_TIMER_MAX}
8816	TRC	{TRACE_EVENT_NAME_MAX}
8817		Maximum length of the trace event name.
8818		Minimum Acceptable Value: {_POSIX_TRACE_EVENT_NAME_MAX}
8819	TRC	{TRACE_NAME_MAX}
8820		Maximum length of the trace generation version string or of the trace stream name.
8821		Minimum Acceptable Value: {_POSIX_TRACE_NAME_MAX}
8822	TRC	{TRACE_SYS_MAX}
8823		Maximum number of trace streams that may simultaneously exist in the system.
8824		Minimum Acceptable Value: {_POSIX_TRACE_SYS_MAX}
8825	TRC	{TRACE_USER_EVENT_MAX}
8826		Maximum number of user trace event type identifiers that may simultaneously exist in a
8827		traced process, including the predefined user trace event
8828		POSIX_TRACE_UNNAMED_USER_EVENT.
8829		Minimum Acceptable Value: {_POSIX_TRACE_USER_EVENT_MAX}
8830		{TTY_NAME_MAX}
8831		Maximum length of terminal device name.
8832		Minimum Acceptable Value: {_POSIX_TTY_NAME_MAX}
8833		{TZNAME_MAX}
8834		Maximum number of bytes supported for the name of a timezone (not of the <i>TZ</i> variable).
8835		Minimum Acceptable Value: {_POSIX_TZNAME_MAX}
8836	Note:	The length given by {TZNAME_MAX} does not include the quoting characters mentioned in
8837		Section 8.3 (on page 165).

8838 Pathname Variable Values

8839 The values in the following list may be constants within an implementation or may vary from
 8840 one pathname to another. For example, file systems or directories may have different
 8841 characteristics.

8842 A definition of one of the values shall be omitted from the <limits.h> header on specific
 8843 implementations where the corresponding value is equal to or greater than the stated minimum,
 8844 but where the value can vary depending on the file to which it is applied. The actual value
 8845 supported for a specific pathname shall be provided by the *pathconf()* function.

8846 {FILESIZEBITS}

8847 Minimum number of bits needed to represent, as a signed integer value, the maximum size
 8848 of a regular file allowed in the specified directory.

8849 Minimum Acceptable Value: 32

8850 {LINK_MAX}

8851 Maximum number of links to a single file.

8852 Minimum Acceptable Value: {_POSIX_LINK_MAX}

8853 {MAX_CANON}

8854 Maximum number of bytes in a terminal canonical input line.

8855 Minimum Acceptable Value: {_POSIX_MAX_CANON}

8856 {MAX_INPUT}

8857 Minimum number of bytes for which space is available in a terminal input queue; therefore,

8858 the maximum number of bytes a conforming application may require to be typed as input
 8859 before reading them.
 8860 Minimum Acceptable Value: {_POSIX_MAX_INPUT}

8861 {NAME_MAX}
 8862 Maximum number of bytes in a filename (not including terminating null).
 8863 Minimum Acceptable Value: {_POSIX_NAME_MAX}
 8864 XSI Minimum Acceptable Value: {_XOPEN_NAME_MAX}

8865 {PATH_MAX}
 8866 Maximum number of bytes in a pathname, including the terminating null character.
 8867 Minimum Acceptable Value: {_POSIX_PATH_MAX}
 8868 XSI Minimum Acceptable Value: {_XOPEN_PATH_MAX}

8869 {PIPE_BUF}
 8870 Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
 8871 Minimum Acceptable Value: {_POSIX_PIPE_BUF}

8872 ADV {POSIX_ALLOC_SIZE_MIN}
 8873 Minimum number of bytes of storage actually allocated for any portion of a file.
 8874 Minimum Acceptable Value: Not specified.

8875 ADV {POSIX_REC_INCR_XFER_SIZE}
 8876 Recommended increment for file transfer sizes between the
 8877 {POSIX_REC_MIN_XFER_SIZE} and {POSIX_REC_MAX_XFER_SIZE} values.
 8878 Minimum Acceptable Value: Not specified.

8879 ADV {POSIX_REC_MAX_XFER_SIZE}
 8880 Maximum recommended file transfer size.
 8881 Minimum Acceptable Value: Not specified.

8882 ADV {POSIX_REC_MIN_XFER_SIZE}
 8883 Minimum recommended file transfer size.
 8884 Minimum Acceptable Value: Not specified.

8885 ADV {POSIX_REC_XFER_ALIGN}
 8886 Recommended file transfer buffer alignment.
 8887 Minimum Acceptable Value: Not specified.

8888 {SYMLINK_MAX}
 8889 Maximum number of bytes in a symbolic link.
 8890 Minimum Acceptable Value: {_POSIX_SYMLINK_MAX}

Runtime Increaseable Values

8891 The magnitude limitations in the following list shall be fixed by specific implementations. An
 8892 application should assume that the value supplied by <limits.h> in a specific implementation is
 8893 the minimum that pertains whenever the application is run under that implementation. A
 8894 specific instance of a specific implementation may increase the value relative to that supplied by
 8895 <limits.h> for that implementation. The actual value supported by a specific instance shall be
 8896 provided by the *sysconf()* function.

8897

8898 {BC_BASE_MAX}
 8899 Maximum *obase* values allowed by the *bc* utility.
 8900 Minimum Acceptable Value: {_POSIX2_BC_BASE_MAX}

8901 {BC_DIM_MAX}
 8902 Maximum number of elements permitted in an array by the *bc* utility.

8903 Minimum Acceptable Value: {_POSIX2_BC_DIM_MAX}
 8904 {BC_SCALE_MAX}
 8905 Maximum *scale* value allowed by the *bc* utility.
 8906 Minimum Acceptable Value: {_POSIX2_BC_SCALE_MAX}
 8907 {BC_STRING_MAX}
 8908 Maximum length of a string constant accepted by the *bc* utility.
 8909 Minimum Acceptable Value: {_POSIX2_BC_STRING_MAX}
 8910 {CHARCLASS_NAME_MAX}
 8911 Maximum number of bytes in a character class name.
 8912 Minimum Acceptable Value: {_POSIX2_CHARCLASS_NAME_MAX}
 8913 {COLL_WEIGHTS_MAX}
 8914 Maximum number of weights that can be assigned to an entry of the *LC_COLLATE* **order**
 8915 keyword in the locale definition file; see Chapter 7 (on page 123).
 8916 Minimum Acceptable Value: {_POSIX2_COLL_WEIGHTS_MAX}
 8917 {EXPR_NEST_MAX}
 8918 Maximum number of expressions that can be nested within parentheses by the *expr* utility.
 8919 Minimum Acceptable Value: {_POSIX2_EXPR_NEST_MAX}
 8920 {LINE_MAX}
 8921 Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
 8922 standard input or another file), when the utility is described as processing text files. The
 8923 length includes room for the trailing <newline>.
 8924 Minimum Acceptable Value: {_POSIX2_LINE_MAX}
 8925 {NGROUPS_MAX}
 8926 Maximum number of simultaneous supplementary group IDs per process.
 8927 Minimum Acceptable Value: {_POSIX_NGROUPS_MAX}
 8928 {RE_DUP_MAX}
 8929 Maximum number of repeated occurrences of a regular expression permitted when using
 8930 the interval notation `\{m,n\}`; see Chapter 9 (on page 169).
 8931 Minimum Acceptable Value: {_POSIX2_RE_DUP_MAX}

8932 Maximum Values

8933 TMR The symbolic constants in the following list shall be defined in <limits.h> with the values
 8934 shown. These are symbolic names for the most restrictive value for certain features on an
 8935 implementation supporting the Timers option. A conforming implementation shall provide
 8936 values no larger than these values. A conforming application must not require a smaller value
 8937 for correct operation.
 8938 TMR {_POSIX_CLOCKRES_MIN}
 8939 The resolution of the *CLOCK_REALTIME* clock, in nanoseconds.
 8940 Value: 20 000 000
 8941 MON If the Monotonic Clock option is supported, the resolution of the *CLOCK_MONOTONIC*
 8942 clock, in nanoseconds, is represented by {_POSIX_CLOCKRES_MIN}.

8943 **Minimum Values**

8944 The symbolic constants in the following list shall be defined in <limits.h> with the values
 8945 shown. These are symbolic names for the most restrictive value for certain features on an
 8946 implementation conforming to this volume of IEEE Std 1003.1-2001. Related symbolic constants
 8947 are defined elsewhere in this volume of IEEE Std 1003.1-2001 which reflect the actual
 8948 implementation and which need not be as restrictive. A conforming implementation shall
 8949 provide values at least this large. A strictly conforming application must not require a larger
 8950 value for correct operation.

8951 AIO { _POSIX_AIO_LISTIO_MAX}
 8952 The number of I/O operations that can be specified in a list I/O call.
 8953 Value: 2

8954 AIO { _POSIX_AIO_MAX}
 8955 The number of outstanding asynchronous I/O operations.
 8956 Value: 1

8957 { _POSIX_ARG_MAX}
 8958 Maximum length of argument to the *exec* functions including environment data.
 8959 Value: 4 096

8960 { _POSIX_CHILD_MAX}
 8961 Maximum number of simultaneous processes per real user ID.
 8962 Value: 25

8963 TMR { _POSIX_DELAYTIMER_MAX}
 8964 The number of timer expiration overruns.
 8965 Value: 32

8966 { _POSIX_HOST_NAME_MAX}
 8967 Maximum length of a host name (not including the terminating null) as returned from the
 8968 *gethostname()* function.
 8969 Value: 255

8970 { _POSIX_LINK_MAX}
 8971 Maximum number of links to a single file.
 8972 Value: 8

8973 { _POSIX_LOGIN_NAME_MAX}
 8974 The size of the storage required for a login name, in bytes, including the terminating null.
 8975 Value: 9

8976 { _POSIX_MAX_CANON}
 8977 Maximum number of bytes in a terminal canonical input queue.
 8978 Value: 255

8979 { _POSIX_MAX_INPUT}
 8980 Maximum number of bytes allowed in a terminal input queue.
 8981 Value: 255

8982 MSG { _POSIX_MQ_OPEN_MAX}
 8983 The number of message queues that can be open for a single process.
 8984 Value: 8

8985 MSG { _POSIX_MQ_PRIO_MAX}
 8986 The maximum number of message priorities supported by the implementation.
 8987 Value: 32

8988		{_POSIX_NAME_MAX}
8989		Maximum number of bytes in a filename (not including terminating null).
8990		Value: 14
8991		{_POSIX_NGROUPS_MAX}
8992		Maximum number of simultaneous supplementary group IDs per process.
8993		Value: 8
8994		{_POSIX_OPEN_MAX}
8995		Maximum number of files that one process can have open at any one time.
8996		Value: 20
8997		{_POSIX_PATH_MAX}
8998		Maximum number of bytes in a pathname.
8999		Value: 256
9000		{_POSIX_PIPE_BUF}
9001		Maximum number of bytes that is guaranteed to be atomic when writing to a pipe.
9002		Value: 512
9003		{_POSIX_RE_DUP_MAX}
9004		The number of repeated occurrences of a BRE permitted by the <i>regex</i> (<i>re</i>) and <i>regcomp</i> (<i>re</i>)
9005		functions when using the interval notation <i>{(m,n)}</i> ; see Section 9.3.6 (on page 174).
9006		Value: 255
9007	RTS	{_POSIX_RTSIG_MAX}
9008		The number of realtime signal numbers reserved for application use.
9009		Value: 8
9010	SEM	{_POSIX_SEM_NSEMS_MAX}
9011		The number of semaphores that a process may have.
9012		Value: 256
9013	SEM	{_POSIX_SEM_VALUE_MAX}
9014		The maximum value a semaphore may have.
9015		Value: 32 767
9016	RTS	{_POSIX_SIGQUEUE_MAX}
9017		The number of queued signals that a process may send and have pending at the receiver(s)
9018		at any time.
9019		Value: 32
9020		{_POSIX_SSIZE_MAX}
9021		The value that can be stored in an object of type ssize_t .
9022		Value: 32 767
9023		{_POSIX_STREAM_MAX}
9024		The number of streams that one process can have open at one time.
9025		Value: 8
9026	SS TSP	{_POSIX_SS_REPL_MAX}
9027		The number of replenishment operations that may be simultaneously pending for a
9028		particular sporadic server scheduler.
9029		Value: 4
9030		{_POSIX_SYMLINK_MAX}
9031		The number of bytes in a symbolic link.
9032		Value: 255

9033		{_POSIX_SYMLOOP_MAX}
9034		The number of symbolic links that can be traversed in the resolution of a pathname in the
9035		absence of a loop.
9036		Value: 8
9037	THR	{_POSIX_THREAD_DESTRUCTOR_ITERATIONS}
9038		The number of attempts made to destroy a thread's thread-specific data values on thread
9039		exit.
9040		Value: 4
9041	THR	{_POSIX_THREAD_KEYS_MAX}
9042		The number of data keys per process.
9043		Value: 128
9044	THR	{_POSIX_THREAD_THREADS_MAX}
9045		The number of threads per process.
9046		Value: 64
9047	TMR	{_POSIX_TIMER_MAX}
9048		The per-process number of timers.
9049		Value: 32
9050	TRC	{_POSIX_TRACE_EVENT_NAME_MAX}
9051		The length in bytes of a trace event name.
9052		Value: 30
9053	TRC	{_POSIX_TRACE_NAME_MAX}
9054		The length in bytes of a trace generation version string or a trace stream name.
9055		Value: 8
9056	TRC	{_POSIX_TRACE_SYS_MAX}
9057		The number of trace streams that may simultaneously exist in the system.
9058		Value: 8
9059	TRC	{_POSIX_TRACE_USER_EVENT_MAX}
9060		The number of user trace event type identifiers that may simultaneously exist in a traced
9061		process, including the predefined user trace event
9062		POSIX_TRACE_UNNAMED_USER_EVENT.
9063		Value: 32
9064		{_POSIX_TTY_NAME_MAX}
9065		The size of the storage required for a terminal device name, in bytes, including the
9066		terminating null.
9067		Value: 9
9068		{_POSIX_TZNAME_MAX}
9069		Maximum number of bytes supported for the name of a timezone (not of the <i>TZ</i> variable).
9070		Value: 6
9071		Note: The length given by {_POSIX_TZNAME_MAX} does not include the quoting characters
9072		mentioned in Section 8.3 (on page 165).
9073		{_POSIX2_BC_BASE_MAX}
9074		Maximum <i>obase</i> values allowed by the <i>bc</i> utility.
9075		Value: 99
9076		{_POSIX2_BC_DIM_MAX}
9077		Maximum number of elements permitted in an array by the <i>bc</i> utility.
9078		Value: 2 048

```

9079      {_POSIX2_BC_SCALE_MAX}
9080          Maximum scale value allowed by the bc utility.
9081          Value: 99

9082      {_POSIX2_BC_STRING_MAX}
9083          Maximum length of a string constant accepted by the bc utility.
9084          Value: 1 000

9085      {_POSIX2_CHARCLASS_NAME_MAX}
9086          Maximum number of bytes in a character class name.
9087          Value: 14

9088      {_POSIX2_COLL_WEIGHTS_MAX}
9089          Maximum number of weights that can be assigned to an entry of the LC_COLLATE order
9090          keyword in the locale definition file; see Chapter 7 (on page 123).
9091          Value: 2

9092      {_POSIX2_EXPR_NEST_MAX}
9093          Maximum number of expressions that can be nested within parentheses by the expr utility.
9094          Value: 32

9095      {_POSIX2_LINE_MAX}
9096          Unless otherwise noted, the maximum length, in bytes, of a utility's input line (either
9097          standard input or another file), when the utility is described as processing text files. The
9098          length includes room for the trailing <newline>.
9099          Value: 2 048

9100      {_POSIX2_RE_DUP_MAX}
9101          Maximum number of repeated occurrences of a regular expression permitted when using
9102          the interval notation \{m,n\}; see Chapter 9 (on page 169).
9103          Value: 255

9104  XSI      {_XOPEN_IOV_MAX}
9105          Maximum number of iovec structures that one process has available for use with readv() or
9106          writev().
9107          Value: 16

9108  XSI      {_XOPEN_NAME_MAX}
9109          Maximum number of bytes in a filename (not including the terminating null).
9110          Value: 255

9111  XSI      {_XOPEN_PATH_MAX}
9112          Maximum number of bytes in a pathname.
9113          Value: 1 024

9114      Numerical Limits

9115      The values in the following lists shall be defined in <limits.h> and are constant expressions
9116  XSI      suitable for use in #if preprocessing directives. Moreover, except for {CHAR_BIT}, {DBL_DIG},
9117          {DBL_MAX}, {FLT_DIG}, {FLT_MAX}, {LONG_BIT}, {WORD_BIT}, and {MB_LEN_MAX}, the
9118          symbolic names are defined as expressions of the correct type.

9119      If the value of an object of type char is treated as a signed integer when used in an expression,
9120          the value of {CHAR_MIN} is the same as that of {SCHAR_MIN} and the value of {CHAR_MAX}
9121          is the same as that of {SCHAR_MAX}. Otherwise, the value of {CHAR_MIN} is 0 and the value
9122          of {CHAR_MAX} is the same as that of {UCHAR_MAX}.

```

9123		{CHAR_BIT}
9124		Number of bits in a type char .
9125	CX	Value: 8
9126		{CHAR_MAX}
9127		Maximum value of type char .
9128		Value: {UCHAR_MAX} or {SCHAR_MAX}
9129		{CHAR_MIN}
9130		Minimum value of type char .
9131		Value: {SCHAR_MIN} or 0
9132		{INT_MAX}
9133		Maximum value of an int .
9134		Minimum Acceptable Value: 2 147 483 647
9135	XSI	{LONG_BIT}
9136		Number of bits in a long .
9137		Minimum Acceptable Value: 32
9138		{LONG_MAX}
9139		Maximum value of a long .
9140		Minimum Acceptable Value: +2 147 483 647
9141		{MB_LEN_MAX}
9142		Maximum number of bytes in a character, for any supported locale.
9143		Minimum Acceptable Value: 1
9144		{SCHAR_MAX}
9145		Maximum value of type signed char .
9146	CX	Value: +127
9147		{SHRT_MAX}
9148		Maximum value of type short .
9149		Minimum Acceptable Value: +32 767
9150		{SSIZE_MAX}
9151		Maximum value of an object of type ssize_t .
9152		Minimum Acceptable Value: {_POSIX_SSIZE_MAX}
9153		{UCHAR_MAX}
9154		Maximum value of type unsigned char .
9155	CX	Value: 255
9156		{UINT_MAX}
9157		Maximum value of type unsigned .
9158		Minimum Acceptable Value: 4 294 967 295
9159		{ULONG_MAX}
9160		Maximum value of type unsigned long .
9161		Minimum Acceptable Value: 4 294 967 295
9162		{USHRT_MAX}
9163		Maximum value for a type unsigned short .
9164		Minimum Acceptable Value: 65 535
9165	XSI	{WORD_BIT}
9166		Number of bits in a word or type int .
9167		Minimum Acceptable Value: 16

9168 {INT_MIN}
 9169 Minimum value of type **int**.
 9170 Maximum Acceptable Value: -2 147 483 647

9171 {LONG_MIN}
 9172 Minimum value of type **long**.
 9173 Maximum Acceptable Value: -2 147 483 647

9174 {SCHAR_MIN}
 9175 Minimum value of type **signed char**.
 9176 CX Value: -128

9177 {SHRT_MIN}
 9178 Minimum value of type **short**.
 9179 Maximum Acceptable Value: -32 767

9180 {LLONG_MIN}
 9181 Minimum value of type **long long**.
 9182 Maximum Acceptable Value: -9 223 372 036 854 775 807

9183 {LLONG_MAX}
 9184 Maximum value of type **long long**.
 9185 Minimum Acceptable Value: +9 223 372 036 854 775 807

9186 {ULLONG_MAX}
 9187 Maximum value of type **unsigned long long**.
 9188 Minimum Acceptable Value: 18 446 744 073 709 551 615

9189 Other Invariant Values

9190 XSI The following constants shall be defined on all implementations in <limits.h>:

9191 XSI {CHARCLASS_NAME_MAX}
 9192 Maximum number of bytes in a character class name.
 9193 Minimum Acceptable Value: 14

9194 XSI {NL_ARGMAX}
 9195 Maximum value of *digit* in calls to the *printf()* and *scanf()* functions.
 9196 Minimum Acceptable Value: 9

9197 XSI {NL_LANGMAX}
 9198 Maximum number of bytes in a *LANG* name.
 9199 Minimum Acceptable Value: 14

9200 XSI {NL_MSGMAX}
 9201 Maximum message number.
 9202 Minimum Acceptable Value: 32 767

9203 XSI {NL_NMAX}
 9204 Maximum number of bytes in an N-to-1 collation mapping.
 9205 Minimum Acceptable Value: No guaranteed value across all conforming implementations.

9206 XSI {NL_SETMAX}
 9207 Maximum set number.
 9208 Minimum Acceptable Value: 255

9209 XSI {NL_TEXTMAX}
 9210 Maximum number of bytes in a message string.
 9211 Minimum Acceptable Value: {_POSIX2_LINE_MAX}

9212 XSI {NZERO}
 9213 Default process priority.
 9214 Minimum Acceptable Value: 20

9215 APPLICATION USAGE

9216 None.

9217 RATIONALE

9218 A request was made to reduce the value of {_POSIX_LINK_MAX} from the value of 8 specified
 9219 for it in the POSIX.1-1990 standard to 2. The standard developers decided to deny this request
 9220 for several reasons:

- 9221 • They wanted to avoid making any changes to the standard that could break conforming
 9222 applications, and the requested change could have that effect.
- 9223 • The use of multiple hard links to a file cannot always be replaced with use of symbolic links.
 9224 Symbolic links are semantically different from hard links in that they associate a pathname
 9225 with another pathname rather than a pathname with a file. This has implications for access
 9226 control, file permanence, and transparency.
- 9227 • The original standard developers had considered the issue of allowing for implementations
 9228 that did not in general support hard links, and decided that this would reduce consensus on
 9229 the standard.

9230 Systems that support historical versions of the development option of the ISO POSIX-2 standard
 9231 retain the name {_POSIX2_RE_DUP_MAX} as an alias for {_POSIX_RE_DUP_MAX}.

9232 {PATH_MAX}
 9233 IEEE PASC Interpretation 1003.1 #15 addressed the inconsistency in the standard with the
 9234 definition of pathname and the description of {PATH_MAX}, allowing application writers to
 9235 allocate either {PATH_MAX} or {PATH_MAX}+1 bytes. The inconsistency has been
 9236 removed by correction to the {PATH_MAX} definition to include the null character. With
 9237 this change, applications that previously allocated {PATH_MAX} bytes will continue to
 9238 succeed.

9239 {SYMLINK_MAX}
 9240 This symbol refers to space for data that is stored in the file system, as opposed to
 9241 {PATH_MAX} which is the length of a name that can be passed to a function. In some
 9242 existing implementations, the filenames pointed to by symbolic links are stored in the
 9243 inodes of the links, so it is important that {SYMLINK_MAX} not be constrained to be as
 9244 large as {PATH_MAX}.

9245 FUTURE DIRECTIONS

9246 None.

9249 CHANGE HISTORY

9250 First released in Issue 1.

9251 Issue 5

9252 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 9253 Threads Extension.

9254 {FILESIZEBITS} is added for the Large File Summit extensions.

9255 The minimum acceptable values for {INT_MAX}, {INT_MIN}, and {UINT_MAX} are changed to
 9256 make 32-bit values the minimum requirement.

9257 The entry is restructured to improve readability.

9258 **Issue 6**

9259 The Open Group Corrigendum U033/4 is applied. The wording is made clear for {CHAR_MIN},
 9260 {INT_MIN}, {LONG_MIN}, {SCHAR_MIN}, and {SHRT_MIN} that these are maximum
 9261 acceptable values.

9262 The following new requirements on POSIX implementations derive from alignment with the
 9263 Single UNIX Specification:

- 9264 • The minimum value for {CHILD_MAX} is 25. This is a FIPS requirement.
- 9265 • The minimum value for {OPEN_MAX} is 20. This is a FIPS requirement.
- 9266 • The minimum value for {NGROUPS_MAX} is 8. This is also a FIPS requirement.

9267 Symbolic constants are added for {_POSIX_SYMLINK_MAX}, {_POSIX_SYMLOOP_MAX},
 9268 {_POSIX_RE_DUP_MAX}, {RE_DUP_MAX}, {SYMLOOP_MAX}, and {SYMLINK_MAX}.

9269 The following values are added for alignment with IEEE Std 1003.1d-1999:

9270 {_POSIX_SS_REPL_MAX}
 9271 {SS_REPL_MAX}
 9272 {POSIX_ALLOC_SIZE_MIN}
 9273 {POSIX_REC_INCR_XFER_SIZE}
 9274 {POSIX_REC_MAX_XFER_SIZE}
 9275 {POSIX_REC_MIN_XFER_SIZE}
 9276 {POSIX_REC_XFER_ALIGN}

9277 Reference to CLOCK_MONOTONIC is added in the description of {_POSIX_CLOCKRES_MIN}
 9278 for alignment with IEEE Std 1003.1j-2000.

9279 The constants {LLONG_MIN}, {LLONG_MAX}, and {ULLONG_MAX} are added for alignment
 9280 with the ISO / IEC 9899: 1999 standard.

9281 The following values are added for alignment with IEEE Std 1003.1q-2000:

9282 {_POSIX_TRACE_EVENT_NAME_MAX}
 9283 {_POSIX_TRACE_NAME_MAX}
 9284 {_POSIX_TRACE_SYS_MAX}
 9285 {_POSIX_TRACE_USER_EVENT_MAX}
 9286 {TRACE_EVENT_NAME_MAX}
 9287 {TRACE_NAME_MAX}
 9288 {TRACE_SYS_MAX}
 9289 {TRACE_USER_EVENT_MAX}

9290 The new limits {_XOPEN_NAME_MAX} and {_XOPEN_PATH_MAX} are added as minimum
 9291 values for {PATH_MAX} and {NAME_MAX} limits on XSI-conformant systems.

9292 The legacy symbols {PASS_MAX} and {TMP_MAX} are removed.

9293 The values for the limits {CHAR_BIT}, {SCHAR_MAX}, and {UCHAR_MAX} are now required
 9294 to be 8, +127, and 255, respectively.

9295 The value for the limit {CHAR_MAX} is now {UCHAR_MAX} or {SCHAR_MAX}.

9296 The value for the limit {CHAR_MIN} is now {SCHAR_MIN} or zero.

9297 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/10 is applied, correcting the value of
 9298 {_POSIX_CHILD_MAX} from 6 to 25. This is for FIPS 151-2 alignment. |

9299 **NAME**

9300 locale.h — category macros

9301 **SYNOPSIS**

9302 #include <locale.h>

9303 **DESCRIPTION**

9304 CX Some of the functionality described on this reference page extends the ISO C standard. Any
9305 conflict between the requirements described here and the ISO C standard is unintentional. This
9306 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9307 The <locale.h> header shall provide a definition for **lconv** structure, which shall include at least
9308 the following members. (See the definitions of *LC_MONETARY* in Section 7.3.3 (on page 142)
9309 and Section 7.3.4 (on page 145).)

```
9310 char    *currency_symbol
9311 char    *decimal_point
9312 char    frac_digits
9313 char    *grouping
9314 char    *int_curr_symbol
9315 char    int_frac_digits
9316 char    int_n_cs_precedes
9317 char    int_n_sep_by_space
9318 char    int_n_sign_posn
9319 char    int_p_cs_precedes
9320 char    int_p_sep_by_space
9321 char    int_p_sign_posn
9322 char    *mon_decimal_point
9323 char    *mon_grouping
9324 char    *mon_thousands_sep
9325 char    *negative_sign
9326 char    n_cs_precedes
9327 char    n_sep_by_space
9328 char    n_sign_posn
9329 char    *positive_sign
9330 char    p_cs_precedes
9331 char    p_sep_by_space
9332 char    p_sign_posn
9333 char    *thousands_sep
```

9334 The <locale.h> header shall define NULL (as defined in <stddef.h>) and at least the following as
9335 macros:

```
9336 LC_ALL
9337 LC_COLLATE
9338 LC_CTYPE
9339 CX LC_MESSAGES
9340 LC_MONETARY
9341 LC_NUMERIC
9342 LC_TIME
```

9343 which shall expand to distinct integer constant expressions, for use as the first argument to the
9344 *setlocale()* function.

9345 Additional macro definitions, beginning with the characters *LC_* and an uppercase letter, may
9346 also be given here.

9347 The following shall be declared as functions and may also be defined as macros. Function
9348 prototypes shall be provided.

9349 struct lconv *localeconv (void);
9350 char *setlocale(int, const char *);

9351 **APPLICATION USAGE**

9352 None.

9353 **RATIONALE**

9354 None.

9355 **FUTURE DIRECTIONS**

9356 None.

9357 **SEE ALSO**

9358 The System Interfaces volume of IEEE Std 1003.1-2001, *localeconv()*, *setlocale()*, Chapter 8 (on
9359 page 161)

9360 **CHANGE HISTORY**

9361 First released in Issue 3.

9362 Included for alignment with the ISO C standard.

9363 **Issue 6**

9364 The **lconv** structure is expanded with new members (**int_n_cs_precedes**, **int_n_sep_by_space**,
9365 **int_n_sign_posn**, **int_p_cs_precedes**, **int_p_sep_by_space**, and **int_p_sign_posn**) for alignment
9366 with the ISO / IEC 9899:1999 standard.

9367 Extensions beyond the ISO C standard are marked.

9368 **NAME**

9369 math.h — mathematical declarations

9370 **SYNOPSIS**

9371 #include <math.h>

9372 **DESCRIPTION**

9373 CX Some of the functionality described on this reference page extends the ISO C standard.
 9374 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 9375 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 9376 symbols in this header.

9377 The <math.h> header shall include definitions for at least the following types:

9378 **float_t** A real-floating type at least as wide as **float**.

9379 **double_t** A real-floating type at least as wide as **double**, and at least as wide as **float_t**.

9380 If FLT_EVAL_METHOD equals 0, **float_t** and **double_t** shall be **float** and **double**, respectively; if
 9381 FLT_EVAL_METHOD equals 1, they shall both be **double**; if FLT_EVAL_METHOD equals 2,
 9382 they shall both be **long double**; for other values of FLT_EVAL_METHOD, they are otherwise
 9383 implementation-defined.

9384 The <math.h> header shall define the following macros, where real-floating indicates that the
 9385 argument shall be an expression of real-floating type:

```
9386 int fpclassify(real-floating x);
9387 int isfinite(real-floating x);
9388 int isinf(real-floating x);
9389 int isnan(real-floating x);
9390 int isnormal(real-floating x);
9391 int signbit(real-floating x);
9392 int isgreater(real-floating x, real-floating y);
9393 int isgreaterequal(real-floating x, real-floating y);
9394 int isless(real-floating x, real-floating y);
9395 int islessequal(real-floating x, real-floating y);
9396 int islessgreater(real-floating x, real-floating y);
9397 int unordered(real-floating x, real-floating y);
```

9398 The <math.h> header shall provide for the following constants. The values are of type **double**
 9399 and are accurate within the precision of the **double** type.

9400	XSI	<u>M_E</u>	Value of e
9401		<u>M_LOG2E</u>	Value of $\log_2 e$
9402		<u>M_LOG10E</u>	Value of $\log_{10} e$
9403		<u>M_LN2</u>	Value of $\log_e 2$
9404		<u>M_LN10</u>	Value of $\log_e 10$
9405		<u>M_PI</u>	Value of π
9406		<u>M_PI_2</u>	Value of $\pi/2$
9407		<u>M_PI_4</u>	Value of $\pi/4$
9408		<u>M_1_PI</u>	Value of $1/\pi$
9409		<u>M_2_PI</u>	Value of $2/\pi$

9410	M_2_SQRTPI	Value of $2/\sqrt{\pi}$
9411	M_SQRT2	Value of $\sqrt{2}$
9412	M_SQRT1_2	Value of $1/\sqrt{2}$
9413	The header shall define the following symbolic constants:	
9414	MAXFLOAT	Value of maximum non-infinite single-precision floating-point number.
9415	HUGE_VAL	A positive double expression, not necessarily representable as a float . Used
9416		as an error value returned by the mathematics library. HUGE_VAL evaluates
9417		to +infinity on systems supporting IEEE Std 754-1985.
9418	HUGE_VALF	A positive float constant expression. Used as an error value returned by the
9419		mathematics library. HUGE_VALF evaluates to +infinity on systems
9420		supporting IEEE Std 754-1985.
9421	HUGE_VALL	A positive long double constant expression. Used as an error value returned
9422		by the mathematics library. HUGE_VALL evaluates to +infinity on systems
9423		supporting IEEE Std 754-1985.
9424	INFINITY	A constant expression of type float representing positive or unsigned infinity,
9425		if available; else a positive constant of type float that overflows at translation
9426		time.
9427	NAN	A constant expression of type float representing a quiet NaN. This symbolic
9428		constant is only defined if the implementation supports quiet NaNs for the
9429		float type.
9430	The following macros shall be defined for number classification. They represent the mutually-	
9431	exclusive kinds of floating-point values. They expand to integer constant expressions with	
9432	distinct values. Additional implementation-defined floating-point classifications, with macro	
9433	definitions beginning with FP_ and an uppercase letter, may also be specified by the	
9434	implementation.	
9435	FP_INFINITE	
9436	FP_NAN	
9437	FP_NORMAL	
9438	FP_SUBNORMAL	
9439	FP_ZERO	
9440	The following optional macros indicate whether the <i>fma()</i> family of functions are fast compared	
9441	with direct code:	
9442	FP_FAST_FMA	
9443	FP_FAST_FMAF	
9444	FP_FAST_FMAL	
9445	The FP_FAST_FMA macro shall be defined to indicate that the <i>fma()</i> function generally executes	
9446	about as fast as, or faster than, a multiply and an add of double operands. The other macros	
9447	have the equivalent meaning for the float and long double versions.	
9448	The following macros shall expand to integer constant expressions whose values are returned by	
9449	<i>ilogb(x)</i> if <i>x</i> is zero or NaN, respectively. The value of FP_ILOGB0 shall be either {INT_MIN} or	
9450	-{INT_MAX}. The value of FP_ILOGBNAN shall be either {INT_MAX} or {INT_MIN}.	
9451	FP_ILOGB0	
9452	FP_ILOGBNAN	

9453 The following macros shall expand to the integer constants 1 and 2, respectively;

9454 **MATH_ERRNO**

9455 **MATH_ERREXCEPT**

9456 The following macro shall expand to an expression that has type **int** and the value

9457 **MATH_ERRNO**, **MATH_ERREXCEPT**, or the bitwise-inclusive OR of both:

9458 **math_errhandling**

9459 The value of **math_errhandling** is constant for the duration of the program. It is unspecified

9460 whether **math_errhandling** is a macro or an identifier with external linkage. If a macro definition

9461 is suppressed or a program defines an identifier with the name **math_errhandling**, the behavior

9462 is undefined. If the expression (**math_errhandling** & **MATH_ERREXCEPT**) can be non-zero, the

9463 implementation shall define the macros **FE_DIVBYZERO**, **FE_INVALID**, and **FE_OVERFLOW** in

9464 **<fenv.h>**.

9465 The following shall be declared as functions and may also be defined as macros. Function

9466 prototypes shall be provided.

9467 double **acos**(double);

9468 float **acosf**(float);

9469 double **acosh**(double);

9470 float **acoshf**(float);

9471 long double **acoshl**(long double);

9472 long double **acosl**(long double);

9473 double **asin**(double);

9474 float **asinf**(float);

9475 double **asinh**(double);

9476 float **asinhf**(float);

9477 long double **asinh1**(long double);

9478 long double **asinl**(long double);

9479 double **atan**(double);

9480 double **atan2**(double, double);

9481 float **atan2f**(float, float);

9482 long double **atan2l**(long double, long double);

9483 float **atanf**(float);

9484 double **atanh**(double);

9485 float **atanhf**(float);

9486 long double **atanh1**(long double);

9487 long double **atanl**(long double);

9488 double **cbrt**(double);

9489 float **cbrtf**(float);

9490 long double **cbrtl**(long double);

9491 double **ceil**(double);

9492 float **ceilf**(float);

9493 long double **ceil1**(long double);

9494 double **copysign**(double, double);

9495 float **copysignf**(float, float);

9496 long double **copysignl**(long double, long double);

9497 double **cos**(double);

9498 float **cosf**(float);

9499 double **cosh**(double);

9500 float **coshf**(float);

9501 long double **cosh1**(long double);

```

9642 XSI double   y0(double);
9643 double      y1(double);
9644 double      yn(int, double);
9645

```

9646 The following external variable shall be defined:

```

9647 XSI extern int signgam;
9648

```

9649 The behavior of each of the functions defined in <math.h> is specified in the System Interfaces
9650 volume of IEEE Std 1003.1-2001 for all representable values of its input arguments, except where
9651 stated otherwise. Each function shall execute as if it were a single operation without generating
9652 any externally visible exceptional conditions.

9653 APPLICATION USAGE

9654 The FP_CONTRACT pragma can be used to allow (if the state is on) or disallow (if the state is
9655 off) the implementation to contract expressions. Each pragma can occur either outside external
9656 declarations or preceding all explicit declarations and statements inside a compound statement.
9657 When outside external declarations, the pragma takes effect from its occurrence until another
9658 FP_CONTRACT pragma is encountered, or until the end of the translation unit. When inside a
9659 compound statement, the pragma takes effect from its occurrence until another FP_CONTRACT
9660 pragma is encountered (including within a nested compound statement), or until the end of the
9661 compound statement; at the end of a compound statement the state for the pragma is restored to
9662 its condition just before the compound statement. If this pragma is used in any other context, the
9663 behavior is undefined. The default state (on or off) for the pragma is implementation-defined.

9664 RATIONALE

9665 Before the ISO/IEC 9899:1999 standard, the math library was defined only for the floating type
9666 **double**. All the names formed by appending 'f' or 'l' to a name in <math.h> were reserved
9667 to allow for the definition of **float** and **long double** libraries; and the ISO/IEC 9899:1999
9668 standard provides for all three versions of math functions.

9669 The functions *ecvt()*, *fcvt()*, and *gcvt()* have been dropped from the ISO C standard since their
9670 capability is available through *sprintf()*. These are provided on XSI-conformant systems
9671 supporting the Legacy Option Group.

9672 FUTURE DIRECTIONS

9673 None.

9679 CHANGE HISTORY

9680 First released in Issue 1.

9681 Issue 6

9682 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

9683 **NAME**

9684 monetary.h — monetary types

9685 **SYNOPSIS**

9686 xSI #include <monetary.h>

9687

9688 **DESCRIPTION**9689 The **<monetary.h>** header shall define the following types:9690 **size_t** As described in **<stddef.h>**.9691 **ssize_t** As described in **<sys/types.h>**.9692 The following shall be declared as a function and may also be defined as a macro. A function
9693 prototype shall be provided.9694 **ssize_t** strfmon(char *restrict, size_t, const char *restrict, ...);9695 **APPLICATION USAGE**

9696 None.

9697 **RATIONALE**

9698 None.

9699 **FUTURE DIRECTIONS**

9700 None.

9701 **SEE ALSO**9702 The System Interfaces volume of IEEE Std 1003.1-2001, *strfmon()*9703 **CHANGE HISTORY**

9704 First released in Issue 4.

9705 **Issue 6**9706 The **restrict** keyword is added to the prototype for *strfmon()*.

9707 **NAME**

9708 mqqueue.h — message queues (**REALTIME**)

9709 **SYNOPSIS**

9710 MSG #include <mqqueue.h>

9711

9712 **DESCRIPTION**

9713 The <mqqueue.h> header shall define the **mqd_t** type, which is used for message queue
9714 descriptors. This is not an array type.

9715 The <mqqueue.h> header shall define the **sigevent** structure (as described in <signal.h>) and the
9716 **mq_attr** structure, which is used in getting and setting the attributes of a message queue.
9717 Attributes are initially set when the message queue is created. An **mq_attr** structure shall have at
9718 least the following fields:

9719	long	mq_flags	Message queue flags.
9720	long	mq_maxmsg	Maximum number of messages.
9721	long	mq_msgsize	Maximum message size.
9722	long	mq_curmsgs	Number of messages currently queued.

9723 The following shall be declared as functions and may also be defined as macros. Function
9724 prototypes shall be provided.

9725	int	mq_close(mqd_t);
9726	int	mq_getattr(mqd_t, struct mq_attr *);
9727	int	mq_notify(mqd_t, const struct sigevent *);
9728	mqd_t	mq_open(const char *, int, ...);
9729	ssize_t	mq_receive(mqd_t, char *, size_t, unsigned *);
9730	int	mq_send(mqd_t, const char *, size_t, unsigned);
9731	int	mq_setattr(mqd_t, const struct mq_attr *restrict,
9732		struct mq_attr *restrict);
9733	TMO	ssize_t mq_timedreceive(mqd_t, char *restrict, size_t,
9734		unsigned *restrict, const struct timespec *restrict);
9735	int	mq_timedsend(mqd_t, const char *, size_t, unsigned,
9736		const struct timespec *);
9737	int	mq_unlink(const char *);

9738 Inclusion of the <mqqueue.h> header may make visible symbols defined in the headers <fcntl.h>,
9739 <signal.h>, <sys/types.h>, and <time.h>.

9740 **APPLICATION USAGE**

9741 None.

9742 **RATIONALE**

9743 None.

9744 **FUTURE DIRECTIONS**

9745 None.

9746 **SEE ALSO**

9747 <fcntl.h>, <signal.h>, <sys/types.h>, <time.h>, the System Interfaces volume of
9748 IEEE Std 1003.1-2001, *mq_close()*, *mq_getattr()*, *mq_notify()*, *mq_open()*, *mq_receive()*, *mq_send()*,
9749 *mq_setattr()*, *mq_timedreceive()*, *mq_timedsend()*, *mq_unlink()*

9750 CHANGE HISTORY

9751 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

9752 Issue 6

9753 The **<mqueue.h>** header is marked as part of the Message Passing option.

9754 The *mq_timedreceive()* and *mq_timedsend()* functions are added for alignment with
9755 IEEE Std 1003.1d-1999.

9756 The **restrict** keyword is added to the prototypes for *mq_setattr()* and *mq_timedreceive()*.

9757 **NAME**

9758 ndbm.h — definitions for ndbm database operations

9759 **SYNOPSIS**9760 xSI `#include <ndbm.h>`

9761

9762 **DESCRIPTION**9763 The <ndbm.h> header shall define the **datum** type as a structure that includes at least the
9764 following members:9765 `void *dptr` A pointer to the application's data.9766 `size_t dsize` The size of the object pointed to by *dptr*.9767 The **size_t** type shall be defined as described in <stddef.h>.9768 The <ndbm.h> header shall define the **DBM** type.9769 The following constants shall be defined as possible values for the *store_mode* argument to
9770 *dbm_store()*:9771 `DBM_INSERT` Insertion of new entries only.9772 `DBM_REPLACE` Allow replacing existing entries.9773 The following shall be declared as functions and may also be defined as macros. Function
9774 prototypes shall be provided.9775 `int dbm_clearerr(DBM *);`9776 `void dbm_close(DBM *);`9777 `int dbm_delete(DBM *, datum);`9778 `int dbm_error(DBM *);`9779 `datum dbm_fetch(DBM *, datum);`9780 `datum dbm_firstkey(DBM *);`9781 `datum dbm_nextkey(DBM *);`9782 `DBM *dbm_open(const char *, int, mode_t);`9783 `int dbm_store(DBM *, datum, datum, int);`9784 The **mode_t** type shall be defined through **typedef** as described in <sys/types.h>.9785 **APPLICATION USAGE**

9786 None.

9787 **RATIONALE**

9788 None.

9789 **FUTURE DIRECTIONS**

9790 None.

9791 **SEE ALSO**9792 <stddef.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *dbm_clearerr()*9793 **CHANGE HISTORY**

9794 First released in Issue 4, Version 2.

9795 **Issue 5**9796 References to the definitions of **size_t** and **mode_t** are added to the DESCRIPTION.

9797 **NAME**

9798 net/if.h — sockets local interfaces

9799 **SYNOPSIS**

9800 #include <net/if.h>

9801 **DESCRIPTION**9802 The **<net/if.h>** header shall define the **if_nameindex** structure that includes at least the
9803 following members:

9804 unsigned if_index Numeric index of the interface.

9805 char *if_name Null-terminated name of the interface.

9806 The **<net/if.h>** header shall define the following macro for the length of a buffer containing an
9807 interface name (including the terminating NULL character):

9808 IF_NAMESIZE Interface name length.

9809 The following shall be declared as functions and may also be defined as macros. Function
9810 prototypes shall be provided.

9811 unsigned if_nametoindex(const char *);

9812 char *if_indextoname(unsigned, char *);

9813 struct if_nameindex *if_nameindex(void);

9814 void if_freenameindex(struct if_nameindex *);

9815 **APPLICATION USAGE**

9816 None.

9817 **RATIONALE**

9818 None.

9819 **FUTURE DIRECTIONS**

9820 None.

9821 **SEE ALSO**9822 The System Interfaces volume of IEEE Std 1003.1-2001, *if_freenameindex()*, *if_indextoname()*,
9823 *if_nameindex()*, *if_nametoindex()*9824 **CHANGE HISTORY**

9825 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9826 **NAME**

9827 netdb.h — definitions for network database operations

9828 **SYNOPSIS**

9829 #include <netdb.h>

9830 **DESCRIPTION**

9831 The <netdb.h> header may define the **in_port_t** type and the **in_addr_t** type as described in
9832 <netinet/in.h>.

9833 The <netdb.h> header shall define the **hostent** structure that includes at least the following
9834 members:

9835	char	*h_name	Official name of the host.
9836	char	**h_aliases	A pointer to an array of pointers to
9837			alternative host names, terminated by a
9838			null pointer.
9839	int	h_addrtype	Address type.
9840	int	h_length	The length, in bytes, of the address.
9841	char	**h_addr_list	A pointer to an array of pointers to network
9842			addresses (in network byte order) for the host,
9843			terminated by a null pointer.

9844 The <netdb.h> header shall define the **netent** structure that includes at least the following
9845 members:

9846	char	*n_name	Official, fully-qualified (including the
9847			domain) name of the host.
9848	char	**n_aliases	A pointer to an array of pointers to
9849			alternative network names, terminated by a
9850			null pointer.
9851	int	n_addrtype	The address type of the network.
9852	uint32_t	n_net	The network number, in host byte order.

9853 The **uint32_t** type shall be defined as described in <inttypes.h>.

9854 The <netdb.h> header shall define the **protoent** structure that includes at least the following
9855 members:

9856	char	*p_name	Official name of the protocol.
9857	char	**p_aliases	A pointer to an array of pointers to
9858			alternative protocol names, terminated by
9859			a null pointer.
9860	int	p_proto	The protocol number.

9861 The <netdb.h> header shall define the **servent** structure that includes at least the following
9862 members:

9863	char	*s_name	Official name of the service.
9864	char	**s_aliases	A pointer to an array of pointers to
9865			alternative service names, terminated by
9866			a null pointer.
9867	int	s_port	The port number at which the service
9868			resides, in network byte order.
9869	char	*s_proto	The name of the protocol to use when
9870			contacting the service.

9871 The <netdb.h> header shall define the IPPORT_RESERVED macro with the value of the highest
 9872 reserved Internet port number.

9873 OB When the <netdb.h> header is included, *h_errno* shall be available as a modifiable lvalue of type
 9874 **int**. It is unspecified whether *h_errno* is a macro or an identifier declared with external linkage.

9875 The <netdb.h> header shall define the following macros for use as error values for
 9876 *gethostbyaddr()* and *gethostbyname()*:

9877 HOST_NOT_FOUND
 9878 NO_DATA
 9879 NO_RECOVERY
 9880 TRY_AGAIN

9881 Address Information Structure

9882 The <netdb.h> header shall define the **addrinfo** structure that includes at least the following
 9883 members:

9884	int	ai_flags	Input flags.
9885	int	ai_family	Address family of socket.
9886	int	ai_socktype	Socket type.
9887	int	ai_protocol	Protocol of socket.
9888	socklen_t	ai_addrlen	Length of socket address.
9889	struct sockaddr	*ai_addr	Socket address of socket.
9890	char	*ai_canonname	Canonical name of service location.
9891	struct addrinfo	*ai_next	Pointer to next in list.

9892 The <netdb.h> header shall define the following macros that evaluate to bitwise-distinct integer
 9893 constants for use in the *flags* field of the **addrinfo** structure:

9894 AI_PASSIVE Socket address is intended for *bind()*.

9895 AI_CANONNAME
 9896 Request for canonical name.

9897 AI_NUMERICHOST
 9898 Return numeric host address as name.

9899 AI_NUMERICSERV
 9900 Inhibit service name resolution.

9901 AI_V4MAPPED If no IPv6 addresses are found, query for IPv4 addresses and return them to
 9902 the caller as IPv4-mapped IPv6 addresses.

9903 AI_ALL Query for both IPv4 and IPv6 addresses.

9904 AI_ADDRCONFIG
 9905 Query for IPv4 addresses only when an IPv4 address is configured; query for
 9906 IPv6 addresses only when an IPv6 address is configured.

9907 The <netdb.h> header shall define the following macros that evaluate to bitwise-distinct integer
 9908 constants for use in the *flags* argument to *getnameinfo()*:

9909 NI_NOFQDN Only the nodename portion of the FQDN is returned for local hosts.

9910 NI_NUMERICHOST
 9911 The numeric form of the node's address is returned instead of its name.

```

9912      NI_NAMEREQD Return an error if the node's name cannot be located in the database.
9913      NI_NUMERICSERV
9914          The numeric form of the service address is returned instead of its name.
9915      NI_NUMERICSCOPE
9916          For IPv6 addresses, the numeric form of the scope identifier is returned
9917          instead of its name.
9918      NI_DGRAM      Indicates that the service is a datagram service (SOCK_DGRAM).

9919      Address Information Errors

9920      The <netdb.h> header shall define the following macros for use as error values for getaddrinfo()
9921      and getnameinfo():

9922      EAI_AGAIN      The name could not be resolved at this time. Future attempts may succeed.
9923      EAI_BADFLAGS   The flags had an invalid value.
9924      EAI_FAIL       A non-recoverable error occurred.
9925      EAI_FAMILY     The address family was not recognized or the address length was invalid for
9926      the specified family.
9927      EAI_MEMORY     There was a memory allocation failure.
9928      EAI_NONAME     The name does not resolve for the supplied parameters.
9929                  NI_NAMEREQD is set and the host's name cannot be located, or both
9930                  nodename and servname were null.
9931      EAI_SERVICE    The service passed was not recognized for the specified socket type.
9932      EAI_SOCKETYPE  The intended socket type was not recognized.
9933      EAI_SYSTEM     A system error occurred. The error code can be found in errno.
9934      EAI_OVERFLOW
9935          An argument buffer overflowed.

9936      The following shall be declared as functions and may also be defined as macros. Function
9937      prototypes shall be provided.

9938      void          endhostent(void);
9939      void          endnetent(void);
9940      void          endprotoent(void);
9941      void          endservent(void);
9942      void          freeaddrinfo(struct addrinfo *);
9943      const char    *gai_strerror(int);
9944      int           getaddrinfo(const char *restrict, const char *restrict,
9945                               const struct addrinfo *restrict,
9946                               struct addrinfo **restrict);
9947      struct hostent *gethostbyaddr(const void *, socklen_t, int);
9948      struct hostent *gethostbyname(const char *);
9949      struct hostent *gethostent(void);
9950      int           getnameinfo(const struct sockaddr *restrict, socklen_t,
9951                               char *restrict, socklen_t, char *restrict,
9952                               socklen_t, int);
9953      struct netent *getnetbyaddr(uint32_t, int);
9954      struct netent *getnetbyname(const char *);

```

```

9955      struct netent      *getnetent(void);
9956      struct protoent    *getprotobyname(const char *);
9957      struct protoent    *getprotobyname(int);
9958      struct protoent    *getprotoent(void);
9959      struct servent      *getservbyname(const char *, const char *);
9960      struct servent      *getservbyport(int, const char *);
9961      struct servent      *getservent(void);
9962      void                sethostent(int);
9963      void                setnetent(int);
9964      void                setprotoent(int);
9965      void                setservent(int);

```

9966 The type **socklen_t** shall be defined through **typedef** as described in <sys/socket.h>.

9967 Inclusion of the <netdb.h> header may also make visible all symbols from <netinet/in.h>,
 9968 <sys/socket.h>, and <inttypes.h>.

9969 APPLICATION USAGE

9970 None.

9971 RATIONALE

9972 None.

9973 FUTURE DIRECTIONS

9974 None.

 9977 IEEE Std 1003.1-2001, *bind()*, *endhostent()*, *endnetent()*, *endprotoent()*, *endservent()*, *getaddrinfo()*,
 9978 *getnameinfo()*

9979 CHANGE HISTORY

9980 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9981 The Open Group Base Resolution bwg2001-009 is applied, which changes the return type for
 9982 *gai_strerror()* from **char *** to **const char ***. This is for coordination with the IPnG Working Group.

9983 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/11 is applied, adding a description of the
 9984 NI_NUMERICSCOPE macro and correcting the *getnameinfo()* function prototype. These changes
 9985 are for alignment with IPv6.

9986 **NAME**

9987 netinet/in.h — Internet address family

9988 **SYNOPSIS**

9989 #include <netinet/in.h>

9990 **DESCRIPTION**

9991 The <netinet/in.h> header shall define the following types:

9992 **in_port_t** Equivalent to the type **uint16_t** as defined in <inttypes.h>.

9993 **in_addr_t** Equivalent to the type **uint32_t** as defined in <inttypes.h>.

9994 The **sa_family_t** type shall be defined as described in <sys/socket.h>.

9995 The **uint8_t** and **uint32_t** type shall be defined as described in <inttypes.h>. Inclusion of the
9996 <netinet/in.h> header may also make visible all symbols from <inttypes.h> and <sys/socket.h>.

9997 The <netinet/in.h> header shall define the **in_addr** structure that includes at least the following
9998 member:

9999 in_addr_t s_addr

10000 The <netinet/in.h> header shall define the **sockaddr_in** structure that includes at least the
10001 following members (all in network byte order):

10002 sa_family_t sin_family AF_INET.
10003 in_port_t sin_port Port number.
10004 struct in_addr sin_addr IP address.

10005 The **sockaddr_in** structure is used to store addresses for the Internet address family. Values of
10006 this type shall be cast by applications to **struct sockaddr** for use with socket functions.

10007 IP6 The <netinet/in.h> header shall define the **in6_addr** structure that contains at least the following
10008 member:

10009 uint8_t s6_addr[16]

10010 This array is used to contain a 128-bit IPv6 address, stored in network byte order.

10011 The <netinet/in.h> header shall define the **sockaddr_in6** structure that includes at least the
10012 following members (all in network byte order):

10013 sa_family_t sin6_family AF_INET6.
10014 in_port_t sin6_port Port number.
10015 uint32_t sin6_flowinfo IPv6 traffic class and flow information.
10016 struct in6_addr sin6_addr IPv6 address.
10017 uint32_t sin6_scope_id Set of interfaces for a scope.

10018 The **sockaddr_in6** structure shall be set to zero by an application prior to using it, since
10019 implementations are free to have additional, implementation-defined fields in **sockaddr_in6**.

10020 The *sin6_scope_id* field is a 32-bit integer that identifies a set of interfaces as appropriate for the
10021 scope of the address carried in the *sin6_addr* field. For a link scope *sin6_addr*, the application
10022 shall ensure that *sin6_scope_id* is a link index. For a site scope *sin6_addr*, the application shall
10023 ensure that *sin6_scope_id* is a site index. The mapping of *sin6_scope_id* to an interface or set of
10024 interfaces is implementation-defined.

10025 The <netinet/in.h> header shall declare the following external variable:

10026 const struct in6_addr in6addr_any

10027	This variable is initialized by the system to contain the wildcard IPv6 address. The	
10028	<netinet/in.h> header also defines the IN6ADDR_ANY_INIT macro. This macro must be	
10029	constant at compile time and can be used to initialize a variable of type struct in6_addr to the	
10030	IPv6 wildcard address.	
10031	The <netinet/in.h> header shall declare the following external variable:	
10032	const struct in6_addr in6addr_loopback	
10033	This variable is initialized by the system to contain the loopback IPv6 address. The	
10034	<netinet/in.h> header also defines the IN6ADDR_LOOPBACK_INIT macro. This macro must be	
10035	constant at compile time and can be used to initialize a variable of type struct in6_addr to the	
10036	IPv6 loopback address.	
10037	The <netinet/in.h> header shall define the ipv6_mreq structure that includes at least the	
10038	following members:	
10039	struct in6_addr	ipv6mr_multiaddr IPv6 multicast address.
10040	unsigned	ipv6mr_interface Interface index.
10041		
10042	The <netinet/in.h> header shall define the following macros for use as values of the <i>level</i>	
10043	argument of <i>getsockopt()</i> and <i>setsockopt()</i> :	
10044	IPPROTO_IP	Internet protocol.
10045 IP6	IPPROTO_IPV6	Internet Protocol Version 6.
10046	IPPROTO_ICMP	Control message protocol.
10047 RS	IPPROTO_RAW	Raw IP Packets Protocol.
10048	IPPROTO_TCP	Transmission control protocol.
10049	IPPROTO_UDP	User datagram protocol.
10050	The <netinet/in.h> header shall define the following macros for use as destination addresses for	
10051	<i>connect()</i> , <i>sendmsg()</i> , and <i>sendto()</i> :	
10052	INADDR_ANY	IPv4 local host address.
10053	INADDR_BROADCAST	IPv4 broadcast address.
10054	The <netinet/in.h> header shall define the following macro to help applications declare buffers	
10055	of the proper size to store IPv4 addresses in string form:	
10056	INET_ADDRSTRLEN	16. Length of the string form for IP.
10057	The <i>htonl()</i> , <i>htons()</i> , <i>ntohl()</i> , and <i>ntohs()</i> functions shall be available as defined in <arpa/inet.h>.	
10058	Inclusion of the <netinet/in.h> header may also make visible all symbols from <arpa/inet.h>.	
10059 IP6	The <netinet/in.h> header shall define the following macro to help applications declare buffers	
10060	of the proper size to store IPv6 addresses in string form:	
10061	INET6_ADDRSTRLEN	46. Length of the string form for IPv6.
10062	The <netinet/in.h> header shall define the following macros, with distinct integer values, for use	
10063	in the <i>option_name</i> argument in the <i>getsockopt()</i> or <i>setsockopt()</i> functions at protocol level	
10064	IPPROTO_IPV6:	
10065	IPV6_JOIN_GROUP	Join a multicast group.

10066	IPV6_LEAVE_GROUP	Quit a multicast group.
10067	IPV6_MULTICAST_HOPS	
10068		Multicast hop limit.
10069	IPV6_MULTICAST_IF	Interface to use for outgoing multicast packets.
10070	IPV6_MULTICAST_LOOP	
10071		Multicast packets are delivered back to the local application.
10072	IPV6_UNICAST_HOPS	Unicast hop limit.
10073	IPV6_V6ONLY	Restrict AF_INET6 socket to IPv6 communications only.
10074	The <netinet/in.h> header shall define the following macros that test for special IPv6 addresses.	
10075	Each macro is of type int and takes a single argument of type const struct in6_addr * :	
10076	IN6_IS_ADDR_UNSPECIFIED	
10077		Unspecified address.
10078	IN6_IS_ADDR_LOOPBACK	
10079		Loopback address.
10080	IN6_IS_ADDR_MULTICAST	
10081		Multicast address.
10082	IN6_IS_ADDR_LINKLOCAL	
10083		Unicast link-local address.
10084	IN6_IS_ADDR_SITELOCAL	
10085		Unicast site-local address.
10086	IN6_IS_ADDR_V4MAPPED	
10087		IPv4 mapped address.
10088	IN6_IS_ADDR_V4COMPAT	
10089		IPv4-compatible address.
10090	IN6_IS_ADDR_MC_NODELOCAL	
10091		Multicast node-local address.
10092	IN6_IS_ADDR_MC_LINKLOCAL	
10093		Multicast link-local address.
10094	IN6_IS_ADDR_MC_SITELOCAL	
10095		Multicast site-local address.
10096	IN6_IS_ADDR_MC_ORGLOCAL	
10097		Multicast organization-local address.
10098	IN6_IS_ADDR_MC_GLOBAL	
10099		Multicast global address.

10100 **APPLICATION USAGE**

10101 None.

10102 **RATIONALE**

10103 None.

10104 **FUTURE DIRECTIONS**

10105 None.

10106 **SEE ALSO**

10107 Section 4.8 (on page 101), <arpa/inet.h>, <inttypes.h>, <sys/socket.h>, the System Interfaces
 10108 volume of IEEE Std 1003.1-2001, *connect()*, *getsockopt()*, *htonl()*, *htons()*, *ntohl()*, *ntohs()*,
 10109 *sendmsg()*, *sendto()*, *setsockopt()*

10110 **CHANGE HISTORY**

10111 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10112 The *sin_zero* member was removed from the **sockaddr_in** structure as per The Open Group Base
 10113 Resolution bwg2001-004.

10114 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/12 is applied, adding **const** qualifiers to
 10115 the *in6addr_any* and *in6addr_loopback* external variables.

10116 **NAME**

10117 netinet/tcp.h — definitions for the Internet Transmission Control Protocol (TCP)

10118 **SYNOPSIS**

10119 #include <netinet/tcp.h>

10120 **DESCRIPTION**

10121 The <netinet/tcp.h> header shall define the following macro for use as a socket option at the
10122 IPPROTO_TCP level:

10123 TCP_NODELAY Avoid coalescing of small segments.

10124 The macro shall be defined in the header. The implementation need not allow the value of the
10125 option to be set via *setsockopt()* or retrieved via *getsockopt()*.

10126 **APPLICATION USAGE**

10127 None.

10128 **RATIONALE**

10129 None.

10130 **FUTURE DIRECTIONS**

10131 None.

10134 **CHANGE HISTORY**

10135 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

10136 **NAME**

10137 nl_types.h — data types

10138 **SYNOPSIS**

10139 xSI #include <nl_types.h>

10140

10141 **DESCRIPTION**

10142 The <nl_types.h> header shall contain definitions of at least the following types:

10143 **nl_catd** Used by the message catalog functions *catopen()*, *catgets()*, and *catclose()*
 10144 to identify a catalog descriptor.

10145 **nl_item** Used by *nl_langinfo()* to identify items of *langinfo* data. Values of objects
 10146 of type **nl_item** are defined in <langinfo.h>.

10147 The <nl_types.h> header shall contain definitions of at least the following constants:

10148 **NL_SETD** Used by *gencat* when no *\$set* directive is specified in a message text source
 10149 file; see the Internationalization Guide. This constant can be passed as the
 10150 value of *set_id* on subsequent calls to *catgets()* (that is, to retrieve
 10151 messages from the default message set). The value of **NL_SETD** is
 10152 implementation-defined.

10153 **NL_CAT_LOCALE** Value that must be passed as the *oflag* argument to *catopen()* to ensure
 10154 that message catalog selection depends on the *LC_MESSAGES* locale
 10155 category, rather than directly on the *LANG* environment variable.

10156 The following shall be declared as functions and may also be defined as macros. Function
 10157 prototypes shall be provided.

```
10158 int      catclose(nl_catd);
10159 char     *catgets(nl_catd, int, int, const char *);
10160 nl_catd  catopen(const char *, int);
```

10161 **APPLICATION USAGE**

10162 None.

10163 **RATIONALE**

10164 None.

10165 **FUTURE DIRECTIONS**

10166 None.

10167 **SEE ALSO**

10168 <langinfo.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *catclose()*, *catgets()*,

10170 **CHANGE HISTORY**

10171 First released in Issue 2.

10172 **NAME**

10173 poll.h — definitions for the poll() function

10174 **SYNOPSIS**

10175 xSI #include <poll.h>

10176

10177 **DESCRIPTION**

10178 The <poll.h> header shall define the **pollfd** structure that includes at least the following
10179 members:

10180 int fd The following descriptor being polled.

10181 short events The input event flags (see below).

10182 short revents The output event flags (see below).

10183 The <poll.h> header shall define the following type through **typedef**:

10184 **nfds_t** An unsigned integer type used for the number of file descriptors.

10185 The implementation shall support one or more programming environments in which the width
10186 of **nfds_t** is no greater than the width of type **long**. The names of these programming
10187 environments can be obtained using the *confstr()* function or the *getconf* utility.

10188 The following symbolic constants shall be defined, zero or more of which may be OR'ed together
10189 to form the *events* or *revents* members in the **pollfd** structure:

10190 POLLIN Data other than high-priority data may be read without blocking.

10191 POLLRDNORM Normal data may be read without blocking.

10192 POLLRDBAND Priority data may be read without blocking.

10193 POLLPRI High priority data may be read without blocking.

10194 POLLOUT Normal data may be written without blocking.

10195 POLLWRNORM Equivalent to POLLOUT.

10196 POLLWRBAND Priority data may be written.

10197 POLLERR An error has occurred (*revents* only).

10198 POLLHUP Device has been disconnected (*revents* only).

10199 POLLNVAL Invalid *fd* member (*revents* only).

10200 The significance and semantics of normal, priority, and high-priority data are file and device-
10201 specific.

10202 The following shall be declared as a function and may also be defined as a macro. A function
10203 prototype shall be provided.

10204 int poll(struct pollfd[], nfds_t, int);

10205 **APPLICATION USAGE**

10206 None.

10207 **RATIONALE**

10208 None.

10209 **FUTURE DIRECTIONS**

10210 None.

10211 **SEE ALSO**

10212 The System Interfaces volume of IEEE Std 1003.1-2001, *confstr()*, *poll()*, the Shell and Utilities
10213 volume of IEEE Std 1003.1-2001, *getconf*

10214 **CHANGE HISTORY**

10215 First released in Issue 4, Version 2.

10216 **Issue 6**10217 The description of the symbolic constants is updated to match the *poll()* function.10218 Text related to STREAMS has been moved to the *poll()* reference page.

10219 A note is added to the DESCRIPTION regarding the significance and semantics of normal,
10220 priority, and high-priority data.

10221 **NAME**

10222 pthread.h — threads

10223 **SYNOPSIS**

10224 THR #include <pthread.h>

10225

10226 **DESCRIPTION**

10227 The <pthread.h> header shall define the following symbols:

10228 BAR PTHREAD_BARRIER_SERIAL_THREAD

10229 PTHREAD_CANCEL_ASYNCHRONOUS

10230 PTHREAD_CANCEL_ENABLE

10231 PTHREAD_CANCEL_DEFERRED

10232 PTHREAD_CANCEL_DISABLE

10233 PTHREAD_CANCELED

10234 PTHREAD_COND_INITIALIZER

10235 PTHREAD_CREATE_DETACHED

10236 PTHREAD_CREATE_JOINABLE

10237 PTHREAD_EXPLICIT_SCHED

10238 PTHREAD_INHERIT_SCHED

10239 XSI PTHREAD_MUTEX_DEFAULT

10240 PTHREAD_MUTEX_ERRORCHECK

10241 PTHREAD_MUTEX_INITIALIZER

10242 XSI PTHREAD_MUTEX_NORMAL

10243 PTHREAD_MUTEX_RECURSIVE

10244 PTHREAD_ONCE_INIT

10245 TPI PTHREAD_PRIO_INHERIT

10246 TPP | TPI PTHREAD_PRIO_NONE

10247 TPP PTHREAD_PRIO_PROTECT

10248 PTHREAD_PROCESS_SHARED

10249 PTHREAD_PROCESS_PRIVATE

10250 TPS PTHREAD_SCOPE_PROCESS

10251 PTHREAD_SCOPE_SYSTEM

10252

10253 The following types shall be defined as described in <sys/types.h>:

10254 pthread_attr_t

10255 BAR pthread_barrier_t

10256 pthread_barrierattr_t

10257 pthread_cond_t

10258 pthread_condattr_t

10259 pthread_key_t

10260 pthread_mutex_t

10261 pthread_mutexattr_t

10262 pthread_once_t

10263 pthread_rwlock_t

10264 pthread_rwlockattr_t

10265 SPI pthread_spinlock_t

10266 pthread_t

10267 The following shall be declared as functions and may also be defined as macros. Function
 10268 prototypes shall be provided.

```

10269     int    pthread_atfork(void (*)(void), void (*)(void),
10270                          void (*)(void));

 10425 *pthread_rwlockattr_setpshared()*, *pthread_self()*, *pthread_setcancelstate()*, *pthread_setspecific()*,
 10426 *pthread_spin_destroy()*, *pthread_spin_init()*, *pthread_spin_lock()*, *pthread_spin_trylock()*,
 10427 *pthread_spin_unlock()*

10428 CHANGE HISTORY

10429 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

10430 Issue 6

10431 The RTT margin markers are broken out into their POSIX options.

10432 The Open Group Corrigendum U021/9 is applied, correcting the prototype for the
 10433 *pthread_cond_wait()* function.

10434 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the
 10435 *pthread_setschedparam()* function so that its second argument is of type **int**.

10436 The *pthread_getcpuclockid()* and *pthread_mutex_timedlock()* functions are added for alignment
 10437 with IEEE Std 1003.1d-1999.

10438 The following functions are added for alignment with IEEE Std 1003.1j-2000:

10439 *pthread_barrier_destroy()*, *pthread_barrier_init()*, *pthread_barrier_wait()*,
 10440 *pthread_barrierattr_destroy()*, *pthread_barrierattr_getpshared()*, *pthread_barrierattr_init()*,
 10441 *pthread_barrierattr_setpshared()*, *pthread_condattr_getclock()*, *pthread_condattr_setclock()*,
 10442 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_spin_destroy()*,
 10443 *pthread_spin_init()*, *pthread_spin_lock()*, *pthread_spin_trylock()*, and *pthread_spin_unlock()*.

10444 PTHREAD_RWLOCK_INITIALIZER is deleted for alignment with IEEE Std 1003.1j-2000.

10445 Functions previously marked as part of the Read-Write Locks option are now moved to the
 10446 Threads option.

10447 The **restrict** keyword is added to the prototypes for *pthread_attr_getguardsize()*,
 10448 *pthread_attr_getinheritsched()*, *pthread_attr_getschedparam()*, *pthread_attr_getschedpolicy()*,
 10449 *pthread_attr_getscope()*, *pthread_attr_getstackaddr()*, *pthread_attr_getstacksize()*,
 10450 *pthread_attr_setschedparam()*, *pthread_barrier_init()*, *pthread_barrierattr_getpshared()*,
 10451 *pthread_cond_init()*, *pthread_cond_signal()*, *pthread_cond_timedwait()*, *pthread_cond_wait()*,
 10452 *pthread_condattr_getclock()*, *pthread_condattr_getpshared()*, *pthread_create()*,
 10453 *pthread_getschedparam()*, *pthread_mutex_getprioceiling()*, *pthread_mutex_init()*,
 10454 *pthread_mutex_setprioceiling()*, *pthread_mutexattr_getprioceiling()*, *pthread_mutexattr_getprotocol()*,
 10455 *pthread_mutexattr_getpshared()*, *pthread_mutexattr_gettype()*, *pthread_rwlock_init()*,
 10456 *pthread_rwlock_timedrdlock()*, *pthread_rwlock_timedwrlock()*, *pthread_rwlockattr_getpshared()*, and
 10457 *pthread_sigmask()*.

10458 IEEE PASC Interpretation 1003.1 #86 is applied, allowing the symbols from <sched.h> and
 10459 <time.h> to be made visible when <pthread.h> is included. Previously this was an XSI
 10460 extension.

10461 IEEE PASC Interpretation 1003.1c #42 is applied, removing the requirement for prototypes for
 10462 the *pthread_kill()* and *pthread_sigmask()* functions. These are required to be in the <signal.h>
 10463 header. They are allowed here through the name space rules.

10464 IEEE PASC Interpretation 1003.1 #96 is applied, adding the *pthread_setschedprio()* function.

10465 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/13 is applied, correcting shading errors
 10466 that were in contradiction with the System Interfaces volume of IEEE Std 1003.1-2001.

10467 **NAME**

10468 pwd.h — password structure

10469 **SYNOPSIS**

10470 #include <pwd.h>

10471 **DESCRIPTION**10472 The <pwd.h> header shall provide a definition for **struct passwd**, which shall include at least the
10473 following members:

10474	char	*pw_name	User's login name.
10475	uid_t	pw_uid	Numerical user ID.
10476	gid_t	pw_gid	Numerical group ID.
10477	char	*pw_dir	Initial working directory.
10478	char	*pw_shell	Program to use as shell.

10479 The **gid_t** and **uid_t** types shall be defined as described in <sys/types.h>.10480 The following shall be declared as functions and may also be defined as macros. Function
10481 prototypes shall be provided.

```

10482     struct passwd *getpwnam(const char *);
10483     struct passwd *getpwuid(uid_t);
10484 TSF   int         getpwnam_r(const char *, struct passwd *, char *,
10485                               size_t, struct passwd **);
10486     int         getpwuid_r(uid_t, struct passwd *, char *,
10487                               size_t, struct passwd **);
10488 XSI   void         endpwent(void);
10489     struct passwd *getpwent(void);
10490     void         setpwent(void);

10502 First released in Issue 1.

10503 **Issue 5**

10504 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

10505 **Issue 6**10506 The following new requirements on POSIX implementations derive from alignment with the
10507 Single UNIX Specification:

- 10508 • The **gid_t** and **uid_t** types are mandated.
- 10509 • The *getpwnam_r()* and *getpwuid_r()* functions are marked as part of the Thread-Safe
10510 Functions option.

10511 **NAME**

10512 regex.h — regular expression matching types

10513 **SYNOPSIS**

10514 #include <regex.h>

10515 **DESCRIPTION**

10516 The <regex.h> header shall define the structures and symbolic constants used by the *regcomp()*,
10517 *regex()*, *regerror()*, and *regfree()* functions.

10518 The structure type **regex_t** shall contain at least the following member:

10519 size_t re_nsub Number of parenthesized subexpressions.

10520 The type **size_t** shall be defined as described in <sys/types.h>.

10521 The type **regoff_t** shall be defined as a signed integer type that can hold the largest value that
10522 can be stored in either a type **off_t** or type **ssize_t**. The structure type **regmatch_t** shall contain
10523 at least the following members:

10524	regoff_t	rm_so	Byte offset from start of string
10525			to start of substring.
10526	regoff_t	rm_eo	Byte offset from start of string of the
10527			first character after the end of substring.

10528 Values for the *cflags* parameter to the *regcomp()* function are as follows:

10529 REG_EXTENDED Use Extended Regular Expressions.

10530 REG_ICASE Ignore case in match.

10531 REG_NOSUB Report only success or fail in *regex()*.

10532 REG_NEWLINE Change the handling of <newline>.

10533 Values for the *eflags* parameter to the *regex()* function are as follows:

10534 REG_NOTBOL The circumflex character ('^'), when taken as a special character, does
10535 not match the beginning of *string*.

10536 REG_NOTEOL The dollar sign ('\$'), when taken as a special character, does not match
10537 the end of *string*.

10538 The following constants shall be defined as error return values:

10539 REG_NOMATCH *regex()* failed to match.

10540 REG_BADPAT Invalid regular expression.

10541 REG_ECOLLATE Invalid collating element referenced.

10542 REG_ETYPE Invalid character class type referenced.

10543 REG_EESCAPE Trailing '\\' in pattern.

10544 REG_ESUBREG Number in *\digit* invalid or in error.

10545 REG_EBRACK "[]" imbalance.

10546 REG_EPAREN "\" "(" imbalance.

10547 REG_EBRACE "\" "{" imbalance.

10548 REG_BADBR Content of "\" "{" invalid: not a number, number too large, more than
10549 two numbers, first larger than second.

10550 REG_ERANGE Invalid endpoint in range expression.

10551 REG_ESPACE Out of memory.

10552 REG_BADRPT '?', '*', or '+' not preceded by valid regular expression.

10553 OB REG_ENOSYS Reserved.

10554 The following shall be declared as functions and may also be defined as macros. Function
10555 prototypes shall be provided.

```
10556 int      regcomp(regex_t *restrict, const char *restrict, int);
10557 size_t  regerror(int, const regex_t *restrict, char *restrict, size_t);
10558 int      regexec(const regex_t *restrict, const char *restrict, size_t,
10559                 regmatch_t[restrict], int);
10560 void     regfree(regex_t *);
```

10561 The implementation may define additional macros or constants using names beginning with
10562 REG_.

10563 **APPLICATION USAGE**

10564 None.

10565 **RATIONALE**

10566 None.

10567 **FUTURE DIRECTIONS**

10568 None.

10569 **SEE ALSO**

10570 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *regcomp()*, the Shell and
10571 Utilities volume of IEEE Std 1003.1-2001

10572 **CHANGE HISTORY**

10573 First released in Issue 4.

10574 Originally derived from the ISO POSIX-2 standard.

10575 **Issue 6**

10576 The REG_ENOSYS constant is marked obsolescent.

10577 The **restrict** keyword is added to the prototypes for *regcomp()*, *regerror()*, and *regexec()*.

10578 A statement is added that the **size_t** type is defined as described in <sys/types.h>.

10579 **NAME**10580 sched.h — execution scheduling (**REALTIME**)10581 **SYNOPSIS**

10582 PS #include <sched.h>

10583

10584 **DESCRIPTION**

10585 The <sched.h> header shall define the **sched_param** structure, which contains the scheduling
 10586 parameters required for implementation of each supported scheduling policy. This structure
 10587 shall contain at least the following member:

10588 int sched_priority Process execution scheduling priority.

10589 SS|TSP In addition, if **_POSIX_SPORADIC_SERVER** or **_POSIX_THREAD_SPORADIC_SERVER** is
 10590 defined, the **sched_param** structure defined in <sched.h> shall contain the following members
 10591 in addition to those specified above:

10592	int	sched_ss_low_priority	Low scheduling priority for
10593			sporadic server.
10594	struct timespec	sched_ss_repl_period	Replenishment period for
10595			sporadic server.
10596	struct timespec	sched_ss_init_budget	Initial budget for sporadic server.
10597	int	sched_ss_max_repl	Maximum pending replenishments for
10598			sporadic server.

10599

10600 Each process is controlled by an associated scheduling policy and priority. Associated with each
 10601 policy is a priority range. Each policy definition specifies the minimum priority range for that
 10602 policy. The priority ranges for each policy may overlap the priority ranges of other policies.

10603 Four scheduling policies are defined; others may be defined by the implementation. The four
 10604 standard policies are indicated by the values of the following symbolic constants:

10605 **SCHED_FIFO** First in-first out (FIFO) scheduling policy.

10606 **SCHED_RR** Round robin scheduling policy.

10607 SS|TSP **SCHED_SPORADIC** Sporadic server scheduling policy.

10608 **SCHED_OTHER** Another scheduling policy.

10609 The values of these constants are distinct.

10610 The following shall be declared as functions and may also be defined as macros. Function
 10611 prototypes shall be provided.

10612	TPS	int	sched_get_priority_max(int);	
10613		int	sched_get_priority_min(int);	
10614		int	sched_getparam(pid_t, struct sched_param *);	
10615		int	sched_getscheduler(pid_t);	
10616	TPS	int	sched_rr_get_interval(pid_t, struct timespec *);	
10617		int	sched_setparam(pid_t, const struct sched_param *);	
10618		int	sched_setscheduler(pid_t, int, const struct sched_param *);	
10619	THR	int	sched_yield(void);	
10620				

10621 Inclusion of the <sched.h> header may make visible all symbols from the <time.h> header.

10622 **APPLICATION USAGE**

10623 None.

10624 **RATIONALE**

10625 None.

10626 **FUTURE DIRECTIONS**

10627 None.

10628 **SEE ALSO**

10629 <time.h>

10630 **CHANGE HISTORY**

10631 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10632 **Issue 6**

10633 The <sched.h> header is marked as part of the Process Scheduling option.

10634 Sporadic server members are added to the **sched_param** structure, and the SCHED_SPORADIC
 10635 scheduling policy is added for alignment with IEEE Std 1003.1d-1999.

10636 IEEE PASC Interpretation 1003.1 #108 is applied, correcting the **sched_param** structure whose
 10637 members *sched_ss_repl_period* and *sched_ss_init_budget* should be type **struct timespec** and not
 10638 **timespec**.

10639 Symbols from <time.h> may be made visible when <sched.h> is included.

10640 IEEE Std 1003.1-2001/Cor 1-2002, items XSH/TC1/D6/52 and XSH/TC1/D6/53 are applied, |
 10641 aligning the function prototype shading and margin codes with the System Interfaces volume of |
 10642 IEEE Std 1003.1-2001. |

10643 **NAME**

10644 search.h — search tables

10645 **SYNOPSIS**

10646 XSI `#include <search.h>`

10647

10648 **DESCRIPTION**

10649 The <search.h> header shall define the **ENTRY** type for structure **entry** which shall include the
10650 following members:

10651 char *key
10652 void *data

10653 and shall define **ACTION** and **VISIT** as enumeration data types through type definitions as
10654 follows:

10655 enum { FIND, ENTER } ACTION;
10656 enum { preorder, postorder, endorder, leaf } VISIT;

10657 The **size_t** type shall be defined as described in <sys/types.h>.

10658 The following shall be declared as functions and may also be defined as macros. Function
10659 prototypes shall be provided.

```
10660 int      hcreate(size_t);
10661 void     hdestroy(void);
10662 ENTRY *hsearch(ENTRY, ACTION);
10663 void     insque(void *, void *);
10664 void     *lfind(const void *, const void *, size_t *,
10665               size_t, int (*)(const void *, const void *));
10666 void     *lsearch(const void *, void *, size_t *,
10667               size_t, int (*)(const void *, const void *));
10668 void     remque(void *);
10669 void     *tdelete(const void *restrict, void **restrict,
10670               int (*)(const void *, const void *));
10671 void     *tfind(const void *, void *const *,
10672               int (*)(const void *, const void *));
10673 void     *tsearch(const void *, void **,
10674               int (*)(const void *, const void *));
10675 void     twalk(const void *,
10676               void (*)(const void *, VISIT, int ));
```

10677 **APPLICATION USAGE**

10678 None.

10679 **RATIONALE**

10680 None.

10681 **FUTURE DIRECTIONS**

10682 None.

10683 **SEE ALSO**

10684 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *hcreate()*, *insque()*,
10685 *lsearch()*, *remque()*, *tsearch()*

10686 **CHANGE HISTORY**

10687 First released in Issue 1. Derived from Issue 1 of the SVID.

10688 **Issue 6**

10689 The Open Group Corrigendum U021/6 is applied, updating the prototypes for *tdelete()* and
10690 *tsearch()*.

10691 The **restrict** keyword is added to the prototype for *tdelete()*.

10692 **NAME**10693 semaphore.h — semaphores (**REALTIME**)10694 **SYNOPSIS**10695 SEM `#include <semaphore.h>`

10696

10697 **DESCRIPTION**

10698 The <semaphore.h> header shall define the **sem_t** type, used in performing semaphore
 10699 operations. The semaphore may be implemented using a file descriptor, in which case
 10700 applications are able to open up at least a total of {OPEN_MAX} files and semaphores. The
 10701 symbol SEM_FAILED shall be defined (see *sem_open()*).

10702 The following shall be declared as functions and may also be defined as macros. Function
 10703 prototypes shall be provided.

```
10704     int      sem_close(sem_t *);
10705     int      sem_destroy(sem_t *);
10706     int      sem_getvalue(sem_t *restrict, int *restrict);
10707     int      sem_init(sem_t *, int, unsigned);
10708     sem_t *sem_open(const char *, int, ...);
10709     int      sem_post(sem_t *);
10710 TMO     int      sem_timedwait(sem_t *restrict, const struct timespec *restrict);
10711     int      sem_trywait(sem_t *);
10712     int      sem_unlink(const char *);
10713     int      sem_wait(sem_t *);
```

10714 Inclusion of the <semaphore.h> header may make visible symbols defined in the headers
 10715 <fcntl.h> and <sys/types.h>.

10716 **APPLICATION USAGE**

10717 None.

10718 **RATIONALE**

10719 None.

10720 **FUTURE DIRECTIONS**

10721 None.

10722 **SEE ALSO**

10723 <fcntl.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *sem_destroy()*,

 10725 *sem_wait()*

10726 **CHANGE HISTORY**

10727 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

10728 **Issue 6**

10729 The <semaphore.h> header is marked as part of the Semaphores option.

10730 The Open Group Corrigendum U021/3 is applied, adding a description of SEM_FAILED.

10731 The *sem_timedwait()* function is added for alignment with IEEE Std 1003.1d-1999.10732 The **restrict** keyword is added to the prototypes for *sem_getvalue()* and *sem_timedwait()*.

10733 **NAME**

10734 setjmp.h — stack environment declarations

10735 **SYNOPSIS**

10736 #include <setjmp.h>

10737 **DESCRIPTION**

10738 CX Some of the functionality described on this reference page extends the ISO C standard.
 10739 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 10740 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 10741 symbols in this header.

10742 CX The <setjmp.h> header shall define the array types **jmp_buf** and **sigjmp_buf**.

10743 The following shall be declared as functions and may also be defined as macros. Function
 10744 prototypes shall be provided.

```
10745       void    longjmp(jmp_buf, int);
10746 CX       void   siglongjmp(sigjmp_buf, int);
10747 XSI       void   _longjmp(jmp_buf, int);
```

10748

10749 The following may be declared as a function, or defined as a macro, or both. Function prototypes
 10750 shall be provided.

```
10751       int     setjmp(jmp_buf);
10752 CX       int     sigsetjmp(sigjmp_buf, int);
10753 XSI       int     _setjmp(jmp_buf);
```

10754

10755 **APPLICATION USAGE**

10756 None.

10757 **RATIONALE**

10758 None.

10759 **FUTURE DIRECTIONS**

10760 None.

10762 The System Interfaces volume of IEEE Std 1003.1-2001, *longjmp()*, *_longjmp()*, *setjmp()*,
 10763 *siglongjmp()*, *sigsetjmp()*

10764 **CHANGE HISTORY**

10765 First released in Issue 1.

10766 **Issue 6**

10767 Extensions beyond the ISO C standard are marked.

10768 **NAME**

10769 signal.h — signals

10770 **SYNOPSIS**

10771 #include <signal.h>

10772 **DESCRIPTION**

10773 CX Some of the functionality described on this reference page extends the ISO C standard.
10774 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
10775 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
10776 symbols in this header.

10777 The <signal.h> header shall define the following symbolic constants, each of which expands to a
10778 distinct constant expression of the type:

10779 void (*)(int)

10780 whose value matches no declarable function.

10781 SIG_DFL Request for default signal handling.

10782 SIG_ERR Return value from *signal()* in case of error.

10783 CX SIG_HOLD Request that signal be held.

10784 SIG_IGN Request that signal be ignored.

10785 The following data types shall be defined through **typedef**:

10786 **sig_atomic_t** Possibly volatile-qualified integer type of an object that can be accessed as
10787 an atomic entity, even in the presence of asynchronous interrupts.

10788 CX **sigset_t** Integer or structure type of an object used to represent sets of signals.

10789 CX **pid_t** As described in <sys/types.h>.

10790 RTS The <signal.h> header shall define the **sigevent** structure, which has at least the following
10791 members:

10792	int	sigev_notify	Notification type.
10793	int	sigev_signo	Signal number.
10794	union sigval	sigev_value	Signal value.
10795	void(*) (union sigval)	sigev_notify_function	Notification function.
10796	(pthread_attr_t *)	sigev_notify_attributes	Notification attributes.

10797 The following values of *sigev_notify* shall be defined:

10798 SIGEV_NONE No asynchronous notification is delivered when the event of interest
10799 occurs.

10800 SIGEV_SIGNAL A queued signal, with an application-defined value, is generated when
10801 the event of interest occurs.

10802 SIGEV_THREAD A notification function is called to perform notification.

10803 The **sigval** union shall be defined as:

10804	int	sival_int	Integer signal value.
10805	void	*sival_ptr	Pointer signal value.

10806 This header shall also declare the macros SIGRTMIN and SIGRTMAX, which evaluate to integer
10807 expressions, and specify a range of signal numbers that are reserved for application use and for
10808 which the realtime signal behavior specified in this volume of IEEE Std 1003.1-2001 is supported.

10809 The signal numbers in this range do not overlap any of the signals specified in the following
10810 table.

10811 The range SIGRTMIN through SIGRTMAX inclusive shall include at least {RTSIG_MAX} signal
10812 numbers.

10813 It is implementation-defined whether realtime signal behavior is supported for other signals.

10814 This header also declares the constants that are used to refer to the signals that occur in the
10815 system. Signals defined here begin with the letters SIG. Each of the signals have distinct positive
10816 integer values. The value 0 is reserved for use as the null signal (see *kill()*). Additional
10817 implementation-defined signals may occur in the system.

10818 CX The ISO C standard only requires the signal names SIGABRT, SIGFPE, SIGILL, SIGINT,
10819 SIGSEGV, and SIGTERM to be defined.

10820 The following signals shall be supported on all implementations (default actions are explained
10821 below the table):

Signal	Default Action	Description
SIGABRT	A	Process abort signal.
SIGALRM	T	Alarm clock.
SIGBUS	A	Access to an undefined portion of a memory object.
SIGCHLD	I	Child process terminated, stopped, or continued.
SIGCONT	C	Continue executing, if stopped.
SIGFPE	A	Erroneous arithmetic operation.
SIGHUP	T	Hangup.
SIGILL	A	Illegal instruction.
SIGINT	T	Terminal interrupt signal.
SIGKILL	T	Kill (cannot be caught or ignored).
SIGPIPE	T	Write on a pipe with no one to read it.
SIGQUIT	A	Terminal quit signal.
SIGSEGV	A	Invalid memory reference.
SIGSTOP	S	Stop executing (cannot be caught or ignored).
SIGTERM	T	Termination signal.
SIGTSTP	S	Terminal stop signal.
SIGTTIN	S	Background process attempting read.
SIGTTOU	S	Background process attempting write.
SIGUSR1	T	User-defined signal 1.
SIGUSR2	T	User-defined signal 2.
SIGPOLL	T	Pollable event.
SIGPROF	T	Profiling timer expired.
SIGSYS	A	Bad system call.
SIGTRAP	A	Trace/breakpoint trap.
SIGURG	I	High bandwidth data is available at a socket.
SIGVTALRM	T	Virtual timer expired.
SIGXCPU	A	CPU time limit exceeded.
SIGXFSZ	A	File size limit exceeded.

10853 The default actions are as follows:

10854 T Abnormal termination of the process. The process is terminated with all the consequences
10855 of *_exit()* except that the status made available to *wait()* and *waitpid()* indicates abnormal
10856 termination by the specified signal.

10857 A Abnormal termination of the process.
 10858 XSI Additionally, implementation-defined abnormal termination actions, such as creation of a
 10859 **core** file, may occur.
 10860 I Ignore the signal.
 10861 S Stop the process.
 10862 C Continue the process, if it is stopped; otherwise, ignore the signal.

10863 CX The header shall provide a declaration of **struct sigaction**, including at least the following
 10864 members:

10865	void (*sa_handler)(int)	Pointer to a signal-catching function or one of the macros
10866		SIG_IGN or SIG_DFL.
10867	sigset_t sa_mask	Set of signals to be blocked during execution of the signal
10868		handling function.
10869	int sa_flags	Special flags.
10870	void (*sa_sigaction)(int, siginfo_t *, void *)	
10871		Pointer to a signal-catching function.

10872

10873 XSI The storage occupied by *sa_handler* and *sa_sigaction* may overlap, and a conforming application
 10874 shall not use both simultaneously.

10875 The following shall be declared as constants:

10876 CX	SA_NOCLDSTOP	Do not generate SIGCHLD when children stop
10877 XSI		or stopped children continue.
10878 CX	SIG_BLOCK	The resulting set is the union of the current set and the signal set pointed
10879		to by the argument <i>set</i> .
10880 CX	SIG_UNBLOCK	The resulting set is the intersection of the current set and the complement
10881		of the signal set pointed to by the argument <i>set</i> .
10882 CX	SIG_SETMASK	The resulting set is the signal set pointed to by the argument <i>set</i> .
10883 XSI	SA_ONSTACK	Causes signal delivery to occur on an alternate stack.
10884 XSI	SA_RESETHAND	Causes signal dispositions to be set to SIG_DFL on entry to signal
10885		handlers.
10886 XSI	SA_RESTART	Causes certain functions to become restartable.
10887 XSI	SA_SIGINFO	Causes extra information to be passed to signal handlers at the time of
10888		receipt of a signal.
10889 XSI	SA_NOCLDWAIT	Causes implementations not to create zombie processes on child death.
10890 XSI	SA_NODEFER	Causes signal not to be automatically blocked on entry to signal handler.
10891 XSI	SS_ONSTACK	Process is executing on an alternate signal stack.
10892 XSI	SS_DISABLE	Alternate signal stack is disabled.
10893 XSI	MINSIGSTKSZ	Minimum stack size for a signal handler.
10894 XSI	SIGSTKSZ	Default size in bytes for the alternate signal stack.
10895 XSI	The ucontext_t structure shall be defined through typedef as described in <ucontext.h>.	
10896	The mcontext_t type shall be defined through typedef as described in <ucontext.h>.	

10897 The <signal.h> header shall define the **stack_t** type as a structure that includes at least the
 10898 following members:

10899	void	*ss_sp	Stack base or pointer.
10900	size_t	ss_size	Stack size.
10901	int	ss_flags	Flags.

10902 The <signal.h> header shall define the **sigstack** structure that includes at least the following
 10903 members:

10904	int	ss_onstack	Non-zero when signal stack is in use.
10905	void	*ss_sp	Signal stack pointer.

10906

10907 CX The <signal.h> header shall define the **siginfo_t** type as a structure that includes at least the
 10908 following members:

10909 CX	int	si_signo	Signal number.
10910 XSI	int	si_errno	If non-zero, an <i>errno</i> value associated with this signal, as defined in <errno.h>.
10911			
10912 CX	int	si_code	Signal code.
10913 XSI	pid_t	si_pid	Sending process ID.
10914	uid_t	si_uid	Real user ID of sending process.
10915	void	*si_addr	Address of faulting instruction.
10916	int	si_status	Exit value or signal.
10917	long	si_band	Band event for SIGPOLL.
10918 RTS	union sigval	si_value	Signal value.
10919			

10920 The macros specified in the **Code** column of the following table are defined for use as values of
 10921 XSI *si_code* that are signal-specific or non-signal-specific reasons why the signal was generated.

Signal	Code	Reason
SIGILL	ILL_ILLOPC	Illegal opcode.
	ILL_ILLOPN	Illegal operand.
	ILL_ILLADR	Illegal addressing mode.
	ILL_ILLTRP	Illegal trap.
	ILL_PRVOPC	Privileged opcode.
	ILL_PRVREG	Privileged register.
	ILL_COPROC	Coprocessor error.
	ILL_BADSTK	Internal stack error.
SIGFPE	FPE_INTDIV	Integer divide by zero.
	FPE_INTOVF	Integer overflow.
	FPE_FLTDIV	Floating-point divide by zero.
	FPE_FLTOVF	Floating-point overflow.
	FPE_FLTUND	Floating-point underflow.
	FPE_FLTRES	Floating-point inexact result.
	FPE_FLTINV	Invalid floating-point operation.
	FPE_FLTSUB	Subscript out of range.
SIGSEGV	SEGV_MAPERR	Address not mapped to object.
	SEGV_ACCERR	Invalid permissions for mapped object.
SIGBUS	BUS_ADRALN	Invalid address alignment.
	BUS_ADRERR	Nonexistent physical address.
	BUS_OBJERR	Object-specific hardware error.
SIGTRAP	TRAP_BRKPT	Process breakpoint.
	TRAP_TRACE	Process trace trap.
SIGCHLD	CLD_EXITED	Child has exited.
	CLD_KILLED	Child has terminated abnormally and did not create a core file.
	CLD_DUMPED	Child has terminated abnormally and created a core file.
	CLD_TRAPPED	Traced child has trapped.
	CLD_STOPPED	Child has stopped.
	CLD_CONTINUED	Stopped child has continued.
SIGPOLL	POLL_IN	Data input available.
	POLL_OUT	Output buffers available.
	POLL_MSG	Input message available.
	POLL_ERR	I/O error.
	POLL_PRI	High priority input available.
	POLL_HUP	Device disconnected.
Any	SI_USER	Signal sent by <i>kill()</i> .
	SI_QUEUE	Signal sent by the <i>sigqueue()</i> .
	SI_TIMER	Signal generated by expiration of a timer set by <i>timer_settime()</i> .
	SI_ASYNCIO	Signal generated by completion of an asynchronous I/O request.
	SI_MESGQ	Signal generated by arrival of a message on an empty message queue.

10968

10969

10970

Implementations may support additional *si_code* values not included in this list, may generate values included in this list under circumstances other than those described in this list, and may contain extensions or limitations that prevent some values from being generated. Implementations do not generate a different value from the ones described in this list for circumstances described in this list.

10971 In addition, the following signal-specific information shall be available:

Signal	Member	Value
SIGILL SIGFPE	void * <i>si_addr</i>	Address of faulting instruction.
SIGSEGV SIGBUS	void * <i>si_addr</i>	Address of faulting memory reference.
SIGCHLD	pid_t <i>si_pid</i> int <i>si_status</i> uid_t <i>si_uid</i>	Child process ID. Exit value or signal. Real user ID of the process that sent the signal.
SIGPOLL	long <i>si_band</i>	Band event for POLL_IN, POLL_OUT, or POLL_MSG.

10982 For some implementations, the value of *si_addr* may be inaccurate.

10983 The following shall be declared as functions and may also be defined as macros:

```

10984 XSI void (*bsd_signal(int, void (*)(int)))(int);
10985 CX   int kill(pid_t, int);
10986 XSI  int killpg(pid_t, int);
10987 THR  int pthread_kill(pthread_t, int);
10988     int pthread_sigmask(int, const sigset_t *, sigset_t *);
10989     int raise(int);
10990 CX   int sigaction(int, const struct sigaction *restrict,
10991                   struct sigaction *restrict);
10992     int sigaddset(sigset_t *, int);
10993 XSI  int sigaltstack(const stack_t *restrict, stack_t *restrict);
10994 CX   int sigdelset(sigset_t *, int);
10995     int sigemptyset(sigset_t *);
10996     int sigfillset(sigset_t *);
10997 XSI  int sighold(int);
10998     int sigignore(int);
10999     int siginterrupt(int, int);
11000 CX   int sigismember(const sigset_t *, int);
11001     void (*signal(int, void (*)(int)))(int);
11002 XSI  int sigpause(int);
11003 CX   int sigpending(sigset_t *);
11004     int sigprocmask(int, const sigset_t *restrict, sigset_t *restrict);
11005 RTS  int sigqueue(pid_t, int, const union sigval);
11006 XSI  int sigrelse(int);
11007     void (*sigset(int, void (*)(int)))(int);
11008 CX   int sigsuspend(const sigset_t *);
11009 RTS  int sigtimedwait(const sigset_t *restrict, siginfo_t *restrict,
11010                     const struct timespec *restrict);
11011 CX   int sigwait(const sigset_t *restrict, int *restrict);
11012 RTS  int sigwaitinfo(const sigset_t *restrict, siginfo_t *restrict);
11013

```

11026 CHANGE HISTORY

11027 First released in Issue 1.

11028 Issue 5

11029 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 11030 Threads Extension.

11031 The default action for SIGURG is changed from i to iii. The function prototype for *sigmask()* is
 11032 removed.

11033 Issue 6

11034 The Open Group Corrigendum U035/2 is applied. In the DESCRIPTION, the wording for
 11035 abnormal termination is clarified.

11036 The Open Group Corrigendum U028/8 is applied, correcting the prototype for the *sigset()*
 11037 function.

11038 The Open Group Corrigendum U026/3 is applied, correcting the type of the *sigev_notify_function*
 11039 function member of the **sigevent** structure.

11040 The following new requirements on POSIX implementations derive from alignment with the
 11041 Single UNIX Specification:

11042 • The SIGCHLD, SIGCONT, SIGSTOP, SIGTSTP, SIGTTIN, and SIGTTOU signals are now
 11043 mandated. This is also a FIPS requirement.

11044 • The **pid_t** definition is mandated.

11045 The RT markings are changed to RTS to denote that the semantics are part of the Realtime
 11046 Signals Extension option.

11047 The **restrict** keyword is added to the prototypes for *sigaction()*, *sigaltstack()*, *sigprocmask()*,
 11048 *sigtimedwait()*, *sigwait()*, and *sigwaitinfo()*.

11049 IEEE PASC Interpretation 1003.1 #85 is applied, adding the statement that symbols from
 11050 <time.h> may be made visible when <signal.h> is included.

11051 Extensions beyond the ISO C standard are marked.

11052 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/14 is applied, changing the descriptive
 11053 text for members of **struct sigaction**.

11054 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/15 is applied, correcting the definition of
 11055 the *sa_sigaction* member of **struct sigaction**.

11056 **NAME**11057 spawn.h — spawn (**ADVANCED REALTIME**)11058 **SYNOPSIS**

11059 SPN #include <spawn.h>

11060

11061 **DESCRIPTION**

11062 The <spawn.h> header shall define the **posix_spawnattr_t** and **posix_spawn_file_actions_t**
 11063 types used in performing spawn operations.

11064 The <spawn.h> header shall define the flags that may be set in a **posix_spawnattr_t** object using
 11065 the *posix_spawnattr_setflags()* function:

11066 POSIX_SPAWN_RESETPIDS

11067 POSIX_SPAWN_SETPGROUP

11068 PS POSIX_SPAWN_SETSCHEDPARAM

11069 POSIX_SPAWN_SETSCHEDULER

11070 POSIX_SPAWN_SETSIGDEF

11071 POSIX_SPAWN_SETSIGMASK

11072 The following shall be declared as functions and may also be defined as macros. Function
 11073 prototypes shall be provided.

```

11074 int    posix_spawn(pid_t *restrict, const char *restrict,
11075                  const posix_spawn_file_actions_t *,
11076                  const posix_spawnattr_t *restrict, char *const [restrict],
11077                  char *const [restrict]);
11078 int    posix_spawn_file_actions_addclose(posix_spawn_file_actions_t *,
11079                  int);
11080 int    posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *,
11081                  int, int);
11082 int    posix_spawn_file_actions_addopen(posix_spawn_file_actions_t *restrict,
11083                  int, const char *restrict, int, mode_t);
11084 int    posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *);
11085 int    posix_spawn_file_actions_init(posix_spawn_file_actions_t *);
11086 int    posix_spawnattr_destroy(posix_spawnattr_t *);
11087 int    posix_spawnattr_getsigdefault(const posix_spawnattr_t *restrict,
11088                  sigset_t *restrict);
11089 int    posix_spawnattr_getflags(const posix_spawnattr_t *restrict,
11090                  short *restrict);
11091 int    posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict,
11092                  pid_t *restrict);
11093 PS int    posix_spawnattr_getschedparam(const posix_spawnattr_t *restrict,
11094                  struct sched_param *restrict);
11095 int    posix_spawnattr_getschedpolicy(const posix_spawnattr_t *restrict,
11096                  int *restrict);
11097 int    posix_spawnattr_getsigmask(const posix_spawnattr_t *restrict,
11098                  sigset_t *restrict);
11099 int    posix_spawnattr_init(posix_spawnattr_t *);
11100 int    posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict,
11101                  const sigset_t *restrict);
11102 int    posix_spawnattr_setflags(posix_spawnattr_t *, short);
11103 int    posix_spawnattr_setpgroup(posix_spawnattr_t *, pid_t);

```

```

11104 PS      int    posix_spawnattr_setschedparam(posix_spawnattr_t *restrict,
11105              const struct sched_param *restrict);
11106      int    posix_spawnattr_setschedpolicy(posix_spawnattr_t *, int);
11107      int    posix_spawnattr_setsigmask(posix_spawnattr_t *restrict,
11108              const sigset_t *restrict);
11109      int    posix_spawn(pid_t *restrict, const char *restrict,
11110              const posix_spawn_file_actions_t *,
11111              const posix_spawnattr_t *restrict,
11112              char *const [restrict], char *const [restrict]);

```

11113 Inclusion of the <spawn.h> header may make visible symbols defined in the <sched.h>,
11114 <signal.h>, and <sys/types.h> headers.

11115 APPLICATION USAGE

11116 None.

11117 RATIONALE

11118 None.

11119 FUTURE DIRECTIONS

11120 None.

11137 *posix_spawnattr_setsigmask()*, and *posix_spawnnp()*.

11138 **NAME**

11139 stdarg.h — handle variable argument list

11140 **SYNOPSIS**

11141 #include <stdarg.h>

```
11142       void va_start(va_list ap, argN);
11143       void va_copy(va_list dest, va_list src);
11144       type va_arg(va_list ap, type);
11145       void va_end(va_list ap);
```

11146 **DESCRIPTION**

11147 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11148 conflict between the requirements described here and the ISO C standard is unintentional. This
 11149 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11150 The <stdarg.h> header shall contain a set of macros which allows portable functions that accept
 11151 variable argument lists to be written. Functions that have variable argument lists (such as
 11152 *printf()*) but do not use these macros are inherently non-portable, as different systems use
 11153 different argument-passing conventions.

11154 The type **va_list** shall be defined for variables used to traverse the list.

11155 The *va_start()* macro is invoked to initialize *ap* to the beginning of the list before any calls to
 11156 *va_arg()*.

11157 The *va_copy()* macro initializes *dest* as a copy of *src*, as if the *va_start()* macro had been applied
 11158 to *dest* followed by the same sequence of uses of the *va_arg()* macro as had previously been used
 11159 to reach the present state of *src*. Neither the *va_copy()* nor *va_start()* macro shall be invoked to
 11160 reinitialize *dest* without an intervening invocation of the *va_end()* macro for the same *dest*.

11161 The object *ap* may be passed as an argument to another function; if that function invokes the
 11162 *va_arg()* macro with parameter *ap*, the value of *ap* in the calling function is unspecified and shall
 11163 be passed to the *va_end()* macro prior to any further reference to *ap*. The parameter *argN* is the
 11164 identifier of the rightmost parameter in the variable parameter list in the function definition (the
 11165 one just before the ...). If the parameter *argN* is declared with the **register** storage class, with a
 11166 function type or array type, or with a type that is not compatible with the type that results after
 11167 application of the default argument promotions, the behavior is undefined.

11168 The *va_arg()* macro shall return the next argument in the list pointed to by *ap*. Each invocation
 11169 of *va_arg()* modifies *ap* so that the values of successive arguments are returned in turn. The *type*
 11170 parameter shall be a type name specified such that the type of a pointer to an object that has the
 11171 specified type can be obtained simply by postfixing a '*' to type. If there is no actual next
 11172 argument, or if *type* is not compatible with the type of the actual next argument (as promoted
 11173 according to the default argument promotions), the behavior is undefined, except for the
 11174 following cases:

- 11175 • One type is a signed integer type, the other type is the corresponding unsigned integer type,
 11176 and the value is representable in both types.
- 11177 • One type is a pointer to **void** and the other is a pointer to a character type.
- 11178 XSI • Both types are pointers.

11179 Different types can be mixed, but it is up to the routine to know what type of argument is
 11180 expected.

11181 The *va_end()* macro is used to clean up; it invalidates *ap* for use (unless *va_start()* or *va_copy()* is
 11182 invoked again).

11183 Each invocation of the *va_start()* and *va_copy()* macros shall be matched by a corresponding
11184 invocation of the *va_end()* macro in the same function.

11185 Multiple traversals, each bracketed by *va_start()*... *va_end()*, are possible.

11186 **EXAMPLES**

11187 This example is a possible implementation of *execl()*:

```
11188 #include <stdarg.h>
11189 #define MAXARGS 31
11190 /*
11191  * execl is called by
11192  * execl(file, arg1, arg2, ..., (char *) (0));
11193  */
11194 int execl(const char *file, const char *args, ...)
11195 {
11196     va_list ap;
11197     char *array[MAXARGS + 1];
11198     int argno = 0;
11199
11200     va_start(ap, args);
11201     while (args != 0 && argno < MAXARGS)
11202     {
11203         array[argno++] = args;
11204         args = va_arg(ap, const char *);
11205     }
11206     array[argno] = (char *) 0;
11207     va_end(ap);
11208     return execv(file, array);
11209 }
```

11209 **APPLICATION USAGE**

11210 It is up to the calling routine to communicate to the called routine how many arguments there
11211 are, since it is not always possible for the called routine to determine this in any other way. For
11212 example, *execl()* is passed a null pointer to signal the end of the list. The *printf()* function can tell
11213 how many arguments are there by the *format* argument.

11214 **RATIONALE**

11215 None.

11216 **FUTURE DIRECTIONS**

11217 None.

11218 **SEE ALSO**

11219 The System Interfaces volume of IEEE Std 1003.1-2001, *exec*, *printf()*

11220 **CHANGE HISTORY**

11221 First released in Issue 4. Derived from the ANSI C standard.

11222 **Issue 6**

11223 This reference page is updated to align with the ISO / IEC 9899:1999 standard.

11224 NAME

11225 stdbool.h — boolean type and values

11226 SYNOPSIS

11227 #include <stdbool.h>

11228 DESCRIPTION

11229 cx The functionality described on this reference page is aligned with the ISO C standard. Any
11230 conflict between the requirements described here and the ISO C standard is unintentional. This
11231 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11232 The **<stdbool.h>** header shall define the following macros:

11233 bool Expands to **_Bool**.

11234 true Expands to the integer constant 1.

11235 false Expands to the integer constant 0.

11236 __bool_true_false_are_defined

11237 Expands to the integer constant 1.

11238 An application may undefine and then possibly redefine the macros bool, true, and false.

11239 APPLICATION USAGE

11240 None.

11241 RATIONALE

11242 None.

11243 FUTURE DIRECTIONS

11244 The ability to undefine and redefine the macros bool, true, and false is an obsolescent feature
11245 and may be withdrawn in a future version.

11246 SEE ALSO

11247 None.

11248 CHANGE HISTORY

11249 First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

11250 **NAME**

11251 **stddef.h** — standard type definitions

11252 **SYNOPSIS**

11253 #include <stddef.h>

11254 **DESCRIPTION**

11255 cx The functionality described on this reference page is aligned with the ISO C standard. Any
11256 conflict between the requirements described here and the ISO C standard is unintentional. This
11257 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11258 The <stddef.h> header shall define the following macros:

11259 **NULL** Null pointer constant.

11260 **offsetof**(*type*, *member-designator*)

11261 Integer constant expression of type **size_t**, the value of which is the offset in bytes
11262 to the structure member (*member-designator*), from the beginning of its structure
11263 (*type*).

11264 The <stddef.h> header shall define the following types:

11265 **ptrdiff_t** Signed integer type of the result of subtracting two pointers.

11266 **wchar_t** Integer type whose range of values can represent distinct wide-character codes for
11267 all members of the largest character set specified among the locales supported by
11268 the compilation environment: the null character has the code value 0 and each
11269 member of the portable character set has a code value equal to its value when used
11270 as the lone character in an integer character constant.

11271 **size_t** Unsigned integer type of the result of the *sizeof* operator.

11272 The implementation shall support one or more programming environments in which the widths
11273 of **ptrdiff_t**, **size_t**, and **wchar_t** are no greater than the width of type **long**. The names of these
11274 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

11275 **APPLICATION USAGE**

11276 None.

11277 **RATIONALE**

11278 None.

11279 **FUTURE DIRECTIONS**

11280 None.

11281 **SEE ALSO**

11282 <**wchar.h**>, <**sys/types.h**>, the System Interfaces volume of IEEE Std 1003.1-2001, *confstr()*, the
11283 Shell and Utilities volume of IEEE Std 1003.1-2001, *getconf*

11284 **CHANGE HISTORY**

11285 First released in Issue 4. Derived from the ANSI C standard.

11286 **NAME**

11287 stdint.h — integer types

11288 **SYNOPSIS**

11289 #include <stdint.h>

11290 **DESCRIPTION**

11291 **CX** Some of the functionality described on this reference page extends the ISO C standard.
 11292 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 11293 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 11294 symbols in this header.

11295 The <stdint.h> header shall declare sets of integer types having specified widths, and shall
 11296 define corresponding sets of macros. It shall also define macros that specify limits of integer
 11297 types corresponding to types defined in other standard headers.

11298 **Note:** The “width” of an integer type is the number of bits used to store its value in a pure binary
 11299 system; the actual type may use more bits than that (for example, a 28-bit type could be stored
 11300 in 32 bits of actual storage). An N -bit signed type has values in the range -2^{N-1} or $1-2^{N-1}$ to
 11301 $2^{N-1}-1$, while an N -bit unsigned type has values in the range 0 to 2^N-1 .

11302 Types are defined in the following categories:

- 11303 • Integer types having certain exact widths
- 11304 • Integer types having at least certain specified widths
- 11305 • Fastest integer types having at least certain specified widths
- 11306 • Integer types wide enough to hold pointers to objects
- 11307 • Integer types having greatest width

11308 (Some of these types may denote the same type.)

11309 Corresponding macros specify limits of the declared types and construct suitable constants.

11310 For each type described herein that the implementation provides, the <stdint.h> header shall
 11311 declare that **typedef** name and define the associated macros. Conversely, for each type described
 11312 herein that the implementation does not provide, the <stdint.h> header shall not declare that
 11313 **typedef** name, nor shall it define the associated macros. An implementation shall provide those
 11314 types described as required, but need not provide any of the others (described as optional).

11315 **Integer Types**

11316 When **typedef** names differing only in the absence or presence of the initial u are defined, they
 11317 shall denote corresponding signed and unsigned types as described in the ISO/IEC 9899:1999
 11318 standard, Section 6.2.5; an implementation providing one of these corresponding types shall also
 11319 provide the other.

11320 In the following descriptions, the symbol N represents an unsigned decimal integer with no
 11321 leading zeros (for example, 8 or 24, but not 04 or 048).

- 11322 • Exact-width integer types

11323 The **typedef** name **int N _t** designates a signed integer type with width N , no padding bits,
 11324 and a two’s-complement representation. Thus, **int8_t** denotes a signed integer type with a
 11325 width of exactly 8 bits.

11326 The **typedef** name **uint N _t** designates an unsigned integer type with width N . Thus,
 11327 **uint24_t** denotes an unsigned integer type with a width of exactly 24 bits.

11328	CX	The following types are required:
11329		int8_t
11330		int16_t
11331		int32_t
11332		uint8_t
11333		uint16_t
11334		uint32_t
11335		If an implementation provides integer types with width 64 that meet these requirements,
11336		then the following types are required:
11337		int64_t
11338		uint64_t
11339	CX	In particular, this will be the case if any of the following are true:
11340		— The implementation supports the <code>_POSIX_V6_ILP32_OFFBIG</code> programming
11341		environment and the application is being built in the <code>_POSIX_V6_ILP32_OFFBIG</code>
11342		programming environment (see the Shell and Utilities volume of IEEE Std 1003.1-2001,
11343		c99, Programming Environments).
11344		— The implementation supports the <code>_POSIX_V6_LP64_OFF64</code> programming environment
11345		and the application is being built in the <code>_POSIX_V6_LP64_OFF64</code> programming
11346		environment.
11347		— The implementation supports the <code>_POSIX_V6_LPBIG_OFFBIG</code> programming
11348		environment and the application is being built in the <code>_POSIX_V6_LPBIG_OFFBIG</code>
11349		programming environment.
11350		All other types of this form are optional.
11351		• Minimum-width integer types
11352		The typedef name int_leastN_t designates a signed integer type with a width of at least <i>N</i> ,
11353		such that no signed integer type with lesser size has at least the specified width. Thus,
11354		int_least32_t denotes a signed integer type with a width of at least 32 bits.
11355		The typedef name uint_leastN_t designates an unsigned integer type with a width of at least
11356		<i>N</i> , such that no unsigned integer type with lesser size has at least the specified width. Thus,
11357		uint_least16_t denotes an unsigned integer type with a width of at least 16 bits.
11358		The following types are required:
11359		int_least8_t
11360		int_least16_t
11361		int_least32_t
11362		int_least64_t
11363		uint_least8_t
11364		uint_least16_t
11365		uint_least32_t
11366		uint_least64_t
11367		All other types of this form are optional.
11368		• Fastest minimum-width integer types
11369		Each of the following types designates an integer type that is usually fastest to operate with
11370		among all integer types that have at least the specified width.

11371 The designated type is not guaranteed to be fastest for all purposes; if the implementation
 11372 has no clear grounds for choosing one type over another, it will simply pick some integer
 11373 type satisfying the signedness and width requirements.

11374 The **typedef** name **int_fastN_t** designates the fastest signed integer type with a width of at
 11375 least *N*. The **typedef** name **uint_fastN_t** designates the fastest unsigned integer type with a
 11376 width of at least *N*.

11377 The following types are required:

11378 **int_fast8_t**
 11379 **int_fast16_t**
 11380 **int_fast32_t**
 11381 **int_fast64_t**
 11382 **uint_fast8_t**
 11383 **uint_fast16_t**
 11384 **uint_fast32_t**
 11385 **uint_fast64_t**

11386 All other types of this form are optional.

- 11387 • Integer types capable of holding object pointers

11388 The following type designates a signed integer type with the property that any valid pointer
 11389 to **void** can be converted to this type, then converted back to a pointer to **void**, and the result
 11390 will compare equal to the original pointer:

11391 **intptr_t**

11392 The following type designates an unsigned integer type with the property that any valid
 11393 pointer to **void** can be converted to this type, then converted back to a pointer to **void**, and
 11394 the result will compare equal to the original pointer:

11395 **uintptr_t**

11396 xsi On XSI-conformant systems, the **intptr_t** and **uintptr_t** types are required; otherwise, they
 11397 are optional.

- 11398 • Greatest-width integer types

11399 The following type designates a signed integer type capable of representing any value of any
 11400 signed integer type:

11401 **intmax_t**

11402 The following type designates an unsigned integer type capable of representing any value of
 11403 any unsigned integer type:

11404 **uintmax_t**

11405 These types are required.

11406 **Note:** Applications can test for optional types by using the corresponding limit macro from **Limits of**
 11407 **Specified-Width Integer Types** (on page 319).

Limits of Specified-Width Integer Types

The following macros specify the minimum and maximum limits of the types declared in the <stdint.h> header. Each macro name corresponds to a similar type name in **Integer Types** (on page 316).

Each instance of any defined macro shall be replaced by a constant expression suitable for use in **#if** preprocessing directives, and this expression shall have the same type as would an expression that is an object of the corresponding type converted according to the integer promotions. Its implementation-defined value shall be equal to or greater in magnitude (absolute value) than the corresponding value given below, with the same sign, except where stated to be exactly the given value.

- Limits of exact-width integer types

- Minimum values of exact-width signed integer types:

{INTN_MIN} Exactly $-(2^{N-1})$

- Maximum values of exact-width signed integer types:

{INTN_MAX} Exactly $2^{N-1} - 1$

- Maximum values of exact-width unsigned integer types:

{UINTN_MAX} Exactly $2^N - 1$

- Limits of minimum-width integer types

- Minimum values of minimum-width signed integer types:

{INT_LEASTN_MIN} $-(2^{N-1} - 1)$

- Maximum values of minimum-width signed integer types:

{INT_LEASTN_MAX} $2^{N-1} - 1$

- Maximum values of minimum-width unsigned integer types:

{UINT_LEASTN_MAX} $2^N - 1$

- Limits of fastest minimum-width integer types

- Minimum values of fastest minimum-width signed integer types:

{INT_FASTN_MIN} $-(2^{N-1} - 1)$

- Maximum values of fastest minimum-width signed integer types:

{INT_FASTN_MAX} $2^{N-1} - 1$

- Maximum values of fastest minimum-width unsigned integer types:

{UINT_FASTN_MAX} $2^N - 1$

- Limits of integer types capable of holding object pointers

- Minimum value of pointer-holding signed integer type:

{INTPTR_MIN} $-(2^{15} - 1)$

- Maximum value of pointer-holding signed integer type:

{INTPTR_MAX} $2^{15} - 1$

- Maximum value of pointer-holding unsigned integer type:

11445 {UINTPTR_MAX} $2^{16} - 1$

11446 • Limits of greatest-width integer types

11447 — Minimum value of greatest-width signed integer type:

11448 {INTMAX_MIN} $-(2^{63} - 1)$

11449 — Maximum value of greatest-width signed integer type:

11450 {INTMAX_MAX} $2^{63} - 1$

11451 — Maximum value of greatest-width unsigned integer type:

11452 {UINTMAX_MAX} $2^{64} - 1$

11453 Limits of Other Integer Types

11454 The following macros specify the minimum and maximum limits of integer types corresponding
11455 to types defined in other standard headers.

11456 Each instance of these macros shall be replaced by a constant expression suitable for use in **#if**
11457 preprocessing directives, and this expression shall have the same type as would an expression
11458 that is an object of the corresponding type converted according to the integer promotions. Its
11459 implementation-defined value shall be equal to or greater in magnitude (absolute value) than
11460 the corresponding value given below, with the same sign.

11461 • Limits of **ptrdiff_t**:

11462 {PTRDIFF_MIN} $-65\,535$

11463 {PTRDIFF_MAX} $+65\,535$

11464 • Limits of **sig_atomic_t**:

11465 {SIG_ATOMIC_MIN} See below.

11466 {SIG_ATOMIC_MAX} See below.

11467 • Limit of **size_t**:

11468 {SIZE_MAX} $65\,535$

11469 • Limits of **wchar_t**:

11470 {WCHAR_MIN} See below.

11471 {WCHAR_MAX} See below.

11472 • Limits of **wint_t**:

11473 {WINT_MIN} See below.

11474 {WINT_MAX} See below.

11475 If **sig_atomic_t** (see the <signal.h> header) is defined as a signed integer type, the value of
11476 {SIG_ATOMIC_MIN} shall be no greater than -127 and the value of {SIG_ATOMIC_MAX} shall
11477 be no less than 127 ; otherwise, **sig_atomic_t** shall be defined as an unsigned integer type, and the
11478 value of {SIG_ATOMIC_MIN} shall be 0 and the value of {SIG_ATOMIC_MAX} shall be no less
11479 than 255 .

11480 If **wchar_t** (see the <stddef.h> header) is defined as a signed integer type, the value of
11481 {WCHAR_MIN} shall be no greater than -127 and the value of {WCHAR_MAX} shall be no less
11482 than 127 ; otherwise, **wchar_t** shall be defined as an unsigned integer type, and the value of
11483 {WCHAR_MIN} shall be 0 and the value of {WCHAR_MAX} shall be no less than 255 .

11484 If **wint_t** (see the <wchar.h> header) is defined as a signed integer type, the value of
 11485 {WINT_MIN} shall be no greater than −32 767 and the value of {WINT_MAX} shall be no less
 11486 than 32 767; otherwise, **wint_t** shall be defined as an unsigned integer type, and the value of
 11487 {WINT_MIN} shall be 0 and the value of {WINT_MAX} shall be no less than 65 535.

11488 **Macros for Integer Constant Expressions**

11489 The following macros expand to integer constant expressions suitable for initializing objects that
 11490 have integer types corresponding to types defined in the <stdint.h> header. Each macro name
 11491 corresponds to a similar type name listed under *Minimum-width integer types* and *Greatest-width*
 11492 *integer types*.

11493 Each invocation of one of these macros shall expand to an integer constant expression suitable
 11494 for use in **#if** preprocessing directives. The type of the expression shall have the same type as
 11495 would an expression that is an object of the corresponding type converted according to the
 11496 integer promotions. The value of the expression shall be that of the argument.

11497 The argument in any instance of these macros shall be a decimal, octal, or hexadecimal constant
 11498 with a value that does not exceed the limits for the corresponding type.

11499 • Macros for minimum-width integer constant expressions

11500 The macro **INTN_C(value)** shall expand to an integer constant expression corresponding to
 11501 the type **int_leastN_t**. The macro **UINTN_C(value)** shall expand to an integer constant
 11502 expression corresponding to the type **uint_leastN_t**. For example, if **uint_least64_t** is a name
 11503 for the type **unsigned long long**, then **UINT64_C(0x123)** might expand to the integer
 11504 constant 0x123ULL.

11505 • Macros for greatest-width integer constant expressions

11506 The following macro expands to an integer constant expression having the value specified by
 11507 its argument and the type **intmax_t**:

11508 **INTMAX_C(value)**

11509 The following macro expands to an integer constant expression having the value specified by
 11510 its argument and the type **uintmax_t**:

11511 **UINTMAX_C(value)**

11512 **APPLICATION USAGE**

11513 None.

11514 **RATIONALE**

11515 The <stdint.h> header is a subset of the <inttypes.h> header more suitable for use in
 11516 freestanding environments, which might not support the formatted I/O functions. In some
 11517 environments, if the formatted conversion support is not wanted, using this header instead of
 11518 the <inttypes.h> header avoids defining such a large number of macros.

11519 As a consequence of adding **int8_t**, the following are true:

- 11520 • A byte is exactly 8 bits.
- 11521 • {CHAR_BIT} has the value 8, {SCHAR_MAX} has the value 127, {SCHAR_MIN} has the
 11522 value −127 or −128, and {UCHAR_MAX} has the value 255.

11523 **FUTURE DIRECTIONS**

11524 **typedef** names beginning with **int** or **uint** and ending with **_t** may be added to the types defined
 11525 in the <stdint.h> header. Macro names beginning with **INT** or **UINT** and ending with **_MAX**,
 11526 **_MIN**, or **_C** may be added to the macros defined in the <stdint.h> header.

11527 **SEE ALSO**11528 **<inttypes.h>**, **<signal.h>**, **<stddef.h>**, **<wchar.h>**11529 **CHANGE HISTORY**

11530 First released in Issue 6. Included for alignment with the ISO / IEC 9899: 1999 standard.

11531 ISO / IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated. |

11532 NAME

11533 stdio.h — standard buffered input/output

11534 SYNOPSIS

11535 #include <stdio.h>

11536 DESCRIPTION

11537 CX Some of the functionality described on this reference page extends the ISO C standard.
 11538 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 11539 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 11540 symbols in this header.

11541 The <stdio.h> header shall define the following macros as positive integer constant expressions:

11542 BUFSIZ Size of <stdio.h> buffers.

11543 _IIOFBF Input/output fully buffered.

11544 _IIOBFB Input/output line buffered.

11545 _IIONBF Input/output unbuffered.

11546 CX L_ctermid Maximum size of character array to hold *ctermid()* output.

11547 L_tmpnam Maximum size of character array to hold *tmpnam()* output.

11548 SEEK_CUR Seek relative to current position.

11549 SEEK_END Seek relative to end-of-file.

11550 SEEK_SET Seek relative to start-of-file.

11551 The following macros shall be defined as positive integer constant expressions which denote
 11552 implementation limits:

11553 {FILENAME_MAX} Maximum size in bytes of the longest filename string that the
 11554 implementation guarantees can be opened.

11555 {FOPEN_MAX} Number of streams which the implementation guarantees can be open
 11556 simultaneously. The value is at least eight.

11557 {TMP_MAX} Minimum number of unique filenames generated by *tmpnam()*.
 11558 Maximum number of times an application can call *tmpnam()* reliably. The
 11559 XSI value of {TMP_MAX} is at least 25. On XSI-conformant systems, the
 11560 value of {TMP_MAX} is at least 10 000.

11561 The following macro name shall be defined as a negative integer constant expression:

11562 EOF End-of-file return value.

11563 The following macro name shall be defined as a null pointer constant:

11564 NULL Null pointer.

11565 The following macro name shall be defined as a string constant:

11566 XSI P_tmpdir Default directory prefix for *tmpnam()*.

11567 The following shall be defined as expressions of type “pointer to **FILE**” that point to the **FILE**
 11568 objects associated, respectively, with the standard error, input, and output streams:

11569 stderr Standard error output stream.

11570 stdin Standard input stream.

11571	<i>stdout</i>	Standard output stream.
11572	The following data types shall be defined through typedef :	
11573	FILE	A structure containing information about a file.
11574	fpos_t	A non-array type containing all information needed to specify uniquely
11575		every position within a file.
11576 XSI	va_list	As described in <stdarg.h>.
11577	size_t	As described in <stddef.h>.
11578	The following shall be declared as functions and may also be defined as macros. Function	
11579	prototypes shall be provided.	
11580	void	clearerr(FILE *);
11581 CX	char	*ctermid(char *);
11582	int	fclose(FILE *);
11583 CX	FILE	*fdopen(int, const char *);
11584	int	feof(FILE *);
11585	int	ferror(FILE *);
11586	int	fflush(FILE *);
11587	int	fgetc(FILE *);
11588	int	fgetpos(FILE *restrict, fpos_t *restrict);
11589	char	*fgets(char *restrict, int, FILE *restrict);
11590 CX	int	fileno(FILE *);
11591 TSF	void	flockfile(FILE *);
11592	FILE	*fopen(const char *restrict, const char *restrict);
11593	int	fprintf(FILE *restrict, const char *restrict, ...);
11594	int	fputc(int, FILE *);
11595	int	fputs(const char *restrict, FILE *restrict);
11596	size_t	fread(void *restrict, size_t, size_t, FILE *restrict);
11597	FILE	*freopen(const char *restrict, const char *restrict,
11598		FILE *restrict);
11599	int	fscanf(FILE *restrict, const char *restrict, ...);
11600	int	fseek(FILE *, long, int);
11601 CX	int	fseeko(FILE *, off_t, int);
11602	int	fsetpos(FILE *, const fpos_t *);
11603	long	ftell(FILE *);
11604 CX	off_t	ftello(FILE *);
11605 TSF	int	ftrylockfile(FILE *);
11606	void	funlockfile(FILE *);
11607	size_t	fwrite(const void *restrict, size_t, size_t, FILE *restrict);
11608	int	getc(FILE *);
11609	int	getchar(void);
11610 TSF	int	getc_unlocked(FILE *);
11611	int	getchar_unlocked(void);
11612	char	*gets(char *);
11613 CX	int	pclose(FILE *);
11614	void	perror(const char *);
11615 CX	FILE	*popen(const char *, const char *);
11616	int	printf(const char *restrict, ...);
11617	int	putc(int, FILE *);
11618	int	putchar(int);
11619 TSF		

```

11620     int      putc_unlocked(int, FILE *);
11621     int      putchar_unlocked(int);
11622     int      puts(const char *);
11623     int      remove(const char *);
11624     int      rename(const char *, const char *);
11625     void     rewind(FILE *);
11626     int      scanf(const char *restrict, ...);
11627     void     setbuf(FILE *restrict, char *restrict);
11628     int      setvbuf(FILE *restrict, char *restrict, int, size_t);
11629     int      snprintf(char *restrict, size_t, const char *restrict, ...);
11630     int      sprintf(char *restrict, const char *restrict, ...);
11631     int      sscanf(const char *restrict, const char *restrict, int ...);
11632 XSI     char  *tempnam(const char *, const char *);
11633     FILE     *tmpfile(void);
11634     char     *tmpnam(char *);
11635     int      ungetc(int, FILE *);
11636     int      vfprintf(FILE *restrict, const char *restrict, va_list);
11637     int      vfprintf(FILE *restrict, const char *restrict, va_list);
11638     int      vprintf(const char *restrict, va_list);
11639     int      vscanf(const char *restrict, va_list);
11640     int      vsnprintf(char *restrict, size_t, const char *restrict, va_list);
11641     int      vsprintf(char *restrict, const char *restrict, va_list);
11642     int      vsscanf(const char *restrict, const char *restrict, va_list arg);

```

11643 XSI Inclusion of the <stdio.h> header may also make visible all symbols from <stddef.h>.

11644 APPLICATION USAGE

11645 None.

11646 RATIONALE

11647 None.

11648 FUTURE DIRECTIONS

11649 None.

11657 CHANGE HISTORY

11658 First released in Issue 1. Derived from Issue 1 of the SVID.

11659 Issue 5

11660 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

11661 Large File System extensions are added.

11662 The constant *L_cuserid* and the external variables *optarg*, *opterr*, *optind*, and *optopt* are marked as
11663 extensions and LEGACY.

11664 The *cuserid()* and *getopt()* functions are marked LEGACY.

11665 **Issue 6**

11666 The constant `L_cuserid` and the external variables *optarg*, *opterr*, *optind*, and *optopt* are removed
11667 as they were previously marked LEGACY.

11668 The *cuserid()*, *getopt()*, and *getw()* functions are removed as they were previously marked
11669 LEGACY.

11670 Several functions are marked as part of the Thread-Safe Functions option.

11671 This reference page is updated to align with the ISO/IEC 9899:1999 standard. Note that the
11672 description of the **fpos_t** type is now explicitly updated to exclude array types.

11673 Extensions beyond the ISO C standard are marked.

11674 **NAME**

11675 stdlib.h — standard library definitions

11676 **SYNOPSIS**

11677 #include <stdlib.h>

11678 **DESCRIPTION**

11679 CX Some of the functionality described on this reference page extends the ISO C standard.
11680 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
11681 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
11682 symbols in this header.

11683 The <stdlib.h> header shall define the following macros:

11684 EXIT_FAILURE Unsuccessful termination for *exit()*; evaluates to a non-zero value.

11685 EXIT_SUCCESS Successful termination for *exit()*; evaluates to 0.

11686 NULL Null pointer.

11687 {RAND_MAX} Maximum value returned by *rand()*; at least 32 767.

11688 {MB_CUR_MAX} Integer expression whose value is the maximum number of bytes in a
11689 character specified by the current locale.

11690 The following data types shall be defined through **typedef**:

11691 **div_t** Structure type returned by the *div()* function.

11692 **ldiv_t** Structure type returned by the *ldiv()* function.

11693 **lldiv_t** Structure type returned by the *lldiv()* function.

11694 **size_t** As described in <stddef.h>.

11695 **wchar_t** As described in <stddef.h>.

11696 In addition, the following symbolic names and macros shall be defined as in <sys/wait.h>, for
11697 use in decoding the return value from *system()*:

11698 XSI WNOHANG
11699 WUNTRACED
11700 WEXITSTATUS
11701 WIFEXITED
11702 WIFSIGNALED
11703 WIFSTOPPED
11704 WSTOPSIG
11705 WTERMSIG
11706

11707 The following shall be declared as functions and may also be defined as macros. Function
11708 prototypes shall be provided.

11709 void _Exit(int);
11710 XSI long a64l(const char *);
11711 void abort(void);
11712 int abs(int);
11713 int atexit(void (*)(void));
11714 double atof(const char *);
11715 int atoi(const char *);
11716 long atol(const char *);

```

11717 long long      atoll(const char *);
11718 void          *bsearch(const void *, const void *, size_t, size_t,
11719                      int (*)(const void *, const void *));
11720 void          *calloc(size_t, size_t);
11721 div_t         div(int, int);
11722 XSI double     drand48(void);
11723 char          *ecvt(double, int, int *restrict, int *restrict); (LEGACY)
11724 double        erand48(unsigned short[3]);
11725 void          exit(int);
11726 XSI char       *fcvt(double, int, int *restrict, int *restrict); (LEGACY)
11727 void          free(void *);
11728 XSI char       *gcvt(double, int, char *); (LEGACY)
11729 char          *getenv(const char *);
11730 XSI int        getsuopt(char **, char *const *, char **);
11731 int           grantpt(int);
11732 char          *initstate(unsigned, char *, size_t);
11733 long          jrand48(unsigned short[3]);
11734 char          *l64a(long);
11735 long          labs(long);
11736 XSI void       lcong48(unsigned short[7]);
11737 ldiv_t        ldiv(long, long);
11738 long long     llabs(long long);
11739 lldiv_t       lldiv(long long, long long);
11740 XSI long       lrand48(void);
11741 void          *malloc(size_t);
11742 int           mblen(const char *, size_t);
11743 size_t        mbstowcs(wchar_t *restrict, const char *restrict, size_t);
11744 int           mbtowc(wchar_t *restrict, const char *restrict, size_t);
11745 XSI char       *mktemp(char *); (LEGACY)
11746 int           mkstemp(char *);
11747 long          mrand48(void);
11748 long          nrand48(unsigned short[3]);
11749 ADV int        posix_memalign(void **, size_t, size_t);
11750 XSI int        posix_openpt(int);
11751 char          *ptsname(int);
11752 int           putenv(char *);
11753 void          qsort(void *, size_t, size_t, int (*)(const void *,
11754                      const void *));
11755 int           rand(void);
11756 TSF int        rand_r(unsigned *);
11757 XSI long       random(void);
11758 void          *realloc(void *, size_t);
11759 XSI char       *realpath(const char *restrict, char *restrict);
11760 unsigned short seed48(unsigned short[3]);
11761 CX int         setenv(const char *, const char *, int);
11762 XSI void       setkey(const char *);
11763 char          *setstate(const char *);
11764 void          srand(unsigned);
11765 XSI void       srand48(long);
11766 void          srandom(unsigned);
11767 double        strtod(const char *restrict, char **restrict);
11768 float         strtod(const char *restrict, char **restrict);

```

```

11769      long          strtol(const char *restrict, char **restrict, int);
11770      long double    strtold(const char *restrict, char **restrict);
11771      long long      strtoll(const char *restrict, char **restrict, int);
11772      unsigned long   strtoul(const char *restrict, char **restrict, int);
11773      unsigned long   long
11774                        strtoull(const char *restrict, char **restrict, int);
11775      int             system(const char *);
11776 XSI      int         unlockpt(int);
11777 CX      int         unsetenv(const char *);
11778      size_t          wcstombs(char *restrict, const wchar_t *restrict, size_t);
11779      int             wctomb(char *, wchar_t);

11780 XSI      Inclusion of the <stdlib.h> header may also make visible all symbols from <stddef.h>,
11781            <limits.h>, <math.h>, and <sys/wait.h>.

```

11796 CHANGE HISTORY

11797 First released in Issue 3.

11798 Issue 5

11799 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

11800 The *ttyslot()* and *valloc()* functions are marked LEGACY.

11801 The type of the third argument to *initstate()* is changed from **int** to **size_t**. The type of the return
11802 value from *setstate()* is changed from **char** to **char ***, and the type of the first argument is
11803 changed from **char *** to **const char ***.

11804 Issue 6

11805 The Open Group Corrigendum U021/1 is applied, correcting the prototype for *realpath()* to be
11806 consistent with the reference page.

11807 The Open Group Corrigendum U028/13 is applied, correcting the prototype for *putenv()* to be
11808 consistent with the reference page.

11809 The *rand_r()* function is marked as part of the Thread-Safe Functions option.

11810 Function prototypes for *setenv()* and *unsetenv()* are added.

11811 The *posix_memalign()* function is added for alignment with IEEE Std 1003.1d-1999.

11812 This reference page is updated to align with the ISO/IEC 9899:1999 standard.

- 11813 The *ecvt()*, *fcvt()*, *gcvt()*, and *mktemp()* functions are marked LEGACY.
- 11814 The *ttyslot()* and *valloc()* functions are removed as they were previously marked LEGACY.
- 11815 Extensions beyond the ISO C standard are marked.

11816 **NAME**

11817 string.h — string operations

11818 **SYNOPSIS**

11819 #include <string.h>

11820 **DESCRIPTION**

11821 CX Some of the functionality described on this reference page extends the ISO C standard.
 11822 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 11823 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 11824 symbols in this header.

11825 The <string.h> header shall define the following:

11826 NULL Null pointer constant.

11827 **size_t** As described in <stddef.h>.

11828 The following shall be declared as functions and may also be defined as macros. Function
 11829 prototypes shall be provided.

```

11830 XSI void *memcpy(void *restrict, const void *restrict, int, size_t);
11831 void *memchr(const void *, int, size_t);
11832 int memcmp(const void *, const void *, size_t);
11833 void *memcpy(void *restrict, const void *restrict, size_t);
11834 void *memmove(void *, const void *, size_t);
11835 void *memset(void *, int, size_t);
11836 char *strcat(char *restrict, const char *restrict);
11837 char *strchr(const char *, int);
11838 int strcmp(const char *, const char *);
11839 int strcoll(const char *, const char *);
11840 char *strcpy(char *restrict, const char *restrict);
11841 size_t strcspn(const char *, const char *);
11842 XSI char *strdup(const char *);
11843 char *strerror(int);
11844 TSF int *strerror_r(int, char *, size_t);
11845 size_t strlen(const char *);
11846 char *strncat(char *restrict, const char *restrict, size_t);
11847 int strncmp(const char *, const char *, size_t);
11848 char *strncpy(char *restrict, const char *restrict, size_t);
11849 char *strpbrk(const char *, const char *);
11850 char *strrchr(const char *, int);
11851 size_t strspn(const char *, const char *);
11852 char *strstr(const char *, const char *);
11853 char *strtok(char *restrict, const char *restrict);
11854 TSF char *strtok_r(char *, const char *, char **);
11855 size_t strxfrm(char *restrict, const char *restrict, size_t);
    
```

11856 XSI Inclusion of the <string.h> header may also make visible all symbols from <stddef.h>.

11857 **APPLICATION USAGE**

11858 None.

11859 **RATIONALE**

11860 None.

11861 **FUTURE DIRECTIONS**

11902 **CHANGE HISTORY**

11903 First released in Issue 4, Version 2.

11904 **Issue 6**

11905 The Open Group Corrigendum U021/2 is applied, correcting the prototype for *index()* to be
 11906 consistent with the reference page.

11907 The *bcmp()*, *bcopy()*, *bzero()*, *index()*, and *rindex()* functions are marked LEGACY.

11908 **NAME**11909 stropts.h — STREAMS interface (**STREAMS**)11910 **SYNOPSIS**

11911 xSR #include <stropts.h>

11912

11913 **DESCRIPTION**11914 The <stropts.h> header shall define the **bandinfo** structure that includes at least the following
11915 members:

11916	unsigned char	bi_pri	Priority band.
11917	int	bi_flag	Flushing type.

11918 The <stropts.h> header shall define the **strpeek** structure that includes at least the following
11919 members:

11920	struct strbuf	ctlbuf	The control portion of the message.
11921	struct strbuf	databuf	The data portion of the message.
11922	t_uscalar_t	flags	RS_HIPRI or 0.

11923 The <stropts.h> header shall define the **strbuf** structure that includes at least the following
11924 members:

11925	int	maxlen	Maximum buffer length.
11926	int	len	Length of data.
11927	char	*buf	Pointer to buffer.

11928 The <stropts.h> header shall define the **strfdinsert** structure that includes at least the following
11929 members:

11930	struct strbuf	ctlbuf	The control portion of the message.
11931	struct strbuf	databuf	The data portion of the message.
11932	t_uscalar_t	flags	RS_HIPRI or 0.
11933	int	fildes	File descriptor of the other STREAM.
11934	int	offset	Relative location of the stored value.

11935 The <stropts.h> header shall define the **strioctl** structure that includes at least the following
11936 members:

11937	int	ic_cmd	ioctl() command.
11938	int	ic_timeout	Timeout for response.
11939	int	ic_len	Length of data.
11940	char	*ic_dp	Pointer to buffer.

11941 The <stropts.h> header shall define the **strrecvfd** structure that includes at least the following
11942 members:

11943	int	fda	Received file descriptor.
11944	uid_t	uid	UID of sender.
11945	gid_t	gid	GID of sender.

11946 The **uid_t** and **gid_t** types shall be defined through **typedef** as described in <sys/types.h>.11947 The <stropts.h> header shall define the **t_scalar_t** and **t_uscalar_t** types, respectively, as signed
11948 and unsigned opaque types of equal length of at least 32 bits.11949 The <stropts.h> header shall define the **str_list** structure that includes at least the following
11950 members:

```

11951      int                sl_nmods      Number of STREAMS module names.
11952      struct str_mlist  *sl_modlist   STREAMS module names.

11953      The <stropts.h> header shall define the str_mlist structure that includes at least the following
11954      member:

11955      char  l_name[FMNAMESZ+1]  A STREAMS module name.

11956      At least the following macros shall be defined for use as the request argument to ioctl():

11957      I_PUSH          Push a STREAMS module.
11958      I_POP           Pop a STREAMS module.
11959      I_LOOK          Get the top module name.
11960      I_FLUSH         Flush a STREAM.
11961      I_FLUSHBAND     Flush one band of a STREAM.
11962      I_SETSIG        Ask for notification signals.
11963      I_GETSIG        Retrieve current notification signals.
11964      I_FIND          Look for a STREAMS module.
11965      I_PEEK          Peek at the top message on a STREAM.
11966      I_SRDOPT        Set the read mode.
11967      I_GRDOPT        Get the read mode.
11968      I_NREAD         Size the top message.
11969      I_FDINSERT      Send implementation-defined information about another STREAM.
11970      I_STR           Send a STREAMS ioctl().
11971      I_SWROPT        Set the write mode.
11972      I_GWROPT        Get the write mode.
11973      I_SENDFD        Pass a file descriptor through a STREAMS pipe.
11974      I_RECVFD        Get a file descriptor sent via I_SENDFD.
11975      I_LIST          Get all the module names on a STREAM.
11976      I_ATMARK        Is the top message “marked”?
11977      I_CKBAND        See if any messages exist in a band.
11978      I_GETBAND       Get the band of the top message on a STREAM.
11979      I_CANPUT        Is a band writable?
11980      I_SETCLTIME     Set close time delay.
11981      I_GETCLTIME     Get close time delay.
11982      I_LINK          Connect two STREAMs.
11983      I_UNLINK        Disconnect two STREAMs.
11984      I_PLINK         Persistently connect two STREAMs.
11985      I_PUNLINK       Dismantle a persistent STREAMS link.

```

11986	At least the following macros shall be defined for use with I_LOOK:	
11987	FMNAMESZ	The minimum size in bytes of the buffer referred to by the <i>arg</i> argument.
11988	At least the following macros shall be defined for use with I_FLUSH:	
11989	FLUSHR	Flush read queues.
11990	FLUSHW	Flush write queues.
11991	FLUSHRW	Flush read and write queues.
11992	At least the following macros shall be defined for use with I_SETSIG:	
11993	S_RDNORM	A normal (priority band set to 0) message has arrived at the head of a
11994		STREAM head read queue.
11995	S_RDBAND	A message with a non-zero priority band has arrived at the head of a STREAM
11996		head read queue.
11997	S_INPUT	A message, other than a high-priority message, has arrived at the head of a
11998		STREAM head read queue.
11999	S_HIPRI	A high-priority message is present on a STREAM head read queue.
12000	S_OUTPUT	The write queue for normal data (priority band 0) just below the STREAM
12001		head is no longer full. This notifies the process that there is room on the queue
12002		for sending (or writing) normal data downstream.
12003	S_WRNORM	Equivalent to S_OUTPUT.
12004	S_WRBAND	The write queue for a non-zero priority band just below the STREAM head is
12005		no longer full.
12006	S_MSG	A STREAMS signal message that contains the SIGPOLL signal reaches the
12007		front of the STREAM head read queue.
12008	S_ERROR	Notification of an error condition reaches the STREAM head.
12009	S_HANGUP	Notification of a hangup reaches the STREAM head.
12010	S_BANDURG	When used in conjunction with S_RDBAND, SIGURG is generated instead of
12011		SIGPOLL when a priority message reaches the front of the STREAM head read
12012		queue.
12013	At least the following macros shall be defined for use with I_PEEK:	
12014	RS_HIPRI	Only look for high-priority messages.
12015	At least the following macros shall be defined for use with I_SRDOPT:	
12016	RNORM	Byte-STREAM mode, the default.
12017	RMSGD	Message-discard mode.
12018	RMSGN	Message-non-discard mode.
12019	RPROTNORM	Fail <i>read()</i> with [EBADMSG] if a message containing a control part is at the
12020		front of the STREAM head read queue.
12021	RPROTDAT	Deliver the control part of a message as data when a process issues a <i>read()</i> .
12022	RPROTDIS	Discard the control part of a message, delivering any data part, when a
12023		process issues a <i>read()</i> .

12024 At least the following macros shall be defined for use with I_SWOPT:

12025 SNDZERO Send a zero-length message downstream when a *write()* of 0 bytes occurs.

12026 At least the following macros shall be defined for use with I_ATMARK:

12027 ANYMARK Check if the message is marked.

12028 LASTMARK Check if the message is the last one marked on the queue.

12029 At least the following macros shall be defined for use with I_UNLINK:

12030 MUXID_ALL Unlink all STREAMs linked to the STREAM associated with *fildev*.

12031 The following macros shall be defined for *getmsg()*, *getpmsg()*, *putmsg()*, and *putpmsg()*:

12032 MSG_ANY Receive any message.

12033 MSG_BAND Receive message from specified band.

12034 MSG_HIPRI Send/receive high-priority message.

12035 MORECTL More control information is left in message.

12036 MOREDATA More data is left in message.

12037 The <stropts.h> header may make visible all of the symbols from <unistd.h>.

12038 The following shall be declared as functions and may also be defined as macros. Function

12039 prototypes shall be provided.

12040 int isastream(int);

12041 int getmsg(int, struct strbuf *restrict, struct strbuf *restrict,

12042 int *restrict);

12043 int getpmsg(int, struct strbuf *restrict, struct strbuf *restrict,

12044 int *restrict, int *restrict);

12045 int ioctl(int, int, ...);

12046 int putmsg(int, const struct strbuf *, const struct strbuf *, int);

12047 int putpmsg(int, const struct strbuf *, const struct strbuf *, int,

12048 int);

12049 int fattach(int, const char *);

12050 int fdetach(const char *);

12060 **CHANGE HISTORY**

12061 First released in Issue 4, Version 2.

12062 **Issue 5**

12063 The *flags* members of the **strpeek** and **strfdinsert** structures are changed from **type long** to
12064 **t_uscalar_t**.

12065 **Issue 6**

12066 This header is marked as part of the XSI STREAMS Option Group.

12067 The **restrict** keyword is added to the prototypes for *getmsg()* and *getpmsg()*.

12068 **NAME**

12069 sys/ipc.h — XSI interprocess communication access structure

12070 **SYNOPSIS**

12071 xsi #include <sys/ipc.h>

12072

12073 **DESCRIPTION**

12074 The <sys/ipc.h> header is used by three mechanisms for XSI interprocess communication (IPC):
 12075 messages, semaphores, and shared memory. All use a common structure type, **ipc_perm**, to pass
 12076 information used in determining permission to perform an IPC operation.

12077 The **ipc_perm** structure shall contain the following members:

12078	uid_t	uid	Owner's user ID.
12079	gid_t	gid	Owner's group ID.
12080	uid_t	cuid	Creator's user ID.
12081	gid_t	cgid	Creator's group ID.
12082	mode_t	mode	Read/write permission.

12083 The **uid_t**, **gid_t**, **mode_t**, and **key_t** types shall be defined as described in <sys/types.h>.

12084 Definitions shall be provided for the following constants:

12085 Mode bits:

12086	IPC_CREAT	Create entry if key does not exist.
12087	IPC_EXCL	Fail if key exists.
12088	IPC_NOWAIT	Error if request must wait.

12089 Keys:

12090	IPC_PRIVATE	Private key.

12091 Control commands:

12092	IPC_RMID	Remove identifier.
12093	IPC_SET	Set options.
12094	IPC_STAT	Get options.

12095 The following shall be declared as a function and may also be defined as a macro. A function
 12096 prototype shall be provided.

12097 key_t ftok(const char *, int);

12098 **APPLICATION USAGE**

12099 None.

12100 **RATIONALE**

12101 None.

12102 **FUTURE DIRECTIONS**

12103 None.

12106 **CHANGE HISTORY**

12107 First released in Issue 2. Derived from System V Release 2.0.

12108 **NAME**

12109 sys/mman.h — memory management declarations

12110 **SYNOPSIS**

12111 #include <sys/mman.h>

12112 **DESCRIPTION**

12113 The <sys/mman.h> header shall be supported if the implementation supports at least one of the
12114 following options:

- 12115 MF • The Memory Mapped Files option
- 12116 SHM • The Shared Memory Objects option
- 12117 ML • The Process Memory Locking option
- 12118 MPR • The Memory Protection option
- 12119 TYM • The Typed Memory Objects option
- 12120 SIO • The Synchronized Input and Output option
- 12121 ADV • The Advisory Information option
- 12122 TYM • The Typed Memory Objects option

12123 MC2 If one or more of the Advisory Information, Memory Mapped Files, or Shared Memory Objects
12124 options are supported, the following protection options shall be defined:

- 12125 MC2 PROT_READ Page can be read.
- 12126 MC2 PROT_WRITE Page can be written.
- 12127 MC2 PROT_EXEC Page can be executed.
- 12128 MC2 PROT_NONE Page cannot be accessed.

12129 The following *flag* options shall be defined:

- 12130 MF|SHM MAP_SHARED Share changes.
- 12131 MF|SHM MAP_PRIVATE Changes are private.
- 12132 MF|SHM MAP_FIXED Interpret *addr* exactly.

12133 The following flags shall be defined for *msync()*:

- 12134 MF|SIO MS_ASYNC Perform asynchronous writes.
- 12135 MF|SIO MS_SYNC Perform synchronous writes.
- 12136 MF|SIO MS_INVALIDATE Invalidate mappings.

12137 ML The following symbolic constants shall be defined for the *mlockall()* function:

- 12138 ML MCL_CURRENT Lock currently mapped pages.
- 12139 ML MCL_FUTURE Lock pages that become mapped.

12140 MF|SHM The symbolic constant MAP_FAILED shall be defined to indicate a failure from the *mmap()*
12141 function.

12142 MC1 If the Advisory Information and either the Memory Mapped Files or Shared Memory Objects
12143 options are supported, values for *advice* used by *posix_madvise()* shall be defined as follows:

- 12144 POSIX_MADV_NORMAL
- 12145 The application has no advice to give on its behavior with respect to the specified range. It

12146		is the default characteristic if no advice is given for a range of memory.
12147		POSIX_MADV_SEQUENTIAL
12148		The application expects to access the specified range sequentially from lower addresses to
12149		higher addresses.
12150		POSIX_MADV_RANDOM
12151		The application expects to access the specified range in a random order.
12152		POSIX_MADV_WILLNEED
12153		The application expects to access the specified range in the near future.
12154		POSIX_MADV_DONTNEED
12155		The application expects that it will not access the specified range in the near future.
12156		
12157	TYM	The following flags shall be defined for <i>posix_typed_mem_open()</i> :
12158		POSIX_TYPED_MEM_ALLOCATE
12159		Allocate on <i>mmap()</i> .
12160		POSIX_TYPED_MEM_ALLOCATE_CONTIG
12161		Allocate contiguously on <i>mmap()</i> .
12162		POSIX_TYPED_MEM_MAP_ALLOCATABLE
12163		Map on <i>mmap()</i> , without affecting allocatability.
12164		
12165		The mode_t , off_t , and size_t types shall be defined as described in <sys/types.h>.
12166	TYM	The <sys/mman.h> header shall define the structure posix_typed_mem_info , which includes at
12167		least the following member:
12168		size_t posix_tmi_length Maximum length which may be allocated
12169		from a typed memory object.
12170		
12171		The following shall be declared as functions and may also be defined as macros. Function
12172		prototypes shall be provided.
12173	MLR	int mlock(const void *, size_t);
12174	ML	int mlockall(int);
12175	MC3	void *mmap(void *, size_t, int, int, int, off_t);
12176	MPR	int mprotect(void *, size_t, int);
12177	MF SIO	int msync(void *, size_t, int);
12178	MLR	int munlock(const void *, size_t);
12179	ML	int munlockall(void);
12180	MC3	int munmap(void *, size_t);
12181	ADV	int posix_madvise(void *, size_t, int);
12182	TYM	int posix_mem_offset(const void *restrict, size_t, off_t *restrict,
12183		size_t *restrict, int *restrict);
12184		int posix_typed_mem_get_info(int, struct posix_typed_mem_info *);
12185		int posix_typed_mem_open(const char *, int, int);
12186	SHM	int shm_open(const char *, int, mode_t);
12187		int shm_unlink(const char *);
12188		

12189 **APPLICATION USAGE**

12190 None.

12191 **RATIONALE**

12192 None.

12193 **FUTURE DIRECTIONS**

12194 None.

12195 **SEE ALSO**

12196 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *mlock()*, *mlockall()*,
 12197 *mmap()*, *mprotect()*, *msync()*, *munlock()*, *munlockall()*, *munmap()*, *posix_mem_offset()*,
 12198 *posix_typed_mem_get_info()*, *posix_typed_mem_open()*, *shm_open()*, *shm_unlink()*

12199 **CHANGE HISTORY**

12200 First released in Issue 4, Version 2.

12201 **Issue 5**

12202 Updated for alignment with the POSIX Realtime Extension.

12203 **Issue 6**

12204 The <sys/mman.h> header is marked as dependent on support for either the Memory Mapped
 12205 Files, Process Memory Locking, or Shared Memory Objects options.

12206 The following changes are made for alignment with IEEE Std 1003.1j-2000:

- 12207 • The TYM margin code is added to the list of margin codes for the <sys/mman.h> header line,
 12208 as well as for other lines.
- 12209 • The POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, and
 12210 POSIX_TYPED_MEM_MAP_ALLOCATABLE flags are added.
- 12211 • The **posix_tmi_length** structure is added.
- 12212 • The *posix_mem_offset()*, *posix_typed_mem_get_info()*, and *posix_typed_mem_open()* functions
 12213 are added.

12214 The **restrict** keyword is added to the prototype for *posix_mem_offset()*.12215 IEEE PASC Interpretation 1003.1 #102 is applied, adding the prototype for *posix_madvise()*.

12216 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/16 is applied, correcting margin code and
 12217 shading errors for the *mlock()* and *munlock()* functions. |

12218 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code |
 12219 for the *mmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM). |

12220 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code |
 12221 for the *munmap()* function from MF|SHM to MC3 (notation for MF|SHM|TYM). |

12222 **NAME**

12223 sys/msg.h — XSI message queue structures

12224 **SYNOPSIS**

12225 xsi #include <sys/msg.h>

12226

12227 **DESCRIPTION**12228 The <sys/msg.h> header shall define the following data types through **typedef**:12229 **msgqnum_t** Used for the number of messages in the message queue.12230 **msglen_t** Used for the number of bytes allowed in a message queue.12231 These types shall be unsigned integer types that are able to store values at least as large as a type
12232 **unsigned short**.

12233 The <sys/msg.h> header shall define the following constant as a message operation flag:

12234 MSG_NOERROR No error if big message.

12235 The **msqid_ds** structure shall contain the following members:

12236	struct ipc_perm	msg_perm	Operation permission structure.
12237	msgqnum_t	msg_qnum	Number of messages currently on queue.
12238	msglen_t	msg_qbytes	Maximum number of bytes allowed on queue.
12239	pid_t	msg_lspid	Process ID of last <i>msgsnd()</i> .
12240	pid_t	msg_lrpid	Process ID of last <i>msgrcv()</i> .
12241	time_t	msg_stime	Time of last <i>msgsnd()</i> .
12242	time_t	msg_rtime	Time of last <i>msgrcv()</i> .
12243	time_t	msg_ctime	Time of last change.

12244 The **pid_t**, **time_t**, **key_t**, **size_t**, and **ssize_t** types shall be defined as described in <sys/types.h>.12245 The following shall be declared as functions and may also be defined as macros. Function
12246 prototypes shall be provided.

12247	int	msgctl(int, int, struct msqid_ds *);
12248	int	msgget(key_t, int);
12249	ssize_t	msgrcv(int, void *, size_t, long, int);
12250	int	msgsnd(int, const void *, size_t, int);

12251 In addition, all of the symbols from <sys/ipc.h> shall be defined when this header is included.

12252 **APPLICATION USAGE**

12253 None.

12254 **RATIONALE**

12255 None.

12256 **FUTURE DIRECTIONS**

12257 None.

12258 **SEE ALSO**12259 <sys/ipc.h>, <sys/types.h>, *msgctl()*, *msgget()*, *msgrcv()*, *msgsnd()*12260 **CHANGE HISTORY**

12261 First released in Issue 2. Derived from System V Release 2.0.

12262 **NAME**

12263 sys/resource.h — definitions for XSI resource operations

12264 **SYNOPSIS**

12265 xsi #include <sys/resource.h>

12266

12267 **DESCRIPTION**12268 The <sys/resource.h> header shall define the following symbolic constants as possible values of
12269 the *which* argument of *getpriority()* and *setpriority()*:12270 PRIO_PROCESS Identifies the *who* argument as a process ID.12271 PRIO_PGRP Identifies the *who* argument as a process group ID.12272 PRIO_USER Identifies the *who* argument as a user ID.12273 The following type shall be defined through **typedef**:12274 **rlim_t** Unsigned integer type used for limit values.

12275 The following symbolic constants shall be defined:

12276 RLIM_INFINITY A value of **rlim_t** indicating no limit.12277 RLIM_SAVED_MAX A value of type **rlim_t** indicating an unrepresentable saved hard
12278 limit.12279 RLIM_SAVED_CUR A value of type **rlim_t** indicating an unrepresentable saved soft limit.12280 On implementations where all resource limits are representable in an object of type **rlim_t**,
12281 RLIM_SAVED_MAX and RLIM_SAVED_CUR need not be distinct from RLIM_INFINITY.12282 The following symbolic constants shall be defined as possible values of the *who* parameter of
12283 *getrusage()*:

12284 RUSAGE_SELF Returns information about the current process.

12285 RUSAGE_CHILDREN Returns information about children of the current process.

12286 The <sys/resource.h> header shall define the **rlimit** structure that includes at least the following
12287 members:

12288 rlim_t rlim_cur The current (soft) limit.

12289 rlim_t rlim_max The hard limit.

12290 The <sys/resource.h> header shall define the **rusage** structure that includes at least the following
12291 members:

12292 struct timeval ru_utime User time used.

12293 struct timeval ru_stime System time used.

12294 The **timeval** structure shall be defined as described in <sys/time.h>.12295 The following symbolic constants shall be defined as possible values for the *resource* argument of
12296 *getrlimit()* and *setrlimit()*:12297 RLIMIT_CORE Limit on size of **core** file.

12298 RLIMIT_CPU Limit on CPU time per process.

12299 RLIMIT_DATA Limit on data segment size.

12300 RLIMIT_FSIZE Limit on file size.

12301 RLIMIT_NOFILE Limit on number of open files.

12302 RLIMIT_STACK Limit on stack size.

12303 RLIMIT_AS Limit on address space size.

12304 The following shall be declared as functions and may also be defined as macros. Function
12305 prototypes shall be provided.

12306 int getpriority(int, id_t);

12307 int getrlimit(int, struct rlimit *);

12308 int getrusage(int, struct rusage *);

12309 int setpriority(int, id_t, int);

12310 int setrlimit(int, const struct rlimit *);

12311 The **id_t** type shall be defined through **typedef** as described in <sys/types.h>.

12312 Inclusion of the <sys/resource.h> header may also make visible all symbols from <sys/time.h>.

12313 **APPLICATION USAGE**

12314 None.

12315 **RATIONALE**

12316 None.

12317 **FUTURE DIRECTIONS**

12318 None.

12319 **SEE ALSO**

12320 <sys/time.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *getpriority()*,

12322 **CHANGE HISTORY**

12323 First released in Issue 4, Version 2.

12324 **Issue 5**

12325 Large File System extensions are added.

12326 **NAME**

12327 sys/select.h — select types

12328 **SYNOPSIS**

12329 #include <sys/select.h>

12330 **DESCRIPTION**

12331 The <sys/select.h> header shall define the **timeval** structure that includes at least the following
12332 members:

12333	time_t	tv_sec	Seconds.
12334	suseconds_t	tv_usec	Microseconds.

12335 The **time_t** and **suseconds_t** types shall be defined as described in <sys/types.h>.

12336 The **sigset_t** type shall be defined as described in <signal.h>.

12337 The **timespec** structure shall be defined as described in <time.h>.

12338 The <sys/select.h> header shall define the **fd_set** type as a structure.

12339 Each of the following may be declared as a function, or defined as a macro, or both:

12340 **void** *FD_CLR*(int *fd*, **fd_set** **fdset*)

12341 Clears the bit for the file descriptor *fd* in the file descriptor set *fdset*.

12342 **int** *FD_ISSET*(int *fd*, **fd_set** **fdset*)

12343 Returns a non-zero value if the bit for the file descriptor *fd* is set in the file descriptor set by
12344 *fdset*, and 0 otherwise.

12345 **void** *FD_SET*(int *fd*, **fd_set** **fdset*)

12346 Sets the bit for the file descriptor *fd* in the file descriptor set *fdset*.

12347 **void** *FD_ZERO*(**fd_set** **fdset*)

12348 Initializes the file descriptor set *fdset* to have zero bits for all file descriptors.

12349 If implemented as macros, these may evaluate their arguments more than once, so applications
12350 should ensure that the arguments they supply are never expressions with side effects.

12351 The following shall be defined as a macro:

12352 **FD_SETSIZE**

12353 Maximum number of file descriptors in an **fd_set** structure.

12354 The following shall be declared as functions and may also be defined as macros. Function
12355 prototypes shall be provided.

12356	int	pselect(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12357		const struct timespec *restrict, const sigset_t *restrict);
12358	int	select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12359		struct timeval *restrict);

12360 Inclusion of the <sys/select.h> header may make visible all symbols from the headers
12361 <signal.h>, <sys/time.h>, and <time.h>.

12371 **CHANGE HISTORY**

12372 First released in Issue 6. Derived from IEEE Std 1003.1g-2000.

12373 The requirement for the **fd_set** structure to have a member *fds_bits* has been removed as per The
12374 Open Group Base Resolution bwg2001-005.

12375 **NAME**

12376 sys/sem.h — XSI semaphore facility

12377 **SYNOPSIS**

12378 xsi #include <sys/sem.h>

12379

12380 **DESCRIPTION**

12381 The <sys/sem.h> header shall define the following constants and structures.

12382 Semaphore operation flags:

12383 SEM_UNDO Set up adjust on exit entry.

12384 Command definitions for the *semctl()* function shall be provided as follows:12385 GETNCNT Get *semncnt*.12386 GETPID Get *sempid*.12387 GETVAL Get *semval*.12388 GETALL Get all cases of *semval*.12389 GETZCNT Get *semzcnt*.12390 SETVAL Set *semval*.12391 SETALL Set all cases of *semval*.12392 The **semid_ds** structure shall contain the following members:

12393 struct ipc_perm sem_perm Operation permission structure.

12394 unsigned short sem_nsems Number of semaphores in set.

12395 time_t sem_otime Last *semop()* time.12396 time_t sem_ctime Last time changed by *semctl()*.12397 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in <sys/types.h>.12398 A semaphore shall be represented by an anonymous structure containing the following
12399 members:

12400 unsigned short semval Semaphore value.

12401 pid_t sempid Process ID of last operation.

12402 unsigned short semncnt Number of processes waiting for *semval*
12403 to become greater than current value.12404 unsigned short semzcnt Number of processes waiting for *semval*
12405 to become 0.12406 The **sembuf** structure shall contain the following members:

12407 unsigned short sem_num Semaphore number.

12408 short sem_op Semaphore operation.

12409 short sem_flg Operation flags.

12410 The following shall be declared as functions and may also be defined as macros. Function
12411 prototypes shall be provided.

12412 int semctl(int, int, int, ...);

12413 int semget(key_t, int, int);

12414 int semop(int, struct sembuf *, size_t);

12415 In addition, all of the symbols from **<sys/ipc.h>** shall be defined when this header is included.

12416 **APPLICATION USAGE**

12417 None.

12418 **RATIONALE**

12424 **CHANGE HISTORY**

12425 First released in Issue 2. Derived from System V Release 2.0.

12426 NAME

12427 sys/shm.h — XSI shared memory facility

12428 SYNOPSIS

12429 xsi #include <sys/shm.h>

12430

12431 DESCRIPTION

12432 The <sys/shm.h> header shall define the following symbolic constants:

12433 SHM_RDONLY Attach read-only (else read-write).

12434 SHM_RND Round attach address to SHMLBA.

12435 The <sys/shm.h> header shall define the following symbolic value:

12436 SHMLBA Segment low boundary address multiple.

12437 The following data types shall be defined through **typedef**:

12438 **shmatt_t** Unsigned integer used for the number of current attaches that must be able to
12439 store values at least as large as a type **unsigned short**.

12440 The **shmid_ds** structure shall contain the following members:

12441	struct ipc_perm	shm_perm	Operation permission structure.
12442	size_t	shm_segsz	Size of segment in bytes.
12443	pid_t	shm_lpid	Process ID of last shared memory operation.
12444	pid_t	shm_cpid	Process ID of creator.
12445	shmatt_t	shm_nattch	Number of current attaches.
12446	time_t	shm_atime	Time of last <i>shmat()</i> .
12447	time_t	shm_dtime	Time of last <i>shmdt()</i> .
12448	time_t	shm_ctime	Time of last change by <i>shmctl()</i> .

12449 The **pid_t**, **time_t**, **key_t**, and **size_t** types shall be defined as described in <sys/types.h>.

12450 The following shall be declared as functions and may also be defined as macros. Function
12451 prototypes shall be provided.

```
12452 void *shmat(int, const void *, int);
12453 int shmctl(int, int, struct shmid_ds *);
12454 int shmdt(const void *);
12455 int shmget(key_t, size_t, int);
```

12456 In addition, all of the symbols from <sys/ipc.h> shall be defined when this header is included.

12457 APPLICATION USAGE

12458 None.

12459 RATIONALE

12460 None.

12461 FUTURE DIRECTIONS

12462 None.

12463 SEE ALSO

12464 <sys/ipc.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *shmat()*,

12466 **CHANGE HISTORY**

12467 First released in Issue 2. Derived from System V Release 2.0.

12468 **Issue 5**

12469 The type of *shm_segsz* is changed from **int** to **size_t**.

12470 **NAME**

12471 sys/socket.h — main sockets header

12472 **SYNOPSIS**

12473 #include <sys/socket.h>

12474 **DESCRIPTION**

12475 The <sys/socket.h> header shall define the type **socklen_t**, which is an integer type of width of
12476 at least 32 bits; see APPLICATION USAGE.

12477 The <sys/socket.h> header shall define the unsigned integer type **sa_family_t**.

12478 The <sys/socket.h> header shall define the **sockaddr** structure that includes at least the
12479 following members:

12480 sa_family_t sa_family Address family.
12481 char sa_data[] Socket address (variable-length data).

12482 The **sockaddr** structure is used to define a socket address which is used in the *bind()*, *connect()*,
12483 *getpeername()*, *getsockname()*, *recvfrom()*, and *sendto()* functions.

12484 The <sys/socket.h> header shall define the **sockaddr_storage** structure. This structure shall be:

- 12485 • Large enough to accommodate all supported protocol-specific address structures
- 12486 • Aligned at an appropriate boundary so that pointers to it can be cast as pointers to protocol-
12487 specific address structures and used to access the fields of those structures without
12488 alignment problems

12489 The **sockaddr_storage** structure shall contain at least the following members:

12490 sa_family_t ss_family

12491 When a **sockaddr_storage** structure is cast as a **sockaddr** structure, the *ss_family* field of the
12492 **sockaddr_storage** structure shall map onto the *sa_family* field of the **sockaddr** structure. When a
12493 **sockaddr_storage** structure is cast as a protocol-specific address structure, the *ss_family* field
12494 shall map onto a field of that structure that is of type **sa_family_t** and that identifies the
12495 protocol's address family.

12496 The <sys/socket.h> header shall define the **msghdr** structure that includes at least the following
12497 members:

12498	void	*msg_name	Optional address.
12499	socklen_t	msg_namelen	Size of address.
12500	struct iovec	*msg_iov	Scatter/gather array.
12501	int	msg_iovlen	Members in <i>msg_iov</i> .
12502	void	*msg_control	Ancillary data; see below.
12503	socklen_t	msg_controllen	Ancillary data buffer <i>len</i> .
12504	int	msg_flags	Flags on received message.

12505 The **msghdr** structure is used to minimize the number of directly supplied parameters to the
12506 *recvmsg()* and *sendmsg()* functions. This structure is used as a *value-result* parameter in the
12507 *recvmsg()* function and *value* only for the *sendmsg()* function.

12508 The **iovec** structure shall be defined as described in <sys/uio.h>.

12509 The <sys/socket.h> header shall define the **cmsg_hdr** structure that includes at least the following
12510 members:

12511	socklen_t	cmsg_len	Data byte count, including the cmsg_hdr .
12512	int	cmsg_level	Originating protocol.

12513 `int` `cmsg_type` Protocol-specific type.

12514 The **cmsghdr** structure is used for storage of ancillary data object information.

12515 Ancillary data consists of a sequence of pairs, each consisting of a **cmsghdr** structure followed
12516 by a data array. The data array contains the ancillary data message, and the **cmsghdr** structure
12517 contains descriptive information that allows an application to correctly parse the data.

12518 The values for `cmsg_level` shall be legal values for the `level` argument to the `getsockopt()` and
12519 `setsockopt()` functions. The system documentation shall specify the `cmsg_type` definitions for the
12520 supported protocols.

12521 Ancillary data is also possible at the socket level. The <sys/socket.h> header defines the
12522 following macro for use as the `cmsg_type` value when `cmsg_level` is `SOL_SOCKET`:

12523 `SCM_RIGHTS` Indicates that the data array contains the access rights to be sent or
12524 received.

12525 The <sys/socket.h> header defines the following macros to gain access to the data arrays in the
12526 ancillary data associated with a message header:

12527 `MSG_DATA(cmsg)`
12528 If the argument is a pointer to a **cmsghdr** structure, this macro shall return an unsigned
12529 character pointer to the data array associated with the **cmsghdr** structure.

12530 `MSG_NXTHDR(mhdr,cmsg)`
12531 If the first argument is a pointer to a **msghdr** structure and the second argument is a pointer
12532 to a **cmsghdr** structure in the ancillary data pointed to by the `msg_control` field of that
12533 **msghdr** structure, this macro shall return a pointer to the next **cmsghdr** structure, or a null
12534 pointer if this structure is the last **cmsghdr** in the ancillary data.

12535 `MSG_FIRSTHDR(mhdr)`
12536 If the argument is a pointer to a **msghdr** structure, this macro shall return a pointer to the
12537 first **cmsghdr** structure in the ancillary data associated with this **msghdr** structure, or a null
12538 pointer if there is no ancillary data associated with the **msghdr** structure.

12539 The <sys/socket.h> header shall define the **linger** structure that includes at least the following
12540 members:

12541 `int` `l_onoff` Indicates whether linger option is enabled.
12542 `int` `l_linger` Linger time, in seconds.

12543 The <sys/socket.h> header shall define the following macros, with distinct integer values:

12544 `SOCK_DGRAM` Datagram socket.

12545 RS `SOCK_RAW` Raw Protocol Interface.

12546 `SOCK_SEQPACKET` Sequenced-packet socket.

12547 `SOCK_STREAM` Byte-stream socket.

12548 The <sys/socket.h> header shall define the following macro for use as the `level` argument of
12549 `setsockopt()` and `getsockopt()`.

12550 `SOL_SOCKET` Options to be accessed at socket level, not protocol level.

12551 The <sys/socket.h> header shall define the following macros, with distinct integer values, for
12552 use as the `option_name` argument in `getsockopt()` or `setsockopt()` calls:

12553 `SO_ACCEPTCONN` Socket is accepting connections.

12554	SO_BROADCAST	Transmission of broadcast messages is supported.
12555	SO_DEBUG	Debugging information is being recorded.
12556	SO_DONTROUTE	Bypass normal routing.
12557	SO_ERROR	Socket error status.
12558	SO_KEEPALIVE	Connections are kept alive with periodic messages.
12559	SO_LINGER	Socket lingers on close.
12560	SO_OOBINLINE	Out-of-band data is transmitted in line.
12561	SO_RCVBUF	Receive buffer size.
12562	SO_RCVLOWAT	Receive “low water mark”.
12563	SO_RCVTIMEO	Receive timeout.
12564	SO_REUSEADDR	Reuse of local addresses is supported.
12565	SO_SNDBUF	Send buffer size.
12566	SO_SNDLOWAT	Send “low water mark”.
12567	SO_SNDTIMEO	Send timeout.
12568	SO_TYPE	Socket type.
12569	The <sys/socket.h> header shall define the following macro as the maximum <i>backlog</i> queue length which may be specified by the <i>backlog</i> field of the <i>listen()</i> function:	
12570		
12571	SOMAXCONN	The maximum <i>backlog</i> queue length.
12572	The <sys/socket.h> header shall define the following macros, with distinct integer values, for use as the valid values for the <i>msg_flags</i> field in the msghdr structure, or the <i>flags</i> parameter in <i>recvfrom()</i> , <i>recvmsg()</i> , <i>sendmsg()</i> , or <i>sendto()</i> calls:	
12573		
12574		
12575	MSG_CTRUNC	Control data truncated.
12576	MSG_DONTROUTE	Send without using routing tables.
12577	MSG_EOR	Terminates a record (if supported by the protocol).
12578	MSG_OOB	Out-of-band data.
12579	MSG_PEEK	Leave received data in queue.
12580	MSG_TRUNC	Normal data truncated.
12581	MSG_WAITALL	Attempt to fill the read buffer.
12582	The <sys/socket.h> header shall define the following macros, with distinct integer values:	
12583	AF_INET	Internet domain sockets for use with IPv4 addresses.
12584	IP6 AF_INET6	Internet domain sockets for use with IPv6 addresses.
12585	AF_UNIX	UNIX domain sockets.
12586	AF_UNSPEC	Unspecified.
12587	The <sys/socket.h> header shall define the following macros, with distinct integer values:	
12588	SHUT_RD	Disables further receive operations.

```

12589      SHUT_RDWR          Disables further send and receive operations.
12590      SHUT_WR           Disables further send operations.
12591      The following shall be declared as functions and may also be defined as macros. Function
12592      prototypes shall be provided.
12593      int      accept(int, struct sockaddr *restrict, socklen_t *restrict);
12594      int      bind(int, const struct sockaddr *, socklen_t);
12595      int      connect(int, const struct sockaddr *, socklen_t);
12596      int      getpeername(int, struct sockaddr *restrict, socklen_t *restrict);
12597      int      getsockname(int, struct sockaddr *restrict, socklen_t *restrict);
12598      int      getsockopt(int, int, int, void *restrict, socklen_t *restrict);
12599      int      listen(int, int);
12600      ssize_t  recv(int, void *, size_t, int);
12601      ssize_t  recvfrom(int, void *restrict, size_t, int,
12602      struct sockaddr *restrict, socklen_t *restrict);
12603      ssize_t  recvmsg(int, struct msghdr *, int);
12604      ssize_t  send(int, const void *, size_t, int);
12605      ssize_t  sendmsg(int, const struct msghdr *, int);
12606      ssize_t  sendto(int, const void *, size_t, int, const struct sockaddr *,
12607      socklen_t);
12608      int      setsockopt(int, int, int, const void *, socklen_t);
12609      int      shutdown(int, int);
12610      int      socket(int, int, int);
12611      int      socketatmark(int);
12612      int      socketpair(int, int, int, int[2]);

```

12613 Inclusion of <sys/socket.h> may also make visible all symbols from <sys/uio.h>.

12614 APPLICATION USAGE

12615 To forestall portability problems, it is recommended that applications not use values larger than
12616 $2^{31} - 1$ for the **socklen_t** type.

12617 The **sockaddr_storage** structure solves the problem of declaring storage for automatic variables
12618 which is both large enough and aligned enough for storing the socket address data structure of
12619 any family. For example, code with a file descriptor and without the context of the address
12620 family can pass a pointer to a variable of this type, where a pointer to a socket address structure
12621 is expected in calls such as *getpeername()*, and determine the address family by accessing the
12622 received content after the call.

12623 The example below illustrates a data structure which aligns on a 64-bit boundary. An
12624 implementation-defined field *_ss_align* following *_ss_pad1* is used to force a 64-bit alignment
12625 which covers proper alignment good enough for needs of at least **sockaddr_in6** (IPv6) and
12626 **sockaddr_in** (IPv4) address data structures. The size of padding field *_ss_pad1* depends on the
12627 chosen alignment boundary. The size of padding field *_ss_pad2* depends on the value of overall
12628 size chosen for the total size of the structure. This size and alignment are represented in the
12629 above example by implementation-defined (not required) constants *_SS_MAXSIZE* (chosen
12630 value 128) and *_SS_ALIGNMENT* (with chosen value 8). Constants *_SS_PAD1SIZE* (derived
12631 value 6) and *_SS_PAD2SIZE* (derived value 112) are also for illustration and not required. The
12632 implementation-defined definitions and structure field names above start with an underscore to
12633 denote implementation private name space. Portable code is not expected to access or reference
12634 those fields or constants.

```

12635      /*
12636      *   Desired design of maximum size and alignment.

```

```

12637     */
12638     #define _SS_MAXSIZE 128
12639     /* Implementation-defined maximum size. */
12640     #define _SS_ALIGNSIZE (sizeof(int64_t))
12641     /* Implementation-defined desired alignment. */
12642     /*
12643     * Definitions used for sockaddr_storage structure paddings design.
12644     */
12645     #define _SS_PAD1SIZE (_SS_ALIGNSIZE - sizeof(sa_family_t))
12646     #define _SS_PAD2SIZE (_SS_MAXSIZE - (sizeof(sa_family_t) + \
12647         _SS_PAD1SIZE + _SS_ALIGNSIZE))
12648     struct sockaddr_storage {
12649         sa_family_t ss_family; /* Address family. */
12650     /*
12651     * Following fields are implementation-defined.
12652     */
12653         char _ss_pad1[_SS_PAD1SIZE];
12654         /* 6-byte pad; this is to make implementation-defined
12655         pad up to alignment field that follows explicit in
12656         the data structure. */
12657         int64_t _ss_align; /* Field to force desired structure
12658         storage alignment. */
12659         char _ss_pad2[_SS_PAD2SIZE];
12660         /* 112-byte pad to achieve desired size,
12661         _SS_MAXSIZE value minus size of ss_family
12662         __ss_pad1, __ss_align fields is 112. */
12663     };

```

12672 CHANGE HISTORY

12673 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

12674 The **restrict** keyword is added to the prototypes for *accept()*, *getpeername()*, *getsockname()*,
12675 *getsockopt()*, and *recvfrom()*.

12676 **NAME**

12677 sys/stat.h — data returned by the stat() function

12678 **SYNOPSIS**

12679 #include <sys/stat.h>

12680 **DESCRIPTION**12681 The <sys/stat.h> header shall define the structure of the data returned by the functions *fstat()*,
12682 *lstat()*, and *stat()*.12683 The **stat** structure shall contain at least the following members:

12684	dev_t	st_dev	Device ID of device containing file.
12685	ino_t	st_ino	File serial number.
12686	mode_t	st_mode	Mode of file (see below).
12687	nlink_t	st_nlink	Number of hard links to the file.
12688	uid_t	st_uid	User ID of file.
12689	gid_t	st_gid	Group ID of file.
12690 XSI	dev_t	st_rdev	Device ID (if file is character or block special).
12691	off_t	st_size	For regular files, the file size in bytes.
12692			For symbolic links, the length in bytes of the
12693			pathname contained in the symbolic link.
12694 SHM			For a shared memory object, the length in bytes.
12695 TYM			For a typed memory object, the length in bytes.
12696			For other file types, the use of this field is
12697			unspecified.
12698	time_t	st_atime	Time of last access.
12699	time_t	st_mtime	Time of last data modification.
12700	time_t	st_ctime	Time of last status change.
12701 XSI	blksize_t	st_blksize	A file system-specific preferred I/O block size for
12702			this object. In some file system types, this may
12703			vary from file to file.
12704	blkcnt_t	st_blocks	Number of blocks allocated for this object.
12705			

12706 The *st_ino* and *st_dev* fields taken together uniquely identify the file within the system. The
 12707 **blkcnt_t**, **blksize_t**, **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types shall be
 12708 defined as described in <sys/types.h>. Times shall be given in seconds since the Epoch.

12709 Unless otherwise specified, the structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*,
 12710 *st_ctime*, and *st_mtime* shall have meaningful values for all file types defined in
 12711 IEEE Std 1003.1-2001.

12712 For symbolic links, the *st_mode* member shall contain meaningful information, which can be
 12713 used with the file type macros described below, that take a *mode* argument. The *st_size* member
 12714 shall contain the length, in bytes, of the pathname contained in the symbolic link. File mode bits
 12715 and the contents of the remaining members of the **stat** structure are unspecified. The value
 12716 returned in the *st_size* field shall be the length of the contents of the symbolic link, and shall not
 12717 count a trailing null if one is present.

12718 The following symbolic names for the values of type **mode_t** shall also be defined.

12719 File type:

12720 XSI	S_IFMT	Type of file.
12721	S_IFBLK	Block special.

12722		S_IFCHR	Character special.
12723		S_IFIFO	FIFO special.
12724		S_IFREG	Regular.
12725		S_IFDIR	Directory.
12726		S_IFLNK	Symbolic link.
12727		S_IFSOCK	Socket.
12728	File mode bits:		
12729	S_IRWXU	Read, write, execute/search by owner.	
12730		S_IRUSR	Read permission, owner.
12731		S_IWUSR	Write permission, owner.
12732		S_IXUSR	Execute/search permission, owner.
12733	S_IRWXG	Read, write, execute/search by group.	
12734		S_IRGRP	Read permission, group.
12735		S_IWGRP	Write permission, group.
12736		S_IXGRP	Execute/search permission, group.
12737	S_IRWXO	Read, write, execute/search by others.	
12738		S_IROTH	Read permission, others.
12739		S_IWOTH	Write permission, others.
12740		S_IXOTH	Execute/search permission, others.
12741	S_ISUID	Set-user-ID on execution.	
12742	S_ISGID	Set-group-ID on execution.	
12743	XSI	S_ISVTX	On directories, restricted deletion flag.
12744	The bits defined by S_IRUSR, S_IWUSR, S_IXUSR, S_IRGRP, S_IWGRP, S_IXGRP, S_IROTH,		
12745	XSI	S_IWOTH, S_IXOTH, S_ISUID, S_ISGID, and S_ISVTX shall be unique.	
12746	S_IRWXU is the bitwise-inclusive OR of S_IRUSR, S_IWUSR, and S_IXUSR.		
12747	S_IRWXG is the bitwise-inclusive OR of S_IRGRP, S_IWGRP, and S_IXGRP.		
12748	S_IRWXO is the bitwise-inclusive OR of S_IROTH, S_IWOTH, and S_IXOTH.		
12749	Implementations may OR other implementation-defined bits into S_IRWXU, S_IRWXG, and		
12750	S_IRWXO, but they shall not overlap any of the other bits defined in this volume of		
12751	IEEE Std 1003.1-2001. The <i>file permission bits</i> are defined to be those corresponding to the		
12752	bitwise-inclusive OR of S_IRWXU, S_IRWXG, and S_IRWXO.		
12753	The following macros shall be provided to test whether a file is of the specified type. The value		
12754	<i>m</i> supplied to the macros is the value of <i>st_mode</i> from a stat structure. The macro shall evaluate		
12755	to a non-zero value if the test is true; 0 if the test is false.		
12756	S_ISBLK(<i>m</i>)	Test for a block special file.	
12757	S_ISCHR(<i>m</i>)	Test for a character special file.	

12758 **S_ISDIR(*m*)** Test for a directory.

12759 **S_ISFIFO(*m*)** Test for a pipe or FIFO special file.

12760 **S_ISREG(*m*)** Test for a regular file.

12761 **S_ISLNK(*m*)** Test for a symbolic link.

12762 **S_ISSOCK(*m*)** Test for a socket.

12763 The implementation may implement message queues, semaphores, or shared memory objects as distinct file types. The following macros shall be provided to test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

12769 **S_TYPEISMQ(*buf*)** Test for a message queue.

12770 **S_TYPEISSEM(*buf*)** Test for a semaphore.

12771 **S_TYPEISSHM(*buf*)** Test for a shared memory object.

12772 TYP The implementation may implement typed memory objects as distinct file types, and the following macro shall test whether a file is of the specified type. The value of the *buf* argument supplied to the macros is a pointer to a **stat** structure. The macro shall evaluate to a non-zero value if the specified object is implemented as a distinct file type and the specified file type is contained in the **stat** structure referenced by *buf*. Otherwise, the macro shall evaluate to zero.

12777 **S_TYPEISTMO(*buf*)** Test macro for a typed memory object.

12779 The following shall be declared as functions and may also be defined as macros. Function prototypes shall be provided.

12781 `int       chmod(const char *, mode_t);`

12782 `int       fchmod(int, mode_t);`

12783 `int       fstat(int, struct stat *);`

12784 `int       lstat(const char *restrict, struct stat *restrict);`

12785 `int       mkdir(const char *, mode_t);`

12786 `int       mkfifo(const char *, mode_t);`

12787 XSI `int       mknod(const char *, mode_t, dev_t);`

12788 `int       stat(const char *restrict, struct stat *restrict);`

12789 `mode_t   umask(mode_t);`

12790 APPLICATION USAGE

12791 Use of the macros is recommended for determining the type of a file.

12792 RATIONALE

12793 A conforming C-language application must include <sys/stat.h> for functions that have arguments or return values of type **mode_t**, so that symbolic values for that type can be used. An alternative would be to require that these constants are also defined by including <sys/types.h>.

12797 The **S_ISUID** and **S_ISGID** bits may be cleared on any write, not just on *open()*, as some historical implementations do.

12799 System calls that update the time entry fields in the **stat** structure must be documented by the implementors. POSIX-conforming systems should not update the time entry fields for functions listed in the System Interfaces volume of IEEE Std 1003.1-2001 unless the standard requires that

12802 they do, except in the case of documented extensions to the standard.

12803 Note that *st_dev* must be unique within a Local Area Network (LAN) in a “system” made up of
12804 multiple computers’ file systems connected by a LAN.

12805 Networked implementations of a POSIX-conforming system must guarantee that all files visible
12806 within the file tree (including parts of the tree that may be remotely mounted from other
12807 machines on the network) on each individual processor are uniquely identified by the
12808 combination of the *st_ino* and *st_dev* fields.

12809 The unit for the *st_blocks* member of the **stat** structure is not defined within IEEE Std 1003.1-2001.
12810 In some implementations it is 512 bytes. It may differ on a file system basis. There is no
12811 correlation between values of the *st_blocks* and *st_blksize*, and the *f_bsize* (from <sys/statvfs.h>
12812 structure members.

12813 Traditionally, some implementations defined the multiplier for *st_blocks* in <sys/param.h> as the
12814 symbol DEV_BSIZE.

12815 **FUTURE DIRECTIONS**

12816 No new S_IFMT symbolic names for the file type values of **mode_t** will be defined by
12817 IEEE Std 1003.1-2001; if new file types are required, they will only be testable through *S_ISxx()*
12818 or *S_TYPEISxxx()* macros instead.

12820 <sys/statvfs.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *chmod()*,
12821 *fchmod()*, *fstat()*, *lstat()*, *mkdir()*, *mkfifo()*, *mknod()*, *stat()*, *umask()*

12822 **CHANGE HISTORY**

12823 First released in Issue 1. Derived from Issue 1 of the SVID.

12824 **Issue 5**

12825 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

12826 The type of *st_blksize* is changed from **long** to **blksize_t**; the type of *st_blocks* is changed from
12827 **long** to **blkcnt_t**.

12828 **Issue 6**

12829 The *S_TYPEISMQ()*, *S_TYPEISSEM()*, and *S_TYPEISSHM()* macros are unconditionally
12830 mandated.

12831 The Open Group Corrigendum U035/4 is applied. In the DESCRIPTION, the types **blksize_t**
12832 and **blkcnt_t** have been described.

12833 The following new requirements on POSIX implementations derive from alignment with the
12834 Single UNIX Specification:

12835 • The **dev_t**, **ino_t**, **mode_t**, **nlink_t**, **uid_t**, **gid_t**, **off_t**, and **time_t** types are mandated.

12836 *S_IFSOCK* and *S_ISSOCK* are added for sockets.

12837 The description of **stat** structure members is changed to reflect contents when file type is a
12838 symbolic link.

12839 The test macro *S_TYPEISTMO* is added for alignment with IEEE Std 1003.1j-2000.

12840 The **restrict** keyword is added to the prototypes for *lstat()* and *stat()*.

12841 The *lstat()* function is made mandatory.

12842 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/17 is applied, adding text regarding the
12843 *st_blocks* member of the **stat** structure to the RATIONALE.

12844 **NAME**

12845 sys/statvfs.h — VFS File System information structure

12846 **SYNOPSIS**

12847 xSI #include <sys/statvfs.h>

12848

12849 **DESCRIPTION**12850 The <sys/statvfs.h> header shall define the **statvfs** structure that includes at least the following
12851 members:

12852	unsigned long	f_bsize	File system block size.
12853	unsigned long	f_frsize	Fundamental file system block size.
12854	fsblkcnt_t	f_blocks	Total number of blocks on file system in units of <i>f_frsize</i> .
12855	fsblkcnt_t	f_bfree	Total number of free blocks.
12856	fsblkcnt_t	f_bavail	Number of free blocks available to non-privileged process.
12857			
12858	fsfilcnt_t	f_files	Total number of file serial numbers.
12859	fsfilcnt_t	f_ffree	Total number of free file serial numbers.
12860	fsfilcnt_t	f_favail	Number of file serial numbers available to non-privileged process.
12861			
12862	unsigned long	f_fsid	File system ID.
12863	unsigned long	f_flag	Bit mask of <i>f_flag</i> values.
12864	unsigned long	f_namemax	Maximum filename length.

12865 The **fsblkcnt_t** and **fsfilcnt_t** types shall be defined as described in <sys/types.h>.12866 The following flags for the *f_flag* member shall be defined:

12867 ST_RDONLY Read-only file system.

12868 ST_NOSUID Does not support the semantics of the ST_ISUID and ST_ISGID file mode bits. |

12869 The following shall be declared as functions and may also be defined as macros. Function
12870 prototypes shall be provided.

12871 int statvfs(const char *restrict, struct statvfs *restrict);

12872 int fstatvfs(int, struct statvfs *);

12873 **APPLICATION USAGE**

12874 None.

12875 **RATIONALE**

12876 None.

12877 **FUTURE DIRECTIONS**

12878 None.

12879 **SEE ALSO**12880 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *fstatvfs()*, *statvfs()*12881 **CHANGE HISTORY**

12882 First released in Issue 4, Version 2.

12883 **Issue 5**12884 The type of *f_blocks*, *f_bfree*, and *f_bavail* is changed from **unsigned long** to **fsblkcnt_t**; the type
12885 of *f_files*, *f_ffree*, and *f_favail* is changed from **unsigned long** to **fsfilcnt_t**.

12886 **Issue 6**

12887 The Open Group Corrigendum U035/5 is applied. In the DESCRIPTION, the types **fsblkcnt_t**
12888 and **fsfilcnt_t** have been described.

12889 The **restrict** keyword is added to the prototype for *statvfs()*.

12890 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/18 is applied, changing the description of |
12891 ST_NOSUID from “Does not support *setuid()/setgid()* semantics” to “Does not support the |
12892 semantics of the ST_ISUID and ST_ISGID file mode bits”. |

12893 **NAME**

12894 sys/time.h — time types

12895 **SYNOPSIS**

12896 xSI #include <sys/time.h>

12897

12898 **DESCRIPTION**12899 The <sys/time.h> header shall define the **timeval** structure that includes at least the following
12900 members:

12901 time_t tv_sec Seconds.

12902 suseconds_t tv_usec Microseconds.

12903 The <sys/time.h> header shall define the **itimerval** structure that includes at least the following
12904 members:

12905 struct timeval it_interval Timer interval.

12906 struct timeval it_value Current value.

12907 The **time_t** and **suseconds_t** types shall be defined as described in <sys/types.h>.12908 The **fd_set** type shall be defined as described in <sys/select.h>.12909 The <sys/time.h> header shall define the following values for the *which* argument of *getitimer()*
12910 and *setitimer()*:

12911 ITIMER_REAL Decrements in real time.

12912 ITIMER_VIRTUAL Decrements in process virtual time.

12913 ITIMER_PROF Decrements both in process virtual time and when the system is running
12914 on behalf of the process.

12915 The following shall be defined as described in <sys/select.h>:

12916 FD_CLR()

12917 FD_ISSET()

12918 FD_SET()

12919 FD_ZERO()

12920 FD_SETSIZE

12921 The following shall be declared as functions and may also be defined as macros. Function
12922 prototypes shall be provided.

12923 int getitimer(int, struct itimerval *);

12924 int gettimeofday(struct timeval *restrict, void *restrict);

12925 int select(int, fd_set *restrict, fd_set *restrict, fd_set *restrict,
12926 struct timeval *restrict);12927 int setitimer(int, const struct itimerval *restrict,
12928 struct itimerval *restrict);12929 int utimes(const char *, const struct timeval [2]); (**LEGACY**)12930 Inclusion of the <sys/time.h> header may make visible all symbols from the <sys/select.h>
12931 header.

12932 **APPLICATION USAGE**

12933 None.

12934 **RATIONALE**

12935 None.

12936 **FUTURE DIRECTIONS**

12937 None.

12938 **SEE ALSO**

12939 <sys/select.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *getitimer()*,
12940 *gettimeofday()*, *select()*, *setitimer()*

12941 **CHANGE HISTORY**

12942 First released in Issue 4, Version 2.

12943 **Issue 5**

12944 The type of *tv_usec* is changed from **long** to **suseconds_t**.

12945 **Issue 6**

12946 The **restrict** keyword is added to the prototypes for *gettimeofday()*, *select()*, and *setitimer()*.

12947 The note is added that inclusion of this header may also make symbols visible from
12948 <sys/select.h>.

12949 The *utimes()* function is marked LEGACY.

12950 **NAME**

12951 sys/timeb.h — additional definitions for date and time

12952 **SYNOPSIS**

12953 xSI #include <sys/timeb.h>

12954

12955 **DESCRIPTION**12956 The <sys/timeb.h> header shall define the **timeb** structure that includes at least the following
12957 members:

12958	time_t	time	The seconds portion of the current time.
12959	unsigned short	millitm	The milliseconds portion of the current time.
12960	short	timezone	The local timezone in minutes west of Greenwich.
12961	short	dstflag	TRUE if Daylight Savings Time is in effect.

12962 The **time_t** type shall be defined as described in <sys/types.h>.12963 The following shall be declared as a function and may also be defined as a macro. A function
12964 prototype shall be provided.12965 int ftime(struct timeb *); (**LEGACY**)12966 **APPLICATION USAGE**

12967 None.

12968 **RATIONALE**

12969 None.

12970 **FUTURE DIRECTIONS**

12971 None.

12972 **SEE ALSO**

12973 <sys/types.h>, <time.h>

12974 **CHANGE HISTORY**

12975 First released in Issue 4, Version 2.

12976 **Issue 6**12977 The *ftime()* function is marked LEGACY.

12978 **NAME**

12979 sys/times.h — file access and modification times structure

12980 **SYNOPSIS**

12981 #include <sys/times.h>

12982 **DESCRIPTION**

12983 The <sys/times.h> header shall define the structure **tms**, which is returned by *times()* and
12984 includes at least the following members:

12985 clock_t tms_utime User CPU time.
12986 clock_t tms_stime System CPU time.
12987 clock_t tms_cutime User CPU time of terminated child processes.
12988 clock_t tms_cstime System CPU time of terminated child processes.

12989 The **clock_t** type shall be defined as described in <sys/types.h>.

12990 The following shall be declared as a function and may also be defined as a macro. A function
12991 prototype shall be provided.

12992 clock_t times(struct tms *);

12993 **APPLICATION USAGE**

12994 None.

12995 **RATIONALE**

12996 None.

12997 **FUTURE DIRECTIONS**

12998 None.

12999 **SEE ALSO**

13000 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *times()*

13001 **CHANGE HISTORY**

13002 First released in Issue 1. Derived from Issue 1 of the SVID.

13003 **NAME**

13004 sys/types.h — data types

13005 **SYNOPSIS**

13006 #include <sys/types.h>

13007 **DESCRIPTION**

13008 The <sys/types.h> header shall include definitions for at least the following types:

13009	blkcnt_t	Used for file block counts.
13010	blksize_t	Used for block sizes.
13011 XSI	clock_t	Used for system times in clock ticks or CLOCKS_PER_SEC; see
13012		<time.h>.
13013 TMR	clockid_t	Used for clock ID type in the clock and timer functions.
13014	dev_t	Used for device IDs.
13015 XSI	fsblkcnt_t	Used for file system block counts.
13016 XSI	fsfilcnt_t	Used for file system file counts.
13017	gid_t	Used for group IDs.
13018 XSI	id_t	Used as a general identifier; can be used to contain at least a pid_t ,
13019		uid_t , or gid_t .
13020	ino_t	Used for file serial numbers.
13021 XSI	key_t	Used for XSI interprocess communication.
13022	mode_t	Used for some file attributes.
13023	nlink_t	Used for link counts.
13024	off_t	Used for file sizes.
13025	pid_t	Used for process IDs and process group IDs.
13026 THR	pthread_attr_t	Used to identify a thread attribute object.
13027 BAR	pthread_barrier_t	Used to identify a barrier.
13028 BAR	pthread_barrierattr_t	Used to define a barrier attributes object.
13029 THR	pthread_cond_t	Used for condition variables.
13030 THR	pthread_condattr_t	Used to identify a condition attribute object.
13031 THR	pthread_key_t	Used for thread-specific data keys.
13032 THR	pthread_mutex_t	Used for mutexes.
13033 THR	pthread_mutexattr_t	Used to identify a mutex attribute object.
13034 THR	pthread_once_t	Used for dynamic package initialization.
13035 THR	pthread_rwlock_t	Used for read-write locks.
13036 THR	pthread_rwlockattr_t	Used for read-write lock attributes.
13037 SPI	pthread_spinlock_t	Used to identify a spin lock.
13038 THR	pthread_t	Used to identify a thread.

13039		size_t	Used for sizes of objects.
13040		ssize_t	Used for a count of bytes or an error indication.
13041	XSI	suseconds_t	Used for time in microseconds.
13042		time_t	Used for time in seconds.
13043	TMR	timer_t	Used for timer ID returned by <i>timer_create()</i> .
13044	TRC	trace_attr_t	Used to identify a trace stream attributes object.
13045	TRC	trace_event_id_t	Used to identify a trace event type.
13046	TRC TEF	trace_event_set_t	Used to identify a trace event type set.
13047	TRC	trace_id_t	Used to identify a trace stream.
13048		uid_t	Used for user IDs.
13049	XSI	useconds_t	Used for time in microseconds.
13050	All of the types shall be defined as arithmetic types of an appropriate length, with the following		
13051	exceptions:		
13052	XSI	key_t	
13053	THR	pthread_attr_t	
13054	BAR	pthread_barrier_t	
13055		pthread_barrierattr_t	
13056	THR	pthread_cond_t	
13057		pthread_condattr_t	
13058		pthread_key_t	
13059		pthread_mutex_t	
13060		pthread_mutexattr_t	
13061		pthread_once_t	
13062		pthread_rwlock_t	
13063		pthread_rwlockattr_t	
13064	SPI	pthread_spinlock_t	
13065	TRC	trace_attr_t	
13066		trace_event_id_t	
13067	TRC TEF	trace_event_set_t	
13068	TRC	trace_id_t	
13069			
13070	Additionally:		
13071	• mode_t shall be an integer type.		
13072	• nlink_t , uid_t , gid_t , and id_t shall be integer types.		
13073	• blkcnt_t and off_t shall be signed integer types.		
13074	XSI	• fsblkcnt_t , fsfilcnt_t , and ino_t shall be defined as unsigned integer types.	
13075	• size_t shall be an unsigned integer type.		
13076	• blksize_t , pid_t , and ssize_t shall be signed integer types.		
13077	• time_t and clock_t shall be integer or real-floating types.		
13078	XSI	The type ssize_t shall be capable of storing values at least in the range $[-1, \{\text{SSIZE\_MAX}\}]$. The	
13079	type useconds_t shall be an unsigned integer type capable of storing values at least in the range		
13080	$[0, 1\,000\,000]$. The type suseconds_t shall be a signed integer type capable of storing values at		

13081 least in the range `[-1, 1 000 000]`.

13082 The implementation shall support one or more programming environments in which the widths
13083 of **blksize_t**, **pid_t**, **size_t**, **ssize_t**, **suseconds_t**, and **useconds_t** are no greater than the width of
13084 type **long**. The names of these programming environments can be obtained using the *confstr()*
13085 function or the *getconf* utility.

13086 There are no defined comparison or assignment operators for the following types:

13087	THR	pthread_attr_t
13088	BAR	pthread_barrier_t
13089		pthread_barrierattr_t
13090	THR	pthread_cond_t
13091		pthread_condattr_t
13092		pthread_mutex_t
13093		pthread_mutexattr_t
13094		pthread_rwlock_t
13095		pthread_rwlockattr_t

13107 volume of IEEE Std 1003.1-2001, *getconf*

13108 CHANGE HISTORY

13109 First released in Issue 1. Derived from Issue 1 of the SVID.

13110 Issue 5

13111 The **clockid_t** and **timer_t** types are defined for alignment with the POSIX Realtime Extension.

13112 The types **blkcnt_t**, **blksize_t**, **fsblkcnt_t**, **fsfilcnt_t**, and **suseconds_t** are added.

13113 Large File System extensions are added.

13114 Updated for alignment with the POSIX Threads Extension.

13115 Issue 6

13116 The **pthread_barrier_t**, **pthread_barrierattr_t**, and **pthread_spinlock_t** types are added for
13117 alignment with IEEE Std 1003.1j-2000.

13118 The margin code is changed from XSI to THR for the **pthread_rwlock_t** and
13119 **pthread_rwlockattr_t** types as Read-Write Locks have been absorbed into the POSIX Threads
13120 option. The threads types are marked THR.

13121 NAME

13122 sys/uio.h — definitions for vector I/O operations

13123 SYNOPSIS

13124 xSI #include <sys/uio.h>

13125

13126 DESCRIPTION

13127 The <sys/uio.h> header shall define the **iovec** structure that includes at least the following
13128 members:

13129 void *iov_base Base address of a memory region for input or output.
13130 size_t iov_len The size of the memory pointed to by *iov_base*.

13131 The <sys/uio.h> header uses the **iovec** structure for scatter/gather I/O.

13132 The **ssize_t** and **size_t** types shall be defined as described in <sys/types.h>.

13133 The following shall be declared as functions and may also be defined as macros. Function
13134 prototypes shall be provided.

13135 ssize_t readv(int, const struct iovec *, int);
13136 ssize_t writev(int, const struct iovec *, int);

13137 APPLICATION USAGE

13138 The implementation can put a limit on the number of scatter/gather elements which can be
13139 processed in one call. The symbol {IOV_MAX} defined in <limits.h> should always be used to
13140 learn about the limits instead of assuming a fixed value.

13141 RATIONALE

13142 Traditionally, the maximum number of scatter/gather elements the system can process in one
13143 call were described by the symbolic value {UIO_MAXIOV}. In IEEE Std 1003.1-2001 this value is
13144 replaced by the constant {IOV_MAX} which can be found in <limits.h>.

13145 FUTURE DIRECTIONS

13146 None.

13147 SEE ALSO

13148 <limits.h>, <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *read()*, *write()*

13149 CHANGE HISTORY

13150 First released in Issue 4, Version 2.

13151 Issue 6

13152 Text referring to scatter/gather I/O is added to the DESCRIPTION.

13153 **NAME**

13154 sys/un.h — definitions for UNIX domain sockets

13155 **SYNOPSIS**

13156 #include <sys/un.h>

13157 **DESCRIPTION**13158 The <sys/un.h> header shall define the **sockaddr_un** structure that includes at least the
13159 following members:13160 sa_family_t sun_family Address family.
13161 char sun_path[] Socket pathname.13162 The **sockaddr_un** structure is used to store addresses for UNIX domain sockets. Values of this
13163 type shall be cast by applications to **struct sockaddr** for use with socket functions.13164 The **sa_family_t** type shall be defined as described in <sys/socket.h>.13165 **APPLICATION USAGE**13166 The size of *sun_path* has intentionally been left undefined. This is because different
13167 implementations use different sizes. For example, 4.3 BSD uses a size of 108, and 4.4 BSD uses a
13168 size of 104. Since most implementations originate from BSD versions, the size is typically in the
13169 range 92 to 108.13170 Applications should not assume a particular length for *sun_path* or assume that it can hold
13171 {_POSIX_PATH_MAX} characters (255).13172 **RATIONALE**

13173 None.

13174 **FUTURE DIRECTIONS**

13175 None.

13176 **SEE ALSO**13177 <sys/socket.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *bind()*, *socket()*,

13180 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

13181 **NAME**

13182 sys/utsname.h — system name structure

13183 **SYNOPSIS**

13184 #include <sys/utsname.h>

13185 **DESCRIPTION**

13186 The <sys/utsname.h> header shall define the structure **utsname** which shall include at least the
13187 following members:

13188	char	sysname[]	Name of this implementation of the operating system.
13189	char	nodename[]	Name of this node within an implementation-defined communications network.
13190			
13191	char	release[]	Current release level of this implementation.
13192	char	version[]	Current version level of this release.
13193	char	machine[]	Name of the hardware type on which the system is running.

13194 The character arrays are of unspecified size, but the data stored in them shall be terminated by a
13195 null byte.

13196 The following shall be declared as a function and may also be defined as a macro:

13197 int uname(struct utsname *);

13198 **APPLICATION USAGE**

13199 None.

13200 **RATIONALE**

13201 None.

13202 **FUTURE DIRECTIONS**

13206 **CHANGE HISTORY**

13207 First released in Issue 1. Derived from Issue 1 of the SVID.

13208 **NAME**

13209 sys/wait.h — declarations for waiting

13210 **SYNOPSIS**

13211 #include <sys/wait.h>

13212 **DESCRIPTION**13213 The <sys/wait.h> header shall define the following symbolic constants for use with *waitpid()*:

13214 WNOHANG Do not hang if no status is available; return immediately.

13215 WUNTRACED Report status of stopped child process.

13216 The <sys/wait.h> header shall define the following macros for analysis of process status values:

13217 WEXITSTATUS Return exit status.

13218 XSI WIFCONTINUED True if child has been continued.

13219 WIFEXITED True if child exited normally.

13220 WIFSIGNALED True if child exited due to uncaught signal.

13221 WIFSTOPPED True if child is currently stopped.

13222 WSTOPSIG Return signal number that caused process to stop.

13223 WTERMSIG Return signal number that caused process to terminate.

13224 XSI The following symbolic constants shall be defined as possible values for the *options* argument to
13225 *waitid()*:

13226 WEXITED Wait for processes that have exited.

13227 WSTOPPED Status is returned for any child that has stopped upon receipt of a signal.

13228 WCONTINUED Status is returned for any child that was stopped and has been continued.

13229 WNOHANG Return immediately if there are no children to wait for.

13230 WNOWAIT Keep the process whose status is returned in *infop* in a waitable state.13231 The type **idtype_t** shall be defined as an enumeration type whose possible values shall include
13232 at least the following:

13233 P_ALL

13234 P_PID

13235 P_PGID

13236

13237 The **id_t** and **pid_t** types shall be defined as described in <sys/types.h>.13238 XSI The **siginfo_t** type shall be defined as described in <signal.h>.13239 The **rusage** structure shall be defined as described in <sys/resource.h>.13240 Inclusion of the <sys/wait.h> header may also make visible all symbols from <signal.h> and
13241 <sys/resource.h>.13242 The following shall be declared as functions and may also be defined as macros. Function
13243 prototypes shall be provided.

13244 pid_t wait(int *);

13245 XSI int waitid(idtype_t, id_t, siginfo_t *, int);

13246 pid_t waitpid(pid_t, int *, int);

13247 **APPLICATION USAGE**

13248 None.

13249 **RATIONALE**

13250 None.

13251 **FUTURE DIRECTIONS**

13252 None.

13253 **SEE ALSO**

13254 <signal.h>, <sys/resource.h>, <sys/types.h>, the System Interfaces volume of
13255 IEEE Std 1003.1-2001, *wait()*, *waitid()*

13256 **CHANGE HISTORY**

13257 First released in Issue 3.

13258 Included for alignment with the POSIX.1-1988 standard.

13259 **Issue 6**

13260 The *wait3()* function is removed.

13261 **NAME**

13262 syslog.h — definitions for system error logging

13263 **SYNOPSIS**

13264 xSI #include <syslog.h>

13265

13266 **DESCRIPTION**13267 The <syslog.h> header shall define the following symbolic constants, zero or more of which may
13268 be OR'ed together to form the *logopt* option of *openlog()*:

13269 LOG_PID Log the process ID with each message.

13270 LOG_CONS Log to the system console on error.

13271 LOG_NDELAY Connect to syslog daemon immediately.

13272 LOG_ODELAY Delay open until *syslog()* is called.

13273 LOG_NOWAIT Do not wait for child processes.

13274 The following symbolic constants shall be defined as possible values of the *facility* argument to
13275 *openlog()*:

13276 LOG_KERN Reserved for message generated by the system.

13277 LOG_USER Message generated by a process.

13278 LOG_MAIL Reserved for message generated by mail system.

13279 LOG_NEWS Reserved for message generated by news system.

13280 LOG_UUCP Reserved for message generated by UUCP system.

13281 LOG_DAEMON Reserved for message generated by system daemon.

13282 LOG_AUTH Reserved for message generated by authorization daemon.

13283 LOG_CRON Reserved for message generated by clock daemon.

13284 LOG_LPR Reserved for message generated by printer system.

13285 LOG_LOCAL0 Reserved for local use.

13286 LOG_LOCAL1 Reserved for local use.

13287 LOG_LOCAL2 Reserved for local use.

13288 LOG_LOCAL3 Reserved for local use.

13289 LOG_LOCAL4 Reserved for local use.

13290 LOG_LOCAL5 Reserved for local use.

13291 LOG_LOCAL6 Reserved for local use.

13292 LOG_LOCAL7 Reserved for local use.

13293 The following shall be declared as macros for constructing the *maskpri* argument to *setlogmask()*.
13294 The following macros expand to an expression of type **int** when the argument *pri* is an
13295 expression of type **int**:13296 LOG_MASK(*pri*) A mask for priority *pri*.13297 The following constants shall be defined as possible values for the *priority* argument of *syslog()*:

13298	LOG_EMERG	A panic condition was reported to all processes.
13299	LOG_ALERT	A condition that should be corrected immediately.
13300	LOG_CRIT	A critical condition.
13301	LOG_ERR	An error message.
13302	LOG_WARNING	A warning message.
13303	LOG_NOTICE	A condition requiring special handling.
13304	LOG_INFO	A general information message.
13305	LOG_DEBUG	A message useful for debugging programs.
13306	The following shall be declared as functions and may also be defined as macros. Function	
13307	prototypes shall be provided.	
13308	void	closelog(void);
13309	void	openlog(const char *, int, int);
13310	int	setlogmask(int);
13311	void	syslog(int, const char *, ...);

13324 **NAME**

13325 tar.h — extended tar definitions

13326 **SYNOPSIS**

13327 #include <tar.h>

13328 **DESCRIPTION**

13329 The <tar.h> header shall define header block definitions as follows.

13330 General definitions:

13331

13332

13333

13334

13335

13336

Name	Description	Value
TMAGIC	"ustar"	ustar plus null byte.
TMAGLEN	6	Length of the above.
TVERSION	"00"	00 without a null byte.
TVERSLEN	2	Length of the above.

13337 *Typeflag* field definitions:

13338

13339

13340

13341

13342

13343

13344

13345

13346

13347

13348

Name	Description	Value
REGTYPE	'0'	Regular file.
AREGTYPE	'\0'	Regular file.
LNKTYPE	'1'	Link.
SYMTYPE	'2'	Symbolic link.
CHRTYPE	'3'	Character special.
BLKTYPE	'4'	Block special.
DIRTYPE	'5'	Directory.
FIFOTYPE	'6'	FIFO special.
CONTTYPE	'7'	Reserved.

13349 *Mode* field bit definitions (octal):

13350

13351

13352

13353

13354 xsi

13355

13356

13357

13358

13359

13360

13361

13362

13363

Name	Description	Value
TSUID	04000	Set UID on execution.
TSGID	02000	Set GID on execution.
TSVTX	01000	On directories, restricted deletion flag.
TUREAD	00400	Read by owner.
TUWRITE	00200	Write by owner special.
TUEXEC	00100	Execute/search by owner.
TGREAD	00040	Read by group.
TGWRITE	00020	Write by group.
TGEXEC	00010	Execute/search by group.
TOREAD	00004	Read by other.
TOWRITE	00002	Write by other.
TOEXEC	00001	Execute/search by other.

13364 **APPLICATION USAGE**

13365 None.

13366 **RATIONALE**

13367 None.

13368 **FUTURE DIRECTIONS**

13369 None.

13370 **SEE ALSO**

13371 The Shell and Utilities volume of IEEE Std 1003.1-2001, *pax*

13372 **CHANGE HISTORY**

13373 First released in Issue 3. Derived from the POSIX.1-1988 standard.

13374 **Issue 6**

13375 The SEE ALSO section now refers to *pax* since the Shell and Utilities volume of
13376 IEEE Std 1003.1-2001 no longer contains the *tar* utility.

13377 **NAME**

13378 termios.h — define values for termios

13379 **SYNOPSIS**

13380 #include <termios.h>

13381 **DESCRIPTION**

13382 The <termios.h> header contains the definitions used by the terminal I/O interfaces (see
 13383 Chapter 11 (on page 187) for the structures and names defined).

13384 **The termios Structure**13385 The following data types shall be defined through **typedef**:13386 **cc_t** Used for terminal special characters.13387 **speed_t** Used for terminal baud rates.13388 **tcflag_t** Used for terminal modes.

13389 The above types shall be all unsigned integer types.

13390 The implementation shall support one or more programming environments in which the widths
 13391 of **cc_t**, **speed_t**, and **tcflag_t** are no greater than the width of type **long**. The names of these
 13392 programming environments can be obtained using the *confstr()* function or the *getconf* utility.

13393 The **termios** structure shall be defined, and shall include at least the following members:

13394 tcflag_t c_iflag Input modes.
 13395 tcflag_t c_oflag Output modes.
 13396 tcflag_t c_cflag Control modes.
 13397 tcflag_t c_lflag Local modes.
 13398 cc_t c_cc [NCCS] Control characters.

13399 A definition shall be provided for:

13400 NCCS Size of the array *c_cc* for control characters.13401 The following subscript names for the array *c_cc* shall be defined:

13402

13403

13404

13405

13406

13407

13408

13409

13410

13411

13412

13413

13414

13415

Subscript Usage		Description
Canonical Mode	Non-Canonical Mode	
VEOF	VINTR	EOF character.
VEOL		EOL character.
VERASE		ERASE character.
VINTR		INTR character.
VKILL	VMIN	KILL character.
		MIN value.
VQUIT		QUIT character.
VSTART		START character.
VSTOP	VSUSP	STOP character.
VSUSP		SUSP character.
	VTIME	TIME value.

13416 The subscript values shall be unique, except that the VMIN and VTIME subscripts may have the
 13417 same values as the VEOF and VEOL subscripts, respectively.

13418 The following flags shall be provided.

13419	Input Modes	
13420	The <i>c_iflag</i> field describes the basic terminal input control:	
13421	BRKINT	Signal interrupt on break.
13422	ICRNL	Map CR to NL on input.
13423	IGNBRK	Ignore break condition.
13424	IGNCR	Ignore CR.
13425	IGNPAR	Ignore characters with parity errors.
13426	INLCR	Map NL to CR on input.
13427	INPCK	Enable input parity check.
13428	ISTRIP	Strip character.
13429 XSI	IXANY	Enable any character to restart output.
13430	IXOFF	Enable start/stop input control.
13431	IXON	Enable start/stop output control.
13432	PARMRK	Mark parity errors.

13433	Output Modes	
13434	The <i>c_oflag</i> field specifies the system treatment of output:	
13435	OPOST	Post-process output.
13436 XSI	ONLCR	Map NL to CR-NL on output.
13437	OCRNL	Map CR to NL on output.
13438	ONOCR	No CR output at column 0.
13439	ONLRET	NL performs CR function.
13440	OFILL	Use fill characters for delay.
13441	NLDLY	Select newline delays:
13442	NL0	Newline type 0.
13443	NL1	Newline type 1.
13444	CRDLY	Select carriage-return delays:
13445	CR0	Carriage-return delay type 0.
13446	CR1	Carriage-return delay type 1.
13447	CR2	Carriage-return delay type 2.
13448	CR3	Carriage-return delay type 3.
13449	TABDLY	Select horizontal-tab delays:
13450	TAB0	Horizontal-tab delay type 0.
13451	TAB1	Horizontal-tab delay type 1.
13452	TAB2	Horizontal-tab delay type 2.

13453		TAB3	Expand tabs to spaces.
13454	BSDLY		Select backspace delays:
13455		BS0	Backspace-delay type 0.
13456		BS1	Backspace-delay type 1.
13457	VTDLY		Select vertical-tab delays:
13458		VT0	Vertical-tab delay type 0.
13459		VT1	Vertical-tab delay type 1.
13460	FFDLY		Select form-feed delays:
13461		FF0	Form-feed delay type 0.
13462		FF1	Form-feed delay type 1.

13463 **Baud Rate Selection**

13464 The input and output baud rates are stored in the **termios** structure. These are the valid values
 13465 for objects of type **speed_t**. The following values shall be defined, but not all baud rates need be
 13466 supported by the underlying hardware.

13467	B0	Hang up
13468	B50	50 baud
13469	B75	75 baud
13470	B110	110 baud
13471	B134	134.5 baud
13472	B150	150 baud
13473	B200	200 baud
13474	B300	300 baud
13475	B600	600 baud
13476	B1200	1 200 baud
13477	B1800	1 800 baud
13478	B2400	2 400 baud
13479	B4800	4 800 baud
13480	B9600	9 600 baud
13481	B19200	19 200 baud
13482	B38400	38 400 baud

13483 **Control Modes**

13484 The *c_cflag* field describes the hardware control of the terminal; not all values specified are
 13485 required to be supported by the underlying hardware:

13486 CSIZE Character size:

13487 CS5 5 bits

13488 CS6 6 bits

13489 CS7 7 bits

13490 CS8 8 bits

13491 CSTOPB Send two stop bits, else one.

13492 CREAD Enable receiver.

13493 PARENB Parity enable.

13494 PARODD Odd parity, else even.

13495 HUPCL Hang up on last close.

13496 CLOCAL Ignore modem status lines.

13497 The implementation shall support the functionality associated with the symbols CS7, CS8,
 13498 CSTOPB, PARODD, and PARENB.

13499 **Local Modes**

13500 The *c_lflag* field of the argument structure is used to control various terminal functions:

13501 ECHO Enable echo.

13502 ECHOE Echo erase character as error-correcting backspace.

13503 ECHOK Echo KILL.

13504 ECHONL Echo NL.

13505 ICANON Canonical input (erase and kill processing).

13506 IEXTEN Enable extended input character processing.

13507 ISIG Enable signals.

13508 NOFLSH Disable flush after interrupt or quit.

13509 TOSTOP Send SIGTTOU for background output.

13510 **Attribute Selection**

13511 The following symbolic constants for use with *tcsetattr()* are defined:

13512 TCSANOW Change attributes immediately.

13513 TCSADRAIN Change attributes when output has drained.

13514 TCSAFLUSH Change attributes when output has drained; also flush pending input.

13515 **Line Control**

13516 The following symbolic constants for use with *tcflush()* shall be defined:

13517 TCIFLUSH Flush pending input.

13518 TCIOFLUSH Flush both pending input and untransmitted output.

13519 TCOFLUSH Flush untransmitted output.

13520 The following symbolic constants for use with *tcflow()* shall be defined:

13521 TCIOFF Transmit a STOP character, intended to suspend input data.

13522 TCION Transmit a START character, intended to restart input data.

13523 TCOOFF Suspend output.

13524 TCOON Restart output.

13525 The following shall be declared as functions and may also be defined as macros. Function
13526 prototypes shall be provided.

```
13527 speed_t cfgetispeed(const struct termios *);
13528 speed_t cfgetospeed(const struct termios *);
13529 int      cfsetispeed(struct termios *, speed_t);
13530 int      cfsetospeed(struct termios *, speed_t);
13531 int      tcdrain(int);
13532 int      tcflow(int, int);
13533 int      tcflush(int, int);
13534 int      tcgetattr(int, struct termios *);
13535 xsi pid_t tcgetsid(int);
13536 int      tcsendbreak(int, int);
13537 int      tcsetattr(int, int, const struct termios *);
```

13538 **APPLICATION USAGE**

13539 The following names are reserved for XSI-conformant systems to use as an extension to the
13540 above; therefore strictly conforming applications shall not use them:

13541	CBAUD	EXTB	VDSUSP
13542	DEFECHO	FLUSHO	VLNEXT
13543	ECHOCTL	LOBLK	VREPRINT
13544	ECHOKE	PENDIN	VSTATUS
13545	ECHOPRT	SWTCH	VWERASE
13546	EXTA	VDISCARD	

13547 **RATIONALE**

13548 None.

13555 **CHANGE HISTORY**

13556 First released in Issue 3.

13557 Included for alignment with the ISO POSIX-1 standard.

13558 **Issue 6**

13559 The LEGACY symbols IUCLC, OLCUC, and XCASE are removed.

13560 FIPS 151-2 requirements for the symbols CS7, CS8, CSTOPB, PARODD, and PARENB are
13561 reaffirmed.

13562 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/19 is applied, changing ECHOK to |
13563 ECHOK in the APPLICATION USAGE section. |

13564 **NAME**

13565 tmath.h — type-generic macros

13566 **SYNOPSIS**

13567 #include <tmath.h>

13568 **DESCRIPTION**

13569 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 13570 conflict between the requirements described here and the ISO C standard is unintentional. This
 13571 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13572 The <tmath.h> header shall include the headers <math.h> and <complex.h> and shall define
 13573 several type-generic macros.

13574 Of the functions contained within the <math.h> and <complex.h> headers without an *f* (**float**) or
 13575 *l* (**long double**) suffix, several have one or more parameters whose corresponding real type is
 13576 **double**. For each such function, except *modf()*, there shall be a corresponding type-generic
 13577 macro. The parameters whose corresponding real type is **double** in the function synopsis are
 13578 generic parameters. Use of the macro invokes a function whose corresponding real type and
 13579 type domain are determined by the arguments for the generic parameters.

13580 Use of the macro invokes a function whose generic parameters have the corresponding real type
 13581 determined as follows:

- 13582 • First, if any argument for generic parameters has type **long double**, the type determined is
 13583 **long double**.
- 13584 • Otherwise, if any argument for generic parameters has type **double** or is of integer type, the
 13585 type determined is **double**.
- 13586 • Otherwise, the type determined is **float**.

13587 For each unsuffixed function in the <math.h> header for which there is a function in the
 13588 <complex.h> header with the same name except for a *c* prefix, the corresponding type-generic
 13589 macro (for both functions) has the same name as the function in the <math.h> header. The
 13590 corresponding type-generic macro for *fabs()* and *cabs()* is *fabs()*.

<math.h> Function	<complex.h> Function	Type-Generic Macro
<i>acos()</i>	<i>cacos()</i>	<i>acos()</i>
<i>asin()</i>	<i>casin()</i>	<i>asin()</i>
<i>atan()</i>	<i>catan()</i>	<i>atan()</i>
<i>acosh()</i>	<i>cacosh()</i>	<i>acosh()</i>
<i>asinh()</i>	<i>casinh()</i>	<i>asinh()</i>
<i>atanh()</i>	<i>catanh()</i>	<i>atanh()</i>
<i>cos()</i>	<i>ccos()</i>	<i>cos()</i>
<i>sin()</i>	<i>csin()</i>	<i>sin()</i>
<i>tan()</i>	<i>ctan()</i>	<i>tan()</i>
<i>cosh()</i>	<i>ccosh()</i>	<i>cosh()</i>
<i>sinh()</i>	<i>csinh()</i>	<i>sinh()</i>
<i>tanh()</i>	<i>ctanh()</i>	<i>tanh()</i>
<i>exp()</i>	<i>cexp()</i>	<i>exp()</i>
<i>log()</i>	<i>clog()</i>	<i>log()</i>
<i>pow()</i>	<i>cpow()</i>	<i>pow()</i>
<i>sqrt()</i>	<i>csqrt()</i>	<i>sqrt()</i>
<i>fabs()</i>	<i>cabs()</i>	<i>fabs()</i>

13610 If at least one argument for a generic parameter is complex, then use of the macro invokes a
13611 complex function; otherwise, use of the macro invokes a real function.

13612 For each unsuffixed function in the <math.h> header without a *c*-prefixed counterpart in the
13613 <complex.h> header, the corresponding type-generic macro has the same name as the function.
13614 These type-generic macros are:

13615	<i>atan2()</i>	<i>fma()</i>	<i>llround()</i>	<i>remainder()</i>
13616	<i>cbrt()</i>	<i>fmax()</i>	<i>log10()</i>	<i>remquo()</i>
13617	<i>ceil()</i>	<i>fmin()</i>	<i>log1p()</i>	<i>rint()</i>
13618	<i>copysign()</i>	<i>fmod()</i>	<i>log2()</i>	<i>round()</i>
13619	<i>erf()</i>	<i>frexp()</i>	<i>logb()</i>	<i>scalbn()</i>
13620	<i>erfc()</i>	<i>hypot()</i>	<i>lrint()</i>	<i>scalbln()</i>
13621	<i>exp2()</i>	<i>ilogb()</i>	<i>lround()</i>	<i>tgamma()</i>
13622	<i>expm1()</i>	<i>ldexp()</i>	<i>nearbyint()</i>	<i>trunc()</i>
13623	<i>fdim()</i>	<i>lgamma()</i>	<i>nextafter()</i>	
13624	<i>floor()</i>	<i>llrint()</i>	<i>nexttoward()</i>	

13625 If all arguments for generic parameters are real, then use of the macro invokes a real function;
13626 otherwise, use of the macro results in undefined behavior.

13627 For each unsuffixed function in the <complex.h> header that is not a *c*-prefixed counterpart to a
13628 function in the <math.h> header, the corresponding type-generic macro has the same name as
13629 the function. These type-generic macros are:

13630 *carg()*
13631 *cimag()*
13632 *conj()*
13633 *cproj()*
13634 *creal()*

13635 Use of the macro with any real or complex argument invokes a complex function.

13636 APPLICATION USAGE

13637 With the declarations:

```
13638 #include <tgmath.h>
13639 int n;
13640 float f;
13641 double d;
13642 long double ld;
13643 float complex fc;
13644 double complex dc;
13645 long double complex ldc;
```

13646 functions invoked by use of type-generic macros are shown in the following table:

Macro	Use Invokes
<i>exp(n)</i>	<i>exp(n)</i> , the function
<i>acosh(f)</i>	<i>acoshf(f)</i>
<i>sin(d)</i>	<i>sin(d)</i> , the function
<i>atan(ld)</i>	<i>atanl(ld)</i>

13672 **RATIONALE**

13673

13674

13675

13676

13677

Type-generic macros allow calling a function whose type is determined by the argument type, as is the case for C operators such as '+' and '*'. For example, with a type-generic `cos()` macro, the expression `cos((float)x)` will have type **float**. This feature enables writing more portably efficient code and alleviates need for awkward casting and suffixing in the process of porting or adjusting precision. Generic math functions are a widely appreciated feature of Fortran.

13678

13679

13680

13681

The only arguments that affect the type resolution are the arguments corresponding to the parameters that have type **double** in the synopsis. Hence the type of a type-generic call to `nexttoward()`, whose second parameter is **long double** in the synopsis, is determined solely by the type of the first argument.

13682

13683

13684

The term “type-generic” was chosen over the proposed alternatives of intrinsic and overloading. The term is more specific than intrinsic, which already is widely used with a more general meaning, and reflects a closer match to Fortran’s generic functions than to C++ overloading.

13685

13686

The macros are placed in their own header in order not to silently break old programs that include the **<math.h>** header; for example, with:

13687

```
printf ("%e", sin(x))
```

13688

13689

`modf(double, double *)` is excluded because no way was seen to make it safe without complicating the type resolution.

13690

13691

13692

The implementation might, as an extension, endow appropriate ones of the macros that IEEE Std 1003.1-2001 specifies only for real arguments with the ability to invoke the complex functions.

13693

13694

13695

IEEE Std 1003.1-2001 does not prescribe any particular implementation mechanism for generic macros. It could be implemented simply with built-in macros. The generic macro for `sqrt()`, for example, could be implemented with:

13696

13697

```
#undef sqrt
#define sqrt(x) __BUILTIN_GENERIC_sqrt(x)
```

13698

13699

Generic macros are designed for a useful level of consistency with C++ overloaded math functions.

13700	The great majority of existing C programs are expected to be unaffected when the <tgmath.h>
13701	header is included instead of the <math.h> or <complex.h> headers. Generic macros are similar
13702	to the ISO /IEC 9899:1999 standard library masking macros, though the semantic types of return
13703	values differ.
13704	The ability to overload on integer as well as floating types would have been useful for some
13705	functions; for example, <i>copysign()</i> . Overloading with different numbers of arguments would
13706	have allowed reusing names; for example, <i>remainder()</i> for <i>remquo()</i> . However, these facilities
13707	would have complicated the specification; and their natural consistent use, such as for a floating
13708	<i>abs()</i> or a two-argument <i>atan()</i> , would have introduced further inconsistencies with the
13709	ISO /IEC 9899:1999 standard for insufficient benefit.
13710	The ISO C standard in no way limits the implementation's options for efficiency, including
13711	inlining library functions.
13712	FUTURE DIRECTIONS
13713	None.

13717	CHANGE HISTORY
13718	First released in Issue 6. Included for alignment with the ISO /IEC 9899:1999 standard.

13719 **NAME**

13720 time.h — time types

13721 **SYNOPSIS**

13722 #include <time.h>

13723 **DESCRIPTION**

13724 CX Some of the functionality described on this reference page extends the ISO C standard.
 13725 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 13726 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 13727 symbols in this header.

13728 The <time.h> header shall declare the structure **tm**, which shall include at least the following
 13729 members:

13730	int	tm_sec	Seconds [0,60].
13731	int	tm_min	Minutes [0,59].
13732	int	tm_hour	Hour [0,23].
13733	int	tm_mday	Day of month [1,31].
13734	int	tm_mon	Month of year [0,11].
13735	int	tm_year	Years since 1900.
13736	int	tm_wday	Day of week [0,6] (Sunday =0).
13737	int	tm_yday	Day of year [0,365].
13738	int	tm_isdst	Daylight Savings flag.

13739 The value of *tm_isdst* shall be positive if Daylight Savings Time is in effect, 0 if Daylight Savings
 13740 Time is not in effect, and negative if the information is not available.

13741 The <time.h> header shall define the following symbolic names:

13742	NULL	Null pointer constant.
13743	CLOCKS_PER_SEC	A number used to convert the value returned by the <i>clock()</i> function into
13744		seconds.

13745	TMR CPT	CLOCK_PROCESS_CPUTIME_ID
13746		The identifier of the CPU-time clock associated with the process making a
13747		<i>clock()</i> or <i>timer*()</i> function call.

13748	TMR TCT	CLOCK_THREAD_CPUTIME_ID
13749		The identifier of the CPU-time clock associated with the thread making a
13750		<i>clock()</i> or <i>timer*()</i> function call.

13751 TMR The <time.h> header shall declare the structure **timespec**, which has at least the following
 13752 members:

13753	time_t	tv_sec	Seconds.
13754	long	tv_nsec	Nanoseconds.

13755 The <time.h> header shall also declare the **itimerspec** structure, which has at least the following
 13756 members:

13757	struct timespec	it_interval	Timer period.
13758	struct timespec	it_value	Timer expiration.

13759 The following manifest constants shall be defined:

13760	CLOCK_REALTIME	The identifier of the system-wide realtime clock.

13761	TIMER_ABSTIME	Flag indicating time is absolute. For functions taking timer objects, this
13762		refers to the clock associated with the timer.

13763 MON	CLOCK_MONOTONIC
13764	The identifier for the system-wide monotonic clock, which is defined as a
13765	clock whose value cannot be set via <i>clock_settime()</i> and which cannot
13766	have backward clock jumps. The maximum possible clock jump shall be
13767	implementation-defined.
13768 TMR	The clock_t , size_t , time_t , clockid_t , and timer_t types shall be defined as described in
13769	<sys/types.h>.
13770 XSI	Although the value of CLOCKS_PER_SEC is required to be 1 million on all XSI-conformant
13771	systems, it may be variable on other systems, and it should not be assumed that
13772	CLOCKS_PER_SEC is a compile-time constant.
13773 XSI	The <time.h> header shall provide a declaration for <i>getdate_err</i> .
13774	The following shall be declared as functions and may also be defined as macros. Function
13775	prototypes shall be provided.
13776	char *asctime(const struct tm *);
13777 TSF	char *asctime_r(const struct tm *restrict, char *restrict);
13778	clock_t clock(void);
13779 CPT	int clock_getcpuclockid(pid_t, clockid_t *);
13780 TMR	int clock_getres(clockid_t, struct timespec *);
13781	int clock_gettime(clockid_t, struct timespec *);
13782 CS	int clock_nanosleep(clockid_t, int, const struct timespec *,
13783	struct timespec *);
13784 TMR	int clock_settime(clockid_t, const struct timespec *);
13785	char *ctime(const time_t *);
13786 TSF	char *ctime_r(const time_t *, char *);
13787	double difftime(time_t, time_t);
13788 XSI	struct tm *getdate(const char *);
13789	struct tm *gmtime(const time_t *);
13790 TSF	struct tm *gmtime_r(const time_t *restrict, struct tm *restrict);
13791	struct tm *localtime(const time_t *);
13792 TSF	struct tm *localtime_r(const time_t *restrict, struct tm *restrict);
13793	time_t mktime(struct tm *);
13794 TMR	int nanosleep(const struct timespec *, struct timespec *);
13795	size_t strftime(char *restrict, size_t, const char *restrict,
13796	const struct tm *restrict);
13797 XSI	char *strptime(const char *restrict, const char *restrict,
13798	struct tm *restrict);
13799	time_t time(time_t *);
13800 TMR	int timer_create(clockid_t, struct sigevent *restrict,
13801	timer_t *restrict);
13802	int timer_delete(timer_t);
13803	int timer_gettime(timer_t, struct itimerspec *);
13804	int timer_getoverrun(timer_t);
13805	int timer_settime(timer_t, int, const struct itimerspec *restrict,
13806	struct itimerspec *restrict);
13807 CX	void tzset(void);
13808	

13809 The following shall be declared as variables:

```
13810 XSI    extern int    daylight;
13811        extern long   timezone;
13812 CX      extern char  *tzname[];
13813
```

13814 CX Inclusion of the <time.h> header may make visible all symbols from the <signal.h> header.

13815 APPLICATION USAGE

13816 The range [0,60] for *tm_sec* allows for the occasional leap second.

13817 *tm_year* is a signed value; therefore, years before 1900 may be represented.

13818 To obtain the number of clock ticks per second returned by the *times()* function, applications
13819 should call *sysconf(_SC_CLK_TCK)*.

13820 RATIONALE

13821 The range [0,60] seconds allows for positive or negative leap seconds. The formal definition of
13822 UTC does not permit double leap seconds, so all mention of double leap seconds has been
13823 removed, and the range shortened from the former [0,61] seconds seen in previous versions of
13824 POSIX.

13825 FUTURE DIRECTIONS

13826 None.

13827 SEE ALSO

13832 CHANGE HISTORY

13833 First released in Issue 1. Derived from Issue 1 of the SVID.

13834 Issue 5

13835 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
13836 Threads Extension.

13837 Issue 6

13838 The Open Group Corrigendum U035/6 is applied. In the DESCRIPTION, the types **clockid_t**
13839 and **timer_t** have been described.

13840 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 13841 • The POSIX timer-related functions are marked as part of the Timers option.

13842 The symbolic name CLK_TCK is removed. Application usage is added describing how its
13843 equivalent functionality can be obtained using *sysconf()*.

13844 The *clock_getcpuclockid()* function and manifest constants CLOCK_PROCESS_CPUTIME_ID and
13845 CLOCK_THREAD_CPUTIME_ID are added for alignment with IEEE Std 1003.1d-1999.

13846 The manifest constant CLOCK_MONOTONIC and the *clock_nanosleep()* function are added for
13847 alignment with IEEE Std 1003.1j-2000.

13848 The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- 13849 • The range for seconds is changed from [0,61] to [0,60].
- 13850 • The **restrict** keyword is added to the prototypes for *asctime_r()*, *gmtime_r()*, *localtime_r()*,
13851 *strftime()*, *strptime()*, *timer_create()*, and *timer_settime()*.

13852 IEEE PASC Interpretation 1003.1 #84 is applied adding the statement that symbols from the
13853 <signal.h> header may be made visible when the <time.h> header is included.
13854 Extensions beyond the ISO C standard are marked.

13855 **NAME**

13856 trace.h — tracing

13857 **SYNOPSIS**

13858 TRC #include <trace.h>

13859

13860 **DESCRIPTION**

13861 The <trace.h> header shall define the **posix_trace_event_info** structure that includes at least the
 13862 following members:

13863	trace_event_id_t	posix_event_id
13864	pid_t	posix_pid
13865	void	*posix_prog_address
13866	int	posix_truncation_status
13867	struct timespec	posix_timestamp
13868 THR	pthread_t	posix_thread_id

13869

13870 The <trace.h> header shall define the **posix_trace_status_info** structure that includes at least the
 13871 following members:

13872	int	posix_stream_status
13873	int	posix_stream_full_status
13874	int	posix_stream_overrun_status
13875 TRL	int	posix_stream_flush_status
13876	int	posix_stream_flush_error
13877	int	posix_log_overrun_status
13878	int	posix_log_full_status

13879

13880 The <trace.h> header shall define the following symbols:

13881	POSIX_TRACE_ALL_EVENTS
13882 TRL	POSIX_TRACE_APPEND
13883 TRI	POSIX_TRACE_CLOSE_FOR_CHILD
13884 TEF	POSIX_TRACE_FILTER
13885 TRL	POSIX_TRACE_FLUSH
13886	POSIX_TRACE_FLUSH_START
13887	POSIX_TRACE_FLUSH_STOP
13888	POSIX_TRACE_FLUSHING
13889	POSIX_TRACE_FULL
13890	POSIX_TRACE_LOOP
13891	POSIX_TRACE_NO_OVERRUN
13892 TRL	POSIX_TRACE_NOT_FLUSHING
13893	POSIX_TRACE_NOT_FULL
13894 TRI	POSIX_TRACE_INHERITED
13895	POSIX_TRACE_NOT_TRUNCATED
13896	POSIX_TRACE_OVERFLOW
13897	POSIX_TRACE_OVERRUN
13898	POSIX_TRACE_RESUME
13899	POSIX_TRACE_RUNNING
13900	POSIX_TRACE_START

14017 CHANGE HISTORY

```

14018     First released in Issue 6. Derived from IEEE Std 1003.1q-2000.

14019     IEEE Std 1003.1-2001 / Cor 1-2002, item XSH/TC1/D6/40 is applied, adding the TRL margin |
14020     code to the posix_trace_flush() function, for alignment with the System Interfaces volume of |
14021     IEEE Std 1003.1-2001. |

```

14022 **NAME**

14023 ucontext.h — user context

14024 **SYNOPSIS**

14025 xSI #include <ucontext.h>

14026

14027 **DESCRIPTION**14028 The <ucontext.h> header shall define the **mcontext_t** type through **typedef**.14029 The <ucontext.h> header shall define the **ucontext_t** type as a structure that shall include at least
14030 the following members:

14031	ucontext_t	*uc_link	Pointer to the context that is resumed
14032			when this context returns.
14033	sigset_t	uc_sigmask	The set of signals that are blocked when this
14034			context is active.
14035	stack_t	uc_stack	The stack used by this context.
14036	mcontext_t	uc_mcontext	A machine-specific representation of the saved
14037			context.

14038 The types **sigset_t** and **stack_t** shall be defined as in <signal.h>.14039 The following shall be declared as functions and may also be defined as macros, Function
14040 prototypes shall be provided.

```

14041       int  getcontext(ucontext_t *);
14042       int  setcontext(const ucontext_t *);
14043       void makecontext(ucontext_t *, void (*)(void), int, ...);
14044       int  swapcontext(ucontext_t *restrict, const ucontext_t *restrict);

```

14057 ulimit.h — ulimit commands

14058 **SYNOPSIS**

14059 xSI #include <ulimit.h>

14060

14061 **DESCRIPTION**

14062 The <ulimit.h> header shall define the symbolic constants used by the *ulimit()* function.

14063 Symbolic constants:

14064 UL_GETFSIZE Get maximum file size.

14065 UL_SETFSIZE Set maximum file size.

14066 The following shall be declared as a function and may also be defined as a macro. A function
14067 prototype shall be provided.

14068 long ulimit(int, ...);

14077 **CHANGE HISTORY**

14078 First released in Issue 3.

14079 **NAME**

14080 unistd.h — standard symbolic constants and types

14081 **SYNOPSIS**

14082 #include <unistd.h>

14083 **DESCRIPTION**

14084 The <unistd.h> header defines miscellaneous symbolic constants and types, and declares
 14085 miscellaneous functions. The actual values of the constants are unspecified except as shown. The
 14086 contents of this header are shown below.

14087 **Version Test Macros**

14088 The following symbolic constants shall be defined:

14089 _POSIX_VERSION

14090 Integer value indicating version of IEEE Std 1003.1 (C-language binding) to which the
 14091 implementation conforms. For implementations conforming to IEEE Std 1003.1-2001, the
 14092 value shall be 200112L.

14093 _POSIX2_VERSION

14094 Integer value indicating version of the Shell and Utilities volume of IEEE Std 1003.1 to
 14095 which the implementation conforms. For implementations conforming to
 14096 IEEE Std 1003.1-2001, the value shall be 200112L.

14097 The following symbolic constant shall be defined only if the implementation supports the XSI
 14098 option; see Section 2.1.4 (on page 21).

14099 XSI _XOPEN_VERSION

14100 Integer value indicating version of the X/Open Portability Guide to which the
 14101 implementation conforms. The value shall be 600.

14102 **Constants for Options and Option Groups**

14103 The following symbolic constants, if defined in <unistd.h>, shall have a value of −1, 0, or greater,
 14104 unless otherwise specified below. If these are undefined, the *fpathconf()*, *pathconf()*, or *sysconf()*
 14105 functions can be used to determine whether the option is provided for a particular invocation of
 14106 the application.

14107 If a symbolic constant is defined with the value −1, the option is not supported. Headers, data
 14108 types, and function interfaces required only for the option need not be supplied. An application
 14109 that attempts to use anything associated only with the option is considered to be requiring an
 14110 extension.

14111 If a symbolic constant is defined with a value greater than zero, the option shall always be
 14112 supported when the application is executed. All headers, data types, and functions shall be
 14113 present and shall operate as specified.

14114 If a symbolic constant is defined with the value zero, all headers, data types, and functions shall
 14115 be present. The application can check at runtime to see whether the option is supported by
 14116 calling *fpathconf()*, *pathconf()*, or *sysconf()* with the indicated *name* parameter.

14117 Unless explicitly specified otherwise, the behavior of functions associated with an unsupported
 14118 option is unspecified, and an application that uses such functions without first checking
 14119 *fpathconf()*, *pathconf()*, or *sysconf()* is considered to be requiring an extension.

14120 For conformance requirements, refer to Chapter 2 (on page 17).

14121	ADV	_POSIX_ADVISORY_INFO
14122		The implementation supports the Advisory Information option. If this symbol has a value
14123		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14124	AIO	_POSIX_ASYNCHRONOUS_IO
14125		The implementation supports the Asynchronous Input and Output option. If this symbol
14126		has a value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14127	BAR	_POSIX_BARRIERS
14128		The implementation supports the Barriers option. If this symbol has a value other than <code>-1</code> or
14129		<code>0</code> , it shall have the value <code>200112L</code> .
14130		_POSIX_CHOWN_RESTRICTED
14131		The use of <i>chown()</i> and <i>fchown()</i> is restricted to a process with appropriate privileges, and
14132		to changing the group ID of a file only to the effective group ID of the process or to one of
14133		its supplementary group IDs. This symbol shall always be set to a value other than <code>-1</code> .
14134	CS	_POSIX_CLOCK_SELECTION
14135		The implementation supports the Clock Selection option. If this symbol has a value other
14136		than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14137	CPT	_POSIX_CPUTIME
14138		The implementation supports the Process CPU-Time Clocks option. If this symbol has a
14139		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14140	FSC	_POSIX_FSYNC
14141		The implementation supports the File Synchronization option. If this symbol has a value
14142		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14143		_POSIX_IPV6
14144		The implementation supports the IPv6 option. If this symbol has a value other than <code>-1</code> or <code>0</code> ,
14145		it shall have the value <code>200112L</code> .
14146		_POSIX_JOB_CONTROL
14147		The implementation supports job control. This symbol shall always be set to a value greater
14148		than zero.
14149	MF	_POSIX_MAPPED_FILES
14150		The implementation supports the Memory Mapped Files option. If this symbol has a value
14151		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14152	ML	_POSIX_MEMLOCK
14153		The implementation supports the Process Memory Locking option. If this symbol has a
14154		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14155	MLR	_POSIX_MEMLOCK_RANGE
14156		The implementation supports the Range Memory Locking option. If this symbol has a value
14157		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14158	MPR	_POSIX_MEMORY_PROTECTION
14159		The implementation supports the Memory Protection option. If this symbol has a value
14160		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14161	MSG	_POSIX_MESSAGE_PASSING
14162		The implementation supports the Message Passing option. If this symbol has a value other
14163		than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14164	MON	_POSIX_MONOTONIC_CLOCK
14165		The implementation supports the Monotonic Clock option. If this symbol has a value other

14166	than -1 or 0, it shall have the value 200112L.
14167	_POSIX_NO_TRUNC
14168	Pathname components longer than {NAME_MAX} generate an error. This symbol shall
14169	always be set to a value other than -1.
14170	_POSIX_PRIORITIZED_IO
14171	The implementation supports the Prioritized Input and Output option. If this symbol has a
14172	value other than -1 or 0, it shall have the value 200112L.
14173	_POSIX_PRIORITY_SCHEDULING
14174	The implementation supports the Process Scheduling option. If this symbol has a value
14175	other than -1 or 0, it shall have the value 200112L.
14176	_POSIX_RAW_SOCKETS
14177	The implementation supports the Raw Sockets option. If this symbol has a value other than
14178	-1 or 0, it shall have the value 200112L.
14179	_POSIX_READER_WRITER_LOCKS
14180	The implementation supports the Read-Write Locks option. This is always set to a value
14181	greater than zero if the Threads option is supported. If this symbol has a value other than -1
14182	or 0, it shall have the value 200112L.
14183	_POSIX_REALTIME_SIGNALS
14184	The implementation supports the Realtime Signals Extension option. If this symbol has a
14185	value other than -1 or 0, it shall have the value 200112L.
14186	_POSIX_REGEX
14187	The implementation supports the Regular Expression Handling option. This symbol shall
14188	always be set to a value greater than zero.
14189	_POSIX_SAVED_IDS
14190	Each process has a saved set-user-ID and a saved set-group-ID. This symbol shall always
14191	be set to a value greater than zero.
14192	_POSIX_SEMAPHORES
14193	The implementation supports the Semaphores option. If this symbol has a value other than
14194	-1 or 0, it shall have the value 200112L.
14195	_POSIX_SHARED_MEMORY_OBJECTS
14196	The implementation supports the Shared Memory Objects option. If this symbol has a value
14197	other than -1 or 0, it shall have the value 200112L.
14198	_POSIX_SHELL
14199	The implementation supports the POSIX shell. This symbol shall always be set to a value
14200	greater than zero.
14201	_POSIX_SPAWN
14202	The implementation supports the Spawn option. If this symbol has a value other than -1 or
14203	0, it shall have the value 200112L.
14204	_POSIX_SPIN_LOCKS
14205	The implementation supports the Spin Locks option. If this symbol has a value other than
14206	-1 or 0, it shall have the value 200112L.
14207	_POSIX_SPORADIC_SERVER
14208	The implementation supports the Process Sporadic Server option. If this symbol has a value
14209	other than -1 or 0, it shall have the value 200112L.

14210	SIO	_POSIX_SYNCHRONIZED_IO
14211		The implementation supports the Synchronized Input and Output option. If this symbol
14212		has a value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14213	TSA	_POSIX_THREAD_ATTR_STACKADDR
14214		The implementation supports the Thread Stack Address Attribute option. If this symbol
14215		has a value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14216	TSS	_POSIX_THREAD_ATTR_STACKSIZE
14217		The implementation supports the Thread Stack Size Attribute option. If this symbol has a
14218		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14219	TCT	_POSIX_THREAD_CPU_TIME
14220		The implementation supports the Thread CPU-Time Clocks option. If this symbol has a
14221		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14222	TPI	_POSIX_THREAD_PRIO_INHERIT
14223		The implementation supports the Thread Priority Inheritance option. If this symbol has a
14224		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14225	TPP	_POSIX_THREAD_PRIO_PROTECT
14226		The implementation supports the Thread Priority Protection option. If this symbol has a
14227		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14228	TPS	_POSIX_THREAD_PRIORITY_SCHEDULING
14229		The implementation supports the Thread Execution Scheduling option. If this symbol has a
14230		value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14231	TSH	_POSIX_THREAD_PROCESS_SHARED
14232		The implementation supports the Thread Process-Shared Synchronization option. If this
14233		symbol has a value other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14234	TSF	_POSIX_THREAD_SAFE_FUNCTIONS
14235		The implementation supports the Thread-Safe Functions option. If this symbol has a value
14236		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14237	TSP	_POSIX_THREAD_SPORADIC_SERVER
14238		The implementation supports the Thread Sporadic Server option. If this symbol has a value
14239		other than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .
14240	THR	_POSIX_THREADS
14241		The implementation supports the Threads option. If this symbol has a value other than <code>-1</code>
14242		or <code>0</code> , it shall have the value <code>200112L</code> .
14243	TMO	_POSIX_TIMEOUTS
14244		The implementation supports the Timeouts option. If this symbol has a value other than <code>-1</code>
14245		or <code>0</code> , it shall have the value <code>200112L</code> .
14246	TMR	_POSIX_TIMERS
14247		The implementation supports the Timers option. If this symbol has a value other than <code>-1</code> or
14248		<code>0</code> , it shall have the value <code>200112L</code> .
14249	TRC	_POSIX_TRACE
14250		The implementation supports the Trace option. If this symbol has a value other than <code>-1</code> or <code>0</code> ,
14251		it shall have the value <code>200112L</code> .
14252	TEF	_POSIX_TRACE_EVENT_FILTER
14253		The implementation supports the Trace Event Filter option. If this symbol has a value other
14254		than <code>-1</code> or <code>0</code> , it shall have the value <code>200112L</code> .

14255 TRI	_POSIX_TRACE_INHERIT
14256	The implementation supports the Trace Inherit option. If this symbol has a value other than
14257	−1 or 0, it shall have the value 200112L.
14258 TRL	_POSIX_TRACE_LOG
14259	The implementation supports the Trace Log option. If this symbol has a value other than −1
14260	or 0, it shall have the value 200112L.
14261 TYM	_POSIX_TYPED_MEMORY_OBJECTS
14262	The implementation supports the Typed Memory Objects option. If this symbol has a value
14263	other than −1 or 0, it shall have the value 200112L.
14264	_POSIX_VDISABLE
14265	This symbol shall be defined to be the value of a character that shall disable terminal special
14266	character handling as described in <termios.h>. This symbol shall always be set to a value
14267	other than −1.
14268	_POSIX2_C_BIND
14269	The implementation supports the C-Language Binding option. This symbol shall always
14270	have the value 200112L.
14271 CD	_POSIX2_C_DEV
14272	The implementation supports the C-Language Development Utilities option. If this symbol
14273	has a value other than −1 or 0, it shall have the value 200112L.
14274	_POSIX2_CHAR_TERM
14275	The implementation supports at least one terminal type.
14276 FD	_POSIX2_FORT_DEV
14277	The implementation supports the FORTRAN Development Utilities option. If this symbol
14278	has a value other than −1 or 0, it shall have the value 200112L.
14279 FR	_POSIX2_FORT_RUN
14280	The implementation supports the FORTRAN Runtime Utilities option. If this symbol has a
14281	value other than −1 or 0, it shall have the value 200112L.
14282	_POSIX2_LOCALEDEF
14283	The implementation supports the creation of locales by the <i>localedef</i> utility. If this symbol
14284	has a value other than −1 or 0, it shall have the value 200112L.
14285 BE	_POSIX2_PBS
14286	The implementation supports the Batch Environment Services and Utilities option. If this
14287	symbol has a value other than −1 or 0, it shall have the value 200112L.
14288 BE	_POSIX2_PBS_ACCOUNTING
14289	The implementation supports the Batch Accounting option. If this symbol has a value other
14290	than −1 or 0, it shall have the value 200112L.
14291 BE	_POSIX2_PBS_CHECKPOINT
14292	The implementation supports the Batch Checkpoint/Restart option. If this symbol has a
14293	value other than −1 or 0, it shall have the value 200112L.
14294 BE	_POSIX2_PBS_LOCATE
14295	The implementation supports the Locate Batch Job Request option. If this symbol has a
14296	value other than −1 or 0, it shall have the value 200112L.
14297 BE	_POSIX2_PBS_MESSAGE
14298	The implementation supports the Batch Job Message Request option. If this symbol has a
14299	value other than −1 or 0, it shall have the value 200112L.

14300	BE	_POSIX2_PBS_TRACK
14301		The implementation supports the Track Batch Job Request option. If this symbol has a value
14302		other than -1 or 0 , it shall have the value 200112L .
14303	SD	_POSIX2_SW_DEV
14304		The implementation supports the Software Development Utilities option. If this symbol has
14305		a value other than -1 or 0 , it shall have the value 200112L .
14306	UP	_POSIX2_UPE
14307		The implementation supports the User Portability Utilities option. If this symbol has a value
14308		other than -1 or 0 , it shall have the value 200112L .
14309		_V6_ILP32_OFF32
14310		The implementation provides a C-language compilation environment with 32-bit int , long ,
14311		pointer , and off_t types.
14312		_V6_ILP32_OFFBIG
14313		The implementation provides a C-language compilation environment with 32-bit int , long ,
14314		and pointer types and an off_t type using at least 64 bits.
14315		_V6_LP64_OFF64
14316		The implementation provides a C-language compilation environment with 32-bit int and
14317		64-bit long , pointer , and off_t types.
14318		_V6_LPBIG_OFFBIG
14319		The implementation provides a C-language compilation environment with an int type
14320		using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14321	XSI	_XBS5_ILP32_OFF32 (LEGACY)
14322		The implementation provides a C-language compilation environment with 32-bit int , long ,
14323		pointer , and off_t types.
14324	XSI	_XBS5_ILP32_OFFBIG (LEGACY)
14325		The implementation provides a C-language compilation environment with 32-bit int , long ,
14326		and pointer types and an off_t type using at least 64 bits.
14327	XSI	_XBS5_LP64_OFF64 (LEGACY)
14328		The implementation provides a C-language compilation environment with 32-bit int and
14329		64-bit long , pointer , and off_t types.
14330	XSI	_XBS5_LPBIG_OFFBIG (LEGACY)
14331		The implementation provides a C-language compilation environment with an int type
14332		using at least 32 bits and long , pointer , and off_t types using at least 64 bits.
14333	XSI	_XOPEN_CRYPT
14334		The implementation supports the X/Open Encryption Option Group.
14335		_XOPEN_ENH_I18N
14336		The implementation supports the Issue 4, Version 2 Enhanced Internationalization Option
14337		Group. This symbol shall always be set to a value other than -1 .
14338		_XOPEN_LEGACY
14339		The implementation supports the Legacy Option Group.
14340		_XOPEN_REALTIME
14341		The implementation supports the X/Open Realtime Option Group.
14342		_XOPEN_REALTIME_THREADS
14343		The implementation supports the X/Open Realtime Threads Option Group.

14344	_XOPEN_SHM
14345	The implementation supports the Issue 4, Version 2 Shared Memory Option Group. This
14346	symbol shall always be set to a value other than <code>-1</code> .
14347	_XOPEN_STREAMS
14348	The implementation supports the XSI STREAMS Option Group.
14349 XSI	_XOPEN_UNIX
14350	The implementation supports the XSI extension.
14351	Execution-Time Symbolic Constants
14352	If any of the following constants are not defined in the <unistd.h> header, the value shall vary
14353	depending on the file to which it is applied.
14354	If any of the following constants are defined to have value <code>-1</code> in the <unistd.h> header, the
14355	implementation shall not provide the option on any file; if any are defined to have a value other
14356	than <code>-1</code> in the <unistd.h> header, the implementation shall provide the option on all applicable
14357	files.
14358	All of the following constants, whether defined in <unistd.h> or not, may be queried with
14359	respect to a specific file using the <i>pathconf()</i> or <i>fpathconf()</i> functions:
14360	_POSIX_ASYNC_IO
14361	Asynchronous input or output operations may be performed for the associated file.
14362	_POSIX_PRIO_IO
14363	Prioritized input or output operations may be performed for the associated file.
14364	_POSIX_SYNC_IO
14365	Synchronized input or output operations may be performed for the associated file.
14366	Constants for Functions
14367	The following symbolic constant shall be defined:
14368	NULL Null pointer
14369	The following symbolic constants shall be defined for the <i>access()</i> function:
14370	F_OK Test for existence of file.
14371	R_OK Test for read permission.
14372	W_OK Test for write permission.
14373	X_OK Test for execute (search) permission.
14374	The constants F_OK , R_OK , W_OK , and X_OK and the expressions <i>R_OK</i> <i>W_OK</i> , <i>R_OK</i> <i>X_OK</i> ,
14375	and <i>R_OK</i> <i>W_OK</i> <i>X_OK</i> shall all have distinct values.
14376	The following symbolic constants shall be defined for the <i>confstr()</i> function:
14377	_CS_PATH
14378	This is the value for the <i>PATH</i> environment variable that finds all standard utilities.
14379	_CS_POSIX_V6_ILP32_OFF32_CFLAGS
14380	If <i>sysconf(_SC_V6_ILP32_OFF32)</i> returns <code>-1</code> , the meaning of this value is unspecified.
14381	Otherwise, this value is the set of initial options to be given to the <i>c99</i> utility to build an
14382	application using a programming model with 32-bit int , long , pointer , and off_t types.

14383 `_CS_POSIX_V6_ILP32_OFF32_LDFLAGS`
 14384 If `sysconf(_SC_V6_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.
 14385 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14386 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14387 `_CS_POSIX_V6_ILP32_OFF32_LIBS`
 14388 If `sysconf(_SC_V6_ILP32_OFF32)` returns `-1`, the meaning of this value is unspecified.
 14389 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14390 application using a programming model with 32-bit **int**, **long**, **pointer**, and **off_t** types.

14391 `_CS_POSIX_V6_ILP32_OFFBIG_CFLAGS`
 14392 If `sysconf(_SC_V6_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14393 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14394 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14395 **off_t** type using at least 64 bits.

14396 `_CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS`
 14397 If `sysconf(_SC_V6_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14398 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14399 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14400 **off_t** type using at least 64 bits.

14401 `_CS_POSIX_V6_ILP32_OFFBIG_LIBS`
 14402 If `sysconf(_SC_V6_ILP32_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14403 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14404 application using a programming model with 32-bit **int**, **long**, and **pointer** types, and an
 14405 **off_t** type using at least 64 bits.

14406 `_CS_POSIX_V6_LP64_OFF64_CFLAGS`
 14407 If `sysconf(_SC_V6_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14408 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14409 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14410 types.

14411 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`
 14412 If `sysconf(_SC_V6_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14413 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14414 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14415 types.

14416 `_CS_POSIX_V6_LP64_OFF64_LIBS`
 14417 If `sysconf(_SC_V6_LP64_OFF64)` returns `-1`, the meaning of this value is unspecified.
 14418 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14419 application using a programming model with 32-bit **int** and 64-bit **long**, **pointer**, and **off_t**
 14420 types.

14421 `_CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS`
 14422 If `sysconf(_SC_V6_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14423 Otherwise, this value is the set of initial options to be given to the `c99` utility to build an
 14424 application using a programming model with an **int** type using at least 32 bits and **long**,
 14425 **pointer**, and **off_t** types using at least 64 bits.

14426 `_CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS`
 14427 If `sysconf(_SC_V6_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14428 Otherwise, this value is the set of final options to be given to the `c99` utility to build an
 14429 application using a programming model with an **int** type using at least 32 bits and **long**,
 14430 **pointer**, and **off_t** types using at least 64 bits.

14431 `_CS_POSIX_V6_LPBIG_OFFBIG_LIBS`
 14432 If `sysconf(_SC_V6_LPBIG_OFFBIG)` returns `-1`, the meaning of this value is unspecified.
 14433 Otherwise, this value is the set of libraries to be given to the `c99` utility to build an
 14434 application using a programming model with an **int** type using at least 32 bits and **long**,
 14435 **pointer**, and **off_t** types using at least 64 bits.

14436 `_CS_POSIX_V6_WIDTH_RESTRICTED_ENVS`
 14437 This value is a <newline>-separated list of names of programming environments supported
 14438 by the implementation in which the widths of the **blksize_t**, **cc_t**, **mode_t**, **nfds_t**, **pid_t**,
 14439 **ptrdiff_t**, **size_t**, **speed_t**, **ssize_t**, **suseconds_t**, **tcflag_t**, **useconds_t**, **wchar_t**, and **wint_t**
 14440 types are no greater than the width of type **long**.

14441 XSI The following symbolic constants are reserved for compatibility with Issue 5:

14442 `_CS_XBS5_ILP32_OFF32_CFLAGS (LEGACY)`
 14443 `_CS_XBS5_ILP32_OFF32_LDFLAGS (LEGACY)`
 14444 `_CS_XBS5_ILP32_OFF32_LIBS (LEGACY)`
 14445 `_CS_XBS5_ILP32_OFF32_LINTFLAGS (LEGACY)`
 14446 `_CS_XBS5_ILP32_OFFBIG_CFLAGS (LEGACY)`
 14447 `_CS_XBS5_ILP32_OFFBIG_LDFLAGS (LEGACY)`
 14448 `_CS_XBS5_ILP32_OFFBIG_LIBS (LEGACY)`
 14449 `_CS_XBS5_ILP32_OFFBIG_LINTFLAGS (LEGACY)`
 14450 `_CS_XBS5_LP64_OFF64_CFLAGS (LEGACY)`
 14451 `_CS_XBS5_LP64_OFF64_LDFLAGS (LEGACY)`
 14452 `_CS_XBS5_LP64_OFF64_LIBS (LEGACY)`
 14453 `_CS_XBS5_LP64_OFF64_LINTFLAGS (LEGACY)`
 14454 `_CS_XBS5_LPBIG_OFFBIG_CFLAGS (LEGACY)`
 14455 `_CS_XBS5_LPBIG_OFFBIG_LDFLAGS (LEGACY)`
 14456 `_CS_XBS5_LPBIG_OFFBIG_LIBS (LEGACY)`
 14457 `_CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (LEGACY)`
 14458

14459 The following symbolic constants shall be defined for the `lseek()` and `fcntl()` functions and shall
 14460 have distinct values:

14461 `SEEK_CUR` Set file offset to current plus *offset*.
 14462 `SEEK_END` Set file offset to EOF plus *offset*.
 14463 `SEEK_SET` Set file offset to *offset*.

14464 The following symbolic constants shall be defined as possible values for the *function* argument
 14465 to the `lockf()` function:

14466 `F_LOCK` Lock a section for exclusive use.
 14467 `F_TEST` Test section for locks by other processes.
 14468 `F_TLOCK` Test and lock a section for exclusive use.
 14469 `F_ULOCK` Unlock locked sections.

14470 The following symbolic constants shall be defined for `pathconf()`:

14471 `_PC_ALLOC_SIZE_MIN`
 14472 `_PC_ASYNC_IO`
 14473 `_PC_CHOWN_RESTRICTED`
 14474 `_PC_FILESIZEBITS`
 14475 `_PC_LINK_MAX`

```

14476     _PC_MAX_CANON
14477     _PC_MAX_INPUT
14478     _PC_NAME_MAX
14479     _PC_NO_TRUNC
14480     _PC_PATH_MAX
14481     _PC_PIPE_BUF
14482     _PC_PRIO_IO
14483     _PC_REC_INCR_XFER_SIZE
14484     _PC_REC_MIN_XFER_SIZE
14485     _PC_REC_XFER_ALIGN
14486     _PC_SYMLINK_MAX
14487     _PC_SYNC_IO
14488     _PC_VDISABLE

```

14489 The following symbolic constants shall be defined for *sysconf()*:

```

14490     _SC_2_C_BIND
14491     _SC_2_C_DEV
14492     _SC_2_C_VERSION
14493     _SC_2_CHAR_TERM
14494     _SC_2_FORT_DEV
14495     _SC_2_FORT_RUN
14496     _SC_2_LOCALEDEF
14497     _SC_2_PBS
14498     _SC_2_PBS_ACCOUNTING
14499     _SC_2_PBS_CHECKPOINT
14500     _SC_2_PBS_LOCATE
14501     _SC_2_PBS_MESSAGE
14502     _SC_2_PBS_TRACK
14503     _SC_2_SW_DEV
14504     _SC_2_UPE
14505     _SC_2_VERSION
14506     _SC_ADVISORY_INFO
14507     _SC_ARG_MAX
14508     _SC_AIO_LISTIO_MAX
14509     _SC_AIO_MAX
14510     _SC_AIO_PRIO_DELTA_MAX
14511     _SC_ASYNCHRONOUS_IO
14512     _SC_ATEXIT_MAX
14513     _SC_BARRIERS
14514     _SC_BC_BASE_MAX
14515     _SC_BC_DIM_MAX
14516     _SC_BC_SCALE_MAX
14517     _SC_BC_STRING_MAX
14518     _SC_CHILD_MAX
14519     _SC_CLK_TCK
14520     _SC_CLOCK_SELECTION
14521     _SC_COLL_WEIGHTS_MAX
14522     _SC_CPUTIME
14523     _SC_DELAYTIMER_MAX
14524     _SC_EXPR_NEST_MAX
14525     _SC_FILE_LOCKING
14526     _SC_FSYNC

```

```

14527     _SC_GETGR_R_SIZE_MAX
14528     _SC_GETPW_R_SIZE_MAX
14529     _SC_HOST_NAME_MAX
14530     _SC_IOV_MAX
14531     _SC_IPV6
14532     _SC_JOB_CONTROL
14533     _SC_LINE_MAX
14534     _SC_LOGIN_NAME_MAX
14535     _SC_MAPPED_FILES

14611     The two constants _SC_PAGESIZE and _SC_PAGE_SIZE may be defined to have the same |
14612     value.

14613     The following symbolic constants shall be defined for file streams:

14614     STDERR_FILENO      File number of stderr; 2.
14615     STDIN_FILENO       File number of stdin; 0.
14616     STDOUT_FILENO      File number of stdout; 1.

14617     Type Definitions

14618     The size_t, ssize_t, uid_t, gid_t, off_t, pid_t, and useconds_t types shall be defined as described
14619     in <sys/types.h>.

14620     The intptr_t type shall be defined as described in <inttypes.h>.

```

14621 **Declarations**

14622 The following shall be declared as functions and may also be defined as macros. Function
 14623 prototypes shall be provided.

```

14624      int            access(const char *, int);
14625      unsigned       alarm(unsigned);
14626      int            chdir(const char *);
14627      int            chown(const char *, uid_t, gid_t);
14628      int            close(int);
14629      size_t         confstr(int, char *, size_t);
14630 XSI      char        *crypt(const char *, const char *);
14631      char        *ctermid(char *);
14632      int            dup(int);
14633      int            dup2(int, int);
14634 XSI      void        encrypt(char[64], int);
14635      int            execl(const char *, const char *, ...);
14636      int            execle(const char *, const char *, ...);
14637      int            execlp(const char *, const char *, ...);
14638      int            execv(const char *, char *const []);
14639      int            execve(const char *, char *const [], char *const []);
14640      int            execvp(const char *, char *const []);
14641      void           _exit(int);
14642      int            fchown(int, uid_t, gid_t);
14643 XSI      int           fchdir(int);
14644 SIO      int           fdatsync(int);
14645      pid_t          fork(void);
14646      long           fpathconf(int, int);
14647 FSC      int           fsync(int);
14648      int            ftruncate(int, off_t);
14649      char           *getcwd(char *, size_t);
14650      gid_t           getegid(void);
14651      uid_t           geteuid(void);
14652      gid_t           getgid(void);
14653      int            getgroups(int, gid_t []);
14654 XSI      long          gethostid(void);
14655      int            gethostname(char *, size_t);
14656      char           *getlogin(void);
14657      int            getlogin_r(char *, size_t);
14658      int            getopt(int, char * const [], const char *);
14659 XSI      pid_t          getpgid(pid_t);
14660      pid_t          getpgrp(void);
14661      pid_t          getpid(void);
14662      pid_t          getppid(void);
14663 XSI      pid_t          getsid(pid_t);
14664      uid_t           getuid(void);
14665 XSI      char           *getwd(char *); (LEGACY)
14666      int            isatty(int);
14667 XSI      int           lchown(const char *, uid_t, gid_t);
14668      int            link(const char *, const char *);
14669 XSI      int           lockf(int, int, off_t);
14670      off_t          lseek(int, off_t, int);
14671 XSI

```

```

14672     int             nice(int);
14673     long            pathconf(const char *, int);
14674     int             pause(void);
14675     int             pipe(int [2]);
14676 XSI    ssize_t      pread(int, void *, size_t, off_t);
14677     ssize_t         pwrite(int, const void *, size_t, off_t);
14678     ssize_t         read(int, void *, size_t);
14679     ssize_t         readlink(const char *restrict, char *restrict, size_t);
14680     int             rmdir(const char *);
14681     int             setegid(gid_t);
14682     int             seteuid(uid_t);
14683     int             setgid(gid_t);
14684     int             setpgid(pid_t, pid_t);
14685 XSI    pid_t        setpgrp(void);
14686     int             setregid(gid_t, gid_t);
14687     int             setreuid(uid_t, uid_t);
14688     pid_t           setsid(void);
14689     int             setuid(uid_t);
14690     unsigned        sleep(unsigned);
14691 XSI    void          swab(const void *restrict, void *restrict, ssize_t);
14692     int             symlink(const char *, const char *);
14693     void            sync(void);
14694     long            sysconf(int);
14695     pid_t           tcgetpgrp(int);
14696     int             tcsetpgrp(int, pid_t);
14697 XSI    int           truncate(const char *, off_t);
14698     char            *ttyname(int);
14699     int             ttyname_r(int, char *, size_t);
14700 XSI    useconds_t    ualarm(useconds_t, useconds_t);
14701     int             unlink(const char *);
14702 XSI    int           usleep(useconds_t);
14703     pid_t           vfork(void);
14704     ssize_t         write(int, const void *, size_t);

```

14705 Implementations may also include the *pthread_atfork()* prototype as defined in <pthread.h> (on
14706 page 289).

14707 The following external variables shall be declared:

```

14708     extern char      *optarg;
14709     extern int       optind, opterr, optopt;

```

14710 APPLICATION USAGE

14711 IEEE Std 1003.1-2001 only describes the behavior of systems that claim conformance to it.
14712 However, application developers who want to write applications that adapt to other versions of
14713 IEEE Std 1003.1 (or to systems that do not conform to any POSIX standard) may find it useful to
14714 code them so as to conditionally compile different code depending on the value of
14715 `_POSIX_VERSION`, for example:

```

14716     #if _POSIX_VERSION >= 200112L
14717     /* Use the newer function that copes with large files. */
14718     off_t pos=ftello(fp);
14719     #else
14720     /* Either this is an old version of POSIX, or _POSIX_VERSION is
14721        not even defined, so use the traditional function. */

```

```

14722     long pos=ftell(fp);
14723     #endif

14724     Earlier versions of IEEE Std 1003.1 and of the Single UNIX Specification can be identified by the
14725     following macros:

14726     POSIX.1-1988 standard
14727         _POSIX_VERSION==198808L

14728     POSIX.1-1990 standard
14729         _POSIX_VERSION==199009L

14730     ISO POSIX-1: 1996 standard
14731         _POSIX_VERSION==199506L

14732     Single UNIX Specification, Version 1
14733         _XOPEN_UNIX and _XOPEN_VERSION==4

14734     Single UNIX Specification, Version 2
14735         _XOPEN_UNIX and _XOPEN_VERSION==500

14736     IEEE Std 1003.1-2001 does not make any attempt to define application binary interaction with
14737     the underlying operating system. However, application developers may find it useful to query
14738     _SC_VERSION at runtime via sysconf() to determine whether the current version of the
14739     operating system supports the necessary functionality as in the following program fragment:

14740     if (sysconf(_SC_VERSION) < 200112L) {
14741         fprintf(stderr, "POSIX.1-2001 system required, terminating \n");
14742         exit(1);
14743     }

14744     New applications should not use _XOPEN_SHM or _XOPEN_ENH_I18N.

```

14745 **RATIONALE**

14746 As IEEE Std 1003.1-2001 evolved, certain options became sufficiently standardized that it was
 14747 concluded that simply requiring one of the option choices was simpler than retaining the option.
 14748 However, for backwards-compatibility, the option flags (with required constant values) are
 14749 retained.

14750 **Version Test Macros**

14751 The standard developers considered altering the definition of `_POSIX_VERSION` and removing
 14752 `_SC_VERSION` from the specification of `sysconf()` since the utility to an application was deemed
 14753 by some to be minimal, and since the implementation of the functionality is potentially
 14754 problematic. However, they recognized that support for existing application binaries is a
 14755 concern to manufacturers, application developers, and the users of implementations conforming
 14756 to IEEE Std 1003.1-2001.

14757 While the example using `_SC_VERSION` in the APPLICATION USAGE section does not provide
 14758 the greatest degree of imaginable utility to the application developer or user, it is arguably better
 14759 than a **core** file or some other equally obscure result. (It is also possible for implementations to
 14760 encode and recognize application binaries compiled in various POSIX.1-conforming
 14761 environments, and modify the semantics of the underlying system to conform to the
 14762 expectations of the application.) For the reasons outlined in the preceding paragraphs and in the
 14763 APPLICATION USAGE section, the standard developers elected to retain the `_POSIX_VERSION`
 14764 and `_SC_VERSION` functionality.

Compile-Time Symbolic Constants for System-Wide Options

IEEE Std 1003.1-2001 now includes support in certain areas for the newly adopted policy governing options and stubs.

This policy provides flexibility for implementations in how they support options. It also specifies how conforming applications can adapt to different implementations that support different sets of options. It allows the following:

1. If an implementation has no interest in supporting an option, it does not have to provide anything associated with that option beyond the announcement that it does not support it.
2. An implementation can support a partial or incompatible version of an option (as a non-standard extension) as long as it does not claim to support the option.
3. An application can determine whether the option is supported. A strictly conforming application must check this announcement mechanism before first using anything associated with the option.

There is an important implication of this policy. IEEE Std 1003.1-2001 cannot dictate the behavior of interfaces associated with an option when the implementation does not claim to support the option. In particular, it cannot require that a function associated with an unsupported option will fail if it does not perform as specified. However, this policy does not prevent a standard from requiring certain functions to always be present, but that they shall always fail on some implementations. The *setpgid()* function in the POSIX.1-1990 standard, for example, is considered appropriate.

The POSIX standards include various options, and the C-language binding support for an option implies that the implementation must supply data types and function interfaces. An application must be able to discover whether the implementation supports each option.

Any application must consider the following three cases for each option:

1. Option never supported.

The implementation advertises at compile time that the option will never be supported. In this case, it is not necessary for the implementation to supply any of the data types or function interfaces that are provided only as part of the option. The implementation might provide data types and functions that are similar to those defined by IEEE Std 1003.1-2001, but there is no guarantee for any particular behavior.

2. Option always supported.

The implementation advertises at compile time that the option will always be supported. In this case, all data types and function interfaces shall be available and shall operate as specified.

3. Option might or might not be supported.

Some implementations might not provide a mechanism to specify support of options at compile time. In addition, the implementation might be unable or unwilling to specify support or non-support at compile time. In either case, any application that might use the option at runtime must be able to compile and execute. The implementation must provide, at compile time, all data types and function interfaces that are necessary to allow this. In this situation, there must be a mechanism that allows the application to query, at runtime, whether the option is supported. If the application attempts to use the option when it is not supported, the result is unspecified unless explicitly specified otherwise in IEEE Std 1003.1-2001.

14809 **FUTURE DIRECTIONS**

14810 None.

14820 **CHANGE HISTORY**

14821 First released in Issue 1. Derived from Issue 1 of the SVID.

14822 **Issue 5**

14823 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 14824 Threads Extension.

14825 The symbolic constants `_XOPEN_REALTIME` and `_XOPEN_REALTIME_THREADS` are added.
 14826 `_POSIX2_C_BIND`, `_XOPEN_ENH_I18N`, and `_XOPEN_SHM` must now be set to a value other
 14827 than `-1` by a conforming implementation.

14828 Large File System extensions are added.

14829 The type of the argument to *sbrk()* is changed from **int** to **intptr_t**.

14830 `_XBS_` constants are added to the list of constants for Options and Option Groups, to the list of
 14831 constants for the *confstr()* function, and to the list of constants to the *sysconf()* function. These
 14832 are all marked EX.

14833 **Issue 6**14834 `_POSIX2_C_VERSION` is removed.14835 The Open Group Corrigendum U026/4 is applied, adding the prototype for *fdatasync()*.

14836 The Open Group Corrigendum U026/1 is applied, adding the symbols `_SC_XOPEN_LEGACY`,
 14837 `_SC_XOPEN_REALTIME`, and `_SC_XOPEN_REALTIME_THREADS`.

14838 The symbols `_XOPEN_STREAMS` and `_SC_XOPEN_STREAMS` are added to support the XSI
 14839 STREAMS Option Group.

14840 Text in the DESCRIPTION relating to conformance requirements is moved elsewhere in
 14841 IEEE Std 1003.1-2001.

14842 The legacy symbol `_SC_PASS_MAX` is removed.

14843 The following new requirements on POSIX implementations derive from alignment with the
 14844 Single UNIX Specification:

- 14845 • The `_CS_POSIX_*` and `_CS_XBS5_*` constants are added for the *confstr()* function.
- 14846 • The `_SC_XBS5_*` constants are added for the *sysconf()* function.
- 14847 • The symbolic constants `F_ULOCK`, `F_LOCK`, `F_TLOCK`, and `F_TEST` are added.
- 14848 • The **uid_t**, **gid_t**, **off_t**, **pid_t**, and **useconds_t** types are mandated.

14849 The *gethostname()* prototype is added for sockets.

14850 A new section is added for System-Wide Options.

14851 Function prototypes for *setegid()* and *seteuid()* are added.

14852 Option symbolic constants are added for `_POSIX_ADVISORY_INFO`, `_POSIX_CPUTIME`,
 14853 `_POSIX_SPAWN`, `_POSIX_SPORADIC_SERVER`, `_POSIX_THREAD_CPUTIME`,
 14854 `_POSIX_THREAD_SPORADIC_SERVER`, and `_POSIX_TIMEOUTS`, and *pathconf()* variables are
 14855 added for `_PC_ALLOC_SIZE_MIN`, `_PC_REC_INCR_XFER_SIZE`, `_PC_REC_MAX_XFER_SIZE`,
 14856 `_PC_REC_MIN_XFER_SIZE`, and `_PC_REC_XFER_ALIGN` for alignment with
 14857 IEEE Std 1003.1d-1999.

14858 The following are added for alignment with IEEE Std 1003.1j-2000:

- 14859 • Option symbolic constants `_POSIX_BARRIERS`, `_POSIX_CLOCK_SELECTION`,
 14860 `_POSIX_MONOTONIC_CLOCK`, `_POSIX_READER_WRITER_LOCKS`,
 14861 `_POSIX_SPIN_LOCKS`, and `_POSIX_TYPED_MEMORY_OBJECTS`
- 14862 • *sysconf()* variables `_SC_BARRIERS`, `_SC_CLOCK_SELECTION`,
 14863 `_SC_MONOTONIC_CLOCK`, `_SC_READER_WRITER_LOCKS`, `_SC_SPIN_LOCKS`, and
 14864 `_SC_TYPED_MEMORY_OBJECTS`

14865 The `_SC_XBS5` macros associated with the ISO/IEC 9899:1990 standard are marked LEGACY,
 14866 and new equivalent `_SC_V6` macros associated with the ISO/IEC 9899:1999 standard are
 14867 introduced.

14868 The *getwd()* function is marked LEGACY.

14869 The **restrict** keyword is added to the prototypes for *readlink()* and *swab()*.

14870 Constants for options are now harmonized, so when supported they take the year of approval of
 14871 IEEE Std 1003.1-2001 as the value.

14872 The following are added for alignment with IEEE Std 1003.1q-2000:

- 14873 • Optional symbolic constants `_POSIX_TRACE`, `_POSIX_TRACE_EVENT_FILTER`,
 14874 `_POSIX_TRACE_LOG`, and `_POSIX_TRACE_INHERIT`
- 14875 • The *sysconf()* symbolic constants `_SC_TRACE`, `_SC_TRACE_EVENT_FILTER`,
 14876 `_SC_TRACE_LOG`, and `_SC_TRACE_INHERIT`

14877 The *brk()* and *sbrk()* legacy functions are removed.

14878 The Open Group Base Resolution bwg2001-006 is applied, which reworks the XSI versioning
 14879 information.

14880 The Open Group Base Resolution bwg2001-008 is applied, changing the *namelen* parameter for
 14881 *gethostname()* from **socklen_t** to **size_t**.

14882 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/2 is applied, changing “Thread Stack
 14883 Address Size” to “Thread Stack Size Attribute”.

14884 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/20 is applied, adding the `_POSIX_IPV6`,
 14885 `_SC_V6`, and `_SC_RAW_SOCKETS` symbols.

14886 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/21 is applied, correcting the description in
 14887 “Constants for Functions” for the `_CS_POSIX_V6_LP64_OFF64_CFLAGS`,
 14888 `_CS_POSIX_V6_LP64_OFF64_LDFLAGS`, and `_CS_POSIX_V6_LP64_OFF64_LIBS` symbols.

14889 IEEE Std 1003.1-2001/Cor 1-2002, item XBD/TC1/D6/22 is applied, removing the shading for
 14890 the `_PC*` and `_SC*` constants, since these are mandatory on all implementations.

14891	IEEE Std 1003.1-2001 / Cor 1-2002, item XBD / TC1 / D6 / 23 is applied, adding the	
14892	_PC_SYMLINK_MAX and _SC_SYMLINK_MAX constants.	
14893	IEEE Std 1003.1-2001 / Cor 1-2002, item XBD / TC1 / D6 / 24 is applied, correcting the shading and	
14894	margin code for the <i>fsync()</i> function.	
14895	IEEE Std 1003.1-2001 / Cor 1-2002, item XBD / TC1 / D6 / 25 is applied, adding the following text to	
14896	the APPLICATION USAGE section: “New applications should not use _XOPEN_SHM or	
14897	_XOPEN_ENH_I18N.”.	

14898 **NAME**

14899 utime.h — access and modification times structure

14900 **SYNOPSIS**

14901 #include <utime.h>

14902 **DESCRIPTION**

14903 The <utime.h> header shall declare the structure **utimbuf**, which shall include the following
14904 members:

14905 time_t actime Access time.
14906 time_t modtime Modification time.

14907 The times shall be measured in seconds since the Epoch.

14908 The type **time_t** shall be defined as described in <sys/types.h>.

14909 The following shall be declared as a function and may also be defined as a macro. A function
14910 prototype shall be provided.

14911 int utime(const char *, const struct utimbuf *);

14912 **APPLICATION USAGE**

14913 None.

14914 **RATIONALE**

14915 None.

14916 **FUTURE DIRECTIONS**

14917 None.

14918 **SEE ALSO**

14919 <sys/types.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *utime()*

14920 **CHANGE HISTORY**

14921 First released in Issue 3.

14922 **Issue 6**

14923 The following new requirements on POSIX implementations derive from alignment with the
14924 Single UNIX Specification:

- 14925 • The **time_t** type is defined.

14926 **NAME**

14927 utmpx.h — user accounting database definitions

14928 **SYNOPSIS**14929 xSI `#include <utmpx.h>`

14930

14931 **DESCRIPTION**14932 The <utmpx.h> header shall define the **utmpx** structure that shall include at least the following
14933 members:

14934	char	ut_user[]	User login name.
14935	char	ut_id[]	Unspecified initialization process identifier.
14936	char	ut_line[]	Device name.
14937	pid_t	ut_pid	Process ID.
14938	short	ut_type	Type of entry.
14939	struct timeval	ut_tv	Time entry was made.

14940 The **pid_t** type shall be defined through **typedef** as described in <sys/types.h>.14941 The **timeval** structure shall be defined as described in <sys/time.h>.

14942 Inclusion of the <utmpx.h> header may also make visible all symbols from <sys/time.h>.

14943 The following symbolic constants shall be defined as possible values for the *ut_type* member of
14944 the **utmpx** structure:

14945	EMPTY	No valid user accounting information.
14946	BOOT_TIME	Identifies time of system boot.
14947	OLD_TIME	Identifies time when system clock changed.
14948	NEW_TIME	Identifies time after system clock changed.
14949	USER_PROCESS	Identifies a process.
14950	INIT_PROCESS	Identifies a process spawned by the init process.
14951	LOGIN_PROCESS	Identifies the session leader of a logged-in user.
14952	DEAD_PROCESS	Identifies a session leader who has exited.

14953 The following shall be declared as functions and may also be defined as macros. Function
14954 prototypes shall be provided.

```

14955 void          endutxent(void);
14956 struct utmpx *getutxent(void);
14957 struct utmpx *getutxid(const struct utmpx *);
14958 struct utmpx *getutxline(const struct utmpx *);
14959 struct utmpx *pututxline(const struct utmpx *);
14960 void          setutxent(void);

```

14961 **APPLICATION USAGE**

14962 None.

14963 **RATIONALE**

14964 None.

14965 **FUTURE DIRECTIONS**

14966 None.

14969 **CHANGE HISTORY**

14970 First released in Issue 4, Version 2.

14971 **NAME**

14972 wchar.h — wide-character handling

14973 **SYNOPSIS**

14974 #include <wchar.h>

14975 **DESCRIPTION**

14976 CX Some of the functionality described on this reference page extends the ISO C standard.
 14977 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 14978 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 14979 symbols in this header.

14980 The <wchar.h> header shall define the following types:

14981 **wchar_t** As described in <stddef.h>.14982 **wint_t** An integer type capable of storing any valid value of **wchar_t** or WEOF.

14983 XSI **wctype_t** A scalar type of a data object that can hold values which represent locale-
 14984 specific character classification.

14985 **mbstate_t** An object type other than an array type that can hold the conversion state
 14986 information necessary to convert between sequences of (possibly multi-byte)
 14987 XSI characters and wide characters. If a codeset is being used such that an
 14988 **mbstate_t** needs to preserve more than 2 levels of reserved state, the results
 14989 are unspecified.

14990 XSI **FILE** As described in <stdio.h>.14991 **size_t** As described in <stddef.h>.14992 XSI **va_list** As described in <stdarg.h>.

14993 The implementation shall support one or more programming environments in which the width
 14994 of **wint_t** is no greater than the width of type **long**. The names of these programming
 14995 environments can be obtained using the *confstr()* function or the *getconf* utility.

14996 The following shall be declared as functions and may also be defined as macros. Function
 14997 prototypes shall be provided.

```

14998       wint_t       btowc(int);
14999       wint_t       fgetwc(FILE *);
15000       wchar_t      *fgetws(wchar_t *restrict, int, FILE *restrict);
15001       wint_t       fputwc(wchar_t, FILE *);
15002       int          fputws(const wchar_t *restrict, FILE *restrict);
15003       int          fwide(FILE *, int);
15004       int          fwprintf(FILE *restrict, const wchar_t *restrict, ...);
15005       int          fwscanf(FILE *restrict, const wchar_t *restrict, ...);
15006       wint_t       getwc(FILE *);
15007       wint_t       getwchar(void);
15008 XSI       int       iswalnum(wint_t);
15009       int       iswalpha(wint_t);
15010       int       iswcntrl(wint_t);
15011       int       iswctype(wint_t, wctype_t);
15012       int       iswdigit(wint_t);
15013       int       iswgraph(wint_t);
15014       int       iswlower(wint_t);
15015       int       iswprint(wint_t);
15016       int       iswpunct(wint_t);

```

```

15017     int             iswspace(wint_t);
15018     int             iswupper(wint_t);
15019     int             iswxdigit(wint_t);
15020     size_t          mbrlen(const char *restrict, size_t, mbstate_t *restrict);
15021     size_t          mbrtowc(wchar_t *restrict, const char *restrict, size_t,
15022                             mbstate_t *restrict);
15023     int             mbsinit(const mbstate_t *);
15024     size_t          mbsrtowcs(wchar_t *restrict, const char **restrict, size_t,
15025                               mbstate_t *restrict);
15026     wint_t          putwc(wchar_t, FILE *);
15027     wint_t          putwchar(wchar_t);
15028     int             swprintf(wchar_t *restrict, size_t,
15029                              const wchar_t *restrict, ...);
15030     int             swscanf(const wchar_t *restrict,
15031                              const wchar_t *restrict, ...);
15032     wint_t          towlower(wint_t);
15033     wint_t          towupper(wint_t);
15034     wint_t          ungetwc(wint_t, FILE *);
15035     int             vfwprintf(FILE *restrict, const wchar_t *restrict, va_list);
15036     int             vwscanf(FILE *restrict, const wchar_t *restrict, va_list);
15037     int             vwprintf(const wchar_t *restrict, va_list);
15038     int             vswprintf(wchar_t *restrict, size_t,
15039                               const wchar_t *restrict, va_list);
15040     int             vswscanf(const wchar_t *restrict, const wchar_t *restrict,
15041                              va_list);
15042     int             vwscanf(const wchar_t *restrict, va_list);
15043     size_t          wctomb(char *restrict, wchar_t, mbstate_t *restrict);
15044     wchar_t         *wcscat(wchar_t *restrict, const wchar_t *restrict);
15045     wchar_t         *wcschr(const wchar_t *, wchar_t);
15046     int             wcscmp(const wchar_t *, const wchar_t *);
15047     int             wcscoll(const wchar_t *, const wchar_t *);
15048     wchar_t         *wcscpy(wchar_t *restrict, const wchar_t *restrict);
15049     size_t          wcscspn(const wchar_t *, const wchar_t *);
15050     size_t          wcsftime(wchar_t *restrict, size_t,
15051                              const wchar_t *restrict, const struct tm *restrict);
15052     size_t          wcslen(const wchar_t *);
15053     wchar_t         *wcsncat(wchar_t *restrict, const wchar_t *restrict, size_t);
15054     int             wcsncmp(const wchar_t *, const wchar_t *, size_t);
15055     wchar_t         *wcsncpy(wchar_t *restrict, const wchar_t *restrict, size_t);
15056     wchar_t         *wcspbrk(const wchar_t *, const wchar_t *);
15057     wchar_t         *wcsrchr(const wchar_t *, wchar_t);
15058     size_t          wcsrtombs(char *restrict, const wchar_t **restrict,
15059                               size_t, mbstate_t *restrict);
15060     size_t          wcsspncpy(const wchar_t *, const wchar_t *);
15061     wchar_t         *wcsstr(const wchar_t *restrict, const wchar_t *restrict);
15062     double          wcstod(const wchar_t *restrict, wchar_t **restrict);
15063     float           wcstof(const wchar_t *restrict, wchar_t **restrict);
15064     wchar_t         *wcstok(wchar_t *restrict, const wchar_t *restrict,
15065                               wchar_t **restrict);
15066     long            wcstol(const wchar_t *restrict, wchar_t **restrict, int);
15067     long double     wcstold(const wchar_t *restrict, wchar_t **restrict);
15068     long long       wcstoll(const wchar_t *restrict, wchar_t **restrict, int);

```

```

15069 unsigned long wcstoul(const wchar_t *restrict, wchar_t **restrict, int);
15070 unsigned long long
15071         wcstoull(const wchar_t *restrict, wchar_t **restrict, int);
15072 XSI wchar_t *wcswcs(const wchar_t *, const wchar_t *);
15073 int wcswidth(const wchar_t *, size_t);
15074 size_t wcsxfrm(wchar_t *restrict, const wchar_t *restrict, size_t);
15075 int wctob(wint_t);
15076 XSI wctype_t wctype(const char *);
15077 int wcwidth(wchar_t);
15078 wchar_t *wmemchr(const wchar_t *, wchar_t, size_t);
15079 int wmemcmp(const wchar_t *, const wchar_t *, size_t);
15080 wchar_t *wmemcpy(wchar_t *restrict, const wchar_t *restrict, size_t);
15081 wchar_t *wmemmove(wchar_t *, const wchar_t *, size_t);
15082 wchar_t *wmemset(wchar_t *, wchar_t, size_t);
15083 int wprintf(const wchar_t *restrict, ...);
15084 int wscanf(const wchar_t *restrict, ...);

```

15085 The <wchar.h> header shall define the following macros:

15086	WCHAR_MAX	The maximum value representable by an object of type wchar_t .
15087	WCHAR_MIN	The minimum value representable by an object of type wchar_t .
15088	WEOF	Constant expression of type wint_t that is returned by several WP functions
15089		to indicate end-of-file.
15090	NULL	As described in <stddef.h>.

15091 The tag **tm** shall be declared as naming an incomplete structure type, the contents of which are
 15092 described in the header <time.h>.

15093 CX Inclusion of the <wchar.h> header may make visible all symbols from the headers <ctype.h>,
 15094 <string.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, and <time.h>.

15095 APPLICATION USAGE

15096 The *iswblank()* function was a late addition to the ISO C standard and was introduced at the
 15097 same time as the ISO C standard introduced <wctype.h>, which contains all of the *isw*()*
 15098 functions. The Open Group Base Specifications had previously aligned with the MSE working
 15099 draft and had introduced the rest of the *isw*()* functions into <wchar.h>. For backwards-
 15100 compatibility, the original set of *isw*()* functions, without *iswblank()*, are permitted (as an XSI
 15101 extension) in <wchar.h>. For maximum portability, applications should include <wctype.h> in
 15102 order to obtain declarations for the *isw*()* functions.

15103 RATIONALE

15104 In the ISO C standard, the symbols referenced as XSI extensions are in <wctype.h>. Their
 15105 presence here is thus an extension.

15106 FUTURE DIRECTIONS

15107 None.

15121 **CHANGE HISTORY**

15122 First released in Issue 4.

15123 **Issue 5**

15124 Aligned with the ISO / IEC 9899: 1990 / Amendment 1: 1995 (E).

15125 **Issue 6**

15126 The Open Group Corrigendum U021/10 is applied. The prototypes for *wcswidth()* and
 15127 *wcwidth()* are marked as extensions.

15128 The Open Group Corrigendum U028/5 is applied, correcting the prototype for the *mbsinit()*
 15129 function.

15130 The following changes are made for alignment with the ISO / IEC 9899: 1999 standard:

- 15131 • Various function prototypes are updated to add the **restrict** keyword.
- 15132 • The functions *vwscanf()*, *vswscanf()*, *wcstof()*, *wcstold()*, *wcstoll()*, and *wcstoull()* are added.

15133 The type **wctype_t**, the *isw*()*, *to*()*, and *wctype()* functions are marked as XSI extensions.

15134 IEEE Std 1003.1-2001 / Cor 1-2002, item XBD / TC1 / D6 / 26 is applied, adding the APPLICATION
 15135 USAGE section.

15136 **NAME**

15137 wctype.h — wide-character classification and mapping utilities

15138 **SYNOPSIS**

15139 #include <wctype.h>

15140 **DESCRIPTION**

15141 CX Some of the functionality described on this reference page extends the ISO C standard.
 15142 Applications shall define the appropriate feature test macro (see the System Interfaces volume of
 15143 IEEE Std 1003.1-2001, Section 2.2, The Compilation Environment) to enable the visibility of these
 15144 symbols in this header.

15145 The <wctype.h> header shall define the following types:

15146 **wint_t** As described in <wchar.h>.

15147 **wctrans_t** A scalar type that can hold values which represent locale-specific character
 15148 mappings.

15149 **wctype_t** As described in <wchar.h>.

15150 The following shall be declared as functions and may also be defined as macros. Function
 15151 prototypes shall be provided.

```

15152 int      iswalnum(wint_t);
15153 int      iswalpha(wint_t);
15154 int      iswblank(wint_t);
15155 int      iswcntrl(wint_t);
15156 int      iswdigit(wint_t);
15157 int      iswgraph(wint_t);
15158 int      iswlower(wint_t);
15159 int      iswprint(wint_t);
15160 int      iswpunct(wint_t);
15161 int      iswspace(wint_t);
15162 int      iswupper(wint_t);
15163 int      iswxdigit(wint_t);
15164 int      iswctype(wint_t, wctype_t);
15165 wint_t   towctrans(wint_t, wctrans_t);
15166 wint_t   tolower(wint_t);
15167 wint_t   towupper(wint_t);
15168 wctrans_t wctrans(const char *);
15169 wctype_t wctype(const char *);

```

15170 The <wctype.h> header shall define the following macro name:

15171 **WEOF** Constant expression of type **wint_t** that is returned by several MSE functions
 15172 to indicate end-of-file.

15173 For all functions described in this header that accept an argument of type **wint_t**, the value is
 15174 representable as a **wchar_t** or equals the value of WEOF. If this argument has any other value,
 15175 the behavior is undefined.

15176 The behavior of these functions shall be affected by the *LC_CTYPE* category of the current locale.

15177 CX Inclusion of the <wctype.h> header may make visible all symbols from the headers <ctype.h>,
 15178 <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>, and <wchar.h>.

15179 **APPLICATION USAGE**

15180 None.

15181 **RATIONALE**

15182 None.

15183 **FUTURE DIRECTIONS**

15184 None.

15185 **SEE ALSO**

15186 <ctype.h>, <locale.h>, <stdarg.h>, <stddef.h>, <stdio.h>, <stdlib.h>, <string.h>, <time.h>,

15190 *wctype()*

15191 **CHANGE HISTORY**

15192 First released in Issue 5. Derived from the ISO/IEC 9899:1990/Amendment 1:1995 (E).

15193 **Issue 6**

15194 The *iswblank()* function is added for alignment with the ISO/IEC 9899:1999 standard.

15195 **NAME**

15196 wordexp.h — word-expansion types

15197 **SYNOPSIS**

15198 #include <wordexp.h>

15199 **DESCRIPTION**15200 The <wordexp.h> header shall define the structures and symbolic constants used by the
15201 wordexp() and wordfree() functions.15202 The structure type **wordexp_t** shall contain at least the following members:

15203 size_t we_wordc Count of words matched by *words*.
 15204 char **we_wordv Pointer to list of expanded words.
 15205 size_t we_offs Slots to reserve at the beginning of *we_wordv*.

15206 The *flags* argument to the wordexp() function shall be the bitwise-inclusive OR of the following
15207 flags:

15208 WRDE_APPEND Append words to those previously generated.
 15209 WRDE_DOOFFS Number of null pointers to prepend to *we_wordv*.
 15210 WRDE_NOCMD Fail if command substitution is requested.
 15211 WRDE_REUSE The *pwordexp* argument was passed to a previous successful call to
 15212 wordexp(), and has not been passed to wordfree(). The result is the same
 15213 as if the application had called wordfree() and then called wordexp()
 15214 without WRDE_REUSE.

15215 WRDE_SHOWERR Do not redirect *stderr* to **/dev/null**.
 15216 WRDE_UNDEF Report error on an attempt to expand an undefined shell variable.

15217 The following constants shall be defined as error return values:

15218 WRDE_BADCHAR One of the unquoted characters—<newline>, ' | ', ' & ', ' ; ', ' < ', ' > ',
 15219 ' (', ') ', ' { ', ' } '—appears in *words* in an inappropriate context.
 15220 WRDE_BADVAL Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.
 15221 WRDE_CMDSUB Command substitution requested when WRDE_NOCMD was set in *flags*.
 15222 WRDE_NOSPACE Attempt to allocate memory failed.

15223 OB XSI WRDE_NOSYS Reserved.

15224 WRDE_SYNTAX Shell syntax error, such as unbalanced parentheses or unterminated
 15225 string.

15226 The <wordexp.h> header shall define the following type:

15227 XSI **size_t** As described in <stddef.h>.

15228 The following shall be declared as functions and may also be defined as macros. Function
 15229 prototypes shall be provided.

15230 int wordexp(const char *restrict, wordexp_t *restrict, int);
 15231 void wordfree(wordexp_t *);

15232 The implementation may define additional macros or constants using names beginning with
 15233 WRDE_.

15234 **APPLICATION USAGE**

15235 None.

15236 **RATIONALE**

15237 None.

15238 **FUTURE DIRECTIONS**

15239 None.

15240 **SEE ALSO**

15241 <stddef.h>, the System Interfaces volume of IEEE Std 1003.1-2001, *wordexp()*, the Shell and

15242 Utilities volume of IEEE Std 1003.1-2001

15243 **CHANGE HISTORY**

15244 First released in Issue 4. Derived from the ISO POSIX-2 standard.

15245 **Issue 6**

15246 The **restrict** keyword is added to the prototype for *wordexp()*.

15247 The WRDE_NOSYS constant is marked obsolescent.

Abstract

This standard is simultaneously ISO/IEC 9945:2002, IEEE Std 1003.1-2001, and forms the core of the Single UNIX Specification, Version 3.

The IEEE Std 1003.1, 2003 Edition includes IEEE Std 1003.1-2001/Cor 1-2002 incorporated into IEEE Std 1003.1-2001 (base document). The Corrigendum addresses problems discovered since the approval of IEEE Std 1003.1-2001. These changes are mainly due to resolving integration issues raised by the merger of the base documents that were incorporated into IEEE Std 1003.1-2001, which is the single common revision to IEEE Std 1003.1™-1996, IEEE Std 1003.2™-1992, ISO/IEC 9945-1:1996, ISO/IEC 9945-2:1993, and the Base Specifications of The Open Group Single UNIX® Specification, Version 2.

This standard defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. This standard is intended to be used by both applications developers and system implementors and comprises four major components (each in an associated volume):

- General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
- Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
- Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
- Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of this standard:

- Graphics interfaces
- Database management system interfaces
- Record I/O considerations
- Object or binary code portability
- System configuration and resource availability

This standard describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX®), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)

Portions of this standard are derived with permission from copyrighted material owned by Hewlett-Packard Company, International Business Machines Corporation, Novell Inc., The Open Software Foundation, and Sun Microsystems, Inc.

Permissions

Authorization to photocopy portions of this standard for internal or personal use is granted provided that the appropriate fee is paid to the Copyright Clearance Center or the equivalent body outside of the U.S. Permission to make multiple copies for educational purposes in the U.S. requires agreement and a license fee to be paid to the Copyright Clearance Center.

Beyond these provisions, permission to reproduce all or any part of this standard must be with the consent of both copyright holders and may be subject to a license fee. Both copyright holders will need to be satisfied that the other has granted permission. Requests to the copyright holders should be sent by email to austin-group-permissions@opengroup.org.

Feedback

This standard has been prepared by the Austin Group. Feedback relating to the material contained in this standard may be submitted using the Austin Group web site at <http://www.opengroup.org/austin/defectform.html>.

IEEE

IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied “AS IS”.

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of the IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with the IEEE.¹ Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE Standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

A patent holder has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates and non-discriminatory, reasonable terms and conditions to all applicants desiring to obtain such licenses. The IEEE makes no representation as to the reasonableness of rates and/or terms and conditions of the license agreements offered by patent holders. Further information may be obtained from the IEEE Standards Department.

Authorization to photocopy portions of any individual standard for internal or personal use is granted in the U.S. by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center.² Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact:

Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923, U.S.A., Tel.: +1 978 750 8400

Amendments, corrigenda, and interpretations for this standard, or information about the IEEE standards development process, may be found at <http://standards.ieee.org>.

Full catalog and ordering information on all IEEE publications is available from the IEEE Online Catalog & Store at <http://shop.ieee.org/store>.

1. For this standard, please send comments via the Austin Group as requested on page iii.

2. Please refer to the special provisions for this standard on page iii concerning permissions from both copyright holders and arrangements to cover photocopying and reproduction across the world, as well as by commercial organizations wishing to license the material for use in product documentation.

The Open Group

The Open Group, a vendor and technology-neutral consortium, is committed to delivering greater business efficiency by bringing together buyers and suppliers of information technology to lower the time, cost, and risks associated with integrating new technology across the enterprise.

The Open Group's mission is to offer all organizations concerned with open information infrastructures a forum to share knowledge, integrate open initiatives, and certify approved products and processes in a manner in which they continue to trust our impartiality.

In the global eCommerce world of today, no single economic entity can achieve independence while still ensuring interoperability. The assurance that products will interoperate with each other across differing systems and platforms is essential to the success of eCommerce and business workflow. The Open Group, with its proven testing and certification program, is the international guarantor of interoperability in the new century.

The Open Group provides opportunities to exchange information and shape the future of IT. The Open Group's members include some of the largest and most influential organizations in the world. The flexible structure of The Open Groups membership allows for almost any organization, no matter what their size, to join and have a voice in shaping the future of the IT world.

More information is available on The Open Group web site at <http://www.opengroup.org>.

The Open Group has over 15 years' experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification. The Open Group portfolio of test suites includes the *Westwood* family of tests for this standard and the associated certification program for Version 3 of the Single UNIX Specification, as well tests for CDE, CORBA, Motif, Linux, LDAP, POSIX.1, POSIX.2, POSIX Realtime, Sockets, UNIX, XPG4, XNFS, XTI, and X11. The Open Group test tools are essential for proper development and maintenance of standards-based products, ensuring conformance of products to industry-standard APIs, applications portability, and interoperability. In-depth testing identifies defects at the earliest possible point in the development cycle, saving costs in development and quality assurance.

More information is available at <http://www.opengroup.org/testing>.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at <http://www.opengroup.org/pubs>.

As with all *live* documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new *Version* indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it *replaces* the previous publication.
- A new *Issue* indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at <http://www.opengroup.org/corrigenda>.

Full catalog and ordering information on all Open Group publications is available at <http://www.opengroup.org/pubs>.

Foreword

Structure of the Standard

This standard was originally developed by the Austin Group, a joint working group of members of the IEEE, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1, as one of the four volumes of IEEE Std 1003.1-2001. The standard was approved by ISO and IEC and published in four parts, correlating to the original volumes.

A mapping of the parts to the volumes is shown below:

ISO/IEC 9945 Part	IEEE Std 1003.1 Volume	Description
9945-1	Base Definitions	Includes general terms, concepts, and interfaces common to all parts of ISO/IEC 9945, including utility conventions and C-language header definitions.
9945-2	System Interfaces	Includes definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery.
9945-3	Shell and Utilities	Includes definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs.
9945-4	Rationale	Includes extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of ISO/IEC 9945 and why features were included or discarded by the standard developers.

All four parts comprise the entire standard, and are intended to be used together to accommodate significant internal referencing among them. POSIX-conforming systems are required to support all four parts.

Introduction

Note: This introduction is not part of IEEE Std 1003.1-2001, Standard for Information Technology — Portable Operating System Interface (POSIX).

This standard has been jointly developed by the IEEE and The Open Group. It is simultaneously an IEEE Standard, an ISO/IEC Standard, and an Open Group Technical Standard.

The Austin Group

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group.³ The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group has been to revise, combine, and update the following standards: ISO/IEC 9945-1, ISO/IEC 9945-2, IEEE Std 1003.1, IEEE Std 1003.2, and the Base Specifications of The Open Group Single UNIX Specification.

After two initial meetings, an agreement was signed in July 1999 between The Open Group and the Institute of Electrical and Electronics Engineers (IEEE), Inc., to formalize the project with the first draft of the revised specifications being made available at the same time. Under this agreement, The Open Group and IEEE agreed to share joint copyright of the resulting work. The Open Group has provided the chair and secretariat for the Austin Group.

The base document for the revision was The Open Group's Base volumes of its Single UNIX Specification, Version 2. These were selected since they were a superset of the existing POSIX.1 and POSIX.2 specifications and had some organizational aspects that would benefit the audience for the new revision.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group's Technical Standard designation, and an ISO/IEC designation. This set of specifications forms the core of the Single UNIX Specification, Version 3.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see <http://www.opengroup.org/austin>.

3. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.

Background

The developers of this standard represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, this standard describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application writers to write portable applications—it was developed with that goal in mind—it has been designated POSIX,⁴ an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a *family* of related standards: IEEE Std 1003.*n* and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

Audience

The intended audience for this standard is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

Purpose

Several principles guided the development of this standard:

- Application-Oriented

The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. This standard codifies the common, existing definition of the UNIX system.

- Interface, Not Implementation

This standard defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

4. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced *pahz-icks*, as in *positive*, not *poh-six*, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.

- Source, Not Object, Portability

This standard has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. This standard does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

- The C Language

The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

- No Superuser, No System Administration

There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in this standard. This standard is also not concerned with hardware constraints or system maintenance.

- Minimal Interface, Minimally Defined

In keeping with the historical design principles of the UNIX system, the mandatory core facilities of this standard have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

- Broadly Implementable

The developers of this standard endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in this standard, but some results of it are mentioned in the Rationale (Informative) volume.

- Minimal Changes to Historical Implementations

When the original version of IEEE Std 1003.1 was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and the subsequent revisions and addenda to all of them have consolidated this consensus, and this revision reflects the significantly increased level of consensus arrived at since the original versions. The earlier standards and their modifications specified a number of areas where consensus had not been reached before, and these are now reflected in this revision. The authors of the original versions tried, as much as possible, to follow the principles below

when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories
2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended *tar* format defined in the *pax* utility
3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the *sigaction()* function

This revision tries to minimize the number of changes required to implementations which conform to the earlier versions of the approved standards to bring them into conformance with the current standard. Specifically, the scope of this work excluded doing any “new” work, but rather collecting into a single document what had been spread across a number of documents, and presenting it in what had been proven in practice to be a more effective way. Some changes to prior conforming implementations were unavoidable, primarily as a consequence of resolving conflicts found in prior revisions, or which became apparent when bringing the various pieces together.

However, since it references the 1999 version of the ISO C standard, and no longer supports “Common Usage C”, there are a number of unavoidable changes. Applications portability is similarly affected.

This standard is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolescent” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of this standard. These need to be used with careful management to be able to adapt to future extensions of this standard and/or port to implementations that provide these services in a different manner.

- Minimal Changes to Existing Application Code

A goal of this standard was to minimize additional work for the developers of applications. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

This Standard

This standard defines the Portable Operating System Interface (POSIX) requirements and consists of the following volumes:

- Base Definitions
- Shell and Utilities
- System Interfaces (this volume)
- Rationale (Informative)

This Volume

The System Interfaces volume describes the interfaces offered to application programs by POSIX-conformant systems. Readers are expected to be experienced C language programmers, and to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards.
- Chapter 2 contains important concepts, terms, and caveats relating to the rest of this volume.
- Chapter 3 defines the functional interfaces to the POSIX-conformant system.

Comprehensive references are available in the index.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as IEEE Std 1003.1-2001, which is technically identical to The Open Group Base Specifications, Issue 6.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in this standard.

Reference	Example	Notes
C-Language Data Structure	aiocb	
C-Language Data Structure Member	<i>aio_lio_opcode</i>	
C-Language Data Type	long	
C-Language External Variable	<i>errno</i>	
C-Language Function	<i>system()</i>	
C-Language Function Argument	<i>arg1</i>	
C-Language Function Family	<i>exec</i>	
C-Language Header	<sys/stat.h>	
C-Language Keyword	return	
C-Language Macro with Argument	<i>assert()</i>	
C-Language Macro with No Argument	INET_ADDRSTRLEN	
C-Language Preprocessing Directive	#define	
Commands within a Utility	a, c	
Conversion Specification, Specifier / Modifier Character	<i>%A, g, E</i>	1
Environment Variable	<i>PATH</i>	
Error Number	[EINTR]	
Example Output	Hello, World	
Filename	/tmp	
Literal Character	<i>'c', '\r', '\'</i>	2
Literal String	<i>"abcde"</i>	2
Optional Items in Utility Syntax	[]	
Parameter	<i><directory pathname></i>	
Special Character	<i><newline></i>	3
Symbolic Constant	_POSIX_VDISABLE	
Symbolic Limit, Configuration Value	{LINE_MAX}	4
Syntax	#include <sys/stat.h>	

Reference	Example	Notes
User Input and Example Code	echo Hello, World	5
Utility Name	awk	
Utility Operand	file_name	
Utility Option	-c	
Utility Option with Option-Argument	-w width	

Notes:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the *fprintf* and *fscanf* formatting functions.
2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, `'\'` (or any of the other sequences such as `''`) is the same as the C constant `'\\'` (or `'\''`).
3. The style selected for some of the special characters, such as `<newline>`, matches the form of the input given to the *localed* utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters `<tab>` or `<newline>`.
4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C **#define** construct.
5. Brackets shown in this font, `" [ ] "`, are part of the syntax and do *not* indicate optional items. In syntax the `' | '` symbol is used to separate alternatives, and ellipses (`" . . . "`) are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.8.1 (on page 3).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- (a,b) means the range of all values from a to b , including neither a nor b .
- $[a,b]$ means the range of all values from a to b , including a and b .
- $[a,b)$ means the range of all values from a to b , including a , but not b .
- $(a,b]$ means the range of all values from a to b , including b , but not a .

Notes:

1. Symbolic limits are used in this volume instead of fixed values for portability. The values of most of these constants are defined in the Base Definitions volume, **<limits.h>** or **<unistd.h>**.
2. The values of errors are defined in the Base Definitions volume, **<errno.h>**.

Participants

IEEE Std 1003.1-2001 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22 WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair

Donald W. Cragun, Organizational Representative, IEEE PASC

Nicholas Stoughton, Organizational Representative, ISO/SC22 WG15

Mark Brown, Organizational Representative, The Open Group

Cathy Hughes, Technical Editor

Austin Group Technical Reviewers

Peter Anvin	Michael Gonzalez	Sandra O'Donnell
Bouazza Bachar	Joseph M. Gwinn	Frank Prindle
Theodore P. Baker	Jon Hitchcock	Curtis Royster Jr.
Walter Briscoe	Yvette Ho Sang	Glen Seeds
Mark Brown	Cathy Hughes	Keld Jorn Simonsen
Dave Butenhof	Lowell G. Johnson	Raja Srinivasan

The Open Group

When The Open Group approved the Base Specifications, Issue 6 on 12 September 2001, the membership of The Open Group Base Working Group was as follows:

Andrew Josey, Chair

Finnbarr P. Murphy, Vice-Chair

Mark Brown, Austin Group Liaison

Cathy Hughes, Technical Editor

Base Working Group Members

Bouazza Bachar

Mark Brown

Dave Butenhof

Donald W. Cragun

Larry Dwyer

Joanna Farley

Andrew Gollan

Karen D. Gordon

Gary Miller

Finnbarr P. Murphy

Frank Prindle

Andrew K. Roach

Curtis Royster Jr.

Nicholas Stoughton

Kenjiro Tsuji

IEEE

When the IEEE Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, the membership of the committees was as follows:

Portable Applications Standards Committee (PASC)

Lowell G. Johnson, Chair
Joseph M. Gwinn, Vice-Chair
Jay Ashford, Functional Chair
Andrew Josey, Functional Chair
Curtis Royster Jr., Functional Chair
Nicholas Stoughton, Secretary

Balloting Committee

The following members of the balloting committee voted on IEEE Std 1003.1-2001. Balloters may have voted for approval, disapproval, or abstention:

Harold C. Adams	Steven A. Haaser	Frank Prindle
Pierre-Jean Arcos	Charles E. Hammons	Francois Riche
Jay Ashford	Chris J. Harding	John D. Riley
Theodore P. Baker	Barry Hedquist	Andrew K. Roach
Robert Barned	Vincent E. Henley	Helmut Roth
David J. Blackwood	Karl Heubaum	Jaideep Roy
Shirley Bockstahler-Brandt	Niklas Holsti	Curtis Royster Jr.
James Bottomley	Thomas Hosmer	Stephen C. Schwarm
Mark Brown	Jim D. Isaak	Richard Seibel
Eric W. Burger	Lowell G. Johnson	David L. Shroads Jr.
Alan Burns	Michael B. Jones	W. Olin Sibert
Dave Butenhof	Andrew Josey	Keld Jorn Simonsen
Keith Chow	Michael J. Karels	Nicholas Stoughton
Donald W. Cragun	Steven Kramer	Donn S. Terry
Juan Antonio De La Puente	Thomas M. Kurihara	Mark-Rene Uchida
Ming De Zhou	C. Douglass Locke	Scott A. Valcourt
Steven J. Dovich	Roger J. Martin	Michael W. Vannier
Richard P. Draves	Craig H. Meyer	Frederick N. Webb
Philip H. Enslow	Finnbarr P. Murphy	Paul A.T. Wolfgang
Michael Gonzalez	John Napier	Oren Yuen
Karen D. Gordon	Peter E. Obermayer	Janusz Zalewski
Joseph M. Gwinn	James T. Oblinger	

The following organizational representative voted on this standard:

Andrew Josey, X/Open Company Ltd.

IEEE-SA Standards Board

When the IEEE-SA Standards Board approved IEEE Std 1003.1-2001 on 6 December 2001, it had the following membership:

Donald N. Heirman, Chair

James T. Carlo, Vice-Chair

Judith Gorman, Secretary

Satish K. Aggarwal

Mark D. Bowman

Gary R. Engmann

Harold E. Epstein

H. Landis Floyd

Jay Forster*

Howard M. Frazier

Ruben D. Garzon

James H. Gurney

Richard J. Holleman

Lowell G. Johnson

Robert J. Kennelly

Joseph L. Koepfinger*

Peter H. Lips

L. Bruce McClung

Daleep C. Mohla

James W. Moore

Robert F. Munzner

Ronald C. Petersen

Gerald H. Peterson

John B. Posey

Gary S. Robinson

Akio Tojo

Donald W. Zipse

Also included are the following non-voting IEEE-SA Standards Board liaisons:

Alan Cookson, NIST Representative

Donald R. Volzka, TAB Representative

Yvette Ho Sang, **Don Messina**, **Savoula Amanatidis**, IEEE Project Editors

* Member Emeritus

IEEE Std 1003.1-2001/Cor 1-2002 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/IEC JTC 1/SC22/WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair

Donald W. Cragun, Organizational Representative, IEEE PASC

Nicholas Stoughton, Organizational Representative, ISO/IEC JTC 1/SC22/WG15

Mark Brown, Organizational Representative, The Open Group

Trademarks

The following information is given for the convenience of users of this standard and does not constitute endorsement of these products by The Open Group or the IEEE. There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

1003.1[™] is a trademark of the Institute of Electrical and Electronic Engineers, Inc.

AIX[®] is a registered trademark of IBM Corporation.

AT&T[®] is a registered trademark of AT&T in the U.S.A. and other countries.

BSD[™] is a trademark of the University of California, Berkeley, U.S.A.

Hewlett-Packard[®], HP[®], and HP-UX[®] are registered trademarks of Hewlett-Packard Company.

IBM[®] is a registered trademark of International Business Machines Corporation.

The Open Group and Boundaryless Information Flow are trademarks and UNIX is a registered trademark of The Open Group in the United States and other countries. All other trademarks are the property of their respective owners.

POSIX[®] is a registered trademark of the Institute of Electrical and Electronic Engineers, Inc.

Sun[®] and Sun Microsystems[®] are registered trademarks of Sun Microsystems, Inc.

/usr/group[®] is a registered trademark of UniForum, the International Network of UNIX System Users.

Acknowledgements

The contributions of the following organizations to the development of IEEE Std 1003.1-2001 are gratefully acknowledged:

- AT&T for permission to reproduce portions of its copyrighted System V Interface Definition (SVID) and material from the UNIX System V Release 2.0 documentation.
- The SC22 WG14 Committees.

This standard was prepared by the Austin Group, a joint working group of the IEEE, The Open Group, and ISO SC22 WG15.

Source Documents

Parts of the following documents were used to create the base documents for this standard:

AIX 3.2 Manual

AIX Version 3.2 For RISC System/6000, Technical Reference: Base Operating System and Extensions, 1990, 1992 (Part No. SC23-2382-00).

OSF/1

OSF/1 Programmer's Reference, Release 1.2 (ISBN: 0-13-020579-6).

OSF AES

Application Environment Specification (AES) Operating System Programming Interfaces Volume, Revision A (ISBN: 0-13-043522-8).

System V Release 2.0

- UNIX System V Release 2.0 Programmer's Reference Manual (April 1984 - Issue 2).
- UNIX System V Release 2.0 Programming Guide (April 1984 - Issue 2).

System V Release 4.2

Operating System API Reference, UNIX SVR4.2 (1992) (ISBN: 0-13-017658-3).

Introduction

1.1 Scope

The scope of IEEE Std 1003.1-2001 is described in the Base Definitions volume of IEEE Std 1003.1-2001.

1.2 Conformance

Conformance requirements for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

1.3 Normative References

Normative references for IEEE Std 1003.1-2001 are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

1.4 Change History

Change history is described in the Rationale (Informative) volume of IEEE Std 1003.1-2001, and in the CHANGE HISTORY section of reference pages.

1.5 Terminology

This section appears in the Base Definitions volume of IEEE Std 1003.1-2001, but is repeated here for convenience:

For the purposes of IEEE Std 1003.1-2001, the following terminology definitions apply:

can

Describes a permissible optional feature or behavior available to the user or application. The feature or behavior is mandatory for an implementation that conforms to IEEE Std 1003.1-2001. An application can rely on the existence of the feature or behavior.

implementation-defined

Describes a value or behavior that is not defined by IEEE Std 1003.1-2001 but is selected by an implementor. The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence of the value or behavior. An application that relies on such a value or behavior cannot be assured to be portable across conforming implementations.

The implementor shall document such a value or behavior so that it can be used correctly by an application.

legacy

Describes a feature or behavior that is being retained for compatibility with older applications, but which has limitations which make it inappropriate for developing portable

applications. New applications should use alternative means of obtaining equivalent functionality.

may

Describes a feature or behavior that is optional for an implementation that conforms to IEEE Std 1003.1-2001. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

To avoid ambiguity, the opposite of *may* is expressed as *need not*, instead of *may not*.

shall

For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or behavior that is mandatory. An application can rely on the existence of the feature or behavior.

For an application or user, describes a behavior that is mandatory.

should

For an implementation that conforms to IEEE Std 1003.1-2001, describes a feature or behavior that is recommended but not mandatory. An application should not rely on the existence of the feature or behavior. An application that relies on such a feature or behavior cannot be assured to be portable across conforming implementations.

For an application, describes a feature or behavior that is recommended programming practice for optimum portability.

undefined

Describes the nature of a value or behavior not defined by IEEE Std 1003.1-2001 which results from use of an invalid program construct or invalid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

unspecified

Describes the nature of a value or behavior not specified by IEEE Std 1003.1-2001 which results from use of a valid program construct or valid data input.

The value or behavior may vary among implementations that conform to IEEE Std 1003.1-2001. An application should not rely on the existence or validity of the value or behavior. An application that relies on any particular value or behavior cannot be assured to be portable across conforming implementations.

1.6 Definitions

Concepts and definitions are defined in the Base Definitions volume of IEEE Std 1003.1-2001.

1.7 Relationship to Other Formal Standards

Great care has been taken to ensure that this volume of IEEE Std 1003.1-2001 is fully aligned with the following standards:

ISO C (1999)

ISO/IEC 9899: 1999, Programming Languages — C.

Parts of the ISO/IEC 9899: 1999 standard (hereinafter referred to as the ISO C standard) are referenced to describe requirements also mandated by this volume of IEEE Std 1003.1-2001. Some functions and headers included within this volume of IEEE Std 1003.1-2001 have a version in the ISO C standard; in this case CX markings are added as appropriate to show where the ISO C standard has been extended (see Section 1.8.1). Any conflict between this volume of IEEE Std 1003.1-2001 and the ISO C standard is unintentional.

This volume of IEEE Std 1003.1-2001 also allows, but does not require, mathematics functions to support IEEE Std 754-1985 and IEEE Std 854-1987.

1.8 Portability

Some of the utilities in the Shell and Utilities volume of IEEE Std 1003.1-2001 and functions in the System Interfaces volume of IEEE Std 1003.1-2001 describe functionality that might not be fully portable to systems meeting the requirements for POSIX conformance (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance).

Where optional, enhanced, or reduced functionality is specified, the text is shaded and a code in the margin identifies the nature of the option, extension, or warning (see Section 1.8.1). For maximum portability, an application should avoid such functionality.

1.8.1 Codes

Margin codes and their meanings are listed in the Base Definitions volume of IEEE Std 1003.1-2001, but are repeated here for convenience:

ADV Advisory Information

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the ADV margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the ADV margin legend.

AIO Asynchronous Input and Output

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the AIO margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the AIO margin legend.

BAR Barriers

The functionality described is optional. The functionality described is also an extension to the

107		ISO C standard.
108		Where applicable, functions are marked with the BAR margin legend in the SYNOPSIS section.
109		Where additional semantics apply to a function, the material is identified by use of the BAR
110		margin legend.
111	BE	Batch Environment Services and Utilities
112		The functionality described is optional.
113		Where applicable, utilities are marked with the BE margin legend in the SYNOPSIS section.
114		Where additional semantics apply to a utility, the material is identified by use of the BE margin
115		legend.
116	CD	C-Language Development Utilities
117		The functionality described is optional.
118		Where applicable, utilities are marked with the CD margin legend in the SYNOPSIS section.
119		Where additional semantics apply to a utility, the material is identified by use of the CD margin
120		legend.
121	CPT	Process CPU-Time Clocks
122		The functionality described is optional. The functionality described is also an extension to the
123		ISO C standard.
124		Where applicable, functions are marked with the CPT margin legend in the SYNOPSIS section.
125		Where additional semantics apply to a function, the material is identified by use of the CPT
126		margin legend.
127	CS	Clock Selection
128		The functionality described is optional. The functionality described is also an extension to the
129		ISO C standard.
130		Where applicable, functions are marked with the CS margin legend in the SYNOPSIS section.
131		Where additional semantics apply to a function, the material is identified by use of the CS
132		margin legend.
133	CX	Extension to the ISO C standard
134		The functionality described is an extension to the ISO C standard. Application writers may make
135		use of an extension as it is supported on all IEEE Std 1003.1-2001-conforming systems.
136		With each function or header from the ISO C standard, a statement to the effect that “any
137		conflict is unintentional” is included. That is intended to refer to a direct conflict.
138		IEEE Std 1003.1-2001 acts in part as a profile of the ISO C standard, and it may choose to further
139		constrain behaviors allowed to vary by the ISO C standard. Such limitations are not considered
140		conflicts.
141		Where additional semantics apply to a function or header, the material is identified by use of the
142		CX margin legend.
143	FD	FORTTRAN Development Utilities
144		The functionality described is optional.
145		Where applicable, utilities are marked with the FD margin legend in the SYNOPSIS section.
146		Where additional semantics apply to a utility, the material is identified by use of the FD margin
147		legend.
148	FR	FORTTRAN Runtime Utilities
149		The functionality described is optional.

150		Where applicable, utilities are marked with the FR margin legend in the SYNOPSIS section.
151		Where additional semantics apply to a utility, the material is identified by use of the FR margin
152		legend.
153	FSC	File Synchronization
154		The functionality described is optional. The functionality described is also an extension to the
155		ISO C standard.
156		Where applicable, functions are marked with the FSC margin legend in the SYNOPSIS section.
157		Where additional semantics apply to a function, the material is identified by use of the FSC
158		margin legend.
159	IP6	IPV6
160		The functionality described is optional. The functionality described is also an extension to the
161		ISO C standard.
162		Where applicable, functions are marked with the IP6 margin legend in the SYNOPSIS section.
163		Where additional semantics apply to a function, the material is identified by use of the IP6
164		margin legend.
165	MC1	Advisory Information and either Memory Mapped Files or Shared Memory Objects
166		The functionality described is optional. The functionality described is also an extension to the
167		ISO C standard.
168		This is a shorthand notation for combinations of multiple option codes.
169		Where applicable, functions are marked with the MC1 margin legend in the SYNOPSIS section.
170		Where additional semantics apply to a function, the material is identified by use of the MC1
171		margin legend.
172		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
173		Notation.
174	MC2	Memory Mapped Files, Shared Memory Objects, or Memory Protection
175		The functionality described is optional. The functionality described is also an extension to the
176		ISO C standard.
177		This is a shorthand notation for combinations of multiple option codes.
178		Where applicable, functions are marked with the MC2 margin legend in the SYNOPSIS section.
179		Where additional semantics apply to a function, the material is identified by use of the MC2
180		margin legend.
181		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
182		Notation.
183	MC3	Memory Mapped Files, Shared Memory Objects, or Typed Memory Objects
184		The functionality described is optional. The functionality described is also an extension to the
185		ISO C standard.
186		This is a shorthand notation for combinations of multiple option codes.
187		Where applicable, functions are marked with the MC3 margin legend in the SYNOPSIS section.
188		Where additional semantics apply to a function, the material is identified by use of the MC3
189		margin legend.
190		Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Section 1.5.2, Margin Code
191		Notation.
192	MF	Memory Mapped Files
193		The functionality described is optional. The functionality described is also an extension to the

194		ISO C standard.
195		Where applicable, functions are marked with the MF margin legend in the SYNOPSIS section.
196		Where additional semantics apply to a function, the material is identified by use of the MF
197		margin legend.
198	ML	Process Memory Locking
199		The functionality described is optional. The functionality described is also an extension to the
200		ISO C standard.
201		Where applicable, functions are marked with the ML margin legend in the SYNOPSIS section.
202		Where additional semantics apply to a function, the material is identified by use of the ML
203		margin legend.
204	MLR	Range Memory Locking
205		The functionality described is optional. The functionality described is also an extension to the
206		ISO C standard.
207		Where applicable, functions are marked with the MLR margin legend in the SYNOPSIS section.
208		Where additional semantics apply to a function, the material is identified by use of the MLR
209		margin legend.
210	MON	Monotonic Clock
211		The functionality described is optional. The functionality described is also an extension to the
212		ISO C standard.
213		Where applicable, functions are marked with the MON margin legend in the SYNOPSIS section.
214		Where additional semantics apply to a function, the material is identified by use of the MON
215		margin legend.
216	MPR	Memory Protection
217		The functionality described is optional. The functionality described is also an extension to the
218		ISO C standard.
219		Where applicable, functions are marked with the MPR margin legend in the SYNOPSIS section.
220		Where additional semantics apply to a function, the material is identified by use of the MPR
221		margin legend.
222	MSG	Message Passing
223		The functionality described is optional. The functionality described is also an extension to the
224		ISO C standard.
225		Where applicable, functions are marked with the MSG margin legend in the SYNOPSIS section.
226		Where additional semantics apply to a function, the material is identified by use of the MSG
227		margin legend.
228	MX	IEC 60559 Floating-Point Option
229		The functionality described is optional. The functionality described is also an extension to the
230		ISO C standard.
231		Where applicable, functions are marked with the MX margin legend in the SYNOPSIS section.
232		Where additional semantics apply to a function, the material is identified by use of the MX
233		margin legend.
234	OB	Obsolescent
235		The functionality described may be withdrawn in a future version of this volume of
236		IEEE Std 1003.1-2001. Strictly Conforming POSIX Applications and Strictly Conforming XSI
237		Applications shall not use obsolescent features.

238		Where applicable, the material is identified by use of the OB margin legend.
239	OF	Output Format Incompletely Specified
240		The functionality described is an XSI extension. The format of the output produced by the utility
241		is not fully specified. It is therefore not possible to post-process this output in a consistent
242		fashion. Typical problems include unknown length of strings and unspecified field delimiters.
243		Where applicable, the material is identified by use of the OF margin legend.
244	OH	Optional Header
245		In the SYNOPSIS section of some interfaces in the System Interfaces volume of
246		IEEE Std 1003.1-2001 an included header is marked as in the following example:
247	OH	<pre>#include <sys/types.h></pre>
248		<pre>#include <grp.h></pre>
249		<pre>struct group *getgrnam(const char *name);</pre>
250		The OH margin legend indicates that the marked header is not required on XSI-conformant
251		systems.
252	PIO	Prioritized Input and Output
253		The functionality described is optional. The functionality described is also an extension to the
254		ISO C standard.
255		Where applicable, functions are marked with the PIO margin legend in the SYNOPSIS section.
256		Where additional semantics apply to a function, the material is identified by use of the PIO
257		margin legend.
258	PS	Process Scheduling
259		The functionality described is optional. The functionality described is also an extension to the
260		ISO C standard.
261		Where applicable, functions are marked with the PS margin legend in the SYNOPSIS section.
262		Where additional semantics apply to a function, the material is identified by use of the PS
263		margin legend.
264	RS	Raw Sockets
265		The functionality described is optional. The functionality described is also an extension to the
266		ISO C standard.
267		Where applicable, functions are marked with the RS margin legend in the SYNOPSIS section.
268		Where additional semantics apply to a function, the material is identified by use of the RS
269		margin legend.
270	RTS	Realtime Signals Extension
271		The functionality described is optional. The functionality described is also an extension to the
272		ISO C standard.
273		Where applicable, functions are marked with the RTS margin legend in the SYNOPSIS section.
274		Where additional semantics apply to a function, the material is identified by use of the RTS
275		margin legend.
276	SD	Software Development Utilities
277		The functionality described is optional.
278		Where applicable, utilities are marked with the SD margin legend in the SYNOPSIS section.
279		Where additional semantics apply to a utility, the material is identified by use of the SD margin
280		legend.

281	SEM	Semaphores
282		The functionality described is optional. The functionality described is also an extension to the
283		ISO C standard.
284		Where applicable, functions are marked with the SEM margin legend in the SYNOPSIS section.
285		Where additional semantics apply to a function, the material is identified by use of the SEM
286		margin legend.
287	SHM	Shared Memory Objects
288		The functionality described is optional. The functionality described is also an extension to the
289		ISO C standard.
290		Where applicable, functions are marked with the SHM margin legend in the SYNOPSIS section.
291		Where additional semantics apply to a function, the material is identified by use of the SHM
292		margin legend.
293	SIO	Synchronized Input and Output
294		The functionality described is optional. The functionality described is also an extension to the
295		ISO C standard.
296		Where applicable, functions are marked with the SIO margin legend in the SYNOPSIS section.
297		Where additional semantics apply to a function, the material is identified by use of the SIO
298		margin legend.
299	SPI	Spin Locks
300		The functionality described is optional. The functionality described is also an extension to the
301		ISO C standard.
302		Where applicable, functions are marked with the SPI margin legend in the SYNOPSIS section.
303		Where additional semantics apply to a function, the material is identified by use of the SPI
304		margin legend.
305	SPN	Spawn
306		The functionality described is optional. The functionality described is also an extension to the
307		ISO C standard.
308		Where applicable, functions are marked with the SPN margin legend in the SYNOPSIS section.
309		Where additional semantics apply to a function, the material is identified by use of the SPN
310		margin legend.
311	SS	Process Sporadic Server
312		The functionality described is optional. The functionality described is also an extension to the
313		ISO C standard.
314		Where applicable, functions are marked with the SS margin legend in the SYNOPSIS section.
315		Where additional semantics apply to a function, the material is identified by use of the SS
316		margin legend.
317	TCT	Thread CPU-Time Clocks
318		The functionality described is optional. The functionality described is also an extension to the
319		ISO C standard.
320		Where applicable, functions are marked with the TCT margin legend in the SYNOPSIS section.
321		Where additional semantics apply to a function, the material is identified by use of the TCT
322		margin legend.
323	TEF	Trace Event Filter
324		The functionality described is optional. The functionality described is also an extension to the
325		ISO C standard.

326		Where applicable, functions are marked with the TEF margin legend in the SYNOPSIS section.
327		Where additional semantics apply to a function, the material is identified by use of the TEF
328		margin legend.
329	THR	Threads
330		The functionality described is optional. The functionality described is also an extension to the
331		ISO C standard.
332		Where applicable, functions are marked with the THR margin legend in the SYNOPSIS section.
333		Where additional semantics apply to a function, the material is identified by use of the THR
334		margin legend.
335	TMO	Timeouts
336		The functionality described is optional. The functionality described is also an extension to the
337		ISO C standard.
338		Where applicable, functions are marked with the TMO margin legend in the SYNOPSIS section.
339		Where additional semantics apply to a function, the material is identified by use of the TMO
340		margin legend.
341	TMR	Timers
342		The functionality described is optional. The functionality described is also an extension to the
343		ISO C standard.
344		Where applicable, functions are marked with the TMR margin legend in the SYNOPSIS section.
345		Where additional semantics apply to a function, the material is identified by use of the TMR
346		margin legend.
347	TPI	Thread Priority Inheritance
348		The functionality described is optional. The functionality described is also an extension to the
349		ISO C standard.
350		Where applicable, functions are marked with the TPI margin legend in the SYNOPSIS section.
351		Where additional semantics apply to a function, the material is identified by use of the TPI
352		margin legend.
353	TPP	Thread Priority Protection
354		The functionality described is optional. The functionality described is also an extension to the
355		ISO C standard.
356		Where applicable, functions are marked with the TPP margin legend in the SYNOPSIS section.
357		Where additional semantics apply to a function, the material is identified by use of the TPP
358		margin legend.
359	TPS	Thread Execution Scheduling
360		The functionality described is optional. The functionality described is also an extension to the
361		ISO C standard.
362		Where applicable, functions are marked with the TPS margin legend for the SYNOPSIS section.
363		Where additional semantics apply to a function, the material is identified by use of the TPS
364		margin legend.
365	TRC	Trace
366		The functionality described is optional. The functionality described is also an extension to the
367		ISO C standard.
368		Where applicable, functions are marked with the TRC margin legend in the SYNOPSIS section.
369		Where additional semantics apply to a function, the material is identified by use of the TRC
370		margin legend.

371	TRI	Trace Inherit
372		The functionality described is optional. The functionality described is also an extension to the
373		ISO C standard.
374		Where applicable, functions are marked with the TRI margin legend in the SYNOPSIS section.
375		Where additional semantics apply to a function, the material is identified by use of the TRI
376		margin legend.
377	TRL	Trace Log
378		The functionality described is optional. The functionality described is also an extension to the
379		ISO C standard.
380		Where applicable, functions are marked with the TRL margin legend in the SYNOPSIS section.
381		Where additional semantics apply to a function, the material is identified by use of the TRL
382		margin legend.
383	TSA	Thread Stack Address Attribute
384		The functionality described is optional. The functionality described is also an extension to the
385		ISO C standard.
386		Where applicable, functions are marked with the TSA margin legend for the SYNOPSIS section.
387		Where additional semantics apply to a function, the material is identified by use of the TSA
388		margin legend.
389	TSF	Thread-Safe Functions
390		The functionality described is optional. The functionality described is also an extension to the
391		ISO C standard.
392		Where applicable, functions are marked with the TSF margin legend in the SYNOPSIS section.
393		Where additional semantics apply to a function, the material is identified by use of the TSF
394		margin legend.
395	TSH	Thread Process-Shared Synchronization
396		The functionality described is optional. The functionality described is also an extension to the
397		ISO C standard.
398		Where applicable, functions are marked with the TSH margin legend in the SYNOPSIS section.
399		Where additional semantics apply to a function, the material is identified by use of the TSH
400		margin legend.
401	TSP	Thread Sporadic Server
402		The functionality described is optional. The functionality described is also an extension to the
403		ISO C standard.
404		Where applicable, functions are marked with the TSP margin legend in the SYNOPSIS section.
405		Where additional semantics apply to a function, the material is identified by use of the TSP
406		margin legend.
407	TSS	Thread Stack Size Attribute
408		The functionality described is optional. The functionality described is also an extension to the
409		ISO C standard.
410		Where applicable, functions are marked with the TSS margin legend in the SYNOPSIS section.
411		Where additional semantics apply to a function, the material is identified by use of the TSS
412		margin legend.
413	TYM	Typed Memory Objects
414		The functionality described is optional. The functionality described is also an extension to the
415		ISO C standard.

Where applicable, functions are marked with the TYM margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the TYM margin legend.

UP

User Portability Utilities

The functionality described is optional.

Where applicable, utilities are marked with the UP margin legend in the SYNOPSIS section. Where additional semantics apply to a utility, the material is identified by use of the UP margin legend.

XSI

Extension

The functionality described is an XSI extension. Functionality marked XSI is also an extension to the ISO C standard. Application writers may confidently make use of an extension on all systems supporting the X/Open System Interfaces Extension.

If an entire SYNOPSIS section is shaded and marked XSI, all the functionality described in that reference page is an extension. See the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.439, XSI.

XSR

XSI STREAMS

The functionality described is optional. The functionality described is also an extension to the ISO C standard.

Where applicable, functions are marked with the XSR margin legend in the SYNOPSIS section. Where additional semantics apply to a function, the material is identified by use of the XSR margin legend.

1.9 Format of Entries

The entries in Chapter 3 are based on a common format as follows. The only sections relating to conformance are the SYNOPSIS, DESCRIPTION, RETURN VALUE, and ERRORS sections.

NAME

This section gives the name or names of the entry and briefly states its purpose.

SYNOPSIS

This section summarizes the use of the entry being described. If it is necessary to include a header to use this function, the names of such headers are shown, for example:

```
#include <stdio.h>
```

DESCRIPTION

This section describes the functionality of the function or header.

RETURN VALUE

This section indicates the possible return values, if any.

If the implementation can detect errors, “successful completion” means that no error has been detected during execution of the function. If the implementation does detect an error, the error is indicated.

For functions where no errors are defined, “successful completion” means that if the implementation checks for errors, no error has been detected. If the implementation can detect errors, and an error is detected, the indicated return value is returned and *errno* may be set.

ERRORS

This section gives the symbolic names of the error values returned by a function or stored into a variable accessed through the symbol *errno* if an error occurs.

“No errors are defined” means that error values returned by a function or stored into a variable accessed through the symbol *errno*, if any, depend on the implementation.

EXAMPLES

This section is informative.

This section gives examples of usage, where appropriate. In the event of conflict between an example and a normative part of this volume of IEEE Std 1003.1-2001, the normative material is to be taken as correct.

APPLICATION USAGE

This section is informative.

This section gives warnings and advice to application writers about the entry. In the event of conflict between warnings and advice and a normative part of this volume of IEEE Std 1003.1-2001, the normative material is to be taken as correct.

RATIONALE

This section is informative.

This section contains historical information concerning the contents of this volume of IEEE Std 1003.1-2001 and why features were included or discarded by the standard developers.

FUTURE DIRECTIONS

This section is informative.

This section provides comments which should be used as a guide to current thinking; there is not necessarily a commitment to adopt these future directions.

SEE ALSO

This section is informative.

This section gives references to related information.

CHANGE HISTORY

This section is informative.

This section shows the derivation of the entry and any significant changes that have been made to it.

General Information

This chapter covers information that is relevant to all the functions specified in Chapter 3 and the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers.

2.1 Use and Implementation of Functions

Each of the following statements shall apply unless explicitly stated otherwise in the detailed descriptions that follow:

1. If an argument to a function has an invalid value (such as a value outside the domain of the function, or a pointer outside the address space of the program, or a null pointer), the behavior is undefined.
2. Any function declared in a header may also be implemented as a macro defined in the header, so a function should not be declared explicitly if its header is included. Any macro definition of a function can be suppressed locally by enclosing the name of the function in parentheses, because the name is then not followed by the left parenthesis that indicates expansion of a macro function name. For the same syntactic reason, it is permitted to take the address of a function even if it is also defined as a macro. The use of the C-language **#undef** construct to remove any such macro definition shall also ensure that an actual function is referred to.
3. Any invocation of a function that is implemented as a macro shall expand to code that evaluates each of its arguments exactly once, fully protected by parentheses where necessary, so it is generally safe to use arbitrary expressions as arguments. Likewise, those function-like macros described in the following sections may be invoked in an expression anywhere a function with a compatible return type could be called.
4. Provided that a function can be declared without reference to any type defined in a header, it is also permissible to declare the function explicitly and use it without including its associated header.
5. If a function that accepts a variable number of arguments is not declared (explicitly or by including its associated header), the behavior is undefined.

2.2 The Compilation Environment

2.2.1 POSIX.1 Symbols

Certain symbols in this volume of IEEE Std 1003.1-2001 are defined in headers (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers). Some of those headers could also define symbols other than those defined by IEEE Std 1003.1-2001, potentially conflicting with symbols used by the application. Also, IEEE Std 1003.1-2001 defines symbols that are not permitted by other standards to appear in those headers without some control on the visibility of those symbols.

Symbols called “feature test macros” are used to control the visibility of symbols that might be included in a header. Implementations, future versions of IEEE Std 1003.1-2001, and other standards may define additional feature test macros.

In the compilation of an application that **#defines** a feature test macro specified by IEEE Std 1003.1-2001, no header defined by IEEE Std 1003.1-2001 shall be included prior to the definition of the feature test macro. This restriction also applies to any implementation-provided header in which these feature test macros are used. If the definition of the macro does not precede the **#include**, the result is undefined.

Feature test macros shall begin with the underscore character ('_').

2.2.1.1 The `_POSIX_C_SOURCE` Feature Test Macro

A POSIX-conforming application should ensure that the feature test macro `_POSIX_C_SOURCE` is defined before inclusion of any header.

When an application includes a header described by IEEE Std 1003.1-2001, and when this feature test macro is defined to have the value 200112L:

1. All symbols required by IEEE Std 1003.1-2001 to appear when the header is included shall be made visible.
2. Symbols that are explicitly permitted, but not required, by IEEE Std 1003.1-2001 to appear in that header (including those in reserved name spaces) may be made visible.
3. Additional symbols not required or explicitly permitted by IEEE Std 1003.1-2001 to be in that header shall not be made visible, except when enabled by another feature test macro.

Identifiers in IEEE Std 1003.1-2001 may only be undefined using the **#undef** directive as described in Section 2.1 (on page 13) or Section 2.2.2. These **#undef** directives shall follow all **#include** directives of any header in IEEE Std 1003.1-2001.

Note: The POSIX.1-1990 standard specified a macro called `_POSIX_SOURCE`. This has been superseded by `_POSIX_C_SOURCE`.

2.2.1.2 The `_XOPEN_SOURCE` Feature Test Macro

An XSI-conforming application should ensure that the feature test macro `_XOPEN_SOURCE` is defined with the value 600 before inclusion of any header. This is needed to enable the functionality described in Section 2.2.1.1 and in addition to enable the XSI extension.

Since this volume of IEEE Std 1003.1-2001 is aligned with the ISO C standard, and since all functionality enabled by `_POSIX_C_SOURCE` set equal to 200112L is enabled by `_XOPEN_SOURCE` set equal to 600, there should be no need to define `_POSIX_C_SOURCE` if `_XOPEN_SOURCE` is so defined. Therefore, if `_XOPEN_SOURCE` is set equal to 600 and `_POSIX_C_SOURCE` is set equal to 200112L, the behavior is the same as if only `_XOPEN_SOURCE` is defined and set equal to 600. However, should `_POSIX_C_SOURCE` be set to a value greater than 200112L, the behavior is unspecified.

2.2.2 The Name Space

All identifiers in this volume of IEEE Std 1003.1-2001, except *environ*, are defined in at least one of the headers, as shown in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers. When `_XOPEN_SOURCE` or `_POSIX_C_SOURCE` is defined, each header defines or declares some identifiers, potentially conflicting with identifiers used by the application. The set of identifiers visible to the application consists of precisely those identifiers from the header pages of the included headers, as well as additional identifiers reserved for the implementation. In addition, some headers may make visible identifiers from other headers as indicated on the relevant header pages.

Implementations may also add members to a structure or union without controlling the visibility of those members with a feature test macro, as long as a user-defined macro with the same name cannot interfere with the correct interpretation of the program. The identifiers reserved for use by the implementation are described below:

1. Each identifier with external linkage described in the header section is reserved for use as an identifier with external linkage if the header is included.
2. Each macro described in the header section is reserved for any use if the header is included.
3. Each identifier with file scope described in the header section is reserved for use as an identifier with file scope in the same name space if the header is included.

The prefixes `posix_`, `POSIX_`, and `_POSIX_` are reserved for use by IEEE Std 1003.1-2001 and other POSIX standards. Implementations may add symbols to the headers shown in the following table, provided the identifiers for those symbols begin with the corresponding reserved prefixes in the following table, and do not use the reserved prefixes `posix_`, `POSIX_`, or `_POSIX_`.

		Header	Prefix	Suffix	Complete Name
584					
585					
586					
587	AIO	<aio.h>	aio_, lio_, AIO_, LIO_		
588		<arpa/inet.h>	in_, inet_		
589		<ctype.h>	to[a-z], is[a-z]		
590		<dirent.h>	d_		
591		<errno.h>	E[0-9], E[A-Z]		
592		<fcntl.h>	l_		
593		<glob.h>	gl_		
594		<grp.h>	gr_		
595		<inttypes.h>			int[0-9a-z]*_t, uint[0-9a-z]*_t
596					
597		<limits.h>		_MAX, _MIN	
598		<locale.h>	LC_[A-Z]		
599	MSG	<mqueue.h>	mq_, MQ_		
600	XSI	<ndbm.h>	dbm_		
601		<netdb.h>	h_, n_, p_, s_		
602		<net/if.h>	if_		
603		<netinet/in.h>	in_, ip_, s_, sin_		
604	IP6		in6_, s6_, sin6_		
605	XSI	<poll.h>	pd_, ph_, ps_		
606		<pthread.h>	pthread_, PTHREAD_		
607		<pwd.h>	pw_		
608		<regex.h>	re_, rm_		
609	PS	<sched.h>	sched_, SCHED_		
610	SEM	<semaphore.h>	sem_, SEM_		
611		<signal.h>	sa_, uc_, SIG[A-Z], SIG_[A-Z]		
612	XSI		ss_, sv_		
613	RTS		si_, SI_, sigev_, SIGEV_, sival_		
614	XSI	<stropts.h>	bi_, ic_, l_, sl_, str_		
615		<stdint.h>			int[0-9a-z]*_t, uint[0-9a-z]*_t
616					
617		<stdlib.h>	str[a-z]		
618		<string.h>	str[a-z], mem[a-z], wcs[a-z]		
619	XSI	<sys/ipc.h>	ipc_		key, pad, seq
620	MF	<sys/mman.h>	shm_, MAP_, MCL_, MS_, PROT_		
621	XSI	<sys/msg.h>	msg		msg
622	XSI	<sys/resource.h>	rlim_, ru_		
623		<sys/select.h>	fd_, fds_, FD_		
624	XSI	<sys/sem.h>	sem		sem
625	XSI	<sys/shm.h>	shm		
626		<sys/socket.h>	ss_, sa_, if_, ifc_, ifru_, infu_, ifra_, msg_, cmsg_, l_		
627					
628		<sys/stat.h>	st_		
629	XSI	<sys/statvfs.h>	f_		
630		<sys/time.h>	fds_, it_, tv_, FD_		
631		<sys/times.h>	tms_		

Header	Prefix	Suffix	Complete Name
<sys/uio.h>	iov_		UIO_MAXIOV
<sys/un.h>	sun_		
<sys/utsname.h>	uts_		
<sys/wait.h>	si_, W[A-Z], P_		
<termios.h>	c_		
<time.h>	tm_		
	clock_, timer_, it_, tv_, CLOCK_, TIMER_		
<ucontext.h>	uc_, ss_		
<ulimit.h>	UL_		
<utime.h>	utim_		
<utmpx.h>	ut_	_LVL, _TIME, _PROCESS	
<wchar.h>	wcs[a-z]		
<wctype.h>	is[a-z], to[a-z]		
<wordexp.h>	we_		
ANY header		_t	

Note: The notation [A–Z] indicates any uppercase letter in the portable character set. The notation [a–z] indicates any lowercase letter in the portable character set. Commas and spaces in the lists of prefixes and complete names in the above table are not part of any prefix or complete name.

If any header in the following table is included, macros with the prefixes shown may be defined. After the last inclusion of a given header, an application may use identifiers with the corresponding prefixes for its own purpose, provided their use is preceded by a **#undef** of the corresponding macro.

	Header	Prefix
660		
661		
662 XSI	<dlfcn.h>	RTLD_
663	<fcntl.h>	F_, O_, S_
664 XSI	<fmtmsg.h>	MM_

666 XSI	<ftw.h>	FTW_
667	<glob.h>	GLOB_
668	<inttypes.h>	PRI[Xa-z], SCN[Xa-z]
669 XSI	<ndbm.h>	DBM_
670	<net/if.h>	IF_
671	<netinet/in.h>	IMPLINK_, IN_, INADDR_, IP_, IPPORT_, IPPROTO_, SOCK_
672 IP6		IPV6_, IN6_
673	<netinet/tcp.h>	TCP_
674 XSI	<nl_types.h>	NL_
675 XSI	<poll.h>	POLL_
676	<regex.h>	REG_
677	<signal.h>	SA_, SIG_[0-9a-z],
678 XSI		BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, SS_, SV_, TRAP_
679 XSI	<stropts.h>	FLUSH[A-Z], I_, M_, MUXID_R[A-Z], S_, SND[A-Z], STR_
680 XSI	<syslog.h>	LOG_
681 XSI	<sys/ipc.h>	IPC_
682 XSI	<sys/mman.h>	PROT_, MAP_, MS_
683 XSI	<sys/msg.h>	MSG[A-Z]
684 XSI	<sys/resource.h>	PRIO_, RLIM_, RLIMIT_, RUSAGE_
685 XSI	<sys/sem.h>	SEM_
686 XSI	<sys/shm.h>	SHM[A-Z], SHM_[A-Z]
687 XSI	<sys/socket.h>	AF_, CMSG_, MSG_, PF_, SCM_, SHUT_, SO_
688	<sys/stat.h>	S_
689 XSI	<sys/statvfs.h>	ST_
690 XSI	<sys/time.h>	FD_, ITIMER_
691 XSI	<sys/uio.h>	IOV_
692 XSI	<sys/wait.h>	BUS_, CLD_, FPE_, ILL_, POLL_, SEGV_, SI_, TRAP_
693	<termios.h>	V, I, O, TC, B[0-9] (See below.)
694	<wordexp.h>	WRDE_

695 The following are used to reserve complete names for the <stdint.h> header:

696 INT[0-9A-Za-z-]*_MIN
697 INT[0-9A-Za-z-]*_MAX
698 INT[0-9A-Za-z-]*_C
699 UINT[0-9A-Za-z-]*_MIN
700 UINT[0-9A-Za-z-]*_MAX
701 UINT[0-9A-Za-z-]*_C

702 **Note:** The notation [0-9] indicates any digit. The notation [A-Z] indicates any uppercase letter in the
703 portable character set. The notation [0-9a-z-] indicates any digit, any lowercase letter in the
704 portable character set, or underscore.

705 The following reserved names are used as exact matches for **<termios.h>**:

706	XSI	CBAUD	EXTB	VDSUSP
707		DEFECHO	FLUSHO	VLNEXT
708		ECHOCTL	LOBLK	VREPRINT
709		ECHOKE	PENDIN	VSTATUS
710		ECHOPRT	SWTCH	VWERASE
711		EXTA	VDISCARD	

712 The following identifiers are reserved regardless of the inclusion of headers:

- 713 1. All identifiers that begin with an underscore and either an uppercase letter or another
714 underscore are always reserved for any use by the implementation.
- 715 2. All identifiers that begin with an underscore are always reserved for use as identifiers with
716 file scope in both the ordinary identifier and tag name spaces.
- 717 3. All identifiers in the table below are reserved for use as identifiers with external linkage.
718 Some of these identifiers do not appear in this volume of IEEE Std 1003.1-2001, but are
719 reserved for future use by the ISO C standard.

720	_Exit	ccoshf	csqrt	fputc	lrintl	sinh
721	abort	ccoshl	csqrtf	fputs	lround	sinhf
722	abs	ccosl	csqrtl	fputwc	lroundf	sinhl
723	acos	ceil	ctan	fputws	lroundl	sinl

788	ccosf	csinhl	fopen	lrint	sin	
789	ccosh	csinl	fprintf	lrintf	sinf	

Note: The notation [a-z] indicates any lowercase letter in the portable character set. The notation '*' indicates any combination of digits, letters in the portable character set, or underscore.

4. All functions and external identifiers defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers are reserved for use as identifiers with external linkage.
5. All the identifiers defined in this volume of IEEE Std 1003.1-2001 that have external linkage are always reserved for use as identifiers with external linkage.

No other identifiers are reserved.

Applications shall not declare or define identifiers with the same name as an identifier reserved in the same context. Since macro names are replaced whenever found, independent of scope and

name space, macro names matching any of the reserved identifier names shall not be defined by an application if any associated header is included.

Except that the effect of each inclusion of `<assert.h>` depends on the definition of `NDEBUG`, headers may be included in any order, and each may be included more than once in a given scope, with no difference in effect from that of being included only once.

If used, the application shall ensure that a header is included outside of any external declaration or definition, and it shall be first included before the first reference to any type or macro it defines, or to any function or object it declares. However, if an identifier is declared or defined in more than one header, the second and subsequent associated headers may be included after the initial reference to the identifier. Prior to the inclusion of a header, the application shall not define any macros with names lexically identical to symbols defined by that header.

2.3 Error Numbers

Most functions can provide an error number. The means by which each function provides its error numbers is specified in its description.

Some functions provide the error number in a variable accessed through the symbol *errno*. The symbol *errno*, defined by including the `<errno.h>` header, expands to a modifiable lvalue of type **int**. It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a macro definition is suppressed in order to access an actual object, or a program defines an identifier with the name *errno*, the behavior is undefined.

The value of *errno* should only be examined when it is indicated to be valid by a function's return value. No function in this volume of IEEE Std 1003.1-2001 shall set *errno* to zero. For each thread of a process, the value of *errno* shall not be affected by function calls or assignments to *errno* by other threads.

Some functions return an error number directly as the function value. These functions return a value of zero to indicate success.

If more than one error occurs in processing a function call, any one of the possible errors may be returned, as the order of detection is undefined.

Implementations may support additional errors not included in this list, may generate errors included in this list under circumstances other than those described here, or may contain extensions or limitations that prevent some errors from occurring. The ERRORS section on each reference page specifies whether an error shall be returned, or whether it may be returned. Implementations shall not generate a different error number from the ones described here for error conditions described in this volume of IEEE Std 1003.1-2001, but may generate additional errors unless explicitly disallowed for a particular function.

Each implementation shall document, in the conformance document, situations in which each of the optional conditions defined in IEEE Std 1003.1-2001 is detected. The conformance document may also contain statements that one or more of the optional error conditions are not detected.

For functions under the Threads option for which `[EINTR]` is not listed as a possible error condition in this volume of IEEE Std 1003.1-2001, an implementation shall not return an error code of `[EINTR]`.

The following symbolic names identify the possible error numbers, in the context of the functions specifically defined in this volume of IEEE Std 1003.1-2001; these general descriptions are more precisely defined in the ERRORS sections of the functions that return them. Only these symbolic names should be used in programs, since the actual value of the error number is

unspecified. All values listed in this section shall be unique integer constant expressions with type **int** suitable for use in **#if** preprocessing directives, except as noted below. The values for all these names shall be found in the **<errno.h>** header defined in the Base Definitions volume of IEEE Std 1003.1-2001. The actual values are unspecified by this volume of IEEE Std 1003.1-2001.

[E2BIG]

Argument list too long. The sum of the number of bytes used by the new process image's argument list and environment list is greater than the system-imposed limit of {ARG_MAX} bytes.

or:

Lack of space in an output buffer.

or:

Argument is greater than the system-imposed maximum.

[EACCES]

Permission denied. An attempt was made to access a file in a way forbidden by its file access permissions.

[EADDRINUSE]

Address in use. The specified address is in use.

[EADDRNOTAVAIL]

Address not available. The specified address is not available from the local system.

[EAFNOSUPPORT]

Address family not supported. The implementation does not support the specified address family, or the specified address is not a valid address for the address family of the specified socket.

[EAGAIN]

Resource temporarily unavailable. This is a temporary condition and later calls to the same routine may complete normally.

[EALREADY]

Connection already in progress. A connection request is already in progress for the specified socket.

[EBADF]

Bad file descriptor. A file descriptor argument is out of range, refers to no open file, or a read (write) request is made to a file that is only open for writing (reading).

[EBADMSG]

Bad message. During a *read()*, *getmsg()*, *getpmsg()*, or *ioctl()* I_RECVFD request to a STREAMS device, a message arrived at the head of the STREAM that is inappropriate for the function receiving the message.

read() Message waiting to be read on a STREAM is not a data message.

getmsg() or *getpmsg()*

A file descriptor was received instead of a control message.

ioctl()

Control or data information was received instead of a file descriptor when I_RECVFD was specified.

or:

887	Bad Message. The implementation has detected a corrupted message.
888	[EBUSY]
889	Resource busy. An attempt was made to make use of a system resource that is not currently
890	available, as it is being used by another process in a manner that would have conflicted with
891	the request being made by this process.
892	[ECANCELED]
893	Operation canceled. The associated asynchronous operation was canceled before
894	completion.
895	[ECHILD]
896	No child process. A <i>wait()</i> or <i>waitpid()</i> function was executed by a process that had no
897	existing or unwaited-for child process.
898	[ECONNABORTED]
899	Connection aborted. The connection has been aborted.
900	[ECONNREFUSED]
901	Connection refused. An attempt to connect to a socket was refused because there was no
902	process listening or because the queue of connection requests was full and the underlying
903	protocol does not support retransmissions.
904	[ECONNRESET]
905	Connection reset. The connection was forcibly closed by the peer.
906	[EDEADLK]
907	Resource deadlock would occur. An attempt was made to lock a system resource that
908	would have resulted in a deadlock situation.
909	[DESTADDRREQ]
910	Destination address required. No bind address was established.
911	[EDOM]
912	Domain error. An input argument is outside the defined domain of the mathematical
913	function (defined in the ISO C standard).
914	[EDQUOT]
915	Reserved.
916	[EEXIST]
917	File exists. An existing file was mentioned in an inappropriate context; for example, as a
918	new link name in the <i>link()</i> function.
919	[EFAULT]
920	Bad address. The system detected an invalid address in attempting to use an argument of a
921	call. The reliable detection of this error cannot be guaranteed, and when not detected may
922	result in the generation of a signal, indicating an address violation, which is sent to the
923	process.
924	[EFBIG]
925	File too large. The size of a file would exceed the maximum file size of an implementation or
926	offset maximum established in the corresponding file description.
927	[EHOSTUNREACH]
928	Host is unreachable. The destination host cannot be reached (probably because the host is
929	down or a remote router cannot reach it).
930	[EIDRM]
931	Identifier removed. Returned during XSI interprocess communication if an identifier has

932	been removed from the system.
933	[EILSEQ]
934	Illegal byte sequence. A wide-character code has been detected that does not correspond to
935	a valid character, or a byte sequence does not form a valid wide-character code (defined in
936	the ISO C standard).
937	[EINPROGRESS]
938	Operation in progress. This code is used to indicate that an asynchronous operation has not
939	yet completed.
940	or:
941	O_NONBLOCK is set for the socket file descriptor and the connection cannot be
942	immediately established.
943	[EINTR]
944	Interrupted function call. An asynchronous signal was caught by the process during the
945	execution of an interruptible function. If the signal handler performs a normal return, the
946	interrupted function call may return this condition (see the Base Definitions volume of
947	IEEE Std 1003.1-2001, <signal.h>).
948	[EINVAL]
949	Invalid argument. Some invalid argument was supplied; for example, specifying an
950	undefined signal in a <i>signal()</i> function or a <i>kill()</i> function.
951	[EIO]
952	Input/output error. Some physical input or output error has occurred. This error may be
953	reported on a subsequent operation on the same file descriptor. Any other error-causing
954	operation on the same file descriptor may cause the [EIO] error indication to be lost.
955	[EISCONN]
956	Socket is connected. The specified socket is already connected.
957	[EISDIR]
958	Is a directory. An attempt was made to open a directory with write mode specified.
959	[ELOOP]
960	Symbolic link loop. A loop exists in symbolic links encountered during pathname
961	resolution. This error may also be returned if more than {SYMLOOP_MAX} symbolic links
962	are encountered during pathname resolution.
963	[EMFILE]
964	Too many open files. An attempt was made to open more than the maximum number of file
965	descriptors allowed in this process.
966	[EMLINK]
967	Too many links. An attempt was made to have the link count of a single file exceed
968	{LINK_MAX}.
969	[EMSGSIZE]
970	Message too large. A message sent on a transport provider was larger than an internal
971	message buffer or some other network limit.
972	or:
973	Inappropriate message buffer length.
974	[EMULTIHOP]
975	Reserved.

976	[ENAMETOOLONG]	
977		Filename too long. The length of a pathname exceeds {PATH_MAX}, or a pathname
978		component is longer than {NAME_MAX}. This error may also occur when pathname
979		substitution, as a result of encountering a symbolic link during pathname resolution, results
980		in a pathname string the size of which exceeds {PATH_MAX}.
981	[ENETDOWN]	
982		Network is down. The local network interface used to reach the destination is down.
983	[ENETRESET]	
984		The connection was aborted by the network.
985	[ENETUNREACH]	
986		Network unreachable. No route to the network is present.
987	[ENFILE]	
988		Too many files open in system. Too many files are currently open in the system. The system
989		has reached its predefined limit for simultaneously open files and temporarily cannot accept
990		requests to open another one.
991	[ENOBUFS]	
992		No buffer space available. Insufficient buffer resources were available in the system to
993		perform the socket operation.
994	XSR [ENODATA]	
995		No message available. No message is available on the STREAM head read queue.
996	[ENODEV]	
997		No such device. An attempt was made to apply an inappropriate function to a device; for
998		example, trying to read a write-only device such as a printer.
999	[ENOENT]	
1000		No such file or directory. A component of a specified pathname does not exist, or the
1001		pathname is an empty string.
1002	[ENOEXEC]	
1003		Executable file format error. A request is made to execute a file that, although it has the
1004		appropriate permissions, is not in the format required by the implementation for executable
1005		files.
1006	[ENOLCK]	
1007		No locks available. A system-imposed limit on the number of simultaneous file and record
1008		locks has been reached and no more are currently available.
1009	[ENOLINK]	
1010		Reserved.
1011	[ENOMEM]	
1012		Not enough space. The new process image requires more memory than is allowed by the
1013		hardware or system-imposed memory management constraints.
1014	[ENOMSG]	
1015		No message of the desired type. The message queue does not contain a message of the
1016		required type during XSI interprocess communication.
1017	[ENOPROTOPT]	
1018		Protocol not available. The protocol option specified to <i>setsockopt()</i> is not supported by the
1019		implementation.

1020		[ENOSPC]
1021		No space left on a device. During the <i>write()</i> function on a regular file or when extending a
1022		directory, there is no free space left on the device.
1023	XSR	[ENOSR]
1024		No STREAM resources. Insufficient STREAMS memory resources are available to perform a
1025		STREAMS-related function. This is a temporary condition; it may be recovered from if other
1026		processes release resources.
1027	XSR	[ENOSTR]
1028		Not a STREAM. A STREAM function was attempted on a file descriptor that was not
1029		associated with a STREAMS device.
1030		[ENOSYS]
1031		Function not implemented. An attempt was made to use a function that is not available in
1032		this implementation.
1033		[ENOTCONN]
1034		Socket not connected. The socket is not connected.
1035		[ENOTDIR]
1036		Not a directory. A component of the specified pathname exists, but it is not a directory,
1037		when a directory was expected.
1038		[ENOTEMPTY]
1039		Directory not empty. A directory other than an empty directory was supplied when an
1040		empty directory was expected.
1041		[ENOTSOCK]
1042		Not a socket. The file descriptor does not refer to a socket.
1043		[ENOTSUP]
1044		Not supported. The implementation does not support this feature of the Realtime Option
1045		Group.
1046		[ENOTTY]
1047		Inappropriate I/O control operation. A control function has been attempted for a file or
1048		special file for which the operation is inappropriate.
1049		[ENXIO]
1050		No such device or address. Input or output on a special file refers to a device that does not
1051		exist, or makes a request beyond the capabilities of the device. It may also occur when, for
1052		example, a tape drive is not on-line.
1053		[EOPNOTSUPP]
1054		Operation not supported on socket. The type of socket (address family or protocol) does not
1055		support the requested operation.
1056		[EOVERFLOW]
1057		Value too large to be stored in data type. An operation was attempted which would
1058		generate a value that is outside the range of values that can be represented in the relevant
1059		data type or that are allowed for a given data item.
1060		[EPERM]
1061		Operation not permitted. An attempt was made to perform an operation limited to
1062		processes with appropriate privileges or to the owner of a file or other resource.
1063		[EPIPE]
1064		Broken pipe. A write was attempted on a socket, pipe, or FIFO for which there is no process

1065	to read the data.
1066	[EPROTO]
1067	Protocol error. Some protocol error occurred. This error is device-specific, but is generally
1068	not related to a hardware failure.
1069	[EPROTONOSUPPORT]
1070	Protocol not supported. The protocol is not supported by the address family, or the protocol
1071	is not supported by the implementation.
1072	[EPROTOTYPE]
1073	Protocol wrong type for socket. The socket type is not supported by the protocol.
1074	[ERANGE]
1075	Result too large or too small. The result of the function is too large (overflow) or too small
1076	(underflow) to be represented in the available space (defined in the ISO C standard).
1077	[EROFS]
1078	Read-only file system. An attempt was made to modify a file or directory on a file system
1079	that is read-only.
1080	[ESPIPE]
1081	Invalid seek. An attempt was made to access the file offset associated with a pipe or FIFO.
1082	[ESRCH]
1083	No such process. No process can be found corresponding to that specified by the given
1084	process ID.
1085	[ESTALE]
1086	Reserved.
1087	XSR [ETIME]
1088	
1089	
1090	
1091	
1092	[ETIMEDOUT]
1093	Connection timed out. The connection to a remote machine has timed out. If the connection
1094	timed out during execution of the function that reported this error (as opposed to timing
1095	out prior to the function being called), it is unspecified whether the function has completed
1096	some or all of the documented behavior associated with a successful completion of the
1097	function.
1098	or:
1099	Operation timed out. The time limit associated with the operation was exceeded before the
1100	operation completed.
1101	[ETXTBSY]
1102	Text file busy. An attempt was made to execute a pure-procedure program that is currently
1103	open for writing, or an attempt has been made to open for writing a pure-procedure
1104	program that is being executed.
1105	[EWOULDBLOCK]
1106	Operation would block. An operation on a socket marked as non-blocking has encountered
1107	a situation such as no data available that otherwise would have caused the function to
1108	suspend execution.

1109 A conforming implementation may assign the same values for [EWOULDBLOCK] and
1110 [EAGAIN].

1111 [EXDEV]

1112 Improper link. A link to a file on another file system was attempted.

1113 2.3.1 Additional Error Numbers

1114 Additional implementation-defined error numbers may be defined in `<errno.h>`.

1115 2.4 Signal Concepts

1116 2.4.1 Signal Generation and Delivery

1117 A signal is said to be “generated” for (or sent to) a process or thread when the event that causes
1118 the signal first occurs. Examples of such events include detection of hardware faults, timer
1119 RTS expiration, signals generated via the `sigevent` structure and terminal activity, as well as
1120 RTS invocations of the `kill()` and `sigqueue()` functions. In some circumstances, the same event
1121 generates signals for multiple processes.

1122 At the time of generation, a determination shall be made whether the signal has been generated
1123 for the process or for a specific thread within the process. Signals which are generated by some
1124 action attributable to a particular thread, such as a hardware fault, shall be generated for the
1125 thread that caused the signal to be generated. Signals that are generated in association with a
1126 process ID or process group ID or an asynchronous event, such as terminal activity, shall be
1127 generated for the process.

1128 Each process has an action to be taken in response to each signal defined by the system (see
1129 Section 2.4.3 (on page 30)). A signal is said to be “delivered” to a process when the appropriate
1130 action for the process and signal is taken. A signal is said to be “accepted” by a process when the
1131 signal is selected and returned by one of the `sigwait()` functions.

1132 During the time between the generation of a signal and its delivery or acceptance, the signal is
1133 said to be “pending”. Ordinarily, this interval cannot be detected by an application. However, a
1134 signal can be “blocked” from delivery to a thread. If the action associated with a blocked signal
1135 is anything other than to ignore the signal, and if that signal is generated for the thread, the
1136 signal shall remain pending until it is unblocked, it is accepted when it is selected and returned
1137 by a call to the `sigwait()` function, or the action associated with it is set to ignore the signal.
1138 Signals generated for the process shall be delivered to exactly one of those threads within the
1139 process which is in a call to a `sigwait()` function selecting that signal or has not blocked delivery
1140 of the signal. If there are no threads in a call to a `sigwait()` function selecting that signal, and if all
1141 threads within the process block delivery of the signal, the signal shall remain pending on the
1142 process until a thread calls a `sigwait()` function selecting that signal, a thread unblocks delivery
1143 of the signal, or the action associated with the signal is set to ignore the signal. If the action
1144 associated with a blocked signal is to ignore the signal and if that signal is generated for the
1145 process, it is unspecified whether the signal is discarded immediately upon generation or
1146 remains pending.

1147 Each thread has a “signal mask” that defines the set of signals currently blocked from delivery
1148 to it. The signal mask for a thread shall be initialized from that of its parent or creating thread,
1149 or from the corresponding thread in the parent process if the thread was created as the result of a
1150 call to `fork()`. The `pthread_sigmask()`, `sigaction()`, `sigprocmask()`, and `sigsuspend()` functions control
1151 the manipulation of the signal mask.

The determination of which action is taken in response to a signal is made at the time the signal is delivered, allowing for any changes since the time of generation. This determination is independent of the means by which the signal was originally generated. If a subsequent occurrence of a pending signal is generated, it is implementation-defined as to whether the signal is delivered or accepted more than once in circumstances other than those in which queuing is required under the Realtime Signals Extension option. The order in which multiple, simultaneously pending signals outside the range SIGRTMIN to SIGRTMAX are delivered to or accepted by a process is unspecified.

When any stop signal (SIGSTOP, SIGTSTP, SIGTTIN, SIGTTOU) is generated for a process, any pending SIGCONT signals for that process shall be discarded. Conversely, when SIGCONT is generated for a process, all pending stop signals for that process shall be discarded. When SIGCONT is generated for a process that is stopped, the process shall be continued, even if the SIGCONT signal is blocked or ignored. If SIGCONT is blocked and not ignored, it shall remain pending until it is either unblocked or a stop signal is generated for the process.

An implementation shall document any condition not specified by this volume of IEEE Std 1003.1-2001 under which the implementation generates signals.

2.4.2 Realtime Signal Generation and Delivery

This section describes extensions to support realtime signal generation and delivery. This functionality is dependent on support of the Realtime Signals Extension option (and the rest of this section is not further shaded for this option).

Some signal-generating functions, such as high-resolution timer expiration, asynchronous I/O completion, interprocess message arrival, and the *sigqueue()* function, support the specification of an application-defined value, either explicitly as a parameter to the function or in a **sigevent** structure parameter. The **sigevent** structure is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	<i>sigev_notify</i>	Notification type.
int	<i>sigev_signo</i>	Signal number.
union signal	<i>sigev_value</i>	Signal value.
void(*)(unsigned signal)	<i>sigev_notify_function</i>	Notification function.
(pthread_attr_t*)	<i>sigev_notify_attributes</i>	Notification attributes.

The *sigev_notify* member specifies the notification mechanism to use when an asynchronous event occurs. This volume of IEEE Std 1003.1-2001 defines the following values for the *sigev_notify* member:

SIGEV_NONE	No asynchronous notification shall be delivered when the event of interest occurs.
SIGEV_SIGNAL	The signal specified in <i>sigev_signo</i> shall be generated for the process when the event of interest occurs. If the implementation supports the Realtime Signals Extension option and if the SA_SIGINFO flag is set for that signal number, then the signal shall be queued to the process and the value specified in <i>sigev_value</i> shall be the <i>si_value</i> component of the generated signal. If SA_SIGINFO is not set for that signal number, it is unspecified whether the signal is queued and what value, if any, is sent.
SIGEV_THREAD	A notification function shall be called to perform notification.

An implementation may define additional notification mechanisms.

The *sigev_signo* member specifies the signal to be generated. The *sigev_value* member is the application-defined value to be passed to the signal-catching function at the time of the signal delivery or to be returned at signal acceptance as the *si_value* member of the **siginfo_t** structure.

The **sigval** union is defined in **<signal.h>** and contains at least the following members:

Member Type	Member Name	Description
int	<i>sival_int</i>	Integer signal value.
void*	<i>sival_ptr</i>	Pointer signal value.

The *sival_int* member shall be used when the application-defined value is of type **int**; the *sival_ptr* member shall be used when the application-defined value is a pointer.

When a signal is generated by the *sigqueue()* function or any signal-generating function that supports the specification of an application-defined value, the signal shall be marked pending and, if the SA_SIGINFO flag is set for that signal, the signal shall be queued to the process along with the application-specified signal value. Multiple occurrences of signals so generated are queued in FIFO order. It is unspecified whether signals so generated are queued when the SA_SIGINFO flag is not set for that signal.

Signals generated by the *kill()* function or other events that cause signals to occur, such as detection of hardware faults, *alarm()* timer expiration, or terminal activity, and for which the implementation does not support queuing, shall have no effect on signals already queued for the same signal number.

When multiple unblocked signals, all in the range SIGRTMIN to SIGRTMAX, are pending, the behavior shall be as if the implementation delivers the pending unblocked signal with the lowest signal number within that range. No other ordering of signal delivery is specified.

If, when a pending signal is delivered, there are additional signals queued to that signal number, the signal shall remain pending. Otherwise, the pending indication shall be reset.

Multi-threaded programs can use an alternate event notification mechanism. When a notification is processed, and the *sigev_notify* member of the **sigevent** structure has the value SIGEV_THREAD, the function *sigev_notify_function* is called with parameter *sigev_value*.

The function shall be executed in an environment as if it were the *start_routine* for a newly created thread with thread attributes specified by *sigev_notify_attributes*. If *sigev_notify_attributes* is NULL, the behavior shall be as if the thread were created with the *detachstate* attribute set to PTHREAD_CREATE_DETACHED. Supplying an attributes structure with a *detachstate* attribute of PTHREAD_CREATE_JOINABLE results in undefined behavior. The signal mask of this thread is implementation-defined.

2.4.3 Signal Actions

There are three types of action that can be associated with a signal: SIG_DFL, SIG_IGN, or a pointer to a function. Initially, all signals shall be set to SIG_DFL or SIG_IGN prior to entry of the *main()* routine (see the *exec* functions). The actions prescribed by these values are as follows:

SIG_DFL Signal-specific default action.

The default actions for the signals defined in this volume of IEEE Std 1003.1-2001 are specified under **<signal.h>**. If the Realtime Signals Extension option is supported, the default actions for the realtime signals in the range SIGRTMIN to SIGRTMAX shall be to terminate the process abnormally.

1241		If the default action is to stop the process, the execution of that process is temporarily suspended. When a process stops, a SIGCHLD signal shall be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag. While a process is stopped, any additional signals that are sent to the process shall not be delivered until the process is continued, except SIGKILL which always terminates the receiving process. A process that is a member of an orphaned process group shall not be allowed to stop in response to the SIGTSTP, SIGTTIN, or SIGTTOU signals. In cases where delivery of one of these signals would stop such a process, the signal shall be discarded.	
1242			
1243			
1244			
1245			
1246			
1247			
1248			
1249			
1250		Setting a signal action to SIG_DFL for a signal that is pending, and whose default action is to ignore the signal (for example, SIGCHLD), shall cause the pending signal to be discarded, whether or not it is blocked. If the Realtime Signals	
1251			
1252	RTS	Extension option is supported, any queued values pending shall be discarded and the resources used to queue them shall be released and returned to the system for other use.	
1253			
1254			
1255			
1256		The default action for SIGCONT is to resume execution at the point where the process was stopped, after first handling any pending unblocked signals.	
1257			
1258	XSI	When a stopped process is continued, a SIGCHLD signal may be generated for its parent process, unless the parent process has set the SA_NOCLDSTOP flag.	
1259			
1260	SIG_IGN	Ignore signal.	
1261		Delivery of the signal shall have no effect on the process. The behavior of a process is undefined after it ignores a SIGFPE, SIGILL, SIGSEGV, or SIGBUS signal that was not generated by <i>kill()</i> , <i>sigqueue()</i> , or <i>raise()</i> .	
1262	RTS		
1263	RTS		
1264		The system shall not allow the action for the signals SIGKILL or SIGSTOP to be set to SIG_IGN.	
1265			
1266		Setting a signal action to SIG_IGN for a signal that is pending shall cause the pending signal to be discarded, whether or not it is blocked.	
1267			
1268		If a process sets the action for the SIGCHLD signal to SIG_IGN, the behavior is unspecified, except as specified below.	
1269	XSI		
1270		If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and <i>wait()</i> , <i>waitid()</i> , and <i>waitpid()</i> shall fail and set <i>errno</i> to [ECHILD].	
1271			
1272			
1273			
1274			
1275			
1276	RTS	If the Realtime Signals Extension option is supported, any queued values pending shall be discarded and the resources used to queue them shall be released and made available to queue other signals.	
1277			
1278			
1279		<i>pointer to a function</i>	
1280		Catch signal.	
1281		On delivery of the signal, the receiving process is to execute the signal-catching function at the specified address. After returning from the signal-catching function, the receiving process shall resume execution at the point at which it was interrupted.	
1282			
1283			
1284			
1285		If the SA_SIGINFO flag for the signal is cleared, the signal-catching function shall be entered as a C-language function call as follows:	
1286			

1287 void *func*(int *signo*);

1288 XSI|RTS If the SA_SIGINFO flag for the signal is set, the signal-catching function shall be
1289 entered as a C-language function call as follows:

1290 void *func*(int *signo*, siginfo_t **info*, void **context*);

1291 where *func* is the specified signal-catching function, *signo* is the signal number of
1292 the signal being delivered, and *info* is a pointer to a **siginfo_t** structure defined in
1293 <signal.h> containing at least the following members:

1294		Member Type	Member Name	Description
1295		int	<i>si_signo</i>	Signal number.
1296		int	<i>si_code</i>	Cause of the signal.
1297		union sigval	<i>si_value</i>	Signal value.
1298				

1299 The *si_signo* member shall contain the signal number. This shall be the same as the
1300 *signo* parameter. The *si_code* member shall contain a code identifying the cause of
1301 the signal. The following values are defined for *si_code*:

1302 SI_USER The signal was sent by the *kill()* function. The implementation
1303 may set *si_code* to SI_USER if the signal was sent by the *raise()* or
1304 *abort()* functions or any similar functions provided as
1305 implementation extensions.

1306 RTS SI_QUEUE The signal was sent by the *sigqueue()* function.

1307 RTS SI_TIMER The signal was generated by the expiration of a timer set by
1308 *timer_settime()*.

1309 RTS SI_ASYNCIO The signal was generated by the completion of an asynchronous
1310 I/O request.

1311 RTS SI_MSGQ The signal was generated by the arrival of a message on an
1312 empty message queue.

1313 If the signal was not generated by one of the functions or events listed above, the
1314 *si_code* shall be set to an implementation-defined value that is not equal to any of
1315 the values defined above.

1316 RTS If the Realtime Signals Extension is supported, and *si_code* is one of SI_QUEUE,
1317 SI_TIMER, SI_ASYNCIO, or SI_MSGQ, then *si_value* shall contain the
1318 application-specified signal value. Otherwise, the contents of *si_value* are
1319 undefined.

1320 The behavior of a process is undefined after it returns normally from a signal-
1321 XSI catching function for a SIGBUS, SIGFPE, SIGILL, or SIGSEGV signal that was not
1322 RTS generated by *kill()*, *sigqueue()*, or *raise()*.

1323 The system shall not allow a process to catch the signals SIGKILL and SIGSTOP.

1324 If a process establishes a signal-catching function for the SIGCHLD signal while it
1325 has a terminated child process for which it has not waited, it is unspecified
1326 whether a SIGCHLD signal is generated to indicate that child process.

1327 When signal-catching functions are invoked asynchronously with process
1328 execution, the behavior of some of the functions defined by this volume of
1329 IEEE Std 1003.1-2001 is unspecified if they are called from a signal-catching
1330 function.

1331 The following table defines a set of functions that shall be either reentrant or non-
 1332 interruptible by signals and shall be async-signal-safe. Therefore applications may
 1333 invoke them, without restriction, from signal-catching functions:

1334	<code>_Exit()</code>	<code>fpathconf()</code>	<code>read()</code>	<code>sigset()</code>
1335	<code>_exit()</code>	<code>fstat()</code>	<code>readlink()</code>	<code>sigsuspend()</code>
1336	<code>abort()</code>	<code>fsync()</code>	<code>recv()</code>	<code>socket()</code>
1337	<code>accept()</code>	<code>ftruncate()</code>	<code>recvfrom()</code>	<code>socketpair()</code>
1338	<code>access()</code>	<code>getegid()</code>	<code>recvmsg()</code>	<code>stat()</code>
1339	<code>aio_error()</code>	<code>geteuid()</code>	<code>rename()</code>	<code>symlink()</code>
1340	<code>aio_return()</code>	<code>getgid()</code>	<code>rmdir()</code>	<code>sysconf()</code>
1341	<code>aio_suspend()</code>	<code>getgroups()</code>	<code>select()</code>	<code>tcdrain()</code>
1342	<code>alarm()</code>	<code>getpeername()</code>	<code>sem_post()</code>	<code>tcflow()</code>
1343	<code>bind()</code>	<code>getpgrp()</code>	<code>send()</code>	<code>tcflush()</code>
1344	<code>cfgetispeed()</code>	<code>getpid()</code>	<code>sendmsg()</code>	<code>tcgetattr()</code>
1345	<code>cfgetospeed()</code>	<code>getppid()</code>	<code>sendto()</code>	<code>tcgetpgrp()</code>
1346	<code>cfsetispeed()</code>	<code>getsockname()</code>	<code>setgid()</code>	<code>tcsendbreak()</code>
1347	<code>cfsetospeed()</code>	<code>getsockopt()</code>	<code>setpgid()</code>	<code>tcsetattr()</code>
1348	<code>chdir()</code>	<code>getuid()</code>	<code>setsid()</code>	<code>tcsetpgrp()</code>
1349	<code>chmod()</code>	<code>kill()</code>	<code>setsockopt()</code>	<code>time()</code>
1350	<code>chown()</code>	<code>link()</code>	<code>setuid()</code>	<code>timer_getoverrun()</code>
1351	<code>clock_gettime()</code>	<code>listen()</code>	<code>shutdown()</code>	<code>timer_gettime()</code>
1352	<code>close()</code>	<code>lseek()</code>	<code>sigaction()</code>	<code>timer_settime()</code>
1353	<code>connect()</code>	<code>lstat()</code>	<code>sigaddset()</code>	<code>times()</code>
1354	<code>creat()</code>	<code>mkdir()</code>	<code>sigdelset()</code>	<code>umask()</code>
1355	<code>dup()</code>	<code>mkfifo()</code>	<code>sigemptyset()</code>	<code>uname()</code>
1356	<code>dup2()</code>	<code>open()</code>	<code>sigfillset()</code>	<code>unlink()</code>
1357	<code>execle()</code>	<code>pathconf()</code>	<code>sigismember()</code>	<code>utime()</code>
1358	<code>execve()</code>	<code>pause()</code>	<code>sleep()</code>	<code>wait()</code>
1359	<code>fchmod()</code>	<code>pipe()</code>	<code>signal()</code>	<code>waitpid()</code>
1360	<code>fchown()</code>	<code>poll()</code>	<code>sigpause()</code>	<code>write()</code>
1361	<code>fcntl()</code>	<code>posix_trace_event()</code>	<code>sigpending()</code>	
1362	<code>fdatasync()</code>	<code>pselect()</code>	<code>sigprocmask()</code>	
1363	<code>fork()</code>	<code>raise()</code>	<code>sigqueue()</code>	

1364 All functions not in the above table are considered to be unsafe with respect to
 1365 signals. In the presence of signals, all functions defined by this volume of
 1366 IEEE Std 1003.1-2001 shall behave as defined when called from or interrupted by a
 1367 signal-catching function, with a single exception: when a signal interrupts an
 1368 unsafe function and the signal-catching function calls an unsafe function, the
 1369 behavior is undefined.

1370 When a signal is delivered to a thread, if the action of that signal specifies termination, stop, or
 1371 continue, the entire process shall be terminated, stopped, or continued, respectively.

2.4.4 Signal Effects on Other Functions

Signals affect the behavior of certain functions defined by this volume of IEEE Std 1003.1-2001 if delivered to a process while it is executing such a function. If the action of the signal is to terminate the process, the process shall be terminated and the function shall not return. If the action of the signal is to stop the process, the process shall stop until continued or terminated. Generation of a SIGCONT signal for the process shall cause the process to be continued, and the original function shall continue at the point the process was stopped. If the action of the signal is to invoke a signal-catching function, the signal-catching function shall be invoked; in this case the original function is said to be “interrupted” by the signal. If the signal-catching function executes a **return** statement, the behavior of the interrupted function shall be as described individually for that function, except as noted for unsafe functions. Signals that are ignored shall not affect the behavior of any function; signals that are blocked shall not affect the behavior of any function until they are unblocked and then delivered, except as specified for the *sigpending()* and *sigwait()* functions.

2.5 Standard I/O Streams

A stream is associated with an external file (which may be a physical device) by “opening” a file, which may involve “creating” a new file. Creating an existing file causes its former contents to be discarded if necessary. If a file can support positioning requests (such as a disk file, as opposed to a terminal), then a “file position indicator” associated with the stream is positioned at the start (byte number 0) of the file, unless the file is opened with append mode, in which case it is implementation-defined whether the file position indicator is initially positioned at the beginning or end of the file. The file position indicator is maintained by subsequent reads, writes, and positioning requests, to facilitate an orderly progression through the file. All input takes place as if bytes were read by successive calls to *fgetc()*; all output takes place as if bytes were written by successive calls to *fputc()*.

When a stream is “unbuffered”, bytes are intended to appear from the source or at the destination as soon as possible; otherwise, bytes may be accumulated and transmitted as a block. When a stream is “fully buffered”, bytes are intended to be transmitted as a block when a buffer is filled. When a stream is “line buffered”, bytes are intended to be transmitted as a block when a newline byte is encountered. Furthermore, bytes are intended to be transmitted as a block when a buffer is filled, when input is requested on an unbuffered stream, or when input is requested on a line-buffered stream that requires the transmission of bytes. Support for these characteristics is implementation-defined, and may be affected via *setbuf()* and *setvbuf()*.

A file may be disassociated from a controlling stream by “closing” the file. Output streams are flushed (any unwritten buffer contents are transmitted) before the stream is disassociated from the file. The value of a pointer to a **FILE** object is unspecified after the associated file is closed (including the standard streams).

A file may be subsequently reopened, by the same or another program execution, and its contents reclaimed or modified (if it can be repositioned at its start). If the *main()* function returns to its original caller, or if the *exit()* function is called, all open files are closed (hence all output streams are flushed) before program termination. Other paths to program termination, such as calling *abort()*, need not close all files properly.

The address of the **FILE** object used to control a stream may be significant; a copy of a **FILE** object need not necessarily serve in place of the original.

At program start-up, three streams are predefined and need not be opened explicitly: *standard input* (for reading conventional input), *standard output* (for writing conventional output), and

1418 *standard error* (for writing diagnostic output). When opened, the standard error stream is not
 1419 fully buffered; the standard input and standard output streams are fully buffered if and only if
 1420 the stream can be determined not to refer to an interactive device.

1421 **2.5.1 Interaction of File Descriptors and Standard I/O Streams**

1422 CX This section describes the interaction of file descriptors and standard I/O streams. This
 1423 functionality is an extension to the ISO C standard (and the rest of this section is not further CX
 1424 shaded).

1425 An open file description may be accessed through a file descriptor, which is created using
 1426 functions such as *open()* or *pipe()*, or through a stream, which is created using functions such as
 1427 *fopen()* or *popen()*. Either a file descriptor or a stream is called a “handle” on the open file
 1428 description to which it refers; an open file description may have several handles.

1429 Handles can be created or destroyed by explicit user action, without affecting the underlying
 1430 open file description. Some of the ways to create them include *fcntl()*, *dup()*, *fdopen()*, *fileno()*,
 1431 and *fork()*. They can be destroyed by at least *fclose()*, *close()*, and the *exec* functions.

1432 A file descriptor that is never used in an operation that could affect the file offset (for example,
 1433 *read()*, *write()*, or *lseek()*) is not considered a handle for this discussion, but could give rise to one
 1434 (for example, as a consequence of *fdopen()*, *dup()*, or *fork()*). This exception does not include the
 1435 file descriptor underlying a stream, whether created with *fopen()* or *fdopen()*, so long as it is not
 1436 used directly by the application to affect the file offset. The *read()* and *write()* functions
 1437 implicitly affect the file offset; *lseek()* explicitly affects it.

1438 The result of function calls involving any one handle (the “active handle”) is defined elsewhere
 1439 in this volume of IEEE Std 1003.1-2001, but if two or more handles are used, and any one of them
 1440 is a stream, the application shall ensure that their actions are coordinated as described below. If
 1441 this is not done, the result is undefined.

1442 A handle which is a stream is considered to be closed when either an *fclose()* or *freopen()* is
 1443 executed on it (the result of *freopen()* is a new stream, which cannot be a handle on the same
 1444 open file description as its previous value), or when the process owning that stream terminates
 1445 with *exit()*, *abort()*, or due to a signal. A file descriptor is closed by *close()*, *_exit()*, or the *exec*
 1446 functions when *FD_CLOEXEC* is set on that file descriptor.

1447 For a handle to become the active handle, the application shall ensure that the actions below are
 1448 performed between the last use of the handle (the current active handle) and the first use of the
 1449 second handle (the future active handle). The second handle then becomes the active handle. All
 1450 activity by the application affecting the file offset on the first handle shall be suspended until it
 1451 again becomes the active file handle. (If a stream function has as an underlying function one that
 1452 affects the file offset, the stream function shall be considered to affect the file offset.)

1453 The handles need not be in the same process for these rules to apply.

1454 Note that after a *fork()*, two handles exist where one existed before. The application shall ensure
 1455 that, if both handles can ever be accessed, they are both in a state where the other could become
 1456 the active handle first. The application shall prepare for a *fork()* exactly as if it were a change of
 1457 active handle. (If the only action performed by one of the processes is one of the *exec* functions or
 1458 *_exit()* (not *exit()*), the handle is never accessed in that process.)

1459 For the first handle, the first applicable condition below applies. After the actions required
 1460 below are taken, if the handle is still open, the application can close it.

- 1461 • If it is a file descriptor, no action is required.

- 1462 • If the only further action to be performed on any handle to this open file descriptor is to close
1463 it, no action need be taken.
- 1464 • If it is a stream which is unbuffered, no action need be taken.
- 1465 • If it is a stream which is line buffered, and the last byte written to the stream was a
1466 <newline> (that is, as if a:
1467

```
putc( '\n' )
```

1468 was the most recent operation on that stream), no action need be taken.
- 1469 • If it is a stream which is open for writing or appending (but not also open for reading), the
1470 application shall either perform an *fflush()*, or the stream shall be closed.
- 1471 • If the stream is open for reading and it is at the end of the file (*feof()* is true), no action need
1472 be taken.
- 1473 • If the stream is open with a mode that allows reading and the underlying open file
1474 description refers to a device that is capable of seeking, the application shall either perform
1475 an *fflush()*, or the stream shall be closed.
- 1476 Otherwise, the result is undefined.
- 1477 For the second handle:
- 1478 • If any previous active handle has been used by a function that explicitly changed the file
1479 offset, except as required above for the first handle, the application shall perform an *lseek()* or
1480 *fseek()* (as appropriate to the type of handle) to an appropriate location.
- 1481 If the active handle ceases to be accessible before the requirements on the first handle, above,
1482 have been met, the state of the open file description becomes undefined. This might occur during
1483 functions such as a *fork()* or *_exit()*.
- 1484 The *exec* functions make inaccessible all streams that are open at the time they are called,
1485 independent of which streams or file descriptors may be available to the new process image.
- 1486 When these rules are followed, regardless of the sequence of handles used, implementations
1487 shall ensure that an application, even one consisting of several processes, shall yield correct
1488 results: no data shall be lost or duplicated when writing, and all data shall be written in order,
1489 except as requested by seeks. It is implementation-defined whether, and under what conditions,
1490 all input is seen exactly once.
- 1491 If the rules above are not followed, the result is unspecified.
- 1492 Each function that operates on a stream is said to have zero or more “underlying functions”.
1493 This means that the stream function shares certain traits with the underlying functions, but does
1494 not require that there be any relation between the implementations of the stream function and its
1495 underlying functions.

1496 2.5.2 Stream Orientation and Encoding Rules

1497 For conformance to the ISO/IEC 9899:1999 standard, the definition of a stream includes an
1498 “orientation”. After a stream is associated with an external file, but before any operations are
1499 performed on it, the stream is without orientation. Once a wide-character input/output function
1500 has been applied to a stream without orientation, the stream shall become “wide-oriented”.
1501 Similarly, once a byte input/output function has been applied to a stream without orientation,
1502 the stream shall become “byte-oriented”. Only a call to the *freopen()* function or the *fwide()*
1503 function can otherwise alter the orientation of a stream.

1504 A successful call to *freopen()* shall remove any orientation. The three predefined streams *standard*
 1505 *input*, *standard output*, and *standard error* shall be unoriented at program start-up.

1506 Byte input/output functions cannot be applied to a wide-oriented stream, and wide-character
 1507 input/output functions cannot be applied to a byte-oriented stream. The remaining stream
 1508 operations shall not affect and shall not be affected by a stream's orientation, except for the
 1509 following additional restriction:

- 1510 • For wide-oriented streams, after a successful call to a file-positioning function that leaves the
 1511 file position indicator prior to the end-of-file, a wide-character output function can overwrite
 1512 a partial character; any file contents beyond the byte(s) written are henceforth undefined.

1513 Each wide-oriented stream has an associated **mbstate_t** object that stores the current parse state
 1514 of the stream. A successful call to *fgetpos()* shall store a representation of the value of this
 1515 **mbstate_t** object as part of the value of the **fpos_t** object. A later successful call to *fsetpos()* using
 1516 the same stored **fpos_t** value shall restore the value of the associated **mbstate_t** object as well as
 1517 the position within the controlled stream.

1518 Implementations that support multiple encoding rules associate an encoding rule with the
 1519 stream. The encoding rule shall be determined by the setting of the *LC_CTYPE* category in the
 1520 current locale at the time when the stream becomes wide-oriented. As with the stream's
 1521 orientation, the encoding rule associated with a stream cannot be changed once it has been set,
 1522 except by a successful call to *freopen()* which clears the encoding rule and resets the orientation
 1523 to unoriented.

1524 Although wide-oriented streams are conceptually sequences of wide characters, the external file
 1525 associated with a wide-oriented stream is a sequence of (possibly multi-byte) characters
 1526 generalized as follows:

- 1527 • Multi-byte encodings within files may contain embedded null bytes (unlike multi-byte
 1528 encodings valid for use internal to the program).
- 1529 • A file need not begin nor end in the initial shift state.

1530 Moreover, the encodings used for characters may differ among files. Both the nature and choice
 1531 of such encodings are implementation-defined.

1532 The wide-character input functions read characters from the stream and convert them to wide
 1533 characters as if they were read by successive calls to the *fgetwc()* function. Each conversion shall
 1534 occur as if by a call to the *mbrtowc()* function, with the conversion state described by the stream's
 1535 own **mbstate_t** object, except the encoding rule associated with the stream is used instead of the
 1536 encoding rule implied by the *LC_CTYPE* category of the current locale.

1537 The wide-character output functions convert wide characters to (possibly multi-byte) characters
 1538 and write them to the stream as if they were written by successive calls to the *fputwc()* function.
 1539 Each conversion shall occur as if by a call to the *wcrtomb()* function, with the conversion state
 1540 described by the stream's own **mbstate_t** object, except the encoding rule associated with the
 1541 stream is used instead of the encoding rule implied by the *LC_CTYPE* category of the current
 1542 locale.

1543 An “encoding error” shall occur if the character sequence presented to the underlying *mbrtowc()*
 1544 function does not form a valid (generalized) character, or if the code value passed to the
 1545 underlying *wcrtomb()* function does not correspond to a valid (generalized) character. The
 1546 wide-character input/output functions and the byte input/output functions store the value of
 1547 the macro [EILSEQ] in *errno* if and only if an encoding error occurs.

2.6 STREAMS

STREAMS functionality is provided on implementations supporting the XSI STREAMS Option Group. This functionality is dependent on support of the XSI STREAMS option (and the rest of this section is not further shaded for this option).

STREAMS provides a uniform mechanism for implementing networking services and other character-based I/O. The STREAMS function provides direct access to protocol modules. STREAMS modules are unspecified objects. Access to STREAMS modules is provided by interfaces in IEEE Std 1003.1-2001. Creation of STREAMS modules is outside the scope of IEEE Std 1003.1-2001.

A STREAM is typically a full-duplex connection between a process and an open device or pseudo-device. However, since pipes may be STREAMS-based, a STREAM can be a full-duplex connection between two processes. The STREAM itself exists entirely within the implementation and provides a general character I/O function for processes. It optionally includes one or more intermediate processing modules that are interposed between the process end of the STREAM (STREAM head) and a device driver at the end of the STREAM (STREAM end).

STREAMS I/O is based on messages. There are three types of message:

- *Data messages* containing actual data for input or output
- *Control data* containing instructions for the STREAMS modules and underlying implementation
- Other messages, which include file descriptors

The interface between the STREAM and the rest of the implementation is provided by a set of functions at the STREAM head. When a process calls *write()*, *writv()*, *putmsg()*, *putpmsg()*, or *ioctl()*, messages are sent down the STREAM, and *read()*, *readv()*, *getmsg()*, or *getpmsg()* accepts data from the STREAM and passes it to a process. Data intended for the device at the downstream end of the STREAM is packaged into messages and sent downstream, while data and signals from the device are composed into messages by the device driver and sent upstream to the STREAM head.

When a STREAMS-based device is opened, a STREAM shall be created that contains the STREAM head and the STREAM end (driver). If pipes are STREAMS-based in an implementation, when a pipe is created, two STREAMS shall be created, each containing a STREAM head. Other modules are added to the STREAM using *ioctl()*. New modules are “pushed” onto the STREAM one at a time in last-in, first-out (LIFO) style, as though the STREAM was a push-down stack.

Priority

Message types are classified according to their queuing priority and may be *normal* (non-priority), *priority*, or *high-priority* messages. A message belongs to a particular priority band that determines its ordering when placed on a queue. Normal messages have a priority band of 0 and shall always be placed at the end of the queue following all other messages in the queue. High-priority messages are always placed at the head of a queue, but shall be discarded if there is already a high-priority message in the queue. Their priority band shall be ignored; they are high-priority by virtue of their type. Priority messages have a priority band greater than 0. Priority messages are always placed after any messages of the same or higher priority. High-priority and priority messages are used to send control and data information outside the normal flow of control. By convention, high-priority messages shall not be affected by flow control. Normal and priority messages have separate flow controls.

Message Parts

A process may access STREAMS messages that contain a data part, control part, or both. The data part is that information which is transmitted over the communication medium and the control information is used by the local STREAMS modules. The other types of messages are used between modules and are not accessible to processes. Messages containing only a data part are accessible via *putmsg()*, *putpmsg()*, *getmsg()*, *getpmsg()*, *read()*, *readv()*, *write()*, or *writev()*. Messages containing a control part with or without a data part are accessible via calls to *putmsg()*, *putpmsg()*, *getmsg()*, or *getpmsg()*.

2.6.1 Accessing STREAMS

A process accesses STREAMS-based files using the standard functions *close()*, *ioctl()*, *getmsg()*, *getpmsg()*, *open()*, *pipe()*, *poll()*, *putmsg()*, *putpmsg()*, *read()*, or *write()*. Refer to the applicable function definitions for general properties and errors.

Calls to *ioctl()* shall perform control functions on the STREAM associated with the file descriptor *fildev*. The control functions may be performed by the STREAM head, a STREAMS module, or the STREAMS driver for the STREAM.

STREAMS modules and drivers can detect errors, sending an error message to the STREAM head, thus causing subsequent functions to fail and set *errno* to the value specified in the message. In addition, STREAMS modules and drivers can elect to fail a particular *ioctl()* request alone by sending a negative acknowledgement message to the STREAM head. This shall cause just the pending *ioctl()* request to fail and set *errno* to the value specified in the message.

2.7 XSI Interprocess Communication

This section describes extensions to support interprocess communication. This functionality is dependent on support of the XSI extension (and the rest of this section is not further shaded for this option).

The following message passing, semaphore, and shared memory services form an XSI interprocess communication facility. Certain aspects of their operation are common, and are defined as follows.

IPC Functions		
<i>msgctl()</i>	<i>semctl()</i>	<i>shmctl()</i>
<i>msgget()</i>	<i>semget()</i>	<i>shmdt()</i>
<i>msgrcv()</i>	<i>semop()</i>	<i>shmget()</i>
<i>msgsnd()</i>	<i>shmat()</i>	

Another interprocess communication facility is provided by functions in the Realtime Option Group; see Section 2.8 (on page 41).

2.7.1 IPC General Description

Each individual shared memory segment, message queue, and semaphore set shall be identified by a unique positive integer, called, respectively, a shared memory identifier, *shmid*, a semaphore identifier, *semid*, and a message queue identifier, *msqid*. The identifiers shall be returned by calls to *shmget()*, *semget()*, and *msgget()*, respectively.

Associated with each identifier is a data structure which contains data related to the operations which may be or may have been performed; see the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/shm.h>**, **<sys/sem.h>**, and **<sys/msg.h>** for their descriptions.

Each of the data structures contains both ownership information and an **ipc_perm** structure (see the Base Definitions volume of IEEE Std 1003.1-2001, **<sys/ipc.h>**) which are used in conjunction to determine whether or not read/write (read/alter for semaphores) permissions should be granted to processes using the IPC facilities. The *mode* member of the **ipc_perm** structure acts as a bit field which determines the permissions.

The values of the bits are given below in octal notation.

Bit	Meaning
0400	Read by user.
0200	Write by user.
0040	Read by group.
0020	Write by group.
0004	Read by others.
0002	Write by others.

The name of the **ipc_perm** structure is *shm_perm*, *sem_perm*, or *msg_perm*, depending on which service is being used. In each case, read and write/alter permissions shall be granted to a process if one or more of the following are true ("xxx" is replaced by *shm*, *sem*, or *msg*, as appropriate):

- The process has appropriate privileges.
- The effective user ID of the process matches *xxx_perm.cuid* or *xxx_perm.uid* in the data structure associated with the IPC identifier, and the appropriate bit of the *user* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* but the effective group ID of the process matches *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, and the appropriate bit of the *group* field in *xxx_perm.mode* is set.
- The effective user ID of the process does not match *xxx_perm.cuid* or *xxx_perm.uid* and the effective group ID of the process does not match *xxx_perm.cgid* or *xxx_perm.gid* in the data structure associated with the IPC identifier, but the appropriate bit of the *other* field in *xxx_perm.mode* is set.

Otherwise, the permission shall be denied.

2.8 Realtime

This section defines functions to support the source portability of applications with realtime requirements. The presence of many of these functions is dependent on support for implementation options described in the text.

The specific functional areas included in this section and their scope include the following. Full definitions of these terms can be found in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 3, Definitions.

- Semaphores
- Process Memory Locking
- Memory Mapped Files and Shared Memory Objects
- Priority Scheduling
- Realtime Signal Extension
- Timers
- Interprocess Communication
- Synchronized Input and Output
- Asynchronous Input and Output

All the realtime functions defined in this volume of IEEE Std 1003.1-2001 are portable, although some of the numeric parameters used by an implementation may have hardware dependencies.

2.8.1 Realtime Signals

RTS Realtime signal generation and delivery is dependent on support for the Realtime Signals Extension option.

See Section 2.4.2 (on page 29).

2.8.2 Asynchronous I/O

AIO The functionality described in this section is dependent on support of the Asynchronous Input and Output option (and the rest of this section is not further shaded for this option).

An asynchronous I/O control block structure **aiocb** is used in many asynchronous I/O functions. It is defined in the Base Definitions volume of IEEE Std 1003.1-2001, **<aio.h>** and has at least the following members:

Member Type	Member Name	Description
int	<i>aio_fildes</i>	File descriptor.
off_t	<i>aio_offset</i>	File offset.
volatile void*	<i>aio_buf</i>	Location of buffer.
size_t	<i>aio_nbytes</i>	Length of transfer.
int	<i>aio_reqprio</i>	Request priority offset.
struct sigevent	<i>aio_sigevent</i>	Signal number and value.
int	<i>aio_lio_opcode</i>	Operation to be performed.

The *aio_fildes* element is the file descriptor on which the asynchronous operation is performed.

If **O_APPEND** is not set for the file descriptor *aio_fildes* and if *aio_fildes* is associated with a device that is capable of seeking, then the requested operation takes place at the absolute position in the file as given by *aio_offset*, as if *lseek()* were called immediately prior to the

operation with an *offset* argument equal to *aio_offset* and a *whence* argument equal to `SEEK_SET`. If `O_APPEND` is set for the file descriptor, or if *aio_fildes* is associated with a device that is incapable of seeking, write operations append to the file in the same order as the calls were made, with the following exception: under implementation-defined circumstances, such as operation on a multi-processor or when requests of differing priorities are submitted at the same time, the ordering restriction may be relaxed. Since there is no way for a strictly conforming application to determine whether this relaxation applies, all strictly conforming applications which rely on ordering of output shall be written in such a way that they will operate correctly if the relaxation applies. After a successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file is unspecified. The *aio_nbytes* and *aio_buf* elements are the same as the *nbyte* and *buf* arguments defined by *read()* and *write()*, respectively.

If `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, then asynchronous I/O is queued in priority order, with the priority of each asynchronous operation based on the current scheduling priority of the calling process. The *aio_reqprio* member can be used to lower (but not raise) the asynchronous I/O operation priority and is within the range zero through `{AIO_PRIO_DELTA_MAX}`, inclusive. Unless both `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing asynchronous I/O requests is unspecified. When both `_POSIX_PRIORITIZED_IO` and `_POSIX_PRIORITY_SCHEDULING` are defined, the order of processing of requests submitted by processes whose schedulers are not `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is unspecified. The priority of an asynchronous request is computed as (process scheduling priority) minus *aio_reqprio*. The priority assigned to each asynchronous I/O request is an indication of the desired order of execution of the request relative to other asynchronous I/O requests for this file. If `_POSIX_PRIORITIZED_IO` is defined, requests issued with the same priority to a character special file are processed by the underlying device in FIFO order; the order of processing of requests of the same priority issued to files that are not character special files is unspecified. Numerically higher priority values indicate requests of higher priority. The value of *aio_reqprio* has no effect on process scheduling priority. When prioritized asynchronous I/O requests to the same file are blocked waiting for a resource required for that I/O operation, the higher-priority I/O requests shall be granted the resource before lower-priority I/O requests are granted the resource. The relative priority of asynchronous I/O and synchronous I/O is implementation-defined. If `_POSIX_PRIORITIZED_IO` is defined, the implementation shall define for which files I/O prioritization is supported.

The *aio_sigevent* determines how the calling process shall be notified upon I/O completion, as specified in Section 2.4.1 (on page 28). If *aio_sigevent.sigev_notify* is `SIGEV_NONE`, then no signal shall be posted upon I/O completion, but the error status for the operation and the return status for the operation shall be set appropriately.

The *aio_lio_opcode* field is used only by the *lio_listio()* call. The *lio_listio()* call allows multiple asynchronous I/O operations to be submitted at a single time. The function takes as an argument an array of pointers to **aiocb** structures. Each **aiocb** structure indicates the operation to be performed (read or write) via the *aio_lio_opcode* field.

The address of the **aiocb** structure is used as a handle for retrieving the error status and return status of the asynchronous operation while it is in progress.

The **aiocb** structure and the data buffers associated with the asynchronous I/O operation are being used by the system for asynchronous I/O while, and only while, the error status of the asynchronous operation is equal to `[EINPROGRESS]`. Applications shall not modify the **aiocb** structure while the structure is being used by the system for asynchronous I/O.

The return status of the asynchronous operation is the number of bytes transferred by the I/O operation. If the error status is set to indicate an error completion, then the return status is set to

1755 the return value that the corresponding *read()*, *write()*, or *fsync()* call would have returned.
 1756 When the error status is not equal to [EINPROGRESS], the return status shall reflect the return
 1757 status of the corresponding synchronous operation.

1758 **2.8.3 Memory Management**

1759 2.8.3.1 *Memory Locking*

1760 MLR Range memory locking operations are defined in terms of pages. Implementations may restrict |
 1761 the size and alignment of range lockings to be on page-size boundaries. The page size, in bytes,
 1762 is the value of the configurable system variable {PAGESIZE}. If an implementation has no
 1763 restrictions on size or alignment, it may specify a 1-byte page size.

1764 ML|MLR Memory locking guarantees the residence of portions of the address space. It is |
 1765 implementation-defined whether locking memory guarantees fixed translation between virtual
 1766 addresses (as seen by the process) and physical addresses. Per-process memory locks are not
 1767 inherited across a *fork()*, and all memory locks owned by a process are unlocked upon *exec* or
 1768 process termination. Unmapping of an address range removes any memory locks established on
 1769 that address range by this process.

1770 2.8.3.2 *Memory Mapped Files*

1771 MF The functionality described in this section is dependent on support of the Memory Mapped Files
 1772 option (and the rest of this section is not further shaded for this option).

1773 Range memory mapping operations are defined in terms of pages. Implementations may
 1774 restrict the size and alignment of range mappings to be on page-size boundaries. The page size,
 1775 in bytes, is the value of the configurable system variable {PAGESIZE}. If an implementation has
 1776 no restrictions on size or alignment, it may specify a 1-byte page size.

1777 Memory mapped files provide a mechanism that allows a process to access files by directly
 1778 incorporating file data into its address space. Once a file is mapped into a process address space,
 1779 the data can be manipulated as memory. If more than one process maps a file, its contents are
 1780 shared among them. If the mappings allow shared write access, then data written into the
 1781 memory object through the address space of one process appears in the address spaces of all
 1782 processes that similarly map the same portion of the memory object.

1783 SHM Shared memory objects are named regions of storage that may be independent of the file system
 1784 and can be mapped into the address space of one or more processes to allow them to share the
 1785 associated memory.

1786 SHM An *unlink()* of a file or *shm_unlink()* of a shared memory object, while causing the removal of the
 1787 name, does not unmap any mappings established for the object. Once the name has been
 1788 removed, the contents of the memory object are preserved as long as it is referenced. The
 1789 memory object remains referenced as long as a process has the memory object open or has some
 1790 area of the memory object mapped.

1791 2.8.3.3 *Memory Protection*

1792 MPR MF The functionality described in this section is dependent on support of the Memory Protection
 1793 and Memory Mapped Files option (and the rest of this section is not further shaded for these
 1794 options).

1795 When an object is mapped, various application accesses to the mapped region may result in
 1796 signals. In this context, SIGBUS is used to indicate an error using the mapped object, and
 1797 SIGSEGV is used to indicate a protection violation or misuse of an address:

- 1798 • A mapping may be restricted to disallow some types of access.
- 1799 • Write attempts to memory that was mapped without write access, or any access to memory
- 1800 mapped PROT_NONE, shall result in a SIGSEGV signal.
- 1801 • References to unmapped addresses shall result in a SIGSEGV signal.
- 1802 • Reference to whole pages within the mapping, but beyond the current length of the object,
- 1803 shall result in a SIGBUS signal.
- 1804 • The size of the object is unaffected by access beyond the end of the object (even if a SIGBUS is
- 1805 not generated).

1806 2.8.3.4 *Typed Memory Objects*

1807 TYM The functionality described in this section is dependent on support of the Typed Memory
 1808 Objects option (and the rest of this section is not further shaded for this option).

1809 Implementations may support the Typed Memory Objects option without supporting the
 1810 Memory Mapped Files option or the Shared Memory Objects option. Typed memory objects are
 1811 implementation-configurable named storage pools accessible from one or more processors in a
 1812 system, each via one or more ports, such as backplane buses, LANs, I/O channels, and so on.
 1813 Each valid combination of a storage pool and a port is identified through a name that is defined
 1814 at system configuration time, in an implementation-defined manner; the name may be
 1815 independent of the file system. Using this name, a typed memory object can be opened and
 1816 mapped into process address space. For a given storage pool and port, it is necessary to support
 1817 both dynamic allocation from the pool as well as mapping at an application-supplied offset
 1818 within the pool; when dynamic allocation has been performed, subsequent deallocation must be
 1819 supported. Lastly, accessing typed memory objects from different ports requires a method for
 1820 obtaining the offset and length of contiguous storage of a region of typed memory (dynamically
 1821 allocated or not); this allows typed memory to be shared among processes and/or processors
 1822 while being accessed from the desired port.

1823 2.8.4 **Process Scheduling**

1824 PS The functionality described in this section is dependent on support of the Process Scheduling
 1825 option (and the rest of this section is not further shaded for this option).

1826 **Scheduling Policies**

1827 The scheduling semantics described in this volume of IEEE Std 1003.1-2001 are defined in terms
 1828 of a conceptual model that contains a set of thread lists. No implementation structures are
 1829 necessarily implied by the use of this conceptual model. It is assumed that no time elapses
 1830 during operations described using this model, and therefore no simultaneous operations are
 1831 possible. This model discusses only processor scheduling for runnable threads, but it should be
 1832 noted that greatly enhanced predictability of realtime applications results if the sequencing of
 1833 other resources takes processor scheduling policy into account.

1834 There is, conceptually, one thread list for each priority. A runnable thread will be on the thread
 1835 list for that thread's priority. Multiple scheduling policies shall be provided. Each non-empty
 1836 thread list is ordered, contains a head as one end of its order, and a tail as the other. The purpose
 1837 of a scheduling policy is to define the allowable operations on this set of lists (for example,
 1838 moving threads between and within lists).

1839 Each process shall be controlled by an associated scheduling policy and priority. These
 1840 parameters may be specified by explicit application execution of the *sched_setscheduler()* or
 1841 *sched_setparam()* functions.

Each thread shall be controlled by an associated scheduling policy and priority. These parameters may be specified by explicit application execution of the *pthread_setschedparam()* function.

Associated with each policy is a priority range. Each policy definition shall specify the minimum priority range for that policy. The priority ranges for each policy may but need not overlap the priority ranges of other policies.

A conforming implementation shall select the thread that is defined as being at the head of the highest priority non-empty thread list to become a running thread, regardless of its associated policy. This thread is then removed from its thread list.

Four scheduling policies are specifically required. Other implementation-defined scheduling policies may be defined. The following symbols are defined in the Base Definitions volume of IEEE Std 1003.1-2001, <**sched.h**>:

SCHED_FIFO First in, first out (FIFO) scheduling policy.

SCHED_RR Round robin scheduling policy.

SCHED_SPORADIC Sporadic server scheduling policy.

SCHED_OTHER Another scheduling policy.

The values of these symbols shall be distinct.

SCHED_FIFO

Conforming implementations shall include a scheduling policy called the FIFO scheduling policy.

Threads scheduled under this policy are chosen from a thread list that is ordered by the time its threads have been on the list without being executed; generally, the head of the list is the thread that has been on the list the longest time, and the tail is the thread that has been on the list the shortest time.

Under the **SCHED_FIFO** policy, the modification of the definitional thread lists is as follows:

1. When a running thread becomes a preempted thread, it becomes the head of the thread list for its priority.
2. When a blocked thread becomes a runnable thread, it becomes the tail of the thread list for its priority.
3. When a running thread calls the *sched_setscheduler()* function, the process specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
4. When a running thread calls the *sched_setparam()* function, the priority of the process specified in the function call is modified to the priority specified by the *param* argument.
5. When a running thread calls the *pthread_setschedparam()* function, the thread specified in the function call is modified to the specified policy and the priority specified by the *param* argument.
6. When a running thread calls the *pthread_setschedprio()* function, the thread specified in the function call is modified to the priority specified by the *prio* argument.
7. If a thread whose policy or priority has been modified other than by *pthread_setschedprio()* is a running thread or is runnable, it then becomes the tail of the thread list for its new priority.

8. If a thread whose policy or priority has been modified by *pthread_setschedprio()* is a running thread or is runnable, the effect on its position in the thread list depends on the direction of the modification, as follows:
 - a. If the priority is raised, the thread becomes the tail of the thread list.
 - b. If the priority is unchanged, the thread does not change position in the thread list.
 - c. If the priority is lowered, the thread becomes the head of the thread list.
9. When a running thread issues the *sched_yield()* function, the thread becomes the tail of the thread list for its priority.
10. At no other time is the position of a thread with this scheduling policy within the thread lists affected.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()* and *sched_get_priority_min()* functions when *SCHED_FIFO* is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_RR

Conforming implementations shall include a scheduling policy called the “round robin” scheduling policy. This policy shall be identical to the *SCHED_FIFO* policy with the additional condition that when the implementation detects that a running thread has been executing as a running thread for a time period of the length returned by the *sched_rr_get_interval()* function or longer, the thread shall become the tail of its thread list and the head of that thread list shall be removed and made a running thread.

The effect of this policy is to ensure that if there are multiple *SCHED_RR* threads at the same priority, one of them does not monopolize the processor. An application should not rely only on the use of *SCHED_RR* to ensure application progress among multiple threads if the application includes threads using the *SCHED_FIFO* policy at the same or higher priority levels or *SCHED_RR* threads at a higher priority level.

A thread under this policy that is preempted and subsequently resumes execution as a running thread completes the unexpired portion of its round robin interval time period.

For this policy, valid priorities shall be within the range returned by the *sched_get_priority_max()* and *sched_get_priority_min()* functions when *SCHED_RR* is provided as the parameter. Conforming implementations shall provide a priority range of at least 32 priorities for this policy.

SCHED_SPORADIC

The functionality described in this section is dependent on support of the Process Sporadic Server or Thread Sporadic Server options (and the rest of this section is not further shaded for these options).

If *_POSIX_SPORADIC_SERVER* or *_POSIX_THREAD_SPORADIC_SERVER* is defined, the implementation shall include a scheduling policy identified by the value *SCHED_SPORADIC*.

The sporadic server policy is based primarily on two parameters: the replenishment period and the available execution capacity. The replenishment period is given by the *sched_ss_repl_period* member of the **sched_param** structure. The available execution capacity is initialized to the value given by the *sched_ss_init_budget* member of the same parameter. The sporadic server policy is identical to the *SCHED_FIFO* policy with some additional conditions that cause the thread’s assigned priority to be switched between the values specified by the *sched_priority* and

1928 *sched_ss_low_priority* members of the **sched_param** structure.

1929 The priority assigned to a thread using the sporadic server scheduling policy is determined in
 1930 the following manner: if the available execution capacity is greater than zero and the number of
 1931 pending replenishment operations is strictly less than *sched_ss_max_repl*, the thread is assigned
 1932 the priority specified by *sched_priority*; otherwise, the assigned priority shall be
 1933 *sched_ss_low_priority*. If the value of *sched_priority* is less than or equal to the value of
 1934 *sched_ss_low_priority*, the results are undefined. When active, the thread shall belong to the
 1935 thread list corresponding to its assigned priority level, according to the mentioned priority
 1936 assignment. The modification of the available execution capacity and, consequently of the
 1937 assigned priority, is done as follows:

- 1938 1. When the thread at the head of the *sched_priority* list becomes a running thread, its
 1939 execution time shall be limited to at most its available execution capacity, plus the
 1940 resolution of the execution time clock used for this scheduling policy. This resolution shall
 1941 be implementation-defined.
- 1942 2. Each time the thread is inserted at the tail of the list associated with *sched_priority*—
 1943 because as a blocked thread it became runnable with priority *sched_priority* or because a
 1944 replenishment operation was performed—the time at which this operation is done is
 1945 posted as the *activation_time*.
- 1946 3. When the running thread with assigned priority equal to *sched_priority* becomes a
 1947 preempted thread, it becomes the head of the thread list for its priority, and the execution
 1948 time consumed is subtracted from the available execution capacity. If the available
 1949 execution capacity would become negative by this operation, it shall be set to zero.
- 1950 4. When the running thread with assigned priority equal to *sched_priority* becomes a blocked
 1951 thread, the execution time consumed is subtracted from the available execution capacity,
 1952 and a replenishment operation is scheduled, as described in 6 and 7. If the available
 1953 execution capacity would become negative by this operation, it shall be set to zero.
- 1954 5. When the running thread with assigned priority equal to *sched_priority* reaches the limit
 1955 imposed on its execution time, it becomes the tail of the thread list for
 1956 *sched_ss_low_priority*, the execution time consumed is subtracted from the available
 1957 execution capacity (which becomes zero), and a replenishment operation is scheduled, as
 1958 described in 6 and 7.
- 1959 6. Each time a replenishment operation is scheduled, the amount of execution capacity to be
 1960 replenished, *replenish_amount*, is set equal to the execution time consumed by the thread
 1961 since the *activation_time*. The replenishment is scheduled to occur at *activation_time* plus
 1962 *sched_ss_repl_period*. If the scheduled time obtained is before the current time, the
 1963 replenishment operation is carried out immediately. Several replenishment operations may
 1964 be pending at the same time, each of which will be serviced at its respective scheduled
 1965 time. With the above rules, the number of replenishment operations simultaneously
 1966 pending for a given thread that is scheduled under the sporadic server policy shall not be
 1967 greater than *sched_ss_max_repl*.
- 1968 7. A replenishment operation consists of adding the corresponding *replenish_amount* to the
 1969 available execution capacity at the scheduled time. If, as a consequence of this operation,
 1970 the execution capacity would become larger than *sched_ss_initial_budget*, it shall be
 1971 rounded down to a value equal to *sched_ss_initial_budget*. Additionally, if the thread was
 1972 runnable or running, and had assigned priority equal to *sched_ss_low_priority*, then it
 1973 becomes the tail of the thread list for *sched_priority*.

1974 Execution time is defined in Section 2.2.2 (on page 14).

1975 For this policy, changing the value of a CPU-time clock via `clock_settime()` shall have no effect on
1976 its behavior.

1977 For this policy, valid priorities shall be within the range returned by the `sched_get_priority_min()`
1978 and `sched_get_priority_max()` functions when `SCHED_SPORADIC` is provided as the parameter.
1979 Conforming implementations shall provide a priority range of at least 32 distinct priorities for
1980 this policy.

1981 **SCHED_OTHER**

1982 Conforming implementations shall include one scheduling policy identified as `SCHED_OTHER`
1983 (which may execute identically with either the FIFO or round robin scheduling policy). The
1984 effect of scheduling threads with the `SCHED_OTHER` policy in a system in which other threads
1985 ss are executing under `SCHED_FIFO`, `SCHED_RR`, or `SCHED_SPORADIC` is implementation-
1986 defined.

1987 This policy is defined to allow strictly conforming applications to be able to indicate in a
1988 portable manner that they no longer need a realtime scheduling policy.

1989 For threads executing under this policy, the implementation shall use only priorities within the
1990 range returned by the `sched_get_priority_max()` and `sched_get_priority_min()` functions when
1991 `SCHED_OTHER` is provided as the parameter.

1992 **2.8.5 Clocks and Timers**

1993 TMR The functionality described in this section is dependent on support of the Timers option (and the
1994 rest of this section is not further shaded for this option).

1995 The `<time.h>` header defines the types and manifest constants used by the timing facility.

1996 **Time Value Specification Structures**

1997 Many of the timing facility functions accept or return time value specifications. A time value
1998 structure **timespec** specifies a single time value and includes at least the following members:

1999	Member Type	Member Name	Description
2000	time_t	<i>tv_sec</i>	Seconds.
2001	long	<i>tv_nsec</i>	Nanoseconds.
2002			

2003 The *tv_nsec* member is only valid if greater than or equal to zero, and less than the number of
2004 nanoseconds in a second (1 000 million). The time interval described by this structure is (*tv_sec* *
2005 10^9 + *tv_nsec*) nanoseconds.

2006 A time value structure **itimerspec** specifies an initial timer value and a repetition interval for use
2007 by the per-process timer functions. This structure includes at least the following members:

2008	Member Type	Member Name	Description
2009	struct timespec	<i>it_interval</i>	Timer period.
2010	struct timespec	<i>it_value</i>	Timer expiration.
2011			

2012 If the value described by *it_value* is non-zero, it indicates the time to or time of the next timer
2013 expiration (for relative and absolute timer values, respectively). If the value described by *it_value*
2014 is zero, the timer shall be disarmed.

2015 If the value described by *it_interval* is non-zero, it specifies an interval which shall be used in
2016 reloading the timer when it expires; that is, a periodic timer is specified. If the value described by

2017 *it_interval* is zero, the timer is disarmed after its next expiration; that is, a one-shot timer is
2018 specified.

2019 **Timer Event Notification Control Block**

2020 RTS Per-process timers may be created that notify the process of timer expirations by queuing a
2021 realtime extended signal. The **sigevent** structure, defined in the Base Definitions volume of
2022 IEEE Std 1003.1-2001, <**signal.h**>, is used in creating such a timer. The **sigevent** structure
2023 contains the signal number and an application-specific data value which shall be used when
2024 notifying the calling process of timer expiration events.

2025 **Manifest Constants**

2026 The following constants are defined in the Base Definitions volume of IEEE Std 1003.1-2001,
2027 <**time.h**>:

2028 **CLOCK_REALTIME** The identifier for the system-wide realtime clock.

2029 **TIMER_ABSTIME** Flag indicating time is absolute with respect to the clock associated
2030 with a timer.

2031 MON **CLOCK_MONOTONIC** The identifier for the system-wide monotonic clock, which is defined
2032 as a clock whose value cannot be set via *clock_settime()* and which
2033 cannot have backward clock jumps. The maximum possible clock
2034 jump is implementation-defined.

2035 MON The maximum allowable resolution for **CLOCK_REALTIME** and **CLOCK_MONOTONIC** clocks
2036 and all time services based on these clocks is represented by **{_POSIX_CLOCKRES_MIN}** and
2037 shall be defined as 20 ms (1/50 of a second). Implementations may support smaller values of
2038 resolution for these clocks to provide finer granularity time bases. The actual resolution
2039 supported by an implementation for a specific clock is obtained using the *clock_getres()* function.
2040 If the actual resolution supported for a time service based on one of these clocks differs from the
2041 resolution supported for that clock, the implementation shall document this difference.

2042 MON The minimum allowable maximum value for **CLOCK_REALTIME** and **CLOCK_MONOTONIC**
2043 clocks and all absolute time services based on them is the same as that defined by the ISO C
2044 standard for the **time_t** type. If the maximum value supported by a time service based on one of
2045 these clocks differs from the maximum value supported by that clock, the implementation shall
2046 document this difference.

2047 **Execution Time Monitoring**

2048 CPT If **_POSIX_CPUTIME** is defined, process CPU-time clocks shall be supported in addition to the
2049 clocks described in **Manifest Constants**.

2050 TCT If **_POSIX_THREAD_CPUTIME** is defined, thread CPU-time clocks shall be supported.

2051 CPT|TCT CPU-time clocks measure execution or CPU time, which is defined in the Base Definitions
2052 volume of IEEE Std 1003.1-2001, Section 3.117, CPU Time (Execution Time). The mechanism
2053 used to measure execution time is described in the Base Definitions volume of
2054 IEEE Std 1003.1-2001, Section 4.9, Measurement of Execution Time.

2055 CPT If **_POSIX_CPUTIME** is defined, the following constant of the type **clockid_t** is defined in
2056 <**time.h**>:

2057 **CLOCK_PROCESS_CPUTIME_ID**

2058 When this value of the type **clockid_t** is used in a *clock()* or *timer*()* function call, it is
2059 interpreted as the identifier of the CPU-time clock associated with the process making the

2060 function call.

2061

2062 TCT If `_POSIX_THREAD_CPUTIME` is defined, the following constant of the type **clockid_t** is

2063 defined in **<time.h>**:

2064 **CLOCK_THREAD_CPUTIME_ID**

2065 When this value of the type **clockid_t** is used in a *clock()* or *timer*()* function call, it is

2066 interpreted as the identifier of the CPU-time clock associated with the thread making the

2067 function call.

2068 2.9 Threads

2069 THR The functionality described in this section is dependent on support of the Threads option (and

2070 the rest of this section is not further shaded for this option).

2071 This section defines functionality to support multiple flows of control, called “threads”, within a

2072 process. For the definition of threads, see the Base Definitions volume of IEEE Std 1003.1-2001,

2073 Section 3.393, Thread.

2074 The specific functional areas covered by threads and their scope include:

- 2075 • Thread management: the creation, control, and termination of multiple flows of control in the
- 2076 same process under the assumption of a common shared address space
- 2077 • Synchronization primitives optimized for tightly coupled operation of multiple control flows
- 2078 in a common, shared address space

2079 2.9.1 Thread-Safety

2080 All functions defined by this volume of IEEE Std 1003.1-2001 shall be thread-safe, except that the

2081 following functions¹ need not be thread-safe.

2082 <i>asctime()</i>	<i>ecvt()</i>	<i>gethostent()</i>	<i>getutxline()</i>	<i>putc_unlocked()</i>
2083 <i>basename()</i>	<i>encrypt()</i>	<i>getlogin()</i>	<i>gmtime()</i>	<i>putchar_unlocked()</i>
2084 <i>catgets()</i>	<i>endgrent()</i>	<i>getnetbyaddr()</i>	<i>hcreate()</i>	<i>putenv()</i>
2085 <i>crypt()</i>	<i>endpwent()</i>	<i>getnetbyname()</i>	<i>hdestroy()</i>	<i>pututxline()</i>
2086 <i>ctime()</i>	<i>endutxent()</i>	<i>getnetent()</i>	<i>hsearch()</i>	<i>rand()</i>
2087 <i>dbm_clearerr()</i>	<i>fcvt()</i>	<i>getopt()</i>	<i>inet_ntoa()</i>	<i>readdir()</i>
2088 <i>dbm_close()</i>	<i>ftw()</i>	<i>getprotobyname()</i>	<i>l64a()</i>	<i>setenv()</i>
2089 <i>dbm_delete()</i>	<i>gcvt()</i>	<i>getprotobyname()</i>	<i>lgamma()</i>	<i>setgrent()</i>
2090 <i>dbm_error()</i>	<i>getc_unlocked()</i>	<i>getprotoent()</i>	<i>lgammaf()</i>	<i>setkey()</i>
2091 <i>dbm_fetch()</i>	<i>getchar_unlocked()</i>	<i>getpwent()</i>	<i>lgammal()</i>	<i>setpwent()</i>
2092 <i>dbm_firstkey()</i>	<i>getdate()</i>	<i>getpwnam()</i>	<i>localeconv()</i>	<i>setutxent()</i>
2093 <i>dbm_nextkey()</i>	<i>getenv()</i>	<i>getpwuid()</i>	<i>localtime()</i>	<i>strerror()</i>
2094 <i>dbm_open()</i>	<i>getgrent()</i>	<i>getservbyname()</i>	<i>lrand48()</i>	<i>strtok()</i>
2095 <i>dbm_store()</i>	<i>getgrgid()</i>	<i>getservbyport()</i>	<i>mrnd48()</i>	<i>ttynam()</i>
2096 <i>dirname()</i>	<i>getgrnam()</i>	<i>getservent()</i>	<i>nftw()</i>	<i>unsetenv()</i>

2097 _____

2098 1. The functions in the table are not shaded to denote applicable options. Individual reference pages should be consulted.

2099	<i>derror()</i>	<i>gethostbyaddr()</i>	<i>getutxent()</i>	<i>nl_langinfo()</i>	<i>wcstombs()</i>
2100	<i>drand48()</i>	<i>gethostbyname()</i>	<i>getutxid()</i>	<i>ptsname()</i>	<i>wctomb()</i>

2101 The *ctermid()* and *tmpnam()* functions need not be thread-safe if passed a NULL argument. The
 2102 *wcrtomb()* and *wcsrtombs()* functions need not be thread-safe if passed a NULL *ps* argument.

2103 Implementations shall provide internal synchronization as necessary in order to satisfy this
 2104 requirement.

2105 2.9.2 Thread IDs

2106 Although implementations may have thread IDs that are unique in a system, applications
 2107 should only assume that thread IDs are usable and unique within a single process. The effect of
 2108 calling any of the functions defined in this volume of IEEE Std 1003.1-2001 and passing as an
 2109 argument the thread ID of a thread from another process is unspecified. A conforming
 2110 implementation is free to reuse a thread ID after the thread terminates if it was created with the
 2111 *detachstate* attribute set to *PTHREAD_CREATE_DETACHED* or if *pthread_detach()* or
 2112 *pthread_join()* has been called for that thread. If a thread is detached, its thread ID is invalid for
 2113 use as an argument in a call to *pthread_detach()* or *pthread_join()*.

2114 2.9.3 Thread Mutexes

2115 A thread that has blocked shall not prevent any unblocked thread that is eligible to use the same
 2116 processing resources from eventually making forward progress in its execution. Eligibility for
 2117 processing resources is determined by the scheduling policy.

2118 A thread shall become the owner of a mutex, *m*, when one of the following occurs:

- 2119 • It returns successfully from *pthread_mutex_lock()* with *m* as the *mutex* argument.
- 2120 • It returns successfully from *pthread_mutex_trylock()* with *m* as the *mutex* argument.
- 2121 TMO • It returns successfully from *pthread_mutex_timedlock()* with *m* as the *mutex* argument.
- 2122 • It returns (successfully or not) from *pthread_cond_wait()* with *m* as the *mutex* argument
 2123 (except as explicitly indicated otherwise for certain errors).
- 2124 • It returns (successfully or not) from *pthread_cond_timedwait()* with *m* as the *mutex* argument
 2125 (except as explicitly indicated otherwise for certain errors).

2126 The thread shall remain the owner of *m* until one of the following occurs:

- 2127 • It executes *pthread_mutex_unlock()* with *m* as the *mutex* argument
- 2128 • It blocks in a call to *pthread_cond_wait()* with *m* as the *mutex* argument.
- 2129 • It blocks in a call to *pthread_cond_timedwait()* with *m* as the *mutex* argument.

2130 The implementation shall behave as if at all times there is at most one owner of any mutex.

2131 A thread that becomes the owner of a mutex is said to have “acquired” the mutex and the mutex
 2132 is said to have become “locked”; when a thread gives up ownership of a mutex it is said to have
 2133 “released” the mutex and the mutex is said to have become “unlocked”.

2.9.4 Thread Scheduling

The functionality described in this section is dependent on support of the Thread Execution Scheduling option (and the rest of this section is not further shaded for this option).

Thread Scheduling Attributes

In support of the scheduling function, threads have attributes which are accessed through the **pthread_attr_t** thread creation attributes object.

The *contentionscope* attribute defines the scheduling contention scope of the thread to be either PTHREAD_SCOPE_PROCESS or PTHREAD_SCOPE_SYSTEM.

The *inheritsched* attribute specifies whether a newly created thread is to inherit the scheduling attributes of the creating thread or to have its scheduling values set according to the other scheduling attributes in the **pthread_attr_t** object.

The *schedpolicy* attribute defines the scheduling policy for the thread. The *schedparam* attribute defines the scheduling parameters for the thread. The interaction of threads having different policies within a process is described as part of the definition of those policies.

If the Thread Execution Scheduling option is defined, and the *schedpolicy* attribute specifies one of the priority-based policies defined under this option, the *schedparam* attribute contains the scheduling priority of the thread. A conforming implementation ensures that the priority value in *schedparam* is in the range associated with the scheduling policy when the thread attributes object is used to create a thread, or when the scheduling attributes of a thread are dynamically modified. The meaning of the priority value in *schedparam* is the same as that of *priority*.

If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the *schedparam* attribute supports four new members that are used for the sporadic server scheduling policy. These members are *sched_ss_low_priority*, *sched_ss_repl_period*, *sched_ss_init_budget*, and *sched_ss_max_repl*. The meaning of these attributes is the same as in the definitions that appear under Section 2.8.4 (on page 44).

When a process is created, its single thread has a scheduling policy and associated attributes equal to the process' policy and attributes. The default scheduling contention scope value is implementation-defined. The default values of other scheduling attributes are implementation-defined.

Thread Scheduling Contention Scope

The scheduling contention scope of a thread defines the set of threads with which the thread competes for use of the processing resources. The scheduling operation selects at most one thread to execute on each processor at any point in time and the thread's scheduling attributes (for example, *priority*), whether under process scheduling contention scope or system scheduling contention scope, are the parameters used to determine the scheduling decision.

The scheduling contention scope, in the context of scheduling a mixed scope environment, affects threads as follows:

- A thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope contends for resources with all other threads in the same scheduling allocation domain relative to their system scheduling attributes. The system scheduling attributes of a thread created with PTHREAD_SCOPE_SYSTEM scheduling contention scope are the scheduling attributes with which the thread was created. The system scheduling attributes of a thread created with PTHREAD_SCOPE_PROCESS scheduling contention scope are the implementation-defined mapping into system attribute space of the scheduling attributes with which the thread was created.

- Threads created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope contend directly with other threads within their process that were created with `PTHREAD_SCOPE_PROCESS` scheduling contention scope. The contention is resolved based on the threads' scheduling attributes and policies. It is unspecified how such threads are scheduled relative to threads in other processes or threads with `PTHREAD_SCOPE_SYSTEM` scheduling contention scope.

- Conforming implementations shall support the `PTHREAD_SCOPE_PROCESS` scheduling contention scope, the `PTHREAD_SCOPE_SYSTEM` scheduling contention scope, or both.

Scheduling Allocation Domain

Implementations shall support scheduling allocation domains containing one or more processors. It should be noted that the presence of multiple processors does not automatically indicate a scheduling allocation domain size greater than one. Conforming implementations on multi-processors may map all or any subset of the CPUs to one or multiple scheduling allocation domains, and could define these scheduling allocation domains on a per-thread, per-process, or per-system basis, depending on the types of applications intended to be supported by the implementation. The scheduling allocation domain is independent of scheduling contention scope, as the scheduling contention scope merely defines the set of threads with which a thread contends for processor resources, while scheduling allocation domain defines the set of processors for which it contends. The semantics of how this contention is resolved among threads for processors is determined by the scheduling policies of the threads.

The choice of scheduling allocation domain size and the level of application control over scheduling allocation domains is implementation-defined. Conforming implementations may change the size of scheduling allocation domains and the binding of threads to scheduling allocation domains at any time.

For application threads with scheduling allocation domains of size equal to one, the scheduling rules defined for `SCHED_FIFO` and `SCHED_RR` shall be used; see **Scheduling Policies** (on page 44). All threads with system scheduling contention scope, regardless of the processes in which they reside, compete for the processor according to their priorities. Threads with process scheduling contention scope compete only with other threads with process scheduling contention scope within their process.

For application threads with scheduling allocation domains of size greater than one, the rules defined for `SCHED_FIFO`, `SCHED_RR`, and `SCHED_SPORADIC` shall be used in an implementation-defined manner. Each thread with system scheduling contention scope competes for the processors in its scheduling allocation domain in an implementation-defined manner according to its priority. Threads with process scheduling contention scope are scheduled relative to other threads within the same scheduling contention scope in the process.

If `_POSIX_THREAD_SPORADIC_SERVER` is defined, the rules defined for `SCHED_SPORADIC` in **Scheduling Policies** (on page 44) shall be used in an implementation-defined manner for application threads whose scheduling allocation domain size is greater than one.

2218 Scheduling Documentation

2219 If `_POSIX_PRIORITY_SCHEDULING` is defined, then any scheduling policies beyond
 2220 TSP `SCHED_OTHER`, `SCHED_FIFO`, `SCHED_RR`, and `SCHED_SPORADIC`, as well as the effects of
 2221 the scheduling policies indicated by these other values, and the attributes required in order to
 2222 support such a policy, are implementation-defined. Furthermore, the implementation shall
 2223 document the effect of all processor scheduling allocation domain values supported for these
 2224 policies.

2225 2.9.5 Thread Cancellation

2226 The thread cancellation mechanism allows a thread to terminate the execution of any other
 2227 thread in the process in a controlled manner. The target thread (that is, the one that is being
 2228 canceled) is allowed to hold cancellation requests pending in a number of ways and to perform
 2229 application-specific cleanup processing when the notice of cancellation is acted upon.

2230 Cancellation is controlled by the cancellation control functions. Each thread maintains its own
 2231 cancelability state. Cancellation may only occur at cancellation points or when the thread is
 2232 asynchronously cancelable.

2233 The thread cancellation mechanism described in this section depends upon programs having set
 2234 *deferred* cancelability state, which is specified as the default. Applications shall also carefully
 2235 follow static lexical scoping rules in their execution behavior. For example, use of *setjmp()*,
 2236 *return*, *goto*, and so on, to leave user-defined cancellation scopes without doing the necessary
 2237 scope pop operation results in undefined behavior.

2238 Use of asynchronous cancelability while holding resources which potentially need to be released
 2239 may result in resource loss. Similarly, cancellation scopes may only be safely manipulated
 2240 (pushed and popped) when the thread is in the *deferred* or *disabled* cancelability states.

2241 2.9.5.1 Cancelability States

2242 The cancelability state of a thread determines the action taken upon receipt of a cancellation
 2243 request. The thread may control cancellation in a number of ways.

2244 Each thread maintains its own cancelability state, which may be encoded in two bits:

- 2245 1. Cancelability-Enable: When cancelability is `PTHREAD_CANCEL_DISABLE` (as defined in
 2246 the Base Definitions volume of IEEE Std 1003.1-2001, **<pthread.h>**), cancellation requests
 2247 against the target thread are held pending. By default, cancelability is set to
 2248 `PTHREAD_CANCEL_ENABLE` (as defined in **<pthread.h>**).
- 2249 2. Cancelability Type: When cancelability is enabled and the cancelability type is
 2250 `PTHREAD_CANCEL_ASYNCHRONOUS` (as defined in **<pthread.h>**), new or pending
 2251 cancellation requests may be acted upon at any time. When cancelability is enabled and
 2252 the cancelability type is `PTHREAD_CANCEL_DEFERRED` (as defined in **<pthread.h>**),
 2253 cancellation requests are held pending until a cancellation point (see below) is reached. If
 2254 cancelability is disabled, the setting of the cancelability type has no immediate effect as all
 2255 cancellation requests are held pending; however, once cancelability is enabled again the
 2256 new type is in effect. The cancelability type is `PTHREAD_CANCEL_DEFERRED` in all
 2257 newly created threads including the thread in which *main()* was first invoked.

2258 2.9.5.2 Cancellation Points

2259 Cancellation points shall occur when a thread is executing the following functions:

2260	<i>accept()</i>	<i>mq_timedsend()</i>	<i>putmsg()</i>	<i>sigpause()</i>
2261	<i>aio_suspend()</i>	<i>msgrcv()</i>	<i>putpmsg()</i>	<i>sigsuspend()</i>
2262	<i>clock_nanosleep()</i>	<i>msgsnd()</i>	<i>pwrite()</i>	<i>sigtimedwait()</i>
2263	<i>close()</i>	<i>msync()</i>	<i>read()</i>	<i>sigwait()</i>
2264	<i>connect()</i>	<i>nanosleep()</i>	<i>readv()</i>	<i>sigwaitinfo()</i>
2265	<i>creat()</i>	<i>open()</i>	<i>recv()</i>	<i>sleep()</i>
2266	<i>fcntl()</i> ²	<i>pause()</i>	<i>recvfrom()</i>	<i>system()</i>
2267	<i>fsync()</i>	<i>poll()</i>	<i>recvmsg()</i>	<i>tcdrain()</i>
2268	<i>getmsg()</i>	<i>pread()</i>	<i>select()</i>	<i>usleep()</i>
2269	<i>getpmsg()</i>	<i>pselect()</i>	<i>sem_timedwait()</i>	<i>wait()</i>
2270	<i>lockf()</i>	<i>pthread_cond_timedwait()</i>	<i>sem_wait()</i>	<i>waitid()</i>
2271	<i>mq_receive()</i>	<i>pthread_cond_wait()</i>	<i>send()</i>	<i>waitpid()</i>
2272	<i>mq_send()</i>	<i>pthread_join()</i>	<i>sendmsg()</i>	<i>write()</i>
2273	<i>mq_timedreceive()</i>	<i>pthread_testcancel()</i>	<i>sendto()</i>	<i>writew()</i>

2274 _____

2275 2. When the *cmd* argument is F_SETLK.

2276 A cancellation point may also occur when a thread is executing the following functions: |

2277	<code>catclose()</code>	<code>ftell()</code>	<code>getwc()</code>	<code>pthread_rwlock_wrlock()</code>
2278	<code>catgets()</code>	<code>ftello()</code>	<code>getwchar()</code>	<code>putc()</code>
2279	<code>catopen()</code>	<code>ftw()</code>	<code>getwd()</code>	<code>putc_unlocked()</code>

2317	<code>fsetpos()</code>	<code>getutxline()</code>	<code>pthread_rwlock_timedwrlock()</code>	

2318 An implementation shall not introduce cancellation points into any other functions specified in |
 2319 this volume of IEEE Std 1003.1-2001.

2320 _____

2321 3. For any value of the *cmd* argument.

2322 The side effects of acting upon a cancellation request while suspended during a call of a function
 2323 are the same as the side effects that may be seen in a single-threaded program when a call to a
 2324 function is interrupted by a signal and the given function returns [EINTR]. Any such side effects
 2325 occur before any cancellation cleanup handlers are called.

2326 Whenever a thread has cancelability enabled and a cancellation request has been made with that
 2327 thread as the target, and the thread then calls any function that is a cancellation point (such as
 2328 *pthread_testcancel()* or *read()*), the cancellation request shall be acted upon before the function
 2329 returns. If a thread has cancelability enabled and a cancellation request is made with the thread
 2330 as a target while the thread is suspended at a cancellation point, the thread shall be awakened
 2331 and the cancellation request shall be acted upon. However, if the thread is suspended at a
 2332 cancellation point and the event for which it is waiting occurs before the cancellation request is
 2333 acted upon, it is unspecified whether the cancellation request is acted upon or whether the
 2334 cancellation request remains pending and the thread resumes normal execution.

2335 2.9.5.3 Thread Cancellation Cleanup Handlers

2336 Each thread maintains a list of cancellation cleanup handlers. The programmer uses the
 2337 *pthread_cleanup_push()* and *pthread_cleanup_pop()* functions to place routines on and remove
 2338 routines from this list.

2339 When a cancellation request is acted upon, the routines in the list are invoked one by one in
 2340 LIFO sequence; that is, the last routine pushed onto the list (Last In) is the first to be invoked
 2341 (First Out). The thread invokes the cancellation cleanup handler with cancellation disabled until
 2342 the last cancellation cleanup handler returns. When the cancellation cleanup handler for a scope
 2343 is invoked, the storage for that scope remains valid. If the last cancellation cleanup handler
 2344 returns, thread execution is terminated and a status of PTHREAD_CANCELED is made
 2345 available to any threads joining with the target. The symbolic constant PTHREAD_CANCELED
 2346 expands to a constant expression of type (**void ***) whose value matches no pointer to an object in
 2347 memory nor the value NULL.

2348 The cancellation cleanup handlers are also invoked when the thread calls *pthread_exit()*.

2349 A side effect of acting upon a cancellation request while in a condition variable wait is that the
 2350 mutex is re-acquired before calling the first cancellation cleanup handler. In addition, the thread
 2351 is no longer considered to be waiting for the condition and the thread shall not have consumed
 2352 any pending condition signals on the condition.

2353 A cancellation cleanup handler cannot exit via *longjmp()* or *siglongjmp()*.

2354 2.9.5.4 Async-Cancel Safety

2355 The *pthread_cancel()*, *pthread_setcancelstate()*, and *pthread_setcanceltype()* functions are defined to
 2356 be async-cancel safe.

2357 No other functions in this volume of IEEE Std 1003.1-2001 are required to be async-cancel-safe.

2358 2.9.6 Thread Read-Write Locks

2359 Multiple readers, single writer (read-write) locks allow many threads to have simultaneous
 2360 read-only access to data while allowing only one thread to have exclusive write access at any
 2361 given time. They are typically used to protect data that is read more frequently than it is
 2362 changed.

2363 One or more readers acquire read access to the resource by performing a read lock operation on
 2364 the associated read-write lock. A writer acquires exclusive write access by performing a write
 2365 lock operation. Basically, all readers exclude any writers and a writer excludes all readers and
 2366 any other writers.

2367 A thread that has blocked on a read-write lock (for example, has not yet returned from a
 2368 *pthread_rwlock_rdlock()* or *pthread_rwlock_wrlock()* call) shall not prevent any unblocked thread
 2369 that is eligible to use the same processing resources from eventually making forward progress in
 2370 its execution. Eligibility for processing resources shall be determined by the scheduling policy.

2371 Read-write locks can be used to synchronize threads in the current process and other processes if
 2372 they are allocated in memory that is writable and shared among the cooperating processes and
 2373 have been initialized for this behavior.

2374 2.9.7 Thread Interactions with Regular File Operations

2375 All of the functions *chmod()*, *close()*, *fchmod()*, *fcntl()*, *fstat()*, *ftruncate()*, *lseek()*, *open()*, *read()*,
 2376 *readlink()*, *stat()*, *symlink()*, and *write()* shall be atomic with respect to each other in the effects
 2377 specified in IEEE Std 1003.1-2001 when they operate on regular files. If two threads each call one
 2378 of these functions, each call shall either see all of the specified effects of the other call, or none of
 2379 them.

2380 2.10 Sockets

2381 A socket is an endpoint for communication using the facilities described in this section. A socket
 2382 is created with a specific socket type, described in Section 2.10.6 (on page 59), and is associated
 2383 with a specific protocol, detailed in Section 2.10.3 (on page 59). A socket is accessed via a file
 2384 descriptor obtained when the socket is created.

2385 2.10.1 Address Families

2386 All network protocols are associated with a specific address family. An address family provides
 2387 basic services to the protocol implementation to allow it to function within a specific network
 2388 environment. These services may include packet fragmentation and reassembly, routing,
 2389 addressing, and basic transport. An address family is normally comprised of a number of
 2390 protocols, one per socket type. Each protocol is characterized by an abstract socket type. It is not
 2391 required that an address family support all socket types. An address family may contain
 2392 multiple protocols supporting the same socket abstraction.

2393 Section 2.10.17 (on page 66), Section 2.10.19 (on page 67), and Section 2.10.20 (on page 67),
 2394 respectively, describe the use of sockets for local UNIX connections, for Internet protocols based
 2395 on IPv4, and for Internet protocols based on IPv6.

2396 2.10.2 Addressing

2397 An address family defines the format of a socket address. All network addresses are described
 2398 using a general structure, called a **sockaddr**, as defined in the Base Definitions volume of
 2399 IEEE Std 1003.1-2001, <sys/socket.h>. However, each address family imposes finer and more
 2400 specific structure, generally defining a structure with fields specific to the address family. The
 2401 field *sa_family* in the **sockaddr** structure contains the address family identifier, specifying the
 2402 format of the *sa_data* area. The size of the *sa_data* area is unspecified.

2403 2.10.3 Protocols

2404 A protocol supports one of the socket abstractions detailed in Section 2.10.6. Selecting a protocol
 2405 involves specifying the address family, socket type, and protocol number to the *socket()*
 2406 function. Certain semantics of the basic socket abstractions are protocol-specific. All protocols
 2407 are expected to support the basic model for their particular socket type, but may, in addition,
 2408 provide non-standard facilities or extensions to a mechanism.

2409 2.10.4 Routing

2410 Sockets provides packet routing facilities. A routing information database is maintained, which
 2411 is used in selecting the appropriate network interface when transmitting packets.

2412 2.10.5 Interfaces

2413 Each network interface in a system corresponds to a path through which messages can be sent
 2414 and received. A network interface usually has a hardware device associated with it, though
 2415 certain interfaces such as the loopback interface, do not.

2416 2.10.6 Socket Types

2417 A socket is created with a specific type, which defines the communication semantics and which
 2418 RS allows the selection of an appropriate communication protocol. Four types are defined:
 2419 **SOCK_RAW**, **SOCK_STREAM**, **SOCK_SEQPACKET**, and **SOCK_DGRAM**. Implementations
 2420 may specify additional socket types.

2421 The **SOCK_STREAM** socket type provides reliable, sequenced, full-duplex octet streams
 2422 between the socket and a peer to which the socket is connected. A socket of type
 2423 **SOCK_STREAM** must be in a connected state before any data may be sent or received. Record
 2424 boundaries are not maintained; data sent on a stream socket using output operations of one size
 2425 may be received using input operations of smaller or larger sizes without loss of data. Data may
 2426 be buffered; successful return from an output function does not imply that the data has been
 2427 delivered to the peer or even transmitted from the local system. If data cannot be successfully
 2428 transmitted within a given time then the connection is considered broken, and subsequent
 2429 operations shall fail. A SIGPIPE signal is raised if a thread sends on a broken stream (one that is
 2430 no longer connected). Support for an out-of-band data transmission facility is protocol-specific.

2431 The **SOCK_SEQPACKET** socket type is similar to the **SOCK_STREAM** type, and is also
 2432 connection-oriented. The only difference between these types is that record boundaries are
 2433 maintained using the **SOCK_SEQPACKET** type. A record can be sent using one or more output
 2434 operations and received using one or more input operations, but a single operation never
 2435 transfers parts of more than one record. Record boundaries are visible to the receiver via the
 2436 **MSG_EOR** flag in the received message flags returned by the *recvmsg()* function. It is protocol-
 2437 specific whether a maximum record size is imposed.

2438 The **SOCK_DGRAM** socket type supports connectionless data transfer which is not necessarily
 2439 acknowledged or reliable. Datagrams may be sent to the address specified (possibly multicast or

2440 broadcast) in each output operation, and incoming datagrams may be received from multiple
 2441 sources. The source address of each datagram is available when receiving the datagram. An
 2442 application may also pre-specify a peer address, in which case calls to output functions shall
 2443 send to the pre-specified peer. If a peer has been specified, only datagrams from that peer shall
 2444 be received. A datagram must be sent in a single output operation, and must be received in a
 2445 single input operation. The maximum size of a datagram is protocol-specific; with some
 2446 protocols, the limit is implementation-defined. Output datagrams may be buffered within the
 2447 system; thus, a successful return from an output function does not guarantee that a datagram is
 2448 actually sent or received. However, implementations should attempt to detect any errors
 2449 possible before the return of an output function, reporting any error by an unsuccessful return
 2450 value.

2451 RS The SOCK_RAW socket type is similar to the SOCK_DGRAM type. It differs in that it is
 2452 normally used with communication providers that underlie those used for the other socket
 2453 types. For this reason, the creation of a socket with type SOCK_RAW shall require appropriate
 2454 privilege. The format of datagrams sent and received with this socket type generally include
 2455 specific protocol headers, and the formats are protocol-specific and implementation-defined.

2456 **2.10.7 Socket I/O Mode**

2457 The I/O mode of a socket is described by the O_NONBLOCK file status flag which pertains to
 2458 the open file description for the socket. This flag is initially off when a socket is created, but may
 2459 be set and cleared by the use of the F_SETFL command of the *fcntl()* function.

2460 When the O_NONBLOCK flag is set, functions that would normally block until they are
 2461 complete shall either return immediately with an error, or shall complete asynchronously to the
 2462 execution of the calling process. Data transfer operations (the *read()*, *write()*, *send()*, and *recv()*
 2463 functions) shall complete immediately, transfer only as much as is available, and then return
 2464 without blocking, or return an error indicating that no transfer could be made without blocking.
 2465 The *connect()* function initiates a connection and shall return without blocking when
 2466 O_NONBLOCK is set; it shall return the error [EINPROGRESS] to indicate that the connection
 2467 was initiated successfully, but that it has not yet completed.

2468 **2.10.8 Socket Owner**

2469 The owner of a socket is unset when a socket is created. The owner may be set to a process ID or
 2470 process group ID using the F_SETOWN command of the *fcntl()* function.

2471 **2.10.9 Socket Queue Limits**

2472 The transmit and receive queue sizes for a socket are set when the socket is created. The default
 2473 sizes used are both protocol-specific and implementation-defined. The sizes may be changed
 2474 using the *setsockopt()* function.

2475 **2.10.10 Pending Error**

2476 Errors may occur asynchronously, and be reported to the socket in response to input from the
 2477 network protocol. The socket stores the pending error to be reported to a user of the socket at the
 2478 next opportunity. The error is returned in response to a subsequent *send()*, *recv()*, or *getsockopt()*
 2479 operation on the socket, and the pending error is then cleared.

2480 2.10.11 Socket Receive Queue

2481 A socket has a receive queue that buffers data when it is received by the system until it is
 2482 removed by a receive call. Depending on the type of the socket and the communication provider,
 2483 the receive queue may also contain ancillary data such as the addressing and other protocol data
 2484 associated with the normal data in the queue, and may contain out-of-band or expedited data.
 2485 The limit on the queue size includes any normal, out-of-band data, datagram source addresses,
 2486 and ancillary data in the queue. The description in this section applies to all sockets, even though
 2487 some elements cannot be present in some instances.

2488 The contents of a receive buffer are logically structured as a series of data segments with
 2489 associated ancillary data and other information. A data segment may contain normal data or
 2490 out-of-band data, but never both. A data segment may complete a record if the protocol
 2491 supports records (always true for types SOCK_SEQPACKET and SOCK_DGRAM). A record
 2492 may be stored as more than one segment; the complete record might never be present in the
 2493 receive buffer at one time, as a portion might already have been returned to the application, and
 2494 another portion might not yet have been received from the communications provider. A data
 2495 segment may contain ancillary protocol data, which is logically associated with the segment.
 2496 Ancillary data is received as if it were queued along with the first normal data octet in the
 2497 segment (if any). A segment may contain ancillary data only, with no normal or out-of-band
 2498 data. For the purposes of this section, a datagram is considered to be a data segment that
 2499 terminates a record, and that includes a source address as a special type of ancillary data. Data
 2500 segments are placed into the queue as data is delivered to the socket by the protocol. Normal
 2501 data segments are placed at the end of the queue as they are delivered. If a new segment
 2502 contains the same type of data as the preceding segment and includes no ancillary data, and if
 2503 the preceding segment does not terminate a record, the segments are logically merged into a
 2504 single segment.

2505 The receive queue is logically terminated if an end-of-file indication has been received or a
 2506 connection has been terminated. A segment shall be considered to be terminated if another
 2507 segment follows it in the queue, if the segment completes a record, or if an end-of-file or other
 2508 connection termination has been reported. The last segment in the receive queue shall also be
 2509 considered to be terminated while the socket has a pending error to be reported.

2510 A receive operation shall never return data or ancillary data from more than one segment.

2511 2.10.12 Socket Out-of-Band Data State

2512 The handling of received out-of-band data is protocol-specific. Out-of-band data may be placed
 2513 in the socket receive queue, either at the end of the queue or before all normal data in the queue.
 2514 In this case, out-of-band data is returned to an application program by a normal receive call.
 2515 Out-of-band data may also be queued separately rather than being placed in the socket receive
 2516 queue, in which case it shall be returned only in response to a receive call that requests out-of-
 2517 band data. It is protocol-specific whether an out-of-band data mark is placed in the receive
 2518 queue to demarcate data preceding the out-of-band data and following the out-of-band data. An
 2519 out-of-band data mark is logically an empty data segment that cannot be merged with other
 2520 segments in the queue. An out-of-band data mark is never returned in response to an input
 2521 operation. The *socketmark()* function can be used to test whether an out-of-band data mark is the
 2522 first element in the queue. If an out-of-band data mark is the first element in the queue when an
 2523 input function is called without the MSG_PEEK option, the mark is removed from the queue and
 2524 the following data (if any) is processed as if the mark had not been present.

2.10.13 Connection Indication Queue

Sockets that are used to accept incoming connections maintain a queue of outstanding connection indications. This queue is a list of connections that are awaiting acceptance by the application; see *listen()*.

2.10.14 Signals

One category of event at the socket interface is the generation of signals. These signals report protocol events or process errors relating to the state of the socket. The generation or delivery of a signal does not change the state of the socket, although the generation of the signal may have been caused by a state change.

The SIGPIPE signal shall be sent to a thread that attempts to send data on a socket that is no longer able to send. In addition, the send operation fails with the error [EPIPE].

If a socket has an owner, the SIGURG signal is sent to the owner of the socket when it is notified of expedited or out-of-band data. The socket state at this time is protocol-dependent, and the status of the socket is specified in Section 2.10.17 (on page 66), Section 2.10.19 (on page 67), and Section 2.10.20 (on page 67). Depending on the protocol, the expedited data may or may not have arrived at the time of signal generation.

2.10.15 Asynchronous Errors

If any of the following conditions occur asynchronously for a socket, the corresponding value listed below shall become the pending error for the socket:

[ECONNABORTED]

The connection was aborted locally.

[ECONNREFUSED]

For a connection-mode socket attempting a non-blocking connection, the attempt to connect was forcefully rejected. For a connectionless-mode socket, an attempt to deliver a datagram was forcefully rejected.

[ECONNRESET]

The peer has aborted the connection.

[EHOSTDOWN]

The destination host has been determined to be down or disconnected.

[EHOSTUNREACH]

The destination host is not reachable.

[EMSGSIZE]

For a connectionless-mode socket, the size of a previously sent datagram prevented delivery.

[ENETDOWN]

The local network connection is not operational.

[ENETRESET]

The connection was aborted by the network.

[ENETUNREACH]

The destination network is not reachable.

2.10.16 Use of Options

There are a number of socket options which either specialize the behavior of a socket or provide useful information. These options may be set at different protocol levels and are always present at the uppermost “socket” level.

Socket options are manipulated by two functions, *getsockopt()* and *setsockopt()*. These functions allow an application program to customize the behavior and characteristics of a socket to provide the desired effect.

All of the options have default values. The type and meaning of these values is defined by the protocol level to which they apply. Instead of using the default values, an application program may choose to customize one or more of the options. However, in the bulk of cases, the default values are sufficient for the application.

Some of the options are used to enable or disable certain behavior within the protocol modules (for example, turn on debugging) while others may be used to set protocol-specific information (for example, IP time-to-live on all the application’s outgoing packets). As each of the options is introduced, its effect on the underlying protocol modules is described.

Table 2-1 shows the value for the socket level.

Table 2-1 Value of Level for Socket Options

Name	Description
SOL_SOCKET	Options are intended for the sockets level.

Table 2-2 (on page 64) lists those options present at the socket level; that is, when the *level* parameter of the *getsockopt()* or *setsockopt()* function is SOL_SOCKET, the types of the option value parameters associated with each option, and a brief synopsis of the meaning of the option value parameter. Unless otherwise noted, each may be examined with *getsockopt()* and set with *setsockopt()* on all types of socket.

Table 2-2 Socket-Level Options

Option	Parameter Type	Parameter Meaning
SO_BROADCAST	int	Non-zero requests permission to transmit broadcast datagrams (SOCK_DGRAM sockets only).
SO_DEBUG	int	Non-zero requests debugging in underlying protocol modules.
SO_DONTROUTE	int	Non-zero requests bypass of normal routing; route based on destination address only.
SO_ERROR	int	Requests and clears pending error information on the socket (<i>getsockopt()</i> only).
SO_KEEPALIVE	int	Non-zero requests periodic transmission of keepalive messages (protocol-specific).
SO_LINGER	struct linger	Specify actions to be taken for queued, unsent data on <i>close()</i> : linger on/off and linger time in seconds.
SO_OOBINLINE	int	Non-zero requests that out-of-band data be placed into normal data input queue as received.
SO_RCVBUF	int	Size of receive buffer (in bytes).
SO_RCVLOWAT	int	Minimum amount of data to return to application for input operations (in bytes).
SO_RCVTIMEO	struct timeval	Timeout value for a socket receive operation.
SO_REUSEADDR	int	Non-zero requests reuse of local addresses in <i>bind()</i> (protocol-specific).
SO_SNDBUF	int	Size of send buffer (in bytes).
SO_SNDLOWAT	int	Minimum amount of data to send for output operations (in bytes).
SO_SNDTIMEO	struct timeval	Timeout value for a socket send operation.
SO_TYPE	int	Identify socket type (<i>getsockopt()</i> only).

The SO_BROADCAST option requests permission to send broadcast datagrams on the socket. Support for SO_BROADCAST is protocol-specific. The default for SO_BROADCAST is that the ability to send broadcast datagrams on a socket is disabled.

The SO_DEBUG option enables debugging in the underlying protocol modules. This can be useful for tracing the behavior of the underlying protocol modules during normal system operation. The semantics of the debug reports are implementation-defined. The default value for SO_DEBUG is for debugging to be turned off.

The SO_DONTROUTE option requests that outgoing messages bypass the standard routing facilities. The destination must be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. It is protocol-specific whether this option has any effect and how the outgoing network interface is chosen. Support for this option with each protocol is implementation-defined.

The SO_ERROR option is used only on *getsockopt()*. When this option is specified, *getsockopt()* shall return any pending error on the socket and clear the error status. It shall return a value of 0 if there is no pending error. SO_ERROR may be used to check for asynchronous errors on connected connectionless-mode sockets or for other types of asynchronous errors. SO_ERROR has no default value.

2636 The SO_KEEPAALIVE option enables the periodic transmission of messages on a connected
2637 socket. The behavior of this option is protocol-specific. The default value for SO_KEEPAALIVE is
2638 zero, specifying that this capability is turned off.

2639 The SO_LINGER option controls the action of the interface when unsent messages are queued
2640 on a socket and a *close()* is performed. The details of this option are protocol-specific. The
2641 default value for SO_LINGER is zero, or off, for the *l_onoff* element of the option value and zero
2642 seconds for the linger time specified by the *l_linger* element.

2643 The SO_OOINLINE option is valid only on protocols that support out-of-band data. The
2644 SO_OOINLINE option requests that out-of-band data be placed in the normal data input queue
2645 as received; it is then accessible using the *read()* or *recv()* functions without the MSG_OOB flag
2646 set. The default for SO_OOINLINE is off; that is, for out-of-band data not to be placed in the
2647 normal data input queue.

2648 The SO_RCVBUF option requests that the buffer space allocated for receive operations on this
2649 socket be set to the value, in bytes, of the option value. Applications may wish to increase buffer
2650 size for high volume connections, or may decrease buffer size to limit the possible backlog of
2651 incoming data. The default value for the SO_RCVBUF option value is implementation-defined,
2652 and may vary by protocol.

2653 The maximum value for the option for a socket may be obtained by the use of the *fpathconf()*
2654 function, using the value `_PC_SOCK_MAXBUF`.

2655 The SO_RCVLOWAT option sets the minimum number of bytes to process for socket input
2656 operations. In general, receive calls block until any (non-zero) amount of data is received, then
2657 return the smaller of the amount available or the amount requested. The default value for
2658 SO_RCVLOWAT is 1, and does not affect the general case. If SO_RCVLOWAT is set to a larger
2659 value, blocking receive calls normally wait until they have received the smaller of the low water
2660 mark value or the requested amount. Receive calls may still return less than the low water mark
2661 if an error occurs, a signal is caught, or the type of data next in the receive queue is different
2662 from that returned (for example, out-of-band data). As mentioned previously, the default value
2663 for SO_RCVLOWAT is 1 byte. It is implementation-defined whether the SO_RCVLOWAT option
2664 can be set.

2665 The SO_RCVTIMEO option is an option to set a timeout value for input operations. It accepts a
2666 **timeval** structure with the number of seconds and microseconds specifying the limit on how
2667 long to wait for an input operation to complete. If a receive operation has blocked for this much
2668 time without receiving additional data, it shall return with a partial count or *errno* shall be set to
2669 [EWOULDBLOCK] if no data were received. The default for this option is the value zero, which
2670 indicates that a receive operation will not time out. It is implementation-defined whether the
2671 SO_RCVTIMEO option can be set.

2672 The SO_REUSEADDR option indicates that the rules used in validating addresses supplied in a
2673 *bind()* should allow reuse of local addresses. Operation of this option is protocol-specific. The
2674 default value for SO_REUSEADDR is off; that is, reuse of local addresses is not permitted.

2675 The SO_SNDBUF option requests that the buffer space allocated for send operations on this
2676 socket be set to the value, in bytes, of the option value. The default value for the SO_SNDBUF
2677 option value is implementation-defined, and may vary by protocol. The maximum value for the
2678 option for a socket may be obtained by the use of the *fpathconf()* function, using the value
2679 `_PC_SOCK_MAXBUF`.

2680 The SO_SNDLOWAT option sets the minimum number of bytes to process for socket output
2681 operations. Most output operations process all of the data supplied by the call, delivering data to
2682 the protocol for transmission and blocking as necessary for flow control. Non-blocking output
2683 operations process as much data as permitted subject to flow control without blocking, but

process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. A *select()* operation testing the ability to write to a socket shall return true only if the send low water mark could be processed. The default value for `SO_SNDLOWAT` is implementation-defined and protocol-specific. It is implementation-defined whether the `SO_SNDLOWAT` option can be set.

The `SO_SNDTIMEO` option is an option to set a timeout value for the amount of time that an output function shall block because flow control prevents data from being sent. As noted in Table 2-2 (on page 64), the option value is a **timeval** structure with the number of seconds and microseconds specifying the limit on how long to wait for an output operation to complete. If a send operation has blocked for this much time, it shall return with a partial count or *errno* set to `[EWOULDBLOCK]` if no data were sent. The default for this option is the value zero, which indicates that a send operation will not time out. It is implementation-defined whether the `SO_SNDTIMEO` option can be set.

The `SO_TYPE` option is used only on *getsockopt()*. When this option is specified, *getsockopt()* shall return the type of the socket (for example, `SOCK_STREAM`). This option is useful to servers that inherit sockets on start-up. `SO_TYPE` has no default value.

2.10.17 Use of Sockets for Local UNIX Connections

Support for UNIX domain sockets is mandatory.

UNIX domain sockets provide process-to-process communication in a single system.

2.10.17.1 Headers

The symbolic constant `AF_UNIX` defined in the `<sys/socket.h>` header is used to identify the UNIX domain address family. The `<sys/un.h>` header contains other definitions used in connection with UNIX domain sockets. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers.

The **sockaddr_storage** structure defined in `<sys/socket.h>` shall be large enough to accommodate a **sockaddr_un** structure (see the `<sys/un.h>` header defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_un** structures and used to access the fields of those structures without alignment problems. When a **sockaddr_storage** structure is cast as a **sockaddr_un** structure, the *ss_family* field maps onto the *sun_family* field.

2.10.18 Use of Sockets over Internet Protocols

When a socket is created in the Internet family with a protocol value of zero, the implementation shall use the protocol listed below for the type of socket created.

`SOCK_STREAM` `IPPROTO_TCP`.

`SOCK_DGRAM` `IPPROTO_UDP`.

RS `SOCK_RAW` `IPPROTO_RAW`.

`SOCK_SEQPACKET` Unspecified.

RS A raw interface to IP is available by creating an Internet socket of type `SOCK_RAW`. The default protocol for type `SOCK_RAW` shall be identified in the IP header with the value `IPPROTO_RAW`. Applications should not use the default protocol when creating a socket with type `SOCK_RAW`, but should identify a specific protocol by value. The ICMP control protocol is accessible from a raw socket by specifying a value of `IPPROTO_ICMP` for protocol.

2.10.19 Use of Sockets over Internet Protocols Based on IPv4

Support for sockets over Internet protocols based on IPv4 is mandatory.

2.10.19.1 Headers

The symbolic constant `AF_INET` defined in the `<sys/socket.h>` header is used to identify the IPv4 Internet address family. The `<netinet/in.h>` header contains other definitions used in connection with IPv4 Internet sockets. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers.

The `sockaddr_storage` structure defined in `<sys/socket.h>` shall be large enough to accommodate a `sockaddr_in` structure (see the `<netinet/in.h>` header defined in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an appropriate boundary so that pointers to it can be cast as pointers to `sockaddr_in` structures and used to access the fields of those structures without alignment problems. When a `sockaddr_storage` structure is cast as a `sockaddr_in` structure, the `ss_family` field maps onto the `sin_family` field.

2.10.20 Use of Sockets over Internet Protocols Based on IPv6

This section describes extensions to support sockets over Internet protocols based on IPv6. This functionality is dependent on support of the IPV6 option (and the rest of this section is not further shaded for this option).

To enable smooth transition from IPv4 to IPv6, the features defined in this section may, in certain circumstances, also be used in connection with IPv4; see Section 2.10.20.2 (on page 68).

2.10.20.1 Addressing

IPv6 overcomes the addressing limitations of previous versions by using 128-bit addresses instead of 32-bit addresses. The IPv6 address architecture is described in RFC 2373.

There are three kinds of IPv6 address:

Unicast

Identifies a single interface.

A unicast address can be global, link-local (designed for use on a single link), or site-local (designed for systems not connected to the Internet). Link-local and site-local addresses need not be globally unique.

Anycast

Identifies a set of interfaces such that a packet sent to the address can be delivered to any member of the set.

An anycast address is similar to a unicast address; the nodes to which an anycast address is assigned must be explicitly configured to know that it is an anycast address.

Multicast

Identifies a set of interfaces such that a packet sent to the address should be delivered to every member of the set.

An application can send multicast datagrams by simply specifying an IPv6 multicast address in the `address` argument of `sendto()`. To receive multicast datagrams, an application must join the multicast group (using `setsockopt()` with `IPV6_JOIN_GROUP`) and must bind to the socket the UDP port on which datagrams will be received. Some applications should also bind the multicast group address to the socket, to prevent other datagrams destined to that port from being delivered to the socket.

2770 A multicast address can be global, node-local, link-local, site-local, or organization-local.

2771 The following special IPv6 addresses are defined:

2772 Unspecified

2773 An address that is not assigned to any interface and is used to indicate the absence of an

2774 address.

2775 Loopback

2776 A unicast address that is not assigned to any interface and can be used by a node to send

2777 packets to itself.

2778 Two sets of IPv6 addresses are defined to correspond to IPv4 addresses:

2779 IPv4-compatible addresses

2780 These are assigned to nodes that support IPv6 and can be used when traffic is “tunneled”

2781 through IPv4.

2782 IPv4-mapped addresses

2783 These are used to represent IPv4 addresses in IPv6 address format; see Section 2.10.20.2.

2784 Note that the unspecified address and the loopback address must not be treated as IPv4-

2785 compatible addresses.

2786 2.10.20.2 Compatibility with IPv4

2787 The API provides the ability for IPv6 applications to interoperate with applications using IPv4,

2788 by using IPv4-mapped IPv6 addresses. These addresses can be generated automatically by the

2789 *getaddrinfo()* function when the specified host has only IPv4 addresses.

2790 Applications can use AF_INET6 sockets to open TCP connections to IPv4 nodes, or send UDP

2791 packets to IPv4 nodes, by simply encoding the destination’s IPv4 address as an IPv4-mapped

2792 IPv6 address, and passing that address, within a **sockaddr_in6** structure, in the *connect()*,

2793 *sendto()*, or *sendmsg()* function. When applications use AF_INET6 sockets to accept TCP

2794 connections from IPv4 nodes, or receive UDP packets from IPv4 nodes, the system shall return

2795 the peer’s address to the application in the *accept()*, *recvfrom()*, *recvmsg()*, or *getpeername()*

2796 function using a **sockaddr_in6** structure encoded this way. If a node has an IPv4 address, then

2797 the implementation shall allow applications to communicate using that address via an

2798 AF_INET6 socket. In such a case, the address will be represented at the API by the

2799 corresponding IPv4-mapped IPv6 address. Also, the implementation may allow an AF_INET6

2800 socket bound to **in6addr_any** to receive inbound connections and packets destined to one of the

2801 node’s IPv4 addresses.

2802 An application can use AF_INET6 sockets to bind to a node’s IPv4 address by specifying the

2803 address as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure in the *bind()* function. For

2804 an AF_INET6 socket bound to a node’s IPv4 address, the system shall return the address in the

2805 *getsockname()* function as an IPv4-mapped IPv6 address in a **sockaddr_in6** structure.

2806 2.10.20.3 Interface Identification

2807 Each local interface is assigned a unique positive integer as a numeric index. Indexes start at 1;

2808 zero is not used. There may be gaps so that there is no current interface for a particular positive

2809 index. Each interface also has a unique implementation-defined name.

2810 2.10.20.4 Options

2811 The following options apply at the IPPROTO_IPV6 level:

2812 IPV6_JOIN_GROUP

2813 When set via *setsockopt()*, it joins the application to a multicast group on an interface
 2814 (identified by its index) and addressed by a given multicast address, enabling packets sent
 2815 to that address to be read via the socket. If the interface index is specified as zero, the
 2816 system selects the interface (for example, by looking up the address in a routing table and
 2817 using the resulting interface).

2818 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

2819 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

2820 IPV6_LEAVE_GROUP

2821 When set via *setsockopt()*, it removes the application from the multicast group on an
 2822 interface (identified by its index) and addressed by a given multicast address.

2823 An attempt to read this option using *getsockopt()* shall result in an [EOPNOTSUPP] error.

2824 The parameter type of this option is a pointer to an **ipv6_mreq** structure.

2825 IPV6_MULTICAST_HOPS

2826 The value of this option is the hop limit for outgoing multicast IPv6 packets sent via the
 2827 socket. Its possible values are the same as those of IPV6_UNICAST_HOPS. If the
 2828 IPV6_MULTICAST_HOPS option is not set, a value of 1 is assumed. This option can be set
 2829 via *setsockopt()* and read via *getsockopt()*.

2830 The parameter type of this option is a pointer to an **int**. (Default value: 1)

2831 IPV6_MULTICAST_IF

2832 The index of the interface to be used for outgoing multicast packets. It can be set via
 2833 *setsockopt()* and read via *getsockopt()*. If the interface index is specified as zero, the system
 2834 selects the interface (for example, by looking up the address in a routing table and using the
 2835 resulting interface).

2836 The parameter type of this option is a pointer to an **unsigned int**. (Default value: 0)

2837 IPV6_MULTICAST_LOOP

2838 This option controls whether outgoing multicast packets should be delivered back to the
 2839 local application when the sending interface is itself a member of the destination multicast
 2840 group. If it is set to 1 they are delivered. If it is set to 0 they are not. Other values result in an
 2841 [EINVAL] error. This option can be set via *setsockopt()* and read via *getsockopt()*.

2842 The parameter type of this option is a pointer to an **unsigned int** which is used as a Boolean
 2843 value. (Default value: 1)

2844 IPV6_UNICAST_HOPS

2845 The value of this option is the hop limit for outgoing unicast IPv6 packets sent via the
 2846 socket. If the option is not set, or is set to -1, the system selects a default value. Attempts to
 2847 set a value less than -1 or greater than 255 shall result in an [EINVAL] error. This option can
 2848 be set via *setsockopt()* and read via *getsockopt()*.

2849 The parameter type of this option is a pointer to an **int**. (Default value: Unspecified)

2850 IPV6_V6ONLY

2851 This socket option restricts AF_INET6 sockets to IPv6 communications only. AF_INET6
 2852 sockets may be used for both IPv4 and IPv6 communications. Some applications may want
 2853 to restrict their use of an AF_INET6 socket to IPv6 communications only. For these

2854 applications, the IPv6_V6ONLY socket option is defined. When this option is turned on, the
 2855 socket can be used to send and receive IPv6 packets only. This is an IPPROTO_IPV6-level
 2856 option.

2857 The parameter type of this option is a pointer to an **int** which is used as a Boolean value.
 2858 (Default value: 0)

2859 An [EOPNOTSUPP] error shall result if IPV6_JOIN_GROUP or IPV6_LEAVE_GROUP is used
 2860 with *getsockopt()*.

2861 2.10.20.5 Headers

2862 The symbolic constant AF_INET6 is defined in the **<sys/socket.h>** header to identify the IPv6
 2863 Internet address family. See the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 13,
 2864 Headers.

2865 The **sockaddr_storage** structure defined in **<sys/socket.h>** shall be large enough to
 2866 accommodate a **sockaddr_in6** structure (see the **<netinet/in.h>** header defined in the Base
 2867 Definitions volume of IEEE Std 1003.1-2001, Chapter 13, Headers) and shall be aligned at an
 2868 appropriate boundary so that pointers to it can be cast as pointers to **sockaddr_in6** structures
 2869 and used to access the fields of those structures without alignment problems. When a
 2870 **sockaddr_storage** structure is cast as a **sockaddr_in6** structure, the *ss_family* field maps onto the
 2871 *sin6_family* field.

2872 The **<netinet/in.h>**, **<arpa/inet.h>**, and **<netdb.h>** headers contain other definitions used in
 2873 connection with IPv6 Internet sockets; see the Base Definitions volume of IEEE Std 1003.1-2001,
 2874 Chapter 13, Headers.

2875 2.11 Tracing

2876 TRC This section describes extensions to support tracing of user applications. This functionality is
 2877 dependent on support of the Trace option (and the rest of this section is not further shaded for
 2878 this option).

2879 The tracing facilities defined in IEEE Std 1003.1-2001 allow a process to select a set of trace event
 2880 types, to activate a trace stream of the selected trace events as they occur in the flow of
 2881 execution, and to retrieve the recorded trace events.

2882 The tracing operation relies on three logically different components: the traced process, the
 2883 controller process, and the analyzer process. During the execution of the traced process, when a
 2884 trace point is reached, a trace event is recorded into the trace streams created for that process in
 2885 which the associated trace event type identifier is not being filtered out. The controller process
 2886 controls the operation of recording the trace events into the trace stream. It shall be able to:

- 2887 • Initialize the attributes of a trace stream
- 2888 • Create the trace stream (for a specified traced process) using those attributes
- 2889 • Start and stop tracing for the trace stream
- 2890 • Filter the type of trace events to be recorded, if the Trace Event Filter option is supported
- 2891 • Shut a trace stream down

2892 These operations can be done for an active trace stream. The analyzer process retrieves the
 2893 traced events either at runtime, when the trace stream has not yet been shut down, but is still
 2894 recording trace events; or after opening a trace log that had been previously recorded and shut
 2895 down. These three logically different operations can be performed by the same process, or can be

distributed into different processes.

A trace stream identifier can be created by a call to *posix_trace_create()*, *posix_trace_create_withlog()*, or *posix_trace_open()*. The *posix_trace_create()* and *posix_trace_create_withlog()* functions should be used by a controller process. The *posix_trace_open()* should be used by an analyzer process.

The tracing functions can serve different purposes. One purpose is debugging the possibly pre-instrumented code, while another is post-mortem fault analysis. These two potential uses differ in that the first requires pre-filtering capabilities to avoid overwhelming the trace stream and permits focusing on expected information; while the second needs comprehensive trace capabilities in order to be able to record all types of information.

The events to be traced belong to two classes:

1. User trace events (generated by the application instrumentation)
2. System trace events (generated by the operating system)

The trace interface defines several system trace event types associated with control of and operation of the trace stream. This small set of system trace events includes the minimum required to interpret correctly the trace event information present in the stream. Other desirable system trace events for some particular application profile may be implemented and are encouraged; for example, process and thread scheduling, signal occurrence, and so on.

Each traced process shall have a mapping of the trace event names to trace event type identifiers that have been defined for that process. Each active trace stream shall have a mapping that incorporates all the trace event type identifiers predefined by the trace system plus all the mappings of trace event names to trace event type identifiers of the processes that are being traced into that trace stream. These mappings are defined from the instrumented application by calling the *posix_trace_eventid_open()* function and from the controller process by calling the *posix_trace_trid_eventid_open()* function. For a pre-recorded trace stream, the list of trace event types is obtained from the pre-recorded trace log.

The *st_ctime* and *st_mtime* fields of a file associated with an active trace stream shall be marked for update every time any of the tracing operations modifies that file.

The *st_atime* field of a file associated with a trace stream shall be marked for update every time any of the tracing operations causes data to be read from that file.

Results are undefined if the application performs any operation on a file descriptor associated with an active or pre-recorded trace stream until *posix_trace_shutdown()* or *posix_trace_close()* is called for that trace stream.

The main purpose of this option is to define a complete set of functions and concepts that allow a conforming application to be traced from creation to termination, whatever its realtime constraints and properties.

2.11.1 Tracing Data Definitions

2.11.1.1 Structures

The **<trace.h>** header shall define the *posix_trace_status_info* and *posix_trace_event_info* structures described below. Implementations may add extensions to these structures.

posix_trace_status_info Structure

To facilitate control of a trace stream, information about the current state of an active trace stream can be obtained dynamically. This structure is returned by a call to the *posix_trace_get_status()* function.

The **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
int	<i>posix_stream_status</i>	The operating mode of the trace stream.
int	<i>posix_stream_full_status</i>	The full status of the trace stream.
int	<i>posix_stream_overnrun_status</i>	Indicates whether trace events were lost in the trace stream.

If the Trace Log option is supported in addition to the Trace option, the **posix_trace_status_info** structure defined in **<trace.h>** shall contain at least the following additional members:

Member Type	Member Name	Description
int	<i>posix_stream_flush_status</i>	Indicates whether a flush is in progress.
int	<i>posix_stream_flush_error</i>	Indicates whether any error occurred during the last flush operation.
int	<i>posix_log_overnrun_status</i>	Indicates whether trace events were lost in the trace log.
int	<i>posix_log_full_status</i>	The full status of the trace log.

The *posix_stream_status* member indicates the operating mode of the trace stream and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_RUNNING

Tracing is in progress; that is, the trace stream is accepting trace events.

POSIX_TRACE_SUSPENDED

The trace stream is not accepting trace events. The tracing operation has not yet started or has stopped, either following a *posix_trace_stop()* function call or because the trace resources are exhausted.

The *posix_stream_full_status* member indicates the full status of the trace stream, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL

The space in the trace stream for trace events is exhausted.

POSIX_TRACE_NOT_FULL

There is still space available in the trace stream.

The combination of the *posix_stream_status* and *posix_stream_full_status* members also indicates the actual status of the stream. The status shall be interpreted as follows:

POSIX_TRACE_RUNNING and POSIX_TRACE_NOT_FULL

This status combination indicates that tracing is in progress, and there is space available for recording more trace events.

POSIX_TRACE_RUNNING and POSIX_TRACE_FULL

This status combination indicates that tracing is in progress and that the trace stream is full of trace events. This status combination cannot occur unless the *stream-full-policy* is set to

2980 POSIX_TRACE_LOOP. The trace stream contains trace events recorded during a moving
 2981 time window of prior trace events, and some older trace events may have been overwritten
 2982 and thus lost.

2983 POSIX_TRACE_SUSPENDED and POSIX_TRACE_NOT_FULL
 2984 This status combination indicates that tracing has not yet been started, has been stopped by
 2985 the *posix_trace_stop()* function, or has been cleared by the *posix_trace_clear()* function.

2986 POSIX_TRACE_SUSPENDED and POSIX_TRACE_FULL
 2987 This status combination indicates that tracing has been stopped by the implementation
 2988 because the *stream-full-policy* attribute was POSIX_TRACE_UNTIL_FULL and trace
 2989 resources were exhausted, or that the trace stream was stopped by the function
 2990 *posix_trace_stop()* at a time when trace resources were exhausted.

2991 The *posix_stream_outrun_status* member indicates whether trace events were lost in the trace
 2992 stream, and shall have one of the following values defined by manifest constants in the
 2993 **<trace.h>** header:

2994 POSIX_TRACE_OVERRUN
 2995 At least one trace event was lost and thus was not recorded in the trace stream.

2996 POSIX_TRACE_NO_OVERRUN
 2997 No trace events were lost.

2998 When the corresponding trace stream is created, the *posix_stream_outrun_status* member shall be
 2999 set to POSIX_TRACE_NO_OVERRUN.

3000 Whenever an overrun occurs, the *posix_stream_outrun_status* member shall be set to
 3001 POSIX_TRACE_OVERRUN.

3002 An overrun occurs when:

- 3003 • The policy is POSIX_TRACE_LOOP and a recorded trace event is overwritten.
- 3004 • The policy is POSIX_TRACE_UNTIL_FULL and the trace stream is full when a trace event is
 3005 generated.
- 3006 • If the Trace Log option is supported, the policy is POSIX_TRACE_FLUSH and at least one
 3007 trace event is lost while flushing the trace stream to the trace log.

3008 The *posix_stream_outrun_status* member is reset to zero after its value is read.

3009 If the Trace Log option is supported in addition to the Trace option, the *posix_stream_flush_status*,
 3010 *posix_stream_flush_error*, *posix_log_outrun_status*, and *posix_log_full_status* members are defined
 3011 as follows; otherwise, they are undefined.

3012 The *posix_stream_flush_status* member indicates whether a flush operation is being performed
 3013 and shall have one of the following values defined by manifest constants in the header
 3014 **<trace.h>**:

3015 POSIX_TRACE_FLUSHING
 3016 The trace stream is currently being flushed to the trace log.

3017 POSIX_TRACE_NOT_FLUSHING
 3018 No flush operation is in progress.

3019 The *posix_stream_flush_status* member shall be set to POSIX_TRACE_FLUSHING if a flush
 3020 operation is in progress either due to a call to the *posix_trace_flush()* function (explicit or caused
 3021 by a trace stream shutdown operation) or because the trace stream has become full with the
 3022 *stream-full-policy* attribute set to POSIX_TRACE_FLUSH. The *posix_stream_flush_status* member
 3023 shall be set to POSIX_TRACE_NOT_FLUSHING if no flush operation is in progress.

The *posix_stream_flush_error* member shall be set to zero if no error occurred during flushing. If an error occurred during a previous flushing operation, the *posix_stream_flush_error* member shall be set to the value of the first error that occurred. If more than one error occurs while flushing, error values after the first shall be discarded. The *posix_stream_flush_error* member is reset to zero after its value is read.

The *posix_log_outrun_status* member indicates whether trace events were lost in the trace log, and shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_OVERRUN

At least one trace event was lost.

POSIX_TRACE_NO_OVERRUN

No trace events were lost.

When the corresponding trace stream is created, the *posix_log_outrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN. Whenever an overrun occurs, this status shall be set to POSIX_TRACE_OVERRUN. The *posix_log_outrun_status* member is reset to zero after its value is read.

The *posix_log_full_status* member indicates the full status of the trace log, and it shall have one of the following values defined by manifest constants in the **<trace.h>** header:

POSIX_TRACE_FULL

The space in the trace log is exhausted.

POSIX_TRACE_NOT_FULL

There is still space available in the trace log.

The *posix_log_full_status* member is only meaningful if the *log-full-policy* attribute is either POSIX_TRACE_UNTIL_FULL or POSIX_TRACE_LOOP.

For an active trace stream without log, that is created by the *posix_trace_create()* function, the *posix_log_outrun_status* member shall be set to POSIX_TRACE_NO_OVERRUN and the *posix_log_full_status* member shall be set to POSIX_TRACE_NOT_FULL.

posix_trace_event_info Structure

The trace event structure **posix_trace_event_info** contains the information for one recorded trace event. This structure is returned by the set of functions *posix_trace_getnext_event()*, *posix_trace_timedgetnext_event()*, and *posix_trace_trygetnext_event()*.

The **posix_trace_event_info** structure defined in **<trace.h>** shall contain at least the following members:

Member Type	Member Name	Description
trace_event_id_t	<i>posix_event_id</i>	Trace event type identification.
pid_t	<i>posix_pid</i>	Process ID of the process that generated the trace event.
void *	<i>posix_prog_address</i>	Address at which the trace point was invoked.
int	<i>posix_truncation_status</i>	Status about the truncation of the data associated with this trace event.
struct timespec	<i>posix_timestamp</i>	Time at which the trace event was generated.

In addition, if the Trace option and the Threads option are both supported, the **posix_trace_event_info** structure defined in **<trace.h>** shall contain the following additional member:

3068
3069
3070
3071
3072

Member Type	Member Name	Description
pthread_t	<i>posix_thread_id</i>	Thread ID of the thread that generated the trace event.

3073
3074
3075
3076
3077

The *posix_event_id* member represents the identification of the trace event type and its value is not directly defined by the user. This identification is returned by a call to one of the following functions: *posix_trace_trid_eventid_open()*, *posix_trace_eventtypelist_getnext_id()*, or *posix_trace_eventid_open()*. The name of the trace event type can be obtained by calling *posix_trace_eventid_get_name()*.

3078
3079
3080

The *posix_pid* is the process identifier of the traced process which generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any process, the *posix_pid* member shall be set to zero.

3081
3082
3083
3084
3085

For a user trace event, the *posix_prog_address* member is the process mapped address of the point at which the associated call to the *posix_trace_event()* function was made. For a system trace event, if the trace event is caused by a system service explicitly called by the application, the *posix_prog_address* member shall be the address of the process at the point where the call to that system service was made.

3086
3087
3088
3089
3090

The *posix_truncation_status* member defines whether the data associated with a trace event has been truncated at the time the trace event was generated, or at the time the trace event was read from the trace stream, or (if the Trace Log option is supported) from the trace log (see the *event* argument from the *posix_trace_getnext_event()* function). The *posix_truncation_status* member shall have one of the following values defined by manifest constants in the **<trace.h>** header:

3091
3092

POSIX_TRACE_NOT_TRUNCATED

All the traced data is available.

3093
3094

POSIX_TRACE_TRUNCATED_RECORD

Data was truncated at the time the trace event was generated.

3095
3096
3097
3098

POSIX_TRACE_TRUNCATED_READ

Data was truncated at the time the trace event was read from a trace stream or a trace log because the reader's buffer was too small. This truncation status overrides the POSIX_TRACE_TRUNCATED_RECORD status.

3099
3100
3101

The *posix_timestamp* member shall be the time at which the trace event was generated. The clock used is implementation-defined, but the resolution of this clock can be retrieved by a call to the *posix_trace_attr_getclockres()* function.

3102

If the Threads option is supported in addition to the Trace option:

3103
3104
3105

- The *posix_thread_id* member is the identifier of the thread that generated the trace event. If the *posix_event_id* member is one of the implementation-defined system trace events and that trace event is not associated with any thread, the *posix_thread_id* member shall be set to zero.

3106

Otherwise, this member is undefined.

3107 2.11.1.2 Trace Stream Attributes

3108
3109

Trace streams have attributes that compose the **posix_trace_attr_t** trace stream attributes object. This object shall contain at least the following attributes:

3110

- The *generation-version* attribute identifies the origin and version of the trace system.

- 3111 • The *trace-name* attribute is a character string defined by the trace controller, and that
3112 identifies the trace stream.
- 3113 • The *creation-time* attribute represents the time of the creation of the trace stream.
- 3114 • The *clock-resolution* attribute defines the clock resolution of the clock used to generate
3115 timestamps.
- 3116 • The *stream-min-size* attribute defines the minimum size in bytes of the trace stream strictly
3117 reserved for the trace events.
- 3118 • The *stream-full-policy* attribute defines the policy followed when the trace stream is full; its
3119 value is `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or `POSIX_TRACE_FLUSH`.
- 3120 • The *max-data-size* attribute defines the maximum record size in bytes of a trace event.

3121 In addition, if the Trace option and the Trace Inherit option are both supported, the
3122 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
3123 attributes:

- 3124 • The *inheritance* attribute specifies whether a newly created trace stream will inherit tracing in
3125 its parent's process trace stream. It is either `POSIX_TRACE_INHERITED` or
3126 `POSIX_TRACE_CLOSE_FOR_CHILD`.

3127 In addition, if the Trace option and the Trace Log option are both supported, the
3128 **posix_trace_attr_t** trace stream creation attributes object shall contain at least the following
3129 attribute:

- 3130 • If the file type corresponding to the trace log supports the `POSIX_TRACE_LOOP` or the
3131 `POSIX_TRACE_UNTIL_FULL` policies, the *log-max-size* attribute defines the maximum size
3132 in bytes of the trace log associated with an active trace stream. Other stream data—for
3133 example, trace attribute values—shall not be included in this size.
- 3134 • The *log-full-policy* attribute defines the policy of a trace log associated with an active trace
3135 stream to be `POSIX_TRACE_LOOP`, `POSIX_TRACE_UNTIL_FULL`, or
3136 `POSIX_TRACE_APPEND`.

3137 2.11.2 Trace Event Type Definitions

3138 2.11.2.1 System Trace Event Type Definitions

3139 The following system trace event types, defined in the **<trace.h>** header, track the invocation of
3140 the trace operations:

- 3141 • `POSIX_TRACE_START` shall be associated with a trace start operation.
- 3142 • `POSIX_TRACE_STOP` shall be associated with a trace stop operation.
- 3143 • If the Trace Event Filter option is supported, `POSIX_TRACE_FILTER` shall be associated with
3144 a trace event type filter change operation.

3145 The following system trace event types, defined in the **<trace.h>** header, report operational trace
3146 events:

- 3147 • `POSIX_TRACE_OVERFLOW` shall mark the beginning of a trace overflow condition.
- 3148 • `POSIX_TRACE_RESUME` shall mark the end of a trace overflow condition.
- 3149 • If the Trace Log option is supported, `POSIX_TRACE_FLUSH_START` shall mark the
3150 beginning of a flush operation.

- If the Trace Log option is supported, POSIX_TRACE_FLUSH_STOP shall mark the end of a flush operation.

- If an implementation-defined trace error condition is reported, it shall be marked POSIX_TRACE_ERROR.

The interpretation of a trace stream or a trace log by a trace analyzer process relies on the information recorded for each trace event, and also on system trace events that indicate the invocation of trace control operations and trace system operational trace events.

The POSIX_TRACE_START and POSIX_TRACE_STOP trace events specify the time windows during which the trace stream is running.

- The POSIX_TRACE_STOP trace event with an associated data that is equal to zero indicates a call of the function *posix_trace_stop()*.
- The POSIX_TRACE_STOP trace event with an associated data that is different from zero indicates an automatic stop of the trace stream (see *posix_trace_attr_getstreamfullpolicy()*).

The POSIX_TRACE_FILTER trace event indicates that a trace event type filter value changed while the trace stream was running.

The POSIX_TRACE_ERROR serves to inform the analyzer process that an implementation-defined internal error of the trace system occurred.

The POSIX_TRACE_OVERFLOW trace event shall be reported with a timestamp equal to the timestamp of the first trace event overwritten. This is an indication that some generated trace events have been lost.

The POSIX_TRACE_RESUME trace event shall be reported with a timestamp equal to the timestamp of the first valid trace event reported after the overflow condition ends and shall be reported before this first valid trace event. This is an indication that the trace system is reliably recording trace events after an overflow condition.

Each of these trace event types shall be defined by a constant trace event name and a **trace_event_id_t** constant; trace event data is associated with some of these trace events.

If the Trace option is supported and the Trace Event Filter option and the Trace Log option are not supported, the following predefined system trace events in Table 2-3 shall be defined:

Table 2-3 Trace Option: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error
		int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto
		int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Event Filter option are both supported, and if the Trace Log option is not supported, the following predefined system trace events in Table 2-4 (on page 78) shall be defined:

Table 2-4 Trace and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	event_filter trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.

If the Trace option and the Trace Log option are both supported, and if the Trace Event Filter option is not supported, the following predefined system trace events in Table 2-5 shall be defined:

Table 2-5 Trace and Trace Log Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	None.
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

If the Trace option, the Trace Event Filter option, and the Trace Log option are all supported, the following predefined system trace events in Table 2-6 (on page 79) shall be defined:

Table 2-6 Trace, Trace Log, and Trace Event Filter Options: System Trace Events

Event Name	Constant	Associated Data
		Data Type
posix_trace_error	POSIX_TRACE_ERROR	error int
posix_trace_start	POSIX_TRACE_START	event_filter trace_event_set_t
posix_trace_stop	POSIX_TRACE_STOP	auto int
posix_trace_filter	POSIX_TRACE_FILTER	old_event_filter new_event_filter trace_event_set_t
posix_trace_overflow	POSIX_TRACE_OVERFLOW	None.
posix_trace_resume	POSIX_TRACE_RESUME	None.
posix_trace_flush_start	POSIX_TRACE_FLUSH_START	None.
posix_trace_flush_stop	POSIX_TRACE_FLUSH_STOP	None.

2.11.2.2 User Trace Event Type Definitions

The user trace event `POSIX_TRACE_UNNAMED_USEREVENT` is defined in the `<trace.h>` header. If the limit of per-process user trace event names represented by `{TRACE_USER_EVENT_MAX}` has already been reached, this predefined user event shall be returned when the application tries to register more events than allowed. The data associated with this trace event is application-defined.

The following predefined user trace event in Table 2-7 shall be defined:

Table 2-7 Trace Option: User Trace Event

Event Name	Constant
posix_trace_unnamed_userevent	POSIX_TRACE_UNNAMED_USEREVENT

2.11.3 Trace Functions

The trace interface is built and structured to improve portability through use of trace data of opaque type. The object-oriented approach for the manipulation of trace attributes and trace event type identifiers requires definition of many constructor and selector functions which operate on these opaque types. Also, the trace interface must support several different tracing roles. To facilitate reading the trace interface, the trace functions are grouped into small functional sets supporting the three different roles:

- A trace controller process requires functions to set up and customize all the resources needed to run a trace stream, including:
 - Attribute initialization and destruction (`posix_trace_attr_init()`)
 - Identification information manipulation (`posix_trace_attr_getgenversion()`)
 - Trace system behavior modification (`posix_trace_attr_getinherited()`)
 - Trace stream and trace log size set (`posix_trace_attr_getmaxusereventsize()`)

- 3262 — Trace stream creation, flush, and shutdown (*posix_trace_create()*)
- 3263 — Trace stream and trace log clear (*posix_trace_clear()*)
- 3264 — Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
- 3265 — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
- 3266 — Trace event type set manipulation (*posix_trace_eventset_empty()*)
- 3267 — Trace event type filter set (*posix_trace_set_filter()*)
- 3268 — Trace stream start and stop (*posix_trace_start()*)
- 3269 — Trace stream information and status read (*posix_trace_get_attr()*)
- 3270 • A traced process requires functions to instrument trace points:
- 3271 — Trace event type identifiers definition and trace points insertion (*posix_trace_event()*)
- 3272 • A trace analyzer process requires functions to retrieve information from a trace stream and
- 3273 trace log:
- 3274 — Identification information read (*posix_trace_attr_getgenversion()*)
- 3275 — Trace system behavior information read (*posix_trace_attr_getinherited()*)
- 3276 — Trace stream and trace log size get (*posix_trace_attr_getmaxusereventsized()*)
- 3277 — Trace event type identifier manipulation (*posix_trace_trid_eventid_open()*)
- 3278 — Trace event type identifier list exploration (*posix_trace_eventtypelist_getnext_id()*)
- 3279 — Trace log open, rewind, and close (*posix_trace_open()*)
- 3280 — Trace stream information and status read (*posix_trace_get_attr()*)
- 3281 — Trace event read (*posix_trace_getnext_event()*)

2.12 Data Types

All of the data types used by various functions are defined by the implementation. The following table describes some of these types. Other types referenced in the description of a function, not mentioned here, can be found in the appropriate header for that function.

Defined Type	Description
cc_t	Type used for terminal special characters.
clock_t	Integer or real-floating type used for processor times, as defined in the ISO C standard.
clockid_t	Used for clock ID type in some timer functions.
dev_t	Arithmetic type used for device numbers.
DIR	Type representing a directory stream.
div_t	Structure type returned by the <i>div()</i> function.
FILE	Structure containing information about a file.
glob_t	Structure type used in pathname pattern matching.
fpos_t	Type containing all information needed to specify uniquely every

gid_t	Integer type used for group IDs.
iconv_t	Type used for conversion descriptors.
id_t	Integer type used as a general identifier; can be used to contain at least the largest of a pid_t , uid_t , or gid_t .
ino_t	Unsigned integer type used for file serial numbers.
key_t	Arithmetic type used for XSI interprocess communication.
ldiv_t	Structure type returned by the <i>ldiv()</i> function.
mode_t	Integer type used for file attributes.
mqd_t	Used for message queue descriptors.
nfds_t	Integer type used for the number of file descriptors.
nlink_t	Integer type used for link counts.
off_t	Signed integer type used for file sizes.
pid_t	Signed integer type used for process and process group IDs.
pthread_attr_t	Used to identify a thread attribute object.
pthread_cond_t	Used for condition variables.
pthread_condattr_t	Used to identify a condition attribute object.
pthread_key_t	Used for thread-specific data keys.
pthread_mutex_t	Used for mutexes.
pthread_mutexattr_t	Used to identify a mutex attribute object.
pthread_once_t	Used for dynamic package initialization.
pthread_rwlock_t	Used for read-write locks.
pthread_rwlockattr_t	Used for read-write lock attributes.
pthread_t	Used to identify a thread.
ptrdiff_t	Signed integer type of the result of subtracting two pointers.
regex_t	Structure type used in regular expression matching.
regmatch_t	Structure type used in regular expression matching.
rlim_t	Unsigned integer type used for limit values, to which objects of type int and off_t can be cast without loss of value.
sem_t	Type used in performing semaphore operations.
sig_atomic_t	Integer type of an object that can be accessed as an atomic entity, even in the presence of asynchronous interrupts.
sigset_t	Integer or structure type of an object used to represent sets of signals.
size_t	Unsigned integer type used for size of objects.
speed_t	Type used for terminal baud rates.
ssize_t	Signed integer type used for a count of bytes or an error indication.
suseconds_t	Signed integer type used for time in microseconds.
tcflag_t	Type used for terminal modes.
time_t	Integer or real-floating type used for time in seconds, as defined in the ISO C standard.
timer_t	Used for timer ID returned by the <i>timer_create()</i> function.
uid_t	Integer type used for user IDs.
useconds_t	Unsigned integer type used for time in microseconds.
va_list	Type used for traversing variable argument lists.
wchar_t	Integer type whose range of values can represent distinct codes for

wordexp_t	Structure type used in word expansion.

System Interfaces

3356

3357

3358

This chapter describes the functions, macros, and external variables to support applications portability at the C-language source level.

3359 **NAME**

3360 FD_CLR — macros for synchronous I/O multiplexing

3361 **SYNOPSIS**

3362 #include <sys/time.h>

3363 FD_CLR(int *fd*, fd_set **fdset*);3364 FD_ISSET(int *fd*, fd_set **fdset*);3365 FD_SET(int *fd*, fd_set **fdset*);3366 FD_ZERO(fd_set **fdset*);3367 **DESCRIPTION**3368 Refer to *pselect()*.

3369 **NAME**

3370 _Exit, _exit — terminate a process

3371 **SYNOPSIS**

3372 #include <stdlib.h> |

3373 void _Exit(int *status*); |

3374 #include <unistd.h>

3375 void _exit(int *status*);3376 **DESCRIPTION**3377 Refer to *exit()*.

3378 NAME

3379 _longjmp, _setjmp — non-local goto

3380 SYNOPSIS

```
3381 xSI      #include <setjmp.h>
3382
3382      void _longjmp(jmp_buf env, int val);
3383      int _setjmp(jmp_buf env);
3384
```

3385 DESCRIPTION

3386 The *_longjmp()* and *_setjmp()* functions shall be equivalent to *longjmp()* and *setjmp()*,
3387 respectively, with the additional restriction that *_longjmp()* and *_setjmp()* shall not manipulate
3388 the signal mask.

3389 If *_longjmp()* is called even though *env* was never initialized by a call to *_setjmp()*, or when the
3390 last such call was in a function that has since returned, the results are undefined.

3391 RETURN VALUE

3392 Refer to *longjmp()* and *setjmp()*.

3393 ERRORS

3394 No errors are defined.

3395 EXAMPLES

3396 None.

3397 APPLICATION USAGE

3398 If *_longjmp()* is executed and the environment in which *_setjmp()* was executed no longer exists,
3399 errors can occur. The conditions under which the environment of the *_setjmp()* no longer exists
3400 include exiting the function that contains the *_setjmp()* call, and exiting an inner block with
3401 temporary storage. This condition might not be detectable, in which case the *_longjmp()* occurs
3402 and, if the environment no longer exists, the contents of the temporary storage of an inner block
3403 are unpredictable. This condition might also cause unexpected process termination. If the
3404 function has returned, the results are undefined.

3405 Passing *longjmp()* a pointer to a buffer not created by *setjmp()*, passing *_longjmp()* a pointer to a
3406 buffer not created by *_setjmp()*, passing *siglongjmp()* a pointer to a buffer not created by
3407 *sigsetjmp()*, or passing any of these three functions a buffer that has been modified by the user
3408 can cause all the problems listed above, and more.

3409 The *_longjmp()* and *_setjmp()* functions are included to support programs written to historical
3410 system interfaces. New applications should use *siglongjmp()* and *sigsetjmp()* respectively.

3411 RATIONALE

3412 None.

3413 FUTURE DIRECTIONS

3414 The *_longjmp()* and *_setjmp()* functions may be marked LEGACY in a future version.

3419 First released in Issue 4, Version 2.

3420 **Issue 5**

3421 Moved from X/OPEN UNIX extension to BASE.

3422 NAME

3423 _toupper — transliterate uppercase characters to lowercase

3424 SYNOPSIS

3425 xSI #include <ctype.h>

3426 int _tolower(int c);

3427

3428 DESCRIPTION

3429 The *_tolower()* macro shall be equivalent to *tolower(c)* except that the application shall ensure
3430 that the argument *c* is an uppercase letter.

3431 RETURN VALUE

3432 Upon successful completion, *_tolower()* shall return the lowercase letter corresponding to the
3433 argument passed.

3434 ERRORS

3435 No errors are defined.

3436 EXAMPLES

3437 None.

3438 APPLICATION USAGE

3439 None.

3440 RATIONALE

3441 None.

3442 FUTURE DIRECTIONS

3476 CHANGE HISTORY

3477 First released in Issue 1. Derived from Issue 1 of the SVID.

3478 Issue 6

3479 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

3480 **NAME**

3481 a64l, l64a — convert between a 32-bit integer and a radix-64 ASCII string

3482 **SYNOPSIS**

3483 xSI #include <stdlib.h>

3484 long a64l(const char *s);

3485 char *l64a(long value);

3486

3487 **DESCRIPTION**

3488 These functions maintain numbers stored in radix-64 ASCII characters. This is a notation by
 3489 which 32-bit integers can be represented by up to six characters; each character represents a digit
 3490 in radix-64 notation. If the type **long** contains more than 32 bits, only the low-order 32 bits shall
 3491 be used for these operations.

3492 The characters used to represent digits are ' .' (dot) for 0, ' / ' for 1, ' 0 ' through ' 9 ' for [2,11],
 3493 ' A ' through ' Z ' for [12,37], and ' a ' through ' z ' for [38,63].

3494 The *a64l()* function shall take a pointer to a radix-64 representation, in which the first digit is the
 3495 least significant, and return the corresponding **long** value. If the string pointed to by *s* contains
 3496 more than six characters, *a64l()* shall use the first six. If the first six characters of the string
 3497 contain a null terminator, *a64l()* shall use only characters preceding the null terminator. The
 3498 *a64l()* function shall scan the character string from left to right with the least significant digit on
 3499 the left, decoding each character as a 6-bit radix-64 number. If the type **long** contains more than
 3500 32 bits, the resulting value is sign-extended. The behavior of *a64l()* is unspecified if *s* is a null
 3501 pointer or the string pointed to by *s* was not generated by a previous call to *l64a()*.

3502 The *l64a()* function shall take a **long** argument and return a pointer to the corresponding radix-
 3503 64 representation. The behavior of *l64a()* is unspecified if *value* is negative.

3504 The value returned by *l64a()* may be a pointer into a static buffer. Subsequent calls to *l64a()* may
 3505 overwrite the buffer.

3506 The *l64a()* function need not be reentrant. A function that is not required to be reentrant is not
 3507 required to be thread-safe.

3508 **RETURN VALUE**

3509 Upon successful completion, *a64l()* shall return the **long** value resulting from conversion of the
 3510 input string. If a string pointed to by *s* is an empty string, *a64l()* shall return 0L.

3511 The *l64a()* function shall return a pointer to the radix-64 representation. If *value* is 0L, *l64a()* shall
 3512 return a pointer to an empty string.

3513 **ERRORS**

3514 No errors are defined.

3515 **EXAMPLES**

3516 None.

3517 **APPLICATION USAGE**3518 If the type **long** contains more than 32 bits, the result of *a64l(l64a(x))* is *x* in the low-order 32 bits.3519 **RATIONALE**3520 This is not the same encoding as used by either encoding variant of the *uuencode* utility.

3521 **FUTURE DIRECTIONS**

3522 None.

3523 **SEE ALSO**

3524 *strtoul()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdlib.h>**, the Shell and Utilities
3525 volume of IEEE Std 1003.1-2001, *uuencode*

3526 **CHANGE HISTORY**

3527 First released in Issue 4, Version 2.

3528 **Issue 5**

3529 Moved from X/OPEN UNIX extension to BASE.

3530 Normative text previously in the APPLICATION USAGE section is moved to the
3531 DESCRIPTION.

3532 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

3533 **NAME**

3534 abort — generate an abnormal process abort

3535 **SYNOPSIS**

3536 #include <stdlib.h>

3537 void abort(void);

3538 **DESCRIPTION**

3539 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 3540 conflict between the requirements described here and the ISO C standard is unintentional. This
 3541 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3542 The *abort()* function shall cause abnormal process termination to occur, unless the signal
 3543 SIGABRT is being caught and the signal handler does not return.

3544 CX The abnormal termination processing shall include the default actions defined for SIGABRT and
 3545 may include an attempt to effect *fclose()* on all open streams.

3546 The SIGABRT signal shall be sent to the calling process as if by means of *raise()* with the
 3547 argument SIGABRT.

3548 CX The status made available to *wait()* or *waitpid()* by *abort()* shall be that of a process terminated
 3549 by the SIGABRT signal. The *abort()* function shall override blocking or ignoring the SIGABRT
 3550 signal.

3551 **RETURN VALUE**3552 The *abort()* function shall not return.3553 **ERRORS**

3554 No errors are defined.

3555 **EXAMPLES**

3556 None.

3557 **APPLICATION USAGE**

3558 Catching the signal is intended to provide the application writer with a portable means to abort
 3559 processing, free from possible interference from any implementation-defined functions.

3560 **RATIONALE**

3561 The ISO/IEC 9899:1999 standard requires the *abort()* function to be async-signal-safe. Since
 3562 IEEE Std 1003.1-2001 defers to the ISO C standard, this required a change to the DESCRIPTION
 3563 from “shall include the effect of *fclose()*” to “may include an attempt to effect *fclose()*.”

3564 The revised wording permits some backwards-compatibility and avoids a potential deadlock
 3565 situation.

3566 The Open Group Base Resolution bwg2002-003 is applied, removing the following XSI shaded
 3567 paragraph from the DESCRIPTION:

3568 “On XSI-conformant systems, in addition the abnormal termination processing shall include the
 3569 effect of *fclose()* on message catalog descriptors.”

3570 There were several reasons to remove this paragraph:

- 3571 • No special processing of open message catalogs needs to be performed prior to abnormal
 3572 process termination.
- 3573 • The main reason to specifically mention that *abort()* includes the effect of *fclose()* on open
 3574 streams is to flush output queued on the stream. Message catalogs in this context are read-
 3575 only and, therefore, do not need to be flushed.

3576 • The effect of *fclose()* on a message catalog descriptor is unspecified. Message catalog
3577 descriptors are allowed, but not required to be implemented using a file descriptor, but there
3578 is no mention in IEEE Std 1003.1-2001 of a message catalog descriptor using a standard I/O
3579 stream FILE object as would be expected by *fclose()*.

3580 **FUTURE DIRECTIONS**

3581 None.

3582 **SEE ALSO**

3583 *exit()*, *kill()*, *raise()*, *signal()*, *wait()*, *waitpid()*, the Base Definitions volume of
3584 IEEE Std 1003.1-2001, **<stdlib.h>**

3585 **CHANGE HISTORY**

3586 First released in Issue 1. Derived from Issue 1 of the SVID.

3587 **Issue 6**

3588 Extensions beyond the ISO C standard are marked.

3589 Changes are made to the DESCRIPTION for alignment with the ISO/IEC 9899:1999 standard.

3590 The Open Group Base Resolution bwg2002-003 is applied.

3591 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/10 is applied, changing the
3592 DESCRIPTION of abnormal termination processing and adding to the RATIONALE section.

3593 **NAME**

3594 abs — return an integer absolute value

3595 **SYNOPSIS**

3596 #include <stdlib.h>

3597 int abs(int i);

3598 **DESCRIPTION**

3599 cx The functionality described on this reference page is aligned with the ISO C standard. Any
3600 conflict between the requirements described here and the ISO C standard is unintentional. This
3601 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3602 The *abs()* function shall compute the absolute value of its integer operand, *i*. If the result cannot
3603 be represented, the behavior is undefined.

3604 **RETURN VALUE**3605 The *abs()* function shall return the absolute value of its integer operand.3606 **ERRORS**

3607 No errors are defined.

3608 **EXAMPLES**

3609 None.

3610 **APPLICATION USAGE**

3611 In two's-complement representation, the absolute value of the negative integer with largest
3612 magnitude {INT_MIN} might not be representable.

3613 **RATIONALE**

3614 None.

3615 **FUTURE DIRECTIONS**

3616 None.

3617 **SEE ALSO**3618 *fabs()*, *labs()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>3619 **CHANGE HISTORY**

3620 First released in Issue 1. Derived from Issue 1 of the SVID.

3621 **Issue 6**

3622 Extensions beyond the ISO C standard are marked.

3623 **NAME**

3624 accept — accept a new connection on a socket

3625 **SYNOPSIS**

3626 #include <sys/socket.h>

```
3627           int accept(int socket, struct sockaddr *restrict address,
3628                      socklen_t *restrict address_len);
```

3629 **DESCRIPTION**

3630 The *accept()* function shall extract the first connection on the queue of pending connections,
 3631 create a new socket with the same socket type protocol and address family as the specified
 3632 socket, and allocate a new file descriptor for that socket.

3633 The *accept()* function takes the following arguments:

3634 *socket* Specifies a socket that was created with *socket()*, has been bound to an address
 3635 with *bind()*, and has issued a successful call to *listen()*.

3636 *address* Either a null pointer, or a pointer to a **sockaddr** structure where the address of
 3637 the connecting socket shall be returned.

3638 *address_len* Points to a **socklen_t** structure which on input specifies the length of the
 3639 supplied **sockaddr** structure, and on output specifies the length of the stored
 3640 address.

3641 If *address* is not a null pointer, the address of the peer for the accepted connection shall be stored
 3642 in the **sockaddr** structure pointed to by *address*, and the length of this address shall be stored in
 3643 the object pointed to by *address_len*.

3644 If the actual length of the address is greater than the length of the supplied **sockaddr** structure,
 3645 the stored address shall be truncated.

3646 If the protocol permits connections by unbound clients, and the peer is not bound, then the value
 3647 stored in the object pointed to by *address* is unspecified.

3648 If the listen queue is empty of connection requests and O_NONBLOCK is not set on the file
 3649 descriptor for the socket, *accept()* shall block until a connection is present. If the *listen()* queue is
 3650 empty of connection requests and O_NONBLOCK is set on the file descriptor for the socket,
 3651 *accept()* shall fail and set *errno* to [EAGAIN] or [EWOULDBLOCK].

3652 The accepted socket cannot itself accept more connections. The original socket remains open and
 3653 can accept more connections.

3654 **RETURN VALUE**

3655 Upon successful completion, *accept()* shall return the non-negative file descriptor of the accepted
 3656 socket. Otherwise, -1 shall be returned and *errno* set to indicate the error.

3657 **ERRORS**

3658 The *accept()* function shall fail if:

3659 [EAGAIN] or [EWOULDBLOCK]

3660 O_NONBLOCK is set for the socket file descriptor and no connections are
 3661 present to be accepted.

3662 [EBADF] The *socket* argument is not a valid file descriptor.

3663 [ECONNABORTED]

3664 A connection has been aborted.

3665	[EINTR]	The <i>accept()</i> function was interrupted by a signal that was caught before a valid connection arrived.
3666		
3667	[EINVAL]	The <i>socket</i> is not accepting connections.
3668	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
3669	[ENFILE]	The maximum number of file descriptors in the system are already open.
3670	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
3671	[EOPNOTSUPP]	The <i>socket</i> type of the specified socket does not support accepting connections.
3672		
3673		The <i>accept()</i> function may fail if:
3674	[ENOBUFS]	No buffer space is available.
3675	[ENOMEM]	There was insufficient memory available to complete the operation.
3676	XSR [EPROTO]	A protocol error has occurred; for example, the STREAMS protocol stack has not been initialized.
3677		

3678 **EXAMPLES**

3679 None.

3680 **APPLICATION USAGE**

3681 When a connection is available, *select()* indicates that the file descriptor for the socket is ready
3682 for reading.

3683 **RATIONALE**

3684 None.

3685 **FUTURE DIRECTIONS**

3686 None.

3687 **SEE ALSO**

3688 *bind()*, *connect()*, *listen()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,
3689 <sys/socket.h>

3690 **CHANGE HISTORY**

3691 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

3692 The **restrict** keyword is added to the *accept()* prototype for alignment with the
3693 ISO/IEC 9899:1999 standard.

3694 **NAME**

3695 access — determine accessibility of a file

3696 **SYNOPSIS**

3697 #include <unistd.h>

3698 int access(const char *path, int amode);

3699 **DESCRIPTION**

3700 The *access()* function shall check the file named by the pathname pointed to by the *path*
 3701 argument for accessibility according to the bit pattern contained in *amode*, using the real user ID
 3702 in place of the effective user ID and the real group ID in place of the effective group ID.

3703 The value of *amode* is either the bitwise-inclusive OR of the access permissions to be checked
 3704 (R_OK, W_OK, X_OK) or the existence test (F_OK).

3705 If any access permissions are checked, each shall be checked individually, as described in the
 3706 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 3, Definitions. If the process has
 3707 appropriate privileges, an implementation may indicate success for X_OK even if none of the
 3708 execute file permission bits are set.

3709 **RETURN VALUE**

3710 If the requested access is permitted, *access()* succeeds and shall return 0; otherwise, -1 shall be
 3711 returned and *errno* shall be set to indicate the error.

3712 **ERRORS**3713 The *access()* function shall fail if:

3714 [EACCES] Permission bits of the file mode do not permit the requested access, or search
 3715 permission is denied on a component of the path prefix.

3716 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 3717 argument.

3718 [ENAMETOOLONG] The length of the *path* argument exceeds {PATH_MAX} or a pathname
 3719 component is longer than {NAME_MAX}.
 3720

3721 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

3722 [ENOTDIR] A component of the path prefix is not a directory.

3723 [EROFS] Write access is requested for a file on a read-only file system.

3724 The *access()* function may fail if:

3725 [EINVAL] The value of the *amode* argument is invalid.

3726 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 3727 resolution of the *path* argument.

3728 [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the *path* argument,
 3729 the length of the substituted pathname string exceeded {PATH_MAX}.
 3730

3731 [ETXTBSY] Write access is requested for a pure procedure (shared text) file that is being
 3732 executed.

3733 **EXAMPLES**3734 **Testing for the Existence of a File**

3735 The following example tests whether a file named **myfile** exists in the **/tmp** directory.

```
3736 #include <unistd.h>
3737 ...
3738 int result;
3739 const char *filename = "/tmp/myfile";
3740 result = access (filename, F_OK);
```

3741 **APPLICATION USAGE**

3742 Additional values of *amode* other than the set defined in the description may be valid; for
 3743 example, if a system has extended access controls.

3744 **RATIONALE**

3745 In early proposals, some inadequacies in the *access()* function led to the creation of an *eaccess()*
 3746 function because:

- 3747 1. Historical implementations of *access()* do not test file access correctly when the process'
 3748 real user ID is superuser. In particular, they always return zero when testing execute
 3749 permissions without regard to whether the file is executable.
- 3750 2. The superuser has complete access to all files on a system. As a consequence, programs
 3751 started by the superuser and switched to the effective user ID with lesser privileges cannot
 3752 use *access()* to test their file access permissions.

3753 However, the historical model of *eaccess()* does not resolve problem (1), so this volume of
 3754 IEEE Std 1003.1-2001 now allows *access()* to behave in the desired way because several
 3755 implementations have corrected the problem. It was also argued that problem (2) is more easily
 3756 solved by using *open()*, *chdir()*, or one of the *exec* functions as appropriate and responding to the
 3757 error, rather than creating a new function that would not be as reliable. Therefore, *eaccess()* is not
 3758 included in this volume of IEEE Std 1003.1-2001.

3759 The sentence concerning appropriate privileges and execute permission bits reflects the two
 3760 possibilities implemented by historical implementations when checking superuser access for
 3761 X_OK.

3762 New implementations are discouraged from returning X_OK unless at least one execution
 3763 permission bit is set.

3764 **FUTURE DIRECTIONS**

3765 None.

3766 **SEE ALSO**

3767 *chmod()*, *stat()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

3768 **CHANGE HISTORY**

3769 First released in Issue 1. Derived from Issue 1 of the SVID.

3770 **Issue 6**

3771 The following new requirements on POSIX implementations derive from alignment with the
 3772 Single UNIX Specification:

- 3773 • The [ELOOP] mandatory error condition is added.
- 3774 • A second [ENAMETOOLONG] is added as an optional error condition.

- 3775 • The [ETXTBSY] optional error condition is added.

3776 The following changes were made to align with the IEEE P1003.1a draft standard:

- 3777 • The [ELOOP] optional error condition is added.

3778 **NAME**

3779 acos, acosf, acosl — arc cosine functions

3780 **SYNOPSIS**

3781 #include <math.h>

3782 double acos(double x);

3783 float acosf(float x);

3784 long double acosl(long double x);

3785 **DESCRIPTION**

3786 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 3787 conflict between the requirements described here and the ISO C standard is unintentional. This
 3788 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3789 These functions shall compute the principal value of the arc cosine of their argument *x*. The
 3790 value of *x* should be in the range $[-1,1]$.

3791 An application wishing to check for error situations should set *errno* to zero and call
 3792 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 3793 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 3794 zero, an error has occurred.

3795 **RETURN VALUE**

3796 Upon successful completion, these functions shall return the arc cosine of *x*, in the range $[0,\pi]$
 3797 radians.

3798 **MX** For finite values of *x* not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 3799 supported), or an implementation-defined value shall be returned.

3800 **MX** If *x* is NaN, a NaN shall be returned.

3801 If *x* is +1, +0 shall be returned.

3802 If *x* is $\pm\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 3803 defined value shall be returned.

3804 **ERRORS**

3805 These functions shall fail if:

3806 **MX** Domain Error The *x* argument is finite and is not in the range $[-1,1]$, or is $\pm\text{Inf}$.

3807 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 3808 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 3809 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 3810 shall be raised.

3811 **EXAMPLES**

3812 None.

3813 **APPLICATION USAGE**

3814 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 3815 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

3816 **RATIONALE**

3817 None.

3818 **FUTURE DIRECTIONS**

3819 None.

3820 **SEE ALSO**

3822 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

3823 **CHANGE HISTORY**

3824 First released in Issue 1. Derived from Issue 1 of the SVID.

3825 **Issue 5**

3826 The DESCRIPTION is updated to indicate how an application should check for an error. This
3827 text was previously published in the APPLICATION USAGE section.

3828 **Issue 6**3829 The *acosf()* and *acosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

3830 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
3831 revised to align with the ISO/IEC 9899:1999 standard.

3832 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
3833 marked.

3834 **NAME**

3835 acosh, acoshf, acoshl — inverse hyperbolic cosine functions

3836 **SYNOPSIS**

3837 #include <math.h>

3838 double acosh(double x);

3839 float acoshf(float x);

3840 long double acoshl(long double x);

3841 **DESCRIPTION**

3842 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 3843 conflict between the requirements described here and the ISO C standard is unintentional. This
 3844 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

3845 These functions shall compute the inverse hyperbolic cosine of their argument x .

3846 An application wishing to check for error situations should set *errno* to zero and call
 3847 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 3848 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 3849 zero, an error has occurred.

3850 **RETURN VALUE**

3851 Upon successful completion, these functions shall return the inverse hyperbolic cosine of their
 3852 argument.

3853 MX For finite values of $x < 1$, a domain error shall occur, and either a NaN (if supported), or an
 3854 implementation-defined value shall be returned.

3855 MX If x is NaN, a NaN shall be returned.3856 If x is $+1$, $+0$ shall be returned.3857 If x is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

3858 If x is $-\text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 3859 defined value shall be returned.

3860 **ERRORS**

3861 These functions shall fail if:

3862 MX Domain Error The x argument is finite and less than $+1.0$, or is $-\text{Inf}$.

3863 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 3864 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 3865 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 3866 shall be raised.

3867 **EXAMPLES**

3868 None.

3869 **APPLICATION USAGE**

3870 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 3871 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

3872 **RATIONALE**

3873 None.

3874 **FUTURE DIRECTIONS**

3875 None.

3876 **SEE ALSO**

3879 **CHANGE HISTORY**

3880 First released in Issue 4, Version 2.

3881 **Issue 5**

3882 Moved from X/OPEN UNIX extension to BASE.

3883 **Issue 6**3884 The *acosh()* function is no longer marked as an extension.

3885 The *acoshf()* and *acoshl()* functions are added for alignment with the ISO/IEC 9899:1999
3886 standard.

3887 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
3888 revised to align with the ISO/IEC 9899:1999 standard.

3889 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
3890 marked.

3891 **NAME**

3892 acosl — arc cosine functions

3893 **SYNOPSIS**

3894 #include <math.h>

3895 long double acosl(long double x);

3896 **DESCRIPTION**3897 Refer to *acos()*.

3898 **NAME**3899 aio_cancel — cancel an asynchronous I/O request (**REALTIME**)3900 **SYNOPSIS**3901 AIO `#include <aio.h>`3902 `int aio_cancel(int fildes, struct aiocb *aiocbp);`

3903

3904 **DESCRIPTION**

3905 The *aio_cancel()* function shall attempt to cancel one or more asynchronous I/O requests
 3906 currently outstanding against file descriptor *fildes*. The *aiocbp* argument points to the
 3907 asynchronous I/O control block for a particular request to be canceled. If *aiocbp* is NULL, then
 3908 all outstanding cancelable asynchronous I/O requests against *fildes* shall be canceled.

3909 Normal asynchronous notification shall occur for asynchronous I/O operations that are
 3910 successfully canceled. If there are requests that cannot be canceled, then the normal
 3911 asynchronous completion process shall take place for those requests when they are completed.

3912 For requested operations that are successfully canceled, the associated error status shall be set to
 3913 [ECANCELED] and the return status shall be -1. For requested operations that are not
 3914 successfully canceled, the *aiocbp* shall not be modified by *aio_cancel()*.

3915 If *aiocbp* is not NULL, then if *fildes* does not have the same value as the file descriptor with which
 3916 the asynchronous operation was initiated, unspecified results occur.

3917 Which operations are cancelable is implementation-defined.

3918 **RETURN VALUE**

3919 The *aio_cancel()* function shall return the value AIO_CANCELED to the calling process if the
 3920 requested operation(s) were canceled. The value AIO_NOTCANCELED shall be returned if at
 3921 least one of the requested operation(s) cannot be canceled because it is in progress. In this case,
 3922 the state of the other operations, if any, referenced in the call to *aio_cancel()* is not indicated by
 3923 the return value of *aio_cancel()*. The application may determine the state of affairs for these
 3924 operations by using *aio_error()*. The value AIO_ALLDONE is returned if all of the operations
 3925 have already completed. Otherwise, the function shall return -1 and set *errno* to indicate the
 3926 error.

3927 **ERRORS**

3928 The *aio_cancel()* function shall fail if:

3929 [EBADF] The *fildes* argument is not a valid file descriptor.

3930 **EXAMPLES**

3931 None.

3932 **APPLICATION USAGE**

3933 The *aio_cancel()* function is part of the Asynchronous Input and Output option and need not be
 3934 available on all implementations.

3935 **RATIONALE**

3936 None.

3937 **FUTURE DIRECTIONS**

3938 None.

3939 SEE ALSO

3941 CHANGE HISTORY

3942 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

3943 Issue 6

3944 The [ENOSYS] error condition has been removed as stubs need not be provided if an
3945 implementation does not support the Asynchronous Input and Output option.

3946 The APPLICATION USAGE section is added.

3947 NAME

3948 `aio_error` — retrieve errors status for an asynchronous I/O operation (**REALTIME**)

3949 SYNOPSIS

3950 AIO `#include <aio.h>`

3951 `int aio_error(const struct aiocb *aiocbp);`

3952

3953 DESCRIPTION

3954 The `aio_error()` function shall return the error status associated with the **aiocb** structure
 3955 referenced by the `aiocbp` argument. The error status for an asynchronous I/O operation is the
 3956 SIO `errno` value that would be set by the corresponding `read()`, `write()`, `fdatasync()`, or `fsync()`
 3957 operation. If the operation has not yet completed, then the error status shall be equal to
 3958 `[EINPROGRESS]`.

3959 RETURN VALUE

3960 If the asynchronous I/O operation has completed successfully, then 0 shall be returned. If the
 3961 asynchronous operation has completed unsuccessfully, then the error status, as described for
 3962 SIO `read()`, `write()`, `fdatasync()`, and `fsync()`, shall be returned. If the asynchronous I/O operation has
 3963 not yet completed, then `[EINPROGRESS]` shall be returned.

3964 ERRORS

3965 The `aio_error()` function may fail if:

3966 `[EINVAL]` The `aiocbp` argument does not refer to an asynchronous operation whose
 3967 return status has not yet been retrieved.

3968 EXAMPLES

3969 None.

3970 APPLICATION USAGE

3971 The `aio_error()` function is part of the Asynchronous Input and Output option and need not be
 3972 available on all implementations.

3973 RATIONALE

3974 None.

3975 FUTURE DIRECTIONS

3976 None.

3977 SEE ALSO

3978 `aio_cancel()`, `aio_fsync()`, `aio_read()`, `aio_return()`, `aio_write()`, `close()`, `exec`, `exit()`, `fork()`, `lio_listio()`,
 3979 `lseek()`, `read()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<aio.h>**

3980 CHANGE HISTORY

3981 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

3982 Issue 6

3983 The `[ENOSYS]` error condition has been removed as stubs need not be provided if an
 3984 implementation does not support the Asynchronous Input and Output option.

3985 The APPLICATION USAGE section is added.

3986 **NAME**3987 aio_fsync — asynchronous file synchronization (**REALTIME**)3988 **SYNOPSIS**3989 AIO `#include <aio.h>`3990 `int aio_fsync(int op, struct aiocb *aiocbp);`

3991

3992 **DESCRIPTION**

3993 The *aio_fsync()* function shall asynchronously force all I/O operations associated with the file
 3994 indicated by the file descriptor *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp*
 3995 argument and queued at the time of the call to *aio_fsync()* to the synchronized I/O completion
 3996 state. The function call shall return when the synchronization request has been initiated or
 3997 queued to the file or device (even when the data cannot be synchronized immediately).

3998 If *op* is *O_DSYNC*, all currently queued I/O operations shall be completed as if by a call to
 3999 *fdatsync()*; that is, as defined for synchronized I/O data integrity completion. If *op* is *O_SYNC*,
 4000 all currently queued I/O operations shall be completed as if by a call to *fsync()*; that is, as
 4001 defined for synchronized I/O file integrity completion. If the *aio_fsync()* function fails, or if the
 4002 operation queued by *aio_fsync()* fails, then, as for *fsync()* and *fdatsync()*, outstanding I/O
 4003 operations are not guaranteed to have been completed.

4004 If *aio_fsync()* succeeds, then it is only the I/O that was queued at the time of the call to
 4005 *aio_fsync()* that is guaranteed to be forced to the relevant completion state. The completion of
 4006 subsequent I/O on the file descriptor is not guaranteed to be completed in a synchronized
 4007 fashion.

4008 The *aiocbp* argument refers to an asynchronous I/O control block. The *aiocbp* value may be used
 4009 as an argument to *aio_error()* and *aio_return()* in order to determine the error status and return
 4010 status, respectively, of the asynchronous operation while it is proceeding. When the request is
 4011 queued, the error status for the operation is *[EINPROGRESS]*. When all data has been
 4012 successfully transferred, the error status shall be reset to reflect the success or failure of the
 4013 operation. If the operation does not complete successfully, the error status for the operation shall
 4014 be set to indicate the error. The *aio_sigevent* member determines the asynchronous notification to
 4015 occur as specified in Section 2.4.1 (on page 28) when all operations have achieved synchronized
 4016 I/O completion. All other members of the structure referenced by *aiocbp* are ignored. If the
 4017 control block referenced by *aiocbp* becomes an illegal address prior to asynchronous I/O
 4018 completion, then the behavior is undefined.

4019 If the *aio_fsync()* function fails or *aiocbp* indicates an error condition, data is not guaranteed to
 4020 have been successfully transferred.

4021 **RETURN VALUE**

4022 The *aio_fsync()* function shall return the value 0 to the calling process if the I/O operation is
 4023 successfully queued; otherwise, the function shall return the value *-1* and set *errno* to indicate
 4024 the error.

4025 **ERRORS**4026 The *aio_fsync()* function shall fail if:

4027 *[EAGAIN]* The requested asynchronous operation was not queued due to temporary
 4028 resource limitations.

4029 *[EBADF]* The *aio_fildes* member of the **aiocb** structure referenced by the *aiocbp* argument
 4030 is not a valid file descriptor open for writing.

4031 [EINVAL] This implementation does not support synchronized I/O for this file.
4032 [EINVAL] A value of *op* other than O_DSYNC or O_SYNC was specified.
4033 In the event that any of the queued I/O operations fail, *aio_fsync()* shall return the error
4034 condition defined for *read()* and *write()*. The error is returned in the error status for the
4035 asynchronous *fsync()* operation, which can be retrieved using *aio_error()*.

4036 EXAMPLES

4037 None.

4038 APPLICATION USAGE

4039 The *aio_fsync()* function is part of the Asynchronous Input and Output option and need not be
4040 available on all implementations.

4041 RATIONALE

4042 None.

4043 FUTURE DIRECTIONS

4044 None.

4048 CHANGE HISTORY

4049 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4050 Issue 6

4051 The [ENOSYS] error condition has been removed as stubs need not be provided if an
4052 implementation does not support the Asynchronous Input and Output option.

4053 The APPLICATION USAGE section is added.

4054 **NAME**4055 aio_read — asynchronous read from a file (**REALTIME**)4056 **SYNOPSIS**4057 AIO `#include <aio.h>`4058 `int aio_read(struct aiocb *aiocbp);`

4059

4060 **DESCRIPTION**

4061 The `aio_read()` function shall read `aiocbp->aio_nbytes` from the file associated with
 4062 `aiocbp->aio_fildes` into the buffer pointed to by `aiocbp->aio_buf`. The function call shall return when
 4063 the read request has been initiated or queued to the file or device (even when the data cannot be
 4064 delivered immediately).

4065 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
 4066 at a priority equal to the scheduling priority of the process minus `aiocbp->aio_reqprio`.

4067 The `aiocbp` value may be used as an argument to `aio_error()` and `aio_return()` in order to
 4068 determine the error status and return status, respectively, of the asynchronous operation while it
 4069 is proceeding. If an error condition is encountered during queuing, the function call shall return
 4070 without having initiated or queued the request. The requested operation takes place at the
 4071 absolute position in the file as given by `aio_offset`, as if `lseek()` were called immediately prior to
 4072 the operation with an `offset` equal to `aio_offset` and a `whence` equal to `SEEK_SET`. After a
 4073 successful call to enqueue an asynchronous I/O operation, the value of the file offset for the file
 4074 is unspecified.

4075 The `aiocbp->aio_lio_opcode` field shall be ignored by `aio_read()`.

4076 The `aiocbp` argument points to an **aiocb** structure. If the buffer pointed to by `aiocbp->aio_buf` or
 4077 the control block pointed to by `aiocbp` becomes an illegal address prior to asynchronous I/O
 4078 completion, then the behavior is undefined.

4079 Simultaneous asynchronous operations using the same `aiocbp` produce undefined results.

4080 SIO If synchronized I/O is enabled on the file associated with `aiocbp->aio_fildes`, the behavior of this
 4081 function shall be according to the definitions of synchronized I/O data integrity completion and
 4082 synchronized I/O file integrity completion.

4083 For any system action that changes the process memory space while an asynchronous I/O is
 4084 outstanding to the address range being changed, the result of that action is undefined.

4085 For regular files, no data transfer shall occur past the offset maximum established in the open
 4086 file description associated with `aiocbp->aio_fildes`.

4087 **RETURN VALUE**

4088 The `aio_read()` function shall return the value zero to the calling process if the I/O operation is
 4089 successfully queued; otherwise, the function shall return the value `-1` and set `errno` to indicate
 4090 the error.

4091 **ERRORS**

4092 The `aio_read()` function shall fail if:

4093 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
 4094 resource limitations.

4095 Each of the following conditions may be detected synchronously at the time of the call to
 4096 `aio_read()`, or asynchronously. If any of the conditions below are detected synchronously, the
 4097 `aio_read()` function shall return `-1` and set `errno` to the corresponding value. If any of the
 4098 conditions below are detected asynchronously, the return status of the asynchronous operation

4099 is set to -1, and the error status of the asynchronous operation is set to the corresponding value.

4100 [EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for reading.

4101 [EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid,
 4102 *aiocbp->aio_reqprio* is not a valid value, or *aiocbp->aio_nbytes* is an invalid
 4103 value.

4104 In the case that the *aio_read()* successfully queues the I/O operation but the operation is
 4105 subsequently canceled or encounters an error, the return status of the asynchronous operation is
 4106 one of the values normally returned by the *read()* function call. In addition, the error status of
 4107 the asynchronous operation is set to one of the error statuses normally set by the *read()* function
 4108 call, or one of the following values:

4109 [EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for reading.

4110 [ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit
 4111 *aio_cancel()* request.

4112 [EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid.

4113 The following condition may be detected synchronously or asynchronously:

4114 [EOVERFLOW] The file is a regular file, *aiocbp->aio_nbytes* is greater than 0, and the starting
 4115 offset in *aiocbp->aio_offset* is before the end-of-file and is at or beyond the offset
 4116 maximum in the open file description associated with *aiocbp->aio_fildes*.

4117 EXAMPLES

4118 None.

4119 APPLICATION USAGE

4120 The *aio_read()* function is part of the Asynchronous Input and Output option and need not be
 4121 available on all implementations.

4122 RATIONALE

4123 None.

4124 FUTURE DIRECTIONS

4125 None.

4126 SEE ALSO

4129 CHANGE HISTORY

4130 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4131 Large File Summit extensions are added.

4132 Issue 6

4133 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 4134 implementation does not support the Asynchronous Input and Output option.

4135 The APPLICATION USAGE section is added.

- 4136 The following new requirements on POSIX implementations derive from alignment with the
4137 Single UNIX Specification:
- 4138 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file
4139 description. This change is to support large files.
 - 4140 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
4141 large files.

4142 **NAME**4143 aio_return — retrieve return status of an asynchronous I/O operation (**REALTIME**)4144 **SYNOPSIS**4145 AIO `#include <aio.h>`4146 `ssize_t aio_return(struct aiocb *aiocbp);`

4147

4148 **DESCRIPTION**

4149 The *aio_return()* function shall return the return status associated with the **aiocb** structure
 4150 referenced by the *aiocbp* argument. The return status for an asynchronous I/O operation is the
 4151 value that would be returned by the corresponding *read()*, *write()*, or *fsync()* function call. If the
 4152 error status for the operation is equal to [EINPROGRESS], then the return status for the
 4153 operation is undefined. The *aio_return()* function may be called exactly once to retrieve the
 4154 return status of a given asynchronous operation; thereafter, if the same **aiocb** structure is used in
 4155 a call to *aio_return()* or *aio_error()*, an error may be returned. When the **aiocb** structure referred
 4156 to by *aiocbp* is used to submit another asynchronous operation, then *aio_return()* may be
 4157 successfully used to retrieve the return status of that operation.

4158 **RETURN VALUE**

4159 If the asynchronous I/O operation has completed, then the return status, as described for *read()*,
 4160 *write()*, and *fsync()*, shall be returned. If the asynchronous I/O operation has not yet completed,
 4161 the results of *aio_return()* are undefined.

4162 **ERRORS**4163 The *aio_return()* function may fail if:

4164 [EINVAL] The *aiocbp* argument does not refer to an asynchronous operation whose
 4165 return status has not yet been retrieved.

4166 **EXAMPLES**

4167 None.

4168 **APPLICATION USAGE**

4169 The *aio_return()* function is part of the Asynchronous Input and Output option and need not be
 4170 available on all implementations.

4171 **RATIONALE**

4172 None.

4178 **CHANGE HISTORY**

4179 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4180 **Issue 6**

4181 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 4182 implementation does not support the Asynchronous Input and Output option.

4183 The APPLICATION USAGE section is added.

4184 The [EINVAL] error condition is updated as a “may fail”. This is for consistency with the
 4185 DESCRIPTION.

NAME

aio_suspend — wait for an asynchronous I/O request (**REALTIME**)

SYNOPSIS

```
#include <aio.h>

int aio_suspend(const struct aiocb * const list[], int nent,
                const struct timespec *timeout);
```

DESCRIPTION

The *aio_suspend()* function shall suspend the calling thread until at least one of the asynchronous I/O operations referenced by the *list* argument has completed, until a signal interrupts the function, or, if *timeout* is not NULL, until the time interval specified by *timeout* has passed. If any of the **aiocb** structures in the list correspond to completed asynchronous I/O operations (that is, the error status for the operation is not equal to [EINPROGRESS]) at the time of the call, the function shall return without suspending the calling thread. The *list* argument is an array of pointers to asynchronous I/O control blocks. The *nent* argument indicates the number of elements in the array. Each **aiocb** structure pointed to has been used in initiating an asynchronous I/O request via *aio_read()*, *aio_write()*, or *lio_listio()*. This array may contain NULL pointers, which are ignored. If this array contains pointers that refer to **aiocb** structures that have not been used in submitting asynchronous I/O, the effect is undefined.

If the time interval indicated in the **timespec** structure pointed to by *timeout* passes before any of the I/O operations referenced by *list* are completed, then *aio_suspend()* shall return with an error. If the Monotonic Clock option is supported, the clock that shall be used to measure this time interval shall be the CLOCK_MONOTONIC clock.

RETURN VALUE

If the *aio_suspend()* function returns after one or more asynchronous I/O operations have completed, the function shall return zero. Otherwise, the function shall return a value of -1 and set *errno* to indicate the error.

The application may determine which asynchronous I/O completed by scanning the associated error and return status using *aio_error()* and *aio_return()*, respectively.

ERRORS

The *aio_suspend()* function shall fail if:

[EAGAIN]	No asynchronous I/O indicated in the list referenced by <i>list</i> completed in the time interval indicated by <i>timeout</i> .
[EINTR]	A signal interrupted the <i>aio_suspend()</i> function. Note that, since each asynchronous I/O operation may possibly provoke a signal when it completes, this error return may be caused by the completion of one (or more) of the very I/O operations being awaited.

EXAMPLES

None.

APPLICATION USAGE

The *aio_suspend()* function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

4230 FUTURE DIRECTIONS

4231 None.

4234 CHANGE HISTORY

4235 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

4236 Issue 6

4237 The [ENOSYS] error condition has been removed as stubs need not be provided if an
4238 implementation does not support the Asynchronous Input and Output option.

4239 The APPLICATION USAGE section is added.

4240 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the
4241 CLOCK_MONOTONIC clock, if supported, is used.

4242 **NAME**4243 aio_write — asynchronous write to a file (**REALTIME**)4244 **SYNOPSIS**4245 AIO `#include <aio.h>`4246 `int aio_write(struct aiocb *aiocbp);`

4247

4248 **DESCRIPTION**

4249 The *aio_write()* function shall write *aiocbp->aio_nbytes* to the file associated with *aiocbp->aio_fildes*
 4250 from the buffer pointed to by *aiocbp->aio_buf*. The function shall return when the write request
 4251 has been initiated or, at a minimum, queued to the file or device.

4252 PIO If prioritized I/O is supported for this file, then the asynchronous operation shall be submitted
 4253 at a priority equal to the scheduling priority of the process minus *aiocbp->aio_reqprio*.

4254 The *aiocbp* argument may be used as an argument to *aio_error()* and *aio_return()* in order to
 4255 determine the error status and return status, respectively, of the asynchronous operation while it
 4256 is proceeding.

4257 The *aiocbp* argument points to an **aiocb** structure. If the buffer pointed to by *aiocbp->aio_buf* or
 4258 the control block pointed to by *aiocbp* becomes an illegal address prior to asynchronous I/O
 4259 completion, then the behavior is undefined.

4260 If O_APPEND is not set for the file descriptor *aio_fildes*, then the requested operation shall take
 4261 place at the absolute position in the file as given by *aio_offset*, as if *lseek()* were called
 4262 immediately prior to the operation with an *offset* equal to *aio_offset* and a *whence* equal to
 4263 SEEK_SET. If O_APPEND is set for the file descriptor, write operations append to the file in the
 4264 same order as the calls were made. After a successful call to enqueue an asynchronous I/O
 4265 operation, the value of the file offset for the file is unspecified.

4266 The *aiocbp->aio_lio_opcode* field shall be ignored by *aio_write()*.

4267 Simultaneous asynchronous operations using the same *aiocbp* produce undefined results.

4268 SIO If synchronized I/O is enabled on the file associated with *aiocbp->aio_fildes*, the behavior of this
 4269 function shall be according to the definitions of synchronized I/O data integrity completion, and
 4270 synchronized I/O file integrity completion.

4271 For any system action that changes the process memory space while an asynchronous I/O is
 4272 outstanding to the address range being changed, the result of that action is undefined.

4273 For regular files, no data transfer shall occur past the offset maximum established in the open
 4274 file description associated with *aiocbp->aio_fildes*.

4275 **RETURN VALUE**

4276 The *aio_write()* function shall return the value zero to the calling process if the I/O operation is
 4277 successfully queued; otherwise, the function shall return the value -1 and set *errno* to indicate
 4278 the error.

4279 **ERRORS**

4280 The *aio_write()* function shall fail if:

4281 [EAGAIN] The requested asynchronous I/O operation was not queued due to system
 4282 resource limitations.

4283 Each of the following conditions may be detected synchronously at the time of the call to
 4284 *aio_write()*, or asynchronously. If any of the conditions below are detected synchronously, the
 4285 *aio_write()* function shall return -1 and set *errno* to the corresponding value. If any of the

conditions below are detected asynchronously, the return status of the asynchronous operation shall be set to -1, and the error status of the asynchronous operation is set to the corresponding value.

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid, *aiocbp->aio_reqprio* is not a valid value, or *aiocbp->aio_nbytes* is an invalid value.

In the case that the *aio_write()* successfully queues the I/O operation, the return status of the asynchronous operation shall be one of the values normally returned by the *write()* function call. If the operation is successfully queued but is subsequently canceled or encounters an error, the error status for the asynchronous operation contains one of the values normally set by the *write()* function call, or one of the following:

[EBADF] The *aiocbp->aio_fildes* argument is not a valid file descriptor open for writing.

[EINVAL] The file offset value implied by *aiocbp->aio_offset* would be invalid.

[ECANCELED] The requested I/O was canceled before the I/O completed due to an explicit *aio_cancel()* request.

The following condition may be detected synchronously or asynchronously:

[EFBIG] The file is a regular file, *aiocbp->aio_nbytes* is greater than 0, and the starting offset in *aiocbp->aio_offset* is at or beyond the offset maximum in the open file description associated with *aiocbp->aio_fildes*.

EXAMPLES

None.

APPLICATION USAGE

The *aio_write()* function is part of the Asynchronous Input and Output option and need not be available on all implementations.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

Issue 6

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Asynchronous Input and Output option.

The APPLICATION USAGE section is added.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs past the offset maximum established in the open file description associated with

4329 *aiocbp->aio_fildes*.

- 4330 • The [EFBIG] error is added as part of the large file support extensions.

4331 **NAME**

4332 alarm — schedule an alarm signal

4333 **SYNOPSIS**

4334 #include <unistd.h>

4335 unsigned alarm(unsigned *seconds*);4336 **DESCRIPTION**

4337 The *alarm()* function shall cause the system to generate a SIGALRM signal for the process after
 4338 the number of realtime seconds specified by *seconds* have elapsed. Processor scheduling delays
 4339 may prevent the process from handling the signal as soon as it is generated.

4340 If *seconds* is 0, a pending alarm request, if any, is canceled.

4341 Alarm requests are not stacked; only one SIGALRM generation can be scheduled in this manner.
 4342 If the SIGALRM signal has not yet been generated, the call shall result in rescheduling the time
 4343 at which the SIGALRM signal is generated.

4344 XSI Interactions between *alarm()* and any of *setitimer()*, *ualarm()*, or *usleep()* are unspecified.

4345 **RETURN VALUE**

4346 If there is a previous *alarm()* request with time remaining, *alarm()* shall return a non-zero value
 4347 that is the number of seconds until the previous request would have generated a SIGALRM
 4348 signal. Otherwise, *alarm()* shall return 0.

4349 **ERRORS**

4350 The *alarm()* function is always successful, and no return value is reserved to indicate an error.

4351 **EXAMPLES**

4352 None.

4353 **APPLICATION USAGE**

4354 The *fork()* function clears pending alarms in the child process. A new process image created by
 4355 one of the *exec* functions inherits the time left to an alarm signal in the old process' image.

4356 Application writers should note that the type of the argument *seconds* and the return value of
 4357 *alarm()* is **unsigned**. That means that a Strictly Conforming POSIX System Interfaces
 4358 Application cannot pass a value greater than the minimum guaranteed value for {UINT_MAX},
 4359 which the ISO C standard sets as 65535, and any application passing a larger value is restricting
 4360 its portability. A different type was considered, but historical implementations, including those
 4361 with a 16-bit **int** type, consistently use either **unsigned** or **int**.

4362 Application writers should be aware of possible interactions when the same process uses both
 4363 the *alarm()* and *sleep()* functions.

4364 **RATIONALE**

4365 Many historical implementations (including Version 7 and System V) allow an alarm to occur up
 4366 to a second early. Other implementations allow alarms up to half a second or one clock tick
 4367 early or do not allow them to occur early at all. The latter is considered most appropriate, since it
 4368 gives the most predictable behavior, especially since the signal can always be delayed for an
 4369 indefinite amount of time due to scheduling. Applications can thus choose the *seconds* argument
 4370 as the minimum amount of time they wish to have elapse before the signal.

4371 The term “realtime” here and elsewhere (*sleep()*, *times()*) is intended to mean “wall clock” time
 4372 as common English usage, and has nothing to do with “realtime operating systems”. It is in
 4373 contrast to *virtual time*, which could be misinterpreted if just *time* were used.

4374 In some implementations, including 4.3 BSD, very large values of the *seconds* argument are
 4375 silently rounded down to an implementation-defined maximum value. This maximum is large

4376 enough (to the order of several months) that the effect is not noticeable.

4377 There were two possible choices for alarm generation in multi-threaded applications: generation
4378 for the calling thread or generation for the process. The first option would not have been
4379 particularly useful since the alarm state is maintained on a per-process basis and the alarm that
4380 is established by the last invocation of *alarm()* is the only one that would be active.

4381 Furthermore, allowing generation of an asynchronous signal for a thread would have introduced
4382 an exception to the overall signal model. This requires a compelling reason in order to be
4383 justified.

4384 **FUTURE DIRECTIONS**

4385 None.

4386 **SEE ALSO**

4387 *alarm()*, *exec*, *fork()*, *getitimer()*, *pause()*, *sigaction()*, *sleep()*, *ualarm()*, *usleep()*, the Base
4388 Definitions volume of IEEE Std 1003.1-2001, <**signal.h**>, <**unistd.h**>

4389 **CHANGE HISTORY**

4390 First released in Issue 1. Derived from Issue 1 of the SVID.

4391 **Issue 6**

4392 The following new requirements on POSIX implementations derive from alignment with the
4393 Single UNIX Specification:

- 4394 • The DESCRIPTION is updated to indicate that interactions with the *setitimer()*, *ualarm()*, and
4395 *usleep()* functions are unspecified.

4396 **NAME**

4397 asctime, asctime_r — convert date and time to a string

4398 **SYNOPSIS**

4399 #include <time.h>

4400 char *asctime(const struct tm *timeptr);

4401 TSF char *asctime_r(const struct tm *restrict tm, char *restrict buf);

4402

4403 **DESCRIPTION**

4404 CX For *asctime()*: The functionality described on this reference page is aligned with the ISO C
 4405 standard. Any conflict between the requirements described here and the ISO C standard is
 4406 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4407 The *asctime()* function shall convert the broken-down time in the structure pointed to by *timeptr*
 4408 into a string in the form:

4409 Sun Sep 16 01:03:52 1973\n\0

4410 using the equivalent of the following algorithm:

```

4411 char *asctime(const struct tm *timeptr)
4412 {
4413     static char wday_name[7][3] = {
4414         "Sun", "Mon", "Tue", "Wed", "Thu", "Fri", "Sat"
4415     };
4416     static char mon_name[12][3] = {
4417         "Jan", "Feb", "Mar", "Apr", "May", "Jun",
4418         "Jul", "Aug", "Sep", "Oct", "Nov", "Dec"
4419     };
4420     static char result[26];
4421     sprintf(result, "%.3s %.3s%3d %.2d:%.2d:%.2d %d\n",
4422         wday_name[timeptr->tm_wday],
4423         mon_name[timeptr->tm_mon],
4424         timeptr->tm_mday, timeptr->tm_hour,
4425         timeptr->tm_min, timeptr->tm_sec,
4426         1900 + timeptr->tm_year);
4427     return result;
4428 }
```

4429 The **tm** structure is defined in the <time.h> header.

4430 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 4431 objects: a broken-down time structure and an array of type **char**. Execution of any of the
 4432 functions may overwrite the information returned in either of these objects by any of the other
 4433 functions.

4434 The *asctime()* function need not be reentrant. A function that is not required to be reentrant is not
 4435 required to be thread-safe.

4436 TSF The *asctime_r()* function shall convert the broken-down time in the structure pointed to by *tm*
 4437 into a string (of the same form as that returned by *asctime()*) that is placed in the user-supplied
 4438 buffer pointed to by *buf* (which shall contain at least 26 bytes) and then return *buf*.

4439 **RETURN VALUE**

4440 Upon successful completion, *asctime()* shall return a pointer to the string.

4441 TSF Upon successful completion, *asctime_r()* shall return a pointer to a character string containing
4442 the date and time. This string is pointed to by the argument *buf*. If the function is unsuccessful,
4443 it shall return NULL.

4444 **ERRORS**

4445 No errors are defined.

4446 **EXAMPLES**

4447 None.

4448 **APPLICATION USAGE**

4449 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.
4450 This function is included for compatibility with older implementations, and does not support
4451 localized date and time formats. Applications should use *strftime()* to achieve maximum
4452 portability.

4453 The *asctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead
4454 of possibly using a static data area that may be overwritten by each call.

4455 **RATIONALE**

4456 None.

4457 **FUTURE DIRECTIONS**

4458 None.

4459 **SEE ALSO**

4461 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

4462 **CHANGE HISTORY**

4463 First released in Issue 1. Derived from Issue 1 of the SVID.

4464 **Issue 5**

4465 Normative text previously in the APPLICATION USAGE section is moved to the
4466 DESCRIPTION.

4467 The *asctime_r()* function is included for alignment with the POSIX Threads Extension.

4468 A note indicating that the *asctime()* function need not be reentrant is added to the
4469 DESCRIPTION.

4470 **Issue 6**

4471 The *asctime_r()* function is marked as part of the Thread-Safe Functions option.

4472 Extensions beyond the ISO C standard are marked.

4473 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
4474 its avoidance of possibly using a static data area.

4475 The DESCRIPTION of *asctime_r()* is updated to describe the format of the string returned.

4476 The **restrict** keyword is added to the *asctime_r()* prototype for alignment with the
4477 ISO/IEC 9899:1999 standard.

4478 **NAME**

4479 asin, asinf, asinl — arc sine function

4480 **SYNOPSIS**

4481 #include <math.h>

4482 double asin(double x);

4483 float asinf(float x);

4484 long double asinl(long double x);

4485 **DESCRIPTION**

4486 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 4487 conflict between the requirements described here and the ISO C standard is unintentional. This
 4488 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4489 These functions shall compute the principal value of the arc sine of their argument *x*. The value
 4490 of *x* should be in the range $[-1,1]$.

4491 An application wishing to check for error situations should set *errno* to zero and call
 4492 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 4493 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 4494 zero, an error has occurred.

4495 **RETURN VALUE**

4496 Upon successful completion, these functions shall return the arc sine of *x*, in the range
 4497 $[-\pi/2, \pi/2]$ radians.

4498 MX For finite values of *x* not in the range $[-1,1]$, a domain error shall occur, and either a NaN (if
 4499 supported), or an implementation-defined value shall be returned.

4500 MX If *x* is NaN, a NaN shall be returned.

4501 If *x* is ± 0 , *x* shall be returned.

4502 If *x* is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 4503 defined value shall be returned.

4504 If *x* is subnormal, a range error may occur and *x* should be returned.

4505 **ERRORS**

4506 These functions shall fail if:

4507 MX Domain Error The *x* argument is finite and is not in the range $[-1,1]$, or is $\pm \text{Inf}$.

4508 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 4509 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 4510 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 4511 shall be raised.

4512 These functions may fail if:

4513 MX Range Error The value of *x* is subnormal.

4514 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 4515 then *errno* shall be set to [ERANGE]. If the integer expression
 4516 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 4517 floating-point exception shall be raised.

4518 **EXAMPLES**

4519 None.

4520 **APPLICATION USAGE**

4521 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
4522 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4523 **RATIONALE**

4524 None.

4525 **FUTURE DIRECTIONS**

4526 None.

4527 **SEE ALSO**

4528 *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, the Base Definitions volume of IEEE Std 1003.1-2001,

4530 **CHANGE HISTORY**

4531 First released in Issue 1. Derived from Issue 1 of the SVID.

4532 **Issue 5**

4533 The DESCRIPTION is updated to indicate how an application should check for an error. This
4534 text was previously published in the APPLICATION USAGE section.

4535 **Issue 6**4536 The *asinf()* and *asinl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

4537 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
4538 revised to align with the ISO/IEC 9899:1999 standard.

4539 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
4540 marked.

4541 **NAME**

4542 asinh, asinhf, asinhl — inverse hyperbolic sine functions

4543 **SYNOPSIS**

4544 #include <math.h>

4545 double asinh(double x);

4546 float asinhf(float x);

4547 long double asinhl(long double x);

4548 **DESCRIPTION**

4549 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 4550 conflict between the requirements described here and the ISO C standard is unintentional. This
 4551 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4552 These functions shall compute the inverse hyperbolic sine of their argument *x*.

4553 An application wishing to check for error situations should set *errno* to zero and call
 4554 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 4555 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 4556 zero, an error has occurred.

4557 **RETURN VALUE**

4558 Upon successful completion, these functions shall return the inverse hyperbolic sine of their
 4559 argument.

4560 MX If *x* is NaN, a NaN shall be returned.4561 If *x* is ± 0 , or $\pm \text{Inf}$, *x* shall be returned.4562 If *x* is subnormal, a range error may occur and *x* should be returned.4563 **ERRORS**

4564 These functions may fail if:

4565 MX Range Error The value of *x* is subnormal.

4566 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 4567 then *errno* shall be set to [ERANGE]. If the integer expression
 4568 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 4569 floating-point exception shall be raised.

4570 **EXAMPLES**

4571 None.

4572 **APPLICATION USAGE**

4573 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 4574 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4575 **RATIONALE**

4576 None.

4577 **FUTURE DIRECTIONS**

4578 None.

4579 **SEE ALSO**

 4581 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

4582 **CHANGE HISTORY**

4583 First released in Issue 4, Version 2.

4584 **Issue 5**

4585 Moved from X/OPEN UNIX extension to BASE.

4586 **Issue 6**4587 The *asinh()* function is no longer marked as an extension.4588 The *asinhf()* and *asinhll()* functions are added for alignment with the ISO/IEC 9899:1999
4589 standard.4590 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
4591 revised to align with the ISO/IEC 9899:1999 standard.4592 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
4593 marked.

4594 **NAME**4595 *asinl* — arc sine function4596 **SYNOPSIS**4597 `#include <math.h>`4598 `long double asinl(long double x);`4599 **DESCRIPTION**4600 Refer to *asin()*.

4601 **NAME**

4602 assert — insert program diagnostics

4603 **SYNOPSIS**

4604 #include <assert.h>

4605 void assert(*scalar expression*);4606 **DESCRIPTION**

4607 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 4608 conflict between the requirements described here and the ISO C standard is unintentional. This
 4609 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4610 The *assert()* macro shall insert diagnostics into programs; it shall expand to a **void** expression.
 4611 When it is executed, if *expression* (which shall have a **scalar** type) is false (that is, compares equal
 4612 to 0), *assert()* shall write information about the particular call that failed on *stderr* and shall call
 4613 *abort()*.

4614 The information written about the call that failed shall include the text of the argument, the
 4615 name of the source file, the source file line number, and the name of the enclosing function; the
 4616 latter are, respectively, the values of the preprocessing macros `__FILE__` and `__LINE__` and of
 4617 the identifier `__func__`.

4618 Forcing a definition of the name `NDEBUG`, either from the compiler command line or with the
 4619 preprocessor control statement **#define** `NDEBUG` ahead of the **#include** `<assert.h>` statement,
 4620 shall stop assertions from being compiled into the program.

4621 **RETURN VALUE**4622 The *assert()* macro shall not return a value.4623 **ERRORS**

4624 No errors are defined.

4625 **EXAMPLES**

4626 None.

4627 **APPLICATION USAGE**

4628 None.

4629 **RATIONALE**

4630 None.

4631 **FUTURE DIRECTIONS**

4632 None.

4633 **SEE ALSO**4634 *abort()*, *stderr*, the Base Definitions volume of IEEE Std 1003.1-2001, `<assert.h>`4635 **CHANGE HISTORY**

4636 First released in Issue 1. Derived from Issue 1 of the SVID.

4637 **Issue 6**

4638 The prototype for the *expression* argument to *assert()* is changed from **int** to **scalar** for alignment
 4639 with the ISO / IEC 9899:1999 standard.

4640 The DESCRIPTION of *assert()* is updated for alignment with the ISO / IEC 9899:1999 standard.

4641 **NAME**

4642 atan, atanf, atanl — arc tangent function

4643 **SYNOPSIS**

4644 #include <math.h>

4645 double atan(double x);

4646 float atanf(float x);

4647 long double atanl(long double x);

4648 **DESCRIPTION**

4649 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 4650 conflict between the requirements described here and the ISO C standard is unintentional. This
 4651 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4652 These functions shall compute the principal value of the arc tangent of their argument *x*.

4653 An application wishing to check for error situations should set *errno* to zero and call
 4654 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 4655 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 4656 zero, an error has occurred.

4657 **RETURN VALUE**

4658 Upon successful completion, these functions shall return the arc tangent of *x* in the range
 4659 $[-\pi/2, \pi/2]$ radians.

4660 MX If *x* is NaN, a NaN shall be returned.4661 If *x* is ± 0 , *x* shall be returned.4662 If *x* is $\pm \text{Inf}$, $\pm \pi/2$ shall be returned.4663 If *x* is subnormal, a range error may occur and *x* should be returned.4664 **ERRORS**

4665 These functions may fail if:

4666 MX Range Error The value of *x* is subnormal.

4667 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 4668 then *errno* shall be set to [ERANGE]. If the integer expression
 4669 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 4670 floating-point exception shall be raised.

4671 **EXAMPLES**

4672 None.

4673 **APPLICATION USAGE**

4674 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 4675 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4676 **RATIONALE**

4677 None.

4678 **FUTURE DIRECTIONS**

4679 None.

4680 **SEE ALSO**

 4682 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
 4683 <math.h>

4684 **CHANGE HISTORY**

4685 First released in Issue 1. Derived from Issue 1 of the SVID.

4686 **Issue 5**4687 The DESCRIPTION is updated to indicate how an application should check for an error. This
4688 text was previously published in the APPLICATION USAGE section.4689 **Issue 6**4690 The *atanf()* and *atanl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.4691 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
4692 revised to align with the ISO/IEC 9899:1999 standard.4693 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
4694 marked.

4695 **NAME**

4696 atan2, atan2f, atan2l — arc tangent functions

4697 **SYNOPSIS**

4698 #include <math.h>

4699 double atan2(double y, double x);

4700 float atan2f(float y, float x);

4701 long double atan2l(long double y, long double x);

4702 **DESCRIPTION**

4703 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 4704 conflict between the requirements described here and the ISO C standard is unintentional. This
 4705 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4706 These functions shall compute the principal value of the arc tangent of y/x , using the signs of
 4707 both arguments to determine the quadrant of the return value.

4708 An application wishing to check for error situations should set *errno* to zero and call
 4709 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 4710 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 4711 zero, an error has occurred.

4712 **RETURN VALUE**

4713 Upon successful completion, these functions shall return the arc tangent of y/x in the range
 4714 $[-\pi, \pi]$ radians.

4715 If y is ± 0 and x is < 0 , $\pm\pi$ shall be returned.4716 If y is ± 0 and x is > 0 , ± 0 shall be returned.4717 If y is < 0 and x is ± 0 , $-\pi/2$ shall be returned.4718 If y is > 0 and x is ± 0 , $\pi/2$ shall be returned.4719 If x is 0, a pole error shall not occur.4720 MX If either x or y is NaN, a NaN shall be returned.4721 If the result underflows, a range error may occur and y/x should be returned.4722 If y is ± 0 and x is -0 , $\pm\pi$ shall be returned.4723 If y is ± 0 and x is $+0$, ± 0 shall be returned.4724 For finite values of $\pm y > 0$, if x is $-\text{Inf}$, $\pm\pi$ shall be returned.4725 For finite values of $\pm y > 0$, if x is $+\text{Inf}$, ± 0 shall be returned.4726 For finite values of x , if y is $\pm\text{Inf}$, $\pm\pi/2$ shall be returned.4727 If y is $\pm\text{Inf}$ and x is $-\text{Inf}$, $\pm 3\pi/4$ shall be returned.4728 If y is $\pm\text{Inf}$ and x is $+\text{Inf}$, $\pm\pi/4$ shall be returned.

4729 If both arguments are 0, a domain error shall not occur.

4730 **ERRORS**

4731 These functions may fail if:

4732 MX Range Error The result underflows.

4733 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 4734 then *errno* shall be set to [ERANGE]. If the integer expression

4735 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
4736 floating-point exception shall be raised.

4737 EXAMPLES

4738 None.

4739 APPLICATION USAGE

4740 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
4741 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

4742 RATIONALE

4743 None.

4744 FUTURE DIRECTIONS

4745 None.

4750 CHANGE HISTORY

4751 First released in Issue 1. Derived from Issue 1 of the SVID.

4752 Issue 5

4753 The DESCRIPTION is updated to indicate how an application should check for an error. This
4754 text was previously published in the APPLICATION USAGE section.

4755 Issue 6

4756 The *atan2f()* and *atan2l()* functions are added for alignment with the ISO/IEC 9899:1999
4757 standard.

4758 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
4759 revised to align with the ISO/IEC 9899:1999 standard.

4760 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
4761 marked.

4762 **NAME**

4763 atanf — arc tangent function

4764 **SYNOPSIS**

4765 #include <math.h>

4766 float atanf(float x);

4767 **DESCRIPTION**4768 Refer to *atan()*.

4769 **NAME**

4770 atanh, atanhf, atanhf — inverse hyperbolic tangent functions

4771 **SYNOPSIS**

4772 #include <math.h>

4773 double atanh(double x);

4774 float atanhf(float x);

4775 long double atanhf(long double x);

4776 **DESCRIPTION**

4777 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4778 conflict between the requirements described here and the ISO C standard is unintentional. This
4779 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4780 These functions shall compute the inverse hyperbolic tangent of their argument x .

4781 An application wishing to check for error situations should set *errno* to zero and call
4782 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
4783 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
4784 zero, an error has occurred.

4785 **RETURN VALUE**

4786 Upon successful completion, these functions shall return the inverse hyperbolic tangent of their
4787 argument.

4788 If x is ± 1 , a pole error shall occur, and *atanh()*, *atanhf()*, and *atanf()* shall return the value of the
4789 macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively, with the same sign as the
4790 correct value of the function.

4791 MX For finite $|x| > 1$, a domain error shall occur, and either a NaN (if supported), or an
4792 implementation-defined value shall be returned.

4793 MX If x is NaN, a NaN shall be returned.

4794 If x is ± 0 , x shall be returned.

4795 If x is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
4796 defined value shall be returned.

4797 If x is subnormal, a range error may occur and x should be returned.

4798 **ERRORS**

4799 These functions shall fail if:

4800 MX Domain Error The x argument is finite and not in the range $[-1, 1]$, or is $\pm \text{Inf}$.

4801 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
4802 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
4803 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
4804 shall be raised.

4805 Pole Error The x argument is ± 1 .

4806 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
4807 then *errno* shall be set to [ERANGE]. If the integer expression
4808 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
4809 zero floating-point exception shall be raised.

4810 These functions may fail if:

4811 MX **Range Error** The value of x is subnormal.

4812 If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero,
 4813 then *errno* shall be set to [ERANGE]. If the integer expression
 4814 `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the underflow
 4815 floating-point exception shall be raised.

4816 **EXAMPLES**

4817 None.

4818 **APPLICATION USAGE**

4819 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
 4820 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

4821 **RATIONALE**

4822 None.

4823 **FUTURE DIRECTIONS**

4824 None.

4825 **SEE ALSO**

4826 *feclearexcept()*, *fetestexcept()*, *tanh()*, the Base Definitions volume of IEEE Std 1003.1-2001, Section
 4827 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

4828 **CHANGE HISTORY**

4829 First released in Issue 4, Version 2.

4830 **Issue 5**

4831 Moved from X/OPEN UNIX extension to BASE.

4832 **Issue 6**

4833 The *atanh()* function is no longer marked as an extension.

4834 The *atanhf()* and *atanhl()* functions are added for alignment with the ISO/IEC 9899:1999
 4835 standard.

4836 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 4837 revised to align with the ISO/IEC 9899:1999 standard.

4838 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 4839 marked.

4840 **NAME**

4841 atanl — arc tangent function

4842 **SYNOPSIS**

4843 #include <math.h>

4844 long double atanl(long double x);

4845 **DESCRIPTION**4846 Refer to *atan()*.

4847 **NAME**

4848 atexit — register a function to run at process termination

4849 **SYNOPSIS**

4850 #include <stdlib.h>

4851 int atexit(void (*func)(void));

4852 **DESCRIPTION**4853 CX The functionality described on this reference page is aligned with the ISO C standard. Any
4854 conflict between the requirements described here and the ISO C standard is unintentional. This
4855 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.4856 The *atexit()* function shall register the function pointed to by *func*, to be called without
4857 arguments at normal program termination. At normal program termination, all functions
4858 registered by the *atexit()* function shall be called, in the reverse order of their registration, except
4859 that a function is called after any previously registered functions that had already been called at
4860 the time it was registered. Normal termination occurs either by a call to *exit()* or a return from
4861 *main()*.4862 At least 32 functions can be registered with *atexit()*.4863 CX After a successful call to any of the *exec* functions, any functions previously registered by *atexit()*
4864 shall no longer be registered.4865 **RETURN VALUE**4866 Upon successful completion, *atexit()* shall return 0; otherwise, it shall return a non-zero value.4867 **ERRORS**

4868 No errors are defined.

4869 **EXAMPLES**

4870 None.

4871 **APPLICATION USAGE**4872 The functions registered by a call to *atexit()* must return to ensure that all registered functions
4873 are called.4874 The application should call *sysconf()* to obtain the value of {ATEXIT_MAX}, the number of
4875 functions that can be registered. There is no way for an application to tell how many functions
4876 have already been registered with *atexit()*.4877 **RATIONALE**

4878 None.

4879 **FUTURE DIRECTIONS**

4880 None.

4881 **SEE ALSO**4882 *exit()*, *sysconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>4883 **CHANGE HISTORY**

4884 First released in Issue 4. Derived from the ANSI C standard.

4885 **Issue 6**

4886 Extensions beyond the ISO C standard are marked.

4887 The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

4888 **NAME**4889 `atof` — convert a string to a double-precision number4890 **SYNOPSIS**4891 `#include <stdlib.h>`4892 `double atof(const char *str);`4893 **DESCRIPTION**4894 `CX` The functionality described on this reference page is aligned with the ISO C standard. Any
4895 conflict between the requirements described here and the ISO C standard is unintentional. This
4896 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.4897 The call `atof(str)` shall be equivalent to:4898 `strtod(str, (char **)NULL),`4899 except that the handling of errors may differ. If the value cannot be represented, the behavior is
4900 undefined.4901 **RETURN VALUE**4902 The `atof()` function shall return the converted value if the value can be represented.4903 **ERRORS**

4904 No errors are defined.

4905 **EXAMPLES**

4906 None.

4907 **APPLICATION USAGE**4908 The `atof()` function is subsumed by `strtod()` but is retained because it is used extensively in
4909 existing code. If the number is not known to be in range, `strtod()` should be used because `atof()` is
4910 not required to perform any error checking.4911 **RATIONALE**

4912 None.

4913 **FUTURE DIRECTIONS**

4914 None.

4915 **SEE ALSO**4916 `strtod()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`4917 **CHANGE HISTORY**

4918 First released in Issue 1. Derived from Issue 1 of the SVID.

4919 **NAME**

4920 atoi — convert a string to an integer

4921 **SYNOPSIS**

4922 #include <stdlib.h>

4923 int atoi(const char *str);

4924 **DESCRIPTION**

4925 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 4926 conflict between the requirements described here and the ISO C standard is unintentional. This
 4927 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4928 The call *atoi(str)* shall be equivalent to:

4929 (int) strtol(str, (char **)NULL, 10)

4930 except that the handling of errors may differ. If the value cannot be represented, the behavior is
 4931 undefined.

4932 **RETURN VALUE**4933 The *atoi()* function shall return the converted value if the value can be represented.4934 **ERRORS**

4935 No errors are defined.

4936 **EXAMPLES**4937 **Converting an Argument**

4938 The following example checks for proper usage of the program. If there is an argument and the
 4939 decimal conversion of this argument (obtained using *atoi()*) is greater than 0, then the program
 4940 has a valid number of minutes to wait for an event.

```

4941         #include <stdlib.h>
4942         #include <stdio.h>
4943         ...
4944         int minutes_to_event;
4945         ...
4946         if (argc < 2 || ((minutes_to_event = atoi (argv[1]))) <= 0) {
4947             fprintf(stderr, "Usage: %s minutes\n", argv[0]); exit(1);
4948         }
4949         ...
```

4950 **APPLICATION USAGE**

4951 The *atoi()* function is subsumed by *strtol()* but is retained because it is used extensively in
 4952 existing code. If the number is not known to be in range, *strtol()* should be used because *atoi()* is
 4953 not required to perform any error checking.

4954 **RATIONALE**

4955 None.

4956 **FUTURE DIRECTIONS**

4957 None.

4958 **SEE ALSO**4959 *strtol()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

CHANGE HISTORY

4960
4961 First released in Issue 1. Derived from Issue 1 of the SVID.

4962 NAME

4963 `atol`, `atoll` — convert a string to a long integer

4964 SYNOPSIS

4965 `#include <stdlib.h>`

4966 `long atol(const char *str);`

4967 `long long atoll(const char *nptr);`

4968 DESCRIPTION

4969 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
4970 conflict between the requirements described here and the ISO C standard is unintentional. This
4971 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

4972 The call `atol(str)` shall be equivalent to:

4973 `strtoul(str, (char **)NULL, 10)`

4974 The call `atoll(str)` shall be equivalent to:

4975 `strtoll(nptr, (char **)NULL, 10)`

4976 except that the handling of errors may differ. If the value cannot be represented, the behavior is
4977 undefined.

4978 RETURN VALUE

4979 These functions shall return the converted value if the value can be represented.

4980 ERRORS

4981 No errors are defined.

4982 EXAMPLES

4983 None.

4984 APPLICATION USAGE

4985 The `atol()` function is subsumed by `strtoul()` but is retained because it is used extensively in
4986 existing code. If the number is not known to be in range, `strtoul()` should be used because `atol()` is
4987 not required to perform any error checking.

4988 RATIONALE

4989 None.

4990 FUTURE DIRECTIONS

4991 None.

4992 SEE ALSO

4993 `strtoul()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

4994 CHANGE HISTORY

4995 First released in Issue 1. Derived from Issue 1 of the SVID.

4996 Issue 6

4997 The `atoll()` function is added for alignment with the ISO/IEC 9899:1999 standard.

NAME

basename — return the last component of a pathname

SYNOPSIS

```
#include <libgen.h>

char *basename(char *path);
```

DESCRIPTION

The *basename()* function shall take the pathname pointed to by *path* and return a pointer to the final component of the pathname, deleting any trailing '/' characters.

If the string consists entirely of the '/' character, *basename()* shall return a pointer to the string "/". If the string is exactly "///", it is implementation-defined whether '/' or "///" is returned.

If *path* is a null pointer or points to an empty string, *basename()* shall return a pointer to the string ".".

The *basename()* function may modify the string pointed to by *path*, and may return a pointer to static storage that may then be overwritten by a subsequent call to *basename()*.

The *basename()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

The *basename()* function shall return a pointer to the final component of *path*.

ERRORS

No errors are defined.

EXAMPLES

Using basename()

The following program fragment returns a pointer to the value *lib*, which is the base name of */usr/lib*.

```
#include <libgen.h>
...
char *name = "/usr/lib";
char *base;

base = basename(name);
...
```

Sample Input and Output Strings for basename()

In the following table, the input string is the value pointed to by *path*, and the output string is the return value of the *basename()* function.

Input String	Output String
"/usr/lib"	"lib"
"/usr/"	"usr"
"/"	"/"
"/" / "///"	"/"
"/usr//lib//"	"lib"

5039 **APPLICATION USAGE**

5040 None.

5041 **RATIONALE**

5042 None.

5043 **FUTURE DIRECTIONS**

5044 None.

5045 **SEE ALSO**

5046 *dirname()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<libgen.h>**, the Shell and
5047 Utilities volume of IEEE Std 1003.1-2001, *basename*

5048 **CHANGE HISTORY**

5049 First released in Issue 4, Version 2.

5050 **Issue 5**

5051 Moved from X/OPEN UNIX extension to BASE.

5052 Normative text previously in the APPLICATION USAGE section is moved to the
5053 DESCRIPTION.

5054 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

5055 **Issue 6**

5056 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

5057 **NAME**5058 bcmp — memory operations (**LEGACY**)5059 **SYNOPSIS**

5060 xSI #include <strings.h>

5061 int bcmp(const void *s1, const void *s2, size_t n);

5062

5063 **DESCRIPTION**5064 The *bcmp()* function shall compare the first *n* bytes of the area pointed to by *s1* with the area
5065 pointed to by *s2*.5066 **RETURN VALUE**5067 The *bcmp()* function shall return 0 if *s1* and *s2* are identical; otherwise, it shall return non-zero.
5068 Both areas are assumed to be *n* bytes long. If the value of *n* is 0, *bcmp()* shall return 0.5069 **ERRORS**

5070 No errors are defined.

5071 **EXAMPLES**

5072 None.

5073 **APPLICATION USAGE**5074 The *memcmp()* function is preferred over this function.5075 For maximum portability, it is recommended to replace the function call to *bcmp()* as follows:

5076 #define bcmp(b1,b2,len) memcmp((b1), (b2), (size_t)(len))

5077 **RATIONALE**

5078 None.

5079 **FUTURE DIRECTIONS**

5080 This function may be withdrawn in a future version.

5081 **SEE ALSO**5082 *memcmp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <strings.h>5083 **CHANGE HISTORY**

5084 First released in Issue 4, Version 2.

5085 **Issue 5**

5086 Moved from X/OPEN UNIX extension to BASE.

5087 **Issue 6**

5088 This function is marked LEGACY.

5089 **NAME**5090 bcopy — memory operations (**LEGACY**)5091 **SYNOPSIS**

5092 xSI #include <strings.h>

5093 void bcopy(const void *s1, void *s2, size_t n);

5094

5095 **DESCRIPTION**5096 The *bcopy()* function shall copy *n* bytes from the area pointed to by *s1* to the area pointed to by
5097 *s2*.5098 The bytes are copied correctly even if the area pointed to by *s1* overlaps the area pointed to by
5099 *s2*.5100 **RETURN VALUE**5101 The *bcopy()* function shall not return a value.5102 **ERRORS**

5103 No errors are defined.

5104 **EXAMPLES**

5105 None.

5106 **APPLICATION USAGE**5107 The *memmove()* function is preferred over this function.

5108 The following are approximately equivalent (note the order of the arguments):

5109 bcopy(s1,s2,n) ~ memmove(s2,s1,n)

5110 For maximum portability, it is recommended to replace the function call to *bcopy()* as follows:

5111 #define bcopy(b1,b2,len) (memmove((b2), (b1), (len)), (void) 0)

5112 **RATIONALE**

5113 None.

5114 **FUTURE DIRECTIONS**

5115 This function may be withdrawn in a future version.

5116 **SEE ALSO**5117 *memmove()*, the Base Definitions volume of IEEE Std 1003.1-2001, <strings.h>5118 **CHANGE HISTORY**

5119 First released in Issue 4, Version 2.

5120 **Issue 5**

5121 Moved from X/OPEN UNIX extension to BASE.

5122 **Issue 6**

5123 This function is marked LEGACY.

5124 NAME

5125 bind — bind a name to a socket

5126 SYNOPSIS

```
5127       #include <sys/socket.h>

5128       int bind(int socket, const struct sockaddr *address,
5129               socklen_t address_len);
```

5130 DESCRIPTION

5131 The *bind()* function shall assign a local socket address *address* to a socket identified by descriptor
5132 *socket* that has no local socket address assigned. Sockets created with the *socket()* function are
5133 initially unnamed; they are identified only by their address family.

5134 The *bind()* function takes the following arguments:

5135 <i>socket</i>	Specifies the file descriptor of the socket to be bound.
5136 <i>address</i>	Points to a sockaddr structure containing the address to be bound to the 5137 socket. The length and format of the address depend on the address family of 5138 the socket.
5139 <i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> 5140 argument.

5141 The socket specified by *socket* may require the process to have appropriate privileges to use the
5142 *bind()* function.

5143 RETURN VALUE

5144 Upon successful completion, *bind()* shall return 0; otherwise, *-1* shall be returned and *errno* set
5145 to indicate the error.

5146 ERRORS

5147 The *bind()* function shall fail if:

5148 [EADDRINUSE]	The specified address is already in use.
5149 [EADDRNOTAVAIL]	The specified address is not available from the local machine.
5150 [EAFNOSUPPORT]	The specified address is not a valid address for the address family of the 5151 specified socket.
5152 [EBADF]	The <i>socket</i> argument is not a valid file descriptor.
5153 [EINVAL]	The socket is already bound to an address, and the protocol does not support 5154 binding to a new address; or the socket has been shut down.
5155 [ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
5156 [EOPNOTSUPP]	The socket type of the specified socket does not support binding to an 5157 address.
5158 If the address family of the socket is AF_UNIX, then <i>bind()</i> shall fail if:	
5159 [EACCES]	A component of the path prefix denies search permission, or the requested 5160 name requires writing in a directory with a mode that denies write 5161 permission.
5162 [EDESTADDRREQ] or [EISDIR]	The <i>address</i> argument is a null pointer.

5166	[EIO]	An I/O error occurred.
5167	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname
5168		in <i>address</i> .
5169	[ENAMETOOLONG]	
5170		A component of a pathname exceeded {NAME_MAX} characters, or an entire
5171		pathname exceeded {PATH_MAX} characters.
5172	[ENOENT]	A component of the pathname does not name an existing file or the pathname
5173		is an empty string.
5174	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> is not a directory.
5175	[EROFS]	The name would reside on a read-only file system.
5176		The <i>bind()</i> function may fail if:
5177	[EACCES]	The specified address is protected and the current user does not have
5178		permission to bind to it.
5179	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family.
5180	[EISCONN]	The socket is already connected.
5181	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during
5182		resolution of the pathname in <i>address</i> .
5183	[ENAMETOOLONG]	
5184		Pathname resolution of a symbolic link produced an intermediate result
5185		whose length exceeds {PATH_MAX}.
5186	[ENOBUFS]	Insufficient resources were available to complete the call.

5187 EXAMPLES

5188 None.

5189 APPLICATION USAGE

5190 An application program can retrieve the assigned socket name with the *getsockname()* function.

5191 RATIONALE

5192 None.

5193 FUTURE DIRECTIONS

5194 None.

5195 SEE ALSO

5196 *connect()*, *getsockname()*, *listen()*, *socket()*, the Base Definitions volume of IEEE Std 1003.1-2001,
5197 <**sys/socket.h**>

5198 CHANGE HISTORY

5199 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

5200 **NAME**

5201 bsd_signal — simplified signal facilities

5202 **SYNOPSIS**

5203 OB XSI #include <signal.h>

5204 void (*bsd_signal(int sig, void (*func)(int)))(int);

5205

5206 **DESCRIPTION**5207 The *bsd_signal()* function provides a partially compatible interface for programs written to
5208 historical system interfaces (see APPLICATION USAGE).5209 The function call *bsd_signal(sig, func)* shall be equivalent to the following:

```

5210 void (*bsd_signal(int sig, void (*func)(int)))(int)
5211 {
5212     struct sigaction act, oact;
5213
5214     act.sa_handler = func;
5215     act.sa_flags = SA_RESTART;
5216     sigemptyset(&act.sa_mask);
5217     sigaddset(&act.sa_mask, sig);
5218     if (sigaction(sig, &act, &oact) == -1)
5219         return(SIG_ERR);
5219     return(oact.sa_handler);
5220 }

```

5221 The handler function should be declared:

5222 void handler(int sig);

5223 where *sig* is the signal number. The behavior is undefined if *func* is a function that takes more
5224 than one argument, or an argument of a different type.5225 **RETURN VALUE**5226 Upon successful completion, *bsd_signal()* shall return the previous action for *sig*. Otherwise,
5227 SIG_ERR shall be returned and *errno* shall be set to indicate the error.5228 **ERRORS**5229 Refer to *sigaction()*.5230 **EXAMPLES**

5231 None.

5232 **APPLICATION USAGE**

5233 This function is a direct replacement for the BSD *signal()* function for simple applications that
5234 are installing a single-argument signal handler function. If a BSD signal handler function is being
5235 installed that expects more than one argument, the application has to be modified to use
5236 *sigaction()*. The *bsd_signal()* function differs from *signal()* in that the SA_RESTART flag is set
5237 and the SA_RESETHAND is clear when *bsd_signal()* is used. The state of these flags is not
5238 specified for *signal()*.

5239 It is recommended that new applications use the *sigaction()* function.5240 **RATIONALE**

5241 None.

5242 **FUTURE DIRECTIONS**

5243 None.

5244 **SEE ALSO**

5245 *sigaction()*, *sigaddset()*, *sigemptyset()*, *signal()*, the Base Definitions volume of
5246 IEEE Std 1003.1-2001, <**signal.h**>

5247 **CHANGE HISTORY**

5248 First released in Issue 4, Version 2.

5249 **Issue 5**

5250 Moved from X/OPEN UNIX extension to BASE.

5251 **Issue 6**

5252 This function is marked obsolescent.

5253 **NAME**

5254 bsearch — binary search a sorted table

5255 **SYNOPSIS**

5256 #include <stdlib.h>

```
5257       void *bsearch(const void *key, const void *base, size_t nel,
5258                   size_t width, int (*compar)(const void *, const void *));
```

5259 **DESCRIPTION**

5260 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 5261 conflict between the requirements described here and the ISO C standard is unintentional. This
 5262 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5263 The *bsearch()* function shall search an array of *nel* objects, the initial element of which is pointed
 5264 to by *base*, for an element that matches the object pointed to by *key*. The size of each element in
 5265 the array is specified by *width*. If the *nel* argument has the value zero, the comparison function
 5266 pointed to by *compar* shall not be called and no match shall be found.

5267 The comparison function pointed to by *compar* shall be called with two arguments that point to
 5268 the *key* object and to an array element, in that order.

5269 The application shall ensure that the comparison function pointed to by *compar* does not alter the
 5270 contents of the array. The implementation may reorder elements of the array between calls to the
 5271 comparison function, but shall not alter the contents of any individual element.

5272 The implementation shall ensure that the first argument is always a pointer to the key.

5273 When the same objects (consisting of *width* bytes, irrespective of their current positions in the
 5274 array) are passed more than once to the comparison function, the results shall be consistent with
 5275 one another. That is, the same object shall always compare the same way with the key.

5276 The application shall ensure that the function returns an integer less than, equal to, or greater
 5277 than 0 if the *key* object is considered, respectively, to be less than, to match, or to be greater than
 5278 the array element. The application shall ensure that the array consists of all the elements that
 5279 compare less than, all the elements that compare equal to, and all the elements that compare
 5280 greater than the *key* object, in that order.

5281 **RETURN VALUE**

5282 The *bsearch()* function shall return a pointer to a matching member of the array, or a null pointer
 5283 if no match is found. If two or more members compare equal, which member is returned is
 5284 unspecified.

5285 **ERRORS**

5286 No errors are defined.

5287 **EXAMPLES**

5288 The example below searches a table containing pointers to nodes consisting of a string and its
 5289 length. The table is ordered alphabetically on the string in the node pointed to by each entry.

5290 The code fragment below reads in strings and either finds the corresponding node and prints out
 5291 the string and its length, or prints an error message.

```
5292     #include <stdio.h>
5293     #include <stdlib.h>
5294     #include <string.h>

5295     #define TABSIZE     1000
```

```

5296     struct node {                                /* These are stored in the table. */
5297         char *string;
5298         int length;
5299     };
5300     struct node table[TABSIZE];    /* Table to be searched. */
5301     .
5302     .
5303     .
5304     {
5305         struct node *node_ptr, node;
5306         /* Routine to compare 2 nodes. */
5307         int node_compare(const void *, const void *);
5308         char str_space[20];    /* Space to read string into. */
5309         .
5310         .
5311         .
5312         node.string = str_space;
5313         while (scanf("%s", node.string) != EOF) {
5314             node_ptr = (struct node *)bsearch((void *)(&node),
5315                 (void *)table, TABSIZE,
5316                 sizeof(struct node), node_compare);
5317             if (node_ptr != NULL) {
5318                 (void)printf("string = %20s, length = %d\n",
5319                     node_ptr->string, node_ptr->length);
5320             } else {
5321                 (void)printf("not found: %s\n", node.string);
5322             }
5323         }
5324     }
5325     /*
5326         This routine compares two nodes based on an
5327         alphabetical ordering of the string field.
5328     */
5329     int
5330     node_compare(const void *node1, const void *node2)
5331     {
5332         return strcmp(((const struct node *)node1)->string,
5333             ((const struct node *)node2)->string);
5334     }

```

5335 APPLICATION USAGE

5336 The pointers to the key and the element at the base of the table should be of type pointer-to-
5337 element.

5338 The comparison function need not compare every byte, so arbitrary data may be contained in
5339 the elements in addition to the values being compared.

5340 In practice, the array is usually sorted according to the comparison function.

5341 RATIONALE

5342 The requirement that the second argument (hereafter referred to as *p*) to the comparison
5343 function is a pointer to an element of the array implies that for every call all of the following
5344 expressions are non-zero: |

```
5345      ((char *)p - (char *(base) % width == 0
5346      (char *)p >= (char *)base
5347      (char *)p < (char *)base + nel * width
```

5348 FUTURE DIRECTIONS

5349 None.

5353 CHANGE HISTORY

5354 First released in Issue 1. Derived from Issue 1 of the SVID.

5355 Issue 6

5356 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

5357 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/11 is applied, adding to the
5358 DESCRIPTION the last sentence of the first non-shaded paragraph, and the following three
5359 paragraphs. The RATIONALE section is also updated. These changes are for alignment with the
5360 ISO C standard.

5361 **NAME**

5362 btowc — single byte to wide character conversion

5363 **SYNOPSIS**

5364 #include <stdio.h>

5365 #include <wchar.h>

5366 wint_t btowc(int c);

5367 **DESCRIPTION**

5368 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5369 conflict between the requirements described here and the ISO C standard is unintentional. This
5370 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5371 The *btowc()* function shall determine whether *c* constitutes a valid (one-byte) character in the
5372 initial shift state.

5373 The behavior of this function shall be affected by the *LC_CTYPE* category of the current locale.

5374 **RETURN VALUE**

5375 The *btowc()* function shall return WEOF if *c* has the value EOF or if (**unsigned char**) *c* does not
5376 constitute a valid (one-byte) character in the initial shift state. Otherwise, it shall return the
5377 wide-character representation of that character.

5378 **ERRORS**

5379 No errors are defined.

5380 **EXAMPLES**

5381 None.

5382 **APPLICATION USAGE**

5383 None.

5384 **RATIONALE**

5385 None.

5386 **FUTURE DIRECTIONS**

5387 None.

5388 **SEE ALSO**5389 *wctob()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**wchar.h**>5390 **CHANGE HISTORY**

5391 First released in Issue 5. Included for alignment with ISO/IEC 9899:1990/Amendment 1:1995
5392 (E).

5393 **NAME**5394 bzero — memory operations (**LEGACY**)5395 **SYNOPSIS**

5396 xSI #include <strings.h>

5397 void bzero(void *s, size_t n);

5398

5399 **DESCRIPTION**5400 The *bzero()* function shall place *n* zero-valued bytes in the area pointed to by *s*.5401 **RETURN VALUE**5402 The *bzero()* function shall not return a value.5403 **ERRORS**

5404 No errors are defined.

5405 **EXAMPLES**

5406 None.

5407 **APPLICATION USAGE**5408 The *memset()* function is preferred over this function.5409 For maximum portability, it is recommended to replace the function call to *bzero()* as follows:

5410 #define bzero(b,len) (memset((b), '\0', (len)), (void) 0)

5411 **RATIONALE**

5412 None.

5413 **FUTURE DIRECTIONS**

5414 This function may be withdrawn in a future version.

5415 **SEE ALSO**5416 *memset()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>5417 **CHANGE HISTORY**

5418 First released in Issue 4, Version 2.

5419 **Issue 5**

5420 Moved from X/OPEN UNIX extension to BASE.

5421 **Issue 6**

5422 This function is marked LEGACY.

5423 **NAME**

5424 cabs, cabsf, cabsl — return a complex absolute value

5425 **SYNOPSIS**

5426 #include <complex.h>

5427 double cabs(double complex z);

5428 float cabsf(float complex z);

5429 long double cabsl(long double complex z);

5430 **DESCRIPTION**

5431 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5432 conflict between the requirements described here and the ISO C standard is unintentional. This
5433 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5434 These functions shall compute the complex absolute value (also called norm, modulus, or
5435 magnitude) of z.

5436 **RETURN VALUE**

5437 These functions shall return the complex absolute value.

5438 **ERRORS**

5439 No errors are defined.

5440 **EXAMPLES**

5441 None.

5442 **APPLICATION USAGE**

5443 None.

5444 **RATIONALE**

5445 None.

5446 **FUTURE DIRECTIONS**

5447 None.

5448 **SEE ALSO**

5449 The Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>

5450 **CHANGE HISTORY**

5451 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5452 **NAME**

5453 cacos, cacosf, cacosl — complex arc cosine functions

5454 **SYNOPSIS**

5455 #include <complex.h>

5456 double complex cacos(double complex z);

5457 float complex cacosf(float complex z);

5458 long double complex cacosl(long double complex z);

5459 **DESCRIPTION**

5460 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5461 conflict between the requirements described here and the ISO C standard is unintentional. This
5462 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5463 These functions shall compute the complex arc cosine of z , with branch cuts outside the interval
5464 $[-1, +1]$ along the real axis.

5465 **RETURN VALUE**

5466 These functions shall return the complex arc cosine value, in the range of a strip mathematically
5467 unbounded along the imaginary axis and in the interval $[0, \pi]$ along the real axis.

5468 **ERRORS**

5469 No errors are defined.

5470 **EXAMPLES**

5471 None.

5472 **APPLICATION USAGE**

5473 None.

5474 **RATIONALE**

5475 None.

5476 **FUTURE DIRECTIONS**

5477 None.

5478 **SEE ALSO**5479 `ccos()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<complex.h>**5480 **CHANGE HISTORY**

5481 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5482 **NAME**

5483 cacosh, cacoshf, cacoshl — complex arc hyperbolic cosine functions

5484 **SYNOPSIS**

5485 #include <complex.h>

5486 double complex cacosh(double complex z);

5487 float complex cacoshf(float complex z);

5488 long double complex cacoshl(long double complex z);

5489 **DESCRIPTION**

5490 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5491 conflict between the requirements described here and the ISO C standard is unintentional. This
5492 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5493 These functions shall compute the complex arc hyperbolic cosine of z , with a branch cut at
5494 values less than 1 along the real axis.

5495 **RETURN VALUE**

5496 These functions shall return the complex arc hyperbolic cosine value, in the range of a half-strip
5497 of non-negative values along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary axis.

5498 **ERRORS**

5499 No errors are defined.

5500 **EXAMPLES**

5501 None.

5502 **APPLICATION USAGE**

5503 None.

5504 **RATIONALE**

5505 None.

5506 **FUTURE DIRECTIONS**

5507 None.

5508 **SEE ALSO**

5509 ccosh(), the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>

5510 **CHANGE HISTORY**

5511 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5512 **NAME**

5513 cacosl — complex arc cosine functions

5514 **SYNOPSIS**

5515 #include <complex.h>

5516 long double complex cacosl(long double complex *z*);5517 **DESCRIPTION**5518 Refer to *cacos*(.).

5519 **NAME**

5520 calloc — a memory allocator

5521 **SYNOPSIS**

5522 #include <stdlib.h>

5523 void *calloc(size_t *nelem*, size_t *elsize*);5524 **DESCRIPTION**

5525 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 5526 conflict between the requirements described here and the ISO C standard is unintentional. This
 5527 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5528 The *calloc()* function shall allocate unused space for an array of *nelem* elements each of whose
 5529 size in bytes is *elsize*. The space shall be initialized to all bits 0.

5530 The order and contiguity of storage allocated by successive calls to *calloc()* is unspecified. The
 5531 pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
 5532 a pointer to any type of object and then used to access such an object or an array of such objects
 5533 in the space allocated (until the space is explicitly freed or reallocated). Each such allocation
 5534 shall yield a pointer to an object disjoint from any other object. The pointer returned shall point
 5535 to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null
 5536 pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-
 5537 defined: the value returned shall be either a null pointer or a unique pointer.

5538 **RETURN VALUE**

5539 Upon successful completion with both *nelem* and *elsize* non-zero, *calloc()* shall return a pointer to
 5540 the allocated space. If either *nelem* or *elsize* is 0, then either a null pointer or a unique pointer
 5541 value that can be successfully passed to *free()* shall be returned. Otherwise, it shall return a null
 5542 CX pointer and set *errno* to indicate the error.

5543 **ERRORS**5544 The *calloc()* function shall fail if:

5545 CX [ENOMEM] Insufficient memory is available.

5546 **EXAMPLES**

5547 None.

5548 **APPLICATION USAGE**

5549 There is now no requirement for the implementation to support the inclusion of <malloc.h>.

5550 **RATIONALE**

5551 None.

5552 **FUTURE DIRECTIONS**

5553 None.

5554 **SEE ALSO**5555 *free()*, *malloc()*, *realloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>5556 **CHANGE HISTORY**

5557 First released in Issue 1. Derived from Issue 1 of the SVID.

5558 **Issue 6**

5559 Extensions beyond the ISO C standard are marked.

- 5560 The following new requirements on POSIX implementations derive from alignment with the
5561 Single UNIX Specification:
- 5562 • The setting of *errno* and the [ENOMEM] error condition are mandatory if an insufficient
5563 memory condition occurs.

5564 **NAME**

5565 carg, cargf, cargl — complex argument functions

5566 **SYNOPSIS**

5567 #include <complex.h>

5568 double carg(double complex z);

5569 float cargf(float complex z);

5570 long double cargl(long double complex z);

5571 **DESCRIPTION**

5572 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5573 conflict between the requirements described here and the ISO C standard is unintentional. This
5574 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5575 These functions shall compute the argument (also called phase angle) of z , with a branch cut
5576 along the negative real axis.

5577 **RETURN VALUE**5578 These functions shall return the value of the argument in the interval $[-\pi, +\pi]$.5579 **ERRORS**

5580 No errors are defined.

5581 **EXAMPLES**

5582 None.

5583 **APPLICATION USAGE**

5584 None.

5585 **RATIONALE**

5586 None.

5587 **FUTURE DIRECTIONS**

5588 None.

5589 **SEE ALSO**5590 *cimag()*, *conj()*, *cproj()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5591 **CHANGE HISTORY**

5592 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5593 NAME

5594 casin, casinf, casinl — complex arc sine functions

5595 SYNOPSIS

5596 #include <complex.h>

5597 double complex casin(double complex z);

5598 float complex casinf(float complex z);

5599 long double complex casinl(long double complex z);

5600 DESCRIPTION

5601 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5602 conflict between the requirements described here and the ISO C standard is unintentional. This
5603 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5604 These functions shall compute the complex arc sine of z , with branch cuts outside the interval
5605 $[-1, +1]$ along the real axis.

5606 RETURN VALUE

5607 These functions shall return the complex arc sine value, in the range of a strip mathematically
5608 unbounded along the imaginary axis and in the interval $[-\pi/2, +\pi/2]$ along the real axis.

5609 ERRORS

5610 No errors are defined.

5611 EXAMPLES

5612 None.

5613 APPLICATION USAGE

5614 None.

5615 RATIONALE

5616 None.

5617 FUTURE DIRECTIONS

5618 None.

5722 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5723 **NAME**

5724 catanl — complex arc tangent functions

5725 **SYNOPSIS**

5726 #include <complex.h>

5727 long double complex catanl(long double complex *z*);5728 **DESCRIPTION**5729 Refer to *catan()*.

5730 **NAME**

5731 catclose — close a message catalog descriptor

5732 **SYNOPSIS**

5733 xSI #include <nl_types.h>

5734 int catclose(nl_catd catd);

5735

5736 **DESCRIPTION**

5737 The *catclose()* function shall close the message catalog identified by *catd*. If a file descriptor is
5738 used to implement the type **nl_catd**, that file descriptor shall be closed.

5739 **RETURN VALUE**

5740 Upon successful completion, *catclose()* shall return 0; otherwise, *-1* shall be returned, and *errno*
5741 set to indicate the error.

5742 **ERRORS**5743 The *catclose()* function may fail if:

5744 [EBADF] The catalog descriptor is not valid.

5745 [EINTR] The *catclose()* function was interrupted by a signal.5746 **EXAMPLES**

5747 None.

5748 **APPLICATION USAGE**

5749 None.

5750 **RATIONALE**

5751 None.

5752 **FUTURE DIRECTIONS**

5753 None.

5754 **SEE ALSO**5755 *catgets()*, *catopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**nl_types.h**>5756 **CHANGE HISTORY**

5757 First released in Issue 2.

5758 **NAME**

5759 catgets — read a program message

5760 **SYNOPSIS**

5761 xSI #include <nl_types.h>

5762 char *catgets(nl_catd catd, int set_id, int msg_id, const char *s);

5763

5764 **DESCRIPTION**

5765 The *catgets()* function shall attempt to read message *msg_id*, in set *set_id*, from the message catalog identified by *catd*. The *catd* argument is a message catalog descriptor returned from an earlier call to *catopen()*. The *s* argument points to a default message string which shall be returned by *catgets()* if it cannot retrieve the identified message.

5769 The *catgets()* function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

5771 **RETURN VALUE**

5772 If the identified message is retrieved successfully, *catgets()* shall return a pointer to an internal buffer area containing the null-terminated message string. If the call is unsuccessful for any reason, *s* shall be returned and *errno* may be set to indicate the error.

5775 **ERRORS**5776 The *catgets()* function may fail if:

5777 [EBADF] The *catd* argument is not a valid message catalog descriptor open for reading.

5778 [EBADMSG] The message identified by *set_id* and *msg_id* in the specified message catalog did not satisfy implementation-defined security criteria.

5780 [EINTR] The read operation was terminated due to the receipt of a signal, and no data was transferred.

5782 [EINVAL] The message catalog identified by *catd* is corrupted.

5783 [ENOMSG] The message identified by *set_id* and *msg_id* is not in the message catalog.

5784 **EXAMPLES**

5785 None.

5786 **APPLICATION USAGE**

5787 None.

5788 **RATIONALE**

5789 None.

5790 **FUTURE DIRECTIONS**

5791 None.

5792 **SEE ALSO**5793 *catclose()*, *catopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <nl_types.h>5794 **CHANGE HISTORY**

5795 First released in Issue 2.

5796 **Issue 5**

5797 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

5798 **Issue 6**

5799 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

5800 **NAME**

5801 catopen — open a message catalog

5802 **SYNOPSIS**

5803 xSI #include <nl_types.h>

5804 nl_catd catopen(const char *name, int oflag);

5805

5806 **DESCRIPTION**

5807 The *catopen()* function shall open a message catalog and return a message catalog descriptor.
 5808 The *name* argument specifies the name of the message catalog to be opened. If *name* contains a
 5809 ' / ', then *name* specifies a complete name for the message catalog. Otherwise, the environment
 5810 variable *NLSPATH* is used with *name* substituted for the %N conversion specification (see the
 5811 Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If
 5812 *NLSPATH* exists in the environment when the process starts, then if the process has appropriate
 5813 privileges, the behavior of *catopen()* is undefined. If *NLSPATH* does not exist in the environment,
 5814 or if a message catalog cannot be found in any of the components specified by *NLSPATH*, then
 5815 an implementation-defined default path shall be used. This default may be affected by the
 5816 setting of *LC_MESSAGES* if the value of *oflag* is *NL_CAT_LOCALE*, or the *LANG* environment
 5817 variable if *oflag* is 0.

5818 A message catalog descriptor shall remain valid in a process until that process closes it, or a
 5819 successful call to one of the *exec* functions. A change in the setting of the *LC_MESSAGES*
 5820 category may invalidate existing open catalogs.

5821 If a file descriptor is used to implement message catalog descriptors, the *FD_CLOEXEC* flag
 5822 shall be set; see <fcntl.h>.

5823 If the value of the *oflag* argument is 0, the *LANG* environment variable is used to locate the
 5824 catalog without regard to the *LC_MESSAGES* category. If the *oflag* argument is
 5825 *NL_CAT_LOCALE*, the *LC_MESSAGES* category is used to locate the message catalog (see the
 5826 Base Definitions volume of IEEE Std 1003.1-2001, Section 8.2, Internationalization Variables).

5827 **RETURN VALUE**

5828 Upon successful completion, *catopen()* shall return a message catalog descriptor for use on
 5829 subsequent calls to *catgets()* and *catclose()*. Otherwise, *catopen()* shall return (**nl_catd**) -1 and set
 5830 *errno* to indicate the error.

5831 **ERRORS**5832 The *catopen()* function may fail if:

5833 [EACCES] Search permission is denied for the component of the path prefix of the
 5834 message catalog or read permission is denied for the message catalog.

5835 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

5836 [ENAMETOOLONG]

5837 The length of a pathname of the message catalog exceeds {PATH_MAX} or a
 5838 pathname component is longer than {NAME_MAX}.

5839 [ENAMETOOLONG]

5840 Pathname resolution of a symbolic link produced an intermediate result
 5841 whose length exceeds {PATH_MAX}.

5842 [ENFILE] Too many files are currently open in the system.

5843 [ENOENT] The message catalog does not exist or the *name* argument points to an empty
 5844 string.

5845 [ENOMEM] Insufficient storage space is available.

5846 [ENOTDIR] A component of the path prefix of the message catalog is not a directory.

5847 **EXAMPLES**

5848 None.

5849 **APPLICATION USAGE**

5850 Some implementations of *catopen()* use *malloc()* to allocate space for internal buffer areas. The
5851 *catopen()* function may fail if there is insufficient storage space available to accommodate these
5852 buffers.

5853 Conforming applications must assume that message catalog descriptors are not valid after a call
5854 to one of the *exec* functions.

5855 Application writers should be aware that guidelines for the location of message catalogs have
5856 not yet been developed. Therefore they should take care to avoid conflicting with catalogs used
5857 by other applications and the standard utilities.

5858 **RATIONALE**

5859 None.

5860 **FUTURE DIRECTIONS**

5861 None.

5862 **SEE ALSO**

5863 *catclose()*, *catgets()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<fcntl.h>**,
5864 **<nl_types.h>**, the Shell and Utilities volume of IEEE Std 1003.1-2001

5865 **CHANGE HISTORY**

5866 First released in Issue 2.

5867 **NAME**

5868 cbrt, cbrtf, cbrtl — cube root functions

5869 **SYNOPSIS**

5870 #include <math.h>

5871 double cbrt(double x);

5872 float cbrtf(float x);

5873 long double cbrtl(long double x);

5874 **DESCRIPTION**

5875 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 5876 conflict between the requirements described here and the ISO C standard is unintentional. This
 5877 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5878 These functions shall compute the real cube root of their argument *x*.5879 **RETURN VALUE**5880 Upon successful completion, these functions shall return the cube root of *x*.5881 **MX** If *x* is NaN, a NaN shall be returned.5882 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.5883 **ERRORS**

5884 No errors are defined.

5885 **EXAMPLES**

5886 None.

5887 **APPLICATION USAGE**

5888 None.

5889 **RATIONALE**

5890 For some applications, a true cube root function, which returns negative results for negative
 5891 arguments, is more appropriate than *pow(x, 1.0/3.0)*, which returns a NaN for *x* less than 0.

5892 **FUTURE DIRECTIONS**

5893 None.

5894 **SEE ALSO**

5895 The Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

5896 **CHANGE HISTORY**

5897 First released in Issue 4, Version 2.

5898 **Issue 5**

5899 Moved from X/OPEN UNIX extension to BASE.

5900 **Issue 6**5901 The *cbrt()* function is no longer marked as an extension.5902 The *cbrtf()* and *cbrtl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

5903 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 5904 revised to align with the ISO/IEC 9899:1999 standard.

5905 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 5906 marked.

5907 NAME

5908 `ccos, ccosh, ccoshl` — complex cosine functions

5909 SYNOPSIS

5910 `#include <complex.h>`

5911 `double complex ccos(double complex z);`

5912 `float complex ccosh(float complex z);`

5913 `long double complex ccoshl(long double complex z);`

5914 DESCRIPTION

5915 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
5916 conflict between the requirements described here and the ISO C standard is unintentional. This
5917 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5918 These functions shall compute the complex cosine of *z*.

5919 RETURN VALUE

5920 These functions shall return the complex cosine value.

5921 ERRORS

5922 No errors are defined.

5923 EXAMPLES

5924 None.

5925 APPLICATION USAGE

5926 None.

5927 RATIONALE

5928 None.

5929 FUTURE DIRECTIONS

5930 None.

5931 SEE ALSO

5932 `cacos()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<complex.h>**

5933 CHANGE HISTORY

5934 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5935 **NAME**

5936 ccosh, ccoshf, ccoshl — complex hyperbolic cosine functions

5937 **SYNOPSIS**

5938 #include <complex.h>

5939 double complex ccosh(double complex z);

5940 float complex ccoshf(float complex z);

5941 long double complex ccoshl(long double complex z);

5942 **DESCRIPTION**

5943 cx The functionality described on this reference page is aligned with the ISO C standard. Any
5944 conflict between the requirements described here and the ISO C standard is unintentional. This
5945 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5946 These functions shall compute the complex hyperbolic cosine of *z*.5947 **RETURN VALUE**

5948 These functions shall return the complex hyperbolic cosine value.

5949 **ERRORS**

5950 No errors are defined.

5951 **EXAMPLES**

5952 None.

5953 **APPLICATION USAGE**

5954 None.

5955 **RATIONALE**

5956 None.

5957 **FUTURE DIRECTIONS**

5958 None.

5959 **SEE ALSO**5960 *cacosh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>5961 **CHANGE HISTORY**

5962 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

5963 **NAME**

5964 ccosl — complex cosine functions

5965 **SYNOPSIS**

5966 #include <complex.h>

5967 long double complex ccosl(long double complex z);

5968 **DESCRIPTION**5969 Refer to *ccos()*.

5970 **NAME**

5971 ceil, ceilf, ceill — ceiling value function

5972 **SYNOPSIS**

5973 #include <math.h>

5974 double ceil(double x);

5975 float ceilf(float x);

5976 long double ceill(long double x);

5977 **DESCRIPTION**

5978 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 5979 conflict between the requirements described here and the ISO C standard is unintentional. This
 5980 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

5981 These functions shall compute the smallest integral value not less than *x*.

5982 An application wishing to check for error situations should set *errno* to zero and call
 5983 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 5984 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 5985 zero, an error has occurred.

5986 **RETURN VALUE**

5987 Upon successful completion, *ceil()*, *ceilf()*, and *ceill()* shall return the smallest integral value not
 5988 less than *x*, expressed as a type **double**, **float**, or **long double**, respectively.

5989 MX If *x* is NaN, a NaN shall be returned.5990 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.

5991 XSI If the correct value would cause overflow, a range error shall occur and *ceil()*, *ceilf()*, and *ceill()*
 5992 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

5993 **ERRORS**

5994 These functions shall fail if:

5995 XSI Range Error The result overflows.

5996 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 5997 then *errno* shall be set to [ERANGE]. If the integer expression
 5998 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 5999 floating-point exception shall be raised.

6000 **EXAMPLES**

6001 None.

6002 **APPLICATION USAGE**

6003 The integral value returned by these functions need not be expressible as an **int** or **long**. The
 6004 return value should be tested before assigning it to an integer type to avoid the undefined results
 6005 of an integer overflow.

6006 The *ceil()* function can only overflow when the floating-point representation has
 6007 DBL_MANT_DIG > DBL_MAX_EXP.

6008 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 6009 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

6010 **RATIONALE**

6011 None.

6012 **FUTURE DIRECTIONS**

6013 None.

6014 **SEE ALSO**

6016 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

6017 **CHANGE HISTORY**

6018 First released in Issue 1. Derived from Issue 1 of the SVID.

6019 **Issue 5**

6020 The DESCRIPTION is updated to indicate how an application should check for an error. This
6021 text was previously published in the APPLICATION USAGE section.

6022 **Issue 6**6023 The *ceilf()* and *ceil()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

6024 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
6025 revised to align with the ISO/IEC 9899:1999 standard.

6026 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
6027 marked.

6028 **NAME**

6029 cexp, cexpf, cexpl — complex exponential functions

6030 **SYNOPSIS**

6031 #include <complex.h>

6032 double complex cexp(double complex z);

6033 float complex cexpf(float complex z);

6034 long double complex cexpl(long double complex z);

6035 **DESCRIPTION**

6036 cx The functionality described on this reference page is aligned with the ISO C standard. Any
6037 conflict between the requirements described here and the ISO C standard is unintentional. This
6038 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6039 These functions shall compute the complex exponent of z , defined as e^z .6040 **RETURN VALUE**6041 These functions shall return the complex exponential value of z .6042 **ERRORS**

6043 No errors are defined.

6044 **EXAMPLES**

6045 None.

6046 **APPLICATION USAGE**

6047 None.

6048 **RATIONALE**

6049 None.

6052 **SEE ALSO**6053 *clog()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>6054 **CHANGE HISTORY**

6055 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

6056 **NAME**

6057 cfgetispeed — get input baud rate

6058 **SYNOPSIS**

6059 #include <termios.h>

6060 speed_t cfgetispeed(const struct termios *termios_p);

6061 **DESCRIPTION**

6062 The *cfgetispeed()* function shall extract the input baud rate from the **termios** structure to which
 6063 the *termios_p* argument points.

6064 This function shall return exactly the value in the **termios** data structure, without interpretation.

6065 **RETURN VALUE**

6066 Upon successful completion, *cfgetispeed()* shall return a value of type **speed_t** representing the
 6067 input baud rate.

6068 **ERRORS**

6069 No errors are defined.

6070 **EXAMPLES**

6071 None.

6072 **APPLICATION USAGE**

6073 None.

6074 **RATIONALE**

6075 The term “baud” is used historically here, but is not technically correct. This is properly “bits
 6076 per second”, which may not be the same as baud. However, the term is used because of the
 6077 historical usage and understanding.

6078 The *cfgetospeed()*, *cfgetispeed()*, *cfsetospeed()*, and *cfsetispeed()* functions do not take arguments as
 6079 numbers, but rather as symbolic names. There are two reasons for this:

- 6080 1. Historically, numbers were not used because of the way the rate was stored in the data
 6081 structure. This is retained even though a function is now used.
- 6082 2. More importantly, only a limited set of possible rates is at all portable, and this constrains
 6083 the application to that set.

6084 There is nothing to prevent an implementation accepting as an extension a number (such as 126),
 6085 and since the encoding of the Bxxx symbols is not specified, this can be done to avoid
 6086 introducing ambiguity.

6087 Setting the input baud rate to zero was a mechanism to allow for split baud rates. Clarifications
 6088 in this volume of IEEE Std 1003.1-2001 have made it possible to determine whether split rates are
 6089 supported and to support them without having to treat zero as a special case. Since this
 6090 functionality is also confusing, it has been declared obsolescent. The 0 argument referred to is
 6091 the literal constant 0, not the symbolic constant B0. This volume of IEEE Std 1003.1-2001 does not
 6092 preclude B0 from being defined as the value 0; in fact, implementations would likely benefit
 6093 from the two being equivalent. This volume of IEEE Std 1003.1-2001 does not fully specify
 6094 whether the previous *cfsetispeed()* value is retained after a *tcgetattr()* as the actual value or as
 6095 zero. Therefore, conforming applications should always set both the input speed and output
 6096 speed when setting either.

6097 In historical implementations, the baud rate information is traditionally kept in **c_cflag**.
 6098 Applications should be written to presume that this might be the case (and thus not blindly copy
 6099 **c_cflag**), but not to rely on it in case it is in some other field of the structure. Setting the **c_cflag**
 6100 field absolutely after setting a baud rate is a non-portable action because of this. In general, the

6101 unused parts of the flag fields might be used by the implementation and should not be blindly
6102 copied from the descriptions of one terminal device to another.

6103 **FUTURE DIRECTIONS**

6104 None.

6107 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, **<termios.h>**

6108 **CHANGE HISTORY**

6109 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6110 **NAME**

6111 cfgetospeed — get output baud rate

6112 **SYNOPSIS**

6113 #include <termios.h>

6114 speed_t cfgetospeed(const struct termios *termios_p);

6115 **DESCRIPTION**6116 The *cfgetospeed()* function shall extract the output baud rate from the **termios** structure to which
6117 the *termios_p* argument points.6118 This function shall return exactly the value in the **termios** data structure, without interpretation.6119 **RETURN VALUE**6120 Upon successful completion, *cfgetospeed()* shall return a value of type **speed_t** representing the
6121 output baud rate.6122 **ERRORS**

6123 No errors are defined.

6124 **EXAMPLES**

6125 None.

6126 **APPLICATION USAGE**

6127 None.

6128 **RATIONALE**6129 Refer to *cfgetispeed()*.6130 **FUTURE DIRECTIONS**

6131 None.

6132 **SEE ALSO**6133 *cfgetispeed()*, *cfsetispeed()*, *cfsetospeed()*, *tcgetattr()*, the Base Definitions volume of
6134 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <**termios.h**>6135 **CHANGE HISTORY**

6136 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6137 **NAME**

6138 cfsetispeed — set input baud rate

6139 **SYNOPSIS**

6140 #include <termios.h>

6141 int cfsetispeed(struct termios *termios_p, speed_t speed);

6142 **DESCRIPTION**6143 The *cfsetispeed()* function shall set the input baud rate stored in the structure pointed to by
6144 *termios_p* to *speed*.6145 There shall be no effect on the baud rates set in the hardware until a subsequent successful call
6146 to *tcsetattr()* with the same **termios** structure. Similarly, errors resulting from attempts to set
6147 baud rates not supported by the terminal device need not be detected until the *tcsetattr()*
6148 function is called.6149 **RETURN VALUE**6150 Upon successful completion, *cfsetispeed()* shall return 0; otherwise, -1 shall be returned, and
6151 *errno* may be set to indicate the error.6152 **ERRORS**6153 The *cfsetispeed()* function may fail if:6154 [EINVAL] The *speed* value is not a valid baud rate.6155 [EINVAL] The value of *speed* is outside the range of possible speed values as specified in
6156 <**termios.h**>.6157 **EXAMPLES**

6158 None.

6159 **APPLICATION USAGE**

6160 None.

6161 **RATIONALE**6162 Refer to *cfgetispeed()*.6163 **FUTURE DIRECTIONS**

6164 None.

6201 None.

6202 **SEE ALSO**6203 *cfgetispeed()*, *cfgetospeed()*, *cfsetispeed()*, *tcsetattr()*, the Base Definitions volume of
6204 IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <**termios.h**>6205 **CHANGE HISTORY**

6206 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

6207 **Issue 6**6208 The following new requirements on POSIX implementations derive from alignment with the
6209 Single UNIX Specification:

- 6210
- The optional setting of *errno* and the [EINVAL] error conditions are added.

6211 **NAME**

6212 chdir — change working directory

6213 **SYNOPSIS**

6214 #include <unistd.h>

6215 int chdir(const char *path);

6216 **DESCRIPTION**

6217 The *chdir()* function shall cause the directory named by the pathname pointed to by the *path*
 6218 argument to become the current working directory; that is, the starting point for path searches
 6219 for pathnames not beginning with *'/'*.

6220 **RETURN VALUE**

6221 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned, the current
 6222 working directory shall remain unchanged, and *errno* shall be set to indicate the error.

6223 **ERRORS**6224 The *chdir()* function shall fail if:

6225 [EACCES] Search permission is denied for any component of the pathname.

6226 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 6227 argument.

6228 [ENAMETOOLONG]

6229 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 6230 component is longer than {NAME_MAX}.

6231 [ENOENT] A component of *path* does not name an existing directory or *path* is an empty
 6232 string.

6233 [ENOTDIR] A component of the pathname is not a directory.

6234 The *chdir()* function may fail if:

6235 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 6236 resolution of the *path* argument.

6237 [ENAMETOOLONG]

6238 As a result of encountering a symbolic link in resolution of the *path* argument,
 6239 the length of the substituted pathname string exceeded {PATH_MAX}.

6240 **EXAMPLES**6241 **Changing the Current Working Directory**

6242 The following example makes the value pointed to by **directory**, **/tmp**, the current working
 6243 directory.

6244 #include <unistd.h>

6245 ...

6246 char *directory = "/tmp";

6247 int ret;

6248 ret = chdir (directory);

6249 APPLICATION USAGE

6250 None.

6251 RATIONALE

6252 The *chdir()* function only affects the working directory of the current process.

6253 FUTURE DIRECTIONS

6254 None.

6255 SEE ALSO

6256 *getcwd()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

6257 CHANGE HISTORY

6258 First released in Issue 1. Derived from Issue 1 of the SVID.

6259 Issue 6

6260 The APPLICATION USAGE section is added.

6261 The following new requirements on POSIX implementations derive from alignment with the
6262 Single UNIX Specification:

- 6263 • The [ELOOP] mandatory error condition is added.
- 6264 • A second [ENAMETOOLONG] is added as an optional error condition.

6265 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6266 • The [ELOOP] optional error condition is added.

6267 **NAME**

6268 chmod — change mode of a file

6269 **SYNOPSIS**

6270 #include <sys/stat.h>

6271 int chmod(const char *path, mode_t mode);

6272 **DESCRIPTION**

6273 xSI The *chmod()* function shall change S_ISUID, S_ISGID, S_ISVTX, and the file permission bits of
 6274 the file named by the pathname pointed to by the *path* argument to the corresponding bits in the
 6275 *mode* argument. The application shall ensure that the effective user ID of the process matches the
 6276 owner of the file or the process has appropriate privileges in order to do this.

6277 xSI S_ISUID, S_ISGID, S_ISVTX, and the file permission bits are described in <sys/stat.h>.

6278 If the calling process does not have appropriate privileges, and if the group ID of the file does
 6279 not match the effective group ID or one of the supplementary group IDs and if the file is a
 6280 regular file, bit S_ISGID (set-group-ID on execution) in the file's mode shall be cleared upon
 6281 successful return from *chmod()*.

6282 Additional implementation-defined restrictions may cause the S_ISUID and S_ISGID bits in
 6283 *mode* to be ignored.

6284 The effect on file descriptors for files open at the time of a call to *chmod()* is implementation-
 6285 defined.

6286 Upon successful completion, *chmod()* shall mark for update the *st_ctime* field of the file.

6287 **RETURN VALUE**

6288 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 6289 indicate the error. If -1 is returned, no change to the file mode occurs.

6290 **ERRORS**

6291 The *chmod()* function shall fail if:

6292 [EACCES] Search permission is denied on a component of the path prefix.

6293 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 6294 argument.

6295 [ENAMETOOLONG]

6296 The length of the *path* argument exceeds {PATH_MAX} or a pathname
 6297 component is longer than {NAME_MAX}.

6298 [ENOTDIR] A component of the path prefix is not a directory.

6299 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

6300 [EPERM] The effective user ID does not match the owner of the file and the process
 6301 does not have appropriate privileges.

6302 [EROFS] The named file resides on a read-only file system.

6303 The *chmod()* function may fail if:

6304 [EINTR] A signal was caught during execution of the function.

6305 [EINVAL] The value of the *mode* argument is invalid.

6306 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 6307 resolution of the *path* argument.

6308 [ENAMETOOLONG]
 6309 As a result of encountering a symbolic link in resolution of the *path* argument,
 6310 the length of the substituted pathname strings exceeded {PATH_MAX}.

6311 EXAMPLES

6312 Setting Read Permissions for User, Group, and Others

6313 The following example sets read permissions for the owner, group, and others.

```
6314 #include <sys/stat.h>
6315 const char *path;
6316 ...
6317 chmod(path, S_IRUSR|S_IRGRP|S_IROTH);
```

6318 Setting Read, Write, and Execute Permissions for the Owner Only

6319 The following example sets read, write, and execute permissions for the owner, and no
 6320 permissions for group and others.

```
6321 #include <sys/stat.h>
6322 const char *path;
6323 ...
6324 chmod(path, S_IRWXU);
```

6325 Setting Different Permissions for Owner, Group, and Other

6326 The following example sets owner permissions for CHANGEFILE to read, write, and execute,
 6327 group permissions to read and execute, and other permissions to read.

```
6328 #include <sys/stat.h>
6329 #define CHANGEFILE "/etc/myfile"
6330 ...
6331 chmod(CHANGEFILE, S_IRWXU|S_IRGRP|S_IXGRP|S_IROTH);
```

6332 Setting and Checking File Permissions

6333 The following example sets the file permission bits for a file named **/home/cnd/mod1**, then calls
 6334 the *stat()* function to verify the permissions.

```
6335 #include <sys/types.h>
6336 #include <sys/stat.h>
6337 int status;
6338 struct stat buffer
6339 ...
6340 chmod("home/cnd/mod1", S_IRWXU|S_IRWXG|S_IROTH|S_IWOTH);
6341 status = stat("home/cnd/mod1", &buffer);
```

6342 APPLICATION USAGE

6343 In order to ensure that the S_ISUID and S_ISGID bits are set, an application requiring this should
 6344 use *stat()* after a successful *chmod()* to verify this.

6345 Any file descriptors currently open by any process on the file could possibly become invalid if
 6346 the mode of the file is changed to a value which would deny access to that process. One

6347 situation where this could occur is on a stateless file system. This behavior will not occur in a
6348 conforming environment.

6349 **RATIONALE**

6350 This volume of IEEE Std 1003.1-2001 specifies that the S_ISGID bit is cleared by *chmod()* on a
6351 regular file under certain conditions. This is specified on the assumption that regular files may
6352 be executed, and the system should prevent users from making executable *setgid()* files perform
6353 with privileges that the caller does not have. On implementations that support execution of
6354 other file types, the S_ISGID bit should be cleared for those file types under the same
6355 circumstances.

6356 Implementations that use the S_ISUID bit to indicate some other function (for example,
6357 mandatory record locking) on non-executable files need not clear this bit on writing. They
6358 should clear the bit for executable files and any other cases where the bit grants special powers
6359 to processes that change the file contents. Similar comments apply to the S_ISGID bit.

6360 **FUTURE DIRECTIONS**

6361 None.

6362 **SEE ALSO**

6363 *chown()*, *mkdir()*, *mkfifo()*, *open()*, *stat()*, *statvfs()*, the Base Definitions volume of
6364 IEEE Std 1003.1-2001, **<sys/stat.h>**, **<sys/types.h>**

6365 **CHANGE HISTORY**

6366 First released in Issue 1. Derived from Issue 1 of the SVID.

6367 **Issue 6**

6368 The following new requirements on POSIX implementations derive from alignment with the
6369 Single UNIX Specification:

6370 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
6371 required for conforming implementations of previous POSIX specifications, it was not
6372 required for UNIX applications.

6373 • The [EINVAL] and [EINTR] optional error conditions are added.

6374 • A second [ENAMETOOLONG] is added as an optional error condition.

6375 The following changes were made to align with the IEEE P1003.1a draft standard:

6376 • The [ELOOP] optional error condition is added.

6377 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

6378 **NAME**

6379 chown — change owner and group of a file

6380 **SYNOPSIS**

6381 #include <unistd.h>

6382 int chown(const char *path, uid_t owner, gid_t group);

6383 **DESCRIPTION**6384 The *chown()* function shall change the user and group ownership of a file.6385 The *path* argument points to a pathname naming a file. The user ID and group ID of the named
6386 file shall be set to the numeric values contained in *owner* and *group*, respectively.6387 Only processes with an effective user ID equal to the user ID of the file or with appropriate
6388 privileges may change the ownership of a file. If `_POSIX_CHOWN_RESTRICTED` is in effect for
6389 *path*:

- 6390
- Changing the user ID is restricted to processes with appropriate privileges.
 - Changing the group ID is permitted to a process with an effective user ID equal to the user
6391 ID of the file, but without appropriate privileges, if and only if *owner* is equal to the file's user
6392 ID or (**uid_t**)−1 and *group* is equal either to the calling process' effective group ID or to one of
6393 its supplementary group IDs.
- 6394

6395 If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of
6396 the file mode are set, and the process does not have appropriate privileges, the set-user-ID
6397 (`S_ISUID`) and set-group-ID (`S_ISGID`) bits of the file mode shall be cleared upon successful
6398 return from *chown()*. If the specified file is a regular file, one or more of the `S_IXUSR`, `S_IXGRP`,
6399 or `S_IXOTH` bits of the file mode are set, and the process has appropriate privileges, it is
6400 implementation-defined whether the set-user-ID and set-group-ID bits are altered. If the *chown()*
6401 function is successfully invoked on a file that is not a regular file and one or more of the
6402 `S_IXUSR`, `S_IXGRP`, or `S_IXOTH` bits of the file mode are set, the set-user-ID and set-group-ID
6403 bits may be cleared.6404 If *owner* or *group* is specified as (**uid_t**)−1 or (**gid_t**)−1, respectively, the corresponding ID of the
6405 file shall not be changed. If both *owner* and *group* are −1, the times need not be updated.6406 Upon successful completion, *chown()* shall mark for update the *st_ctime* field of the file.6407 **RETURN VALUE**6408 Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and *errno* set to
6409 indicate the error. If −1 is returned, no changes are made in the user ID and group ID of the file.6410 **ERRORS**6411 The *chown()* function shall fail if:

- 6412 [EACCES] Search permission is denied on a component of the path prefix.
-
- 6413 [ELOOP] A loop exists in symbolic links encountered during resolution of the
- path*
-
- 6414 argument.
-
- 6415 [ENAMETOOLONG] The length of the
- path*
- argument exceeds {PATH_MAX} or a pathname
-
- 6416 component is longer than {NAME_MAX}.
-
- 6417 [ENOTDIR] A component of the path prefix is not a directory.
-
- 6418 [ENOENT] A component of
- path*
- does not name an existing file or
- path*
- is an empty string.
-
- 6419

6420 [EPERM] The effective user ID does not match the owner of the file, or the calling
 6421 process does not have appropriate privileges and
 6422 _POSIX_CHOWN_RESTRICTED indicates that such privilege is required.

6423 [EROFS] The named file resides on a read-only file system.

6424 The *chown()* function may fail if:

6425 [EIO] An I/O error occurred while reading or writing to the file system.

6426 [EINTR] The *chown()* function was interrupted by a signal which was caught.

6427 [EINVAL] The owner or group ID supplied is not a value supported by the
 6428 implementation.

6429 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 6430 resolution of the *path* argument.

6431 [ENAMETOOLONG]
 6432 As a result of encountering a symbolic link in resolution of the *path* argument,
 6433 the length of the substituted pathname string exceeded {PATH_MAX}.

6434 EXAMPLES

6435 None.

6436 APPLICATION USAGE

6437 Although *chown()* can be used on some implementations by the file owner to change the owner
 6438 and group to any desired values, the only portable use of this function is to change the group of
 6439 a file to the effective GID of the calling process or to a member of its group set.

6440 RATIONALE

6441 System III and System V allow a user to give away files; that is, the owner of a file may change
 6442 its user ID to anything. This is a serious problem for implementations that are intended to meet
 6443 government security regulations. Version 7 and 4.3 BSD permit only the superuser to change the
 6444 user ID of a file. Some government agencies (usually not ones concerned directly with security)
 6445 find this limitation too confining. This volume of IEEE Std 1003.1-2001 uses *may* to permit secure
 6446 implementations while not disallowing System V.

6447 System III and System V allow the owner of a file to change the group ID to anything. Version 7
 6448 permits only the superuser to change the group ID of a file. 4.3 BSD permits the owner to
 6449 change the group ID of a file to its effective group ID or to any of the groups in the list of
 6450 supplementary group IDs, but to no others.

6451 The POSIX.1-1990 standard requires that the *chown()* function invoked by a non-appropriate
 6452 privileged process clear the S_ISGID and the S_ISUID bits for regular files, and permits them to
 6453 be cleared for other types of files. This is so that changes in accessibility do not accidentally
 6454 cause files to become security holes. Unfortunately, requiring these bits to be cleared on non-
 6455 executable data files also clears the mandatory file locking bit (shared with S_ISGID), which is
 6456 an extension on many implementations (it first appeared in System V). These bits should only be
 6457 required to be cleared on regular files that have one or more of their execute bits set.

6458 FUTURE DIRECTIONS

6459 None.

6460 SEE ALSO

6461 *chmod()*, *pathconf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**sys/types.h**>,
 6462 <**unistd.h**>

6463 **CHANGE HISTORY**

6464 First released in Issue 1. Derived from Issue 1 of the SVID.

6465 **Issue 6**

6466 The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- 6467 • The wording describing the optional dependency on `_POSIX_CHOWN_RESTRICTED` is
- 6468 restored.
- 6469 • The `[EPERM]` error is restored as an error dependent on `_POSIX_CHOWN_RESTRICTED`.
- 6470 This is since its operand is a pathname and applications should be aware that the error may
- 6471 not occur for that pathname if the file system does not support
- 6472 `_POSIX_CHOWN_RESTRICTED`.

6473 The following new requirements on POSIX implementations derive from alignment with the

6474 Single UNIX Specification:

- 6475 • The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was
- 6476 required for conforming implementations of previous POSIX specifications, it was not
- 6477 required for UNIX applications.
- 6478 • The value for *owner* of `(uid_t)-1` allows the use of `-1` by the owner of a file to change the
- 6479 group ID only. A corresponding change is made for group.
- 6480 • The `[ELOOP]` mandatory error condition is added.
- 6481 • The `[EIO]` and `[EINTR]` optional error conditions are added.
- 6482 • A second `[ENAMETOOLONG]` is added as an optional error condition.

6483 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6484 • Clarification is added that the `S_ISUID` and `S_ISGID` bits do not need to be cleared when the
- 6485 process has appropriate privileges.
- 6486 • The `[ELOOP]` optional error condition is added.

6487 **NAME**

6488 cimag, cimagf, cimagl — complex imaginary functions

6489 **SYNOPSIS**

6490 #include <complex.h>

6491 double cimag(double complex z);

6492 float cimagf(float complex z);

6493 long double cimagl(long double complex z);

6494 **DESCRIPTION**

6495 CX The functionality described on this reference page is aligned with the ISO C standard. Any
6496 conflict between the requirements described here and the ISO C standard is unintentional. This
6497 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6498 These functions shall compute the imaginary part of *z*.6499 **RETURN VALUE**

6500 These functions shall return the imaginary part value (as a real).

6501 **ERRORS**

6502 No errors are defined.

6503 **EXAMPLES**

6504 None.

6505 **APPLICATION USAGE**6506 For a variable *z* of complex type:6507 *z* == creal(*z*) + cimag(*z*)*I6508 **RATIONALE**

6509 None.

6510 **FUTURE DIRECTIONS**

6511 None.

6512 **SEE ALSO**6513 *carg()*, *conj()*, *cproj()*, *creal()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>6514 **CHANGE HISTORY**

6516 **NAME**

6517 clearerr — clear indicators on a stream

6518 **SYNOPSIS**

6519 #include <stdio.h>

6520 void clearerr(FILE **stream*);6521 **DESCRIPTION**

6522 cx The functionality described on this reference page is aligned with the ISO C standard. Any
6523 conflict between the requirements described here and the ISO C standard is unintentional. This
6524 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6525 The *clearerr()* function shall clear the end-of-file and error indicators for the stream to which
6526 *stream* points.

6527 **RETURN VALUE**6528 The *clearerr()* function shall not return a value.6529 **ERRORS**

6530 No errors are defined.

6531 **EXAMPLES**

6532 None.

6533 **APPLICATION USAGE**

6534 None.

6535 **RATIONALE**

6536 None.

6537 **FUTURE DIRECTIONS**

6538 None.

6539 **SEE ALSO**6540 The Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>6541 **CHANGE HISTORY**

6542 First released in Issue 1. Derived from Issue 1 of the SVID.

6543 **NAME**

6544 clock — report CPU time used

6545 **SYNOPSIS**

6546 #include <time.h>

6547 clock_t clock(void);

6548 **DESCRIPTION**

6549 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 6550 conflict between the requirements described here and the ISO C standard is unintentional. This
 6551 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6552 The *clock()* function shall return the implementation's best approximation to the processor time
 6553 used by the process since the beginning of an implementation-defined era related only to the
 6554 process invocation.

6555 **RETURN VALUE**

6556 To determine the time in seconds, the value returned by *clock()* should be divided by the value
 6557 XSI of the macro CLOCKS_PER_SEC. CLOCKS_PER_SEC is defined to be one million in <time.h>.
 6558 If the processor time used is not available or its value cannot be represented, the function shall
 6559 return the value (clock_t)-1.

6560 **ERRORS**

6561 No errors are defined.

6562 **EXAMPLES**

6563 None.

6564 **APPLICATION USAGE**

6565 In order to measure the time spent in a program, *clock()* should be called at the start of the
 6566 program and its return value subtracted from the value returned by subsequent calls. The value
 6567 returned by *clock()* is defined for compatibility across systems that have clocks with different
 6568 resolutions. The resolution on any particular system need not be to microsecond accuracy.

6569 The value returned by *clock()* may wrap around on some implementations. For example, on a
 6570 machine with 32-bit values for **clock_t**, it wraps after 2 147 seconds or 36 minutes.

6571 **RATIONALE**

6572 None.

6573 **FUTURE DIRECTIONS**

6574 None.

6575 **SEE ALSO**

6576 *asctime()*, *ctime()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,
 6577 the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>

6578 **CHANGE HISTORY**

6579 First released in Issue 1. Derived from Issue 1 of the SVID.

6580 **NAME**6581 clock_getcpuclockid — access a process CPU-time clock (**ADVANCED REALTIME**)6582 **SYNOPSIS**6583 CPT `#include <time.h>`6584 `int clock_getcpuclockid(pid_t pid, clockid_t *clock_id);`

6585

6586 **DESCRIPTION**

6587 The `clock_getcpuclockid()` function shall return the clock ID of the CPU-time clock of the process
6588 specified by *pid*. If the process described by *pid* exists and the calling process has permission,
6589 the clock ID of this clock shall be returned in *clock_id*.

6590 If *pid* is zero, the `clock_getcpuclockid()` function shall return the clock ID of the CPU-time clock of
6591 the process making the call, in *clock_id*.

6592 The conditions under which one process has permission to obtain the CPU-time clock ID of
6593 other processes are implementation-defined.

6594 **RETURN VALUE**

6595 Upon successful completion, `clock_getcpuclockid()` shall return zero; otherwise, an error number
6596 shall be returned to indicate the error.

6597 **ERRORS**

6598 The `clock_getcpuclockid()` function shall fail if:

6599 [EPERM] The requesting process does not have permission to access the CPU-time
6600 clock for the process.

6601 The `clock_getcpuclockid()` function may fail if:

6602 [ESRCH] No process can be found corresponding to the process specified by *pid*.

6603 **EXAMPLES**

6604 None.

6605 **APPLICATION USAGE**

6606 The `clock_getcpuclockid()` function is part of the Process CPU-Time Clocks option and need not
6607 be provided on all implementations.

6608 **RATIONALE**

6609 None.

6610 **FUTURE DIRECTIONS**

6611 None.

6612 **SEE ALSO**

6613 `clock_getres()`, `timer_create()`, the Base Definitions volume of IEEE Std 1003.1-2001, **<time.h>**

6614 **CHANGE HISTORY**

6615 First released in Issue 6. Derived from IEEE Std 1003.1d-1999.

6616 In the SYNOPSIS, the inclusion of **<sys/types.h>** is no longer required.

6617 **NAME**6618 clock_getres, clock_gettime, clock_settime — clock and timer functions (**REALTIME**)6619 **SYNOPSIS**

6620 TMR #include <time.h>

```

6621 int clock_getres(clockid_t clock_id, struct timespec *res);
6622 int clock_gettime(clockid_t clock_id, struct timespec *tp);
6623 int clock_settime(clockid_t clock_id, const struct timespec *tp);
6624

```

6625 **DESCRIPTION**

6626 The *clock_getres()* function shall return the resolution of any clock. Clock resolutions are
 6627 implementation-defined and cannot be set by a process. If the argument *res* is not NULL, the
 6628 resolution of the specified clock shall be stored in the location pointed to by *res*. If *res* is NULL,
 6629 the clock resolution is not returned. If the *time* argument of *clock_settime()* is not a multiple of *res*,
 6630 then the value is truncated to a multiple of *res*.

6631 The *clock_gettime()* function shall return the current value *tp* for the specified clock, *clock_id*.

6632 The *clock_settime()* function shall set the specified clock, *clock_id*, to the value specified by *tp*.
 6633 Time values that are between two consecutive non-negative integer multiples of the resolution
 6634 of the specified clock shall be truncated down to the smaller multiple of the resolution.

6635 A clock may be system-wide (that is, visible to all processes) or per-process (measuring time that
 6636 is meaningful only within a process). All implementations shall support a *clock_id* of
 6637 CLOCK_REALTIME as defined in <time.h>. This clock represents the realtime clock for the
 6638 system. For this clock, the values returned by *clock_gettime()* and specified by *clock_settime()*
 6639 represent the amount of time (in seconds and nanoseconds) since the Epoch. An implementation
 6640 may also support additional clocks. The interpretation of time values for these clocks is
 6641 unspecified.

6642 If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock
 6643 shall be used to determine the time of expiration for absolute time services based upon the
 6644 CLOCK_REALTIME clock. This applies to the time at which armed absolute timers expire. If the
 6645 absolute time requested at the invocation of such a time service is before the new value of the
 6646 clock, the time service shall expire immediately as if the clock had reached the requested time
 6647 normally.

6648 Setting the value of the CLOCK_REALTIME clock via *clock_settime()* shall have no effect on
 6649 threads that are blocked waiting for a relative time service based upon this clock, including the
 6650 *nanosleep()* function; nor on the expiration of relative timers based upon this clock.
 6651 Consequently, these time services shall expire when the requested relative interval elapses,
 6652 independently of the new or old value of the clock.

6653 MON If the Monotonic Clock option is supported, all implementations shall support a *clock_id* of
 6654 CLOCK_MONOTONIC defined in <time.h>. This clock represents the monotonic clock for the
 6655 system. For this clock, the value returned by *clock_gettime()* represents the amount of time (in
 6656 seconds and nanoseconds) since an unspecified point in the past (for example, system start-up
 6657 time, or the Epoch). This point does not change after system start-up time. The value of the
 6658 CLOCK_MONOTONIC clock cannot be set via *clock_settime()*. This function shall fail if it is
 6659 invoked with a *clock_id* argument of CLOCK_MONOTONIC.

6660 The effect of setting a clock via *clock_settime()* on armed per-process timers associated with a
 6661 clock other than CLOCK_REALTIME is implementation-defined.

6662 CS If the value of the CLOCK_REALTIME clock is set via *clock_settime()*, the new value of the clock
 6663 shall be used to determine the time at which the system shall awaken a thread blocked on an

absolute *clock_nanosleep()* call based upon the `CLOCK_REALTIME` clock. If the absolute time requested at the invocation of such a time service is before the new value of the clock, the call shall return immediately as if the clock had reached the requested time normally.

Setting the value of the `CLOCK_REALTIME` clock via *clock_settime()* shall have no effect on any thread that is blocked on a relative *clock_nanosleep()* call. Consequently, the call shall return when the requested relative interval elapses, independently of the new or old value of the clock.

The appropriate privilege to set a particular clock is implementation-defined.

CPT If `_POSIX_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *clock_getcpuclockid()*, which represent the CPU-time clock of a given process. Implementations shall also support the special **clockid_t** value `CLOCK_PROCESS_CPUTIME_ID`, which represents the CPU-time clock of the calling process when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values returned by *clock_gettime()* and specified by *clock_settime()* represent the amount of execution time of the process associated with the clock. Changing the value of a CPU-time clock via *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see **Scheduling Policies** (on page 44)).

TCT If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support clock ID values obtained by invoking *pthread_getcpuclockid()*, which represent the CPU-time clock of a given thread. Implementations shall also support the special **clockid_t** value `CLOCK_THREAD_CPUTIME_ID`, which represents the CPU-time clock of the calling thread when invoking one of the *clock_**() or *timer_**() functions. For these clock IDs, the values returned by *clock_gettime()* and specified by *clock_settime()* shall represent the amount of execution time of the thread associated with the clock. Changing the value of a CPU-time clock via *clock_settime()* shall have no effect on the behavior of the sporadic server scheduling policy (see **Scheduling Policies** (on page 44)).

6689 RETURN VALUE

A return value of 0 shall indicate that the call succeeded. A return value of -1 shall indicate that an error occurred, and *errno* shall be set to indicate the error.

6692 ERRORS

The *clock_getres()*, *clock_gettime()*, and *clock_settime()* functions shall fail if:

[EINVAL] The *clock_id* argument does not specify a known clock.

The *clock_settime()* function shall fail if:

[EINVAL] The *tp* argument to *clock_settime()* is outside the range for the given clock ID.

[EINVAL] The *tp* argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

MON [EINVAL] The value of the *clock_id* argument is `CLOCK_MONOTONIC`.

The *clock_settime()* function may fail if:

[EPERM] The requesting process does not have the appropriate privilege to set the specified clock.

6703 **EXAMPLES**

6704 None.

6705 **APPLICATION USAGE**

6706 These functions are part of the Timers option and need not be available on all implementations.

6707 Note that the absolute value of the monotonic clock is meaningless (because its origin is
 6708 arbitrary), and thus there is no need to set it. Furthermore, realtime applications can rely on the
 6709 fact that the value of this clock is never set and, therefore, that time intervals measured with this
 6710 clock will not be affected by calls to *clock_settime()*.

6711 **RATIONALE**

6712 None.

6713 **FUTURE DIRECTIONS**

6714 None.

 6718 Definitions volume of IEEE Std 1003.1-2001, <time.h>

6719 **CHANGE HISTORY**

6720 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

6721 **Issue 6**

6722 The [ENOSYS] error condition has been removed as stubs need not be provided if an
 6723 implementation does not support the Timers option.

6724 The APPLICATION USAGE section is added.

6725 The following changes were made to align with the IEEE P1003.1a draft standard:

- 6726 • Clarification is added of the effect of resetting the clock resolution.

6727 CPU-time clocks and the *clock_getcpuclockid()* function are added for alignment with
 6728 IEEE Std 1003.1d-1999.

6729 The following changes are added for alignment with IEEE Std 1003.1j-2000:

- 6730 • The DESCRIPTION is updated as follows:

- 6731 — The value returned by *clock_gettime()* for CLOCK_MONOTONIC is specified.

- 6732 — The *clock_settime()* function failing for CLOCK_MONOTONIC is specified.

- 6733 — The effects of *clock_settime()* on the *clock_nanosleep()* function with respect to
 6734 CLOCK_REALTIME are specified.

- 6735 • An [EINVAL] error is added to the ERRORS section, indicating that *clock_settime()* fails for
 6736 CLOCK_MONOTONIC.

- 6737 • The APPLICATION USAGE section notes that the CLOCK_MONOTONIC clock need not
 6738 and shall not be set by *clock_settime()* since the absolute value of the CLOCK_MONOTONIC
 6739 clock is meaningless.

- 6740 • The *clock_nanosleep()*, *mq_timedreceive()*, *mq_timedsend()*, *pthread_mutex_timedlock()*,
 6741 *sem_timedwait()*, *timer_create()*, and *timer_settime()* functions are added to the SEE ALSO
 6742 section.

6743 **NAME**6744 clock_nanosleep — high resolution sleep with specifiable clock (**ADVANCED REALTIME**)6745 **SYNOPSIS**6746 `cs #include <time.h>`

```
6747 int clock_nanosleep(clockid_t clock_id, int flags,
6748     const struct timespec *rqtp, struct timespec *rmtp);
6749
```

6750 **DESCRIPTION**

6751 If the flag `TIMER_ABSTIME` is not set in the *flags* argument, the *clock_nanosleep()* function shall
 6752 cause the current thread to be suspended from execution until either the time interval specified
 6753 by the *rqtp* argument has elapsed, or a signal is delivered to the calling thread and its action is to
 6754 invoke a signal-catching function, or the process is terminated. The clock used to measure the
 6755 time shall be the clock specified by *clock_id*.

6756 If the flag `TIMER_ABSTIME` is set in the *flags* argument, the *clock_nanosleep()* function shall
 6757 cause the current thread to be suspended from execution until either the time value of the clock
 6758 specified by *clock_id* reaches the absolute time specified by the *rqtp* argument, or a signal is
 6759 delivered to the calling thread and its action is to invoke a signal-catching function, or the
 6760 process is terminated. If, at the time of the call, the time value specified by *rqtp* is less than or
 6761 equal to the time value of the specified clock, then *clock_nanosleep()* shall return immediately
 6762 and the calling process shall not be suspended.

6763 The suspension time caused by this function may be longer than requested because the
 6764 argument value is rounded up to an integer multiple of the sleep resolution, or because of the
 6765 scheduling of other activity by the system. But, except for the case of being interrupted by a
 6766 signal, the suspension time for the relative *clock_nanosleep()* function (that is, with the
 6767 `TIMER_ABSTIME` flag not set) shall not be less than the time interval specified by *rqtp*, as
 6768 measured by the corresponding clock. The suspension for the absolute *clock_nanosleep()* function
 6769 (that is, with the `TIMER_ABSTIME` flag set) shall be in effect at least until the value of the
 6770 corresponding clock reaches the absolute time specified by *rqtp*, except for the case of being
 6771 interrupted by a signal.

6772 The use of the *clock_nanosleep()* function shall have no effect on the action or blockage of any
 6773 signal.

6774 The *clock_nanosleep()* function shall fail if the *clock_id* argument refers to the CPU-time clock of
 6775 the calling thread. It is unspecified whether *clock_id* values of other CPU-time clocks are
 6776 allowed.

6777 **RETURN VALUE**

6778 If the *clock_nanosleep()* function returns because the requested time has elapsed, its return value
 6779 shall be zero.

6780 If the *clock_nanosleep()* function returns because it has been interrupted by a signal, it shall return
 6781 the corresponding error value. For the relative *clock_nanosleep()* function, if the *rmtp* argument is
 6782 non-NULL, the **timespec** structure referenced by it shall be updated to contain the amount of
 6783 time remaining in the interval (the requested time minus the time actually slept). If the *rmtp*
 6784 argument is NULL, the remaining time is not returned. The absolute *clock_nanosleep()* function
 6785 has no effect on the structure referenced by *rmtp*.

6786 If *clock_nanosleep()* fails, it shall return the corresponding error value.

6787 ERRORS

6788 The *clock_nanosleep()* function shall fail if:

6789	[EINTR]	The <i>clock_nanosleep()</i> function was interrupted by a signal.
6790	[EINVAL]	The <i>rtp</i> argument specified a nanosecond value less than zero or greater than or equal to 1 000 million; or the <code>TIMER_ABSTIME</code> flag was specified in <i>flags</i> and the <i>rtp</i> argument is outside the range for the clock specified by <i>clock_id</i> ; or the <i>clock_id</i> argument does not specify a known clock, or specifies the CPU-time clock of the calling thread.
6795	[ENOTSUP]	The <i>clock_id</i> argument specifies a clock for which <i>clock_nanosleep()</i> is not supported, such as a CPU-time clock.

6797 EXAMPLES

6798 None.

6799 APPLICATION USAGE

6800 Calling *clock_nanosleep()* with the value `TIMER_ABSTIME` not set in the *flags* argument and with a *clock_id* of `CLOCK_REALTIME` is equivalent to calling *nanosleep()* with the same *rtp* and *rmtp* arguments.

6803 RATIONALE

6804 The *nanosleep()* function specifies that the system-wide clock `CLOCK_REALTIME` is used to measure the elapsed time for this time service. However, with the introduction of the monotonic clock `CLOCK_MONOTONIC` a new relative sleep function is needed to allow an application to take advantage of the special characteristics of this clock.

6808 There are many applications in which a process needs to be suspended and then activated multiple times in a periodic way; for example, to poll the status of a non-interrupting device or to refresh a display device. For these cases, it is known that precise periodic activation cannot be achieved with a relative *sleep()* or *nanosleep()* function call. Suppose, for example, a periodic process that is activated at time *T*₀, executes for a while, and then wants to suspend itself until time *T*₀+*T*, the period being *T*. If this process wants to use the *nanosleep()* function, it must first call *clock_gettime()* to get the current time, then calculate the difference between the current time and *T*₀+*T* and, finally, call *nanosleep()* using the computed interval. However, the process could be preempted by a different process between the two function calls, and in this case the interval computed would be wrong; the process would wake up later than desired. This problem would not occur with the absolute *clock_nanosleep()* function, since only one function call would be necessary to suspend the process until the desired time. In other cases, however, a relative sleep is needed, and that is why both functionalities are required.

6821 Although it is possible to implement periodic processes using the timers interface, this implementation would require the use of signals, and the reservation of some signal numbers. In this regard, the reasons for including an absolute version of the *clock_nanosleep()* function in IEEE Std 1003.1-2001 are the same as for the inclusion of the relative *nanosleep()*.

6825 It is also possible to implement precise periodic processes using *pthread_cond_timedwait()*, in which an absolute timeout is specified that takes effect if the condition variable involved is never signaled. However, the use of this interface is unnatural, and involves performing other operations on mutexes and condition variables that imply an unnecessary overhead. Furthermore, *pthread_cond_timedwait()* is not available in implementations that do not support threads.

6831 Although the interface of the relative and absolute versions of the new high resolution sleep service is the same *clock_nanosleep()* function, the *rmtp* argument is only used in the relative sleep. This argument is needed in the relative *clock_nanosleep()* function to reissue the function

6834 call if it is interrupted by a signal, but it is not needed in the absolute *clock_nanosleep()* function
6835 call; if the call is interrupted by a signal, the absolute *clock_nanosleep()* function can be invoked
6836 again with the same *rqtp* argument used in the interrupted call.

6837 **FUTURE DIRECTIONS**

6838 None.

6852 NAME

6853 clog, clogf, clogl — complex natural logarithm functions

6854 SYNOPSIS

6855 #include <complex.h>

6856 double complex clog(double complex z);

6857 float complex clogf(float complex z);

6858 long double complex clogl(long double complex z);

6859 DESCRIPTION

6860 cx The functionality described on this reference page is aligned with the ISO C standard. Any
6861 conflict between the requirements described here and the ISO C standard is unintentional. This
6862 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

6863 These functions shall compute the complex natural (base e) logarithm of z , with a branch cut
6864 along the negative real axis.

6865 RETURN VALUE

6866 These functions shall return the complex natural logarithm value, in the range of a strip
6867 mathematically unbounded along the real axis and in the interval $[-i\pi, +i\pi]$ along the imaginary
6868 axis.

6869 ERRORS

6870 No errors are defined.

6881 CHANGE HISTORY

6882 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

6883 **NAME**

6884 close — close a file descriptor

6885 **SYNOPSIS**

6886 #include <unistd.h>

6887 int close(int *fildes*);6888 **DESCRIPTION**

6889 The *close()* function shall deallocate the file descriptor indicated by *fildes*. To deallocate means
 6890 to make the file descriptor available for return by subsequent calls to *open()* or other functions
 6891 that allocate file descriptors. All outstanding record locks owned by the process on the file
 6892 associated with the file descriptor shall be removed (that is, unlocked).

6893 If *close()* is interrupted by a signal that is to be caught, it shall return -1 with *errno* set to [EINTR]
 6894 and the state of *fildes* is unspecified. If an I/O error occurred while reading from or writing to the
 6895 file system during *close()*, it may return -1 with *errno* set to [EIO]; if this error is returned, the
 6896 state of *fildes* is unspecified.

6897 When all file descriptors associated with a pipe or FIFO special file are closed, any data
 6898 remaining in the pipe or FIFO shall be discarded.

6899 When all file descriptors associated with an open file description have been closed, the open file
 6900 description shall be freed.

6901 If the link count of the file is 0, when all file descriptors associated with the file are closed, the
 6902 space occupied by the file shall be freed and the file shall no longer be accessible.

6903 XSR If a STREAMS-based *fildes* is closed and the calling process was previously registered to receive
 6904 a SIGPOLL signal for events associated with that STREAM, the calling process shall be
 6905 unregistered for events associated with the STREAM. The last *close()* for a STREAM shall cause
 6906 the STREAM associated with *fildes* to be dismantled. If O_NONBLOCK is not set and there have
 6907 been no signals posted for the STREAM, and if there is data on the module's write queue, *close()*
 6908 shall wait for an unspecified time (for each module and driver) for any output to drain before
 6909 dismantling the STREAM. The time delay can be changed via an I_SETCLTIME *ioctl()* request. If
 6910 the O_NONBLOCK flag is set, or if there are any pending signals, *close()* shall not wait for
 6911 output to drain, and shall dismantle the STREAM immediately.

6912 If the implementation supports STREAMS-based pipes, and *fildes* is associated with one end of a
 6913 pipe, the last *close()* shall cause a hangup to occur on the other end of the pipe. In addition, if the
 6914 other end of the pipe has been named by *fattach()*, then the last *close()* shall force the named end
 6915 to be detached by *fdetach()*. If the named end has no open file descriptors associated with it and
 6916 gets detached, the STREAM associated with that end shall also be dismantled.

6917 XSI If *fildes* refers to the master side of a pseudo-terminal, and this is the last close, a SIGHUP signal
 6918 shall be sent to the controlling process, if any, for which the slave side of the pseudo-terminal is
 6919 the controlling terminal. It is unspecified whether closing the master side of the pseudo-terminal
 6920 flushes all queued input and output.

6921 XSR If *fildes* refers to the slave side of a STREAMS-based pseudo-terminal, a zero-length message
 6922 may be sent to the master.

6923 AIO When there is an outstanding cancelable asynchronous I/O operation against *fildes* when *close()*
 6924 is called, that I/O operation may be canceled. An I/O operation that is not canceled completes
 6925 as if the *close()* operation had not yet occurred. All operations that are not canceled shall
 6926 complete as if the *close()* blocked until the operations completed. The *close()* operation itself
 6927 need not block awaiting such I/O completion. Whether any I/O operation is canceled, and
 6928 which I/O operation may be canceled upon *close()*, is implementation-defined.

6929 MF|SHM If a shared memory object or a memory mapped file remains referenced at the last close (that is,
 6930 a process has it mapped), then the entire contents of the memory object shall persist until the
 6931 memory object becomes unreferenced. If this is the last close of a shared memory object or a
 6932 memory mapped file and the close results in the memory object becoming unreferenced, and the
 6933 memory object has been unlinked, then the memory object shall be removed.

6934 If *fildest* refers to a socket, *close()* shall cause the socket to be destroyed. If the socket is in
 6935 connection-mode, and the `SO_LINGER` option is set for the socket with non-zero linger time,
 6936 and the socket has untransmitted data, then *close()* shall block for up to the current linger
 6937 interval until all data is transmitted.

6938 RETURN VALUE

6939 Upon successful completion, 0 shall be returned; otherwise, -1 shall be returned and *errno* set to
 6940 indicate the error.

6941 ERRORS

6942 The *close()* function shall fail if:

6943 [EBADF] The *fildest* argument is not a valid file descriptor.

6944 [EINTR] The *close()* function was interrupted by a signal.

6945 The *close()* function may fail if:

6946 [EIO] An I/O error occurred while reading from or writing to the file system.

6947 EXAMPLES

6948 Reassigning a File Descriptor

6949 The following example closes the file descriptor associated with standard output for the current
 6950 process, re-assigns standard output to a new file descriptor, and closes the original file
 6951 descriptor to clean up. This example assumes that the file descriptor 0 (which is the descriptor
 6952 for standard input) is not closed.

```
6953 #include <unistd.h>
6954 ...
6955 int pfd;
6956 ...
6957 close(1);
6958 dup(pfd);
6959 close(pfd);
6960 ...
```

6961 Incidentally, this is exactly what could be achieved using:

```
6962 dup2(pfd, 1);
6963 close(pfd);
```

6964 Closing a File Descriptor

6965 In the following example, *close()* is used to close a file descriptor after an unsuccessful attempt is
 6966 made to associate that file descriptor with a stream.

```
6967 #include <stdio.h>
6968 #include <unistd.h>
6969 #include <stdlib.h>
```

```

6970     #define LOCKFILE "/etc/ptmp"
6971     ...
6972     int pfd;
6973     FILE *fpfd;
6974     ...
6975     if ((fpfd = fdopen (pfd, "w")) == NULL) {
6976         close(pfd);
6977         unlink(LOCKFILE);
6978         exit(1);
6979     }
6980     ...

```

6981 APPLICATION USAGE

6982 An application that had used the *stdio* routine *fopen()* to open a file should use the
 6983 corresponding *fclose()* routine rather than *close()*. Once a file is closed, the file descriptor no
 6984 longer exists, since the integer corresponding to it no longer refers to a file.

6985 RATIONALE

6986 The use of interruptible device close routines should be discouraged to avoid problems with the
 6987 implicit closes of file descriptors by *exec* and *exit()*. This volume of IEEE Std 1003.1-2001 only
 6988 intends to permit such behavior by specifying the [EINTR] error condition.

6989 FUTURE DIRECTIONS

6990 None.

6991 SEE ALSO

6992 Section 2.6 (on page 38), *fattach()*, *fclose()*, *fdetach()*, *fopen()*, *ioctl()*, *open()*, the Base Definitions
 6993 volume of IEEE Std 1003.1-2001, <**unistd.h**>

6994 CHANGE HISTORY

6995 First released in Issue 1. Derived from Issue 1 of the SVID.

6996 Issue 5

6997 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

6998 Issue 6

6999 The DESCRIPTION related to a STREAMS-based file or pseudo-terminal is marked as part of the
 7000 XSI STREAMS Option Group.

7001 The following new requirements on POSIX implementations derive from alignment with the
 7002 Single UNIX Specification:

- 7003 • The [EIO] error condition is added as an optional error.
- 7004 • The DESCRIPTION is updated to describe the state of the *fildev* file descriptor as unspecified
 7005 if an I/O error occurs and an [EIO] error condition is returned.

7006 Text referring to sockets is added to the DESCRIPTION.

7007 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 7008 shared memory objects and memory mapped files (and not typed memory objects) are the types
 7009 of memory objects to which the paragraph on last closes applies.

7010 IEEE Std 1003.1-2001 / Cor 1-2002, item XSH / TC1 / D6 / 12 is applied, correcting the XSH shaded
 7011 text relating to the master side of a pseudo-terminal. The reason for the change is that the
 7012 behavior of pseudo-terminals and regular terminals should be as much alike as possible in this
 7013 case; the change achieves that and matches historical behavior.

7014 **NAME**

7015 closedir — close a directory stream

7016 **SYNOPSIS**

7017 #include <dirent.h>

7018 int closedir(DIR *dirp);

7019 **DESCRIPTION**

7020 The *closedir()* function shall close the directory stream referred to by the argument *dirp*. Upon
 7021 return, the value of *dirp* may no longer point to an accessible object of the type **DIR**. If a file
 7022 descriptor is used to implement type **DIR**, that file descriptor shall be closed.

7023 **RETURN VALUE**

7024 Upon successful completion, *closedir()* shall return 0; otherwise, -1 shall be returned and *errno*
 7025 set to indicate the error.

7026 **ERRORS**7027 The *closedir()* function may fail if:7028 [EBADF] The *dirp* argument does not refer to an open directory stream.7029 [EINTR] The *closedir()* function was interrupted by a signal.7030 **EXAMPLES**7031 **Closing a Directory Stream**7032 The following program fragment demonstrates how the *closedir()* function is used.

```

7033       ...
7034       DIR *dir;
7035       struct dirent *dp;
7036       ...
7037       if ((dir = opendir(".")) == NULL) {
7038       ...
7039       }
7040       while ((dp = readdir(dir)) != NULL) {
7041       ...
7042       }
7043       closedir(dir);
7044       ...
```

7045 **APPLICATION USAGE**

7046 None.

7047 **RATIONALE**

7048 None.

7049 **FUTURE DIRECTIONS**

7050 None.

7051 **SEE ALSO**7052 *opendir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**dirent.h**>

7053 **CHANGE HISTORY**

7054 First released in Issue 2.

7055 **Issue 6**7056 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.7057 The following new requirements on POSIX implementations derive from alignment with the
7058 Single UNIX Specification:

- 7059 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
7060 required for conforming implementations of previous POSIX specifications, it was not
7061 required for UNIX applications.
- 7062 • The [EINTR] error condition is added as an optional error condition.

NAME

closelog, openlog, setlogmask, syslog — control system log

SYNOPSIS

```
#include <syslog.h>

void closelog(void);
void openlog(const char *ident, int logopt, int facility);
int setlogmask(int maskpri);
void syslog(int priority, const char *message, ... /* arguments */);
```

DESCRIPTION

The *syslog()* function shall send a message to an implementation-defined logging facility, which may log it in an implementation-defined system log, write it to the system console, forward it to a list of users, or forward it to the logging facility on another host over the network. The logged message shall include a message header and a message body. The message header contains at least a timestamp and a tag string.

The message body is generated from the *message* and following arguments in the same manner as if these were arguments to *printf()*, except that the additional conversion specification *%m* shall be recognized; it shall convert no arguments, shall cause the output of the error message string associated with the value of *errno* on entry to *syslog()*, and may be mixed with argument specifications of the "*%n\$*" form. If a complete conversion specification with the *m* conversion specifier character is not just *%m*, the behavior is undefined. A trailing *<newline>* may be added if needed.

Values of the *priority* argument are formed by OR'ing together a severity-level value and an optional facility value. If no facility value is specified, the current default facility value is used.

Possible values of severity level include:

LOG_EMERG	A panic condition.
LOG_ALERT	A condition that should be corrected immediately, such as a corrupted system database.
LOG_CRIT	Critical conditions, such as hard device errors.
LOG_ERR	Errors.
LOG_WARNING	Warning messages.
LOG_NOTICE	Conditions that are not error conditions, but that may require special handling.
LOG_INFO	Informational messages.
LOG_DEBUG	Messages that contain information normally of use only when debugging a program.

The facility indicates the application or system component generating the message. Possible facility values include:

LOG_USER	Messages generated by arbitrary processes. This is the default facility identifier if none is specified.
LOG_LOCAL0	Reserved for local use.

7105	LOG_LOCAL1	Reserved for local use.
7106	LOG_LOCAL2	Reserved for local use.
7107	LOG_LOCAL3	Reserved for local use.
7108	LOG_LOCAL4	Reserved for local use.
7109	LOG_LOCAL5	Reserved for local use.
7110	LOG_LOCAL6	Reserved for local use.
7111	LOG_LOCAL7	Reserved for local use.
7112	The <i>openlog()</i> function shall set process attributes that affect subsequent calls to <i>syslog()</i> . The	
7113	<i>ident</i> argument is a string that is prepended to every message. The <i>logopt</i> argument indicates	
7114	logging options. Values for <i>logopt</i> are constructed by a bitwise-inclusive OR of zero or more of	
7115	the following:	
7116	LOG_PID	Log the process ID with each message. This is useful for identifying specific
7117		processes.
7118	LOG_CONS	Write messages to the system console if they cannot be sent to the logging
7119		facility. The <i>syslog()</i> function ensures that the process does not acquire the
7120		console as a controlling terminal in the process of writing the message.
7121	LOG_NDELAY	Open the connection to the logging facility immediately. Normally the open is
7122		delayed until the first message is logged. This is useful for programs that need
7123		to manage the order in which file descriptors are allocated.
7124	LOG_ODELAY	Delay open until <i>syslog()</i> is called.
7125	LOG_NOWAIT	Do not wait for child processes that may have been created during the course
7126		of logging the message. This option should be used by processes that enable
7127		notification of child termination using SIGCHLD, since <i>syslog()</i> may
7128		otherwise block waiting for a child whose exit status has already been
7129		collected.
7130	The <i>facility</i> argument encodes a default facility to be assigned to all messages that do not have	
7131	an explicit facility already encoded. The initial default facility is LOG_USER.	
7132	The <i>openlog()</i> and <i>syslog()</i> functions may allocate a file descriptor. It is not necessary to call	
7133	<i>openlog()</i> prior to calling <i>syslog()</i> .	
7134	The <i>closelog()</i> function shall close any open file descriptors allocated by previous calls to	
7135	<i>openlog()</i> or <i>syslog()</i> .	
7136	The <i>setlogmask()</i> function shall set the log priority mask for the current process to <i>maskpri</i> and	
7137	return the previous mask. If the <i>maskpri</i> argument is 0, the current log mask is not modified.	
7138	Calls by the current process to <i>syslog()</i> with a priority not set in <i>maskpri</i> shall be rejected. The	
7139	default log mask allows all priorities to be logged. A call to <i>openlog()</i> is not required prior to	
7140	calling <i>setlogmask()</i> .	
7141	Symbolic constants for use as values of the <i>logopt</i> , <i>facility</i> , <i>priority</i> , and <i>maskpri</i> arguments are	
7142	defined in the <syslog.h> header.	
7143	RETURN VALUE	
7144	The <i>setlogmask()</i> function shall return the previous log priority mask. The <i>closelog()</i> , <i>openlog()</i> ,	
7145	and <i>syslog()</i> functions shall not return a value.	

7146 **ERRORS**

7147 No errors are defined.

7148 **EXAMPLES**

7149 **Using openlog()**

7150 The following example causes subsequent calls to *syslog()* to log the process ID with each message, and to write messages to the system console if they cannot be sent to the logging facility.

```
7153       #include <syslog.h>

7154       char *ident = "Process demo";
7155       int logopt = LOG_PID | LOG_CONS;
7156       int facility = LOG_USER;
7157       ...
7158       openlog(ident, logopt, facility);
```

7159 **Using setlogmask()**

7160 The following example causes subsequent calls to *syslog()* to accept error messages, and to reject all other messages.

```
7162       #include <syslog.h>

7163       int result;
7164       int mask = LOG_MASK (LOG_ERR);
7165       ...
7166       result = setlogmask(mask);
```

7167 **Using syslog**

7168 The following example sends the message "This is a message" to the default logging facility, marking the message as an error message generated by random processes.

```
7170       #include <syslog.h>

7171       char *message = "This is a message";
7172       int priority = LOG_ERR | LOG_USER;
7173       ...
7174       syslog(priority, message);
```

7190 **NAME**

7191 confstr — get configurable variables

7192 **SYNOPSIS**

7193 #include <unistd.h>

7194 size_t confstr(int name, char *buf, size_t len);

7195 **DESCRIPTION**7196 The *confstr()* function shall return configuration-defined string values. Its use and purpose are
7197 similar to *sysconf()*, but it is used where string values rather than numeric values are returned.7198 The *name* argument represents the system variable to be queried. The implementation shall
7199 support the following name values, defined in <unistd.h>. It may support others:

7200 _CS_PATH
 7201 _CS_POSIX_V6_ILP32_OFF32_CFLAGS
 7202 _CS_POSIX_V6_ILP32_OFF32_LDFLAGS
 7203 _CS_POSIX_V6_ILP32_OFF32_LIBS
 7204 _CS_POSIX_V6_ILP32_OFFBIG_CFLAGS
 7205 _CS_POSIX_V6_ILP32_OFFBIG_LDFLAGS
 7206 _CS_POSIX_V6_ILP32_OFFBIG_LIBS
 7207 _CS_POSIX_V6_LP64_OFF64_CFLAGS
 7208 _CS_POSIX_V6_LP64_OFF64_LDFLAGS
 7209 _CS_POSIX_V6_LP64_OFF64_LIBS
 7210 _CS_POSIX_V6_LPBIG_OFFBIG_CFLAGS
 7211 _CS_POSIX_V6_LPBIG_OFFBIG_LDFLAGS
 7212 _CS_POSIX_V6_LPBIG_OFFBIG_LIBS
 7213 _CS_POSIX_V6_WIDTH_RESTRICTED_ENVS
 7214 XSI _CS_XBS5_ILP32_OFF32_CFLAGS (**LEGACY**)

 7229 _CS_XBS5_LPBIG_OFFBIG_LINTFLAGS (**LEGACY**)

7230

7231 If *len* is not 0, and if *name* has a configuration-defined value, *confstr()* shall copy that value into
 7232 the *len*-byte buffer pointed to by *buf*. If the string to be returned is longer than *len* bytes,
 7233 including the terminating null, then *confstr()* shall truncate the string to *len*–1 bytes and null-
 7234 terminate the result. The application can detect that the string was truncated by comparing the
 7235 value returned by *confstr()* with *len*.

7236 If *len* is 0 and *buf* is a null pointer, then *confstr()* shall still return the integer value as defined
 7237 below, but shall not return a string. If *len* is 0 but *buf* is not a null pointer, the result is
 7238 unspecified.

7239 If the implementation supports the POSIX shell option, the string stored in *buf* after a call to:

7240 `confstr(_CS_PATH, buf, sizeof(buf))`

7241 can be used as a value of the *PATH* environment variable that accesses all of the standard
7242 utilities of IEEE Std 1003.1-2001, if the return value is less than or equal to *sizeof(buf)*.

7243 RETURN VALUE

7244 If *name* has a configuration-defined value, *confstr()* shall return the size of buffer that would be
7245 needed to hold the entire configuration-defined value including the terminating null. If this
7246 return value is greater than *len*, the string returned in *buf* is truncated.

7247 If *name* is invalid, *confstr()* shall return 0 and set *errno* to indicate the error.

7248 If *name* does not have a configuration-defined value, *confstr()* shall return 0 and leave *errno*
7249 unchanged.

7250 ERRORS

7251 The *confstr()* function shall fail if:

7252 [EINVAL] The value of the *name* argument is invalid.

7253 EXAMPLES

7254 None.

7255 APPLICATION USAGE

7256 An application can distinguish between an invalid *name* parameter value and one that
7257 corresponds to a configurable variable that has no configuration-defined value by checking if
7258 *errno* is modified. This mirrors the behavior of *sysconf()*.

7259 The original need for this function was to provide a way of finding the configuration-defined
7260 default value for the environment variable *PATH*. Since *PATH* can be modified by the user to
7261 include directories that could contain utilities replacing the standard utilities in the Shell and
7262 Utilities volume of IEEE Std 1003.1-2001, applications need a way to determine the system-
7263 supplied *PATH* environment variable value that contains the correct search path for the standard
7264 utilities.

7265 An application could use:

7266 `confstr(name, (char *)NULL, (size_t)0)`

7267 to find out how big a buffer is needed for the string value; use *malloc()* to allocate a buffer to
7268 hold the string; and call *confstr()* again to get the string. Alternately, it could allocate a fixed,
7269 static buffer that is big enough to hold most answers (perhaps 512 or 1024 bytes), but then use
7270 *malloc()* to allocate a larger buffer if it finds that this is too small.

7271 RATIONALE

7272 Application developers can normally determine any configuration variable by means of reading
7273 from the stream opened by a call to:

7274 `popen("command -p getconf variable", "r");`

7275 The *confstr()* function with a *name* argument of *_CS_PATH* returns a string that can be used as a
7276 *PATH* environment variable setting that will reference the standard shell and utilities as
7277 described in the Shell and Utilities volume of IEEE Std 1003.1-2001.

7278 The *confstr()* function copies the returned string into a buffer supplied by the application instead
7279 of returning a pointer to a string. This allows a cleaner function in some implementations (such
7280 as those with lightweight threads) and resolves questions about when the application must copy
7281 the string returned.

7282 **FUTURE DIRECTIONS**

7283 None.

7284 **SEE ALSO**

7285 `pathconf()`, `sysconf()`, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>, the Shell
7286 and Utilities volume of IEEE Std 1003.1-2001, *c99*

7287 **CHANGE HISTORY**

7288 First released in Issue 4. Derived from the ISO POSIX-2 standard.

7289 **Issue 5**

7290 A table indicating the permissible values of *name* is added to the DESCRIPTION. All those
7291 marked EX are new in this issue.

7292 **Issue 6**

7293 The Open Group Corrigendum U033/7 is applied. The return value for the case returning the
7294 size of the buffer now explicitly states that this includes the terminating null.

7295 The following new requirements on POSIX implementations derive from alignment with the
7296 Single UNIX Specification:

- 7297 • The DESCRIPTION is updated with new arguments which can be used to determine
7298 configuration strings for C compiler flags, linker/loader flags, and libraries for each different
7299 supported programming environment. This is a change to support data size neutrality.

7300 The following changes were made to align with the IEEE P1003.1a draft standard:

- 7301 • The DESCRIPTION is updated to include text describing how `_CS_PATH` can be used to
7302 obtain a *PATH* to access the standard utilities.

7303 The macros associated with the *c89* programming models are marked LEGACY and new
7304 equivalent macros associated with *c99* are introduced.

7305 **NAME**

7306 conj, conjf, conjl — complex conjugate functions

7307 **SYNOPSIS**

7308 #include <complex.h>

7309 double complex conj(double complex z);

7310 float complex conjf(float complex z);

7311 long double complex conjl(long double complex z);

7312 **DESCRIPTION**

7313 cx The functionality described on this reference page is aligned with the ISO C standard. Any
7314 conflict between the requirements described here and the ISO C standard is unintentional. This
7315 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7316 These functions shall compute the complex conjugate of *z*, by reversing the sign of its imaginary
7317 part.

7318 **RETURN VALUE**

7319 These functions return the complex conjugate value.

7320 **ERRORS**

7321 No errors are defined.

7322 **EXAMPLES**

7323 None.

7324 **APPLICATION USAGE**

7325 None.

7326 **RATIONALE**

7333 **CHANGE HISTORY**

7334 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7335 **NAME**

7336 connect — connect a socket

7337 **SYNOPSIS**

7338 #include <sys/socket.h>

```
7339 int connect(int socket, const struct sockaddr *address,
7340             socklen_t address_len);
```

7341 **DESCRIPTION**

7342 The *connect()* function shall attempt to make a connection on a socket. The function takes the
 7343 following arguments:

7344	<i>socket</i>	Specifies the file descriptor associated with the socket.
7345	<i>address</i>	Points to a sockaddr structure containing the peer address. The length and format of the address depend on the address family of the socket.
7347	<i>address_len</i>	Specifies the length of the sockaddr structure pointed to by the <i>address</i> argument.

7349 If the socket has not already been bound to a local address, *connect()* shall bind it to an address
 7350 which, unless the socket's address family is AF_UNIX, is an unused local address.

7351 If the initiating socket is not connection-mode, then *connect()* shall set the socket's peer address,
 7352 and no connection is made. For SOCK_DGRAM sockets, the peer address identifies where all
 7353 datagrams are sent on subsequent *send()* functions, and limits the remote sender for subsequent
 7354 *recv()* functions. If *address* is a null address for the protocol, the socket's peer address shall be
 7355 reset.

7356 If the initiating socket is connection-mode, then *connect()* shall attempt to establish a connection
 7357 to the address specified by the *address* argument. If the connection cannot be established
 7358 immediately and O_NONBLOCK is not set for the file descriptor for the socket, *connect()* shall
 7359 block for up to an unspecified timeout interval until the connection is established. If the timeout
 7360 interval expires before the connection is established, *connect()* shall fail and the connection
 7361 attempt shall be aborted. If *connect()* is interrupted by a signal that is caught while blocked
 7362 waiting to establish a connection, *connect()* shall fail and set *errno* to [EINTR], but the connection
 7363 request shall not be aborted, and the connection shall be established asynchronously.

7364 If the connection cannot be established immediately and O_NONBLOCK is set for the file
 7365 descriptor for the socket, *connect()* shall fail and set *errno* to [EINPROGRESS], but the connection
 7366 request shall not be aborted, and the connection shall be established asynchronously.
 7367 Subsequent calls to *connect()* for the same socket, before the connection is established, shall fail
 7368 and set *errno* to [EALREADY].

7369 When the connection has been established asynchronously, *select()* and *poll()* shall indicate that
 7370 the file descriptor for the socket is ready for writing.

7371 The socket in use may require the process to have appropriate privileges to use the *connect()*
 7372 function.

7373 **RETURN VALUE**

7374 Upon successful completion, *connect()* shall return 0; otherwise, -1 shall be returned and *errno*
 7375 set to indicate the error.

7376 **ERRORS**

7377 The *connect()* function shall fail if:

7378 [EADDRNOTAVAIL]

7379 The specified address is not available from the local machine.

7380	[EAFNOSUPPORT]	
7381		The specified address is not a valid address for the address family of the
7382		specified socket.
7383	[EALREADY]	A connection request is already in progress for the specified socket.
7384	[EBADF]	The <i>socket</i> argument is not a valid file descriptor.
7385	[ECONNREFUSED]	
7386		The target address was not listening for connections or refused the connection
7387		request.
7388	[EINPROGRESS]	O_NONBLOCK is set for the file descriptor for the socket and the connection
7389		cannot be immediately established; the connection shall be established
7390		asynchronously.
7391	[EINTR]	The attempt to establish a connection was interrupted by delivery of a signal
7392		that was caught; the connection shall be established asynchronously.
7393	[EISCONN]	The specified socket is connection-mode and is already connected.
7394	[ENETUNREACH]	
7395		No route to the network is present.
7396	[ENOTSOCK]	The <i>socket</i> argument does not refer to a socket.
7397	[EPROTOTYPE]	The specified address has a different type than the socket bound to the
7398		specified peer address.
7399	[ETIMEDOUT]	The attempt to connect timed out before a connection was made.
7400	If the address family of the socket is AF_UNIX, then <i>connect()</i> shall fail if:	
7401	[EIO]	An I/O error occurred while reading from or writing to the file system.
7402	[ELOOP]	A loop exists in symbolic links encountered during resolution of the pathname
7403		in <i>address</i> .
7404	[ENAMETOOLONG]	
7405		A component of a pathname exceeded {NAME_MAX} characters, or an entire
7406		pathname exceeded {PATH_MAX} characters.
7407	[ENOENT]	A component of the pathname does not name an existing file or the pathname
7408		is an empty string.
7409	[ENOTDIR]	A component of the path prefix of the pathname in <i>address</i> is not a directory.
7410	The <i>connect()</i> function may fail if:	
7411	[EACCES]	Search permission is denied for a component of the path prefix; or write
7412		access to the named socket is denied.
7413	[EADDRINUSE]	Attempt to establish a connection that uses addresses that are already in use.
7414	[ECONNRESET]	Remote host reset the connection request.
7415	[EHOSTUNREACH]	
7416		The destination host cannot be reached (probably because the host is down or
7417		a remote router cannot reach it).
7418	[EINVAL]	The <i>address_len</i> argument is not a valid length for the address family; or
7419		invalid address family in the sockaddr structure.

7420 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
7421 resolution of the pathname in *address*.

7422 [ENAMETOOLONG]
7423 Pathname resolution of a symbolic link produced an intermediate result
7424 whose length exceeds {PATH_MAX}.

7425 [ENETDOWN] The local network interface used to reach the destination is down.

7426 [ENOBUFS] No buffer space is available.

7427 [EOPNOTSUPP] The socket is listening and cannot be connected.

7428 **EXAMPLES**
7429 None.

7430 **APPLICATION USAGE**
7431 If *connect()* fails, the state of the socket is unspecified. Conforming applications should close the
7432 file descriptor and create a new socket before attempting to reconnect.

7433 **RATIONALE**
7434 None.

7435 **FUTURE DIRECTIONS**
7436 None.

7437 **SEE ALSO**
7438 *accept()*, *bind()*, *close()*, *getsockname()*, *poll()*, *select()*, *send()*, *shutdown()*, *socket()*, the Base
7439 Definitions volume of IEEE Std 1003.1-2001, <**sys/socket.h**>

7440 **CHANGE HISTORY**
7441 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

7442 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
7443 [ELOOP] error condition is added.

7444 **NAME**

7445 copysign, copysignf, copysignl — number manipulation function

7446 **SYNOPSIS**

7447 #include <math.h>

7448 double copysign(double x, double y);

7449 float copysignf(float x, float y);

7450 long double copysignl(long double x, long double y);

7451 **DESCRIPTION**

7452 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
7453 conflict between the requirements described here and the ISO C standard is unintentional. This
7454 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7455 These functions shall produce a value with the magnitude of *x* and the sign of *y*. On
7456 implementations that represent a signed zero but do not treat negative zero consistently in
7457 arithmetic operations, these functions regard the sign of zero as positive.

7458 **RETURN VALUE**

7459 Upon successful completion, these functions shall return a value with the magnitude of *x* and
7460 the sign of *y*.

7461 **ERRORS**

7462 No errors are defined.

7463 **EXAMPLES**

7464 None.

7465 **APPLICATION USAGE**

7466 None.

7467 **RATIONALE**

7468 None.

7469 **FUTURE DIRECTIONS**

7470 None.

7471 **SEE ALSO**7472 *signbit()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>7473 **CHANGE HISTORY**

7474 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7475 **NAME**

7476 cos, cosf, cosl — cosine function

7477 **SYNOPSIS**

7478 #include <math.h>

7479 double cos(double x);

7480 float cosf(float x);

7481 long double cosl(long double x);

7482 **DESCRIPTION**

7483 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7484 conflict between the requirements described here and the ISO C standard is unintentional. This
 7485 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7486 These functions shall compute the cosine of their argument x , measured in radians.

7487 An application wishing to check for error situations should set *errno* to zero and call
 7488 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 7489 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 7490 zero, an error has occurred.

7491 **RETURN VALUE**7492 Upon successful completion, these functions shall return the cosine of x .7493 MX If x is NaN, a NaN shall be returned.7494 If x is ± 0 , the value 1.0 shall be returned.

7495 If x is $\pm \text{Inf}$, a domain error shall occur, and either a NaN (if supported), or an implementation-
 7496 defined value shall be returned.

7497 **ERRORS**

7498 These functions shall fail if:

7499 MX **Domain Error** The x argument is $\pm \text{Inf}$.

7500 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 7501 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 7502 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 7503 shall be raised.

7504 **EXAMPLES**7505 **Taking the Cosine of a 45-Degree Angle**

7506 #include <math.h>

7507 ...

7508 double radians = 45 * M_PI / 180;

7509 double result;

7510 ...

7511 result = cos(radians);

7512 **APPLICATION USAGE**

7513 These functions may lose accuracy when their argument is near an odd multiple of $\pi/2$ or is far
 7514 from 0.

7515 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 7516 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

7517 **RATIONALE**

7518 None.

7519 **FUTURE DIRECTIONS**

7520 None.

7521 **SEE ALSO**

7522 *acos()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sin()*, *tan()*, the Base Definitions volume of
7523 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
7524 **<math.h>**

7525 **CHANGE HISTORY**

7526 First released in Issue 1. Derived from Issue 1 of the SVID.

7527 **Issue 5**

7528 The DESCRIPTION is updated to indicate how an application should check for an error. This
7529 text was previously published in the APPLICATION USAGE section.

7530 **Issue 6**7531 The *cosf()* and *cosl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

7532 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
7533 revised to align with the ISO/IEC 9899:1999 standard.

7534 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
7535 marked.

7536 **NAME**

7537 cosh, coshf, coshl — hyperbolic cosine functions

7538 **SYNOPSIS**

7539 #include <math.h>

7540 double cosh(double x);

7541 float coshf(float x);

7542 long double coshl(long double x);

7543 **DESCRIPTION**

7544 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 7545 conflict between the requirements described here and the ISO C standard is unintentional. This
 7546 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7547 These functions shall compute the hyperbolic cosine of their argument x .

7548 An application wishing to check for error situations should set *errno* to zero and call
 7549 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 7550 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 7551 zero, an error has occurred.

7552 **RETURN VALUE**7553 Upon successful completion, these functions shall return the hyperbolic cosine of x .

7554 If the correct value would cause overflow, a range error shall occur and *cosh()*, *coshf()*, and
 7555 *coshl()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 7556 respectively.

7557 MX If x is NaN, a NaN shall be returned.7558 If x is ± 0 , the value 1.0 shall be returned.7559 If x is $\pm\text{Inf}$, $+\text{Inf}$ shall be returned.7560 **ERRORS**

7561 These functions shall fail if:

7562 Range Error The result would cause an overflow.

7563 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 7564 then *errno* shall be set to [ERANGE]. If the integer expression
 7565 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 7566 floating-point exception shall be raised.

7567 **EXAMPLES**

7568 None.

7569 **APPLICATION USAGE**

7570 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 7571 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

7572 For IEEE Std 754-1985 **double**, $710.5 < |x|$ implies that *cosh*(x) has overflowed.7573 **RATIONALE**

7574 None.

7575 **FUTURE DIRECTIONS**

7576 None.

7577 **SEE ALSO**

7578 *acosh()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, *sinh()*, *tanh()*, the Base Definitions volume of
7579 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
7580 **<math.h>**

7581 **CHANGE HISTORY**

7582 First released in Issue 1. Derived from Issue 1 of the SVID.

7583 **Issue 5**

7584 The DESCRIPTION is updated to indicate how an application should check for an error. This
7585 text was previously published in the APPLICATION USAGE section.

7586 **Issue 6**

7587 The *coshf()* and *coshl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

7588 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
7589 revised to align with the ISO/IEC 9899:1999 standard.

7590 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
7591 marked.

7592 **NAME**

7593 cosl — cosine function

7594 **SYNOPSIS**

7595 #include <math.h>

7596 long double cosl(long double x);

7597 **DESCRIPTION**7598 Refer to *cos()*.

7599 **NAME**

7600 cpow, cpowf, cpowl — complex power functions

7601 **SYNOPSIS**

7602 #include <complex.h>

7603 double complex cpow(double complex x, double complex y);

7604 float complex cpowf(float complex x, float complex y);

7605 long double complex cpowl(long double complex x,

7606 long double complex y);

7607 **DESCRIPTION**

7608 CX The functionality described on this reference page is aligned with the ISO C standard. Any
7609 conflict between the requirements described here and the ISO C standard is unintentional. This
7610 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7611 These functions shall compute the complex power function x^y , with a branch cut for the first
7612 parameter along the negative real axis.

7613 **RETURN VALUE**

7614 These functions shall return the complex power function value.

7615 **ERRORS**

7616 No errors are defined.

7617 **EXAMPLES**

7618 None.

7619 **APPLICATION USAGE**

7620 None.

7621 **RATIONALE**

7622 None.

7623 **FUTURE DIRECTIONS**

7624 None.

7625 **SEE ALSO**7626 *cabs()*, *csqrt()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7627 **CHANGE HISTORY**

7628 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7629 **NAME**

7630 cproj, cprojf, cprojl — complex projection functions

7631 **SYNOPSIS**

7632 #include <complex.h>

7633 double complex cproj(double complex z);

7634 float complex cprojf(float complex z);

7635 long double complex cprojl(long double complex z);

7636 **DESCRIPTION**

7637 CX The functionality described on this reference page is aligned with the ISO C standard. Any
7638 conflict between the requirements described here and the ISO C standard is unintentional. This
7639 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7640 These functions shall compute a projection of *z* onto the Riemann sphere: *z* projects to *z*, except
7641 that all complex infinities (even those with one infinite part and one NaN part) project to
7642 positive infinity on the real axis. If *z* has an infinite part, then *cproj(z)* shall be equivalent to:

7643 INFINITY + I * copysign(0.0, cimag(z))

7644 **RETURN VALUE**

7645 These functions shall return the value of the projection onto the Riemann sphere.

7646 **ERRORS**

7647 No errors are defined.

7648 **EXAMPLES**

7649 None.

7650 **APPLICATION USAGE**

7651 None.

7652 **RATIONALE**

7653 Two topologies are commonly used in complex mathematics: the complex plane with its
7654 continuum of infinities, and the Riemann sphere with its single infinity. The complex plane is
7655 better suited for transcendental functions, the Riemann sphere for algebraic functions. The
7656 complex types with their multiplicity of infinities provide a useful (though imperfect) model for
7657 the complex plane. The *cproj()* function helps model the Riemann sphere by mapping all
7658 infinities to one, and should be used just before any operation, especially comparisons, that
7659 might give spurious results for any of the other infinities. Note that a complex value with one
7660 infinite part and one NaN part is regarded as an infinity, not a NaN, because if one part is
7661 infinite, the complex value is infinite independent of the value of the other part. For the same
7662 reason, *cabs()* returns an infinity if its argument has an infinite part and a NaN part.

7663 **FUTURE DIRECTIONS**

7664 None.

7665 **SEE ALSO**7666 *carg()*, *cimag()*, *conj()*, *creal()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7667 **CHANGE HISTORY**

7668 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7669 **NAME**7670 `creal, crealf, creall` — complex real functions7671 **SYNOPSIS**7672 `#include <complex.h>`7673 `double creal(double complex z);`7674 `float crealf(float complex z);`7675 `long double creall(long double complex z);`7676 **DESCRIPTION**

7677 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
7678 conflict between the requirements described here and the ISO C standard is unintentional. This
7679 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

7680 These functions shall compute the real part of *z*.7681 **RETURN VALUE**

7682 These functions shall return the real part value.

7683 **ERRORS**

7684 No errors are defined.

7685 **EXAMPLES**

7686 None.

7687 **APPLICATION USAGE**7688 For a variable *z* of type **complex**:7689 `z == creal(z) + cimag(z)*I`7690 **RATIONALE**

7691 None.

7692 **FUTURE DIRECTIONS**

7693 None.

7694 **SEE ALSO**

7695 `carg()`, `cimag()`, `conj()`, `cproj()`, the Base Definitions volume of IEEE Std 1003.1-2001,
7696 **<complex.h>**

7697 **CHANGE HISTORY**

7698 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7699 **NAME**

7700 creat — create a new file or rewrite an existing one

7701 **SYNOPSIS**

7702 OH #include <sys/stat.h>

7703 #include <fcntl.h>

7704 int creat(const char *path, mode_t mode);

7705 **DESCRIPTION**

7706 The function call:

7707 creat(path, mode)

7708 shall be equivalent to:

7709 open(path, O_WRONLY|O_CREAT|O_TRUNC, mode)

7710 **RETURN VALUE**7711 Refer to *open()*.7712 **ERRORS**7713 Refer to *open()*.7714 **EXAMPLES**7715 **Creating a File**

7716 The following example creates the file **/tmp/file** with read and write permissions for the file
 7717 owner and read permission for group and others. The resulting file descriptor is assigned to the
 7718 *fd* variable.

7719 #include <fcntl.h>

7720 ...

7721 int fd;

7722 mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;

7723 char *filename = "/tmp/file";

7724 ...

7725 fd = creat(filename, mode);

7726 ...

7727 **APPLICATION USAGE**

7728 None.

7729 **RATIONALE**

7730 The *creat()* function is redundant. Its services are also provided by the *open()* function. It has
 7731 been included primarily for historical purposes since many existing applications depend on it. It
 7732 is best considered a part of the C binding rather than a function that should be provided in other
 7733 languages.

7734 **FUTURE DIRECTIONS**

7735 None.

7736 **SEE ALSO**

7737 *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>, <sys/stat.h>,
 7738 <sys/types.h>

7739 **CHANGE HISTORY**

7740 First released in Issue 1. Derived from Issue 1 of the SVID.

7741 **Issue 6**7742 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.7743 The following new requirements on POSIX implementations derive from alignment with the
7744 Single UNIX Specification:

- 7745 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
7746 required for conforming implementations of previous POSIX specifications, it was not
7747 required for UNIX applications.

7748 **NAME**7749 crypt — string encoding function (**CRYPT**)7750 **SYNOPSIS**7751 xSI `#include <unistd.h>`7752 `char *crypt(const char *key, const char *salt);`

7753

7754 **DESCRIPTION**7755 The *crypt()* function is a string encoding function. The algorithm is implementation-defined.7756 The *key* argument points to a string to be encoded. The *salt* argument is a string chosen from the
7757 set:

7758 a b c d e f g h i j k l m n o p q r s t u v w x y z

7759 A B C D E F G H I J K L M N O P Q R S T U V W X Y Z

7760 0 1 2 3 4 5 6 7 8 9 . /

7761 The first two characters of this string may be used to perturb the encoding algorithm.

7762 The return value of *crypt()* points to static data that is overwritten by each call.7763 The *crypt()* function need not be reentrant. A function that is not required to be reentrant is not
7764 required to be thread-safe.7765 **RETURN VALUE**7766 Upon successful completion, *crypt()* shall return a pointer to the encoded string. The first two
7767 characters of the returned value shall be those of the *salt* argument. Otherwise, it shall return a
7768 null pointer and set *errno* to indicate the error.7769 **ERRORS**7770 The *crypt()* function shall fail if:

7771 [ENOSYS] The functionality is not supported on this implementation.

7772 **EXAMPLES**7773 **Encoding Passwords**7774 The following example finds a user database entry matching a particular user name and changes
7775 the current password to a new password. The *crypt()* function generates an encoded version of
7776 each password. The first call to *crypt()* produces an encoded version of the old password; that
7777 encoded password is then compared to the password stored in the user database. The second
7778 call to *crypt()* encodes the new password before it is stored.7779 The *putpwent()* function, used in the following example, is not part of IEEE Std 1003.1-2001.7780 `#include <unistd.h>`7781 `#include <pwd.h>`7782 `#include <string.h>`7783 `#include <stdio.h>`7784 `...`7785 `int valid_change;`7786 `int pfd; /* Integer for file descriptor returned by open(). */`7787 `FILE *fpfd; /* File pointer for use in putpwent(). */`7788 `struct passwd *p;`7789 `char user[100];`7790 `char oldpasswd[100];`7791 `char newpasswd[100];`

```

7792     char savepasswd[100];
7793     ...
7794     valid_change = 0;
7795     while ((p = getpwent()) != NULL) {
7796         /* Change entry if found. */
7797         if (strcmp(p->pw_name, user) == 0) {
7798             if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
7799                 strcpy(savepasswd, crypt(newpasswd, user));
7800                 p->pw_passwd = savepasswd;
7801                 valid_change = 1;
7802             }
7803             else {
7804                 fprintf(stderr, "Old password is not valid\n");
7805             }
7806         }
7807         /* Put passwd entry into ptmp. */
7808         putpwent(p, fpfd);
7809     }

```

7810 APPLICATION USAGE

7811 The values returned by this function need not be portable among XSI-conformant systems.

7812 RATIONALE

7813 None.

7814 FUTURE DIRECTIONS

7815 None.

7968 **SEE ALSO**7969 *catanh()*, the Base Definitions volume of IEEE Std 1003.1-2001, <complex.h>7970 **CHANGE HISTORY**

7971 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

7972 **NAME**

7973 ctanl — complex tangent functions

7974 **SYNOPSIS**

7975 #include <complex.h>

7976 long double complex ctanl(long double complex *z*);7977 **DESCRIPTION**7978 Refer to *ctan()*.

7979 **NAME**

7980 ctermid — generate a pathname for the controlling terminal

7981 **SYNOPSIS**7982 **CX** #include <stdio.h>

7983 char *ctermid(char *s);

7984

7985 **DESCRIPTION**

7986 The *ctermid()* function shall generate a string that, when used as a pathname, refers to the
 7987 current controlling terminal for the current process. If *ctermid()* returns a pathname, access to the
 7988 file is not guaranteed.

7989 If the application uses any of the `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS`
 7990 functions, it shall ensure that the *ctermid()* function is called with a non-NULL parameter.

7991 **RETURN VALUE**

7992 If *s* is a null pointer, the string shall be generated in an area that may be static (and therefore may
 7993 be overwritten by each call), the address of which shall be returned. Otherwise, *s* is assumed to
 7994 point to a character array of at least `L_ctermid` bytes; the string is placed in this array and the
 7995 value of *s* shall be returned. The symbolic constant `L_ctermid` is defined in <stdio.h>, and shall
 7996 have a value greater than 0.

7997 The *ctermid()* function shall return an empty string if the pathname that would refer to the
 7998 controlling terminal cannot be determined, or if the function is unsuccessful.

7999 **ERRORS**

8000 No errors are defined.

8001 **EXAMPLES**8002 **Determining the Controlling Terminal for the Current Process**

8003 The following example returns a pointer to a string that identifies the controlling terminal for the
 8004 current process. The pathname for the terminal is stored in the array pointed to by the *ptr*
 8005 argument, which has a size of `L_ctermid` bytes, as indicated by the *term* argument.

```
8006       #include <stdio.h>
8007       ...
8008       char term[L_ctermid];
8009       char *ptr;
8010       ptr = ctermid(term);
```

8011 **APPLICATION USAGE**

8012 The difference between *ctermid()* and *ttyname()* is that *ttyname()* must be handed a file
 8013 descriptor and return a path of the terminal associated with that file descriptor, while *ctermid()*
 8014 returns a string (such as `"/dev/tty"`) that refers to the current controlling terminal if used as a
 8015 pathname.

8016 **RATIONALE**

8017 `L_ctermid` must be defined appropriately for a given implementation and must be greater than
 8018 zero so that array declarations using it are accepted by the compiler. The value includes the
 8019 terminating null byte.

8020 Conforming applications that use threads cannot call *ctermid()* with NULL as the parameter if
 8021 either `_POSIX_THREAD_SAFE_FUNCTIONS` or `_POSIX_THREADS` is defined. If *s* is not
 8022 NULL, the *ctermid()* function generates a string that, when used as a pathname, refers to the

8023 current controlling terminal for the current process. If *s* is NULL, the return value of *ctermid()* is
8024 undefined.

8025 There is no additional burden on the programmer—changing to use a hypothetical thread-safe
8026 version of *ctermid()* along with allocating a buffer is more of a burden than merely allocating a
8027 buffer. Application code should not assume that the returned string is short, as some
8028 implementations have more than two pathname components before reaching a logical device
8029 name.

8030 **FUTURE DIRECTIONS**

8031 None.

8032 **SEE ALSO**

8033 *ttyname()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>

8034 **CHANGE HISTORY**

8035 First released in Issue 1. Derived from Issue 1 of the SVID.

8036 **Issue 5**

8037 The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

8038 **Issue 6**

8039 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

8040 **NAME**

8041 ctime, ctime_r — convert a time value to a date and time string

8042 **SYNOPSIS**

8043 #include <time.h>

8044 char *ctime(const time_t *clock);

8045 TSF char *ctime_r(const time_t *clock, char *buf);

8046

8047 **DESCRIPTION**

8048 CX For *ctime()*: The functionality described on this reference page is aligned with the ISO C
 8049 standard. Any conflict between the requirements described here and the ISO C standard is
 8050 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8051 The *ctime()* function shall convert the time pointed to by *clock*, representing time in seconds
 8052 since the Epoch, to local time in the form of a string. It shall be equivalent to:

8053 asctime(localtime(clock))

8054 CX The *asctime()*, *ctime()*, *gmtime()*, and *localtime()* functions shall return values in one of two static
 8055 objects: a broken-down time structure and an array of **char**. Execution of any of the functions
 8056 may overwrite the information returned in either of these objects by any of the other functions.

8057 The *ctime()* function need not be reentrant. A function that is not required to be reentrant is not
 8058 required to be thread-safe.

8059 TSF The *ctime_r()* function shall convert the calendar time pointed to by *clock* to local time in exactly
 8060 the same form as *ctime()* and put the string into the array pointed to by *buf* (which shall be at
 8061 least 26 bytes in size) and return *buf*.

8062 Unlike *ctime()*, the thread-safe version *ctime_r()* is not required to set *tzname*.8063 **RETURN VALUE**

8064 The *ctime()* function shall return the pointer returned by *asctime()* with that broken-down time
 8065 as an argument.

8066 TSF Upon successful completion, *ctime_r()* shall return a pointer to the string pointed to by *buf*.
 8067 When an error is encountered, a null pointer shall be returned.

8068 **ERRORS**

8069 No errors are defined.

8070 **EXAMPLES**

8071 None.

8072 **APPLICATION USAGE**

8073 Values for the broken-down time structure can be obtained by calling *gmtime()* or *localtime()*.
 8074 The *ctime()* function is included for compatibility with older implementations, and does not
 8075 support localized date and time formats. Applications should use the *strftime()* function to
 8076 achieve maximum portability.

8077 The *ctime_r()* function is thread-safe and shall return values in a user-supplied buffer instead of
 8078 possibly using a static data area that may be overwritten by each call.

8079 **RATIONALE**

8080 None.

8081 **FUTURE DIRECTIONS**

8082 None.

8083 **SEE ALSO**

8084 *asctime()*, *clock()*, *difftime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,
8085 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

8086 **CHANGE HISTORY**

8087 First released in Issue 1. Derived from Issue 1 of the SVID.

8088 **Issue 5**

8089 Normative text previously in the APPLICATION USAGE section is moved to the
8090 DESCRIPTION.

8091 The *ctime_r()* function is included for alignment with the POSIX Threads Extension.8092 A note indicating that the *ctime()* function need not be reentrant is added to the DESCRIPTION.8093 **Issue 6**

8094 Extensions beyond the ISO C standard are marked.

8095 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8096 The APPLICATION USAGE section is updated to include a note on the thread-safe function and
8097 its avoidance of possibly using a static data area.

8098 **NAME**
8099 daylight — daylight savings time flag

8100 **SYNOPSIS**

8101 xSI `#include <time.h>`
8102 `extern int daylight;`
8103

8104 **DESCRIPTION**

8105 Refer to `tzset()`.

8106 **NAME**

8107 dbm_clearerr, dbm_close, dbm_delete, dbm_error, dbm_fetch, dbm_firstkey, dbm_nextkey,
8108 dbm_open, dbm_store — database functions

8109 **SYNOPSIS**

```
8110 xSI    #include <ndbm.h>

8111    int dbm_clearerr(DBM *db);
8112    void dbm_close(DBM *db);
8113    int dbm_delete(DBM *db, datum key);
8114    int dbm_error(DBM *db);
8115    datum dbm_fetch(DBM *db, datum key);
8116    datum dbm_firstkey(DBM *db);
8117    datum dbm_nextkey(DBM *db);
8118    DBM *dbm_open(const char *file, int open_flags, mode_t file_mode);
8119    int dbm_store(DBM *db, datum key, datum content, int store_mode);
8120
```

8121 **DESCRIPTION**

8122 These functions create, access, and modify a database.

8123 A **datum** consists of at least two members, *dptr* and *dsize*. The *dptr* member points to an object
8124 that is *dsize* bytes in length. Arbitrary binary data, as well as character strings, may be stored in
8125 the object pointed to by *dptr*.

8126 The database is stored in two files. One file is a directory containing a bitmap of keys and has
8127 **.dir** as its suffix. The second file contains all data and has **.pag** as its suffix.

8128 The *dbm_open()* function shall open a database. The *file* argument to the function is the
8129 pathname of the database. The function opens two files named *file.dir* and *file.pag*. The
8130 *open_flags* argument has the same meaning as the *flags* argument of *open()* except that a database
8131 opened for write-only access opens the files for read and write access and the behavior of the
8132 O_APPEND flag is unspecified. The *file_mode* argument has the same meaning as the third
8133 argument of *open()*.

8134 The *dbm_close()* function shall close a database. The application shall ensure that argument *db* is
8135 a pointer to a **dbm** structure that has been returned from a call to *dbm_open()*.

8136 These database functions shall support an internal block size large enough to support
8137 key/content pairs of at least 1023 bytes.

8138 The *dbm_fetch()* function shall read a record from a database. The argument *db* is a pointer to a
8139 database structure that has been returned from a call to *dbm_open()*. The argument *key* is a
8140 **datum** that has been initialized by the application to the value of the key that matches the key of
8141 the record the program is fetching.

8142 The *dbm_store()* function shall write a record to a database. The argument *db* is a pointer to a
8143 database structure that has been returned from a call to *dbm_open()*. The argument *key* is a
8144 **datum** that has been initialized by the application to the value of the key that identifies (for
8145 subsequent reading, writing, or deleting) the record the application is writing. The argument
8146 *content* is a **datum** that has been initialized by the application to the value of the record the
8147 program is writing. The argument *store_mode* controls whether *dbm_store()* replaces any pre-
8148 existing record that has the same key that is specified by the *key* argument. The application shall
8149 set *store_mode* to either DBM_INSERT or DBM_REPLACE. If the database contains a record that
8150 matches the *key* argument and *store_mode* is DBM_REPLACE, the existing record shall be
8151 replaced with the new record. If the database contains a record that matches the *key* argument
8152 and *store_mode* is DBM_INSERT, the existing record shall be left unchanged and the new record

8153 ignored. If the database does not contain a record that matches the *key* argument and *store_mode*
 8154 is either DBM_INSERT or DBM_REPLACE, the new record shall be inserted in the database.

8155 If the sum of a key/content pair exceeds the internal block size, the result is unspecified.
 8156 Moreover, the application shall ensure that all key/content pairs that hash together fit on a
 8157 single block. The *dbm_store()* function shall return an error in the event that a disk block fills
 8158 with inseparable data.

8159 The *dbm_delete()* function shall delete a record and its key from the database. The argument *db* is
 8160 a pointer to a database structure that has been returned from a call to *dbm_open()*. The argument
 8161 *key* is a **datum** that has been initialized by the application to the value of the key that identifies
 8162 the record the program is deleting.

8163 The *dbm_firstkey()* function shall return the first key in the database. The argument *db* is a
 8164 pointer to a database structure that has been returned from a call to *dbm_open()*.

8165 The *dbm_nextkey()* function shall return the next key in the database. The argument *db* is a
 8166 pointer to a database structure that has been returned from a call to *dbm_open()*. The application
 8167 shall ensure that the *dbm_firstkey()* function is called before calling *dbm_nextkey()*. Subsequent
 8168 calls to *dbm_nextkey()* return the next key until all of the keys in the database have been
 8169 returned.

8170 The *dbm_error()* function shall return the error condition of the database. The argument *db* is a
 8171 pointer to a database structure that has been returned from a call to *dbm_open()*.

8172 The *dbm_clearerr()* function shall clear the error condition of the database. The argument *db* is a
 8173 pointer to a database structure that has been returned from a call to *dbm_open()*.

8174 The *dptr* pointers returned by these functions may point into static storage that may be changed
 8175 by subsequent calls.

8176 These functions need not be reentrant. A function that is not required to be reentrant is not
 8177 required to be thread-safe.

8178 **RETURN VALUE**

8179 The *dbm_store()* and *dbm_delete()* functions shall return 0 when they succeed and a negative
 8180 value when they fail.

8181 The *dbm_store()* function shall return 1 if it is called with a *flags* value of DBM_INSERT and the
 8182 function finds an existing record with the same key.

8183 The *dbm_error()* function shall return 0 if the error condition is not set and return a non-zero
 8184 value if the error condition is set.

8185 The return value of *dbm_clearerr()* is unspecified.

8186 The *dbm_firstkey()* and *dbm_nextkey()* functions shall return a key **datum**. When the end of the
 8187 database is reached, the *dptr* member of the key is a null pointer. If an error is detected, the *dptr*
 8188 member of the key shall be a null pointer and the error condition of the database shall be set.

8189 The *dbm_fetch()* function shall return a content **datum**. If no record in the database matches the
 8190 key or if an error condition has been detected in the database, the *dptr* member of the content
 8191 shall be a null pointer.

8192 The *dbm_open()* function shall return a pointer to a database structure. If an error is detected
 8193 during the operation, *dbm_open()* shall return a (**DBM ***)0.

8194 **ERRORS**

8195 No errors are defined.

8196 **EXAMPLES**

8197 None.

8198 **APPLICATION USAGE**

8199 The following code can be used to traverse the database:

8200 `for(key = dbm_firstkey(db); key.dptr != NULL; key = dbm_nextkey(db))`

8201 The *dbm_** functions provided in this library should not be confused in any way with those of a
 8202 general-purpose database management system. These functions do not provide for multiple
 8203 search keys per entry, they do not protect against multi-user access (in other words they do not
 8204 lock records or files), and they do not provide the many other useful database functions that are
 8205 found in more robust database management systems. Creating and updating databases by use of
 8206 these functions is relatively slow because of data copies that occur upon hash collisions. These
 8207 functions are useful for applications requiring fast lookup of relatively static information that is
 8208 to be indexed by a single key.

8209 Note that a strictly conforming application is extremely limited by these functions: since there is
 8210 no way to determine that the keys in use do not all hash to the same value (although that would
 8211 be rare), a strictly conforming application cannot be guaranteed that it can store more than one
 8212 block's worth of data in the database. As long as a key collision does not occur, additional data
 8213 may be stored, but because there is no way to determine whether an error is due to a key
 8214 collision or some other error condition (*dbm_error()* being effectively a Boolean), once an error is
 8215 detected, the application is effectively limited to guessing what the error might be if it wishes to
 8216 continue using these functions.

8217 The *dbm_delete()* function need not physically reclaim file space, although it does make it
 8218 available for reuse by the database.

8219 After calling *dbm_store()* or *dbm_delete()* during a pass through the keys by *dbm_firstkey()* and
 8220 *dbm_nextkey()*, the application should reset the database by calling *dbm_firstkey()* before again
 8221 calling *dbm_nextkey()*. The contents of these files are unspecified and may not be portable.

8222 **RATIONALE**

8223 None.

8224 **FUTURE DIRECTIONS**

8225 None.

8230 **Issue 5**

8231 Moved from X/OPEN UNIX extension to BASE.

8232 Normative text previously in the APPLICATION USAGE section is moved to the
 8233 DESCRIPTION.

8234 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8235 **Issue 6**

8236 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

8237 NAME

8238 difftime — compute the difference between two calendar time values

8239 SYNOPSIS

8240 #include <time.h>

8241 double difftime(time_t *time1*, time_t *time0*);

8242 DESCRIPTION

8243 cx The functionality described on this reference page is aligned with the ISO C standard. Any
8244 conflict between the requirements described here and the ISO C standard is unintentional. This
8245 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8246 The *difftime()* function shall compute the difference between two calendar times (as returned by
8247 *time()*): *time1* − *time0*.

8248 RETURN VALUE

8249 The *difftime()* function shall return the difference expressed in seconds as a type **double**.

8250 ERRORS

8251 No errors are defined.

8252 EXAMPLES

8253 None.

8254 APPLICATION USAGE

8255 None.

8256 RATIONALE

8257 None.

8258 FUTURE DIRECTIONS

8259 None.

8260 SEE ALSO

8261 *asctime()*, *clock()*, *ctime()*, *gmtime()*, *localtime()*, *mktime()*, *strftime()*, *strptime()*, *time()*, *utime()*,
8262 the Base Definitions volume of IEEE Std 1003.1-2001, <**time.h**>

8263 CHANGE HISTORY

8264 First released in Issue 4. Derived from the ISO C standard.

8265 **NAME**

8266 dirname — report the parent directory name of a file pathname

8267 **SYNOPSIS**

8268 xSI #include <libgen.h>

8269 char *dirname(char *path);

8270

8271 **DESCRIPTION**

8272 The *dirname()* function shall take a pointer to a character string that contains a pathname, and
 8273 return a pointer to a string that is a pathname of the parent directory of that file. Trailing '/'
 8274 characters in the path are not counted as part of the path.

8275 If *path* does not contain a '/', then *dirname()* shall return a pointer to the string ".". If *path* is a
 8276 null pointer or points to an empty string, *dirname()* shall return a pointer to the string ".".

8277 The *dirname()* function need not be reentrant. A function that is not required to be reentrant is
 8278 not required to be thread-safe.

8279 **RETURN VALUE**

8280 The *dirname()* function shall return a pointer to a string that is the parent directory of *path*. If
 8281 *path* is a null pointer or points to an empty string, a pointer to a string "." is returned.

8282 The *dirname()* function may modify the string pointed to by *path*, and may return a pointer to
 8283 static storage that may then be overwritten by subsequent calls to *dirname()*.

8284 **ERRORS**

8285 No errors are defined.

8286 **EXAMPLES**

8287 The following code fragment reads a pathname, changes the current working directory to the
 8288 parent directory, and opens the file.

```
8289 char path[PATH_MAX], *pathcopy;
8290 int fd;
8291 fgets(path, PATH_MAX, stdin);
8292 pathcopy = strdup(path);
8293 chdir(dirname(pathcopy));
8294 fd = open(basename(path), O_RDONLY);
```

8295 **Sample Input and Output Strings for dirname()**

8296 In the following table, the input string is the value pointed to by *path*, and the output string is
 8297 the return value of the *dirname()* function.

Input String	Output String
"/usr/lib"	"/usr"
"/usr/"	"/"
"usr"	"."
"/"	"/"
"."	"."
".."	"."

Changing the Current Directory to the Parent Directory

The following program fragment reads a pathname, changes the current working directory to the parent directory, and opens the file.

```
#include <unistd.h>
#include <limits.h>
#include <stdio.h>
#include <fcntl.h>
#include <string.h>
#include <libgen.h>
...
char path[PATH_MAX], *pathcopy;
int fd;
...
fgets(path, PATH_MAX, stdin);
pathcopy = strdup(path);
chdir(dirname(pathcopy));
fd = open(basename(path), O_RDONLY);
```

APPLICATION USAGE

The *dirname()* and *basename()* functions together yield a complete pathname. The expression *dirname(path)* obtains the pathname of the directory where *basename(path)* is found.

Since the meaning of the leading *"/"* is implementation-defined, *dirname("//foo)* may return either *"/"* or *'/'* (but nothing else).

RATIONALE

None.

FUTURE DIRECTIONS

None.

basename(), the Base Definitions volume of IEEE Std 1003.1-2001, **<libgen.h>**

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

8340 **NAME**8341 `div` — compute the quotient and remainder of an integer division8342 **SYNOPSIS**8343 `#include <stdlib.h>`8344 `div_t div(int numer, int denom);`8345 **DESCRIPTION**

8346 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
8347 conflict between the requirements described here and the ISO C standard is unintentional. This
8348 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

8349 The `div()` function shall compute the quotient and remainder of the division of the numerator
8350 *numer* by the denominator *denom*. If the division is inexact, the resulting quotient is the integer
8351 of lesser magnitude that is the nearest to the algebraic quotient. If the result cannot be
8352 represented, the behavior is undefined; otherwise, *quot*denom+rem* shall equal *numer*.

8353 **RETURN VALUE**

8354 The `div()` function shall return a structure of type **div_t**, comprising both the quotient and the
8355 remainder. The structure includes the following members, in any order:

8356 `int quot; /* quotient */`8357 `int rem; /* remainder */`8358 **ERRORS**

8359 No errors are defined.

8360 **EXAMPLES**

8361 None.

8362 **APPLICATION USAGE**

8363 None.

8364 **RATIONALE**

8365 None.

8366 **FUTURE DIRECTIONS**

8367 None.

8368 **SEE ALSO**8369 `ldiv()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`8370 **CHANGE HISTORY**

8371 First released in Issue 4. Derived from the ISO C standard.

8372 **NAME**8373 dldclose — close a *dlopen()* object8374 **SYNOPSIS**

8375 xSI #include <dldfcn.h>

8376 int dldclose(void *handle);

8377

8378 **DESCRIPTION**8379 The *dldclose()* function shall inform the system that the object referenced by a *handle* returned
8380 from a previous *dlopen()* invocation is no longer needed by the application.8381 The use of *dldclose()* reflects a statement of intent on the part of the process, but does not create
8382 any requirement upon the implementation, such as removal of the code or symbols referenced
8383 by *handle*. Once an object has been closed using *dldclose()* an application should assume that its
8384 symbols are no longer available to *dlsym()*. All objects loaded automatically as a result of
8385 invoking *dlopen()* on the referenced object shall also be closed if this is the last reference to it.8386 Although a *dldclose()* operation is not required to remove structures from an address space,
8387 neither is an implementation prohibited from doing so. The only restriction on such a removal is
8388 that no object shall be removed to which references have been relocated, until or unless all such
8389 references are removed. For instance, an object that had been loaded with a *dlopen()* operation
8390 specifying the RTLD_GLOBAL flag might provide a target for dynamic relocations performed in
8391 the processing of other objects—in such environments, an application may assume that no
8392 relocation, once made, shall be undone or remade unless the object requiring the relocation has
8393 itself been removed.8394 **RETURN VALUE**8395 If the referenced object was successfully closed, *dldclose()* shall return 0. If the object could not be
8396 closed, or if *handle* does not refer to an open object, *dldclose()* shall return a non-zero value. More
8397 detailed diagnostic information shall be available through *dlderror()*.8398 **ERRORS**

8399 No errors are defined.

8400 **EXAMPLES**8401 The following example illustrates use of *dlopen()* and *dldclose()*:8402 ...
8403 /* Open a dynamic library and then close it ... */
8404 #include <dldfcn.h>
8405 void *mylib;
8406 int eret;
8407 mylib = dlopen("mylib.so", RTLD_LOCAL | RTLD_LAZY);
8408 ...
8409 eret = dldclose(mylib);
8410 ...8411 **APPLICATION USAGE**8412 A conforming application should employ a *handle* returned from a *dlopen()* invocation only
8413 within a given scope bracketed by the *dlopen()* and *dldclose()* operations. Implementations are
8414 free to use reference counting or other techniques such that multiple calls to *dlopen()* referencing
8415 the same object may return the same object for *handle*. Implementations are also free to reuse a
8416 *handle*. For these reasons, the value of a *handle* must be treated as an opaque object by the
8417 application, used only in calls to *dlsym()* and *dldclose()*.

8418 **RATIONALE**

8419 None.

8420 **FUTURE DIRECTIONS**

8421 None.

8422 **SEE ALSO**8423 *dLError()*, *dlopen()*, *dlsym()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**dlfcn.h**>8424 **CHANGE HISTORY**

8425 First released in Issue 5.

8426 **Issue 6**8427 The DESCRIPTION is updated to say that the referenced object is closed “if this is the last
8428 reference to it”.

8429 **NAME**8430 `dlderror` — get diagnostic information8431 **SYNOPSIS**8432 `XS1 #include <dldfcn.h>`8433 `char *dlderror(void);`

8434

8435 **DESCRIPTION**

8436 The `dlderror()` function shall return a null-terminated character string (with no trailing <newline>) that describes the last error that occurred during dynamic linking processing. If no dynamic linking errors have occurred since the last invocation of `dlderror()`, `dlderror()` shall return NULL. Thus, invoking `dlderror()` a second time, immediately following a prior invocation, shall result in NULL being returned.

8441 The `dlderror()` function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

8443 **RETURN VALUE**

8444 If successful, `dlderror()` shall return a null-terminated character string; otherwise, NULL shall be returned.

8446 **ERRORS**

8447 No errors are defined.

8448 **EXAMPLES**

8449 The following example prints out the last dynamic linking error:

```
8450 ...
8451 #include <dldfcn.h>
8452 char *errstr;
8453 errstr = dlderror();
8454 if (errstr != NULL)
8455     printf ("A dynamic linking error occurred: (%s)\n", errstr);
8456 ...
```

8457 **APPLICATION USAGE**

8458 The messages returned by `dlderror()` may reside in a static buffer that is overwritten on each call to `dlderror()`. Application code should not write to this buffer. Programs wishing to preserve an error message should make their own copies of that message. Depending on the application environment with respect to asynchronous execution events, such as signals or other asynchronous computation sharing the address space, conforming applications should use a critical section to retrieve the error pointer and buffer.

8464 **RATIONALE**

8465 None.

8466 **FUTURE DIRECTIONS**

8467 None.

8468 **SEE ALSO**8469 `dldclose()`, `dldopen()`, `dldsym()`, the Base Definitions volume of IEEE Std 1003.1-2001, <dldfcn.h>

8470 **CHANGE HISTORY**

8471 First released in Issue 5.

8472 **Issue 6**

8473 In the DESCRIPTION the note about reentrancy and thread-safety is added.

8474 **NAME**

8475 dlopen — gain access to an executable object file

8476 **SYNOPSIS**

8477 xSI #include <dlfcn.h>

8478 void *dlopen(const char *file, int mode);

8479

8480 **DESCRIPTION**

8481 The *dlopen()* function shall make an executable object file specified by *file* available to the calling
 8482 program. The class of files eligible for this operation and the manner of their construction are
 8483 implementation-defined, though typically such files are executable objects such as shared
 8484 libraries, relocatable files, or programs. Note that some implementations permit the construction
 8485 of dependencies between such objects that are embedded within files. In such cases, a *dlopen()*
 8486 operation shall load such dependencies in addition to the object referenced by *file*.
 8487 Implementations may also impose specific constraints on the construction of programs that can
 8488 employ *dlopen()* and its related services.

8489 A successful *dlopen()* shall return a *handle* which the caller may use on subsequent calls to
 8490 *dlsym()* and *dlclose()*. The value of this *handle* should not be interpreted in any way by the caller.

8491 The *file* argument is used to construct a pathname to the object file. If *file* contains a slash
 8492 character, the *file* argument is used as the pathname for the file. Otherwise, *file* is used in an
 8493 implementation-defined manner to yield a pathname.

8494 If the value of *file* is 0, *dlopen()* shall provide a *handle* on a global symbol object. This object shall
 8495 provide access to the symbols from an ordered set of objects consisting of the original program
 8496 image file, together with any objects loaded at program start-up as specified by that process
 8497 image file (for example, shared libraries), and the set of objects loaded using a *dlopen()* operation
 8498 together with the RTLD_GLOBAL flag. As the latter set of objects can change during execution,
 8499 the set identified by *handle* can also change dynamically.

8500 Only a single copy of an object file is brought into the address space, even if *dlopen()* is invoked
 8501 multiple times in reference to the file, and even if different pathnames are used to reference the
 8502 file.

8503 The *mode* parameter describes how *dlopen()* shall operate upon *file* with respect to the processing
 8504 of relocations and the scope of visibility of the symbols provided within *file*. When an object is
 8505 brought into the address space of a process, it may contain references to symbols whose
 8506 addresses are not known until the object is loaded. These references shall be relocated before the
 8507 symbols can be accessed. The *mode* parameter governs when these relocations take place and
 8508 may have the following values:

8509	RTLD_LAZY	Relocations shall be performed at an implementation-defined time,
8510		ranging from the time of the <i>dlopen()</i> call until the first reference to a
8511		given symbol occurs. Specifying RTLD_LAZY should improve
8512		performance on implementations supporting dynamic symbol binding as
8513		a process may not reference all of the functions in any given object. And,
8514		for systems supporting dynamic symbol resolution for normal process
8515		execution, this behavior mimics the normal handling of process
8516		execution.

8517	RTLD_NOW	All necessary relocations shall be performed when the object is first
8518		loaded. This may waste some processing if relocations are performed for
8519		functions that are never referenced. This behavior may be useful for
8520		applications that need to know as soon as an object is loaded that all

8521 symbols referenced during execution are available.

8522 Any object loaded by *dlopen()* that requires relocations against global symbols can reference the
 8523 symbols in the original process image file, any objects loaded at program start-up, from the
 8524 object itself as well as any other object included in the same *dlopen()* invocation, and any objects
 8525 that were loaded in any *dlopen()* invocation and which specified the RTLD_GLOBAL flag. To
 8526 determine the scope of visibility for the symbols loaded with a *dlopen()* invocation, the *mode*
 8527 parameter should be a bitwise-inclusive OR with one of the following values:

8528	RTLD_GLOBAL	The object's symbols shall be made available for the relocation processing
8529		of any other object. In addition, symbol lookup using <i>dlopen(0, mode)</i> and
8530		an associated <i>dlsym()</i> allows objects loaded with this <i>mode</i> to be searched.
8531	RTLD_LOCAL	The object's symbols shall not be made available for the relocation
8532		processing of any other object.

8533 If neither RTLD_GLOBAL nor RTLD_LOCAL are specified, then an implementation-defined
 8534 default behavior shall be applied.

8535 If a *file* is specified in multiple *dlopen()* invocations, *mode* is interpreted at each invocation. Note,
 8536 however, that once RTLD_NOW has been specified all relocations shall have been completed
 8537 rendering further RTLD_NOW operations redundant and any further RTLD_LAZY operations
 8538 irrelevant. Similarly, note that once RTLD_GLOBAL has been specified the object shall maintain
 8539 the RTLD_GLOBAL status regardless of any previous or future specification of RTLD_LOCAL,
 8540 as long as the object remains in the address space (see *dlclose()*).

8541 Symbols introduced into a program through calls to *dlopen()* may be used in relocation
 8542 activities. Symbols so introduced may duplicate symbols already defined by the program or
 8543 previous *dlopen()* operations. To resolve the ambiguities such a situation might present, the
 8544 resolution of a symbol reference to symbol definition is based on a symbol resolution order. Two
 8545 such resolution orders are defined: *load* or *dependency* ordering. Load order establishes an
 8546 ordering among symbol definitions, such that the definition first loaded (including definitions
 8547 from the image file and any dependent objects loaded with it) has priority over objects added
 8548 later (via *dlopen()*). Load ordering is used in relocation processing. Dependency ordering uses a
 8549 breadth-first order starting with a given object, then all of its dependencies, then any dependents
 8550 of those, iterating until all dependencies are satisfied. With the exception of the global symbol
 8551 object obtained via a *dlopen()* operation on a *file* of 0, dependency ordering is used by the
 8552 *dlsym()* function. Load ordering is used in *dlsym()* operations upon the global symbol object.

8553 When an object is first made accessible via *dlopen()* it and its dependent objects are added in
 8554 dependency order. Once all the objects are added, relocations are performed using load order.
 8555 Note that if an object or its dependencies had been previously loaded, the load and dependency
 8556 orders may yield different resolutions.

8557 The symbols introduced by *dlopen()* operations and available through *dlsym()* are at a minimum
 8558 those which are exported as symbols of global scope by the object. Typically such symbols shall
 8559 be those that were specified in (for example) C source code as having *extern* linkage. The precise
 8560 manner in which an implementation constructs the set of exported symbols for a *dlopen()* object
 8561 is specified by that implementation.

8562 **RETURN VALUE**

8563 If *file* cannot be found, cannot be opened for reading, is not of an appropriate object format for
 8564 processing by *dlopen()*, or if an error occurs during the process of loading *file* or relocating its
 8565 symbolic references, *dlopen()* shall return NULL. More detailed diagnostic information shall be
 8566 available through *dLError()*.

8567 ERRORS

8568 No errors are defined.

8579 CHANGE HISTORY

8580 First released in Issue 5.

8581 **NAME**8582 dlsym — obtain the address of a symbol from a *dlopen()* object8583 **SYNOPSIS**8584 **XSI** #include <dlfcn.h>8585 void *dlsym(void *restrict *handle*, const char *restrict *name*);

8586

8587 **DESCRIPTION**

8588 The *dlsym()* function shall obtain the address of a symbol defined within an object made
 8589 accessible through a *dlopen()* call. The *handle* argument is the value returned from a call to
 8590 *dlopen()* (and which has not since been released via a call to *dlclose()*), and *name* is the symbol's
 8591 name as a character string.

8592 The *dlsym()* function shall search for the named symbol in all objects loaded automatically as a
 8593 result of loading the object referenced by *handle* (see *dlopen()*). Load ordering is used in *dlsym()*
 8594 operations upon the global symbol object. The symbol resolution algorithm used shall be
 8595 dependency order as described in *dlopen()*.

8596 The RTLD_DEFAULT and RTLD_NEXT flags are reserved for future use.

8597 **RETURN VALUE**

8598 If *handle* does not refer to a valid object opened by *dlopen()*, or if the named symbol cannot be
 8599 found within any of the objects associated with *handle*, *dlsym()* shall return NULL. More
 8600 detailed diagnostic information shall be available through *dlerror()*.

8601 **ERRORS**

8602 No errors are defined.

8603 **EXAMPLES**

8604 The following example shows how *dlopen()* and *dlsym()* can be used to access either function or
 8605 data objects. For simplicity, error checking has been omitted.

```
8606       void       *handle;
8607       int        *iptr, (*fptr)(int);

8608       /* open the needed object */
8609       handle = dlopen("/usr/home/me/libfoo.so", RTLD_LOCAL | RTLD_LAZY);

8610       /* find the address of function and data objects */
8611       *(void **)(&fptr) = dlsym(handle, "my_function");
8612       iptr = (int *)dlsym(handle, "my_object");

8613       /* invoke function, passing value of integer as a parameter */
8614       (*fptr)(*iptr);
```

8615 **APPLICATION USAGE**

8616 Special purpose values for *handle* are reserved for future use. These values and their meanings
 8617 are:

8618 RTLD_DEFAULT The symbol lookup happens in the normal global scope; that is, a search for a
 8619 symbol using this handle would find the same definition as a direct use of this
 8620 symbol in the program code.

8621 RTLD_NEXT Specifies the next object after this one that defines *name*. *This one* refers to the
 8622 object containing the invocation of *dlsym()*. The *next* object is the one found
 8623 upon the application of a load order symbol resolution algorithm (see
 8624 *dlopen()*). The next object is either one of global scope (because it was
 8625 introduced as part of the original process image or because it was added with

8626 a *dlopen()* operation including the RTLD_GLOBAL flag), or is an object that
 8627 was included in the same *dlopen()* operation that loaded this one.

8628 The RTLD_NEXT flag is useful to navigate an intentionally created hierarchy
 8629 of multiply-defined symbols created through *interposition*. For example, if a
 8630 program wished to create an implementation of *malloc()* that embedded some
 8631 statistics gathering about memory allocations, such an implementation could
 8632 use the real *malloc()* definition to perform the memory allocation—and itself
 8633 only embed the necessary logic to implement the statistics gathering function.

8634 RATIONALE

8635 The ISO C standard does not require that pointers to functions can be cast back and forth to
 8636 pointers to data. Indeed, the ISO C standard does not require that an object of type **void *** can
 8637 hold a pointer to a function. Implementations supporting the XSI extension, however, do require
 8638 that an object of type **void *** can hold a pointer to a function. The result of converting a pointer to
 8639 a function into a pointer to another data type (except **void ***) is still undefined, however. Note
 8640 that compilers conforming to the ISO C standard are required to generate a warning if a
 8641 conversion from a **void *** pointer to a function pointer is attempted as in:

```
8642 fptr = (int (*)(int))dlsym(handle, "my_function");
```

8643 Due to the problem noted here, a future version may either add a new function to return
 8644 function pointers, or the current interface may be deprecated in favor of two new functions: one
 8645 that returns data pointers and the other that returns function pointers.

8646 FUTURE DIRECTIONS

8647 None.

8650 CHANGE HISTORY

8651 First released in Issue 5.

8652 Issue 6

8653 The **restrict** keyword is added to the *dlsym()* prototype for alignment with the
 8654 ISO / IEC 9899:1999 standard.

8655 The RTLD_DEFAULT and RTLD_NEXT flags are reserved for future use.

8656 IEEE Std 1003.1-2001 / Cor 1-2002, item XSH / TC1 / D6 / 14 is applied, correcting an example, and
 8657 adding text to the RATIONALE describing issues related to conversion of pointers to functions
 8658 and back again.

NAME

drand48, erand48, jrand48, lcong48, lrand48, mrand48, nrand48, seed48, srand48 — generate uniformly distributed pseudo-random numbers

SYNOPSIS

```

#include <stdlib.h>

double drand48(void);
double erand48(unsigned short xsubi[3]);
long jrand48(unsigned short xsubi[3]);
void lcong48(unsigned short param[7]);
long lrand48(void);
long mrand48(void);
long nrand48(unsigned short xsubi[3]);
unsigned short *seed48(unsigned short seed16v[3]);
void srand48(long seedval);

```

DESCRIPTION

This family of functions shall generate pseudo-random numbers using a linear congruential algorithm and 48-bit integer arithmetic.

The *drand48()* and *erand48()* functions shall return non-negative, double-precision, floating-point values, uniformly distributed over the interval [0.0,1.0).

The *lrand48()* and *nrand48()* functions shall return non-negative, long integers, uniformly distributed over the interval $[0, 2^{31})$.

The *mrnd48()* and *jrnd48()* functions shall return signed long integers uniformly distributed over the interval $[-2^{31}, 2^{31})$.

The *srand48()*, *seed48()*, and *lcong48()* functions are initialization entry points, one of which should be invoked before either *drand48()*, *lrand48()*, or *mrnd48()* is called. (Although it is not recommended practice, constant default initializer values shall be supplied automatically if *drand48()*, *lrand48()*, or *mrnd48()* is called without a prior call to an initialization entry point.) The *erand48()*, *nrand48()*, and *jrnd48()* functions do not require an initialization entry point to be called first.

All the routines work by generating a sequence of 48-bit integer values, X_i , according to the linear congruential formula:

$$X_{n+1} = (aX_n + c)_{\text{mod } m} \quad n \geq 0$$

The parameter $m = 2^{48}$; hence 48-bit integer arithmetic is performed. Unless *lcong48()* is invoked, the multiplier value a and the addend value c are given by:

$$a = 5\text{DEECE66D}_{16} = 273673163155_8$$

$$c = \text{B}_{16} = 13_8$$

The value returned by any of the *drand48()*, *erand48()*, *jrnd48()*, *lrand48()*, *mrnd48()*, or *nrand48()* functions is computed by first generating the next 48-bit X_i in the sequence. Then the appropriate number of bits, according to the type of data item to be returned, are copied from the high-order (leftmost) bits of X_i and transformed into the returned value.

The *drand48()*, *lrand48()*, and *mrnd48()* functions store the last 48-bit X_i generated in an internal buffer; that is why the application shall ensure that these are initialized prior to being invoked. The *erand48()*, *nrand48()*, and *jrnd48()* functions require the calling program to provide storage for the successive X_i values in the array specified as an argument when the

8704 functions are invoked. That is why these routines do not have to be initialized; the calling
 8705 program merely has to place the desired initial value of X_i into the array and pass it as an
 8706 argument. By using different arguments, *erand48()*, *nrand48()*, and *jrand48()* allow separate
 8707 modules of a large program to generate several *independent* streams of pseudo-random numbers;
 8708 that is, the sequence of numbers in each stream shall *not* depend upon how many times the
 8709 routines are called to generate numbers for the other streams.

8710 The initializer function *srand48()* sets the high-order 32 bits of X_i to the low-order 32 bits
 8711 contained in its argument. The low-order 16 bits of X_i are set to the arbitrary value $330E_{16}$.

8712 The initializer function *seed48()* sets the value of X_i to the 48-bit value specified in the argument
 8713 array. The low-order 16 bits of X_i are set to the low-order 16 bits of *seed16v*[0]. The mid-order 16
 8714 bits of X_i are set to the low-order 16 bits of *seed16v*[1]. The high-order 16 bits of X_i are set to the
 8715 low-order 16 bits of *seed16v*[2]. In addition, the previous value of X_i is copied into a 48-bit
 8716 internal buffer, used only by *seed48()*, and a pointer to this buffer is the value returned by
 8717 *seed48()*. This returned pointer, which can just be ignored if not needed, is useful if a program is
 8718 to be restarted from a given point at some future time—use the pointer to get at and store the
 8719 last X_i value, and then use this value to reinitialize via *seed48()* when the program is restarted.

8720 The initializer function *lcong48()* allows the user to specify the initial X_i , the multiplier value a ,
 8721 and the addend value c . Argument array elements *param*[0-2] specify X_i , *param*[3-5] specify the
 8722 multiplier a , and *param*[6] specifies the 16-bit addend c . After *lcong48()* is called, a subsequent
 8723 call to either *srand48()* or *seed48()* shall restore the standard multiplier and addend values, a and
 8724 c , specified above.

8725 The *drand48()*, *lrand48()*, and *mrnd48()* functions need not be reentrant. A function that is not
 8726 required to be reentrant is not required to be thread-safe.

8727 RETURN VALUE

8728 As described in the DESCRIPTION above.

8729 ERRORS

8730 No errors are defined.

8741 CHANGE HISTORY

8742 First released in Issue 1. Derived from Issue 1 of the SVID.

8743 Issue 5

8744 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8745 Issue 6

8746 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

8747 **NAME**

8748 dup, dup2 — duplicate an open file descriptor

8749 **SYNOPSIS**

8750 #include <unistd.h>

8751 int dup(int *fil-des*);8752 int dup2(int *fil-des*, int *fil-des2*);8753 **DESCRIPTION**8754 The *dup()* and *dup2()* functions provide an alternative interface to the service provided by *fcntl()* using the *F_DUPFD* command. The call:8756 *fid* = *dup(fil-des)*;

8757 shall be equivalent to:

8758 *fid* = *fcntl(fil-des, F_DUPFD, 0)*;

8759 The call:

8760 *fid* = *dup2(fil-des, fil-des2)*;

8761 shall be equivalent to:

8762 *close(fil-des2)*;8763 *fid* = *fcntl(fil-des, F_DUPFD, fil-des2)*;

8764 except for the following:

- 8765 • If *fil-des2* is less than 0 or greater than or equal to {*OPEN_MAX*}, *dup2()* shall return *-1* with
- 8766 *errno* set to [*EBADF*].
- 8767 • If *fil-des* is a valid file descriptor and is equal to *fil-des2*, *dup2()* shall return *fil-des2* without
- 8768 closing it.
- 8769 • If *fil-des* is not a valid file descriptor, *dup2()* shall return *-1* and shall not close *fil-des2*.
- 8770 • The value returned shall be equal to the value of *fil-des2* upon successful completion, or *-1*
- 8771 upon failure.

8772 **RETURN VALUE**8773 Upon successful completion a non-negative integer, namely the file descriptor, shall be returned;
8774 otherwise, *-1* shall be returned and *errno* set to indicate the error.8775 **ERRORS**8776 The *dup()* function shall fail if:8777 [*EBADF*] The *fil-des* argument is not a valid open file descriptor.8778 [*EMFILE*] The number of file descriptors in use by this process would exceed
8779 {*OPEN_MAX*}.8780 The *dup2()* function shall fail if:8781 [*EBADF*] The *fil-des* argument is not a valid open file descriptor or the argument *fil-des2* is
8782 negative or greater than or equal to {*OPEN_MAX*}.8783 [*EINTR*] The *dup2()* function was interrupted by a signal.

8784 **EXAMPLES**8785 **Redirecting Standard Output to a File**

8786 The following example closes standard output for the current processes, re-assigns standard
8787 output to go to the file referenced by *pdf*, and closes the original file descriptor to clean up.

```
8788 #include <unistd.h>
8789 ...
8790 int pdf;
8791 ...
8792 close(1);
8793 dup(pdf);
8794 close(pdf);
8795 ...
```

8796 **Redirecting Error Messages**

8797 The following example redirects messages from *stderr* to *stdout*.

```
8798 #include <unistd.h>
8799 ...
8800 dup2(1, 2);
8801 ...
```

8802 **APPLICATION USAGE**

8803 None.

8804 **RATIONALE**

8805 The *dup()* and *dup2()* functions are redundant. Their services are also provided by the *fcntl()*
8806 function. They have been included in this volume of IEEE Std 1003.1-2001 primarily for historical
8807 reasons, since many existing applications use them.

8808 While the brief code segment shown is very similar in behavior to *dup2()*, a conforming
8809 implementation based on other functions defined in this volume of IEEE Std 1003.1-2001 is
8810 significantly more complex. Least obvious is the possible effect of a signal-catching function that
8811 could be invoked between steps and allocate or deallocate file descriptors. This could be avoided
8812 by blocking signals.

8813 The *dup2()* function is not marked obsolescent because it presents a type-safe version of
8814 functionality provided in a type-unsafe version by *fcntl()*. It is used in the POSIX Ada binding.

8815 The *dup2()* function is not intended for use in critical regions as a synchronization mechanism.

8816 In the description of [EBADF], the case of *fildes* being out of range is covered by the given case of
8817 *fildes* not being valid. The descriptions for *fildes* and *fildes2* are different because the only kind of
8818 invalidity that is relevant for *fildes2* is whether it is out of range; that is, it does not matter
8819 whether *fildes2* refers to an open file when the *dup2()* call is made.

8820 **FUTURE DIRECTIONS**

8821 None.

8822 **SEE ALSO**

8823 *close()*, *fcntl()*, *open()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<unistd.h>**

8824 **CHANGE HISTORY**

8825 First released in Issue 1. Derived from Issue 1 of the SVID.

8826 **NAME**8827 ecvt, fcvt, gcvt — convert a floating-point number to a string (**LEGACY**)8828 **SYNOPSIS**

8829 xSI #include <stdlib.h>

```

8830     char *ecvt(double value, int ndigit, int *restrict decpt,
8831                int *restrict sign);
8832     char *fcvt(double value, int ndigit, int *restrict decpt,
8833                int *restrict sign);
8834     char *gcvt(double value, int ndigit, char *buf);
8835 
```

8836 **DESCRIPTION**8837 The *ecvt()*, *fcvt()*, and *gcvt()* functions shall convert floating-point numbers to null-terminated strings.

8839 The *ecvt()* function shall convert *value* to a null-terminated string of *ndigit* digits (where *ndigit* is reduced to an unspecified limit determined by the precision of a **double**) and return a pointer to the string. The high-order digit shall be non-zero, unless the value is 0. The low-order digit shall be rounded in an implementation-defined manner. The position of the radix character relative to the beginning of the string shall be stored in the integer pointed to by *decpt* (negative means to the left of the returned digits). If *value* is zero, it is unspecified whether the integer pointed to by *decpt* would be 0 or 1. The radix character shall not be included in the returned string. If the sign of the result is negative, the integer pointed to by *sign* shall be non-zero; otherwise, it shall be 0.

8847 If the converted value is out of range or is not representable, the contents of the returned string are unspecified.

8849 The *fcvt()* function shall be equivalent to *ecvt()*, except that *ndigit* specifies the number of digits desired after the radix character. The total number of digits in the result string is restricted to an unspecified limit as determined by the precision of a **double**.

8852 The *gcvt()* function shall convert *value* to a null-terminated string (similar to that of the %g conversion specification format of *printf()*) in the array pointed to by *buf* and shall return *buf*. It shall produce *ndigit* significant digits (limited to an unspecified value determined by the precision of a **double**) in the %F conversion specification format of *printf()* if possible, or the %e conversion specification format of *printf()* (scientific notation) otherwise. A minus sign shall be included in the returned string if *value* is less than 0. A radix character shall be included in the returned string if *value* is not a whole number. Trailing zeros shall be suppressed where *value* is not a whole number. The radix character is determined by the current locale. If *setlocale()* has not been called successfully, the default locale, POSIX, is used. The default locale specifies a period ('.') as the radix character. The *LC_NUMERIC* category determines the value of the radix character within the current locale.

8863 These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

8865 **RETURN VALUE**8866 The *ecvt()* and *fcvt()* functions shall return a pointer to a null-terminated string of digits.8867 The *gcvt()* function shall return *buf*.

8868 The return values from *ecvt()* and *fcvt()* may point to static data which may be overwritten by subsequent calls to these functions.

8870 ERRORS

8871 No errors are defined.

8872 EXAMPLES

8873 None.

8874 APPLICATION USAGE

8875 The *sprintf()* function is preferred over this function.

8876 RATIONALE

8877 None.

8878 FUTURE DIRECTIONS

8879 These functions may be withdrawn in a future version.

8880 SEE ALSO

8882 CHANGE HISTORY

8883 First released in Issue 4, Version 2.

8884 Issue 5

8885 Moved from X/OPEN UNIX extension to BASE.

8886 Normative text previously in the APPLICATION USAGE section is moved to the
8887 DESCRIPTION.

8888 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8889 Issue 6

8890 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8891 This function is marked LEGACY.

8892 The **restrict** keyword is added to the *ecvt()* and *fcvt()* prototypes for alignment with the
8893 ISO/IEC 9899:1999 standard.

8894 The DESCRIPTION is updated to explicitly use “conversion specification” to describe %g, %f,
8895 and %e.

8896 **NAME**8897 encrypt — encoding function (**CRYPT**)8898 **SYNOPSIS**

8899 xSI #include <unistd.h>

8900 void encrypt(char block[64], int edflag);

8901

8902 **DESCRIPTION**

8903 The *encrypt()* function shall provide access to an implementation-defined encoding algorithm.
8904 The key generated by *setkey()* is used to encrypt the string *block* with *encrypt()*.

8905 The *block* argument to *encrypt()* shall be an array of length 64 bytes containing only the bytes
8906 with values of 0 and 1. The array is modified in place to a similar array using the key set by
8907 *setkey()*. If *edflag* is 0, the argument is encoded. If *edflag* is 1, the argument may be decoded (see
8908 the APPLICATION USAGE section); if the argument is not decoded, *errno* shall be set to
8909 [ENOSYS].

8910 The *encrypt()* function shall not change the setting of *errno* if successful. An application wishing
8911 to check for error situations should set *errno* to 0 before calling *encrypt()*. If *errno* is non-zero on
8912 return, an error has occurred.

8913 The *encrypt()* function need not be reentrant. A function that is not required to be reentrant is
8914 not required to be thread-safe.

8915 **RETURN VALUE**8916 The *encrypt()* function shall not return a value.8917 **ERRORS**8918 The *encrypt()* function shall fail if:

8919 [ENOSYS] The functionality is not supported on this implementation.

8920 **EXAMPLES**

8921 None.

8922 **APPLICATION USAGE**8923 Historical implementations of the *encrypt()* function used a rather primitive encoding algorithm.

8924 In some environments, decoding might not be implemented. This is related to some Government
8925 restrictions on encryption and decryption routines. Historical practice has been to ship a
8926 different version of the encryption library without the decryption feature in the routines
8927 supplied. Thus the exported version of *encrypt()* does encoding but not decoding.

8928 **RATIONALE**

8929 None.

8930 **FUTURE DIRECTIONS**

8931 None.

8932 **SEE ALSO**8933 *crypt()*, *setkey()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>8934 **CHANGE HISTORY**

8935 First released in Issue 1. Derived from Issue 1 of the SVID.

8936 **Issue 5**

8937 A note indicating that this function need not be reentrant is added to the DESCRIPTION.

8938 **Issue 6**

8939 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8940 **NAME**

8941 endgrent, getgrent, setgrent — group database entry functions

8942 **SYNOPSIS**8943 xSI `#include <grp.h>`

```
8944 void endgrent(void);
8945 struct group *getgrent(void);
8946 void setgrent(void);
8947
```

8948 **DESCRIPTION**

8949 The *getgrent()* function shall return a pointer to a structure containing the broken-out fields of an
 8950 entry in the group database. When first called, *getgrent()* shall return a pointer to a **group**
 8951 structure containing the first entry in the group database. Thereafter, it shall return a pointer to a
 8952 **group** structure containing the next group structure in the group database, so successive calls
 8953 may be used to search the entire database.

8954 An implementation that provides extended security controls may impose further
 8955 implementation-defined restrictions on accessing the group database. In particular, the system
 8956 may deny the existence of some or all of the group database entries associated with groups other
 8957 than those groups associated with the caller and may omit users other than the caller from the
 8958 list of members of groups in database entries that are returned.

8959 The *setgrent()* function shall rewind the group database to allow repeated searches.

8960 The *endgrent()* function may be called to close the group database when processing is complete.

8961 These functions need not be reentrant. A function that is not required to be reentrant is not
 8962 required to be thread-safe.

8963 **RETURN VALUE**

8964 When first called, *getgrent()* shall return a pointer to the first group structure in the group
 8965 database. Upon subsequent calls it shall return the next group structure in the group database.
 8966 The *getgrent()* function shall return a null pointer on end-of-file or an error and *errno* may be set
 8967 to indicate the error.

8968 The return value may point to a static area which is overwritten by a subsequent call to
 8969 *getgrgid()*, *getgrnam()*, or *getgrent()*.

8970 **ERRORS**

8971 The *getgrent()* function may fail if:

8972	[EINTR]	A signal was caught during the operation.
8973	[EIO]	An I/O error has occurred.
8974	[EMFILE]	{OPEN_MAX} file descriptors are currently open in the calling process.
8975	[ENFILE]	The maximum allowable number of files is currently open in the system.

8976 EXAMPLES

8977 None.

8978 APPLICATION USAGE

8979 These functions are provided due to their historical usage. Applications should avoid
8980 dependencies on fields in the group database, whether the database is a single file, or where in
8981 the file system name space the database resides. Applications should use *getgrnam()* and
8982 *getgrgid()* whenever possible because it avoids these dependencies.

8983 RATIONALE

8984 None.

8985 FUTURE DIRECTIONS

8986 None.

8987 SEE ALSO

8988 *getgrgid()*, *getgrnam()*, *getlogin()*, *getpwent()*, the Base Definitions volume of
8989 IEEE Std 1003.1-2001, <grp.h>

8990 CHANGE HISTORY

8991 First released in Issue 4, Version 2.

8992 Issue 5

8993 Moved from X/OPEN UNIX extension to BASE.

8994 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
8995 VALUE section.

8996 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

8997 Issue 6

8998 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

8999 **NAME**

9000 endhostent, gethostent, sethostent — network host database functions

9001 **SYNOPSIS**

9002 #include <netdb.h>

9003 void endhostent(void);

9004 struct hostent *gethostent(void);

9005 void sethostent(int stayopen);

9006 **DESCRIPTION**

9007 These functions shall retrieve information about hosts. This information is considered to be
9008 stored in a database that can be accessed sequentially or randomly. The implementation of this
9009 database is unspecified.

9010 **Note:** In many cases this database is implemented by the Domain Name System, as documented in
9011 RFC 1034, RFC 1035, and RFC 1886.

9012 The *sethostent()* function shall open a connection to the database and set the next entry for
9013 retrieval to the first entry in the database. If the *stayopen* argument is non-zero, the connection
9014 shall not be closed by a call to *gethostent()*, *gethostbyname()*, or *gethostbyaddr()*, and the
9015 implementation may maintain an open file descriptor.

9016 The *gethostent()* function shall read the next entry in the database, opening and closing a
9017 connection to the database as necessary.

9018 Entries shall be returned in **hostent** structures. Refer to *gethostbyaddr()* for a definition of the
9019 **hostent** structure.

9020 The *endhostent()* function shall close the connection to the database, releasing any open file
9021 descriptor.

9022 These functions need not be reentrant. A function that is not required to be reentrant is not
9023 required to be thread-safe.

9024 **RETURN VALUE**

9025 Upon successful completion, the *gethostent()* function shall return a pointer to a **hostent**
9026 structure if the requested entry was found, and a null pointer if the end of the database was
9027 reached or the requested entry was not found.

9028 **ERRORS**9029 No errors are defined for *endhostent()*, *gethostent()*, and *sethostent()*.9030 **EXAMPLES**

9031 None.

9032 **APPLICATION USAGE**

9033 The *gethostent()* function may return pointers to static data, which may be overwritten by
9034 subsequent calls to any of these functions.

9035 **RATIONALE**

9036 None.

9037 **FUTURE DIRECTIONS**

9038 None.

9039 **SEE ALSO**9040 *endservent()*, *gethostbyaddr()*, the Base Definitions volume of IEEE Std 1003.1-2001, <netdb.h>

9041 **CHANGE HISTORY**

9042 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9043 **NAME**

9044 endnetent, getnetbyaddr, getnetbyname, getnetent, setnetent — network database functions

9045 **SYNOPSIS**

9046 #include <netdb.h>

9047 void endnetent(void);

9048 struct netent *getnetbyaddr(uint32_t net, int type);

9049 struct netent *getnetbyname(const char *name);

9050 struct netent *getnetent(void);

9051 void setnetent(int stayopen);

9052 **DESCRIPTION**

9053 These functions shall retrieve information about networks. This information is considered to be
 9054 stored in a database that can be accessed sequentially or randomly. The implementation of this
 9055 database is unspecified.

9056 The *setnetent()* function shall open and rewind the database. If the *stayopen* argument is non-
 9057 zero, the connection to the *net* database shall not be closed after each call to *getnetent()* (either
 9058 directly, or indirectly through one of the other *getnet**(*)* functions), and the implementation may
 9059 maintain an open file descriptor to the database.

9060 The *getnetent()* function shall read the next entry of the database, opening and closing a
 9061 connection to the database as necessary.

9062 The *getnetbyaddr()* function shall search the database from the beginning, and find the first entry
 9063 for which the address family specified by *type* matches the *n_addrtype* member and the network
 9064 number *net* matches the *n_net* member, opening and closing a connection to the database as
 9065 necessary. The *net* argument shall be the network number in host byte order.

9066 The *getnetbyname()* function shall search the database from the beginning and find the first entry
 9067 for which the network name specified by *name* matches the *n_name* member, opening and
 9068 closing a connection to the database as necessary.

9069 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions shall each return a pointer to a
 9070 **netent** structure, the members of which shall contain the fields of an entry in the network
 9071 database.

9072 The *endnetent()* function shall close the database, releasing any open file descriptor.

9073 These functions need not be reentrant. A function that is not required to be reentrant is not
 9074 required to be thread-safe.

9075 **RETURN VALUE**

9076 Upon successful completion, *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* shall return a
 9077 pointer to a **netent** structure if the requested entry was found, and a null pointer if the end of the
 9078 database was reached or the requested entry was not found. Otherwise, a null pointer shall be
 9079 returned.

9080 **ERRORS**

9081 No errors are defined.

9082 **EXAMPLES**

9083 None.

9084 **APPLICATION USAGE**

9085 The *getnetbyaddr()*, *getnetbyname()*, and *getnetent()* functions may return pointers to static data,
9086 which may be overwritten by subsequent calls to any of these functions.

9087 **RATIONALE**

9088 None.

9089 **FUTURE DIRECTIONS**

9090 None.

9091 **SEE ALSO**9092 The Base Definitions volume of IEEE Std 1003.1-2001, <**netdb.h**>9093 **CHANGE HISTORY**

9094 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9095 **NAME**

9096 endprotoent, getprotobyname, getprotobynumber, getprotoent, setprotoent — network protocol
 9097 database functions

9098 **SYNOPSIS**

```
9099     #include <netdb.h>

9100     void endprotoent(void);
9101     struct protoent *getprotobyname(const char *name);
9102     struct protoent *getprotobynumber(int proto);
9103     struct protoent *getprotoent(void);
9104     void setprotoent(int stayopen);
```

9105 **DESCRIPTION**

9106 These functions shall retrieve information about protocols. This information is considered to be
 9107 stored in a database that can be accessed sequentially or randomly. The implementation of this
 9108 database is unspecified.

9109 The *setprotoent()* function shall open a connection to the database, and set the next entry to the
 9110 first entry. If the *stayopen* argument is non-zero, the connection to the network protocol database
 9111 shall not be closed after each call to *getprotoent()* (either directly, or indirectly through one of the
 9112 other *getproto**(*)* functions), and the implementation may maintain an open file descriptor for
 9113 the database.

9114 The *getprotobyname()* function shall search the database from the beginning and find the first
 9115 entry for which the protocol name specified by *name* matches the *p_name* member, opening and
 9116 closing a connection to the database as necessary.

9117 The *getprotobynumber()* function shall search the database from the beginning and find the first
 9118 entry for which the protocol number specified by *proto* matches the *p_proto* member, opening
 9119 and closing a connection to the database as necessary.

9120 The *getprotoent()* function shall read the next entry of the database, opening and closing a
 9121 connection to the database as necessary.

9122 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions shall each return a pointer
 9123 to a **protoent** structure, the members of which shall contain the fields of an entry in the network
 9124 protocol database.

9125 The *endprotoent()* function shall close the connection to the database, releasing any open file
 9126 descriptor.

9127 These functions need not be reentrant. A function that is not required to be reentrant is not
 9128 required to be thread-safe.

9129 **RETURN VALUE**

9130 Upon successful completion, *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* return a
 9131 pointer to a **protoent** structure if the requested entry was found, and a null pointer if the end of
 9132 the database was reached or the requested entry was not found. Otherwise, a null pointer is
 9133 returned.

9134 **ERRORS**

9135 No errors are defined.

9136 **EXAMPLES**

9137 None.

9138 **APPLICATION USAGE**

9139 The *getprotobyname()*, *getprotobynumber()*, and *getprotoent()* functions may return pointers to
9140 static data, which may be overwritten by subsequent calls to any of these functions.

9141 **RATIONALE**

9142 None.

9143 **FUTURE DIRECTIONS**

9144 None.

9145 **SEE ALSO**9146 The Base Definitions volume of IEEE Std 1003.1-2001, <**netdb.h**>9147 **CHANGE HISTORY**

9148 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9149 **NAME**

9150 endpwent, getpwent, setpwent — user database functions

9151 **SYNOPSIS**9152 xSI `#include <pwd.h>`9153 `void endpwent(void);`9154 `struct passwd *getpwent(void);`9155 `void setpwent(void);`

9156

9157 **DESCRIPTION**

9158 These functions shall retrieve information about users.

9159 The *getpwent()* function shall return a pointer to a structure containing the broken-out fields of
 9160 an entry in the user database. Each entry in the user database contains a **passwd** structure. When
 9161 first called, *getpwent()* shall return a pointer to a **passwd** structure containing the first entry in
 9162 the user database. Thereafter, it shall return a pointer to a **passwd** structure containing the next
 9163 entry in the user database. Successive calls can be used to search the entire user database.

9164 If an end-of-file or an error is encountered on reading, *getpwent()* shall return a null pointer.

9165 An implementation that provides extended security controls may impose further
 9166 implementation-defined restrictions on accessing the user database. In particular, the system
 9167 may deny the existence of some or all of the user database entries associated with users other
 9168 than the caller.

9169 The *setpwent()* function effectively rewinds the user database to allow repeated searches.9170 The *endpwent()* function may be called to close the user database when processing is complete.

9171 These functions need not be reentrant. A function that is not required to be reentrant is not
 9172 required to be thread-safe.

9173 **RETURN VALUE**9174 The *getpwent()* function shall return a null pointer on end-of-file or error.9175 **ERRORS**9176 The *getpwent()*, *setpwent()*, and *endpwent()* functions may fail if:

9177 [EIO] An I/O error has occurred.

9178 In addition, *getpwent()* and *setpwent()* may fail if:

9179 [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

9180 [ENFILE] The maximum allowable number of files is currently open in the system.

9181 The return value may point to a static area which is overwritten by a subsequent call to
 9182 *getpwuid()*, *getpwnam()*, or *getpwent()*.

9183 **EXAMPLES**9184 **Searching the User Database**

9185 The following example uses the *getpwent()* function to get successive entries in the user
9186 database, returning a pointer to a **passwd** structure that contains information about each user.
9187 The call to *endpwent()* closes the user database and cleans up.

```
9188 #include <pwd.h>
9189 ...
9190 struct passwd *p;
9191 ...
9192 while ((p = getpwent ()) != NULL) {
9193     ...
9194 }
9195 endpwent();
9196 ...
```

9197 **APPLICATION USAGE**

9198 These functions are provided due to their historical usage. Applications should avoid
9199 dependencies on fields in the password database, whether the database is a single file, or where
9200 in the file system name space the database resides. Applications should use *getpwuid()*
9201 whenever possible because it avoids these dependencies.

9202 **RATIONALE**

9203 None.

9204 **FUTURE DIRECTIONS**

9205 None.

9206 **SEE ALSO**

9207 *endgrent()*, *getlogin()*, *getpwnam()*, *getpwuid()*, the Base Definitions volume of
9208 IEEE Std 1003.1-2001, **<pwd.h>**

9209 **CHANGE HISTORY**

9210 First released in Issue 4, Version 2.

9211 **Issue 5**

9212 Moved from X/OPEN UNIX extension to BASE.

9213 Normative text previously in the APPLICATION USAGE section is moved to the RETURN
9214 VALUE section.

9215 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9216 **Issue 6**

9217 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

9218 **NAME**

9219 endservent, getservbyname, getservbyport, getservent, setservent — network services database
9220 functions

9221 **SYNOPSIS**

```
9222 #include <netdb.h>

9223 void endservent(void);
9224 struct servent *getservbyname(const char *name, const char *proto);
9225 struct servent *getservbyport(int port, const char *proto);
9226 struct servent *getservent(void);
9227 void setservent(int stayopen);
```

9228 **DESCRIPTION**

9229 These functions shall retrieve information about network services. This information is
9230 considered to be stored in a database that can be accessed sequentially or randomly. The
9231 implementation of this database is unspecified.

9232 The *setservent()* function shall open a connection to the database, and set the next entry to the
9233 first entry. If the *stayopen* argument is non-zero, the *net* database shall not be closed after each
9234 call to the *getservent()* function (either directly, or indirectly through one of the other *getserv*()*
9235 functions), and the implementation may maintain an open file descriptor for the database.

9236 The *getservent()* function shall read the next entry of the database, opening and closing a
9237 connection to the database as necessary.

9238 The *getservbyname()* function shall search the database from the beginning and find the first
9239 entry for which the service name specified by *name* matches the *s_name* member and the protocol
9240 name specified by *proto* matches the *s_proto* member, opening and closing a connection to the
9241 database as necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be
9242 matched.

9243 The *getservbyport()* function shall search the database from the beginning and find the first entry
9244 for which the port specified by *port* matches the *s_port* member and the protocol name specified
9245 by *proto* matches the *s_proto* member, opening and closing a connection to the database as
9246 necessary. If *proto* is a null pointer, any value of the *s_proto* member shall be matched. The *port*
9247 argument shall be in network byte order.

9248 The *getservbyname()*, *getservbyport()*, and *getservent()* functions shall each return a pointer to a
9249 **servent** structure, the members of which shall contain the fields of an entry in the network
9250 services database.

9251 The *endservent()* function shall close the database, releasing any open file descriptor.

9252 These functions need not be reentrant. A function that is not required to be reentrant is not
9253 required to be thread-safe.

9254 **RETURN VALUE**

9255 Upon successful completion, *getservbyname()*, *getservbyport()*, and *getservent()* return a pointer to
9256 a **servent** structure if the requested entry was found, and a null pointer if the end of the database
9257 was reached or the requested entry was not found. Otherwise, a null pointer is returned.

9258 **ERRORS**

9259 No errors are defined.

9260 **EXAMPLES**

9261 None.

9262 **APPLICATION USAGE**9263 The *port* argument of *getservbyport()* need not be compatible with the port values of all address
9264 families.9265 The *getservbyname()*, *getservbyport()*, and *getservent()* functions may return pointers to static
9266 data, which may be overwritten by subsequent calls to any of these functions.9267 **RATIONALE**

9268 None.

9269 **FUTURE DIRECTIONS**

9270 None.

9271 **SEE ALSO**9272 *endhostent()*, *endprotoent()*, *htonl()*, *inet_addr()*, the Base Definitions volume of
9273 IEEE Std 1003.1-2001, <**netdb.h**>9274 **CHANGE HISTORY**

9275 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

9276 **NAME**

9277 endutxent, getutxent, getutxid, getutxline, pututxline, setutxent — user accounting database
 9278 functions

9279 **SYNOPSIS**

```
9280 xSI #include <utmpx.h>

9281 void endutxent(void);
9282 struct utmpx *getutxent(void);
9283 struct utmpx *getutxid(const struct utmpx *id);
9284 struct utmpx *getutxline(const struct utmpx *line);
9285 struct utmpx *pututxline(const struct utmpx *utmpx);
9286 void setutxent(void);
9287
```

9288 **DESCRIPTION**

9289 These functions shall provide access to the user accounting database.

9290 The *getutxent()* function shall read the next entry from the user accounting database. If the
 9291 database is not already open, it shall open it. If it reaches the end of the database, it shall fail.

9292 The *getutxid()* function shall search forward from the current point in the database. If the
 9293 *ut_type* value of the **utmpx** structure pointed to by *id* is *BOOT_TIME*, *OLD_TIME*, or
 9294 *NEW_TIME*, then it shall stop when it finds an entry with a matching *ut_type* value. If the
 9295 *ut_type* value is *INIT_PROCESS*, *LOGIN_PROCESS*, *USER_PROCESS*, or *DEAD_PROCESS*,
 9296 then it shall stop when it finds an entry whose type is one of these four and whose *ut_id* member
 9297 matches the *ut_id* member of the **utmpx** structure pointed to by *id*. If the end of the database is
 9298 reached without a match, *getutxid()* shall fail.

9299 The *getutxline()* function shall search forward from the current point in the database until it
 9300 finds an entry of the type *LOGIN_PROCESS* or *USER_PROCESS* which also has a *ut_line* value
 9301 matching that in the **utmpx** structure pointed to by *line*. If the end of the database is reached
 9302 without a match, *getutxline()* shall fail.

9303 The *getutxid()* or *getutxline()* function may cache data. For this reason, to use *getutxline()* to
 9304 search for multiple occurrences, the application shall zero out the static data after each success,
 9305 or *getutxline()* may return a pointer to the same **utmpx** structure.

9306 There is one exception to the rule about clearing the structure before further reads are done. The
 9307 implicit read done by *pututxline()* (if it finds that it is not already at the correct place in the user
 9308 accounting database) shall not modify the static structure returned by *getutxent()*, *getutxid()*, or
 9309 *getutxline()*, if the application has modified this structure and passed the pointer back to
 9310 *pututxline()*.

9311 For all entries that match a request, the *ut_type* member indicates the type of the entry. Other
 9312 members of the entry shall contain meaningful data based on the value of the *ut_type* member as
 9313 follows:

ut_type Member	Other Members with Meaningful Data
EMPTY	No others
BOOT_TIME	<i>ut_tv</i>
OLD_TIME	<i>ut_tv</i>
NEW_TIME	<i>ut_tv</i>
USER_PROCESS	<i>ut_id</i> , <i>ut_user</i> (login name of the user), <i>ut_line</i> , <i>ut_pid</i> , <i>ut_tv</i>
INIT_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>
LOGIN_PROCESS	<i>ut_id</i> , <i>ut_user</i> (implementation-defined name of the login process), <i>ut_pid</i> , <i>ut_tv</i>
DEAD_PROCESS	<i>ut_id</i> , <i>ut_pid</i> , <i>ut_tv</i>

An implementation that provides extended security controls may impose implementation-defined restrictions on accessing the user accounting database. In particular, the system may deny the existence of some or all of the user accounting database entries associated with users other than the caller.

If the process has appropriate privileges, the *pututxline()* function shall write out the structure into the user accounting database. It shall use *getutxid()* to search for a record that satisfies the request. If this search succeeds, then the entry shall be replaced. Otherwise, a new entry shall be made at the end of the user accounting database.

The *endutxent()* function shall close the user accounting database.

The *setutxent()* function shall reset the input to the beginning of the database. This should be done before each search for a new entry if it is desired that the entire database be examined.

These functions need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE

Upon successful completion, *getutxent()*, *getutxid()*, and *getutxline()* shall return a pointer to a **utmpx** structure containing a copy of the requested entry in the user accounting database. Otherwise, a null pointer shall be returned.

The return value may point to a static area which is overwritten by a subsequent call to *getutxid()* or *getutxline()*.

Upon successful completion, *pututxline()* shall return a pointer to a **utmpx** structure containing a copy of the entry added to the user accounting database. Otherwise, a null pointer shall be returned.

The *endutxent()* and *setutxent()* functions shall not return a value.

ERRORS

No errors are defined for the *endutxent()*, *getutxent()*, *getutxid()*, *getutxline()*, and *setutxent()* functions.

The *pututxline()* function may fail if:

[EPERM] The process does not have appropriate privileges.

9353 **EXAMPLES**

9354 None.

9355 **APPLICATION USAGE**9356 The sizes of the arrays in the structure can be found using the *sizeof* operator.9357 **RATIONALE**

9358 None.

9359 **FUTURE DIRECTIONS**

9360 None.

9361 **SEE ALSO**

9362 The Base Definitions volume of IEEE Std 1003.1-2001, <utmpx.h>

9363 **CHANGE HISTORY**

9364 First released in Issue 4, Version 2.

9365 **Issue 5**

9366 Moved from X/OPEN UNIX extension to BASE.

9367 Normative text previously in the APPLICATION USAGE section is moved to the
9368 DESCRIPTION.

9369 A note indicating that these functions need not be reentrant is added to the DESCRIPTION.

9370 **Issue 6**

9371 In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

9372 **NAME**9373 `environ` — array of character pointers to the environment strings9374 **SYNOPSIS**9375 `extern char **environ;`9376 **DESCRIPTION**9377 Refer to the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables
9378 and *exec*.

9379 **NAME**

9380 erand48 — generate uniformly distributed pseudo-random numbers

9381 **SYNOPSIS**

9382 xSI #include <stdlib.h>

9383 double erand48(unsigned short xsubi[3]);

9384

9385 **DESCRIPTION**9386 Refer to *drand48()*.

9387 **NAME**

9388 erf, erff, erfl — error functions

9389 **SYNOPSIS**

9390 #include <math.h>

9391 double erf(double x);

9392 float erff(float x);

9393 long double erfl(long double x);

9394 **DESCRIPTION**

9395 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 9396 conflict between the requirements described here and the ISO C standard is unintentional. This
 9397 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9398 These functions shall compute the error function of their argument x , defined as:

$$9399 \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$$

9400 An application wishing to check for error situations should set *errno* to zero and call
 9401 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 9402 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 9403 zero, an error has occurred.

9404 **RETURN VALUE**

9405 Upon successful completion, these functions shall return the value of the error function.

9406 MX If x is NaN, a NaN shall be returned.

9407 If x is ± 0 , ± 0 shall be returned.

9408 If x is $\pm \text{Inf}$, ± 1 shall be returned.

9409 If x is subnormal, a range error may occur, and $2 * x / \text{sqrt}(\pi)$ should be returned.

9410 **ERRORS**

9411 These functions may fail if:

9412 MX **Range Error** The result underflows.

9413 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 9414 then *errno* shall be set to [ERANGE]. If the integer expression
 9415 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 9416 floating-point exception shall be raised.

9417 **EXAMPLES**

9418 None.

9419 **APPLICATION USAGE**

9420 Underflow occurs when $|x| < \text{DBL\_MIN} * (\text{sqrt}(\pi) / 2)$.

9421 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 9422 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

9423 **RATIONALE**

9424 None.

9425 **FUTURE DIRECTIONS**

9426 None.

9427 **SEE ALSO**

9428 *erfc()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,
9429 Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

9430 **CHANGE HISTORY**

9431 First released in Issue 1. Derived from Issue 1 of the SVID.

9432 **Issue 5**

9433 The DESCRIPTION is updated to indicate how an application should check for an error. This
9434 text was previously published in the APPLICATION USAGE section.

9435 **Issue 6**9436 The *erf()* function is no longer marked as an extension.9437 The *erfc()* function is split out onto its own reference page. |9438 The *erfff()* and *erfl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

9439 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
9440 revised to align with the ISO/IEC 9899:1999 standard.

9441 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
9442 marked.

9443 **NAME**

9444 erfc, erfcf, erfcl — complementary error functions

9445 **SYNOPSIS**

9446 #include <math.h>

9447 double erfc(double x);

9448 float erfcf(float x);

9449 long double erfcl(long double x);

9450 **DESCRIPTION**

9451 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 9452 conflict between the requirements described here and the ISO C standard is unintentional. This
 9453 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

9454 These functions shall compute the complementary error function $1.0 - \text{erf}(x)$.

9455 An application wishing to check for error situations should set *errno* to zero and call
 9456 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 9457 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 9458 zero, an error has occurred.

9459 **RETURN VALUE**9460 Upon successful completion, these functions shall return the value of the complementary error
9461 function.

9462 If the correct value would cause underflow and is not representable, a range error may occur
 9463 **MX** and either 0.0 (if representable), or an implementation-defined value shall be returned.

9464 **MX** If *x* is NaN, a NaN shall be returned.9465 If *x* is ± 0 , +1 shall be returned.9466 If *x* is $-\text{Inf}$, +2 shall be returned.9467 If *x* is $+\text{Inf}$, +0 shall be returned.

9468 If the correct value would cause underflow and is representable, a range error may occur and the
 9469 correct value shall be returned.

9470 **ERRORS**

9471 These functions may fail if:

9472 Range Error The result underflows.

9473 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 9474 then *errno* shall be set to [ERANGE]. If the integer expression
 9475 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 9476 floating-point exception shall be raised.

9477 **EXAMPLES**

9478 None.

9479 **APPLICATION USAGE**

9480 The *erfc()* function is provided because of the extreme loss of relative accuracy if *erf(x)* is called
 9481 for large *x* and the result subtracted from 1.0.

9482 Note for IEEE Std 754-1985 **double**, $26.55 < x$ implies *erfc(x)* has underflowed.

9483 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 9484 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

9485 **RATIONALE**

9486 None.

9487 **FUTURE DIRECTIONS**

9488 None.

9489 **SEE ALSO**

9490 *erf()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,
9491 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

9492 **CHANGE HISTORY**

9493 First released in Issue 1. Derived from Issue 1 of the SVID.

9494 **Issue 5**

9495 The DESCRIPTION is updated to indicate how an application should check for an error. This
9496 text was previously published in the APPLICATION USAGE section.

9497 **Issue 6**9498 The *erfc()* function is no longer marked as an extension.9499 These functions are split out from the *erf()* reference page.

9500 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
9501 revised to align with the ISO/IEC 9899:1999 standard.

9502 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
9503 marked.

9504 **NAME**

9505 erff, erfl — error functions

9506 **SYNOPSIS**

9507 #include <math.h>

9508 float erff(float x);

9509 long double erfl(long double x);

9510 **DESCRIPTION**9511 Refer to *erf()*.

9512 **NAME**

9513 errno — error return value

9514 **SYNOPSIS**

9515 #include <errno.h>

9516 **DESCRIPTION**9517 The lvalue *errno* is used by many functions to return error values.

9518 Many functions provide an error number in *errno*, which has type **int** and is defined in
9519 <**errno.h**>. The value of *errno* shall be defined only after a call to a function for which it is
9520 explicitly stated to be set and until it is changed by the next function call or if the application
9521 assigns it a value. The value of *errno* should only be examined when it is indicated to be valid by
9522 a function's return value. Applications shall obtain the definition of *errno* by the inclusion of
9523 <**errno.h**>. No function in this volume of IEEE Std 1003.1-2001 shall set *errno* to 0.

9524 It is unspecified whether *errno* is a macro or an identifier declared with external linkage. If a
9525 macro definition is suppressed in order to access an actual object, or a program defines an
9526 identifier with the name *errno*, the behavior is undefined.

9527 The symbolic values stored in *errno* are documented in the ERRORS sections on all relevant
9528 pages.

9529 **RETURN VALUE**

9530 None.

9531 **ERRORS**

9532 None.

9533 **EXAMPLES**

9534 None.

9535 **APPLICATION USAGE**

9536 Previously both POSIX and X/Open documents were more restrictive than the ISO C standard
9537 in that they required *errno* to be defined as an external variable, whereas the ISO C standard
9538 required only that *errno* be defined as a modifiable lvalue with type **int**.

9539 An application that needs to examine the value of *errno* to determine the error should set it to 0
9540 before a function call, then inspect it before a subsequent function call.

9541 **RATIONALE**

9542 None.

9543 **FUTURE DIRECTIONS**

9544 None.

9545 **SEE ALSO**9546 Section 2.3, the Base Definitions volume of IEEE Std 1003.1-2001, <**errno.h**>9547 **CHANGE HISTORY**

9548 First released in Issue 1. Derived from Issue 1 of the SVID.

9549 **Issue 5**

9550 The following sentence is deleted from the DESCRIPTION: “The value of *errno* is 0 at program
9551 start-up, but is never set to 0 by any XSI function”. The DESCRIPTION also no longer states that
9552 conforming implementations may support the declaration:

9553 extern int errno;

9554 **Issue 6**

9555 Obsolescent text regarding defining *errno* as:

9556 `extern int errno`

9557 is removed.

9558 Text regarding no function setting *errno* to zero to indicate an error is changed to no function
9559 shall set *errno* to zero. This is for alignment with the ISO / IEC 9899:1999 standard.

NAME

environ, execl, execv, execl, execve, execlp, execvp — execute a file

SYNOPSIS

```
#include <unistd.h>

extern char **environ;
int execl(const char *path, const char *arg0, ... /*, (char *)0 */);
int execv(const char *path, char *const argv[]);
int execl(const char *path, const char *arg0, ... /*,
(char *)0, char *const envp[] */);
int execve(const char *path, char *const argv[], char *const envp[]);
int execlp(const char *file, const char *arg0, ... /*, (char *)0 */);
int execvp(const char *file, char *const argv[]);
```

DESCRIPTION

The *exec* family of functions shall replace the current process image with a new process image. The new image shall be constructed from a regular, executable file called the *new process image file*. There shall be no return from a successful *exec*, because the calling process image is overlaid by the new process image.

When a C-language program is executed as a result of this call, it shall be entered as a C-language function call as follows:

```
int main (int argc, char *argv[]);
```

where *argc* is the argument count and *argv* is an array of character pointers to the arguments themselves. In addition, the following variable:

```
extern char **environ;
```

is initialized as a pointer to an array of character pointers to the environment strings. The *argv* and *environ* arrays are each terminated by a null pointer. The null pointer terminating the *argv* array is not counted in *argc*.

THR Conforming multi-threaded applications shall not use the *environ* variable to access or modify any environment variable while any other thread is concurrently modifying any environment variable. A call to any function dependent on any environment variable shall be considered a use of the *environ* variable to access that environment variable.

The arguments specified by a program with one of the *exec* functions shall be passed on to the new process image in the corresponding *main()* arguments.

The argument *path* points to a pathname that identifies the new process image file.

The argument *file* is used to construct a pathname that identifies the new process image file. If the *file* argument contains a slash character, the *file* argument shall be used as the pathname for this file. Otherwise, the path prefix for this file is obtained by a search of the directories passed as the environment variable *PATH* (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If this environment variable is not present, the results of the search are implementation-defined.

There are two distinct ways in which the contents of the process image file may cause the execution to fail, distinguished by the setting of *errno* to either [ENOEXEC] or [EINVAL] (see the ERRORS section). In the cases where the other members of the *exec* family of functions would fail and set *errno* to [ENOEXEC], the *execlp()* and *execvp()* functions shall execute a command interpreter and the environment of the executed command shall be as if the process invoked the *sh* utility using *execl()* as follows:

9605 `execl(<shell path>, arg0, file, arg1, ..., (char *)0);`

9606 where *<shell path>* is an unspecified pathname for the *sh* utility, *file* is the process image file, and
 9607 for *execvp()*, where *arg0*, *arg1*, and so on correspond to the values passed to *execvp()* in *argv*[0],
 9608 *argv*[1], and so on.

9609 The arguments represented by *arg0*,... are pointers to null-terminated character strings. These
 9610 strings shall constitute the argument list available to the new process image. The list is
 9611 terminated by a null pointer. The argument *arg0* should point to a filename that is associated
 9612 with the process being started by one of the *exec* functions.

9613 The argument *argv* is an array of character pointers to null-terminated strings. The application
 9614 shall ensure that the last member of this array is a null pointer. These strings shall constitute the
 9615 argument list available to the new process image. The value in *argv*[0] should point to a filename
 9616 that is associated with the process being started by one of the *exec* functions.

9617 The argument *envp* is an array of character pointers to null-terminated strings. These strings
 9618 shall constitute the environment for the new process image. The *envp* array is terminated by a
 9619 null pointer.

9620 For those forms not containing an *envp* pointer (*execl()*, *execv()*, *execlp()*, and *execvp()*), the
 9621 environment for the new process image shall be taken from the external variable *environ* in the
 9622 calling process.

9623 The number of bytes available for the new process' combined argument and environment lists is
 9624 {ARG_MAX}. It is implementation-defined whether null terminators, pointers, and/or any
 9625 alignment bytes are included in this total.

9626 File descriptors open in the calling process image shall remain open in the new process image,
 9627 except for those whose close-on-exec flag FD_CLOEXEC is set. For those file descriptors that
 9628 remain open, all attributes of the open file description remain unchanged. For any file descriptor
 9629 that is closed for this reason, file locks are removed as a result of the close as described in *close()*.
 9630 Locks that are not removed by closing of file descriptors remain unchanged.

9631 If file descriptors 0, 1, and 2 would otherwise be closed after a successful call to one of the *exec* |
 9632 family of functions, and the new process image file has the set-user-ID or set-group-ID file mode |
 9633 bits set, and the ST_NOSUID bit is not set for the file system containing the new process image |
 9634 file, implementations may open an unspecified file for each of these file descriptors in the new |
 9635 process image. |

9636 Directory streams open in the calling process image shall be closed in the new process image.

9637 The state of the floating-point environment in the new process image shall be set to the default.

9638 XSI The state of conversion descriptors and message catalog descriptors in the new process image is
 9639 undefined. For the new process image, the equivalent of:

9640 `setlocale(LC_ALL, "C")`

9641 shall be executed at start-up.

9642 Signals set to the default action (SIG_DFL) in the calling process image shall be set to the default
 9643 action in the new process image. Except for SIGCHLD, signals set to be ignored (SIG_IGN) by
 9644 the calling process image shall be set to be ignored by the new process image. Signals set to be
 9645 caught by the calling process image shall be set to the default action in the new process image
 9646 (see **<signal.h>**). If the SIGCHLD signal is set to be ignored by the calling process image, it is
 9647 unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the new
 9648 XSI process image. After a successful call to any of the *exec* functions, alternate signal stacks are not
 9649 preserved and the SA_ONSTACK flag shall be cleared for all signals.

9650		After a successful call to any of the <i>exec</i> functions, any functions previously registered by <i>atexit()</i>
9651		are no longer registered.
9652	XSI	If the ST_NOSUID bit is set for the file system containing the new process image file, then the
9653		effective user ID, effective group ID, saved set-user-ID, and saved set-group-ID are unchanged
9654		in the new process image. Otherwise, if the set-user-ID mode bit of the new process image file is
9655		set, the effective user ID of the new process image shall be set to the user ID of the new process
9656		image file. Similarly, if the set-group-ID mode bit of the new process image file is set, the
9657		effective group ID of the new process image shall be set to the group ID of the new process
9658		image file. The real user ID, real group ID, and supplementary group IDs of the new process
9659		image shall remain the same as those of the calling process image. The effective user ID and
9660		effective group ID of the new process image shall be saved (as the saved set-user-ID and the
9661		saved set-group-ID) for use by <i>setuid()</i> .
9662	XSI	Any shared memory segments attached to the calling process image shall not be attached to the
9663		new process image.
9664	SEM	Any named semaphores open in the calling process shall be closed as if by appropriate calls to
9665		<i>sem_close()</i> .
9666	TYM	Any blocks of typed memory that were mapped in the calling process are unmapped, as if
9667		<i>munmap()</i> was implicitly called to unmap them.
9668	ML	Memory locks established by the calling process via calls to <i>mlockall()</i> or <i>mlock()</i> shall be
9669		removed. If locked pages in the address space of the calling process are also mapped into the
9670		address spaces of other processes and are locked by those processes, the locks established by the
9671		other processes shall be unaffected by the call by this process to the <i>exec</i> function. If the <i>exec</i>
9672		function fails, the effect on memory locks is unspecified.
9673	MF SHM	Memory mappings created in the process are unmapped before the address space is rebuilt for
9674		the new process image.
9675	PS	For the SCHED_FIFO and SCHED_RR scheduling policies, the policy and priority settings shall
9676		not be changed by a call to an <i>exec</i> function. For other scheduling policies, the policy and priority
9677		settings on <i>exec</i> are implementation-defined.
9678	TMR	Per-process timers created by the calling process shall be deleted before replacing the current
9679		process image with the new process image.
9680	MSG	All open message queue descriptors in the calling process shall be closed, as described in
9681		<i>mq_close()</i> .
9682	AIO	Any outstanding asynchronous I/O operations may be canceled. Those asynchronous I/O
9683		operations that are not canceled shall complete as if the <i>exec</i> function had not yet occurred, but
9684		any associated signal notifications shall be suppressed. It is unspecified whether the <i>exec</i>
9685		function itself blocks awaiting such I/O completion. In no event, however, shall the new process
9686		image created by the <i>exec</i> function be affected by the presence of outstanding asynchronous I/O
9687		operations at the time the <i>exec</i> function is called. Whether any I/O is canceled, and which I/O
9688		may be canceled upon <i>exec</i> , is implementation-defined.
9689	CPT	The new process image shall inherit the CPU-time clock of the calling process image. This
9690		inheritance means that the process CPU-time clock of the process being <i>exec</i> -ed shall not be
9691		reinitialized or altered as a result of the <i>exec</i> function other than to reflect the time spent by the
9692		process executing the <i>exec</i> function itself.
9693	TCT	The initial value of the CPU-time clock of the initial thread of the new process image shall be set
9694		to zero.

9695	TRC	If the calling process is being traced, the new process image shall continue to be traced into the same trace stream as the original process image, but the new process image shall not inherit the mapping of trace event names to trace event type identifiers that was defined by calls to the <i>posix_trace_eventid_open()</i> or the <i>posix_trace_trid_eventid_open()</i> functions in the calling process image.
9696		
9697		
9698		
9699		
9700		If the calling process is a trace controller process, any trace streams that were created by the calling process shall be shut down as described in the <i>posix_trace_shutdown()</i> function.
9701		
9702		The new process shall inherit at least the following attributes from the calling process image:
9703	XSI	• Nice value (see <i>nice()</i>)
9704	XSI	• <i>semadj</i> values (see <i>semop()</i>)
9705		• Process ID
9706		• Parent process ID
9707		• Process group ID
9708		• Session membership
9709		• Real user ID
9710		• Real group ID
9711		• Supplementary group IDs
9712		• Time left until an alarm clock signal (see <i>alarm()</i>)
9713		• Current working directory
9714		• Root directory
9715		• File mode creation mask (see <i>umask()</i>)
9716	XSI	• File size limit (see <i>ulimit()</i>)
9717		• Process signal mask (see <i>sigprocmask()</i>)
9718		• Pending signal (see <i>sigpending()</i>)
9719		• <i>tms_utime</i> , <i>tms_stime</i> , <i>tms_cutime</i> , and <i>tms_cstime</i> (see <i>times()</i>)
9720	XSI	• Resource limits
9721	XSI	• Controlling terminal
9722	XSI	• Interval timers
9723		All other process attributes defined in this volume of IEEE Std 1003.1-2001 shall be the same in the new and old process images. The inheritance of process attributes not defined by this volume of IEEE Std 1003.1-2001 is implementation-defined.
9724		
9725		
9726		A call to any <i>exec</i> function from a process with more than one thread shall result in all threads being terminated and the new executable image being loaded and executed. No destructor functions shall be called.
9727		
9728		
9729		Upon successful completion, the <i>exec</i> functions shall mark for update the <i>st_atime</i> field of the file.
9730		If an <i>exec</i> function failed but was able to locate the process image file, whether the <i>st_atime</i> field is marked for update is unspecified. Should the <i>exec</i> function succeed, the process image file shall be considered to have been opened with <i>open()</i> . The corresponding <i>close()</i> shall be considered to occur at a time after this open, but before process termination or successful completion of a subsequent call to one of the <i>exec</i> functions, <i>posix_spawn()</i> , or <i>posix_spawnp()</i> .
9731		
9732		
9733		
9734		

9735 The *argv[]* and *envp[]* arrays of pointers and the strings to which those arrays point shall not be
 9736 modified by a call to one of the *exec* functions, except as a consequence of replacing the process
 9737 image.

9738 XSI The saved resource limits in the new process image are set to be a copy of the process'
 9739 corresponding hard and soft limits.

9740 RETURN VALUE

9741 If one of the *exec* functions returns to the calling process image, an error has occurred; the return
 9742 value shall be -1 , and *errno* shall be set to indicate the error.

9743 ERRORS

9744 The *exec* functions shall fail if:

9745 [E2BIG] The number of bytes used by the new process image's argument list and
 9746 environment list is greater than the system-imposed limit of {ARG_MAX}
 9747 bytes.

9748 [EACCES] Search permission is denied for a directory listed in the new process image
 9749 file's path prefix, or the new process image file denies execution permission,
 9750 or the new process image file is not a regular file and the implementation does
 9751 not support execution of files of its type.

9752 [EINVAL] The new process image file has the appropriate permission and has a
 9753 recognized executable binary format, but the system does not support
 9754 execution of a file with this format.

9755 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path* or *file*
 9756 argument.

9757 [ENAMETOOLONG]
 9758 The length of the *path* or *file* arguments exceeds {PATH_MAX} or a pathname
 9759 component is longer than {NAME_MAX}.

9760 [ENOENT] A component of *path* or *file* does not name an existing file or *path* or *file* is an
 9761 empty string.

9762 [ENOTDIR] A component of the new process image file's path prefix is not a directory.

9763 The *exec* functions, except for *execlp()* and *execvp()*, shall fail if:

9764 [ENOEXEC] The new process image file has the appropriate access permission but has an
 9765 unrecognized format.

9766 The *exec* functions may fail if:

9767 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 9768 resolution of the *path* or *file* argument.

9769 [ENAMETOOLONG]
 9770 As a result of encountering a symbolic link in resolution of the *path* argument,
 9771 the length of the substituted pathname string exceeded {PATH_MAX}.

9772 [ENOMEM] The new process image requires more memory than is allowed by the
 9773 hardware or system-imposed memory management constraints.

9774 [ETXTBSY] The new process image file is a pure procedure (shared text) file that is
 9775 currently open for writing by some process.

9776 **EXAMPLES**9777 **Using execl()**

9778 The following example executes the *ls* command, specifying the pathname of the executable
9779 (**/bin/ls**) and using arguments supplied directly to the command to produce single-column
9780 output.

```
9781 #include <unistd.h>
9782 int ret;
9783 ...
9784 ret = execl ("/bin/ls", "ls", "-l", (char *)0);
```

9785 **Using execle()**

9786 The following example is similar to **Using execl()**. In addition, it specifies the environment for
9787 the new process image using the *env* argument.

```
9788 #include <unistd.h>
9789 int ret;
9790 char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
9791 ...
9792 ret = execle ("/bin/ls", "ls", "-l", (char *)0, env);
```

9793 **Using execlp()**

9794 The following example searches for the location of the *ls* command among the directories
9795 specified by the *PATH* environment variable.

```
9796 #include <unistd.h>
9797 int ret;
9798 ...
9799 ret = execlp ("ls", "ls", "-l", (char *)0);
```

9800 **Using execv()**

9801 The following example passes arguments to the *ls* command in the *cmd* array.

```
9802 #include <unistd.h>
9803 int ret;
9804 char *cmd[] = { "ls", "-l", (char *)0 };
9805 ...
9806 ret = execv ("/bin/ls", cmd);
```

Using `execve()`

The following example passes arguments to the *ls* command in the *cmd* array, and specifies the environment for the new process image using the *env* argument.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
char *env[] = { "HOME=/usr/home", "LOGNAME=home", (char *)0 };
...
ret = execve ("/bin/ls", cmd, env);
```

Using `execvp()`

The following example searches for the location of the *ls* command among the directories specified by the *PATH* environment variable, and passes arguments to the *ls* command in the *cmd* array.

```
#include <unistd.h>

int ret;
char *cmd[] = { "ls", "-l", (char *)0 };
...
ret = execvp ("ls", cmd);
```

APPLICATION USAGE

As the state of conversion descriptors and message catalog descriptors in the new process image is undefined, conforming applications should not rely on their use and should close them prior to calling one of the *exec* functions.

Applications that require other than the default POSIX locale should call *setlocale()* with the appropriate parameters to establish the locale of the new process.

The *environ* array should not be accessed directly by the application.

Applications should not depend on file descriptors 0, 1, and 2 being closed after an *exec*. A future version may allow these file descriptors to be automatically opened for any process.

RATIONALE

Early proposals required that the value of *argc* passed to *main()* be “one or greater”. This was driven by the same requirement in drafts of the ISO C standard. In fact, historical implementations have passed a value of zero when no arguments are supplied to the caller of the *exec* functions. This requirement was removed from the ISO C standard and subsequently removed from this volume of IEEE Std 1003.1-2001 as well. The wording, in particular the use of the word *should*, requires a Strictly Conforming POSIX Application to pass at least one argument to the *exec* function, thus guaranteeing that *argc* be one or greater when invoked by such an application. In fact, this is good practice, since many existing applications reference *argv[0]* without first checking the value of *argc*.

The requirement on a Strictly Conforming POSIX Application also states that the value passed as the first argument be a filename associated with the process being started. Although some existing applications pass a pathname rather than a filename in some circumstances, a filename is more generally useful, since the common usage of *argv[0]* is in printing diagnostics. In some cases the filename passed is not the actual filename of the file; for example, many implementations of the *login* utility use a convention of prefixing a hyphen (‘-’) to the actual filename, which indicates to the command interpreter being invoked that it is a “login shell”.

Historically there have been two ways that implementations can *exec* shell scripts.

One common historical implementation is that the *execl()*, *execv()*, *execle()*, and *execve()* functions return an [ENOEXEC] error for any file not recognizable as executable, including a shell script. When the *execlp()* and *execvp()* functions encounter such a file, they assume the file to be a shell script and invoke a known command interpreter to interpret such files. This is now required by IEEE Std 1003.1-2001. These implementations of *execvp()* and *execlp()* only give the [ENOEXEC] error in the rare case of a problem with the command interpreter's executable file. Because of these implementations, the [ENOEXEC] error is not mentioned for *execlp()* or *execvp()*, although implementations can still give it.

Another way that some historical implementations handle shell scripts is by recognizing the first two bytes of the file as the character string "#!" and using the remainder of the first line of the file as the name of the command interpreter to execute.

One potential source of confusion noted by the standard developers is over how the contents of a process image file affect the behavior of the *exec* family of functions. The following is a description of the actions taken:

1. If the process image file is a valid executable (in a format that is executable and valid and having appropriate permission) for this system, then the system executes the file.
2. If the process image file has appropriate permission and is in a format that is executable but not valid for this system (such as a recognized binary for another architecture), then this is an error and *errno* is set to [EINVAL] (see later RATIONALE on [EINVAL]).
3. If the process image file has appropriate permission but is not otherwise recognized:
 - a. If this is a call to *execlp()* or *execvp()*, then they invoke a command interpreter assuming that the process image file is a shell script.
 - b. If this is not a call to *execlp()* or *execvp()*, then an error occurs and *errno* is set to [ENOEXEC].

Applications that do not require to access their arguments may use the form:

```
main(void)
```

as specified in the ISO C standard. However, the implementation will always provide the two arguments *argc* and *argv*, even if they are not used.

Some implementations provide a third argument to *main()* called *envp*. This is defined as a pointer to the environment. The ISO C standard specifies invoking *main()* with two arguments, so implementations must support applications written this way. Since this volume of IEEE Std 1003.1-2001 defines the global variable *environ*, which is also provided by historical implementations and can be used anywhere that *envp* could be used, there is no functional need for the *envp* argument. Applications should use the *getenv()* function rather than accessing the environment directly via either *envp* or *environ*. Implementations are required to support the two-argument calling sequence, but this does not prohibit an implementation from supporting *envp* as an optional third argument.

This volume of IEEE Std 1003.1-2001 specifies that signals set to SIG_IGN remain set to SIG_IGN, and that the process signal mask be unchanged across an *exec*. This is consistent with historical implementations, and it permits some useful functionality, such as the *nohup* command. However, it should be noted that many existing applications wrongly assume that they start with certain signals set to the default action and/or unblocked. In particular, applications written with a simpler signal model that does not include blocking of signals, such as the one in the ISO C standard, may not behave properly if invoked with some signals blocked. Therefore, it is best not to block or ignore signals across *execs* without explicit reason to do so,

and especially not to block signals across *execs* of arbitrary (not closely co-operating) programs.

The *exec* functions always save the value of the effective user ID and effective group ID of the process at the completion of the *exec*, whether or not the set-user-ID or the set-group-ID bit of the process image file is set.

The statement about *argv[]* and *envp[]* being constants is included to make explicit to future writers of language bindings that these objects are completely constant. Due to a limitation of the ISO C standard, it is not possible to state that idea in standard C. Specifying two levels of *const-qualification* for the *argv[]* and *envp[]* parameters for the *exec* functions may seem to be the natural choice, given that these functions do not modify either the array of pointers or the characters to which the function points, but this would disallow existing correct code. Instead, only the array of pointers is noted as constant. The table of assignment compatibility for *dst=src* derived from the ISO C standard summarizes the compatibility:

<i>dst:</i>	char *[]	const char *[]	char *const[]	const char *const[]
<i>src:</i>				
char *[]	VALID	—	VALID	—
const char *[]	—	VALID	—	VALID
char *const[]	—	—	VALID	—
const char *const[]	—	—	—	VALID

Since all existing code has a source type matching the first row, the column that gives the most valid combinations is the third column. The only other possibility is the fourth column, but using it would require a cast on the *argv* or *envp* arguments. It is unfortunate that the fourth column cannot be used, because the declaration a non-expert would naturally use would be that in the second row.

The ISO C standard and this volume of IEEE Std 1003.1-2001 do not conflict on the use of *environ*, but some historical implementations of *environ* may cause a conflict. As long as *environ* is treated in the same way as an entry point (for example, *fork()*), it conforms to both standards. A library can contain *fork()*, but if there is a user-provided *fork()*, that *fork()* is given precedence and no problem ensues. The situation is similar for *environ*: the definition in this volume of IEEE Std 1003.1-2001 is to be used if there is no user-provided *environ* to take precedence. At least three implementations are known to exist that solve this problem.

[E2BIG] The limit {ARG_MAX} applies not just to the size of the argument list, but to the sum of that and the size of the environment list.

[EFAULT] Some historical systems return [EFAULT] rather than [ENOEXEC] when the new process image file is corrupted. They are non-conforming.

[EINVAL] This error condition was added to IEEE Std 1003.1-2001 to allow an implementation to detect executable files generated for different architectures, and indicate this situation to the application. Historical implementations of shells, *execvp()*, and *execlp()* that encounter an [ENOEXEC] error will execute a shell on the assumption that the file is a shell script. This will not produce the desired effect when the file is a valid executable for a different architecture. An implementation may now choose to avoid this problem by returning [EINVAL] when a valid executable for a different architecture is encountered. Some historical implementations return [EINVAL] to indicate that the *path* argument contains a character with the high order bit set. The standard developers chose to deviate from historical practice for the following reasons:

1. The new utilization of [EINVAL] will provide some measure of utility to the user community.
2. Historical use of [EINVAL] is not acceptable in an internationalized operating environment.

[ENAMETOOLONG]

Since the file pathname may be constructed by taking elements in the *PATH* variable and putting them together with the filename, the [ENAMETOOLONG] error condition could also be reached this way.

[ETXTBSY]

System V returns this error when the executable file is currently open for writing by some process. This volume of IEEE Std 1003.1-2001 neither requires nor prohibits this behavior.

Other systems (such as System V) may return [EINTR] from *exec*. This is not addressed by this volume of IEEE Std 1003.1-2001, but implementations may have a window between the call to *exec* and the time that a signal could cause one of the *exec* calls to return with [EINTR].

An explicit statement regarding the floating-point environment (as defined in the **<fenv.h>** header) was added to make it clear that the floating-point environment is set to its default when a call to one of the *exec* functions succeeds. The requirements for inheritance or setting to the default for other process and thread start-up functions is covered by more generic statements in their descriptions and can be summarized as follows:

posix_spawn() Set to default.

fork() Inherit.

pthread_create() Inherit.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

Issue 6

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, behavior is defined for when the process image file is not a valid executable.
- In this issue, `_POSIX_SAVED_IDS` is mandated, thus the effective user ID and effective group ID of the new process image shall be saved (as the saved set-user-ID and the saved set-group-ID) for use by the *setuid()* function.

9987	• The [ELOOP] mandatory error condition is added.
9988	• A second [ENAMETOOLONG] is added as an optional error condition.
9989	• The [ETXTBSY] optional error condition is added.
9990	The following changes were made to align with the IEEE P1003.1a draft standard:
9991	• The [EINVAL] mandatory error condition is added.
9992	• The [ELOOP] optional error condition is added.
9993	The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.
9994	The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for
9995	typed memory.
9996	The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
9997	The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.
9998	IEEE PASC Interpretation 1003.1 #132 is applied.
9999	The DESCRIPTION is updated to make it explicit that the floating-point environment in the new
10000	process image is set to the default.
10001	The DESCRIPTION and RATIONALE are updated to include clarifications of how the contents
10002	of a process image file affect the behavior of the <i>exec</i> functions.
10003	IEEE Std 1003.1-2001 / Cor 1-2002, item XSH / TC1 / D6 / 15 is applied, adding a new paragraph to
10004	the DESCRIPTION and text to the end of the APPLICATION USAGE section. This change
10005	addresses a security concern, where implementations may want to reopen file descriptors 0, 1,
10006	and 2 for programs with the set-user-id or set-group-id file mode bits calling the <i>exec</i> family of
10007	functions.

10008 **NAME**

10009 exit, _Exit, _exit — terminate a process

10010 **SYNOPSIS**

10011 #include <stdlib.h>

10012 void exit(int *status*);10013 void _Exit(int *status*);

10014 #include <unistd.h>

10015 void _exit(int *status*);10016 **DESCRIPTION**

10017 CX For *exit()* and *_Exit()*: The functionality described on this reference page is aligned with the
 10018 ISO C standard. Any conflict between the requirements described here and the ISO C standard is
 10019 unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10020 CX The value of *status* may be 0, EXIT_SUCCESS, EXIT_FAILURE, or any other value, though only
 10021 the least significant 8 bits (that is, *status* & 0377) shall be available to a waiting parent process.

10022 The *exit()* function shall first call all functions registered by *atexit()*, in the reverse order of their
 10023 registration, except that a function is called after any previously registered functions that had
 10024 already been called at the time it was registered. Each function is called as many times as it was
 10025 registered. If, during the call to any such function, a call to the *longjmp()* function is made that
 10026 would terminate the call to the registered function, the behavior is undefined.

10027 If a function registered by a call to *atexit()* fails to return, the remaining registered functions shall
 10028 not be called and the rest of the *exit()* processing shall not be completed. If *exit()* is called more
 10029 than once, the behavior is undefined.

10030 The *exit()* function shall then flush all open streams with unwritten buffered data, close all open
 10031 streams, and remove all files created by *tmpfile()*. Finally, control shall be terminated with the
 10032 consequences described below.

10033 CX The *_Exit()* and *_exit()* functions shall be functionally equivalent.

10034 CX The *_Exit()* and *_exit()* functions shall not call functions registered with *atexit()* nor any
 10035 registered signal handlers. Whether open streams are flushed or closed, or temporary files are
 10036 removed is implementation-defined. Finally, the calling process is terminated with the
 10037 consequences described below.

10038 CX These functions shall terminate the calling process with the following consequences:

10039 **Note:** These consequences are all extensions to the ISO C standard and are not further CX shaded.
 10040 However, XSI extensions are shaded.

10041 XSI • All of the file descriptors, directory streams, conversion descriptors, and message catalog
 10042 descriptors open in the calling process shall be closed.

10043 XSI • If the parent process of the calling process is executing a *wait()* or *waitpid()*, and has neither
 10044 set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, it shall be notified of the calling
 10045 process' termination and the low-order eight bits (that is, bits 0377) of *status* shall be made
 10046 available to it. If the parent is not waiting, the child's status shall be made available to it
 10047 when the parent subsequently executes *wait()* or *waitpid()*.

10048 XSI The semantics of the *waitid()* function shall be equivalent to *wait()*.

10049 XSI • If the parent process of the calling process is not executing a *wait()* or *waitpid()*, and has
 10050 neither set its SA_NOCLDWAIT flag nor set SIGCHLD to SIG_IGN, the calling process shall
 10051 be transformed into a *zombie process*. A *zombie process* is an inactive process and it shall be

10052		deleted at some later time when its parent process executes <code>wait()</code> or <code>waitpid()</code> .
10053	XSI	The semantics of the <code>waitid()</code> function shall be equivalent to <code>wait()</code> .
10054		• Termination of a process does not directly terminate its children. The sending of a <code>SIGHUP</code> signal as described below indirectly terminates children in some circumstances.
10055		
10056		• Either:
10057		If the implementation supports the <code>SIGCHLD</code> signal, a <code>SIGCHLD</code> shall be sent to the parent process.
10058		
10059		Or:
10060	XSI	If the parent process has set its <code>SA_NOCLDWAIT</code> flag, or set <code>SIGCHLD</code> to <code>SIG_IGN</code> , the status shall be discarded, and the lifetime of the calling process shall end immediately. If
10061		<code>SA_NOCLDWAIT</code> is set, it is implementation-defined whether a <code>SIGCHLD</code> signal is sent to
10062		the parent process.
10063		
10064		• The parent process ID of all of the calling process' existing child processes and zombie processes shall be set to the process ID of an implementation-defined system process. That is, these processes shall be inherited by a special system process.
10065		
10066		
10067	XSI	• Each attached shared-memory segment is detached and the value of <code>shm_nattch</code> (see
10068		<code>shmget()</code>) in the data structure associated with its shared memory ID shall be decremented by
10069		1.
10070	XSI	• For each semaphore for which the calling process has set a <code>semadj</code> value (see <code>semop()</code>), that
10071		value shall be added to the <code>semval</code> of the specified semaphore.
10072		• If the process is a controlling process, the <code>SIGHUP</code> signal shall be sent to each process in the
10073		foreground process group of the controlling terminal belonging to the calling process.
10074		• If the process is a controlling process, the controlling terminal associated with the session
10075		shall be disassociated from the session, allowing it to be acquired by a new controlling
10076		process.
10077		• If the exit of the process causes a process group to become orphaned, and if any member of
10078		the newly-orphaned process group is stopped, then a <code>SIGHUP</code> signal followed by a
10079		<code>SIGCONT</code> signal shall be sent to each process in the newly-orphaned process group.
10080	SEM	• All open named semaphores in the calling process shall be closed as if by appropriate calls to
10081		<code>sem_close()</code> .
10082	ML	• Any memory locks established by the process via calls to <code>mlockall()</code> or <code>mlock()</code> shall be
10083		removed. If locked pages in the address space of the calling process are also mapped into the
10084		address spaces of other processes and are locked by those processes, the locks established by
10085		the other processes shall be unaffected by the call by this process to <code>_Exit()</code> or <code>_exit()</code> .
10086	MF SHM	• Memory mappings that were created in the process shall be unmapped before the process is
10087		destroyed.
10088	TYM	• Any blocks of typed memory that were mapped in the calling process shall be unmapped, as
10089		if <code>munmap()</code> was implicitly called to unmap them.
10090	MSG	• All open message queue descriptors in the calling process shall be closed as if by appropriate
10091		calls to <code>mq_close()</code> .
10092	AIO	• Any outstanding cancelable asynchronous I/O operations may be canceled. Those
10093		asynchronous I/O operations that are not canceled shall complete as if the <code>_Exit()</code> or <code>_exit()</code>
10094		operation had not yet occurred, but any associated signal notifications shall be suppressed.

10095 The `_Exit()` or `_exit()` operation may block awaiting such I/O completion. Whether any I/O
 10096 is canceled, and which I/O may be canceled upon `_Exit()` or `_exit()`, is implementation-
 10097 defined.

10098 • Threads terminated by a call to `_Exit()` or `_exit()` shall not invoke their cancellation cleanup
 10099 handlers or per-thread data destructors.

10100 TRC • If the calling process is a trace controller process, any trace streams that were created by the
 10101 calling process shall be shut down as described by the `posix_trace_shutdown()` function, and
 10102 any process' mapping of trace event names to trace event type identifiers built for these trace
 10103 streams may be deallocated.

10104 RETURN VALUE

10105 These functions do not return.

10106 ERRORS

10107 No errors are defined.

10108 EXAMPLES

10109 None.

10110 APPLICATION USAGE

10111 Normally applications should use `exit()` rather than `_Exit()` or `_exit()`.

10112 RATIONALE

10113 Process Termination

10114 Early proposals drew a distinction between normal and abnormal process termination.
 10115 Abnormal termination was caused only by certain signals and resulted in implementation-
 10116 defined “actions”, as discussed below. Subsequent proposals distinguished three types of
 10117 termination: *normal termination* (as in the current specification), *simple abnormal termination*, and
 10118 *abnormal termination with actions*. Again the distinction between the two types of abnormal
 10119 termination was that they were caused by different signals and that implementation-defined
 10120 actions would result in the latter case. Given that these actions were completely
 10121 implementation-defined, the early proposals were only saying when the actions could occur and
 10122 how their occurrence could be detected, but not what they were. This was of little or no use to
 10123 conforming applications, and thus the distinction is not made in this volume of
 10124 IEEE Std 1003.1-2001.

10125 The implementation-defined actions usually include, in most historical implementations, the
 10126 creation of a file named **core** in the current working directory of the process. This file contains an
 10127 image of the memory of the process, together with descriptive information about the process,
 10128 perhaps sufficient to reconstruct the state of the process at the receipt of the signal.

10129 There is a potential security problem in creating a **core** file if the process was set-user-ID and the
 10130 current user is not the owner of the program, if the process was set-group-ID and none of the
 10131 user's groups match the group of the program, or if the user does not have permission to write in
 10132 the current directory. In this situation, an implementation either should not create a **core** file or
 10133 should make it unreadable by the user.

10134 Despite the silence of this volume of IEEE Std 1003.1-2001 on this feature, applications are
 10135 advised not to create files named **core** because of potential conflicts in many implementations.
 10136 Some implementations use a name other than **core** for the file; for example, by appending the
 10137 process ID to the filename.

Terminating a Process

It is important that the consequences of process termination as described occur regardless of whether the process called `_exit()` (perhaps indirectly through `exit()`) or instead was terminated due to a signal or for some other reason. Note that in the specific case of `exit()` this means that the *status* argument to `exit()` is treated in the same way as the *status* argument to `_exit()`.

A language other than C may have other termination primitives than the C-language `exit()` function, and programs written in such a language should use its native termination primitives, but those should have as part of their function the behavior of `_exit()` as described. Implementations in languages other than C are outside the scope of this version of this volume of IEEE Std 1003.1-2001, however.

As required by the ISO C standard, using **return** from `main()` has the same behavior (other than with respect to language scope issues) as calling `exit()` with the returned value. Reaching the end of the `main()` function has the same behavior as calling `exit(0)`.

A value of zero (or `EXIT_SUCCESS`, which is required to be zero) for the argument *status* conventionally indicates successful termination. This corresponds to the specification for `exit()` in the ISO C standard. The convention is followed by utilities such as *make* and various shells, which interpret a zero status from a child process as success. For this reason, applications should not call `exit(0)` or `_exit(0)` when they terminate unsuccessfully; for example, in signal-catching functions.

Historically, the implementation-defined process that inherits children whose parents have terminated without waiting on them is called *init* and has a process ID of 1.

The sending of a `SIGHUP` to the foreground process group when a controlling process terminates corresponds to somewhat different historical implementations. In System V, the kernel sends a `SIGHUP` on termination of (essentially) a controlling process. In 4.2 BSD, the kernel does not send `SIGHUP` in a case like this, but the termination of a controlling process is usually noticed by a system daemon, which arranges to send a `SIGHUP` to the foreground process group with the `vhangup()` function. However, in 4.2 BSD, due to the behavior of the shells that support job control, the controlling process is usually a shell with no other processes in its process group. Thus, a change to make `_exit()` behave this way in such systems should not cause problems with existing applications.

The termination of a process may cause a process group to become orphaned in either of two ways. The connection of a process group to its parent(s) outside of the group depends on both the parents and their children. Thus, a process group may be orphaned by the termination of the last connecting parent process outside of the group or by the termination of the last direct descendant of the parent process(es). In either case, if the termination of a process causes a process group to become orphaned, processes within the group are disconnected from their job control shell, which no longer has any information on the existence of the process group. Stopped processes within the group would languish forever. In order to avoid this problem, newly orphaned process groups that contain stopped processes are sent a `SIGHUP` signal and a `SIGCONT` signal to indicate that they have been disconnected from their session. The `SIGHUP` signal causes the process group members to terminate unless they are catching or ignoring `SIGHUP`. Under most circumstances, all of the members of the process group are stopped if any of them are stopped.

The action of sending a `SIGHUP` and a `SIGCONT` signal to members of a newly orphaned process group is similar to the action of 4.2 BSD, which sends `SIGHUP` and `SIGCONT` to each stopped child of an exiting process. If such children exit in response to the `SIGHUP`, any additional descendants receive similar treatment at that time. In this volume of IEEE Std 1003.1-2001, the signals are sent to the entire process group at the same time. Also, in

10186 this volume of IEEE Std 1003.1-2001, but not in 4.2 BSD, stopped processes may be orphaned, but
 10187 may be members of a process group that is not orphaned; therefore, the action taken at `_exit()`
 10188 must consider processes other than child processes.

10189 It is possible for a process group to be orphaned by a call to `setpgid()` or `setsid()`, as well as by
 10190 process termination. This volume of IEEE Std 1003.1-2001 does not require sending `SIGHUP` and
 10191 `SIGCONT` in those cases, because, unlike process termination, those cases are not caused
 10192 accidentally by applications that are unaware of job control. An implementation can choose to
 10193 send `SIGHUP` and `SIGCONT` in those cases as an extension; such an extension must be
 10194 documented as required in **<signal.h>**.

10195 The ISO/IEC 9899:1999 standard adds the `_Exit()` function that results in immediate program
 10196 termination without triggering signals or `atexit()`-registered functions. In IEEE Std 1003.1-2001,
 10197 this is equivalent to the `_exit()` function.

10198 **FUTURE DIRECTIONS**

10199 None.

10200 **SEE ALSO**

10201 `atexit()`, `close()`, `fclose()`, `longjmp()`, `posix_trace_shutdown()`, `posix_trace_trid_eventid_open()`,
 10202 `semop()`, `shmget()`, `sigaction()`, `wait()`, `waitid()`, `waitpid()`, the Base Definitions volume of
 10203 IEEE Std 1003.1-2001, **<stdlib.h>**, **<unistd.h>**

10204 **CHANGE HISTORY**

10205 First released in Issue 1. Derived from Issue 1 of the SVID.

10206 **Issue 5**

10207 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
 10208 Threads Extension.

10209 Interactions with the `SA_NOCLDWAIT` flag and `SIGCHLD` signal are further clarified.

10210 The values of `status` from `exit()` are better described.

10211 **Issue 6**

10212 Extensions beyond the ISO C standard are marked.

10213 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for
 10214 typed memory.

10215 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 10216 • The `_Exit()` function is included.
- 10217 • The DESCRIPTION is updated.

10218 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

10219 References to the `wait3()` function are removed.

10220 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/16 is applied, correcting grammar in the
 10221 DESCRIPTION.

10222 **NAME**

10223 exp, expf, expl — exponential function

10224 **SYNOPSIS**

10225 #include <math.h>

10226 double exp(double x);

10227 float expf(float x);

10228 long double expl(long double x);

10229 **DESCRIPTION**

10230 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 10231 conflict between the requirements described here and the ISO C standard is unintentional. This
 10232 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10233 These functions shall compute the base-*e* exponential of *x*.

10234 An application wishing to check for error situations should set *errno* to zero and call
 10235 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 10236 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 10237 zero, an error has occurred.

10238 **RETURN VALUE**10239 Upon successful completion, these functions shall return the exponential value of *x*.

10240 If the correct value would cause overflow, a range error shall occur and *exp()*, *expf()*, and *expl()*
 10241 shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

10242 If the correct value would cause underflow, and is not representable, a range error may occur,
 10243 **MX** and either 0.0 (if supported), or an implementation-defined value shall be returned.

10244 **MX** If *x* is NaN, a NaN shall be returned.10245 If *x* is ± 0 , 1 shall be returned.10246 If *x* is $-\text{Inf}$, +0 shall be returned.10247 If *x* is $+\text{Inf}$, *x* shall be returned.

10248 If the correct value would cause underflow, and is representable, a range error may occur and
 10249 the correct value shall be returned.

10250 **ERRORS**

10251 These functions shall fail if:

10252 Range Error The result overflows.

10253 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10254 then *errno* shall be set to [ERANGE]. If the integer expression
 10255 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 10256 floating-point exception shall be raised.

10257 These functions may fail if:

10258 Range Error The result underflows.

10259 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10260 then *errno* shall be set to [ERANGE]. If the integer expression
 10261 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 10262 floating-point exception shall be raised.

10263 **EXAMPLES**

10264 None.

10265 **APPLICATION USAGE**

10266 Note that for IEEE Std 754-1985 **double**, $709.8 < x$ implies $\exp(x)$ has overflowed. The value
10267 $x < -708.4$ implies $\exp(x)$ has underflowed.

10268 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
10269 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

10270 **RATIONALE**

10271 None.

10272 **FUTURE DIRECTIONS**

10273 None.

10274 **SEE ALSO**

10275 `feclearexcept()`, `fetestexcept()`, `isnan()`, `log()`, the Base Definitions volume of IEEE Std 1003.1-2001,
10276 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

10277 **CHANGE HISTORY**

10278 First released in Issue 1. Derived from Issue 1 of the SVID.

10279 **Issue 5**

10280 The DESCRIPTION is updated to indicate how an application should check for an error. This
10281 text was previously published in the APPLICATION USAGE section.

10282 **Issue 6**10283 The `expf()` and `expl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

10284 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
10285 revised to align with the ISO/IEC 9899:1999 standard.

10286 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
10287 marked.

10288 **NAME**

10289 exp2, exp2f, exp2l — exponential base 2 functions

10290 **SYNOPSIS**

10291 #include <math.h>

10292 double exp2(double x);

10293 float exp2f(float x);

10294 long double exp2l(long double x);

10295 **DESCRIPTION**

10296 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 10297 conflict between the requirements described here and the ISO C standard is unintentional. This
 10298 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10299 These functions shall compute the base-2 exponential of x .

10300 An application wishing to check for error situations should set *errno* to zero and call
 10301 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 10302 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 10303 zero, an error has occurred.

10304 **RETURN VALUE**10305 Upon successful completion, these functions shall return 2^x .

10306 If the correct value would cause overflow, a range error shall occur and *exp2()*, *exp2f()*, and
 10307 *exp2l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 10308 respectively.

10309 If the correct value would cause underflow, and is not representable, a range error may occur,
 10310 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

10311 MX If x is NaN, a NaN shall be returned.10312 If x is ± 0 , 1 shall be returned.10313 If x is $-\text{Inf}$, +0 shall be returned.10314 If x is $+\text{Inf}$, x shall be returned.

10315 If the correct value would cause underflow, and is representable, a range error may occur and
 10316 the correct value shall be returned.

10317 **ERRORS**

10318 These functions shall fail if:

10319 Range Error The result overflows.

10320 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10321 then *errno* shall be set to [ERANGE]. If the integer expression
 10322 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 10323 floating-point exception shall be raised.

10324 These functions may fail if:

10325 Range Error The result underflows.

10326 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10327 then *errno* shall be set to [ERANGE]. If the integer expression
 10328 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 10329 floating-point exception shall be raised.

10330 **EXAMPLES**

10331 None.

10332 **APPLICATION USAGE**

10333 For IEEE Std 754-1985 **double**, $1024 \leq x$ implies $\exp2(x)$ has overflowed. The value $x < -1022$
10334 implies $\exp(x)$ has underflowed.

10335 On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling &`
10336 `MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

10337 **RATIONALE**

10338 None.

10339 **FUTURE DIRECTIONS**

10340 None.

10341 **SEE ALSO**

10342 `exp()`, `feclearexcept()`, `fetestexcept()`, `isnan()`, `log()`, the Base Definitions volume of
10343 IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions,
10344 <math.h>

10345 **CHANGE HISTORY**

10346 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

10347 **NAME**

10348 expm1, expm1f, expm1l — compute exponential functions

10349 **SYNOPSIS**

10350 #include <math.h>

10351 double expm1(double x);

10352 float expm1f(float x);

10353 long double expm1l(long double x);

10354 **DESCRIPTION**

10355 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 10356 conflict between the requirements described here and the ISO C standard is unintentional. This
 10357 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10358 These functions shall compute $e^x - 1.0$.

10359 An application wishing to check for error situations should set *errno* to zero and call
 10360 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 10361 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 10362 zero, an error has occurred.

10363 **RETURN VALUE**10364 Upon successful completion, these functions return $e^x - 1.0$.

10365 If the correct value would cause overflow, a range error shall occur and *expm1()*, *expm1f()*, and
 10366 *expm1l()* shall return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL,
 10367 respectively.

10368 **MX** If *x* is NaN, a NaN shall be returned.10369 If *x* is ± 0 , ± 0 shall be returned.10370 If *x* is $-\text{Inf}$, -1 shall be returned.10371 If *x* is $+\text{Inf}$, *x* shall be returned.10372 If *x* is subnormal, a range error may occur and *x* should be returned.10373 **ERRORS**

10374 These functions shall fail if:

10375 Range Error The result overflows.

10376 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10377 then *errno* shall be set to [ERANGE]. If the integer expression
 10378 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 10379 floating-point exception shall be raised.

10380 These functions may fail if:

10381 **MX** Range Error The value of *x* is subnormal.

10382 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 10383 then *errno* shall be set to [ERANGE]. If the integer expression
 10384 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 10385 floating-point exception shall be raised.

10386 **EXAMPLES**

10387 None.

10388 **APPLICATION USAGE**10389 The value of *expm1*(*x*) may be more accurate than *exp*(*x*)−1.0 for small values of *x*.10390 The *expm1*() and *log1p*() functions are useful for financial calculations of $((1+x)^n-1)/x$, namely:10391 $\text{expm1}(n * \text{log1p}(x)) / x$ 10392 when *x* is very small (for example, when calculating small daily interest rates). These functions
10393 also simplify writing accurate inverse hyperbolic functions.10394 For IEEE Std 754-1985 **double**, $709.8 < x$ implies *expm1*(*x*) has overflowed.10395 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
10396 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.10397 **RATIONALE**

10398 None.

10399 **FUTURE DIRECTIONS**

10400 None.

10401 **SEE ALSO**10402 *exp*(), *feclearexcept*(), *fetestexcept*(), *ilogb*(), *log1p*(), the Base Definitions volume of

10404 <math.h>10405 **CHANGE HISTORY**

10406 First released in Issue 4, Version 2.

10407 **Issue 5**

10408 Moved from X/OPEN UNIX extension to BASE.

10409 **Issue 6**10410 The *expm1f*() and *expm1l*() functions are added for alignment with the ISO/IEC 9899:1999
10411 standard.10412 The *expm1*() function is no longer marked as an extension.10413 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
10414 revised to align with the ISO/IEC 9899:1999 standard.10415 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
10416 marked.

10417 **NAME**

10418 fabs, fabsf, fabsl — absolute value function

10419 **SYNOPSIS**

10420 #include <math.h>

10421 double fabs(double x);

10422 float fabsf(float x);

10423 long double fabsl(long double x);

10424 **DESCRIPTION**

10425 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 10426 conflict between the requirements described here and the ISO C standard is unintentional. This
 10427 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10428 These functions shall compute the absolute value of their argument x , $|x|$.10429 **RETURN VALUE**10430 Upon successful completion, these functions shall return the absolute value of x .10431 MX If x is NaN, a NaN shall be returned.10432 If x is ± 0 , $+0$ shall be returned.10433 If x is $\pm \text{Inf}$, $+\text{Inf}$ shall be returned.10434 **ERRORS**

10435 No errors are defined.

10436 **EXAMPLES**

10437 None.

10438 **APPLICATION USAGE**

10439 None.

10440 **RATIONALE**

10441 None.

10442 **FUTURE DIRECTIONS**

10443 None.

10444 **SEE ALSO**10445 *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>10446 **CHANGE HISTORY**

10447 First released in Issue 1. Derived from Issue 1 of the SVID.

10448 **Issue 5**

10449 The DESCRIPTION is updated to indicate how an application should check for an error. This
 10450 text was previously published in the APPLICATION USAGE section.

10451 **Issue 6**10452 The *fabsf()* and *fabsl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

10453 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
 10454 revised to align with the ISO/IEC 9899:1999 standard.

10455 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
 10456 marked.

10457 **NAME**

10458 fattach — attach a STREAMS-based file descriptor to a file in the file system name space
 10459 **(STREAMS)**

10460 **SYNOPSIS**

```
10461 xSR       #include <stropts.h>
10462       int fattach(int fildev, const char *path);
10463
```

10464 **DESCRIPTION**

10465 The *fattach()* function shall attach a STREAMS-based file descriptor to a file, effectively
 10466 associating a pathname with *fildev*. The application shall ensure that the *fildev* argument is a
 10467 valid open file descriptor associated with a STREAMS file. The *path* argument points to a
 10468 pathname of an existing file. The application shall have the appropriate privileges or be the
 10469 owner of the file named by *path* and have write permission. A successful call to *fattach()* shall
 10470 cause all pathnames that name the file named by *path* to name the STREAMS file associated with
 10471 *fildev*, until the STREAMS file is detached from the file. A STREAMS file can be attached to more
 10472 than one file and can have several pathnames associated with it.

10473 The attributes of the named STREAMS file shall be initialized as follows: the permissions, user
 10474 ID, group ID, and times are set to those of the file named by *path*, the number of links is set to 1,
 10475 and the size and device identifier are set to those of the STREAMS file associated with *fildev*. If
 10476 any attributes of the named STREAMS file are subsequently changed (for example, by *chmod()*),
 10477 neither the attributes of the underlying file nor the attributes of the STREAMS file to which *fildev*
 10478 refers shall be affected.

10479 File descriptors referring to the underlying file, opened prior to an *fattach()* call, shall continue to
 10480 refer to the underlying file.

10481 **RETURN VALUE**

10482 Upon successful completion, *fattach()* shall return 0. Otherwise, *-1* shall be returned and *errno*
 10483 set to indicate the error.

10484 **ERRORS**

10485 The *fattach()* function shall fail if:

10486	[EACCES]	Search permission is denied for a component of the path prefix, or the process is the owner of <i>path</i> but does not have write permissions on the file named by <i>path</i> .
10487		
10488		
10489	[EBADF]	The <i>fildev</i> argument is not a valid open file descriptor.
10490	[EBUSY]	The file named by <i>path</i> is currently a mount point or has a STREAMS file attached to it.
10491		
10492	[ELOOP]	A loop exists in symbolic links encountered during resolution of the <i>path</i> argument.
10493		
10494	[ENAMETOOLONG]	
10495		The size of <i>path</i> exceeds {PATH_MAX} or a component of <i>path</i> is longer than {NAME_MAX}.
10496		
10497	[ENOENT]	A component of <i>path</i> does not name an existing file or <i>path</i> is an empty string.
10498	[ENOTDIR]	A component of the path prefix is not a directory.
10499	[EPERM]	The effective user ID of the process is not the owner of the file named by <i>path</i> and the process does not have appropriate privilege.
10500		

10501 The *fattach()* function may fail if:

10502 [EINVAL] The *fildev* argument does not refer to a STREAMS file.

10503 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
10504 resolution of the *path* argument.

10505 [ENAMETOOLONG]

10506 Pathname resolution of a symbolic link produced an intermediate result
10507 whose length exceeds {PATH_MAX}.

10508 [EXDEV] A link to a file on another file system was attempted.

10509 EXAMPLES

10510 Attaching a File Descriptor to a File

10511 In the following example, *fd* refers to an open STREAMS file. The call to *fattach()* associates this
10512 STREAM with the file **/tmp/named-STREAM**, such that any future calls to open **/tmp/named-**
10513 **STREAM**, prior to breaking the attachment via a call to *fdetach()*, will instead create a new file
10514 handle referring to the STREAMS file associated with *fd*.

```
10515 #include <stropts.h>
```

```
10516 ...
```

```
10517     int fd;
```

```
10518     char *filename = "/tmp/named-STREAM";
```

```
10519     int ret;
```

```
10520     ret = fattach(fd, filename);
```

10521 APPLICATION USAGE

10522 The *fattach()* function behaves similarly to the traditional *mount()* function in the way a file is
10523 temporarily replaced by the root directory of the mounted file system. In the case of *fattach()*, the
10524 replaced file need not be a directory and the replacing file is a STREAMS file.

10525 RATIONALE

10526 The file attributes of a file which has been the subject of an *fattach()* call are specifically set
10527 because of an artefact of the original implementation. The internal mechanism was the same as
10528 for the *mount()* function. Since *mount()* is typically only applied to directories, the effects when
10529 applied to a regular file are a little surprising, especially as regards the link count which rigidly
10530 remains one, even if there were several links originally and despite the fact that all original links
10531 refer to the STREAM as long as the *fattach()* remains in effect.

10532 FUTURE DIRECTIONS

10533 None.

10534 SEE ALSO

10535 *fdetach()*, *isastream()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stropts.h>**

10536 CHANGE HISTORY

10537 First released in Issue 4, Version 2.

10538 Issue 5

10539 Moved from X/OPEN UNIX extension to BASE.

10540 The [EXDEV] error is added to the list of optional errors in the ERRORS section.

10541 **Issue 6**

10542 This function is marked as part of the XSI STREAMS Option Group.

10543 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

10544 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
10545 [ELOOP] error condition is added.

10546 **NAME**

10547 fchdir — change working directory

10548 **SYNOPSIS**

10549 xSI #include <unistd.h>

10550 int fchdir(int *fildev*);

10551

10552 **DESCRIPTION**

10553 The *fchdir()* function shall be equivalent to *chdir()* except that the directory that is to be the new
 10554 current working directory is specified by the file descriptor *fildev*.

10555 A conforming application can obtain a file descriptor for a file of type directory using *open()*,
 10556 provided that the file status flags and access modes do not contain O_WRONLY or O_RDWR.

10557 **RETURN VALUE**

10558 Upon successful completion, *fchdir()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 10559 indicate the error. On failure the current working directory shall remain unchanged.

10560 **ERRORS**10561 The *fchdir()* function shall fail if:

10562 [EACCES] Search permission is denied for the directory referenced by *fildev*.

10563 [EBADF] The *fildev* argument is not an open file descriptor.

10564 [ENOTDIR] The open file descriptor *fildev* does not refer to a directory.

10565 The *fchdir()* may fail if:

10566 [EINTR] A signal was caught during the execution of *fchdir()*.

10567 [EIO] An I/O error occurred while reading from or writing to the file system.

10568 **EXAMPLES**

10569 None.

10570 **APPLICATION USAGE**

10571 None.

10572 **RATIONALE**

10573 None.

10574 **FUTURE DIRECTIONS**

10575 None.

10576 **SEE ALSO**10577 *chdir()*, the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>10578 **CHANGE HISTORY**

10579 First released in Issue 4, Version 2.

10580 **Issue 5**

10581 Moved from X/OPEN UNIX extension to BASE.

10582 **NAME**

10583 fchmod — change mode of a file

10584 **SYNOPSIS**

10585 #include <sys/stat.h>

10586 int fchmod(int *fildes*, mode_t *mode*);10587 **DESCRIPTION**

10588 The *fchmod()* function shall be equivalent to *chmod()* except that the file whose permissions are
 10589 changed is specified by the file descriptor *fildes*.

10590 SHM If *fildes* references a shared memory object, the *fchmod()* function need only affect the S_IRUSR,
 10591 S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits.

10592 TYM If *fildes* references a typed memory object, the behavior of *fchmod()* is unspecified.

10593 If *fildes* refers to a socket, the behavior of *fchmod()* is unspecified.

10594 XSR If *fildes* refers to a STREAM (which is *fattach()*-ed into the file system name space) the call
 10595 returns successfully, doing nothing.

10596 **RETURN VALUE**

10597 Upon successful completion, *fchmod()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 10598 indicate the error.

10599 **ERRORS**

10600 The *fchmod()* function shall fail if:

10601 [EBADF] The *fildes* argument is not an open file descriptor.

10602 [EPERM] The effective user ID does not match the owner of the file and the process
 10603 does not have appropriate privilege.

10604 [EROFS] The file referred to by *fildes* resides on a read-only file system.

10605 The *fchmod()* function may fail if:

10606 XSI [EINTR] The *fchmod()* function was interrupted by a signal.

10607 XSI [EINVAL] The value of the *mode* argument is invalid.

10608 [EINVAL] The *fildes* argument refers to a pipe and the implementation disallows
 10609 execution of *fchmod()* on a pipe.

10610 **EXAMPLES**10611 **Changing the Current Permissions for a File**

10612 The following example shows how to change the permissions for a file named **/home/cnd/mod1**
 10613 so that the owner and group have read/write/execute permissions, but the world only has
 10614 read/write permissions.

10615 #include <sys/stat.h>

10616 #include <fcntl.h>

10617 mode_t mode;

10618 int fildes;

10619 ...

10620 fildes = open("/home/cnd/mod1", O_RDWR);

10621 fchmod(fildes, S_IRWXU | S_IRWXG | S_IROTH | S_IWOTH);

10622 APPLICATION USAGE

10623 None.

10624 RATIONALE

10625 None.

10626 FUTURE DIRECTIONS

10627 None.

10628 SEE ALSO

10629 *chmod()*, *chown()*, *creat()*, *fcntl()*, *fstatvfs()*, *mknod()*, *open()*, *read()*, *stat()*, *write()*, the Base
10630 Definitions volume of IEEE Std 1003.1-2001, <**sys/stat.h**>

10631 CHANGE HISTORY

10632 First released in Issue 4, Version 2.

10633 Issue 5

10634 Moved from X/OPEN UNIX extension to BASE and aligned with *fchmod()* in the POSIX
10635 Realtime Extension. Specifically, the second paragraph of the DESCRIPTION is added and a
10636 second instance of [EINVAL] is defined in the list of optional errors.

10637 Issue 6

10638 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by stating that *fchmod()*
10639 behavior is unspecified for typed memory objects.

10640 **NAME**

10641 fchown — change owner and group of a file

10642 **SYNOPSIS**

10643 #include <unistd.h>

10644 int fchown(int *fildev*, uid_t *owner*, gid_t *group*);10645 **DESCRIPTION**

10646 The *fchown()* function shall be equivalent to *chown()* except that the file whose owner and group
 10647 are changed is specified by the file descriptor *fildev*.

10648 **RETURN VALUE**

10649 Upon successful completion, *fchown()* shall return 0. Otherwise, it shall return -1 and set *errno* to
 10650 indicate the error.

10651 **ERRORS**10652 The *fchown()* function shall fail if:10653 [EBADF] The *fildev* argument is not an open file descriptor.

10654 [EPERM] The effective user ID does not match the owner of the file or the process does
 10655 not have appropriate privilege and _POSIX_CHOWN_RESTRICTED indicates
 10656 that such privilege is required.

10657 [EROFS] The file referred to by *fildev* resides on a read-only file system.10658 The *fchown()* function may fail if:

10659 [EINVAL] The owner or group ID is not a value supported by the implementation. The
 10660 XSR *fildev* argument refers to a pipe or socket or an *fattach()*-ed STREAM and the
 10661 implementation disallows execution of *fchown()* on a pipe.

10662 [EIO] A physical I/O error has occurred.

10663 [EINTR] The *fchown()* function was interrupted by a signal which was caught.10664 **EXAMPLES**10665 **Changing the Current Owner of a File**

10666 The following example shows how to change the owner of a file named */home/cnd/mod1* to
 10667 “jones” and the group to “cnd”.

10668 The numeric value for the user ID is obtained by extracting the user ID from the user database
 10669 entry associated with “jones”. Similarly, the numeric value for the group ID is obtained by
 10670 extracting the group ID from the group database entry associated with “cnd”. This example
 10671 assumes the calling program has appropriate privileges.

10672 #include <sys/types.h>

10673 #include <unistd.h>

10674 #include <fcntl.h>

10675 #include <pwd.h>

10676 #include <grp.h>

10677 struct passwd *pwd;

10678 struct group *grp;

10679 int fildev;

10680 ...

10681 fildev = open("/home/cnd/mod1", O_RDWR);

10682 pwd = getpwnam("jones");

```
10683     grp = getgrnam("cnd");
10684     fchown(fildes, pwd->pw_uid, grp->gr_gid);
```

10685 APPLICATION USAGE

10686 None.

10687 RATIONALE

10688 None.

10689 FUTURE DIRECTIONS

10690 None.

10691 SEE ALSO

10692 *chown()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**unistd.h**>

10693 CHANGE HISTORY

10694 First released in Issue 4, Version 2.

10695 Issue 5

10696 Moved from X/OPEN UNIX extension to BASE.

10697 Issue 6

10698 The following changes were made to align with the IEEE P1003.1a draft standard:

- 10699 • Clarification is added that a call to *fchown()* may not be allowed on a pipe.

10700 The *fchown()* function is defined as mandatory.

10701 **NAME**

10702 fclose — close a stream

10703 **SYNOPSIS**

10704 #include <stdio.h>

10705 int fclose(FILE *stream);

10706 **DESCRIPTION**

10707 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 10708 conflict between the requirements described here and the ISO C standard is unintentional. This
 10709 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

10710 The *fclose()* function shall cause the stream pointed to by *stream* to be flushed and the associated
 10711 file to be closed. Any unwritten buffered data for the stream shall be written to the file; any
 10712 unread buffered data shall be discarded. Whether or not the call succeeds, the stream shall be
 10713 disassociated from the file and any buffer set by the *setbuf()* or *setvbuf()* function shall be
 10714 disassociated from the stream. If the associated buffer was automatically allocated, it shall be
 10715 deallocated.

10716 CX The *fclose()* function shall mark for update the *st_ctime* and *st_mtime* fields of the underlying file,
 10717 if the stream was writable, and if buffered data remains that has not yet been written to the file.
 10718 The *fclose()* function shall perform the equivalent of a *close()* on the file descriptor that is
 10719 associated with the stream pointed to by *stream*.

10720 After the call to *fclose()*, any use of *stream* results in undefined behavior.

10721 **RETURN VALUE**

10722 CX Upon successful completion, *fclose()* shall return 0; otherwise, it shall return EOF and set *errno* to
 10723 indicate the error.

10724 **ERRORS**

10725 The *fclose()* function shall fail if:

10726 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 10727 process would be delayed in the write operation.

10728 CX [EBADF] The file descriptor underlying stream is not valid.

10729 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

10730 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

10731 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 10732 offset maximum associated with the corresponding stream.

10733 CX [EINTR] The *fclose()* function was interrupted by a signal.

10734 CX [EIO] The process is a member of a background process group attempting to write
 10735 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor
 10736 blocking SIGTTOU, and the process group of the process is orphaned. This
 10737 error may also be returned under implementation-defined conditions.

10738 CX [ENOSPC] There was no free space remaining on the device containing the file.

10739 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 10740 any process. A SIGPIPE signal shall also be sent to the thread.

10741 The *fclose()* function may fail if:

10742 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 10743 capabilities of the device.

10744 **EXAMPLES**

10745 None.

10746 **APPLICATION USAGE**

10747 None.

10748 **RATIONALE**

10749 None.

10750 **FUTURE DIRECTIONS**

10751 None.

10752 **SEE ALSO**

10753 *close()*, *fopen()*, *getrlimit()*, *ulimit()*, the Base Definitions volume of IEEE Std 1003.1-2001,
10754 <stdio.h>

10755 **CHANGE HISTORY**

10756 First released in Issue 1. Derived from Issue 1 of the SVID.

10757 **Issue 5**

10758 Large File Summit extensions are added.

10759 **Issue 6**

10760 Extensions beyond the ISO C standard are marked.

10761 The following new requirements on POSIX implementations derive from alignment with the
10762 Single UNIX Specification:

- 10763 • The [EFBIG] error is added as part of the large file support extensions.
- 10764 • The [ENXIO] optional error condition is added.

10765 The DESCRIPTION is updated to note that the stream and any buffer are disassociated whether
10766 or not the call succeeds. This is for alignment with the ISO/IEC 9899:1999 standard.

10767 **NAME**

10768 fcntl — file control

10769 **SYNOPSIS**

10770 OH #include <unistd.h>

10771 #include <fcntl.h>

10772 int fcntl(int *fildes*, int *cmd*, ...);10773 **DESCRIPTION**

10774 The *fcntl()* function shall perform the operations described below on open files. The *fildes*
 10775 argument is a file descriptor.

10776 The available values for *cmd* are defined in <fcntl.h> and are as follows:

10777 **F_DUPFD** Return a new file descriptor which shall be the lowest numbered available
 10778 (that is, not already open) file descriptor greater than or equal to the third
 10779 argument, *arg*, taken as an integer of type **int**. The new file descriptor shall
 10780 refer to the same open file description as the original file descriptor, and shall
 10781 share any locks. The FD_CLOEXEC flag associated with the new file
 10782 descriptor shall be cleared to keep the file open across calls to one of the *exec*
 10783 functions.

10784 **F_GETFD** Get the file descriptor flags defined in <fcntl.h> that are associated with the
 10785 file descriptor *fildes*. File descriptor flags are associated with a single file
 10786 descriptor and do not affect other file descriptors that refer to the same file.

10787 **F_SETFD** Set the file descriptor flags defined in <fcntl.h>, that are associated with *fildes*,
 10788 to the third argument, *arg*, taken as type **int**. If the FD_CLOEXEC flag in the
 10789 third argument is 0, the file shall remain open across the *exec* functions;
 10790 otherwise, the file shall be closed upon successful execution of one of the *exec*
 10791 functions.

10792 **F_GETFL** Get the file status flags and file access modes, defined in <fcntl.h>, for the file
 10793 description associated with *fildes*. The file access modes can be extracted from
 10794 the return value using the mask O_ACCMODE, which is defined in <fcntl.h>.
 10795 File status flags and file access modes are associated with the file description
 10796 and do not affect other file descriptors that refer to the same file with different
 10797 open file descriptions.

10798 **F_SETFL** Set the file status flags, defined in <fcntl.h>, for the file description associated
 10799 with *fildes* from the corresponding bits in the third argument, *arg*, taken as
 10800 type **int**. Bits corresponding to the file access mode and the file creation flags,
 10801 as defined in <fcntl.h>, that are set in *arg* shall be ignored. If any bits in *arg*
 10802 other than those mentioned here are changed by the application, the result is
 10803 unspecified.

10804 **F_GETOWN** If *fildes* refers to a socket, get the process or process group ID specified to
 10805 receive SIGURG signals when out-of-band data is available. Positive values
 10806 indicate a process ID; negative values, other than -1, indicate a process group
 10807 ID. If *fildes* does not refer to a socket, the results are unspecified.

10808 **F_SETOWN** If *fildes* refers to a socket, set the process or process group ID specified to
 10809 receive SIGURG signals when out-of-band data is available, using the value of
 10810 the third argument, *arg*, taken as type **int**. Positive values indicate a process
 10811 ID; negative values, other than -1, indicate a process group ID. If *fildes* does
 10812 not refer to a socket, the results are unspecified.

10813	The following values for <i>cmd</i> are available for advisory record locking. Record locking shall be	
10814	supported for regular files, and may be supported for other files.	
10815	F_GETLK	Get the first lock which blocks the lock description pointed to by the third
10816		argument, <i>arg</i> , taken as a pointer to type struct flock , defined in <fcntl.h> .
10817		The information retrieved shall overwrite the information passed to <i>fcntl()</i> in
10818		the structure flock . If no lock is found that would prevent this lock from
10819		being created, then the structure shall be left unchanged except for the lock
10820		type which shall be set to F_UNLCK.
10821	F_SETLK	Set or clear a file segment lock according to the lock description pointed to by
10822		the third argument, <i>arg</i> , taken as a pointer to type struct flock , defined in
10823		<fcntl.h> . F_SETLK can establish shared (or read) locks (F_RDLCK) or
10824		exclusive (or write) locks (F_WRLCK), as well as to remove either type of lock
10825		(F_UNLCK). F_RDLCK, F_WRLCK, and F_UNLCK are defined in <fcntl.h> .
10826		If a shared or exclusive lock cannot be set, <i>fcntl()</i> shall return immediately
10827		with a return value of -1.
10828	F_SETLKW	This command shall be equivalent to F_SETLK except that if a shared or
10829		exclusive lock is blocked by other locks, the thread shall wait until the request
10830		can be satisfied. If a signal that is to be caught is received while <i>fcntl()</i> is
10831		waiting for a region, <i>fcntl()</i> shall be interrupted. Upon return from the signal
10832		handler, <i>fcntl()</i> shall return -1 with <i>errno</i> set to [EINTR], and the lock
10833		operation shall not be done.
10834	Additional implementation-defined values for <i>cmd</i> may be defined in <fcntl.h> . Their names	
10835	shall start with F_.	
10836	When a shared lock is set on a segment of a file, other processes shall be able to set shared locks	
10837	on that segment or a portion of it. A shared lock prevents any other process from setting an	
10838	exclusive lock on any portion of the protected area. A request for a shared lock shall fail if the	
10839	file descriptor was not opened with read access.	
10840	An exclusive lock shall prevent any other process from setting a shared lock or an exclusive lock	
10841	on any portion of the protected area. A request for an exclusive lock shall fail if the file	
10842	descriptor was not opened with write access.	
10843	The structure flock describes the type (<i>l_type</i>), starting offset (<i>l_whence</i>), relative offset (<i>l_start</i>),	
10844	size (<i>l_len</i>), and process ID (<i>l_pid</i>) of the segment of the file to be affected.	
10845	The value of <i>l_whence</i> is SEEK_SET, SEEK_CUR, or SEEK_END, to indicate that the relative	
10846	offset <i>l_start</i> bytes shall be measured from the start of the file, current position, or end of the file,	
10847	respectively. The value of <i>l_len</i> is the number of consecutive bytes to be locked. The value of	
10848	<i>l_len</i> may be negative (where the definition of off_t permits negative values of <i>l_len</i>). The <i>l_pid</i>	
10849	field is only used with F_GETLK to return the process ID of the process holding a blocking lock.	
10850	After a successful F_GETLK request, when a blocking lock is found, the values returned in the	
10851	flock structure shall be as follows:	
10852	<i>l_type</i>	Type of blocking lock found.
10853	<i>l_whence</i>	SEEK_SET.
10854	<i>l_start</i>	Start of the blocking lock.
10855	<i>l_len</i>	Length of the blocking lock.
10856	<i>l_pid</i>	Process ID of the process that holds the blocking lock.

10857 If the command is F_SETLKW and the process must wait for another process to release a lock,
 10858 then the range of bytes to be locked shall be determined before the *fcntl()* function blocks. If the
 10859 file size or file descriptor seek offset change while *fcntl()* is blocked, this shall not affect the
 10860 range of bytes locked.

10861 If *l_len* is positive, the area affected shall start at *l_start* and end at *l_start+l_len-1*. If *l_len* is
 10862 negative, the area affected shall start at *l_start+l_len* and end at *l_start-1*. Locks may start and
 10863 extend beyond the current end of a file, but shall not extend before the beginning of the file. A
 10864 lock shall be set to extend to the largest possible value of the file offset for that file by setting
 10865 *l_len* to 0. If such a lock also has *l_start* set to 0 and *l_whence* is set to SEEK_SET, the whole file
 10866 shall be locked.

10867 There shall be at most one type of lock set for each byte in the file. Before a successful return
 10868 from an F_SETLK or an F_SETLKW request when the calling process has previously existing
 10869 locks on bytes in the region specified by the request, the previous lock type for each byte in the
 10870 specified region shall be replaced by the new lock type. As specified above under the
 10871 descriptions of shared locks and exclusive locks, an F_SETLK or an F_SETLKW request
 10872 (respectively) shall fail or block when another process has existing locks on bytes in the specified
 10873 region and the type of any of those locks conflicts with the type specified in the request.

10874 All locks associated with a file for a given process shall be removed when a file descriptor for
 10875 that file is closed by that process or the process holding that file descriptor terminates. Locks are
 10876 not inherited by a child process.

10877 A potential for deadlock occurs if a process controlling a locked region is put to sleep by
 10878 attempting to lock another process' locked region. If the system detects that sleeping until a
 10879 locked region is unlocked would cause a deadlock, *fcntl()* shall fail with an [EDEADLK] error.

10880 An unlock (F_UNLCK) request in which *l_len* is non-zero and the offset of the last byte of the
 10881 requested segment is the maximum value for an object of type **off_t**, when the process has an
 10882 existing lock in which *l_len* is 0 and which includes the last byte of the requested segment, shall
 10883 be treated as a request to unlock from the start of the requested segment with an *l_len* equal to 0.
 10884 Otherwise, an unlock (F_UNLCK) request shall attempt to unlock only the requested segment.

10885 SHM When the file descriptor *filides* refers to a shared memory object, the behavior of *fcntl()* shall be
 10886 the same as for a regular file except the effect of the following values for the argument *cmd* shall
 10887 be unspecified: F_SETFL, F_GETLK, F_SETLK, and F_SETLKW.

10888 TYM If *filides* refers to a typed memory object, the result of the *fcntl()* function is unspecified.

10889 RETURN VALUE

10890 Upon successful completion, the value returned shall depend on *cmd* as follows:

10891	F_DUPFD	A new file descriptor.
10892	F_GETFD	Value of flags defined in <fcntl.h>. The return value shall not be negative.
10893	F_SETFD	Value other than -1.
10894	F_GETFL	Value of file status flags and access modes. The return value is not negative.
10895	F_SETFL	Value other than -1.
10896	F_GETLK	Value other than -1.
10897	F_SETLK	Value other than -1.
10898	F_SETLKW	Value other than -1.
10899	F_GETOWN	Value of the socket owner process or process group; this will not be -1.

10900	F_SETOWN	Value other than -1.
10901		Otherwise, -1 shall be returned and <i>errno</i> set to indicate the error.
10902	ERRORS	
10903		The <i>fcntl()</i> function shall fail if:
10904	[EACCES] or [EAGAIN]	
10905		The <i>cmd</i> argument is F_SETLK; the type of lock (<i>l_type</i>) is a shared (F_RDLCK) or exclusive (F_WRLCK) lock and the segment of a file to be locked is already exclusive-locked by another process, or the type is an exclusive lock and some portion of the segment of a file to be locked is already shared-locked or exclusive-locked by another process.
10910	[EBADF]	The <i>fildest</i> argument is not a valid open file descriptor, or the argument <i>cmd</i> is F_SETLK or F_SETLKW, the type of lock, <i>l_type</i> , is a shared lock (F_RDLCK), and <i>fildest</i> is not a valid file descriptor open for reading, or the type of lock, <i>l_type</i> , is an exclusive lock (F_WRLCK), and <i>fildest</i> is not a valid file descriptor open for writing.
10915	[EINTR]	The <i>cmd</i> argument is F_SETLKW and the function was interrupted by a signal.
10916	[EINVAL]	The <i>cmd</i> argument is invalid, or the <i>cmd</i> argument is F_DUPFD and <i>arg</i> is negative or greater than or equal to {OPEN_MAX}, or the <i>cmd</i> argument is F_GETLK, F_SETLK, or F_SETLKW and the data pointed to by <i>arg</i> is not valid, or <i>fildest</i> refers to a file that does not support locking.
10920	[EMFILE]	The argument <i>cmd</i> is F_DUPFD and {OPEN_MAX} file descriptors are currently open in the calling process, or no file descriptors greater than or equal to <i>arg</i> are available.
10923	[ENOLCK]	The argument <i>cmd</i> is F_SETLK or F_SETLKW and satisfying the lock or unlock request would result in the number of locked regions in the system exceeding a system-imposed limit.
10926	[EOVERFLOW]	One of the values to be returned cannot be represented correctly.
10927	[EOVERFLOW]	The <i>cmd</i> argument is F_GETLK, F_SETLK, or F_SETLKW and the smallest or, if <i>l_len</i> is non-zero, the largest offset of any byte in the requested segment cannot be represented correctly in an object of type off_t .
10930		The <i>fcntl()</i> function may fail if:
10931	[EDEADLK]	The <i>cmd</i> argument is F_SETLKW, the lock is blocked by a lock from another process, and putting the calling process to sleep to wait for that lock to become free would cause a deadlock.

EXAMPLES

10935 None.

APPLICATION USAGE

10937 None.

RATIONALE

10939 The ellipsis in the SYNOPSIS is the syntax specified by the ISO C standard for a variable number of arguments. It is used because System V uses pointers for the implementation of file locking functions.

10942 The *arg* values to F_GETFD, F_SETFD, F_GETFL, and F_SETFL all represent flag values to allow for future growth. Applications using these functions should do a read-modify-write operation

10944 on them, rather than assuming that only the values defined by this volume of
10945 IEEE Std 1003.1-2001 are valid. It is a common error to forget this, particularly in the case of
10946 F_SETFD.

10947 This volume of IEEE Std 1003.1-2001 permits concurrent read and write access to file data using
10948 the *fcntl()* function; this is a change from the 1984 /usr/group standard and early proposals.
10949 Without concurrency controls, this feature may not be fully utilized without occasional loss of
10950 data.

10951 Data losses occur in several ways. One case occurs when several processes try to update the
10952 same record, without sequencing controls; several updates may occur in parallel and the last
10953 writer “wins”. Another case is a bit-tree or other internal list-based database that is undergoing
10954 reorganization. Without exclusive use to the tree segment by the updating process, other reading
10955 processes chance getting lost in the database when the index blocks are split, condensed,
10956 inserted, or deleted. While *fcntl()* is useful for many applications, it is not intended to be overly
10957 general and does not handle the bit-tree example well.

10958 This facility is only required for regular files because it is not appropriate for many devices such
10959 as terminals and network connections.

10960 Since *fcntl()* works with “any file descriptor associated with that file, however it is obtained”,
10961 the file descriptor may have been inherited through a *fork()* or *exec* operation and thus may
10962 affect a file that another process also has open.

10963 The use of the open file description to identify what to lock requires extra calls and presents
10964 problems if several processes are sharing an open file description, but there are too many
10965 implementations of the existing mechanism for this volume of IEEE Std 1003.1-2001 to use
10966 different specifications.

10967 Another consequence of this model is that closing any file descriptor for a given file (whether or
10968 not it is the same open file description that created the lock) causes the locks on that file to be
10969 relinquished for that process. Equivalently, any close for any file/process pair relinquishes the
10970 locks owned on that file for that process. But note that while an open file description may be
10971 shared through *fork()*, locks are not inherited through *fork()*. Yet locks may be inherited through
10972 one of the *exec* functions.

10973 The identification of a machine in a network environment is outside the scope of this volume of
10974 IEEE Std 1003.1-2001. Thus, an *l_sysid* member, such as found in System V, is not included in the
10975 locking structure.

10976 Changing of lock types can result in a previously locked region being split into smaller regions.

10977 Mandatory locking was a major feature of the 1984 /usr/group standard.

10978 For advisory file record locking to be effective, all processes that have access to a file must
10979 cooperate and use the advisory mechanism before doing I/O on the file. Enforcement-mode
10980 record locking is important when it cannot be assumed that all processes are cooperating. For
10981 example, if one user uses an editor to update a file at the same time that a second user executes
10982 another process that updates the same file and if only one of the two processes is using advisory
10983 locking, the processes are not cooperating. Enforcement-mode record locking would protect
10984 against accidental collisions.

10985 Secondly, advisory record locking requires a process using locking to bracket each I/O operation
10986 with lock (or test) and unlock operations. With enforcement-mode file and record locking, a
10987 process can lock the file once and unlock when all I/O operations have been completed.
10988 Enforcement-mode record locking provides a base that can be enhanced; for example, with
10989 sharable locks. That is, the mechanism could be enhanced to allow a process to lock a file so
10990 other processes could read it, but none of them could write it.

- 10991 Mandatory locks were omitted for several reasons:
- 10992 1. Mandatory lock setting was done by multiplexing the set-group-ID bit in most
10993 implementations; this was confusing, at best.
 - 10994 2. The relationship to file truncation as supported in 4.2 BSD was not well specified.
 - 10995 3. Any publicly readable file could be locked by anyone. Many historical implementations
10996 keep the password database in a publicly readable file. A malicious user could thus
10997 prohibit logins. Another possibility would be to hold open a long-distance telephone line.
 - 10998 4. Some demand-paged historical implementations offer memory mapped files, and
10999 enforcement cannot be done on that type of file.
- 11000 Since sleeping on a region is interrupted with any signal, *alarm()* may be used to provide a
11001 timeout facility in applications requiring it. This is useful in deadlock detection. Since
11002 implementation of full deadlock detection is not always feasible, the [EDEADLK] error was
11003 made optional.
- 11004 **FUTURE DIRECTIONS**
- 11005 None.
- 11006 **SEE ALSO**
- 11007 *alarm()*, *close()*, *exec*, *open()*, *sigaction()*, the Base Definitions volume of IEEE Std 1003.1-2001,
11008 **<fcntl.h>**, **<signal.h>**, **<unistd.h>**
- 11009 **CHANGE HISTORY**
- 11010 First released in Issue 1. Derived from Issue 1 of the SVID.
- 11011 **Issue 5**
- 11012 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
11013 Threads Extension.
- 11014 Large File Summit extensions are added.
- 11015 **Issue 6**
- 11016 In the SYNOPSIS, the optional include of the **<sys/types.h>** header is removed.
- 11017 The following new requirements on POSIX implementations derive from alignment with the
11018 Single UNIX Specification:
- 11019 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
11020 required for conforming implementations of previous POSIX specifications, it was not
11021 required for UNIX applications.
 - 11022 • In the DESCRIPTION, sentences describing behavior when *l_len* is negative are now
11023 mandated, and the description of unlock (F_UNLOCK) when *l_len* is non-negative is
11024 mandated.
 - 11025 • In the ERRORS section, the [EINVAL] error condition has the case mandated when the *cmd* is
11026 invalid, and two [EOVERFLOW] error conditions are added.
- 11027 The F_GETOWN and F_SETOWN values are added for sockets.
- 11028 The following changes were made to align with the IEEE P1003.1a draft standard:
- 11029 • Clarification is added that the extent of the bytes locked is determined prior to the blocking
11030 action.
- 11031 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
11032 *fcntl()* results are unspecified for typed memory objects.

11033

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

11034 **NAME**11035 fcvt — convert a floating-point number to a string (**LEGACY**)11036 **SYNOPSIS**

11037 xSI #include <stdlib.h>

11038 char *fcvt(double *value*, int *ndigit*, int *restrict *decpt*,
11039 int *restrict *sign*);

11040

11041 **DESCRIPTION**11042 Refer to *ecvt()*.

11043 NAME

11044 `fdatasync` — synchronize the data of a file (**REALTIME**)

11045 SYNOPSIS

11046 `SIO` `#include <unistd.h>`

11047 `int fdatasync(int fildes);`

11048

11049 DESCRIPTION

11050 The `fdatasync()` function shall force all currently queued I/O operations associated with the file
11051 indicated by file descriptor *fil*des to the synchronized I/O completion state.

11052 The functionality shall be equivalent to `fsync()` with the symbol `_POSIX_SYNCHRONIZED_IO`
11053 defined, with the exception that all I/O operations shall be completed as defined for
11054 synchronized I/O data integrity completion.

11055 RETURN VALUE

11056 If successful, the `fdatasync()` function shall return the value 0; otherwise, the function shall return
11057 the value `-1` and set *errno* to indicate the error. If the `fdatasync()` function fails, outstanding I/O
11058 operations are not guaranteed to have been completed.

11059 ERRORS

11060 The `fdatasync()` function shall fail if:

11061 [EBADF] The *fil*des argument is not a valid file descriptor open for writing.

11062 [EINVAL] This implementation does not support synchronized I/O for this file.

11063 In the event that any of the queued I/O operations fail, `fdatasync()` shall return the error
11064 conditions defined for `read()` and `write()`.

11065 EXAMPLES

11066 None.

11067 APPLICATION USAGE

11068 None.

11069 RATIONALE

11070 None.

11071 FUTURE DIRECTIONS

11072 None.

11073 SEE ALSO

11074 `aio_fsync()`, `fcntl()`, `fsync()`, `open()`, `read()`, `write()`, the Base Definitions volume of
11075 IEEE Std 1003.1-2001, `<unistd.h>`

11076 CHANGE HISTORY

11077 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

11078 Issue 6

11079 The [ENOSYS] error condition has been removed as stubs need not be provided if an
11080 implementation does not support the Synchronized Input and Output option.

11081 The `fdatasync()` function is marked as part of the Synchronized Input and Output option.

11082 **NAME**11083 fdetach — detach a name from a STREAMS-based file descriptor (**STREAMS**)11084 **SYNOPSIS**

11085 xSR #include <stropts.h>

11086 int fdetach(const char *path);

11087

11088 **DESCRIPTION**

11089 The *fdetach()* function shall detach a STREAMS-based file from the file to which it was attached
 11090 by a previous call to *fattach()*. The *path* argument points to the pathname of the attached
 11091 STREAMS file. The process shall have appropriate privileges or be the owner of the file. A
 11092 successful call to *fdetach()* shall cause all pathnames that named the attached STREAMS file to
 11093 again name the file to which the STREAMS file was attached. All subsequent operations on *path*
 11094 shall operate on the underlying file and not on the STREAMS file.

11095 All open file descriptions established while the STREAMS file was attached to the file referenced
 11096 by *path* shall still refer to the STREAMS file after the *fdetach()* has taken effect.

11097 If there are no open file descriptors or other references to the STREAMS file, then a successful
 11098 call to *fdetach()* shall be equivalent to performing the last *close()* on the attached file.

11099 **RETURN VALUE**

11100 Upon successful completion, *fdetach()* shall return 0; otherwise, it shall return -1 and set *errno* to
 11101 indicate the error.

11102 **ERRORS**11103 The *fdetach()* function shall fail if:

11104 [EACCES] Search permission is denied on a component of the path prefix.

11105 [EINVAL] The *path* argument names a file that is not currently attached.

11106 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 11107 argument.

11108 [ENAMETOOLONG]

11109 The size of a pathname exceeds {PATH_MAX} or a pathname component is
 11110 longer than {NAME_MAX}.

11111 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

11112 [ENOTDIR] A component of the path prefix is not a directory.

11113 [EPERM] The effective user ID is not the owner of *path* and the process does not have
 11114 appropriate privileges.

11115 The *fdetach()* function may fail if:

11116 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 11117 resolution of the *path* argument.

11118 [ENAMETOOLONG]

11119 Pathname resolution of a symbolic link produced an intermediate result
 11120 whose length exceeds {PATH_MAX}.

11121 **EXAMPLES**11122 **Detaching a File**

11123 The following example detaches the STREAMS-based file **/tmp/named-STREAM** from the file to
11124 which it was attached by a previous, successful call to *fattach()*. Subsequent calls to open this
11125 file refer to the underlying file, not to the STREAMS file.

```
11126 #include <stropts.h>
11127 ...
11128     char *filename = "/tmp/named-STREAM";
11129     int ret;
11130     ret = fdetach(filename);
```

11131 **APPLICATION USAGE**

11132 None.

11133 **RATIONALE**

11134 None.

11135 **FUTURE DIRECTIONS**

11136 None.

11137 **SEE ALSO**

11138 *fattach()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stropts.h>

11139 **CHANGE HISTORY**

11140 First released in Issue 4, Version 2.

11141 **Issue 5**

11142 Moved from X/OPEN UNIX extension to BASE.

11143 **Issue 6**

11144 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

11145 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
11146 [ELOOP] error condition is added.

11147 **NAME**

11148 fdim, fdimf, fdiml — compute positive difference between two floating-point numbers

11149 **SYNOPSIS**

11150 #include <math.h>

11151 double fdim(double x, double y);

11152 float fdimf(float x, float y);

11153 long double fdiml(long double x, long double y);

11154 **DESCRIPTION**

11155 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11156 conflict between the requirements described here and the ISO C standard is unintentional. This
 11157 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11158 These functions shall determine the positive difference between their arguments. If *x* is greater
 11159 than *y*, *x*−*y* is returned. If *x* is less than or equal to *y*, +0 is returned.

11160 An application wishing to check for error situations should set *errno* to zero and call
 11161 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 11162 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 11163 zero, an error has occurred.

11164 **RETURN VALUE**

11165 Upon successful completion, these functions shall return the positive difference value.

11166 If *x*−*y* is positive and overflows, a range error shall occur and *fdim*(), *fdimf*(), and *fdiml*() shall
 11167 return the value of the macro HUGE_VAL, HUGE_VALF, and HUGE_VALL, respectively.

11168 XSI If *x*−*y* is positive and underflows, a range error may occur, and either (*x*−*y*) (if representable), or
 11169 0.0 (if supported), or an implementation-defined value shall be returned.

11170 MX If *x* or *y* is NaN, a NaN shall be returned.

11171 **ERRORS**

11172 The *fdim*() function shall fail if:

11173 Range Error The result overflows.

11174 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 11175 then *errno* shall be set to [ERANGE]. If the integer expression
 11176 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 11177 floating-point exception shall be raised.

11178 The *fdim*() function may fail if:

11179 Range Error The result underflows.

11180 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 11181 then *errno* shall be set to [ERANGE]. If the integer expression
 11182 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 11183 floating-point exception shall be raised.

11184 EXAMPLES

11185 None.

11186 APPLICATION USAGE

11187 On implementations supporting IEEE Std 754-1985, $x-y$ cannot underflow, and hence the 0.0
11188 return value is shaded as an extension for implementations supporting the XSI extension rather
11189 than an MX extension.

11190 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
11191 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

11192 RATIONALE

11193 None.

11194 FUTURE DIRECTIONS

11199 CHANGE HISTORY

11200 First released in Issue 6. Derived from the ISO / IEC 9899:1999 standard.

11201 **NAME**

11202 fdopen — associate a stream with a file descriptor

11203 **SYNOPSIS**11204 CX `#include <stdio.h>`11205 `FILE *fdopen(int fil-des, const char *mode);`

11206

11207 **DESCRIPTION**11208 The *fdopen()* function shall associate a stream with a file descriptor.11209 The *mode* argument is a character string having one of the following values:11210 *r* or *rb* Open a file for reading.11211 *w* or *wb* Open a file for writing.11212 *a* or *ab* Open a file for writing at end-of-file.11213 *r+* or *rb+* or *r+b* Open a file for update (reading and writing).11214 *w+* or *wb+* or *w+b* Open a file for update (reading and writing).11215 *a+* or *ab+* or *a+b* Open a file for update (reading and writing) at end-of-file.11216 The meaning of these flags is exactly as specified in *fopen()*, except that modes beginning with *w*
11217 shall not cause truncation of the file.11218 Additional values for the *mode* argument may be supported by an implementation.11219 The application shall ensure that the mode of the stream as expressed by the *mode* argument is
11220 allowed by the file access mode of the open file description to which *fil-des* refers. The file
11221 position indicator associated with the new stream is set to the position indicated by the file
11222 offset associated with the file descriptor.11223 The error and end-of-file indicators for the stream shall be cleared. The *fdopen()* function may
11224 cause the *st_atime* field of the underlying file to be marked for update.11225 SHM If *fil-des* refers to a shared memory object, the result of the *fdopen()* function is unspecified.11226 TYM If *fil-des* refers to a typed memory object, the result of the *fdopen()* function is unspecified.11227 The *fdopen()* function shall preserve the offset maximum previously set for the open file
11228 description corresponding to *fil-des*.11229 **RETURN VALUE**11230 Upon successful completion, *fdopen()* shall return a pointer to a stream; otherwise, a null pointer
11231 shall be returned and *errno* set to indicate the error.11232 **ERRORS**11233 The *fdopen()* function may fail if:11234 [EBADF] The *fil-des* argument is not a valid file descriptor.11235 [EINVAL] The *mode* argument is not a valid mode.

11236 [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

11237 [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

11238 [ENOMEM] Insufficient space to allocate a buffer.

11239 EXAMPLES

11240 None.

11241 APPLICATION USAGE

11242 File descriptors are obtained from calls like *open()*, *dup()*, *creat()*, or *pipe()*, which open files but
 11243 do not return streams.

11244 RATIONALE

11245 The file descriptor may have been obtained from *open()*, *creat()*, *pipe()*, *dup()*, or *fcntl()*;
 11246 inherited through *fork()* or *exec*; or perhaps obtained by implementation-defined means, such as
 11247 the 4.3 BSD *socket()* call.

11248 The meanings of the *mode* arguments of *fdopen()* and *fopen()* differ. With *fdopen()*, open for write
 11249 (*w* or *w+*) does not truncate, and append (*a* or *a+*) cannot create for writing. The *mode* argument
 11250 formats that include *a b* are allowed for consistency with the ISO C standard function *fopen()*.
 11251 The *b* has no effect on the resulting stream. Although not explicitly required by this volume of
 11252 IEEE Std 1003.1-2001, a good implementation of append (*a*) mode would cause the *O_APPEND*
 11253 flag to be set.

11254 FUTURE DIRECTIONS

11255 None.

11259 CHANGE HISTORY

11260 First released in Issue 1. Derived from Issue 1 of the SVID.

11261 Issue 5

11262 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

11263 Large File Summit extensions are added.

11264 Issue 6

11265 The following new requirements on POSIX implementations derive from alignment with the
 11266 Single UNIX Specification:

- 11267 • In the DESCRIPTION, the use and setting of the *mode* argument are changed to include
 11268 binary streams.
- 11269 • In the DESCRIPTION, text is added for large file support to indicate setting of the offset
 11270 maximum in the open file description.
- 11271 • All errors identified in the ERRORS section are added.
- 11272 • In the DESCRIPTION, text is added that the *fdopen()* function may cause *st_atime* to be
 11273 updated.

11274 The following changes were made to align with the IEEE P1003.1a draft standard:

- 11275 • Clarification is added that it is the responsibility of the application to ensure that the mode is
 11276 compatible with the open file descriptor.

11277 The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that
 11278 *fdopen()* results are unspecified for typed memory objects.

11279 **NAME**

11280 feclearexcept — clear floating-point exception

11281 **SYNOPSIS**

11282 #include <fenv.h>

11283 int feclearexcept(int *excepts*);11284 **DESCRIPTION**

11285 cx The functionality described on this reference page is aligned with the ISO C standard. Any
11286 conflict between the requirements described here and the ISO C standard is unintentional. This
11287 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11288 The *feclearexcept()* function shall attempt to clear the supported floating-point exceptions
11289 represented by *excepts*.

11290 **RETURN VALUE**

11291 If the argument is zero or if all the specified exceptions were successfully cleared, *feclearexcept()*
11292 shall return zero. Otherwise, it shall return a non-zero value.

11293 **ERRORS**

11294 No errors are defined.

11295 **EXAMPLES**

11296 None.

11297 **APPLICATION USAGE**

11298 None.

11299 **RATIONALE**

11300 None.

11301 **FUTURE DIRECTIONS**

11302 None.

11303 **SEE ALSO**

11304 *fegetexceptflag()*, *feraiseexcept()*, *fesetexceptflag()*, *fetestexcept()*, the Base Definitions volume of
11305 IEEE Std 1003.1-2001, <**fenv.h**>

11306 **CHANGE HISTORY**

11307 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11308 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

11309 **NAME**

11310 fegetenv, fesetenv — get and set current floating-point environment

11311 **SYNOPSIS**

11312 #include <fenv.h>

11313 int fegetenv(fenv_t *envp);

11314 int fesetenv(const fenv_t *envp);

11315 **DESCRIPTION**

11316 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 11317 conflict between the requirements described here and the ISO C standard is unintentional. This
 11318 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11319 The *fegetenv()* function shall attempt to store the current floating-point environment in the object
 11320 pointed to by *envp*.

11321 The *fesetenv()* function shall attempt to establish the floating-point environment represented by
 11322 the object pointed to by *envp*. The argument *envp* shall point to an object set by a call to
 11323 *fegetenv()* or *feholdexcept()*, or equal a floating-point environment macro. The *fesetenv()* function
 11324 does not raise floating-point exceptions, but only installs the state of the floating-point status
 11325 flags represented through its argument.

11326 **RETURN VALUE**

11327 If the representation was successfully stored, *fegetenv()* shall return zero. Otherwise, it shall
 11328 return a non-zero value. If the environment was successfully established, *fesetenv()* shall return
 11329 zero. Otherwise, it shall return a non-zero value.

11330 **ERRORS**

11331 No errors are defined.

11332 **EXAMPLES**

11333 None.

11334 **APPLICATION USAGE**

11335 None.

11336 **RATIONALE**

11337 None.

11338 **FUTURE DIRECTIONS**

11339 None.

11340 **SEE ALSO**11341 *feholdexcept()*, *feupdateenv()*, the Base Definitions volume of IEEE Std 1003.1-2001, <fenv.h>11342 **CHANGE HISTORY**

11343 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11344 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

11345 **NAME**

11346 fegetexceptflag, fesetexceptflag — get and set floating-point status flags

11347 **SYNOPSIS**

11348 #include <fenv.h>

11349 int fegetexceptflag(fexcept_t *flagp, int excepts);

11350 int fesetexceptflag(const fexcept_t *flagp, int excepts);

11351 **DESCRIPTION**

11352 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 11353 conflict between the requirements described here and the ISO C standard is unintentional. This
 11354 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11355 The *fegetexceptflag()* function shall attempt to store an implementation-defined representation of
 11356 the states of the floating-point status flags indicated by the argument *excepts* in the object
 11357 pointed to by the argument *flagp*.

11358 The *fesetexceptflag()* function shall attempt to set the floating-point status flags indicated by the
 11359 argument *excepts* to the states stored in the object pointed to by *flagp*. The value pointed to by
 11360 *flagp* shall have been set by a previous call to *fegetexceptflag()* whose second argument
 11361 represented at least those floating-point exceptions represented by the argument *excepts*. This
 11362 function does not raise floating-point exceptions, but only sets the state of the flags.

11363 **RETURN VALUE**

11364 If the representation was successfully stored, *fegetexceptflag()* shall return zero. Otherwise, it
 11365 shall return a non-zero value. If the *excepts* argument is zero or if all the specified exceptions
 11366 were successfully set, *fesetexceptflag()* shall return zero. Otherwise, it shall return a non-zero
 11367 value.

11368 **ERRORS**

11369 No errors are defined.

11370 **EXAMPLES**

11371 None.

11372 **APPLICATION USAGE**

11373 None.

11374 **RATIONALE**

11375 None.

11376 **FUTURE DIRECTIONS**

11377 None.

11378 **SEE ALSO**

 11380 <fenv.h>

11381 **CHANGE HISTORY**

11382 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11383 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

11384 NAME

11385 fegetround, fesetround — get and set current rounding direction

11386 SYNOPSIS

```
11387       #include <fenv.h>

11388       int fegetround(void);
11389       int fesetround(int round);
```

11390 DESCRIPTION

11391 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 11392 conflict between the requirements described here and the ISO C standard is unintentional. This
 11393 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11394 The *fegetround()* function shall get the current rounding direction.

11395 The *fesetround()* function shall establish the rounding direction represented by its argument
 11396 *round*. If the argument is not equal to the value of a rounding direction macro, the rounding
 11397 direction is not changed.

11398 RETURN VALUE

11399 The *fegetround()* function shall return the value of the rounding direction macro representing the
 11400 current rounding direction or a negative value if there is no such rounding direction macro or
 11401 the current rounding direction is not determinable.

11402 The *fesetround()* function shall return a zero value if and only if the requested rounding direction
 11403 was established.

11404 ERRORS

11405 No errors are defined.

11406 EXAMPLES

11407 The following example saves, sets, and restores the rounding direction, reporting an error and
 11408 aborting if setting the rounding direction fails:

```
11409       #include <fenv.h>
11410       #include <assert.h>
11411       void f(int round_dir)
11412       {
11413           #pragma STDC FENV_ACCESS ON
11414           int save_round;
11415           int setround_ok;
11416           save_round = fegetround();
11417           setround_ok = fesetround(round_dir);
11418           assert(setround_ok == 0);
11419           /* ... */
11420           fesetround(save_round);
11421           /* ... */
11422       }
```

11423 APPLICATION USAGE

11424 None.

11425 RATIONALE

11426 None.

11427 **FUTURE DIRECTIONS**

11428 None.

11429 **SEE ALSO**

11430 The Base Definitions volume of IEEE Std 1003.1-2001, <fenv.h>

11431 **CHANGE HISTORY**

11432 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11433 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

11434 **NAME**

11435 feholdexcept — save current floating-point environment

11436 **SYNOPSIS**

11437 #include <fenv.h>

11438 int feholdexcept(fenv_t *envp);

11439 **DESCRIPTION**

11440 cx The functionality described on this reference page is aligned with the ISO C standard. Any
11441 conflict between the requirements described here and the ISO C standard is unintentional. This
11442 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11443 The *feholdexcept()* function shall save the current floating-point environment in the object
11444 pointed to by *envp*, clear the floating-point status flags, and then install a non-stop (continue on
11445 floating-point exceptions) mode, if available, for all floating-point exceptions.

11446 **RETURN VALUE**

11447 The *feholdexcept()* function shall return zero if and only if non-stop floating-point exception
11448 handling was successfully installed.

11449 **ERRORS**

11450 No errors are defined.

11451 **EXAMPLES**

11452 None.

11453 **APPLICATION USAGE**

11454 None.

11455 **RATIONALE**

11456 The *feholdexcept()* function should be effective on typical IEC 60559:1989 standard
11457 implementations which have the default non-stop mode and at least one other mode for trap
11458 handling or aborting. If the implementation provides only the non-stop mode, then installing the
11459 non-stop mode is trivial.

11460 **FUTURE DIRECTIONS**

11461 None.

11462 **SEE ALSO**

11463 *fegetenv()*, *fesetenv()*, *feupdateenv()*, the Base Definitions volume of IEEE Std 1003.1-2001,
11464 <fenv.h>

11465 **CHANGE HISTORY**

11466 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11467 NAME

11468 feof — test end-of-file indicator on a stream

11469 SYNOPSIS

11470 #include <stdio.h>

11471 int feof(FILE *stream);

11472 DESCRIPTION

11473 CX The functionality described on this reference page is aligned with the ISO C standard. Any
11474 conflict between the requirements described here and the ISO C standard is unintentional. This
11475 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11476 The *feof()* function shall test the end-of-file indicator for the stream pointed to by *stream*.

11477 RETURN VALUE

11478 The *feof()* function shall return non-zero if and only if the end-of-file indicator is set for *stream*.

11479 ERRORS

11480 No errors are defined.

11481 EXAMPLES

11482 None.

11483 APPLICATION USAGE

11484 None.

11485 RATIONALE

11486 None.

11487 FUTURE DIRECTIONS

11488 None.

11489 SEE ALSO

11490 *clearerr()*, *ferror()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

11491 CHANGE HISTORY

11492 First released in Issue 1. Derived from Issue 1 of the SVID.

11493 **NAME**11494 `feraiseexcept` — raise floating-point exception11495 **SYNOPSIS**11496 `#include <fenv.h>`11497 `int fraiseexcept(int excepts);`11498 **DESCRIPTION**

11499 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 11500 conflict between the requirements described here and the ISO C standard is unintentional. This
 11501 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11502 The `feraiseexcept()` function shall attempt to raise the supported floating-point exceptions
 11503 represented by the argument *excepts*. The order in which these floating-point exceptions are
 11504 raised is unspecified. Whether the `feraiseexcept()` function additionally raises the inexact
 11505 floating-point exception whenever it raises the overflow or underflow floating-point exception is
 11506 implementation-defined.

11507 **RETURN VALUE**

11508 If the argument is zero or if all the specified exceptions were successfully raised, `feraiseexcept()`
 11509 shall return zero. Otherwise, it shall return a non-zero value.

11510 **ERRORS**

11511 No errors are defined.

11512 **EXAMPLES**

11513 None.

11514 **APPLICATION USAGE**

11515 The effect is intended to be similar to that of floating-point exceptions raised by arithmetic
 11516 operations. Hence, enabled traps for floating-point exceptions raised by this function are taken.

11517 **RATIONALE**

11518 Raising overflow or underflow is allowed to also raise inexact because on some architectures the
 11519 only practical way to raise an exception is to execute an instruction that has the exception as a
 11520 side effect. The function is not restricted to accept only valid coincident expressions for atomic
 11521 operations, so the function can be used to raise exceptions accrued over several operations.

11522 **FUTURE DIRECTIONS**

11523 None.

11528 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

11529 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

11530 **NAME**11531 *ferror* — test error indicator on a stream11532 **SYNOPSIS**11533 `#include <stdio.h>`11534 `int ferror(FILE *stream);`11535 **DESCRIPTION**

11536 cx The functionality described on this reference page is aligned with the ISO C standard. Any
11537 conflict between the requirements described here and the ISO C standard is unintentional. This
11538 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11539 The *ferror()* function shall test the error indicator for the stream pointed to by *stream*.11540 **RETURN VALUE**11541 The *ferror()* function shall return non-zero if and only if the error indicator is set for *stream*.11542 **ERRORS**

11543 No errors are defined.

11544 **EXAMPLES**

11545 None.

11546 **APPLICATION USAGE**

11547 None.

11548 **RATIONALE**

11549 None.

11550 **FUTURE DIRECTIONS**

11551 None.

11552 **SEE ALSO**11553 *clearerr()*, *feof()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdio.h>**11554 **CHANGE HISTORY**

11555 First released in Issue 1. Derived from Issue 1 of the SVID.

11556 **NAME**

11557 fesetenv — set current floating-point environment

11558 **SYNOPSIS**

11559 #include <fenv.h>

11560 int fesetenv(const fenv_t *envp);

11561 **DESCRIPTION**11562 Refer to *fegetenv()*.

11563 **NAME**

11564 fesetexceptflag — set floating-point status flags

11565 **SYNOPSIS**

11566 #include <fenv.h>

11567 int fesetexceptflag(const fexcept_t *flagp, int excepts);

11568 **DESCRIPTION**

11569 Refer to *fegetexceptflag()*.

11570 **NAME**

11571 fesetround — set current rounding direction

11572 **SYNOPSIS**

11573 #include <fenv.h>

11574 int fesetround(int *round*) ;

11575 **DESCRIPTION**

11576 Refer to *fegetround()*.

11577 **NAME**

11578 fetestexcept — test floating-point exception flags

11579 **SYNOPSIS**

11580 #include <fenv.h>

11581 int fetestexcept(int *excepts*);11582 **DESCRIPTION**

11583 **CX** The functionality described on this reference page is aligned with the ISO C standard. Any
 11584 conflict between the requirements described here and the ISO C standard is unintentional. This
 11585 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11586 The *fetestexcept()* function shall determine which of a specified subset of the floating-point
 11587 exception flags are currently set. The *excepts* argument specifies the floating-point status flags to
 11588 be queried.

11589 **RETURN VALUE**

11590 The *fetestexcept()* function shall return the value of the bitwise-inclusive OR of the floating-point
 11591 exception macros corresponding to the currently set floating-point exceptions included in
 11592 *excepts*.

11593 **ERRORS**

11594 No errors are defined.

11595 **EXAMPLES**

11596 The following example calls function *f()* if an invalid exception is set, and then function *g()* if an
 11597 overflow exception is set:

```

11598       #include <fenv.h>
11599       /* ... */
11600       {
11601           #pragma STDC FENV_ACCESS ON
11602           int set_excepts;
11603           feclearexcept(FE_INVALID | FE_OVERFLOW);
11604           // maybe raise exceptions
11605           set_excepts = fetestexcept(FE_INVALID | FE_OVERFLOW);
11606           if (set_excepts & FE_INVALID) f();
11607           if (set_excepts & FE_OVERFLOW) g();
11608           /* ... */
11609       }
```

11610 **APPLICATION USAGE**

11611 None.

11612 **RATIONALE**

11613 None.

11614 **FUTURE DIRECTIONS**

11615 None.

11616 **SEE ALSO**

11617 *feclearexcept()*, *fegetexceptflag()*, *feraiseexcept()*, the Base Definitions volume of
 11618 IEEE Std 1003.1-2001, <**fenv.h**>

11619 **CHANGE HISTORY**

11620 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.

11621 **NAME**

11622 feupdateenv — update floating-point environment

11623 **SYNOPSIS**

11624 #include <fenv.h>

11625 int feupdateenv(const fenv_t *envp);

11626 **DESCRIPTION**

11627 cx The functionality described on this reference page is aligned with the ISO C standard. Any
 11628 conflict between the requirements described here and the ISO C standard is unintentional. This
 11629 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11630 The *feupdateenv()* function shall attempt to save the currently raised floating-point exceptions in
 11631 its automatic storage, attempt to install the floating-point environment represented by the object
 11632 pointed to by *envp*, and then attempt to raise the saved floating-point exceptions. The argument
 11633 *envp* shall point to an object set by a call to *feholdexcept()* or *fegetenv()*, or equal a floating-point
 11634 environment macro.

11635 **RETURN VALUE**

11636 The *feupdateenv()* function shall return a zero value if and only if all the required actions were
 11637 successfully carried out.

11638 **ERRORS**

11639 No errors are defined.

11640 **EXAMPLES**

11641 The following example shows sample code to hide spurious underflow floating-point
 11642 exceptions:

```
11643 #include <fenv.h>
11644 double f(double x)
11645 {
11646     #pragma STDC FENV_ACCESS ON
11647     double result;
11648     fenv_t save_env;
11649     feholdexcept(&save_env);
11650     // compute result
11651     if (/* test spurious underflow */)
11652         feclearexcept(FE_UNDERFLOW);
11653     feupdateenv(&save_env);
11654     return result;
11655 }
```

11656 **APPLICATION USAGE**

11657 None.

11658 **RATIONALE**

11659 None.

11660 **FUTURE DIRECTIONS**

11661 None.

11662 **SEE ALSO**11663 *fegetenv()*, *feholdexcept()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**fenv.h**>

11664 **CHANGE HISTORY**

- 11665 First released in Issue 6. Derived from the ISO / IEC 9899: 1999 standard.
- 11666 ISO / IEC 9899: 1999 standard, Technical Corrigendum 1 is incorporated.

11667 **NAME**

11668 fflush — flush a stream

11669 **SYNOPSIS**

11670 #include <stdio.h>

11671 int fflush(FILE **stream*);11672 **DESCRIPTION**

11673 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11674 conflict between the requirements described here and the ISO C standard is unintentional. This
 11675 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11676 If *stream* points to an output stream or an update stream in which the most recent operation was
 11677 CX not input, *fflush()* shall cause any unwritten data for that stream to be written to the file, and the
 11678 *st_ctime* and *st_mtime* fields of the underlying file shall be marked for update.

11679 If *stream* is a null pointer, *fflush()* shall perform this flushing action on all streams for which the
 11680 behavior is defined above.

11681 **RETURN VALUE**

11682 Upon successful completion, *fflush()* shall return 0; otherwise, it shall set the error indicator for
 11683 CX the stream, return EOF, and set *errno* to indicate the error.

11684 **ERRORS**11685 The *fflush()* function shall fail if:

11686 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 11687 process would be delayed in the write operation.

11688 CX [EBADF] The file descriptor underlying *stream* is not valid.

11689 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

11690 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

11691 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 11692 offset maximum associated with the corresponding stream.

11693 CX [EINTR] The *fflush()* function was interrupted by a signal.

11694 CX [EIO] The process is a member of a background process group attempting to write
 11695 to its controlling terminal, TOSTOP is set, the process is neither ignoring nor
 11696 blocking SIGTTOU, and the process group of the process is orphaned. This
 11697 error may also be returned under implementation-defined conditions.

11698 CX [ENOSPC] There was no free space remaining on the device containing the file.

11699 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 11700 any process. A SIGPIPE signal shall also be sent to the thread.

11701 The *fflush()* function may fail if:

11702 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 11703 capabilities of the device.

11704 **EXAMPLES**11705 **Sending Prompts to Standard Output**

11706 The following example uses *printf()* calls to print a series of prompts for information the user
 11707 must enter from standard input. The *fflush()* calls force the output to standard output. The
 11708 *fflush()* function is used because standard output is usually buffered and the prompt may not
 11709 immediately be printed on the output or terminal. The *gets()* calls read strings from standard
 11710 input and place the results in variables, for use later in the program.

```
11711 #include <stdio.h>
11712 ...
11713 char user[100];
11714 char oldpasswd[100];
11715 char newpasswd[100];
11716 ...
11717 printf("User name: ");
11718 fflush(stdout);
11719 gets(user);

11720 printf("Old password: ");
11721 fflush(stdout);
11722 gets(oldpasswd);

11723 printf("New password: ");
11724 fflush(stdout);
11725 gets(newpasswd);
11726 ...
```

11727 **APPLICATION USAGE**

11728 None.

11729 **RATIONALE**

11730 Data buffered by the system may make determining the validity of the position of the current
 11731 file descriptor impractical. Thus, enforcing the repositioning of the file descriptor after *fflush()*
 11732 on streams open for *read()* is not mandated by IEEE Std 1003.1-2001.

11733 **FUTURE DIRECTIONS**

11734 None.

11735 **SEE ALSO**

11736 *getrlimit()*, *ulimit()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdio.h>**

11737 **CHANGE HISTORY**

11738 First released in Issue 1. Derived from Issue 1 of the SVID.

11739 **Issue 5**

11740 Large File Summit extensions are added.

11741 **Issue 6**

11742 Extensions beyond the ISO C standard are marked.

11743 The following new requirements on POSIX implementations derive from alignment with the
 11744 Single UNIX Specification:

- 11745 • The [EFBIG] error is added as part of the large file support extensions.
- 11746 • The [ENXIO] optional error condition is added.

11747 The RETURN VALUE section is updated to note that the error indicator shall be set for the
11748 stream. This is for alignment with the ISO/IEC 9899:1999 standard.

11749 **NAME**

11750 ffs — find first set bit

11751 **SYNOPSIS**

11752 xSI #include <strings.h>

11753 int ffs(int i);

11754

11755 **DESCRIPTION**

11756 The *ffs()* function shall find the first bit set (beginning with the least significant bit) in *i*, and
11757 return the index of that bit. Bits are numbered starting at one (the least significant bit).

11758 **RETURN VALUE**11759 The *ffs()* function shall return the index of the first bit set. If *i* is 0, then *ffs()* shall return 0.11760 **ERRORS**

11761 No errors are defined.

11762 **EXAMPLES**

11763 None.

11764 **APPLICATION USAGE**

11765 None.

11766 **RATIONALE**

11767 None.

11768 **FUTURE DIRECTIONS**

11769 None.

11770 **SEE ALSO**11771 The Base Definitions volume of IEEE Std 1003.1-2001, <**strings.h**>11772 **CHANGE HISTORY**

11773 First released in Issue 4, Version 2.

11774 **Issue 5**

11775 Moved from X/OPEN UNIX extension to BASE.

11776 **NAME**

11777 fgetc — get a byte from a stream

11778 **SYNOPSIS**

11779 #include <stdio.h>

11780 int fgetc(FILE *stream);

11781 **DESCRIPTION**

11782 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11783 conflict between the requirements described here and the ISO C standard is unintentional. This
 11784 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11785 If the end-of-file indicator for the input stream pointed to by *stream* is not set and a next byte is
 11786 present, the *fgetc()* function shall obtain the next byte as an **unsigned char** converted to an **int**,
 11787 from the input stream pointed to by *stream*, and advance the associated file position indicator for
 11788 the stream (if defined). Since *fgetc()* operates on bytes, reading a character consisting of multiple
 11789 bytes (or “a multi-byte character”) may require multiple calls to *fgetc()*.

11790 CX The *fgetc()* function may mark the *st_atime* field of the file associated with *stream* for update. The
 11791 *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
 11792 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns
 11793 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

11794 **RETURN VALUE**

11795 Upon successful completion, *fgetc()* shall return the next byte from the input stream pointed to
 11796 by *stream*. If the end-of-file indicator for the stream is set, or if the stream is at end-of-file, the
 11797 end-of-file indicator for the stream shall be set and *fgetc()* shall return EOF. If a read error occurs,
 11798 CX the error indicator for the stream shall be set, *fgetc()* shall return EOF, and shall set *errno* to
 11799 indicate the error.

11800 **ERRORS**11801 The *fgetc()* function shall fail if data needs to be read and:

11802 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 11803 process would be delayed in the *fgetc()* operation.

11804 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 11805 reading.

11806 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 11807 was transferred.

11808 CX [EIO] A physical I/O error has occurred, or the process is in a background process
 11809 group attempting to read from its controlling terminal, and either the process
 11810 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
 11811 This error may also be generated for implementation-defined reasons.

11812 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
 11813 offset maximum associated with the corresponding stream.

11814 The *fgetc()* function may fail if:

11815 CX [ENOMEM] Insufficient storage space is available.

11816 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 11817 capabilities of the device.

11818 EXAMPLES

11819 None.

11820 APPLICATION USAGE

11821 If the integer value returned by *fgetc()* is stored into a variable of type **char** and then compared
11822 against the integer constant EOF, the comparison may never succeed, because sign-extension of
11823 a variable of type **char** on widening to integer is implementation-defined.

11824 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an
11825 end-of-file condition.

11826 RATIONALE

11827 None.

11828 FUTURE DIRECTIONS

11829 None.

11830 SEE ALSO

11831 *feof()*, *ferror()*, *fopen()*, *getchar()*, *getc()*, the Base Definitions volume of IEEE Std 1003.1-2001,
11832 <stdio.h>

11833 CHANGE HISTORY

11834 First released in Issue 1. Derived from Issue 1 of the SVID.

11835 Issue 5

11836 Large File Summit extensions are added.

11837 Issue 6

11838 Extensions beyond the ISO C standard are marked.

11839 The following new requirements on POSIX implementations derive from alignment with the
11840 Single UNIX Specification:

- 11841 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 11842 • The [ENOMEM] and [ENXIO] optional error conditions are added.

11843 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 11844 • The DESCRIPTION is updated to clarify the behavior when the end-of-file indicator for the
11845 input stream is not set.
- 11846 • The RETURN VALUE section is updated to note that the error indicator shall be set for the
11847 stream.

11848 **NAME**

11849 fgetpos — get current file position information

11850 **SYNOPSIS**

11851 #include <stdio.h>

11852 int fgetpos(FILE *restrict *stream*, fpos_t *restrict *pos*);11853 **DESCRIPTION**

11854 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11855 conflict between the requirements described here and the ISO C standard is unintentional. This
 11856 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11857 The *fgetpos()* function shall store the current values of the parse state (if any) and file position
 11858 indicator for the stream pointed to by *stream* in the object pointed to by *pos*. The value stored
 11859 contains unspecified information usable by *fsetpos()* for repositioning the stream to its position
 11860 at the time of the call to *fgetpos()*.

11861 **RETURN VALUE**

11862 Upon successful completion, *fgetpos()* shall return 0; otherwise, it shall return a non-zero value
 11863 and set *errno* to indicate the error.

11864 **ERRORS**11865 The *fgetpos()* function shall fail if:

11866 CX [EOVERFLOW] The current value of the file position cannot be represented correctly in an
 11867 object of type **fpos_t**.

11868 The *fgetpos()* function may fail if:

11869 CX [EBADF] The file descriptor underlying *stream* is not valid.

11870 CX [ESPIPE] The file descriptor underlying *stream* is associated with a pipe, FIFO, or socket.
 11871

11872 **EXAMPLES**

11873 None.

11874 **APPLICATION USAGE**

11875 None.

11876 **RATIONALE**

11877 None.

11878 **FUTURE DIRECTIONS**

11879 None.

11880 **SEE ALSO**11881 *fopen()*, *ftell()*, *rewind()*, *ungetc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>11882 **CHANGE HISTORY**

11883 First released in Issue 4. Derived from the ISO C standard.

11884 **Issue 5**

11885 Large File Summit extensions are added.

11886 **Issue 6**

11887 Extensions beyond the ISO C standard are marked.

11888 The following new requirements on POSIX implementations derive from alignment with the
 11889 Single UNIX Specification:

- 11890 • The [EBADF] and [ESPIPE] optional error conditions are added.
- 11891 An additional [ESPIPE] error condition is added for sockets.
- 11892 The prototype for *fgetpos()* is changed for alignment with the ISO/IEC 9899:1999 standard.

11893 **NAME**

11894 fgets — get a string from a stream

11895 **SYNOPSIS**

11896 #include <stdio.h>

11897 char *fgets(char *restrict *s*, int *n*, FILE *restrict *stream*);11898 **DESCRIPTION**

11899 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11900 conflict between the requirements described here and the ISO C standard is unintentional. This
 11901 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11902 The *fgets()* function shall read bytes from *stream* into the array pointed to by *s*, until *n*−1 bytes
 11903 are read, or a <newline> is read and transferred to *s*, or an end-of-file condition is encountered.
 11904 The string is then terminated with a null byte.

11905 CX The *fgets()* function may mark the *st_atime* field of the file associated with *stream* for update. The
 11906 *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
 11907 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns
 11908 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

11909 **RETURN VALUE**

11910 Upon successful completion, *fgets()* shall return *s*. If the stream is at end-of-file, the end-of-file
 11911 indicator for the stream shall be set and *fgets()* shall return a null pointer. If a read error occurs,
 11912 CX the error indicator for the stream shall be set, *fgets()* shall return a null pointer, and shall set
 11913 *errno* to indicate the error.

11914 **ERRORS**11915 Refer to *fgetc()*.11916 **EXAMPLES**11917 **Reading Input**

11918 The following example uses *fgets()* to read each line of input. {LINE_MAX}, which defines the
 11919 maximum size of the input line, is defined in the <limits.h> header.

```
11920        #include <stdio.h>
11921        ...
11922        char line[LINE_MAX];
11923        ...
11924        while (fgets(line, LINE_MAX, fp) != NULL) {
11925        ...
11926        }
11927        ...
```

11928 **APPLICATION USAGE**

11929 None.

11930 **RATIONALE**

11931 None.

11932 **FUTURE DIRECTIONS**

11933 None.

11934 **SEE ALSO**

11935 *fopen()*, *fread()*, *gets()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

11936 **CHANGE HISTORY**

11937 First released in Issue 1. Derived from Issue 1 of the SVID.

11938 **Issue 6**

11939 Extensions beyond the ISO C standard are marked.

11940 The prototype for *fgets()* is changed for alignment with the ISO / IEC 9899: 1999 standard.

11941 **NAME**

11942 fgetwc — get a wide-character code from a stream

11943 **SYNOPSIS**

11944 #include <stdio.h>

11945 #include <wchar.h>

11946 wint_t fgetwc(FILE *stream);

11947 **DESCRIPTION**

11948 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 11949 conflict between the requirements described here and the ISO C standard is unintentional. This
 11950 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

11951 The *fgetwc()* function shall obtain the next character (if present) from the input stream pointed to
 11952 by *stream*, convert that to the corresponding wide-character code, and advance the associated
 11953 file position indicator for the stream (if defined).

11954 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

11955 CX The *fgetwc()* function may mark the *st_atime* field of the file associated with *stream* for update.
 11956 The *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
 11957 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns
 11958 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

11959 **RETURN VALUE**

11960 Upon successful completion, the *fgetwc()* function shall return the wide-character code of the
 11961 character read from the input stream pointed to by *stream* converted to a type **wint_t**. If the
 11962 stream is at end-of-file, the end-of-file indicator for the stream shall be set and *fgetwc()* shall
 11963 return WEOF. If a read error occurs, the error indicator for the stream shall be set, *fgetwc()* shall
 11964 CX return WEOF, and shall set *errno* to indicate the error. If an encoding error occurs, the error
 11965 indicator for the stream shall be set, *fgetwc()* shall return WEOF, and shall set *errno* to indicate
 11966 the error.

11967 **ERRORS**

11968 The *fgetwc()* function shall fail if data needs to be read and:

11969 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 11970 process would be delayed in the *fgetwc()* operation.

11971 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 11972 reading.

11973 [EILSEQ] The data obtained from the input stream does not form a valid character.

11974 CX [EINTR] The read operation was terminated due to the receipt of a signal, and no data
 11975 was transferred.

11976 CX [EIO] A physical I/O error has occurred, or the process is in a background process
 11977 group attempting to read from its controlling terminal, and either the process
 11978 is ignoring or blocking the SIGTTIN signal or the process group is orphaned.
 11979 This error may also be generated for implementation-defined reasons.

11980 CX [EOVERFLOW] The file is a regular file and an attempt was made to read at or beyond the
 11981 offset maximum associated with the corresponding stream.

11982 The *fgetwc()* function may fail if:

11983 CX [ENOMEM] Insufficient storage space is available.

11984 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 11985 capabilities of the device.

11986 **EXAMPLES**

11987 None.

11988 **APPLICATION USAGE**

11989 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an
 11990 end-of-file condition.

11991 **RATIONALE**

11992 None.

11993 **FUTURE DIRECTIONS**

11994 None.

11995 **SEE ALSO**

11996 *feof()*, *ferror()*, *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdio.h>**,
 11997 **<wchar.h>**

11998 **CHANGE HISTORY**

11999 First released in Issue 4. Derived from the MSE working draft.

12000 **Issue 5**

12001 The Optional Header (OH) marking is removed from **<stdio.h>**.

12002 Large File Summit extensions are added.

12003 **Issue 6**

12004 Extensions beyond the ISO C standard are marked.

12005 The following new requirements on POSIX implementations derive from alignment with the
 12006 Single UNIX Specification:

- 12007 • The [EIO] and [EOVERFLOW] mandatory error conditions are added.
- 12008 • The [ENOMEM] and [ENXIO] optional error conditions are added.

12009 **NAME**

12010 fgetws — get a wide-character string from a stream

12011 **SYNOPSIS**

12012 #include <stdio.h>

12013 #include <wchar.h>

12014 wchar_t *fgetws(wchar_t *restrict ws, int n,

12015 FILE *restrict stream);

12016 **DESCRIPTION**

12017 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 12018 conflict between the requirements described here and the ISO C standard is unintentional. This
 12019 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12020 The *fgetws()* function shall read characters from the *stream*, convert these to the corresponding
 12021 wide-character codes, place them in the **wchar_t** array pointed to by *ws*, until *n*−1 characters are
 12022 read, or a <newline> is read, converted, and transferred to *ws*, or an end-of-file condition is
 12023 encountered. The wide-character string, *ws*, shall then be terminated with a null wide-character
 12024 code.

12025 If an error occurs, the resulting value of the file position indicator for the stream is unspecified.

12026 CX The *fgetws()* function may mark the *st_atime* field of the file associated with *stream* for update.
 12027 The *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
 12028 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns
 12029 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

12030 **RETURN VALUE**

12031 Upon successful completion, *fgetws()* shall return *ws*. If the stream is at end-of-file, the end-of-
 12032 file indicator for the stream shall be set and *fgetws()* shall return a null pointer. If a read error
 12033 CX occurs, the error indicator for the stream shall be set, *fgetws()* shall return a null pointer, and
 12034 shall set *errno* to indicate the error.

12035 **ERRORS**12036 Refer to *fgetwc()*.12037 **EXAMPLES**

12038 None.

12039 **APPLICATION USAGE**

12040 None.

12041 **RATIONALE**

12042 None.

12043 **FUTURE DIRECTIONS**

12044 None.

12045 **SEE ALSO**12046 *fopen()*, *fread()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>12047 **CHANGE HISTORY**

12048 First released in Issue 4. Derived from the MSE working draft.

12049 **Issue 5**

12050 The Optional Header (OH) marking is removed from <stdio.h>.

12051 **Issue 6**

12052 Extensions beyond the ISO C standard are marked.

12053 The prototype for *fgetws()* is changed for alignment with the ISO / IEC 9899: 1999 standard.

12054 NAME

12055 `fileno` — map a stream pointer to a file descriptor

12056 SYNOPSIS

12057 `CX` `#include <stdio.h>`

12058 `int fileno(FILE *stream);`

12059

12060 DESCRIPTION

12061 The `fileno()` function shall return the integer file descriptor associated with the stream pointed to
12062 by `stream`.

12063 RETURN VALUE

12064 Upon successful completion, `fileno()` shall return the integer value of the file descriptor
12065 associated with `stream`. Otherwise, the value `-1` shall be returned and `errno` set to indicate the
12066 error.

12067 ERRORS

12068 The `fileno()` function may fail if:

12069 [EBADF] The `stream` argument is not a valid stream.

12070 EXAMPLES

12071 None.

12072 APPLICATION USAGE

12073 None.

12074 RATIONALE

12075 Without some specification of which file descriptors are associated with these streams, it is
12076 impossible for an application to set up the streams for another application it starts with `fork()`
12077 and `exec`. In particular, it would not be possible to write a portable version of the `sh` command
12078 interpreter (although there may be other constraints that would prevent that portability).

12079 FUTURE DIRECTIONS

12080 None.

12081 SEE ALSO

12082 Section 2.5.1 (on page 35), `fdopen()`, `fopen()`, `stdin`, the Base Definitions volume of
12083 IEEE Std 1003.1-2001, `<stdio.h>`

12084 CHANGE HISTORY

12085 First released in Issue 1. Derived from Issue 1 of the SVID.

12086 Issue 6

12087 The following new requirements on POSIX implementations derive from alignment with the
12088 Single UNIX Specification:

- 12089 • The [EBADF] optional error condition is added.

12090 **NAME**

12091 flockfile, ftrylockfile, funlockfile — stdio locking functions

12092 **SYNOPSIS**12093 TSF `#include <stdio.h>`

```
12094 void flockfile(FILE *file);
12095 int ftrylockfile(FILE *file);
12096 void funlockfile(FILE *file);
12097
```

12098 **DESCRIPTION**

12099 These functions shall provide for explicit application-level locking of stdio (**FILE ***) objects.
 12100 These functions can be used by a thread to delineate a sequence of I/O statements that are
 12101 executed as a unit.

12102 The *flockfile()* function shall acquire for a thread ownership of a (**FILE ***) object.

12103 The *ftrylockfile()* function shall acquire for a thread ownership of a (**FILE ***) object if the object is
 12104 available; *ftrylockfile()* is a non-blocking version of *flockfile()*.

12105 The *funlockfile()* function shall relinquish the ownership granted to the thread. The behavior is
 12106 undefined if a thread other than the current owner calls the *funlockfile()* function.

12107 The functions shall behave as if there is a lock count associated with each (**FILE ***) object. This
 12108 count is implicitly initialized to zero when the (**FILE ***) object is created. The (**FILE ***) object is
 12109 unlocked when the count is zero. When the count is positive, a single thread owns the (**FILE ***)
 12110 object. When the *flockfile()* function is called, if the count is zero or if the count is positive and
 12111 the caller owns the (**FILE ***) object, the count shall be incremented. Otherwise, the calling thread
 12112 shall be suspended, waiting for the count to return to zero. Each call to *funlockfile()* shall
 12113 decrement the count. This allows matching calls to *flockfile()* (or successful calls to *ftrylockfile()*)
 12114 and *funlockfile()* to be nested.

12115 All functions that reference (**FILE ***) objects shall behave as if they use *flockfile()* and *funlockfile()*
 12116 internally to obtain ownership of these (**FILE ***) objects.

12117 **RETURN VALUE**

12118 None for *flockfile()* and *funlockfile()*.

12119 The *ftrylockfile()* function shall return zero for success and non-zero to indicate that the lock
 12120 cannot be acquired.

12121 **ERRORS**

12122 No errors are defined.

12123 **EXAMPLES**

12124 None.

12125 **APPLICATION USAGE**

12126 Applications using these functions may be subject to priority inversion, as discussed in the Base
 12127 Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

12128 **RATIONALE**

12129 The *flockfile()* and *funlockfile()* functions provide an orthogonal mutual-exclusion lock for each
 12130 **FILE**. The *ftrylockfile()* function provides a non-blocking attempt to acquire a file lock,
 12131 analogous to *pthread_mutex_trylock()*.

12132 These locks behave as if they are the same as those used internally by *stdio* for thread-safety.
 12133 This both provides thread-safety of these functions without requiring a second level of internal
 12134 locking and allows functions in *stdio* to be implemented in terms of other *stdio* functions.

12135 Application writers and implementors should be aware that there are potential deadlock
12136 problems on **FILE** objects. For example, the line-buffered flushing semantics of *stdio* (requested
12137 via `{_IOLBF}`) require that certain input operations sometimes cause the buffered contents of
12138 implementation-defined line-buffered output streams to be flushed. If two threads each hold the
12139 lock on the other's **FILE**, deadlock ensues. This type of deadlock can be avoided by acquiring
12140 **FILE** locks in a consistent order. In particular, the line-buffered output stream deadlock can
12141 typically be avoided by acquiring locks on input streams before locks on output streams if a
12142 thread would be acquiring both.

12143 In summary, threads sharing *stdio* streams with other threads can use *flockfile()* and *funlockfile()*
12144 to cause sequences of I/O performed by a single thread to be kept bundled. The only case where
12145 the use of *flockfile()* and *funlockfile()* is required is to provide a scope protecting uses of the
12146 `*_unlocked()` functions/macros. This moves the cost/performance tradeoff to the optimal point.

12147 **FUTURE DIRECTIONS**

12148 None.

12149 **SEE ALSO**

12150 *getc_unlocked()*, *putc_unlocked()*, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdio.h>`

12151 **CHANGE HISTORY**

12152 First released in Issue 5. Included for alignment with the POSIX Threads Extension.

12153 **Issue 6**

12154 These functions are marked as part of the Thread-Safe Functions option.

12155 **NAME**

12156 floor, floorf, floorl — floor function

12157 **SYNOPSIS**

12158 #include <math.h>

12159 double floor(double x);

12160 float floorf(float x);

12161 long double floorl(long double x);

12162 **DESCRIPTION**

12163 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 12164 conflict between the requirements described here and the ISO C standard is unintentional. This
 12165 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12166 These functions shall compute the largest integral value not greater than *x*.

12167 An application wishing to check for error situations should set *errno* to zero and call
 12168 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 12169 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 12170 zero, an error has occurred.

12171 **RETURN VALUE**

12172 Upon successful completion, these functions shall return the largest integral value not greater
 12173 than *x*, expressed as a **double**, **float**, or **long double**, as appropriate for the return type of the
 12174 function.

12175 MX If *x* is NaN, a NaN shall be returned.12176 If *x* is ± 0 or $\pm \text{Inf}$, *x* shall be returned.

12177 XSI If the correct value would cause overflow, a range error shall occur and *floor*(), *floorf*(), and
 12178 *floorl*() shall return the value of the macro `-HUGE_VAL`, `-HUGE_VALF`, and `-HUGE_VALL`,
 12179 respectively.

12180 **ERRORS**

12181 These functions shall fail if:

12182 XSI **Range Error** The result would cause an overflow.

12183 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 12184 then *errno* shall be set to [ERANGE]. If the integer expression
 12185 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 12186 floating-point exception shall be raised.

12187 **EXAMPLES**

12188 None.

12189 **APPLICATION USAGE**

12190 The integral value returned by these functions might not be expressible as an **int** or **long**. The
 12191 return value should be tested before assigning it to an integer type to avoid the undefined results
 12192 of an integer overflow.

12193 The *floor*() function can only overflow when the floating-point representation has
 12194 DBL_MANT_DIG > DBL_MAX_EXP.

12195 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
 12196 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

12197 **RATIONALE**

12198 None.

12199 **FUTURE DIRECTIONS**

12200 None.

12201 **SEE ALSO**

12202 *ceil()*, *feclearexcept()*, *fetestexcept()*, *isnan()*, the Base Definitions volume of IEEE Std 1003.1-2001,
12203 Section 4.18, Treatment of Error Conditions for Mathematical Functions, **<math.h>**

12204 **CHANGE HISTORY**

12205 First released in Issue 1. Derived from Issue 1 of the SVID.

12206 **Issue 5**

12207 The DESCRIPTION is updated to indicate how an application should check for an error. This
12208 text was previously published in the APPLICATION USAGE section.

12209 **Issue 6**

12210 The *floorf()* and *floorl()* functions are added for alignment with the ISO/IEC 9899:1999 standard.

12211 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
12212 revised to align with the ISO/IEC 9899:1999 standard.

12213 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
12214 marked.

12215 **NAME**

12216 fma, fmaf, fmal — floating-point multiply-add

12217 **SYNOPSIS**

12218 #include <math.h>

12219 double fma(double x, double y, double z);

12220 float fmaf(float x, float y, float z);

12221 long double fmal(long double x, long double y, long double z);

12222 **DESCRIPTION**

12223 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 12224 conflict between the requirements described here and the ISO C standard is unintentional. This
 12225 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12226 These functions shall compute $(x * y) + z$, rounded as one ternary operation: they shall compute
 12227 the value (as if) to infinite precision and round once to the result format, according to the
 12228 rounding mode characterized by the value of FLT_ROUNDS.

12229 An application wishing to check for error situations should set *errno* to zero and call
 12230 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 12231 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 12232 zero, an error has occurred.

12233 **RETURN VALUE**

12234 Upon successful completion, these functions shall return $(x * y) + z$, rounded as one ternary
 12235 operation.

12236 MX If *x* or *y* are NaN, a NaN shall be returned.

12237 If *x* multiplied by *y* is an exact infinity and *z* is also an infinity but with the opposite sign, a
 12238 domain error shall occur, and either a NaN (if supported), or an implementation-defined value
 12239 shall be returned.

12240 If one of *x* and *y* is infinite, the other is zero, and *z* is not a NaN, a domain error shall occur, and
 12241 either a NaN (if supported), or an implementation-defined value shall be returned.

12242 If one of *x* and *y* is infinite, the other is zero, and *z* is a NaN, a NaN shall be returned and a
 12243 domain error may occur.

12244 If $x * y$ is not $0 * \text{Inf}$ nor $\text{Inf} * 0$ and *z* is a NaN, a NaN shall be returned.

12245 **ERRORS**

12246 These functions shall fail if:

12247 MX **Domain Error** The value of $x * y + z$ is invalid, or the value $x * y$ is invalid and *z* is not a NaN.

12248 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 12249 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 12250 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 12251 shall be raised.

12252 MX **Range Error** The result overflows.

12253 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 12254 then *errno* shall be set to [ERANGE]. If the integer expression
 12255 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
 12256 floating-point exception shall be raised.

12257 These functions may fail if:

12258 MX **Domain Error** The value $x*y$ is invalid and z is a NaN.

12259 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,
 12260 then *errno* shall be set to [EDOM]. If the integer expression (`math_errhandling`
 12261 & `MATH_ERREXCEPT`) is non-zero, then the invalid floating-point exception
 12262 shall be raised.

12263 MX **Range Error** The result underflows.

12264 If the integer expression (`math_errhandling & MATH_ERRNO`) is non-zero,
 12265 then *errno* shall be set to [ERANGE]. If the integer expression
 12266 (`math_errhandling & MATH_ERREXCEPT`) is non-zero, then the underflow
 12267 floating-point exception shall be raised.

12268 EXAMPLES

12269 None.

12270 APPLICATION USAGE

12271 On error, the expressions (`math_errhandling & MATH_ERRNO`) and (`math_errhandling &`
 12272 `MATH_ERREXCEPT`) are independent of each other, but at least one of them must be non-zero.

12273 RATIONALE

12274 In many cases, clever use of floating (*fused*) multiply-add leads to much improved code; but its
 12275 unexpected use by the compiler can undermine carefully written code. The `FP_CONTRACT`
 12276 macro can be used to disallow use of floating multiply-add; and the *fma()* function guarantees
 12277 its use where desired. Many current machines provide hardware floating multiply-add
 12278 instructions; software implementation can be used for others.

12279 FUTURE DIRECTIONS

12280 None.

12281 SEE ALSO

 12283 Treatment of Error Conditions for Mathematical Functions, <math.h>

12284 CHANGE HISTORY

12285 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

12286 **NAME**

12287 fmax, fmaxf, fmaxl — determine maximum numeric value of two floating-point numbers

12288 **SYNOPSIS**

12289 #include <math.h>

12290 double fmax(double x, double y);

12291 float fmaxf(float x, float y);

12292 long double fmaxl(long double x, long double y);

12293 **DESCRIPTION**

12294 CX The functionality described on this reference page is aligned with the ISO C standard. Any
12295 conflict between the requirements described here and the ISO C standard is unintentional. This
12296 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12297 These functions shall determine the maximum numeric value of their arguments. NaN
12298 arguments shall be treated as missing data: if one argument is a NaN and the other numeric,
12299 then these functions shall choose the numeric value.

12300 **RETURN VALUE**

12301 Upon successful completion, these functions shall return the maximum numeric value of their
12302 arguments.

12303 If just one argument is a NaN, the other argument shall be returned.

12304 MX If x and y are NaN, a NaN shall be returned.

12305 **ERRORS**

12306 No errors are defined.

12307 **EXAMPLES**

12308 None.

12309 **APPLICATION USAGE**

12310 None.

12311 **RATIONALE**

12312 None.

12352 **NAME**

12353 fmod, fmodf, fmodl — floating-point remainder value function

12354 **SYNOPSIS**

12355 #include <math.h>

12356 double fmod(double x, double y);

12357 float fmodf(float x, float y);

12358 long double fmodl(long double x, long double y);

12359 **DESCRIPTION**

12360 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 12361 conflict between the requirements described here and the ISO C standard is unintentional. This
 12362 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12363 These functions shall return the floating-point remainder of the division of x by y .

12364 An application wishing to check for error situations should set *errno* to zero and call
 12365 *feclearexcept*(FE_ALL_EXCEPT) before calling these functions. On return, if *errno* is non-zero or
 12366 *fetestexcept*(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
 12367 zero, an error has occurred.

12368 **RETURN VALUE**

12369 These functions shall return the value $x - i*y$, for some integer i such that, if y is non-zero, the
 12370 result has the same sign as x and magnitude less than the magnitude of y .

12371 If the correct value would cause underflow, and is not representable, a range error may occur,
 12372 MX and either 0.0 (if supported), or an implementation-defined value shall be returned.

12373 MX If x or y is NaN, a NaN shall be returned.

12374 If y is zero, a domain error shall occur, and either a NaN (if supported), or an implementation-
 12375 defined value shall be returned.

12376 If x is infinite, a domain error shall occur, and either a NaN (if supported), or an
 12377 implementation-defined value shall be returned.

12378 If x is ± 0 and y is not zero, ± 0 shall be returned.12379 If x is not infinite and y is $\pm \text{Inf}$, x shall be returned.

12380 If the correct value would cause underflow, and is representable, a range error may occur and
 12381 the correct value shall be returned.

12382 **ERRORS**

12383 These functions shall fail if:

12384 MX **Domain Error** The x argument is infinite or y is zero.

12385 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 12386 then *errno* shall be set to [EDOM]. If the integer expression (math_errhandling
 12387 & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
 12388 shall be raised.

12389 These functions may fail if:

12390 **Range Error** The result underflows.

12391 If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
 12392 then *errno* shall be set to [ERANGE]. If the integer expression
 12393 (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow
 12394 floating-point exception shall be raised.

12395 EXAMPLES

12396 None.

12397 APPLICATION USAGE

12398 On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
12399 MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

12400 RATIONALE

12401 None.

12402 FUTURE DIRECTIONS

12403 None.

12404 SEE ALSO

12407 CHANGE HISTORY

12408 First released in Issue 1. Derived from Issue 1 of the SVID.

12409 Issue 5

12410 The DESCRIPTION is updated to indicate how an application should check for an error. This
12411 text was previously published in the APPLICATION USAGE section.

12412 Issue 6

12413 The behavior for when the *y* argument is zero is now defined.

12414 The *fmodf()* and *fmodl()* functions are added for alignment with the ISO/IEC 9899:1999
12415 standard.

12416 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
12417 revised to align with the ISO/IEC 9899:1999 standard.

12418 IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
12419 marked.

12420 **NAME**

12421 fmtmsg — display a message in the specified format on standard error and/or a system console

12422 **SYNOPSIS**

12423 xSI #include <fmtmsg.h>

```
12424       int fmtmsg(long classification, const char *label, int severity,
12425               const char *text, const char *action, const char *tag);
```

12426

12427 **DESCRIPTION**12428 The *fmtmsg()* function shall display messages in a specified format instead of the traditional
12429 *printf()* function.12430 Based on a message's classification component, *fmtmsg()* shall write a formatted message either
12431 to standard error, to the console, or to both.12432 A formatted message consists of up to five components as defined below. The component
12433 *classification* is not part of a message displayed to the user, but defines the source of the message
12434 and directs the display of the formatted message.

12435 *classification* Contains the sum of identifying values constructed from the constants defined
12436 below. Any one identifier from a subclass may be used in combination with a
12437 single identifier from a different subclass. Two or more identifiers from the
12438 same subclass should not be used together, with the exception of identifiers
12439 from the display subclass. (Both display subclass identifiers may be used so
12440 that messages can be displayed to both standard error and the system
12441 console.)

12442 **Major Classifications**12443 Identifies the source of the condition. Identifiers are: MM_HARD
12444 (hardware), MM_SOFT (software), and MM_FIRM (firmware).12445 **Message Source Subclassifications**12446 Identifies the type of software in which the problem is detected.
12447 Identifiers are: MM_APPL (application), MM_UTIL (utility), and
12448 MM_OPSYS (operating system).12449 **Display Subclassifications**12450 Indicates where the message is to be displayed. Identifiers are:
12451 MM_PRINT to display the message on the standard error stream,
12452 MM_CONSOLE to display the message on the system console. One or
12453 both identifiers may be used.12454 **Status Subclassifications**12455 Indicates whether the application can recover from the condition.
12456 Identifiers are: MM_RECOVER (recoverable) and MM_NRECOV (non-
12457 recoverable).12458 An additional identifier, MM_NULLMC, indicates that no classification
12459 component is supplied for the message.12460 *label* Identifies the source of the message. The format is two fields separated by a
12461 colon. The first field is up to 10 bytes, the second is up to 14 bytes.12462 *severity* Indicates the seriousness of the condition. Identifiers for the levels of *severity*
12463 are:

12464		MM_HALT	Indicates that the application has encountered a severe fault and is halting. Produces the string "HALT".
12465			
12466		MM_ERROR	Indicates that the application has detected a fault. Produces the string "ERROR".
12467			
12468		MM_WARNING	Indicates a condition that is out of the ordinary, that might be a problem, and should be watched. Produces the string "WARNING".
12469			
12470			
12471		MM_INFO	Provides information about a condition that is not in error. Produces the string "INFO".
12472			
12473		MM_NOSEV	Indicates that no severity level is supplied for the message.
12474	<i>text</i>		Describes the error condition that produced the message. The character string is not limited to a specific size. If the character string is empty, then the text produced is unspecified.
12475			
12476			
12477	<i>action</i>		Describes the first step to be taken in the error-recovery process. The <i>fmtmsg()</i> function precedes the action string with the prefix: "TO FIX:". The <i>action</i> string is not limited to a specific size.
12478			
12479			
12480	<i>tag</i>		An identifier that references on-line documentation for the message. Suggested usage is that <i>tag</i> includes the <i>label</i> and a unique identifying number. A sample <i>tag</i> is "XSI:cat:146".
12481			
12482			

12483 The *MSGVERB* environment variable (for message verbosity) shall determine for *fmtmsg()*
 12484 which message components it is to select when writing messages to standard error. The value of
 12485 *MSGVERB* shall be a colon-separated list of optional keywords. Valid keywords are: *label*,
 12486 *severity*, *text*, *action*, and *tag*. If *MSGVERB* contains a keyword for a component and the
 12487 component's value is not the component's null value, *fmtmsg()* shall include that component in
 12488 the message when writing the message to standard error. If *MSGVERB* does not include a
 12489 keyword for a message component, that component shall not be included in the display of the
 12490 message. The keywords may appear in any order. If *MSGVERB* is not defined, if its value is the
 12491 null string, if its value is not of the correct format, or if it contains keywords other than the valid
 12492 ones listed above, *fmtmsg()* shall select all components.

12493 *MSGVERB* shall determine which components are selected for display to standard error. All
 12494 message components shall be included in console messages.

12495 RETURN VALUE

12496 The *fmtmsg()* function shall return one of the following values:

12497	MM_OK	The function succeeded.
12498	MM_NOTOK	The function failed completely.
12499	MM_NOMSG	The function was unable to generate a message on standard error, but otherwise succeeded.
12500		
12501	MM_NOCON	The function was unable to generate a console message, but otherwise succeeded.
12502		

12503 ERRORS

12504 None.

12505 **EXAMPLES**

12506 1. The following example of *fmtmsg()*:

12507 `fmtmsg(MM_PRINT, "XSI:cat", MM_ERROR, "illegal option",`
12508 `"refer to cat in user's reference manual", "XSI:cat:001")`

12509 produces a complete message in the specified message format:

12510 `XSI:cat: ERROR: illegal option`
12511 `TO FIX: refer to cat in user's reference manual XSI:cat:001`

12512 2. When the environment variable *MSGVERB* is set as follows:

12513 `MSGVERB=severity:text:action`

12514 and Example 1 is used, *fmtmsg()* produces:

12515 `ERROR: illegal option`
12516 `TO FIX: refer to cat in user's reference manual`

12517 **APPLICATION USAGE**

12518 One or more message components may be systematically omitted from messages generated by
12519 an application by using the null value of the argument for that component.

12520 **RATIONALE**

12521 None.

12522 **FUTURE DIRECTIONS**

12523 None.

12524 **SEE ALSO**

12525 *printf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**fmtmsg.h**>

12526 **CHANGE HISTORY**

12527 First released in Issue 4, Version 2.

12528 **Issue 5**

12529 Moved from X/OPEN UNIX extension to BASE.

12530 **NAME**

12531 fnmatch — match a filename or a pathname

12532 **SYNOPSIS**

12533 #include <fnmatch.h>

12534 int fnmatch(const char **pattern*, const char **string*, int *flags*);12535 **DESCRIPTION**

12536 The *fnmatch()* function shall match patterns as described in the Shell and Utilities volume of
 12537 IEEE Std 1003.1-2001, Section 2.13.1, Patterns Matching a Single Character, and Section 2.13.2,
 12538 Patterns Matching Multiple Characters. It checks the string specified by the *string* argument to
 12539 see if it matches the pattern specified by the *pattern* argument.

12540 The *flags* argument shall modify the interpretation of *pattern* and *string*. It is the bitwise-inclusive
 12541 OR of zero or more of the flags defined in <fnmatch.h>. If the FNM_PATHNAME flag is set in
 12542 *flags*, then a slash character ('/') in *string* shall be explicitly matched by a slash in *pattern*; it shall
 12543 not be matched by either the asterisk or question-mark special characters, nor by a bracket
 12544 expression. If the FNM_PATHNAME flag is not set, the slash character shall be treated as an
 12545 ordinary character.

12546 If FNM_NOESCAPE is not set in *flags*, a backslash character ('\ ') in *pattern* followed by any
 12547 other character shall match that second character in *string*. In particular, "\\\" shall match a
 12548 backslash in *string*. If FNM_NOESCAPE is set, a backslash character shall be treated as an
 12549 ordinary character.

12550 If FNM_PERIOD is set in *flags*, then a leading period (' . ') in *string* shall match a period in
 12551 *pattern*; as described by rule 2 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
 12552 2.13.3, Patterns Used for Filename Expansion where the location of “leading” is indicated by the
 12553 value of FNM_PATHNAME:

- 12554 • If FNM_PATHNAME is set, a period is “leading” if it is the first character in *string* or if it
 12555 immediately follows a slash.
- 12556 • If FNM_PATHNAME is not set, a period is “leading” only if it is the first character of *string*.

12557 If FNM_PERIOD is not set, then no special restrictions are placed on matching a period.

12558 **RETURN VALUE**

12559 If *string* matches the pattern specified by *pattern*, then *fnmatch()* shall return 0. If there is no
 12560 match, *fnmatch()* shall return FNM_NOMATCH, which is defined in <fnmatch.h>. If an error
 12561 occurs, *fnmatch()* shall return another non-zero value.

12562 **ERRORS**

12563 No errors are defined.

12564 **EXAMPLES**

12565 None.

12566 **APPLICATION USAGE**

12567 The *fnmatch()* function has two major uses. It could be used by an application or utility that
 12568 needs to read a directory and apply a pattern against each entry. The *find* utility is an example of
 12569 this. It can also be used by the *pax* utility to process its *pattern* operands, or by applications that
 12570 need to match strings in a similar manner.

12571 The name *fnmatch()* is intended to imply *filename* match, rather than *pathname* match. The default
 12572 action of this function is to match filenames, rather than pathnames, since it gives no special
 12573 significance to the slash character. With the FNM_PATHNAME flag, *fnmatch()* does match
 12574 pathnames, but without tilde expansion, parameter expansion, or special treatment for a period

12575 at the beginning of a filename.

12576 **RATIONALE**

12577 This function replaced the REG_FILENAME flag of *regcomp()* in early proposals of this volume
12578 of IEEE Std 1003.1-2001. It provides virtually the same functionality as the *regcomp()* and
12579 *regexexec()* functions using the REG_FILENAME and REG_FSLASH flags (the REG_FSLASH flag
12580 was proposed for *regcomp()*, and would have had the opposite effect from FNM_PATHNAME),
12581 but with a simpler function and less system overhead.

12582 **FUTURE DIRECTIONS**

12583 None.

12584 **SEE ALSO**

12585 *glob()*, *wordexp()*, the Base Definitions volume of IEEE Std 1003.1-2001, <**fnmatch.h**>, the Shell
12586 and Utilities volume of IEEE Std 1003.1-2001

12587 **CHANGE HISTORY**

12588 First released in Issue 4. Derived from the ISO POSIX-2 standard.

12589 **Issue 5**

12590 Moved from POSIX2 C-language Binding to BASE.

12591 **NAME**

12592 fopen — open a stream

12593 **SYNOPSIS**

12594 #include <stdio.h>

12595 FILE *fopen(const char *restrict *filename*, const char *restrict *mode*);12596 **DESCRIPTION**

12597 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 12598 conflict between the requirements described here and the ISO C standard is unintentional. This
 12599 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

12600 The *fopen()* function shall open the file whose pathname is the string pointed to by *filename*, and
 12601 associates a stream with it.

12602 The *mode* argument points to a string. If the string is one of the following, the file shall be opened
 12603 in the indicated mode. Otherwise, the behavior is undefined.

12604 *r* or *rb* Open file for reading.

12605 *w* or *wb* Truncate to zero length or create file for writing.

12606 *a* or *ab* Append; open or create file for writing at end-of-file.

12607 *r+* or *rb+* or *r+b* Open file for update (reading and writing).

12608 *w+* or *wb+* or *w+b* Truncate to zero length or create file for update.

12609 *a+* or *ab+* or *a+b* Append; open or create file for update, writing at end-of-file.

12610 CX The character 'b' shall have no effect, but is allowed for ISO C standard conformance. Opening
 12611 a file with read mode (*r* as the first character in the *mode* argument) shall fail if the file does not
 12612 exist or cannot be read.

12613 Opening a file with append mode (*a* as the first character in the *mode* argument) shall cause all
 12614 subsequent writes to the file to be forced to the then current end-of-file, regardless of intervening
 12615 calls to *fseek()*.

12616 When a file is opened with update mode ('+' as the second or third character in the *mode*
 12617 argument), both input and output may be performed on the associated stream. However, the
 12618 application shall ensure that output is not directly followed by input without an intervening call
 12619 to *fflush()* or to a file positioning function (*fseek()*, *fsetpos()*, or *rewind()*), and input is not directly
 12620 followed by output without an intervening call to a file positioning function, unless the input
 12621 operation encounters end-of-file.

12622 When opened, a stream is fully buffered if and only if it can be determined not to refer to an
 12623 interactive device. The error and end-of-file indicators for the stream shall be cleared.

12624 CX If *mode* is *w*, *wb*, *a*, *ab*, *w+*, *wb+*, *w+b*, *a+*, *ab+*, or *a+b*, and the file did not previously exist, upon
 12625 successful completion, the *fopen()* function shall mark for update the *st_atime*, *st_ctime*, and
 12626 *st_mtime* fields of the file and the *st_ctime* and *st_mtime* fields of the parent directory.

12627 If *mode* is *w*, *wb*, *w+*, *wb+*, or *w+b*, and the file did previously exist, upon successful completion,
 12628 *fopen()* shall mark for update the *st_ctime* and *st_mtime* fields of the file. The *fopen()* function
 12629 shall allocate a file descriptor as *open()* does.

12630 XSI After a successful call to the *fopen()* function, the orientation of the stream shall be cleared, the
 12631 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an
 12632 initial conversion state.

12633 CX The largest value that can be represented correctly in an object of type **off_t** shall be established
 12634 as the offset maximum in the open file description.

12635 RETURN VALUE

12636 Upon successful completion, *fopen()* shall return a pointer to the object controlling the stream.
 12637 CX Otherwise, a null pointer shall be returned, and *errno* shall be set to indicate the error.

12638 ERRORS

12639 The *fopen()* function shall fail if:

12640 CX [EACCES] Search permission is denied on a component of the path prefix, or the file
 12641 exists and the permissions specified by *mode* are denied, or the file does not
 12642 exist and write permission is denied for the parent directory of the file to be
 12643 created.

12644 CX [EINTR] A signal was caught during *fopen()*.

12645 CX [EISDIR] The named file is a directory and *mode* requires write access.

12646 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 12647 argument.

12648 CX [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

12649 CX [ENAMETOOLONG] The length of the *filename* argument exceeds {PATH_MAX} or a pathname
 12650 component is longer than {NAME_MAX}.
 12651

12652 CX [ENFILE] The maximum allowable number of files is currently open in the system.

12653 CX [ENOENT] A component of *filename* does not name an existing file or *filename* is an empty
 12654 string.

12655 CX [ENOSPC] The directory or file system that would contain the new file cannot be
 12656 expanded, the file does not exist, and the file was to be created.

12657 CX [ENOTDIR] A component of the path prefix is not a directory.

12658 CX [ENXIO] The named file is a character special or block special file, and the device
 12659 associated with this special file does not exist.

12660 CX [EOVERFLOW] The named file is a regular file and the size of the file cannot be represented
 12661 correctly in an object of type **off_t**.

12662 CX [EROFS] The named file resides on a read-only file system and *mode* requires write
 12663 access.

12664 The *fopen()* function may fail if:

12665 CX [EINVAL] The value of the *mode* argument is not valid.

12666 CX [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
 12667 resolution of the *path* argument.

12668 CX [EMFILE] {FOPEN_MAX} streams are currently open in the calling process.

12669 CX [EMFILE] {STREAM_MAX} streams are currently open in the calling process.

12670 CX [ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
 12671 whose length exceeds {PATH_MAX}.
 12672

12673	CX	[ENOMEM]	Insufficient storage space is available.
12674	CX	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i>
12675			requires write access.

12676 **EXAMPLES**12677 **Opening a File**

12678 The following example tries to open the file named **file** for reading. The *fopen()* function returns
 12679 a file pointer that is used in subsequent *fgets()* and *fclose()* calls. If the program cannot open the
 12680 file, it just ignores it.

```

12681 #include <stdio.h>
12682 ...
12683 FILE *fp;
12684 ...
12685 void rgrep(const char *file)
12686 {
12687     ...
12688     if ((fp = fopen(file, "r")) == NULL)
12689         return;
12690     ...
12691 }
```

12692 **APPLICATION USAGE**

12693 None.

12694 **RATIONALE**

12695 None.

12696 **FUTURE DIRECTIONS**

12697 None.

12698 **SEE ALSO**

12699 *fclose()*, *fdopen()*, *freopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, **<stdio.h>**

12700 **CHANGE HISTORY**

12701 First released in Issue 1. Derived from Issue 1 of the SVID.

12702 **Issue 5**

12703 Large File Summit extensions are added.

12704 **Issue 6**

12705 Extensions beyond the ISO C standard are marked.

12706 The following new requirements on POSIX implementations derive from alignment with the
 12707 Single UNIX Specification:

- 12708 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file
 12709 description. This change is to support large files.
- 12710 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
 12711 large files.
- 12712 • The [ELOOP] mandatory error condition is added.
- 12713 • The [EINVAL], [EMFILE], [ENAMETOOLONG], [ENOMEM], and [ETXTBSY] optional error
 12714 conditions are added.

- 12715 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
- 12716 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- 12717 • The prototype for *fopen()* is updated.
 - 12718 • The DESCRIPTION is updated to note that if the argument *mode* points to a string other than
 - 12719 those listed, then the behavior is undefined.
- 12720 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
- 12721 [ELOOP] error condition is added.

12722 **NAME**

12723 fork — create a new process

12724 **SYNOPSIS**

12725 #include <unistd.h>

12726 pid_t fork(void);

12727 **DESCRIPTION**

12728 The *fork()* function shall create a new process. The new process (child process) shall be an exact
 12729 copy of the calling process (parent process) except as detailed below:

- 12730 • The child process shall have a unique process ID.
- 12731 • The child process ID also shall not match any active process group ID.
- 12732 • The child process shall have a different parent process ID, which shall be the process ID of
 12733 the calling process.
- 12734 • The child process shall have its own copy of the parent's file descriptors. Each of the child's
 12735 file descriptors shall refer to the same open file description with the corresponding file
 12736 descriptor of the parent.
- 12737 • The child process shall have its own copy of the parent's open directory streams. Each open
 12738 directory stream in the child process may share directory stream positioning with the
 12739 corresponding directory stream of the parent.
- 12740 XSI • The child process shall have its own copy of the parent's message catalog descriptors.
- 12741 • The child process' values of *tms_utime*, *tms_stime*, *tms_cutime*, and *tms_cstime* shall be set to 0.
- 12742 • The time left until an alarm clock signal shall be reset to zero, and the alarm, if any, shall be
 12743 canceled; see *alarm()*.
- 12744 XSI • All *semadj* values shall be cleared.
- 12745 • File locks set by the parent process shall not be inherited by the child process.
- 12746 • The set of signals pending for the child process shall be initialized to the empty set.
- 12747 XSI • Interval timers shall be reset in the child process.
- 12748 SEM • Any semaphores that are open in the parent process shall also be open in the child process.
- 12749 ML • The child process shall not inherit any address space memory locks established by the parent
 12750 process via calls to *mlockall()* or *mlock()*.
- 12751 MF|SHM • Memory mappings created in the parent shall be retained in the child process.
 12752 MAP_PRIVATE mappings inherited from the parent shall also be MAP_PRIVATE mappings
 12753 in the child, and any modifications to the data in these mappings made by the parent prior to
 12754 calling *fork()* shall be visible to the child. Any modifications to the data in MAP_PRIVATE
 12755 mappings made by the parent after *fork()* returns shall be visible only to the parent.
 12756 Modifications to the data in MAP_PRIVATE mappings made by the child shall be visible only
 12757 to the child.
- 12758 PS • For the SCHED_FIFO and SCHED_RR scheduling policies, the child process shall inherit the
 12759 policy and priority settings of the parent process during a *fork()* function. For other
 12760 scheduling policies, the policy and priority settings on *fork()* are implementation-defined.
- 12761 TMR • Per-process timers created by the parent shall not be inherited by the child process.
- 12762 MSG • The child process shall have its own copy of the message queue descriptors of the parent.
 12763 Each of the message descriptors of the child shall refer to the same open message queue

12764		description as the corresponding message descriptor of the parent.
12765 AIO		• No asynchronous input or asynchronous output operations shall be inherited by the child
12766		process.
12767		• A process shall be created with a single thread. If a multi-threaded process calls <i>fork()</i> , the
12768		new process shall contain a replica of the calling thread and its entire address space, possibly
12769		including the states of mutexes and other resources. Consequently, to avoid errors, the child
12770		process may only execute async-signal-safe operations until such time as one of the <i>exec</i>
12771 THR		functions is called. Fork handlers may be established by means of the <i>pthread_atfork()</i>
12772		function in order to maintain application invariants across <i>fork()</i> calls.
12773		When the application calls <i>fork()</i> from a signal handler and any of the fork handlers
12774		registered by <i>pthread_atfork()</i> calls a function that is not asynch-signal-safe, the behavior is
12775		undefined.
12776 TRC TRI		• If the Trace option and the Trace Inherit option are both supported:
12777		If the calling process was being traced in a trace stream that had its inheritance policy set to
12778		POSIX_TRACE_INHERITED, the child process shall be traced into that trace stream, and the
12779		child process shall inherit the parent's mapping of trace event names to trace event type
12780		identifiers. If the trace stream in which the calling process was being traced had its
12781		inheritance policy set to POSIX_TRACE_CLOSE_FOR_CHILD, the child process shall not be
12782		traced into that trace stream. The inheritance policy is set by a call to the
12783		<i>posix_trace_attr_setinherited()</i> function.
12784 TRC		• If the Trace option is supported, but the Trace Inherit option is not supported:
12785		The child process shall not be traced into any of the trace streams of its parent process.
12786 TRC		• If the Trace option is supported, the child process of a trace controller process shall not
12787		control the trace streams controlled by its parent process.
12788 CPT		• The initial value of the CPU-time clock of the child process shall be set to zero.
12789 TCT		• The initial value of the CPU-time clock of the single thread of the child process shall be set to
12790		zero.
12791		All other process characteristics defined by IEEE Std 1003.1-2001 shall be the same in the parent
12792		and child processes. The inheritance of process characteristics not defined by
12793		IEEE Std 1003.1-2001 is unspecified by IEEE Std 1003.1-2001.
12794		After <i>fork()</i> , both the parent and the child processes shall be capable of executing independently
12795		before either one terminates.
12796	RETURN VALUE	
12797		Upon successful completion, <i>fork()</i> shall return 0 to the child process and shall return the
12798		process ID of the child process to the parent process. Both processes shall continue to execute
12799		from the <i>fork()</i> function. Otherwise, -1 shall be returned to the parent process, no child process
12800		shall be created, and <i>errno</i> shall be set to indicate the error.
12801	ERRORS	
12802		The <i>fork()</i> function shall fail if:
12803	[EAGAIN]	The system lacked the necessary resources to create another process, or the
12804		system-imposed limit on the total number of processes under execution
12805		system-wide or by a single user {CHILD_MAX} would be exceeded.

12806 The *fork()* function may fail if:

12807 [ENOMEM] Insufficient storage space is available.

12808 **EXAMPLES**

12809 None.

12810 **APPLICATION USAGE**

12811 None.

12812 **RATIONALE**

12813 Many historical implementations have timing windows where a signal sent to a process group
 12814 (for example, an interactive SIGINT) just prior to or during execution of *fork()* is delivered to the
 12815 parent following the *fork()* but not to the child because the *fork()* code clears the child's set of
 12816 pending signals. This volume of IEEE Std 1003.1-2001 does not require, or even permit, this
 12817 behavior. However, it is pragmatic to expect that problems of this nature may continue to exist
 12818 in implementations that appear to conform to this volume of IEEE Std 1003.1-2001 and pass
 12819 available verification suites. This behavior is only a consequence of the implementation failing to
 12820 make the interval between signal generation and delivery totally invisible. From the
 12821 application's perspective, a *fork()* call should appear atomic. A signal that is generated prior to
 12822 the *fork()* should be delivered prior to the *fork()*. A signal sent to the process group after the
 12823 *fork()* should be delivered to both parent and child. The implementation may actually initialize
 12824 internal data structures corresponding to the child's set of pending signals to include signals
 12825 sent to the process group during the *fork()*. Since the *fork()* call can be considered as atomic
 12826 from the application's perspective, the set would be initialized as empty and such signals would
 12827 have arrived after the *fork()*; see also **<signal.h>**.

12828 One approach that has been suggested to address the problem of signal inheritance across *fork()*
 12829 is to add an [EINTR] error, which would be returned when a signal is detected during the call.
 12830 While this is preferable to losing signals, it was not considered an optimal solution. Although it
 12831 is not recommended for this purpose, such an error would be an allowable extension for an
 12832 implementation.

12833 The [ENOMEM] error value is reserved for those implementations that detect and distinguish
 12834 such a condition. This condition occurs when an implementation detects that there is not enough
 12835 memory to create the process. This is intended to be returned when [EAGAIN] is inappropriate
 12836 because there can never be enough memory (either primary or secondary storage) to perform the
 12837 operation. Since *fork()* duplicates an existing process, this must be a condition where there is
 12838 sufficient memory for one such process, but not for two. Many historical implementations
 12839 actually return [ENOMEM] due to temporary lack of memory, a case that is not generally
 12840 distinct from [EAGAIN] from the perspective of a conforming application.

12841 Part of the reason for including the optional error [ENOMEM] is because the SVID specifies it
 12842 and it should be reserved for the error condition specified there. The condition is not applicable
 12843 on many implementations.

12844 IEEE Std 1003.1-1988 neglected to require concurrent execution of the parent and child of *fork()*.
 12845 A system that single-threads processes was clearly not intended and is considered an
 12846 unacceptable "toy implementation" of this volume of IEEE Std 1003.1-2001. The only objection
 12847 anticipated to the phrase "executing independently" is testability, but this assertion should be
 12848 testable. Such tests require that both the parent and child can block on a detectable action of the
 12849 other, such as a write to a pipe or a signal. An interactive exchange of such actions should be
 12850 possible for the system to conform to the intent of this volume of IEEE Std 1003.1-2001.

12851 The [EAGAIN] error exists to warn applications that such a condition might occur. Whether it
 12852 occurs or not is not in any practical sense under the control of the application because the
 12853 condition is usually a consequence of the user's use of the system, not of the application's code.

Thus, no application can or should rely upon its occurrence under any circumstances, nor should the exact semantics of what concept of “user” is used be of concern to the application writer. Validation writers should be cognizant of this limitation.

There are two reasons why POSIX programmers call *fork()*. One reason is to create a new thread of control within the same program (which was originally only possible in POSIX by creating a new process); the other is to create a new process running a different program. In the latter case, the call to *fork()* is soon followed by a call to one of the *exec* functions.

The general problem with making *fork()* work in a multi-threaded world is what to do with all of the threads. There are two alternatives. One is to copy all of the threads into the new process. This causes the programmer or implementation to deal with threads that are suspended on system calls or that might be about to execute system calls that should not be executed in the new process. The other alternative is to copy only the thread that calls *fork()*. This creates the difficulty that the state of process-local resources is usually held in process memory. If a thread that is not calling *fork()* holds a resource, that resource is never released in the child process because the thread whose job it is to release the resource does not exist in the child process.

When a programmer is writing a multi-threaded program, the first described use of *fork()*, creating new threads in the same program, is provided by the *pthread_create()* function. The *fork()* function is thus used only to run new programs, and the effects of calling functions that require certain resources between the call to *fork()* and the call to an *exec* function are undefined.

The addition of the *forkall()* function to the standard was considered and rejected. The *forkall()* function lets all the threads in the parent be duplicated in the child. This essentially duplicates the state of the parent in the child. This allows threads in the child to continue processing and allows locks and the state to be preserved without explicit *pthread_atfork()* code. The calling process has to ensure that the threads processing state that is shared between the parent and child (that is, file descriptors or MAP_SHARED memory) behaves properly after *forkall()*. For example, if a thread is reading a file descriptor in the parent when *forkall()* is called, then two threads (one in the parent and one in the child) are reading the file descriptor after the *forkall()*. If this is not desired behavior, the parent process has to synchronize with such threads before calling *forkall()*.

While the *fork()* function is async-signal-safe, there is no way for an implementation to determine whether the fork handlers established by *pthread_atfork()* are async-signal-safe. The fork handlers may attempt to execute portions of the implementation that are not async-signal-safe, such as those that are protected by mutexes, leading to a deadlock condition. It is therefore undefined for the fork handlers to execute functions that are not async-signal-safe when *fork()* is called from a signal handler.

When *forkall()* is called, threads, other than the calling thread, that are in functions that can return with an [EINTR] error may have those functions return [EINTR] if the implementation cannot ensure that the function behaves correctly in the parent and child. In particular, *pthread_cond_wait()* and *pthread_cond_timedwait()* need to return in order to ensure that the condition has not changed. These functions can be awakened by a spurious condition wakeup rather than returning [EINTR].

12901 **CHANGE HISTORY**

12902 First released in Issue 1. Derived from Issue 1 of the SVID.

12903 **Issue 5**12904 The DESCRIPTION is changed for alignment with the POSIX Realtime Extension and the POSIX
12905 Threads Extension.12906 **Issue 6**12907 The following new requirements on POSIX implementations derive from alignment with the
12908 Single UNIX Specification:

- 12909 • The requirement to include **<sys/types.h>** has been removed. Although **<sys/types.h>** was
12910 required for conforming implementations of previous POSIX specifications, it was not
12911 required for UNIX applications.

12912 The following changes were made to align with the IEEE P1003.1a draft standard:

- 12913 • The effect of *fork()* on a pending alarm call in the child process is clarified.

12914 The description of CPU-time clock semantics is added for alignment with IEEE Std 1003.1d-1999.

12915 The description of tracing semantics is added for alignment with IEEE Std 1003.1q-2000.

12916 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/17 is applied, adding text to the |
 12917 DESCRIPTION and RATIONALE relating to fork handlers registered by the *pthread_atfork()* |
 12918 function and async-signal safety. |

12919 **NAME**

12920 fpathconf, pathconf — get configurable pathname variables

12921 **SYNOPSIS**

12922 #include <unistd.h>

12923 long fpathconf(int *filde*s, int *name*);12924 long pathconf(const char **path*, int *name*);12925 **DESCRIPTION**12926 The *fpathconf()* and *pathconf()* functions shall determine the current value of a configurable limit
12927 or option (*variable*) that is associated with a file or directory.12928 For *pathconf()*, the *path* argument points to the pathname of a file or directory.12929 For *fpathconf()*, the *filde*s argument is an open file descriptor.12930 The *name* argument represents the variable to be queried relative to that file or directory.
12931 Implementations shall support all of the variables listed in the following table and may support
12932 others. The variables in the following table come from <limits.h> or <unistd.h> and the
12933 symbolic constants, defined in <unistd.h>, are the corresponding values used for *name*.

12955 **Requirements**

- 12956 1. If *path* or *filde*s refers to a directory, the value returned shall apply to the directory itself.
- 12957 2. If *path* or *filde*s does not refer to a terminal file, it is unspecified whether an implementation
12958 supports an association of the variable name with the specified file.
- 12959 3. If *path* or *filde*s refers to a directory, the value returned shall apply to filenames within the
12960 directory.
- 12961 4. If *path* or *filde*s does not refer to a directory, it is unspecified whether an implementation
12962 supports an association of the variable name with the specified file.

- 12963 5. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of a
12964 relative pathname when the specified directory is the working directory.
- 12965 6. If *path* refers to a FIFO, or *fildes* refers to a pipe or FIFO, the value returned shall apply to
12966 the referenced object. If *path* or *fildes* refers to a directory, the value returned shall apply to
12967 any FIFO that exists or can be created within the directory. If *path* or *fildes* refers to any
12968 other type of file, it is unspecified whether an implementation supports an association of
12969 the variable name with the specified file.
- 12970 7. If *path* or *fildes* refers to a directory, the value returned shall apply to any files, other than
12971 directories, that exist or can be created within the directory.
- 12972 8. If *path* or *fildes* refers to a directory, it is unspecified whether an implementation supports
12973 an association of the variable name with the specified file.
- 12974 9. If *path* or *fildes* refers to a directory, the value returned shall be the maximum length of the
12975 string that a symbolic link in that directory can contain.

12976 RETURN VALUE

12977 If *name* is an invalid value, both *pathconf()* and *fpathconf()* shall return `-1` and set *errno* to
12978 indicate the error.

12979 If the variable corresponding to *name* has no limit for the *path* or file descriptor, both *pathconf()*
12980 and *fpathconf()* shall return `-1` without changing *errno*. If the implementation needs to use *path*
12981 to determine the value of *name* and the implementation does not support the association of *name*
12982 with the file specified by *path*, or if the process did not have appropriate privileges to query the
12983 file specified by *path*, or *path* does not exist, *pathconf()* shall return `-1` and set *errno* to indicate the
12984 error.

12985 If the implementation needs to use *fildes* to determine the value of *name* and the implementation
12986 does not support the association of *name* with the file specified by *fildes*, or if *fildes* is an invalid
12987 file descriptor, *fpathconf()* shall return `-1` and set *errno* to indicate the error.

12988 Otherwise, *pathconf()* or *fpathconf()* shall return the current variable value for the file or
12989 directory without changing *errno*. The value returned shall not be more restrictive than the
12990 corresponding value available to the application when it was compiled with the
12991 implementation's `<limits.h>` or `<unistd.h>`.

12992 ERRORS

12993 The *pathconf()* function shall fail if:

- 12994 [EINVAL] The value of *name* is not valid.
- 12995 [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
12996 argument.
- 12997 The *pathconf()* function may fail if:
- 12998 [EACCES] Search permission is denied for a component of the path prefix.
- 12999 [EINVAL] The implementation does not support an association of the variable *name* with
13000 the specified file.
- 13001 [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during
13002 resolution of the *path* argument.
- 13003 [ENAMETOOLONG]
- 13004 The length of the *path* argument exceeds {PATH_MAX} or a pathname
13005 component is longer than {NAME_MAX}.

13006 [ENAMETOOLONG]
 13007 As a result of encountering a symbolic link in resolution of the *path* argument,
 13008 the length of the substituted pathname string exceeded {PATH_MAX}.

13009 [ENOENT] A component of *path* does not name an existing file or *path* is an empty string.

13010 [ENOTDIR] A component of the path prefix is not a directory.

13011 The *fpathconf()* function shall fail if:

13012 [EINVAL] The value of *name* is not valid.

13013 The *fpathconf()* function may fail if:

13014 [EBADF] The *filides* argument is not a valid file descriptor.

13015 [EINVAL] The implementation does not support an association of the variable *name* with
 13016 the specified file.

13017 EXAMPLES

13018 None.

13019 APPLICATION USAGE

13020 None.

13021 RATIONALE

13022 The *pathconf()* function was proposed immediately after the *sysconf()* function when it was
 13023 realized that some configurable values may differ across file system, directory, or device
 13024 boundaries.

13025 For example, {NAME_MAX} frequently changes between System V and BSD-based file systems;
 13026 System V uses a maximum of 14, BSD 255. On an implementation that provides both types of file
 13027 systems, an application would be forced to limit all pathname components to 14 bytes, as this
 13028 would be the value specified in <limits.h> on such a system.

13029 Therefore, various useful values can be queried on any pathname or file descriptor, assuming
 13030 that the appropriate permissions are in place.

13031 The value returned for the variable {PATH_MAX} indicates the longest relative pathname that
 13032 could be given if the specified directory is the process' current working directory. A process may
 13033 not always be able to generate a name that long and use it if a subdirectory in the pathname
 13034 crosses into a more restrictive file system.

13035 The value returned for the variable _POSIX_CHOWN_RESTRICTED also applies to directories
 13036 that do not have file systems mounted on them. The value may change when crossing a mount
 13037 point, so applications that need to know should check for each directory. (An even easier check
 13038 is to try the *chown()* function and look for an error in case it happens.)

13039 Unlike the values returned by *sysconf()*, the pathname-oriented variables are potentially more
 13040 volatile and are not guaranteed to remain constant throughout the process' lifetime. For
 13041 example, in between two calls to *pathconf()*, the file system in question may have been
 13042 unmounted and remounted with different characteristics.

13043 Also note that most of the errors are optional. If one of the variables always has the same value
 13044 on an implementation, the implementation need not look at *path* or *filides* to return that value and
 13045 is, therefore, not required to detect any of the errors except the meaning of [EINVAL] that
 13046 indicates that the value of *name* is not valid for that variable.

13047 If the value of any of the limits is unspecified (logically infinite), they will not be defined in
 13048 <limits.h> and the *pathconf()* and *fpathconf()* functions return -1 without changing *errno*. This
 13049 can be distinguished from the case of giving an unrecognized *name* argument because *errno* is set

13050 to [EINVAL] in this case.

13051 Since `-1` is a valid return value for the `pathconf()` and `fpathconf()` functions, applications should
13052 set `errno` to zero before calling them and check `errno` only if the return value is `-1`.

13053 For the case of {SYMLINK_MAX}, since both `pathconf()` and `open()` follow symbolic links, there
13054 is no way that `path` or `filenames` could refer to a symbolic link.

13055 FUTURE DIRECTIONS

13056 None.

13057 SEE ALSO

13058 `confstr()`, `sysconf()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<limits.h>`, `<unistd.h>`,

13060 CHANGE HISTORY

13061 First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

13062 Issue 5

13063 The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

13064 Large File Summit extensions are added.

13065 Issue 6

13066 The following new requirements on POSIX implementations derive from alignment with the
13067 Single UNIX Specification:

- 13068 • The DESCRIPTION is updated to include {FILESIZEBITS}.
- 13069 • The [ELOOP] mandatory error condition is added.
- 13070 • A second [ENAMETOOLONG] is added as an optional error condition.

13071 The following changes were made to align with the IEEE P1003.1a draft standard:

- 13072 • The `_PC_SYMLINK_MAX` entry is added to the table in the DESCRIPTION.

13073 The following `pathconf()` variables and their associated names are added for alignment with
13074 IEEE Std 1003.1d-1999:

13075 {POSIX_ALLOC_SIZE_MIN}
13076 {POSIX_REC_INCR_XFER_SIZE}
13077 {POSIX_REC_MAX_XFER_SIZE}
13078 {POSIX_REC_MIN_XFER_SIZE}
13079 {POSIX_REC_XFER_ALIGN}

13080 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/18 is applied, changing the fourth
13081 paragraph of the DESCRIPTION and removing shading and margin markers from the table. This
13082 change is needed since implementations are required to support all of these symbols.

13083 **NAME**

13084 fpclassify — classify real floating type

13085 **SYNOPSIS**

13086 #include <math.h>

13087 int fpclassify(real-floating x);

13088 **DESCRIPTION**

13089 cx The functionality described on this reference page is aligned with the ISO C standard. Any
13090 conflict between the requirements described here and the ISO C standard is unintentional. This
13091 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13092 The *fpclassify()* macro shall classify its argument value as NaN, infinite, normal, subnormal,
13093 zero, or into another implementation-defined category. First, an argument represented in a
13094 format wider than its semantic type is converted to its semantic type. Then classification is based
13095 on the type of the argument.

13096 **RETURN VALUE**

13097 The *fpclassify()* macro shall return the value of the number classification macro appropriate to
13098 the value of its argument.

13099 **ERRORS**

13100 No errors are defined.

13101 **EXAMPLES**

13102 None.

13103 **APPLICATION USAGE**

13104 None.

13105 **RATIONALE**

13106 None.

13107 **FUTURE DIRECTIONS**

13108 None.

13111 IEEE Std 1003.1-2001, <math.h>

13112 **CHANGE HISTORY**

13113 First released in Issue 6. Derived from the ISO/IEC 9899:1999 standard.

13114 NAME

13115 fprintf, printf, snprintf, sprintf — print formatted output

13116 SYNOPSIS

13117 #include <stdio.h>

13118 int fprintf(FILE *restrict *stream*, const char *restrict *format*, ...);

13119 int printf(const char *restrict *format*, ...);

13120 int snprintf(char *restrict *s*, size_t *n*,

13121 const char *restrict *format*, ...);

13122 int sprintf(char *restrict *s*, const char *restrict *format*, ...);

13123 DESCRIPTION

13124 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13125 conflict between the requirements described here and the ISO C standard is unintentional. This
13126 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13127 The *fprintf()* function shall place output on the named output *stream*. The *printf()* function shall
13128 place output on the standard output stream *stdout*. The *sprintf()* function shall place output
13129 followed by the null byte, '\0', in consecutive bytes starting at *s*; it is the user's responsibility
13130 to ensure that enough space is available.

13131 The *snprintf()* function shall be equivalent to *sprintf()*, with the addition of the *n* argument
13132 which states the size of the buffer referred to by *s*. If *n* is zero, nothing shall be written and *s* may
13133 be a null pointer. Otherwise, output bytes beyond the *n*-1st shall be discarded instead of being
13134 written to the array, and a null byte is written at the end of the bytes actually written into the
13135 array.

13136 If copying takes place between objects that overlap as a result of a call to *sprintf()* or *snprintf()*,
13137 the results are undefined.

13138 Each of these functions converts, formats, and prints its arguments under control of the *format*.
13139 The *format* is a character string, beginning and ending in its initial shift state, if any. The *format* is
13140 composed of zero or more directives: *ordinary characters*, which are simply copied to the output
13141 stream, and *conversion specifications*, each of which shall result in the fetching of zero or more
13142 arguments. The results are undefined if there are insufficient arguments for the *format*. If the
13143 *format* is exhausted while arguments remain, the excess arguments shall be evaluated but are
13144 otherwise ignored.

13145 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
13146 to the next unused argument. In this case, the conversion specifier character % (see below) is
13147 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}],
13148 giving the position of the argument in the argument list. This feature provides for the definition
13149 of format strings that select arguments in an order appropriate to specific languages (see the
13150 EXAMPLES section).

13151 The *format* can contain either numbered argument conversion specifications (that is, "%n\$" and
13152 "*m\$"), or unnumbered argument conversion specifications (that is, % and *), but not both. The
13153 only exception to this is that %% can be mixed with the "%n\$" form. The results of mixing
13154 numbered and unnumbered argument specifications in a *format* string are undefined. When
13155 numbered argument specifications are used, specifying the *N*th argument requires that all the
13156 leading arguments, from the first to the (*N*-1)th, are specified in the format string.

13157 In format strings containing the "%n\$" form of conversion specification, numbered arguments
13158 in the argument list can be referenced from the format string as many times as required.

13159 In format strings containing the % form of conversion specification, each conversion specification
13160 uses the first unused argument in the argument list.

13161 CX	All forms of the <i>fprintf()</i> functions allow for the insertion of a language-dependent radix character in the output string. The radix character is defined in the program's locale (category <i>LC_NUMERIC</i>). In the POSIX locale, or in a locale where the radix character is not defined, the radix character shall default to a period ('.').
13162	
13163	
13164	
13165 XSI	Each conversion specification is introduced by the '%' character or by the character sequence "%n\$", after which the following appear in sequence:
13166	
13167	• Zero or more <i>flags</i> (in any order), which modify the meaning of the conversion specification.
13168	• An optional minimum <i>field width</i>. If the converted value has fewer bytes than the field width, it shall be padded with spaces by default on the left; it shall be padded on the right if the left-adjustment flag ('-'), described below, is given to the field width. The field width takes the form of an asterisk ('*'), described below, or a decimal integer.
13169	
13170	
13171	
13172	• An optional <i>precision</i> that gives the minimum number of digits to appear for the d, i, o, u, x, and X conversion specifiers; the number of digits to appear after the radix character for the a, A, e, E, f, and F conversion specifiers; the maximum number of significant digits for the g and G conversion specifiers; or the maximum number of bytes to be printed from a string in the s and S conversion specifiers. The precision takes the form of a period ('.') followed either by an asterisk ('*'), described below, or an optional decimal digit string, where a null digit string is treated as zero. If a precision appears with any other conversion specifier, the behavior is undefined.
13173	
13174	
13175	
13176 XSI	
13177	
13178	
13179	
13180	• An optional length modifier that specifies the size of the argument.
13181	• A <i>conversion specifier</i> character that indicates the type of conversion to be applied.
13182	A field width, or precision, or both, may be indicated by an asterisk ('*'). In this case an argument of type int supplies the field width or precision. Applications shall ensure that arguments specifying field width, or precision, or both appear in that order before the argument, if any, to be converted. A negative field width is taken as a '-' flag followed by a positive field width. A negative precision is taken as if the precision were omitted. In format strings containing the "%n\$" form of a conversion specification, a field width or precision may be indicated by the sequence "*m\$", where <i>m</i> is a decimal integer in the range [1,{NL_ARGMAX}] giving the position in the argument list (after the <i>format</i> argument) of an integer argument containing the field width or precision, for example:
13183	
13184	
13185	
13186 XSI	
13187	
13188	
13189	
13190	
13191	<pre>printf("%1\$d:%2\$.*3\$d:%4\$.*3\$d\n", hour, min, precision, sec);</pre>
13192	The flag characters and their meanings are:
13193 XSI	
13194	
13195	' The integer portion of the result of a decimal conversion (%i, %d, %u, %f, %F, %g, or %G) shall be formatted with thousands' grouping characters. For other conversions the behavior is undefined. The non-monetary grouping character is used.
13196	- The result of the conversion shall be left-justified within the field. The conversion is right-justified if this flag is not specified.
13197	
13198	+ The result of a signed conversion shall always begin with a sign ('+' or '-'). The conversion shall begin with a sign only when a negative value is converted if this flag is not specified.
13199	
13200	
13201	<space> If the first character of a signed conversion is not a sign or if a signed conversion results in no characters, a <space> shall be prefixed to the result. This means that if the <space> and '+' flags both appear, the <space> flag shall be ignored.
13202	
13203	
13204	# Specifies that the value is to be converted to an alternative form. For o conversion, it increases the precision (if necessary) to force the first digit of the result to be zero. For x
13205	

13206 or X conversion specifiers, a non-zero result shall have 0x (or 0X) prefixed to it. For a, A,
 13207 e, E, f, F, g, and G conversion specifiers, the result shall always contain a radix
 13208 character, even if no digits follow the radix character. Without this flag, a radix
 13209 character appears in the result of these conversions only if a digit follows it. For g and G
 13210 conversion specifiers, trailing zeros shall *not* be removed from the result as they
 13211 normally are. For other conversion specifiers, the behavior is undefined.

13212 0 For d, i, o, u, x, X, a, A, e, E, f, F, g, and G conversion specifiers, leading zeros
 13213 (following any indication of sign or base) are used to pad to the field width; no space
 13214 padding is performed. If the '0' and '-' flags both appear, the '0' flag is ignored. For
 13215 d, i, o, u, x, and X conversion specifiers, if a precision is specified, the '0' flag is
 13216 xsl ignored. If the '0' and ' ' flags both appear, the grouping characters are inserted
 13217 before zero padding. For other conversions, the behavior is undefined.

13218 The length modifiers and their meanings are:

13219 hh Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **signed char**
 13220 or **unsigned char** argument (the argument will have been promoted according to the
 13221 integer promotions, but its value shall be converted to **signed char** or **unsigned char**
 13222 before printing); or that a following n conversion specifier applies to a pointer to a
 13223 **signed char** argument.

13224 h Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **short** or
 13225 **unsigned short** argument (the argument will have been promoted according to the
 13226 integer promotions, but its value shall be converted to **short** or **unsigned short** before
 13227 printing); or that a following n conversion specifier applies to a pointer to a **short**
 13228 argument.

13229 l (ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long** or
 13230 **unsigned long** argument; that a following n conversion specifier applies to a pointer to
 13231 a **long** argument; that a following c conversion specifier applies to a **wint_t** argument;
 13232 that a following s conversion specifier applies to a pointer to a **wchar_t** argument; or
 13233 has no effect on a following a, A, e, E, f, F, g, or G conversion specifier.

13234 ll (ell-ell) Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **long long** or
 13235 **unsigned long long** argument; or that a following n conversion specifier applies to a
 13236 pointer to a **long long** argument.

13238 j Specifies that a following d, i, o, u, x, or X conversion specifier applies to an **intmax_t**
 13239 or **uintmax_t** argument; or that a following n conversion specifier applies to a pointer
 13240 to an **intmax_t** argument.

13241 z Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **size_t** or the
 13242 corresponding signed integer type argument; or that a following n conversion specifier
 13243 applies to a pointer to a signed integer type corresponding to a **size_t** argument.

13244 t Specifies that a following d, i, o, u, x, or X conversion specifier applies to a **ptrdiff_t** or
 13245 the corresponding **unsigned** type argument; or that a following n conversion specifier
 13246 applies to a pointer to a **ptrdiff_t** argument.

13247 L Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to a **long**
 13248 **double** argument.

13249 If a length modifier appears with any conversion specifier other than as specified above, the
 13250 behavior is undefined.

13251		The conversion specifiers and their meanings are:
13252	d, i	The int argument shall be converted to a signed decimal in the style "[-] dddd". The
13253		precision specifies the minimum number of digits to appear; if the value being
13254		converted can be represented in fewer digits, it shall be expanded with leading zeros.
13255		The default precision is 1. The result of converting zero with an explicit precision of
13256		zero shall be no characters.
13257	o	The unsigned argument shall be converted to unsigned octal format in the style
13258		"ddd". The precision specifies the minimum number of digits to appear; if the value
13259		being converted can be represented in fewer digits, it shall be expanded with leading
13260		zeros. The default precision is 1. The result of converting zero with an explicit precision
13261		of zero shall be no characters.
13262	u	The unsigned argument shall be converted to unsigned decimal format in the style
13263		"ddd". The precision specifies the minimum number of digits to appear; if the value
13264		being converted can be represented in fewer digits, it shall be expanded with leading
13265		zeros. The default precision is 1. The result of converting zero with an explicit precision
13266		of zero shall be no characters.
13267	x	The unsigned argument shall be converted to unsigned hexadecimal format in the style
13268		"ddd"; the letters "abcdef" are used. The precision specifies the minimum number
13269		of digits to appear; if the value being converted can be represented in fewer digits, it
13270		shall be expanded with leading zeros. The default precision is 1. The result of
13271		converting zero with an explicit precision of zero shall be no characters.
13272	X	Equivalent to the x conversion specifier, except that letters "ABCDEF" are used instead
13273		of "abcdef".
13274	f, F	The double argument shall be converted to decimal notation in the style
13275		"[-] ddd.ddd", where the number of digits after the radix character is equal to the
13276		precision specification. If the precision is missing, it shall be taken as 6; if the precision
13277		is explicitly zero and no '#' flag is present, no radix character shall appear. If a radix
13278		character appears, at least one digit appears before it. The low-order digit shall be
13279		rounded in an implementation-defined manner.
13280		A double argument representing an infinity shall be converted in one of the styles
13281		"[-] inf" or "[-] infinity"; which style is implementation-defined. A double
13282		argument representing a NaN shall be converted in one of the styles "[-] nan(<i>n-char-sequence</i>)
13283		" or "[-] nan"; which style, and the meaning of any <i>n-char-sequence</i> ,
13284		is implementation-defined. The F conversion specifier produces "INF", "INFINITY",
13285		or "NAN" instead of "inf", "infinity", or "nan", respectively.
13286	e, E	The double argument shall be converted in the style "[-] d.ddde±dd", where there is
13287		one digit before the radix character (which is non-zero if the argument is non-zero) and
13288		the number of digits after it is equal to the precision; if the precision is missing, it shall
13289		be taken as 6; if the precision is zero and no '#' flag is present, no radix character shall
13290		appear. The low-order digit shall be rounded in an implementation-defined manner.
13291		The E conversion specifier shall produce a number with 'E' instead of 'e'
13292		introducing the exponent. The exponent shall always contain at least two digits. If the
13293		value is zero, the exponent shall be zero.
13294		A double argument representing an infinity or NaN shall be converted in the style of
13295		an f or F conversion specifier.
13296	g, G	The double argument shall be converted in the style f or e (or in the style F or E in the
13297		case of a G conversion specifier), with the precision specifying the number of significant

13298		digits. If an explicit precision is zero, it shall be taken as 1. The style used depends on
13299		the value converted; style <code>e</code> (or <code>E</code>) shall be used only if the exponent resulting from
13300		such a conversion is less than <code>-4</code> or greater than or equal to the precision. Trailing zeros
13301		shall be removed from the fractional portion of the result; a radix character shall appear
13302		only if it is followed by a digit or a <code>'#'</code> flag is present.
13303		A double argument representing an infinity or NaN shall be converted in the style of
13304		an <code>f</code> or <code>F</code> conversion specifier.
13305	a, A	A double argument representing a floating-point number shall be converted in the
13306		style <code>"[-] 0xh.hhhhp±d"</code> , where there is one hexadecimal digit (which shall be non-
13307		zero if the argument is a normalized floating-point number and is otherwise
13308		unspecified) before the decimal-point character and the number of hexadecimal digits
13309		after it is equal to the precision; if the precision is missing and <code>FLT_RADIX</code> is a power
13310		of 2, then the precision shall be sufficient for an exact representation of the value; if the
13311		precision is missing and <code>FLT_RADIX</code> is not a power of 2, then the precision shall be
13312		sufficient to distinguish values of type double , except that trailing zeros may be
13313		omitted; if the precision is zero and the <code>'#'</code> flag is not specified, no decimal-point
13314		character shall appear. The letters <code>"abcdef"</code> shall be used for a conversion and the
13315		letters <code>"ABCDEF"</code> for <code>A</code> conversion. The <code>A</code> conversion specifier produces a number with
13316		<code>'X'</code> and <code>'P'</code> instead of <code>'x'</code> and <code>'p'</code> . The exponent shall always contain at least one
13317		digit, and only as many more digits as necessary to represent the decimal exponent of
13318		2. If the value is zero, the exponent shall be zero.
13319		A double argument representing an infinity or NaN shall be converted in the style of
13320		an <code>f</code> or <code>F</code> conversion specifier.
13321	c	The int argument shall be converted to an unsigned char , and the resulting byte shall
13322		be written.
13323		If an <code>l</code> (ell) qualifier is present, the wint_t argument shall be converted as if by an <code>ls</code>
13324		conversion specification with no precision and an argument that points to a two-
13325		element array of type wchar_t , the first element of which contains the wint_t argument
13326		to the <code>ls</code> conversion specification and the second element contains a null wide
13327		character.
13328	s	The argument shall be a pointer to an array of char . Bytes from the array shall be
13329		written up to (but not including) any terminating null byte. If the precision is specified,
13330		no more than that many bytes shall be written. If the precision is not specified or is
13331		greater than the size of the array, the application shall ensure that the array contains a
13332		null byte.
13333		If an <code>l</code> (ell) qualifier is present, the argument shall be a pointer to an array of type
13334		wchar_t . Wide characters from the array shall be converted to characters (each as if by
13335		a call to the <code>wcrtomb()</code> function, with the conversion state described by an mbstate_t
13336		object initialized to zero before the first wide character is converted) up to and
13337		including a terminating null wide character. The resulting characters shall be written
13338		up to (but not including) the terminating null character (byte). If no precision is
13339		specified, the application shall ensure that the array contains a null wide character. If a
13340		precision is specified, no more than that many characters (bytes) shall be written
13341		(including shift sequences, if any), and the array shall contain a null wide character if,
13342		to equal the character sequence length given by the precision, the function would need
13343		to access a wide character one past the end of the array. In no case shall a partial
13344		character be written.

13345	p	The argument shall be a pointer to void . The value of the pointer is converted to a
13346		sequence of printable characters, in an implementation-defined manner.
13347	n	The argument shall be a pointer to an integer into which is written the number of bytes
13348		written to the output so far by this call to one of the <i>fprintf()</i> functions. No argument is
13349		converted.
13350	XSI C	Equivalent to <code>lc</code> .
13351	XSI S	Equivalent to <code>ls</code> .
13352	%	Print a '%' character; no argument is converted. The complete conversion specification
13353		shall be <code>%%</code> .
13354		If a conversion specification does not match one of the above forms, the behavior is undefined. If
13355		any argument is not the correct type for the corresponding conversion specification, the
13356		behavior is undefined.
13357		In no case shall a nonexistent or small field width cause truncation of a field; if the result of a
13358		conversion is wider than the field width, the field shall be expanded to contain the conversion
13359		result. Characters generated by <i>fprintf()</i> and <i>printf()</i> are printed as if <i>fputc()</i> had been called.
13360		For the <code>a</code> and <code>A</code> conversion specifiers, if <code>FLT_RADIX</code> is a power of 2, the value shall be correctly
13361		rounded to a hexadecimal floating number with the given precision.
13362		For <code>a</code> and <code>A</code> conversions, if <code>FLT_RADIX</code> is not a power of 2 and the result is not exactly
13363		representable in the given precision, the result should be one of the two adjacent numbers in
13364		hexadecimal floating style with the given precision, with the extra stipulation that the error
13365		should have a correct sign for the current rounding direction.
13366		For the <code>e</code> , <code>E</code> , <code>f</code> , <code>F</code> , <code>g</code> , and <code>G</code> conversion specifiers, if the number of significant decimal digits is at
13367		most <code>DECIMAL_DIG</code> , then the result should be correctly rounded. If the number of significant
13368		decimal digits is more than <code>DECIMAL_DIG</code> but the source value is exactly representable with
13369		<code>DECIMAL_DIG</code> digits, then the result should be an exact representation with trailing zeros.
13370		Otherwise, the source value is bounded by two adjacent decimal strings $L < U$, both having
13371		<code>DECIMAL_DIG</code> significant digits; the value of the resultant decimal string D should satisfy $L \leq$
13372		$D \leq U$, with the extra stipulation that the error should have a correct sign for the current
13373		rounding direction.
13374	CX	The <code>st_ctime</code> and <code>st_mtime</code> fields of the file shall be marked for update between the call to a
13375		successful execution of <i>fprintf()</i> or <i>printf()</i> and the next successful completion of a call to <i>fflush()</i>
13376		or <i>fclose()</i> on the same stream or a call to <i>exit()</i> or <i>abort()</i> .
13377	RETURN VALUE	
13378		Upon successful completion, the <i>fprintf()</i> and <i>printf()</i> functions shall return the number of bytes
13379		transmitted.
13380		Upon successful completion, the <i>sprintf()</i> function shall return the number of bytes written to <code>s</code> ,
13381		excluding the terminating null byte.
13382		Upon successful completion, the <i>snprintf()</i> function shall return the number of bytes that would
13383		be written to <code>s</code> had <code>n</code> been sufficiently large excluding the terminating null byte.
13384		If an output error was encountered, these functions shall return a negative value.
13385		If the value of <code>n</code> is zero on a call to <i>snprintf()</i> , nothing shall be written, the number of bytes that
13386		would have been written had <code>n</code> been sufficiently large excluding the terminating null shall be
13387		returned, and <code>s</code> may be a null pointer.

13388 ERRORS

13389 For the conditions under which *fprintf()* and *printf()* fail and may fail, refer to *fputc()* or
13390 *fputwc()*.

13391 In addition, all forms of *fprintf()* may fail if:

13392 XSI [EILSEQ] A wide-character code that does not correspond to a valid character has been
13393 detected.

13394 XSI [EINVAL] There are insufficient arguments.

13395 The *printf()* and *fprintf()* functions may fail if:

13396 XSI [ENOMEM] Insufficient storage space is available.

13397 The *snprintf()* function shall fail if:

13398 XSI [EOVERFLOW] The value of *n* is greater than {INT_MAX} or the number of bytes needed to
13399 hold the output excluding the terminating null is greater than {INT_MAX}.

13400 EXAMPLES

13401 Printing Language-Independent Date and Time

13402 The following statement can be used to print date and time using a language-independent
13403 format:

13404 `printf(format, weekday, month, day, hour, min);`

13405 For American usage, *format* could be a pointer to the following string:

13406 `"%s, %s %d, %d:%.2d\n"`

13407 This example would produce the following message:

13408 Sunday, July 3, 10:02

13409 For German usage, *format* could be a pointer to the following string:

13410 `"%1$s, %3$d. %2$s, %4$d:%5$.2d\n"`

13411 This definition of *format* would produce the following message:

13412 Sonntag, 3. Juli, 10:02

13413 Printing File Information

13414 The following example prints information about the type, permissions, and number of links of a
13415 specific file in a directory.

13416 The first two calls to *printf()* use data decoded from a previous *stat()* call. The user-defined
13417 *strperm()* function shall return a string similar to the one at the beginning of the output for the
13418 following command:

13419 `ls -l`

13420 The next call to *printf()* outputs the owner's name if it is found using *getpwuid()*; the *getpwuid()*
13421 function shall return a **passwd** structure from which the name of the user is extracted. If the user
13422 name is not found, the program instead prints out the numeric value of the user ID.

13423 The next call prints out the group name if it is found using *getgrgid()*; *getgrgid()* is very similar to
13424 *getpwuid()* except that it shall return group information based on the group number. Once
13425 again, if the group is not found, the program prints the numeric value of the group for the entry.

```

13426     The final call to printf() prints the size of the file.
13427     #include <stdio.h>
13428     #include <sys/types.h>
13429     #include <pwd.h>
13430     #include <grp.h>
13431
13432     char *strperm (mode_t);
13433     ...
13434     struct stat statbuf;
13435     struct passwd *pwd;
13436     struct group *grp;
13437     ...
13438     printf("%10.10s", strperm (statbuf.st_mode));
13439     printf("%4d", statbuf.st_nlink);
13440
13441     if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
13442         printf(" %-8.8s", pwd->pw_name);
13443     else
13444         printf(" %-8ld", (long) statbuf.st_uid);
13445
13446     if ((grp = getgrgid(statbuf.st_gid)) != NULL)
13447         printf(" %-8.8s", grp->gr_name);
13448     else
13449         printf(" %-8ld", (long) statbuf.st_gid);
13450
13451     printf("%9jd", (intmax_t) statbuf.st_size);
13452     ...

```

Printing a Localized Date String

```

13453     The following example gets a localized date string. The nl_langinfo() function shall return the
13454     localized date string, which specifies the order and layout of the date. The strftime() function
13455     takes this information and, using the tm structure for values, places the date and time
13456     information into datestring. The printf() function then outputs datestring and the name of the
13457     entry.
13458
13459     #include <stdio.h>
13460     #include <time.h>
13461     #include <langinfo.h>
13462     ...
13463     struct dirent *dp;
13464     struct tm *tm;
13465     char datestring[256];
13466     ...
13467     strftime(datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
13468
13469     printf(" %s %s\n", datestring, dp->d_name);
13470     ...

```

Printing Error Information

The following example uses *fprintf()* to write error information to standard error.

In the first group of calls, the program tries to open the password lock file named **LOCKFILE**. If the file already exists, this is an error, as indicated by the **O_EXCL** flag on the *open()* function. If the call fails, the program assumes that someone else is updating the password file, and the program exits.

The next group of calls saves a new password file as the current password file by creating a link between **LOCKFILE** and the new password file **PASSWDFILE**.

```
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>

#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
...
int pfd;
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
...
if (link(LOCKFILE, PASSWDFILE) == -1) {
    fprintf(stderr, "Link error: %s\n", strerror(errno));
    exit(1);
}
...
```

Printing Usage Information

The following example checks to make sure the program has the necessary arguments, and uses *fprintf()* to print usage information if the expected number of arguments is not present.

```
#include <stdio.h>
#include <stdlib.h>
...
char *Options = "hdbtl";
...
if (argc < 2) {
    fprintf(stderr, "Usage: %s -%s <file\n", argv[0], Options); exit(1);
}
...
```

Formatting a Decimal String

The following example prints a key and data pair on *stdout*. Note use of the '*' (asterisk) in the format string; this ensures the correct number of decimal places for the element based on the number of elements requested.

```
#include <stdio.h>
...
long i;
char *keyst;
int elementlen, len;
...
while (len < elementlen) {
...
    printf("%s Element%0*ld\n", keyst, elementlen, i);
...
}
```

Creating a Filename

The following example creates a filename using information from a previous *getpwnam()* function that returned the HOME directory of the user.

```
#include <stdio.h>
#include <sys/types.h>
#include <unistd.h>
...
char filename[PATH_MAX+1];
struct passwd *pw;
...
sprintf(filename, "%s/%d.out", pw->pw_dir, getpid());
...
```

Reporting an Event

The following example loops until an event has timed out. The *pause()* function waits forever unless it receives a signal. The *fprintf()* statement should never occur due to the possible return values of *pause()*.

```
#include <stdio.h>
#include <unistd.h>
#include <string.h>
#include <errno.h>
...
while (!event_complete) {
...
    if (pause() != -1 || errno != EINTR)
        fprintf(stderr, "pause: unknown error: %s\n", strerror(errno));
...
}
```

Printing Monetary Information

The following example uses *strfmon()* to convert a number and store it as a formatted monetary string named *convbuf*. If the first number is printed, the program prints the format and the description; otherwise, it just prints the number.

```
#include <monetary.h>
#include <stdio.h>
...
struct tblfmt {
    char *format;
    char *description;
};

struct tblfmt table[] = {
    { "%n", "default formatting" },
    { "%11n", "right align within an 11 character field" },
    { "%#5n", "aligned columns for values up to 99999" },
    { "%=*#5n", "specify a fill character" },
    { "%=0#5n", "fill characters do not use grouping" },
    { "%^#5n", "disable the grouping separator" },
    { "%^#5.0n", "round off to whole units" },
    { "%^#5.4n", "increase the precision" },
    { "%(#5n", "use an alternative pos/neg style" },
    { "%!(#5n", "disable the currency symbol" },
};
...
float input[3];
int i, j;
char convbuf[100];
...
strfmon(convbuf, sizeof(convbuf), table[i].format, input[j]);

if (j == 0) {
    printf("%s%s\n", table[i].format,
           convbuf, table[i].description);
}
else {
    printf("%s\n", convbuf);
}
...
```

Printing Wide Characters

The following example prints a series of wide characters. Suppose that "L'@'" expands to three bytes:

```
wchar_t wz [3] = L"@@";           // Zero-terminated
wchar_t wn [3] = L"@@";           // Unterminated

fprintf (stdout, "%ls", wz);       // Outputs 6 bytes
fprintf (stdout, "%ls", wn);       // Undefined because wn has no terminator
fprintf (stdout, "%4ls", wz);      // Outputs 3 bytes
fprintf (stdout, "%4ls", wn);      // Outputs 3 bytes; no terminator needed
fprintf (stdout, "%9ls", wz);      // Outputs 6 bytes
```

```

13600 fprintf (stdout,"%9ls", wn); // Outputs 9 bytes; no terminator needed
13601 fprintf (stdout,"%10ls", wz); // Outputs 6 bytes
13602 fprintf (stdout,"%10ls", wn); // Undefined because wn has no terminator

```

13603 In the last line of the example, after processing three characters, nine bytes have been output.
 13604 The fourth character must then be examined to determine whether it converts to one byte or
 13605 more. If it converts to more than one byte, the output is only nine bytes. Since there is no fourth
 13606 character in the array, the behavior is undefined.

13607 APPLICATION USAGE

13608 If the application calling *fprintf()* has any objects of type **wint_t** or **wchar_t**, it must also include
 13609 the **<wchar.h>** header to have these objects defined.

13610 RATIONALE

13617 CHANGE HISTORY

13618 First released in Issue 1. Derived from Issue 1 of the SVID.

13619 Issue 5

13620 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier can
 13621 now be used with *c* and *s* conversion specifiers.

13622 The *snprintf()* function is new in Issue 5.

13623 Issue 6

13624 Extensions beyond the ISO C standard are marked.

13625 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

13626 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 13627 • The prototypes for *fprintf()*, *printf()*, *snprintf()*, and *sprintf()* are updated, and the XSI
- 13628 shading is removed from *snprintf()*.
- 13629 • The description of *snprintf()* is aligned with the ISO C standard. Note that this supersedes
- 13630 the *snprintf()* description in The Open Group Base Resolution bwg98-006, which changed the
- 13631 behavior from Issue 5.
- 13632 • The DESCRIPTION is updated.

13633 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
 13634 specification” consistently.

13635 ISO/IEC 9899:1999 standard, Technical Corrigendum 1 is incorporated.

13636 An example of printing wide characters is added.

13637 **NAME**

13638 fputc — put a byte on a stream

13639 **SYNOPSIS**

13640 #include <stdio.h>

13641 int fputc(int *c*, FILE **stream*);13642 **DESCRIPTION**

13643 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13644 conflict between the requirements described here and the ISO C standard is unintentional. This
 13645 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13646 The *fputc()* function shall write the byte specified by *c* (converted to an **unsigned char**) to the
 13647 output stream pointed to by *stream*, at the position indicated by the associated file-position
 13648 indicator for the stream (if defined), and shall advance the indicator appropriately. If the file
 13649 cannot support positioning requests, or if the stream was opened with append mode, the byte
 13650 shall be appended to the output stream.

13651 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 13652 execution of *fputc()* and the next successful completion of a call to *fflush()* or *fclose()* on the same
 13653 stream or a call to *exit()* or *abort()*.

13654 **RETURN VALUE**

13655 Upon successful completion, *fputc()* shall return the value it has written. Otherwise, it shall
 13656 CX return EOF, the error indicator for the stream shall be set, and *errno* shall be set to indicate the
 13657 error.

13658 **ERRORS**

13659 The *fputc()* function shall fail if either the *stream* is unbuffered or the *stream*'s buffer needs to be
 13660 flushed, and:

13661 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 13662 process would be delayed in the write operation.

13663 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 13664 writing.

13665 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size.

13666 XSI [EFBIG] An attempt was made to write to a file that exceeds the process' file size limit.

13667 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 13668 offset maximum.

13669 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 13670 was transferred.

13671 CX [EIO] A physical I/O error has occurred, or the process is a member of a
 13672 background process group attempting to write to its controlling terminal,
 13673 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the
 13674 process group of the process is orphaned. This error may also be returned
 13675 under implementation-defined conditions.

13676 CX [ENOSPC] There was no free space remaining on the device containing the file.

13677 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 13678 any process. A SIGPIPE signal shall also be sent to the thread.

13679 The *fputc()* function may fail if:

13680 CX [ENOMEM] Insufficient storage space is available.

13681 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
13682 capabilities of the device.

13683 **EXAMPLES**

13684 None.

13685 **APPLICATION USAGE**

13686 None.

13687 **RATIONALE**

13688 None.

13689 **FUTURE DIRECTIONS**

13690 None.

13691 **SEE ALSO**

13692 *ferror()*, *fopen()*, *getrlimit()*, *putc()*, *puts()*, *setbuf()*, *ulimit()*, the Base Definitions volume of
13693 IEEE Std 1003.1-2001, **<stdio.h>**

13694 **CHANGE HISTORY**

13695 First released in Issue 1. Derived from Issue 1 of the SVID.

13696 **Issue 5**

13697 Large File Summit extensions are added.

13698 **Issue 6**

13699 Extensions beyond the ISO C standard are marked.

13700 The following new requirements on POSIX implementations derive from alignment with the
13701 Single UNIX Specification:

- 13702 • The [EIO] and [EFBIG] mandatory error conditions are added.
- 13703 • The [ENOMEM] and [ENXIO] optional error conditions are added.

13704 **NAME**

13705 fputs — put a string on a stream

13706 **SYNOPSIS**

13707 #include <stdio.h>

13708 int fputs(const char *restrict *s*, FILE *restrict *stream*);13709 **DESCRIPTION**

13710 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13711 conflict between the requirements described here and the ISO C standard is unintentional. This
 13712 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13713 The *fputs()* function shall write the null-terminated string pointed to by *s* to the stream pointed
 13714 to by *stream*. The terminating null byte shall not be written.

13715 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 13716 execution of *fputs()* and the next successful completion of a call to *fflush()* or *fclose()* on the same
 13717 stream or a call to *exit()* or *abort()*.

13718 **RETURN VALUE**

13719 Upon successful completion, *fputs()* shall return a non-negative number. Otherwise, it shall
 13720 CX return EOF, set an error indicator for the stream, and set *errno* to indicate the error.

13721 **ERRORS**13722 Refer to *fputc()*.13723 **EXAMPLES**13724 **Printing to Standard Output**

13725 The following example gets the current time, converts it to a string using *localtime()* and
 13726 *asctime()*, and prints it to standard output using *fputs()*. It then prints the number of minutes to
 13727 an event for which it is waiting.

```
13728 #include <time.h>
13729 #include <stdio.h>
13730 ...
13731 time_t now;
13732 int minutes_to_event;
13733 ...
13734 time(&now);
13735 printf("The time is ");
13736 fputs(asctime(localtime(&now)), stdout);
13737 printf("There are still %d minutes to the event.\n",
13738       minutes_to_event);
13739 ...
```

13740 **APPLICATION USAGE**13741 The *puts()* function appends a <newline> while *fputs()* does not.13742 **RATIONALE**

13743 None.

13744 **FUTURE DIRECTIONS**

13745 None.

13746 **SEE ALSO**

13747 *fopen()*, *putc()*, *puts()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

13748 **CHANGE HISTORY**

13749 First released in Issue 1. Derived from Issue 1 of the SVID.

13750 **Issue 6**

13751 Extensions beyond the ISO C standard are marked.

13752 The *fputs()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

13753 **NAME**

13754 fputc — put a wide-character code on a stream

13755 **SYNOPSIS**

13756 #include <stdio.h>

13757 #include <wchar.h>

13758 wint_t fputc(wchar_t wc, FILE *stream);

13759 **DESCRIPTION**

13760 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13761 conflict between the requirements described here and the ISO C standard is unintentional. This
 13762 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13763 The *fputc()* function shall write the character corresponding to the wide-character code *wc* to
 13764 the output stream pointed to by *stream*, at the position indicated by the associated file-position
 13765 indicator for the stream (if defined), and advances the indicator appropriately. If the file cannot
 13766 support positioning requests, or if the stream was opened with append mode, the character is
 13767 appended to the output stream. If an error occurs while writing the character, the shift state of
 13768 the output file is left in an undefined state.

13769 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 13770 execution of *fputc()* and the next successful completion of a call to *fflush()* or *fclose()* on the
 13771 same stream or a call to *exit()* or *abort()*.

13772 **RETURN VALUE**

13773 Upon successful completion, *fputc()* shall return *wc*. Otherwise, it shall return WEOF, the error
 13774 CX indicator for the stream shall be set, and *errno* shall be set to indicate the error.

13775 **ERRORS**

13776 The *fputc()* function shall fail if either the stream is unbuffered or data in the *stream*'s buffer
 13777 needs to be written, and:

13778 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor underlying *stream* and the
 13779 process would be delayed in the write operation.

13780 CX [EBADF] The file descriptor underlying *stream* is not a valid file descriptor open for
 13781 writing.

13782 CX [EFBIG] An attempt was made to write to a file that exceeds the maximum file size or
 13783 the process' file size limit.

13784 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 13785 offset maximum associated with the corresponding stream.

13786 [EILSEQ] The wide-character code *wc* does not correspond to a valid character.

13787 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 13788 was transferred.

13789 CX [EIO] A physical I/O error has occurred, or the process is a member of a
 13790 background process group attempting to write to its controlling terminal,
 13791 TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the
 13792 process group of the process is orphaned. This error may also be returned
 13793 under implementation-defined conditions.

13794 CX [ENOSPC] There was no free space remaining on the device containing the file.

13795 CX [EPIPE] An attempt is made to write to a pipe or FIFO that is not open for reading by
 13796 any process. A SIGPIPE signal shall also be sent to the thread.

13797 The *fputwc()* function may fail if:

13798 CX [ENOMEM] Insufficient storage space is available.

13799 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
13800 capabilities of the device.

13801 EXAMPLES

13812 CHANGE HISTORY

13813 First released in Issue 4. Derived from the MSE working draft.

13814 Issue 5

13815 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of argument *wc*
13816 is changed from **wint_t** to **wchar_t**.

13817 The Optional Header (OH) marking is removed from **<stdio.h>**.

13818 Large File Summit extensions are added.

13819 Issue 6

13820 Extensions beyond the ISO C standard are marked.

13821 The following new requirements on POSIX implementations derive from alignment with the
13822 Single UNIX Specification:

- 13823 • The [EFBIG] and [EIO] mandatory error conditions are added.
- 13824 • The [ENOMEM] and [ENXIO] optional error conditions are added.

13825 **NAME**

13826 fputws — put a wide-character string on a stream

13827 **SYNOPSIS**

13828 #include <stdio.h>

13829 #include <wchar.h>

13830 int fputws(const wchar_t *restrict ws, FILE *restrict stream);

13831 **DESCRIPTION**

13832 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13833 conflict between the requirements described here and the ISO C standard is unintentional. This
 13834 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13835 The *fputws()* function shall write a character string corresponding to the (null-terminated)
 13836 wide-character string pointed to by *ws* to the stream pointed to by *stream*. No character
 13837 corresponding to the terminating null wide-character code shall be written.

13838 CX The *st_ctime* and *st_mtime* fields of the file shall be marked for update between the successful
 13839 execution of *fputws()* and the next successful completion of a call to *fflush()* or *fclose()* on the
 13840 same stream or a call to *exit()* or *abort()*.

13841 **RETURN VALUE**

13842 Upon successful completion, *fputws()* shall return a non-negative number. Otherwise, it shall
 13843 CX return -1, set an error indicator for the stream, and set *errno* to indicate the error.

13844 **ERRORS**13845 Refer to *fputwc()*.13846 **EXAMPLES**

13847 None.

13848 **APPLICATION USAGE**13849 The *fputws()* function does not append a <newline>.13850 **RATIONALE**

13851 None.

13852 **FUTURE DIRECTIONS**

13853 None.

13854 **SEE ALSO**13855 *fopen()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>13856 **CHANGE HISTORY**

13857 First released in Issue 4. Derived from the MSE working draft.

13858 **Issue 5**

13859 The Optional Header (OH) marking is removed from <stdio.h>.

13860 **Issue 6**

13861 Extensions beyond the ISO C standard are marked.

13862 The *fputws()* prototype is updated for alignment with the ISO / IEC 9899:1999 standard.

13863 **NAME**

13864 fread — binary input

13865 **SYNOPSIS**

13866 #include <stdio.h>

```
13867     size_t fread(void *restrict ptr, size_t size, size_t nitems,
13868                 FILE *restrict stream);
```

13869 **DESCRIPTION**

13870 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 13871 conflict between the requirements described here and the ISO C standard is unintentional. This
 13872 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13873 The *fread()* function shall read into the array pointed to by *ptr* up to *nitems* elements whose size
 13874 is specified by *size* in bytes, from the stream pointed to by *stream*. For each object, *size* calls shall
 13875 be made to the *fgetc()* function and the results stored, in the order read, in an array of **unsigned**
 13876 **char** exactly overlaying the object. The file position indicator for the stream (if defined) shall be
 13877 advanced by the number of bytes successfully read. If an error occurs, the resulting value of the
 13878 file position indicator for the stream is unspecified. If a partial element is read, its value is
 13879 unspecified.

13880 CX The *fread()* function may mark the *st_atime* field of the file associated with *stream* for update. The
 13881 *st_atime* field shall be marked for update by the first successful execution of *fgetc()*, *fgets()*,
 13882 *fgetwc()*, *fgetws()*, *fread()*, *fscanf()*, *getc()*, *getchar()*, *gets()*, or *scanf()* using *stream* that returns
 13883 data not supplied by a prior call to *ungetc()* or *ungetwc()*.

13884 **RETURN VALUE**

13885 Upon successful completion, *fread()* shall return the number of elements successfully read which
 13886 is less than *nitems* only if a read error or end-of-file is encountered. If *size* or *nitems* is 0, *fread()*
 13887 shall return 0 and the contents of the array and the state of the stream remain unchanged.
 13888 CX Otherwise, if a read error occurs, the error indicator for the stream shall be set, and *errno* shall be
 13889 set to indicate the error.

13890 **ERRORS**13891 Refer to *fgetc()*.13892 **EXAMPLES**13893 **Reading from a Stream**13894 The following example reads a single element from the *fp* stream into the array pointed to by *buf*.

```
13895 #include <stdio.h>
13896 ...
13897 size_t bytes_read;
13898 char buf[100];
13899 FILE *fp;
13900 ...
13901 bytes_read = fread(buf, sizeof(buf), 1, fp);
13902 ...
```

13903 **APPLICATION USAGE**

13904 The *ferror()* or *feof()* functions must be used to distinguish between an error condition and an
 13905 end-of-file condition.

13906 Because of possible differences in element length and byte ordering, files written using *fwrite()*
 13907 are application-dependent, and possibly cannot be read using *fread()* by a different application

13908 or by the same application on a different processor.

13909 **RATIONALE**

13910 None.

13911 **FUTURE DIRECTIONS**

13912 None.

13913 **SEE ALSO**

13916 **CHANGE HISTORY**

13917 First released in Issue 1. Derived from Issue 1 of the SVID.

13918 **Issue 6**

13919 Extensions beyond the ISO C standard are marked.

13920 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 13921 • The *fread()* prototype is updated.
- 13922 • The DESCRIPTION is updated to describe how the bytes from a call to *fgetc()* are stored.

13923 **NAME**

13924 free — free allocated memory

13925 **SYNOPSIS**

13926 #include <stdlib.h>

13927 void free(void *ptr);

13928 **DESCRIPTION**

13929 CX The functionality described on this reference page is aligned with the ISO C standard. Any
13930 conflict between the requirements described here and the ISO C standard is unintentional. This
13931 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

13932 The *free()* function shall cause the space pointed to by *ptr* to be deallocated; that is, made
13933 available for further allocation. If *ptr* is a null pointer, no action shall occur. Otherwise, if the
13934 ADV argument does not match a pointer earlier returned by the *calloc()*, *malloc()*, *posix_memalign()*,
13935 XSI *realloc()*, or *strdup()* function, or if the space has been deallocated by a call to *free()* or *realloc()*,
13936 the behavior is undefined.

13937 Any use of a pointer that refers to freed space results in undefined behavior.

13938 **RETURN VALUE**13939 The *free()* function shall not return a value.13940 **ERRORS**

13941 No errors are defined.

13942 **EXAMPLES**

13943 None.

13944 **APPLICATION USAGE**

13945 There is now no requirement for the implementation to support the inclusion of <malloc.h>.

13946 **RATIONALE**

13947 None.

13948 **FUTURE DIRECTIONS**

13949 None.

13950 **SEE ALSO**13951 *calloc()*, *malloc()*, *realloc()*, the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>13952 **CHANGE HISTORY**

13953 First released in Issue 1. Derived from Issue 1 of the SVID.

13954 **Issue 6**13955 Reference to the *valloc()* function is removed.

13956 **NAME**

13957 freeaddrinfo, getaddrinfo — get address information

13958 **SYNOPSIS**

```

13959     #include <sys/socket.h>
13960     #include <netdb.h>

13961     void freeaddrinfo(struct addrinfo *ai);
13962     int getaddrinfo(const char *restrict nodename,
13963                    const char *restrict servname,
13964                    const struct addrinfo *restrict hints,
13965                    struct addrinfo **restrict res);

```

13966 **DESCRIPTION**

13967 The *freeaddrinfo()* function shall free one or more **addrinfo** structures returned by *getaddrinfo()*,
 13968 along with any additional storage associated with those structures. If the *ai_next* field of the
 13969 structure is not null, the entire list of structures shall be freed. The *freeaddrinfo()* function shall
 13970 support the freeing of arbitrary sublists of an **addrinfo** list originally returned by *getaddrinfo()*.

13971 The *getaddrinfo()* function shall translate the name of a service location (for example, a host
 13972 name) and/or a service name and shall return a set of socket addresses and associated
 13973 information to be used in creating a socket with which to address the specified service.

13974 **Note:** In many cases it is implemented by the Domain Name System, as documented in RFC 1034,
 13975 RFC 1035, and RFC 1886.

13976 The *freeaddrinfo()* and *getaddrinfo()* functions shall be thread-safe.

13977 The *nodename* and *servname* arguments are either null pointers or pointers to null-terminated
 13978 strings. One or both of these two arguments shall be supplied by the application as a non-null
 13979 pointer.

13980 The format of a valid name depends on the address family or families. If a specific family is not
 13981 given and the name could be interpreted as valid within multiple supported families, the
 13982 implementation shall attempt to resolve the name in all supported families and, in absence of
 13983 errors, one or more results shall be returned.

13984 If the *nodename* argument is not null, it can be a descriptive name or can be an address string. If
 13985 IP6 the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, valid descriptive names
 13986 include host names. If the specified address family is AF_INET or AF_UNSPEC, address strings
 13987 using Internet standard dot notation as specified in *inet_addr()* are valid.

13988 IP6 If the specified address family is AF_INET6 or AF_UNSPEC, standard IPv6 text forms described
 13989 in *inet_ntop()* are valid.

13990 If *nodename* is not null, the requested service location is named by *nodename*; otherwise, the
 13991 requested service location is local to the caller.

13992 If *servname* is null, the call shall return network-level addresses for the specified *nodename*. If
 13993 *servname* is not null, it is a null-terminated character string identifying the requested service. This
 13994 can be either a descriptive name or a numeric representation suitable for use with the address
 13995 IP6 family or families. If the specified address family is AF_INET, AF_INET6, or AF_UNSPEC, the
 13996 service can be specified as a string specifying a decimal port number.

13997 If the *hints* argument is not null, it refers to a structure containing input values that may direct
 13998 the operation by providing options and by limiting the returned information to a specific socket
 13999 type, address family, and/or protocol. In this *hints* structure every member other than *ai_flags*,
 14000 *ai_family*, *ai_socktype*, and *ai_protocol* shall be set to zero or a null pointer. A value of
 14001 AF_UNSPEC for *ai_family* means that the caller shall accept any address family. A value of zero

for *ai_socktype* means that the caller shall accept any socket type. A value of zero for *ai_protocol* means that the caller shall accept any protocol. If *hints* is a null pointer, the behavior shall be as if it referred to a structure containing the value zero for the *ai_flags*, *ai_socktype*, and *ai_protocol* fields, and AF_UNSPEC for the *ai_family* field.

The *ai_flags* field to which the *hints* parameter points shall be set to zero or be the bitwise-inclusive OR of one or more of the values AI_PASSIVE, AI_CANONNAME, AI_NUMERICHOST, AI_NUMERICSERV, AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG.

If the AI_PASSIVE flag is specified, the returned address information shall be suitable for use in binding a socket for accepting incoming connections for the specified service. In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to INADDR_ANY for an IPv4 address or IN6ADDR_ANY_INIT for an IPv6 address. If the AI_PASSIVE flag is not specified, the returned address information shall be suitable for a call to *connect()* (for a connection-mode protocol) or for a call to *connect()*, *sendto()*, or *sendmsg()* (for a connectionless protocol). In this case, if the *nodename* argument is null, then the IP address portion of the socket address structure shall be set to the loopback address. The AI_PASSIVE flag shall be ignored if the *nodename* argument is not null.

If the AI_CANONNAME flag is specified and the *nodename* argument is not null, the function shall attempt to determine the canonical name corresponding to *nodename* (for example, if *nodename* is an alias or shorthand notation for a complete name).

Note: Since different implementations use different conceptual models, the terms “canonical name” and “alias” cannot be precisely defined for the general case. However, Domain Name System implementations are expected to interpret them as they are used in RFC 1034.

A numeric host address string is not a “name”, and thus does not have a “canonical name” form; no address to host name translation is performed. See below for handling of the case where a canonical name cannot be obtained.

If the AI_NUMERICHOST flag is specified, then a non-null *nodename* string supplied shall be a numeric host address string. Otherwise, an [EAI_NONAME] error is returned. This flag shall prevent any type of name resolution service (for example, the DNS) from being invoked.

If the AI_NUMERICSERV flag is specified, then a non-null *servname* string supplied shall be a numeric port string. Otherwise, an [EAI_NONAME] error shall be returned. This flag shall prevent any type of name resolution service (for example, NIS+) from being invoked.

If the AI_V4MAPPED flag is specified along with an *ai_family* of AF_INET6, then *getaddrinfo()* shall return IPv4-mapped IPv6 addresses on finding no matching IPv6 addresses (*ai_addrlen* shall be 16). The AI_V4MAPPED flag shall be ignored unless *ai_family* equals AF_INET6. If the AI_ALL flag is used with the AI_V4MAPPED flag, then *getaddrinfo()* shall return all matching IPv6 and IPv4 addresses. The AI_ALL flag without the AI_V4MAPPED flag is ignored.

If the AI_ADDRCONFIG flag is specified, IPv4 addresses shall be returned only if an IPv4 address is configured on the local system, and IPv6 addresses shall be returned only if an IPv6 address is configured on the local system.

The *ai_socktype* field to which argument *hints* points specifies the socket type for the service, as defined in *socket()*. If a specific socket type is not given (for example, a value of zero) and the service name could be interpreted as valid with multiple supported socket types, the implementation shall attempt to resolve the service name for all supported socket types and, in the absence of errors, all possible results shall be returned. A non-zero socket type value shall limit the returned information to values with the specified socket type.

If the *ai_family* field to which *hints* points has the value AF_UNSPEC, addresses shall be returned for use with any address family that can be used with the specified *nodename* and/or *servname*. Otherwise, addresses shall be returned for use only with the specified address family.

14050 If *ai_family* is not AF_UNSPEC and *ai_protocol* is not zero, then addresses are returned for use
 14051 only with the specified address family and protocol; the value of *ai_protocol* shall be interpreted
 14052 as in a call to the *socket()* function with the corresponding values of *ai_family* and *ai_protocol*.

14053 RETURN VALUE

14054 A zero return value for *getaddrinfo()* indicates successful completion; a non-zero return value
 14055 indicates failure. The possible values for the failures are listed in the ERRORS section.

14056 Upon successful return of *getaddrinfo()*, the location to which *res* points shall refer to a linked list
 14057 of **addrinfo** structures, each of which shall specify a socket address and information for use in
 14058 creating a socket with which to use that socket address. The list shall include at least one
 14059 **addrinfo** structure. The *ai_next* field of each structure contains a pointer to the next structure on
 14060 the list, or a null pointer if it is the last structure on the list. Each structure on the list shall
 14061 include values for use with a call to the *socket()* function, and a socket address for use with the
 14062 *connect()* function or, if the AI_PASSIVE flag was specified, for use with the *bind()* function. The
 14063 fields *ai_family*, *ai_socktype*, and *ai_protocol* shall be usable as the arguments to the *socket()*
 14064 function to create a socket suitable for use with the returned address. The fields *ai_addr* and
 14065 *ai_addrlen* are usable as the arguments to the *connect()* or *bind()* functions with such a socket,
 14066 according to the AI_PASSIVE flag.

14067 If *nodename* is not null, and if requested by the AI_CANONNAME flag, the *ai_canonname* field of
 14068 the first returned **addrinfo** structure shall point to a null-terminated string containing the
 14069 canonical name corresponding to the input *nodename*; if the canonical name is not available, then
 14070 *ai_canonname* shall refer to the *nodename* argument or a string with the same contents. The
 14071 contents of the *ai_flags* field of the returned structures are undefined.

14072 All fields in socket address structures returned by *getaddrinfo()* that are not filled in through an
 14073 explicit argument (for example, *sin6_flowinfo*) shall be set to zero.

14074 **Note:** This makes it easier to compare socket address structures.

14075 ERRORS

14076 The *getaddrinfo()* function shall fail and return the corresponding value if:

14077 [EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.

14078 [EAI_BADFLAGS]

14079 The *flags* parameter had an invalid value.

14080 [EAI_FAIL] A non-recoverable error occurred when attempting to resolve the name.

14081 [EAI_FAMILY] The address family was not recognized.

14082 [EAI_MEMORY] There was a memory allocation failure when trying to allocate storage for the
 14083 return value.

14084 [EAI_NONAME] The name does not resolve for the supplied parameters.

14085 Neither *nodename* nor *servname* were supplied. At least one of these shall be
 14086 supplied.

14087 [EAI_SERVICE] The service passed was not recognized for the specified socket type.

14088 [EAI_SOCKTYPE]

14089 The intended socket type was not recognized.

14090 [EAI_SYSTEM] A system error occurred; the error code can be found in *errno*.

14091 [EAI_OVERFLOW]

14092 An argument buffer overflowed.

14093 **EXAMPLES**

14094 None.

14095 **APPLICATION USAGE**

14096 If the caller handles only TCP and not UDP, for example, then the *ai_protocol* member of the *hints*
 14097 structure should be set to IPPROTO_TCP when *getaddrinfo()* is called.

14098 If the caller handles only IPv4 and not IPv6, then the *ai_family* member of the *hints* structure
 14099 should be set to AF_INET when *getaddrinfo()* is called.

14100 The term “canonical name” is misleading; it is taken from the Domain Name System (RFC 2181).
 14101 It should be noted that the canonical name is a result of alias processing, and not necessarily a
 14102 unique attribute of a host, address, or set of addresses. See RFC 2181 for more discussion of this
 14103 in the Domain Name System context.

14104 **RATIONALE**

14105 None.

14106 **FUTURE DIRECTIONS**

14107 None.

14108 **SEE ALSO**

14109 *connect()*, *gai_strerror()*, *gethostbyaddr()*, *getnameinfo()*, *getservbyname()*, *socket()*, the Base
 14110 Definitions volume of IEEE Std 1003.1-2001, <netdb.h>, <sys/socket.h>

14111 **CHANGE HISTORY**

14112 First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

14113 The **restrict** keyword is added to the *getaddrinfo()* prototype for alignment with the
 14114 ISO/IEC 9899:1999 standard.

14115 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/19 is applied, adding three notes to the
 14116 DESCRIPTION and adding text to the APPLICATION USAGE related to the term “canonical
 14117 name”. A reference to RFC 2181 is also added to the Informative References.

14118 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/20 is applied, making changes for
 14119 alignment with IPv6. These include the following:

- 14120 • Adding AI_V4MAPPED, AI_ALL, and AI_ADDRCONFIG to the allowed values for the
 14121 *ai_flags* field
- 14122 • Adding a description of AI_ADDRCONFIG
- 14123 • Adding a description of the consequences of ignoring the AI_PASSIVE flag.

14124 **NAME**

14125 freopen — open a stream

14126 **SYNOPSIS**

14127 #include <stdio.h>

14128 FILE *freopen(const char *restrict *filename*, const char *restrict *mode*,
 14129 FILE *restrict *stream*);

14130 **DESCRIPTION**

14131 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14132 conflict between the requirements described here and the ISO C standard is unintentional. This
 14133 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14134 The *freopen()* function shall first attempt to flush the stream and close any file descriptor
 14135 associated with *stream*. Failure to flush or close the file descriptor successfully shall be ignored.
 14136 The error and end-of-file indicators for the stream shall be cleared.

14137 The *freopen()* function shall open the file whose pathname is the string pointed to by *filename* and
 14138 associate the stream pointed to by *stream* with it. The *mode* argument shall be used just as in
 14139 *fopen()*.

14140 The original stream shall be closed regardless of whether the subsequent open succeeds.

14141 If *filename* is a null pointer, the *freopen()* function shall attempt to change the mode of the stream
 14142 to that specified by *mode*, as if the name of the file currently associated with the stream had been
 14143 used. It is implementation-defined which changes of mode are permitted (if any), and under
 14144 what circumstances.

14145 XSI After a successful call to the *freopen()* function, the orientation of the stream shall be cleared, the
 14146 encoding rule shall be cleared, and the associated **mbstate_t** object shall be set to describe an
 14147 initial conversion state.

14148 CX The largest value that can be represented correctly in an object of type **off_t** shall be established
 14149 as the offset maximum in the open file description.

14150 **RETURN VALUE**

14151 Upon successful completion, *freopen()* shall return the value of *stream*. Otherwise, a null pointer
 14152 CX shall be returned, and *errno* shall be set to indicate the error.

14153 **ERRORS**

14154 The *freopen()* function shall fail if:

14155 CX [EACCES] Search permission is denied on a component of the path prefix, or the file
 14156 exists and the permissions specified by *mode* are denied, or the file does not
 14157 exist and write permission is denied for the parent directory of the file to be
 14158 created.

14159 CX [EINTR] A signal was caught during *freopen()*.

14160 CX [EISDIR] The named file is a directory and *mode* requires write access.

14161 CX [ELOOP] A loop exists in symbolic links encountered during resolution of the *path*
 14162 argument.

14163 CX [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

14164 CX [ENAMETOOLONG] The length of the *filename* argument exceeds {PATH_MAX} or a pathname
 14165 component is longer than {NAME_MAX}.
 14166

14167 CX	[ENFILE]	The maximum allowable number of files is currently open in the system.
14168 CX 14169	[ENOENT]	A component of <i>filename</i> does not name an existing file or <i>filename</i> is an empty string.
14170 CX 14171	[ENOSPC]	The directory or file system that would contain the new file cannot be expanded, the file does not exist, and it was to be created.
14172 CX	[ENOTDIR]	A component of the path prefix is not a directory.
14173 CX 14174	[ENXIO]	The named file is a character special or block special file, and the device associated with this special file does not exist.
14175 CX 14176	[EOVERFLOW]	The named file is a regular file and the size of the file cannot be represented correctly in an object of type off_t .
14177 CX 14178	[EROFS]	The named file resides on a read-only file system and <i>mode</i> requires write access.
14179	The <i>freopen()</i> function may fail if:	
14180 CX	[EINVAL]	The value of the <i>mode</i> argument is not valid.
14181 CX 14182	[ELOOP]	More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the <i>path</i> argument.
14183 CX 14184 14185	[ENAMETOOLONG]	Pathname resolution of a symbolic link produced an intermediate result whose length exceeds {PATH_MAX}.
14186 CX	[ENOMEM]	Insufficient storage space is available.
14187 CX 14188	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
14189 CX 14190	[ETXTBSY]	The file is a pure procedure (shared text) file that is being executed and <i>mode</i> requires write access.

14191 EXAMPLES

14192 Directing Standard Output to a File

14193 The following example logs all standard output to the **/tmp/logfile** file.

```

14194 #include <stdio.h>
14195 ...
14196 FILE *fp;
14197 ...
14198 fp = freopen ("/tmp/logfile", "a+", stdout);
14199 ...

```

14200 APPLICATION USAGE

14201 The *freopen()* function is typically used to attach the preopened *streams* associated with *stdin*,
 14202 *stdout*, and *stderr* to other files.

14203 RATIONALE

14204 None.

14205 **FUTURE DIRECTIONS**

14206 None.

14207 **SEE ALSO**

14208 *fclose()*, *fopen()*, *fdopen()*, *mbsinit()*, the Base Definitions volume of IEEE Std 1003.1-2001,
14209 **<stdio.h>**

14210 **CHANGE HISTORY**

14211 First released in Issue 1. Derived from Issue 1 of the SVID.

14212 **Issue 5**

14213 The DESCRIPTION is updated to indicate that the orientation of the stream is cleared and the
14214 conversion state of the stream is set to an initial conversion state by a successful call to the
14215 *freopen()* function.

14216 Large File Summit extensions are added.

14217 **Issue 6**

14218 Extensions beyond the ISO C standard are marked.

14219 The following new requirements on POSIX implementations derive from alignment with the
14220 Single UNIX Specification:

- 14221 • In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file
14222 description. This change is to support large files.
- 14223 • In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support
14224 large files.
- 14225 • The [ELOOP] mandatory error condition is added.
- 14226 • A second [ENAMETOOLONG] is added as an optional error condition.
- 14227 • The [EINVAL], [ENOMEM], [ENXIO], and [ETXTBSY] optional error conditions are added.

14228 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 14229 • The *freopen()* prototype is updated.
- 14230 • The DESCRIPTION is updated.

14231 The wording of the mandatory [ELOOP] error condition is updated, and a second optional
14232 [ELOOP] error condition is added.

14233 The DESCRIPTION is updated regarding failure to close, changing the “file” to “file descriptor”.

14234 **NAME**

14235 frexp, frexpf, frexpl — extract mantissa and exponent from a double precision number

14236 **SYNOPSIS**

14237 #include <math.h>

14238 double frexp(double num, int *exp);

14239 float frexpf(float num, int *exp);

14240 long double frexpl(long double num, int *exp);

14241 **DESCRIPTION**

14242 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14243 conflict between the requirements described here and the ISO C standard is unintentional. This
 14244 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14245 These functions shall break a floating-point number *num* into a normalized fraction and an
 14246 integral power of 2. The integer exponent shall be stored in the **int** object pointed to by *exp*.

14247 **RETURN VALUE**

14248 For finite arguments, these functions shall return the value *x*, such that *x* has a magnitude in the
 14249 interval $[\frac{1}{2}, 1)$ or 0, and *num* equals *x* times 2 raised to the power **exp*.

14250 MX If *num* is NaN, a NaN shall be returned, and the value of **exp* is unspecified.

14251 If *num* is ± 0 , ± 0 shall be returned, and the value of **exp* shall be 0.

14252 If *num* is $\pm \text{Inf}$, *num* shall be returned, and the value of **exp* is unspecified.

14253 **ERRORS**

14254 No errors are defined.

14255 **EXAMPLES**

14256 None.

14257 **APPLICATION USAGE**

14258 None.

14259 **RATIONALE**

14260 None.

14261 **FUTURE DIRECTIONS**

14262 None.

14263 **SEE ALSO**14264 *isnan()*, *ldexp()*, *modf()*, the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>14265 **CHANGE HISTORY**

14266 First released in Issue 1. Derived from Issue 1 of the SVID.

14267 **Issue 5**

14268 The DESCRIPTION is updated to indicate how an application should check for an error. This
 14269 text was previously published in the APPLICATION USAGE section.

14270 **Issue 6**

14271 The *frexpf()* and *frexpl()* functions are added for alignment with the ISO/IEC 9899:1999
 14272 standard.

14273	The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.
14274	
14275	IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are marked.
14276	

14277 **NAME**

14278 fscanf, scanf, sscanf — convert formatted input

14279 **SYNOPSIS**

14280 #include <stdio.h>

14281 int fscanf(FILE *restrict *stream*, const char *restrict *format*, ...);14282 int scanf(const char *restrict *format*, ...);14283 int sscanf(const char *restrict *s*, const char *restrict *format*, ...);14284 **DESCRIPTION**

14285 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14286 conflict between the requirements described here and the ISO C standard is unintentional. This
 14287 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14288 The *fscanf()* function shall read from the named input *stream*. The *scanf()* function shall read
 14289 from the standard input stream *stdin*. The *sscanf()* function shall read from the string *s*. Each
 14290 function reads bytes, interprets them according to a format, and stores the results in its
 14291 arguments. Each expects, as arguments, a control string *format* described below, and a set of
 14292 *pointer* arguments indicating where the converted input should be stored. The result is
 14293 undefined if there are insufficient arguments for the format. If the format is exhausted while
 14294 arguments remain, the excess arguments shall be evaluated but otherwise ignored.

14295 XSI Conversions can be applied to the *n*th argument after the *format* in the argument list, rather than
 14296 to the next unused argument. In this case, the conversion specifier character % (see below) is
 14297 replaced by the sequence "%n\$", where *n* is a decimal integer in the range [1,{NL_ARGMAX}].
 14298 This feature provides for the definition of format strings that select arguments in an order
 14299 appropriate to specific languages. In format strings containing the "%n\$" form of conversion
 14300 specifications, it is unspecified whether numbered arguments in the argument list can be
 14301 referenced from the format string more than once.

14302 The *format* can contain either form of a conversion specification—that is, % or "%n\$"—but the
 14303 two forms cannot be mixed within a single *format* string. The only exception to this is that %% or
 14304 %* can be mixed with the "%n\$" form. When numbered argument specifications are used,
 14305 specifying the *N*th argument requires that all the leading arguments, from the first to the
 14306 (*N*−1)th, are pointers.

14307 CX The *fscanf()* function in all its forms shall allow detection of a language-dependent radix
 14308 character in the input string. The radix character is defined in the program's locale (category
 14309 LC_NUMERIC). In the POSIX locale, or in a locale where the radix character is not defined, the
 14310 radix character shall default to a period ('.').

14311 The format is a character string, beginning and ending in its initial shift state, if any, composed
 14312 of zero or more directives. Each directive is composed of one of the following: one or more
 14313 white-space characters (<space>s, <tab>s, <newline>s, <vertical-tab>s, or <form-feed>s); an
 14314 ordinary character (neither '%' nor a white-space character); or a conversion specification. Each
 14315 XSI conversion specification is introduced by the character '%' or the character sequence "%n\$",
 14316 after which the following appear in sequence:

- 14317 • An optional assignment-suppressing character '*'.
- 14318 • An optional non-zero decimal integer that specifies the maximum field width.
- 14319 • An option length modifier that specifies the size of the receiving object.
- 14320 • A *conversion specifier* character that specifies the type of conversion to be applied. The valid
 14321 conversion specifiers are described below.

14322 The *fscanf()* functions shall execute each directive of the format in turn. If a directive fails, as
 14323 detailed below, the function shall return. Failures are described as input failures (due to the
 14324 unavailability of input bytes) or matching failures (due to inappropriate input).

14325 A directive composed of one or more white-space characters shall be executed by reading input
 14326 until no more valid input can be read, or up to the first byte which is not a white-space character,
 14327 which remains unread.

14328 A directive that is an ordinary character shall be executed as follows: the next byte shall be read
 14329 from the input and compared with the byte that comprises the directive; if the comparison
 14330 shows that they are not equivalent, the directive shall fail, and the differing and subsequent
 14331 bytes shall remain unread. Similarly, if end-of-file, an encoding error, or a read error prevents a
 14332 character from being read, the directive shall fail.

14333 A directive that is a conversion specification defines a set of matching input sequences, as
 14334 described below for each conversion character. A conversion specification shall be executed in
 14335 the following steps.

14336 Input white-space characters (as specified by *isspace()*) shall be skipped, unless the conversion
 14337 specification includes a *l*, *c*, *C*, or *n* conversion specifier.

14338 An item shall be read from the input, unless the conversion specification includes an *n*
 14339 conversion specifier. An input item shall be defined as the longest sequence of input bytes (up to
 14340 any specified maximum field width, which may be measured in characters or bytes dependent
 14341 on the conversion specifier) which is an initial subsequence of a matching sequence. The first
 14342 byte, if any, after the input item shall remain unread. If the length of the input item is 0, the
 14343 execution of the conversion specification shall fail; this condition is a matching failure, unless
 14344 end-of-file, an encoding error, or a read error prevented input from the stream, in which case it is
 14345 an input failure.

14346 Except in the case of a *%* conversion specifier, the input item (or, in the case of a *%n* conversion
 14347 specification, the count of input bytes) shall be converted to a type appropriate to the conversion
 14348 character. If the input item is not a matching sequence, the execution of the conversion
 14349 specification fails; this condition is a matching failure. Unless assignment suppression was
 14350 indicated by a *'*'*, the result of the conversion shall be placed in the object pointed to by the
 14351 first argument following the *format* argument that has not already received a conversion result if
 14352 xsl the conversion specification is introduced by *%*, or in the *n*th argument if introduced by the
 14353 character sequence *"%n\$"*. If this object does not have an appropriate type, or if the result of the
 14354 conversion cannot be represented in the space provided, the behavior is undefined.

14355 The length modifiers and their meanings are:

14356 hh Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an
 14357 argument with type pointer to **signed char** or **unsigned char**.

14358 h Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an
 14359 argument with type pointer to **short** or **unsigned short**.

14360 l (ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an
 14361 argument with type pointer to **long** or **unsigned long**; that a following *a*, *A*, *e*, *E*, *f*, *F*, *g*,
 14362 or *G* conversion specifier applies to an argument with type pointer to **double**; or that a
 14363 following *c*, *s*, or *l* conversion specifier applies to an argument with type pointer to
 14364 **wchar_t**.

14365 ll (ell-ell) Specifies that a following *d*, *i*, *o*, *u*, *x*, *X*, or *n* conversion specifier applies to an
 14366 argument with type pointer to **long long** or **unsigned long long**.
 14367

14368	j	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to intmax_t or uintmax_t .
14369		
14370	z	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to size_t or the corresponding signed integer type.
14371		
14372	t	Specifies that a following d, i, o, u, x, X, or n conversion specifier applies to an argument with type pointer to ptrdiff_t or the corresponding unsigned type.
14373		
14374	L	Specifies that a following a, A, e, E, f, F, g, or G conversion specifier applies to an argument with type pointer to long double .
14375		
14376		If a length modifier appears with any conversion specifier other than as specified above, the behavior is undefined.
14377		
14378		The following conversion specifiers are valid:
14379	d	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
14380		
14381		
14382		
14383	i	Matches an optionally signed integer, whose format is the same as expected for the subject sequence of <i>strtol()</i> with 0 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to int .
14384		
14385		
14386		
14387	o	Matches an optionally signed octal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 8 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
14388		
14389		
14390		
14391	u	Matches an optionally signed decimal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 10 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
14392		
14393		
14394		
14395	x	Matches an optionally signed hexadecimal integer, whose format is the same as expected for the subject sequence of <i>strtoul()</i> with the value 16 for the <i>base</i> argument. In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to unsigned .
14396		
14397		
14398		
14399	a, e, f, g	
14400		Matches an optionally signed floating-point number, infinity, or NaN, whose format is the same as expected for the subject sequence of <i>strtod()</i> . In the absence of a size modifier, the application shall ensure that the corresponding argument is a pointer to float .
14401		
14402		
14403		
14404		If the <i>fprintf()</i> family of functions generates character string representations for infinity and NaN (a symbolic entity encoded in floating-point format) to support IEEE Std 754-1985, the <i>fscanf()</i> family of functions shall recognize them as input.
14405		
14406		
14407	s	Matches a sequence of bytes that are not white-space characters. The application shall ensure that the corresponding argument is a pointer to the initial byte of an array of char , signed char , or unsigned char large enough to accept the sequence and a terminating null character code, which shall be added automatically.
14408		
14409		
14410		
14411		If an l (ell) qualifier is present, the input is a sequence of characters that begins in the initial shift state. Each character shall be converted to a wide character as if by a call to
14412		

14413		the <i>mbrtowc()</i> function, with the conversion state described by an mbstate_t object
14414		initialized to zero before the first character is converted. The application shall ensure
14415		that the corresponding argument is a pointer to an array of wchar_t large enough to
14416		accept the sequence and the terminating null wide character, which shall be added
14417		automatically.
14418	[	Matches a non-empty sequence of bytes from a set of expected bytes (the <i>scanset</i>). The
14419		normal skip over white-space characters shall be suppressed in this case. The
14420		application shall ensure that the corresponding argument is a pointer to the initial byte
14421		of an array of char , signed char , or unsigned char large enough to accept the sequence
14422		and a terminating null byte, which shall be added automatically.
14423		If an l (ell) qualifier is present, the input is a sequence of characters that begins in the
14424		initial shift state. Each character in the sequence shall be converted to a wide character
14425		as if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an
14426		mbstate_t object initialized to zero before the first character is converted. The
14427		application shall ensure that the corresponding argument is a pointer to an array of
14428		wchar_t large enough to accept the sequence and the terminating null wide character,
14429		which shall be added automatically.
14430		The conversion specification includes all subsequent bytes in the <i>format</i> string up to
14431		and including the matching right square bracket (']'). The bytes between the square
14432		brackets (the <i>scanlist</i>) comprise the scanset, unless the byte after the left square bracket
14433		is a circumflex ('^'), in which case the scanset contains all bytes that do not appear in
14434		the scanlist between the circumflex and the right square bracket. If the conversion
14435		specification begins with "[^]" or "[^]", the right square bracket is included in the
14436		scanlist and the next right square bracket is the matching right square bracket that ends
14437		the conversion specification; otherwise, the first right square bracket is the one that
14438		ends the conversion specification. If a '-' is in the scanlist and is not the first character,
14439		nor the second where the first character is a '^', nor the last character, the behavior is
14440		implementation-defined.
14441	c	Matches a sequence of bytes of the number specified by the field width (1 if no field
14442		width is present in the conversion specification). The application shall ensure that the
14443		corresponding argument is a pointer to the initial byte of an array of char , signed char ,
14444		or unsigned char large enough to accept the sequence. No null byte is added. The
14445		normal skip over white-space characters shall be suppressed in this case.
14446		If an l (ell) qualifier is present, the input shall be a sequence of characters that begins in
14447		the initial shift state. Each character in the sequence is converted to a wide character as
14448		if by a call to the <i>mbrtowc()</i> function, with the conversion state described by an
14449		mbstate_t object initialized to zero before the first character is converted. The
14450		application shall ensure that the corresponding argument is a pointer to an array of
14451		wchar_t large enough to accept the resulting sequence of wide characters. No null wide
14452		character is added.
14453	p	Matches an implementation-defined set of sequences, which shall be the same as the set
14454		of sequences that is produced by the %p conversion specification of the corresponding
14455		<i>fprintf()</i> functions. The application shall ensure that the corresponding argument is a
14456		pointer to a pointer to void . The interpretation of the input item is implementation-
14457		defined. If the input item is a value converted earlier during the same program
14458		execution, the pointer that results shall compare equal to that value; otherwise, the
14459		behavior of the %p conversion specification is undefined.
14460	n	No input is consumed. The application shall ensure that the corresponding argument is
14461		a pointer to the integer into which shall be written the number of bytes read from the

14462 input so far by this call to the *fscanf()* functions. Execution of a %n conversion
 14463 specification shall not increment the assignment count returned at the completion of
 14464 execution of the function. No argument shall be converted, but one shall be consumed.
 14465 If the conversion specification includes an assignment-suppressing character or a field
 14466 width, the behavior is undefined.

14467 XSI C Equivalent to lc.

14468 XSI S Equivalent to ls.

14469 % Matches a single '%' character; no conversion or assignment occurs. The complete
 14470 conversion specification shall be %%.

14471 If a conversion specification is invalid, the behavior is undefined.

14472 The conversion specifiers A, E, F, G, and X are also valid and shall be equivalent to a, e, f, g, and
 14473 x, respectively.

14474 If end-of-file is encountered during input, conversion shall be terminated. If end-of-file occurs
 14475 before any bytes matching the current conversion specification (except for %n) have been read
 14476 (other than leading white-space characters, where permitted), execution of the current
 14477 conversion specification shall terminate with an input failure. Otherwise, unless execution of the
 14478 current conversion specification is terminated with a matching failure, execution of the
 14479 following conversion specification (if any) shall be terminated with an input failure.

14480 Reaching the end of the string in *sscanf()* shall be equivalent to encountering end-of-file for
 14481 *fscanf()*.

14482 If conversion terminates on a conflicting input, the offending input is left unread in the input.
 14483 Any trailing white space (including <newline>s) shall be left unread unless matched by a
 14484 conversion specification. The success of literal matches and suppressed assignments is only
 14485 directly determinable via the %n conversion specification.

14486 CX The *fscanf()* and *scanf()* functions may mark the *st_atime* field of the file associated with *stream*
 14487 for update. The *st_atime* field shall be marked for update by the first successful execution of
 14488 *fgetc()*, *fgets()*, *fread()*, *getc()*, *getchar()*, *gets()*, *fscanf()*, or *scanf()* using *stream* that returns data
 14489 not supplied by a prior call to *ungetc()*.

14490 RETURN VALUE

14491 Upon successful completion, these functions shall return the number of successfully matched
 14492 and assigned input items; this number can be zero in the event of an early matching failure. If
 14493 the input ends before the first matching failure or conversion, EOF shall be returned. If a read
 14494 CX error occurs, the error indicator for the stream is set, EOF shall be returned, and *errno* shall be set
 14495 to indicate the error.

14496 ERRORS

14497 For the conditions under which the *fscanf()* functions fail and may fail, refer to *fgetc()* or
 14498 *fgetwc()*.

14499 In addition, *fscanf()* may fail if:

14500 XSI [EILSEQ] Input byte sequence does not form a valid character.

14501 XSI [EINVAL] There are insufficient arguments.

14502 **EXAMPLES**

14503 The call:

```
14504     int i, n; float x; char name[50];
14505     n = scanf("%d%f%s", &i, &x, name);
```

14506 with the input line:

14507 25 54.32E-1 Hamster

14508 assigns to *n* the value 3, to *i* the value 25, to *x* the value 5.432, and *name* contains the string
 14509 "Hamster".

14510 The call:

```
14511     int i; float x; char name[50];
14512     (void) scanf("%2d%f*d %[0123456789]", &i, &x, name);
```

14513 with input:

14514 56789 0123 56a72

14515 assigns 56 to *i*, 789.0 to *x*, skips 0123, and places the string "56\0" in *name*. The next call to
 14516 *getchar()* shall return the character 'a'.

14517 **Reading Data into an Array**

14518 The following call uses *fscanf()* to read three floating-point numbers from standard input into
 14519 the *input* array.

```
14520     float input[3]; fscanf (stdin, "%f %f %f", input, input+1, input+2);
```

14521 **APPLICATION USAGE**

14522 If the application calling *fscanf()* has any objects of type **wint_t** or **wchar_t**, it must also include
 14523 the **<wchar.h>** header to have these objects defined.

14524 **RATIONALE**

14525 This function is aligned with the ISO/IEC 9899:1999 standard, and in doing so a few “obvious”
 14526 things were not included. Specifically, the set of characters allowed in a scanset is limited to
 14527 single-byte characters. In other similar places, multi-byte characters have been permitted, but
 14528 for alignment with the ISO/IEC 9899:1999 standard, it has not been done here. Applications
 14529 needing this could use the corresponding wide-character functions to achieve the desired
 14530 results.

14531 **FUTURE DIRECTIONS**

14532 None.

14533 **SEE ALSO**

14534 *getc()*, *printf()*, *setlocale()*, *strtod()*, *strtol()*, *strtoul()*, *wcrtomb()*, the Base Definitions volume of
 14535 IEEE Std 1003.1-2001, Chapter 7, Locale, **<langinfo.h>**, **<stdio.h>**, **<wchar.h>**

14536 **CHANGE HISTORY**

14537 First released in Issue 1. Derived from Issue 1 of the SVID.

14538 **Issue 5**

14539 Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the *l* (ell) qualifier is
 14540 now defined for the *c*, *s*, and *[* conversion specifiers.

14541 The DESCRIPTION is updated to indicate that if infinity and NaN can be generated by the
 14542 *fprintf()* family of functions, then they are recognized by the *fscanf()* family.

14543 **Issue 6**

14544 The Open Group Corrigenda U021/7 and U028/10 are applied. These correct several
14545 occurrences of “characters” in the text which have been replaced with the term “bytes”.

14546 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14547 The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- 14548 • The prototypes for *fscanf()*, *scanf()*, and *sscanf()* are updated.
- 14549 • The DESCRIPTION is updated.
- 14550 • The hh, ll, j, t, and z length modifiers are added.
- 14551 • The a, A, and F conversion characters are added.

14552 The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion
14553 specification” consistently.

14554 **NAME**

14555 fseek, fseeko — reposition a file-position indicator in a stream

14556 **SYNOPSIS**

14557 #include <stdio.h>

14558 int fseek(FILE *stream, long offset, int whence);

14559 CX int fseeko(FILE *stream, off_t offset, int whence);

14560

14561 **DESCRIPTION**

14562 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14563 conflict between the requirements described here and the ISO C standard is unintentional. This
 14564 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14565 The *fseek()* function shall set the file-position indicator for the stream pointed to by *stream*. If a
 14566 read or write error occurs, the error indicator for the stream shall be set and *fseek()* fails.

14567 The new position, measured in bytes from the beginning of the file, shall be obtained by adding
 14568 *offset* to the position specified by *whence*. The specified point is the beginning of the file for
 14569 SEEK_SET, the current value of the file-position indicator for SEEK_CUR, or end-of-file for
 14570 SEEK_END.

14571 If the stream is to be used with wide-character input/output functions, the application shall
 14572 ensure that *offset* is either 0 or a value returned by an earlier call to *ftell()* on the same stream and
 14573 *whence* is SEEK_SET.

14574 A successful call to *fseek()* shall clear the end-of-file indicator for the stream and undo any effects
 14575 of *ungetc()* and *ungetwc()* on the same stream. After an *fseek()* call, the next operation on an
 14576 update stream may be either input or output.

14577 CX If the most recent operation, other than *ftell()*, on a given stream is *fflush()*, the file offset in the
 14578 underlying open file description shall be adjusted to reflect the location specified by *fseek()*.

14579 The *fseek()* function shall allow the file-position indicator to be set beyond the end of existing
 14580 data in the file. If data is later written at this point, subsequent reads of data in the gap shall
 14581 return bytes with the value 0 until data is actually written into the gap.

14582 The behavior of *fseek()* on devices which are incapable of seeking is implementation-defined.
 14583 The value of the file offset associated with such a device is undefined.

14584 If the stream is writable and buffered data had not been written to the underlying file, *fseek()*
 14585 shall cause the unwritten data to be written to the file and shall mark the *st_ctime* and *st_mtime*
 14586 fields of the file for update.

14587 In a locale with state-dependent encoding, whether *fseek()* restores the stream's shift state is
 14588 implementation-defined.

14589 The *fseeko()* function shall be equivalent to the *fseek()* function except that the *offset* argument is
 14590 of type **off_t**.

14591 **RETURN VALUE**14592 CX The *fseek()* and *fseeko()* functions shall return 0 if they succeed.14593 CX Otherwise, they shall return -1 and set *errno* to indicate the error.14594 **ERRORS**

14595 CX The *fseek()* and *fseeko()* functions shall fail if, either the *stream* is unbuffered or the *stream*'s
 14596 buffer needed to be flushed, and the call to *fseek()* or *fseeko()* causes an underlying *lseek()* or
 14597 *write()* to be invoked, and:

14598 CX	[EAGAIN]	The O_NONBLOCK flag is set for the file descriptor and the process would be delayed in the write operation.
14599		
14600 CX	[EBADF]	The file descriptor underlying the stream file is not open for writing or the stream's buffer needed to be flushed and the file is not open.
14601		
14602 CX	[EFBIG]	An attempt was made to write a file that exceeds the maximum file size.
14603 XSI	[EFBIG]	An attempt was made to write a file that exceeds the process' file size limit.
14604 CX	[EFBIG]	The file is a regular file and an attempt was made to write at or beyond the offset maximum associated with the corresponding stream.
14605		
14606 CX	[EINTR]	The write operation was terminated due to the receipt of a signal, and no data was transferred.
14607		
14608 CX	[EINVAL]	The <i>whence</i> argument is invalid. The resulting file-position indicator would be set to a negative value.
14609		
14610 CX	[EIO]	A physical I/O error has occurred, or the process is a member of a background process group attempting to perform a <i>write()</i> to its controlling terminal, TOSTOP is set, the process is neither ignoring nor blocking SIGTTOU, and the process group of the process is orphaned. This error may also be returned under implementation-defined conditions.
14611		
14612		
14613		
14614		
14615 CX	[ENOSPC]	There was no free space remaining on the device containing the file.
14616 CX	[ENXIO]	A request was made of a nonexistent device, or the request was outside the capabilities of the device.
14617		
14618 CX	[EOVERFLOW]	For <i>fseek()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type long .
14619		
14620 CX	[EOVERFLOW]	For <i>fseeko()</i> , the resulting file offset would be a value which cannot be represented correctly in an object of type off_t .
14621		
14622 CX	[EPIPE]	An attempt was made to write to a pipe or FIFO that is not open for reading by any process; a SIGPIPE signal shall also be sent to the thread.
14623		
14624 CX	[ESPIPE]	The file descriptor underlying <i>stream</i> is associated with a pipe or FIFO.

 14635 Definitions volume of IEEE Std 1003.1-2001, <**stdio.h**>

14636 **CHANGE HISTORY**

14637 First released in Issue 1. Derived from Issue 1 of the SVID.

14638 **Issue 5**

14639 Normative text previously in the APPLICATION USAGE section is moved to the
14640 DESCRIPTION.

14641 Large File Summit extensions are added.

14642 **Issue 6**

14643 Extensions beyond the ISO C standard are marked.

14644 The following new requirements on POSIX implementations derive from alignment with the
14645 Single UNIX Specification:

- 14646 • The *fseeko()* function is added.
- 14647 • The [EFBIG], [EOVERFLOW], and [ENXIO] mandatory error conditions are added.

14648 The following change is incorporated for alignment with the FIPS requirements:

- 14649 • The [EINTR] error is no longer an indication that the implementation does not report partial
14650 transfers.

14651 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14652 The DESCRIPTION is updated to explicitly state that *fseek()* sets the file-position indicator, and
14653 then on error the error indicator is set and *fseek()* fails. This is for alignment with the
14654 ISO / IEC 9899:1999 standard.

14655 **NAME**

14656 fsetpos — set current file position

14657 **SYNOPSIS**

14658 #include <stdio.h>

14659 int fsetpos(FILE *stream, const fpos_t *pos);

14660 **DESCRIPTION**

14661 CX The functionality described on this reference page is aligned with the ISO C standard. Any
 14662 conflict between the requirements described here and the ISO C standard is unintentional. This
 14663 volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

14664 The *fsetpos()* function shall set the file position and state indicators for the stream pointed to by
 14665 *stream* according to the value of the object pointed to by *pos*, which the application shall ensure
 14666 is a value obtained from an earlier call to *fgetpos()* on the same stream. If a read or write error
 14667 occurs, the error indicator for the stream shall be set and *fsetpos()* fails.

14668 A successful call to the *fsetpos()* function shall clear the end-of-file indicator for the stream and
 14669 undo any effects of *ungetc()* on the same stream. After an *fsetpos()* call, the next operation on an
 14670 update stream may be either input or output.

14671 CX The behavior of *fsetpos()* on devices which are incapable of seeking is implementation-defined.
 14672 The value of the file offset associated with such a device is undefined.

14673 **RETURN VALUE**

14674 The *fsetpos()* function shall return 0 if it succeeds; otherwise, it shall return a non-zero value and
 14675 set *errno* to indicate the error.

14676 **ERRORS**

14677 CX The *fsetpos()* function shall fail if, either the *stream* is unbuffered or the *stream*'s buffer needed to
 14678 be flushed, and the call to *fsetpos()* causes an underlying *lseek()* or *write()* to be invoked, and:

14679 CX [EAGAIN] The O_NONBLOCK flag is set for the file descriptor and the process would be
 14680 delayed in the write operation.

14681 CX [EBADF] The file descriptor underlying the stream file is not open for writing or the
 14682 stream's buffer needed to be flushed and the file is not open.

14683 CX [EFBIG] An attempt was made to write a file that exceeds the maximum file size.

14684 XSI [EFBIG] An attempt was made to write a file that exceeds the process' file size limit.

14685 CX [EFBIG] The file is a regular file and an attempt was made to write at or beyond the
 14686 offset maximum associated with the corresponding stream.

14687 CX [EINTR] The write operation was terminated due to the receipt of a signal, and no data
 14688 was transferred.

14689 CX [EIO] A physical I/O error has occurred, or the process is a member of a
 14690 background process group attempting to perform a *write()* to its controlling
 14691 terminal, TOSTOP is set, the process is neither ignoring nor blocking
 14692 SIGTTOU, and the process group of the process is orphaned. This error may
 14693 also be returned under implementation-defined conditions.

14694 CX [ENOSPC] There was no free space remaining on the device containing the file.

14695 CX [ENXIO] A request was made of a nonexistent device, or the request was outside the
 14696 capabilities of the device.

14697 CX [EPIPE] The file descriptor underlying *stream* is associated with a pipe or FIFO.

14698 CX [EPIPE] An attempt was made to write to a pipe or FIFO that is not open for reading

14699 by any process; a SIGPIPE signal shall also be sent to the thread.

14710 IEEE Std 1003.1-2001, <stdio.h>

14711 CHANGE HISTORY

14712 First released in Issue 4. Derived from the ISO C standard.

14713 Issue 6

14714 Extensions beyond the ISO C standard are marked.

14715 An additional [ESPIPE] error condition is added for sockets.

14716 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

14717 The DESCRIPTION is updated to clarify that the error indicator is set for the stream on a read or

14718 write error. This is for alignment with the ISO/IEC 9899:1999 standard.

14719 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/21 is applied, deleting an erroneous |

14720 [EINVAL] error case from the ERRORS section. |

14721 **NAME**

14722 fstat — get file status

14723 **SYNOPSIS**

14724 #include <sys/stat.h>

14725 int fstat(int *fildes*, struct stat **buf*);14726 **DESCRIPTION**

14727 The *fstat()* function shall obtain information about an open file associated with the file
 14728 descriptor *fildes*, and shall write it to the area pointed to by *buf*.

14729 SHM If *fildes* references a shared memory object, the implementation shall update in the **stat** structure
 14730 pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
 14731 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
 14732 valid. The implementation may update other fields and flags.

14733 TYM If *fildes* references a typed memory object, the implementation shall update in the **stat** structure
 14734 pointed to by the *buf* argument only the *st_uid*, *st_gid*, *st_size*, and *st_mode* fields, and only the
 14735 S_IRUSR, S_IWUSR, S_IRGRP, S_IWGRP, S_IROTH, and S_IWOTH file permission bits need be
 14736 valid. The implementation may update other fields and flags.

14737 The *buf* argument is a pointer to a **stat** structure, as defined in <sys/stat.h>, into which
 14738 information is placed concerning the file.

14739 The structure members *st_mode*, *st_ino*, *st_dev*, *st_uid*, *st_gid*, *st_atime*, *st_ctime*, and *st_mtime*
 14740 shall have meaningful values for all other file types defined in this volume of
 14741 IEEE Std 1003.1-2001. The value of the member *st_nlink* shall be set to the number of links to the
 14742 file.

14743 An implementation that provides additional or alternative file access control mechanisms may,
 14744 under implementation-defined conditions, cause *fstat()* to fail.

14745 The *fstat()* function shall update any time-related fields as described in the Base Definitions
 14746 volume of IEEE Std 1003.1-2001, Section 4.7, File Times Update, before writing into the **stat**
 14747 structure.

14748 **RETURN VALUE**

14749 Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and *errno* set to
 14750 indicate the error.

14751 **ERRORS**14752 The *fstat()* function shall fail if:

14753 [EBADF] The *fildes* argument is not a valid file descriptor.

14754 [EIO] An I/O error occurred while reading from the file system.

14755 [EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file
 14756 serial number cannot be represented correctly in the structure pointed to by
 14757 *buf*.

14758 The *fstat()* function may fail if:
