1

## Historical roots:

- **Evolution Strategies (ESs):**

- developed by Rechenberg, Schwefel, etc. in 1960s.
- focus: real-valued parameter optimization
- individual: vector of real-valued parameters
- reproduction: Gaussian “mutation” of parameters
- M parents,  $K \gg M$  offspring

2

## Historical roots:

- **Evolutionary Programming (EP):**

- Developed by Fogel in 1960s
- Goal: evolve intelligent behavior
- Individuals: finite state machines
- Offspring via mutation of FSMs
- M parents, M offspring

3

## Historical roots:

- **Genetic Algorithms (GAs):**

- developed by Holland in 1960s
- goal: robust, adaptive systems
- used an internal “genetic” encoding of points
- reproduction via mutation and recombination of the genetic code.
- M parents, M offspring

4

## Present Status:

- wide variety of evolutionary algorithms (EAs)
- wide variety of applications
  - optimization
  - search
  - learning, adaptation
- well-developed analysis
  - theoretical
  - experimental

5

## Interesting dilemma:

- A bewildering variety of algorithms and approaches:
  - GAs, ESs, EP, GP, Genitor, CHC, messy GAs, ...
- Hard to see relationships, assess strengths & weaknesses, make choices, ...

6

## A Personal Interest:

- Develop a general framework that:
  - Helps one compare and contrast approaches.
  - Encourages crossbreeding.
  - Facilitates intelligent design choices.

7

## Viewpoint:

8

## Starting point:

- Common features
- Basic definitions and terminology

9

## Common Features:

- Use of Darwinian-like evolutionary processes to solve difficult computational problems.
- Hence, the name:

### Evolutionary Computation

10

## Key Element: An Evolutionary Algorithm

- Based on a Darwinian notion of an evolutionary system.
- Basic elements:
  - a population of “individuals”
  - a notion of “fitness”
  - a birth/death cycle biased by fitness
  - a notion of “inheritance”

11

## An EA template:

1. Randomly generate an initial population.
2. Do until some stopping criteria is met:
  - Select individuals to be parents (biased by fitness).
  - Produce offspring.
  - Select individuals to die (biased by fitness).End Do.
3. Return a result.

12

## Instantiate by specifying:

- Population dynamics:
  - Population size
  - Parent selection
  - Reproduction and inheritance
  - Survival competition
- Representation:
  - Internal to external mapping
- Fitness

13

## EA Population Dynamics:

14

## Population sizing:

- Parent population size M:
  - degree of parallelism
- Offspring population size K:
  - amount of activity w/o feedback

15

## Population sizing:

- Examples:
  - M=1, K small: early ESs
  - M small, K large: typical ESs
  - M moderate, K=M: traditional GAs and EP
  - M large, K small: steady state GAs
  - M = K large: traditional GP

16

## Selection pressure:

- Overlapping generations:
  - more pressure than non-overlapping
- Selection strategies (decreasing pressure):
  - truncation
  - tournament and ranking
  - fitness proportional
  - uniform
- Stochastic vs. deterministic

17

## Reproduction:

- Preserve useful features
- Introduce variety and novelty
- Strategies:
  - single parent: cloning + mutation
  - multi-parent: recombination + mutation
  - ...
- Price's theorem:
  - fitness covariance

18

## Exploitation/Exploration Balance:

- Selection pressure: exploitation
  - reduce scope of search
- Reproduction: exploration
  - expand scope of search
- Key issue: appropriate balance
  - e.g., strong selection + high mutation rates
  - e.g., weak selection + low mutation rates

19

## Representation:

- How to represent the space to be searched?
  - **Genotypic** representations:
    - universal encodings
    - portability
    - minimal domain knowledge

20

## Representation:

- How to represent the space to be searched?
  - **Phenotypic** representations:
    - problem-specific encodings
    - leverage domain knowledge
    - lack of portability

21

## Fitness landscapes:

- Continuous/discrete
- Number of local/global peaks
- Ruggedness
- Constraints
- Static/dynamic

22

## The Art of EC:

- Choosing problems that make sense.
- Choosing an appropriate EA:
  - reuse an existing one
  - hand-craft a new one

23

## EC: Using EAs to Solve Problems

- What kinds of problems?
- What kinds of EAs?

24

### **Intuitive view:**

- parallel, adaptive search procedure.
- useful global search heuristic.
- a paradigm that can be instantiated in a variety of ways.
- can be very general or problem specific.
- strong sense of fitness “optimization”.

25

### **Evolutionary Optimization:**

- fitness: function to be optimized
- individuals: points in the space
- reproduction: generating new sample points from existing ones.

26

### **Useful Optimization Properties:**

- applicable to continuous, discrete, mixed optimization problems.
- no *a priori* assumptions about convexity, continuity, differentiability, etc.
- relatively insensitive to noise
- easy to parallelize

27

### **Real-valued Param. Optimization:**

- high dimensional problems
- highly multi-modal problems
- problems with non-linear constraints

28

### **Discrete Optimization:**

- TSP problems
- Boolean satisfiability problems
- Frequency assignment problems
- Job shop scheduling problems

29

### **Multi-objective Optimization:**

- Pareto optimality problems
- a variety of industrial problems

30

### Properties of standard EAs:

- **GAs:**
  - universality encourages new applications
  - well-balanced for global search
  - requires mapping to internal representation

31

### Properties of standard EAs:

- **ESs:**
  - well-suited for real-valued optimization.
  - built-in self-adaptation.
  - requires significant redesign for other application areas.

32

### Properties of standard EAs:

- **EP:**
  - well-suited for phenotypic representations.
  - encourages domain-specific representation and operators.
  - requires significant design for each application area.

33

### Other EAs:

- **GENITOR: (Whitley)**
  - “steady state” population dynamics
    - K=1 offspring
    - overlapping generations
  - parent selection: ranking
  - survival selection: ranking
  - large population sizes
  - high mutation rates

34

### Other EAs:

- **GP: (Koza)**
  - standard GA population dynamics
  - individuals: parse trees of Lisp code
  - large population sizes
  - specialized crossover
  - minimal mutation

35

### Other EAs:

- **Messy GAs: (Goldberg)**
  - Standard GA population dynamics
  - Adaptive binary representation
    - genes are position-independent

36

## Other EAs:

- GENOCOP: (Michalewicz)
  - Standard GA population dynamics
  - Specialized representation & operators for real valued constrained optimization problems.

37

## Designing an EA:

- Choose an appropriate representation
  - effective building blocks
  - semantically meaningful subassemblies
- Choose effective reproductive operators
  - fitness covariance

38

## Designing an EA:

- Choose appropriate selection pressure
  - local vs. global search
- Choosing a useful fitness function
  - exploitable information

39

## Industrial Example: Evolving NLP Tagging Rules

- Existing tagging engine
- Existing rule syntax
- Existing rule semantics
- Goal: improve
  - development time for new domains
  - tagging accuracy

40

## Evolving NLP Tagging Rules

- Representation: (first thoughts)
  - variable length list of GP-like trees

- Difficulty: effective operators

41

## Evolving NLP Tagging Rules

- Representation: (second thoughts)
  - variable length list of pointers to rules

- Operators:
  - mutation: permute, delete rules
  - recombination: exchange rule subsets
  - Lamarckian: add a new rule

42

## Evolving NLP Tagging Rules

- Population dynamics:
  - multi-modal:  $M > \text{small}$ 
    - typical: 30-50
  - high operator variance:  $K/M > 1$ 
    - typical: 3-5 : 1
  - parent selection: uniform
  - survival selection: binary tournament

43

## Evolving NLP Tagging Rules

- So, what is this thing?
  - A GA, ES, EP, ...
- My answer:
  - a thoughtfully designed EA

44

## Analysis tools:

- Schema analysis
- Convergence analysis
- Markov models
- Statistical Mechanics
- Visualization

45

## New developments and directions:

- Exploiting parallelism:
  - coarsely grained network models
    - isolated islands with occasional migrations
  - finely grained diffusion models
    - continuous interaction in local neighborhoods

46

## New developments and directions:

- Co-evolutionary models:
  - competitive co-evolution
    - improve performance via “arms race”
  - cooperative co-evolution
    - evolve subcomponents in parallel

47

## New developments and directions:

- Exploiting Morphogenesis:
  - sophisticated genotype --> phenotype mappings
  - evolve plans for building complex objects rather than the objects themselves.

48

## New developments and directions:

- Self-adaptive EAs:
  - dynamically adapt to problem characteristics:
    - varying population size
    - varying selection pressure
    - varying representation
    - varying reproductive operators
  - goal: robust “black box” optimizer

49

## New developments and directions:

- Hybrid Systems:
  - combine EAs with other techniques:
    - EAs and gradient methods
    - EAs and TABU search
    - EAs and ANNs
    - EAs and symbolic machine learning

50

## New developments and directions:

- Time-varying environments:
  - fitness landscape changes during evolution
  - goal: adaptation, tracking
  - standard optimization-oriented EAs not well-suited for this.

51

## New developments and directions:

- Agent-oriented problems:
  - individuals more autonomous, active
  - fitness a function of other agents and environment-altering actions
  - standard optimization-oriented EAs not well-suited for this.

52

## Conclusions:

- Powerful tool for your toolbox.
- Complements other techniques.
- Best viewed as a paradigm to be instantiated, guided by theory and practice.
- Success a function of particular instantiation.
