Although historical versions of `getdate()` did not require that `<time.h>` declare the external variable `getdate_err`, this volume of IEEE Std 1003.1-2001 does require it. The standard developers encourage applications to remove declarations of `getdate_err` and instead incorporate the declaration by including `<time.h>`.

Applications should use `%Y (4-digit years) in preference to `%y (2-digit years).

### RATIONALE

In standard locales, the conversion specifications `%c`, `%x`, and `%X` do not include unsupported conversion specifiers and so the text regarding results being undefined is not a problem in that case.

### FUTURE DIRECTIONS

None.

### SEE ALSO

`ctime()`, `localtime()`, `setlocale()`, `strftime()`, `times()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<time.h>`

### CHANGE HISTORY

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

The last paragraph of the DESCRIPTION is added.

The `%C` conversion specification is added, and the exact meaning of the `%y conversion specification is clarified in the DESCRIPTION.
A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The `%R` conversion specification is changed to follow historical practice.

**Issue 6**

The DESCRIPTION is updated to refer to “seconds since the Epoch” rather than “seconds since 00:00:00 UTC (Coordinated Universal Time), January 1 1970” for consistency with other `time` functions.

The description of `%S` is updated so that the valid range is [00,60] rather than [00,61].

The DESCRIPTION is updated to refer to conversion specifications instead of field descriptors for consistency with other functions.
getegid()

NAME
getegid — get the effective group ID

SYNOPSIS
#include <unistd.h>
gid_t getegid(void);

DESCRIPTION
The getegid() function shall return the effective group ID of the calling process.

RETURN VALUE
The getegid() function shall always be successful and no return value is reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
geteuid(), getgid(), geteuid(), setegid(), seteuid(), setgid(), setrevid(), setuid(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
NAME
getenv — get value of an environment variable

SYNOPSIS
#include <stdlib.h>
char *getenv(const char *name);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `getenv()` function shall search the environment of the calling process (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables) for the environment variable `name` if it exists and return a pointer to the value of the environment variable. If the specified environment variable cannot be found, a null pointer shall be returned.

The application shall ensure that it does not modify the string pointed to by the `getenv()` function.

The string pointed to may be overwritten by a subsequent call to `getenv()`, `setenv()`, or `unsetenv()`, but shall not be overwritten by a call to any other function in this volume of IEEE Std 1003.1-2001.

If the application modifies `environ` or the pointers to which it points, the behavior of `getenv()` is undefined.

The `getenv()` function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE
Upon successful completion, `getenv()` shall return a pointer to a string containing the value for the specified `name`. If the specified `name` cannot be found in the environment of the calling process, a null pointer shall be returned.

The return value from `getenv()` may point to static data which may be overwritten by subsequent calls to `getenv()`, `setenv()`, or `unsetenv()`.

On XSI-conformant systems, the return value from `getenv()` may point to static data which may also be overwritten by subsequent calls to `putenv()`.

ERRORS
No errors are defined.

EXAMPLES

Getting the Value of an Environment Variable
The following example gets the value of the `HOME` environment variable.

```c
#include <stdlib.h>
...
const char *name = "HOME";
char *value;
value = getenv(name);
```
**APPLICATION USAGE**

None.

**RATIONALE**

The `clearenv()` function was considered but rejected. The `putenv()` function has now been included for alignment with the Single UNIX Specification.

The `getenv()` function is inherently not reentrant because it returns a value pointing to static data.

Conforming applications are required not to modify `environ` directly, but to use only the functions described here to manipulate the process environment as an abstract object. Thus, the implementation of the environment access functions has complete control over the data structure used to represent the environment (subject to the requirement that `environ` be maintained as a list of strings with embedded equal signs for applications that wish to scan the environment). This constraint allows the implementation to properly manage the memory it allocates, either by using allocated storage for all variables (copying them on the first invocation of `setenv()` or `unsetenv()`), or keeping track of which strings are currently in allocated space and which are not, via a separate table or some other means. This enables the implementation to free any allocated space used by strings (and perhaps the pointers to them) stored in `environ` when `unsetenv()` is called. A C runtime start-up procedure (that which invokes `main()` and perhaps initializes `environ`) can also initialize a flag indicating that none of the environment has yet been copied to allocated storage, or that the separate table has not yet been initialized.

In fact, for higher performance of `getenv()`, the implementation could also maintain a separate copy of the environment in a data structure that could be searched much more quickly (such as an indexed hash table, or a binary tree), and update both it and the linear list at `environ` when `setenv()` or `unsetenv()` is invoked.

Performance of `getenv()` can be important for applications which have large numbers of environment variables. Typically, applications like this use the environment as a resource database of user-configurable parameters. The fact that these variables are in the user's shell environment usually means that any other program that uses environment variables (such as `ls`, which attempts to use `COLUMNS`), or really almost any utility (`LANG`, `LC_ALL`, and so on) is similarly slowed down by the linear search through the variables.

An implementation that maintains separate data structures, or even one that manages the memory it consumes, is not currently required as it was thought it would reduce consensus among implementors who do not want to change their historical implementations.

The POSIX Threads Extension states that multi-threaded applications must not modify `environ` directly, and that IEEE Std 1003.1-2001 is providing functions which such applications can use in the future to manipulate the environment in a thread-safe manner. Thus, moving away from application use of `environ` is desirable from that standpoint as well.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`exec`, `putenv()`, `setenv()`, `unsetenv()`, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables, `<stdlib.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.
**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The following changes were made to align with the IEEE P1003.1a draft standard:

- References added to the new `setenv()` and `unsetenv()` functions.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
getuid — get the effective user ID

SYNOPSIS
#include <unistd.h>

uid_t geteuid(void);

DESCRIPTION
The geteuid() function shall return the effective user ID of the calling process.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
NAME
getgrent — get the group database entry

SYNOPSIS
#include <grp.h>
struct group *getgrent(void);

DESCRIPTION
Refer to endgrent().
NAME
    getgrgid, getgrgid_r — get group database entry for a group ID

SYNOPSIS
    #include <grp.h>
    struct group *getgrgid(gid_t gid);
    int getgrgid_r(gid_t gid, struct group *grp, char *buffer, size_t bufsize, struct group **result);

DESCRIPTION
    The getgrgid() function shall search the group database for an entry with a matching gid.
    The getgrgid() function need not be reentrant. A function that is not required to be reentrant is
    not required to be thread-safe.
    
    TSF  The getgrgid_r() function shall update the group structure pointed to by grp and store a pointer
to that structure at the location pointed to by result. The structure shall contain an entry from
the group database with a matching gid. Storage referenced by the group structure is allocated
from the memory provided with the buffer parameter, which is bufsize bytes in size. The
maximum size needed for this buffer can be determined with the { _SC_GETGR_R_SIZE_MAX} sysconf() parameter. A NULL pointer shall be returned at the location pointed to by result on
error or if the requested entry is not found.

RETURN VALUE
    Upon successful completion, getgrgid() shall return a pointer to a struct group with the structure
defined in <grp.h> with a matching entry if one is found. The getgrgid() function shall return a
null pointer if either the requested entry was not found, or an error occurred. On error, errno
shall be set to indicate the error.

    The return value may point to a static area which is overwritten by a subsequent call to
getgrent(), getgrgid(), or getgrnam().

    TSF  If successful, the getgrgid_r() function shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS
    The getgrgid() and getgrgid_r() functions may fail if:
    
    [EIO]      An I/O error has occurred.
    [EINVAL]   A signal was caught during getgrgid().
    [EMFILE]   {OPEN_MAX} file descriptors are currently open in the calling process.
    [ENOMEM]    The maximum allowable number of files is currently open in the system.
    
    TSF  The getgrgid_r() function may fail if:
    
    [ERANGE]   Insufficient storage was supplied via buffer and bufsize to contain the data to
be referenced by the resulting group structure.
EXAMPLES

Finding an Entry in the Group Database

The following example uses `getgrgid()` to search the group database for a group ID that was previously stored in a `stat` structure, then prints out the group name if it is found. If the group is not found, the program prints the numeric value of the group for the entry.

```c
#include <sys/types.h>
#include <grp.h>
#include <stdio.h>
...
struct stat statbuf;
struct group *grp;
...
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8.8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);
```

APPLICATION USAGE

Applications wishing to check for error situations should set `errno` to 0 before calling `getgrgid()`.
If `errno` is set on return, an error occurred.
The `getgrgid_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

`endgrent()`, `getgrnam()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<grp.h>`, `<limits.h>`, `<sys/types.h>`

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.
The `getgrgid_r()` function is included for alignment with the POSIX Threads Extension.
A note indicating that the `getgrgid()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The `getgrgid_r()` function is marked as part of the Thread-Safe Functions option.
The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the `gid`.
In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- In the RETURN VALUE section, the requirement to set `errno` on error is added.

- The `[EIO]`, `[EINVAL]`, `[EMFILE]`, and `[ENFILE]` optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from `bufsize` characters to bytes.
NAME
getgrnam, getgrnam_r — search group database for a name

SYNOPSIS
#include <grp.h>

struct group *getgrnam(const char *name);

TSF int getgrnam_r(const char *name, struct group *grp, char *buffer,
size_t bufsize, struct group **result);

DESCRIPTION
The getgrnam() function shall search the group database for an entry with a matching name.
The getgrnam() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

TSF The getgrnam_r() function shall update the group structure pointed to by grp and store a pointer to that structure at the location pointed to by result. The structure shall contain an entry from the group database with a matching gid or name. Storage referenced by the group structure is allocated from the memory provided with the buffer parameter, which is bufsize bytes in size. The maximum size needed for this buffer can be determined with the {SC_GETGR_R_SIZE_MAX} sysconf() parameter. A NULL pointer is returned at the location pointed to by result on error or if the requested entry is not found.

RETURN VALUE
The getgrnam() function shall return a pointer to a struct group with the structure defined in <grp.h> with a matching entry if one is found. The getgrnam() function shall return a null pointer if either the requested entry was not found, or an error occurred. On error, errno shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to getgrent(), getgrgid(), or getgrnam().

TSF If successful, the getgrnam_r() function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The getgrnam() and getgrnam_r() functions may fail if:

[EIO] An I/O error has occurred.

EINTR] A signal was caught during getgrnam().

EMFILE | (OPEN_MAX) file descriptors are currently open in the calling process.

ENFILE The maximum allowable number of files is currently open in the system.

The getgrnam_r() function may fail if:

TSF ERANGE Insufficient storage was supplied via buffer and bufsize to contain the data to be referenced by the resulting group structure.
EXAMPLES
None.

APPLICATION USAGE
Applications wishing to check for error situations should set *errno* to 0 before calling `getgrnam()`.
If *errno* is set on return, an error occurred.
The `getgrnam_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from System V Release 2.0.

Issue 5
Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.
The `getgrnam_r()` function is included for alignment with the POSIX Threads Extension.
A note indicating that the `getgrnam()` function need not be reentrant is added to the DESCRIPTION.

Issue 6
The `getgrnam_r()` function is marked as part of the Thread-Safe Functions option.
In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the RETURN VALUE section, the requirement to set *errno* on error is added.
- The [EIO], [EINTR], [EMFILE], and [ENFILE] optional error conditions are added.
The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.
IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from *bufsize* characters to bytes.
NAME
getgroups — get supplementary group IDs

SYNOPSIS
#include <unistd.h>
int getgroups(int gidsetsize, gid_t grouplist[]);

DESCRIPTION
The getgroups() function shall fill in the array grouplist with the current supplementary group
IDs of the calling process. It is implementation-defined whether getgroups() also returns the
effective group ID in the grouplist array.
The gidsetsize argument specifies the number of elements in the array grouplist. The actual
number of group IDs stored in the array shall be returned. The values of array entries with
indices greater than or equal to the value returned are undefined.
If gidsetsize is 0, getgroups() shall return the number of group IDs that it would otherwise return
without modifying the array pointed to by grouplist.
If the effective group ID of the process is returned with the supplementary group IDs, the value
returned shall always be greater than or equal to one and less than or equal to the value of
{NGROUPS_MAX}+1.

RETURN VALUE
Upon successful completion, the number of supplementary group IDs shall be returned. A
return value of −1 indicates failure and errno shall be set to indicate the error.

ERRORS
The getgroups() function shall fail if:
[EINVAL] The gidsetsize argument is non-zero and less than the number of group IDs
that would have been returned.

EXAMPLES
Getting the Supplementary Group IDs of the Calling Process
The following example places the current supplementary group IDs of the calling process into
the group array.
#include <sys/types.h>
#include <unistd.h>
...
gid_t *group;
int nogroups;
long ngroups_max;
ngroups_max = sysconf(_SC_NGROUPS_MAX) + 1;
group = (gid_t *)malloc(ngroups_max * sizeof(gid_t));
ngroups = getgroups(ngroups_max, group);

APPLICATION USAGE
None.

RATIONALE
The related function setgroups() is a privileged operation and therefore is not covered by this
As implied by the definition of supplementary groups, the effective group ID may appear in the array returned by `getgroups()` or it may be returned only by `getegid()`. Duplication may exist, but the application needs to call `getegid()` to be sure of getting all of the information. Various implementation variations and administrative sequences cause the set of groups appearing in the result of `getgroups()` to vary in order and as to whether the effective group ID is included, even when the set of groups is the same (in the mathematical sense of “set”). (The history of a process and its parents could affect the details of the result.)

Application writers should note that `{NGROUPS_MAX}` is not necessarily a constant on all implementations.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`getegid()`, `setgid()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/types.h>`, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the DESCRIPTION.

**Issue 6**

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- A return value of 0 is not permitted, because `{NGROUPS_MAX}` cannot be 0. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added that the effective group ID may be included in the supplementary group list.
gethostbyaddr()  System Interfaces

NAME  
gethostbyaddr, gethostbyname — network host database functions

SYNOPSIS  
#include <netdb.h>

struct hostent *gethostbyaddr(const void *addr, socklen_t len,
   int type);

struct hostent *gethostbyname(const char *name);

DESCRIPTION  
These functions shall retrieve information about hosts. This information is considered to be
stored in a database that can be accessed sequentially or randomly. Implementation of this
database is unspecified.

Note: In many cases it is implemented by the Domain Name System, as documented in RFC 1034,
RFC 1035, and RFC 1886.

Entries shall be returned in hostent structures.

The gethostbyaddr() function shall return an entry containing addresses of address family type for
the host with address addr. The len argument contains the length of the address pointed to by
addr. The gethostbyaddr() function need not be reentrant. A function that is not required to be
reentrant is not required to be thread-safe.

The gethostbyname() function shall return an entry containing addresses of address family
AF_INET for the host with name name. The gethostbyname() function need not be reentrant. A
function that is not required to be reentrant is not required to be thread-safe.

The addr argument of gethostbyaddr() shall be an in_addr structure when type is AF_INET. It
contains a binary format (that is, not null-terminated) address in network byte order. The
gethostbyaddr() function is not guaranteed to return addresses of address families other than
AF_INET, even when such addresses exist in the database.

If gethostbyaddr() returns successfully, then the h_addrtype field in the result shall be the same as
the type argument that was passed to the function, and the h_addr_list field shall list a single
address that is a copy of the addr argument that was passed to the function.

The name argument of gethostbyname() shall be a node name; the behavior of gethostbyname()
when passed a numeric address string is unspecified. For IPv4, a numeric address string shall be
in the dotted-decimal notation described in inet_addr().

If name is not a numeric address string and is an alias for a valid host name, then gethostbyname()
shall return information about the host name to which the alias refers, and name shall be
included in the list of aliases returned.

RETURN VALUE  
Upon successful completion, these functions shall return a pointer to a hostent structure if the
requested entry was found, and a null pointer if the end of the database was reached or the
requested entry was not found.

Upon unsuccessful completion, gethostbyaddr() and gethostbyname() shall set h_errno to indicate
the error.

ERRORS  
These functions shall fail in the following cases. The gethostbyaddr() and gethostbyname() functions shall set h_errno to the value shown in the list below. Any changes to errno are
unspecified.
[HOST_NOT_FOUND]  No such host is known.

[NO_DATA]  The server recognized the request and the name, but no address is available.

[NO_DATA]  Another type of request to the name server for the domain might return an
answer.

[NO_RECOVERY]  An unexpected server failure occurred which cannot be recovered.

[TRY_AGAIN]  A temporary and possibly transient error occurred, such as a failure of a
server to respond.

EXAMPLES

None.

APPLICATION USAGE

The gethostbyaddr() and gethostbyname() functions may return pointers to static data, which may
be overwritten by subsequent calls to any of these functions.

The getaddrinfo() and getnameinfo() functions are preferred over the gethostbyaddr() and
gethostbyname() functions.

RATIONALE

None.

FUTURE DIRECTIONS

The gethostbyaddr() and gethostbyname() functions may be withdrawn in a future version.

NAME

gethostname — get name of current host

SYNOPSIS

#include <unistd.h>

int gethostname(char *name, size_t namelen);

DESCRIPTION

The gethostname() function shall return the standard host name for the current machine. The
name argument shall specify the size of the array pointed to by the name argument. The
returned name shall be null-terminated, except that if namelen is an insufficient length to hold
the host name, then the returned name shall be truncated and it is unspecified whether the
returned name is null-terminated.

Host names are limited to [HOST_NAME_MAX] bytes.

RETURN VALUE

Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned.

socklen_t to size_t.
NAME
getitimer, setitimer — get and set value of interval timer

SYNOPSIS
XSI
#include <sys/time.h>

int getitimer(int which, struct itimerval *value);

int setitimer(int which, const struct itimerval *restrict value,
struct itimerval *restrict ovalue);

DESCRIPTION
The getitimer() function shall store the current value of the timer specified by which into the
structure pointed to by value. The setitimer() function shall set the timer specified by which to
the value specified in the structure pointed to by value, and if ovalue is not a null pointer, store
the previous value of the timer in the structure pointed to by ovalue.

A timer value is defined by the itimerval structure, specified in <sys/time.h>. If it_value is non-
zero, it shall indicate the time to the next timer expiration. If it_interval is non-zero, it shall
specify a value to be used in reloading it_value when the timer expires. Setting it_value to 0 shall
disable a timer, regardless of the value of it_interval. Setting it_interval to 0 shall disable a timer
after its next expiration (assuming it_value is non-zero).

Implementations may place limitations on the granularity of timer values. For each interval
timer, if the requested timer value requires a finer granularity than the implementation supports,
the actual timer value shall be rounded up to the next supported value.

An XSI-conforming implementation provides each process with at least three interval timers,
which are indicated by the which argument:

ITIMER_REAL Decrement in real time. A SIGALRM signal is delivered when this timer expires.

ITIMER_VIRTUAL Decrement in process virtual time. It runs only when the process is executing. A SIGVTALRM signal is delivered when it expires.

ITIMER_PROF Decrement both in process virtual time and when the system is running on behalf of the process. It is designed to be used by interpreters in statistically profiling the execution of interpreted programs. Each time the ITIMER_PROF timer expires, the SIGPROF signal is delivered.

The interaction between setitimer() and any of alarm(), sleep(), or usleep() is unspecified.

RETURN VALUE
Upon successful completion, getitimer() or setitimer() shall return 0; otherwise, −1 shall be
returned and errno set to indicate the error.

ERRORS
The setitimer() function shall fail if:

[EINVAL] The value argument is not in canonical form. (In canonical form, the number of microseconds is a non-negative integer less than 1 000 000 and the number of seconds is a non-negative integer.)

The getitimer() and setitimer() functions may fail if:

[EINVAL] The which argument is not recognized.
getitimer()  

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
The restrict keyword is added to the setitimer() prototype for alignment with the ISO/IEC 9899:1999 standard.
getlogin()
EXAMPLES

Getting the User Login Name

The following example calls the getlogin() function to obtain the name of the user associated with the calling process, and passes this information to the getpwnam() function to get the associated user database information.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
```

APPLICATION USAGE

Three names associated with the current process can be determined: getpwuid(geteuid()) shall return the name associated with the effective user ID of the process; getlogin() shall return the name associated with the current login activity; and getpwuid(getuid()) shall return the name associated with the real user ID of the process.

The getlogin_r() function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

The getlogin() function returns a pointer to the user’s login name. The same user ID may be shared by several login names. If it is desired to get the user database entry that is used during login, the result of getlogin() should be used to provide the argument to the getpwnam() function. (This might be used to determine the user’s login shell, particularly where a single user has multiple login shells with distinct login names, but the same user ID.)

The information provided by the cuserid() function, which was originally defined in the POSIX.1-1988 standard and subsequently removed, can be obtained by the following:

```
getpwuid(geteuid())
```

while the information provided by historical implementations of cuserid() can be obtained by:

```
gotpuid(getuid())
```

The thread-safe version of this function places the user name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.

FUTURE DIRECTIONS

None.

**getlogin()**

**CHANGE HISTORY**

First released in Issue 1. Derived from System V Release 2.0.

**Issue 5**

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The `getlogin_r()` function is included for alignment with the POSIX Threads Extension.

A note indicating that the `getlogin()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The `getlogin_r()` function is marked as part of the Thread-Safe Functions option.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set `errno` on error is added.
- The `[EMFILE]`, `[ENFILE]`, and `[ENXIO]` optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.
NAME

getmsg, getpmsg — receive next message from a STREAMS file (STREAMS)

SYNOPSIS

```c
#include <stropts.h>

int getmsg(int fildes, struct strbuf *restrict ctlptr,
            struct strbuf *restrict dataptr, int *restrict flagsp);
int getpmsg(int fildes, struct strbuf *restrict ctlptr,
            struct strbuf *restrict dataptr, int *restrict bandp,
            int *restrict flagsp);
```

DESCRIPTION

The `getmsg()` function shall retrieve the contents of a message located at the head of the
STREAM head read queue associated with a STREAMS file and place the contents into one or
more buffers. The message contains either a data part, a control part, or both. The data and
control parts of the message shall be placed into separate buffers, as described below. The
semantics of each part are defined by the originator of the message.

The `getpmsg()` function shall be equivalent to `getmsg()`, except that it provides finer control over
the priority of the messages received. Except where noted, all requirements on `getmsg()` also
pertain to `getpmsg()`.

The `fildes` argument specifies a file descriptor referencing a STREAMS-based file.

The `ctlptr` and `dataptr` arguments each point to a `strbuf` structure, in which the `buf` member points
to a buffer in which the data or control information is to be placed, and the `maxlen` member
indicates the maximum number of bytes this buffer can hold. On return, the `len` member shall
contain the number of bytes of data or control information actually received. The `len` member
shall be set to 0 if there is a zero-length control or data part and `len` shall be set to −1 if no data or
control information is present in the message.

When `getmsg()` is called, `flagsp` should point to an integer that indicates the type of message the
process is able to receive. This is described further below.

The `ctlptr` argument is used to hold the control part of the message, and `dataptr` is used to hold
the data part of the message. If `ctlptr` (or `dataptr`) is a null pointer or the `maxlen` member is −1, the
control (or data) part of the message shall not be processed and shall be left on the STREAM
head read queue, and if the `ctlptr` (or `dataptr`) is not a null pointer, `len` shall be set to −1. If the
`maxlen` member is set to 0 and there is a zero-length control (or data) part, that zero-length part
shall be removed from the read queue and `len` shall be set to 0. If the `maxlen` member is set to 0
and there are more than 0 bytes of control (or data) information, that information shall be left on
the read queue and `len` shall be set to 0. If the `maxlen` member in `ctlptr` (or `dataptr`) is less than the
control (or data) part of the message, `maxlen` bytes shall be retrieved. In this case, the remainder
of the message shall be left on the STREAM head read queue and a non-zero return value shall
be provided.

By default, `getmsg()` shall process the first available message on the STREAM head read queue.
However, a process may choose to retrieve only high-priority messages by setting the integer
pointed to by `flagsp` to RS_HIPRI. In this case, `getmsg()` shall only process the next message if it is
a high-priority message. When the integer pointed to by `flagsp` is 0, any available message shall
be retrieved. In this case, on return, the integer pointed to by `flagsp` shall be set to RS_HIPRI if a
high-priority message was retrieved, or 0 otherwise.

For `getpmsg()`, the flags are different. The `flagsp` argument points to a bitmask with the following
mutually-exclusive flags defined: MSG_HIPRI, MSG_BAND, and MSG_ANY. Like `getmsg()`,
getpmsg() shall process the first available message on the STREAM head read queue. A process may choose to retrieve only high-priority messages by setting the integer pointed to by flagsp to MSG_HIPRI and the integer pointed to by bandp to 0. In this case, getpmsg() shall only process the next message if it is a high-priority message. In a similar manner, a process may choose to retrieve a message from a particular priority band by setting the integer pointed to by flagsp to MSG_BAND and the integer pointed to by bandp to the priority band of interest. In this case, getpmsg() shall only process the next message if it is in a priority band equal to, or greater than, the integer pointed to by bandp, or if it is a high-priority message. If a process wants to get the first message off the queue, the integer pointed to by flagsp should be set to MSG_ANY and the integer pointed to by bandp should be set to 0. On return, if the message retrieved was a high-priority message, the integer pointed to by flagsp shall be set to MSG_HIPRI and the integer pointed to by bandp shall be set to 0. Otherwise, the integer pointed to by flagsp shall be set to MSG_BAND and the integer pointed to by bandp shall be set to the priority band of the message.

If O_NONBLOCK is not set, getmsg() and getpmsg() shall block until a message of the type specified by flagsp is available at the front of the STREAM head read queue. If O_NONBLOCK is set and a message of the specified type is not present at the front of the read queue, getmsg() and getpmsg() shall fail and set errno to [EAGAIN].

If a hangup occurs on the STREAM from which messages are retrieved, getmsg() and getpmsg() shall continue to operate normally, as described above, until the STREAM head read queue is empty. Thereafter, they shall return 0 in the len members of ctlptr and dataptr.

RETURN VALUE
Upon successful completion, getmsg() and getpmsg() shall return a non-negative value. A value of 0 indicates that a full message was read successfully. A return value of MORECTL indicates that more control information is waiting for retrieval. A return value of MOREDATA indicates that more data is waiting for retrieval. A return value of the bitwise-logical OR of MORECTL and MOREDATA indicates that both types of information remain. Subsequent getmsg() and getpmsg() calls shall retrieve the remainder of the message. However, if a message of higher priority has come in on the STREAM head read queue, the next call to getmsg() or getpmsg() shall retrieve that higher-priority message before retrieving the remainder of the previous message.

If the high priority control part of the message is consumed, the message shall be placed back on the queue as a normal message of band 0. Subsequent getmsg() and getpmsg() calls shall retrieve the remainder of the message. If, however, a priority message arrives or already exists on the STREAM head, the subsequent call to getmsg() or getpmsg() shall retrieve the higher-priority message before retrieving the remainder of the message that was put back.

Upon failure, getmsg() and getpmsg() shall return -1 and set errno to indicate the error.

ERRORS
The getmsg() and getpmsg() functions shall fail if:

[EAGAIN] The O_NONBLOCK flag is set and no messages are available.

[EBADF] The fildes argument is not a valid file descriptor open for reading.

[EBADMSG] The queued message to be read is not valid for getmsg() or getpmsg() or a pending file descriptor is at the STREAM head.

[EINTR] A signal was caught during getmsg() or getpmsg().

[EINVAL] An illegal value was specified by flagsp, or the STREAM or multiplexer referenced by fildes is linked (directly or indirectly) downstream from a multiplexer.
getmsg()

A STREAM is not associated with fildes.

In addition, getmsg() and getpmsg() shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of errno does not reflect the result of getmsg() or getpmsg() but reflects the prior error.

EXAMPLES

Getting Any Message

In the following example, the value of fd is assumed to refer to an open STREAMS file. The call to getmsg() retrieves any available message on the associated STREAM-head read queue, returning control and data information to the buffers pointed to by ctrlbuf and databuf, respectively.

```c
#include <stropts.h>
...
int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int flags = 0;
int ret;
ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);
data.buf = databuf;
data.maxlen = sizeof(databuf);
ret = getmsg (fd, &ctrl, &data, &flags);
```

Getting the First Message off the Queue

In the following example, the call to getpmsg() retrieves the first available message on the associated STREAM-head read queue.

```c
#include <stropts.h>
...
int fd;
char ctrlbuf[128];
char databuf[512];
struct strbuf ctrl;
struct strbuf data;
int band = 0;
int flags = MSG_ANY;
int ret;
ctrl.buf = ctrlbuf;
ctrl.maxlen = sizeof(ctrlbuf);
data.buf = databuf;
data.maxlen = sizeof(databuf);
ret = getpmsg (fd, &ctrl, &data, &band, &flags);
```
getmsg()

APPLICATION USAGE
None.

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked as part of the XSI STREAMS Option Group.

The restrict keyword is added to the getmsg() and getpmsg() prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME
getnameinfo — get name information

SYNOPSIS
#include <sys/socket.h>
#include <netdb.h>

int getnameinfo(const struct sockaddr *restrict sa, socklen_t salen,
    char *restrict node, socklen_t nodelen, char *restrict service,
    socklen_t servicelen, int flags);

DESCRIPTION
The getnameinfo() function shall translate a socket address to a node name and service location,
all of which are defined as in getaddrinfo().

The sa argument points to a socket address structure to be translated.

IP6
If the socket address structure contains an IPv4-mapped IPv6 address or an IPv4-compatible
IPv6 address, the implementation shall extract the embedded IPv4 address and lookup the node
name for that IPv4 address.

Note: The IPv6 unspecified address ("::") and the IPv6 loopback address ("::1") are not IPv4-
compatible addresses. If the address is the IPv6 unspecified address ("::"), a lookup is not
performed, and the [EAI_NONAME] error is returned.

If the node argument is non-NULL and the nodelen argument is non-zero, then the node argument
points to a buffer able to contain up to nodelen characters that receives the node name as a null-
terminated string. If the node argument is NULL or the nodelen argument is zero, the node name
shall not be returned. If the node’s name cannot be located, the numeric form of the address
contained in the socket address structure pointed to by the sa argument is returned instead of its
name.

If the service argument is non-NULL and the servicelen argument is non-zero, then the service
argument points to a buffer able to contain up to servicelen bytes that receives the service name
as a null-terminated string. If the service argument is NULL or the servicelen argument is zero,
the service name shall not be returned. If the service’s name cannot be located, the numeric form
of the service address (for example, its port number) shall be returned instead of its name.

The flags argument is a flag that changes the default actions of the function. By default the fully-
qualified domain name (FQDN) for the host shall be returned, but:

- If the flag bit NI_NOFQDN is set, only the node name portion of the FQDN shall be returned
  for local hosts.

- If the flag bit NI_NUMERICHOST is set, the numeric form of the address contained in the
  socket address structure pointed to by the sa argument shall be returned instead of its name,
  under all circumstances.

- If the flag bit NI_NAMEREQD is set, an error shall be returned if the host’s name cannot be
  located.

- If the flag bit NI_NUMERICSERV is set, the numeric form of the service address shall be
  returned (for example, its port number) instead of its name, under all circumstances.

- If the flag bit NI_NUMERICSCAPE is set, the numeric form of the scope identifier shall be
  returned (for example, interface index) instead of its name. This flag shall be ignored if the sa
  argument is not an IPv6 address.

- If the flag bit NI_DGRAM is set, this indicates that the service is a datagram service
  (SOCK_DGRAM). The default behavior shall assume that the service is a stream service

528 System Interfaces, Issue 6 — Copyright © 2001-2003, IEEE and The Open Group. All rights reserved.
System Interfaces

getnameinfo()

(SOCK_STREAM).

Notes:

1. The two NI_NUMERICxxx flags are required to support the -n flag that many commands provide.
2. The NI_DGRAM flag is required for the few AF_INET and AF_INET6 port numbers (for example, [512,514]) that represent different services for UDP and TCP.

The getnameinfo() function shall be thread-safe.

RETURN VALUE

A zero return value for getnameinfo() indicates successful completion; a non-zero return value indicates failure. The possible values for the failures are listed in the ERRORS section.

Upon successful completion, getnameinfo() shall return the node and service names, if requested, in the buffers provided. The returned names are always null-terminated strings.

ERRORS

The getnameinfo() function shall fail and return the corresponding value if:

[EAI_AGAIN] The name could not be resolved at this time. Future attempts may succeed.
[EAI_BADFLAGS] The flags had an invalid value.
[EAI_FAIL] A non-recoverable error occurred.
[EAI_FAMILY] The address family was not recognized or the address length was invalid for the specified family.
[EAI_MEMORY] There was a memory allocation failure.
[EAI_NONAME] The name does not resolve for the supplied parameters.

NI_NAMEREQD is set and the host’s name cannot be located, or both nodename and servname were null.

[EAI_OVERFLOW] An argument buffer overflowed. The buffer pointed to by the node argument or the service argument was too small.

[EAI_SYSTEM] A system error occurred. The error code can be found in errno.

EXAMPLES

None.

APPLICATION USAGE

If the returned values are to be used as part of any further name resolution (for example, passed to getaddrinfo()), applications should provide buffers large enough to store any result possible on the system.

Given the IPv4-mapped IPv6 address "::ffff:1.2.3.4", the implementation performs a lookup as if the socket address structure contains the IPv4 address "1.2.3.4".

RATIONALE

None.

FUTURE DIRECTIONS

None.

getnetbyaddr()  

NAME
getnetbyaddr, getnetbyname, getnetent — network database functions

SYNOPSIS
#include <netdb.h>

struct netent *getnetbyaddr(uint32_t net, int type);
struct netent *getnetbyname(const char *name);
struct netent *getnetent(void);

DESCRIPTION
Refer to endnetent().
NAME

g getopt, optarg, opterr, optind, optopt — command option parsing

SYNOPSIS

#include <unistd.h>

int getopt(int argc, char * const argv[], const char *optstring);

extern char *optarg;

extern int optind, opterr, optopt;

DESCRIPTION

The getopt() function is a command-line parser that shall follow Utility Syntax Guidelines 3, 4, 5, 6, 7, 9, and 10 in the Base Definitions volume of IEEE Std 1003.1-2001, Section 12.2, Utility Syntax Guidelines.

The parameters argc and argv are the argument count and argument array as passed to main() (see exec). The argument optstring is a string of recognized option characters; if a character is followed by a colon, the option takes an argument. All option characters allowed by Utility Syntax Guideline 3 are allowed in optstring. The implementation may accept other characters as an extension.

The variable optind is the index of the next element of the argv[] vector to be processed. It shall be initialized to 1 by the system, and getopt() shall update it when it finishes with each element of argv[]. When an element of argv[] contains multiple option characters, it is unspecified how getopt() determines which options have already been processed.

The getopt() function shall return the next option character (if one is found) from argv that matches a character in optstring, if there is one that matches. If the option takes an argument, getopt() shall set the variable optarg to point to the option-argument as follows:

1. If the option was the last character in the string pointed to by an element of argv, then optarg shall contain the next element of argv, and optind shall be incremented by 2. If the resulting value of optind is greater than argc, this indicates a missing option-argument, and getopt() shall return an error indication.

2. Otherwise, optarg shall point to the string following the option character in that element of argv, and optind shall be incremented by 1.

If, when getopt() is called:

argv[optind] is a null pointer
*argv[optind] is not the character –
argv[optind] points to the string "–"

getopt() shall return –1 without changing optind. If:

argv[optind] points to the string "--"

getopt() shall return –1 after incrementing optind.

If getopt() encounters an option character that is not contained in optstring, it shall return the question-mark (‘?’) character. If it detects a missing option-argument, it shall return the colon character (‘:’) if the first character of optstring was a colon, or a question-mark character (‘?’) otherwise. In either case, getopt() shall set the variable optopt to the option character that caused the error. If the application has not set the variable opterr to 0 and the first character of optstring is not a colon, getopt() shall also print a diagnostic message to stderr in the format specified for the getopts utility.

The getopt() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.
**RETURN VALUE**

The getopt() function shall return the next option character specified on the command line.

A colon (‘:’) shall be returned if getopt() detects a missing argument and the first character of optstring was a colon (‘:’).

A question mark (‘?’) shall be returned if getopt() encounters an option character not in optstring or detects a missing argument and the first character of optstring was not a colon (‘:’).

Otherwise, getopt() shall return −1 when all command line options are parsed.

**ERRORS**

No errors are defined.

**EXAMPLES**

**Parsing Command Line Options**

The following code fragment shows how you might process the arguments for a utility that can take the mutually-exclusive options a and b and the options f and o, both of which require arguments:

```c
#include <unistd.h>

int main(int argc, char *argv[])
{
    int c;
    int bflg, aflg, errflg;
    char *ifile;
    char *ofile;
    extern char *optarg;
    extern int optind, optopt;
    ...
    while ((c = getopt(argc, argv, "abf:o:")) != -1) {
        switch(c) {
        case 'a':
            if (bflg)
                errflg++;
            else
                aflg++;
            break;
        case 'b':
            if (aflg)
                errflg++;
            else {
                bflg++;
                bproc();
            }
            break;
        case 'f':
            ifile = optarg;
            break;
        case 'o':
            ofile = optarg;
            break;
        default:
            fprintf(stderr, "unknown option \
```
This code accepts any of the following as equivalent:

```c
cmd -ao arg path path
cmd -a -o arg path path
cmd -o arg -a path path
cmd -a -o arg -- path path
cmd -a -oarg path path
cmd -aoarg path path
```

### Checking Options and Arguments

The following example parses a set of command line options and prints messages to standard output for each option and argument that it encounters.

```c
#include <unistd.h>
#include <stdio.h>
...#include <stdio.h>
int c;
char *filename;
extern char *optarg;
extern int optind, optopt, opterr;
...
while ((c = getopt(argc, argv, "abf:")) != -1) {
    switch(c) {
    case 'a':
        printf("a is set\n");
        break;
    case 'b':
        printf("b is set\n");
        break;
    case 'f':
        filename = optarg;
        printf("filename is %s\n", filename);
        break;
    ```
case ':':
    printf("-%c without filename\n", optopt);
    break;
    case '?':
    printf("unknown arg %c\n", optopt);
    break;
    }
}

Selecting Options from the Command Line
The following example selects the type of database routines the user wants to use based on the Options argument.

```c
#include <unistd.h>
#include <string.h>
...
char *Options = "hdbtl";
...
int dbtype, i;
char c;
char *st;
...
dbtype = 0;
while ((c = getopt(argc, argv, Options)) != -1) {
    if ((st = strchr(Options, c)) != NULL) {
        dbtype = st - Options;
        break;
    }
}
```

APPLICATION USAGE
The `getopt()` function is only required to support option characters included in Utility Syntax Guideline 3. Many historical implementations of `getopt()` support other characters as options. This is an allowed extension, but applications that use extensions are not maximally portable. Note that support for multi-byte option characters is only possible when such characters can be represented as type `int`.

RATIONALE
The `optopt` variable represents historical practice and allows the application to obtain the identity of the invalid option.

The description has been written to make it clear that `getopt()`, like the `getopts` utility, deals with option-arguments whether separated from the option by `<blank>`s or not. Note that the requirements on `getopt()` and `getopts` are more stringent than the Utility Syntax Guidelines.

The `getopt()` function shall return -1, rather than EOF, so that `<stdio.h>` is not required.

The special significance of a colon as the first character of `optstring` makes `getopt()` consistent with the `getopts` utility. It allows an application to make a distinction between a missing argument and an incorrect option letter without having to examine the option letter. It is true that a missing argument can only be detected in one case, but that is a case that has to be considered.
FUTURE DIRECTIONS

None.

NAME
getpeername — get the name of the peer socket

SYNOPSIS
#include <sys/socket.h>

int getpeername(int socket, struct sockaddr *restrict address,
    socklen_t *restrict address_len);

DESCRIPTION
The getpeername() function shall retrieve the peer address of the specified socket, store this
address in the sockaddr structure pointed to by the address argument, and store the length of this
address in the object pointed to by the address_len argument.

If the actual length of the address is greater than the length of the supplied sockaddr structure,
the stored address shall be truncated.

If the protocol permits connections by unbound clients, and the peer is not bound, then the value
stored in the object pointed to by address is unspecified.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, -1 shall be returned and errno set to
indicate the error.

ERRORS
The getpeername() function shall fail if:

[EBADF] The socket argument is not a valid file descriptor.
[EINVAL] The socket has been shut down.
[ENOTCONN] The socket is not connected or otherwise has not had the peer pre-specified.
[ENOTSOCK] The socket argument does not refer to a socket.
[EOPNOTSUPP] The operation is not supported for the socket protocol.

The getpeername() function may fail if:

[ENOBUS] Insufficient resources were available in the system to complete the call.

NAME
getpgid — get the process group ID for a process

SYNOPSIS
#include <unistd.h>

pid_t getpgid(pid_t pid);

DESCRIPTION
The getpgid() function shall return the process group ID of the process whose process ID is equal
to pid. If pid is equal to 0, getpgid() shall return the process group ID of the calling process.

RETURN VALUE
Upon successful completion, getpgid() shall return a process group ID. Otherwise, it shall return
(pid_t)--1 and set errno to indicate the error.

ERRORS
The getpgid() function shall fail if:

[EPERM] The process whose process ID is equal to pid is not in the same session as the
calling process, and the implementation does not allow access to the process
group ID of that process from the calling process.

[ESRCH] There is no process with a process ID equal to pid.

The getpgid() function may fail if:

[EINVAL] The value of the pid argument is invalid.

NAME
getpgrp — get the process group ID of the calling process

SYNOPSIS
#include <unistd.h>
pid_t getpgrp(void);

DESCRIPTION
The getpgrp() function shall return the process group ID of the calling process.

RETURN VALUE
The getpgrp() function shall always be successful and no return value is reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
4.3 BSD provides a getpgrp() function that returns the process group ID for a specified process. Although this function supports job control, all known job control shells always specify the calling process with this function. Thus, the simpler System V getpgrp() suffices, and the added complexity of the 4.3 BSD getpgrp() is provided by the XSI extension getpgid().

FUTURE DIRECTIONS
None.

SEE ALSO

**NAME**
getpriority, setpriority — get and set the nice value

**SYNOPSIS**
```
#include <sys/resource.h>

int getpriority(int which, id_t who);
int setpriority(int which, id_t who, int value);
```

**DESCRIPTION**
The `getpriority()` function shall obtain the nice value of a process, process group, or user. The `setpriority()` function shall set the nice value of a process, process group, or user to `value + NZERO`.

Target processes are specified by the values of the `which` and `who` arguments. The `which` argument may be one of the following values: PRIO_PROCESS, PRIO_PGRP, or PRIO_USER, indicating that the `who` argument is to be interpreted as a process ID, a process group ID, or an effective user ID, respectively. A 0 value for the `who` argument specifies the current process, process group, or user.

The nice value set with `setpriority()` shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

If more than one process is specified, `getpriority()` shall return value `{NZERO}` less than the lowest nice value pertaining to any of the specified processes, and `setpriority()` shall set the nice values of all of the specified processes to `value + NZERO`.

The default nice value is `{NZERO}`; lower nice values shall cause more favorable scheduling. While the range of valid nice values is `[0, {NZERO}^2 − 1]`, implementations may enforce more restrictive limits. If `value + {NZERO}` is less than the system's lowest supported nice value, `setpriority()` shall set the nice value to the lowest supported value; if `value + {NZERO}` is greater than the system's highest supported nice value, `setpriority()` shall set the nice value to the highest supported value.

Only a process with appropriate privileges can lower its nice value.

Any processes or threads using SCHED_FIFO or SCHED_RR shall be unaffected by a call to `setpriority()`. This is not considered an error. A process which subsequently reverts to SCHED_OTHER need not have its priority affected by such a `setpriority()` call.

The effect of changing the nice value may vary depending on the process-scheduling algorithm in effect.

Since `getpriority()` can return the value −1 on successful completion, it is necessary to set `errno` to 0 prior to a call to `getpriority()`. If `getpriority()` returns the value −1, then `errno` can be checked to see if an error occurred or if the value is a legitimate nice value.

Upon successful completion, `getpriority()` shall return an integer in the range −{NZERO} to {NZERO}−1. Otherwise, −1 shall be returned and `errno` set to indicate the error.

Upon successful completion, `setpriority()` shall return 0; otherwise, −1 shall be returned and `errno` set to indicate the error.

The `getpriority()` and `setpriority()` functions shall fail if:

- [ESRCH] No process could be located using the `which` and `who` argument values specified.
getpriority()  

The value of the which argument was not recognized, or the value of the who argument is not a valid process ID, process group ID, or user ID.

In addition, setpriority() may fail if:

- EINVAL: The value of the which argument was not recognized, or the value of the who argument is not a valid process ID, process group ID, or user ID.
- EPERM: A process was located, but neither the real nor effective user ID of the executing process match the effective user ID of the process whose nice value is being changed.
- EACCES: A request was made to change the nice value to a lower numeric value and the current process does not have appropriate privileges.

EXAMPLES

Using getpriority()

The following example returns the current scheduling priority for the process ID returned by the call to getpid().

```c
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int ret;
pid = getpid();
ret = getpriority(which, pid);
```

Using setpriority()

The following example sets the priority for the current process ID to −20.

```c
#include <sys/resource.h>
...
int which = PRIO_PROCESS;
id_t pid;
int priority = -20;
int ret;
pid = getpid();
ret = setpriority(which, pid, priority);
```

APPLICATION USAGE

The getpriority() and setpriority() functions work with an offset nice value (nice value \( -[\text{NZERO}] \)). The nice value is in the range \([0,2^{*}[\text{NZERO}] -1]\), while the return value for getpriority() and the third parameter for setpriority() are in the range \([-[\text{NZERO}], [\text{NZERO}] -1]\).

RATIONALE

None.

FUTURE DIRECTIONS

None.

17945 CHANGE HISTORY
17946 First released in Issue 4, Version 2.
17947 Issue 5
17948 Moved from X/OPEN UNIX extension to BASE.
17949 The DESCRIPTION is reworded in terms of the nice value rather than priority to avoid confusion with functionality in the POSIX Realtime Extension.
getprotobynumber()  

NAME
getprotobyname, getprotobynumber, getprotoent — network protocol database functions

SYNOPSIS
#include <netdb.h>

struct protoent *getprotobyname(const char *name);
struct protoent *getprotobynumber(int proto);
struct protoent *getprotoent(void);

DESCRIPTION
Refer to endprotoent().
NAME
getpwent — get user database entry

SYNOPSIS
#include <pwd.h>

struct passwd *getpwent(void);

DESCRIPTION
Refer to endpwent().
NAME
getpwnam, getpwnam_r — search user database for a name

SYNOPSIS
#include <pwd.h>

struct passwd *getpwnam(const char *name);

TSF
int getpwnam_r(const char *name, struct passwd *pwd, char *buffer,
size_t bufsize, struct passwd **result);

DESCRIPTION
The getpwnam() function shall search the user database for an entry with a matching name.

The getpwnam() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

Applications wishing to check for error situations should set errno to 0 before calling
getpwnam(). If getpwnam() returns a null pointer and errno is non-zero, an error occurred.

TSF
The getpwnam_r() function shall update the passwd structure pointed to by pwd and store a
pointer to that structure at the location pointed to by result. The structure shall contain an entry
from the user database with a matching name. Storage referenced by the structure is allocated
from the memory provided with the buffer parameter, which is bufsize bytes in size. The
maximum size needed for this buffer can be determined with the {_SC_GETPW_R_SIZE_MAX}
sysconf() parameter. A NULL pointer shall be returned at the location pointed to by result on
error or if the requested entry is not found.

RETURN VALUE
The getpwnam() function shall return a pointer to a struct passwd with the structure as defined
in <pwd.h> with a matching entry if found. A null pointer shall be returned if the requested
entry is not found, or an error occurs. On error, errno shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to
getpwent(), getpwnam(), or getpwuid().

TSF
If successful, the getpwnam_r() function shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS
The getpwnam() and getpwnam_r() functions may fail if:

[EIO] An I/O error has occurred.

[EINVAL] A signal was caught during getpwnam().

[EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

[ENFILE] The maximum allowable number of files is currently open in the system.

The getpwnam_r() function may fail if:

[ERANGE] Insufficient storage was supplied via buffer and bufsize to contain the data to
be referenced by the resulting passwd structure.
EXAMPLES

Getting an Entry for the Login Name

The following example uses the getlogin() function to return the name of the user who logged in; this information is passed to the getpwnam() function to get the user database entry for that user.

```c
#include <sys/types.h>
#include <pwd.h>
#include <unistd.h>
#include <stdio.h>
#include <stdlib.h>
...
char *lgn;
struct passwd *pw;
...
if ((lgn = getlogin()) == NULL || (pw = getpwnam(lgn)) == NULL) {
    fprintf(stderr, "Get of user information failed.\n"); exit(1);
}
...
```

APPLICATION USAGE

Three names associated with the current process can be determined: getpwuid(geteuid()) returns the name associated with the effective user ID of the process; getlogin() returns the name associated with the current login activity; and getpwuid(getuid()) returns the name associated with the real user ID of the process.

The getpwnam_r() function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

getpwuid(), the Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <pwd.h>, <sys/types.h>

CHANGE HISTORY

First released in Issue 1. Derived from System V Release 2.0.

Issue 5

Normative text previously in the APPLICATION USAGE section is moved to the RETURN VALUE section.

The getpwnam_r() function is included for alignment with the POSIX Threads Extension.

A note indicating that the getpwnam() function need not be reentrant is added to the DESCRIPTION.

Issue 6

The getpwnam_r() function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U028/3 is applied, correcting text in the DESCRIPTION describing matching the name.
In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- In the RETURN VALUE section, the requirement to set `errno` on error is added.

- The `[EMFILE]`, `[ENFILE]`, and `[ENXIO]` optional error conditions are added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the buffer from `bufsize` characters to bytes.
```c
#include <pwd.h>

struct passwd *getpwuid(uid_t uid);

int getpwuid_r(uid_t uid, struct passwd *pwd, char *buffer, size_t bufsize, struct passwd **result);
```

**DESCRIPTION**

The `getpwuid()` function shall search the user database for an entry with a matching `uid`. The `getpwuid()` function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

Applications wishing to check for error situations should set `errno` to 0 before calling `getpwuid()`. If `getpwuid()` returns a null pointer and `errno` is set to non-zero, an error occurred.

The `getpwuid_r()` function shall update the `passwd` structure pointed to by `pwd` and store a pointer to that structure at the location pointed to by `result`. The structure shall contain an entry from the user database with a matching `uid`. Storage referenced by the structure is allocated from the memory provided with the `buffer` parameter, which is `bufsize` bytes in size. The maximum size needed for this buffer can be determined with the `_SC_GETPW_R_SIZE_MAX` `sysconf()` parameter. A NULL pointer shall be returned at the location pointed to by `result` on error or if the requested entry is not found.

**RETURN VALUE**

The `getpwuid()` function shall return a pointer to a `struct passwd` with the structure as defined in `<pwd.h>` with a matching entry if found. A null pointer shall be returned if the requested entry is not found, or an error occurs. On error, `errno` shall be set to indicate the error.

The return value may point to a static area which is overwritten by a subsequent call to `getpwent()`, `getpwnam()`, or `getpwuid()`.

If successful, the `getpwuid_r()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The `getpwuid()` and `getpwuid_r()` functions may fail if:

- `[EIO]` An I/O error has occurred.
- `[EINTR]` A signal was caught during `getpwuid()`.
- `[EMFILE]` `{OPEN_MAX}` file descriptors are currently open in the calling process.
- `[ENFILE]` The maximum allowable number of files is currently open in the system.

The `getpwuid_r()` function may fail if:

- `[ERANGE]` Insufficient storage was supplied via `buffer` and `bufsize` to contain the data to be referenced by the resulting `passwd` structure.
### EXAMPLES

**Getting an Entry for the Root User**

The following example gets the user database entry for the user with user ID 0 (root).

```
#include <sys/types.h>
#include <pwd.h>
...
uid_t id = 0;
struct passwd *pwd;
pwd = getpwuid(id);
```

**Finding the Name for the Effective User ID**

The following example defines `pws` as a pointer to a structure of type `passwd`, which is used to store the structure pointer returned by the call to the `getpwuid()` function. The `geteuid()` function shall return the effective user ID of the calling process; this is used as the search criteria for the `getpwuid()` function. The call to `getpwuid()` shall return a pointer to the structure containing that user ID value.

```
#include <unistd.h>
#include <sys/types.h>
#include <pwd.h>
...
struct passwd *pws;
pws = getpwuid(geteuid());
```

**Finding an Entry in the User Database**

The following example uses `getpwuid()` to search the user database for a user ID that was previously stored in a `stat` structure, then prints out the user name if it is found. If the user is not found, the program prints the numeric value of the user ID for the entry.

```
#include <sys/types.h>
#include <pwd.h>
#include <stdio.h>
...
struct stat statbuf;
struct passwd *pwd;
...
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8.8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);
```

**APPLICATION USAGE**

Three names associated with the current process can be determined: `getpwuid(geteuid())` returns the name associated with the effective user ID of the process; `getlogin()` returns the name associated with the current login activity; and `getpwuid(getuid())` returns the name associated with the real user ID of the process.

The `getpwuid_r()` function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and
its avoidance of possibly using a static data area.
IEEE PASC Interpretation 1003.1 #116 is applied, changing the description of the size of the
buffer from bufsize characters to bytes.
NAME
getrlimit, setrlimit — control maximum resource consumption

SYNOPSIS
XSI
#include <sys/resource.h>

int getrlimit(int resource, struct rlimit *rlp);
int setrlimit(int resource, const struct rlimit *rlp);

DESCRIPTION
The getrlimit() function shall get, and the setrlimit() function shall set, limits on the consumption of a variety of resources.

Each call to either getrlimit() or setrlimit() identifies a specific resource to be operated upon as well as a resource limit. A resource limit is represented by an rlimit structure. The rlim_cur member specifies the current or soft limit and the rlim_max member specifies the maximum or hard limit. Soft limits may be changed by a process to any value that is less than or equal to the hard limit. A process may (irreversibly) lower its hard limit to any value that is greater than or equal to the soft limit. Only a process with appropriate privileges can raise a hard limit. Both hard and soft limits can be changed in a single call to setrlimit() subject to the constraints described above.

The value RLIM_INFINITY, defined in <sys/resource.h>, shall be considered to be larger than any other limit value. If a call to getrlimit() returns RLIM_INFINITY for a resource, it means the implementation shall not enforce limits on that resource. Specifying RLIM_INFINITY as any resource limit value on a successful call to setrlimit() shall inhibit enforcement of that resource limit.

The following resources are defined:

RLIMIT_CORE This is the maximum size of a core file, in bytes, that may be created by a process. A limit of 0 shall prevent the creation of a core file. If this limit is exceeded, the writing of a core file shall terminate at this size.

RLIMIT_CPU This is the maximum amount of CPU time, in seconds, used by a process. If this limit is exceeded, SIGXCPU shall be generated for the process. If the process is catching or ignoring SIGXCPU, or all threads belonging to that process are blocking SIGXCPU, the behavior is unspecified.

RLIMIT_DATA This is the maximum size of a process' data segment, in bytes. If this limit is exceeded, the malloc() function shall fail with errno set to [ENOMEM].

RLIMIT_FSIZE This is the maximum size of a file, in bytes, that may be created by a process. If a write or truncate operation would cause this limit to be exceeded, SIGXFSZ shall be generated for the thread. If the thread is blocking, or the process is catching or ignoring SIGXFSZ, continued attempts to increase the size of a file from end-of-file to beyond the limit shall fail with errno set to [EFBIG].

RLIMIT_NOFILE This is a number one greater than the maximum value that the system may assign to a newly-created descriptor. If this limit is exceeded, functions that allocate a file descriptor shall fail with errno set to [EMFILE]. This limit constrains the number of file descriptors that a process may allocate.

RLIMIT_STACK This is the maximum size of a process' stack, in bytes. The implementation does not automatically grow the stack beyond this limit.
If this limit is exceeded, SIGSEGV shall be generated for the thread. If the thread is blocking SIGSEGV, or the process is ignoring or catching SIGSEGV and has not made arrangements to use an alternate stack, the disposition of SIGSEGV shall be set to SIG_DFL before it is generated.

**RLIMIT_AS**

This is the maximum size of a process' total available memory, in bytes. If this limit is exceeded, the `malloc()` and `mmap()` functions shall fail with `errno` set to `[ENOMEM]`. In addition, the automatic stack growth fails with the effects outlined above.

When using the `getrlimit()` function, if a resource limit can be represented correctly in an object of type `rlim_t` then its representation is returned; otherwise, if the value of the resource limit is equal to that of the corresponding saved hard limit, the value returned shall be `RLIM_SAVED_MAX`; otherwise, the value returned shall be `RLIM_SAVED_CUR`.

When using the `setrlimit()` function, if the requested new limit is `RLIM_INFINITY`, the new limit shall be “no limit”; otherwise, if the requested new limit is `RLIM_SAVED_MAX`, the new limit shall be the corresponding saved hard limit; otherwise, if the requested new limit is `RLIM_SAVED_CUR`, the new limit shall be the corresponding saved soft limit; otherwise, the new limit shall be the requested value. In addition, if the corresponding saved limit can be represented correctly in an object of type `rlim_t` then it shall be overwritten with the new limit.

The result of setting a limit to `RLIM_SAVED_MAX` or `RLIM_SAVED_CUR` is unspecified unless a previous call to `getrlimit()` returned that value as the soft or hard limit for the corresponding resource limit.

The determination of whether a limit can be correctly represented in an object of type `rlim_t` is implementation-defined. For example, some implementations permit a limit whose value is greater than `RLIM_INFINITY` and others do not.

The `exec` family of functions shall cause resource limits to be saved.

**RETURN VALUE**

Upon successful completion, `getrlimit()` and `setrlimit()` shall return 0. Otherwise, these functions shall return −1 and set `errno` to indicate the error.

**ERRORS**

The `getrlimit()` and `setrlimit()` functions shall fail if:

- **[EINVAL]** An invalid `resource` was specified; or in a `setrlimit()` call, the new `rlim_cur` exceeds the new `rlim_max`.

- **[EPERM]** The limit specified to `setrlimit()` would have raised the maximum limit value, and the calling process does not have appropriate privileges.

The `setrlimit()` function may fail if:

- **[EINVAL]** The limit specified cannot be lowered because current usage is already higher than the limit.
getrlimit()

EXAMPLES
None.

APPLICATION USAGE
If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the value
of (_POSIX_OPEN_MAX) from <limits.h>, unexpected behavior may occur.
If a process attempts to set the hard limit or soft limit for RLIMIT_NOFILE to less than the
highest currently open file descriptor +1, unexpected behavior may occur.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Issue 6
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/25 is applied, changing wording for
RLIMIT_NOFILE in the DESCRIPTION related to functions that allocate a file descriptor failing
with [EMFILE]. Text is added to the APPLICATION USAGE section noting the consequences of
a process attempting to set the hard or soft limit for RLIMIT_NOFILE less than the highest
currently open file descriptor +1.
NAME
getrusage — get information about resource utilization

SYNOPSIS
XSI
#include <sys/resource.h>

int getrusage(int who, struct rusage *r_usage);

DESCRIPTION
The getrusage() function shall provide measures of the resources used by the current process or its terminated and waited-for child processes. If the value of the who argument is RUSAGE_SELF, information shall be returned about resources used by the current process. If the value of the who argument is RUSAGE_CHILDREN, information shall be returned about resources used by the terminated and waited-for children of the current process. If the child is never waited for (for example, if the parent has SA_NOCLDWAIT set or sets SIGCHLD to SIG_IGN), the resource information for the child process is discarded and not included in the resource information provided by getrusage().

The r_usage argument is a pointer to an object of type struct rusage in which the returned information is stored.

RETURN VALUE
Upon successful completion, getrusage() shall return 0; otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The getrusage() function shall fail if:

[EINVAL] The value of the who argument is not valid.

EXAMPLES
Using getrusage()
The following example returns information about the resources used by the current process.

#include <sys/resource.h>
...
int who = RUSAGE_SELF;
struct rusage usage;
int ret;
ret = getrusage(who, &usage);

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

getusage()
NAME
gets — get a string from a stdin stream

SYNOPSIS
#include <stdio.h>
char *gets(char *s);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The gets() function shall read bytes from the standard input stream, stdin, into the array pointed to by s, until a <newline> is read or an end-of-file condition is encountered. Any <newline> shall be discarded and a null byte shall be placed immediately after the last byte read into the array.

The gets() function may mark the st_atime field of the file associated with stream for update. The st_atime field shall be marked for update by the first successful execution of fgetc(), fgets(), fread(), getc(), getchar(), gets(), fscanf(), or scanf() using stream that returns data not supplied by a prior call to ungetc().

RETURN VALUE
Upon successful completion, gets() shall return s. If the stream is at end-of-file, the end-of-file indicator for the stream shall be set and gets() shall return a null pointer. If a read error occurs, the error indicator for the stream shall be set, gets() shall return a null pointer, and set errno to indicate the error.

ERRORS
Refer to fgetc().

EXAMPLES
None.

APPLICATION USAGE
Reading a line that overflows the array pointed to by s results in undefined behavior. The use of fgets() is recommended.

Since the user cannot specify the length of the buffer passed to gets(), use of this function is discouraged. The length of the string read is unlimited. It is possible to overflow this buffer in such a way as to cause applications to fail, or possible system security violations.

It is recommended that the fgets() function should be used to read input lines.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME

getservbyname, getservbyport, getservent — network services database functions

SYNOPSIS

#include <netdb.h>

struct servent *getservbyname(const char *name, const char *proto);
struct servent *getservbyport(int port, const char *proto);
struct servent *getservent(void);

DESCRIPTION

Refer to endservent().
NAME
getsid — get the process group ID of a session leader

SYNOPSIS
#include <unistd.h>

pid_t getsid(pid_t pid);

DESCRIPTION
The getsid() function shall obtain the process group ID of the process that is the session leader of
the process specified by pid. If pid is (pid_t)0, it specifies the calling process.

RETURN VALUE
Upon successful completion, getsid() shall return the process group ID of the session leader of
the specified process. Otherwise, it shall return (pid_t)−1 and set errno to indicate the error.

ERRORS
The getsid() function shall fail if:

[EPERM] The process specified by pid is not in the same session as the calling process,
and the implementation does not allow access to the process group ID of the
session leader of that process from the calling process.

[ESRCH] There is no process with a process ID equal to pid.

NAME
getsockname — get the socket name

SYNOPSIS
#include <sys/socket.h>

int getsockname(int socket, struct sockaddr *restrict address,
                 socklen_t *restrict address_len);

DESCRIPTION
The getsockname() function shall retrieve the locally-bound name of the specified socket, store
this address in the sockaddr structure pointed to by the address argument, and store the length of
this address in the object pointed to by the address_len argument.

If the actual length of the address is greater than the length of the supplied sockaddr structure,
the stored address shall be truncated.

If the socket has not been bound to a local name, the value stored in the object pointed to by
address is unspecified.

RETURN VALUE
Upon successful completion, 0 shall be returned, the address argument shall point to the address
of the socket, and the address_len argument shall point to the length of the address. Otherwise, −1
shall be returned and errno set to indicate the error.

ERRORS
The getsockname() function shall fail if:

[EBADF] The socket argument is not a valid file descriptor.
[ENOTSOCK] The socket argument does not refer to a socket.
[EOPNOTSUPP] The operation is not supported for this socket’s protocol.

The getsockname() function may fail if:

[EINVAL] The socket has been shut down.
[ENOMEM] Insufficient resources were available in the system to complete the function.

NAME

getsockopt — get the socket options

SYNOPSIS

```c
#include <sys/socket.h>

int getsockopt(int socket, int level, int option_name, 
    void *restrict option_value, socklen_t *restrict option_len);
```

DESCRIPTION

The `getsockopt()` function manipulates options associated with a socket.

The `getsockopt()` function shall retrieve the value for the option specified by the `option_name` argument for the socket specified by the `socket` argument. If the size of the option value is greater than `option_len`, the value stored in the object pointed to by the `option_value` argument shall be silently truncated. Otherwise, the object pointed to by the `option_len` argument shall be modified to indicate the actual length of the value.

The `level` argument specifies the protocol level at which the option resides. To retrieve options at the socket level, specify the `level` argument as SOL_SOCKET. To retrieve options at other levels, supply the appropriate level identifier for the protocol controlling the option. For example, to indicate that an option is interpreted by the TCP (Transmission Control Protocol), set `level` to IPPROTO_TCP as defined in the `<netinet/in.h>` header.

The socket in use may require the process to have appropriate privileges to use the `getsockopt()` function.

The `option_name` argument specifies a single option to be retrieved. It can be one of the following values defined in `<sys/socket.h>`:

- **SO_DEBUG** Reports whether debugging information is being recorded. This option shall store an `int` value. This is a Boolean option.
- **SO_ACCEPTCONN** Reports whether socket listening is enabled. This option shall store an `int` value. This is a Boolean option.
- **SO_BROADCAST** Reports whether transmission of broadcast messages is supported, if this is supported by the protocol. This option shall store an `int` value. This is a Boolean option.
- **SO_REUSEADDR** Reports whether the rules used in validating addresses supplied to `bind()` should allow reuse of local addresses, if this is supported by the protocol. This option shall store an `int` value. This is a Boolean option.
- **SO_KEEPALIVE** Reports whether connections are kept active with periodic transmission of messages, if this is supported by the protocol. If the connected socket fails to respond to these messages, the connection shall be broken and threads writing to that socket shall be notified with a SIGPIPE signal. This option shall store an `int` value. This is a Boolean option.
- **SO_LINGER** Reports whether the socket lingers on `close()` if data is present. If SO_LINGER is set, the system blocks the process during `close()` until it can transmit the data or until the end of the interval indicated by the `l_linger` member, whichever comes first. If SO_LINGER is not specified, and `close()` is issued, the system handles the call in a way that allows the process to continue as quickly as possible. This option shall store a `linger` structure.
SO_OOBINLINE  Reports whether the socket leaves received out-of-band data (data marked urgent) inline. This option shall store an int value. This is a Boolean option.

SO_SNDBUF  Reports send buffer size information. This option shall store an int value.

SO_RCVBUF  Reports receive buffer size information. This option shall store an int value.

SO_ERROR  Reports information about error status and clears it. This option shall store an int value.

SO_TYPE  Reports the socket type. This option shall store an int value. Socket types are described in Section 2.10.6 (on page 59).

SO_DONTROUTE  Reports whether outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option shall store an int value. This is a Boolean option.

SO_RCVLOWAT  Reports the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option shall store an int value. Note that not all implementations allow this option to be retrieved.

SO_RCVTIMEO  Reports the timeout value for input operations. This option shall store a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or errno set to [EAGAIN] or [EWOULDBLOCK] if no data was received. The default for this option is zero, which indicates that a receive operation shall not time out. Note that not all implementations allow this option to be retrieved.

SO_SNDLOWAT  Reports the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option shall store an int value. Note that not all implementations allow this option to be retrieved.

SO_SNDTIMEO  Reports the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with errno set to [EAGAIN] or [EWOULDBLOCK] if no data was sent. The default for this option is zero, which indicates that a send operation shall not time out. The option shall store a timeval structure. Note that not all implementations allow this option to be retrieved.

For Boolean options, a zero value indicates that the option is disabled and a non-zero value indicates that the option is enabled.
System Interfaces

getsockopt()

RETURN VALUE
Upon successful completion, getsockopt() shall return 0; otherwise, −1 shall be returned and errno
set to indicate the error.

ERRORS
The getsockopt() function shall fail if:

[EBADF] The socket argument is not a valid file descriptor.

[EINVAL] The specified option is invalid at the specified socket level.

[ENOPROTOOPT] The option is not supported by the protocol.

[ENOTSOCK] The socket argument does not refer to a socket.

The getsockopt() function may fail if:

[EACCES] The calling process does not have the appropriate privileges.

[EINVAL] The socket has been shut down.

[ENOBUFFS] Insufficient resources are available in the system to complete the function.

NAME
getsubopt — parse suboption arguments from a string

SYNOPSIS
XSI
#include <stdlib.h>

int getsubopt(char **optionp, char * const *keylistp, char **valuep);

DESCRIPTION
The getsubopt() function shall parse suboption arguments in a flag argument. Such options often result from the use of getopt().

The getsubopt() argument optionp is a pointer to a pointer to the option argument string. The suboption arguments shall be separated by commas and each may consist of either a single token, or a token-value pair separated by an equal sign.

The keylistp argument shall be a pointer to a vector of strings. The end of the vector is identified by a null pointer. Each entry in the vector is one of the possible tokens that might be found in *optionp. Since commas delimit suboption arguments in optionp, they should not appear in any of the strings pointed to by keylistp. Similarly, because an equal sign separates a token from its value, the application should not include an equal sign in any of the strings pointed to by keylistp.

The valuep argument is the address of a value string pointer.

If a comma appears in optionp, it shall be interpreted as a suboption separator. After commas have been processed, if there are one or more equal signs in a suboption string, the first equal sign in any suboption string shall be interpreted as a separator between a token and a value. Subsequent equal signs in a suboption string shall be interpreted as part of the value.

If the string at *optionp contains only one suboption argument (equivalently, no commas), getsubopt() shall update *optionp to point to the null character at the end of the string. Otherwise, it shall isolate the suboption argument by replacing the comma separator with a null character, and shall update *optionp to point to the start of the next suboption argument. If the suboption argument has an associated value (equivalently, contains an equal sign), getsubopt() shall update *valuep to point to the value's first character. Otherwise, it shall set *valuep to a null pointer. The calling application may use this information to determine whether the presence or absence of a value for the suboption is an error.

Additionally, when getsubopt() fails to match the suboption argument with a token in the keylistp array, the calling application should decide if this is an error, or if the unrecognized option should be processed in another way.

RETURN VALUE
The getsubopt() function shall return the index of the matched token string, or −1 if no token strings were matched.

ERRORS
No errors are defined.
EXAMPLES

```c
#include <stdio.h>
#include <stdlib.h>

int do_all;
const char *type;
int read_size;
int write_size;
int read_only;

enum
{
    RO_OPTION = 0,
    RW_OPTION,
    READ_SIZE_OPTION,
    WRITE_SIZE_OPTION
};

const char *mount_opts[] =
{
    [RO_OPTION] = "ro",
    [RW_OPTION] = "rw",
    [READ_SIZE_OPTION] = "rsize",
    [WRITE_SIZE_OPTION] = "wsize",
    NULL
};

int
main(int argc, char *argv[])
{
    char *subopts, *value;
    int opt;
    
    while ((opt = getopt(argc, argv, "at:o:")) != -1)
    switch(opt)
    {
        case 'a':
            do_all = 1;
            break;
        case 't':
            type = optarg;
            break;
        case 'o':
            subopts = optarg;
            while (*subopts != '\0')
            switch(getsubopt(&subopts, mount_opts, &value))
            {
                case RO_OPTION:
                    read_only = 1;
                    break;
                case RW_OPTION:
                    read_only = 0;
                    break;
                case READ_SIZE_OPTION:
```
`getsubopt()` function is called to parse a value argument in the `optarg` external variable returned by a call to `getopt()`.

```c
#include <stdlib.h>
...
int opt, index;
while ((opt = getopt(argc, argv, "e:")) != -1) {
    switch(opt) {
    case 'e':
        while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
            switch(index) {
            ...
            break;
            ...
            }
        break;
        ...
    default:
        abort();
        }
    return 0;
}
```

### Parsing Suboptions

The following example uses the `getsubopt()` function to parse a `value` argument in the `optarg` external variable returned by a call to `getopt()`.

```c
#include <stdlib.h>
...
char *tokens[] = {"HOME", "PATH", "LOGNAME", (char *) NULL };
char *value;
while ((opt = getopt(argc, argv, "e:")) != -1) {
    switch(opt) {
    case 'e':
        while ((index = getsubopt(&optarg, tokens, &value)) != -1) {
            switch(index) {
            ...
            break;
            ...
            }
        break;
        ...
    case WRITE_SIZE_OPTION:
        if (value == NULL)
            abort();
        read_size = atoi(value);
        break;
    case WRITE_SIZE_OPTION:
        if (value == NULL)
            abort();
        write_size = atoi(value);
        break;
    default:
        /* Unknown suboption. */
        printf("Unknown suboption '%s'\n", value);
        break;
    }
    break;
    default:
        abort();
    }
    return 0;
}
```

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
NAME
getutxent( ), getutxid( ), getutxline( ) — get user accounting database entries

SYNOPSIS
XSI

```c
#include <utmpx.h>

struct utmpx *getutxent(void);
struct utmpx *getutxid(const struct utmpx *id);
struct utmpx *getutxline(const struct utmpx *line);
```

DESCRIPTION
Refer to `endutxent()`.
NAME
getwc — get a wide character from a stream

SYNOPSIS
#include <stdio.h>
#include <wchar.h>
wint_t getwc(FILE *stream);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The getwc() function shall be equivalent to fgetwc(), except that if it is implemented as a macro it may evaluate stream more than once, so the argument should never be an expression with side effects.

RETURN VALUE
Refer to fgetwc().

ERRORS
Refer to fgetwc().

EXAMPLES
None.

APPLICATION USAGE
Since it may be implemented as a macro, getwc() may treat incorrectly a stream argument with side effects. In particular, getwc(*f++) does not necessarily work as expected. Therefore, use of this function is not recommended; fgetwc() should be used instead.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
fgetwc(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>, <wchar.h>

CHANGE HISTORY
First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

Issue 5
The Optional Header (OH) marking is removed from <stdio.h>.
NAME
getwchar — get a wide character from a stdin stream

SYNOPSIS
#include <wchar.h>

wint_t getwchar(void);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The getwchar() function shall be equivalent to getwc(stdin).

RETURN VALUE
Refer to fgetwc().

ERRORS
Refer to fgetwc().

EXAMPLES
None.

APPLICATION USAGE
If the wint_t value returned by getwchar() is stored into a variable of type wchar_t and then
compared against the wint_t macro WEOF, the result may be incorrect. Only the wint_t type is
guaranteed to be able to represent any wide character and WEOF.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
fgetwc(), getwc(), the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

CHANGE HISTORY
First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working
draft.
getwd()  NAME
getwd — get the current working directory pathname (LEGACY)

SYNOPSIS
#include <unistd.h>
char *getwd(char *path_name);

DESCRIPTION
The getwd() function shall determine an absolute pathname of the current working directory of
the calling process, and copy a string containing that pathname into the array pointed to by the
path_name argument.

If the length of the pathname of the current working directory is greater than ({PATH_MAX}+1)
including the null byte, getwd() shall fail and return a null pointer.

RETURN VALUE
Upon successful completion, a pointer to the string containing the absolute pathname of the
current working directory shall be returned. Otherwise, getwd() shall return a null pointer and
the contents of the array pointed to by path_name are undefined.

ERRORS
No errors are defined.

APPLICATION USAGE
For applications portability, the getcwd() function should be used to determine the current
working directory instead of getwd().

RATIONALE
Since the user cannot specify the length of the buffer passed to getwd(), use of this function is
discouraged. The length of a pathname described in {PATH_MAX} is file system-dependent and
may vary from one mount point to another, or might even be unlimited. It is possible to
overflow this buffer in such a way as to cause applications to fail, or possible system security
violations.

It is recommended that the getcwd() function should be used to determine the current working
directory.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

SEE ALSO
getcwd(), the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

CHANGE HISTORY
First released in Issue 4, Version 2.
Moved from X/OPEN UNIX extension to BASE.
This function is marked LEGACY.
NAME
glob, globfree — generate pathnames matching a pattern

SYNOPSIS
#include <glob.h>

int glob(const char *restrict pattern, int flags,
        int(*errfunc)(const char *epath, int eerrno),
        glob_t *restrict pglob);
void globfree(glob_t *pglob);

DESCRIPTION
The glob() function is a pathname generator that shall implement the rules defined in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern Matching Notation, with optional support for rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13.3, Patterns Used for Filename Expansion.

The structure type glob_t is defined in <glob.h> and includes at least the following members:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size_t</td>
<td>gl_pathc</td>
<td>Count of paths matched by pattern.</td>
</tr>
<tr>
<td>char **</td>
<td>gl_pathv</td>
<td>Pointer to a list of matched pathnames.</td>
</tr>
<tr>
<td>size_t</td>
<td>gl_offs</td>
<td>Slots to reserve at the beginning of gl_pathv.</td>
</tr>
</tbody>
</table>

The argument pattern is a pointer to a pathname pattern to be expanded. The glob() function shall match all accessible pathnames against this pattern and develop a list of all pathnames that match. In order to have access to a pathname, glob() requires search permission on every component of a path except the last, and read permission on each directory of any filename component of pattern that contains any of the following special characters: ‘*’, ‘?’, and ‘[’.

The glob() function shall store the number of matched pathnames into pglob->gl_pathc and a pointer to a list of pointers to pathnames into pglob->gl_pathv. The pathnames shall be in sort order as defined by the current setting of the LC_COLLATE category; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, LC_COLLATE. The first pointer after the last pathname shall be a null pointer. If the pattern does not match any pathnames, the returned number of matched paths is set to 0, and the contents of pglob->gl_pathv are implementation-defined.

It is the caller’s responsibility to create the structure pointed to by pglob. The glob() function shall allocate other space as needed, including the memory pointed to by gl_pathv. The globfree() function shall free any space associated with pglob from a previous call to glob().

The flags argument is used to control the behavior of glob(). The value of flags is a bitwise-inclusive OR of zero or more of the following constants, which are defined in <glob.h>:

- **GLOB_APPEND** Append pathnames generated to the ones from a previous call to glob().
- **GLOB_DOOFFS** Make use of pglob->gl_offs. If this flag is set, pglob->gl_offs is used to specify how many null pointers to add to the beginning of pglob->gl_pathv. In other words, pglob->gl_pathv shall point to pglob->gl_offs null pointers, followed by pglob->gl_pathc pathname pointers, followed by a null pointer.
- **GLOB_ERR** Cause glob() to return when it encounters a directory that it cannot open or read. Ordinarily, glob() continues to find matches.
GLOB_MARK  Each pathname that is a directory that matches pattern shall have a slash appended.

GLOB_NOCHECK  Supports rule 3 in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13.3, Patterns Used for Filename Expansion. If pattern does not match any pathname, then glob() shall return a list consisting of only pattern, and the number of matched pathnames is 1.

GLOB_NOESCAPE  Disable backslash escaping.

GLOB_NOSORT  Ordinarily, glob() sorts the matching pathnames according to the current setting of the LC_COLLATE category; see the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.2, LC_COLLATE. When this flag is used, the order of pathnames returned is unspecified.

The GLOB_APPEND flag can be used to append a new set of pathnames to those found in a previous call to glob(). The following rules apply to applications when two or more calls to glob() are made with the same value of pglob and without intervening calls to globfree():

1. The first such call shall not set GLOB_APPEND. All subsequent calls shall set it.

2. All the calls shall set GLOB_DOOFFS, or all shall not set it.

3. After the second call, pglob->gl_pathv points to a list containing the following:
   a. Zero or more null pointers, as specified by GLOB_DOOFFS and pglob->gl_offs.
   b. Pointers to the pathnames that were in the pglob->gl_pathv list before the call, in the same order as before.
   c. Pointers to the new pathnames generated by the second call, in the specified order.

4. The count returned in pglob->gl_pathc shall be the total number of pathnames from the two calls.

5. The application can change any of the fields after a call to glob(). If it does, the application shall reset them to the original value before a subsequent call, using the same pglob value, to globfree() or glob() with the GLOB_APPEND flag.

If, during the search, a directory is encountered that cannot be opened or read and errfunc is not a null pointer, glob() calls (*errfunc()) with two arguments:

1. The epath argument is a pointer to the path that failed.

2. The errno argument is the value of errno from the failure, as set by opendir(), readdir(), or stat(). (Other values may be used to report other errors not explicitly documented for those functions.)

If (*errfunc()) is called and returns non-zero, or if the GLOB_ERR flag is set in flags, glob() shall stop the scan and return GLOB_ABORTED after setting gl_pathc and gl_pathv in pglob to reflect the paths already scanned. If GLOB_ERR is not set and either errfunc is a null pointer or (*errfunc()) returns 0, the error shall be ignored.

The glob() function shall not fail because of large files.

RETURN VALUE

Upon successful completion, glob() shall return 0. The argument pglob->gl_pathc shall return the number of matched pathnames and the argument pglob->gl_pathv shall contain a pointer to a null-terminated list of matched and sorted pathnames. However, if pglob->gl_pathc is 0, the content of pglob->gl_pathv is undefined.
The `glob()` function shall not return a value.

If `glob()` terminates due to an error, it shall return one of the non-zero constants defined in `<glib.h>`. The arguments `pglob->gl_pathc` and `pglob->gl_pathv` are still set as defined above.

**ERRORS**

The `glob()` function shall fail and return the corresponding value if:

- **GLOB_ABORTED** The scan was stopped because `GLOB_ERR` was set or (`*errfunc()` returned non-zero.
- **GLOB_NOMATCH** The pattern does not match any existing pathname, and `GLOB_NOCHECK` was not set in flags.
- **GLOB_NOSPACE** An attempt to allocate memory failed.

**EXAMPLES**

One use of the `GLOB_DOOFFS` flag is by applications that build an argument list for use with `execv()`, `execve()`, or `execvp()`. Suppose, for example, that an application wants to do the equivalent of:

```
ls -l *.c
```

but for some reason:

```
system("ls -l *.c")
```

is not acceptable. The application could obtain approximately the same result using the sequence:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
globbuf.gl_pathv[0] = "ls";
globbuf.gl_pathv[1] = "-l";
execvp("ls", &globbuf.gl_pathv[0]);
```

Using the same example:

```
ls -l *.c *.h
```

could be approximately simulated using `GLOB_APPEND` as follows:

```
globbuf.gl_offs = 2;
glob("*.c", GLOB_DOOFFS, NULL, &globbuf);
glob("*.h", GLOB_DOOFFS|GLOB_APPEND, NULL, &globbuf);
...
```

**APPLICATION USAGE**

This function is not provided for the purpose of enabling utilities to perform pathname expansion on their arguments, as this operation is performed by the shell, and utilities are explicitly not expected to redo this. Instead, it is provided for applications that need to do pathname expansion on strings obtained from other sources, such as a pattern typed by a user or read from a file.

If a utility needs to see if a pathname matches a given pattern, it can use `fnmatch()`.

Note that `gl_pathc` and `gl_pathv` have meaning even if `glob()` fails. This allows `glob()` to report partial results in the event of an error. However, if `gl_pathc` is 0, `gl_pathv` is unspecified even if `glob()` did not return an error.

The `GLOB_NOCHECK` option could be used when an application wants to expand a pathname if wildcards are specified, but wants to treat the pattern as just a string otherwise. The `sh` utility
might use this for option-arguments, for example.

The new pathnames generated by a subsequent call with GLOB_APPEND are not sorted
together with the previous pathnames. This mirrors the way that the shell handles pathname
expansion when multiple expansions are done on a command line.

Applications that need tilde and parameter expansion should use wordexp().

### RATIONALE

It was claimed that the GLOB_DOOFFS flag is unnecessary because it could be simulated using:

```c
new = (char **)malloc((n + pglob->gl_pathc + 1)
       * sizeof(char *)));
(void) memcpy(new+n, pglob->gl_pathv,
pglob->gl_pathc * sizeof(char *));
(void) memset(new, 0, n * sizeof(char *));
free(pglob->gl_pathv);
pglob->gl_pathv = new;
```

However, this assumes that the memory pointed to by gl_pathv is a block that was separately
created using malloc(). This is not necessarily the case. An application should make no
assumptions about how the memory referenced by fields in pglob was allocated. It might have
been obtained from malloc() in a large chunk and then carved up within glob(), or it might have
been created using a different memory allocator. It is not the intent of the standard developers to
specify or imply how the memory used by glob() is managed.

The GLOB_APPEND flag would be used when an application wants to expand several different
patterns into a single list.

### CHANGE HISTORY

**Issue 5**

Moved from POSIX2 C-language Binding to BASE.

**Issue 6**

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The restrict keyword is added to the glob() prototype for alignment with the ISO/IEC 9899:1999
standard.
NAME

gmtime, gmtime_r — convert a time value to a broken-down UTC time

SYNOPSIS

#include <time.h>

struct tm *gmtime(const time_t *timer);

TSF

struct tm *gmtime_r(const time_t *restrict timer,

struct tm *restrict result);

DESCRIPTION

For gmtime(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The gmtime() function shall convert the time in seconds since the Epoch pointed to by timer into a broken-down time, expressed as Coordinated Universal Time (UTC).

The relationship between a time in seconds since the Epoch used as an argument to gmtime() and the tm structure (defined in the <time.h> header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch), where the names in the structure and in the expression correspond.

The same relationship shall apply for gmtime_r().

The gmtime() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The asctime(), ctime(), gmtime(), and localtime() functions shall return values in one of two static objects: a broken-down time structure and an array of type char. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The gmtime_r() function shall convert the time in seconds since the Epoch pointed to by timer into a broken-down time expressed as Coordinated Universal Time (UTC). The broken-down time is stored in the structure referred to by result. The gmtime_r() function shall also return the address of the same structure.

RETURN VALUE

Upon successful completion, the gmtime() function shall return a pointer to a struct tm. If an error is detected, gmtime() shall return a null pointer and set errno to indicate the error.

Upon successful completion, gmtime_r() shall return the address of the structure pointed to by the argument result. If an error is detected, gmtime_r() shall return a null pointer.

ERRORS

The gmtime() function shall fail if:

[EOVERFLOW] The result cannot be represented.
EXAMPLES
None.

APPLICATION USAGE
The gmtime_r() function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
A note indicating that the gmtime() function need not be reentrant is added to the DESCRIPTION.
The gmtime_r() function is included for alignment with the POSIX Threads Extension.

Issue 6
The gmtime_r() function is marked as part of the Thread-Safe Functions option.
Extensions beyond the ISO C standard are marked.
The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.
The restrict keyword is added to the gmtime_r() prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
grantpt — grant access to the slave pseudo-terminal device

SYNOPSIS

XSI
#include <stdlib.h>

int grantpt(int fildes);

DESCRIPTION
The grantpt() function shall change the mode and ownership of the slave pseudo-terminal
device associated with its master pseudo-terminal counterpart. The fildes argument is a file
descriptor that refers to a master pseudo-terminal device. The user ID of the slave shall be set to
the real UID of the calling process and the group ID shall be set to an unspecified group ID. The
permission mode of the slave pseudo-terminal shall be set to readable and writable by the
owner, and writable by the group.

The behavior of the grantpt() function is unspecified if the application has installed a signal
handler to catch SIGCHLD signals.

RETURN VALUE
Upon successful completion, grantpt() shall return 0; otherwise, it shall return −1 and set errno to
indicate the error.

ERRORS
The grantpt() function may fail if:

[EBADF] The fildes argument is not a valid open file descriptor.

[EINVAL] The fildes argument is not associated with a master pseudo-terminal device.

[EACCES] The corresponding slave pseudo-terminal device could not be accessed.

NAME
h_errno — error return value for network database operations

SYNOPSIS
 Ob #include <netdb.h>

DESCRIPTION
This method of returning errors is used only in connection with obsolescent functions.
The <netdb.h> header provides a declaration of h_errno as a modifiable lvalue of type int.
It is unspecified whether h_errno is a macro or an identifier declared with external linkage. If a
macro definition is suppressed in order to access an actual object, or a program defines an
identifier with the name h_errno, the behavior is undefined.

RETURN VALUE
None.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
Applications should obtain the definition of h_errno by the inclusion of the <netdb.h> header.

RATIONALE
None.

FUTURE DIRECTIONS
h_errno may be withdrawn in a future version.

NAME
hcreate, hdestroy, hsearch — manage hash search table

SYNOPSIS
XSI
#include <search.h>

int hcreate(size_t nel);
void hdestroy(void);
ENTRY *hsearch(ENTRY item, ACTION action);

DESCRIPTION
The hcreate(), hdestroy(), and hsearch() functions shall manage hash search tables.

The hcreate() function shall allocate sufficient space for the table, and the application shall
ensure it is called before hsearch() is used. The nel argument is an estimate of the maximum
number of entries that the table shall contain. This number may be adjusted upward by the
algorithm in order to obtain certain mathematically favorable circumstances.

The hdestroy() function shall dispose of the search table, and may be followed by another call to
hcreate(). After the call to hdestroy(), the data can no longer be considered accessible.

The hsearch() function is a hash-table search routine. It shall return a pointer into a hash table
indicating the location at which an entry can be found. The item argument is a structure of type
ENTRY (defined in the <search.h> header) containing two pointers: item.key points to the
comparison key (a char *), and item.data (a void *) points to any other data to be associated with
that key. The comparison function used by hsearch() is strcmp(). The action argument is a
member of an enumeration type ACTION indicating the disposition of the entry if it cannot be
found in the table. ENTER indicates that the item should be inserted in the table at an
appropriate point. FIND indicates that no entry should be made. Unsuccessful resolution is
indicated by the return of a null pointer.

These functions need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

RETURN VALUE
The hcreate() function shall return 0 if it cannot allocate sufficient space for the table; otherwise,
it shall return non-zero.

The hdestroy() function shall not return a value.

The hsearch() function shall return a null pointer if either the action is FIND and the item could
not be found or the action is ENTER and the table is full.

ERRORS
The hcreate() and hsearch() functions may fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES
The following example reads in strings followed by two numbers and stores them in a hash
table, discarding duplicates. It then reads in strings and finds the matching entry in the hash
table and prints it out.

#include <stdio.h>
#include <search.h>
#include <string.h>

struct info { /* This is the info stored in the table */
  int age, room; /* other than the key. */
}
```c
#define NUM_EMPL 5000 /* # of elements in search table. */

int main(void)
{
    char string_space[NUM_EMPL*20]; /* Space to store strings. */
    struct info info_space[NUM_EMPL]; /* Space to store employee info. */
    char *str_ptr = string_space; /* Next space in string_space. */
    struct info *info_ptr = info_space;
        /* Next space in info_space. */
    ENTRY item;
    ENTRY *found_item; /* Name to look for in table. */
    char name_to_find[30];

    int i = 0;

    /* Create table; no error checking is performed. */
    (void) hcreate(NUM_EMPL);
    while (scanf("%s%d%d",
               str_ptr, &info_ptr->age,
               &info_ptr->room) != EOF && i++ < NUM_EMPL) {
        /* Put information in structure, and structure in item. */
        item.key = str_ptr;
        item.data = info_ptr;
        str_ptr += strlen(str_ptr) + 1;
        info_ptr++;
        /* Put item into table. */
        (void) hsearch(item, ENTER);
    }

    /* Access table. */
    item.key = name_to_find;
    while (scanf("%s",
                 item.key) != EOF) {
        if ((found_item = hsearch(item, FIND)) != NULL) {
            /* If item is in the table. */
            (void)printf("found %s, age = %d, room = %d
",
                         found_item->key,
                         ((struct info *)found_item->data)->age,
                         ((struct info *)found_item->data)->room);
        } else
            (void)printf("no such employee %s\n", name_to_find);

    return 0;
}

APPLICATION USAGE
The hcreate() and hsearch() functions may use malloc() to allocate space.

RATIONALE
None.
```
**FUTURE DIRECTIONS**
None.

**Issue 6**
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.
NAME
htonl(), htons, ntohl, ntohs — convert values between host and network byte order

SYNOPSIS
#include <arpa/inet.h>

uint32_t htonl(uint32_t hostlong);
uint16_t htons(uint16_t hostshort);
uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);

DESCRIPTION
These functions shall convert 16-bit and 32-bit quantities between network byte order and host byte order. On some implementations, these functions are defined as macros.

The uint32_t and uint16_t types are defined in <inttypes.h>.

RETURN VALUE
The htonl() and htons() functions shall return the argument value converted from host to network byte order.
The ntohl() and ntohs() functions shall return the argument value converted from network to host byte order.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
These functions are most often used in conjunction with IPv4 addresses and ports as returned by gethostent() and getservent().

RATIONALE

NAME
hypot, hypotf, hypotl — Euclidean distance function

SYNOPSIS
#include <math.h>

double hypot(double x, double y);
float hypotf(float x, float y);
long double hypotl(long double x, long double y);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This

These functions shall compute the value of the square root of \(x^2 + y^2\) without undue overflow or
underflow.

An application wishing to check for error situations should set \textit{errno} to zero and call
\textit{fclearexcept}(FE_ALL_EXCEPT) before calling these functions. On return, if \textit{errno} is non-zero or
\textit{fetestexcept}(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the length of the hypotenuse of a
right-angled triangle with sides of length \(x\) and \(y\).

If the correct value would cause overflow, a range error shall occur and \textit{hypot()}, \textit{hypotf()}, and
\textit{hypotl()} shall return the value of the macro \textit{HUGE_VAL}, \textit{HUGE_VALF}, and \textit{HUGE_VALL},
respectively.

\[\frac{x}{y} \text{ or } \frac{y}{x} \text{ is } \pm \infty, \text{ or } \text{NaN}\]

If \(x\) is NaN, and the other is not \(\pm\infty\), a NaN shall be returned.

If both arguments are subnormal and the correct result is subnormal, a range error may occur
and the correct result is returned.

ERRORS
These functions shall fail if:

Range Error The result overflows.

If the integer expression (math_errno & MATH_ERRNO) is non-zero,
then \textit{errno} shall be set to [ERANGE]. If the integer expression
(math_errno & MATH_ERREXCEPT) is non-zero, then the overflow
floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (math_errno & MATH_ERRNO) is non-zero,
then \textit{errno} shall be set to [ERANGE]. If the integer expression
(math_errno & MATH_ERREXCEPT) is non-zero, then the underflow
floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
- `hypot(x, y)`, `hypot(y, x)`, and `hypot(x, -y)` are equivalent.
- `hypot(x, ±0)` is equivalent to `fabs(x)`.
- Underflow only happens when both `x` and `y` are subnormal and the (inexact) result is also subnormal.
- These functions take precautions against overflow during intermediate steps of the computation.
- On error, the expressions `(math_errhandling & MATH_ERRNO)` and `(math_errhandling & MATH_ERREXCEPT)` are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
- `feclearexcept()`, `fetestexcept()`, `isnan()`, `sqrt()`.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
- The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6
- The `hypot()` function is no longer marked as an extension.
- The `hypotf()` and `hypotl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.
- The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.
NAME
iconv — codeset conversion function

SYNOPSIS
XSI
#include <iconv.h>

size_t iconv(iconv_t cd, char **restrict inbuf,
size_t *restrict inbytesleft, char **restrict outbuf,
size_t *restrict outbytesleft);

DESCRIPTION
The iconv() function shall convert the sequence of characters from one codeset, in the array
specified by inbuf, into a sequence of corresponding characters in another codeset, in the array
specified by outbuf. The codesets are those specified in the iconv_open() call that returned the
conversion descriptor, cd. The inbuf argument points to a variable that points to the first
character in the input buffer and inbytesleft indicates the number of bytes to the end of the buffer
to be converted. The outbuf argument points to a variable that points to the first available byte in
the output buffer and outbytesleft indicates the number of the available bytes to the end of the
buffer.

For state-dependent encodings, the conversion descriptor cd is placed into its initial shift state by
a call for which inbuf is a null pointer, or for which inbuf points to a null pointer. When iconv() is
called in this way, and if outbuf is not a null pointer or a pointer to a null pointer, and outbytesleft
points to a positive value, iconv() shall place, into the output buffer, the byte sequence to change
the output buffer to its initial shift state. If the output buffer is not large enough to hold the
entire reset sequence, iconv() shall fail and set errno to [E2BIG]. Subsequent calls with inbuf as
other than a null pointer or a pointer to a null pointer cause the conversion to take place from
the current state of the conversion descriptor.

If a sequence of input bytes does not form a valid character in the specified codeset, conversion
shall stop after the previous successfully converted character. If the input buffer ends with an
incomplete character or shift sequence, conversion shall stop after the previous successfully
converted bytes. If the output buffer is not large enough to hold the entire converted input,
conversion shall stop just prior to the input bytes that would cause the output buffer to
overflow. The variable pointed to by inbuf shall be updated to point to the byte following the last
byte successfully used in the conversion. The value pointed to by inbytesleft shall be
decremented to reflect the number of bytes still not converted in the input buffer. The variable
pointed to by outbuf shall be updated to point to the byte following the last byte of converted
output data. The value pointed to by outbytesleft shall be decremented to reflect the number of
bytes still available in the output buffer. For state-dependent encodings, the conversion
descriptor shall be updated to reflect the shift state in effect at the end of the last successfully
converted byte sequence.

If iconv() encounters a character in the input buffer that is valid, but for which an identical
character does not exist in the target codeset, iconv() shall perform an implementation-defined
conversion on this character.

RETURN VALUE
The iconv() function shall update the variables pointed to by the arguments to reflect the extent
of the conversion and return the number of non-identical conversions performed. If the entire
string in the input buffer is converted, the value pointed to by inbytesleft shall be 0. If the input
conversion is stopped due to any conditions mentioned above, the value pointed to by inbytesleft
shall be non-zero and errno shall be set to indicate the condition. If an error occurs, iconv() shall
return (size_t)−1 and set errno to indicate the error.
system interfaces

iconv()

19452 ERRORS
19453 The iconv() function shall fail if:
19454 [EILSEQ] Input conversion stopped due to an input byte that does not belong to the
19455 input codeset.
19456 [E2BIG] Input conversion stopped due to lack of space in the output buffer.
19457 [EINVAL] Input conversion stopped due to an incomplete character or shift sequence at
19458 the end of the input buffer.
19459 The iconv() function may fail if:
19460 [EBADF] The cd argument is not a valid open conversion descriptor.

19461 EXAMPLES
19462 None.

19463 APPLICATION USAGE
19464 The inbuf argument indirectly points to the memory area which contains the conversion input
data. The outbuf argument indirectly points to the memory area which is to contain the result of
the conversion. The objects indirectly pointed to by inbuf and outbuf are not restricted to
containing data that is directly representable in the ISO C standard language char data type. The
type of inbuf and outbuf, char **, does not imply that the objects pointed to are interpreted as
null-terminated C strings or arrays of characters. Any interpretation of a byte sequence that
represents a character in a given character set encoding scheme is done internally within the
codeset converters. For example, the area pointed to indirectly by inbuf and/or outbuf can
contain all zero octets that are not interpreted as string terminators but as coded character data
according to the respective codeset encoding scheme. The type of the data (char, short, long, and
so on) read or stored in the objects is not specified, but may be inferred for both the input and
output data by the converters determined by the fromcode and tocode arguments of iconv_open().
19466
Regardless of the data type inferred by the converter, the size of the remaining space in both
input and output objects (the intbytesleft and outbytesleft arguments) is always measured in bytes.

19467 For implementations that support the conversion of state-dependent encodings, the conversion
descriptor must be able to accurately reflect the shift-state in effect at the end of the last
successful conversion. It is not required that the conversion descriptor itself be updated, which
would require it to be a pointer type. Thus, implementations are free to implement the
descriptor as a handle (other than a pointer type) by which the conversion information can be
accessed and updated.

19474 CHANGE HISTORY

19476 Issue 6
19477 The SYNOPSIS has been corrected to align with the <iconv.h> reference page.
19478 The restrict keyword is added to the iconv() prototype for alignment with the
iconv_close() — codeset conversion deallocation function

**SYNOPSIS**

```c
#include <iconv.h>

int iconv_close(iconv_t cd);
```

**DESCRIPTION**

The `iconv_close()` function shall deallocate the conversion descriptor `cd` and all other associated resources allocated by `iconv_open()`.

If a file descriptor is used to implement the type `iconv_t`, that file descriptor shall be closed.

**RETURN VALUE**

Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and `errno` set to indicate the error.

**ERRORS**

The `iconv_close()` function may fail if:

- **[EBADF]** The conversion descriptor is invalid.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

`iconv()`, `iconv_open()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<iconv.h>`

**CHANGE HISTORY**

NAME
iconv_open — codeset conversion allocation function

SYNOPSIS
XSI
#include <iconv.h>

iconv_t iconv_open(const char *tocode, const char *fromcode);

DESCRIPTION
The iconv_open() function shall return a conversion descriptor that describes a conversion from
the codeset specified by the string pointed to by the fromcode argument to the codeset specified
by the string pointed to by the tocode argument. For state-dependent encodings, the conversion
descriptor shall be in a codeset-dependent initial shift state, ready for immediate use with
iconv().
Settings of fromcode and tocode and their permitted combinations are implementation-defined.
A conversion descriptor shall remain valid until it is closed by iconv_close() or an implicit close.
If a file descriptor is used to implement conversion descriptors, the FD_CLOEXEC flag shall be
set; see <fcntl.h>.

RETURN VALUE
Upon successful completion, iconv_open() shall return a conversion descriptor for use on
subsequent calls to iconv(). Otherwise, iconv_open() shall return (iconv_t)-1 and set errno to
indicate the error.

ERRORS
The iconv_open() function may fail if:
[EMFILE] [OPEN_MAX] file descriptors are currently open in the calling process.
[ENFILE] Too many files are currently open in the system.
[ENOMEM] Insufficient storage space is available.
[EINVAL] The conversion specified by fromcode and tocode is not supported by the
implementation.

EXAMPLES
None.

APPLICATION USAGE
Some implementations of iconv_open() use malloc() to allocate space for internal buffer areas.
The iconv_open() function may fail if there is insufficient storage space to accommodate these
buffers.
Conforming applications must assume that conversion descriptors are not valid after a call to
one of the exec functions.
Application developers should consult the system documentation to determine the supported
codesets and their naming schemes.

RATIONALE

if_indextoname() — map a network interface index to its corresponding name

**SYNOPSIS**

```c
#include <net/if.h>

char *if_indextoname(unsigned ifindex, char *ifname);
```

**DESCRIPTION**

The `if_indextoname()` function shall map an interface index to its corresponding name. When this function is called, `ifname` shall point to a buffer of at least `IF_NAMESIZE` bytes. The function shall place in this buffer the name of the interface with index `ifindex`.

**RETURN VALUE**

If `ifindex` is an interface index, then the function shall return the value supplied in `ifname`, which points to a buffer now containing the interface name. Otherwise, the function shall return a NULL pointer and set `errno` to indicate the error.

**ERRORS**

The `if_indextoname()` function shall fail if:

- `ENXIO`: The interface does not exist.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/28 is applied, changing `IFNAMSIZ` to `IF_NAMESIZ` in the DESCRIPTION.
if_nameindex()

NAME
if_nameindex — return all network interface names and indexes

SYNOPSIS
#include <net/if.h>

struct if_nameindex *if_nameindex(void);

DESCRIPTION
The if_nameindex() function shall return an array of if_nameindex structures, one structure per interface. The end of the array is indicated by a structure with an if_index field of zero and an if_name field of NULL.

Applications should call if_freenameindex() to release the memory that may be dynamically allocated by this function, after they have finished using it.

RETURN VALUE
An array of structures identifying local interfaces. A NULL pointer is returned upon an error, with errno set to indicate the error.

ERRORS
The if_nameindex() function may fail if:

[ENOBUSFS] Insufficient resources are available to complete the function.

EXAMPLES
None.

APPLICATION USAGE
None.

NAME
ilogb, ilogbf, ilogbl — return an unbiased exponent

SYNOPSIS
#include <math.h>
int ilogb(double x);
int ilogbf(float x);
int ilogbl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall return the exponent part of their argument x. Formally, the return value is the integral part of \log_r |x| as a signed integral value, for non-zero x, where r is the radix of the machine’s floating-point arithmetic, which is the value of FLT_RADIX defined in <float.h>.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the exponent part of x as a signed integer value. They are equivalent to calling the corresponding logb() function and casting the returned value to type int.

If x is 0, a domain error shall occur, and the value FP_ILOGB0 shall be returned.
If x is ±Inf, a domain error shall occur, and the value [INT_MAX] shall be returned.
If x is a NaN, a domain error shall occur, and the value FP_ILOGBNAN shall be returned.
If the correct value is greater than [INT_MAX], [INT_MAX] shall be returned and a domain error shall occur.
If the correct value is less than [INT_MIN], [INT_MIN] shall be returned and a domain error shall occur.

ERRORS
These functions shall fail if:

Domain Error
The x argument is zero, NaN, or ±Inf, or the correct value is not representable as an integer.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.
**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

The errors come from taking the expected floating-point value and converting it to int, which is an invalid operation in IEEE Std 754-1985 (since overflow, infinity, and NaN are not representable in a type int), so should be a domain error.

There are no known implementations that overflow. For overflow to happen, |INT_MAX| must be less than LDBL_MAX_EXP*log2(FLT_RADIX) or |INT_MIN| must be greater than LDBL_MIN_EXP*log2(FLT_RADIX) if subnormals are not supported, or |INT_MIN| must be greater than (LDBL_MIN_EXP-LDBL_MANT_DIG)*log2(FLT_RADIX) if subnormals are supported.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

**Issue 6**

The ilogb() function is no longer marked as an extension.

The ilogbf() and ilogbl() functions are added for alignment with the ISO/IEC 9899:1999 standard.

The RETURN VALUE section is revised for alignment with the ISO/IEC 9899:1999 standard.

XSI extensions are marked.
NAME
imaxabs — return absolute value

SYNOPSIS
#include <inttypes.h>
intmax_t imaxabs(intmax_t j);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The \textbf{imaxabs()} function shall compute the absolute value of an integer \texttt{j}. If the result cannot be represented, the behavior is undefined.

RETURN VALUE
The \textbf{imaxabs()} function shall return the absolute value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The absolute value of the most negative number cannot be represented in two's complement.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME
index — character string operations (LEGACY)

SYNOPSIS
#include <strings.h>

char *index(const char *s, int c);

DESCRIPTION
The index() function shall be equivalent to strchr().

RETURN VALUE
See strchr().

ERRORS
See strchr().

EXAMPLES
None.

APPLICATION USAGE
The strchr() function is preferred over this function.
For maximum portability, it is recommended to replace the function call to index() as follows:
#define index(a,b) strchr((a),(b))

RATIONALE
None.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked LEGACY.
NAME
inet_addr, inet_ntoa — IPv4 address manipulation

SYNOPSIS
#include <arpa/inet.h>

in_addr_t inet_addr(const char *cp);
char *inet_ntoa(struct in_addr in);

DESCRIPTION
The inet_addr() function shall convert the string pointed to by cp, in the standard IPv4 dotted
decimal notation, to an integer value suitable for use as an Internet address.

The inet_ntoa() function shall convert the Internet host address specified by in to a string in the
Internet standard dot notation.

The inet_ntoa() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

All Internet addresses shall be returned in network order (bytes ordered from left to right).

Values specified using IPv4 dotted decimal notation take one of the following forms:

a.b.c.d When four parts are specified, each shall be interpreted as a byte of data and
assigned, from left to right, to the four bytes of an Internet address.

a.b.c When a three-part address is specified, the last part shall be interpreted as a 16-bit
quantity and placed in the rightmost two bytes of the network address. This makes
the three-part address format convenient for specifying Class B network addresses
as "128.net.host".

a.b When a two-part address is supplied, the last part shall be interpreted as a 24-bit
quantity and placed in the rightmost three bytes of the network address. This
makes the two-part address format convenient for specifying Class A network
addresses as "net.host".

a When only one part is given, the value shall be stored directly in the network
address without any byte rearrangement.

All numbers supplied as parts in IPv4 dotted decimal notation may be decimal, octal, or
hexadecimal, as specified in the ISO C standard (that is, a leading 0x or 0X implies hexadecimal;
otherwise, a leading '0' implies octal; otherwise, the number is interpreted as decimal).

RETURN VALUE
Upon successful completion, inet_addr() shall return the Internet address. Otherwise, it shall
return (in_addr_t)(-1).

The inet_ntoa() function shall return a pointer to the network address in Internet standard dot
notation.

ERRORS
No errors are defined.
EXAMPLES
None.

APPLICATION USAGE
The return value of \texttt{inet\_ntoa()} may point to static data that may be overwritten by subsequent calls to \texttt{inet\_ntoa()}.

RATIONALE
None.

FUTURE DIRECTIONS
None.

\texttt{endhostent()}, \texttt{endnetent()}, the Base Definitions volume of IEEE Std 1003.1-2001, \texttt{<arpa/inet.h>}

CHANGE HISTORY
First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
NAME
inet_ntop, inet_pton — convert IPv4 and IPv6 addresses between binary and text form

SYNOPSIS
#include <arpa/inet.h>

const char *inet_ntop(int af, const void *restrict src, char *restrict dst, socklen_t size);

int inet_pton(int af, const char *restrict src, void *restrict dst);

DESCRIPTION
The `inet_ntop()` function shall convert a numeric address into a text string suitable for presentation. The `af` argument shall specify the family of the address. This can be AF_INET or AF_INET6. The `src` argument points to a buffer holding an IPv4 address if the `af` argument is AF_INET, or an IPv6 address if the `af` argument is AF_INET6; the address must be in network byte order. The `dst` argument points to a buffer where the function stores the resulting text string; it shall not be NULL. The `size` argument specifies the size of this buffer, which shall be large enough to hold the text string (INET_ADDRSTRLEN characters for IPv4, INET6_ADDRSTRLEN characters for IPv6).

The `inet_pton()` function shall convert an address in its standard text presentation form into its numeric binary form. The `af` argument shall specify the family of the address. The AF_INET and AF_INET6 address families shall be supported. The `src` argument points to the string being passed in. The `dst` argument points to a buffer into which the function stores the numeric address; this shall be large enough to hold the numeric address (32 bits for AF_INET, 128 bits for AF_INET6).

If the `af` argument of `inet_ntop()` is AF_INET, the `src` string shall be in the standard IPv4 dotted-decimal form:

```
ddd.ddd.ddd.ddd
```

where "ddd" is a one to three digit decimal number between 0 and 255 (see `inet_addr()`). The `inet_ntop()` function does not accept other formats (such as the octal numbers, hexadecimal numbers, and fewer than four numbers that `inet_addr()` accepts).

If the `af` argument of `inet_ntop()` is AF_INET6, the `src` string shall be in one of the following standard IPv6 text forms:

1. The preferred form is "x:x:x:x:x:x:x:x", where the 'x's are the hexadecimal values of the eight 16-bit pieces of the address. Leading zeros in individual fields can be omitted, but there shall be at least one numeral in every field.

2. A string of contiguous zero fields in the preferred form can be shown as "::". The "::" can only appear once in an address. Unspecified addresses ("0:0:0:0:0:0:0:0") may be represented simply as "::".

3. A third form that is sometimes more convenient when dealing with a mixed environment of IPv4 and IPv6 nodes is "x:x:x:x:x:d.d.d.d", where the 'x's are the hexadecimal values of the six high-order 16-bit pieces of the address, and the 'd's are the decimal values of the four low-order 8-bit pieces of the address (standard IPv4 representation).

Note: A more extensive description of the standard representations of IPv6 addresses can be found in RFC 2373.
RETURN VALUE
The `inet_ntop()` function shall return a pointer to the buffer containing the text string if the conversion succeeds, and NULL otherwise, and set `errno` to indicate the error.

The `inet_pton()` function shall return 1 if the conversion succeeds, with the address pointed to by `dst` in network byte order. It shall return 0 if the input is not a valid IPv4 dotted-decimal string or a valid IPv6 address string, or -1 with `errno` set to `[EAFNOSUPPORT]` if the `af` argument is unknown.

ERRORS
The `inet_ntop()` and `inet_pton()` functions shall fail if:

- `[EAFNOSUPPORT]` The `af` argument is invalid.
- `[ENOSPC]` The size of the `inet_ntop()` result buffer is inadequate.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
The Base Definitions volume of IEEE Std 1003.1-2001, `<arpa/inet.h>`

CHANGE HISTORY
First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
IPv6 extensions are marked.
The `restrict` keyword is added to the `inet_ntop()` and `inet_pton()` prototypes for alignment with the ISO/IEC 9899:1999 standard.
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/29 is applied, adding “the address must be in network byte order” to the end of the fourth sentence of the first paragraph in the DESCRIPTION.
NAME
initstate, random, setstate, srandom — pseudo-random number functions

SYNOPSIS
XSI
#include <stdlib.h>

char *initstate(unsigned seed, char *state, size_t size);
long random(void);
char *setstate(const char *state);
void srandom(unsigned seed);

DESCRIPTION
The random() function shall use a non-linear additive feedback random-number generator employing a default state array size of 31 long integers to return successive pseudo-random numbers in the range from 0 to \(2^{31} - 1\). The period of this random-number generator is approximately \(16 \times (2^{31} - 1)\). The size of the state array determines the period of the random-number generator. Increasing the state array size shall increase the period.

With 256 bytes of state information, the period of the random-number generator shall be greater than \(2^{69}\).

Like rand(), random() shall produce by default a sequence of numbers that can be duplicated by calling srandom() with 1 as the seed.

The srandom() function shall initialize the current state array using the value of seed.

The initstate() and setstate() functions handle restarting and changing random-number generators. The initstate() function allows a state array, pointed to by the state argument, to be initialized for future use. The size argument, which specifies the size in bytes of the state array, shall be used by initstate() to decide what type of random-number generator to use; the larger the state array, the more random the numbers. Values for the amount of state information are 8, 32, 64, 128, and 256 bytes. Other values greater than 8 bytes are rounded down to the nearest one of these values. If initstate() is called with \(8 \leq \text{size} < 32\), then random() shall use a simple linear congruential random number generator. The seed argument specifies a starting point for the random-number sequence and provides for restarting at the same point. The initstate() function shall return a pointer to the previous state information array.

If initstate() has not been called, then random() shall behave as though initstate() had been called with seed=1 and size=128.

Once a state has been initialized, setstate() allows switching between state arrays. The array defined by the state argument shall be used for further random-number generation until initstate() is called or setstate() is called again. The setstate() function shall return a pointer to the previous state array.

RETURN VALUE
If initstate() is called with size less than 8, it shall return NULL.

The random() function shall return the generated pseudo-random number.

The srandom() function shall not return a value.

Upon successful completion, initstate() and setstate() shall return a pointer to the previous state array; otherwise, a null pointer shall be returned.
1998 ERRORS
1999 No errors are defined.

EXAMPLES
2000 None.

APPLICATION USAGE
2002 After initialization, a state array can be restarted at a different point in one of two ways:
2003 1. The `initstate()` function can be used, with the desired seed, state array, and size of the array.
2004 2. The `setstate()` function, with the desired state, can be used, followed by `srandom()` with the desired seed. The advantage of using both of these functions is that the size of the state array does not have to be saved once it is initialized.
2009 Although some implementations of `random()` have written messages to standard error, such implementations do not conform to IEEE Std 1003.1-2001.
2011 Issue 5 restored the historical behavior of this function.
2012 Threaded applications should use `erand48()`, `nrand48()`, or `jrand48()` instead of `random()` when an independent random number sequence in multiple threads is required.

RATIONALE
2014 None.

FUTURE DIRECTIONS
2016 None.

SEE ALSO
2018 `drand48()`, `rand()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

CHANGE HISTORY
2022 Issue 5
2023 Moved from X/OPEN UNIX extension to BASE.
2024 In the DESCRIPTION, the phrase “values smaller than 8” is replaced with “values greater than or equal to 8, or less than 32”, “size<8” is replaced with “8≤size<32”, and a new first paragraph is added to the RETURN VALUE section. A note is added to the APPLICATION USAGE indicating that these changes restore the historical behavior of the function.
2028 Issue 6
2029 In the DESCRIPTION, duplicate text “For values greater than or equal to 8...” is removed.
2030 IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/30 is applied, removing `rand_r()` from the list of suggested functions in the APPLICATION USAGE section.
NAME
insque, remque — insert or remove an element in a queue

SYNOPSIS
#include <search.h>

void insque(void *element, void *pred);
void remque(void *element);

DESCRIPTION
The insque() and remque() functions shall manipulate queues built from doubly-linked lists. The queue can be either circular or linear. An application using insque() or remque() shall ensure it defines a structure in which the first two members of the structure are pointers to the same type of structure, and any further members are application-specific. The first member of the structure is a forward pointer to the next entry in the queue. The second member is a backward pointer to the previous entry in the queue. If the queue is linear, the queue is terminated with null pointers. The names of the structure and of the pointer members are not subject to any special restriction.

The insque() function shall insert the element pointed to by element into a queue immediately after the element pointed to by pred.

The remque() function shall remove the element pointed to by element from a queue.

If the queue is to be used as a linear list, invoking insque(&element, NULL), where element is the initial element of the queue, shall initialize the forward and backward pointers of element to null pointers.

If the queue is to be used as a circular list, the application shall ensure it initializes the forward pointer and the backward pointer of the initial element of the queue to the element’s own address.

RETURN VALUE
The insque() and remque() functions do not return a value.

ERRORS
No errors are defined.

EXAMPLES
Creating a Linear Linked List
The following example creates a linear linked list.

#include <search.h>
...
struct myque element1;
struct myque element2;
char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;
insque (&element1, NULL);
insque (&element2, &element1);
Creating a Circular Linked List

The following example creates a circular linked list.

```c
#include <search.h>
...
struct myque element1;
struct myque element2;
char *data1 = "DATA1";
char *data2 = "DATA2";
...
element1.data = data1;
element2.data = data2;
element1.fwd = &element1;
element1.bck = &element1;
insque (&element2, &element1);
```

Removing an Element

The following example removes the element pointed to by `element1`.

```c
#include <search.h>
...
struct myque element1;
...
remque (&element1);
```

APPLICATION USAGE

The historical implementations of these functions described the arguments as being of type `struct qelem` * rather than as being of type `void` * as defined here. In those implementations, `struct qelem` was commonly defined in `<search.h>` as:

```c
struct qelem {
    struct qelem  *q_forw;
    struct qelem  *q_back;
};
```

Applications using these functions, however, were never able to use this structure directly since it provided no room for the actual data contained in the elements. Most applications defined structures that contained the two pointers as the initial elements and also provided space for, or pointers to, the object's data. Applications that used these functions to update more than one type of table also had the problem of specifying two or more different structures with the same name, if they literally used `struct qelem` as specified.

As described here, the implementations were actually expecting a structure type where the first two members were forward and backward pointers to structures. With C compilers that didn't provide function prototypes, applications used structures as specified in the DESCRIPTION above and the compiler did what the application expected.

If this method had been carried forward with an ISO C standard compiler and the historical function prototype, most applications would have to be modified to cast pointers to the structures actually used to be pointers to `struct qelem` to avoid compilation warnings. By specifying `void` * as the argument type, applications do not need to change (unless they specifically referenced `struct qelem` and depended on it being defined in `<search.h>`).

CHANGE HISTORY
First released in Issue 4, Version 2.
Moved from X/OPEN UNIX extension to BASE.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
ioctl — control a STREAMS device (STREAMS)

SYNOPSIS
#include <stropts.h>
int ioctl(int fildes, int request, ... /* arg */);

DESCRIPTION
The ioctl() function shall perform a variety of control functions on STREAMS devices. For non-
STREAMS devices, the functions performed by this call are unspecified. The request argument
and an optional third argument (with varying type) shall be passed to and interpreted by the
appropriate part of the STREAM associated with fildes.

The fildes argument is an open file descriptor that refers to a device.

The request argument selects the control function to be performed and shall depend on the
STREAMS device being addressed.

The arg argument represents additional information that is needed by this specific STREAMS
device to perform the requested function. The type of arg depends upon the particular control
request, but it shall be either an integer or a pointer to a device-specific data structure.

The ioctl() commands applicable to STREAMS, their arguments, and error conditions that apply
to each individual command are described below.

The following ioctl() commands, with error values indicated, are applicable to all STREAMS
files:

I_PUSH Pushes the module whose name is pointed to by arg onto the top of the
current STREAM, just below the STREAM head. It then calls the open() function of the newly-pushed module.

The ioctl() function with the I_PUSH command shall fail if:

[EINVAL] Invalid module name.

I_POP Removes the module just below the STREAM head of the STREAM pointed to
by fildes. The arg argument should be 0 in an I_POP request.

The ioctl() function with the I_POP command shall fail if:

[EINVAL] No module present in the STREAM.
[ENXIO] Hangup received on fildes.

I_LOOK Retrieves the name of the module just below the STREAM head of the
STREAM pointed to by fildes, and places it in a character string pointed to by arg. The buffer pointed to by arg should be at least FMNAMESZ+1 bytes long,
where FMNAMESZ is defined in <stropts.h>.

The ioctl() function with the I_LOOK command shall fail if:

[EINVAL] No module present in the STREAM.

I_FLUSH Flushes read and/or write queues, depending on the value of arg. Valid arg
values are:
FLUSHR  Flush all read queues.
FLUSHW  Flush all write queues.
FLUSHRW Flush all read and all write queues.

The `ioctl()` function with the I_FLUSH command shall fail if:

- `[EINVAL]` Invalid `arg` value.
- `[EAGAIN]` or `[ENOSR]` Unable to allocate buffers for flush message.
- `[ENXIO]` Hangup received on `fildes`.

**I_FLUSHBAND** Flashes a particular band of messages. The `arg` argument points to a `bandinfo` structure. The `bi_flag` member may be one of FLUSHR, FLUSHW, or FLUSHRW as described above. The `bi_pri` member determines the priority band to be flushed.

**I_SETSIG** Requests that the STREAMS implementation send the SIGPOLL signal to the calling process when a particular event has occurred on the STREAM associated with `fildes`. `I_SETSIG` supports an asynchronous processing capability in STREAMS. The value of `arg` is a bitmask that specifies the events for which the process should be signaled. It is the bitwise-inclusive OR of any combination of the following constants:

- **S_RDNORM** A normal (priority band set to 0) message has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
- **S_RDBAND** A message with a non-zero priority band has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
- **S_INPUT** A message, other than a high-priority message, has arrived at the head of a STREAM head read queue. A signal shall be generated even if the message is of zero length.
- **S_HIPRI** A high-priority message is present on a STREAM head read queue. A signal shall be generated even if the message is of zero length.
- **S_OUTPUT** The write queue for normal data (priority band 0) just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) normal data downstream.
- **S_WRNORM** Equivalent to S_OUTPUT.
- **S_WRBAND** The write queue for a non-zero priority band just below the STREAM head is no longer full. This notifies the process that there is room on the queue for sending (or writing) priority data downstream.
- **S_MSG** A STREAMS signal message that contains the SIGPOLL signal has reached the front of the STREAM head read queue.
- **S_ERROR** Notification of an error condition has reached the STREAM head.
S_HANGUP Notification of a hangup has reached the STREAM head.

S_BANDURG When used in conjunction with S_RDBAND, SIGURG is
generated instead of SIGPOLL when a priority message
reaches the front of the STREAM head read queue.

If arg is 0, the calling process shall be unregistered and shall not receive
further SIGPOLL signals for the stream associated with fildes.

Processes that wish to receive SIGPOLL signals shall ensure that they
explicitly register to receive them using I_SETSIG. If several processes register
to receive this signal for the same event on the same STREAM, each process
shall be signaled when the event occurs.

The ioctl() function with the I_SETSIG command shall fail if:

EINVAL The value of arg is invalid.

EINVAL The value of arg is 0 and the calling process is not registered
to receive the SIGPOLL signal.

EAGAIN There were insufficient resources to store the signal request.

I_GETSIG Returns the events for which the calling process is currently registered to be
sent a SIGPOLL signal. The events are returned as a bitmask in an int pointed
to by arg, where the events are those specified in the description of I_SETSIG
above.

The ioctl() function with the I_GETSIG command shall fail if:

EINVAL Process is not registered to receive the SIGPOLL signal.

I_FIND Compares the names of all modules currently present in the STREAM to the
name pointed to by arg, and returns 1 if the named module is present in the
STREAM, or returns 0 if the named module is not present.

The ioctl() function with the I_FIND command shall fail if:

EINVAL arg does not contain a valid module name.

I_PEEK Retrieves the information in the first message on the STREAM head read
queue without taking the message off the queue. It is analogous to getmsg().
except that this command does not remove the message from the queue. The
arg argument points to a strpeek structure.

The application shall ensure that the maxlen member in the ctlbuf and databuf
strbuf structures is set to the number of bytes of control information and/or
data information, respectively, to retrieve. The flags member may be marked
RS_HIPRI or 0, as described by getmsg(). If the process sets flags to RS_HIPRI,
for example, I_PEEK shall only look for a high-priority message on the
STREAM head read queue.

I_PEEK returns 1 if a message was retrieved, and returns 0 if no message was
found on the STREAM head read queue, or if the RS_HIPRI flag was set in
flags and a high-priority message was not present on the STREAM head read
queue. It does not wait for a message to arrive. On return, ctlbuf specifies
information in the control buffer, databuf specifies information in the data
buffer, and flags contains the value RS_HIPRI or 0.

I_SRDOPT Sets the read mode using the value of the argument arg. Read modes are
described in read(). Valid arg flags are:
ioctl()

RNORM     Byte-stream mode, the default.
RMSGD     Message-discard mode.
RMSGN     Message-nondiscard mode.

The bitwise-inclusive OR of RMSGD and RMSGN shall return [EINVAL]. The bitwise-inclusive OR of RNORM and either RMSGD or RMSGN shall result in the other flag overriding RNORM which is the default.

In addition, treatment of control messages by the STREAM head may be changed by setting any of the following flags in arg:

RPROTNORM Fail read() with [EBADMSG] if a message containing a control part is at the front of the STREAM head read queue.
RPROTDAT  Deliver the control part of a message as data when a process issues a read().
RPROTDIS  Discard the control part of a message, delivering any data portion, when a process issues a read().

The ioctl() function with the I_SRDOPT command shall fail if:

[EINVAL]    The arg argument is not valid.

I_GRDOPT    Returns the current read mode setting, as described above, in an int pointed to by the argument arg. Read modes are described in read().

I_NREAD     Counts the number of data bytes in the data part of the first message on the STREAM head read queue and places this value in the int pointed to by arg. The return value for the command shall be the number of messages on the STREAM head read queue. For example, if 0 is returned in arg, but the ioctl() return value is greater than 0, this indicates that a zero-length message is next on the queue.

I_FDINSERT Creates a message from specified buffer(s), adds information about another STREAM, and sends the message downstream. The message contains a control part and an optional data part. The data and control parts to be sent are distinguished by placement in separate buffers, as described below. The arg argument points to a strfdinsert structure.

The application shall ensure that the len member in the ctbuf strbuf structure is set to the size of a t_uscalar_t plus the number of bytes of control information to be sent with the message. The fildes member specifies the file descriptor of the other STREAM, and the offset member, which must be suitably aligned for use as a t_uscalar_t, specifies the offset from the start of the control buffer where I_FDINSERT shall store a t_uscalar_t whose interpretation is specific to the STREAM end. The application shall ensure that the len member in the databuf strbuf structure is set to the number of bytes of data information to be sent with the message, or to 0 if no data part is to be sent.

The flags member specifies the type of message to be created. A normal message is created if flags is set to 0, and a high-priority message is created if flags is set to RS_HIPRI. For non-priority messages, I_FDINSERT shall block if the STREAM write queue is full due to internal flow control conditions. For priority messages, I_FDINSERT does not block on this condition. For non-priority messages, I_FDINSERT does not block when the write queue is full.
and O_NONBLOCK is set. Instead, it fails and sets errno to [EAGAIN].

I_FDINSERT also blocks, unless prevented by lack of internal resources, waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message is sent.

The ioctl() function with the I_FDINSERT command shall fail if:

- [EAGAIN] A non-priority message is specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions.
- [EAGAIN] or [ENOSR] Buffers cannot be allocated for the message that is to be created.
- [EINVAL] One of the following:
  - The fildes member of the strfdinsert structure is not a valid, open STREAM file descriptor.
  - The size of a t_uscalar_t plus offset is greater than the len member for the buffer specified through ctlbuf.
  - The offset member does not specify a properly-aligned location in the data buffer.
  - An undefined value is stored in flags.
- [ENXIO] Hangup received on the STREAM identified by either the fildes argument or the fildes member of the strfdinsert structure.
- [ERANGE] The len member for the buffer specified through databuf does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module; or the len member for the buffer specified through databuf is larger than the maximum configured size of the data part of a message; or the len member for the buffer specified through ctlbuf is larger than the maximum configured size of the control part of a message.

I_STRConstructs an internal STREAMS ioctl() message from the data pointed to by arg, and sends that message downstream.

This mechanism is provided to send ioctl() requests to downstream modules and drivers. It allows information to be sent with ioctl(), and returns to the process any information sent upstream by the downstream recipient. I_STR shall block until the system responds with either a positive or negative acknowledgement message, or until the request times out after some period of time. If the request times out, it shall fail with errno set to [ETIME].

At most, one I_STR can be active on a STREAM. Further I_STR calls shall block until the active I_STR completes at the STREAM head. The default timeout interval for these requests is 15 seconds. The O_NONBLOCK flag has no effect on this call.

To send requests downstream, the application shall ensure that arg points to a strioctl structure.
The `ioctl()` function with the I_STR command shall fail if:

- [EAGAIN] or [ENOSR] Unable to allocate buffers for the `ioctl()` message.
- [EINVAL] The `ic_len` member is less than 0 or larger than the maximum configured size of the data part of a message, or `ic_timout` is less than −1.
- [ENXIO] Hangup received on `fildes`.
- [ETIME] A downstream `ioctl()` timed out before acknowledgement was received.

An I_STR can also fail while waiting for an acknowledgement if a message indicating an error or a hangup is received at the STREAM head. In addition, an error code can be returned in the positive or negative acknowledgement message, in the event the `ioctl()` command sent downstream fails. For these cases, I_STR shall fail with `errno` set to the value in the message.

**I_SWROPT**

Sets the write mode using the value of the argument `arg`. Valid bit settings for `arg` are:

- SNDZERO Send a zero-length message downstream when a `write()` of 0 bytes occurs. To not send a zero-length message when a `write()` of 0 bytes occurs, the application shall ensure that this bit is not set in `arg` (for example, `arg` would be set to 0).

The `ioctl()` function with the I_SWROPT command shall fail if:

- [EINVAL] `arg` is not the above value.

**I_GWROPT**

Returns the current write mode setting, as described above, in the `int` that is pointed to by the argument `arg`.

**I_SENDFD**

Creates a new reference to the open file description associated with the file descriptor `arg`, and writes a message on the STREAMS-based pipe `fildes` containing this reference, together with the user ID and group ID of the calling process.

The `ioctl()` function with the I_SENDFD command shall fail if:

- [EAGAIN] The sending STREAM is unable to allocate a message block to contain the file pointer; or the read queue of the receiving STREAM head is full and cannot accept the message sent by I_SENDFD.
I_RECVFD

Retrieves the reference to an open file description from a message written to a STREAMS-based pipe using the I_SENDFD command, and allocates a new file descriptor in the calling process that refers to this open file description. The arg argument is a pointer to a strutcvfd data structure as defined in <stropts.h>.

The fd member is a file descriptor. The uid and gid members are the effective user ID and effective group ID, respectively, of the sending process.

If O_NONBLOCK is not set, I_RECVFD shall block until a message is present at the STREAM head. If O_NONBLOCK is set, I_RECVFD shall fail with errno set to [EAGAIN] if no message is present at the STREAM head.

If the message at the STREAM head is a message sent by an I_SENDFD, a new file descriptor shall be allocated for the open file descriptor referenced in the message. The new file descriptor is placed in the fd member of the strutcvfd structure pointed to by arg.

The ioctl() function with the I_RECVFD command shall fail if:

- [EAGAIN] A message is not present at the STREAM head read queue and the O_NONBLOCK flag is set.
- [EBADMSG] The message at the STREAM head read queue is not a message containing a passed file descriptor.
- [EMFILE] The process has the maximum number of file descriptors currently open that it is allowed.
- [ENXIO] Hangup received on fildes.

I_LIST

Allows the process to list all the module names on the STREAM, up to and including the topmost driver name. If arg is a null pointer, the return value shall be the number of modules, including the driver, that are on the STREAM pointed to by fildes. This lets the process allocate enough space for the module names. Otherwise, it should point to a str_list structure.

The sl_nmods member indicates the number of entries the process has allocated in the array. Upon return, the sl_modlist member of the str_list structure shall contain the list of module names, and the number of entries that have been filled into the sl_modlist array is found in the sl_nmods member (the number includes the number of modules including the driver). The return value from ioctl() shall be 0. The entries are filled in starting at the top of the STREAM and continuing downstream until either the end of the STREAM is reached, or the number of requested modules (sl_nmods) is satisfied.

The ioctl() function with the I_LIST command shall fail if:

- [EINVAL] The sl_nmods member is less than 1.
- [EAGAIN] or [ENOSR] Unable to allocate buffers.

I_ATMARK

Allows the process to see if the message at the head of the STREAM head read queue is marked by some module downstream. The arg argument determines
how the checking is done when there may be multiple marked messages on
the STREAM head read queue. It may take on the following values:

- **ANYMARK**: Check if the message is marked.
- **LASTMARK**: Check if the message is the last one marked on the queue.

The bitwise-inclusive OR of the flags ANYMARK and LASTMARK is
permitted.

The return value shall be 1 if the mark condition is satisfied; otherwise, the
value shall be 0.

The `ioctl()` function with the I_ATMARK command shall fail if:

- `EINVAL` Invalid `arg` value.

**I_CKBAND** Checks if the message of a given priority band exists on the STREAM head
read queue. This shall return 1 if a message of the given priority exists, 0 if no
such message exists, or −1 on error. `arg` should be of type `int`.

The `ioctl()` function with the I_CKBAND command shall fail if:

- `EINVAL` Invalid `arg` value.

**I_GETBAND** Returns the priority band of the first message on the STREAM head read
queue in the integer referenced by `arg`.

The `ioctl()` function with the I_GETBAND command shall fail if:

- `ENODATA` No message on the STREAM head read queue.

**I_CANPUT** Checks if a certain band is writable. `arg` is set to the priority band in question.
The return value shall be 0 if the band is flow-controlled, 1 if the band is
writable, or −1 on error.

The `ioctl()` function with the I_CANPUT command shall fail if:

- `EINVAL` Invalid `arg` value.

**I_SETCLTIME** This request allows the process to set the time the STREAM head shall delay
when a STREAM is closing and there is data on the write queues. Before
closing each module or driver, if there is data on its write queue, the STREAM
head shall delay for the specified amount of time to allow the data to drain. If,
after the delay, data is still present, it shall be flushed. The `arg` argument is a
pointer to an integer specifying the number of milliseconds to delay, rounded
up to the nearest valid value. If I_SETCLTIME is not performed on a STREAM,
an implementation-defined default timeout interval is used.

The `ioctl()` function with the I_SETCLTIME command shall fail if:

- `EINVAL` Invalid `arg` value.

**I_GETCLTIME** Returns the close time delay in the integer pointed to by `arg`.

The `ioctl()` function with the I_GETCLTIME command shall fail if:

- `EINVAL` Invalid `arg` value.
Multiplexed STREAMS Configurations

The following commands are used for connecting and disconnecting multiplexed STREAMS configurations. These commands use an implementation-defined default timeout interval.

I_LINK

Connects two STREAMs, where fildes is the file descriptor of the STREAM connected to the multiplexing driver, and arg is the file descriptor of the STREAM connected to another driver. The STREAM designated by arg is connected below the multiplexing driver. I_LINK requires the multiplexing driver to send an acknowledgement message to the STREAM head regarding the connection. This call shall return a multiplexer ID number (an identifier used to disconnect the multiplexer; see I_UNLINK) on success, and −1 on failure.

The ioctl() function with the I_LINK command shall fail if:

- [ENXIO] Hangup received on fildes.
- [ETIME] Timeout before acknowledgement message was received at STREAM head.
- [EAGAIN] or [ENOSR] Unable to allocate STREAMS storage to perform the I_LINK.
- [EBADF] The arg argument is not a valid, open file descriptor.
- [EINVAL] The fildes argument does not support multiplexing; or arg is not a STREAM or is already connected downstream from a multiplexer; or the specified I_LINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_LINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of fildes. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_LINK fails with errno set to the value in the message.

I_UNLINK

Disconnects the two STREAMs specified by fildes and arg. fildes is the file descriptor of the STREAM connected to the multiplexing driver. The arg argument is the multiplexer ID number that was returned by the I_LINK ioctl() command when a STREAM was connected downstream from the multiplexing driver. If arg is MUXID_ALL, then all STREAMs that were connected to fildes shall be disconnected. As in I_LINK, this command requires acknowledgement.

The ioctl() function with the I_UNLINK command shall fail if:

- [ENXIO] Hangup received on fildes.
- [ETIME] Timeout before acknowledgement message was received at STREAM head.
- [EAGAIN] or [ENOSR] Unable to allocate buffers for the acknowledgement message.
- [EINVAL] Invalid multiplexer ID number.
An I_UNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of fildes. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_UNLINK shall fail with errno set to the value in the message.

**I_PLINK**

Creates a persistent connection between two STREAMs, where fildes is the file descriptor of the STREAM connected to the multiplexing driver, and arg is the file descriptor of the STREAM connected to another driver. This call shall create a persistent connection which can exist even if the file descriptor fildes associated with the upper STREAM to the multiplexing driver is closed. The STREAM designated by arg gets connected via a persistent connection below the multiplexing driver. I_PLINK requires the multiplexing driver to send an acknowledgement message to the STREAM head. This call shall return a multiplexer ID number (an identifier that may be used to disconnect the multiplexer; see I_PUNLINK) on success, and −1 on failure.

The ioctl() function with the I_PLINK command shall fail if:

- [ENXIO] Hangup received on fildes.
- [ETIME] Timeout before acknowledgement message was received at STREAM head.
- [EAGAIN] or [ENOSR] Unable to allocate STREAMS storage to perform the I_PLINK.
- [EBADF] The arg argument is not a valid, open file descriptor.
- [EINVAL] The fildes argument does not support multiplexing; or arg is not a STREAM or is already connected downstream from a multiplexer; or the specified I_PLINK operation would connect the STREAM head in more than one place in the multiplexed STREAM.

An I_PLINK can also fail while waiting for the multiplexing driver to acknowledge the request, if a message indicating an error or a hangup is received at the STREAM head of fildes. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PLINK shall fail with errno set to the value in the message.

**I_PUNLINK**

Disconnects the two STREAMs specified by fildes and arg from a persistent connection. The fildes argument is the file descriptor of the STREAM connected to the multiplexing driver. The arg argument is the multiplexer ID number that was returned by the I_PLINK ioctl() command when a STREAM was connected downstream from the multiplexing driver. If arg is MUXID_ALL, then all STREAMs which are persistent connections to fildes shall be disconnected. As in I_PLINK, this command requires the multiplexing driver to acknowledge the request.

The ioctl() function with the I_PUNLINK command shall fail if:

- [ENXIO] Hangup received on fildes.
- [ETIME] Timeout before acknowledgement message was received at STREAM head.
[EAGAIN] or [ENOMEM]
Unable to allocate buffers for the acknowledgement message.

[EINVAL] Invalid multiplexer ID number.

An I_PUNLINK can also fail while waiting for the multiplexing driver to acknowledge the request if a message indicating an error or a hangup is received at the STREAM head of fildes. In addition, an error code can be returned in the positive or negative acknowledgement message. For these cases, I_PUNLINK shall fail with errno set to the value in the message.

RETURN VALUE
Upon successful completion, ioctl() shall return a value other than −1 that depends upon the STREAMS device control function. Otherwise, it shall return −1 and set errno to indicate the error.

ERRORS
Under the following general conditions, ioctl() shall fail if:

[EBADF] The fildes argument is not a valid open file descriptor.

[EINTR] A signal was caught during the ioctl() operation.

[EINVAL] The STREAM or multiplexer referenced by fildes is linked (directly or indirectly) downstream from a multiplexer.

If an underlying device driver detects an error, then ioctl() shall fail if:

[EINVAL] The request or arg argument is not valid for this device.

[EIO] Some physical I/O error has occurred.

[ENOTTY] The fildes argument is not associated with a STREAMS device that accepts control functions.

[ENXIO] The request and arg arguments are valid for this device driver, but the service requested cannot be performed on this particular sub-device.

[ENODEV] The fildes argument refers to a valid STREAMS device, but the corresponding device driver does not support the ioctl() function.

If a STREAM is connected downstream from a multiplexer, any ioctl() command except I_UNLINK and I_PUNLINK shall set errno to [EINVAL].

EXAMPLES
None.

APPLICATION USAGE
The implementation-defined timeout interval for STREAMS has historically been 15 seconds.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Moved from X/OPEN UNIX extension to BASE.

The Open Group Corrigendum U028/4 is applied, correcting text in the I_FDINSERT [EINVAL] case to refer to `ctlbuf`.

This function is marked as part of the XSI STREAMS Option Group.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
isalnum — test for an alphanumeric character

SYNOPSIS
#include <ctype.h>
int isalnum(int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The isalnum() function shall test whether c is a character of class alpha or digit in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The c argument is an int, the value of which the application shall ensure is representable as an unsigned char or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE
The isalnum() function shall return non-zero if c is an alphanumeric character; otherwise, it shall return 0.

ERRORS
No errors are defined.

APPLICATION USAGE
To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME
isascii — test for a 7-bit US-ASCII character

SYNOPSIS

```c
#include <ctype.h>

int isascii(int c);
```

DESCRIPTION
The `isascii()` function shall test whether `c` is a 7-bit US-ASCII character code.

RETURN VALUE
The `isascii()` function shall return non-zero if `c` is a 7-bit US-ASCII character code between 0 and octal 0177 inclusive; otherwise, it shall return 0.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.
isastream() — test a file descriptor (STREAMS)

#include <stropts.h>

int isastream(int fildes);

The isastream() function shall test whether fildes, an open file descriptor, is associated with a STREAMS-based file.

Upon successful completion, isastream() shall return 1 if fildes refers to a STREAMS-based file and 0 if not. Otherwise, isastream() shall return −1 and set errno to indicate the error.

The isastream() function shall fail if:

[EBADF] The fildes argument is not a valid open file descriptor.

NAME
isatty — test for a terminal device

SYNOPSIS
#include <unistd.h>
int isatty(int fildes);

DESCRIPTION
The isatty() function shall test whether fildes, an open file descriptor, is associated with a
terminal device.

RETURN VALUE
The isatty() function shall return 1 if fildes is associated with a terminal; otherwise, it shall return
0 and may set errno to indicate the error.

ERRORS
The isatty() function may fail if:

[EBADF] The fildes argument is not a valid open file descriptor.
[ENOTTY] The fildes argument is not associated with a terminal.

EXAMPLES
None.

APPLICATION USAGE
The isatty() function does not necessarily indicate that a human being is available for interaction
via fildes. It is quite possible that non-terminal devices are connected to the communications
line.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
The Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

• The optional setting of errno to indicate an error is added.
• The [EBADF] and [ENOTTY] optional error conditions are added.
isblank() — test for a blank character

**SYNOPSIS**
```
#include <ctype.h>

int isblank(int c);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `isblank()` function shall test whether `c` is a character of class `blank` in the program’s current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The `c` argument is a type `int`, the value of which the application shall ensure is a character representable as an `unsigned char` or equal to the value of the macro `EOF`. If the argument has any other value, the behavior is undefined.

**RETURN VALUE**

The `isblank()` function shall return non-zero if `c` is a `<blank>`; otherwise, it shall return 0.

**ERRORS**

No errors are defined.

**APPLICATION USAGE**

To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

NAME
iscntrl — test for a control character

SYNOPSIS
#include <ctype.h>
int iscntrl(int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The iscntrl() function shall test whether c is a character of class cntrl in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The c argument is a type int, the value of which the application shall ensure is a character representable as an unsigned char or equal to the value of the macro EOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE
The iscntrl() function shall return non-zero if c is a control character; otherwise, it shall return 0.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for character classification.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
isdigit — test for a decimal digit

SYNOPSIS
#include <ctype.h>
int isdigit(int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The isdigit() function shall test whether c is a character of class digit in the program’s current
locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The c argument is an int, the value of which the application shall ensure is a character
representable as an unsigned char or equal to the value of the macro EOF. If the argument has
any other value, the behavior is undefined.

RETURN VALUE
The isdigit() function shall return non-zero if c is a decimal digit; otherwise, it shall return 0.

ERRORS
No errors are defined.

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
isgreater()  

NAME
isgreater — test if x greater than y

SYNOPSIS
#include <math.h>
int isgreater(real-floating x, real-floating y);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The isgreater() macro shall determine whether its first argument is greater than its second argument. The value of isgreater(x, y) shall be equal to (x) > (y); however, unlike (x) > (y), isgreater(x, y) shall not raise the invalid floating-point exception when x and y are unordered.

RETURN VALUE
Upon successful completion, the isgreater() macro shall return the value of (x) > (y).

If x or y is NaN, 0 shall be returned.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, real-floating indicates that the argument shall be an expression of real-floating type.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME

isgreaterequal — test if x is greater than or equal to y

SYNOPSIS

```
#include <math.h>

int isgreaterequal(real-floating x, real-floating y);
```

DESCRIPTION

CX The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This

The isgreaterequal() macro shall determine whether its first argument is greater than or equal to
its second argument. The value of isgreaterequal(x, y) shall be equal to (x) >= (y), however, unlike
(x) >= (y), isgreaterequal(x, y) shall not raise the invalid floating-point exception when x and y are
unordered.

RETURN VALUE

Upon successful completion, the isgreaterequal() macro shall return the value of (x) >= (y).

If x or y is NaN, 0 shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

islower( )

NAME
islower — test for a lowercase letter

SYNOPSIS
#include <ctype.h>
int islower(int c);

DESCRIPTION
CX The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The islower() function shall test whether c is a character of class lower in the program’s current
locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The c argument is an int, the value of which the application shall ensure is a character
representable as an unsigned char or equal to the value of the macro EOF. If the argument has
any other value, the behavior is undefined.

RETURN VALUE
The islower() function shall return non-zero if c is a lowercase letter; otherwise, it shall return 0.

ERRORS
No errors are defined.

EXAMPLES
Testing for a Lowercase Letter
The following example tests whether the value is a lowercase letter, based on the locale of the
user, then uses it as part of a key value.

#include <ctype.h>
#include <stdlib.h>
#include <locale.h>
...
char *keystr;
int elementlen, len;
char c;
...
setlocale(LC_ALL, "")
...
len = 0;
while (len < elementlen) {
    c = (char) (rand() % 256);
    ...
    if (islower(c))
        keystr[len++] = c;
    }

NAME
isunordered — test if arguments are unordered

SYNOPSIS
#include <math.h>
int isunordered(real-floating x, real-floating y);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The isunordered() macro shall determine whether its arguments are unordered.

RETURN VALUE
Upon successful completion, the isunordered() macro shall return 1 if its arguments are unordered, and 0 otherwise.

If x or y is NaN, 0 shall be returned.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The relational and equality operators support the usual mathematical relationships between numeric values. For any ordered pair of numeric values, exactly one of the relationships (less, greater, and equal) is true. Relational operators may raise the invalid floating-point exception when argument values are NaNs. For a NaN and a numeric value, or for two NaNs, just the unordered relationship is true. This macro is a quiet (non-floating-point exception raising) version of a relational operator. It facilitates writing efficient code that accounts for NaNs without suffering the invalid floating-point exception. In the SYNOPSIS section, real-floating indicates that the argument shall be an expression of real-floating type.

RATIONALE

CHANGE HISTORY
NAME
isupper — test for an uppercase letter

SYNOPSIS
#include <ctype.h>
int isupper(int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The isupper() function shall test whether c is a character of class upper in the program’s current
locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The c argument is an int, the value of which the application shall ensure is a character
representable as an unsigned char or equal to the value of the macro EOF. If the argument has
any other value, the behavior is undefined.

RETURN VALUE
The isupper() function shall return non-zero if c is an uppercase letter; otherwise, it shall return 0.

ERRORS
No errors are defined.

APPLICATION USAGE
To ensure applications portability, especially across natural languages, only this function and
those listed in the SEE ALSO section should be used for character classification.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
iswalnum — test for an alphanumeric wide-character code

SYNOPSIS
#include <wctype.h>
int iswalnum(wint_t wc);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The iswalnum() function shall test whether wc is a wide-character code representing a character
of class alpha or digit in the program’s current locale; see the Base Definitions volume of

The wc argument is a wint_t, the value of which the application shall ensure is a wide-character
code corresponding to a valid character in the current locale, or equal to the value of the macro
WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE
The iswalnum() function shall return non-zero if wc is an alphanumeric wide-character code;
otherwise, it shall return 0.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
To ensure applications portability, especially across natural languages, only this function and

First released in Issue 4.

**Issue 5**
The following change has been made in this issue for alignment with ISO/IEC 9899: 1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.

**Issue 6**
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME

iswctype — test character for a specified class

SYNOPSIS

#include <wctype.h>

int iswctype(wint_t wc, wctype_t charclass);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The iswctype() function shall determine whether the wide-character code wc has the character
class charclass, returning true or false. The iswctype() function is defined on WEOF and wide-
character codes corresponding to the valid character encodings in the current locale. If the wc
argument is not in the domain of the function, the result is undefined. If the value of charclass is
invalid (that is, not obtained by a call to wctype() or charclass is invalidated by a subsequent call
to setlocale() that has affected category LC_CTYPE) the result is unspecified.

RETURN VALUE

The iswctype() function shall return non-zero (true) if and only if wc has the property described
by charclass. If charclass is 0, iswctype() shall return 0.

ERRORS

No errors are defined.

EXAMPLES

Testing for a Valid Character

#include <wctype.h>
...
int yes_or_no;

wint_t wc;

wctype_t valid_class;
...

if ((valid_class=wctype("vowel")) == (wctype_t)0)
/* Invalid character class. */

yes_or_no=iswctype(wc,valid_class);

APPLICATION USAGE

The twelve strings "alnum", "alpha", "blank", "cntrl", "digit", "graph", "lower", "print", "punct", "space", "upper", and "xdigit" are reserved for the standard
class character classes. In the table below, the functions in the left column are equivalent to the
functions in the right column.

iswalnum(wc)    iswctype(wc, wctype("alnum"))
isalpha(wc)     iswctype(wc, wctype("alpha"))
isblank(wc)      iswctype(wc, wctype("blank"))
iswcntrl(wc)    iswctype(wc, wctype("cntrl"))
iswdigit(wc)    iswctype(wc, wctype("digit"))
iswgraph(wc)    iswctype(wc, wctype("graph"))
iswlower(wc)    iswctype(wc, wctype("lower"))
iswprint(wc)    iswctype(wc, wctype("print"))
iswpunct(wc)    iswctype(wc, wctype("punct"))
iswspace(wc)    iswctype(wc, wctype("space"))
iswctype() iswctype(wc, wctype("upper"))
iswctype(wc, wctype("xdigit"))

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

CHANGE HISTORY
First released as World-wide Portability Interfaces in Issue 4.

Issue 5
The following change has been made in this issue for alignment with
• The SYNOPSIS has been changed to indicate that this function and associated data types are
now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

Issue 6
The behavior of \( n=0 \) is now described.
An example is added.
A new function, \( \text{iswblank}() \), is added to the list in the APPLICATION USAGE.
NAME
iswdigit — test for a decimal digit wide-character code

SYNOPSIS
#include <wctype.h>

int iswdigit(wint_t wc);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The iswdigit() function shall test whether wc is a wide-character code representing a character of class digit in the program's current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The wc argument is a wint_t, the value of which the application shall ensure is a wide-character code corresponding to a valid character in the current locale, or equal to the value of the macro WEOF. If the argument has any other value, the behavior is undefined.

RETURN VALUE
The iswdigit() function shall return non-zero if wc is a decimal digit wide-character code; otherwise, it shall return 0.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
To ensure applications portability, especially across natural languages, only this function and those listed in the SEE ALSO section should be used for classification of wide-character codes.

isxdigit() — test for a hexadecimal digit

SYNOPSIS

```
#include <ctype.h>

int isxdigit(int c);
```

DESCRIPTION

The `isxdigit()` function shall test whether `c` is a character of class `xdigit` in the program’s current locale; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale.

The `c` argument is an `int`, the value of which the application shall ensure is a character representable as an `unsigned char` or equal to the value of the macro `EOF`. If the argument has any other value, the behavior is undefined.

RETURN VALUE

The `isxdigit()` function shall return non-zero if `c` is a hexadecimal digit; otherwise, it shall return 0.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
j0, j1, jn — Bessel functions of the first kind

SYNOPSIS
XSI
#include <math.h>

double j0(double x);
double j1(double x);
double jn(int n, double x);

DESCRIPTION
The j0(), j1(), and jn() functions shall compute Bessel functions of \( x \) of the first kind of orders 0, 1, and \( n \), respectively.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the relevant Bessel value of \( x \) of the first kind.

If the \( x \) argument is too large in magnitude, or the correct result would cause underflow, 0 shall be returned and a range error may occur.

If \( x \) is NaN, a NaN shall be returned.

ERRORS
These functions may fail if:

Range Error The value of \( x \) was too large in magnitude, or an underflow occurred.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

No other errors shall occur.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The may fail [EDOM] error is removed for the case for NaN.

The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling with the ISO/IEC 9899: 1999 standard.
NAME
jrand48 — generate a uniformly distributed pseudo-random long signed integer

SYNOPSIS
XSI
#include <stdlib.h>

long jrand48(unsigned short xsubi[3]);

DESCRIPTION
Refer to drand48().
NAME
kill — send a signal to a process or a group of processes

SYNOPSIS

```c
#include <signal.h>

int kill(pid_t pid, int sig);
```

DESCRIPTION
The `kill()` function shall send a signal to a process or a group of processes specified by `pid`. The signal to be sent is specified by `sig` and is either one from the list given in `<signal.h>` or 0. If `sig` is 0 (the null signal), error checking is performed but no signal is actually sent. The null signal can be used to check the validity of `pid`.

For a process to have permission to send a signal to a process designated by `pid`, unless the sending process has appropriate privileges, the real or effective user ID of the sending process shall match the real or saved set-user-ID of the receiving process.

If `pid` is greater than 0, `sig` shall be sent to the process whose process ID is equal to `pid`.

If `pid` is 0, `sig` shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the process group ID of the sender, and for which the process has permission to send a signal.

If `pid` is −1, `sig` shall be sent to all processes (excluding an unspecified set of system processes) for which the process has permission to send that signal.

If `pid` is negative, but not −1, `sig` shall be sent to all processes (excluding an unspecified set of system processes) whose process group ID is equal to the absolute value of `pid`, and for which the process has permission to send a signal.

If the value of `pid` causes `sig` to be generated for the sending process, and if `sig` is not blocked for the calling thread and if no other thread has `sig` unblocked or is waiting in a `sigwait()` function for `sig`, either `sig` or at least one pending unblocked signal shall be delivered to the sending thread before `kill()` returns.

The user ID tests described above shall not be applied when sending SIGCONT to a process that is a member of the same session as the sending process.

An implementation that provides extended security controls may impose further implementation-defined restrictions on the sending of signals, including the null signal. In particular, the system may deny the existence of some or all of the processes specified by `pid`.

The `kill()` function is successful if the process has permission to send `sig` to any of the processes specified by `pid`. If `kill()` fails, no signal shall be sent.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and `errno` set to indicate the error.

ERRORS
The `kill()` function shall fail if:

- `[EINVAL]` The value of the `sig` argument is an invalid or unsupported signal number.
- `[EPERM]` The process does not have permission to send the signal to any receiving process.
- `[ESRCH]` No process or process group can be found corresponding to that specified by `pid`.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The semantics for permission checking for \texttt{kill()} differed between System V and most other implementations, such as Version 7 or 4.3 BSD. The semantics chosen for this volume of IEEE Std 1003.1-2001 agree with System V. Specifically, a set-user-ID process cannot protect itself against signals (or at least not against SIGKILL) unless it changes its real user ID. This choice allows the user who starts an application to send it signals even if it changes its effective user ID. The other semantics give more power to an application that wants to protect itself from the user who ran it.

Some implementations provide semantic extensions to the \texttt{kill()} function when the absolute value of \texttt{pid} is greater than some maximum, or otherwise special, value. Negative values are a flag to \texttt{kill()}. Since most implementations return [ESRCH] in this case, this behavior is not included in this volume of IEEE Std 1003.1-2001, although a conforming implementation could provide such an extension.

The implementation-defined processes to which a signal cannot be sent may include the scheduler or \texttt{init}.

There was initially strong sentiment to specify that, if \texttt{pid} specifies that a signal be sent to the calling process and that signal is not blocked, that signal would be delivered before \texttt{kill()} returns. This would permit a process to call \texttt{kill()} and be guaranteed that the call never return. However, historical implementations that provide only the \texttt{signal()} function make only the weaker guarantee in this volume of IEEE Std 1003.1-2001, because they only deliver one signal each time a process enters the kernel. Modifications to such implementations to support the \texttt{sigaction()} function generally require entry to the kernel following return from a signal-catching function, in order to restore the signal mask. Such modifications have the effect of satisfying the stronger requirement, at least when \texttt{sigaction()} is used, but not necessarily when \texttt{signal()} is used. The developers of this volume of IEEE Std 1003.1-2001 considered making the stronger requirement except when \texttt{signal()} is used, but felt this would be unnecessarily complex. Implementors are encouraged to meet the stronger requirement whenever possible. In practice, the weaker requirement is the same, except in the rare case when two signals arrive during a very short window. This reasoning also applies to a similar requirement for \texttt{sigprocmask()}.

In 4.2 BSD, the SIGCONT signal can be sent to any descendant process regardless of user-ID security checks. This allows a job control shell to continue a job even if processes in the job have altered their user IDs (as in the \texttt{su} command). In keeping with the addition of the concept of sessions, similar functionality is provided by allowing the SIGCONT signal to be sent to any process in the same session regardless of user ID security checks. This is less restrictive than BSD in the sense that ancestor processes (in the same session) can now be the recipient. It is more restrictive than BSD in the sense that descendant processes that form new sessions are now subject to the user ID checks. A similar relaxation of security is not necessary for the other job control signals since those signals are typically sent by the terminal driver in recognition of special characters being typed; the terminal driver bypasses all security checks.

In secure implementations, a process may be restricted from sending a signal to a process having a different security label. In order to prevent the existence or nonexistence of a process from being used as a covert channel, such processes should appear nonexistent to the sender; that is, [ESRCH] should be returned, rather than [EPERM], if \texttt{pid} refers only to such processes.
Existing implementations vary on the result of a kill() with pid indicating an inactive process (a
terminated process that has not been waited for by its parent). Some indicate success on such a
call (subject to permission checking), while others give an error of [ESRCH]. Since the definition
of process lifetime in this volume of IEEE Std 1003.1-2001 covers inactive processes, the
[ESRCH] error as described is inappropriate in this case. In particular, this means that an
application cannot have a parent process check for termination of a particular child with kill().
(Usually this is done with the null signal; this can be done reliably with waitpid().)

There is some belief that the name kill() is misleading, since the function is not always intended
to cause process termination. However, the name is common to all historical implementations,
and any change would be in conflict with the goal of minimal changes to existing application
code.

**FUTURE DIRECTIONS**

None.

g getpid(), raise(), setsid(), sigaction(), sigqueue(), the Base Definitions volume of
IEEE Std 1003.1-2001, <signal.h>, <sys/types.h>

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**Issue 6**

In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

- In the DESCRIPTION, the second paragraph is reworded to indicate that the saved set-user-
  ID of the calling process is checked in place of its effective user ID. This is a FIPS
  requirement.

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
  required for conforming implementations of previous POSIX specifications, it was not
  required for UNIX applications.

- The behavior when pid is −1 is now specified. It was previously explicitly unspecified in the
  POSIX.1-1988 standard.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
killpg — send a signal to a process group

SYNOPSIS
#include <signal.h>
int killpg(pid_t pgrp, int sig);

DESCRIPTION
The killpg() function shall send the signal specified by sig to the process group specified by pgrp.

If pgrp is greater than 1, killpg(pgrp, sig) shall be equivalent to kill(−pgrp, sig). If pgrp is less than or equal to 1, the behavior of killpg() is undefined.

RETURN VALUE
Refer to kill().

ERRORS
Refer to kill().

EXAMPLES
None.

APPLICATION USAGE

NAME
l64a — convert a 32-bit integer to a radix-64 ASCII string

SYNOPSIS
XSI
#include <stdlib.h>
char *l64a(long value);

DESCRIPTION
Refer to a64l().
NAME
labs, llabs — return a long integer absolute value

SYNOPSIS
#include <stdlib.h>

long labs(long i);
long long llabs(long long i);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The labs() function shall compute the absolute value of the long integer operand i. The llabs() function
shall compute the absolute value of the long long integer operand i. If the result cannot be
represented, the behavior is undefined.

RETURN VALUE
The labs() function shall return the absolute value of the long integer operand. The labs() function
shall return the absolute value of the long long integer operand.

ERRORS
No errors are defined.

APPLICATION USAGE
None.

RATIONALE
None.

Issue 6
The llabs() function is added for alignment with the ISO/IEC 9899:1999 standard.
lchown( )

NAME
lchown — change the owner and group of a symbolic link

SYNOPSIS
#include <unistd.h>

int lchown(const char *path, uid_t owner, gid_t group);

DESCRIPTION
The lchown() function shall be equivalent to chown(), except in the case where the named file is a
symbolic link. In this case, lchown() shall change the ownership of the symbolic link file itself,
while chown() changes the ownership of the file or directory to which the symbolic link refers.

RETURN VALUE
Upon successful completion, lchown() shall return 0. Otherwise, it shall return −1 and set errno to
indicate an error.

ERRORS
The lchown() function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix of path.

EINVAL The owner or group ID is not a value supported by the implementation.

[ENOENT] A component of path does not name an existing file or path is an empty string.

[ENOENT] A component of the path prefix of path is not a directory.

[EOPNOTSUPP] The path argument names a symbolic link and the implementation does not
support setting the owner or group of a symbolic link.

[EPERM] The effective user ID does not match the owner of the file and the process
does not have appropriate privileges.

[EROFS] The file resides on a read-only file system.

The lchown() function may fail if:

[EIO] An I/O error occurred while reading or writing to the file system.

[EINTR] A signal was caught during execution of the function.

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during
resolution of the path argument.

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
whose length exceeds [PATH_MAX].
EXAMPLES

Changing the Current Owner of a File

The following example shows how to change the ownership of the symbolic link named /modules/pass1 to the user ID associated with “jones” and the group ID associated with “cnd”.

The numeric value for the user ID is obtained by using the getpwnam() function. The numeric value for the group ID is obtained by using the getgrnam() function.

#include <sys/types.h>
#include <unistd.h>
#include <pwd.h>
#include <grp.h>

struct passwd *pwd;
struct group *grp;
char *path = "/modules/pass1";
...

pwd = getpwnam("jones");
grp = getgrnam("cnd");
lchown(path, pwd->pw_uid, grp->gr_gid);

APPLICATION USAGE

On implementations which support symbolic links as directory entries rather than files, lchown() may fail.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

The Open Group Base Resolution bwg2001-013 is applied, adding wording to the APPLICATION USAGE.
lcong48() — seed a uniformly distributed pseudo-random signed long integer generator

SYNOPSIS

```c
#include <stdlib.h>

void lcong48(unsigned short param[7]);
```

DESCRIPTION

Refer to `drand48()`.
NAME
ldexp, ldexpf, ldexpl — load exponent of a floating-point number

SYNOPSIS
#include <math.h>

double ldexp(double x, int exp);
float ldexpf(float x, int exp);
long double ldexpl(long double x, int exp);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the quantity $x \times 2^\text{exp}$.

An application wishing to check for error situations should set $\text{errno}$ to zero and call $\text{feclearexcept}(\text{FE_ALL_EXCEPT})$ before calling these functions. On return, if $\text{errno}$ is non-zero or $\text{fetestexcept}(\text{FE_INVALID} \mid \text{FE_DIVBYZERO} \mid \text{FE_OVERFLOW} \mid \text{FE_UNDERFLOW})$ is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return $x$ multiplied by 2, raised to the power $\text{exp}$.

If these functions would cause overflow, a range error shall occur and $\text{ldexp}()$, $\text{ldexpf}()$, and $\text{ldexpl}()$ shall return $\pm \text{HUGE_VAL}$, $\pm \text{HUGE_VALF}$, and $\pm \text{HUGE_VALL}$ (according to the sign of $x$), respectively.

If the correct value would cause underflow, and is not representable, a range error may occur, and either 0.0 (if supported), or an implementation-defined value shall be returned.

If $x$ is NaN, a NaN shall be returned.

If $x$ is $\pm 0$ or $\pm \text{Inf}$, $x$ shall be returned.

If $\text{exp}$ is 0, $x$ shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS
These functions shall fail if:

Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then $\text{errno}$ shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then $\text{errno}$ shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.
idexp()

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6
The ldexpf() and ldexpl() functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

NAME
ldiv, lldiv — compute quotient and remainder of a long division

SYNOPSIS
#include <stdlib.h>
ldiv_t ldiv(long numer, long denom);
lldiv_t lldiv(long long numer, long long denom);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
These functions shall compute the quotient and remainder of the division of the numerator
numer by the denominator denom. If the division is inexact, the resulting quotient is the long
integer (for the ldiv() function) or long long integer (for the lldiv() function) of lesser magnitude
that is the nearest to the algebraic quotient. If the result cannot be represented, the behavior is
undefined; otherwise, quot * denom + rem shall equal numer.

RETURN VALUE
The ldiv() function shall return a structure of type ldiv_t, comprising both the quotient and the
remainder. The structure shall include the following members, in any order:
long quot; /* Quotient */
long rem; /* Remainder */
The lldiv() function shall return a structure of type lldiv_t, comprising both the quotient and the
remainder. The structure shall include the following members, in any order:
long long quot; /* Quotient */
long long rem; /* Remainder */

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME
lfind — find entry in a linear search table

SYNOPSIS
XSI
#include <search.h>

void *lfind(const void *key, const void *base, size_t *nelp,
size_t width, int (*compar)(const void *, const void *));

DESCRIPTION
Refer to lsearch().
NAME
lgamma, lgammaf, lgammal — log gamma function

SYNOPSIS
#include <math.h>
double lgamma(double x);
float lgammaf(float x);
long double lgammal(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

These functions shall compute \log_\Gamma(x) where \Gamma(x) is defined as \( \int_0^\infty e^{-t} t^{x-1} \, dt \). The argument \( x \) need not be a non-positive integer (\( \Gamma(x) \) is defined over the reals, except the non-positive
integers).

The sign of \( \Gamma(x) \) is returned in the external integer signgam.

These functions need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

An application wishing to check for error situations should set errno to zero and call
feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the logarithmic gamma of \( x \).

If \( x \) is a non-positive integer, a pole error shall occur and lgamma(), lgammaf(), and lgammal() shall return +HUGE_VAL, +HUGE_VALF, and +HUGE_VALL, respectively.

If the correct value would cause overflow, a range error shall occur and lgamma(), lgammaf(), and lgammal() shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (having the same
sign as the correct value), respectively.

If \( x \) is NaN, a NaN shall be returned.

If \( x \) is 1 or 2, +0 shall be returned.

If \( x \) is ±Inf, +Inf shall be returned.

ERRORS
These functions shall fail if:

Pole Error The \( x \) argument is a negative integer or zero.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

Range Error The result overflows.
If the integer expression \((\text{math\_errhandling} \& \text{MATH\_ERRNO})\) is non-zero, then \(\text{errno}\) shall be set to [ERANGE]. If the integer expression \((\text{math\_errhandling} \& \text{MATH\_ERREXCEPT})\) is non-zero, then the overflow floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions \((\text{math\_errhandling} \& \text{MATH\_ERRNO})\) and \((\text{math\_errhandling} \& \text{MATH\_ERREXCEPT})\) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 3.

**Issue 5**

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The \(\text{lgamma()}\) function is no longer marked as an extension.

The \(\text{lgammaf()}\) and \(\text{lgammal()}\) functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

XSI extensions are marked.
**NAME**
link — link to a file

**SYNOPSIS**
```c
#include <unistd.h>
int link(const char *path1, const char *path2);
```

**DESCRIPTION**
The `link()` function shall create a new link (directory entry) for the existing file, `path1`.

The `path1` argument points to a pathname naming an existing file. The `path2` argument points to a pathname naming the new directory entry to be created. The `link()` function shall atomically create a new link for the existing file and the link count of the file shall be incremented by one.

If `path1` names a directory, `link()` shall fail unless the process has appropriate privileges and the implementation supports using `link()` on directories.

Upon successful completion, `link()` shall mark for update the `st_ctime` field of the file. Also, the `st_ctime` and `st_mtime` fields of the directory that contains the new entry shall be marked for update.

If `link()` fails, no link shall be created and the link count of the file shall remain unchanged.

The implementation may require that the calling process has permission to access the existing file.

**RETURN VALUE**
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and `errno` set to indicate the error.

**ERRORS**
The `link()` function shall fail if:

- `[EACCES]` A component of either path prefix denies search permission, or the requested link requires writing in a directory that denies write permission, or the calling process does not have permission to access the existing file and this is required by the implementation.

- `[EXISTS]` `path2` argument resolves to an existing file or refers to a symbolic link.

- `[ELOOP]` A loop exists in symbolic links encountered during resolution of the `path1` or `path2` argument.

- `[EMLINK]` The number of links to the file named by `path1` would exceed `{LINK_MAX}`.

- `[ENAMETOOLONG]` The length of the `path1` or `path2` argument exceeds `{PATH_MAX}` or a pathname component is longer than `{NAME_MAX}`.

- `[ENOENT]` A component of either path prefix does not exist; the file named by `path1` does not exist; or `path1` or `path2` points to an empty string.

- `[ENOSPC]` The directory to contain the link cannot be extended.

- `[ENOTDIR]` A component of either path prefix is not a directory.

- `[EPERM]` The file named by `path1` is a directory and either the calling process does not have appropriate privileges or the implementation prohibits using `link()` on directories.
The requested link requires writing in a directory on a read-only file system.

The link named by path2 and the file named by path1 are on different file systems and the implementation does not support links between file systems.

path1 refers to a named STREAM.

The link() function may fail if:

More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the path1 or path2 argument.

As a result of encountering a symbolic link in resolution of the path1 or path2 argument, the length of the substituted pathname string exceeded {PATH_MAX}.

**EXAMPLES**

**Creating a Link to a File**

The following example shows how to create a link to a file named `/home/cnd/mod1` by creating a new directory entry named `/modules/pass1`.

```c
#include <unistd.h>
char *path1 = "/home/cnd/mod1";
char *path2 = "/modules/pass1";
int status;
...
status = link (path1, path2);
```

**Creating a Link to a File Within a Program**

In the following program example, the link() function links the `/etc/passwd` file (defined as PASSWDFILE) to a file named `/etc/opasswd` (defined as SAVEFILE), which is used to save the current password file. Then, after removing the current password file (defined as PASSWDFILE), the new password file is saved as the current password file using the link() function again.

```c
#include <unistd.h>
#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* Save current password file */
link (PASSWDFILE, SAVEFILE);
/* Remove current password file. */
unlink (PASSWDFILE);
/* Save new password file as current password file. */
link (LOCKFILE,PASSWDFILE);
```
APPLICATION USAGE
Some implementations do allow links between file systems.

RATIONALE
Linking to a directory is restricted to the superuser in most historical implementations because this capability may produce loops in the file hierarchy or otherwise corrupt the file system. This volume of IEEE Std 1003.1-2001 continues that philosophy by prohibiting `link()` and `unlink()` from doing this. Other functions could do it if the implementor designed such an extension.

Some historical implementations allow linking of files on different file systems. Wording was added to explicitly allow this optional behavior.

The exception for cross-file system links is intended to apply only to links that are programmatically indistinguishable from “hard” links.

FUTURE DIRECTIONS
None.

SEE ALSO
`symlink()`, `unlink()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- An explanation is added of the action when `path2` refers to a symbolic link.
- The [ELOOP] optional error condition is added.
NAME
lio_listio — list directed I/O (REALTIME)

SYNOPSIS
#include <aio.h>

int lio_listio(int mode, struct aiocb *restrict const list[restrict], int nent, struct sigevent *restrict sig);

DESCRIPTION
The lio_listio() function shall initiate a list of I/O requests with a single function call.

The mode argument takes one of the values LIO_WAIT or LIO_NOWAIT declared in <aio.h> and determines whether the function returns when the I/O operations have been completed, or as soon as the operations have been queued. If the mode argument is LIO_WAIT, the function shall wait until all I/O is complete and the sig argument shall be ignored.

If the mode argument is LIO_NOWAIT, the function shall return immediately, and asynchronous notification shall occur, according to the sig argument, when all the I/O operations complete. If sig is NULL, then no asynchronous notification shall occur. If sig is not NULL, asynchronous notification occurs as specified in Section 2.4.1 (on page 28) when all the requests in list have completed.

The I/O requests enumerated by list are submitted in an unspecified order.

The list argument is an array of pointers to aiocb structures. The array contains nent elements. The array may contain NULL elements, which shall be ignored.

The aio_lio_opcode field of each aiocb structure specifies the operation to be performed. The supported operations are LIO_READ, LIO_WRITE, and LIO_NOP; these symbols are defined in <aio.h>. The LIO_NOP operation causes the list entry to be ignored. If the aio_lio_opcode element is equal to LIO_READ, then an I/O operation is submitted as if by a call to aio_read() with the aiocbp equal to the address of the aiocb structure. If the aio_lio_opcode element is equal to LIO_WRITE, then an I/O operation is submitted as if by a call to aio_write() with the aiocbp equal to the address of the aiocb structure.

The aio_fildes member specifies the file descriptor on which the operation is to be performed.

The aio_buf member specifies the address of the buffer to or from which the data is transferred.

The aio_nbytes member specifies the number of bytes of data to be transferred.

The members of the aiocb structure further describe the I/O operation to be performed, in a manner identical to that of the corresponding aiocb structure when used by the aio_read() and aio_write() functions.

The nent argument specifies how many elements are members of the list; that is, the length of the array.

The behavior of this function is altered according to the definitions of synchronized I/O data integrity completion and synchronized I/O file integrity completion if synchronized I/O is enabled on the file associated with aio_fildes.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with aiocbp->aio_fildes.
RETURN VALUE

If the `mode` argument has the value `LIO_NOWAIT`, the `lio_listio()` function shall return the value
zero if the I/O operations are successfully queued; otherwise, the function shall return the value
−1 and set `errno` to indicate the error.

If the `mode` argument has the value `LIO_WAIT`, the `lio_listio()` function shall return the value
zero when all the indicated I/O has completed successfully. Otherwise, `lio_listio()` shall return a
value of −1 and set `errno` to indicate the error.

In either case, the return value only indicates the success or failure of the `lio_listio()` call itself,
not the status of the individual I/O requests. In some cases one or more of the I/O requests
contained in the list may fail. Failure of an individual request does not prevent completion of
any other individual request. To determine the outcome of each I/O request, the application
shall examine the error status associated with each `aiocb` control block. The error statuses so
returned are identical to those returned as the result of an `aio_read()` or `aio_write()` function.

ERRORS

The `lio_listio()` function shall fail if:

- **[EAGAIN]** The resources necessary to queue all the I/O requests were not available. The
  application may check the error status for each `aiocb` to determine the
  individual request(s) that failed.

- **[EAGAIN]** The number of entries indicated by `nent` would cause the system-wide limit
  `[AIO_MAX]` to be exceeded.

- **[EINVAL]** The `mode` argument is not a proper value, or the value of `nent` was greater than
  `[AIO_LISTIO_MAX]`.

- **[EINTR]** A signal was delivered while waiting for all I/O requests to complete during
  an `LIO_WAIT` operation. Note that, since each I/O operation invoked by
  `lio_listio()` may possibly provoke a signal when it completes, this error return
  may be caused by the completion of one (or more) of the very I/O operations
  being awaited. Outstanding I/O requests are not canceled, and the application
  shall examine each list element to determine whether the request was
  initiated, canceled, or completed.

- **[EIO]** One or more of the individual I/O operations failed. The application may
  check the error status for each `aiocb` structure to determine the individual
  request(s) that failed.

In addition to the errors returned by the `lio_listio()` function, if the `lio_listio()` function succeeds
or fails with errors of [EAGAIN], [EINTR], or [EIO], then some of the I/O specified by the list
may have been initiated. If the `lio_listio()` function fails with an error code other than [EAGAIN],
[EINTR], or [EIO], no operations from the list shall have been initiated. The I/O operation
indicated by each list element can encounter errors specific to the individual read or write
function being performed. In this event, the error status for each `aiocb` control block contains the
associated error code. The error codes that can be set are the same as would be set by a `read()` or
`write()` function, with the following additional error codes possible:

- **[EAGAIN]** The requested I/O operation was not queued due to resource limitations.

- **[ECANCELED]** The requested I/O was canceled before the I/O completed due to an explicit
  `aio_cancel()` request.

- **[EFBIG]** The `aiocbp->aio_llio_opcode` is `LIO_WRITE`, the file is a regular file,
  `aiocbp->aio_nbytes` is greater than 0, and the `aiocbp->aio_offset` is greater than or
equal to the offset maximum in the open file description associated with
lio_listio()  

aiocbp->aio_fildes.

22767 [EINPROGRESS] The requested I/O is in progress.

22768 [EOVERFLOW] The aiocbp->aio_lio_opcode is LIO_READ, the file is a regular file,
22769 aiocbp->aio_nbytes is greater than 0, and the aiocbp->aio_offset is before the
22770 end-of-file and is greater than or equal to the offset maximum in the open file
22771 description associated with aiocbp->aio_fildes.

22772 EXAMPLES
22773 None.

22774 APPLICATION USAGE
22775 None.

22776 RATIONALE
22777 Although it may appear that there are inconsistencies in the specified circumstances for error
22778 codes, the [EIO] error condition applies when any circumstance relating to an individual
22779 operation makes that operation fail. This might be due to a badly formulated request (for
22780 example, the aio_lio_opcode field is invalid, and aio_error() returns [EINVAL]) or might arise from
22781 application behavior (for example, the file descriptor is closed before the operation is initiated,
22782 and aio_error() returns [EBADF]).

22783 The limitation on the set of error codes returned when operations from the list shall have been
22784 initiated enables applications to know when operations have been started and whether
22785 aio_error() is valid for a specific operation.

22786 FUTURE DIRECTIONS
22787 None.

22788 SEE ALSO
22789 aio_read(), aio_write(), aio_error(), aio_return(), aio_cancel(), close(), exec, exit(), fork(), lseek(),
22790 read(), the Base Definitions volume of IEEE Std 1003.1-2001, <aio.h>

22791 CHANGE HISTORY
22792 First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
22793 Large File Summit extensions are added.

22794 Issue 6
22795 The [ENOSYS] error condition has been removed as stubs need not be provided if an
22796 implementation does not support the Asynchronous Input and Output option.

22797 The lio_listio() function is marked as part of the Asynchronous Input and Output option.

22798 The following new requirements on POSIX implementations derive from alignment with the
22799 Single UNIX Specification:

22800 • In the DESCRIPTION, text is added to indicate that for regular files no data transfer occurs
22801 past the offset maximum established in the open file description associated with
22802 aiocbp->aio_fildes. This change is to support large files.

22803 • The [EBIG] and [EOVERFLOW] error conditions are defined. This change is to support large
22804 files.

22805 The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

22806 The restrict keyword is added to the lio_listio() prototype for alignment with the
NAME
listen — listen for socket connections and limit the queue of incoming connections

SYNOPSIS
#include <sys/socket.h>
int listen(int socket, int backlog);

DESCRIPTION
The listen() function shall mark a connection-mode socket, specified by the socket argument, as
accepting connections.

The backlog argument provides a hint to the implementation which the implementation shall use
to limit the number of outstanding connections in the socket’s listen queue. Implementations
may impose a limit on backlog and silently reduce the specified value. Normally, a larger backlog
argument value shall result in a larger or equal length of the listen queue. Implementations shall
support values of backlog up to SOMAXCONN, defined in <sys/socket.h>.

The implementation may include incomplete connections in its listen queue. The limits on the
number of incomplete connections and completed connections queued may be different.

The implementation may have an upper limit on the length of the listen queue—either global or
per accepting socket. If backlog exceeds this limit, the length of the listen queue is set to the limit.

If listen() is called with a backlog argument value that is less than 0, the function behaves as if it
had been called with a backlog argument value of 0.

A backlog argument of 0 may allow the socket to accept connections, in which case the length of
the listen queue may be set to an implementation-defined minimum value.

The socket in use may require the process to have appropriate privileges to use the listen() function.

RETURN VALUE
Upon successful completions, listen() shall return 0; otherwise, −1 shall be returned and errno set
to indicate the error.

ERRORS
The listen() function shall fail if:

[EBADF] The socket argument is not a valid file descriptor.
[EDESTADDRREQ] The socket is not bound to a local address, and the protocol does not support
listening on an unbound socket.
[EINVAL] The socket is already connected.
[ENOTSOCK] The socket argument does not refer to a socket.
[EOPNOTSUPP] The socket protocol does not support listen().

The listen() function may fail if:

[EACCES] The calling process does not have the appropriate privileges.
[EINVAL] The socket has been shut down.
[ENOBUFS] Insufficient resources are available in the system to complete the call.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

accept(), connect(), socket(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>

CHANGE HISTORY
First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The DESCRIPTION is updated to describe the relationship of SOMAXCONN and the backlog argument.
NAME
llabs — return a long integer absolute value

SYNOPSIS
#include <stdlib.h>
long long llabs(long long i);

DESCRIPTION
Refer to labs().
**NAME**

lldiv — compute quotient and remainder of a long division

**SYNOPSIS**

```c
#include <stdlib.h>

lldiv_t lldiv(long long numer, long long denom);
```

**DESCRIPTION**

Refer to *ldiv*. 
NAME
llrint, llrintf, llrintl — round to the nearest integer value using current rounding direction

SYNOPSIS
#include <math.h>

long long llrint(double x);
long long llrintf(float x);
long long llrintl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the rounded integer value.

If x is NaN, a domain error shall occur, and an unspecified value is returned.

If x is +Inf, a domain error shall occur and an unspecified value is returned.

If x is −Inf, a domain error shall occur and an unspecified value is returned.

If the correct value is positive and too large to represent as a long long, a domain error shall occur and an unspecified value is returned.

If the correct value is negative and too large to represent as a long long, a domain error shall occur and an unspecified value is returned.

ERRORS
These functions shall fail if:

Domain Error  The x argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact
floating-point exception.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`feclearexcept()`, `fetestexcept()`, `lrint()`, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions, `<math.h>`

**CHANGE HISTORY**

NAME
llround(), llroundf(), llroundl — round to nearest integer value

SYNOPSIS
#include <math.h>

long long llround(double x);
long long llroundf(float x);
long long llroundl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the rounded integer value.

MX If x is NaN, a domain error shall occur, and an unspecified value is returned.
MX If x is +Inf, a domain error shall occur and an unspecified value is returned.
MX If x is −Inf, a domain error shall occur and an unspecified value is returned.
MX If the correct value is positive and too large to represent as a long long, a domain error shall occur and an unspecified value is returned.
MX If the correct value is negative and too large to represent as a long long, a domain error shall occur and an unspecified value is returned.

ERRORS
These functions shall fail if:

MX Domain Error The x argument is NaN or ±Inf, or the correct value is not representable as an integer.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
These functions differ from the llrint() functions in that the default rounding direction for the llround() functions round halfway cases away from zero and need not raise the inexact floating-point exception for non-integer arguments that round to within the range of the return type.
FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME
localeconv — return locale-specific information

SYNOPSIS
#include <locale.h>
struct lconv *localeconv(void);

DESCRIPTION
CX The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The localeconv() function shall set the components of an object with the type struct lconv with
the values appropriate for the formatting of numeric quantities (monetary and otherwise)
according to the rules of the current locale.

The members of the structure with type char * are pointers to strings, any of which (except
decimal_point) can point to "", to indicate that the value is not available in the current locale or
is of zero length. The members with type char are non-negative numbers, any of which can be
{CHAR_MAX} to indicate that the value is not available in the current locale.

The members include the following:

char *decimal_point
The radix character used to format non-monetary quantities.

cchar *thousands_sep
The character used to separate groups of digits before the decimal-point character in
formatted non-monetary quantities.

cchar *grouping
A string whose elements taken as one-byte integer values indicate the size of each group of
digits in formatted non-monetary quantities.

cchar *int_curr_symbol
The international currency symbol applicable to the current locale. The first three
characters contain the alphabetic international currency symbol in accordance with those
specified in the ISO 4217:2001 standard. The fourth character (immediately preceding the
null byte) is the character used to separate the international currency symbol from the
monetary quantity.

cchar *currency_symbol
The local currency symbol applicable to the current locale.

cchar *mon_decimal_point
The radix character used to format monetary quantities.

cchar *mon_thousands_sep
The separator for groups of digits before the decimal-point in formatted monetary
quantities.

cchar *mon_grouping
A string whose elements taken as one-byte integer values indicate the size of each group of
digits in formatted monetary quantities.

cchar *positive_sign
The string used to indicate a non-negative valued formatted monetary quantity.
localeconv()

char *negative_sign
    The string used to indicate a negative valued formatted monetary quantity.

char int_frac_digits
    The number of fractional digits (those after the decimal-point) to be displayed in an
    internationally formatted monetary quantity.

char frac_digits
    The number of fractional digits (those after the decimal-point) to be displayed in a
    formatted monetary quantity.

cchar p_cs_precedes
    Set to 1 if the currency_symbol precedes the value for a non-negative formatted monetary
    quantity. Set to 0 if the symbol succeeds the value.

cchar p_sep_by_space
    Set to a value indicating the separation of the currency_symbol, the sign string, and the
    value for a non-negative formatted monetary quantity.

cchar n_n_cs_precedes
    Set to 1 if the currency_symbol precedes the value for a negative formatted monetary
    quantity. Set to 0 if the symbol succeeds the value.

cchar n_sep_by_space
    Set to a value indicating the separation of the currency_symbol, the sign string, and the
    value for a negative formatted monetary quantity.

cchar p_sign_posn
    Set to a value indicating the positioning of the positive_sign for a non-negative formatted
    monetary quantity.

cchar n_sign_posn
    Set to a value indicating the positioning of the negative_sign for a negative formatted
    monetary quantity.

char int_p_cs_precedes
    Set to 1 or 0 if the int_curr_symbol respectively precedes or succeeds the value for a non-
    negative internationally formatted monetary quantity.

char int_n_cs_precedes
    Set to 1 or 0 if the int_curr_symbol respectively precedes or succeeds the value for a
    negative internationally formatted monetary quantity.

char int_p_sep_by_space
    Set to a value indicating the separation of the int_curr_symbol, the sign string, and the
    value for a non-negative internationally formatted monetary quantity.

char int_n_sep_by_space
    Set to a value indicating the separation of the int_curr_symbol, the sign string, and the
    value for a negative internationally formatted monetary quantity.

char int_p_sign_posn
    Set to a value indicating the positioning of the positive_sign for a non-negative
    internationally formatted monetary quantity.

char int_n_sign_posn
    Set to a value indicating the positioning of the negative_sign for a negative internationally
    formatted monetary quantity.
The elements of `grouping` and `mon_grouping` are interpreted according to the following:

- **[CHAR_MAX]**: No further grouping is to be performed.
- **0**: The previous element is to be repeatedly used for the remainder of the digits.
- **other**: The integer value is the number of digits that comprise the current group. The next element is examined to determine the size of the next group of digits before the current group.

The values of `p_sep_by_space`, `n_sep_by_space`, `int_p_sep_by_space`, and `int_n_sep_by_space` are interpreted according to the following:

- **0**: No space separates the currency symbol and value.
- **1**: If the currency symbol and sign string are adjacent, a space separates them from the value; otherwise, a space separates the currency symbol from the value.
- **2**: If the currency symbol and sign string are adjacent, a space separates them; otherwise, a space separates the sign string from the value.

For `int_p_sep_by_space` and `int_n_sep_by_space`, the fourth character of `int_curr_symbol` is used instead of a space.

The values of `p_sign_posn`, `n_sign_posn`, `int_p_sign_posn`, and `int_n_sign_posn` are interpreted according to the following:

- **0**: Parentheses surround the quantity and `currency_symbol` or `int_curr_symbol`.
- **1**: The sign string precedes the quantity and `currency_symbol` or `int_curr_symbol`.
- **2**: The sign string succeeds the quantity and `currency_symbol` or `int_curr_symbol`.
- **3**: The sign string immediately precedes the `currency_symbol` or `int_curr_symbol`.
- **4**: The sign string immediately succeeds the `currency_symbol` or `int_curr_symbol`.

The implementation shall behave as if no function in this volume of IEEE Std 1003.1-2001 calls `localeconv()`.

**RETURN VALUE**

The `localeconv()` function shall return a pointer to the filled-in object. The application shall not modify the structure pointed to by the return value which may be overwritten by a subsequent call to `localeconv()`. In addition, calls to `setlocale()` with the categories `LC_ALL`, `LC_MONETARY`, or `LC_NUMERIC` may overwrite the contents of the structure.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

The following table illustrates the rules which may be used by four countries to format monetary quantities.
localeconv()

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

A note indicating that this function need not be reentrant is added to the DESCRIPTION.

The RETURN VALUE section is rewritten to avoid use of the term "must".

This reference page is updated for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/31 is applied, removing references to `int_curr_symbol` and updating the descriptions of `p_sep_by_space` and `n_sep_by_space`. These changes are for alignment with the ISO C standard.
NAME
localtime, localtime_r — convert a time value to a broken-down local time

SYNOPSIS
#include <time.h>

struct tm *localtime(const time_t *timer);

struct tm *localtime_r(const time_t *restrict timer,
                      struct tm *restrict result);

DESCRIPTION
For localtime(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The localtime() function shall convert the time in seconds since the Epoch pointed to by timer into a broken-down time, expressed as a local time. The function corrects for the timezone and any seasonal time adjustments. Local timezone information is used as though localtime() calls tzset().

The relationship between a time in seconds since the Epoch used as an argument to localtime() and the tm structure (defined in the <time.h> header) is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch) corrected for timezone and any seasonal time adjustments, where the names in the structure and in the expression correspond.

The same relationship shall apply for localtime_r().

The localtime() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The asctime(), ctime(), gmtime(), and localtime() functions shall return values in one of two static objects: a broken-down time structure and an array of type char. Execution of any of the functions may overwrite the information returned in either of these objects by any of the other functions.

The localtime_r() function shall convert the time in seconds since the Epoch pointed to by timer into a broken-down time stored in the structure to which result points. The localtime_r() function shall also return a pointer to that same structure.

Unlike localtime(), the reentrant version is not required to set tzname.

RETURN VALUE
Upon successful completion, the localtime() function shall return a pointer to the broken-down time structure. If an error is detected, localtime() shall return a null pointer and set errno to indicate the error.

Upon successful completion, localtime_r() shall return a pointer to the structure pointed to by the argument result.

ERRORS
The localtime() function shall fail if:

[EOVERFLOW] The result cannot be represented.
EXAMPLES

Getting the Local Date and Time

The following example uses the `time()` function to calculate the time elapsed, in seconds, since January 1, 1970 0:00 UTC (the Epoch), `localtime()` to convert that value to a broken-down time, and `asctime()` to convert the broken-down time values into a printable string.

```c
#include <stdio.h>
#include <time.h>

int main(void)
{
    time_t result;
    result = time(NULL);
    printf("%s%ju secs since the Epoch\n",
           asctime(localtime(&result)),
           (uintmax_t)result);
    return(0);
}
```

This example writes the current time to `stdout` in a form like this:

```
835810335 secs since the Epoch
```

Getting the Modification Time for a File

The following example gets the modification time for a file. The `localtime()` function converts the `time_t` value of the last modification date, obtained by a previous call to `stat()`, into a `tm` structure that contains the year, month, day, and so on.

```c
#include <time.h>
...
struct stat statbuf;
...
```

Timing an Event

The following example gets the current time, converts it to a string using `localtime()` and `asctime()`, and prints it to standard output using `fputs()`. It then prints the number of minutes to an event being timed.

```c
#include <time.h>
#include <stdio.h>
...
time_t now;
int minutes_to_event;
...
time(&now);
printf("The time is ");
fputs(asctime(localtime(&now)), stdout);
printf("There are still %d minutes to the event.\n", minutes_to_event);
```
localtime()

```c
    minutes_to_event);

..."

APPLICATION USAGE

The `localtime_r()` function is thread-safe and returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

A note indicating that the `localtime()` function need not be reentrant is added to the DESCRIPTION.

The `localtime_r()` function is included for alignment with the POSIX Threads Extension.

Issue 6

The `localtime_r()` function is marked as part of the Thread-Safe Functions option.

Extensions beyond the ISO C standard are marked.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The `restrict` keyword is added to the `localtime_r()` prototype for alignment with the ISO/IEC 9899:1999 standard.

Examples are added.

NAME
lockf — record locking on files

SYNOPSIS
XSI
#include <unistd.h>

int lockf(int fildes, int function, off_t size);

DESCRIPTION
The lockf() function shall lock sections of a file with advisory-mode locks. Calls to lockf() from other threads which attempt to lock the locked file section shall either return an error value or block until the section becomes unlocked. All the locks for a process are removed when the process terminates. Record locking with lockf() shall be supported for regular files and may be supported for other files.

The fildes argument is an open file descriptor. To establish a lock with this function, the file descriptor shall be opened with write-only permission (O_WRONLY) or with read/write permission (O_RDWR).

The function argument is a control value which specifies the action to be taken. The permissible values for function are defined in <unistd.h> as follows:

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>F_ULOCK</td>
<td>Unlock locked sections.</td>
</tr>
<tr>
<td>F_LOCK</td>
<td>Lock a section for exclusive use.</td>
</tr>
<tr>
<td>F_TLOCK</td>
<td>Test and lock a section for exclusive use.</td>
</tr>
<tr>
<td>F_TEST</td>
<td>Test a section for locks by other processes.</td>
</tr>
</tbody>
</table>

F_TEST shall detect if a lock by another process is present on the specified section.

F_LOCK and F_TLOCK shall both lock a section of a file if the section is available.

F_ULOCK shall remove locks from a section of the file.

The size argument is the number of contiguous bytes to be locked or unlocked. The section to be locked or unlocked starts at the current offset in the file and extends forward for a positive size or backward for a negative size (the preceding bytes up to but not including the current offset).

If size is 0, the section from the current offset through the largest possible file offset shall be locked (that is, from the current offset through the present or any future end-of-file). An area need not be allocated to the file to be locked because locks may exist past the end-of-file.

The sections locked with F_LOCK or F_TLOCK may, in whole or in part, contain or be contained by a previously locked section for the same process. When this occurs, or if adjacent locked sections would occur, the sections shall be combined into a single locked section. If the request would cause the number of locks to exceed a system-imposed limit, the request shall fail.

F_LOCK and F_TLOCK requests differ only by the action taken if the section is not available. F_LOCK shall block the calling thread until the section is available. F_TLOCK shall cause the function to fail if the section is already locked by another process.

File locks shall be released on first close by the locking process of any file descriptor for the file.

F_ULOCK requests may release (wholly or in part) one or more locked sections controlled by the process. Locked sections shall be unlocked starting at the current file offset through size bytes or to the end-of-file if size is (off_t)0. When all of a locked section is not released (that is, when the beginning or end of the area to be unlocked falls within a locked section), the remaining portions of that section shall remain locked by the process. Releasing the center portion of a locked
section shall cause the remaining locked beginning and end portions to become two separate
locked sections. If the request would cause the number of locks in the system to exceed a
system-imposed limit, the request shall fail.

A potential for deadlock occurs if the threads of a process controlling a locked section are
blocked by accessing another process' locked section. If the system detects that deadlock would
occur, lockf() shall fail with an [EDEADLK] error.

The interaction between fcntl() and lockf() locks is unspecified.

Blocking on a section shall be interrupted by any signal.

An F_ULOCK request in which size is non-zero and the offset of the last byte of the requested
section is the maximum value for an object of type off_t, when the process has an existing lock
in which size is 0 and which includes the last byte of the requested section, shall be treated as a
request to unlock from the start of the requested section with a size equal to 0. Otherwise, an
F_ULOCK request shall attempt to unlock only the requested section.

Attempting to lock a section of a file that is associated with a buffered stream produces
unspecified results.

RETURN VALUE

Upon successful completion, lockf() shall return 0. Otherwise, it shall return −1, set errno to
indicate an error, and existing locks shall not be changed.

ERRORS

The lockf() function shall fail if:

[EBADF] The fildes argument is not a valid open file descriptor; or function is F_LOCK
or F_TLOCK and fildes is not a valid file descriptor open for writing.

[EACCES] or [EAGAIN] The function argument is F_TLOCK or F_TEST and the section is already
locked by another process.

[EDEADLK] The function argument is F_LOCK and a deadlock is detected.

[EINTR] A signal was caught during execution of the function.

[EINVAL] The function argument is not one of F_LOCK, F_TLOCK, F_TEST, or
F_ULOCK; or size plus the current file offset is less than 0.

[EOVERFLOW] The offset of the first, or if size is not 0 then the last, byte in the requested
section cannot be represented correctly in an object of type off_t.

The lockf() function may fail if:

[EAGAIN] The function argument is F_LOCK or F_TLOCK and the file is mapped with
mmap().

[EDEADLK] or [ENOLCK] The function argument is F_LOCK, F_TLOCK, or F_ULOCK, and the request
would cause the number of locks to exceed a system-imposed limit.

[EOPNOTSUPP] or [EINVAL] The implementation does not support the locking of files of the type indicated
by the fildes argument.
**EXAMPLES**

**Locking a Portion of a File**

In the following example, a file named `/home/cnd/mod1` is being modified. Other processes that use locking are prevented from changing it during this process. Only the first 10,000 bytes are locked, and the lock call fails if another process has any part of this area locked already.

```c
#include <fcntl.h>
#include <unistd.h>

int fildes;
int status;
...

fildes = open("/home/cnd/mod1", O_RDWR);
status = lockf(fildes, F_TLOCK, (off_t)10000);
```

**APPLICATION USAGE**

Record-locking should not be used in combination with the `fopen()`, `fread()`, `fwrite()`, and other `stdio` functions. Instead, the more primitive, non-buffered functions (such as `open()`) should be used. Unexpected results may occur in processes that do buffering in the user address space. The process may later read/write data which is/was locked. The `stdio` functions are the most common source of unexpected buffering.

The `alarm()` function may be used to provide a timeout facility in applications requiring it.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`alarm()`, `chmod()`, `close()`, `creat()`, `fcntl()`, `fopen()`, `mmap()`, `open()`, `read()`, `write()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

Large File Summit extensions are added. In particular, the description of `[EINVAL]` is clarified and moved from optional to mandatory status.

A note is added to the DESCRIPTION indicating the effects of attempting to lock a section of a file that is associated with a buffered stream.

**Issue 6**

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME

log, logf, logl — natural logarithm function

SYNOPSIS

```c
#include <math.h>

double log(double x);
float logf(float x);
long double logl(long double x);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the natural logarithm of their argument \( x \), \( \log_e(x) \).

An application wishing to check for error situations should set \( \text{errno} \) to zero and call \text{fexceptexcept}(FE_ALL_EXCEPT) before calling these functions. On return, if \( \text{errno} \) is non-zero or \text{fetestexcept}(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the natural logarithm of \( x \).

If \( x \) is ±0, a pole error shall occur and \( \log() \), \( \logf() \), and \( \logl() \) shall return \( -\text{HUGE_VAL} \), \( -\text{HUGE_VALF} \), and \( -\text{HUGE_VALL} \), respectively.

For finite values of \( x \) that are less than 0, or if \( x \) is \( -\text{Inf} \), a domain error shall occur, and either a \( \text{NaN} \) (if supported), or an implementation-defined value shall be returned.

If \( x \) is \( \text{NaN} \), a \( \text{NaN} \) shall be returned.

If \( x \) is 1, \( +0 \) shall be returned.

If \( x \) is \( +\text{Inf} \), \( x \) shall be returned.

ERRORS

These functions shall fail if:

Domain Error  The finite value of \( x \) is negative, or \( x \) is \( -\text{Inf} \).

If the integer expression (\text{math_errno} & MATH_ERRNO) is non-zero, then \( \text{errno} \) shall be set to [EDOM]. If the integer expression (\text{math_errno} & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error  The value of \( x \) is zero.

If the integer expression (\text{math_errno} & MATH_ERRNO) is non-zero, then \( \text{errno} \) shall be set to [ERANGE]. If the integer expression (\text{math_errno} & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The logf() and logl() functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

NAME
log10, log10f, log10l — base 10 logarithm function

SYNOPSIS
#include <math.h>

double log10(double x);
float log10f(float x);
long double log10l(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the base 10 logarithm of their argument x, \( \log_{10}(x) \).

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the base 10 logarithm of x.

If x is ±0, a pole error shall occur and log10(), log10f(), and log10l() shall return -HUGE_VAL, -HUGE_VALF, and -HUGE_VALL, respectively.

For finite values of x that are less than 0, or if x is -Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If x is NaN, a NaN shall be returned.

If x is 1, +0 shall be returned.

If x is +Inf, +Inf shall be returned.

ERRORS
These functions shall fail if:

Domain Error The finite value of x is negative, or x is -Inf.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error The value of x is zero.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.
EXAMPLES
None.

NAME

log1p, log1pf, log1pl — compute a natural logarithm

SYNOPSIS

#include <math.h>

double log1p(double x);

float log1pf(float x);

long double log1pl(long double x);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute \( \log_e(1.0 + x) \).

An application wishing to check for error situations should set \( \text{errno} \) to zero and call \text{ferror} or \text{feof} before calling these functions. On return, if \( \text{errno} \) is non-zero or \text{fetestexcept}(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the natural logarithm of \( 1.0 + x \).

If \( x \) is \( -1 \), a pole error shall occur and \( \log1p() \), \( \log1pf() \), and \( \log1pl() \) shall return \(-\text{HUGE}_\text{VAL}, \text{HUGE}_\text{VAL}, \text{HUGE}_\text{VALL} \) respectively.

For finite values of \( x \) that are less than \( -1 \), or if \( x \) is \( -\text{Inf} \), a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If \( x \) is NaN, a NaN shall be returned.

If \( x \) is \( \pm 0 \), or \( +\text{Inf} \), \( x \) shall be returned.

If \( x \) is subnormal, a range error may occur and \( x \) should be returned.

ERRORS

These functions shall fail if:

Domain Error The finite value of \( x \) is less than \( -1 \), or \( x \) is \( -\text{Inf} \).

If the integer expression \( (\text{math_errhandling} & \text{MATH_ERRNO}) \) is non-zero, then \( \text{errno} \) shall be set to [EDOM]. If the integer expression \( (\text{math_errhandling} & \text{MATH_ERREXCEPT}) \) is non-zero, then the invalid floating-point exception shall be raised.

Pole Error The value of \( x \) is \( -1 \).

If the integer expression \( (\text{math_errhandling} & \text{MATH_ERRNO}) \) is non-zero, then \( \text{errno} \) shall be set to [ERANGE]. If the integer expression \( (\text{math_errhandling} & \text{MATH_ERREXCEPT}) \) is non-zero, then the divide-by-zero floating-point exception shall be raised.

These functions may fail if:

Range Error The value of \( x \) is subnormal.

If the integer expression \( (\text{math_errhandling} & \text{MATH_ERRNO}) \) is non-zero, then \( \text{errno} \) shall be set to [ERANGE]. If the integer expression \( (\text{math_errhandling} & \text{MATH_ERREXCEPT}) \) is non-zero, then the underflow floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS

NAME
   log2, log2f, log2l — compute base 2 logarithm functions

SYNOPSIS
   #include <math.h>
   double log2(double x);
   float log2f(float x);
   long double log2l(long double x);

DESCRIPTION
   The functionality described on this reference page is aligned with the ISO C standard. Any
   conflict between the requirements described here and the ISO C standard is unintentional. This
   These functions shall compute the base 2 logarithm of their argument x, log2(x).
   An application wishing to check for error situations should set errno to zero and call
   feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
   fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
   zero, an error has occurred.

RETURN VALUE
   Upon successful completion, these functions shall return the base 2 logarithm of x.
   If x is ±0, a pole error shall occur and log2(), log2f(), and log2l() shall return -HUGE_VAL,
   -HUGE_VALF, and -HUGE_VALL, respectively.
   For finite values of x that are less than 0, or if x is -Inf, a domain error shall occur, and either a
   NaN (if supported), or an implementation-defined value shall be returned.
   If x is NaN, a NaN shall be returned.
   If x is 1, +0 shall be returned.
   If x is +Inf, x shall be returned.

ERRORS
   These functions shall fail if:
   Domain Error       The finite value of x is less than zero, or x is -Inf.
   If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
   then errno shall be set to [EDOM]. If the integer expression (math_errhandling
   & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
   shall be raised.
   Pole Error          The value of x is zero.
   If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
   then errno shall be set to [ERANGE]. If the integer expression
   (math_errhandling & MATH_ERREXCEPT) is non-zero, then the divide-by-
   zero floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &

NAME
    logb, logbf, logbl — radix-independent exponent

SYNOPSIS
    #include <math.h>
    double logb(double x);
    float logbf(float x);
    long double logbl(long double x);

DESCRIPTION
    CX   The functionality described on this reference page is aligned with the ISO C standard. Any
         conflict between the requirements described here and the ISO C standard is unintentional. This

    These functions shall compute the exponent of x, which is the integral part of \log_r |x|, as a
    signed floating-point value, for non-zero x, where r is the radix of the machine's floating-point
    arithmetic, which is the value of FLT_RADIX defined in the <float.h> header.

    If x is subnormal it is treated as though it were normalized; thus for finite positive x:
        1 <= x * FLT_RADIX^{-logb(x)} < FLT_RADIX

    An application wishing to check for error situations should set errno to zero and call
    feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
    fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero,
    an error has occurred.

RETURN VALUE
    Upon successful completion, these functions shall return the exponent of x.

    If x is ±0, a pole error shall occur and logb(), logbf(), and logbl() shall return -HUGE_VAL,
    -HUGE_VALF, and -HUGE_VALL, respectively.

    If x is NaN, a NaN shall be returned.

    If x is ±Inf, +Inf shall be returned.

ERRORS
    These functions shall fail if:

    Pole Error                  The value of x is ±0.

    If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE].
    If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the divide-by-
    zero floating-point exception shall be raised.

EXAMPLES
    None.

APPLICATION USAGE
    On error, the expressions (math_errno & MATH_ERRNO) and (math_errno & MATH_ERREXCEPT)
    are independent of each other, but at least one of them must be non-zero.

Issue 6

The logb() function is no longer marked as an extension.

The logbf() and logbl() functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

NAME
logf, logl — natural logarithm function

SYNOPSIS
#include <math.h>

float logf(float x);
long double logl(long double x);

DESCRIPTION
Refer to log().
NAME
longjmp — non-local goto

SYNOPSIS
#include <setjmp.h>

void longjmp(jmp_buf env, int val);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The longjmp() function shall restore the environment saved by the most recent invocation of setjmp() in the same thread, with the corresponding jmp_buf argument. If there is no such invocation, or if the function containing the invocation of setjmp() has terminated execution in the interim, or if the invocation of setjmp() was within the scope of an identifier with variably modified type and execution has left that scope in the interim, the behavior is undefined. It is unspecified whether longjmp() restores the signal mask, leaves the signal mask unchanged, or restores it to its value at the time setjmp() was called.

All accessible objects have values, and all other components of the abstract machine have state (for example, floating-point status flags and open files), as of the time longjmp() was called, except that the values of objects of automatic storage duration are unspecified if they meet all the following conditions:

• They are local to the function containing the corresponding setjmp() invocation.
• They do not have volatile-qualified type.
• They are changed between the setjmp() invocation and longjmp() call.

As it bypasses the usual function call and return mechanisms, longjmp() shall execute correctly in contexts of interrupts, signals, and any of their associated functions. However, if longjmp() is invoked from a nested signal handler (that is, from a function invoked as a result of a signal raised during the handling of another signal), the behavior is undefined.

The effect of a call to longjmp() where initialization of the jmp_buf structure was not performed in the calling thread is undefined.

RETURN VALUE
After longjmp() is completed, program execution continues as if the corresponding invocation of setjmp() had just returned the value specified by val. The longjmp() function shall not cause setjmp() to return 0; if val is 0, setjmp() shall return 1.

ERRORS
No errors are defined.

APPLICATION USAGE
Applications whose behavior depends on the value of the signal mask should not use longjmp() and setjmp(), since their effect on the signal mask is unspecified, but should instead use the siglongjmp() and sigset jmp() functions (which can save and restore the signal mask under application control).
RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6
Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The DESCRIPTION now explicitly makes longjmp()'s effect on the signal mask unspecified.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899: 1999 standard.
NAME
lrand48 — generate uniformly distributed pseudo-random non-negative long integers

SYNOPSIS
XSI
#include <stdlib.h>

long lrand48(void);

DESCRIPTION
Refer to drand48().
NAME
lrint, lrintf, lrintl — round to nearest integer value using current rounding direction

SYNOPSIS
#include <math.h>
long lrint(double x);
long lrintf(float x);
long lrintl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value, rounding according to the current rounding direction.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the rounded integer value.

MX If x is NaN, a domain error shall occur and an unspecified value is returned.
If x is +Inf, a domain error shall occur and an unspecified value is returned.
If x is −Inf, a domain error shall occur and an unspecified value is returned.
If the correct value is positive and too large to represent as a long, a domain error shall occur and an unspecified value is returned.
If the correct value is negative and too large to represent as a long, a domain error shall occur and an unspecified value is returned.

ERRORS
These functions shall fail if:

MX Domain Error The x argument is NaN or ±Inf, or the correct value is not representable as an integer.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
These functions provide floating-to-integer conversions. They round according to the current rounding direction. If the rounded value is outside the range of the return type, the numeric result is unspecified and the invalid floating-point exception is raised. When they raise no other floating-point exception and the result differs from the argument, they raise the inexact
floating-point exception.

FUTURE DIRECTIONS
None.

NAME
lround, lroundf, lroundl — round to nearest integer value

SYNOPSIS
#include <math.h>
long lround(double x);
long lroundf(float x);
long lroundl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
These functions shall round their argument to the nearest integer value, rounding halfway cases
away from zero, regardless of the current rounding direction.
An application wishing to check for error situations should set errno to zero and call
feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the rounded integer value.

If x is NaN, a domain error shall occur and an unspecified value is returned.
If x is +Inf, a domain error shall occur and an unspecified value is returned.
If x is −Inf, a domain error shall occur and an unspecified value is returned.
If the correct value is positive and too large to represent as a long, a domain error shall occur
and an unspecified value is returned.
If the correct value is negative and too large to represent as a long, a domain error shall occur
and an unspecified value is returned.

ERRORS
These functions shall fail if:

The x argument is NaN or ±Inf, or the correct value is not representable as an
integer.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
then errno shall be set to [EDOM]. If the integer expression (math_errhandling
&MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
These functions differ from the lrint( ) functions in the default rounding direction, with the
lround( ) functions rounding halfway cases away from zero and needing not to raise the inexact
floating-point exception for non-integer arguments that round to within the range of the return
type.
FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME
lsearch, lfind — linear search and update

SYNOPSIS
#include <search.h>

XSI

void *lsearch(const void *key, void *base, size_t *nelp, size_t width,
   int (*compar)(const void *, const void *));

void *lfind(const void *key, const void *base, size_t *nelp,
   size_t width, int (*compar)(const void *, const void *));

DESCRIPTION
The lsearch() function shall linearly search the table and return a pointer into the table for the
matching entry. If the entry does not occur, it shall be added at the end of the table. The key
argument points to the entry to be sought in the table. The base argument points to the first
element in the table. The width argument is the size of an element in bytes. The nelp argument
points to an integer containing the current number of elements in the table. The integer to which
nelp points shall be incremented if the entry is added to the table. The compar argument points to
a comparison function which the application shall supply (for example, strcmp()). It is called
with two arguments that point to the elements being compared. The application shall ensure
that the function returns 0 if the elements are equal, and non-zero otherwise.

The lfind() function shall be equivalent to lsearch(), except that if the entry is not found, it is not
added to the table. Instead, a null pointer is returned.

RETURN VALUE
If the searched for entry is found, both lsearch() and lfind() shall return a pointer to it. Otherwise,
lfind() shall return a null pointer and lsearch() shall return a pointer to the newly added element.

ERRORS
No errors are defined.

EXAMPLES
Storing Strings in a Table
This fragment reads in less than or equal to TABSIZE strings of length less than or equal to
ELSIZE and stores them in a table, eliminating duplicates.

#include <stdio.h>
#include <string.h>
#include <search.h>
#define TABSIZE 50
#define ELSIZE 120
...

char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
...
while (fgets(line, ELSIZE, stdin) != NULL && nel < TABSIZE)
   (void) lsearch(line, tab, &nel,
      ELSIZE, (int (*)(const void *, const void *)) strcmp);
...

...
Finding a Matching Entry

The following example finds any line that reads "This is a test.".

```
#include <search.h>
#include <string.h>
...
char line[ELSIZE], tab[TABSIZE][ELSIZE];
size_t nel = 0;
char *findline;
void *entry;
findline = "This is a test.\n";
entry = lfind(findline, tab, &nel, ELSIZE, (
    int (*)(const void *, const void *)) strcmp);
```

APPLICATION USAGE

The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

Undefined results can occur if there is not enough room in the table to add a new item.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
lseek — move the read/write file offset

SYNOPSIS
#include <unistd.h>
off_t lseek(int fildes, off_t offset, int whence);

DESCRIPTION
The lseek() function shall set the file offset for the open file description associated with the file
descriptor fildes, as follows:
• If whence is SEEK_SET, the file offset shall be set to offset bytes.
• If whence is SEEK_CUR, the file offset shall be set to its current location plus offset.
• If whence is SEEK_END, the file offset shall be set to the size of the file plus offset.
The symbolic constants SEEK_SET, SEEK_CUR, and SEEK_END are defined in <unistd.h>.
The behavior of lseek() on devices which are incapable of seeking is implementation-defined.
The value of the file offset associated with such a device is undefined.
The lseek() function shall allow the file offset to be set beyond the end of the existing data in the
file. If data is later written at this point, subsequent reads of data in the gap shall return bytes
with the value 0 until data is actually written into the gap.
The lseek() function shall not, by itself, extend the size of a file.

RETURN VALUE
Upon successful completion, the resulting offset, as measured in bytes from the beginning of the
file, shall be returned. Otherwise, (off_t)-1 shall be returned, errno shall be set to indicate the
error, and the file offset shall remain unchanged.

ERRORS
The lseek() function shall fail if:
[EBADF] The fildes argument is not an open file descriptor.
[EINVAL] The whence argument is not a proper value, or the resulting file offset would
be negative for a regular file, block special file, or directory.
[EOVERFLOW] The resulting file offset would be a value which cannot be represented
correctly in an object of type off_t.
[ESPIPE] The fildes argument is associated with a pipe, FIFO, or socket.

APPLICATION USAGE

RATIONALE
The ISO C standard includes the functions fgetpos() and fsetpos(), which work on very large files
by use of a special positioning type.
Although lseek() may position the file offset beyond the end of the file, this function does not
itself extend the size of the file. While the only function in IEEE Std 1003.1-2001 that may directly
extend the size of the file is `write()`, `truncate()`, and `ftruncate()`), several functions originally derived from the ISO C standard, such as `fwrite()`, `fprintf()`, and so on, may do so (by causing calls on `write()`).

An invalid file offset that would cause `[EINVAL]` to be returned may be both implementation-defined and device-dependent (for example, memory may have few invalid values). A negative file offset may be valid for some devices in some implementations.

The POSIX.1-1990 standard did not specifically prohibit `lseek()` from returning a negative offset. Therefore, an application was required to clear `errno` prior to the call and check `errno` upon return to determine whether a return value of `(off_t)−1` is a negative offset or an indication of an error condition. The standard developers did not wish to require this action on the part of a conforming application, and chose to require that `errno` be set to `[EINVAL]` when the resulting file offset would be negative for a regular file, block special file, or directory.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
`open()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/types.h>`, `<unistd.h>`

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
The DESCRIPTION is updated for alignment with the POSIX Realtime Extension.

Large File Summit extensions are added.

**Issue 6**
In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- The `[EOVERFLOW]` error condition is added. This change is to support large files.

An additional `[ESPIPE]` error condition is added for sockets.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that `lseek()` results are unspecified for typed memory objects.
NAME
lstat — get symbolic link status

SYNOPSIS
#include <sys/stat.h>

int lstat(const char *restrict path, struct stat *restrict buf);

DESCRIPTION
The lstat() function shall be equivalent to stat(), except when path refers to a symbolic link. In that case lstat() shall return information about the link, while stat() shall return information about the file the link references.

For symbolic links, the st_mode member shall contain meaningful information when used with the file type macros, and the st_size member shall contain the length of the pathname contained in the symbolic link. File mode bits and the contents of the remaining members of the stat structure are unspecified. The value returned in the st_size member is the length of the contents of the symbolic link, and does not count any trailing null.

RETURN VALUE
Upon successful completion, lstat() shall return 0. Otherwise, it shall return -1 and set errno to indicate the error.

ERRORS
The lstat() function shall fail if:

[EACCES] A component of the path prefix denies search permission.

[EIO] An error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of a pathname exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOTDIR] A component of the path prefix is not a directory.

[ENOENT] A component of path does not name an existing file or path is an empty string.

[Eoverflow] The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by buf.

The lstat() function may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the path argument.

[ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the path argument, the length of the substituted pathname string exceeded [PATH_MAX].

[Eoverflow] One of the members is too large to store into the structure pointed to by the buf argument.
EXAMPLES

Obtaining Symbolic Link Status Information

The following example shows how to obtain status information for a symbolic link named
/modules/pass1. The structure variable buffer is defined for the stat structure. If the path
argument specified the filename for the file pointed to by the symbolic link (/home/cnd/mod1),
the results of calling the function would be the same as those returned by a call to the stat() function.

```c
#include <sys/stat.h>

struct stat buffer;
int status;
...
status = lstat("/modules/pass1", &buffer);
```

APPLICATION USAGE
None.

RATIONALE
The lstat() function is not required to update the time-related fields if the named file is not a
symbolic link. While the st_uid, st_gid, st_atime, st_mtime, and st_ctime members of the stat
structure may apply to a symbolic link, they are not required to do so. No functions in
IEEE Std 1003.1-2001 are required to maintain any of these time fields.

FUTURE DIRECTIONS
None.

SEE ALSO
fstat(), readlink(), stat(), symlink(), the Base Definitions volume of IEEE Std 1003.1-2001,
/sys/stat.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
Large File Summit extensions are added.

Issue 6
The following changes were made to align with the IEEE P1003.1a draft standard:

- This function is now mandatory.
- The [ELOOP] optional error condition is added.

The restrict keyword is added to the lstat() prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
makecontext, swapcontext — manipulate user contexts

SYNOPSIS

XSI

```c
#include <ucontext.h>

void makecontext(ucontext_t *ucp, void (*func)(void),
                 int argc, ...);

int swapcontext(ucontext_t *restrict oucp,
                 const ucontext_t *restrict ucp);
```

DESCRIPTION

The `makecontext()` function shall modify the context specified by `ucp`, which has been initialized using `getcontext()`. When this context is resumed using `swapcontext()` or `setcontext()`, program execution shall continue by calling `func`, passing it the arguments that follow `argc` in the `makecontext()` call.

Before a call is made to `makecontext()`, the application shall ensure that the context being modified has a stack allocated for it. The application shall ensure that the value of `argc` matches the number of arguments of type `int` passed to `func`; otherwise, the behavior is undefined.

The `uc_link` member is used to determine the context that shall be resumed when the context being modified by `makecontext()` returns. The application shall ensure that the `uc_link` member is initialized prior to the call to `makecontext()`.

The `swapcontext()` function shall save the current context in the context structure pointed to by `oucp` and shall set the context to the context structure pointed to by `ucp`.

RETURN VALUE

Upon successful completion, `swapcontext()` shall return 0. Otherwise, −1 shall be returned and `errno` set to indicate the error.

ERRORS

The `swapcontext()` function shall fail if:

- [ENOMEM] The `ucp` argument does not have enough stack left to complete the operation.

EXAMPLES

The following example illustrates the use of `makecontext()`:

```c
#include <stdio.h>
#include <ucontext.h>

static ucontext_t ctx[3];

static void f1 (void)
{
    puts("start f1");
    swapcontext(&ctx[1], &ctx[2]);
    puts("finish f1");
}

static void f2 (void)
{
    puts("start f2");
    swapcontext(&ctx[2], &ctx[1]);
}
```
main (void) {
    char st1[8192];
    char st2[8192];
    getcontext(&ctx[1]);
    ctx[1].uc_stack.ss_sp = st1;
    ctx[1].uc_stack.ss_size = sizeof st1;
    ctx[1].uc_link = &ctx[0];
    makecontext(&ctx[1], f1, 0);
    getcontext(&ctx[2]);
    ctx[2].uc_stack.ss_sp = st2;
    ctx[2].uc_stack.ss_size = sizeof st2;
    ctx[2].uc_link = &ctx[1];
    makecontext(&ctx[2], f2, 0);
    swapcontext(&ctx[0], &ctx[2]);
    return 0;
}
**NAME**
malloc — a memory allocator

**SYNOPSIS**
```c
#include <stdlib.h>
void *malloc(size_t size);
```

**DESCRIPTION**
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `malloc()` function shall allocate unused space for an object whose size in bytes is specified by `size` and whose value is unspecified. The order and contiguity of storage allocated by successive calls to `malloc()` is unspecified. The pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to a pointer to any type of object and then used to access such an object in the space allocated (until the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object disjoint from any other object. The pointer returned points to the start (lowest byte address) of the allocated space. If the space cannot be allocated, a null pointer shall be returned. If the size of the space requested is 0, the behavior is implementation-defined: the value returned shall be either a null pointer or a unique pointer.

**RETURN VALUE**
Upon successful completion with `size` not equal to 0, `malloc()` shall return a pointer to the allocated space. If `size` is 0, either a null pointer or a unique pointer that can be successfully passed to `free()` shall be returned. Otherwise, it shall return a null pointer and set `errno` to indicate the error.

**ERRORS**
The `malloc()` function shall fail if:

- `[ENOMEM]` Insufficient storage space is available.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
calloc(), free(), realloc(), the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• In the RETURN VALUE section, the requirement to set `errno` to indicate an error is added.
• The [ENOMEM] error condition is added.
NAME
mblen — get number of bytes in a character

SYNOPSIS
#include <stdlib.h>
int mblen(const char *s, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

If s is not a null pointer, mblen() shall determine the number of bytes constituting the character pointed to by s. Except that the shift state of mbtowc() is not affected, it shall be equivalent to:

```c
mbtowc((wchar_t *)0, s, n);
```

The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls mblen().

The behavior of this function is affected by the LC_CTYPE category of the current locale. For a state-dependent encoding, this function shall be placed into its initial state by a call for which its character pointer argument, s, is a null pointer. Subsequent calls with s as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with s as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the LC_CTYPE category causes the shift state of this function to be unspecified.

RETURN VALUE
If s is a null pointer, mblen() shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If s is not a null pointer, mblen() shall either return 0 (if s points to the null byte), or return the number of bytes that constitute the character (if the next n or fewer bytes form a valid character), or return −1 (if they do not form a valid character) and may set errno to indicate the error. In no case shall the value returned be greater than n or the value of the [MB_CUR_MAX] macro.

ERRORS
The mblen() function may fail if:

```
[EILSEQ]    Invalid character sequence is detected.
```

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4. Aligned with the ISO C standard.
NAME
mbrlen — get number of bytes in a character (restartable)

SYNOPSIS
#include <wchar.h>

size_t mbrlen(const char *restrict s, size_t n, 
               mbstate_t *restrict ps);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

If s is not a null pointer, mbrlen() shall determine the number of bytes constituting the character
pointed to by s. It shall be equivalent to:

mbstate_t internal;
mbtowc(NULL, s, n, ps != NULL ? ps : &internal);

If ps is a null pointer, the mbrlen() function shall use its own internal mbstate_t object, which is
initialized at program start-up to the initial conversion state. Otherwise, the mbstate_t object
pointed to by ps shall be used to completely describe the current conversion state of the
associated character sequence. The implementation shall behave as if no function defined in this
volume of IEEE Std 1003.1-2001 calls mbrlen().

The behavior of this function is affected by the LC_CTYPE category of the current locale.

RETURN VALUE
The mbrlen() function shall return the first of the following that applies:

0 If the next n or fewer bytes complete the character that corresponds to the null
wide character.

positive If the next n or fewer bytes complete a valid character; the value returned shall
be the number of bytes that complete the character.

(size_t)−2 If the next n bytes contribute to an incomplete but potentially valid character,
and all n bytes have been processed. When n has at least the value of the
{MB_CUR_MAX} macro, this case can only occur if s points at a sequence of
redundant shift sequences (for implementations with state-dependent
encodings).

(size_t)−1 If an encoding error occurs, in which case the next n or fewer bytes do not
contribute to a complete and valid character. In this case, [EILSEQ] shall be
stored in errno and the conversion state is undefined.

ERRORS
The mbrlen() function may fail if:

[EINVAL] ps points to an object that contains an invalid conversion state.

[EILSEQ] Invalid character sequence is detected.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY

Issue 6
The mbrcnt() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
mbrtowc — convert a character to a wide-character code (restartable)

SYNOPSIS
#include <wchar.h>

size_t mbtowc(wchar_t *restrict pwc, const char *restrict s, size_t n, mbstate_t *restrict ps);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

If s is a null pointer, the mbtowc() function shall be equivalent to the call:

mbtowc(NULL, "", 1, ps)

In this case, the values of the arguments pwc and n are ignored.

If s is not a null pointer, the mbtowc() function shall inspect at most n bytes beginning at the byte pointed to by s to determine the number of bytes needed to complete the next character (including any shift sequences). If the function determines that the next character is completed, it shall determine the value of the corresponding wide character and then, if pwc is not a null pointer, shall store that value in the object pointed to by pwc. If the corresponding wide character is the null wide character, the resulting state described shall be the initial conversion state.

If ps is a null pointer, the mbtowc() function shall use its own internal mbstate_t object, which shall be initialized at program start-up to the initial conversion state. Otherwise, the mbstate_t object pointed to by ps shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls mbtowc().

The behavior of this function is affected by the LC_CTYPE category of the current locale.

RETURN VALUE
The mbtowc() function shall return the first of the following that applies:

0 If the next n or fewer bytes complete the character that corresponds to the null wide character (which is the value stored).

between 1 and n inclusive
If the next n or fewer bytes complete a valid character (which is the value stored); the value returned shall be the number of bytes that complete the character.

(size_t)−2 If the next n bytes contribute to an incomplete but potentially valid character, and all n bytes have been processed (no value is stored). When n has at least the value of the [MB_CUR_MAX] macro, this case can only occur if s points at a sequence of redundant shift sequences (for implementations with state-dependent encodings).

(size_t)−1 If an encoding error occurs, in which case the next n or fewer bytes do not contribute to a complete and valid character (no value is stored). In this case, [EILSEQ] shall be stored in errno and the conversion state is undefined.
The `mbrtowc()` function may fail if:

- `[EINVAL]` \( ps \) points to an object that contains an invalid conversion state.
- `[EILSEQ]` Invalid character sequence is detected.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
None.

**FUTURE DIRECTIONS**

**SEE ALSO**
`mbsinit()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<wchar.h>`

**CHANGE HISTORY**

**Issue 6**
The `mbrtowc()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The `[EINVAL]` error condition is added.

mbsinit()

NAME
mbsinit — determine conversion object status

SYNOPSIS
#include <wchar.h>
int mbsinit(const mbstate_t *ps);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
If ps is not a null pointer, the mbsinit() function shall determine whether the object pointed to by
ps describes an initial conversion state.

RETURN VALUE
The mbsinit() function shall return non-zero if ps is a null pointer, or if the pointed-to object
describes an initial conversion state; otherwise, it shall return zero.
If an mbstate_t object is altered by any of the functions described as “restartable”, and is then
used with a different character sequence, or in the other conversion direction, or with a different
LC_CTYPE category setting than on earlier function calls, the behavior is undefined.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The mbstate_t object is used to describe the current conversion state from a particular character
sequence to a wide-character sequence (or vice versa) under the rules of a particular setting of the
LC_CTYPE category of the current locale.
The initial conversion state corresponds, for a conversion in either direction, to the beginning of
a new character sequence in the initial shift state. A zero valued mbstate_t object is at least one
way to describe an initial conversion state. A zero valued mbstate_t object can be used to initiate
conversion involving any character sequence, in any LC_CTYPE category setting.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
(E).
NAME

mbsrtowcs — convert a character string to a wide-character string (restartable)

SYNOPSIS

#include <wchar.h>

size_t mbsrtowcs(wchar_t *restrict dst, const char **restrict src, size_t len, mbstate_t *restrict ps);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The mbsrtowcs() function shall convert a sequence of characters, beginning in the conversion state described by the object pointed to by ps, from the array indirectly pointed to by src into a sequence of corresponding wide characters. If dst is not a null pointer, the converted characters shall be stored into the array pointed to by dst. Conversion continues up to and including a terminating null character, which shall also be stored. Conversion shall stop early in either of the following cases:

- A sequence of bytes is encountered that does not form a valid character.
- len codes have been stored into the array pointed to by dst (and dst is not a null pointer).

Each conversion shall take place as if by a call to the mbrtowc() function.

If dst is not a null pointer, the pointer object pointed to by src shall be assigned either a null pointer (if conversion stopped due to reaching a terminating null character) or the address just past the last character converted (if any). If conversion stopped due to reaching a terminating null character, and if dst is not a null pointer, the resulting state described shall be the initial conversion state.

If ps is a null pointer, the mbsrtowcs() function shall use its own internal mbstate_t object, which is initialized at program start-up to the initial conversion state. Otherwise, the mbstate_t object pointed to by ps shall be used to completely describe the current conversion state of the associated character sequence. The implementation behaves as if no function defined in this volume of IEEE Std 1003.1-2001 calls mbsrtowcs().

The behavior of this function shall be affected by the LC_CTYPE category of the current locale.

RETURN VALUE

If the input conversion encounters a sequence of bytes that do not form a valid character, an encoding error occurs. In this case, the mbsrtowcs() function stores the value of the macro [EILSEQ] in errno and shall return (size_t)-1; the conversion state is undefined. Otherwise, it shall return the number of characters successfully converted, not including the terminating null (if any).

ERRORS

The mbsrtowcs() function may fail if:

- [EINVAL] ps points to an object that contains an invalid conversion state.
- [EILSEQ] Invalid character sequence is detected.

CHANGE HISTORY

Issue 6
The mbsrtowcs() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
The [EINVAL] error condition is marked CX.
NAME
mbstowcs — convert a character string to a wide-character string

SYNOPSIS
#include <stdlib.h>

size_t mbstowcs(wchar_t *restrict pwcs, const char *restrict s, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The mbstowcs() function shall convert a sequence of characters that begins in the initial shift
state from the array pointed to by s into a sequence of corresponding wide-character codes and
shall store not more than n wide-character codes into the array pointed to by pwcs. No
characters that follow a null byte (which is converted into a wide-character code with value 0)
shall be examined or converted. Each character shall be converted as if by a call to mbtowc(),
except that the shift state of mbtowc() is not affected.

No more than n elements shall be modified in the array pointed to by pwcs. If copying takes
place between objects that overlap, the behavior is undefined.

The behavior of this function shall be affected by the LC_CTYPE category of the current locale. If
pwcs is a null pointer, mbstowcs() shall return the length required to convert the entire array
regardless of the value of n, but no values are stored.

RETURN VALUE
If an invalid character is encountered, mbstowcs() shall return (size_t)-1 and may set errno to
indicate the error.

Otherwise, mbstowcs() shall return the number of the array elements modified (or required if
pwcs is null), not including a terminating 0 code, if any. The array shall not be zero-terminated if
the value returned is n.

ERRORS
The mbstowcs() function may fail if:

[EILSEQ] Invalid byte sequence is detected.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

**NAME**

mbtowc — convert a character to a wide-character code

**SYNOPSIS**

```c
#include <stdlib.h>

int mbtowc(wchar_t *restrict pwc, const char *restrict s, size_t n);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

If `s` is not a null pointer, `mbtowc()` shall determine the number of bytes that constitute the character pointed to by `s`. It shall then determine the wide-character code for the value of type `wchar_t` that corresponds to that character. (The value of the wide-character code corresponding to the null byte is 0.) If the character is valid and `pwc` is not a null pointer, `mbtowc()` shall store the wide-character code in the object pointed to by `pwc`.

The behavior of this function is affected by the `LC_CTYPE` category of the current locale. For a state-dependent encoding, this function is placed into its initial state by a call for which its character pointer argument, `s`, is a null pointer. Subsequent calls with `s` as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with `s` as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. If the implementation employs special bytes to change the shift state, these bytes shall not produce separate wide-character codes, but shall be grouped with an adjacent character. Changing the `LC_CTYPE` category causes the shift state of this function to be unspecified. At most `n` bytes of the array pointed to by `s` shall be examined.

The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls `mbtowc()`.

**RETURN VALUE**

If `s` is a null pointer, `mbtowc()` shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If `s` is not a null pointer, `mbtowc()` shall either return 0 (if `s` points to the null byte), or return the number of bytes that constitute the converted character (if the next `n` or fewer bytes form a valid character), or return −1 and may set `errno` to indicate the error (if they do not form a valid character).

In no case shall the value returned be greater than `n` or the value of the `{MB_CUR_MAX}` macro.

**ERRORS**

The `mbtowc()` function may fail if:

-[EILSEQ] Invalid character sequence is detected.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Issue 6

The mbtowc() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

Extensions beyond the ISO C standard are marked.
NAME
memccpy — copy bytes in memory

SYNOPSIS
XSI
#include <string.h>

void *memccpy(void *restrict s1, const void *restrict s2, 
               int c, size_t n);

DESCRIPTION
The memccpy() function shall copy bytes from memory area s2 into s1, stopping after the first 
occurrence of byte c (converted to an unsigned char) is copied, or after n bytes are copied, 
whichever comes first. If copying takes place between objects that overlap, the behavior is 
undefined.

RETURN VALUE
The memccpy() function shall return a pointer to the byte after the copy of c in s1, or a null 
pointer if c was not found in the first n bytes of s2.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The memccpy() function does not check for the overflow of the receiving memory area.

NAME
memchr — find byte in memory

SYNOPSIS
#include <string.h>

void *memchr(const void *s, int c, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The memchr() function shall locate the first occurrence of c (converted to an unsigned char) in the initial n bytes (each interpreted as unsigned char) of the object pointed to by s.

RETURN VALUE
The memchr() function shall return a pointer to the located byte, or a null pointer if the byte does not occur in the object.

ERRORS
No errors are defined.

EXAMPLES

NAME
     memcmp — compare bytes in memory

SYNOPSIS
     #include <string.h>

     int memcmp(const void *s1, const void *s2, size_t n);

DESCRIPTION
     The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

     The memcmp() function shall compare the first n bytes (each interpreted as unsigned char) of the object pointed to by s1 to the first n bytes of the object pointed to by s2.

     The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type unsigned char) that differ in the objects being compared.

RETURN VALUE
     The memcmp() function shall return an integer greater than, equal to, or less than 0, if the object pointed to by s1 is greater than, equal to, or less than the object pointed to by s2, respectively.

ERRORS
     No errors are defined.

EXAMPLES
     None.

memcpy() — copy bytes in memory

#include <string.h>

void *memcpy(void *restrict s1, const void *restrict s2, size_t n);

The memcpy() function shall copy \( n \) bytes from the object pointed to by \( s2 \) into the object pointed to by \( s1 \). If copying takes place between objects that overlap, the behavior is undefined.

The memcpy() function shall return \( s1 \); no return value is reserved to indicate an error.

No errors are defined.

The memcpy() function does not check for the overflow of the receiving memory area.

The memcpy() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.

First released in Issue 1. Derived from Issue 1 of the SVID.
NAME
memmove — copy bytes in memory with overlapping areas

SYNOPSIS
#include <string.h>

void *memmove(void *s1, const void *s2, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The memmove() function shall copy n bytes from the object pointed to by s2 into the object pointed to by s1. Copying takes place as if the n bytes from the object pointed to by s2 are first copied into a temporary array of n bytes that does not overlap the objects pointed to by s1 and s2, and then the n bytes from the temporary array are copied into the object pointed to by s1.

RETURN VALUE
The memmove() function shall return s1; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.
NAME
mkdir — make a directory

SYNOPSIS
#include <sys/stat.h>

int mkdir(const char *path, mode_t mode);

DESCRIPTION
The mkdir() function shall create a new directory with name path. The file permission bits of the
new directory shall be initialized from mode. These file permission bits of the mode argument
shall be modified by the process' file creation mask.
When bits in mode other than the file permission bits are set, the meaning of these additional bits
is implementation-defined.
The directory's user ID shall be set to the process' effective user ID. The directory's group ID
shall be set to the group ID of the parent directory or to the effective group ID of the process.
Implementations shall provide a way to initialize the directory's group ID to the group ID of the
parent directory. Implementations may, but need not, provide an implementation-defined way
to initialize the directory's group ID to the effective group ID of the calling process.
The newly created directory shall be an empty directory.
If path names a symbolic link, mkdir() shall fail and set errno to [EEXIST].
Upon successful completion, mkdir() shall mark for update the st_atime, st_ctime, and st_mtime
fields of the directory. Also, the st_ctime and st_mtime fields of the directory that contains the
new entry shall be marked for update.

RETURN VALUE
Upon successful completion, mkdir() shall return 0. Otherwise, −1 shall be returned, no directory
shall be created, and errno shall be set to indicate the error.

ERRORS
The mkdir() function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write
permission is denied on the parent directory of the directory to be created.
[EEXIST] The named file exists.
[ELOOP] A loop exists in symbolic links encountered during resolution of the path
argument.
[ENOMEM] The link count of the parent directory would exceed {LINK_MAX}.
[ENAMETOOLONG] The length of the path argument exceeds {PATH_MAX} or a pathname
component is longer than {NAME_MAX}.
[ENOENT] A component of the path prefix specified by path does not name an existing
directory or path is an empty string.
[ENOSPC] The file system does not contain enough space to hold the contents of the new
directory or to extend the parent directory of the new directory.
[ENOTDIR] A component of the path prefix is not a directory.
[EROFS] The parent directory resides on a read-only file system.
The `mkdir()` function may fail if:

- [ELOOP] More than `SYMLOOP_MAX` symbolic links were encountered during resolution of the `path` argument.
- [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the `path` argument, the length of the substituted pathname string exceeded `PATH_MAX`.

**EXAMPLES**

**Creating a Directory**

The following example shows how to create a directory named `/home/cnd/mod1`, with read/write/search permissions for owner and group, and with read/search permissions for others.

```
#include <sys/types.h>
#include <sys/stat.h>

int status;
...
status = mkdir("/home/cnd/mod1", S_IRWXU | S_IRWXG | S_IROTH | S_IXOTH);
```

**APPLICATION USAGE**

None.

**RATIONALE**

The `mkdir()` function originated in 4.2 BSD and was added to System V in Release 3.0.

FIPS 151-2 required that implementations provide a way to have the group ID of the containing directory or the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use `chown()` to set the group ID after the directory is created, or determine under what conditions the implementation will set the desired group ID.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`umask()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
• The [ELOOP] mandatory error condition is added.

• A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

• The [ELOOP] optional error condition is added.
NAME

mkfifo — make a FIFO special file

SYNOPSIS

#include <sys/stat.h>

int mkfifo(const char *path, mode_t mode);

DESCRIPTION

The mkfifo() function shall create a new FIFO special file named by the pathname pointed to by path. The file permission bits of the new FIFO shall be initialized from mode. The file permission bits of the mode argument shall be modified by the process’ file creation mask.

When bits in mode other than the file permission bits are set, the effect is implementation-defined.

If path names a symbolic link, mkfifo() shall fail and set errno to [EEXIST].

The FIFO’s user ID shall be set to the process’ effective user ID. The FIFO’s group ID shall be set to the group ID of the parent directory or to the effective group ID of the process. Implementations shall provide a way to initialize the FIFO’s group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the FIFO’s group ID to the effective group ID of the calling process.

Upon successful completion, mkfifo() shall mark for update the st_atime, st_ctime, and st_mtime fields of the file. Also, the st_ctime and st_mtime fields of the directory that contains the new entry shall be marked for update.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned, no FIFO shall be created, and errno shall be set to indicate the error.

ERRORS

The mkfifo() function shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory of the FIFO to be created.

[EEXIST] The named file already exists.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOENT] A component of the path prefix specified by path does not name an existing directory or path is an empty string.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix is not a directory.

[EROFS] The named file resides on a read-only file system.

The mkfifo() function may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the path argument.
As a result of encountering a symbolic link in resolution of the path argument, the length of the substituted pathname string exceeded {PATH_MAX}.

**EXAMPLES**

**Creating a FIFO File**

The following example shows how to create a FIFO file named `/home/cnd/mod_done`, with read/write permissions for owner, and with read permissions for group and others.

```c
#include <sys/types.h>
#include <sys/stat.h>
int status;
...
status = mkfifo("/home/cnd/mod_done", S_IWUSR | S_IRUSR |
               S_IRGRP | S_IROTH);
```

**APPLICATION USAGE**

None.

**RATIONALE**

The syntax of this function is intended to maintain compatibility with historical implementations of `mknod()`. The latter function was included in the 1984 /usr/group standard but only for use in creating FIFO special files. The `mknod()` function was originally excluded from the POSIX.1-1988 standard as implementation-defined and replaced by `mkdir()` and `mkfifo()`. The `mknod()` function is now included for alignment with the Single UNIX Specification.

The POSIX.1-1990 standard required that the group ID of a newly created FIFO be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use `chown()` to set the group ID after the FIFO is created, or determine under what conditions the implementation will set the desired group ID.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`umask()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/stat.h>`, `<sys/types.h>`

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
• The [ELOOP] mandatory error condition is added.
• A second [ENAMETOOLONG] is added as an optional error condition.
The following changes were made to align with the IEEE P1003.1a draft standard:
• The [ELOOP] optional error condition is added.
NAME

mknod — make a directory, a special file, or a regular file

SYNOPSIS

```c
#include <sys/stat.h>

int mknod(const char *path, mode_t mode, dev_t dev);
```

DESCRIPTION

The `mknod()` function shall create a new file named by the pathname to which the argument `path` points.

The file type for `path` is OR’d into the `mode` argument, and the application shall select one of the following symbolic constants:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S_IFIFO</td>
<td>FIFO-special</td>
</tr>
<tr>
<td>S_IFCHR</td>
<td>Character-special (non-portable)</td>
</tr>
<tr>
<td>S_IFDIR</td>
<td>Directory (non-portable)</td>
</tr>
<tr>
<td>S_IFBLK</td>
<td>Block-special (non-portable)</td>
</tr>
<tr>
<td>S_IFREG</td>
<td>Regular (non-portable)</td>
</tr>
</tbody>
</table>

The only portable use of `mknod()` is to create a FIFO-special file. If `mode` is not S_IFIFO or `dev` is not 0, the behavior of `mknod()` is unspecified.

The permissions for the new file are OR’d into the `mode` argument, and may be selected from any combination of the following symbolic constants:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>S_ISUID</td>
<td>Set user ID on execution.</td>
</tr>
<tr>
<td>S_ISGID</td>
<td>Set group ID on execution.</td>
</tr>
<tr>
<td>S_IRWXU</td>
<td>Read, write, or execute (search) by owner.</td>
</tr>
<tr>
<td>S_IRUSR</td>
<td>Read by owner.</td>
</tr>
<tr>
<td>S_IWUSR</td>
<td>Write by owner.</td>
</tr>
<tr>
<td>S_IWUSR</td>
<td>Write by owner.</td>
</tr>
<tr>
<td>S_IRUSR</td>
<td>Execute (search) by owner.</td>
</tr>
<tr>
<td>S_IRUSR</td>
<td>Execute (search) by group.</td>
</tr>
<tr>
<td>S_IXGRP</td>
<td>Read, write, or execute (search) by group.</td>
</tr>
<tr>
<td>S_IRGRP</td>
<td>Read by group.</td>
</tr>
<tr>
<td>S_IWGRP</td>
<td>Write by group.</td>
</tr>
<tr>
<td>S_IXGRP</td>
<td>Execute (search) by group.</td>
</tr>
<tr>
<td>S_IXGRP</td>
<td>Execute (search) by others.</td>
</tr>
<tr>
<td>S_IXOTH</td>
<td>Read by others.</td>

</tr>
<tr>
<td>S_ISVTX</td>
<td>On directories, restricted deletion flag.</td>
</tr>
</tbody>
</table>

The user ID of the file shall be initialized to the effective user ID of the process. The group ID of the file shall be initialized to either the effective group ID of the process or the group ID of the parent directory. Implementations shall provide a way to initialize the file’s group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file’s group ID to the effective group ID of the calling process. The owner, group, and other permission bits of `mode` shall be modified by the file mode creation mask of the process. The `mknod()` function shall clear each bit whose corresponding bit in the file mode creation mask of the process is set.
If path names a symbolic link, mknod() shall fail and set errno to [EEXIST].

Upon successful completion, mknod() shall mark for update the st_atime, st_ctime, and st_mtime fields of the file. Also, the st_ctime and st_mtime fields of the directory that contains the new entry shall be marked for update.

Only a process with appropriate privileges may invoke mknod() for file types other than FIFO-special.

RETURN VALUE

Upon successful completion, mknod() shall return 0. Otherwise, it shall return −1, the new file shall not be created, and errno shall be set to indicate the error.

ERRORS

The mknod() function shall fail if:

[EACCES] A component of the path prefix denies search permission, or write permission is denied on the parent directory.

[EEXIST] The named file exists.

[EINVAL] An invalid argument exists.

[EIO] An I/O error occurred while accessing the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of a pathname exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOENT] A component of the path prefix specified by path does not name an existing directory or path is an empty string.

[ENOSPC] The directory that would contain the new file cannot be extended or the file system is out of file allocation resources.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The invoking process does not have appropriate privileges and the file type is not FIFO-special.

[EROFS] The directory in which the file is to be created is located on a read-only file system.

The mknod() function may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the path argument.

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds [PATH_MAX].
EXAMPLES

Creating a FIFO Special File

The following example shows how to create a FIFO special file named `/home/cnd/mod_done`, with read/write permissions for owner, and with read permissions for group and others.

```c
#include <sys/types.h>
#include <sys/stat.h>

dev_t dev;
int status;
...

status = mknod("/home/cnd/mod_done", S_IFIFO | S_IWUSR |
               S_IRUSR | S_IRGRP | S_IROTH, dev);
```

APPLICATION USAGE

The `mkfifo` function is preferred over this function for making FIFO special files.

RATIONALE

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group
ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required
that implementations provide a way to have the group ID be set to the group ID of the
containing directory, but did not prohibit implementations also supporting a way to set the
group ID to the effective group ID of the creating process. Conforming applications should not
assume which group ID will be used. If it matters, an application can use `chown()` to set the
group ID after the file is created, or determine under what conditions the implementation will
set the desired group ID.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional
[ELOOP] error condition is added.
NAME
mkstemp — make a unique filename

SYNOPSIS
#include <stdlib.h>

int mkstemp(char *template);

DESCRIPTION
The mkstemp() function shall replace the contents of the string pointed to by template by a unique filename, and return a file descriptor for the file open for reading and writing. The function thus prevents any possible race condition between testing whether the file exists and opening it for use. The string in template should look like a filename with six trailing ‘X’ s; mkstemp() replaces each ‘X’ with a character from the portable filename character set. The characters are chosen such that the resulting name does not duplicate the name of an existing file at the time of a call to mkstemp().

RETURN VALUE
Upon successful completion, mkstemp() shall return an open file descriptor. Otherwise, −1 shall be returned if no suitable file could be created.

ERRORS
No errors are defined.

EXAMPLES

Generating a Filename
The following example creates a file with a 10-character name beginning with the characters "file" and opens the file for reading and writing. The value returned as the value of fd is a file descriptor that identifies the file.

#include <stdlib.h>
...
char template[] = "/tmp/fileXXXXXX";

int fd;

fd = mkstemp(template);

APPLICATION USAGE
It is possible to run out of letters.

The mkstemp() function need not check to determine whether the filename part of template exceeds the maximum allowable filename length.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
getpid(), open(), tmpfile(), tmpnam(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>
CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
The `mktemp()` function shall replace the contents of the string pointed to by `template` by a unique filename and return `template`. The application shall initialize `template` to be a filename with six trailing 'X's; `mktemp()` shall replace each 'X' with a single byte character from the portable filename character set.

The `mktemp()` function shall return the pointer `template`. If a unique name cannot be created, `template` shall point to a null string.

No errors are defined.

The following example replaces the contents of the "template" string with a 10-character filename beginning with the characters "file" and returns a pointer to the "template" string that contains the new filename.

```
#include <stdlib.h>
...
char *template = "/tmp/fileXXXXXX";
char *ptr;
ptr = mktemp(template);
```

Between the time a pathname is created and the file opened, it is possible for some other process to create a file with the same name. The `mkstemp()` function avoids this problem and is preferred over this function.

None.

This function may be withdrawn in a future version.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
mktime — convert broken-down time into time since the Epoch

SYNOPSIS
#include <time.h>

time_t mktime(struct tm *timeptr);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The mktime() function shall convert the broken-down time, expressed as local time, in the structure pointed to by timeptr, into a time since the Epoch value with the same encoding as that of the values returned by time(). The original values of the tm_wday and tm_yday components of the structure are ignored, and the original values of the other components are not restricted to the ranges described in <time.h>.

A positive or 0 value for tm_isdst shall cause mktime() to presume initially that Daylight Savings Time, respectively, is or is not in effect for the specified time. A negative value for tm_isdst shall cause mktime() to attempt to determine whether Daylight Savings Time is in effect for the specified time.

Local timezone information shall be set as though mktime() called tzset().

The relationship between the tm structure (defined in the <time.h> header) and the time in seconds since the Epoch is that the result shall be as specified in the expression given in the definition of seconds since the Epoch (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.14, Seconds Since the Epoch) corrected for timezone and any seasonal time adjustments, where the names in the structure and in the expression correspond.

Upon successful completion, the values of the tm_wday and tm_yday components of the structure shall be set appropriately, and the other components are set to represent the specified time since the Epoch, but with their values forced to the ranges indicated in the <time.h> entry; the final value of tm_mday shall not be set until tm_mon and tm_year are determined.

RETURN VALUE
The mktime() function shall return the specified time since the Epoch encoded as a value of type time_t. If the time since the Epoch cannot be represented, the function shall return the value (time_t)−1.

ERRORS
No errors are defined.

EXAMPLES
What day of the week is July 4, 2001?

#include <stdio.h>
#include <time.h>

struct tm time_str;

char daybuf[20];

int main(void)
{
    time_str.tm_year = 2001 - 1900;
    time_str.tm_mon = 7 - 1;
    time_str.tm_mday = 4;
}
System Interfaces

mktime()

```c
25166 time_str.tm_hour = 0;
25167 time_str.tm_min = 0;
25168 time_str.tm_sec = 1;
25169 time_str.tm_isdst = -1;
25170 if (mktime(&time_str) == -1)
25171     (void)puts("-unknown-"):
25172 else {
25173     (void)strftime(daybuf, sizeof(daybuf), "%A", &time_str);
25174     (void)puts(daybuf);
25175 }
25176 return 0;
25177 }
```

APPLICATION USAGE

None.

CHANGE HISTORY

Issue 6

Extensions beyond the ISO C standard are marked.
NAME
mlock, munlock — lock or unlock a range of process address space (REALTIME)

SYNOPSIS
#include <sys/mman.h>

int mlock(const void *addr, size_t len);
int munlock(const void *addr, size_t len);

DESCRIPTION
The mlock() function shall cause those whole pages containing any part of the address space of
the process starting at address addr and continuing for len bytes to be memory-resident until
unlocked or until the process exits or execs another process image. The implementation may
require that addr be a multiple of {PAGESIZE}.

The munlock() function shall unlock those whole pages containing any part of the address space
of the process starting at address addr and continuing for len bytes, regardless of how many
times mlock() has been called by the process for any of the pages in the specified range. The
implementation may require that addr be a multiple of {PAGESIZE}.

If any of the pages in the range specified to a call to munlock() are also mapped into the address
spaces of other processes, any locks established on those pages by another process are
unaffected by the call of this process to munlock(). If any of the pages in the range specified by a
call to munlock() are also mapped into other portions of the address space of the calling process
outside the range specified, any locks established on those pages via the other mappings are also
unaffected by this call.

Upon successful return from mlock(), pages in the specified range shall be locked and memory-
resident. Upon successful return from munlock(), pages in the specified range shall be unlocked
with respect to the address space of the process. Memory residency of unlocked pages is
unspecified.

The appropriate privilege is required to lock process memory with mlock().

RETURN VALUE
Upon successful completion, the mlock() and munlock() functions shall return a value of zero.
Otherwise, no change is made to any locks in the address space of the process, and the function
shall return a value of −1 and set errno to indicate the error.

ERRORS
The mlock() and munlock() functions shall fail if:

[ENOMEM] Some or all of the address range specified by the addr and len arguments does
not correspond to valid mapped pages in the address space of the process.

The mlock() function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked
when the call was made.

The mlock() and munlock() functions may fail if:

[EINVAL] The addr argument is not a multiple of {PAGESIZE}.

The mlock() function may fail if:

[ENOMEM] Locking the pages mapped by the specified range would exceed an
implementation-defined limit on the amount of memory that the process may
lock.
[EPERM] The calling process does not have the appropriate privilege to perform the requested operation.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The mlock() and munlock() functions are marked as part of the Range Memory Locking option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Range Memory Locking option.
mlockall() — lock/unlock the address space of a process (REALTIME)

SYNOPSIS
#include <sys/mman.h>

int mlockall(int flags);
int munlockall(void);

DESCRIPTION
The mlockall() function shall cause all of the pages mapped by the address space of a process to be memory-resident until unlocked or until the process exits or execs another process image. The flags argument determines whether the pages to be locked are those currently mapped by the address space of the process, those that are mapped in the future, or both. The flags argument is constructed from the bitwise-inclusive OR of one or more of the following symbolic constants, defined in <sys/mman.h>:

MCL_CURRENT Lock all of the pages currently mapped into the address space of the process.
MCL_FUTURE Lock all of the pages that become mapped into the address space of the process in the future, when those mappings are established.

If MCL_FUTURE is specified, and the automatic locking of future mappings eventually causes the amount of locked memory to exceed the amount of available physical memory or any other implementation-defined limit, the behavior is implementation-defined. The manner in which the implementation informs the application of these situations is also implementation-defined.

The munlockall() function shall unlock all currently mapped pages of the address space of the process. Any pages that become mapped into the address space of the process after a call to munlockall() shall not be locked, unless there is an intervening call to mlockall() specifying MCL_FUTURE or a subsequent call to mlockall() specifying MCL_CURRENT. If pages mapped into the address space of the process are also mapped into the address spaces of other processes and are locked by those processes, the locks established by the other processes shall be unaffected by a call by this process to munlockall().

Upon successful return from the mlockall() function that specifies MCL_CURRENT, all currently mapped pages of the process’ address space shall be memory-resident and locked. Upon return from the munlockall() function, all currently mapped pages of the process’ address space shall be unlocked with respect to the process’ address space. The memory residency of unlocked pages is unspecified.

The appropriate privilege is required to lock process memory with mlockall().

RETURN VALUE
Upon successful completion, the mlockall() function shall return a value of zero. Otherwise, no additional memory shall be locked, and the function shall return a value of −1 and set errno to indicate the error. The effect of failure of mlockall() on previously existing locks in the address space is unspecified.

If it is supported by the implementation, the munlockall() function shall always return a value of zero. Otherwise, the function shall return a value of −1 and set errno to indicate the error.

ERRORS
The mlockall() function shall fail if:

[EAGAIN] Some or all of the memory identified by the operation could not be locked when the call was made.
The `mlockall()` function may fail if:

- **[EINVAL]** The `flags` argument is zero, or includes unimplemented flags.
- **[ENOMEM]** Locking all of the pages currently mapped into the address space of the process would exceed an implementation-defined limit on the amount of memory that the process may lock.
- **[EPERM]** The calling process does not have the appropriate privilege to perform the requested operation.

NAME
mmap — map pages of memory

SYNOPSIS
#include <sys/mman.h>

void *mmap(void *addr, size_t len, int prot, int flags,
          int fildes, off_t off);

DESCRIPTION
The mmap() function shall establish a mapping between a process’ address space and a file, shared memory object, or typed memory object. The format of the call is as follows:

pa = malloc(addr, len, prot, flags, fildes, off);

The mmap() function shall establish a mapping between the address space of the process at an address pa for len bytes to the memory object represented by the file descriptor fildes at offset off for len bytes. The value of pa is an implementation-defined function of the parameter addr and the values of flags, further described below. A successful mmap() call shall return pa as its result.

The address range starting at pa and continuing for len bytes shall be legitimate for the possible (not necessarily current) address space of the process. The range of bytes starting at off and continuing for len bytes shall be legitimate for the possible (not necessarily current) offsets in the file, shared memory object, or typed memory object represented by fildes.

If fildes represents a typed memory object opened with either the POSIX_TYPED_MEM_ALLOCATE flag or the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the memory object to be mapped shall be that portion of the typed memory object allocated by the implementation as specified below. In this case, if off is non-zero, the behavior of mmap() is undefined. If fildes refers to a valid typed memory object that is not accessible from the calling process, mmap() shall fail.

The mapping established by mmap() shall replace any previous mappings for those whole pages containing any part of the address space of the process starting at pa and continuing for len bytes.

If the size of the mapped file changes after the call to mmap() as a result of some other operation on the mapped file, the effect of references to portions of the mapped region that correspond to added or removed portions of the file is unspecified.

The mmap() function shall be supported for regular files, shared memory objects, and typed memory objects. Support for any other type of file is unspecified.

The parameter prot determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The prot shall be either PROT_NONE or the bitwise-inclusive OR of one or more of the other flags in the following table, defined in the <sys/mman.h> header.

<table>
<thead>
<tr>
<th>Symbolic Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROT_READ</td>
<td>Data can be read.</td>
</tr>
<tr>
<td>PROT_WRITE</td>
<td>Data can be written.</td>
</tr>
<tr>
<td>PROT_EXEC</td>
<td>Data can be executed.</td>
</tr>
<tr>
<td>PROT_NONE</td>
<td>Data cannot be accessed.</td>
</tr>
</tbody>
</table>

If an implementation cannot support the combination of access types specified by prot, the call to mmap() shall fail.
An implementation may permit accesses other than those specified by \texttt{prot}; however, if the Memory Protection option is supported, the implementation shall not permit a write to succeed where \texttt{ PROT_WRITE} has not been set or shall not permit any access where \texttt{ PROT_NONE} alone has been set. The implementation shall support at least the following values of \texttt{prot}: \texttt{ PROT_NONE, PROT_READ, PROT_WRITE}, and the bitwise-inclusive OR of \texttt{ PROT_READ} and \texttt{ PROT_WRITE}. If the Memory Protection option is not supported, the result of any access that conflicts with the specified protection is undefined. The file descriptor \texttt{fildes} shall have been opened with read permission, regardless of the protection options specified. If \texttt{ PROT_WRITE} is specified, the application shall ensure that it has opened the file descriptor \texttt{fildes} with write permission unless \texttt{ MAP_PRIVATE} is specified in the \texttt{flags} parameter as described below.

The parameter \texttt{flags} provides other information about the handling of the mapped data. The value of \texttt{flags} is the bitwise-inclusive OR of these options, defined in \texttt{<sys/mman.h>}:

<table>
<thead>
<tr>
<th>Symbolic Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{MAP_SHARED}</td>
<td>Changes are shared.</td>
</tr>
<tr>
<td>\texttt{MAP_PRIVATE}</td>
<td>Changes are private.</td>
</tr>
<tr>
<td>\texttt{MAP_FIXED}</td>
<td>Interpret \texttt{addr} exactly.</td>
</tr>
</tbody>
</table>

Implementations that do not support the Memory Mapped Files option are not required to support \texttt{MAP_PRIVATE}.

It is implementation-defined whether \texttt{MAP_FIXED} shall be supported. \texttt{MAP_FIXED} shall be supported on XSI-conformant systems.

MAP\_SHARED and MAP\_PRIVATE describe the disposition of write references to the memory object. If MAP\_SHARED is specified, write references shall change the underlying object. If MAP\_PRIVATE is specified, modifications to the mapped data by the calling process shall be visible only to the calling process and shall not change the underlying object. It is unspecified whether modifications to the underlying object done after the MAP\_PRIVATE mapping is established are visible through the MAP\_PRIVATE mapping. Either MAP\_SHARED or MAP\_PRIVATE can be specified, but not both. The mapping type is retained across \texttt{fork()}.

When \texttt{fildes} represents a typed memory object opened with either the POSIX\_TYPED\_MEM\_ALLOCATE flag or the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, \texttt{mmap()} shall, if there are enough resources available, map \texttt{len} bytes allocated from the corresponding typed memory object which were not previously allocated to any process in any processor that may access that typed memory object. If there are not enough resources available, the function shall fail. If \texttt{fildes} represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag, these allocated bytes shall be contiguous within the typed memory object. If \texttt{fildes} represents a typed memory object opened with the POSIX\_TYPED\_MEM\_ALLOCATE flag, these allocated bytes may be composed of non-contiguous fragments within the typed memory object. If \texttt{fildes} represents a typed memory object opened with neither the POSIX\_TYPED\_MEM\_ALLOCATE\_CONTIG flag nor the POSIX\_TYPED\_MEM\_ALLOCATE flag, \texttt{len} bytes starting at offset \texttt{off} within the typed memory object are mapped, exactly as when mapping a file or shared memory object. In this case, if two processes map an area of typed memory using the same \texttt{off} and \texttt{len} values and using file descriptors that refer to the same memory pool (either from the same port or from a different port), both processes shall map the same region of storage.

When MAP\_FIXED is set in the \texttt{flags} argument, the implementation is informed that the value of \texttt{pa} shall be \texttt{addr}, exactly. If MAP\_FIXED is set, \texttt{mmap()} may return MAP\_FAILED and set \texttt{errno} to [EINVAL]. If a MAP\_FIXED request is successful, the mapping established by \texttt{mmap()} replaces any previous mappings for the process’ pages in the range \texttt{[pa,pa+len]}.  

When MAP_FIXED is not set, the implementation uses \textit{addr} in an implementation-defined manner to arrive at \textit{pa}. The \textit{pa} so chosen shall be an area of the address space that the implementation deems suitable for a mapping of \textit{len} bytes to the file. All implementations interpret an \textit{addr} value of 0 as granting the implementation complete freedom in selecting \textit{pa}, subject to constraints described below. A non-zero value of \textit{addr} is taken to be a suggestion of a process address near which the mapping should be placed. When the implementation selects a value for \textit{pa}, it never places a mapping at address 0, nor does it replace any extant mapping.

The \textit{off} argument is constrained to be aligned and sized according to the value returned by \textit{sysconf()} when passed \_SC_PAGESIZE or \_SC_PAGE_SIZE. When MAP_FIXED is specified, the application shall ensure that the argument \textit{addr} also meets these constraints. The implementation performs mapping operations over whole pages. Thus, while the argument \textit{len} need not meet a size or alignment constraint, the implementation shall include, in any mapping operation, any partial page specified by the range \([\textit{pa}, \textit{pa}+\textit{len}])

The system shall always zero-fill any partial page at the end of an object. Further, the system shall never write out any modified portions of the last page of an object which are beyond its end. References within the address range starting at \textit{pa} and continuing for \textit{len} bytes to whole pages following the end of an object shall result in delivery of a SIGBUS signal

An implementation may generate SIGBUS signals when a reference would cause an error in the mapped object, such as out-of-space condition.

The \textit{mmap()} function shall add an extra reference to the file associated with the file descriptor \textit{fildes} which is not removed by a subsequent \textit{close()} on that file descriptor. This reference shall be removed when there are no more mappings to the file.

The \textit{st_atime} field of the mapped file may be marked for update at any time between the \textit{mmap()} call and the corresponding \textit{munmap()} call. The initial read or write reference to a mapped region shall cause the file's \textit{st_atime} field to be marked for update if it has not already been marked for update.

The \textit{st_ctime} and \textit{st_mtime} fields of a file that is mapped with MAP_SHARED and PROT_WRITE shall be marked for update at some point in the interval between a write reference to the mapped region and the next call to \textit{msync()} with MSASYNC or MS_SYNC for that portion of the file by any process. If there is no such call and if the underlying file is modified as a result of a write reference, then these fields shall be marked for update at some time after the write reference.

There may be implementation-defined limits on the number of memory regions that can be mapped (per process or per system).

If such a limit is imposed, whether the number of memory regions that can be mapped by a process is decreased by the use of \textit{shmaddr()} is implementation-defined.

If \textit{mmap()} fails for reasons other than [EBADF], [EINVAL], or [ENOTSUP], some of the mappings in the address range starting at \textit{addr} and continuing for \textit{len} bytes may have been unmapped.

\textbf{RETURN VALUE}

Upon successful completion, the \textit{mmap()} function shall return the address at which the mapping was placed (\textit{pa}); otherwise, it shall return a value of MAP_FAILED and set \textit{errno} to indicate the error. The symbol MAP_FAILED is defined in the <sys/mman.h> header. No successful return from \textit{mmap()} shall return the value MAP_FAILED.
The `mmap()` function shall fail if:

**[EACCES]** The `filedes` argument is not open for read, regardless of the protection specified, or `filedes` is not open for write and PROT_WRITE was specified for a MAP_SHARED type mapping.

**[EINVAL]** The value of `flags` is invalid (neither MAP_PRIVATE nor MAP_SHARED is set).

**[EMFILE]** The number of mapped regions would exceed an implementation-defined limit (per process or per system).

**[ENOMEM]** MAP_FIXED was specified, and the range `[addr,addr+len)` exceeds that allowed for the address space of a process; or, if MAP_FIXED was not specified and there is insufficient room in the address space to effect the mapping.

**[ENOMEM]** The mapping could not be locked in memory, if required by `mlockall()`, because it would require more space than the system is able to supply.

**[ENOMEM]** Not enough unallocated memory resources remain in the typed memory object designated by `filedes` to allocate `len` bytes.

**[EINVAL]** MAP_FIXED or MAP_PRIVATE was specified in the `flags` argument and the implementation does not support this functionality.

**[ENOEXEC]** The implementation does not support the combination of accesses requested in the `prot` argument.

**[ENXIO]** Addresses in the range `[off,off+len)` are invalid for the object specified by `filedes`.

**[ENXIO]** MAP_FIXED was specified in `flags` and the combination of `addr`, `len`, and `off` is invalid for the object specified by `filedes`.

**[ENXIO]** The `filedes` argument refers to a typed memory object that is not accessible from the calling process.

**[EOVERFLOW]** The file is a regular file and the value of `off` plus `len` exceeds the offset maximum established in the open file description associated with `filedes`.

### Examples

None.

### Application Usage

Use of `mmap()` may reduce the amount of memory available to other memory allocation functions.

Use of MAP_FIXED may result in unspecified behavior in further use of `malloc()` and `shmat()`.

The use of MAP_FIXED is discouraged, as it may prevent an implementation from making the most effective use of resources.
The application must ensure correct synchronization when using `mmap()` in conjunction with any other file access method, such as `read()` and `write()`, standard input/output, and `shmat()`.

The `mmap()` function allows access to resources via address space manipulations, instead of `read()`/`write()`. Once a file is mapped, all a process has to do to access it is use the data at the address to which the file was mapped. So, using pseudo-code to illustrate the way in which an existing program might be changed to use `mmap()`, the following:

```c
fildes = open(...)
lseek(fildes, some_offset)
read(fildes, buf, len)
/* Use data in buf. */
```

becomes:

```c
fildes = open(...)
address = mmap(0, len, PROT_READ, MAP_PRIVATE, fildes, some_offset)
/* Use data at address. */
```

**RATIONALE**

After considering several other alternatives, it was decided to adopt the `mmap()` definition found in SVR4 for mapping memory objects into process address spaces. The SVR4 definition is minimal, in that it describes only what has been built, and what appears to be necessary for a general and portable mapping facility.

Note that while `mmap()` was first designed for mapping files, it is actually a general-purpose mapping facility. It can be used to map any appropriate object, such as memory, files, devices, and so on, into the address space of a process.

When a mapping is established, it is possible that the implementation may need to map more than is requested into the address space of the process because of hardware requirements. An application, however, cannot count on this behavior. Implementations that do not use a paged architecture may simply allocate a common memory region and return the address of it; such implementations probably do not allocate any more than is necessary. References past the end of the requested area are unspecified.

If an application requests a mapping that would overlay existing mappings in the process, it might be desirable that an implementation detect this and inform the application. However, the default, portable (not MAP_FIXED) operation does not overlay existing mappings. On the other hand, if the program specifies a fixed address mapping (which requires some implementation knowledge to determine a suitable address, if the function is supported at all), then the program is presumed to be successfully managing its own address space and should be trusted when it asks to map over existing data structures. Furthermore, it is also desirable to make as few system calls as possible, and it might be considered onerous to require an `munmap()` before an `mmap()` to the same address range. This volume of IEEE Std 1003.1-2001 specifies that the new mappings replace any existing mappings, following existing practice in this regard.

It is not expected, when the Memory Protection option is supported, that all hardware implementations are able to support all combinations of permissions at all addresses. When this option is supported, implementations are required to disallow write access to mappings without write permission and to disallow access to mappings without any access permission. Other than these restrictions, implementations may allow access types other than those requested by the application. For example, if the application requests only PROT_WRITE, the implementation may also allow read access. A call to `mmap()` fails if the implementation cannot support allowing all the access requested by the application. For example, some implementations cannot support a request for both write access and execute access simultaneously. All implementations supporting the Memory Protection option must support requests for no access, read access,
write access, and both read and write access. Strictly conforming code must only rely on the
required checks. These restrictions allow for portability across a wide range of hardware.

The MAP_FIXED address treatment is likely to fail for non-page-aligned values and for certain
architecture-dependent address ranges. Conforming implementations cannot count on being
able to choose address values for MAP_FIXED without utilizing non-portable, implementation-
defined knowledge. Nonetheless, MAP_FIXED is provided as a standard interface conforming to
existing practice for utilizing such knowledge when it is available.

Similarly, in order to allow implementations that do not support virtual addresses, support for
directly specifying any mapping addresses via MAP_FIXED is not required and thus a
conforming application may not count on it.

The MAP_PRIVATE function can be implemented efficiently when memory protection hardware
is available. When such hardware is not available, implementations can implement such
“mappings” by simply making a real copy of the relevant data into process private memory,
though this tends to behave similarly to read().

The function has been defined to allow for many different models of using shared memory.
However, all uses are not equally portable across all machine architectures. In particular, the
mmap() function allows the system as well as the application to specify the address at which to
map a specific region of a memory object. The most portable way to use the function is always to
let the system choose the address, specifying NULL as the value for the argument addr and not to
specify MAP_FIXED.

If it is intended that a particular region of a memory object be mapped at the same address in a
group of processes (on machines where this is even possible), then MAP_FIXED can be used to
pass in the desired mapping address. The system can still be used to choose the desired address
if the first such mapping is made without specifying MAP_FIXED, and then the resulting
mapping address can be passed to subsequent processes for them to pass in via MAP_FIXED.
The availability of a specific address range cannot be guaranteed, in general.

The mmap() function can be used to map a region of memory that is larger than the current size
of the object. Memory access within the mapping but beyond the current end of the underlying
objects may result in SIGBUS signals being sent to the process. The reason for this is that the size
of the object can be manipulated by other processes and can change at any moment. The
implementation should tell the application that a memory reference is outside the object where
this can be detected; otherwise, written data may be lost and read data may not reflect actual
data in the object.

Note that references beyond the end of the object do not extend the object as the new end cannot
be determined precisely by most virtual memory hardware. Instead, the size can be directly
manipulated by ftruncate().

Process memory locking does apply to shared memory regions, and the MEMLOCK_FUTURE
argument to mlockall() can be relied upon to cause new shared memory regions to be
automatically locked.

Existing implementations of mmap() return the value −1 when unsuccessful. Since the casting of
this value to type void * cannot be guaranteed by the ISO C standard to be distinct from a
successful value, this volume of IEEE Std 1003.1-2001 defines the symbol MAP_FAILED, which a
conforming implementation does not return as the result of a successful call.

FUTURE DIRECTIONS
None.
SEE ALSO
exec, fcntl(), fork(), lockf(), msync(), mprotect(), posix_typed_mem_open(), shmat(),
sysconf(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Moved from X/OPEN UNIX extension to BASE.

Aligned with mmap() in the POSIX Realtime Extension as follows:

- The DESCRIPTION is extensively reworded.
- The [EAGAIN] and [ENOTSUP] mandatory error conditions are added.
- New cases of [ENOMEM] and [ENXIO] are added as mandatory error conditions.
- The value returned on failure is the value of the constant MAP_FAILED; this was previously defined as −1.
- Large File Summit extensions are added.

The mmap() function is marked as part of the Memory Mapped Files option.

The Open Group Corrigendum U028/6 is applied, changing (void *)−1 to MAP_FAILED.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to describe the use of MAP_FIXED.
- The DESCRIPTION is updated to describe the addition of an extra reference to the file associated with the file descriptor passed to mmap().
- The DESCRIPTION is updated to state that there may be implementation-defined limits on the number of memory regions that can be mapped.
- The DESCRIPTION is updated to describe constraints on the alignment and size of the off argument.
- The [EINVAL] and [EMFILE] error conditions are added.
- The [EOVERFLOW] error condition is added. This change is to support large files.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The DESCRIPTION is updated to describe the cases when MAP_PRIVATE and MAP_FIXED need not be supported.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- Semantics for typed memory objects are added to the DESCRIPTION.
- New [ENOMEM] and [ENXIO] errors are added to the ERRORS section.
- The posix_typed_mem_open() function is added to the SEE ALSO section.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/34 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).
**NAME**
modf, modff, modfl — decompose a floating-point number

**SYNOPSIS**
```c
#include <math.h>
double modf(double x, double *iptr);
float modff(float value, float *iptr);
long double modfl(long double value, long double *iptr);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall break the argument \( x \) into integral and fractional parts, each of which has the same sign as the argument. It stores the integral part as a **double** (for the \texttt{modf()} function), a **float** (for the \texttt{modff()} function), or a **long double** (for the \texttt{modfl()} function), in the object pointed to by \texttt{iptr}.

**RETURN VALUE**

Upon successful completion, these functions shall return the signed fractional part of \( x \).

**ERRORS**
No errors are defined.

**EXAMPLES**
None.

**APPLICATION USAGE**

The \texttt{modf()} function computes the function result and \texttt{*iptr} such that:

\[
a = \texttt{modf}(x, \texttt{iptr}) \; ;
\]

\[
x = a + \texttt{*iptr} \; ;
\]

allowing for the usual floating-point inaccuracies.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**

\texttt{frexp()}, \texttt{isnan()}, \texttt{ldexp()}, the Base Definitions volume of IEEE Std 1003.1-2001, \texttt{<math.h>}

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

**Issue 6**
The \texttt{modff()} and \texttt{modfl()} functions are added for alignment with the ISO/IEC 9899:1999 standard.
The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/35 is applied, correcting the code example in the APPLICATION USAGE section.
NAME
mprotect — set protection of memory mapping

SYNOPSIS
#include <sys/mman.h>

int mprotect(void *addr, size_t len, int prot);

DESCRIPTION
The mprotect() function shall change the access protections to be that specified by prot for those whole pages containing any part of the address space of the process starting at address addr and continuing for len bytes. The parameter prot determines whether read, write, execute, or some combination of accesses are permitted to the data being mapped. The prot argument should be either PROT_NONE or the bitwise-inclusive OR of one or more of PROT_READ, PROT_WRITE, and PROT_EXEC.

If an implementation cannot support the combination of access types specified by prot, the call to mprotect() shall fail.

An implementation may permit accesses other than those specified by prot; however, no implementation shall permit a write to succeed where PROT_WRITE has not been set or shall permit any access where PROT_NONE alone has been set. Implementations shall support at least the following values of prot: PROT_NONE, PROT_READ, PROT_WRITE, and the bitwise-inclusive OR of PROT_READ and PROT_WRITE. If PROT_WRITE is specified, the application shall ensure that it has opened the mapped objects in the specified address range with write permission, unless MAP_PRIVATE was specified in the original mapping, regardless of whether the file descriptors used to map the objects have since been closed.

The implementation shall require that addr be a multiple of the page size as returned by sysconf().

The behavior of this function is unspecified if the mapping was not established by a call to mmap().

When mprotect() fails for reasons other than [EINVAL], the protections on some of the pages in the range [addr,addr+len) may have been changed.

RETURN VALUE
Upon successful completion, mprotect() shall return 0; otherwise, it shall return −1 and set errno to indicate the error.

ERRORS
The mprotect() function shall fail if:

[EACCES] The prot argument specifies a protection that violates the access permission the process has to the underlying memory object.

[EAGAIN] The prot argument specifies PROT_WRITE over a MAP_PRIVATE mapping and there are insufficient memory resources to reserve for locking the private page.

[EINVAL] The addr argument is not a multiple of the page size as returned by sysconf().

[ENOMEM] Addresses in the range [addr,addr+len) are invalid for the address space of a process, or specify one or more pages which are not mapped.

[ENOMEM] The prot argument specifies PROT_WRITE on a MAP_PRIVATE mapping, and it would require more space than the system is able to supply for locking the private pages, if required.
The implementation does not support the combination of accesses requested in the `prot` argument.

**EXAMPLES**
None.

**APPLICATION USAGE**
The `EINVAL` error above is marked EX because it is defined as an optional error in the POSIX Realtime Extension.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
`mmap()`, `sysconf()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/mman.h>`

**CHANGE HISTORY**
First released in Issue 4, Version 2.

**Issue 5**
Moved from X/OPEN UNIX extension to BASE.
Aligned with `mprotect()` in the POSIX Realtime Extension as follows:
- The DESCRIPTION is largely reworded.
- `[ENOTSUP]` and a second form of `[ENOMEM]` are added as mandatory error conditions.
- `[EAGAIN]` is moved from the optional to the mandatory error conditions.

**Issue 6**
The `mprotect()` function is marked as part of the Memory Protection option.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
- The DESCRIPTION is updated to state that implementations require `addr` to be a multiple of the page size as returned by `sysconf()`.
- The `[EINVAL]` error condition is added.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
mq_close — close a message queue (REALTIME)

SYNOPSIS
#include <mqueue.h>
int mq_close(mqd_t mqdes);

DESCRIPTION
The mq_close() function shall remove the association between the message queue descriptor, mqdes, and its message queue. The results of using this message queue descriptor after successful return from this mq_close(), and until the return of this message queue descriptor from a subsequent mq_open(), are undefined.

If the process has successfully attached a notification request to the message queue via this mqdes, this attachment shall be removed, and the message queue is available for another process to attach for notification.

RETURN VALUE
Upon successful completion, the mq_close() function shall return a value of zero; otherwise, the function shall return a value of −1 and set errno to indicate the error.

ERRORS
The mq_close() function shall fail if:

[EBADF] The mqdes argument is not a valid message queue descriptor.

EXAMPLES
None.

APPLICATION USAGE
None.

Issue 6
The mq_close() function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.
NAME
mq_getattr — get message queue attributes (REALTIME)

SYNOPSIS
MSG
#include <mqueue.h>

int mq_getattr(mqd_t mqdes, struct mq_attr *mqstat);

DESCRIPTION
The mq_getattr() function shall obtain status information and attributes of the message queue and the open message queue description associated with the message queue descriptor.

The mqdes argument specifies a message queue descriptor.

The results shall be returned in the mq_attr structure referenced by the mqstat argument.

Upon return, the following members shall have the values associated with the open message queue description as set when the message queue was opened and as modified by subsequent mq_setattr() calls: mq_flags.

The following attributes of the message queue shall be returned as set at message queue creation: mq_maxmsg, mq_msgsize.

Upon return, the following members within the mq_attr structure referenced by the mqstat argument shall be set to the current state of the message queue:

mq_curmsgs The number of messages currently on the queue.

RETURN VALUE
Upon successful completion, the mq_getattr() function shall return zero. Otherwise, the function shall return −1 and set errno to indicate the error.

ERRORS
The mq_getattr() function shall fail if:

[EBADF] The mqdes argument is not a valid message queue descriptor.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

Issue 6
The mq_getattr() function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.
The `mq_timedsend()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
NAME
mq_notify — notify process that a message is available (REALTIME)

SYNOPSIS
#include <mqueue.h>

int mq_notify(mqd_t mqdes, const struct sigevent *notification);

DESCRIPTION
If the argument notification is not NULL, this function shall register the calling process to be notified of message arrival at an empty message queue associated with the specified message queue descriptor, mqdes. The notification specified by the notification argument shall be sent to the process when the message queue transitions from empty to non-empty. At any time, only one process may be registered for notification by a message queue. If the calling process or any other process has already registered for notification of message arrival at the specified message queue, subsequent attempts to register for that message queue shall fail.

If notification is NULL and the process is currently registered for notification by the specified message queue, the existing registration shall be removed.

When the notification is sent to the registered process, its registration shall be removed. The message queue shall then be available for registration.

If a process has registered for notification of message arrival at a message queue and some thread is blocked in mq_receive() waiting to receive a message when a message arrives at the queue, the arriving message shall satisfy the appropriate mq_receive(). The resulting behavior is as if the message queue remains empty, and no notification shall be sent.

RETURN VALUE
Upon successful completion, the mq_notify() function shall return a value of zero; otherwise, the function shall return a value of −1 and set errno to indicate the error.

ERRORS
The mq_notify() function shall fail if:

[EBADF] The mqdes argument is not a valid message queue descriptor.
[EBUSY] A process is already registered for notification by the message queue.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

The `mq_timedsend()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
mq_open()  

NAME
mq_open — open a message queue (REALTIME)

SYNOPSIS
#include <mqueue.h>

mqd_t mq_open(const char *name, int oflag, ...);

DESCRIPTION
The mq_open() function shall establish the connection between a process and a message queue with a message queue descriptor. It shall create an open message queue description that refers to the message queue, and a message queue descriptor that refers to that open message queue description. The message queue descriptor is used by other functions to refer to that message queue. The name argument points to a string naming a message queue. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The name argument shall conform to the construction rules for a pathname. If name begins with the slash character, then processes calling mq_open() with the same value of name shall refer to the same message queue object, as long as that name has not been removed. If name does not begin with the slash character, the effect is implementation-defined. The interpretation of slash characters other than the leading slash character in name is implementation-defined. If the name argument is not the name of an existing message queue and creation is not requested, mq_open() shall fail and return an error.

A message queue descriptor may be implemented using a file descriptor, in which case applications can open up to at least {OPEN_MAX} file and message queues.

The oflag argument requests the desired receive and/or send access to the message queue. The requested access permission to receive messages or send messages shall be granted if the calling process would be granted read or write access, respectively, to an equivalently protected file.

The value of oflag is the bitwise-inclusive OR of values from the following list. Applications shall specify exactly one of the first three values (access modes) below in the value of oflag:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>O_RDONLY</td>
<td>Open the message queue for receiving messages. The process can use the returned message queue descriptor with mq_receive(), but not mq_send(). A message queue may be open multiple times in the same or different processes for receiving messages.</td>
</tr>
<tr>
<td>O_WRONLY</td>
<td>Open the queue for sending messages. The process can use the returned message queue descriptor with mq_send() but not mq_receive(). A message queue may be open multiple times in the same or different processes for sending messages.</td>
</tr>
<tr>
<td>O_RDWR</td>
<td>Open the queue for both receiving and sending messages. The process can use any of the functions allowed for O_RDONLY and O_WRONLY. A message queue may be open multiple times in the same or different processes for sending messages.</td>
</tr>
</tbody>
</table>
| O_CREAT    | Create a message queue. It requires two additional arguments: mode, which shall be of type mode_t, and attr, which shall be a pointer to an mq_attr structure. If the pathname name has already been used to create a message queue that still exists, then this flag shall have no effect, except as noted under O_EXCL. Otherwise, a message queue shall be created without any messages in it. The user ID of the message queue shall be set to the effective user ID of the process, and the group ID of the message queue shall be set to the effective...

790  System Interfaces, Issue 6 — Copyright © 2001-2003, IEEE and The Open Group. All rights reserved.
group ID of the process. The file permission bits shall be set to the value of
mode. When bits in mode other than file permission bits are set, the effect is
implementation-defined. If attr is NULL, the message queue shall be created
with implementation-defined default message queue attributes. If attr is non-
NULL and the calling process has the appropriate privilege on name, the
message queue mq_maxmsg and mq_msgsize attributes shall be set to the values
of the corresponding members in the mq_attr structure referred to by attr. If
attr is non-NULL, but the calling process does not have the appropriate
privilege on name, the mq_open() function shall fail and return an error
without creating the message queue.

O_EXCL If O_EXCL and O_CREAT are set, mq_open() shall fail if the message queue
name exists. The check for the existence of the message queue and the creation
of the message queue if it does not exist shall be atomic with respect to other
threads executing mq_open() naming the same name with O_EXCL and
O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is
undefined.

O_NONBLOCK Determines whether an mq_send() or mq_receive() waits for resources or
messages that are not currently available, or fails with errno set to [EAGAIN];
see mq_send() and mq_receive() for details.

The mq_open() function does not add or remove messages from the queue.

RETURN VALUE
Upon successful completion, the function shall return a message queue descriptor; otherwise,
the function shall return (mqd_t)−1 and set errno to indicate the error.

ERRORS
The mq_open() function shall fail if:

[EACCES] The message queue exists and the permissions specified by oflag are denied, or
the message queue does not exist and permission to create the message queue
is denied.

[EXIST] O_CREAT and O_EXCL are set and the named message queue already exists.

[EINTR] The mq_open() function was interrupted by a signal.

[EINVAL] The mq_open() function is not supported for the given name.

[EINVAL] O_CREAT was specified in oflag, the value of attr is not NULL, and either
mq_maxmsg or mq_msgsize was less than or equal to zero.

[EMFILE] Too many message queue descriptors or file descriptors are currently in use by
this process.

[ENAMETOOLONG] The length of the name argument exceeds [PATH_MAX] or a pathname
component is longer than [NAME_MAX].

[ENFILE] Too many message queues are currently open in the system.

[ENOENT] O_CREAT is not set and the named message queue does not exist.

[ENOSPC] There is insufficient space for the creation of the new message queue.

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
The mq_open() function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The mq_timedreceive() and mq_timedsend() functions are added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.
NAME
mq_receive, mq_timedreceive — receive a message from a message queue (REALTIME)

SYNOPSIS
#include <mqueue.h>

ssize_t mq_receive(mqd_t mqdes, char *msg_ptr, size_t msg_len, unsigned *msg_prio);

#include <mqueue.h>
#include <time.h>

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr, size_t msg_len, unsigned *restrict msg_prio,
const struct timespec *restrict abs_timeout);

DESCRIPTION
The mq_receive() function shall receive the oldest of the highest priority message(s) from the
message queue specified by mqdes. If the size of the buffer in bytes, specified by the msg_len
argument, is less than the mq_msgsize attribute of the message queue, the function shall fail and
return an error. Otherwise, the selected message shall be removed from the queue and copied to
the buffer pointed to by the msg_ptr argument.

If the value of msg_len is greater than {SSIZE_MAX}, the result is implementation-defined.

If the argument msg_prio is not NULL, the priority of the selected message shall be stored in the
location referenced by msg_prio.

If the specified message queue is empty and O_NONBLOCK is not set in the message queue
description associated with mqdes, mq_receive() shall block until a message is enqueued on the
message queue or until mq_receive() is interrupted by a signal. If more than one thread is waiting
to receive a message when a message arrives at an empty queue and the Priority Scheduling
option is supported, then the thread of highest priority that has been waiting the longest shall be
selected to receive the message. Otherwise, it is unspecified which waiting thread receives the
message. If the specified message queue is empty and O_NONBLOCK is set in the message
queue description associated with mqdes, no message shall be removed from the queue, and
mq_receive() shall return an error.

The mq_timedreceive() function shall receive the oldest of the highest priority messages from the
message queue specified by mqdes as described for the mq_receive() function. However, if
O_NONBLOCK was not specified when the message queue was opened via the mq_open() function,
and no message exists on the queue to satisfy the receive, the wait for such a message
shall be terminated when the specified timeout expires. If O_NONBLOCK is set, this function is
equivalent to mq_receive().

The timeout expires when the absolute time specified by abs_timeout passes, as measured by the
clock on which timeouts are based (that is, when the value of that clock equals or exceeds
abs_timeout), or if the absolute time specified by abs_timeout has already been passed at the time
of the call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
the Timers option is not supported, the timeout shall be based on the system clock as returned
by the time() function.

The resolution of the timeout shall be the resolution of the clock on which it is based. The
timespec argument is defined in the <time.h> header.
mq_receive() System Interfaces

Under no circumstance shall the operation fail with a timeout if a message can be removed from the message queue immediately. The validity of the abs_timeout parameter need not be checked if a message can be removed from the message queue immediately.

RETURN VALUE

Upon successful completion, the mq_receive() and mq_timedreceive() functions shall return the length of the selected message in bytes and the message shall be removed from the queue. Otherwise, no message shall be removed from the queue, the functions shall return a value of −1, and set errno to indicate the error.

ERRORS

The mq_receive() and mq_timedreceive() functions shall fail if:

- [EAGAIN] O_NONBLOCK was set in the message description associated with mqdes, and the specified message queue is empty.
- [EBADF] The mqdes argument is not a valid message queue descriptor open for reading.
- [EMSGSIZE] The specified message buffer size, msg_len, is less than the message size attribute of the message queue.
- [EINTR] The mq_receive() or mq_timedreceive() operation was interrupted by a signal.
- [EINVAL] The process or thread would have blocked, and the abs_timeout parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
- [ETIMEOUT] The O_NONBLOCK flag was not set when the message queue was opened, but no message arrived on the queue before the specified timeout expired.

The mq_receive() and mq_timedreceive() functions may fail if:

- [EBADMSG] The implementation has detected a data corruption problem with the message.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The mq_receive() function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/4 is applied. The DESCRIPTION is changed to refer to msg_len rather than maxsize.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In this function it is possible for the return value to exceed the range of the type `ssize_t` (since `size_t` has a larger range of positive values than `ssize_t`). A sentence restricting the size of the `size_t` object is added to the description to resolve this conflict.

The `mq_timedreceive()` function is added for alignment with IEEE Std 1003.1d-1999.

The `restrict` keyword is added to the `mq_timedreceive()` prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE PASC Interpretation 1003.1 #109 is applied, correcting the return type for `mq_timedreceive()` from `int` to `ssize_t`. 
NAME
mq_send, mq_timedsend — send a message to a message queue (REALTIME)

SYNOPSIS
MSG
#include <mqueue.h>

int mq_send(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
unsigned msg_prio);

TMO
#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
unsigned msg_prio, const struct timespec *abs_timeout);

DESCRIPTION
The mq_send() function shall add the message pointed to by the argument msg_ptr to the
message queue specified by mqdes. The msg_len argument specifies the length of the message, in
bytes, pointed to by msg_ptr. The value of msg_len shall be less than or equal to the mq_msgsize
attribute of the message queue, or mq_send() shall fail.

If the specified message queue is not full, mq_send() shall behave as if the message is inserted
into the message queue at the position indicated by the msg_prio argument. A message with a
larger numeric value of msg_prio shall be inserted before messages with lower values of
msg_prio. A message shall be inserted after other messages in the queue, if any, with equal
msg_prio. The value of msg_prio shall be less than {MQ_PRIO_MAX}.

If the specified message queue is full and O_NONBLOCK is not set in the message queue
description associated with mqdes, mq_send() shall block until space becomes available to
enqueue the message, or until mq_send() is interrupted by a signal. If more than one thread is
waiting to send when space becomes available in the message queue and the Priority Scheduling
option is supported, then the thread of the highest priority that has been waiting the longest
shall be unblocked to send its message. Otherwise, it is unspecified which waiting thread is
unblocked. If the specified message queue is full and O_NONBLOCK is set in the message
queue description associated with mqdes, the message shall not be queued and mq_send() shall
return an error.

The mq_timedsend() function shall add a message to the message queue specified by mqdes in the
manner defined for the mq_send() function. However, if the specified message queue is full and
O_NONBLOCK is not set in the message queue description associated with mqdes, the wait for
sufficient room in the queue shall be terminated when the specified timeout expires. If
O_NONBLOCK is set in the message queue description, this function shall be equivalent to
mq_send().

The timeout shall expire when the absolute time specified by abs_timeout passes, as measured by
the clock on which timeouts are based (that is, when the value of that clock equals or exceeds
abs_timeout), or if the absolute time specified by abs_timeout has already been passed at the time
of the call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
the Timers option is not supported, the timeout shall be based on the system clock as returned
by the time() function.

The resolution of the timeout shall be the resolution of the clock on which it is based. The
timespec argument is defined in the <time.h> header.
Under no circumstance shall the operation fail with a timeout if there is sufficient room in the
queue to add the message immediately. The validity of the \textit{abs\_timeout} parameter need not be
checked when there is sufficient room in the queue.

\textbf{RETURN VALUE}

Upon successful completion, the \texttt{mq\_send()} and \texttt{mq\_timedsend()} functions shall return a value of
zero. Otherwise, no message shall be enqueued, the functions shall return \texttt{−1}, and \texttt{errno} shall be
set to indicate the error.

\textbf{ERRORS}

The \texttt{mq\_send()} and \texttt{mq\_timedsend()} functions shall fail if:

\begin{itemize}
  \item \texttt{[EAGAIN]} The O\_NONBLOCK flag is set in the message queue description associated
           with \texttt{mqdes}, and the specified message queue is full.
  \item \texttt{[EBADF]} The \texttt{mqdes} argument is not a valid message queue descriptor open for writing.
  \item \texttt{[EINVAL]} The value of \texttt{msg\_prio} was outside the valid range.
  \item \texttt{[EINVAL]} The process or thread would have blocked, and the \texttt{abs\_timeout} parameter
           specified a nanoseconds field value less than zero or greater than or equal to
           1 000 million.
  \item \texttt{[EMSGSIZE]} The specified message length, \texttt{msg\_len}, exceeds the message size attribute of
           the message queue.
  \item \texttt{[ETIMEDOUT]} The O\_NONBLOCK flag was not set when the message queue was opened,
           but the timeout expired before the message could be added to the queue.
\end{itemize}

\textbf{EXAMPLES}

None.

\textbf{APPLICATION USAGE}

The value of the symbol \texttt{\{MQ\_PRIO\_MAX\}} limits the number of priority levels supported by the
application. Message priorities range from 0 to \texttt{\{MQ\_PRIO\_MAX\}}−1.

\textbf{RATIONALE}

None.

\textbf{FUTURE DIRECTIONS}

None.

\textbf{CHANGE HISTORY}

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

\textbf{Issue 6}

The \texttt{mq\_send()} function is marked as part of the Message Passing option.

The \texttt{[ENOSYS]} error condition has been removed as stubs need not be provided if an
implementation does not support the Message Passing option.

The \texttt{mq\_timedsend()} function is added for alignment with IEEE Std 1003.1d-1999.
NAME
mq_setattr — set message queue attributes (REALTIME)

SYNOPSIS
#include <mqueue.h>

int mq_setattr(mqd_t mqdes, const struct mq_attr *restrict
struct mq_attr *restrict omqstat);

DESCRIPTION
The mq_setattr() function shall set attributes associated with the open message queue
description referenced by the message queue descriptor specified by mqdes.

The message queue attributes corresponding to the following members defined in the mq_attr
structure shall be set to the specified values upon successful completion of mq_setattr():

mq_flags The value of this member is the bitwise-logical OR of zero or more of
O_NONBLOCK and any implementation-defined flags.

The values of the mq_maxmsg, mq_msgsize, and mq_curmsgs members of the mq_attr structure
shall be ignored by mq_setattr().

If omqstat is non-NULL, the mq_setattr() function shall store, in the location referenced by
omqstat, the previous message queue attributes and the current queue status. These values shall
be the same as would be returned by a call to mq_getattr() at that point.

RETURN VALUE
Upon successful completion, the function shall return a value of zero and the attributes of the
message queue shall have been changed as specified.

Otherwise, the message queue attributes shall be unchanged, and the function shall return a
value of −1 and set errno to indicate the error.

ERRORS
The mq_setattr() function shall fail if:

[EBADF] The mqdes argument is not a valid message queue descriptor.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
mq_open(), mq_send(), mq_timedsend(), msgctl(), msgget(), msgrcv(), msgsnd(), the Base
Definitions volume of IEEE Std 1003.1-2001, <mqueue.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
The `mq_setattr()` function is marked as part of the Message Passing option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.

The `mq_timedsend()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The `restrict` keyword is added to the `mq_setattr()` prototype for alignment with the ISO/IEC 9899:1999 standard.
mq_timedreceive()  

NAME  
mq_timedreceive — receive a message from a message queue (ADVANCED REALTIME)  

SYNOPSIS  
#include <mqueue.h>  
#include <time.h>  

ssize_t mq_timedreceive(mqd_t mqdes, char *restrict msg_ptr,  
size_t msg_len, unsigned *restrict msg_prio,  
const struct timespec *restrict abs_timeout);  

DESCRIPTION  
Refer to mq_receive().
NAME
mq_timedsend — send a message to a message queue (ADVANCED REALTIME)

SYNOPSIS
#include <mqueue.h>
#include <time.h>

int mq_timedsend(mqd_t mqdes, const char *msg_ptr, size_t msg_len,
                 unsigned msg_prio, const struct timespec *abs_timeout);

DESCRIPTION
Refer to mq_send().
NAME
mq_unlink — remove a message queue (REALTIME)

SYNOPSIS
MSG
#include <mqueue.h>

int mq_unlink(const char *name);

DESCRIPTION
The mq_unlink() function shall remove the message queue named by the pathname name. After
a successful call to mq_unlink() with name, a call to mq_open() with name shall fail if the flag
O_CREAT is not set in flags. If one or more processes have the message queue open when
mq_unlink() is called, destruction of the message queue shall be postponed until all references to
the message queue have been closed.

Calls to mq_open() to recreate the message queue may fail until the message queue is actually
removed. However, the mq_unlink() call need not block until all references have been closed; it
may return immediately.

RETURN VALUE
Upon successful completion, the function shall return a value of zero. Otherwise, the named
message queue shall be unchanged by this function call, and the function shall return a value of
-1 and set errno to indicate the error.

ERRORS
The mq_unlink() function shall fail if:

[EACCES] Permission is denied to unlink the named message queue.
[ENAMETOOLONG] The length of the name argument exceeds [PATH_MAX] or a pathname
component is longer than [NAME_MAX].
[ENOENT] The named message queue does not exist.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

IEEE Std 1003.1-2001, <mqueue.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue
The mq_unlink() function is marked as part of the Message Passing option.

The Open Group Corrigendum U021/5 is applied, clarifying that upon unsuccessful completion,
the named message queue is unchanged by this function.
The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Message Passing option.
NAME
mrand48 — generate uniformly distributed pseudo-random signed long integers

SYNOPSIS
XSI
#include <stdlib.h>
long mrand48(void);

DESCRIPTION
Refer to drand48().
NAME
msgctl — XSI message control operations

SYNOPSIS
#include <sys/msg.h>

int msgctl(int msqid, int cmd, struct msqid_ds *buf);

DESCRIPTION
The msgctl() function operates on XSI message queues (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
page 41).

The msgctl() function shall provide message control operations as specified by cmd. The
following values for cmd, and the message control operations they specify, are:

IPC_STAT Place the current value of each member of the msqid_ds data structure
associated with msqid into the structure pointed to by buf. The contents of this
structure are defined in <sys/msg.h>.

IPC_SET Set the value of the following members of the msqid_ds data structure
associated with msqid to the corresponding value found in the structure
pointed to by buf:
msg_perm.uid
msg_perm.gid
msg_perm.mode
msg_qbytes

IPC_SET can only be executed by a process with appropriate privileges or that
has an effective user ID equal to the value of msg_perm.cuid or
msg_perm.uid in the msqid_ds data structure associated with msqid. Only a
process with appropriate privileges can raise the value of msg_qbytes.

IPC_RMID Remove the message queue identifier specified by msqid from the system and
destroy the message queue and msqid_ds data structure associated with it.
IPC_RMID can only be executed by a process with appropriate privileges or
one that has an effective user ID equal to the value of msg_perm.cuid or
msg_perm.uid in the msqid_ds data structure associated with msqid.

RETURN VALUE
Upon successful completion, msgctl() shall return 0; otherwise, it shall return −1 and set errno to
indicate the error.

ERRORS
The msgctl() function shall fail if:

[EACCES] The argument cmd is IPC_STAT and the calling process does not have read
permission; see Section 2.7 (on page 39).

[EINVAL] The value of msqid is not a valid message queue identifier; or the value of cmd
is not a valid command.

[EPERM] The argument cmd is IPC_RMID or IPC_SET and the effective user ID of the
calling process is not equal to that of a process with appropriate privileges
and it is not equal to the value of msg_perm.cuid or msg_perm.uid in the data
structure associated with msqid.
[26347] The argument cmd is IPC_SET, an attempt is being made to increase to the value of msg_qbytes, and the effective user ID of the calling process does not have appropriate privileges.

26350 EXAMPLES
26351 None.

26352 APPLICATION USAGE
26353 The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

26365 CHANGE HISTORY
26366 First released in Issue 2. Derived from Issue 2 of the SVID.

26367 Issue 5
26368 The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.
**NAME**

msgget — get the XSI message queue identifier

**SYNOPSIS**

```c
#include <sys/msg.h>

int msgget(key_t key, int msgflg);
```

**DESCRIPTION**

The `msgget()` function operates on XSI message queues (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 41).

The `msgget()` function shall return the message queue identifier associated with the argument `key`.

A message queue identifier, associated message queue, and data structure (see `<sys/msg.h>`), shall be created for the argument `key` if one of the following is true:

- The argument `key` is equal to IPC_PRIVATE.
- The argument `key` does not already have a message queue identifier associated with it, and `(msgflg & IPC_CREAT)` is non-zero.

Upon creation, the data structure associated with the new message queue identifier shall be initialized as follows:

- `msg_perm.cuid`, `msg_perm.uid`, `msg_perm.cgid`, and `msg_perm.gid` shall be set equal to the effective user ID and effective group ID, respectively, of the calling process.
- The low-order 9 bits of `msg_perm.mode` shall be set equal to the low-order 9 bits of `msgflg`.
- `msg_qnum`, `msg_lspid`, `msg_lrpid`, `msg_stime`, and `msg_rtime` shall be set equal to 0.
- `msg_ctime` shall be set equal to the current time.
- `msg_qbytes` shall be set equal to the system limit.

**RETURN VALUE**

Upon successful completion, `msgget()` shall return a non-negative integer, namely a message queue identifier. Otherwise, it shall return −1 and set `errno` to indicate the error.

**ERRORS**

The `msgget()` function shall fail if:

- **[EACCES]** A message queue identifier exists for the argument `key`, but operation permission as specified by the low-order 9 bits of `msgflg` would not be granted; see Section 2.7 (on page 39).
- **[EEXIST]** A message queue identifier exists for the argument `key` but `((msgflg & IPC_CREAT) && (msgflg & IPC_EXCL))` is non-zero.
- **[ENOENT]** A message queue identifier does not exist for the argument `key` and `(msgflg & IPC_CREAT)` is 0.
- **[ENOSPC]** A message queue identifier is to be created but the system-imposed limit on the maximum number of allowed message queue identifiers system-wide would be exceeded.
EXAMPLES
None.

APPLICATION USAGE
The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

NAME
msgrcv — XSI message receive operation

SYNOPSIS
XSI
#include <sys/msg.h>

ssize_t msgrcv(int msqid, void *msgp, size_t msgsz, long msgtyp,
int msgflg);

DESCRIPTION
The msgrcv() function operates on XSI message queues (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function
interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
page 41).

The msgrcv() function shall read a message from the queue associated with the message queue
identifier specified by msqid and place it in the user-defined buffer pointed to by msgp.

The application shall ensure that the argument msgp points to a user-defined buffer that contains
first a field of type long specifying the type of the message, and then a data portion that holds
the data bytes of the message. The structure below is an example of what this user-defined
buffer might look like:

struct mymsg {
    long mtype; /* Message type. */
    char mtext[1]; /* Message text. */
}

The structure member mtype is the received message's type as specified by the sending process.
The structure member mtext is the text of the message.

The argument msgsz specifies the size in bytes of mtext. The received message shall be truncated
to msgsz bytes if it is larger than msgsz and (msgflg & MSG_NOERROR) is non-zero. The
truncated part of the message shall be lost and no indication of the truncation shall be given to
the calling process.

If the value of msgsz is greater than \{SSIZE_MAX\}, the result is implementation-defined.

The argument msgtyp specifies the type of message requested as follows:

- If msgtyp is 0, the first message on the queue shall be received.
- If msgtyp is greater than 0, the first message of type msgtyp shall be received.
- If msgtyp is less than 0, the first message of the lowest type that is less than or equal to the
  absolute value of msgtyp shall be received.

The argument msgflg specifies the action to be taken if a message of the desired type is not on the
queue. These are as follows:

- If (msgflg & IPC_NOWAIT) is non-zero, the calling thread shall return immediately with a
  return value of -1 and errno set to [ENOMSG].
- If (msgflg & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the
  following occurs:
    - A message of the desired type is placed on the queue.
    - The message queue identifier msqid is removed from the system; when this occurs, errno
      shall be set equal to [EIDRM] and -1 shall be returned.
The calling thread receives a signal that is to be caught; in this case a message is not received and the calling thread resumes execution in the manner prescribed in `sigaction()`.

Upon successful completion, the following actions are taken with respect to the data structure associated with `msqid`:

- `msg_qnum` shall be decremented by 1.
- `msg_lrpid` shall be set equal to the process ID of the calling process.
- `msg_rtime` shall be set equal to the current time.

**RETURN VALUE**
Upon successful completion, `msgrcv()` shall return a value equal to the number of bytes actually placed into the buffer `mtext`. Otherwise, no message shall be received, `msgrcv()` shall return `(-1)` and `errno` shall be set to indicate the error.

**ERRORS**
The `msgrcv()` function shall fail if:

- `[E2BIG]` The value of `mtext` is greater than `msgsz` and `(msgflg & MSG_NOERROR)` is 0.
- `[EACCES]` Operation permission is denied to the calling process; see Section 2.7 (on page 39).
- `[EIDRM]` The message queue identifier `msqid` is removed from the system.
- `[EINTR]` The `msgrcv()` function was interrupted by a signal.
- `[EINVAL]` `msqid` is not a valid message queue identifier.
- `[ENOMSG]` The queue does not contain a message of the desired type and `(msgflg & IPC_NOWAIT)` is non-zero.

**EXAMPLES**

**Receiving a Message**

The following example receives the first message on the queue (based on the value of the `msgtyp` argument, 0). The queue is identified by the `msqid` argument (assuming that the value has previously been set). This call specifies that an error should be reported if no message is available, but not if the message is too large. The message size is calculated directly using the `sizeof` operator.

```c
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;
...
result = msgrcv(msqid, (void *) &msg, sizeof(msg.text),
                msgtyp, MSG_NOERROR | IPC_NOWAIT);
```
APPLICATION USAGE
The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY
First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5
The type of the return value is changed from int to ssize_t, and a warning is added to the DESCRIPTION about values of msgs larger than {SSIZE_MAX}.

Issue 6
The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to the APPLICATION USAGE section.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
msgsnd — XSI message send operation

SYNOPSIS
#include <sys/msg.h>

int msgsnd(int msqid, const void *msgp, size_t msgsz, int msgflg);

DESCRIPTION
The msgsnd() function operates on XSI message queues (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.224, Message Queue). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 41).

The msgsnd() function shall send a message to the queue associated with the message queue identifier specified by msqid.

The application shall ensure that the argument msgp points to a user-defined buffer that contains first a field of type long specifying the type of the message, and then a data portion that holds the data bytes of the message. The structure below is an example of what this user-defined buffer might look like:

```
struct mymsg {
    long mtype; /* Message type. */
    char mtext[1]; /* Message text. */
}
```

The structure member mtype is a non-zero positive type long that can be used by the receiving process for message selection.

The structure member mtext is any text of length msgsz bytes. The argument msgsz can range from 0 to a system-imposed maximum.

The argument msgflg specifies the action to be taken if one or more of the following is true:

- The number of bytes already on the queue is equal to msg_qbytes; see <sys/msg.h>.
- The total number of messages on all queues system-wide is equal to the system-imposed limit.

These actions are as follows:

- If (msgflg & IPC_NOWAIT) is non-zero, the message shall not be sent and the calling thread shall return immediately.
- If (msgflg & IPC_NOWAIT) is 0, the calling thread shall suspend execution until one of the following occurs:
  - The condition responsible for the suspension no longer exists, in which case the message is sent.
  - The message queue identifier msqid is removed from the system; when this occurs, errno shall be set equal to [EIDRM] and −1 shall be returned.
  - The calling thread receives a signal that is to be caught; in this case the message is not sent and the calling thread resumes execution in the manner prescribed in sigaction().

Upon successful completion, the following actions are taken with respect to the data structure associated with msqid; see <sys/msg.h>:
- `msg_qnum` shall be incremented by 1.
- `msg_lspid` shall be set equal to the process ID of the calling process.
- `msg_stime` shall be set equal to the current time.

**RETURN VALUE**

Upon successful completion, `msgsnd()` shall return 0; otherwise, no message shall be sent, `msgsnd()` shall return −1, and `errno` shall be set to indicate the error.

**ERRORS**

The `msgsnd()` function shall fail if:

- **[EACCES]** Operation permission is denied to the calling process; see Section 2.7 (on page 39).
- **[EAGAIN]** The message cannot be sent for one of the reasons cited above and (`msgflg` & `IPC_NOWAIT`) is non-zero.
- **[EIDRM]** The message queue identifier `msqid` is removed from the system.
- **[EINVAL]** The value of `msqid` is not a valid message queue identifier, or the value of `mtype` is less than 1; or the value of `msgsz` is less than 0 or greater than the system-imposed limit.

**EXAMPLES**

**Sending a Message**

The following example sends a message to the queue identified by the `msqid` argument (assuming that value has previously been set). This call specifies that an error should be reported if no message is available. The message size is calculated directly using the `sizeof` operator.

```c
#include <sys/msg.h>
...
int result;
int msqid;
struct message {
    long type;
    char text[20];
} msg;
msg.type = 1;
strcpy(msg.text, "This is message 1");
...
result = msgsnd(msqid, (void *) &msg, sizeof(msg.text), IPC_NOWAIT);
```

**APPLICATION USAGE**

The POSIX Realtime Extension defines alternative interfaces for interprocess communication (IPC). Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

CHANGE HISTORY
First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5
The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
msync — synchronize memory with physical storage

SYNOPSIS
#include <sys/mman.h>

int msync(void *addr, size_t len, int flags);

DESCRIPTION
The msync() function shall write all modified data to permanent storage locations, if any, in
those whole pages containing any part of the address space of the process starting at address
addr and continuing for len bytes. If no such storage exists, msync() need not have any effect. If
requested, the msync() function shall then invalidate cached copies of data.

The implementation shall require that addr be a multiple of the page size as returned by
sysconf().

For mappings to files, the msync() function shall ensure that all write operations are completed
defined for synchronized I/O data integrity completion. It is unspecified whether the
implementation also writes out other file attributes. When the msync() function is called on
MAP_PRIVATE mappings, any modified data shall not be written to the underlying object and
shall not cause such data to be made visible to other processes. It is unspecified whether data in
MAP_PRIVATE mappings has any permanent storage locations. The effect of msync() on a
shared memory object or a typed memory object is unspecified. The behavior of this function is
unspecified if the mapping was not established by a call to mmap().

The flags argument is constructed from the bitwise-inclusive OR of one or more of the following
flags defined in the <sys/mman.h> header:

<table>
<thead>
<tr>
<th>Symbolic Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MS_ASYNC</td>
<td>Perform asynchronous writes.</td>
</tr>
<tr>
<td>MS_SYNC</td>
<td>Perform synchronous writes.</td>
</tr>
<tr>
<td>MS_INVALIDATE</td>
<td>Invalidate cached data.</td>
</tr>
</tbody>
</table>

When MS_ASYNC is specified, msync() shall return immediately once all the write operations
are initiated or queued for servicing; when MS_SYNC is specified, msync() shall not return until
all write operations are completed as defined for synchronized I/O data integrity completion.
Either MS_ASYNC or MS_SYNC is specified, but not both.

When MS_INVALIDATE is specified, msync() shall invalidate all cached copies of mapped data
that are inconsistent with the permanent storage locations such that subsequent references shall
obtain data that was consistent with the permanent storage locations sometime between the call
to msync() and the first subsequent memory reference to the data.

If msync() causes any write to a file, the file’s st_ctime and st_mtime fields shall be marked for
update.

RETURN VALUE
Upon successful completion, msync() shall return 0; otherwise, it shall return −1 and set errno to
indicate the error.

ERRORS
The msync() function shall fail if:

[EBUSY] Some or all of the addresses in the range starting at addr and continuing for len
bytes are locked, and MS_INVALIDATE is specified.
msync()

System Interfaces

[EINVAL] The value of flags is invalid.

[EINVAL] The value of addr is not a multiple of the page size [PAGESIZE].

[ENOMEM] The addresses in the range starting at addr and continuing for len bytes are
outside the range allowed for the address space of a process or specify one or
more pages that are not mapped.

EXAMPLES

None.

APPLICATION USAGE

The msync() function is only supported if the Memory Mapped Files option and the
Synchronized Input and Output option are supported, and thus need not be available on all
implementations.

The msync() function should be used by programs that require a memory object to be in a
known state; for example, in building transaction facilities.

Normal system activity can cause pages to be written to disk. Therefore, there are no guarantees
that msync() is the only control over when pages are or are not written to disk.

RATIONALE

The msync() function writes out data in a mapped region to the permanent storage for the
underlying object. The call to msync() ensures data integrity of the file.

After the data is written out, any cached data may be invalidated if the MS_INVALIDATE flag
was specified. This is useful on systems that do not support read/write consistency.

FUTURE DIRECTIONS

None.

SEE ALSO

mmap(), sysconf(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/mman.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Aligned with msync() in the POSIX Realtime Extension as follows:

• The DESCRIPTION is extensively worded.

• [EBUSY] and a new form of [EINVAL] are added as mandatory error conditions.

Issue 6

The msync() function is marked as part of the Memory Mapped Files and Synchronized Input
and Output options.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

• The [EBUSY] mandatory error condition is added.

The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

• The DESCRIPTION is updated to state that implementations require addr to be a multiple of
  the page size.

• The second [EINVAL] error condition is made mandatory.
The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding reference to typed memory objects.
munlock() — unlock a range of process address space

#include <sys/mman.h>

int munlock(const void *addr, size_t len);

Refer to mlock().
munlockall( )

NAME
munlockall — unlock the address space of a process

SYNOPSIS
#include <sys/mman.h>
int munlockall(void);

DESCRIPTION
Refer to mlockall().
munmap()

NAME
munmap — unmap pages of memory

SYNOPSIS
#include <sys/mman.h>

int munmap(void *addr, size_t len);

DESCRIPTION
The munmap( ) function shall remove any mappings for those entire pages containing any part of
the address space of the process starting at addr and continuing for len bytes. Further references
to these pages shall result in the generation of a SIGSEGV signal to the process. If there are no
mappings in the specified address range, then munmap( ) has no effect.

The implementation shall require that addr be a multiple of the page size [PAGESIZE].

If a mapping to be removed was private, any modifications made in this address range shall be
discarded.

Any memory locks (see mlock() and mlockall()) associated with this address range shall be
removed, as if by an appropriate call to munlock().

If a mapping removed from a typed memory object causes the corresponding address range of
the memory pool to be inaccessible by any process in the system except through allocatable
mappings (that is, mappings of typed memory objects opened with the
POSIX_TYPED_MEM_MAP_ALLOCATABLE flag), then that range of the memory pool shall
become deallocated and may become available to satisfy future typed memory allocation
requests.

A mapping removed from a typed memory object opened with the
POSIX_TYPED_MEM_MAP_ALLOCATABLE flag shall not affect in any way the availability of
that typed memory for allocation.

The behavior of this function is unspecified if the mapping was not established by a call to
munmap().

RETURN VALUE
Upon successful completion, munmap() shall return 0; otherwise, it shall return −1 and set errno
to indicate the error.

ERRORS
The munmap() function shall fail if:

[EINVAL] Addresses in the range [addr,addr+len) are outside the valid range for the
address space of a process.

[EINVAL] The len argument is 0.

[EINVAL] The addr argument is not a multiple of the page size as returned by sysconf().
EXAMPLES
None.

APPLICATION USAGE
The munmap() function is only supported if the Memory Mapped Files option or the Shared Memory Objects option is supported.

RATIONALE
The munmap() function corresponds to SVR4, just as the mmap() function does.

It is possible that an application has applied process memory locking to a region that contains shared memory. If this has occurred, the munmap() call ignores those locks and, if necessary, causes those locks to be removed.

FUTURE DIRECTIONS
None.

SEE ALSO
mlock(), mlockall(), mmap(), posix_typed_mem_open(), sysconf(), the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>, <sys/mman.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
Aligned with munmap() in the POSIX Realtime Extension as follows:
• The DESCRIPTION is extensively reworded.
• The SIGBUS error is no longer permitted to be generated.

Issue 6
The munmap() function is marked as part of the Memory Mapped Files and Shared Memory Objects option.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• The DESCRIPTION is updated to state that implementations require addr to be a multiple of the page size.
• The [EINVAL] error conditions are added.
The following changes are made for alignment with IEEE Std 1003.1j-2000:
• Semantics for typed memory objects are added to the DESCRIPTION.
• The posix_typed_mem_open() function is added to the SEE ALSO section.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/36 is applied, changing the margin code in the SYNOPSIS from MF|SHM to MC3 (notation for MF|SHM|TYM).
nan()  

NAME
nan, nanf, nanl — return quiet NaN

SYNOPSIS
#include <math.h>

double nan(const char *tagp);
float nanf(const char *tagp);
long double nanl(const char *tagp);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The function call nan("n-char-sequence") shall be equivalent to:
strtol("NAN(n-char-sequence)", (char **) NULL);

The function call nan("") shall be equivalent to:
strtol("NAN()", (char **) NULL)

If tagp does not point to an n-char sequence or an empty string, the function call shall be equivalent to:
strtol("NAN", (char **) NULL)

Function calls to nanf() and nanl() are equivalent to the corresponding function calls to strtof() and strtold().

RETURN VALUE
These functions shall return a quiet NaN, if available, with content indicated through tagp.

If the implementation does not support quiet NaNs, these functions shall return zero.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

strtol(), strtold(), the Base Definitions volume of IEEE Std 1003.1-2001, <math.h>

CHANGE HISTORY
NAME
nanosleep — high resolution sleep (REALTIME)

SYNOPSIS
#include <time.h>

int nanosleep(const struct timespec *rqtp, struct timespec *rmtp);

DESCRIPTION
The nanosleep() function shall cause the current thread to be suspended from execution until either the time interval specified by the rqtp argument has elapsed or a signal is delivered to the calling thread, and its action is to invoke a signal-catching function or to terminate the process. The suspension time may be longer than requested because the argument value is rounded up to an integer multiple of the sleep resolution or because of the scheduling of other activity by the system. But, except for the case of being interrupted by a signal, the suspension time shall not be less than the time specified by rqtp, as measured by the system clock CLOCK_REALTIME.
The use of the nanosleep() function has no effect on the action or blockage of any signal.

RETURN VALUE
If the nanosleep() function returns because the requested time has elapsed, its return value shall be zero.
If the nanosleep() function returns because it has been interrupted by a signal, it shall return a value of −1 and set errno to indicate the interruption. If the rmtp argument is non-NULL, the timespec structure referenced by it is updated to contain the amount of time remaining in the interval (the requested time minus the time actually slept). If the rmtp argument is NULL, the remaining time is not returned.
If nanosleep() fails, it shall return a value of −1 and set errno to indicate the error.

ERRORS
The nanosleep() function shall fail if:

[EINTR] The nanosleep() function was interrupted by a signal.
[EINVAL] The rqtp argument specified a nanosecond value less than zero or greater than or equal to 1 000 million.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
It is common to suspend execution of a process for an interval in order to poll the status of a non-interrupting function. A large number of actual needs can be met with a simple extension to sleep() that provides finer resolution.
In the POSIX.1-1990 standard and SVR4, it is possible to implement such a routine, but the frequency of wakeup is limited by the resolution of the alarm() and sleep() functions. In 4.3 BSD, it is possible to write such a routine using no static storage and reserving no system facilities. Although it is possible to write a function with similar functionality to sleep() using the remainder of the timer_*() functions, such a function requires the use of signals and the reservation of some signal number. This volume of IEEE Std 1003.1-2001 requires that nanosleep() be non-intrusive of the signals function.
The `nanosleep()` function shall return a value of 0 on success and −1 on failure or if interrupted.
This latter case is different from `sleep()`. This was done because the remaining time is returned via an argument structure pointer, `rmtt`, instead of as the return value.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
`clock_nanosleep()`, `sleep()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<time.h>`

**CHANGE HISTORY**
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**
The `nanosleep()` function is marked as part of the Timers option.
The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/37 is applied, updating the SEE ALSO section to include the `clock_nanosleep()` function.
System Interfaces

nearbyint()  

NAME
nearbyint, nearbyintf, nearbyintl — floating-point rounding functions

SYNOPSIS
#include <math.h>

double nearbyint(double x);
float nearbyintf(float x);
long double nearbyintl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to an integer value in floating-point format, using the current rounding direction and without raising the inexact floating-point exception.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the rounded integer value.

MX
If x is NaN, a NaN shall be returned.

If x is ±0, ±0 shall be returned.

If x is ±Inf, x shall be returned.

XSI
If the correct value would cause overflow, a range error shall occur and nearbyint(), nearbyintf(), and nearbyintl() shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as x), respectively.

ERRORS
These functions shall fail if:

XSI
Range Error The result would cause an overflow.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.
nearbyint()

Treatment of Error Conditions for Mathematical Functions, <math.h>

CHANGE HISTORY

NAME

nextafter, nextafterf, nextafterl, nexttoward, nexttowardf, nexttowardl — next representable floating-point number

SYNOPSIS

#include <math.h>

double nextafter(double x, double y);
float nextafterf(float x, float y);
long double nextafterl(long double x, long double y);
double nexttoward(double x, long double y);
float nexttowardf(float x, long double y);
long double nexttowardl(long double x, long double y);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The nextafter(), nextafterf(), and nextafterl() functions shall compute the next representable floating-point value following x in the direction of y. Thus, if y is less than x, nextafter() shall return the largest representable floating-point number less than x. The nextafter(), nextafterf(), and nextafterl() functions shall return y if x equals y.

The nexttoward(), nexttowardf(), and nexttowardl() functions shall be equivalent to the corresponding nextafter() functions, except that the second parameter shall have type long double and the functions shall return y converted to the type of the function if x equals y.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the next representable floating-point value following x in the direction of y.

If x==y, y (of the type x) shall be returned.

If x is finite and the correct function value would overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as x) shall be returned as appropriate for the return type of the function.

If x or y is NaN, a NaN shall be returned.

If x! =y and the correct function value is subnormal, zero, or underflows, a range error shall occur, and either the correct function value (if representable) or 0.0 shall be returned.

ERRORS

These functions shall fail if:

Range Error The correct value overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

Range Error The correct value is subnormal or underflows.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4, Version 2.
Issue 5
Moved from X/OPEN UNIX extension to BASE.
Issue 6
The nextafter() function is no longer marked as an extension.
The nextafterf(), nextafterl(), nexttoward(), nexttowardf(), and nexttowardl() functions are added for alignment with the ISO/IEC 9899:1999 standard.
The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.
NAME
nftw — walk a file tree

SYNOPSIS
#include <ftw.h>

int nftw(const char *path, int (*fn)(const char *,
        const struct stat *, int, struct FTW *), int depth, int flags);

DESCRIPTION
The nftw() function shall recursively descend the directory hierarchy rooted in path. The nftw() function has a similar effect to ftw() except that it takes an additional argument flags, which is a bitwise-inclusive OR of zero or more of the following flags:

FTW_CHDIR  If set, nftw() shall change the current working directory to each directory as it reports files in that directory. If clear, nftw() shall not change the current working directory.

FTW_DEPTH  If set, nftw() shall report all files in a directory before reporting the directory itself. If clear, nftw() shall report any directory before reporting the files in that directory.

FTW_MOUNT  If set, nftw() shall only report files in the same file system as path. If clear, nftw() shall report all files encountered during the walk.

FTW_PHYS  If set, nftw() shall perform a physical walk and shall not follow symbolic links.

If FTW_PHYS is clear and FTW_DEPTH is set, nftw() shall follow links instead of reporting them, but shall not report any directory that would be a descendant of itself. If FTW_PHYS is clear and FTW_DEPTH is clear, nftw() shall follow links instead of reporting them, but shall not report the contents of any directory that would be a descendant of itself.

At each file it encounters, nftw() shall call the user-supplied function fn with four arguments:

• The first argument is the pathname of the object.

• The second argument is a pointer to the stat buffer containing information on the object.

• The third argument is an integer giving additional information. Its value is one of the following:

  FTW_F  The object is a file.

  FTW_D  The object is a directory.

  FTW_DP  The object is a directory and subdirectories have been visited. (This condition shall only occur if the FTW_DEPTH flag is included in flags.)

  FTW_SL  The object is a symbolic link. (This condition shall only occur if the FTW_PHYS flag is included in flags.)

  FTW_SLN  The object is a symbolic link that does not name an existing file. (This condition shall only occur if the FTW_PHYS flag is not included in flags.)

  FTW_DNR  The object is a directory that cannot be read. The fn function shall not be called for any of its descendants.

  FTW_NS  The stat() function failed on the object because of lack of appropriate permission. The stat buffer passed to fn is undefined. Failure of stat() for any other reason is considered an error and nftw() shall return −1.
The fourth argument is a pointer to an **FTW** structure. The value of **base** is the offset of the object’s filename in the pathname passed as the first argument to **fn**. The value of **level** indicates depth relative to the root of the walk, where the root level is 0.

The results are unspecified if the application-supplied **fn** function does not preserve the current working directory.

The argument **depth** sets the maximum number of file descriptors that shall be used by **nftw()** while traversing the file tree. At most one file descriptor shall be used for each directory level.

The **nftw()** function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

RETURN VALUE
The **nftw()** function shall continue until the first of the following conditions occurs:

- An invocation of **fn** shall return a non-zero value, in which case **nftw()** shall return that value.
- The **nftw()** function detects an error other than **[EACCES]** (see **FTW_DNR and FTW_NS** above), in which case **nftw()** shall return −1 and set **errno** to indicate the error.
- The tree is exhausted, in which case **nftw()** shall return 0.

ERRORS
The **nftw()** function shall fail if:

- **[EACCES]** Search permission is denied for any component of **path** or read permission is denied for **path**, or **fn** returns −1 and does not reset **errno**.
- **[ELOOP]** A loop exists in symbolic links encountered during resolution of the **path** argument.
- **[ENAMETOOLONG]** The length of the **path** argument exceeds **PATH_MAX** or a pathname component is longer than **NAME_MAX**.
- **[ENOENT]** A component of **path** does not name an existing file or **path** is an empty string.
- **[ENOTDIR]** A component of **path** is not a directory.
- **[EOVERFLOW]** A field in the **stat** structure cannot be represented correctly in the current programming environment for one or more files found in the file hierarchy.

The **nftw()** function may fail if:

- **[ELOOP]** More than **SYMLOOP_MAX** symbolic links were encountered during resolution of the **path** argument.
- **[EMFILE]** **OPEN_MAX** file descriptors are currently open in the calling process.
- **[ENAMETOOLONG]** Pathname resolution of a symbolic link produced an intermediate result whose length exceeds **PATH_MAX**.
- **[ENFILE]** Too many files are currently open in the system.

In addition, **errno** may be set if the function pointed to by **fn** causes **errno** to be set.
The following example walks the /tmp directory and its subdirectories, calling the nftw() function for every directory entry, to a maximum of 5 levels deep.

```
#include <ftw.h>
...
int nftwfunc(const char *, const struct stat *, int, struct FTW *);
int nftwfunc(const char *filename, const struct stat *statptr,
   int fileflags, struct FTW *pfwt)
{
    return 0;
}
...
char *startpath = "/tmp";
int depth = 5;
int flags = FTW_CHDIR | FTW_DEPTH | FTW_MOUNT;
int ret;
ret = nftw(startpath, nftwfunc, depth, flags);
```

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
lstat(), opendir(), readdir(), stat(), the Base Definitions volume of IEEE Std 1003.1-2001, <ftw.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
In the DESCRIPTION, the definition of the depth argument is clarified.

Issue 6
The Open Group Base Resolution bwg97-003 is applied.
The ERRORS section is updated as follows:
The wording of the mandatory [ELOOP] error condition is updated.
A second optional [ELOOP] error condition is added.
The [EOVERFLOW] mandatory error condition is added.

Text is added to the DESCRIPTION to say that the nftw() function need not be reentrant and that the results are unspecified if the application-supplied fn function does not preserve the current working directory.
nice() — change the nice value of a process

NAME
nice — change the nice value of a process

SYNOPSIS
#include <unistd.h>

int nice(int incr);

DESCRIPTION
The nice() function shall add the value of incr to the nice value of the calling process. A process’ nice value is a non-negative number for which a more positive value shall result in less favorable scheduling.

A maximum nice value of 2*{NZERO}−1 and a minimum nice value of 0 shall be imposed by the system. Requests for values above or below these limits shall result in the nice value being set to the corresponding limit. Only a process with appropriate privileges can lower the nice value.

Calling the nice() function has no effect on the priority of processes or threads with policy SCHED_FIFO or SCHED_RR. The effect on processes or threads with other scheduling policies is implementation-defined.

The nice value set with nice() shall be applied to the process. If the process is multi-threaded, the nice value shall affect all system scope threads in the process.

As −1 is a permissible return value in a successful situation, an application wishing to check for error situations should set errno to 0, then call nice(), and if it returns −1, check to see whether errno is non-zero.

RETURN VALUE
Upon successful completion, nice() shall return the new nice value −{NZERO}. Otherwise, −1 shall be returned, the process’ nice value shall not be changed, and errno shall be set to indicate the error.

ERRORS
The nice() function shall fail if:

[EPERM] The incr argument is negative and the calling process does not have appropriate privileges.

EXAMPLES
Changing the Nice Value
The following example adds the value of the incr argument, −20, to the nice value of the calling process.

#include <unistd.h>
...
int incr = -20;
int ret;
ret = nice(incre);
**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`getpriority()`, `setpriority()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<limits.h>`, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

A statement is added to the description indicating the effects of this function on the different scheduling policies and multi-threaded processes.
NAME
nl_langinfo — language information

SYNOPSIS
#include <langinfo.h>
char *nl_langinfo(nl_item item);

DESCRIPTION
The nl_langinfo() function shall return a pointer to a string containing information relevant to
the particular language or cultural area defined in the program's locale (see <langinfo.h>). The
manifest constant names and values of item are defined in <langinfo.h>. For example:

nl_langinfo(ABDAY_1)

would return a pointer to the string "Dom" if the identified language was Portuguese, and
"Sun" if the identified language was English.

Calls to setlocale() with a category corresponding to the category of item (see <langinfo.h>), or to
the category LC_ALL, may overwrite the array pointed to by the return value.

The nl_langinfo() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

RETURN VALUE
In a locale where langinfo data is not defined, nl_langinfo() shall return a pointer to the
 corresponding string in the POSIX locale. In all locales, nl_langinfo() shall return a pointer to an
empty string if item contains an invalid setting.

This pointer may point to static data that may be overwritten on the next call.

ERRORS
No errors are defined.

EXAMPLES

Getting Date and Time Formatting Information
The following example returns a pointer to a string containing date and time formatting
information, as defined in the LC_TIME category of the current locale.

#include <time.h>
#include <langinfo.h>
... strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
... 

APPLICATION USAGE
The array pointed to by the return value should not be modified by the program, but may be
modified by further calls to nl_langinfo().

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 2.

Issue 5
The last paragraph of the DESCRIPTION is moved from the APPLICATION USAGE section.
A note indicating that this function need not be reentrant is added to the DESCRIPTION.
**NAME**
nrand48 — generate uniformly distributed pseudo-random non-negative long integers

**SYNOPSIS**
```
#include <stdlib.h>
long nrand48(unsigned short xsubi[3]);
```

**DESCRIPTION**
Refer to *drand48()*.
NAME
ntohl, ntohs — convert values between host and network byte order

SYNOPSIS
#include <arpa/inet.h>

uint32_t ntohl(uint32_t netlong);
uint16_t ntohs(uint16_t netshort);

DESCRIPTION
Refer to htonl().
**NAME**

`open` — open a file

**SYNOPSIS**

```c
#include <sys/stat.h>

#include <fcntl.h>

int open(const char *path, int oflag, ...);
```

**DESCRIPTION**

The `open`() function shall establish the connection between a file and a file descriptor. It shall create an open file description that refers to a file and a file descriptor that refers to that open file description. The file descriptor is used by other I/O functions to refer to that file. The `path` argument points to a pathname naming the file.

The `open`() function shall return a file descriptor for the named file that is the lowest file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other process in the system. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared.

The file offset used to mark the current position within the file shall be set to the beginning of the file.

The file status flags and file access modes of the open file description shall be set according to the value of `oflag`.

Values for `oflag` are constructed by a bitwise-inclusive OR of flags from the following list, defined in `<fcntl.h>`. Applications shall specify exactly one of the first three values (file access modes) below in the value of `oflag`:

- **O_RDONLY** Open for reading only.
- **O_WRONLY** Open for writing only.
- **O_RDWR** Open for reading and writing. The result is undefined if this flag is applied to a FIFO.

Any combination of the following may be used:

- **O_APPEND** If set, the file offset shall be set to the end of the file prior to each write.
- **O_CREAT** If the file exists, this flag has no effect except as noted under O_EXCL below. Otherwise, the file shall be created; the user ID of the file shall be set to the effective user ID of the process; the group ID of the file shall be set to the group ID of the file's parent directory or to the effective group ID of the process; and the access permission bits (see `<sys/stat.h>`) of the file mode shall be set to the value of the third argument taken as type `mode_t` modified as follows: a bitwise AND is performed on the file-mode bits and the corresponding bits in the complement of the process' file mode creation mask. Thus, all bits in the file mode whose corresponding bit in the file mode creation mask is set are cleared. When bits other than the file permission bits are set, the effect is unspecified. The third argument does not affect whether the file is open for reading, writing, or for both. Implementations shall provide a way to initialize the file’s group ID to the group ID of the parent directory. Implementations may, but need not, provide an implementation-defined way to initialize the file’s group ID to the effective group ID of the calling process.
- **O_DSYNC** Write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.
If O_CREAT and O_EXCL are set, open() shall fail if the file exists. The check for the existence of the file and the creation of the file if it does not exist shall be atomic with respect to other threads executing open() naming the same filename in the same directory with O_EXCL and O_CREAT set. If O_EXCL and O_CREAT are set, and path names a symbolic link, open() shall fail and set errno to [EEXIST], regardless of the contents of the symbolic link. If O_EXCL is set and O_CREAT is not set, the result is undefined.

If set and path identifies a terminal device, open() shall not cause the terminal device to become the controlling terminal for the process.

When opening a FIFO with O_RDONLY or O_WRONLY set:

- If O_NONBLOCK is set, an open() for reading-only shall return without delay. An open() for writing-only shall return an error if no process currently has the file open for reading.
- If O_NONBLOCK is clear, an open() for reading-only shall block the calling thread until a thread opens the file for writing. An open() for writing-only shall block the calling thread until a thread opens the file for reading.

When opening a block special or character special file that supports non-blocking opens:

- If O_NONBLOCK is set, the open() function shall return without blocking for the device to be ready or available. Subsequent behavior of the device is device-specific.
- If O_NONBLOCK is clear, the open() function shall block the calling thread until the device is ready or available before returning.

Otherwise, the behavior of O_NONBLOCK is unspecified.

Read I/O operations on the file descriptor shall complete at the same level of integrity as specified by the O_DSYNC and O_SYNC flags. If both O_DSYNC and O_RSYNC are set in oflag, all I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If both O_SYNC and O_RSYNC are set in flags, all I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

Write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

If the file exists and is a regular file, and the file is successfully opened O_RDWR or O_WRONLY, its length shall be truncated to 0, and the mode and owner shall be unchanged. It shall have no effect on FIFO special files or terminal device files. Its effect on other file types is implementation-defined.

The result of using O_TRUNC with O_RDONLY is undefined.

If O_CREAT is set and the file did not previously exist, upon successful completion, open() shall mark for update the st_atime, st_ctime, and st_mtime fields of the file and the st_ctime and st_mtime fields of the parent directory.

If O_TRUNC is set and the file did previously exist, upon successful completion, open() shall mark for update the st_ctime and st_mtime fields of the file.
If both the O_SYNC and O_DSYNC flags are set, the effect is as if only the O_SYNC flag was set.

If `path` refers to a STREAMS file, `oflag` may be constructed from O_NONBLOCK OR'ed with either O_RDONLY, O_WRONLY, or O_RDWR. Other flag values are not applicable to STREAMS devices and shall have no effect on them. The value O_NONBLOCK affects the operation of STREAMS drivers and certain functions applied to file descriptors associated with STREAMS files. For STREAMS drivers, the implementation of O_NONBLOCK is device-specific.

If `path` names the master side of a pseudo-terminal device, then it is unspecified whether `open()` locks the slave side so that it cannot be opened. Conforming applications shall call `unlockpt()` before opening the slave side.

The largest value that can be represented correctly in an object of type `off_t` shall be established as the offset maximum in the open file description.

**RETURN VALUE**

Upon successful completion, the function shall open the file and return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, −1 shall be returned and `errno` set to indicate the error. No files shall be created or modified if the function returns −1.

**ERRORS**

The `open()` function shall fail if:

- **[EACCES]** Search permission is denied on a component of the path prefix, or the file exists and the permissions specified by `oflag` are denied, or the file does not exist and write permission is denied for the parent directory of the file to be created, or O_TRUNC is specified and write permission is denied.

- **[EEXIST]** O_CREAT and O_EXCL are set, and the named file exists.

- **[EINVAL]** The implementation does not support synchronized I/O for this file.

- **[EIO]** The `path` argument names a STREAMS file and a hangup or error occurred during the `open()`.

- **[EISDIR]** The named file is a directory and `oflag` includes O_WRONLY or O_RDWR.

- **[ELOOP]** A loop exists in symbolic links encountered during resolution of the `path` argument.

- **[EMFILE]** [OPEN_MAX] file descriptors are currently open in the calling process.

- **[ENAMETOOLONG]** The length of the `path` argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

- **[ENFILE]** The maximum allowable number of files is currently open in the system.

- **[ENOENT]** O_CREAT is not set and the named file does not exist; or O_CREAT is set and either the path prefix does not exist or the `path` argument points to an empty string.

- **[ENOSR]** The `path` argument names a STREAMS-based file and the system is unable to allocate a STREAM.

- **[ENOSPC]** The directory or file system that would contain the new file cannot be expanded, the file does not exist, and O_CREAT is specified.
open()

 system interfaces

ENOTDIR A component of the path prefix is not a directory.

ENXIO O_NONBLOCK is set, the named file is a FIFO, O_WRONLY is set, and no process has the file open for reading.

ENXIO The named file is a character special or block special file, and the device associated with this special file does not exist.

EEXIST The named file is a regular file and the size of the file cannot be represented correctly in an object of type off_t.

EROFS The named file resides on a read-only file system and either O_WRONLY, O_RDWR, O_CREAT (if the file does not exist), or O_TRUNC is set in the oflag argument.

The open() function may fail if:

EAGAIN The path argument names the slave side of a pseudo-terminal device that is locked.

EINVAL The value of the oflag argument is not valid.

ELOOP More than SYMLOOP_MAX symbolic links were encountered during resolution of the path argument.

ENAMETOOLONG As a result of encountering a symbolic link in resolution of the path argument, the length of the substituted pathname string exceeded PATH_MAX.

ENOMEM The path argument names a STREAMS file and the system is unable to allocate resources.

ETXTBSY The file is a pure procedure (shared text) file that is being executed and oflag is O_WRONLY or O_RDWR.

EXAMPLES

Opening a File for Writing by the Owner

The following example opens the file /tmp/file, either by creating it (if it does not already exist), or by truncating its length to 0 (if it does exist). In the former case, if the call creates a new file, the access permission bits in the file mode of the file are set to permit reading and writing by the owner, and to permit reading only by group members and others.

If the call to open() is successful, the file is opened for writing.

#include <fcntl.h>
...
int fd;
mode_t mode = S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH;
char *filename = "/tmp/file";
...
fd = open(filename, O_WRONLY | O_CREAT | O_TRUNC, mode);
...
Opening a File Using an Existence Check

The following example uses the `open()` function to try to create the `LOCKFILE` file and open it for writing. Since the `open()` function specifies the `O_EXCL` flag, the call fails if the file already exists. In that case, the program assumes that someone else is updating the password file and exits.

```c
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd; /* Integer for file descriptor returned by open() call. */
...
if ((pfd = open(LOCKFILE, O_WRONLY | O_CREAT | O_EXCL,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
... 
```

Opening a File for Writing

The following example opens a file for writing, creating the file if it does not already exist. If the file does exist, the system truncates the file to zero bytes.

```c
#include <fcntl.h>
#include <stdio.h>
#include <stdlib.h>

#define LOCKFILE "/etc/ptmp"
...
int pfd;
char filename[PATH_MAX+1];
...
if ((pfd = open(filename, O_WRONLY | O_CREAT | O_TRUNC,
    S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1)
{
    perror("Cannot open output file\n"); exit(1);
}
... 
```

APPLICATION USAGE

None.

RATIONALE

Except as specified in this volume of IEEE Std 1003.1-2001, the flags allowed in `oflag` are not mutually-exclusive and any number of them may be used simultaneously.

Some implementations permit opening FIFOs with `O_RDWR`. Since FIFOs could be implemented in other ways, and since two file descriptors can be used to the same effect, this possibility is left as undefined.

See `getgroups()` about the group of a newly created file.
The use of `open()` to create a regular file is preferable to the use of `creat()`, because the latter is redundant and included only for historical reasons.

The use of the O_TRUNC flag on FIFOs and directories (pipes cannot be `open()`-ed) must be permissible without unexpected side effects (for example, `creat()` on a FIFO must not remove data). Since terminal special files might have type-ahead data stored in the buffer, O_TRUNC should not affect their content, particularly if a program that normally opens a regular file should open the current controlling terminal instead. Other file types, particularly implementation-defined ones, are left implementation-defined.

IEEE Std 1003.1-2001 permits [EACCES] to be returned for conditions other than those explicitly listed.

The O_NOCTTY flag was added to allow applications to avoid unintentionally acquiring a controlling terminal as a side effect of opening a terminal file. This volume of IEEE Std 1003.1-2001 does not specify how a controlling terminal is acquired, but it allows an implementation to provide this on `open()` if the O_NOCTTY flag is not set and other conditions specified in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface are met. The O_NOCTTY flag is an effective no-op if the file being opened is not a terminal device.

In historical implementations the value of O_RDONLY is zero. Because of that, it is not possible to detect the presence of O_RDONLY and another option. Future implementations should encode O_RDONLY and O_WRONLY as bit flags so that:

```
O_RDONLY | O_WRONLY == O_RDWR
```

In general, the `open()` function follows the symbolic link if `path` names a symbolic link. However, the `open()` function, when called with O_CREAT and O_EXCL, is required to fail with [EEXIST] if `path` names an existing symbolic link, even if the symbolic link refers to a nonexistent file. This behavior is required so that privileged applications can create a new file in a known location without the possibility that a symbolic link might cause the file to be created in a different location.

For example, a privileged application that must create a file with a predictable name in a user-writable directory, such as the user’s home directory, could be compromised if the user creates a symbolic link with that name that refers to a nonexistent file in a system directory. If the user can influence the contents of a file, the user could compromise the system by creating a new system configuration or spool file that would then be interpreted by the system. The test for a symbolic link which refers to a nonexistent file must be atomic with the creation of a new file.

The POSIX.1-1990 standard required that the group ID of a newly created file be set to the group ID of its parent directory or to the effective group ID of the creating process. FIPS 151-2 required that implementations provide a way to have the group ID be set to the group ID of the containing directory, but did not prohibit implementations also supporting a way to set the group ID to the effective group ID of the creating process. Conforming applications should not assume which group ID will be used. If it matters, an application can use `chown()` to set the group ID after the file is created, or determine under what conditions the implementation will set the desired group ID.

**FUTURE DIRECTIONS**

None.

open()

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.
Large File Summit extensions are added.

**Issue 6**
In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- In the DESCRIPTION, O_CREAT is amended to state that the group ID of the file is set to the group ID of the file's parent directory or to the effective group ID of the process. This is a FIPS requirement.
- In the DESCRIPTION, text is added to indicate setting of the offset maximum in the open file description. This change is to support large files.
- In the ERRORS section, the [EOVERFLOW] condition is added. This change is to support large files.
- The [ENXIO] mandatory error condition is added.
- The [EINVAL], [ENAMETOOLONG], and [ETXTBSY] optional error conditions are added.

The DESCRIPTION and ERRORS sections are updated so that items related to the optional XSI STREAMS Option Group are marked.
The following changes were made to align with the IEEE P1003.1a draft standard:
- An explanation is added of the effect of the O_CREAT and O_EXCL flags when the path refers to a symbolic link.
- The [ELOOP] optional error condition is added.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The DESCRIPTION of O_EXCL is updated in response to IEEE PASC Interpretation 1003.1c #48.
NAME  
opendir — open a directory

SYNOPSIS  
#include <dirent.h>  
DIR *opendir(const char *dirname);

DESCRIPTION  
The opendir() function shall open a directory stream corresponding to the directory named by  
the dirname argument. The directory stream is positioned at the first entry. If the type DIR is  
implemented using a file descriptor, applications shall only be able to open up to a total of  
{OPEN_MAX} files and directories.

RETURN VALUE  
Upon successful completion, opendir() shall return a pointer to an object of type DIR.  
Otherwise, a null pointer shall be returned and errno set to indicate the error.

ERRORS  
The opendir() function shall fail if:

- [EACCES] Search permission is denied for the component of the path prefix of dirname or  
  read permission is denied for dirname.

- [ELOOP] A loop exists in symbolic links encountered during resolution of the dirname  
  argument.

- [ENAMETOOLONG] The length of the dirname argument exceeds {PATH_MAX} or a pathname  
  component is longer than {NAME_MAX}.

- [ENOENT] A component of dirname does not name an existing directory or dirname is an  
  empty string.

- [ENOTDIR] A component of dirname is not a directory.

The opendir() function may fail if:

- [ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during  
  resolution of the dirname argument.

- [EMFILE] {OPEN_MAX} file descriptors are currently open in the calling process.

- [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the dirname  
  argument, the length of the substituted pathname string exceeded {PATH_MAX}.

- [ENFILE] Too many files are currently open in the system.
opendir()  

System Interfaces

EXAMPLES

Open a Directory Stream

The following program fragment demonstrates how the opendir() function is used.

```c
#include <sys/types.h>
#include <dirent.h>
#include <libgen.h>

DIR *dir;
struct dirent *dp;

if ((dir = opendir (".")) == NULL) {
    perror ("Cannot open ".");
    exit (1);
}

while ((dp = readdir (dir)) != NULL) {
    ...
}
```

APPLICATION USAGE

The opendir() function should be used in conjunction with readdir(), closedir(), and rewinddir() to examine the contents of the directory (see the EXAMPLES section in readdir()). This method is recommended for portability.

RATIONALE

Based on historical implementations, the rules about file descriptors apply to directory streams as well. However, this volume of IEEE Std 1003.1-2001 does not mandate that the directory stream be implemented using file descriptors. The description of closedir() clarifies that if a file descriptor is used for the directory stream, it is mandatory that closedir() deallocate the file descriptor. When a file descriptor is used to implement the directory stream, it behaves as if the FD_CLOEXEC had been set for the file descriptor.

The directory entries for dot and dot-dot are optional. This volume of IEEE Std 1003.1-2001 does not provide a way to test a priori for their existence because an application that is portable must be written to look for (and usually ignore) those entries. Writing code that presumes that they are the first two entries does not always work, as many implementations permit them to be other than the first two entries, with a “normal” entry preceding them. There is negligible value in providing a way to determine what the implementation does because the code to deal with dot and dot-dot must be written in any case and because such a flag would add to the list of those flags (which has proven in itself to be objectionable) and might be abused.

Since the structure and buffer allocation, if any, for directory operations are defined by the implementation, this volume of IEEE Std 1003.1-2001 imposes no portability requirements for erroneous program constructs, erroneous data, or the use of unspecified values such as the use or referencing of a dirp value or a dirent structure value after a directory stream has been closed or after a fork() or one of the exec function calls.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 2.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.
**NAME**

openlog — open a connection to the logging facility

**SYNOPSIS**

```c
#include <syslog.h>

void openlog(const char *ident, int logopt, int facility);
```

**DESCRIPTION**

Refer to `closelog()`.
NAME
optarg, opterr, optind, optopt — options parsing variables

SYNOPSIS
#include <unistd.h>
extern char *optarg;
extern int opterr, optind, optopt;

DESCRIPTION
Refer to getopt().
NAME
pathconf — get configurable pathname variables

SYNOPSIS
#include <unistd.h>
long pathconf(const char *path, int name);

DESCRIPTION
Refer to fpathconf().
pause( )

NAME
pause — suspend the thread until a signal is received

SYNOPSIS
#include <unistd.h>
int pause(void);

DESCRIPTION
The pause( ) function shall suspend the calling thread until delivery of a signal whose action is
either to execute a signal-catching function or to terminate the process.
If the action is to terminate the process, pause() shall not return.
If the action is to execute a signal-catching function, pause() shall return after the signal-catching
function returns.

RETURN VALUE
Since pause() suspends thread execution indefinitely unless interrupted by a signal, there is no
successful completion return value. A value of −1 shall be returned and errno set to indicate the
error.

ERRORS
The pause() function shall fail if:
[EINTR] A signal is caught by the calling process and control is returned from the
signal-catching function.

EXAMPLES
None.

APPLICATION USAGE
Many common uses of pause() have timing windows. The scenario involves checking a
condition related to a signal and, if the signal has not occurred, calling pause(). When the signal
occurs between the check and the call to pause(), the process often blocks indefinitely. The
sigprocmask() and sigsuspend() functions can be used to avoid this type of problem.

Issue 5
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6
The APPLICATION USAGE section is added.
NAME
pclose — close a pipe stream to or from a process

SYNOPSIS
#include <stdio.h>

int pclose(FILE *stream);

DESCRIPTION
The pclose() function shall close a stream that was opened by popen(), wait for the command to
terminate, and return the termination status of the process that was running the command
language interpreter. However, if a call caused the termination status to be unavailable to
pclose(), then pclose() shall return −1 with errno set to [ECHILD] to report this situation. This can
happen if the application calls one of the following functions:

• wait()
• waitpid() with a pid argument less than or equal to 0 or equal to the process ID of the
command line interpreter
• Any other function not defined in this volume of IEEE Std 1003.1-2001 that could do one of
the above

In any case, pclose() shall not return before the child process created by popen() has terminated.

If the command language interpreter cannot be executed, the child termination status returned
by pclose() shall be as if the command language interpreter terminated using exit(127) or
_exit(127).

The pclose() function shall not affect the termination status of any child of the calling process
other than the one created by popen() for the associated stream.

If the argument stream to pclose() is not a pointer to a stream created by popen(), the result of
pclose() is undefined.

RETURN VALUE
Upon successful return, pclose() shall return the termination status of the command language
interpreter. Otherwise, pclose() shall return −1 and set errno to indicate the error.

ERRORS
The pclose() function shall fail if:

ECHILD] The status of the child process could not be obtained, as described above.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
There is a requirement that pclose() not return before the child process terminates. This is
intended to disallow implementations that return [EINTR] if a signal is received while waiting.

If pclose() returned before the child terminated, there would be no way for the application to
discover which child used to be associated with the stream, and it could not do the cleanup
itself.

If the stream pointed to by stream was not created by popen(), historical implementations of
pclose() return −1 without setting errno. To avoid requiring pclose() to set errno in this case,
IEEE Std 1003.1-2001 makes the behavior unspecified. An application should not use pclose() to
close any stream that was not created by `popen()`.

Some historical implementations of `pclose()` either block or ignore the signals SIGINT, SIGQUIT, and SIGHUP while waiting for the child process to terminate. Since this behavior is not described for the `pclose()` function in IEEE Std 1003.1-2001, such implementations are not conforming. Also, some historical implementations return [EINTR] if a signal is received, even though the child process has not terminated. Such implementations are also considered non-conforming.

Consider, for example, an application that uses:

```c
popen("command", "r")
```

to start `command`, which is part of the same application. The parent writes a prompt to its standard output (presumably the terminal) and then reads from the `popen()`ed stream. The child reads the response from the user, does some transformation on the response (pathname expansion, perhaps) and writes the result to its standard output. The parent process reads the result from the pipe, does something with it, and prints another prompt. The cycle repeats. Assuming that both processes do appropriate buffer flushing, this would be expected to work.

To conform to IEEE Std 1003.1-2001, `pclose()` must use `waitpid()`, or some similar function, instead of `wait()`.

The code sample below illustrates how the `pclose()` function might be implemented on a system conforming to IEEE Std 1003.1-2001.

```c
int pclose(FILE *stream)
{
    int stat;
    pid_t pid;
    pid = <pid for process created for stream by popen()>
    (void) fclose(stream);
    while (waitpid(pid, &stat, 0) == -1) {
        if (errno != EINTR)
            stat = -1;
        break;
    }
    return(stat);
}
```

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.
NAME
perror — write error messages to standard error

SYNOPSIS
#include <stdio.h>

void perror(const char *s);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The perror() function shall map the error number accessed through the symbol errno to a
language-dependent error message, which shall be written to the standard error stream as follows:

• First (if s is not a null pointer and the character pointed to by s is not the null byte), the string
  pointed to by s followed by a colon and a <space>.
• Then an error message string followed by a <newline>.

The contents of the error message strings shall be the same as those returned by strerror() with
argument errno.

The perror() function shall mark the file associated with the standard error stream as having
been written (st_ctime, st_mtime marked for update) at some time between its successful
completion and exit(), abort(), or the completion of fflush() or fclose() on stderr.

The perror() function shall not change the orientation of the standard error stream.

RETURN VALUE
The perror() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
Printing an Error Message for a Function
The following example replaces bufptr with a buffer that is the necessary size. If an error occurs,
the perror() function prints a message and the program exits.

#include <stdio.h>
#include <stdlib.h>
...
char *bufptr;
size_t szbuf;
...
if ((bufptr = malloc(szbuf)) == NULL) {
  perror("malloc"); exit(2);
}
...

APPLICATION USAGE
None.
RATIONALE
None.

FUTURE DIRECTIONS
None.

strerror(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
A paragraph is added to the DESCRIPTION indicating that perror() does not change the orientation of the standard error stream.

Issue 6
Extensions beyond the ISO C standard are marked.
NAME
pipe — create an interprocess channel

SYNOPSIS
#include <unistd.h>
int pipe(int fildes[2]);

DESCRIPTION
The pipe() function shall create a pipe and place two file descriptors, one each into the
arguments fildes[0] and fildes[1], that refer to the open file descriptions for the read and write
ends of the pipe. Their integer values shall be the two lowest available at the time of the pipe()
call. The O_NONBLOCK and FD_CLOEXEC flags shall be clear on both file descriptors. (The
fcntl() function can be used to set both these flags.)

Data can be written to the file descriptor fildes[1] and read from the file descriptor fildes[0]. A
read on the file descriptor fildes[0] shall access data written to the file descriptor fildes[1] on a
first-in-first-out basis. It is unspecified whether fildes[0] is also open for writing and whether
fildes[1] is also open for reading.

A process has the pipe open for reading (correspondingly writing) if it has a file descriptor open
that refers to the read end, fildes[0] (write end, fildes[1]).

Upon successful completion, pipe() shall mark for update the st_atime, st_ctime, and st_mtime
fields of the pipe.

RETURN VALUE
Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The pipe() function shall fail if:

- [EMFILE] More than {OPEN_MAX} minus two file descriptors are already in use by this
  process.
- [ENFILE] The number of simultaneously open files in the system would exceed a
  system-imposed limit.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The wording carefully avoids using the verb “to open” in order to avoid any implication of use
of open(); see also write().

FUTURE DIRECTIONS
None.

SEE ALSO
fcntl(), read(), write(), the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>,
<unistd.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION is updated to indicate that certain dispositions of `fildes[0]` and `fildes[1]` are unspecified.
NAME
poll — input/output multiplexing

SYNOPSIS
#include <poll.h>

int poll(struct pollfd fds[], nfds_t nfds, int timeout);

DESCRIPTION
The poll() function provides applications with a mechanism for multiplexing input/output over
a set of file descriptors. For each member of the array pointed to by fds, poll() shall examine the
given file descriptor for the event(s) specified in events. The number of pollfd structures in the
fds array is specified by nfds. The poll() function shall identify those file descriptors on which an
application can read or write data, or on which certain events have occurred.

The fds argument specifies the file descriptors to be examined and the events of interest for each
file descriptor. It is a pointer to an array with one member for each open file descriptor of
interest. The array’s members are pollfd structures within which fd specifies an open file
descriptor and events and revents are bitmasks constructed by OR’ing a combination of the
following event flags:

POLLIN Data other than high-priority data may be read without blocking.
For STREAMS, this flag is set in revents even if the message is of zero length.
This flag shall be equivalent to POLLRDNNORM | POLLRDNNBAND.
POLLRDNNORM Normal data may be read without blocking.
For STREAMS, data on priority band 0 may be read without blocking. This
flag is set in revents even if the message is of zero length.
POLLRDNNBAND Priority data may be read without blocking.
For STREAMS, data on priority bands greater than 0 may be read without
blocking. This flag is set in revents even if the message is of zero length.
POLLPRI High-priority data may be read without blocking.
For STREAMS, this flag is set in revents even if the message is of zero length.
POLLOUT Normal data may be written without blocking.
For STREAMS, data on priority band 0 may be written without blocking.
POLLWRNORM Equivalent to POLLOUT.
POLLWRRBAND Priority data may be written.
For STREAMS, data on priority bands greater than 0 may be written without
blocking. If any priority band has been written to on this STREAM, this event
only examines bands that have been written to at least once.
POLLERR An error has occurred on the device or stream. This flag is only valid in the
revents bitmask; it shall be ignored in the events member.
POLLHUP The device has been disconnected. This event and POLLOUT are mutually-
exclusive; a stream can never be writable if a hangup has occurred. However,
this event and POLLIN, POLLRDNNORM, POLLRDNNBAND, or POLLPRI are not
mutually-exclusive. This flag is only valid in the revents bitmask; it shall be
ignored in the events member.
POLLNVAL The specified fd value is invalid. This flag is only valid in the revents member; it shall ignored in the events member.

The significance and semantics of normal, priority, and high-priority data are file and device-specific.

If the value of fd is less than 0, events shall be ignored, and revents shall be set to 0 in that entry on return from poll().

In each pollfd structure, poll() shall clear the revents member, except that where the application requested a report on a condition by setting one of the bits of events listed above, poll() shall set the corresponding bit in revents if the requested condition is true. In addition, poll() shall set the POLLHUP, POLLERR, and POLLNVAL flag in revents if the condition is true, even if the application did not set the corresponding bit in events.

If none of the defined events have occurred on any selected file descriptor, poll() shall wait at least timeout milliseconds for an event to occur on any of the selected file descriptors. If the value of timeout is 0, poll() shall return immediately. If the value of timeout is −1, poll() shall block until a requested event occurs or until the call is interrupted.

Implementations may place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

The poll() function shall not be affected by the O_NONBLOCK flag.

The poll() function shall support regular files, terminal and pseudo-terminal devices, FIFOs, pipes, sockets and STREAMS-based files. The behavior of poll() on elements of fds that refer to other types of file is unspecified.

Regular files shall always poll TRUE for reading and writing.

A file descriptor for a socket that is listening for connections shall indicate that it is ready for reading, once connections are available. A file descriptor for a socket that is connecting asynchronously shall indicate that it is ready for writing, once a connection has been established.

RETURN VALUE

Upon successful completion, poll() shall return a non-negative value. A positive value indicates the total number of file descriptors that have been selected (that is, file descriptors for which the revents member is non-zero). A value of 0 indicates that the call timed out and no file descriptors have been selected. Upon failure, poll() shall return −1 and set errno to indicate the error.

ERRORS

The poll() function shall fail if:

[EAGAIN] The allocation of internal data structures failed but a subsequent request may succeed.

[EINTR] A signal was caught during poll().

[EINVAL] The nfds argument is greater than {OPEN_MAX}, or one of the fd members refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.
Checking for Events on a Stream

The following example opens a pair of STREAMS devices and then waits for either one to become writable. This example proceeds as follows:

1. Sets the timeout parameter to 500 milliseconds.
2. Opens the STREAMS devices /dev/dev0 and /dev/dev1, and then polls them, specifying POLLOUT and POLLWRBAND as the events of interest.

The STREAMS device names /dev/dev0 and /dev/dev1 are only examples of how STREAMS devices can be named; STREAMS naming conventions may vary among systems conforming to the IEEE Std 1003.1-2001.

3. Uses the ret variable to determine whether an event has occurred on either of the two STREAMS. The poll() function is given 500 milliseconds to wait for an event to occur (if it has not occurred prior to the poll() call).

4. Checks the returned value of ret. If a positive value is returned, one of the following can be done:
   a. Priority data can be written to the open STREAM on priority bands greater than 0, because the POLLWRBAND event occurred on the open STREAM (fds[0] or fds[1]).
   b. Data can be written to the open STREAM on priority-band 0, because the POLLOUT event occurred on the open STREAM (fds[0] or fds[1]).

5. If the returned value is not a positive value, permission to write data to the open STREAM (on any priority band) is denied.
6. If the POLLHUP event occurs on the open STREAM (fds[0] or fds[1]), the device on the open STREAM has disconnected.

```c
#include <stropts.h>
#include <poll.h>
...
struct pollfd fds[2];
int timeout_msecs = 500;
int ret;
int i;
/* Open STREAMS device. */
fds[0].fd = open("/dev/dev0", ...);
fds[1].fd = open("/dev/dev1", ...);
fds[0].events = POLLOUT | POLLWRBAND;
fds[1].events = POLLOUT | POLLWRBAND;
ret = poll(fds, 2, timeout_msecs);
if (ret > 0) {
    /* An event on one of the fds has occurred. */
    for (i=0; i<2; i++) {
        if (fds[i].revents & POLLWRBAND) {
            /* Priority data may be written on device number i. */
...
        }
        if (fds[i].revents & POLLOUT) {
```
/* Data may be written on device number i. */
...
}
if (fds[i].revents & POLLHUP) {
    /* A hangup has occurred on device number i. */
    ...
}

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
The description of POLLWRBAND is updated.

Issue 6
Text referring to sockets is added to the DESCRIPTION.
Text relating to the XSI STREAMS Option Group is marked.
The Open Group Corrigendum U055/3 is applied, updating the DESCRIPTION of POLLWRBAND.
popen()

NAME
popen — initiate pipe streams to or from a process

SYNOPSIS

```c
#include <stdio.h>

FILE *popen(const char *command, const char *mode);
```

DESCRIPTION
The `popen()` function shall execute the command specified by the string `command`. It shall create a pipe between the calling program and the executed command, and shall return a pointer to a stream that can be used to either read from or write to the pipe.

The environment of the executed command shall be as if a child process were created within the `popen()` call using the `fork()` function, and the child invoked the `sh` utility using the call:

```c
execl(shell path, "sh", ":c", command, (char *)0);
```

where `shell path` is an unspecified pathname for the `sh` utility.

The `popen()` function shall ensure that any streams from previous `popen()` calls that remain open in the parent process are closed in the new child process.

The `mode` argument to `popen()` is a string that specifies I/O mode:

1. If `mode` is `r`, when the child process is started, its file descriptor `STDOUT_FILENO` shall be the writable end of the pipe, and the file descriptor `fileno(stream)` in the calling process, where `stream` is the stream pointer returned by `popen()`, shall be the readable end of the pipe.

2. If `mode` is `w`, when the child process is started its file descriptor `STDIN_FILENO` shall be the readable end of the pipe, and the file descriptor `fileno(stream)` in the calling process, where `stream` is the stream pointer returned by `popen()`, shall be the writable end of the pipe.

3. If `mode` is any other value, the result is undefined.

After `popen()`, both the parent and the child process shall be capable of executing independently before either terminates.

Pipe streams are byte-oriented.

RETURN VALUE
Upon successful completion, `popen()` shall return a pointer to an open stream that can be used to read or write to the pipe. Otherwise, it shall return a null pointer and may set `errno` to indicate the error.

ERRORS
The `popen()` function may fail if:

- `[EMFILE]` {FOPEN_MAX} or {STREAM_MAX} streams are currently open in the calling process.
- `[EINVAL]` The `mode` argument is invalid.

The `popen()` function may also set `errno` values as described by `fork()` or `pipe()`.
EXAMPLES
None.

APPLICATION USAGE
Since open files are shared, a mode r command can be used as an input filter and a mode w command as an output filter.

Buffered reading before opening an input filter may leave the standard input of that filter mispositioned. Similar problems with an output filter may be prevented by careful buffer flushing; for example, with fflush().

A stream opened by popen() should be closed by pclose().

The behavior of popen() is specified for values of mode of r and w. Other modes such as rb and wb might be supported by specific implementations, but these would not be portable features.

Note that historical implementations of popen() only check to see if the first character of mode is r. Thus, a mode of robert the robot would be treated as mode r, and a mode of anything else would be treated as mode w.

If the application calls waitpid() or waitid() with a pid argument greater than 0, and it still has a stream that was called with popen() open, it must ensure that pid does not refer to the process started by popen().

To determine whether or not the environment specified in the Shell and Utilities volume of IEEE Std 1003.1-2001 is present, use the function call:

\texttt{sysconf\(_{\text{-SC\_2\_VERSION}}\)}

(See \texttt{sysconf()}).

RATIONALE
The popen() function should not be used by programs that have set user (or group) ID privileges. The fork() and exec family of functions (except execlp() and execvp()), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

If the original and popen()ed processes both intend to read or write or read and write a common file, and either will be using FILE-type C functions (fread(), fwrite(), and so on), the rules for sharing file handles must be observed (see Section 2.5.1 (on page 35)).

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
A statement is added to the DESCRIPTION indicating that pipe streams are byte-oriented.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The optional [EMFILE] error condition is added.
NAME
posix_fadvise — file advisory information (ADVANCED REALTIME)

SYNOPSIS
#include <fcntl.h>

int posix_fadvise(int fd, off_t offset, size_t len, int advice);

DESCRIPTION
The posix_fadvise() function shall advise the implementation on the expected behavior of the
application with respect to the data in the file associated with the open file descriptor, fd,
starting at offset and continuing for len bytes. The specified range need not currently exist in the
file. If len is zero, all data following offset is specified. The implementation may use this
information to optimize handling of the specified data. The posix_fadvise() function shall have no
effect on the semantics of other operations on the specified data, although it may affect the
performance of other operations.

The advice to be applied to the data is specified by the advice parameter and may be one of the
following values:

POSIX_FADV_NORMAL
Specifies that the application has no advice to give on its behavior with respect to the
specified data. It is the default characteristic if no advice is given for an open file.

POSIX_FADV_SEQUENTIAL
Specifies that the application expects to access the specified data sequentially from lower
offsets to higher offsets.

POSIX_FADV_RANDOM
Specifies that the application expects to access the specified data in a random order.

POSIX_FADV_WILLNEED
Specifies that the application expects to access the specified data in the near future.

POSIX_FADV_DONTNEED
Specifies that the application expects that it will not access the specified data in the near
future.

POSIX_FADV_NOREUSE
Specifies that the application expects to access the specified data once and then not reuse it
thereafter.

These values are defined in <fcntl.h>.

RETURN VALUE
Upon successful completion, posix_fadvise() shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The posix_fadvise() function shall fail if:

[EBADF] The fd argument is not a valid file descriptor.

[EINVAL] The value of advice is invalid.

[ESPIPE] The fd argument is associated with a pipe or FIFO.
posix_fadvise()
posix_fallocate()

NAME
posix_fallocate — file space control

SYNOPSIS
ADV
#include <fcntl.h>

int posix_fallocate(int fd, off_t offset, size_t len);

DESCRIPTION
The posix_fallocate() function shall ensure that any required storage for regular file data starting
at offset and continuing for len bytes is allocated on the file system storage media. If
posix_fallocate() returns successfully, subsequent writes to the specified file data shall not fail
due to the lack of free space on the file system storage media.

If the offset+len is beyond the current file size, then posix_fallocate() shall adjust the file size to
offset+len. Otherwise, the file size shall not be changed.

It is implementation-defined whether a previous posix_fadvise() call influences allocation
strategy.

Space allocated via posix_fallocate() shall be freed by a successful call to creat() or open() that
truncates the size of the file. Space allocated via posix_fallocate() may be freed by a successful call
to ftruncate() that reduces the file size to a size smaller than offset+len.

RETURN VALUE
Upon successful completion, posix_fallocate() shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The posix_fallocate() function shall fail if:

[EBADF] The fd argument is not a valid file descriptor.
[EBADF] The fd argument references a file that was opened without write permission.
[EFBIG] The value of offset+len is greater than the maximum file size.
[EINTR] A signal was caught during execution.
[EINVAL] The len argument was zero or the offset argument was less than zero.
[EIO] An I/O error occurred while reading from or writing to a file system.
[ENODEV] The fd argument does not refer to a regular file.
[ENOSPC] There is insufficient free space remaining on the file system storage media.
[ESPIPE] The fd argument is associated with a pipe or FIFO.

EXAMPLES
None.

APPLICATION USAGE
The posix_fallocate() function is part of the Advisory Information option and need not be
provided on all implementations.

RATIONALE
None.
FUTURE DIRECTIONS

None.

CHANGE HISTORY

In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.
posix_madvise()

NAME
posix_madvise — memory advisory information and alignment control (ADVANCED
REALTIME)

SYNOPSIS
#include <sys/mman.h>

int posix_madvise(void *addr, size_t len, int advice);

DESCRIPTION
The posix_madvise() function need only be supported if either the Memory Mapped Files or the
Shared Memory Objects options are supported.

The posix_madvise() function shall advise the implementation on the expected behavior of the
application with respect to the data in the memory starting at address addr, and continuing for
len bytes. The implementation may use this information to optimize handling of the specified
data. The posix_madvise() function shall have no effect on the semantics of access to memory in
the specified range, although it may affect the performance of access.

The implementation may require that addr be a multiple of the page size, which is the value
returned by sysconf() when the name value _SC_PAGESIZE is used.

The advice to be applied to the memory range is specified by the advice parameter and may be
one of the following values:

POSIX_MADV_NORMAL
Specifies that the application has no advice to give on its behavior with respect to the
specified range. It is the default characteristic if no advice is given for a range of memory.

POSIX_MADV_SEQUENTIAL
Specifies that the application expects to access the specified range sequentially from lower
addresses to higher addresses.

POSIX_MADV_RANDOM
Specifies that the application expects to access the specified range in a random order.

POSIX_MADV_WILLNEED
Specifies that the application expects to access the specified range in the near future.

POSIX_MADV_DONTNEED
Specifies that the application expects that it will not access the specified range in the near
future.

These values are defined in the <sys/mman.h> header.

RETURN VALUE
Upon successful completion, posix_madvise() shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The posix_madvise() function shall fail if:

EINVAL The value of advice is invalid.

ENOMEM Addresses in the range starting at addr and continuing for len bytes are partly
or completely outside the range allowed for the address space of the calling
process.
The `posix_madvise()` function may fail if:

- [EINVAL] The value of `addr` is not a multiple of the value returned by `sysconf()` when the name value `_SC_PAGESIZE` is used.
- [EINVAL] The value of `len` is zero.

**EXAMPLES**

None.

**APPLICATION USAGE**

The `posix_madvise()` function is part of the Advisory Information option and need not be provided on all implementations.

**CHANGE HISTORY**

IEEE PASC Interpretation 1003.1 #102 is applied.
NAME
posix_mem_offset — find offset and length of a mapped typed memory block (ADVANCED REALTIME)

SYNOPSIS
#include <sys/mman.h>

int posix_mem_offset(const void *restrict addr, size_t len,
        off_t *restrict off, size_t *restrict contig_len,
        int *restrict fildes);

DESCRIPTION
The posix_mem_offset() function shall return in the variable pointed to by off a value that identifies the offset (or location), within a memory object, of the memory block currently mapped at addr. The function shall return in the variable pointed to by fildes, the descriptor used (via mmap()) to establish the mapping which contains addr. If that descriptor was closed since the mapping was established, the returned value of fildes shall be −1. The len argument specifies the length of the block of the memory object the user wishes the offset for; upon return, the value pointed to by contig_len shall equal either len, or the length of the largest contiguous block of the memory object that is currently mapped to the calling process starting at addr, whichever is smaller.

If the memory object mapped at addr is a typed memory object, then if the off and contig_len values obtained by calling posix_mem_offset() are used in a call to mmap() with a file descriptor that refers to the same memory pool as fildes (either through the same port or through a different port), and that was opened with neither the POSIX_TYPED_MEM_ALLOCATE nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG flag, the typed memory area that is mapped shall be exactly the same area that was mapped at addr in the address space of the process that called posix_mem_offset().

If the memory object specified by fildes is not a typed memory object, then the behavior of this function is implementation-defined.

RETURN VALUE
Upon successful completion, the posix_mem_offset() function shall return zero; otherwise, the corresponding error status value shall be returned.

ERRORS
The posix_mem_offset() function shall fail if:

[EACCES] The process has not mapped a memory object supported by this function at the given address addr.

This function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.
FUTURE DIRECTIONS

CHANGE HISTORY
NAME
posix_memalign — aligned memory allocation (ADVANCED REALTIME)

SYNOPSIS
#include <stdlib.h>

int posix_memalign(void **memptr, size_t alignment, size_t size);

DESCRIPTION
The posix_memalign() function shall allocate size bytes aligned on a boundary specified by alignment, and shall return a pointer to the allocated memory in memptr. The value of alignment shall be a multiple of sizeof(void *), that is also a power of two. Upon successful completion, the value pointed to by memptr shall be a multiple of alignment.

The free() function shall deallocate memory that has previously been allocated by posix_memalign().

RETURN VALUE
Upon successful completion, posix_memalign() shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The posix_memalign() function shall fail if:

- EINVAL The value of the alignment parameter is not a power of two multiple of sizeof(void *).
- ENOMEM There is insufficient memory available with the requested alignment.

EXAMPLES
None.

APPLICATION USAGE
The posix_memalign() function is part of the Advisory Information option and need not be provided on all implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.
NAME
posix_openpt — open a pseudo-terminal device

SYNOPSIS
XSI
#include <stdlib.h>
#include <fcntl.h>

int posix_openpt(int oflag);

DESCRIPTION
The posix_openpt() function shall establish a connection between a master device for a pseudo-
terminal and a file descriptor. The file descriptor is used by other I/O functions that refer to that
pseudo-terminal.

The file status flags and file access modes of the open file description shall be set according to
the value of oflag.

Values for oflag are constructed by a bitwise-inclusive OR of flags from the following list,
defined in <fcntl.h>:

- O_RDWR Open for reading and writing.
- O_NOCTTY If set posix_openpt() shall not cause the terminal device to become the
  controlling terminal for the process.

The behavior of other values for the oflag argument is unspecified.

RETURN VALUE
Upon successful completion, the posix_openpt() function shall open a master pseudo-terminal
device and return a non-negative integer representing the lowest numbered unused file
descriptor. Otherwise, -1 shall be returned and errno set to indicate the error.

ERRORS
The posix_openpt() function shall fail if:

- [EMFILE] [OPEN_MAX] file descriptors are currently open in the calling process.
- [ENFILE] The maximum allowable number of files is currently open in the system.

The posix_openpt() function may fail if:

- [EINVAL] The value of oflag is not valid.
- [EAGAIN] Out of pseudo-terminal resources.
- [ENOSR] Out of STREAMS resources.

EXAMPLES
Opening a Pseudo-Terminal and Returning the Name of the Slave Device and a File
Descriptor
#include <fcntl.h>
#include <stdio.h>

int masterfd, slavefd;
char *slavedevice;
masterfd = posix_openpt(O_RDWR | O_NOCTTY);
if (masterfd == -1
 || grantpt (masterfd) == -1
posix_openpt()  System Interfaces

|| unlockpt (masterfd) == -1
|| (slavedevice = ptsname (masterfd)) == NULL)
return -1;

printf("slave device is: %s\n", slavedevice);
slavefd = open(slave, O_RDWR|O_NOCTTY);
if (slavefd < 0)
return -1;

APPLICATION USAGE  This function is a method for portably obtaining a file descriptor of a master terminal device for a pseudo-terminal. The grantpt() and ptsname() functions can be used to manipulate mode and ownership permissions, and to obtain the name of the slave device, respectively.

RATIONALE  The standard developers considered the matter of adding a special device for cloning master pseudo-terminals: the /dev/ptmx device. However, consensus could not be reached, and it was felt that adding a new function would permit other implementations. The posix_openpt() function is designed to complement the grantpt(), ptsname(), and unlockpt() functions.

On implementations supporting the /dev/ptmx clone device, opening the master device of a pseudo-terminal is simply:

mfdp = open("/dev/ptmx", oflag );
if (mfdp < 0)
return -1;

FUTURE DIRECTIONS  None.

SEE ALSO  grantpt(), open(), ptsname(), unlockpt(), the Base Definitions volume of IEEE Std 1003.1-2001, <fcntl.h>

CHANGE HISTORY  First released in Issue 6.
NAME
posix_spawn, posix_spawnp — spawn a process (ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>

int posix_spawn(pid_t *restrict pid, const char *restrict path,
const posix_spawn_file_actions_t *file_actions,
const posix_spawnattr_t *restrict attrp,
char *const argv[restrict], char *const envp[restrict]);

int posix_spawnp(pid_t *restrict pid, const char *restrict file,
const posix_spawn_file_actions_t *file_actions,
const posix_spawnattr_t *restrict attrp,
char *const argv[restrict], char *const envp[restrict]);

DESCRIPTION
The **posix_spawn**() and **posix_spawnp**() functions shall create a new process (child process) from
the specified process image. The new process image shall be constructed from a regular
executable file called the new process image file.

When a C program is executed as the result of this call, it shall be entered as a C-language
function call as follows:

```c
int main(int argc, char *argv[]);
```

where **argc** is the argument count and **argv** is an array of character pointers to the arguments
themselves. In addition, the following variable:

```c
extern char **environ;
```

shall be initialized as a pointer to an array of character pointers to the environment strings.

The argument **argv** is an array of character pointers to null-terminated strings. The last member
of this array shall be a null pointer and is not counted in **argc**. These strings constitute the
argument list available to the new process image. The value in **argv[0]** should point to a filename
that is associated with the process image being started by the **posix_spawn()** or **posix_spawnp()**
function.

The argument **envp** is an array of character pointers to null-terminated strings. These strings
constitute the environment for the new process image. The environment array is terminated by a
null pointer.

The number of bytes available for the child process’ combined argument and environment lists
is [ARG_MAX]. The implementation shall specify in the system documentation (see the Base
Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance) whether any list
overhead, such as length words, null terminators, pointers, or alignment bytes, is included in
this total.

The **path** argument to **posix_spawn()** is a pathname that identifies the new process image file to
execute.

The **file** parameter to **posix_spawnp()** shall be used to construct a pathname that identifies the
new process image file. If the **file** parameter contains a slash character, the **file** parameter shall be
used as the pathname for the new process image file. Otherwise, the path prefix for this file shall
be obtained by a search of the directories passed as the environment variable **PATH** (see the Base
Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables). If this
environment variable is not defined, the results of the search are implementation-defined.
If `file_actions` is a null pointer, then file descriptors open in the calling process shall remain open in the child process, except for those whose close-on-exec flag FD_CLOEXEC is set (see `fcntl()`). For those file descriptors that remain open, all attributes of the corresponding open file descriptions, including file locks (see `fcntl()`), shall remain unchanged.

If `file_actions` is not NULL, then the file descriptors open in the child process shall be those open in the calling process as modified by the spawn file actions object pointed to by `file_actions` and the FD_CLOEXEC flag of each remaining open file descriptor after the spawn file actions have been processed. The effective order of processing the spawn file actions shall be:

1. The set of open file descriptors for the child process shall initially be the same set as is open for the calling process. All attributes of the corresponding open file descriptions, including file locks (see `fcntl()`), shall remain unchanged.

2. The signal mask, signal default actions, and the effective user and group IDs for the child process shall be changed as specified in the attributes object referenced by `attrp`.

3. The file actions specified by the spawn file actions object shall be performed in the order in which they were added to the spawn file actions object.

4. Any file descriptor that has its FD_CLOEXEC flag set (see `fcntl()`) shall be closed.

The `posix_spawnattr_t` spawn attributes object type is defined in `<spawn.h>`. It shall contain at least the attributes defined below.

If the `POSIX_SPAWN_SETGROUP` flag is set in the `spawn-flags` attribute of the object referenced by `attrp`, and the `spawn-pgroup` attribute of the same object is non-zero, then the child’s process group shall be as specified in the `spawn-pgroup` attribute of the object referenced by `attrp`.

As a special case, if the `POSIX_SPAWN_SETGROUP` flag is set in the `spawn-flags` attribute of the object referenced by `attrp`, and the `spawn-pgroup` attribute of the same object is set to zero, then the child shall be in a new process group with a process group ID equal to its process ID.

If the `POSIX_SPAWN_SETGROUP` flag is not set in the `spawn-flags` attribute of the object referenced by `attrp`, the new child process shall inherit the parent’s process group.

If the `POSIX_SPAWN_SETSCHEDPARAM` flag is set in the `spawn-flags` attribute of the object referenced by `attrp`, but `POSIX_SPAWN_SETSCHEDULER` is not set, the new process image shall initially have the scheduling policy of the calling process with the scheduling parameters specified in the `spawn-schedparam` attribute of the object referenced by `attrp`.

If the `POSIX_SPAWN_SETSCHEDULER` flag is set in the `spawn-flags` attribute of the object referenced by `attrp` (regardless of the setting of the `POSIX_SPAWN_SETSCHEDPARAM` flag), the new process image shall initially have the scheduling policy specified in the `spawn-schedpolicy` attribute of the object referenced by `attrp` and the scheduling parameters specified in the `spawn-schedparam` attribute of the same object.

The `POSIX_SPAWN_RESETIDS` flag in the `spawn-flags` attribute of the object referenced by `attrp` governs the effective user ID of the child process. If this flag is not set, the child process shall inherit the parent process’ effective user ID. If this flag is set, the child process’ effective user ID shall be reset to the parent’s real user ID. In either case, if the set-user-ID mode bit of the new process image file is set, the effective user ID of the child process shall become that file’s owner ID before the new process image begins execution.

The `POSIX_SPAWN_RESETIDS` flag in the `spawn-flags` attribute of the object referenced by `attrp` also governs the effective group ID of the child process. If this flag is not set, the child process shall inherit the parent process’ effective group ID. If this flag is set, the child process’ effective group ID shall be reset to the parent’s real group ID. In either case, if the set-group-ID mode bit
of the new process image file is set, the effective group ID of the child process shall become that file’s group ID before the new process image begins execution.

If the POSIX_SPAWN_SETSIGMASK flag is set in the spawn-flags attribute of the object referenced by attrp, the child process shall initially have the signal mask specified in the spawn-sigmask attribute of the object referenced by attrp.

If the POSIX_SPAWN_SETSIGDEF flag is set in the spawn-flags attribute of the object referenced by attrp, the signals specified in the spawn-sigdefault attribute of the same object shall be set to their default actions in the child process. Signals set to the default action in the parent process shall be set to the default action in the child process.

Signals set to be caught by the calling process shall be set to the default action in the child process.

Except for SIGCHLD, signals set to be ignored by the calling process image shall be set to be ignored by the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the spawn-flags attribute of the object referenced by attrp and the signals being indicated in the spawn-sigdefault attribute of the object referenced by attrp.

If the SIGCHLD signal is set to be ignored by the calling process, it is unspecified whether the SIGCHLD signal is set to be ignored or to the default action in the child process, unless otherwise specified by the POSIX_SPAWN_SETSIGDEF flag being set in the spawn_flags attribute of the object referenced by attrp and the SIGCHLD signal being indicated in the spawn_sigdefault attribute of the object referenced by attrp.

If the value of the attrp pointer is NULL, then the default values are used.

All process attributes, other than those influenced by the attributes set in the object referenced by attrp as specified above or by the file descriptor manipulations specified in file_actions, shall appear in the new process image as though fork() had been called to create a child process and then a member of the exec family of functions had been called by the child process to execute the new process image.

THR

It is implementation-defined whether the fork handlers are run when posix_spawn() or posix_spawnp() is called.

RETURN VALUE

Upon successful completion, posix_spawn() and posix_spawnp() shall return the process ID of the child process to the parent process, in the variable pointed to by a non-NULL pid argument, and shall return zero as the function return value. Otherwise, no child process shall be created, the value stored into the variable pointed to by a non-NULL pid is unspecified, and an error number shall be returned as the function return value to indicate the error. If the pid argument is a null pointer, the process ID of the child is not returned to the caller.

ERRORS

The posix_spawn() and posix_spawnp() functions may fail if:

[EINVAL] The value specified by file_actions or attrp is invalid.

If this error occurs after the calling process successfully returns from the posix_spawn() or posix_spawnp() function, the child process may exit with exit status 127.

If posix_spawn() or posix_spawnp() fail for any of the reasons that would cause fork() or one of the exec family of functions to fail, an error value shall be returned as described by fork() and exec, respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).
If POSIX_SPAWN_SETPGROUP is set in the spawn-flags attribute of the object referenced by attrp, and posix_spawn() or posix_spawnp() fails while changing the child’s process group, an error value shall be returned as described by setpgid() (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETSCHEDPARAM is set and POSIX_SPAWN_SETSCHEDULER is not set in the spawn-flags attribute of the object referenced by attrp, then if posix_spawn() or posix_spawnp() fails for any of the reasons that would cause sched_setparam() to fail, an error value shall be returned as described by sched_setparam() (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If POSIX_SPAWN_SETSCHEDULER is set in the spawn-flags attribute of the object referenced by attrp, and if posix_spawn() or posix_spawnp() fails for any of the reasons that would cause sched_setscheduler() to fail, an error value shall be returned as described by sched_setscheduler() (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127).

If the file_actions argument is not NULL, and specifies any close, dup2, or open actions to be performed, and if posix_spawn() or posix_spawnp() fails for any of the reasons that would cause close(), dup2(), or open() to fail, an error value shall be returned as described by close(), dup2(), and open(), respectively (or, if the error occurs after the calling process successfully returns, the child process shall exit with exit status 127). An open file action may, by itself, result in any of the errors described by close() or dup2(), in addition to those described by open().

**EXAMPLES**
None.

**APPLICATION USAGE**
These functions are part of the Spawn option and need not be provided on all implementations.

**RATIONALE**
The posix_spawn() function and its close relation posix_spawnp() have been introduced to overcome the following perceived difficulties with fork(): the fork() function is difficult or impossible to implement without swapping or dynamic address translation.

- Swapping is generally too slow for a realtime environment.
- Dynamic address translation is not available everywhere that POSIX might be useful.
- Processes are too useful to simply option out of POSIX whenever it must run without address translation or other MMU services.

Thus, POSIX needs process creation and file execution primitives that can be efficiently implemented without address translation or other MMU services.

The posix_spawn() function is implementable as a library routine, but both posix_spawn() and posix_spawnp() are designed as kernel operations. Also, although they may be an efficient replacement for many fork()/exec pairs, their goal is to provide useful process creation primitives for systems that have difficulty with fork(), not to provide drop-in replacements for fork()/exec.

This view of the role of posix_spawn() and posix_spawnp() influenced the design of their API. It does not attempt to provide the full functionality of fork()/exec in which arbitrary user-specified operations of any sort are permitted between the creation of the child process and the execution of the new process image; any attempt to reach that level would need to provide a programming language as parameters. Instead, posix_spawn() and posix_spawnp() are process creation primitives like the Start_Process and Start_Process_Search Ada language bindings package POSIX_Process_Primitives and also like those in many operating systems that are not UNIX.
systems, but with some POSIX-specific additions.

To achieve its coverage goals, `posix_spawn()` and `posix_spawnp()` have control of six types of inheritance: file descriptors, process group ID, user and group ID, signal mask, scheduling, and whether each signal ignored in the parent will remain ignored in the child, or be reset to its default action in the child.

Control of file descriptors is required to allow an independently written child process image to access data streams opened by and even generated or read by the parent process without being specifically coded to know which parent files and file descriptors are to be used. Control of the process group ID is required to control how the child process' job control relates to that of the parent.

Control of the signal mask and signal defaulting is sufficient to support the implementation of `system()`. Although support for `system()` is not explicitly one of the goals for `posix_spawn()` and `posix_spawnp()`, it is covered under the “at least 50%” coverage goal.

The intention is that the normal file descriptor inheritance across `fork()`, the subsequent effect of the specified spawn file actions, and the normal file descriptor inheritance across one of the `exec` family of functions should fully specify open file inheritance. The implementation need make no decisions regarding the set of open file descriptors when the child process image begins execution, those decisions having already been made by the caller and expressed as the set of open file descriptors and their FD_CLOEXEC flags at the time of the call and the spawn file actions object specified in the call. We have been assured that in cases where the POSIX `Start_Process` Ada primitives have been implemented in a library, this method of controlling file descriptor inheritance may be implemented very easily.

We can identify several problems with `posix_spawn()` and `posix_spawnp()`, but there does not appear to be a solution that introduces fewer problems. Environment modification for child process attributes not specifiable via the `attrp` or `file_actions` arguments must be done in the parent process, and since the parent generally wants to save its context, it is more costly than similar functionality with `fork()`/`exec`. It is also complicated to modify the environment of a multi-threaded process temporarily, since all threads must agree when it is safe for the environment to be changed. However, this cost is only borne by those invocations of `posix_spawn()` and `posix_spawnp()` that use the additional functionality. Since extensive modifications are not the usual case, and are particularly unlikely in time-critical code, keeping much of the environment control out of `posix_spawn()` and `posix_spawnp()` is appropriate design.

The `posix_spawn()` and `posix_spawnp()` functions do not have all the power of `fork()`/`exec`. This is to be expected. The `fork()` function is a wonderfully powerful operation. We do not expect to duplicate its functionality in a simple, fast function with no special hardware requirements. It is worth noting that `posix_spawn()` and `posix_spawnp()` are very similar to the process creation operations on many operating systems that are not UNIX systems.

**Requirements**

The requirements for `posix_spawn()` and `posix_spawnp()` are:

- They must be implementable without an MMU or unusual hardware.
- They must be compatible with existing POSIX standards.

Additional goals are:

- They should be efficiently implementable.
- They should be able to replace at least 50% of typical executions of `fork()`.
A system with `posix_spawn()` and `posix_spawnp()` and without `fork()` should be useful, at least for realtime applications.

A system with `fork()` and the `exec` family should be able to implement `posix_spawn()` and `posix_spawnp()` as library routines.

**Two-Syntax**

POSIX `exec` has several calling sequences with approximately the same functionality. These appear to be required for compatibility with existing practice. Since the existing practice for the `posix_spawn*()` functions is otherwise substantially unlike POSIX, we feel that simplicity outweighs compatibility. There are, therefore, only two names for the `posix_spawn*()` functions.

The parameter list does not differ between `posix_spawn()` and `posix_spawnp()`. `posix_spawnp()` interprets the second parameter more elaborately than `posix_spawn()`.

**Compatibility with POSIX.5 (Ada)**

The `Start_Process` and `Start_Process_Search` procedures from the `POSIX_Process_Primitives` package from the Ada language binding to POSIX.1 encapsulate `fork()` and `exec` functionality in a manner similar to that of `posix_spawn()` and `posix_spawnp()`. Originally, in keeping with our simplicity goal, the standard developers had limited the capabilities of `posix_spawn()` and `posix_spawnp()` to a subset of the capabilities of `Start_Process` and `Start_Process_Search`; certain non-default capabilities were not supported. However, based on suggestions by the ballot group to improve file descriptor mapping or drop it, and on the advice of an Ada Language Bindings working group member, the standard developers decided that `posix_spawn()` and `posix_spawnp()` should be sufficiently powerful to implement `Start_Process` and `Start_Process_Search`. The rationale is that if the Ada language binding to such a primitive had already been approved as an IEEE standard, there can be little justification for not approving the functionally-equivalent parts of a C binding. The only three capabilities provided by `posix_spawn()` and `posix_spawnp()` that are not provided by `Start_Process` and `Start_Process_Search` are optionally specifying the child’s process group ID, the set of signals to be reset to default signal handling in the child process, and the child’s scheduling policy and parameters.

For the Ada language binding for `Start_Process` to be implemented with `posix_spawn()`, that binding would need to explicitly pass an empty signal mask and the parent’s environment to `posix_spawn()` whenever the caller of `Start_Process` allowed these arguments to default, since `posix_spawn()` does not provide such defaults. The ability of `Start_Process` to mask user-specified signals during its execution is functionally unique to the Ada language binding and must be dealt with in the binding separately from the call to `posix_spawn()`.

**Process Group**

The process group inheritance field can be used to join the child process with an existing process group. By assigning a value of zero to the `spawn-pgroup` attribute of the object referenced by `attrp`, the `setpgid()` mechanism will place the child process in a new process group.
Without the `posix_spawn()` and `posix_spawnp()` functions, systems without address translation can still use threads to give an abstraction of concurrency. In many cases, thread creation suffices, but it is not always a good substitute. The `posix_spawn()` and `posix_spawnp()` functions are considerably “heavier” than thread creation. Processes have several important attributes that threads do not. Even without address translation, a process may have base-and-bound memory protection. Each process has a process environment including security attributes and file capabilities, and powerful scheduling attributes. Processes abstract the behavior of non-uniform-memory-architecture multi-processors better than threads, and they are more convenient to use for activities that are not closely linked.

The `posix_spawn()` and `posix_spawnp()` functions may not bring support for multiple processes to every configuration. Process creation is not the only piece of operating system support required to support multiple processes. The total cost of support for multiple processes may be quite high in some circumstances. Existing practice shows that support for multiple processes is uncommon and threads are common among “tiny kernels”. There should, therefore, probably continue to be AEPs for operating systems with only one process.

**Asynchronous Error Notification**

A library implementation of `posix_spawn()` or `posix_spawnp()` may not be able to detect all possible errors before it forks the child process. IEEE Std 1003.1-2001 provides for an error indication returned from a child process which could not successfully complete the spawn operation via a special exit status which may be detected using the status value returned by `wait()` and `waitpid()`.

The `stat_val` interface and the macros used to interpret it are not well suited to the purpose of returning API errors, but they are the only path available to a library implementation. Thus, an implementation may cause the child process to exit with exit status 127 for any error detected during the spawn process after the `posix_spawn()` or `posix_spawnp()` function has successfully returned.

The standard developers had proposed using two additional macros to interpret `stat_val`. The first, WIFSPAWNFAIL, would have detected a status that indicated that the child exited because of an error detected during the `posix_spawn()` or `posix_spawnp()` operations rather than during actual execution of the child process image; the second, WSPAWNNERRNO, would have extracted the error value if WIFSPAWNFAIL indicated a failure. Unfortunately, the ballot group strongly opposed this because it would make a library implementation of `posix_spawn()` or `posix_spawnp()` dependent on kernel modifications to `waitpid()` to be able to embed special information in `stat_val` to indicate a spawn failure.

The 8 bits of child process exit status that are guaranteed by IEEE Std 1003.1-2001 to be accessible to the waiting parent process are insufficient to disambiguate a spawn error from any other kind of error that may be returned by an arbitrary process image. No other bits of the exit status are required to be visible in `stat_val`, so these macros could not be strictly implemented at the library level. Reserving an exit status of 127 for such spawn errors is consistent with the use of this value by `system()` and `popen()` to signal failures in these operations that occur after the function has returned but before a shell is able to execute. The exit status of 127 does not uniquely identify this class of error, nor does it provide any detailed information on the nature of the failure. Note that a kernel implementation of `posix_spawn()` or `posix_spawnp()` is permitted (and encouraged) to return any possible error as the function value, thus providing more detailed failure information to the parent process.

Thus, no special macros are available to isolate asynchronous `posix_spawn()` or `posix_spawnp()` errors. Instead, errors detected by the `posix_spawn()` or `posix_spawnp()` operations in the context
of the child process before the new process image executes are reported by setting the child’s exit status to 127. The calling process may use the WIFEXITED and WEXITSTATUS macros on the stat_val stored by the wait() or waitpid() functions to detect spawn failures to the extent that other status values with which the child process image may exit (before the parent can conclusively determine that the child process image has begun execution) are distinct from exit status 127.

IEEE PASC Interpretation 1003.1 #132 is applied.
**NAME**
posix_spawn_file_actions_addclose, posix_spawn_file_actions_addopen — add close or open action to spawn file actions object (ADVANCED REALTIME)

**SYNOPSIS**
```
#include <spawn.h>

int posix_spawn_file_actions_addclose(posix_spawn_file_actions_t * file_actions, int fildes);
int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t * restrict file_actions, int fildes,
                                       const char *restrict path, int oflag, mode_t mode);
```

**DESCRIPTION**
These functions shall add or delete a close or open action to a spawn file actions object.

A spawn file actions object is of type `posix_spawn_file_actions_t` (defined in `<spawn.h>`) and is used to specify a series of actions to be performed by a `posix_spawn()` or `posix_spawnp()` operation in order to arrive at the set of open file descriptors for the child process given the set of open file descriptors of the parent. IEEE Std 1003.1-2001 does not define comparison or assignment operators for the type `posix_spawn_file_actions_t`.

A spawn file actions object, when passed to `posix_spawn()` or `posix_spawnp()`, shall specify how the set of open file descriptors in the calling process is transformed into a set of potentially open file descriptors for the spawned process. This transformation shall be as if the specified sequence of actions was performed exactly once, in the context of the spawned process (prior to execution of the new process image), in the order in which the actions were added to the object; additionally, when the new process image is executed, any file descriptor (from this new set) which has its FD_CLOEXEC flag set shall be closed (see `posix_spawn()`).

The `posix_spawn_file_actions_addclose()` function shall add a close action to the object referenced by `file_actions` that shall cause the file descriptor `fildes` to be closed (as if `close(fildes)` had been called) when a new process is spawned using this file actions object.

The `posix_spawn_file_actions_addopen()` function shall add an open action to the object referenced by `file_actions` that shall cause the file named by `path` to be opened (as if `open(path, oflag, mode)` had been called, and the returned file descriptor, if not `fildes`, had been changed to `fildes`) when a new process is spawned using this file actions object. If `fildes` was already an open file descriptor, it shall be closed before the new file is opened.

The string described by `path` shall be copied by the `posix_spawn_file_actions_addopen()` function.

**RETURN VALUE**
Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**
These functions shall fail if:

- **[EBADF]** The value specified by `fildes` is negative or greater than or equal to `OPEN_MAX`.
- **[EINVAL]** The value specified by `file_actions` is invalid.
- **[ENOMEM]** Insufficient memory exists to add to the spawn file actions object.
It shall not be considered an error for the *fildes* argument passed to these functions to specify a
file descriptor for which the specified operation could not be performed at the time of the call.
Any such error will be detected when the associated file actions object is later used during a
`posix_spawn()` or `posix_spawnp()` operation.

**EXAMPLES**

None.

**APPLICATION USAGE**

These functions are part of the Spawn option and need not be provided on all implementations.

**RATIONALE**

A spawn file actions object may be initialized to contain an ordered sequence of `close()`, `dup2()`,
and `open()` operations to be used by `posix_spawn()` or `posix_spawnp()` to arrive at the set of open
file descriptors inherited by the spawned process from the set of open file descriptors in the
parent at the time of the `posix_spawn()` or `posix_spawnp()` call. It had been suggested that the
`close()` and `dup2()` operations alone are sufficient to rearrange file descriptors, and that files
which need to be opened for use by the spawned process can be handled either by having the
calling process open them before the `posix_spawn()` or `posix_spawnp()` call (and close them after),
or by passing filenames to the spawned process (in `argv`) so that it may open them itself. The
standard developers recommend that applications use one of these two methods when practical,
since detailed error status on a failed open operation is always available to the application this
way. However, the standard developers feel that allowing a spawn file actions object to specify
open operations is still appropriate because:

1. It is consistent with equivalent POSIX.5 (Ada) functionality.
2. It supports the I/O redirection paradigm commonly employed by POSIX programs
designed to be invoked from a shell. When such a program is the child process, it may not
be designed to open files on its own.
3. It allows file opens that might otherwise fail or violate file ownership/access rights if
executed by the parent process.

Regarding 2. above, note that the spawn open file action provides to `posix_spawn()` and
`posix_spawnp()` the same capability that the shell redirection operators provide to `system()`, only
without the intervening execution of a shell; for example:

```
    system ("myprog <file1 3<file2");
```

Regarding 3. above, note that if the calling process needs to open one or more files for access by
the spawned process, but has insufficient spare file descriptors, then the open action is necessary
to allow the `open()` to occur in the context of the child process after other file descriptors have
been closed (that must remain open in the parent).

Additionally, if a parent is executed from a file having a “set-user-id” mode bit set and the
POSIX_SPAWN_RESETIDS flag is set in the spawn attributes, a file created within the parent
process will (possibly incorrectly) have the parent’s effective user ID as its owner, whereas a file
created via an `open()` action during `posix_spawn()` or `posix_spawnp()` will have the parent’s real
ID as its owner; and an open by the parent process may successfully open a file to which the real
user should not have access or fail to open a file to which the real user should have access.
System Interfaces

**posix_spawn_file_actions_addclose()**

### File Descriptor Mapping

The standard developers had originally proposed using an array which specified the mapping of child file descriptors back to those of the parent. It was pointed out by the ballot group that it is not possible to reshuffle file descriptors arbitrarily in a library implementation of `posix_spawn()` or `posix_spawnp()` without provision for one or more spare file descriptor entries (which simply may not be available). Such an array requires that an implementation develop a complex strategy to achieve the desired mapping without inadvertently closing the wrong file descriptor at the wrong time.

It was noted by a member of the Ada Language Bindings working group that the approved Ada Language `Start_Process` family of POSIX process primitives use a caller-specified set of file actions to alter the normal `fork()`/`exec` semantics for inheritance of file descriptors in a very flexible way, yet no such problems exist because the burden of determining how to achieve the final file descriptor mapping is completely on the application. Furthermore, although the file actions interface appears frightening at first glance, it is actually quite simple to implement in either a library or the kernel.

### CHANGE HISTORY

IEEE PASC Interpretation 1003.1 #105 is applied, adding a note to the DESCRIPTION that the string pointed to by `path` is copied by the `posix_spawn_file_actions_addopen()` function.
NAME
posix_spawn_file_actions_adddup2 — add dup2 action to spawn file actions object
(ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>

int posix_spawn_file_actions_adddup2(posix_spawn_file_actions_t *
file_actions, int fildes, int newfildes);

DESCRIPTION
The posix_spawn_file_actions_adddup2() function shall add a dup2() action to the object
referenced by file_actions that shall cause the file descriptor fildes to be duplicated as newfildes (as
if dup2(fildes, newfildes) had been called) when a new process is spawned using this file actions
object.

A spawn file actions object is as defined in posix_spawn_file_actions_addclose().

RETURN VALUE
Upon successful completion, the posix_spawn_file_actions_adddup2() function shall return zero;
otherwise, an error number shall be returned to indicate the error.

ERRORS
The posix_spawn_file_actions_adddup2() function shall fail if:

[EBADF] The value specified by fildes or newfildes is negative or greater than or equal to
[OPEN_MAX].

[ENOMEM] Insufficient memory exists to add to the spawn file actions object.

The posix_spawn_file_actions_adddup2() function may fail if:

[EINVAL] The value specified by file_actions is invalid.

It shall not be considered an error for the fildes argument passed to the
posix_spawn_file_actions_adddup2() function to specify a file descriptor for which the specified
operation could not be performed at the time of the call. Any such error will be detected when
the associated file actions object is later used during a posix_spawn() or posix_spawnp() operation.

EXAMPLES
None.

APPLICATION USAGE
The posix_spawn_file_actions_adddup2() function is part of the Spawn option and need not be
provided on all implementations.

RATIONALE
Refer to the RATIONALE in posix_spawn_file_actions_addclose().

FUTURE DIRECTIONS
None.

SEE ALSO
dup(), posix_spawn(), posix_spawn_file_actions_addclose(), posix_spawn_file_actions_destroy(),
posix_spawnp(), the Base Definitions volume of IEEE Std 1003.1-2001, <spawn.h>

IEEE PASC Interpretation 1003.1 #104 is applied, noting that the [EBADF] error can apply to the newfildes argument in addition to fildes.
NAME
posix_spawn_file_actions_addopen — add open action to spawn file actions object
(ADVANCED REALTIME)

SYNOPSIS

```c
#include <spawn.h>

int posix_spawn_file_actions_addopen(posix_spawn_file_actions_t * file_actions, int fildes,
    const char *restrict path, int oflag, mode_t mode);
```

DESCRIPTION

Refer to `posix_spawn_file_actions_addclose()`.
NAME
posix_spawn_file_actions_destroy, posix_spawn_file_actions_init — destroy and initialize
class spawn file actions object (ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>

int posix_spawn_file_actions_destroy(posix_spawn_file_actions_t *
    file_actions);

int posix_spawn_file_actions_init(posix_spawn_file_actions_t *
    file_actions);

DESCRIPTION
The posix_spawn_file_actions_destroy() function shall destroy the object referenced by file_actions;
the object becomes, in effect, uninitialized. An implementation may cause
posix_spawn_file_actions_destroy() to set the object referenced by file_actions to an invalid value. A
destroyed spawn file actions object can be reinitialized using posix_spawn_file_actions_init(); the
results of otherwise referencing the object after it has been destroyed are undefined.

The posix_spawn_file_actions_init() function shall initialize the object referenced by file_actions to
contain no file actions for posix_spawn() or posix_spawnp() to perform.
A spawn file actions object is as defined in posix_spawn_file_actions_addclose().

The effect of initializing an already initialized spawn file actions object is undefined.

RETURN VALUE
Upon successful completion, these functions shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The posix_spawn_file_actions_init() function shall fail if:
[ENOMEM] Insufficient memory exists to initialize the spawn file actions object.

The posix_spawn_file_actions_destroy() function may fail if:
[EINVAL] The value specified by file_actions is invalid.

EXAMPLES
None.

APPLICATION USAGE
These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE
Refer to the RATIONALE in posix_spawn_file_actions_addclose().

FUTURE DIRECTIONS
None.

CHANGE HISTORY
In the SYNOPSIS, the inclusion of <sys/types.h> is no longer required.
NAME

posix_spawnattr_destroy, posix_spawnattr_init — destroy and initialize spawn attributes object

(ADVANCED REALTIME)

SYNOPSIS

#include <spawn.h>

int posix_spawnattr_destroy(posix_spawnattr_t *attr);
int posix_spawnattr_init(posix_spawnattr_t *attr);

DESCRIPTION

The **posix_spawnattr_destroy()** function shall destroy a spawn attributes object. A destroyed **attr** attributes object can be reinitialized using **posix_spawnattr_init();** the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause **posix_spawnattr_destroy()** to set the object referenced by **attr** to an invalid value.

The **posix_spawnattr_init()** function shall initialize a spawn attributes object **attr** with the default value for all of the individual attributes used by the implementation. Results are undefined if **posix_spawnattr_init()** is called specifying an already initialized **attr** attributes object.

A spawn attributes object is of type **posix_spawnattr_t** (defined in **<spawn.h>**) and is used to specify the inheritance of process attributes across a spawn operation. IEEE Std 1003.1-2001 does not define comparison or assignment operators for the type **posix_spawnattr_t**.

Each implementation shall document the individual attributes it uses and their default values unless these values are defined by IEEE Std 1003.1-2001. Attributes not defined by IEEE Std 1003.1-2001, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

The resulting spawn attributes object (possibly modified by setting individual attribute values), is used to modify the behavior of **posix_spawn()** or **posix_spawnp()**. After a spawn attributes object has been used to spawn a process by a call to a **posix_spawn()** or **posix_spawnp()**, any function affecting the attributes object (including destruction) shall not affect any process that has been spawned in this way.

RETURN VALUE

Upon successful completion, **posix_spawnattr_destroy()** and **posix_spawnattr_init()** shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The **posix_spawnattr_init()** function shall fail if:

- [ENOMEM] Insufficient memory exists to initialize the spawn attributes object.

The **posix_spawnattr_destroy()** function may fail if:

- [EINVAL] The value specified by **attr** is invalid.

EXAMPLES

None.

APPLICATION USAGE

These functions are part of the Spawn option and need not be provided on all implementations.

RATIONALE

The original spawn interface proposed in IEEE Std 1003.1-2001 defined the attributes that specify the inheritance of process attributes across a spawn operation as a structure. In order to be able to separate optional individual attributes under their appropriate options (that is, the **spawn schedparam** and **spawn schedpolicy** attributes depending upon the Process Scheduling option), and
also for extensibility and consistency with the newer POSIX interfaces, the attributes interface
has been changed to an opaque data type. This interface now consists of the type
\texttt{posix_spawnattr_t}, representing a spawn attributes object, together with associated functions to
initialize or destroy the attributes object, and to set or get each individual attribute. Although the
new object-oriented interface is more verbose than the original structure, it is simple to use,
more extensible, and easy to implement.

\textbf{CHANGE HISTORY}

IEEE PASC Interpretation 1003.1 #106 is applied, noting that the effect of initializing an already
initialized spawn attributes option is undefined.
NAME
posix_spawnattr_getflags, posix_spawnattr_setflags — get and set the spawn-flags attribute of a
spawn attributes object (ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>

int posix_spawnattr_getflags(const posix_spawnattr_t *restrict attr, short *restrict flags);

int posix_spawnattr_setflags(posix_spawnattr_t *attr, short flags);

DESCRIPTION
The posix_spawnattr_getflags() function shall obtain the value of the spawn-flags attribute from
the attributes object referenced by attr.

The posix_spawnattr_setflags() function shall set the spawn-flags attribute in an initialized
attributes object referenced by attr.

The spawn-flags attribute is used to indicate which process attributes are to be changed in the
new process image when invoking posix_spawn() or posix_spawnp(). It is the bitwise-inclusive
OR of zero or more of the following flags:

POSIX_SPAWN_RESETIDS
POSIX_SPAWN_SETPGROUP
POSIX_SPAWN_SETSIGDEF
POSIX_SPAWN_SETSIGMASK
POSIX_SPAWN_SETSCHEDPARAM
POSIX_SPAWN_SETSCHEDULER

These flags are defined in <spawn.h>. The default value of this attribute shall be as if no flags
were set.

RETURN VALUE
Upon successful completion, posix_spawnattr_getflags() shall return zero and store the value of
the spawn-flags attribute of attr into the object referenced by the flags parameter; otherwise, an
error number shall be returned to indicate the error.

Upon successful completion, posix_spawnattr_setflags() shall return zero; otherwise, an error
number shall be returned to indicate the error.

ERRORS
These functions may fail if:

[EINVAL] The value specified by attr is invalid.

The posix_spawnattr_setflags() function may fail if:

[EINVAL] The value of the attribute being set is not valid.
Examples
None.

Application Usage
These functions are part of the Spawn option and need not be provided on all implementations.

Rationale
None.

Future Directions

NAME
posix_spawnattr_getpgroup, posix_spawnattr_setpgroup — get and set the spawn-pgroup attribute of a spawn attributes object (ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>

int posix_spawnattr_getpgroup(const posix_spawnattr_t *restrict attr, pid_t *restrict pgroup);
int posix_spawnattr_setpgroup(posix_spawnattr_t *attr, pid_t pgroup);

DESCRIPTION
The posix_spawnattr_getpgroup() function shall obtain the value of the spawn-pgroup attribute from the attributes object referenced by attr.

The posix_spawnattr_setpgroup() function shall set the spawn-pgroup attribute in an initialized attributes object referenced by attr.

The spawn-pgroup attribute represents the process group to be joined by the new process image in a spawn operation (if POSIX_SPAWN_SETPGROUP is set in the spawn-flags attribute). The default value of this attribute shall be zero.

RETURN VALUE
Upon successful completion, posix_spawnattr_getpgroup() shall return zero and store the value of the spawn-pgroup attribute of attr into the object referenced by the pgroup parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, posix_spawnattr_setpgroup() shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
These functions may fail if:

EINVAL The value specified by attr is invalid.

The posix_spawnattr_setpgroup() function may fail if:

EINVAL The value of the attribute being set is not valid.

posix_spawnattr_getpgroup()
NAME
posix_spawnattr_getschedparam, posix_spawnattr_setschedparam — get and set the spawn-schedparam attribute of a spawn attributes object (ADVANCED REALTIME)

SYNOPSIS
#include <spawn.h>
#include <sched.h>

int posix_spawnattr_getschedparam(const posix_spawnattr_t * restrict attr, struct sched_param *restrict schedparam);
int posix_spawnattr_setschedparam(posix_spawnattr_t *restrict attr, const struct sched_param *restrict schedparam);

DESCRIPTION
The posix_spawnattr_getschedparam() function shall obtain the value of the spawn-schedparam attribute from the attributes object referenced by attr.

The posix_spawnattr_setschedparam() function shall set the spawn-schedparam attribute in an initialized attributes object referenced by attr.

The spawn-schedparam attribute represents the scheduling parameters to be assigned to the new process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER or POSIX_SPAWN_SETSCHEDPARAM is set in the spawn-flags attribute). The default value of this attribute is unspecified.

RETURN VALUE
Upon successful completion, posix_spawnattr_getschedparam() shall return zero and store the value of the spawn-schedparam attribute of attr into the object referenced by the schedparam parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, posix_spawnattr_setschedparam() shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

int posix_spawnattr_getschedpolicy(const posix_spawnattr_t *attr,
                 int schedpolicy);
int posix_spawnattr_setschedpolicy(posix_spawnattr_t *attr,
                 int schedpolicy);

DESCRIPTION
The posix_spawnattr_getschedpolicy() function shall obtain the value of the
spawn-schedpolicy attribute from the attributes object referenced by attr.

The posix_spawnattr_setschedpolicy() function shall set the spawn-schedpolicy attribute in an
initialized attributes object referenced by attr.

The spawn-schedpolicy attribute represents the scheduling policy to be assigned to the new
process image in a spawn operation (if POSIX_SPAWN_SETSCHEDULER is set in the spawn-
flags attribute). The default value of this attribute is unspecified.

RETURN VALUE
Upon successful completion, posix_spawnattr_getschedpolicy() shall return zero and store the
value of the spawn-schedpolicy attribute of attr into the object referenced by the schedpolicy
parameter; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, posix_spawnattr_setschedpolicy() shall return zero; otherwise, an
error number shall be returned to indicate the error.

posix_spawnattr_getsigdefault, posix_spawnattr_setsigdefault — get and set the spawn-
sigdefault attribute of a spawn attributes object (ADVANCED REALTIME)

SYNOPSIS
SPN
#include <signal.h>
#include <spawn.h>

int posix_spawnattr_getsigdefault(const posix_spawnattr_t *attr,
     sigset_t *restrict sigdefault);
int posix_spawnattr_setsigdefault(posix_spawnattr_t *restrict attr,
     const sigset_t *restrict sigdefault);

DESCRIPTION
The posix_spawnattr_getsigdefault() function shall obtain the value of the spawn-sigdefault
attribute from the attributes object referenced by attr.

The posix_spawnattr_setsigdefault() function shall set the spawn-sigdefault attribute in an
initialized attributes object referenced by attr.

The spawn-sigdefault attribute represents the set of signals to be forced to default signal handling
in the new process image (if POSIX_SPAWN_SETSIGDEF is set in the spawn-flags attribute) by a
spawn operation. The default value of this attribute shall be an empty signal set.

RETURN VALUE
Upon successful completion, posix_spawnattr_getsigdefault() shall return zero and store the value
of the spawn-sigdefault attribute of attr into the object referenced by the sigdefault parameter;
otherwise, an error number shall be returned to indicate the error.

Upon successful completion, posix_spawnattr_setsigdefault() shall return zero; otherwise, an error
number shall be returned to indicate the error.

DESCRIPTION
Refer to posix_spawn().
NAME
posix_trace_attr_destroy, posix_trace_attr_init — destroy and initialize the trace stream attributes object (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_attr_destroy(trace_attr_t *attr);
int posix_trace_attr_init(trace_attr_t *attr);

DESCRIPTION
The posix_trace_attr_destroy() function shall destroy an initialized trace attributes object. A destroyed attr attributes object can be reinitialized using posix_trace_attr_init(); the results of otherwise referencing the object after it has been destroyed are undefined.

The posix_trace_attr_init() function shall initialize a trace attributes object attr with the default value for all of the individual attributes used by a given implementation. The read-only generation-version and clock-resolution attributes of the newly initialized trace attributes object shall be set to their appropriate values (see Section 2.11.1.2 (on page 75)).

Results are undefined if posix_trace_attr_init() is called specifying an already initialized attr attributes object.

Implementations may add extensions to the trace attributes object structure as permitted in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 2, Conformance.

The resulting attributes object (possibly modified by setting individual attributes values), when used by posix_trace_create(), defines the attributes of the trace stream created. A single attributes object can be used in multiple calls to posix_trace_create(). After one or more trace streams have been created using an attributes object, any function affecting that attributes object, including destruction, shall not affect any trace stream previously created. An initialized attributes object also serves to receive the attributes of an existing trace stream or trace log when calling the posix_trace_get_attr() function.

RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS
The posix_trace_attr_destroy() function may fail if:

[EINVAL] The value of attr is invalid.

The posix_trace_attr_init() function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the trace attributes object.

```

DESCRIPTION

The `posix_trace_attr_getclockres()` function shall copy the clock resolution of the clock used to
generate timestamps from the `clock-resolution` attribute of the attributes object pointed to by the
`attr` argument into the structure pointed to by the `resolution` argument.

The `posix_trace_attr_getcreatetime()` function shall copy the trace stream creation time from the
`creation-time` attribute of the attributes object pointed to by the `attr` argument into the structure
pointed to by the `createtime` argument. The `creation-time` attribute shall represent the time of
creation of the trace stream.

The `posix_trace_attr_getgenversion()` function shall copy the string containing version information
from the `generation-version` attribute of the attributes object pointed to by the `attr` argument into the
string pointed to by the `genversion` argument. The `genversion` argument shall be the address of
a character array which can store at least `{TRACE_NAME_MAX}` characters.

The `posix_trace_attr_getname()` function shall copy the string containing the trace name from the
`trace-name` attribute of the attributes object pointed to by the `attr` argument into the string
pointed to by the `tracename` argument. The `tracename` argument shall be the address of a character
array which can store at least `{TRACE_NAME_MAX}` characters.

The `posix_trace_attr_setname()` function shall set the name in the `trace-name` attribute of the
attributes object pointed to by the `attr` argument, using the trace name string supplied by the
`tracename` argument. If the supplied string contains more than `{TRACE_NAME_MAX}`
characters, the name copied into the `trace-name` attribute may be truncated to one less than the
length of `{TRACE_NAME_MAX}` characters. The default value is a null string.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
return the corresponding error number.

If successful, the `posix_trace_attr_getclockres()` function stores the `clock-resolution` attribute value
in the object pointed to by `resolution`. Otherwise, the content of this object is unspecified.
If successful, the \texttt{posix_trace_attr_getcreatetime()} function stores the trace stream creation time in the object pointed to by \texttt{createtime}. Otherwise, the content of this object is unspecified.

If successful, the \texttt{posix_trace_attr_getgenversion()} function stores the trace version information in the string pointed to by \texttt{genversion}. Otherwise, the content of this string is unspecified.

If successful, the \texttt{posix_trace_attr_getname()} function stores the trace name in the string pointed to by \texttt{tracename}. Otherwise, the content of this string is unspecified.

**ERRORS**

The \texttt{posix_trace_attr_getclockres()}, \texttt{posix_trace_attr_getcreatetime()}, \texttt{posix_trace_attr_getgenversion()}, and \texttt{posix_trace_attr_getname()} functions may fail if:

\begin{itemize}
  \item \texttt{EINVAL} The value specified by one of the arguments is invalid.
\end{itemize}

**CHANGE HISTORY**

NAME
posix_trace_attr_getinherited(), posix_trace_attr_getlogfullpolicy,
posix_trace_attr_getstreamfullpolicy, posix_trace_attr_setinherited,
posix_trace_attr_setlogfullpolicy, posix_trace_attr_setstreamfullpolicy — retrieve and set the
behavior of a trace stream (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_attr_getinherited(const trace_attr_t *restrict attr,
    int *restrict inheritancepolicy);
int posix_trace_attr_getlogfullpolicy(const trace_attr_t *restrict attr,
    int *restrict logpolicy);
int posix_trace_attr_getstreamfullpolicy(const trace_attr_t *attr,
    int * restrict streampolicy);
int posix_trace_attr_setinherited(trace_attr_t *attr,
    int inheritancepolicy);
int posix_trace_attr_setlogfullpolicy(trace_attr_t *attr,
    int logpolicy);
int posix_trace_attr_setstreamfullpolicy(trace_attr_t *attr,
    int streampolicy);

DESCRIPTION
The posix_trace_attr_getinherited() and posix_trace_attr_setinherited() functions, respectively, shall
get and set the inheritance policy stored in the inheritance attribute for traced processes across
the fork() and spawn() operations. The inheritance attribute of the attributes object pointed to by
the attr argument shall be set to one of the following values defined by manifest constants in the
<trace.h> header:

POSIX_TRACE_CLOSE_FOR_CHILD
After a fork() or spawn() operation, the child shall not be traced, and tracing of the parent
shall continue.

POSIX_TRACE_INHERITED
After a fork() or spawn() operation, if the parent is being traced, its child shall be
concurrently traced using the same trace stream.

The default value for the inheritance attribute is POSIX_TRACE_CLOSE_FOR_CHILD.

The posix_trace_attr_getlogfullpolicy() and posix_trace_attr_setlogfullpolicy() functions,
respectively, shall get and set the trace log full policy stored in the log-full-policy attribute of the
attributes object pointed to by the attr argument.

The log-full-policy attribute shall be set to one of the following values defined by manifest
constants in the <trace.h> header:

POSIX_TRACE_LOOP
The trace log shall loop until the associated trace stream is stopped. This policy means that
when the trace log gets full, the file system shall reuse the resources allocated to the oldest
trace events that were recorded. In this way, the trace log will always contain the most
recent trace events flushed.

POSIX_TRACE_UNTIL_FULL
The trace stream shall be flushed to the trace log until the trace log is full. This condition can
be deduced from the posix_log_full_status member status (see the posix_trace_status_info
structure defined in <trace.h>). The last recorded trace event shall be the
POSIX_TRACE_STOP trace event.

POSIX_TRACE_APPEND

The associated trace stream shall be flushed to the trace log without log size limitation. If
the application specifies POSIX_TRACE_APPEND, the implementation shall ignore the
log-max-size attribute.

The default value for the log-full-policy attribute is POSIX_TRACE_LOOP.

The posix_trace_attr_getstreamfullpolicy() and posix_trace_attr_setstreamfullpolicy() functions,
respectively, shall get and set the trace stream full policy stored in the stream-full-policy attribute
of the attributes object pointed to by the attr argument.

The stream-full-policy attribute shall be set to one of the following values defined by manifest
constants in the <trace.h> header:

POSIX_TRACE_LOOP

The trace stream shall loop until explicitly stopped by the posix_trace_stop() function. This
policy means that when the trace stream is full, the trace system shall reuse the resources
allocated to the oldest trace events recorded. In this way, the trace stream will always
contain the most recent trace events recorded.

POSIX_TRACE_UNTIL_FULL

The trace stream will run until the trace stream resources are exhausted. Then the trace
stream will stop. This condition can be deduced from posix_stream_status and
posix_stream_full_status (see the posix_trace_status_info structure defined in <trace.h>).
When this trace stream is read, a POSIX_TRACE_STOP trace event shall be reported after
reporting the last recorded trace event. The trace system shall reuse the resources allocated
to any trace events already reported—see the posix_trace_getnext_event(),
posix_trace_trygetnext_event(), and posix_trace_timedgetnext_event() functions—or already
flushed for an active trace stream with log if the Trace Log option is supported; see the
posix_trace_flush() function. The trace system shall restart the trace stream when it is empty
and may restart it sooner. A POSIX_TRACE_START trace event shall be reported before
reporting the next recorded trace event.

TRL

POSIX_TRACE_FLUSH

If the Trace Log option is supported, this policy is identical to the
POSIX_TRACE_UNTIL_FULL trace stream full policy except that the trace stream shall be
flushed regularly as if posix_trace_flush() had been explicitly called. Defining this policy for
an active trace stream without log shall be invalid.

The default value for the stream-full-policy attribute shall be POSIX_TRACE_LOOP for an active
trace stream without log.

TRL

If the Trace Log option is supported, the default value for the stream-full-policy attribute shall be
POSIX_TRACE_FLUSH for an active trace stream with log.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
return the corresponding error number.

TRI

If successful, the posix_trace_attr_getinherited() function shall store the inheritance attribute value
in the object pointed to by inheritancepolicy. Otherwise, the content of this object is undefined.

TRL

If successful, the posix_trace_attr_getlogfullpolicy() function shall store the log-full-policy attribute
value in the object pointed to by logpolicy. Otherwise, the content of this object is undefined.

If successful, the posix_trace_attr_getstreamfullpolicy() function shall store the stream-full-policy
attribute value in the object pointed to by streampolicy. Otherwise, the content of this object is
undefined.

ERRORS
These functions may fail if:

[EINVAL] The value specified by at least one of the arguments is invalid.

CHANGE HISTORY
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/39 is applied, adding the TRL and TRC margin codes to the posix_trace_attr_setlogfullpolicy() function.
The `posix_trace_attr_getlogsize()` function shall copy the log size, in bytes, from the `log-max-size` attribute of the attributes object pointed to by the `attr` argument into the variable pointed to by the `logsize` argument. This log size is the maximum total of bytes that shall be allocated for system and user trace events in the trace log. The default value for the `log-max-size` attribute is implementation-defined.

The `posix_trace_attr_setlogsize()` function shall set the maximum allowed size, in bytes, in the `log-max-size` attribute of the attributes object pointed to by the `attr` argument, using the size value supplied by the `logsize` argument.

The trace log size shall be used if the `log-full-policy` attribute is set to `POSIX_TRACE_LOOP` or `POSIX_TRACE_UNTIL_FULL`. If the `log-full-policy` attribute is set to `POSIX_TRACE_APPEND`, the implementation shall ignore the `log-max-size` attribute.

The `posix_trace_attr_getmaxdatasize()` function shall copy the maximum user trace event data size, in bytes, from the `max-data-size` attribute of the attributes object pointed to by the `attr` argument into the variable pointed to by the `maxdatasize` argument. The default value for the `max-data-size` attribute is implementation-defined.

The `posix_trace_attr_getmaxsystemeventsize()` function shall calculate the maximum memory size, in bytes, required to store a single system trace event. This value is calculated for the trace stream attributes object pointed to by the `attr` argument and is returned in the variable pointed to by the `eventsize` argument.
The values returned as the maximum memory sizes of the user and system trace events shall be such that if the sum of the maximum memory sizes of a set of the trace events that may be recorded in a trace stream is less than or equal to the stream-min-size attribute of that trace stream, the system provides the necessary resources for recording all those trace events, without loss.

The posix_trace_attr_getmaxusereventsize() function shall calculate the maximum memory size, in bytes, required to store a single user trace event generated by a call to posix_trace_event() with a data_len parameter equal to the data_len value specified in this call. This value is calculated for the trace stream attributes object pointed to by the attr argument and is returned in the variable pointed to by the eventsize argument.

The posix_trace_attr_getstreamsize() function shall copy the stream size, in bytes, from the stream-min-size attribute of the attributes object pointed to by the attr argument into the variable pointed to by the streamsize argument.

This stream size is the current total memory size reserved for system and user trace events in the trace stream. The default value for the stream-min-size attribute is implementation-defined. The stream size refers to memory used to store trace event records. Other stream data (for example, trace attribute values) shall not be included in this size.

The posix_trace_attr_getstreamsize() function shall set the minimum allowed size, in bytes, in the stream-min-size attribute of the attributes object pointed to by the attr argument, using the size value supplied by the streamsize argument.

The posix_trace_attr_setstreamsize() function shall set the minimum allowed size, in bytes, in the stream-min-size attribute of the attributes object pointed to by the attr argument, using the size value supplied by the streamsize argument.

RETURN VALUE

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The posix_trace_attr_getlogsize() function stores the maximum trace log allowed size in the object pointed to by logsize, if successful.

The posix_trace_attr_getmaxusereventsize() function stores the maximum trace event record memory size in the object pointed to by maxdatasize, if successful.

The posix_trace_attr_getmaxsystemeventsize() function stores the maximum memory size to store a single system trace event in the object pointed to by eventsize, if successful.

The posix_trace_attr_getmaxusereventsize() function stores the maximum memory size to store a single user trace event in the object pointed to by eventsize, if successful.

The posix_trace_attr_getstreamsize() function stores the maximum trace stream allowed size in the object pointed to by streamsize, if successful.

ERRORS

These functions may fail if:

[EINVAL] The value specified by one of the arguments is invalid.

NAME
posix_trace_clear — clear trace stream and trace log (TRACING)

SYNOPSIS

```
#include <sys/types.h>
#include <trace.h>

int posix_trace_clear(trace_id_t trid);
```

DESCRIPTION

The `posix_trace_clear()` function shall reinitialize the trace stream identified by the argument `trid` as if it were returning from the `posix_trace_create()` function, except that the same allocated resources shall be reused, the mapping of trace event type identifiers to trace event names shall be unchanged, and the trace stream status shall remain unchanged (that is, if it was running, it remains running and if it was suspended, it remains suspended).

All trace events in the trace stream recorded before the call to `posix_trace_clear()` shall be lost. The `posix_stream_full_status` status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee that all trace events that occurred during the `posix_trace_clear()` call are recorded; the behavior with respect to trace points that may occur during this call is unspecified.

If the Trace Log option is supported and the trace stream has been created with a log, the `posix_trace_clear()` function shall reinitialize the trace stream with the same behavior as if the trace stream was created without the log, plus it shall reinitialize the trace log associated with the trace stream identified by the argument `trid` as if it were returning from the `posix_trace_create_withlog()` function, except that the same allocated resources, for the trace log, may be reused and the associated trace stream status remains unchanged. The first trace event recorded in the trace log after the call to `posix_trace_clear()` shall be the same as the first trace event recorded in the active trace stream after the call to `posix_trace_clear()`. The `posix_log_full_status` status shall be set to POSIX_TRACE_NOT_FULL. There is no guarantee that all trace events that occurred during the `posix_trace_clear()` call are recorded in the trace log; the behavior with respect to trace points that may occur during this call is unspecified. If the log full policy is POSIX_TRACE_APPEND, the effect of a call to this function is unspecified for the trace log associated with the trace stream identified by the `trid` argument.

RETURN VALUE

Upon successful completion, the `posix_trace_clear()` function shall return a value of zero. Otherwise, it shall return the corresponding error number.

ERRORS

The `posix_trace_clear()` function shall fail if:

```
[EINVAL] The value of the trid argument does not correspond to an active trace stream.
```

CHANGE HISTORY

IEEE PASC Interpretation 1003.1 #123 is applied.
NAME
posix_trace_close, posix_trace_open, posix_trace_rewind — trace log management (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_close(trace_id_t trid);
int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);

DESCRIPTION
The posix_trace_close() function shall deallocate the trace log identifier indicated by trid, and all
of its associated resources. If there is no valid trace log pointed to by the trid, this function shall
fail.

The posix_trace_open() function shall allocate the necessary resources and establish the
connection between a trace log identified by the file_desc argument and a trace stream identifier
identified by the object pointed to by the trid argument. The file_desc argument should be a valid
open file descriptor that corresponds to a trace log. The file_desc argument shall be open for
reading. The current trace event timestamp, which specifies the timestamp of the trace event
that will be read by the next call to posix_trace_getnext_event(), shall be set to the timestamp of
the oldest trace event recorded in the trace log identified by trid.

The posix_trace_open() function shall return a trace stream identifier in the variable pointed to by
the trid argument, that may only be used by the following functions:

posix_trace_close()         posix_trace_get_attr()
posix_trace_eventid_equal()   posix_trace_get_status()
posix_trace_eventid_get_name() posix_trace_get_eventid()
posix_trace_eventtypelist_getnext_id() posix_trace_rewind()
posix_trace_eventtypelist_rewind()

In particular, notice that the operations normally used by a trace controller process, such as
posix_trace_start(), posix_trace_stop(), or posix_trace_shutdown(), cannot be invoked using the
trace stream identifier returned by the posix_trace_open() function.

The posix_trace_rewind() function shall reset the current trace event timestamp, which specifies
the timestamp of the trace event that will be read by the next call to posix_trace_getnext_event(),
to the timestamp of the oldest trace event recorded in the trace log identified by trid.

RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
return the corresponding error number.

If successful, the posix_trace_open() function stores the trace stream identifier value in the object
pointed to by trid.

ERRORS
The posix_trace_open() function shall fail if:

[EINTR] The operation was interrupted by a signal and thus no trace log was opened.

[EINVAL] The object pointed to by file_desc does not correspond to a valid trace log.

The posix_trace_close() and posix_trace_rewind() functions may fail if:

[EINVAL] The object pointed to by trid does not correspond to a valid trace log.

CHANGE HISTORY
IEEE PASC Interpretation 1003.1 #123 is applied.
posix_trace_create( )

NAME
posix_trace_create, posix_trace_create_withlog, posix_trace_flush, posix_trace_shutdown —
trace stream initialization, flush, and shutdown from a process (TRACING)

SYNOPSIS

```c
#include <sys/types.h>
#include <trace.h>

int posix_trace_create(pid_t pid, const trace_attr_t *restrict attr, trace_id_t *restrict trid);
int posix_trace_create_withlog(pid_t pid, const trace_attr_t *restrict attr, int file_desc, trace_id_t *restrict trid);
int posix_trace_flush(trace_id_t trid);
int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

The posix_trace_create() function shall create an active trace stream. It allocates all the resources
needed by the trace stream being created for tracing the process specified by pid in accordance
with the attr argument. The attr argument represents the initial attributes of the trace stream and
shall have been initialized by the function posix_trace_attr_init() prior to the posix_trace_create()
call. If the argument attr is NULL, the default attributes shall be used. The attr attributes object
shall be manipulated through a set of functions described in the posix_trace_attr family of
functions. If the attributes of the object pointed to by attr are modified later, the attributes of the
trace stream shall not be affected. The creation-time attribute of the newly created trace stream
shall be set to the value of the system clock, if the Timers option is not supported, or to the value
of the CLOCK_REALTIME clock, if the Timers option is supported.

The pid argument represents the target process to be traced. If the process executing this
function does not have appropriate privileges to trace the process identified by pid, an error shall
be returned. If the pid argument is zero, the calling process shall be traced.

The posix_trace_create() function shall store the trace stream identifier of the new trace stream in
the object pointed to by the trid argument. This trace stream identifier shall be used in
subsequent calls to control tracing. The trid argument may only be used by the following
functions:

```c
posix_trace_clear()          posix_trace_getnext_event()
posix_trace_eventid_equal()  posix_trace_shutdown()
posix_trace_eventid_get_name()  posix_trace_start()
posix_trace_eventtypelist_getnext_id()  posix_trace_stop()
posix_trace_eventtypelist_56rewind()  posix_trace_timedgetnext_event()
posix_trace_get_attr()       posix_trace_trid_eventid_open()
posix_trace_get_status()     posix_trace_trygetnext_event()
```

If the Trace Event Filter option is supported, the following additional functions may use the trid
argument:

```c
posix_trace_get_filter()     posix_trace_set_filter()
```
In particular, notice that the operations normally used by a trace analyzer process, such as
`posix_trace_rewind()` or `posix_trace_close()`, cannot be invoked using the trace stream identifier
returned by the `posix_trace_create()` function.

A trace stream shall be created in a suspended state. If the Trace Event Filter option is
supported, its trace event type filter shall be empty.

The `posix_trace_create()` function may be called multiple times from the same or different
processes, with the system-wide limit indicated by the runtime invariant value
`{TRACE_SYS_MAX}`, which has the minimum value `_POSIX_TRACE_SYS_MAX`.

The trace stream identifier returned by the `posix_trace_create()` function in the argument pointed
to by `trid` is valid only in the process that made the function call. If it is used from another
process, that is a child process, in functions defined in IEEE Std 1003.1-2001, these functions shall
return with the error `EINVAL`.

The `posix_trace_create_withlog()` function shall be equivalent to `posix_trace_create()`, except that it
associates a trace log with this stream. The `file_desc` argument shall be the file descriptor
designating the trace log destination. The function shall fail if this file descriptor refers to a file
with a file type that is not compatible with the log policy associated with the trace log. The list of
the appropriate file types that are compatible with each log policy is implementation-defined.

The `posix_trace_create_withlog()` function shall return in the parameter pointed to by `trid` the trace
stream identifier, which uniquely identifies the newly created trace stream, and shall be used in
subsequent calls to control tracing. The `trid` argument may only be used by the following
functions:

```c
posix_trace_clear()  posix_trace_getnext_event()
posix_trace_eventid_equal()  posix_trace_shutdown()
posix_trace_eventid_get_name()  posix_trace_start()
posix_trace_eventtypelist_getnext_id()  posix_trace_stop()
posix_trace_eventtypelist_rewind()  posix_trace_timedgetnext_event()
posix_trace_flush()  posix_trace_trid_eventid_open()
posix_trace_get_attr()  posix_trace_trygetnext_event()
posix_trace_get_status()  
```

If the Trace Event Filter option is supported, the following additional functions may use the `trid`
argument:

```c
posix_trace_get_filter()  posix_trace_set_filter()
```

In particular, notice that the operations normally used by a trace analyzer process, such as
`posix_trace_rewind()` or `posix_trace_close()`, cannot be invoked using the trace stream identifier
returned by the `posix_trace_create_withlog()` function.

The `posix_trace_flush()` function shall initiate a flush operation which copies the contents of the
trace stream identified by the argument `trid` into the trace log associated with the trace stream at
the creation time. If no trace log has been associated with the trace stream pointed to by `trid`, this
function shall return an error. The termination of the flush operation can be polled by the
`posix_trace_get_status()` function. During the flush operation, it shall be possible to trace new
trace events up to the point when the trace stream becomes full. After flushing is completed, the
space used by the flushed trace events shall be available for tracing new trace events.
If flushing the trace stream causes the resulting trace log to become full, the trace log full policy shall be applied. If the trace log-full-policy attribute is set, the following occurs:

**POSIX_TRACE_UNTIL_FULL**
- The trace events that have not yet been flushed shall be discarded.

**POSIX_TRACE_LOOP**
- The trace events that have not yet been flushed shall be written to the beginning of the trace log, overwriting previous trace events stored there.

**POSIX_TRACE_APPEND**
- The trace events that have not yet been flushed shall be appended to the trace log.

The `posix_trace_shutdown()` function shall stop the tracing of trace events in the trace stream identified by `trid`, as if `posix_trace_stop()` had been invoked. The `posix_trace_shutdown()` function shall free all the resources associated with the trace stream.

The `posix_trace_shutdown()` function shall not return until all the resources associated with the trace stream have been freed. When the `posix_trace_shutdown()` function returns, the `trid` argument becomes an invalid trace stream identifier. A call to this function shall unconditionally deallocate the resources regardless of whether all trace events have been retrieved by the analyzer process. Any thread blocked on one of the `trace_getnext_event()` functions (which specified this `trid`) before this call is unblocked with the error [EINVAL].

If the process exits, invokes a member of the exec family of functions, or is terminated, the trace streams that the process had created and that have not yet been shut down, shall be automatically shut down as if an explicit call were made to the `posix_trace_shutdown()` function.

For an active trace stream with log, when the `posix_trace_shutdown()` function is called, all trace events that have not yet been flushed to the trace log shall be flushed, as in the `posix_trace_flush()` function, and the trace log shall be closed.

When a trace log is closed, all the information that may be retrieved later from the trace log through the trace interface shall have been written to the trace log. This information includes the trace attributes, the list of trace event types (with the mapping between trace event names and trace event type identifiers), and the trace status.

In addition, unspecified information shall be written to the trace log to allow detection of a valid trace log during the `posix_trace_open()` operation.

The `posix_trace_shutdown()` function shall not return until all trace events have been flushed.

**RETURN VALUE**
- Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The `posix_trace_create()` and `posix_trace_create_withlog()` functions store the trace stream identifier value in the object pointed to by `trid`, if successful.

**ERRORS**
- The `posix_trace_create()` and `posix_trace_create_withlog()` functions shall fail if:
  - [EAGAIN] No more trace streams can be started now. [TRACE_SYS_MAX] has been exceeded.
  - [EINVAL] One or more of the trace parameters specified by the `attr` parameter is invalid.
The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.

The caller does not have appropriate privilege to trace the process specified by \texttt{pid}.

The \texttt{pid} argument does not refer to an existing process.

The \texttt{posix_trace_create_withlog()} function shall fail if:

- \texttt{ENOMEM} The implementation does not currently have sufficient memory to create the trace stream with the specified parameters.
- \texttt{EPERM} The caller does not have appropriate privilege to trace the process specified by \texttt{pid}.
- \texttt{ESRCH} The \texttt{pid} argument does not refer to an existing process.

The \texttt{file_desc} argument is not a valid file descriptor open for writing.

The \texttt{file_desc} argument refers to a file with a file type that does not support the log policy associated with the trace log.

No space left on device. The device corresponding to the argument \texttt{file_desc} does not contain the space required to create this trace log.

The \texttt{posix_trace_flush()} and \texttt{posix_trace_shutdown()} functions shall fail if:

- \texttt{EINVAL} The value of the \texttt{trid} argument does not correspond to an active trace stream with log.
- \texttt{EFBIG} The trace log file has attempted to exceed an implementation-defined maximum file size.
- \texttt{ENOSPC} No space left on device.

NAME
posix_trace_event, posix_trace_eventid_open — trace functions for instrumenting application
code (TRACING)

SYNOPSIS

```c
#include <sys/types.h>
#include <trace.h>

void posix_trace_event(trace_event_id_t event_id,
                       const void *restrict data_ptr, size_t data_len);

int posix_trace_eventid_open(const char *restrict event_name,
                              trace_event_id_t *restrict event_id);
```

DESCRIPTION

The `posix_trace_event()` function shall record the `event_id` and the user data pointed to by `data_ptr`
in the trace stream into which the calling process is being traced and in which `event_id` is not
filtered out. If the total size of the user trace event data represented by `data_len` is not greater
than the declared maximum size for user trace event data, then the `truncation-status` attribute of
the trace event recorded is `POSIX_TRACE_NOT_TRUNCATED`. Otherwise, the user trace event
data is truncated to this declared maximum size and the `truncation-status` attribute of the trace
event recorded is `POSIX_TRACE_TRUNCATED_RECORD`.

If there is no trace stream created for the process or if the created trace stream is not running, or
if the trace event specified by `event_id` is filtered out in the trace stream, the `posix_trace_event()`
function shall have no effect.

The `posix_trace_eventid_open()` function shall associate a user trace event name with a trace event
type identifier for the calling process. The trace event name is the string pointed to by the
argument `event_name`. It shall have a maximum of `{TRACE_EVENT_NAME_MAX}` characters
(which has the minimum value `{_POSIX_TRACE_EVENT_NAME_MAX}`). The number of user
trace event type identifiers that can be defined for any given process is limited by the maximum
value `{TRACE_USER_EVENT_MAX}`, which has the minimum value
 `{POSIX_TRACE_USER_EVENT_MAX}`.

If the Trace Inherit option is not supported, the `posix_trace_eventid_open()` function shall
associate the user trace event name pointed to by the `event_name` argument with a trace event
type identifier that is unique for the traced process, and is returned in the variable pointed to by
the `event_id` argument. If the user trace event name has already been mapped for the traced
process, then the previously assigned trace event type identifier shall be returned. If the per-
process user trace event name limit represented by `{TRACE_USER_EVENT_MAX}` has been
reached, the pre-defined `POSIX_TRACE_UNNAMED_USEREVENT` (see Table 2-7 (on page 79))
user trace event shall be returned.

If the Trace Inherit option is supported, the `posix_trace_eventid_open()` function shall associate the
user trace event name pointed to by the `event_name` argument with a trace event type identifier
that is unique for all the processes being traced in this same trace stream, and is returned in the
variable pointed to by the `event_id` argument. If the user trace event name has already been
mapped for the traced processes, then the previously assigned trace event type identifier shall be
returned. If the per-process user trace event name limit represented by `{TRACE_USER_EVENT_MAX}` has been
reached, the pre-defined `POSIX_TRACE_UNNAMED_USEREVENT` (Table 2-7 (on page 79)) user trace event shall be
returned.

Note: The above procedure, together with the fact that multiple processes can only be traced into the
same trace stream by inheritance, ensure that all the processes that are traced into a trace
stream have the same mapping of trace event names to trace event type identifiers.
If there is no trace stream created, the `posix_trace_eventid_open()` function shall store this information for future trace streams created for this process.

**RETURN VALUE**

No return value is defined for the `posix_trace_event()` function.

Upon successful completion, the `posix_trace_eventid_open()` function shall return a value of zero. Otherwise, it shall return the corresponding error number. The `posix_trace_eventid_open()` function stores the trace event type identifier value in the object pointed to by `event_id`, if successful.

**ERRORS**

The `posix_trace_eventid_open()` function shall fail if:

- `[ENAMETOOLONG]`

  The size of the name pointed to by the `event_name` argument was longer than the implementation-defined value `{TRACE_EVENT_NAME_MAX}`.

**CHANGE HISTORY**

IEEE PASC Interpretation 1003.1 #123 is applied.

IEEE PASC Interpretation 1003.1 #127 is applied, correcting some editorial errors in the names of the `posix_trace_eventid_open()` function and the `event_id` argument.
NAME
posix_trace_eventid_equal, posix_trace_eventid_get_name, posix_trace_trid_eventid_open —
manipulate the trace event type identifier (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_eventid_equal(trace_id_t trid, trace_event_id_t event1,
trace_event_id_t event2);

int posix_trace_eventid_get_name(trace_id_t trid,
trace_event_id_t event, char *event_name);

int posix_trace_trid_eventid_open(trace_id_t trid,
const char *restrict event_name,
trace_event_id_t *restrict event);

DESCRIPTION
The posix_trace_eventid_equal() function shall compare the trace event type identifiers event1 and
event2 from the same trace stream or the same trace log identified by the trid argument. If the
trace event type identifiers event1 and event2 are from different trace streams, the return value
shall be unspecified.

The posix_trace_eventid_get_name() function shall return, in the argument pointed to by
event_name, the trace event name associated with the trace event type identifier identified by the
argument event, for the trace stream or for the trace log identified by the trid argument. The
name of the trace event shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
(which has the minimum value {POSIX_TRACE_EVENT_NAME_MAX}). Successive calls to
this function with the same trace event type identifier and the same trace stream identifier shall
return the same event name.

The posix_trace_trid_eventid_open() function shall associate a user trace event name with a trace
event type identifier for a given trace stream. The trace stream is identified by the trid argument,
and it shall be an active trace stream. The trace event name is the string pointed to by the
argument event_name. It shall have a maximum of {TRACE_EVENT_NAME_MAX} characters
(which has the minimum value {POSIX_TRACE_EVENT_NAME_MAX}). The number of user
trace event type identifiers that can be defined for any given process is limited by the maximum
value {TRACE_USER_EVENT_MAX}, which has the minimum value
{POSIX_TRACE_USER_EVENT_MAX}.

If the Trace Inherit option is not supported, the posix_trace_trid_eventid_open() function shall
associate the user trace event name pointed to by the event_name argument with a trace event
type identifier that is unique for the process being traced in the trace stream identified by the trid
argument, and is returned in the variable pointed to by the event argument. If the user trace
event name has already been mapped for the traced process, then the previously assigned trace
event type identifier shall be returned. If the per-process user trace event name limit represented
by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be
returned.

If the Trace Inherit option is supported, the posix_trace_trid_eventid_open() function shall
associate the user trace event name pointed to by the event_name argument with a trace event
type identifier that is unique for all the processes being traced in the trace stream identified by
the trid argument, and is returned in the variable pointed to by the event argument. If the user trace
event name has already been mapped for the traced processes, then the previously assigned trace
event type identifier shall be returned. If the per-process user trace event name limit represented
by {TRACE_USER_EVENT_MAX} has been reached, the pre-defined
POSIX_TRACE_UNNAMED_USEREVENT (see Table 2-7 (on page 79)) user trace event shall be returned.

**RETURN VALUE**

Upon successful completion, the `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The `posix_trace_eventid_equal()` function shall return a non-zero value if `event1` and `event2` are equal; otherwise, a value of zero shall be returned. No errors are defined. If either `event1` or `event2` are not valid trace event type identifiers for the trace stream specified by `trid` or if the `trid` is invalid, the behavior shall be unspecified.

The `posix_trace_eventid_get_name()` function stores the trace event name value in the object pointed to by `event_name`, if successful.

The `posix_trace_trid_eventid_open()` function stores the trace event type identifier value in the object pointed to by `event`, if successful.

**ERRORS**

The `posix_trace_eventid_get_name()` and `posix_trace_trid_eventid_open()` functions shall fail if:

- **[EINVAL]** The `trid` argument was not a valid trace stream identifier.

The `posix_trace_trid_eventid_open()` function shall fail if:

- **[ENAMETOOLONG]** The size of the name pointed to by the `event_name` argument was longer than the implementation-defined value `{TRACE_EVENT_NAME_MAX}`.

The `posix_trace_eventid_get_name()` function shall fail if:

- **[EINVAL]** The trace event type identifier `event` was not associated with any name.

**CHANGE HISTORY**

IEEE PASC Interpretations 1003.1 #123 and #129 are applied.
posix_trace_eventid_open()

NAME
posix_trace_eventid_open — trace functions for instrumenting application code (TRACING)

SYNOPSIS
#include <sys/types.h>
#include <trace.h>

int posix_trace_eventid_open(const char *restrict event_name,
trace_event_id_t *restrict event_id);

DESCRIPTION
Refer to posix_trace_event().
NAME
posix_trace_eventset_add, posix_trace_eventset_del, posix_trace_eventset_empty,
posix_trace_eventset_fill, posix_trace_eventset_ismember — manipulate trace event type sets

SYNOPSIS
#include <trace.h>

int posix_trace_eventset_add(trace_event_id_t event_id, trace_event_set_t *set);
int posix_trace_eventset_del(trace_event_id_t event_id, trace_event_set_t *set);
int posix_trace_eventset_empty(trace_event_set_t *set);
int posix_trace_eventset_fill(trace_event_set_t *set, int what);
int posix_trace_eventset_ismember(trace_event_id_t event_id, const trace_event_set_t *restrict set, int *restrict ismember);

DESCRIPTION
These primitives manipulate sets of trace event types. They operate on data objects addressable
by the application, not on the current trace event filter of any trace stream.

The posix_trace_eventset_add() and posix_trace_eventset_del() functions, respectively, shall add or
delete the individual trace event type specified by the value of the argument event_id to or from
the trace event type set pointed to by the argument set. Adding a trace event type already in the
set or deleting a trace event type not in the set shall not be considered an error.

The posix_trace_eventset_empty() function shall initialize the trace event type set pointed to by
the set argument such that all trace event types defined, both system and user, shall be excluded
from the set.

The posix_trace_eventset_fill() function shall initialize the trace event type set pointed to by the
argument set, such that the set of trace event types defined by the argument what shall be
included in the set. The value of the argument what shall consist of one of the following values,
as defined in the <trace.h> header:

POSIX_TRACE_WOPID_EVENTS
All the process-independent implementation-defined system trace event types are included
in the set.

POSIX_TRACE_SYSTEM_EVENTS
All the implementation-defined system trace event types are included in the set, as are those

POSIX_TRACE_ALL_EVENTS
All trace event types defined, both system and user, are included in the set.

Applications shall call either posix_trace_eventset_empty() or posix_trace_eventset_fill() at least
once for each object of type trace_event_set_t prior to any other use of that object. If such an
object is not initialized in this way, but is nonetheless supplied as an argument to any of the
posix_trace_eventset_add(), posix_trace_eventset_del(), or posix_trace_eventset_ismember() functions,
the results are undefined.

The posix_trace_eventset_ismember() function shall test whether the trace event type specified by
the value of the argument event_id is a member of the set pointed to by the argument set. The
value returned in the object pointed to by ismember argument is zero if the trace event type
identifier is not a member of the set and a value different from zero if it is a member of the set.
RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

ERRORS
These functions may fail if:
[EINVAL] The value of one of the arguments is invalid.

CHANGE HISTORY
NAME
posix_trace_eventtypelist_getnext_id, posix_trace_eventtypelist_rewind — iterate over a
mapping of trace event types (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_eventtypelist_getnext_id(trace_id_t trid, 
trace_event_id_t *restrict event, int *restrict unavailable);
int posix_trace_eventtypelist_rewind(trace_id_t trid);

DESCRIPTION
The first time posix_trace_eventtypelist_getnext_id() is called, the function shall return in the
variable pointed to by event the first trace event type identifier of the list of trace events of the
trace stream identified by the trid argument. Successive calls to posix_trace_eventtypelist_getnext_id() return in the variable pointed to by event the next trace event type identifier in that same list. Each time a trace event type identifier is successfully
written into the variable pointed to by the event argument, the variable pointed to by the unavailable argument shall be set to zero. When no more trace event type identifiers are
available, and so none is returned, the variable pointed to by the unavailable argument shall be
set to a value different from zero.

The posix_trace_eventtypelist_rewind() function shall reset the next trace event type identifier to
be read to the first trace event type identifier from the list of trace events used in the trace stream
identified by trid.

RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall
return the corresponding error number.

The posix_trace_eventtypelist_getnext_id() function stores the trace event type identifier value in
the object pointed to by event, if successful.

ERRORS
These functions shall fail if:

[EINVAL] The trid argument was not a valid trace stream identifier.

IEEE PASC Interpretations 1003.1 #123 and #129 are applied.
posix_trace_flush()
posix_trace_get_attr()  

NAME
posix_trace_get_attr, posix_trace_get_status — retrieve the trace attributes or trace status (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_get_attr(trace_id_t trid, trace_attr_t *attr);
int posix_trace_get_status(trace_id_t trid, struct posix_trace_status_info *statusinfo);

DESCRIPTION
The posix_trace_get_attr() function shall copy the attributes of the active trace stream identified by trid into the object pointed to by the attr argument. If the Trace Log option is supported, trid may represent a pre-recorded trace log.

The posix_trace_get_status() function shall return, in the structure pointed to by the statusinfo argument, the current trace status for the trace stream identified by the trid argument. These status values returned in the structure pointed to by statusinfo shall have been appropriately read to ensure that the returned values are consistent. If the Trace Log option is supported and the trid argument refers to a pre-recorded trace stream, the status shall be the status of the completed trace stream.

Each time the posix_trace_get_status() function is used, the overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN immediately after the call completes. If the Trace Log option is supported, the posix_trace_get_status() function shall behave the same as when the option is not supported except for the following differences:

- If the trid argument refers to a trace stream with log, each time the posix_trace_get_status() function is used, the log overrun status of the trace stream shall be reset to POSIX_TRACE_NO_OVERRUN and the flush_error status shall be reset to zero immediately after the call completes.
- If the trid argument refers to a pre-recorded trace stream, the status returned shall be the status of the completed trace stream and the status values of the trace stream shall not be reset.

RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The posix_trace_get_attr() function stores the trace attributes in the object pointed to by attr, if successful.

The posix_trace_get_status() function stores the trace status in the object pointed to by statusinfo, if successful.

ERRORS
These functions shall fail if:

[EINVAL] The trace stream argument trid does not correspond to a valid active trace stream or a valid trace log.

NAME
posix_trace_get_filter, posix_trace_set_filter — retrieve and set the filter of an initialized trace stream (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_get_filter(trace_id_t trid, trace_event_set_t *set);
int posix_trace_set_filter(trace_id_t trid,
const trace_event_set_t *set, int how);

DESCRIPTION
The posix_trace_get_filter() function shall retrieve, into the argument pointed to by set, the actual trace event filter from the trace stream specified by trid.

The posix_trace_set_filter() function shall change the set of filtered trace event types after a trace stream identified by the trid argument is created. This function may be called prior to starting the trace stream, or while the trace stream is active. By default, if no call is made to posix_trace_set_filter(), all trace events shall be recorded (that is, none of the trace event types are filtered out).

If this function is called while the trace is in progress, a special system trace event, POSIX_TRACE_FILTER, shall be recorded in the trace indicating both the old and the new sets of filtered trace event types (see Table 2-4 (on page 78) and Table 2-6 (on page 79)).

If the posix_trace_set_filter() function is interrupted by a signal, an error shall be returned and the filter shall not be changed. In this case, the state of the trace stream shall not be changed.

The value of the argument how indicates the manner in which the set is to be changed and shall have one of the following values, as defined in the <trace.h> header:

POSIX_TRACE_SET_EVENTSET
The resulting set of trace event types to be filtered shall be the trace event type set pointed to by the argument set.

POSIX_TRACE_ADD_EVENTSET
The resulting set of trace event types to be filtered shall be the union of the current set and the trace event type set pointed to by the argument set.

POSIX_TRACE_SUB_EVENTSET
The resulting set of trace event types to be filtered shall be all trace event types in the current set that are not in the set pointed to by the argument set; that is, remove each element of the specified set from the current filter.

RETURN VALUE
Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

The posix_trace_get_filter() function stores the set of filtered trace event types in set, if successful.

ERRORS
These functions shall fail if:

[EINVAL] The value of the trid argument does not correspond to an active trace stream or the value of the argument pointed to by set is invalid.

[EINTR] The operation was interrupted by a signal.

NAME
posix_trace_get_status — retrieve the trace status (TRACING)

SYNOPSIS
```
#include <trace.h>

int posix_trace_get_status(trace_id_t trid, struct posix_trace_status_info *statusinfo);
```

DESCRIPTION
Refer to `posix_trace_get_attr()`.
NAME
posix_trace_getnext_event, posix_trace_timedgetnext_event, posix_trace_trygetnext_event —
retrieve a trace event (TRACING)

SYNOPSIS
#include <sys/types.h>
#include <trace.h>

int posix_trace_getnext_event(trace_id_t trid,
   struct posix_trace_event_info *restrict event,
   void *restrict data, size_t num_bytes,
   size_t *restrict data_len, int *restrict unavailable);

int posix_trace_timedgetnext_event(trace_id_t trid,
   struct posix_trace_event_info *restrict event,
   void *restrict data, size_t num_bytes,
   size_t *restrict data_len, int *restrict unavailable,
   const struct timespec *restrict abs_timeout);

int posix_trace_trygetnext_event(trace_id_t trid,
   struct posix_trace_event_info *restrict event,
   void *restrict data, size_t num_bytes,
   size_t *restrict data_len, int *restrict unavailable);

DESCRIPTION
The `posix_trace_getnext_event()` function shall report a recorded trace event either from an active
trace stream without log or a pre-recorded trace stream identified by the `trid` argument. The
`posix_trace_trygetnext_event()` function shall report a recorded trace event from an active trace
stream without log identified by the `trid` argument.

The trace event information associated with the recorded trace event shall be copied by the
function into the structure pointed to by the argument `event` and the data associated with the
trace event shall be copied into the buffer pointed to by the `data` argument.

The `posix_trace_getnext_event()` function shall block if the `trid` argument identifies an active trace
stream and there is currently no trace event ready to be retrieved. When returning, if a recorded
trace event was reported, the variable pointed to by the `unavailable` argument shall be set to zero.
Otherwise, the variable pointed to by the `unavailable` argument shall be set to a value different
from zero.

The `posix_trace_timedgetnext_event()` function shall attempt to get another trace event from an
active trace stream without log, as in the `posix_trace_getnext_event()` function. However, if no trace
event is available from the trace stream, the implied wait shall be terminated when the
timeout specified by the argument `abs_timeout` expires, and the function shall return the error
[ETIMEDOUT].

The timeout shall expire when the absolute time specified by `abs_timeout` passes, as measured by
the clock upon which timeouts are based (that is, when the value of that clock equals or exceeds
`abs_timeout`), or if the absolute time specified by `abs_timeout` has already passed at the time of the
call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock;
if the Timers option is not supported, the timeout shall be based on the system clock as returned
by the `time()` function. The resolution of the timeout shall be the resolution of the clock on which
it is based. The `timespec` data type is defined in the `<time.h>` header.

Under no circumstance shall the function fail with a timeout if a trace event is immediately
available from the trace stream. The validity of the `abs_timeout` argument need not be checked if
a trace event is immediately available from the trace stream.

The behavior of this function for a pre-recorded trace stream is unspecified.

The `posix_trace_getnext_event()` function shall not block. This function shall return an error if the `trid` argument identifies a pre-recorded trace stream. If a recorded trace event was reported, the variable pointed to by the `unavailable` argument shall be set to zero. Otherwise, if no trace event was reported, the variable pointed to by the `unavailable` argument shall be set to a value different from zero.

The argument `num_bytes` shall be the size of the buffer pointed to by the `data` argument. The argument `data_len` reports to the application the length in bytes of the data record just transferred. If `num_bytes` is greater than or equal to the size of the data associated with the trace event pointed to by the `event` argument, all the recorded data shall be transferred. In this case, the `truncation-status` member of the trace event structure shall be either `POSIX_TRACE_NOT_TRUNCATED`, if the trace event data was recorded without truncation while tracing, or `POSIX_TRACE_TRUNCATED_RECORD`, if the trace event data was truncated when it was recorded. If the `num_bytes` argument is less than the length of recorded trace event data, the data transferred shall be truncated to a length of `num_bytes`, the value stored in the variable pointed to by `data_len` shall be equal to `num_bytes`, and the `truncation-status` member of the `event` structure argument shall be set to `POSIX_TRACE_TRUNCATED_READ` (see the `posix_trace_event_info` structure defined in `<trace.h>`).

The report of a trace event shall be sequential starting from the oldest recorded trace event. Trace events shall be reported in the order in which they were generated, up to an implementation-defined time resolution that causes the ordering of trace events occurring very close to each other to be unknown. Once reported, a trace event cannot be reported again from an active trace stream. Once a trace event is reported from an active trace stream without log, the trace stream shall make the resources associated with that trace event available to record future generated trace events.

**RETURN VALUE**

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

If successful, these functions store:

- The recorded trace event in the object pointed to by `event`
- The trace event information associated with the recorded trace event in the object pointed to by `data`
- The length of this trace event information in the object pointed to by `data_len`
- The value of zero in the object pointed to by `unavailable`

**ERRORS**

These functions shall fail if:

- `[EINVAL]` The trace stream identifier argument `trid` is invalid.
- The `posix_trace_getnext_event()` and `posix_trace_timedgetnext_event()` functions shall fail if:
- `[EINTR]` The operation was interrupted by a signal, and so the call had no effect.
- The `posix_trace_trygetnext_event()` function shall fail if:
- `[EINVAL]` The trace stream identifier argument `trid` does not correspond to an active trace stream.
The `posix_trace_timedgetnext_event()` function shall fail if:

- `[EINVAL]` There is no trace event immediately available from the trace stream, and the `timeout` argument is invalid.
- `[ETIMEDOUT]` No trace event was available from the trace stream before the specified `timeout` expired.

posix_trace_open()  System Interfaces

NAME
posix_trace_open, posix_trace_rewind — trace log management (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_open(int file_desc, trace_id_t *trid);
int posix_trace_rewind(trace_id_t trid);

DESCRIPTION
Refer to posix_trace_close().
NAME
posix_trace_set_filter — set filter of an initialized trace stream (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_set_filter(trace_id_t trid,
const trace_event_set_t *set, int how);

DESCRIPTION
Refer to posix_trace_get_filter().
NAME
posix_trace_shutdown — trace stream shutdown from a process (TRACING)

SYNOPSIS

```c
#include <sys/types.h>
#include <trace.h>

int posix_trace_shutdown(trace_id_t trid);
```

DESCRIPTION

Refer to `posix_trace_create()`.
The **posix_trace_start()** and **posix_trace_stop()** functions, respectively, shall start and stop the trace stream identified by the argument `trid`.

The effect of calling the **posix_trace_start()** function shall be recorded in the trace stream as the POSIX_TRACE_START system trace event and the status of the trace stream shall become POSIX_TRACE_RUNNING. If the trace stream is in progress when this function is called, the POSIX_TRACE_START system trace event shall not be recorded and the trace stream shall continue to run. If the trace stream is full, the POSIX_TRACE_START system trace event shall not be recorded and the status of the trace stream shall not be changed.

The effect of calling the **posix_trace_stop()** function shall be recorded in the trace stream as the POSIX_TRACE_STOP system trace event and the status of the trace stream shall become POSIX_TRACE_SUSPENDED. If the trace stream is suspended when this function is called, the POSIX_TRACE_STOP system trace event shall not be recorded and the trace stream shall remain suspended. If the trace stream is full, the POSIX_TRACE_STOP system trace event shall not be recorded and the status of the trace stream shall not be changed.

Upon successful completion, these functions shall return a value of zero. Otherwise, they shall return the corresponding error number.

These functions shall fail if:

- `[EINVAL]` The value of the argument `trid` does not correspond to an active trace stream and thus no trace stream was started or stopped.
- `[EINTR]` The operation was interrupted by a signal and thus the trace stream was not necessarily started or stopped.

NAME
posix_trace_timedgetnext_event, — retrieve a trace event (TRACING)

SYNOPSIS
#include <sys/types.h>
#include <trace.h>

int posix_trace_timedgetnext_event(trace_id_t trid, 
        struct posix_trace_event_info *restrict event, 
        void *restrict data, size_t num_bytes, 
        size_t *restrict data_len, int *restrict unavailable, 
        const struct timespec *restrict abs_timeout);

DESCRIPTION
Refer to posix_trace_getnext_event().
NAME
posix_trace_trid_eventid_open — open a trace event type identifier (TRACING)

SYNOPSIS
#include <trace.h>

int posix_trace_trid_eventid_open(trace_id_t trid,
const char *restrict event_name,
trace_event_id_t *restrict event);

DESCRIPTION
Refer to posix_trace_eventid_equal().
NAME
posix_trace_trygetnext_event — retrieve a trace event (TRACING)

SYNOPSIS
#include <sys/types.h>
#include <trace.h>

int posix_trace_trygetnext_event(trace_id_t trid,
struct posix_trace_event_info *restrict event,
void *restrict data, size_t num_bytes,
size_t *restrict data_len, int *restrict unavailable);

DESCRIPTION
Refer to posix_trace_getnext_event().
NAME
posix_typed_mem_get_info — query typed memory information (ADVANCED REALTIME)

SYNOPSIS
#include <sys/mman.h>

int posix_typed_mem_get_info(int fildes, struct posix_typed_mem_info *info);

DESCRIPTION
The posix_typed_mem_get_info() function shall return, in the posix_tmi_length field of the
posix_typed_mem_info structure pointed to by info, the maximum length which may be
successfully allocated by the typed memory object designated by fildes. This maximum length
shall take into account the flag POSIX_TYPED_MEM_ALLOCATE or
POSIX_TYPED_MEM_ALLOCATE_CONTIG specified when the typed memory object
represented by fildes was opened. The maximum length is dynamic; therefore, the value returned
is valid only while the current mapping of the corresponding typed memory pool remains
unchanged.

If fildes represents a typed memory object opened with neither the
POSIX_TYPED_MEM_ALLOCATE flag nor the POSIX_TYPED_MEM_ALLOCATE_CONTIG
flag specified, the returned value of info->posix_tmi_length is unspecified.

The posix_typed_mem_get_info() function may return additional implementation-defined
information in other fields of the posix_typed_mem_info structure pointed to by info.

If the memory object specified by fildes is not a typed memory object, then the behavior of this
function is undefined.

RETURN VALUE
Upon successful completion, the posix_typed_mem_get_info() function shall return zero;
otherwise, the corresponding error status value shall be returned.

ERRORS
The posix_typed_mem_get_info() function shall fail if:

[EBADF] The fildes argument is not a valid open file descriptor.

[ENODEV] The fildes argument is not connected to a memory object supported by this
function.

This function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
An application that needs to allocate a block of typed memory with length dependent upon the
amount of memory currently available must either query the typed memory object to obtain the
amount available, or repeatedly invoke mmap() attempting to guess an appropriate length.
While the latter method is existing practice with malloc(), it is awkward and imprecise. The
posix_typed_mem_get_info() function allows an application to immediately determine available
memory. This is particularly important for typed memory objects that may in some cases be
scarce resources. Note that when a typed memory pool is a shared resource, some form of
mutual-exclusion or synchronization may be required while typed memory is being queried and
System Interfaces

posix_typed_mem_get_info()

allocated to prevent race conditions.

The existing $fstat()$ function is not suitable for this purpose. We realize that implementations may wish to provide other attributes of typed memory objects (for example, alignment requirements, page size, and so on). The $fstat()$ function returns a structure which is not extensible and, furthermore, contains substantial information that is inappropriate for typed memory objects.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
posix_typed_mem_open()

NAME

posix_typed_mem_open — open a typed memory object (ADVANCED REALTIME)

SYNOPSIS

```
#include <sys/mman.h>

int posix_typed_mem_open(const char *name, int oflag, int tflag);
```

DESCRIPTION

The `posix_typed_mem_open()` function shall establish a connection between the typed memory object specified by the string pointed to by `name` and a file descriptor. It shall create an open file description that refers to the typed memory object and a file descriptor that refers to that open file description. The file descriptor is used by other functions to refer to that typed memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The `name` argument shall conform to the construction rules for a pathname. If `name` begins with the slash character, then processes calling `posix_typed_mem_open()` with the same value of `name` shall refer to the same typed memory object. If `name` does not begin with the slash character, the effect is implementation-defined. The interpretation of slash characters other than the leading slash character in `name` is implementation-defined.

Each typed memory object supported in a system shall be identified by a name which specifies not only its associated typed memory pool, but also the path or port by which it is accessed. That is, the same typed memory pool accessed via several different ports shall have several different corresponding names. The binding between names and typed memory objects is established in an implementation-defined manner. Unlike shared memory objects, there is no way within IEEE Std 1003.1-2001 for a program to create a typed memory object.

The value of `tflag` shall determine how the typed memory object behaves when subsequently mapped by calls to `mmap()`. At most, one of the following flags defined in `<sys/mman.h>` may be specified:

```
POSIX_TYPED_MEM_ALLOCATE
Allocate on `mmap()`.

POSIX_TYPED_MEM_ALLOCATE_CONTIG
Allocate contiguously on `mmap()`.

POSIX_TYPED_MEM_MAP_ALLOCATABLE
Map on `mmap()`, without affecting allocatability.
```

If `tflag` has the flag `POSIX_TYPED_MEM_ALLOCATE` specified, any subsequent call to `mmap()` using the returned file descriptor shall result in allocation and mapping of typed memory from the specified typed memory pool. The allocated memory may be a contiguous previously unallocated area of the typed memory pool or several non-contiguous previously unallocated areas (mapped to a contiguous portion of the process address space). If `tflag` has the flag `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified, any subsequent call to `mmap()` using the returned file descriptor shall result in allocation and mapping of a single contiguous previously unallocated area of the typed memory pool (also mapped to a contiguous portion of the process address space). If `tflag` has none of the flags `POSIX_TYPED_MEM_ALLOCATE` or `POSIX_TYPED_MEM_ALLOCATE_CONTIG` specified, any subsequent call to `mmap()` using the returned file descriptor shall map an application-chosen area from the specified typed memory pool such that this mapped area becomes unavailable for allocation until unmapped by all processes. If `tflag` has the flag `POSIX_TYPED_MEM_MAP_ALLOCATABLE` specified, any subsequent call to `mmap()` using the returned file descriptor shall map an application-chosen area from the specified typed memory pool without an effect on the availability of that area for
allocation; that is, mapping such an object leaves each byte of the mapped area unallocated if it was unallocated prior to the mapping or allocated if it was allocated prior to the mapping. The appropriate privilege to specify the POSIX_TYPED_MEM_MAP_ALLOCATABLE flag is implementation-defined.

If successful, posix_typed_mem_open() shall return a file descriptor for the typed memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor shall not share it with any other processes. It is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file descriptor shall be cleared.

The behavior of msync(), ftruncate(), and all file operations other than mmap(), posix_mem_offset(), posix_typed_mem_get_info(), fstat(), dup(), dup2(), and close(), is unspecified when passed a file descriptor connected to a typed memory object by this function.

The file status flags of the open file description shall be set according to the value of oflag. Applications shall specify exactly one of the three access mode values described below and defined in the <fcntl.h> header, as the value of oflag.

- O_RDONLY Open for read access only.
- O_WRONLY Open for write access only.
- O_RDWR Open for read or write access.

Upon successful completion, the posix_typed_mem_open() function shall return a non-negative integer representing the lowest numbered unused file descriptor. Otherwise, it shall return −1 and set errno to indicate the error.

The posix_typed_mem_open() function shall fail if:

- [EACCES] The typed memory object exists and the permissions specified by oflag are denied.
- [EINTR] The posix_typed_mem_open() operation was interrupted by a signal.
- [EINVAL] The flags specified in tflag are invalid (more than one of POSIX_TYPED_MEM_ALLOCATE, POSIX_TYPED_MEM_ALLOCATE_CONTIG, or POSIX_TYPED_MEM_MAP_ALLOCATABLE is specified).
- [ENFILE] Too many file descriptors are currently in use by this process.
- [ENAMETOOLONG] The length of the name argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].
- [ENOFILE] Too many file descriptors are currently open in the system.
- [ENOTENT] The named typed memory object does not exist.
- [EPERM] The caller lacks the appropriate privilege to specify the flag POSIX_TYPED_MEM_MAP_ALLOCATABLE in argument tflag.

CHANGE HISTORY
**NAME**

`pow`, `powf`, `powl` — power function

**SYNOPSIS**

```c
#include <math.h>

double pow(double x, double y);
float powf(float x, float y);
long double powl(long double x, long double y);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the value of \( x \) raised to the power \( y \), \( x^y \). If \( x \) is negative, the application shall ensure that \( y \) is an integer value.

An application wishing to check for error situations should set `errno` to zero and call `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-zero, an error has occurred.

**RETURN VALUE**

Upon successful completion, these functions shall return the value of \( x \) raised to the power \( y \).

For finite values of \( x < 0 \), and finite non-integer values of \( y \), a domain error shall occur and either a NaN (if representable), or an implementation-defined value shall be returned.

If the correct value would cause overflow, a range error shall occur and `pow()`, `powf()`, and `powl()` shall return ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL, respectively, with the same sign as the correct value of the function.

If the correct value would cause underflow, and is not representable, a range error may occur, and either 0.0 (if supported), or an implementation-defined value shall be returned.

If \( x \) or \( y \) is a NaN, a NaN shall be returned (unless specified elsewhere in this description).

For any value of \( y \) (including NaN), if \( x \) is +1, 1.0 shall be returned.

For any value of \( x \) (including NaN), if \( y \) is ±0, 1.0 shall be returned.

For any odd integer value of \( y > 0 \), if \( x \) is ±0, ±0 shall be returned.

For \( y > 0 \) and not an odd integer, if \( x \) is ±0, +0 shall be returned.

If \( x \) is −1, and \( y \) is ±Inf, 1.0 shall be returned.

For \( |x| < 1 \), if \( y \) is −Inf, +Inf shall be returned.

For \( |x| > 1 \), if \( y \) is −Inf, +0 shall be returned.

For \( |x| < 1 \), if \( y \) is +Inf, +0 shall be returned.

For \( |x| > 1 \), if \( y \) is +Inf, +Inf shall be returned.

For \( y \) an odd integer < 0, if \( x \) is −Inf, −0 shall be returned.

For \( y < 0 \) and not an odd integer, if \( x \) is −Inf, +0 shall be returned.

For \( y \) an odd integer > 0, if \( x \) is −Inf, −Inf shall be returned.

For \( y > 0 \) and not an odd integer, if \( x \) is −Inf, +Inf shall be returned.
For $y < 0$, if $x$ is $+\text{Inf}$, $+0$ shall be returned.

For $y > 0$, if $x$ is $+\text{Inf}$, $+\text{Inf}$ shall be returned.

For $y$ an odd integer $< 0$, if $x$ is $\pm0$, a pole error shall occur and $\pm\text{HUGE}_\text{VAL}$, $\pm\text{HUGE}_\text{VALF}$, and $\pm\text{HUGE}_\text{VALL}$ shall be returned for $\text{pow}()$, $\text{powf}()$, and $\text{powl}()$, respectively.

For $y < 0$ and not an odd integer, if $x$ is $\pm0$, a pole error shall occur and $\text{HUGE}_\text{VAL}$, $\text{HUGE}_\text{VALF}$, and $\text{HUGE}_\text{VALL}$ shall be returned for $\text{pow}()$, $\text{powf}()$, and $\text{powl}()$, respectively.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

**ERRORS**

These functions shall fail if:

**Domain Error** The value of $x$ is negative and $y$ is a finite non-integer.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

**Pole Error** The value of $x$ is zero and $y$ is negative.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the divide-by-zero floating-point exception shall be raised.

**Range Error** The result overflows.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

**Range Error** The result underflows.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (math_errno & MATH_ERRNO) and (math_errno & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

NAME
pselect, select — synchronous I/O multiplexing

SYNOPSIS
#include <sys/select.h>
int pselect(int nfds, fd_set *restrict readfds,
            fd_set *restrict writefds, fd_set *restrict errorfds,
            const struct timespec *restrict timeout,
            const sigset_t *restrict sigmask);
int select(int nfds, fd_set *restrict readfds,
           fd_set *restrict writefds, fd_set *restrict errorfds,
           struct timeval *restrict timeout);
void FD_CLR(int fd, fd_set *fdset);
int FD_ISSET(int fd, fd_set *fdset);
void FD_SET(int fd, fd_set *fdset);
void FD_ZERO(fd_set *fdset);

DESCRIPTION
The pselect() function shall examine the file descriptor sets whose addresses are passed in the
readfds, writefds, and errorfds parameters to see whether some of their descriptors are ready for
reading, are ready for writing, or have an exceptional condition pending, respectively.

The select() function shall be equivalent to the pselect() function, except as follows:
• For the select() function, the timeout period is given in seconds and microseconds in an
  argument of type struct timeval, whereas for the pselect() function the timeout period is
given in seconds and nanoseconds in an argument of type struct timespec.
• The select() function has no sigmask argument; it shall behave as pselect() does when sigmask
  is a null pointer.
• Upon successful completion, the select() function may modify the object pointed to by the
timeout argument.

The pselect() and select() functions shall support regular files, terminal and pseudo-terminal
devices, STREAMS-based files, FIFOs, pipes, and sockets. The behavior of pselect() and select()
on file descriptors that refer to other types of file is unspecified.

The nfds argument specifies the range of descriptors to be tested. The first nfds descriptors shall
be checked in each set; that is, the descriptors from zero through nfds−1 in the descriptor sets
shall be examined.

If the readfds argument is not a null pointer, it points to an object of type fd_set that on input
specifies the file descriptors to be checked for being ready to read, and on output indicates
which file descriptors are ready to read.

If the writefds argument is not a null pointer, it points to an object of type fd_set that on input
specifies the file descriptors to be checked for being ready to write, and on output indicates
which file descriptors are ready to write.

If the errorfds argument is not a null pointer, it points to an object of type fd_set that on input
specifies the file descriptors to be checked for error conditions pending, and on output indicates
which file descriptors have error conditions pending.

Upon successful completion, the pselect() or select() function shall modify the objects pointed to
by the readfds, writefds, and errorfds arguments to indicate which file descriptors are ready for
reading, ready for writing, or have an error condition pending, respectively, and shall return the
total number of ready descriptors in all the output sets. For each file descriptor less than nfds, the
If none of the selected descriptors are ready for the requested operation, the `pselect()` or `select()` function shall block until at least one of the requested operations becomes ready, until the `timeout` occurs, or until interrupted by a signal. The `timeout` parameter controls how long the `pselect()` or `select()` function shall take before timing out. If the `timeout` parameter is not a null pointer, it specifies a maximum interval to wait for the selection to complete. If the specified time interval expires without any requested operation becoming ready, the function shall return.

If the `timeout` parameter is a null pointer, then the call to `pselect()` or `select()` shall block indefinitely until at least one descriptor meets the specified criteria. To effect a poll, the `timeout` parameter should not be a null pointer, and should point to a zero-valued `timespec` structure.

The use of a timeout does not affect any pending timers set up by `alarm()`, `ualarm()`, or `setitimer()`.

Implementations may place limitations on the maximum timeout interval supported. All implementations shall support a maximum timeout interval of at least 31 days. If the `timeout` argument specifies a timeout interval greater than the implementation-defined maximum value, the maximum value shall be used as the actual timeout value. Implementations may also place limitations on the granularity of timeout intervals. If the requested timeout interval requires a finer granularity than the implementation supports, the actual timeout interval shall be rounded up to the next supported value.

If `sigmask` is not a null pointer, then the `pselect()` function shall replace the signal mask of the process by the set of signals pointed to by `sigmask` before examining the descriptors, and shall restore the signal mask of the process before returning.

A descriptor shall be considered ready for reading when a call to an input function with `O_NONBLOCK` clear would not block, whether or not the function would transfer data successfully. (The function might return data, an end-of-file indication, or an error other than one indicating that it is blocked, and in each of these cases the descriptor shall be considered ready for reading.)

A descriptor shall be considered ready for writing when a call to an output function with `O_NONBLOCK` clear would not block, whether or not the function would transfer data successfully.

If a socket has a pending error, it shall be considered to have an exceptional condition pending. Otherwise, what constitutes an exceptional condition is file type-specific. For a file descriptor for use with a socket, it is protocol-specific except as noted below. For other file types it is implementation-defined. If the operation is meaningless for a particular file type, `pselect()` or `select()` shall indicate that the descriptor is ready for read or write operations, and shall indicate that the descriptor has no exceptional condition pending.

If a descriptor refers to a socket, the implied input function is the `recvmsg()` function with parameters requesting normal and ancillary data, such that the presence of either type shall cause the socket to be marked as readable. The presence of out-of-band data shall be checked if the socket option `SO_OOBINLINE` has been enabled, as out-of-band data is enqueued with normal data. If the socket is currently listening, then it shall be marked as readable if an incoming connection request has been received, and a call to the `accept()` function shall complete without blocking.

If a descriptor refers to a socket, the implied output function is the `sendmsg()` function supplying an amount of normal data equal to the current value of the `SO_SNDLOWAT` option for the socket. If a non-blocking call to the `connect()` function has been made for a socket, and the connection attempt has either succeeded or failed leaving a pending error, the socket shall be
marked as writable.

A socket shall be considered to have an exceptional condition pending if a receive operation with O_NONBLOCK clear for the open file description and with the MSG_OOB flag set would return out-of-band data without blocking. (It is protocol-specific whether the MSG_OOB flag would be used to read out-of-band data.) A socket shall also be considered to have an exceptional condition pending if an out-of-band data mark is present in the receive queue. Other circumstances under which a socket may be considered to have an exceptional condition pending are protocol-specific and implementation-defined.

If the readfds, writefds, and errorfds arguments are all null pointers and the timeout argument is not a null pointer, the pselect() or select() function shall block for the time specified, or until interrupted by a signal. If the readfds, writefds, and errorfds arguments are all null pointers and the timeout argument is a null pointer, the pselect() or select() function shall block until interrupted by a signal.

File descriptors associated with regular files shall always select true for ready to read, ready to write, and error conditions.

On failure, the objects pointed to by the readfds, writefds, and errorfds arguments shall not be modified. If the timeout interval expires without the specified condition being true for any of the specified file descriptors, the objects pointed to by the readfds, writefds, and errorfds arguments shall have all bits set to 0.

File descriptor masks of type fd_set can be initialized and tested with FD_CLR(), FD_ISSET(), FD_SET(), and FD_ZERO(). It is unspecified whether each of these is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with any of these names, the behavior is undefined.

FD_CLR(fd, fdsetp) shall remove the file descriptor fd from the set pointed to by fdsetp. If fd is not a member of this set, there shall be no effect on the set, nor will an error be returned.

FD_ISSET(fd, fdsetp) shall evaluate to non-zero if the file descriptor fd is a member of the set pointed to by fdsetp, and shall evaluate to zero otherwise.

FD_SET(fd, fdsetp) shall add the file descriptor fd to the set pointed to by fdsetp. If the file descriptor fd is already in this set, there shall be no effect on the set, nor will an error be returned.

FD_ZERO(fdsetp) shall initialize the descriptor set pointed to by fdsetp to the null set. No error is returned if the set is not empty at the time FD_ZERO() is invoked.

The behavior of these macros is undefined if the fd argument is less than 0 or greater than or equal to FD_SETSIZE, or if fd is not a valid file descriptor, or if any of the arguments are expressions with side effects.

**RETURN VALUE**

Upon successful completion, the pselect() and select() functions shall return the total number of bits set in the bit masks. Otherwise, -1 shall be returned, and errno shall be set to indicate the error.

FD_CLR(), FD_SET(), and FD_ZERO() do not return a value. FD_ISSET() shall return a non-zero value if the bit for the file descriptor fd is set in the file descriptor set pointed to by fdset, and 0 otherwise.

**ERRORS**

Under the following conditions, pselect() and select() shall fail and set errno to:

[EBADF] One or more of the file descriptor sets specified a file descriptor that is not a valid open file descriptor.
The function was interrupted before any of the selected events occurred and before the timeout interval expired.

If SA_RESTART has been set for the interrupting signal, it is implementation-defined whether the function restarts or returns with [EINTR].

An invalid timeout interval was specified.

The nfds argument is less than 0 or greater than FD_SETSIZE.

One of the specified file descriptors refers to a STREAM or multiplexer that is linked (directly or indirectly) downstream from a multiplexer.

None.

None.

In previous versions of the Single UNIX Specification, the select() function was defined in the <sys/time.h> header. This is now changed to <sys/select.h>. The rationale for this change was as follows: the introduction of the pselect() function included the <sys/select.h> header and the <sys/select.h> header defines all the related definitions for the pselect() and select() functions. Backwards-compatibility to existing XSI implementations is handled by allowing <sys/time.h> to include <sys/select.h>.

None.

In the ERRORS section, the text has been changed to indicate that [EINVAL] is returned when nfds is less than 0 or greater than FD_SETSIZE. It previously stated less than 0, or greater than or equal to FD_SETSIZE. Text about timeout is moved from the APPLICATION USAGE section to the DESCRIPTION.

The Open Group Corrigendum U026/6 is applied, changing the occurrences of readfs and writefs in the select() DESCRIPTION to be readfds and writefds. Text referring to sockets is added to the DESCRIPTION. The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group. The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- These functions are now mandatory.
- The pselect() function is added for alignment with IEEE Std 1003.1g-2000 and additional detail related to sockets semantics is added to the DESCRIPTION.
The `select()` function now requires inclusion of `<sys/select.h>`.

The `restrict` keyword is added to the `select()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
pthread_atfork — register fork handlers

SYNOPSIS
THR
#include <pthread.h>

int pthread_atfork(void (*prepare)(void), void (*parent)(void),
void (*child)(void));

DESCRIPTION
The pthread_atfork() function shall declare fork handlers to be called before and after fork(), in
the context of the thread that called fork(). The prepare fork handler shall be called before fork()
processing commences. The parent fork handle shall be called after fork() processing completes
in the parent process. The child fork handler shall be called after fork() processing completes in
the child process. If no handling is desired at one or more of these three points, the
corresponding fork handler address(es) may be set to NULL.

The order of calls to pthread_atfork() is significant. The parent and child fork handlers shall be
called in the order in which they were established by calls to pthread_atfork(). The prepare fork
handlers shall be called in the opposite order.

RETURN VALUE
Upon successful completion, pthread_atfork() shall return a value of zero; otherwise, an error
number shall be returned to indicate the error.

ERRORS
The pthread_atfork() function shall fail if:

[ENOMEM] Insufficient table space exists to record the fork handler addresses.

The pthread_atfork() function shall not return an error code of [EINVAL].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
There are at least two serious problems with the semantics of fork() in a multi-threaded
program. One problem has to do with state (for example, memory) covered by mutexes.
Consider the case where one thread has a mutex locked and the state covered by that mutex is
inconsistent while another thread calls fork(). In the child, the mutex is in the locked state
locked by a nonexistent thread and thus can never be unlocked. Having the child simply
reinitialize the mutex is unsatisfactory since this approach does not resolve the question about
how to correct or otherwise deal with the inconsistent state in the child.

It is suggested that programs that use fork() call an exec function very soon afterwards in the
child process, thus resetting all states. In the meantime, only a short list of async-signal-safe
library routines are promised to be available.

Unfortunately, this solution does not address the needs of multi-threaded libraries. Application
programs may not be aware that a multi-threaded library is in use, and they feel free to call any
number of library routines between the fork() and exec calls, just as they always have. Indeed,
they may be extant single-threaded programs and cannot, therefore, be expected to obey new
restrictions imposed by the threads library.
On the other hand, the multi-threaded library needs a way to protect its internal state during `fork()` in case it is re-entered later in the child process. The problem arises especially in multi-threaded I/O libraries, which are almost sure to be invoked between the `fork()` and `exec` calls to effect I/O redirection. The solution may require locking mutex variables during `fork()`, or it may entail simply resetting the state in the child after the `fork()` processing completes.

The `pthread_atfork()` function provides multi-threaded libraries with a means to protect themselves from innocent application programs that call `fork()`, and it provides multi-threaded application programs with a standard mechanism for protecting themselves from `fork()` calls in a library routine or the application itself.

The expected usage is that the `prepare` handler acquires all mutex locks and the other two `fork` handlers release them.

For example, an application can supply a `prepare` routine that acquires the necessary mutexes the library maintains and supply `child` and `parent` routines that release those mutexes, thus ensuring that the child gets a consistent snapshot of the state of the library (and that no mutexes are left stranded). Alternatively, some libraries might be able to supply just a `child` routine that reinitializes the mutexes in the library and all associated states to some known value (for example, what it was when the image was originally executed).

When `fork()` is called, only the calling thread is duplicated in the child process. Synchronization variables remain in the same state in the child as they were in the parent at the time `fork()` was called. Thus, for example, mutex locks may be held by threads that no longer exist in the child process, and any associated states may be inconsistent. The parent process may avoid this by explicit code that acquires and releases locks critical to the child via `pthread_atfork()`. In addition, any critical threads need to be recreated and reinitialized to the proper state in the child (also via `pthread_atfork()`).

A higher-level package may acquire locks on its own data structures before invoking lower-level packages. Under this scenario, the order specified for fork handler calls allows a simple rule of initialization for avoiding package deadlock: a package initializes all packages on which it depends before it calls the `pthread_atfork()` function for itself.

`atexit()`, `fork()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/types.h>`

**CHANGE HISTORY**

First released in Issue 5. Derived from the POSIX Threads Extension.

IEEE PASC Interpretation 1003.1c #4 is applied.

**Issue 6**

The `pthread_atfork()` function is marked as part of the Threads option.

The `<pthread.h>` header is added to the SYNOPSIS.
NAME

pthread_attr_destroy, pthread_attr_init — destroy and initialize the thread attributes object

SYNOPSIS

THR #include <pthread.h>

int pthread_attr_destroy(pthread_attr_t *attr);
int pthread_attr_init(pthread_attr_t *attr);

DESCRIPTION

The pthread_attr_destroy() function shall destroy a thread attributes object. An implementation
may cause pthread_attr_destroy() to set attr to an implementation-defined invalid value. A
destroyed attr attributes object can be reinitialized using pthread_attr_init(); the results of
otherwise referencing the object after it has been destroyed are undefined.

The pthread_attr_init() function shall initialize a thread attributes object attr with the default
value for all of the individual attributes used by a given implementation.

The resulting attributes object (possibly modified by setting individual attribute values) when
used by pthread_create() defines the attributes of the thread created. A single attributes object can
be used in multiple simultaneous calls to pthread_create(). Results are undefined if
pthread_attr_init() is called specifying an already initialized attr attributes object.

RETURN VALUE

Upon successful completion, pthread_attr_destroy() and pthread_attr_init() shall return a value of
0; otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_attr_init() function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the thread attributes object.

These functions shall not return an error code of [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Attributes objects are provided for threads, mutexes, and condition variables as a mechanism to
support probable future standardization in these areas without requiring that the function itself
be changed.

Attributes objects provide clean isolation of the configurable aspects of threads. For example,
“stack size” is an important attribute of a thread, but it cannot be expressed portably. When
porting a threaded program, stack sizes often need to be adjusted. The use of attributes objects
can help by allowing the changes to be isolated in a single place, rather than being spread across
every instance of thread creation.

Attributes objects can be used to set up “classes” of threads with similar attributes; for example,
“threads with large stacks and high priority” or “threads with minimal stacks”. These classes
can be defined in a single place and then referenced wherever threads need to be created.
Changes to “class” decisions become straightforward, and detailed analysis of each
pthread_create() call is not required.

The attributes objects are defined as opaque types as an aid to extensibility. If these objects had
been specified as structures, adding new attributes would force recompilation of all multi-
threaded programs when the attributes objects are extended; this might not be possible if different program components were supplied by different vendors.

Additionally, opaque attributes objects present opportunities for improving performance. Argument validity can be checked once when attributes are set, rather than each time a thread is created. Implementations often need to cache kernel objects that are expensive to create. Opaque attributes objects provide an efficient mechanism to detect when cached objects become invalid due to attribute changes.

Since assignment is not necessarily defined on a given opaque type, implementation-defined default values cannot be defined in a portable way. The solution to this problem is to allow attributes objects to be initialized dynamically by attributes object initialization functions, so that default values can be supplied automatically by the implementation.

The following proposal was provided as a suggested alternative to the supplied attributes:

1. Maintain the style of passing a parameter formed by the bitwise-inclusive OR of flags to the initialization routines (\texttt{pthread_create()}, \texttt{pthread_mutex_init()}, \texttt{pthread_cond_init()}). The parameter containing the flags should be an opaque type for extensibility. If no flags are set in the parameter, then the objects are created with default characteristics. An implementation may specify implementation-defined flag values and associated behavior.

2. If further specialization of mutexes and condition variables is necessary, implementations may specify additional procedures that operate on the \texttt{pthread_mutex_t} and \texttt{pthread_cond_t} objects (instead of on attributes objects).

The difficulties with this solution are:

1. A bitmask is not opaque if bits have to be set into bitvector attributes objects using explicitly-coded bitwise-inclusive OR operations. If the set of options exceeds an \texttt{int}, application programmers need to know the location of each bit. If bits are set or read by encapsulation (that is, get and set functions), then the bitmask is merely an implementation of attributes objects as currently defined and should not be exposed to the programmer.

2. Many attributes are not Boolean or very small integral values. For example, scheduling policy may be placed in 3-bit or 4-bit, but priority requires 5-bit or more, thereby taking up at least 8 bits out of a possible 16 bits on machines with 16-bit integers. Because of this, the bitmask can only reasonably control whether particular attributes are set or not, and it cannot serve as the repository of the value itself. The value needs to be specified as a function parameter (which is non-extensible), or by setting a structure field (which is non-opaque), or by get and set functions (making the bitmask a redundant addition to the attributes objects).

Stack size is defined as an optional attribute because the very notion of a stack is inherently machine-dependent. Some implementations may not be able to change the size of the stack, for example, and others may not need to because stack pages may be discontiguous and can be allocated and released on demand.

The attribute mechanism has been designed in large measure for extensibility. Future extensions to the attribute mechanism or to any attributes object defined in this volume of IEEE Std 1003.1-2001 has to be done with care so as not to affect binary-compatibility.

Attributes objects, even if allocated by means of dynamic allocation functions such as \texttt{malloc()}, may have their size fixed at compile time. This means, for example, a \texttt{pthread_create()} in an implementation with extensions to \texttt{pthread_attr_t} cannot look beyond the area that the binary application assumes is valid. This suggests that implementations should maintain a size field in the attributes object, as well as possibly version information, if extensions in different directions...
(possibly by different vendors) are to be accommodated.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The `pthread_attr_destroy()` and `pthread_attr_init()` functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1 #107 is applied, noting that the effect of initializing an already initialized thread attributes object is undefined.
NAME

pthread_attr_getdetachstate(), pthread_attr_setdetachstate — get and set the detachstate attribute

SYNOPSIS

THR

```c
#include <pthread.h>

int pthread_attr_getdetachstate(const pthread_attr_t *attr,
    int *detachstate);

int pthread_attr_setdetachstate(pthread_attr_t *attr, int detachstate);
```

DESCRIPTION

The detachstate attribute controls whether the thread is created in a detached state. If the thread is created detached, then use of the ID of the newly created thread by the pthread_detach() or pthread_join() function is an error.

The pthread_attr_getdetachstate() and pthread_attr_setdetachstate() functions, respectively, shall get and set the detachstate attribute in the attr object.

For pthread_attr_getdetachstate(), detachstate shall be set to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

For pthread_attr_setdetachstate(), the application shall set detachstate to either PTHREAD_CREATE_DETACHED or PTHREAD_CREATE_JOINABLE.

A value of PTHREAD_CREATE_DETACHED shall cause all threads created with attr to be in the detached state, whereas using a value of PTHREAD_CREATE_JOINABLE shall cause all threads created with attr to be in the joinable state. The default value of the detachstate attribute shall be PTHREAD_CREATE_JOINABLE.

RETURN VALUE

Upon successful completion, pthread_attr_getdetachstate() and pthread_attr_setdetachstate() shall return a value of 0; otherwise, an error number shall be returned to indicate the error.

The pthread_attr_getdetachstate() function stores the value of the detachstate attribute in detachstate if successful.

ERRORS

The pthread_attr_setdetachstate() function shall fail if:

[EINVAL] The value of detachstate was not valid

These functions shall not return an error code of [EINTR].

System Interfaces

pthread_attr_getdetachstate()

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The pthread_attr_setdetachstate() and pthread_attr_getdetachstate() functions are marked as part of the Threads option.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME

pthread_attr_getguardsize, pthread_attr_setguardsize — get and set the thread guardsize attribute

SYNOPSIS

XSI

#include <pthread.h>

int pthread_attr_getguardsize(const pthread_attr_t *restrict attr,
    size_t *restrict guardsize);

int pthread_attr_setguardsize(pthread_attr_t *attr,
    size_t guardsize);

DESCRIPTION

The pthread_attr_getguardsize() function shall get the guardsize attribute in the attr object. This attribute shall be returned in the guardsize parameter.

The pthread_attr_setguardsize() function shall set the guardsize attribute in the attr object. The new value of this attribute shall be obtained from the guardsize parameter. If guardsize is zero, a guard area shall not be provided for threads created with attr. If guardsize is greater than zero, a guard area of at least size guardsize bytes shall be provided for each thread created with attr.

The guardsize attribute controls the size of the guard area for the created thread’s stack. The guardsize attribute provides protection against overflow of the stack pointer. If a thread’s stack is created with guard protection, the implementation allocates extra memory at the overflow end of the stack as a buffer against stack overflow of the stack pointer. If an application overflows into this buffer an error shall result (possibly in a SIGSEGV signal being delivered to the thread).

A conforming implementation may round up the value contained in guardsize to a multiple of the configurable system variable {PAGESIZE} (see <sys/mman.h>). If an implementation rounds up the value of guardsize to a multiple of {PAGESIZE}, a call to pthread_attr_getguardsize() specifying attr shall store in the guardsize parameter the guard size specified by the previous pthread_attr_setguardsize() function call.

The default value of the guardsize attribute is {PAGESIZE} bytes. The actual value of {PAGESIZE} is implementation-defined.

If the stackaddr or stack attribute has been set (that is, the caller is allocating and managing its own thread stacks), the guardsize attribute shall be ignored and no protection shall be provided by the implementation. It is the responsibility of the application to manage stack overflow along with stack allocation and management in this case.

RETURN VALUE

If successful, the pthread_attr_getguardsize() and pthread_attr_setguardsize() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_attr_getguardsize() and pthread_attr_setguardsize() functions shall fail if:

[EINVAL] The attribute attr is invalid.

[EINVAL] The parameter guardsize is invalid.

These functions shall not return an error code of [EINTR].
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The `guardsize` attribute is provided to the application for two reasons:

1. Overflow protection can potentially result in wasted system resources. An application that creates a large number of threads, and which knows its threads never overflow their stack, can save system resources by turning off guard areas.
2. When threads allocate large data structures on the stack, large guard areas may be needed to detect stack overflow.

FUTURE DIRECTIONS
None.

SEE ALSO
The Base Definitions volume of IEEE Std 1003.1-2001, `<pthread.h>`, `<sys/mman.h>`

CHANGE HISTORY
First released in Issue 5.

Issue 6
In the ERRORS section, a third [EINVAL] error condition is removed as it is covered by the second error condition.

The `restrict` keyword is added to the `pthread_attr_getguardsize()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME

pthread_attr_getinheritsched, pthread_attr_setinheritsched — get and set the inheritsched attribute (REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_attr_getinheritsched(const pthread_attr_t *restrict attr,
                                  int *restrict inheritsched);
int pthread_attr_setinheritsched(pthread_attr_t *attr,
                                  int inheritsched);
```

DESCRIPTION

The `pthread_attr_getinheritsched()` and `pthread_attr_setinheritsched()` functions, respectively, shall get and set the `inheritsched` attribute in the `attr` argument.

When the attributes objects are used by `pthread_create()`, the `inheritsched` attribute determines how the other scheduling attributes of the created thread shall be set.

- **PTHREAD_INHERIT_SCHED**
  Specifies that the thread scheduling attributes shall be inherited from the creating thread, and the scheduling attributes in this `attr` argument shall be ignored.

- **PTHREAD_EXPLICIT_SCHED**
  Specifies that the thread scheduling attributes shall be set to the corresponding values from this attributes object.

The symbols PTHREAD_INHERIT_SCHED and PTHREAD_EXPLICIT_SCHED are defined in the `<pthread.h>` header.

The following thread scheduling attributes defined by IEEE Std 1003.1-2001 are affected by the `inheritsched` attribute: scheduling policy (**schedpolicy**), scheduling parameters (**schedparam**), and scheduling contention scope (**contentionscope**).

RETURN VALUE

If successful, the `pthread_attr_getinheritsched()` and `pthread_attr_setinheritsched()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_attr_setinheritsched()` function may fail if:

- `[EINVAL]` The value of `inheritsched` is not valid.
- `[ENOTSUP]` An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of `[EINTR]`.

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using `pthread_create()`. Using these routines does not affect the current running thread.

RATIONALE

None.
FUTURE DIRECTIONS

NAME
pthread_attr_getschedparam, pthread_attr_setschedparam — get and set the schedparam attribute

SYNOPSIS
THR #include <pthread.h>

int pthread_attr_getschedparam(const pthread_attr_t *restrict attr,
struct sched_param *restrict param);
int pthread_attr_setschedparam(pthread_attr_t *restrict attr,
const struct sched_param *restrict param);

DESCRIPTION
The pthread_attr_getschedparam(), and pthread_attr_setschedparam() functions, respectively, shall get and set the scheduling parameter attributes in the attr argument. The contents of the param structure are defined in the <sched.h> header. For the SCHED_FIFO and SCHED_RR policies, the only required member of param is sched_priority.

TSP For the SCHED_SPORADIC policy, the required members of the param structure are sched_priority, sched_ss_low_priority, sched_ss_repl_period, sched_ss_init_budget, and sched_ss_max_repl. The specified sched_ss_repl_period must be greater than or equal to the specified sched_ss_init_budget for the function to succeed; if it is not, then the function shall fail. The value of sched_ss_max_repl shall be within the inclusive range [1,SS_REPL_MAX] for the function to succeed; if not, the function shall fail.

RETURN VALUE
If successful, the pthread_attr_getschedparam() and pthread_attr_setschedparam() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The pthread_attr_setschedparam() function may fail if:
EINVAL The value of param is not valid.
ENOTSUP An attempt was made to set the attribute to an unsupported value.
These functions shall not return an error code of [EINTR].

NAME

pthread_attr_getscope, pthread_attr_setscope — get and set the contentionscope attribute

(REALTIME THREADS)

SYNOPSIS

#include <pthread.h>

int pthread_attr_getscope(const pthread_attr_t *restrict attr, int *restrict contentionscope);

int pthread_attr_setscope(pthread_attr_t *attr, int contentionscope);

DESCRIPTION

The pthread_attr_getscope() and pthread_attr_setscope() functions, respectively, shall get and set
the contentionscope attribute in the attr object.

The contentionscope attribute may have the values PTHREAD_SCOPE_SYSTEM, signifying
system scheduling contention scope, or PTHREAD_SCOPE_PROCESS, signifying process
scheduling contention scope. The symbols PTHREAD_SCOPE_SYSTEM and
PTHREAD_SCOPE_PROCESS are defined in the <pthread.h> header.

RETURN VALUE

If successful, the pthread_attr_getscope() and pthread_attr_setscope() functions shall return zero;
otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_attr_setscope() function may fail if:

[EINVAL] The value of contentionscope is not valid.

[ENOTSUP] An attempt was made to set the attribute to an unsupported value.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

After these attributes have been set, a thread can be created with the specified attributes using
pthread_create(). Using these routines does not affect the current running thread.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.
The `pthread_attr_getscope()` and `pthread_attr_setscope()` functions are marked as part of the Threads and Thread Execution Scheduling options.

The `[ENOSYS]` error condition has been removed as stubs need not be provided if an implementation does not support the Thread Execution Scheduling option.

The `restrict` keyword is added to the `pthread_attr_getscope()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME

pthread_attr_getstack, pthread_attr_setstack — get and set stack attributes

SYNOPSIS

```c
#include <pthread.h>

int pthread_attr_getstack(const pthread_attr_t *restrict attr, void **restrict stackaddr, size_t *restrict stacksize);
int pthread_attr_setstack(pthread_attr_t *attr, void *stackaddr, size_t stacksize);
```

DESCRIPTION

The `pthread_attr_getstack()` and `pthread_attr_setstack()` functions, respectively, shall get and set
the thread creation stack attributes `stackaddr` and `stacksize` in the `attr` object.

The stack attributes specify the area of storage to be used for the created thread's stack. The base
(lowest addressable byte) of the storage shall be `stackaddr`, and the size of the storage shall be
`stacksize` bytes. The `stacksize` shall be at least `{PTHREAD_STACK_MIN}`. The `stackaddr` shall be
aligned appropriately to be used as a stack; for example, `pthread_attr_setstack()` may fail with
[EINVAL] if (`stackaddr` & 0x7) is not 0. All pages within the stack described by `stackaddr` and
`stacksize` shall be both readable and writable by the thread.

RETURN VALUE

Upon successful completion, these functions shall return a value of 0; otherwise, an error
number shall be returned to indicate the error.

The `pthread_attr_getstack()` function shall store the stack attribute values in `stackaddr` and `stacksize`
if successful.

ERRORS

The `pthread_attr_setstack()` function shall fail if:

[EINVAL] The value of `stacksize` is less than `{PTHREAD_STACK_MIN}` or exceeds an
implementation-defined limit.

The `pthread_attr_setstack()` function may fail if:

[EINVAL] The value of `stackaddr` does not have proper alignment to be used as a stack, or
if (`stackaddr + stacksize`) lacks proper alignment.

[EACCES] The stack page(s) described by `stackaddr` and `stacksize` are not both readable
and writable by the thread.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

These functions are appropriate for use by applications in an environment where the stack for a
thread must be placed in some particular region of memory.

While it might seem that an application could detect stack overflow by providing a protected
page outside the specified stack region, this cannot be done portably. Implementations are free
to place the thread's initial stack pointer anywhere within the specified region to accommodate
the machine's stack pointer behavior and allocation requirements. Furthermore, on some
architectures, such as the IA-64, “overflow” might mean that two separate stack pointers
allocated within the region will overlap somewhere in the middle of the region.
RATIONALE
None.

FUTURE DIRECTIONS
None.

pthread_attr_init(), pthread_attr_setdetachstate(), pthread_attr_setstacksize(), pthread_create(), the Base Definitions volume of IEEE Std 1003.1-2001, <limits.h>, <pthread.h>

CHANGE HISTORY
First released in Issue 6. Developed as an XSI extension and brought into the BASE by IEEE PASC Interpretation 1003.1 #101.
NAME
pthread_attr_getstackaddr, pthread_attr_setstackaddr — get and set the stackaddr attribute

SYNOPSIS
#include <pthread.h>

int pthread_attr_getstackaddr(const pthread_attr_t *restrict attr,  
void **restrict stackaddr);

int pthread_attr_setstackaddr(pthread_attr_t *attr, void *stackaddr);

DESCRIPTION
The pthread_attr_getstackaddr() and pthread_attr_setstackaddr() functions, respectively, shall get  
and set the thread creation stackaddr attribute in the attr object.

The stackaddr attribute specifies the location of storage to be used for the created thread’s stack.
The size of the storage shall be at least [PTHREAD_STACK_MIN].

RETURN VALUE
Upon successful completion, pthread_attr_getstackaddr() and pthread_attr_setstackaddr() shall  
return a value of 0; otherwise, an error number shall be returned to indicate the error.

The pthread_attr_getstackaddr() function stores the stackaddr attribute value in stackaddr if  
successful.

ERRORS
No errors are defined.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
The specification of the stackaddr attribute presents several ambiguities that make portable use of  
these interfaces impossible. The description of the single address parameter as a “stack” does  
not specify a particular relationship between the address and the “stack” implied by that  
address. For example, the address may be taken as the low memory address of a buffer intended  
for use as a stack, or it may be taken as the address to be used as the initial stack pointer register  
value for the new thread. These two are not the same except for a machine on which the stack  
grows “up” from low memory to high, and on which a “push” operation first stores the value in  
memory and then increments the stack pointer register. Further, on a machine where the stack  
grows “down” from high memory to low, interpretation of the address as the “low memory”  
address requires a determination of the intended size of the stack. IEEE Std 1003.1-2001 has  
introduced the new interfaces pthread_attr_setstack() and pthread_attr_getstack() to resolve these  
ambiguities.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The `pthread_attr_getstackaddr()` and `pthread_attr_setstackaddr()` functions are marked as part of the Threads and Thread Stack Address Attribute options.

The `restrict` keyword is added to the `pthread_attr_getstackaddr()` prototype for alignment with the ISO/IEC 9899:1999 standard.

These functions are marked obsolescent.
NAME
  pthread_attr_getstacksize, pthread_attr_setstacksize — get and set the stack size attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_attr_getstacksize(const pthread_attr_t *restrict attr,
                           size_t *restrict stacksize);
int pthread_attr_setstacksize(pthread_attr_t *attr, size_t stacksize);
```

DESCRIPTION

The `pthread_attr_getstacksize()` and `pthread_attr_setstacksize()` functions, respectively, shall get
and set the thread creation stacksize attribute in the `attr` object.

The `stacksize` attribute shall define the minimum stack size (in bytes) allocated for the created
threads stack.

RETURN VALUE

Upon successful completion, `pthread_attr_getstacksize()` and `pthread_attr_setstacksize()` shall
return a value of 0; otherwise, an error number shall be returned to indicate the error.

The `pthread_attr_getstacksize()` function stores the `stacksize` attribute value in `stacksize` if
successful.

ERRORS

The `pthread_attr_setstacksize()` function shall fail if:

- [EINVAL] The value of `stacksize` is less than [PTHREAD_STACK_MIN] or exceeds a
  system-imposed limit.

These functions shall not return an error code of [EINTR].

NAME

pthread_barrier_destroy, pthread_barrier_init — destroy and initialize a barrier object
(ADVANCED REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_barrier_destroy(pthread_barrier_t *barrier);
int pthread_barrier_init(pthread_barrier_t *restrict barrier,
const pthread_barrierattr_t *restrict attr, unsigned count);
```

DESCRIPTION

The `pthread_barrier_destroy()` function shall destroy the barrier referenced by `barrier` and release any resources used by the barrier. The effect of subsequent use of the barrier is undefined until the barrier is reinitialized by another call to `pthread_barrier_init()`. An implementation may use this function to set `barrier` to an invalid value. The results are undefined if `pthread_barrier_destroy()` is called when any thread is blocked on the barrier, or if this function is called with an uninitialized barrier.

The `pthread_barrier_init()` function shall allocate any resources required to use the barrier referenced by `barrier` and shall initialize the barrier with attributes referenced by `attr`. If `attr` is NULL, the default barrier attributes shall be used; the effect is the same as passing the address of a default barrier attributes object. The results are undefined if `pthread_barrier_init()` is called when any thread is blocked on the barrier (that is, has not returned from the `pthread_barrier_wait()` call). The results are undefined if a barrier is used without first being initialized. The results are undefined if `pthread_barrier_init()` is called specifying an already initialized barrier.

The `count` argument specifies the number of threads that must call `pthread_barrier_wait()` before any of them successfully return from the call. The value specified by `count` must be greater than zero.

If the `pthread_barrier_init()` function fails, the barrier shall not be initialized and the contents of `barrier` are undefined.

Only the object referenced by `barrier` may be used for performing synchronization. The result of referring to copies of that object in calls to `pthread_barrier_destroy()` or `pthread_barrier_wait()` is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_barrier_destroy()` function may fail if:

- **EBUSY**: The implementation has detected an attempt to destroy a barrier while it is in use (for example, while being used in a `pthread_barrier_wait()` call) by another thread.

- **EINVAL**: The value specified by `barrier` is invalid.

The `pthread_barrier_init()` function shall fail if:

- **EAGAIN**: The system lacks the necessary resources to initialize another barrier.

- **EINVAL**: The value specified by `count` is equal to zero.
Insufficient memory exists to initialize the barrier.

The `pthread_barrier_init()` function may fail if:

- `[ENOMEM]` Insufficient memory exists to initialize the barrier.
- `[EBUSY]` The implementation has detected an attempt to reinitialize a barrier while it is in use (for example, while being used in a `pthreadBarrierWait()` call) by another thread.
- `[EINVAL]` The value specified by `attr` is invalid.

These functions shall not return an error code of `[EINTR]`.

**EXAMPLES**

None.

**APPLICATION USAGE**

The `pthread_barrier_destroy()` and `pthread_barrier_init()` functions are part of the Barriers option and need not be provided on all implementations.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

**CHANGE HISTORY**

NAME

pthread_barrier_wait — synchronize at a barrier (ADVANCED REALTIME THREADS)

SYNOPSIS

```
#include <pthread.h>

int pthread_barrier_wait(pthread_barrier_t *barrier);
```

DESCRIPTION

The `pthread_barrier_wait()` function shall synchronize participating threads at the barrier referenced by `barrier`. The calling thread shall block until the required number of threads have called `pthread_barrier_wait()` specifying the barrier.

When the required number of threads have called `pthread_barrier_wait()` specifying the barrier, the constant PTHREAD_BARRIER_SERIAL_THREAD shall be returned to one unspecified thread and zero shall be returned to each of the remaining threads. At this point, the barrier shall be reset to the state it had as a result of the most recent `pthread_barrier_init()` function that referenced it.

The constant PTHREAD_BARRIER_SERIAL_THREAD is defined in `<pthread.h>` and its value shall be distinct from any other value returned by `pthread_barrier_wait()`.

The results are undefined if this function is called with an uninitialized barrier.

If a signal is delivered to a thread blocked on a barrier, upon return from the signal handler the thread shall resume waiting at the barrier if the barrier wait has not completed (that is, if the required number of threads have not arrived at the barrier during the execution of the signal handler); otherwise, the thread shall continue as normal from the completed barrier wait. Until the thread in the signal handler returns from it, it is unspecified whether other threads may proceed past the barrier once they have all reached it.

A thread that has blocked on a barrier shall not prevent any unblocked thread that is eligible to use the same processing resources from eventually making forward progress in its execution. Eligibility for processing resources shall be determined by the scheduling policy.

RETURN VALUE

Upon successful completion, the `pthread_barrier_wait()` function shall return PTHREAD_BARRIER_SERIAL_THREAD for a single (arbitrary) thread synchronized at the barrier and zero for each of the other threads. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_barrier_wait()` function may fail if:

- [EINVAL] The value specified by `barrier` does not refer to an initialized barrier object.
- [EINTR] This function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

Applications using this function may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

The `pthread_barrier_wait()` function is part of the Barriers option and need not be provided on all implementations.
**SYSTEM INTERFACES**

**CHANGE HISTORY**

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.
NAME

pthread_barrierattr_destroy, pthread_barrierattr_init — destroy and initialize the barrier attributes object (ADVANCED REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_barrierattr_destroy(pthread_barrierattr_t *attr);
int pthread_barrierattr_init(pthread_barrierattr_t *attr);
```

DESCRIPTION

The `pthread_barrierattr_destroy()` function shall destroy a barrier attributes object. A destroyed `attr` attributes object can be reinitialized using `pthread_barrierattr_init()`; the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause `pthread_barrierattr_destroy()` to set the object referenced by `attr` to an invalid value.

The `pthread_barrierattr_init()` function shall initialize a barrier attributes object `attr` with the default value for all of the attributes defined by the implementation.

Results are undefined if `pthread_barrierattr_init()` is called specifying an already initialized `attr` attributes object.

After a barrier attributes object has been used to initialize one or more barriers, any function affecting the attributes object (including destruction) shall not affect any previously initialized barrier.

RETURN VALUE

If successful, the `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_barrierattr_destroy()` function may fail if:

- [EINVAL] The value specified by `attr` is invalid.

The `pthread_barrierattr_init()` function shall fail if:

- [ENOMEM] Insufficient memory exists to initialize the barrier attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

The `pthread_barrierattr_destroy()` and `pthread_barrierattr_init()` functions are part of the Barriers option and need not be provided on all implementations.

RATIONALE

SEE ALSO

`pthread_barrierattr_getpshared()`, `pthread_barrierattr_setpshared()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<pthread.h>`.
CHANGE HISTORY

In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.
NAME

pthread_barrierattr_getpshared, pthread_barrierattr_setpshared — get and set the process-shared attribute of the barrier attributes object (ADDITIONAL REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_barrierattr_getpshared(const pthread_barrierattr_t * restrict attr, int *restrict pshared);
int pthread_barrierattr_setpshared(pthread_barrierattr_t *attr, int pshared);
```

DESCRIPTION

The `pthread_barrierattr_getpshared()` function shall obtain the value of the `process-shared` attribute from the attributes object referenced by `attr`. The `pthread_barrierattr_setpshared()` function shall set the `process-shared` attribute in an initialized attributes object referenced by `attr`.

The `process-shared` attribute is set to PTHREAD_PROCESS_SHARED to permit a barrier to be operated upon by any thread that has access to the memory where the barrier is allocated. If the `process-shared` attribute is PTHREAD_PROCESS_PRIVATE, the barrier shall only be operated upon by threads created within the same process as the thread that initialized the barrier; if threads of different processes attempt to operate on such a barrier, the behavior is undefined.

The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE. Both constants PTHREAD_PROCESS_SHARED and PTHREAD_PROCESS_PRIVATE are defined in `<pthread.h>`.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

RETURN VALUE

If successful, the `pthread_barrierattr_getpshared()` function shall return zero and store the value of the `process-shared` attribute of `attr` into the object referenced by the `pshared` parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the `pthread_barrierattr_setpshared()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by `attr` is invalid.

The `pthread_barrierattr_setpshared()` function may fail if:

[EINVAL] The new value specified for the `process-shared` attribute is not one of the legal values PTHREAD_PROCESS_SHARED or PTHREAD_PROCESS_PRIVATE.

These functions shall not return an error code of [EINTR].
EXERCISES
None.

APPLICATION USAGE
The `pthreadBarrierattr_getpshared()` and `pthreadBarrierattr_setpshared()` functions are part of the

```

DESCRIPTION

Refer to `pthread_barrierattr_getpshared()`.
NAME

pthread_cancel — cancel execution of a thread

SYNOPSIS

THR

#include <pthread.h>

int pthread_cancel(pthread_t thread);

DESCRIPTION

The pthread_cancel() function shall request that thread be canceled. The target thread’s
cancelability state and type determines when the cancellation takes effect. When the cancellation
is acted on, the cancellation cleanup handlers for thread shall be called. When the last
cancellation cleanup handler returns, the thread-specific data destructor functions shall be called
for thread. When the last destructor function returns, thread shall be terminated.

The cancellation processing in the target thread shall run asynchronously with respect to the
calling thread returning from pthread_cancel().

RETURN VALUE

If successful, the pthread_cancel() function shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS

The pthread_cancel() function may fail if:

[ESRCH] No thread could be found corresponding to that specified by the given thread
ID.

The pthread_cancel() function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

Two alternative functions were considered for sending the cancellation notification to a thread. One
would be to define a new SIGCANCEL signal that had the cancellation semantics when
delivered; the other was to define the new pthread_cancel() function, which would trigger the
cancellation semantics.

The advantage of a new signal was that so much of the delivery criteria were identical to that
used when trying to deliver a signal that making cancellation notification a signal was seen as
consistent. Indeed, many implementations implement cancellation using a special signal. On the
other hand, there would be no signal functions that could be used with this signal except
pthread_kill(), and the behavior of the delivered cancellation signal would be unlike any
previously existing defined signal.

The benefits of a special function include the recognition that this signal would be defined
because of the similar delivery criteria and that this is the only common behavior between a
cancellation request and a signal. In addition, the cancellation delivery mechanism does not
have to be implemented as a signal. There are also strong, if not stronger, parallels with
language exception mechanisms than with signals that are potentially obscured if the delivery
mechanism is visibly closer to signals.

In the end, it was considered that as there were so many exceptions to the use of the new signal
with existing signals functions it would be misleading. A special function has resolved this
problem. This function was carefully defined so that an implementation wishing to provide the cancellation functions on top of signals could do so. The special function also means that implementations are not obliged to implement cancellation with signals.

**FUTURE DIRECTIONS**
None.

`pthread_exit`, `pthread_cond_timedwait`, `pthread_join`, `pthread_setcancelstate`, the Base Definitions volume of IEEE Std 1003.1-2001, `<pthread.h>`

**CHANGE HISTORY**
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**
The `pthread_cancel` function is marked as part of the Threads option.
**NAME**

pthread_cleanup_pop, pthread_cleanup_push — establish cancellation handlers

**SYNOPSIS**

```c
#include <pthread.h>
void pthread_cleanup_pop(int execute);
void pthread_cleanup_push(void (*routine)(void*), void *arg);
```

**DESCRIPTION**

The `pthread_cleanup_pop()` function shall remove the routine at the top of the calling thread’s cancellation cleanup stack and optionally invoke it (if `execute` is non-zero).

The `pthread_cleanup_push()` function shall push the specified cancellation cleanup handler `routine` onto the calling thread’s cancellation cleanup stack. The cancellation cleanup handler shall be popped from the cancellation cleanup stack and invoked with the argument `arg` when:

- The thread exits (that is, calls `pthread_exit()`).
- The thread acts upon a cancellation request.
- The thread calls `pthread_cleanup_pop()` with a non-zero `execute` argument.

These functions may be implemented as macros. The application shall ensure that they appear as statements, and in pairs within the same lexical scope (that is, the `pthread_cleanup_push()` macro may be thought to expand to a token list whose first token is ‘{’ with `pthread_cleanup_pop()` expanding to a token list whose last token is the corresponding ‘}’).

The effect of calling `longjmp()` or `siglongjmp()` is undefined if there have been any calls to `pthread_cleanup_push()` or `pthread_cleanup_pop()` made without the matching call since the jump buffer was filled. The effect of calling `longjmp()` or `siglongjmp()` from inside a cancellation cleanup handler is also undefined unless the jump buffer was also filled in the cancellation cleanup handler.

**RETURN VALUE**

The `pthread_cleanup_push()` and `pthread_cleanup_pop()` functions shall not return a value.

**ERRORS**

No errors are defined.

These functions shall not return an error code of [EINVAL].

**EXAMPLES**

The following is an example using thread primitives to implement a cancelable, writers-priority read-write lock:

```c
typedef struct {
    pthread_mutex_t lock;
    pthread_cond_t rcond,
    wcond;
    int lock_count; /* < 0 .. Held by writer. */
    /* > 0 .. Held by lock_count readers. */
    /* = 0 .. Held by nobody. */
    int waiting_writers; /* Count of waiting writers. */
} rwlock;

void
waiting_reader_cleanup(void *arg)
{
```
rwlock *l;
l = (rwlock *) arg;
pthread_mutex_unlock(&l->lock);
}

void
lock_for_read(rwlock *l)
{
    pthread_mutex_lock(&l->lock);
    pthread_cleanup_push(waiting_readerCleanup, l);
    while ((l->lock_count < 0) && (l->waiting_writers != 0))
        pthread_cond_wait(&l->rcond, &l->lock);
    l->lock_count++;
    /*
    * Note the pthread_cleanup_pop executes
    * waiting_readerCleanup.
    */
    pthread_cleanup_pop(1);
}

void
release_read_lock(rwlock *l)
{
    pthread_mutex_lock(&l->lock);
    if (--l->lock_count == 0)
        pthread_cond_signal(&l->wcond);
    pthread_mutex_unlock(l);
}

    pthread_cleanup_pop(1);
}
APPLICATION USAGE

The two routines that push and pop cancellation cleanup handlers, `pthread_cleanup_push()` and `pthread_cleanup_pop()`, can be thought of as left and right parentheses. They always need to be matched.

RATIONALE

The restriction that the two routines that push and pop cancellation cleanup handlers, `pthread_cleanup_push()` and `pthread_cleanup_pop()`, have to appear in the same lexical scope allows for efficient macro or compiler implementations and efficient storage management. A sample implementation of these routines as macros might look like this:

```c
#define pthread_cleanup_push(rtn, arg) { \
    struct _pthread_handler_rec __cleanup_handler, **__head; \n    __cleanup_handler.rtn = rtn; \n    __cleanup_handler.arg = arg; \n    (void) pthread_getspecific(_ pthread_handler_key, &__head); \n    __cleanup_handler.next = *__head; \n    *__head = &__cleanup_handler; \
} \
#define pthread_cleanup_pop(ex) \n    *__head = __cleanup_handler.next; \n    if (ex) (*__cleanup_handler.rtn)(__cleanup_handler.arg); \n}
```

A more ambitious implementation of these routines might do even better by allowing the compiler to note that the cancellation cleanup handler is a constant and can be expanded inline.

This volume of IEEE Std 1003.1-2001 currently leaves unspecified the effect of calling `longjmp()` from a signal handler executing in a POSIX System Interfaces function. If an implementation wants to allow this and give the programmer reasonable behavior, the `longjmp()` function has to call all cancellation cleanup handlers that have been pushed but not popped since the time `setjmp()` was called.

Consider a multi-threaded function called by a thread that uses signals. If a signal were delivered to a signal handler during the operation of `qsort()` and that handler were to call `longjmp()` (which, in turn, did not call the cancellation cleanup handlers) the helper threads created by the `qsort()` function would not be canceled. Instead, they would continue to execute and write into the argument array even though the array might have been popped off the stack.

Note that the specified cleanup handling mechanism is especially tied to the C language and, while the requirement for a uniform mechanism for expressing cleanup is language-independent, the mechanism used in other languages may be quite different. In addition, this mechanism is really only necessary due to the lack of a real exception mechanism in the C language, which would be the ideal solution.

There is no notion of a cancellation cleanup-safe function. If an application has no cancellation points in its signal handlers, blocks any signal whose handler may have cancellation points while calling async-unsafe functions, or disables cancellation while calling async-unsafe functions, all functions may be safely called from cancellation cleanup routines.

FUTURE DIRECTIONS

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The `pthread_cleanup_pop()` and `pthread_cleanup_push()` functions are marked as part of the Threads option.

The APPLICATION USAGE section is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME

pthread_cond_broadcast, pthread_cond_signal — broadcast or signal a condition

SYNOPSIS

THR

```c
#include <pthread.h>

int pthread_cond_broadcast(pthread_cond_t *cond);
int pthread_cond_signal(pthread_cond_t *cond);
```

DESCRIPTION

These functions shall unblock threads blocked on a condition variable.

The `pthread_cond_broadcast()` function shall unblock all threads currently blocked on the specified condition variable `cond`.

The `pthread_cond_signal()` function shall unblock at least one of the threads that are blocked on the specified condition variable `cond` (if any threads are blocked on `cond`).

If more than one thread is blocked on a condition variable, the scheduling policy shall determine the order in which threads are unblocked. When each thread unblocked as a result of a `pthread_cond_broadcast()` or `pthread_cond_signal()` returns from its call to `pthread_cond_wait()` or `pthread_cond_timedwait()`, the thread shall own the mutex with which it called `pthread_cond_wait()` or `pthread_cond_timedwait()`. The thread(s) that are unblocked shall contend for the mutex according to the scheduling policy (if applicable), and as if each had called `pthread_mutex_lock()`.

The `pthread_cond_broadcast()` or `pthread_cond_signal()` functions may be called by a thread whether or not it currently owns the mutex that threads calling `pthread_cond_wait()` or `pthread_cond_timedwait()` have associated with the condition variable during their waits; however, if predictable scheduling behavior is required, then that mutex shall be locked by the thread calling `pthread_cond_broadcast()` or `pthread_cond_signal()`.

The `pthread_cond_broadcast()` and `pthread_cond_signal()` functions shall have no effect if there are no threads currently blocked on `cond`.

RETURN VALUE

If successful, the `pthread_cond_broadcast()` and `pthread_cond_signal()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_cond_broadcast()` and `pthread_cond_signal()` function may fail if:

- `[EINVAL]` The value `cond` does not refer to an initialized condition variable.

These functions shall not return an error code of `[EINTR]`.

EXAMPLES

None.

APPLICATION USAGE

The `pthread_cond_broadcast()` function is used whenever the shared-variable state has been changed in a way that more than one thread can proceed with its task. Consider a single producer/multiple consumer problem, where the producer can insert multiple items on a list that is accessed one item at a time by the consumers. By calling the `pthread_cond_broadcast()` function, the producer would notify all consumers that might be waiting, and thereby the application would receive more throughput on a multi-processor. In addition, `pthread_cond_broadcast()` makes it easier to implement a read-write lock. The `pthread_cond_broadcast()` function is needed in order to wake up all waiting readers when a
writer releases its lock. Finally, the two-phase commit algorithm can use this broadcast function
to notify all clients of an impending transaction commit.

It is not safe to use the `pthread_cond_signal()` function in a signal handler that is invoked
asynchronously. Even if it were safe, there would still be a race between the test of the Boolean
`pthread_cond_wait()` that could not be efficiently eliminated.

Mutexes and condition variables are thus not suitable for releasing a waiting thread by signaling
from code running in a signal handler.

**RATIONALE**

**Multiple awakenings by condition signal**

On a multi-processor, it may be impossible for an implementation of `pthread_cond_signal()` to
avoid the unblocking of more than one thread blocked on a condition variable. For example,
consider the following partial implementation of `pthread_cond_wait()` and `pthread_cond_signal()`,
executed by two threads in the order given. One thread is trying to wait on the condition
variable, another is concurrently executing `pthread_cond_signal()`, while a third thread is already
waiting.

```c
pthread_cond_wait(mutex, cond):
  value = cond->value; /* 1 */
  pthread_mutex_unlock(mutex); /* 2 */
  pthread_mutex_lock(cond->mutex); /* 10 */
  if (value == cond->value) { /* 11 */
    me->next_cond = cond->waiter;
    cond->waiter = me;
    pthread_mutex_unlock(cond->mutex);
    unable_to_run(me);
  } else
    pthread_mutex_unlock(cond->mutex); /* 12 */
  pthread_mutex_lock(mutex); /* 13 */

pthread_cond_signal(cond):
  pthread_mutex_lock(cond->mutex); /* 3 */
  cond->value++; /* 4 */
  if (cond->waiter) { /* 5 */
    sleeper = cond->waiter; /* 6 */
    cond->waiter = sleeper->next_cond; /* 7 */
    able_to_run(sleeper); /* 8 */
  }
  pthread_mutex_unlock(cond->mutex); /* 9 */
```

The effect is that more than one thread can return from its call to `pthread_cond_wait()` or
`pthread_cond_timedwait()` as a result of one call to `pthread_cond_signal()`. This effect is called
“spurious wakeup”. Note that the situation is self-correcting in that the number of threads that
are so awakened is finite; for example, the next thread to call `pthread_cond_wait()` after the
sequence of events above blocks.

While this problem could be resolved, the loss of efficiency for a fringe condition that occurs
only rarely is unacceptable, especially given that one has to check the predicate associated with a
condition variable anyway. Correcting this problem would unnecessarily reduce the degree of
concurrency in this basic building block for all higher-level synchronization operations.

An added benefit of allowing spurious wakeups is that applications are forced to code a
predicate-testing-loop around the condition wait. This also makes the application tolerate
superfluous condition broadcasts or signals on the same condition variable that may be coded in
some other part of the application. The resulting applications are thus more robust. Therefore,
IEEE Std 1003.1-2001 explicitly documents that spurious wakeups may occur.

FUTURE DIRECTIONS
None.

Threads option.
The APPLICATION USAGE section is added.
NAME

pthread_cond_destroy, pthread_cond_init — destroy and initialize condition variables

SYNOPSIS

THR  #include <pthread.h>

int pthread_cond_destroy(pthread_cond_t *cond);
int pthread_cond_init(pthread_cond_t *restrict cond,
                      const pthread_condattr_t *restrict attr);

pthread_cond_t cond = PTHREAD_COND_INITIALIZER;

DESCRIPTION

The pthread_cond_destroy() function shall destroy the given condition variable specified by cond; the object becomes, in effect, uninitialized. An implementation may cause pthread_cond_destroy() to set the object referenced by cond to an invalid value. A destroyed condition variable object can be reinitialized using pthread_cond_init(); the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized condition variable upon which no threads are currently blocked. Attempting to destroy a condition variable upon which other threads are currently blocked results in undefined behavior.

The pthread_cond_init() function shall initialize the condition variable referenced by cond with attributes referenced by attr. If attr is NULL, the default condition variable attributes shall be used; the effect is the same as passing the address of a default condition variable attributes object. Upon successful initialization, the state of the condition variable shall become initialized.

Only cond itself may be used for performing synchronization. The result of referring to copies of cond in calls to pthread_cond_wait(), pthread_cond_timedwait(), pthread_cond_signal(), pthread_cond_broadcast(), and pthread_cond_destroy() is undefined.

Attempting to initialize an already initialized condition variable results in undefined behavior.

In cases where default condition variable attributes are appropriate, the macro PTHREAD_COND_INITIALIZER can be used to initialize condition variables that are statically allocated. The effect shall be equivalent to dynamic initialization by a call to pthread_cond_init() with parameter attr specified as NULL, except that no error checks are performed.

RETURN VALUE

If successful, the pthread_cond_destroy() and pthread_cond_init() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

The [EBUSY] and [EINVAL] error checks, if implemented, shall act as if they were performed immediately at the beginning of processing for the function and caused an error return prior to modifying the state of the condition variable specified by cond.

ERRORS

The pthread_cond_destroy() function may fail if:

[EBUSY] The implementation has detected an attempt to destroy the object referenced by cond while it is referenced (for example, while being used in a pthread_cond_wait() or pthread_cond_timedwait()) by another thread.

[EINVAL] The value specified by cond is invalid.

The pthread_cond_init() function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another condition variable.
The `pthread_cond_destroy()` function may fail if:

- **[ENOMEM]** Insufficient memory exists to initialize the condition variable.
- **[EBUSY]** The implementation has detected an attempt to reinitialize the object referenced by `cond`, a previously initialized, but not yet destroyed, condition variable.
- **[EINVAL]** The value specified by `attr` is invalid.

These functions shall not return an error code of **[EINTR]**.

**EXAMPLES**

A condition variable can be destroyed immediately after all the threads that are blocked on it are awakened. For example, consider the following code:

```c
struct list {
    pthread_mutex_t lm;
    ...
}

struct elt {
    key k;
    int busy;
    pthread_cond_t notbusy;
    ...
}

/* Find a list element and reserve it. */
struct elt *
list_find(struct list *lp, key k)
{
    struct elt *ep;
    pthread_mutex_lock(&lp->lm);
    while ((ep = find_elt(l, k) != NULL) && ep->busy)
       pthread_cond_wait(&ep->notbusy, &lp->lm);
    if (ep != NULL)
       ep->busy = 1;
    pthread_mutex_unlock(&lp->lm);
    return(ep);
}

delete_elt(struct list *lp, struct elt *ep)
{
    pthread_mutex_lock(&lp->lm);
    assert(ep->busy);
    ... remove ep from list ...
    ep->busy = 0; /* Paranoid. */
    (A) pthread_cond_broadcast(&ep->notbusy);
    pthread_mutex_unlock(&lp->lm);
    (B) pthread_cond_destroy(&ep->notbusy);
    free(ep);
}
```

In this example, the condition variable and its list element may be freed (line B) immediately after all threads waiting for it are awakened (line A), since the mutex and the code ensure that no other thread can touch the element to be deleted.

DESCRIPTION

Refer to pthread_cond_broadcast().
NAME

pthread_cond_timedwait, pthread_cond_wait — wait on a condition

SYNOPSIS

THR

#include <pthread.h>

int pthread_cond_timedwait(pthread_cond_t *restrict cond,
               pthread_mutex_t *restrict mutex,
               const struct timespec *restrict abstime);

int pthread_cond_wait(pthread_cond_t *restrict cond,
               pthread_mutex_t *restrict mutex);

DESCRIPTION

The pthread_cond_timedwait() and pthread_cond_wait() functions shall block on a condition variable. They shall be called with mutex locked by the calling thread or undefined behavior results.

These functions atomically release mutex and cause the calling thread to block on the condition variable cond; atomically here means ‘atomically with respect to access by another thread to the mutex and then the condition variable’. That is, if another thread is able to acquire the mutex after the about-to-block thread has released it, then a subsequent call to pthread_cond_broadcast() or pthread_cond_signal() in that thread shall behave as if it were issued after the about-to-block thread has blocked.

Upon successful return, the mutex shall have been locked and shall be owned by the calling thread.

When using condition variables there is always a Boolean predicate involving shared variables associated with each condition wait that is true if the thread should proceed. Spurious wakeups from the pthread_cond_timedwait() or pthread_cond_wait() functions may occur. Since the return from pthread_cond_timedwait() or pthread_cond_wait() does not imply anything about the value of this predicate, the predicate should be re-evaluated upon such return.

The effect of using more than one mutex for concurrent pthread_cond_timedwait() or pthread_cond_wait() operations on the same condition variable is undefined; that is, a condition variable becomes bound to a unique mutex when a thread waits on the condition variable, and this (dynamic) binding shall end when the wait returns.

A condition wait (whether timed or not) is a cancellation point. When the cancelability enable state of a thread is set to PTHREAD_CANCEL_DEFERRED, a side effect of acting upon a cancellation request while in a condition wait is that the mutex is (in effect) re-acquired before calling the first cancellation cleanup handler. The effect is as if the thread were unblocked, allowed to execute up to the point of returning from the call to pthread_cond_timedwait() or pthread_cond_wait(), but at that point notices the cancellation request and instead of returning to the caller of pthread_cond_timedwait() or pthread_cond_wait(), starts the thread cancellation activities, which includes calling cancellation cleanup handlers.

A thread that has been unblocked because it has been canceled while blocked in a call to pthread_cond_timedwait() or pthread_cond_wait() shall not consume any condition signal that may be directed concurrently at the condition variable if there are other threads blocked on the condition variable.

The pthread_cond_timedwait() function shall be equivalent to pthread_cond_wait(), except that an error is returned if the absolute time specified by abstime passes (that is, system time equals or exceeds abstime) before the condition cond is signaled or broadcasted, or if the absolute time specified by abstime has already been passed at the time of the call.
If the Clock Selection option is supported, the condition variable shall have a clock attribute which specifies the clock that shall be used to measure the time specified by the \textit{abstime} argument. When such timeouts occur, \texttt{pthread_cond_timedwait()} shall nonetheless release and re-acquire the mutex referenced by \textit{mutex}. The \texttt{pthread_cond_timedwait()} function is also a cancellation point.

If a signal is delivered to a thread waiting for a condition variable, upon return from the signal handler the thread resumes waiting for the condition variable as if it was not interrupted, or it shall return zero due to spurious wakeup.

**RETURN VALUE**

Except in the case of \[ETIMEDOUT\], all these error checks shall act as if they were performed immediately at the beginning of processing for the function and shall cause an error return, in effect, prior to modifying the state of the mutex specified by \textit{mutex} or the condition variable specified by \textit{cond}.

Upon successful completion, a value of zero shall be returned; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The \texttt{pthread_cond_timedwait()} function shall fail if:

- \[ETIMEDOUT\] The time specified by \textit{abstime} to \texttt{pthread_cond_timedwait()} has passed.

- \[EINVAL\] The value specified by \textit{cond}, \textit{mutex}, or \textit{abstime} is invalid.

- \[EINVAL\] Different mutexes were supplied for concurrent \texttt{pthread_cond_timedwait()} or \texttt{pthread_cond_wait()} operations on the same condition variable.

- \[EPERM\] The mutex was not owned by the current thread at the time of the call.

These functions shall not return an error code of \[EINTR\].

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

**Condition Wait Semantics**

It is important to note that when \texttt{pthread_cond_wait()} and \texttt{pthread_cond_timedwait()} return without error, the associated predicate may still be false. Similarly, when \texttt{pthread_cond_timedwait()} returns with the timeout error, the associated predicate may be true due to an unavoidable race between the expiration of the timeout and the predicate state change.

Some implementations, particularly on a multi-processor, may sometimes cause multiple threads to wake up when the condition variable is signaled simultaneously on different processors.

In general, whenever a condition wait returns, the thread has to re-evaluate the predicate associated with the condition wait to determine whether it can safely proceed, should wait again, or should declare a timeout. A return from the wait does not imply that the associated predicate is either true or false.

It is thus recommended that a condition wait be enclosed in the equivalent of a “while loop” that checks the predicate.
Timed Wait Semantics

An absolute time measure was chosen for specifying the timeout parameter for two reasons.
First, a relative time measure can be easily implemented on top of a function that specifies
absolute time, but there is a race condition associated with specifying an absolute timeout on top
of a function that specifies relative timeouts. For example, assume that `clock_gettime()` returns
the current time and `cond_relative_timed_wait()` uses relative timeouts:

```c
clock_gettime(CLOCK_REALTIME, &now)
reltime = sleep_til_this_absolute_time -now;
cond_relative_timed_wait(c, m, &reltime);
```

If the thread is preempted between the first statement and the last statement, the thread blocks
for too long. Blocking, however, is irrelevant if an absolute timeout is used. An absolute timeout
also need not be recomputed if it is used multiple times in a loop, such as that enclosing a
condition wait.

For cases when the system clock is advanced discontinuously by an operator, it is expected that
implementations process any timed wait expiring at an intervening time as if that time had
actually occurred.

Cancellation and Condition Wait

A condition wait, whether timed or not, is a cancellation point. That is, the functions
`pthread_cond_wait()` or `pthread_cond_timedwait()` are points where a pending (or concurrent)
cancellation request is noticed. The reason for this is that an indefinite wait is possible at these
points—whatever event is being waited for, even if the program is totally correct, might never
occur; for example, some input data being awaited might never be sent. By making condition
wait a cancellation point, the thread can be canceled and perform its cancellation cleanup
handler even though it may be stuck in some indefinite wait.

A side effect of acting on a cancellation request while a thread is blocked on a condition variable
is to re-acquire the mutex before calling any of the cancellation cleanup handlers. This is done in
order to ensure that the cancellation cleanup handler is executed in the same state as the critical
code that lies both before and after the call to the condition wait function. This rule is also
required when interfacing to POSIX threads from languages, such as Ada or C++, which may
choose to map cancellation onto a language exception; this rule ensures that each exception
handler guarding a critical section can always safely depend upon the fact that the associated
mutex has already been locked regardless of exactly where within the critical section the
exception was raised. Without this rule, there would not be a uniform rule that exception
handlers could follow regarding the lock, and so coding would become very cumbersome.

Therefore, since some statement has to be made regarding the state of the lock when a
cancellation is delivered during a wait, a definition has been chosen that makes application
coding most convenient and error free.

When acting on a cancellation request while a thread is blocked on a condition variable, the
implementation is required to ensure that the thread does not consume any condition signals
directed at that condition variable if there are any other threads waiting on that condition
variable. This rule is specified in order to avoid deadlock conditions that could occur if these two
independent requests (one acting on a thread and the other acting on the condition variable)
were not processed independently.
Performance of Mutexes and Condition Variables

Mutexes are expected to be locked only for a few instructions. This practice is almost automatically enforced by the desire of programmers to avoid long serial regions of execution (which would reduce total effective parallelism).

When using mutexes and condition variables, one tries to ensure that the usual case is to lock the mutex, access shared data, and unlock the mutex. Waiting on a condition variable should be a relatively rare situation. For example, when implementing a read-write lock, code that acquires a read-lock typically needs only to increment the count of readers (under mutual-exclusion) and return. The calling thread would actually wait on the condition variable only when there is already an active writer. So the efficiency of a synchronization operation is bounded by the cost of mutex lock/unlock and not by condition wait. Note that in the usual case there is no context switch.

This is not to say that the efficiency of condition waiting is unimportant. Since there needs to be at least one context switch per Ada rendezvous, the efficiency of waiting on a condition variable is important. The cost of waiting on a condition variable should be little more than the minimal cost for a context switch plus the time to unlock and lock the mutex.

Features of Mutexes and Condition Variables

It had been suggested that the mutex acquisition and release be decoupled from condition wait. This was rejected because it is the combined nature of the operation that, in fact, facilitates realtime implementations. Those implementations can atomically move a high-priority thread between the condition variable and the mutex in a manner that is transparent to the caller. This can prevent extra context switches and provide more deterministic acquisition of a mutex when the waiting thread is signaled. Thus, fairness and priority issues can be dealt with directly by the scheduling discipline. Furthermore, the current condition wait operation matches existing practice.

Scheduling Behavior of Mutexes and Condition Variables

Synchronization primitives that attempt to interfere with scheduling policy by specifying an ordering rule are considered undesirable. Threads waiting on mutexes and condition variables are selected to proceed in an order dependent upon the scheduling policy rather than in some fixed order (for example, FIFO or priority). Thus, the scheduling policy determines which thread(s) are awakened and allowed to proceed.

Timed Condition Wait

The pthread_cond_timedwait() function allows an application to give up waiting for a particular condition after a given amount of time. An example of its use follows:

```c
(void) pthread_mutex_lock(&t.mn);
    t.waiters++;
    clock_gettime(CLOCK_REALTIME, &ts);
    ts.tv_sec += 5;
    rc = 0;
    while (! mypredicate(&t) && rc == 0)
        rc = pthread_cond_timedwait(&t.cond, &t.mn, &ts);
    t.waiters--;
    if (rc == 0) setmystate(&t);
(void) pthread_mutex_unlock(&t.mn);
```
By making the timeout parameter absolute, it does not need to be recomputed each time the program checks its blocking predicate. If the timeout was relative, it would have to be recomputed before each call. This would be especially difficult since such code would need to take into account the possibility of extra wakeups that result from extra broadcasts or signals on the condition variable that occur before either the predicate is true or the timeout is due.

FUTURE DIRECTIONS

The pthread_cond_timedwait() and pthread_cond_wait() functions are marked as part of the Threads option.

The Open Group Corrigendum U021/9 is applied, correcting the prototype for the pthread_cond_wait() function.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding semantics for the Clock Selection option.

The ERRORS section has an additional case for [EPERM] in response to IEEE PASC Interpretation 1003.1c #28.

The restrict keyword is added to the pthread_cond_timedwait() and pthread_cond_wait() prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME

pthread_condattr_destroy, pthread_condattr_init — destroy and initialize the condition variable attributes object

SYNOPSIS

THR

#include <pthread.h>

int pthread_condattr_destroy(pthread_condattr_t *attr);

int pthread_condattr_init(pthread_condattr_t *attr);

DESCRIPTION

The pthread_condattr_destroy() function shall destroy a condition variable attributes object; the object becomes, in effect, uninitialized. An implementation may cause pthread_condattr_destroy() to set the object referenced by attr to an invalid value. A destroyed attr attributes object can be reinitialized using pthread_condattr_init(); the results of otherwise referencing the object after it has been destroyed are undefined.

The pthread_condattr_init() function shall initialize a condition variable attributes object attr with the default value for all of the attributes defined by the implementation.

Results are undefined if pthread_condattr_init() is called specifying an already initialized attr attributes object.

After a condition variable attributes object has been used to initialize one or more condition variables, any function affecting the attributes object (including destruction) shall not affect any previously initialized condition variables.

This volume of IEEE Std 1003.1-2001 requires two attributes, the clock attribute and the process-shared attribute.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

RETURN VALUE

If successful, the pthread_condattr_destroy() and pthread_condattr_init() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_condattr_destroy() function may fail if:

EINVAL The value specified by attr is invalid.

The pthread_condattr_init() function shall fail if:

ENOMEM Insufficient memory exists to initialize the condition variable attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

NAME

pthread_condattr_getclock, pthread_condattr_setclock — get and set the clock selection condition variable attribute (ADVANCED REALTIME)

SYNOPSIS

THR CS
#include <pthread.h>

int pthread_condattr_getclock(const pthread_condattr_t *restrict attr,
clockid_t *restrict clock_id);

int pthread_condattr_setclock(pthread_condattr_t *attr,
clockid_t clock_id);

DESCRIPTION

The pthread_condattr_getclock() function shall obtain the value of the clock attribute from the attributes object referenced by attr. The pthread_condattr_setclock() function shall set the clock attribute in an initialized attributes object referenced by attr. If pthread_condattr_setclock() is called with a clock_id argument that refers to a CPU-time clock, the call shall fail.

The clock attribute is the clock ID of the clock that shall be used to measure the timeout service of pthread_cond_timedwait(). The default value of the clock attribute shall refer to the system clock.

RETURN VALUE

If successful, the pthread_condattr_getclock() function shall return zero and store the value of the clock attribute of attr into the object referenced by the clock_id argument. Otherwise, an error number shall be returned to indicate the error.

If successful, the pthread_condattr_setclock() function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value specified by attr is invalid.

The pthread_condattr_setclock() function may fail if:

[EINVAL] The value specified by clock_id does not refer to a known clock, or is a CPU-time clock.

These functions shall not return an error code of [EINTR].

EXAMPLES

NAME

pthread_condattr_getpshared, pthread_condattr_setpshared — get and set the process-shared condition variable attributes

SYNOPSIS

#include <pthread.h>

int pthread_condattr_getpshared(const pthread_condattr_t *restrict attr,
    int *restrict pshared);

int pthread_condattr_setpshared(pthread_condattr_t *attr,
    int pshared);

DESCRIPTION

The pthread_condattr_getpshared() function shall obtain the value of the process-shared attribute from the attributes object referenced by attr. The pthread_condattr_setpshared() function shall set the process-shared attribute in an initialized attributes object referenced by attr.

The process-shared attribute is set to PTHREAD_PROCESS_SHARED to permit a condition variable to be operated upon by any thread that has access to the memory where the condition variable is allocated, even if the condition variable is allocated in memory that is shared by multiple processes. If the process-shared attribute is PTHREAD_PROCESS_PRIVATE, the condition variable shall only be operated upon by threads created within the same process as the thread that initialized the condition variable; if threads of differing processes attempt to operate on such a condition variable, the behavior is undefined. The default value of the attribute is PTHREAD_PROCESS_PRIVATE.

RETURN VALUE

If successful, the pthread_condattr_setpshared() function shall return zero; otherwise, an error number shall be returned to indicate the error.

If successful, the pthread_condattr_getpshared() function shall return zero and store the value of the process-shared attribute of attr into the object referenced by the pshared parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_condattr_getpshared() and pthread_condattr_setpshared() functions may fail if:

[EINVAL] The value specified by attr is invalid.

The pthread_condattr_setpshared() function may fail if:

[EINVAL] The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of [EINTR].

NAME

pthread_create — thread creation

SYNOPSIS

#include <pthread.h>

int pthread_create(pthread_t *restrict thread,
                  const pthread_attr_t *restrict attr,
                  void *(*start_routine)(void*), void *restrict arg);

DESCRIPTION

The pthread_create() function shall create a new thread, with attributes specified by attr, within a
process. If attr is NULL, the default attributes shall be used. If the attributes specified by attr are
modified later, the thread’s attributes shall not be affected. Upon successful completion, pthread_create() shall store the ID of the created thread in the location referenced by thread.

The thread is created executing start_routine with arg as its sole argument. If the start_routine
returns, the effect shall be as if there was an implicit call to pthread_exit() using the return value
of start_routine as the exit status. Note that the thread in which main() was originally invoked
differs from this. When it returns from main(), the effect shall be as if there was an implicit call
to exit() using the return value of main() as the exit status.

The signal state of the new thread shall be initialized as follows:

- The signal mask shall be inherited from the creating thread.
- The set of signals pending for the new thread shall be empty.
- The alternate stack shall not be inherited.
- The floating-point environment shall be inherited from the creating thread.

If pthread_create() fails, no new thread is created and the contents of the location referenced by
thread are undefined.

If _POSIX_THREAD_CPUTIME is defined, the new thread shall have a CPU-time clock
accessible, and the initial value of this clock shall be set to zero.

RETURN VALUE

If successful, the pthread_create() function shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS

The pthread_create() function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread, or the
system-imposed limit on the total number of threads in a process
[PTHREAD_THREADS_MAX] would be exceeded.

[EINVAL] The value specified by attr is invalid.

[EPERM] The caller does not have appropriate permission to set the required
scheduling parameters or scheduling policy.

The pthread_create() function shall not return an error code of [EINTR].
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
A suggested alternative to pthread_create() would be to define two separate operations: create and start. Some applications would find such behavior more natural. Ada, in particular, separates the “creation” of a task from its “activation.”

Splitting the operation was rejected by the standard developers for many reasons:

- The number of calls required to start a thread would increase from one to two and thus place an additional burden on applications that do not require the additional synchronization. The second call, however, could be avoided by the additional complication of a start-up state attribute.
- An extra state would be introduced: “created but not started”. This would require the standard to specify the behavior of the thread operations when the target has not yet started executing.
- For those applications that require such behavior, it is possible to simulate the two separate steps with the facilities that are currently provided. The start_routine() can synchronize by waiting on a condition variable that is signaled by the start operation.

An Ada implementor can choose to create the thread at either of two points in the Ada program: when the task object is created, or when the task is activated (generally at a “begin”). If the first approach is adopted, the start_routine() needs to wait on a condition variable to receive the order to begin “activation”. The second approach requires no such condition variable or extra synchronization. In either approach, a separate Ada task control block would need to be created when the task object is created to hold rendezvous queues, and so on.

An extension of the preceding model would be to allow the state of the thread to be modified between the create and start. This would allow the thread attributes object to be eliminated. This has been rejected because:

- All state in the thread attributes object has to be able to be set for the thread. This would require the definition of functions to modify thread attributes. There would be no reduction in the number of function calls required to set up the thread. In fact, for an application that creates all threads using identical attributes, the number of function calls required to set up the threads would be dramatically increased. Use of a thread attributes object permits the application to make one set of attribute setting function calls. Otherwise, the set of attribute setting function calls needs to be made for each thread creation.
- Depending on the implementation architecture, functions to set thread state would require kernel calls, or for other implementation reasons would not be able to be implemented as macros, thereby increasing the cost of thread creation.
- The ability for applications to segregate threads by class would be lost.

Another suggested alternative uses a model similar to that for process creation, such as “thread fork”. The fork semantics would provide more flexibility and the “create” function can be implemented simply by doing a thread fork followed immediately by a call to the desired “start routine” for the thread. This alternative has these problems:

- For many implementations, the entire stack of the calling thread would need to be duplicated, since in many architectures there is no way to determine the size of the calling frame.
 pthread_create()  

• Efficiency is reduced since at least some part of the stack has to be copied, even though in most cases the thread never needs the copied context, since it merely calls the desired start routine.

FUTURE DIRECTIONS
None.

<pthread.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The pthread_create() function is marked as part of the Threads option.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The [EPERM] mandatory error condition is added.
The thread CPU-time clock semantics are added for alignment with IEEE Std 1003.1d-1999.
The restrict keyword is added to the pthread_create() prototype for alignment with the ISO/IEC 9899:1999 standard.
The DESCRIPTION is updated to make it explicit that the floating-point environment is inherited from the creating thread.
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/44 is applied, adding text that the alternate stack is not inherited.
NAME
pthread_detach — detach a thread

SYNOPSIS
#include <pthread.h>

int pthread_detach(pthread_t thread);

DESCRIPTION
The pthread_detach() function shall indicate to the implementation that storage for the thread thread can be reclaimed when that thread terminates. If thread has not terminated, pthread_detach() shall not cause it to terminate. The effect of multiple pthread_detach() calls on the same target thread is unspecified.

RETURN VALUE
If the call succeeds, pthread_detach() shall return 0; otherwise, an error number shall be returned to indicate the error.

ERRORS
The pthread_detach() function shall fail if:

[EINVAL] The implementation has detected that the value specified by thread does not refer to a joinable thread.

[ESRCH] No thread could be found corresponding to that specified by the given thread ID.

The pthread_detach() function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The pthread_join() or pthread_detach() functions should eventually be called for every thread that is created so that storage associated with the thread may be reclaimed.

It has been suggested that a “detach” function is not necessary; the detachstate thread creation attribute is sufficient, since a thread need never be dynamically detached. However, need arises in at least two cases:

1. In a cancellation handler for a pthread_join() it is nearly essential to have a pthread_detach() function in order to detach the thread on which pthread_join() was waiting. Without it, it would be necessary to have the handler do another pthread_join() to attempt to detach the thread, which would both delay the cancellation processing for an unbounded period and introduce a new call to pthread_join(), which might itself need a cancellation handler. A dynamic detach is nearly essential in this case.

2. In order to detach the “initial thread” (as may be desirable in processes that set up server threads).

FUTURE DIRECTIONS
None.

NAME
pthread_equal — compare thread IDs

SYNOPSIS
THR
#include <pthread.h>

int pthread_equal(pthread_t t1, pthread_t t2);

DESCRIPTION
This function shall compare the thread IDs t1 and t2.

RETURN VALUE
The pthread_equal() function shall return a non-zero value if t1 and t2 are equal; otherwise, zero shall be returned.

If either t1 or t2 are not valid thread IDs, the behavior is undefined.

ERRORS
No errors are defined.

The pthread_equal() function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Implementations may choose to define a thread ID as a structure. This allows additional flexibility and robustness over using an int. For example, a thread ID could include a sequence number that allows detection of “dangling IDs” (copies of a thread ID that has been detached). Since the C language does not support comparison on structure types, the pthread_equal() function is provided to compare thread IDs.

FUTURE DIRECTIONS
None.

Issue 6
The pthread_equal() function is marked as part of the Threads option.
NAME

pthread_exit — thread termination

SYNOPSIS

```
#include <pthread.h>

void pthread_exit(void *value_ptr);
```

DESCRIPTION

The pthread_exit() function shall terminate the calling thread and make the value value_ptr available to any successful join with the terminating thread. Any cancellation cleanup handlers that have been pushed and not yet popped shall be popped in the reverse order that they were pushed and then executed. After all cancellation cleanup handlers have been executed, if the thread has any thread-specific data, appropriate destructor functions shall be called in an unspecified order. Thread termination does not release any application visible process resources, including, but not limited to, mutexes and file descriptors, nor does it perform any process-level cleanup actions, including, but not limited to, calling any atexit() routines that may exist.

An implicit call to pthread_exit() is made when a thread other than the thread in which main() was first invoked returns from the start routine that was used to create it. The function’s return value shall serve as the thread’s exit status.

The behavior of pthread_exit() is undefined if called from a cancellation cleanup handler or destructor function that was invoked as a result of either an implicit or explicit call to pthread_exit().

After a thread has terminated, the result of access to local (auto) variables of the thread is undefined. Thus, references to local variables of the exiting thread should not be used for the pthreadExit(value_ptr) parameter value.

The process shall exit with an exit status of 0 after the last thread has been terminated. The behavior shall be as if the implementation called exit() with a zero argument at thread termination time.

RETURN VALUE

The pthread_exit() function cannot return to its caller.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The normal mechanism by which a thread terminates is to return from the routine that was specified in the pthread_create() call that started it. The pthread_exit() function provides the capability for a thread to terminate without requiring a return from the start routine of that thread, thereby providing a function analogous to exit().

Regardless of the method of thread termination, any cancellation cleanup handlers that have been pushed and not yet popped are executed, and the destructors for any existing thread-specific data are executed. This volume of IEEE Std 1003.1-2001 requires that cancellation cleanup handlers be popped and called in order. After all cancellation cleanup handlers have been executed, thread-specific data destructors are called, in an unspecified order, for each item of thread-specific data that exists in the thread. This ordering is necessary because cancellation...
cleanup handlers may rely on thread-specific data.

As the meaning of the status is determined by the application (except when the thread has been canceled, in which case it is PTHREAD_CANCELED), the implementation has no idea what an illegal status value is, which is why no address error checking is done.

FUTURE DIRECTIONS

None.

The pthread_exit() function is marked as part of the Threads option.
NAME

pthread_getconcurrency, pthread_setconcurrency — get and set the level of concurrency

SYNOPSIS

XSI

```c
#include <pthread.h>

int pthread_getconcurrency(void);
int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Unbound threads in a process may or may not be required to be simultaneously active. By default, the threads implementation ensures that a sufficient number of threads are active so that the process can continue to make progress. While this conserves system resources, it may not produce the most effective level of concurrency.

The `pthread_setconcurrency()` function allows an application to inform the threads implementation of its desired concurrency level, `new_level`. The actual level of concurrency provided by the implementation as a result of this function call is unspecified.

If `new_level` is zero, it causes the implementation to maintain the concurrency level at its discretion as if `pthread_setconcurrency()` had never been called.

The `pthread_getconcurrency()` function shall return the value set by a previous call to the `pthread_setconcurrency()` function. If the `pthread_setconcurrency()` function was not previously called, this function shall return zero to indicate that the implementation is maintaining the concurrency level.

A call to `pthread_setconcurrency()` shall inform the implementation of its desired concurrency level. The implementation shall use this as a hint, not a requirement.

If an implementation does not support multiplexing of user threads on top of several kernel-scheduled entities, the `pthread_setconcurrency()` and `pthread_getconcurrency()` functions are provided for source code compatibility but they shall have no effect when called. To maintain the function semantics, the `new_level` parameter is saved when `pthread_setconcurrency()` is called so that a subsequent call to `pthread_getconcurrency()` shall return the same value.

RETURN VALUE

If successful, the `pthread_setconcurrency()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

The `pthread_getconcurrency()` function shall always return the concurrency level set by a previous call to `pthread_setconcurrency()`. If the `pthread_setconcurrency()` function has never been called, `pthread_getconcurrency()` shall return zero.

ERRORS

The `pthread_setconcurrency()` function shall fail if:

- [EINVAL] The value specified by `new_level` is negative.
- [EAGAIN] The value specific by `new_level` would cause a system resource to be exceeded.

These functions shall not return an error code of [EINTR].
EXAMPLES
None.

APPLICATION USAGE
Use of these functions changes the state of the underlying concurrency upon which the application depends. Library developers are advised to not use the `pthread_getconcurrency()` and `pthread_setconcurrency()` functions since their use may conflict with an application's use of these functions.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME
pthread_getschedparam, pthread_setschedparam — dynamic thread scheduling parameters
access (REALTIME THREADS)

SYNOPSIS
#include <pthread.h>

int pthread_getschedparam(pthread_t thread, int *restrict policy,
struct sched_param *restrict param);
int pthread_setschedparam(pthread_t thread, int policy,
const struct sched_param *param);

DESCRIPTION
The pthread_getschedparam() and pthread_setschedparam() functions shall, respectively, get and set
the scheduling policy and parameters of individual threads within a multi-threaded process to
be retrieved and set. For SCHED_FIFO and SCHED_RR, the only required member of the
sched_param structure is the priority sched_priority. For SCHED_OTHER, the affected
scheduling parameters are implementation-defined.

The pthread_getschedparam() function shall retrieve the scheduling policy and scheduling
parameters for the thread whose thread ID is given by thread and shall store those values in
policy and param, respectively. The priority value returned from pthread_getschedparam() shall be
the value specified by the most recent pthread_setschedparam(), pthread_setschedprio(), or
pthread_create() call affecting the target thread. It shall not reflect any temporary adjustments to
its priority as a result of any priority inheritance or ceiling functions. The pthread_setschedparam() function shall set the scheduling policy and associated scheduling parameters for the thread
whose thread ID is given by thread to the policy and associated parameters provided in policy
and param, respectively.

The policy parameter may have the value SCHED_OTHER, SCHED_FIFO, or SCHED_RR. The
scheduling parameters for the SCHED_OTHER policy are implementation-defined. The
SCHED_FIFO and SCHED_RR policies shall have a single scheduling parameter, priority.

If _POSIX_THREAD_SPORADIC_SERVER is defined, then the policy argument may have the
value SCHED_SPORADIC, with the exception for the pthread_setschedparam() function that if the
scheduling policy was not SCHED_SPORADIC at the time of the call, it is implementation-
defined whether the function is supported; in other words, the implementation need not allow
the application to dynamically change the scheduling policy to SCHED_SPORADIC. The
sporadic server scheduling policy has the associated parameters sched_ss_low_priority, sched_ss_repl_period, sched_ss_init_budget, sched_priority, and sched_ss_max_repl. The specified
sched_ss_repl_period shall be greater than or equal to the specified sched_ss_init_budget for the
function to succeed; if it is not, then the function shall fail. The value of sched_ss_max_repl shall
be within the inclusive range [1, SS_REPL_MAX]] for the function to succeed; if not, the function
shall fail.

If the pthread_setschedparam() function fails, the scheduling parameters shall not be changed for
the target thread.

RETURN VALUE
If successful, the pthread_getschedparam() and pthread_setschedparam() functions shall return zero;
otherwise, an error number shall be returned to indicate the error.
33377 ERRORS
33378 The `pthread_getschedparam()` function may fail if:
33379 [ESRCH] The value specified by `thread` does not refer to an existing thread.
33380 The `pthread_setschedparam()` function may fail if:
33381 [EINVAL] The value specified by `policy` or one of the scheduling parameters associated
33382 with the scheduling policy `policy` is invalid.
33383 [ENOTSUP] An attempt was made to set the policy or scheduling parameters to an
33384 unsupported value.
33385 [ENOTSUP] An attempt was made to dynamically change the scheduling policy to
33386 SCHED_SPORADIC, and the implementation does not support this change.
33387 [EPERM] The caller does not have the appropriate permission to set either the
33388 scheduling parameters or the scheduling policy of the specified thread.
33389 [EPERM] The implementation does not allow the application to modify one of the
33390 parameters to the value specified.
33391 [ESRCH] The value specified by `thread` does not refer to a existing thread.
33392 These functions shall not return an error code of [EINTR].

33409 The [ENOSYS] error condition has been removed as stubs need not be provided if an
33410 implementation does not support the Thread Execution Scheduling option.
33411 The Open Group Corrigendum U026/2 is applied, correcting the prototype for the
33412 `pthread_setschedparam()` function so that its second argument is of type `int`.
33413 The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.
33414 The `restrict` keyword is added to the `pthread_getschedparam()` prototype for alignment with the
33416 The Open Group Corrigendum U047/1 is applied.
IEEE PASC Interpretation 1003.1 #96 is applied, noting that priority values can also be set by a call to the `pthread_setschedprio()` function.
NAME
pthread_getspecific, pthread_setspecific — thread-specific data management

SYNOPSIS
THR
#include <pthread.h>

void *pthread_getspecific(pthread_key_t key);
int pthread_setspecific(pthread_key_t key, const void *value);

DESCRIPTION
The pthread_getspecific() function shall return the value currently bound to the specified key on behalf of the calling thread.

The pthread_setspecific() function shall associate a thread-specific value with a key obtained via a previous call to pthread_key_create(). Different threads may bind different values to the same key. These values are typically pointers to blocks of dynamically allocated memory that have been reserved for use by the calling thread.

The effect of calling pthread_getspecific() or pthread_setspecific() with a key value not obtained from pthread_key_create() or after key has been deleted with pthread_key_delete() is undefined.

Both pthread_getspecific() and pthread_setspecific() may be called from a thread-specific data destructor function. A call to pthread_getspecific() for the thread-specific data key being destroyed shall return the value NULL, unless the value is changed (after the destructor starts) by a call to pthread_setspecific(). Calling pthread_setspecific() from a thread-specific data destructor routine may result either in lost storage (after at least PTHREAD_DESTRUCTOR_ITERATIONS attempts at destruction) or in an infinite loop.

Both functions may be implemented as macros.

RETURN VALUE
The pthread_getspecific() function shall return the thread-specific data value associated with the given key. If no thread-specific data value is associated with key, then the value NULL shall be returned.

If successful, the pthread_setspecific() function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
No errors are returned from pthread_getspecific().

The pthread_setspecific() function shall fail if:

[ENOMEM] Insufficient memory exists to associate the value with the key.

The pthread_setspecific() function may fail if:

[EINVAL] The key value is invalid.

These functions shall not return an error code of [EINTR].
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Performance and ease-of-use of `pthread_getspecific()` are critical for functions that rely on maintaining state in thread-specific data. Since no errors are required to be detected by it, and since the only error that could be detected is the use of an invalid key, the function to `pthread_getspecific()` has been designed to favor speed and simplicity over error reporting.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The `pthread_getspecific()` and `pthread_setspecific()` functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #3 (Part 6) is applied, updating the DESCRIPTION.
NAME

pthread_join — wait for thread termination

SYNOPSIS

```c
#include <pthread.h>

int pthread_join(pthread_t thread, void **value_ptr);
```

DESCRIPTION

The `pthread_join()` function shall suspend execution of the calling thread until the target `thread` terminates, unless the target `thread` has already terminated. On return from a successful `pthread_join()` call with a non-NULL `value_ptr` argument, the value passed to `pthread_exit()` by the terminating thread shall be made available in the location referenced by `value_ptr`. When a `pthread_join()` returns successfully, the target thread has been terminated. The results of multiple simultaneous calls to `pthread_join()` specifying the same target thread are undefined. If the thread calling `pthread_join()` is canceled, then the target thread shall not be detached.

It is unspecified whether a thread that has exited but remains unjoined counts against `PTHREAD_THREADS_MAX`.

RETURN VALUE

If successful, the `pthread_join()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_join()` function shall fail if:

- **EINVAL** The implementation has detected that the value specified by `thread` does not refer to a joinable thread.
- **ESRCH** No thread could be found corresponding to that specified by the given thread ID.

The `pthread_join()` function may fail if:

- **EDEADLK** A deadlock was detected or the value of `thread` specifies the calling thread.

The `pthread_join()` function shall not return an error code of **EINTR**.

EXAMPLES

An example of thread creation and deletion follows:

```c
typedef struct {
    int *ar;
    long n;
} subarray;

void *
incer(void *arg)
{
    long i;
    for (i = 0; i < ((subarray *)arg)->n; i++)
        ((subarray *)arg)->ar[i]++;
}

int main(void)
{
    int ar[1000000];
```
System Interfaces

33518           pthread_t   th1, th2;
33519           subarray   sb1, sb2;
33520           sb1.ar = &ar[0];
33521           sb1.n = 500000;
33522           (void) pthread_create(&th1, NULL, incer, &sb1);
33523           sb2.ar = &ar[500000];
33524           sb2.n = 500000;
33525           (void) pthread_create(&th2, NULL, incer, &sb2);
33526           (void) pthread_join(th1, NULL);
33527           (void) pthread_join(th2, NULL);
33528           return 0;
33529       }

APPLICATION USAGE

None.

RATIONALE

The pthread_join() function is a convenience that has proven useful in multi-threaded applications. It is true that a programmer could simulate this function if it were not provided by passing extra state as part of the argument to the start_routine(). The terminating thread would set a flag to indicate termination and broadcast a condition that is part of that state; a joining thread would wait on that condition variable. While such a technique would allow a thread to wait on more complex conditions (for example, waiting for multiple threads to terminate), waiting on individual thread termination is considered widely useful. Also, including the pthread_join() function in no way precludes a programmer from coding such complex waits. Thus, while not a primitive, including pthread_join() in this volume of IEEE Std 1003.1-2001 was considered valuable.

The pthread_join() function provides a simple mechanism allowing an application to wait for a thread to terminate. After the thread terminates, the application may then choose to clean up resources that were used by the thread. For instance, after pthread_join() returns, any application-provided stack storage could be reclaimed.

The pthread_join() or pthread_detach() function should eventually be called for every thread that is created with the detachstate attribute set to PTHREAD_CREATE_JOINABLE so that storage associated with the thread may be reclaimed.

The interaction between pthread_join() and cancellation is well-defined for the following reasons:

• The pthread_join() function, like all other non-async-cancel-safe functions, can only be called with deferred cancelability type.

• Cancellation cannot occur in the disabled cancelability state.

Thus, only the default cancelability state need be considered. As specified, either the pthread_join() call is canceled, or it succeeds, but not both. The difference is obvious to the application, since either a cancellation handler is run or pthread_join() returns. There are no race conditions since pthread_join() was called in the deferred cancelability state.

NAME

pthread_key_create — thread-specific data key creation

SYNOPSIS

THR

#include <pthread.h>

int pthread_key_create(pthread_key_t *key, void (*destructor)(void*));

DESCRIPTION

The pthread_key_create() function shall create a thread-specific data key visible to all threads in the process. Key values provided by pthread_key_create() are opaque objects used to locate thread-specific data. Although the same key value may be used by different threads, the values bound to the key by pthread_setspecific() are maintained on a per-thread basis and persist for the life of the calling thread.

Upon key creation, the value NULL shall be associated with the new key in all active threads. Upon thread creation, the value NULL shall be associated with all defined keys in the new thread.

An optional destructor function may be associated with each key value. At thread exit, if a key value has a non-NULL destructor pointer, and the thread has a non-NULL value associated with that key, the value of the key is set to NULL, and then the function pointed to is called with the previously associated value as its sole argument. The order of destructor calls is unspecified if more than one destructor exists for a thread when it exits.

If, after all the destructors have been called for all non-NULL values with associated destructors, there are still some non-NULL values with associated destructors, then the process is repeated. If, after at least [PTHREAD_DESTRUCTOR_ITERATIONS] iterations of destructor calls for outstanding non-NULL values, there are still some non-NULL values with associated destructors, implementations may stop calling destructors, or they may continue calling destructors until no non-NULL values with associated destructors exist, even though this might result in an infinite loop.

RETURN VALUE

If successful, the pthread_key_create() function shall store the newly created key value at *key and shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_key_create() function shall fail if:

[EAGAIN] The system lacked the necessary resources to create another thread-specific data key, or the system-imposed limit on the total number of keys per process [PTHREAD_KEYS_MAX] has been exceeded.

[ENOMEM] Insufficient memory exists to create the key.

The pthread_key_create() function shall not return an error code of [EINTR].
The following example demonstrates a function that initializes a thread-specific data key when it is first called, and associates a thread-specific object with each calling thread, initializing this object when necessary.

```c
static pthread_key_t key;
static pthread_once_t key_once = PTHREAD_ONCE_INIT;

static void
make_key()
{
    (void) pthread_key_create(&key, NULL);
}

func()
{
    void *ptr;
    (void) pthread_once(&key_once, make_key);
    if ((ptr = pthread_getspecific(key)) == NULL) {
        ptr = malloc(OBJECT_SIZE);
        ...
        (void) pthread_setspecific(key, ptr);
    }

    ...
}
```

Note that the key has to be initialized before `pthread_getspecific()` or `pthread_setspecific()` can be used. The `pthread_key_create()` call could either be explicitly made in a module initialization routine, or it can be done implicitly by the first call to a module as in this example. Any attempt to use the key before it is initialized is a programming error, making the code below incorrect.

```c
static pthread_key_t key;

func()
{
    void *ptr;
    /* KEY NOT INITIALIZED!!! THIS WON’T WORK!!! */
    if ((ptr = pthread_getspecific(key)) == NULL &&
        pthread_setspecific(key, NULL) != 0) {
        pthread_key_create(&key, NULL);
        ...
    }
}
```

**APPLICATION USAGE**

None.
Destructor Functions

Normally, the value bound to a key on behalf of a particular thread is a pointer to storage allocated dynamically on behalf of the calling thread. The destructor functions specified with `pthread_key_create()` are intended to be used to free this storage when the thread exits. Thread cancellation cleanup handlers cannot be used for this purpose because thread-specific data may persist outside the lexical scope in which the cancellation cleanup handlers operate.

If the value associated with a key needs to be updated during the lifetime of the thread, it may be necessary to release the storage associated with the old value before the new value is bound. Although the `pthread_setspecific()` function could do this automatically, this feature is not needed often enough to justify the added complexity. Instead, the programmer is responsible for freeing the stale storage:

```c
pthread_getspecific(key, &old);
new = allocate();
destructor(old);
pthread_setspecific(key, new);
```

**Note:** The above example could leak storage if run with asynchronous cancellation enabled. No such problems occur in the default cancellation state if no cancellation points occur between the get and set.

There is no notion of a destructor-safe function. If an application does not call `pthread_exit()` from a signal handler, or if it blocks any signal whose handler may call `pthread_exit()` while calling async-unsafe functions, all functions may be safely called from destructors.

Non-Idempotent Data Key Creation

There were requests to make `pthread_key_create()` idempotent with respect to a given `key` address parameter. This would allow applications to call `pthread_key_create()` multiple times for a given `key` address and be guaranteed that only one key would be created. Doing so would require the key value to be previously initialized (possibly at compile time) to a known null value and would require that implicit mutual-exclusion be performed based on the address and contents of the `key` parameter in order to guarantee that exactly one key would be created.

Unfortunately, the implicit mutual-exclusion would not be limited to only `pthread_key_create()`. On many implementations, implicit mutual-exclusion would also have to be performed by `pthread_getspecific()` and `pthread_setspecific()` in order to guard against using incompletely stored or not-yet-visible key values. This could significantly increase the cost of important operations, particularly `pthread_getspecific()`.

Thus, this proposal was rejected. The `pthread_key_create()` function performs no implicit synchronization. It is the responsibility of the programmer to ensure that it is called exactly once per key before use of the key. Several straightforward mechanisms can already be used to accomplish this, including calling explicit module initialization functions, using mutexes, and using `pthread_once()`. This places no significant burden on the programmer, introduces no possibly confusing ad hoc implicit synchronization mechanism, and potentially allows commonly used thread-specific data operations to be more efficient.

**FUTURE DIRECTIONS**

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The `pthread_key_create()` function is marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #8 is applied, updating the DESCRIPTION.
NAME
pthread_key_delete — thread-specific data key deletion

SYNOPSIS
THR
#include <pthread.h>

int pthread_key_delete(pthread_key_t key);

DESCRIPTION
The pthread_key_delete() function shall delete a thread-specific data key previously returned by
pthread_key_create(). The thread-specific data values associated with key need not be NULL at
the time pthread_key_delete() is called. It is the responsibility of the application to free any
application storage or perform any cleanup actions for data structures related to the deleted key
or associated thread-specific data in any threads; this cleanup can be done either before or after
pthread_key_delete() is called. Any attempt to use key following the call to pthread_key_delete()
results in undefined behavior.

The pthread_key_delete() function shall be callable from within destructor functions. No
destructor functions shall be invoked by pthread_key_delete(). Any destructor function that may
have been associated with key shall no longer be called upon thread exit.

RETURN VALUE
If successful, the pthread_key_delete() function shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The pthread_key_delete() function may fail if:
[EINVAL] The key value is invalid.

The pthread_key_delete() function shall not return an error code of [EINVAL].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
A thread-specific data key deletion function has been included in order to allow the resources
associated with an unused thread-specific data key to be freed. Unused thread-specific data keys
can arise, among other scenarios, when a dynamically loaded module that allocated a key is
unloaded.

Conforming applications are responsible for performing any cleanup actions needed for data
structures associated with the key to be deleted, including data referenced by thread-specific
data values. No such cleanup is done by pthread_key_delete(). In particular, destructor functions
are not called. There are several reasons for this division of responsibility:

1. The associated destructor functions used to free thread-specific data at thread exit time are
   only guaranteed to work correctly when called in the thread that allocated the thread-
   specific data. (Destructors themselves may utilize thread-specific data.) Thus, they cannot
   be used to free thread-specific data in other threads at key deletion time. Attempting to
   have them called by other threads at key deletion time would require other threads to be
   asynchronously interrupted. But since interrupted threads could be in an arbitrary state,
   including holding locks necessary for the destructor to run, this approach would fail. In
general, there is no safe mechanism whereby an implementation could free thread-specific
data at key deletion time.
2. Even if there were a means of safely freeing thread-specific data associated with keys to be deleted, doing so would require that implementations be able to enumerate the threads with non-NULL data and potentially keep them from creating more thread-specific data while the key deletion is occurring. This special case could cause extra synchronization in the normal case, which would otherwise be unnecessary.

For an application to know that it is safe to delete a key, it has to know that all the threads that might potentially ever use the key do not attempt to use it again. For example, it could know this if all the client threads have called a cleanup procedure declaring that they are through with the module that is being shut down, perhaps by setting a reference count to zero.

FUTURE DIRECTIONS
None.

**NAME**

pthread_kill — send a signal to a thread

**SYNOPSIS**

```
#include <signal.h>

int pthread_kill(pthread_t thread, int sig);
```

**DESCRIPTION**

The `pthread_kill()` function shall request that a signal be delivered to the specified thread.

As in `kill()`, if `sig` is zero, error checking shall be performed but no signal shall actually be sent.

**RETURN VALUE**

Upon successful completion, the function shall return a value of zero. Otherwise, the function shall return an error number. If the `pthread_kill()` function fails, no signal shall be sent.

**ERRORS**

The `pthread_kill()` function shall fail if:

- `[ESRCH]` No thread could be found corresponding to that specified by the given thread ID.
- `[EINVAL]` The value of the `sig` argument is an invalid or unsupported signal number.
- `[EINTR]` The `pthread_kill()` function shall not return an error code of `[EINTR]`.

**EXAMPLES**

None.

**APPLICATION USAGE**

The `pthread_kill()` function provides a mechanism for asynchronously directing a signal at a thread in the calling process. This could be used, for example, by one thread to affect broadcast delivery of a signal to a set of threads.

Note that `pthread_kill()` only causes the signal to be handled in the context of the given thread; the signal action (termination or stopping) affects the process as a whole.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**Issue 6**

The `pthread_kill()` function is marked as part of the Threads option.

The APPLICATION USAGE section is added.
NAME

pthread_mutex_destroy, pthread_mutex_init — destroy and initialize a mutex

SYNOPSIS

**THR**

```c
#include <pthread.h>

int pthread_mutex_destroy(pthread_mutex_t *mutex);
int pthread_mutex_init(pthread_mutex_t *restrict mutex, const pthread_mutexattr_t *restrict attr);
pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

DESCRIPTION

The *pthread_mutex_destroy()* function shall destroy the mutex object referenced by *mutex*; the mutex object becomes, in effect, uninitialized. An implementation may cause *pthread_mutex_destroy()* to set the object referenced by *mutex* to an invalid value. A destroyed mutex object can be reinitialized using *pthread_mutex_init()*; the results of otherwise referencing the object after it has been destroyed are undefined.

It shall be safe to destroy an initialized mutex that is unlocked. Attempting to destroy a locked mutex results in undefined behavior.

The *pthread_mutex_init()* function shall initialize the mutex referenced by *mutex* with attributes specified by *attr*. If *attr* is NULL, the default mutex attributes are used; the effect shall be the same as passing the address of a default mutex attributes object. Upon successful initialization, the state of the mutex becomes initialized and unlocked.

Only *mutex* itself may be used for performing synchronization. The result of referring to copies of *mutex* in calls to *pthread_mutex_lock()* , *pthread_mutex_trylock()* , *pthread_mutex_unlock()* , and *pthread_mutex_destroy()* is undefined.

Attempting to initialize an already initialized mutex results in undefined behavior.

In cases where default mutex attributes are appropriate, the macro PTHREAD_MUTEX_INITIALIZER can be used to initialize mutexes that are statically allocated. The effect shall be equivalent to dynamic initialization by a call to *pthread_mutex_init()* with parameter *attr* specified as NULL, except that no error checks are performed.

RETURN VALUE

If successful, the *pthread_mutex_destroy()* and *pthread_mutex_init()* functions shall return zero; otherwise, an error number shall be returned to indicate the error.

The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed immediately at the beginning of processing for the function and shall cause an error return prior to modifying the state of the mutex specified by *mutex*.

ERRORS

The *pthread_mutex_destroy()* function may fail if:

[EBUSY] The implementation has detected an attempt to destroy the object referenced by *mutex* while it is locked or referenced (for example, while being used in a *pthread_cond_timedwait()* or *pthread_cond_wait()* ) by another thread.

EINVAL The value specified by *mutex* is invalid.

The *pthread_mutex_init()* function shall fail if:

[EAGAIN] The system lacked the necessary resources (other than memory) to initialize another mutex.
The `pthread_mutex_init()` function may fail if:

- [ENOMEM] Insufficient memory exists to initialize the mutex.
- [EPERM] The caller does not have the privilege to perform the operation.
- [EBUSY] The implementation has detected an attempt to reinitialize the object referenced by `mutex`, a previously initialized, but not yet destroyed, mutex.
- [EINVAL] The value specified by `attr` is invalid.

These functions shall not return an error code of [EINTR].

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**

**Alternate Implementations Possible**

This volume of IEEE Std 1003.1-2001 supports several alternative implementations of mutexes. An implementation may store the lock directly in the object of type `pthread_mutex_t`. Alternatively, an implementation may store the lock in the heap and merely store a pointer, handle, or unique ID in the mutex object. Either implementation has advantages or may be required on certain hardware configurations. So that portable code can be written that is invariant to this choice, this volume of IEEE Std 1003.1-2001 does not define assignment or equality for this type, and it uses the term “initialize” to reinforce the (more restrictive) notion that the lock may actually reside in the mutex object itself.

Note that this precludes an over-specification of the type of the mutex or condition variable and motivates the opaqueness of the type.

An implementation is permitted, but not required, to have `pthread_mutex_destroy()` store an illegal value into the mutex. This may help detect erroneous programs that try to lock (or otherwise reference) a mutex that has already been destroyed.

**Tradeoff Between Error Checks and Performance Supported**

Many of the error checks were made optional in order to let implementations trade off performance versus degree of error checking according to the needs of their specific applications and execution environment. As a general rule, errors or conditions caused by the system (such as insufficient memory) always need to be reported, but errors due to an erroneously coded application (such as failing to provide adequate synchronization to prevent a mutex from being deleted while in use) are made optional.

A wide range of implementations is thus made possible. For example, an implementation intended for application debugging may implement all of the error checks, but an implementation running a single, provably correct application under very tight performance constraints in an embedded computer might implement minimal checks. An implementation might even be provided in two versions, similar to the options that compilers provide: a full-checking, but slower version; and a limited-checking, but faster version. To forbid this optionality would be a disservice to users.

By carefully limiting the use of “undefined behavior” only to things that an erroneous (badly coded) application might do, and by defining that resource-not-available errors are mandatory, this volume of IEEE Std 1003.1-2001 ensures that a fully-conforming application is portable.
across the full range of implementations, while not forcing all implementations to add overhead
to check for numerous things that a correct program never does.

**Why No Limits are Defined**

Defining symbols for the maximum number of mutexes and condition variables was considered
but rejected because the number of these objects may change dynamically. Furthermore, many
implementations place these objects into application memory; thus, there is no explicit
maximum.

**Static Initializers for Mutexes and Condition Variables**

Providing for static initialization of statically allocated synchronization objects allows modules
with private static synchronization variables to avoid runtime initialization tests and overhead.
Furthermore, it simplifies the coding of self-initializing modules. Such modules are common in
C libraries, where for various reasons the design calls for self-initialization instead of requiring
an explicit module initialization function to be called. An example use of static initialization
follows.

Without static initialization, a self-initializing routine `foo()` might look as follows:

```c
static pthread_once_t foo_once = PTHREAD_ONCE_INIT;
static pthread_mutex_t foo_mutex;

void foo_init()
{
    pthread_mutex_init(&foo_mutex, NULL);
}

void foo()
{
    pthread_once(&foo_once, foo_init);
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

With static initialization, the same routine could be coded as follows:

```c
static pthread_mutex_t foo_mutex = PTHREAD_MUTEX_INITIALIZER;

void foo()
{
    pthread_mutex_lock(&foo_mutex);
    /* Do work. */
    pthread_mutex_unlock(&foo_mutex);
}
```

Note that the static initialization both eliminates the need for the initialization test inside
`pthread_once()` and the fetch of `&foo_mutex` to learn the address to be passed to
`pthread_mutex_lock()` or `pthread_mutex_unlock()`.

Thus, the C code written to initialize static objects is simpler on all systems and is also faster on a
large class of systems; those where the (entire) synchronization object can be stored in
application memory.

Yet the locking performance question is likely to be raised for machines that require mutexes to
be allocated out of special memory. Such machines actually have to have mutexes and possibly
condition variables contain pointers to the actual hardware locks. For static initialization to work
on such machines, pthread_mutex_lock() also has to test whether or not the pointer to the actual
lock has been allocated. If it has not, pthread_mutex_lock() has to initialize it before use. The
reservation of such resources can be made when the program is loaded, and hence return codes
have not been added to mutex locking and condition variable waiting to indicate failure to
complete initialization.

This runtime test in pthread_mutex_lock() would at first seem to be extra work; an extra test is
required to see whether the pointer has been initialized. On most machines this would actually
be implemented as a fetch of the pointer, testing the pointer against zero, and then using the
pointer if it has already been initialized. While the test might seem to add extra work, the extra
effort of testing a register is usually negligible since no extra memory references are actually
done. As more and more machines provide caches, the real expenses are memory references, not
instructions executed.

Alternatively, depending on the machine architecture, there are often ways to eliminate all
overhead in the most important case: on the lock operations that occur after the lock has been
initialized. This can be done by shifting more overhead to the less frequent operation:
initialization. Since out-of-line mutex allocation also means that an address has to be
derreferenced to find the actual lock, one technique that is widely applicable is to have static
initialization store a bogus value for that address; in particular, an address that causes a machine
fault to occur. When such a fault occurs upon the first attempt to lock such a mutex, validity
checks can be done, and then the correct address for the actual lock can be filled in. Subsequent
lock operations incur no extra overhead since they do not “fault”. This is merely one technique
that can be used to support static initialization, while not adversely affecting the performance of
lock acquisition. No doubt there are other techniques that are highly machine-dependent.

The locking overhead for machines doing out-of-line mutex allocation is thus similar for
modules being implicitly initialized, where it is improved for those doing mutex allocation
entirely inline. The inline case is thus made much faster, and the out-of-line case is not
significantly worse.

Besides the issue of locking performance for such machines, a concern is raised that it is possible
that threads would serialize contending for initialization locks when attempting to finish
initializing statically allocated mutexes. (Such finishing would typically involve taking an
internal lock, allocating a structure, storing a pointer to the structure in the mutex, and releasing
the internal lock.) First, many implementations would reduce such serialization by hashing on
the mutex address. Second, such serialization can only occur a bounded number of times. In
particular, it can happen at most as many times as there are statically allocated synchronization
objects. Dynamically allocated objects would still be initialized via pthread_mutex_init() or
pthread_cond_init().

Finally, if none of the above optimization techniques for out-of-line allocation yields sufficient
performance for an application on some implementation, the application can avoid static
initialization altogether by explicitly initializing all synchronization objects with the
corresponding pthread_*_init() functions, which are supported by all implementations. An
implementation can also document the tradeoffs and advise which initialization technique is
more efficient for that particular implementation.
Destroying Mutexes

A mutex can be destroyed immediately after it is unlocked. For example, consider the following code:

```c
struct obj {
  pthread_mutex_t om;
  int refcnt;
  ...
};

obj_done(struct obj *op) {
  pthread_mutex_lock(&op->om);
  if (--op->refcnt == 0) {
    pthread_mutex_unlock(&op->om);
    (A) pthread_mutex_destroy(&op->om);
    (B) free(op);
  } else
    (C) pthread_mutex_unlock(&op->om);
}
```

In this case `obj` is reference counted and `obj_done()` is called whenever a reference to the object is dropped. Implementations are required to allow an object to be destroyed and freed and potentially unmapped (for example, lines A and B) immediately after the object is unlocked (line C).

**Issue 6**

The `pthread_mutex_destroy()` and `pthread_mutex_init()` functions are marked as part of the Threads option.

The `pthread_mutex_timedlock()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

IEEE PASC Interpretation 1003.1c #34 is applied, updating the DESCRIPTION.

The `restrict` keyword is added to the `pthread_mutex_init()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
pthread_mutex_getprioceiling, pthread_mutex_setprioceiling — get and set the priority ceiling of a mutex (REALTIME THREADS)

SYNOPSIS
#include <pthread.h>

int pthread_mutex_getprioceiling(const pthread_mutex_t *restrict mutex, int *restrict prioceiling);

int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex, int prioceiling, int *restrict old_ceiling);

DESCRIPTION
The pthread_mutex_getprioceiling() function shall return the current priority ceiling of the mutex.

The pthread_mutex_setprioceiling() function shall either lock the mutex if it is unlocked, or block until it can successfully lock the mutex, then it shall change the mutex’s priority ceiling and release the mutex. When the change is successful, the previous value of the priority ceiling shall be returned in old_ceiling. The process of locking the mutex need not adhere to the priority protect protocol.

If the pthread_mutex_setprioceiling() function fails, the mutex priority ceiling shall not be changed.

RETURN VALUE
If successful, the pthread_mutex_getprioceiling() and pthread_mutex_setprioceiling() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The pthread_mutex_getprioceiling() and pthread_mutex_setprioceiling() functions may fail if:

EINVAL The priority requested by prioceiling is out of range.
EINVAL The value specified by mutex does not refer to a currently existing mutex.
EPERM The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
pthread_mutex_destroy(), pthread_mutex_lock(), pthread_mutex_timedlock(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.
Marked as part of the Realtime Threads Feature Group.
The `pthread_mutex_getprioceiling()` and `pthread_mutex_setprioceiling()` functions are marked as part of the Threads and Thread Priority Protection options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

The [ENOSYS] error denoting non-support of the priority ceiling protocol for mutexes has been removed. This is because if the implementation provides the functions (regardless of whether `_POSIX_PTHREAD_PRIO_PROTECT` is defined), they must function as in the DESCRIPTION and therefore the priority ceiling protocol for mutexes is supported.

The `pthread_mutex_timedlock()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

The `restrict` keyword is added to the `pthread_mutex_getprioceiling()` and `pthread_mutex_setprioceiling()` prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME
pthread_mutex_init — initialize a mutex

SYNOPSIS

```c
#include <pthread.h>

int pthread_mutex_init(pthread_mutex_t *restrict mutex,
                       const pthread_mutexattr_t *restrict attr);

pthread_mutex_t mutex = PTHREAD_MUTEX_INITIALIZER;
```

DESCRIPTION

Refer to `pthread_mutex_destroy()`.
NAME

pthread_mutex_lock, pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS

THR

#include <pthread.h>

int pthread_mutex_lock(pthread_mutex_t *mutex);
int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);

DESCRIPTION

The mutex object referenced by mutex shall be locked by calling pthread_mutex_lock(). If the mutex is already locked, the calling thread shall block until the mutex becomes available. This operation shall return with the mutex object referenced by mutex in the locked state with the calling thread as its owner.

If the mutex type is PTHREAD_MUTEX_NORMAL, deadlock detection shall not be provided. Attempting to relock the mutex causes deadlock. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, undefined behavior results.

If the mutex type is PTHREAD_MUTEX_ERRORCHECK, then error checking shall be provided. If a thread attempts to relock a mutex that it has already locked, an error shall be returned. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error shall be returned.

If the mutex type is PTHREAD_MUTEX_RECURSIVE, then the mutex shall maintain the concept of a lock count. When a thread successfully acquires a mutex for the first time, the lock count shall be set to one. Every time a thread relocks this mutex, the lock count shall be incremented by one. Each time the thread unlocks the mutex, the lock count shall be decremented by one. When the lock count reaches zero, the mutex shall become available for other threads to acquire. If a thread attempts to unlock a mutex that it has not locked or a mutex which is unlocked, an error shall be returned.

If the mutex type is PTHREAD_MUTEX_DEFAULT, attempting to recursively lock the mutex results in undefined behavior. Attempting to unlock the mutex if it was not locked by the calling thread results in undefined behavior. Attempting to unlock the mutex if it is not locked results in undefined behavior.

The pthread_mutex_trylock() function shall be equivalent to pthread_mutex_lock(), except that if the mutex object referenced by mutex is currently locked (by any thread, including the current thread), the call shall return immediately. If the mutex type is PTHREAD_MUTEX_RECURSIVE and the mutex is currently owned by the calling thread, the mutex lock count shall be incremented by one and the pthread_mutex_trylock() function shall immediately return success.

The pthread_mutex_unlock() function shall release the mutex object referenced by mutex. The manner in which a mutex is released is dependent upon the mutex’s type attribute. If there are threads blocked on the mutex object referenced by mutex when pthread_mutex_unlock() is called, resulting in the mutex becoming available, the scheduling policy shall determine which thread shall acquire the mutex.

(In the case of PTHREAD_MUTEX_RECURSIVE mutexes, the mutex shall become available when the count reaches zero and the calling thread no longer has any locks on this mutex.)

If a signal is delivered to a thread waiting for a mutex, upon return from the signal handler the thread shall resume waiting for the mutex as if it was not interrupted.
RETURN VALUE
If successful, the \texttt{pthread_mutex_lock()} and \texttt{pthread_mutex_unlock()} functions shall return zero; otherwise, an error number shall be returned to indicate the error.

The \texttt{pthread_mutex_trylock()} function shall return zero if a lock on the mutex object referenced by \texttt{mutex} is acquired. Otherwise, an error number is returned to indicate the error.

ERRORS
The \texttt{pthread_mutex_lock()} and \texttt{pthread_mutex_trylock()} functions shall fail if:

- [EINVAL] The \texttt{mutex} was created with the protocol attribute having the value PTHREAD_PRIO_PROTECT and the calling thread’s priority is higher than the mutex’s current priority ceiling.

The \texttt{pthread_mutex_trylock()} function shall fail if:

- [EBUSY] The \texttt{mutex} could not be acquired because it was already locked.

The \texttt{pthread_mutex_lock()}, \texttt{pthread_mutex_trylock()}, and \texttt{pthread_mutex_unlock()} functions may fail if:

- [EINVAL] The value specified by \texttt{mutex} does not refer to an initialized mutex object.
- [EAGAIN] The mutex could not be acquired because the maximum number of recursive locks for \texttt{mutex} has been exceeded.
- [EDEADLK] The current thread already owns the mutex.

The \texttt{pthread_mutex_unlock()} function may fail if:

- [EPERM] The current thread does not own the mutex.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Mutex objects are intended to serve as a low-level primitive from which other thread synchronization functions can be built. As such, the implementation of mutexes should be as efficient as possible, and this has ramifications on the features available at the interface.

The mutex functions and the particular default settings of the mutex attributes have been motivated by the desire to not preclude fast, inlined implementations of mutex locking and unlocking.

For example, deadlocking on a double-lock is explicitly allowed behavior in order to avoid requiring more overhead in the basic mechanism than is absolutely necessary. (More “friendly” mutexes that detect deadlock or that allow multiple locking by the same thread are easily constructed by the user via the other mechanisms provided. For example, \texttt{pthread_self()} can be used to record mutex ownership.) Implementations might also choose to provide such extended features as options via special mutex attributes.

Since most attributes only need to be checked when a thread is going to be blocked, the use of attributes does not slow the (common) mutex-locking case.
Likewise, while being able to extract the thread ID of the owner of a mutex might be desirable, it would require storing the current thread ID when each mutex is locked, and this could incur unacceptable levels of overhead. Similar arguments apply to a `mutex_tryunlock` operation.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

**Issue 6**

The `pthread_mutex_lock()`, `pthread_mutex_trylock()`, and `pthread_mutex_unlock()` functions are marked as part of the Threads option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The behavior when attempting to relock a mutex is defined.

The `pthread_mutex_timedlock()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
NAME

pthread_mutex_setprioceiling — change the priority ceiling of a mutex (REALTIME THREADS)

SYNOPSIS

THR TPP

#include <pthread.h>

int pthread_mutex_setprioceiling(pthread_mutex_t *restrict mutex,
int prioceiling, int *restrict old_ceiling);

DESCRIPTION

Refer to pthread_mutex_getprioceiling().
NAME

pthread_mutex_timedlock — lock a mutex (ADVANCED REALTIME)

SYNOPSIS

```c
#include <pthread.h>
#include <time.h>

int pthread_mutex_timedlock(pthread_mutex_t *restrict mutex,
                          const struct timespec *restrict abs_timeout);
```

DESCRIPTION

The `pthread_mutex_timedlock()` function shall lock the mutex object referenced by `mutex`. If the
mutex is already locked, the calling thread shall block until the mutex becomes available as in
the `pthread_mutex_lock()` function. If the mutex cannot be locked without waiting for another
thread to unlock the mutex, this wait shall be terminated when the specified timeout expires.

The timeout shall expire when the absolute time specified by `abs_timeout` passes, as measured by
the clock on which timeouts are based (that is, when the value of that clock equals or exceeds
`abs_timeout`), or if the absolute time specified by `abs_timeout` has already been passed at the time
of the call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock; if
the Timers option is not supported, the timeout shall be based on the system clock as returned
by the `time()` function.

The resolution of the timeout shall be the resolution of the clock on which it is based. The
timespec data type is defined in the `<time.h>` header.

Under no circumstance shall the function fail with a timeout if the mutex can be locked
immediately. The validity of the `abs_timeout` parameter need not be checked if the mutex can be
locked immediately.

As a consequence of the priority inheritance rules (for mutexes initialized with the
PRIO_INHERIT protocol), if a timed mutex wait is terminated because its timeout expires, the
priority of the owner of the mutex shall be adjusted as necessary to reflect the fact that this
thread is no longer among the threads waiting for the mutex.

RETURN VALUE

If successful, the `pthread_mutex_timedlock()` function shall return zero; otherwise, an error
number shall be returned to indicate the error.

ERRORS

The `pthread_mutex_timedlock()` function shall fail if:

[EINVAL] The mutex was created with the protocol attribute having the value
PTHREAD_PRIO_PROTECT and the calling thread’s priority is higher than
the mutex’ current priority ceiling.

[EINVAL] The process or thread would have blocked, and the `abs_timeout` parameter
specified a nanoseconds field value less than zero or greater than or equal to
1 000 million.

[ETIMEDOUT] The mutex could not be locked before the specified timeout expired.

The `pthread_mutex_timedlock()` function may fail if:

[EINVAL] The value specified by `mutex` does not refer to an initialized mutex object.
The mutex could not be acquired because the maximum number of recursive locks for mutex has been exceeded.

The current thread already owns the mutex.

This function shall not return an error code of [EINTR].

None.

The pthread_mutex_timedlock() function is part of the Threads and Timeouts options and need not be provided on all implementations.

None.

None.

 pthread_mutex_destroy(), pthread_mutex_lock(), pthread_mutex_trylock(), time(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>, <time.h>

NAME
pthread_mutex_trylock, pthread_mutex_unlock — lock and unlock a mutex

SYNOPSIS
THR

```
#include <pthread.h>

int pthread_mutex_trylock(pthread_mutex_t *mutex);
int pthread_mutex_unlock(pthread_mutex_t *mutex);
```

DESCRIPTION
Refer to pthread_mutex_lock().
NAME
pthread_mutexattr_destroy, pthread_mutexattr_init — destroy and initialize the mutex attributes object

SYNOPSIS
THR #include <pthread.h>

int pthread_mutexattr_destroy(pthread_mutexattr_t *attr);
int pthread_mutexattr_init(pthread_mutexattr_t *attr);

DESCRIPTION
The pthread_mutexattr_destroy() function shall destroy a mutex attributes object; the object becomes, in effect, uninitialized. An implementation may cause pthread_mutexattr_destroy() to set the object referenced by attr to an invalid value. A destroyed attr attributes object can be reinitialized using pthread_mutexattr_init(); the results of otherwise referencing the object after it has been destroyed are undefined.

The pthread_mutexattr_init() function shall initialize a mutex attributes object attr with the default value for all of the attributes defined by the implementation.

Results are undefined if pthread_mutexattr_init() is called specifying an already initialized attr attributes object.

After a mutex attributes object has been used to initialize one or more mutexes, any function affecting the attributes object (including destruction) shall not affect any previously initialized mutexes.

RETURN VALUE
Upon successful completion, pthread_mutexattr_destroy() and pthread_mutexattr_init() shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The pthread_mutexattr_destroy() function may fail if:

[EINVAL] The value specified by attr is invalid.

The pthread_mutexattr_init() function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the mutex attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
See pthread_attr_init() for a general explanation of attributes. Attributes objects allow implementations to experiment with useful extensions and permit extension of this volume of IEEE Std 1003.1-2001 without changing the existing functions. Thus, they provide for future extensibility of this volume of IEEE Std 1003.1-2001 and reduce the temptation to standardize prematurely on semantics that are not yet widely implemented or understood.

Examples of possible additional mutex attributes that have been discussed are spin_only, limited-spin, no-spin, recursive, and metered. (To explain what the latter attributes might mean: recursive mutexes would allow for multiple re-locking by the current owner; metered mutexes would transparently keep records of queue length, wait time, and so on.) Since there is not yet
wide agreement on the usefulness of these resulting from shared implementation and usage experience, they are not yet specified in this volume of IEEE Std 1003.1-2001. Mutex attributes objects, however, make it possible to test out these concepts for possible standardization at a later time.

**Mutex Attributes and Performance**

Care has been taken to ensure that the default values of the mutex attributes have been defined such that mutexes initialized with the defaults have simple enough semantics so that the locking and unlocking can be done with the equivalent of a test-and-set instruction (plus possibly a few other basic instructions).

There is at least one implementation method that can be used to reduce the cost of testing at lock-time if a mutex has non-default attributes. One such method that an implementation can employ (and this can be made fully transparent to fully conforming POSIX applications) is to secretly pre-lock any mutexes that are initialized to non-default attributes. Any later attempt to lock such a mutex causes the implementation to branch to the "slow path" as if the mutex were unavailable; then, on the slow path, the implementation can do the "real work" to lock a non-default mutex. The underlying unlock operation is more complicated since the implementation never really wants to release the pre-lock on this kind of mutex. This illustrates that, depending on the hardware, there may be certain optimizations that can be used so that whatever mutex attributes are considered "most frequently used" can be processed most efficiently.

**Process Shared Memory and Synchronization**

The existence of memory mapping functions in this volume of IEEE Std 1003.1-2001 leads to the possibility that an application may allocate the synchronization objects from this section in memory that is accessed by multiple processes (and therefore, by threads of multiple processes).

In order to permit such usage, while at the same time keeping the usual case (that is, usage within a single process) efficient, a *process-shared* option has been defined.

If an implementation supports the `_POSIX_THREAD_PROCESS_SHARED` option, then the *process-shared* attribute can be used to indicate that mutexes or condition variables may be accessed by threads of multiple processes.

The default setting of `PTHREAD_PROCESS_PRIVATE` has been chosen for the *process-shared* attribute so that the most efficient forms of these synchronization objects are created by default.

Synchronization variables that are initialized with the `PTHREAD_PROCESS_PRIVATE` *process-shared* attribute may only be operated on by threads in the process that initialized them. Synchronization variables that are initialized with the `PTHREAD_PROCESS_SHARED` *process-shared* attribute may be operated on by any thread in any process that has access to it. In particular, these processes may exist beyond the lifetime of the initializing process. For example, the following code implements a simple counting semaphore in a mapped file that may be used by many processes.

```c
/* sem.h */

struct semaphore {
    pthread_mutex_t lock;
    pthread_cond_t nonzero;
    unsigned count;
};

typedef struct semaphore semaphore_t;

semaphore_t *semaphore_create(char *semaphore_name);
semaphore_t *semaphore_open(char *semaphore_name);
```
System Interfaces

void semaphore_post(semaphore_t *semap);
void semaphore_wait(semaphore_t *semap);
void semaphore_close(semaphore_t *semap);

/* sem.c */
#include <sys/types.h>
#include <sys/stat.h>
#include <sys/mman.h>
#include <fcntl.h>
#include <pthread.h>
#include "sem.h"

semaphore_t *
semaphore_create(char *semaphore_name)
{
    int fd;
    semaphore_t *semap;
    pthread_mutexattr_t psharedm;
    pthread_condattr_t psharedc;
    fd = open(semaphore_name, O_RDWR | O_CREAT | O_EXCL, 0666);
    if (fd < 0)
        return (NULL);
    (void) ftruncate(fd, sizeof(semaphore_t));
    (void) pthread_mutexattr_init(&psharedm);
    (void) pthread_mutexattr_setpshared(&psharedm,
        PTHREAD_PROCESS_SHARED);
    (void) pthread_condattr_init(&psharedc);
    (void) pthread_condattr_setpshared(&psharedc,
        PTHREAD_PROCESS_SHARED);
    semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
        PROT_READ | PROT_WRITE, MAP_SHARED,
        fd, 0);
    close (fd);
    (void) pthread_mutex_init(&semap->lock, &psharedm);
    (void) pthread_cond_init(&semap->nonzero, &psharedc);
    semap->count = 0;
    return (semap);
}

semaphore_t *
semaphore_open(char *semaphore_name)
{
    int fd;
    semaphore_t *semap;
    fd = open(semaphore_name, O_RDWR, 0666);
    if (fd < 0)
        return (NULL);
    semap = (semaphore_t *) mmap(NULL, sizeof(semaphore_t),
        PROT_READ | PROT_WRITE, MAP_SHARED,
        fd, 0);
    close (fd);
    return (semap);
}
The following code is for three separate processes that create, post, and wait on a semaphore in the file \texttt{/tmp/semaphore}. Once the file is created, the post and wait programs increment and decrement the counting semaphore (waiting and waking as required) even though they did not initialize the semaphore.
```c
#include <pthread.h>
#include <sem.h>

int main()
{
    semaphore_t *semap;
    semap = semaphore_open("/tmp/semaphore");
    if (semap == NULL)
        exit(1);
    semaphore_wait(semap);
    semaphore_close(semap);
    return (0);
}

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The pthread_mutexattr_destroy() and pthread_mutexattr_init() functions are marked as part of the Threads option.

IEEE PASC Interpretation 1003.1c #27 is applied, updating the ERRORS section.
NAME

pthread_mutexattr_getprioceiling, pthread_mutexattr_setprioceiling — get and set the
prioceiling attribute of the mutex attributes object (REALTIME THREADS)

SYNOPSIS

#include <pthread.h>

int pthread_mutexattr_getprioceiling(const pthread_mutexattr_t * restrict attr, int *restrict prioceiling);
int pthread_mutexattr_setprioceiling(pthread_mutexattr_t *attr, int prioceiling);

DESCRIPTION

The pthread_mutexattr_getprioceiling() and pthread_mutexattr_setprioceiling() functions,
respectively, shall get and set the priority ceiling attribute of a mutex attributes object pointed to
by attr which was previously created by the function pthread_mutexattr_init().

The prioceiling attribute contains the priority ceiling of initialized mutexes. The values of
prioceiling are within the maximum range of priorities defined by SCHED_FIFO.

The prioceiling attribute defines the priority ceiling of initialized mutexes, which is the minimum
priority level at which the critical section guarded by the mutex is executed. In order to avoid
priority inversion, the priority ceiling of the mutex shall be set to a priority higher than or equal
to the highest priority of all the threads that may lock that mutex. The values of prioceiling are
within the maximum range of priorities defined under the SCHED_FIFO scheduling policy.

RETURN VALUE

Upon successful completion, the pthread_mutexattr_getprioceiling() and
pthread_mutexattr_setprioceiling() functions shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS

The pthread_mutexattr_getprioceiling() and pthread_mutexattr_setprioceiling() functions may fail if:

EINVAL The value specified by attr or prioceiling is invalid.
EPERM The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

EXAMPLES

IEEE Std 1003.1-2001, <pthread.h>
CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.
Marked as part of the Realtime Threads Feature Group.

Issue 6

The `pthread_mutexattr_getprioceiling()` and `pthread_mutexattr_setprioceiling()` functions are marked as part of the Threads and Thread Priority Protection options.

The `[ENOSYS]` error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection option.

The `[ENOTSUP]` error condition has been removed since these functions do not have a `protocol` argument.

The `restrict` keyword is added to the `pthread_mutexattr_getprioceiling()` prototype for alignment with the ISO/IEC 9899: 1999 standard.
NAME

pthread_mutexattr_getprotocol, pthread_mutexattr_setprotocol — get and set the protocol attribute of the mutex attributes object (REALTIME THREADS)

SYNOPSIS

THR

```c
#include <pthread.h>

int pthread_mutexattr_getprotocol(const pthread_mutexattr_t * restrict attr, int *restrict protocol);
```

TPI

```c
int pthread_mutexattr_setprotocol(pthread_mutexattr_t * attr, int protocol);
```

DESCRIPTION

The `pthread_mutexattr_getprotocol()` and `pthread_mutexattr_setprotocol()` functions, respectively, shall get and set the protocol attribute of a mutex attributes object pointed to by `attr` which was previously created by the function `pthread_mutexattr_init()`.

The `protocol` attribute defines the protocol to be followed in utilizing mutexes. The value of `protocol` may be one of:

- PTHREAD_PRIO_NONE
- PTHREAD_PRIO_INHERIT
- PTHREAD_PRIO_PROTECT

which are defined in the `<pthread.h>` header.

When a thread owns a mutex with the PTHREAD_PRIO_NONE `protocol` attribute, its priority and scheduling shall not be affected by its mutex ownership.

When a thread is blocking higher priority threads because of owning one or more mutexes with the PTHREAD_PRIO_INHERIT `protocol` attribute, it shall execute at the higher of its priority or the priority of the highest priority thread waiting on any of the mutexes owned by this thread and initialized with this protocol.

When a thread owns one or more mutexes initialized with the PTHREAD_PRIO_PROTECT `protocol`, it shall execute at the higher of its priority or the highest of the priority ceilings of all the mutexes owned by this thread and initialized with this attribute, regardless of whether other threads are blocked on any of these mutexes or not.

While a thread is holding a mutex which has been initialized with the PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT `protocol` attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed, such as by a call to `sched_setparam()` . Likewise, when a thread unlocks a mutex that has been initialized with the PTHREAD_PRIO_INHERIT or PTHREAD_PRIO_PROTECT `protocol` attributes, it shall not be subject to being moved to the tail of the scheduling queue at its priority in the event that its original priority is changed.

If a thread simultaneously owns several mutexes initialized with different protocols, it shall execute at the highest of the priorities that it would have obtained by each of these protocols.

When a thread makes a call to `pthread_mutex_lock()`, the mutex was initialized with the protocol attribute having the value PTHREAD_PRIO_INHERIT, when the calling thread is blocked because the mutex is owned by another thread, that owner thread shall inherit the priority level of the calling thread as long as it continues to own the mutex. The implementation shall update its execution priority to the maximum of its assigned priority and all its inherited priorities. Furthermore, if this owner thread itself becomes blocked on another mutex, the same priority...
inheritance effect shall be propagated to this other owner thread, in a recursive manner.

**RETURN VALUE**

Upon successful completion, the pthread_mutexattr_getprotocol() and pthread_mutexattr_setprotocol() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The pthread_mutexattr_setprotocol() function shall fail if:

- [ENOTSUP] The value specified by protocol is an unsupported value.

The pthread_mutexattr_getprotocol() and pthread_mutexattr_setprotocol() functions may fail if:

- [EINVAL] The value specified by attr or protocol is invalid.
- [EPERM] The caller does not have the privilege to perform the operation.

These functions shall not return an error code of [EINTR].

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Marked as part of the Realtime Threads Feature Group.

**Issue 6**

The pthread_mutexattr_getprotocol() and pthread_mutexattr_setprotocol() functions are marked as part of the Threads option and either the Thread Priority Protection or Thread Priority Inheritance options.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Thread Priority Protection or Thread Priority Inheritance options.

The restrict keyword is added to the pthread_mutexattr_getprotocol() prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME

pthread_mutexattr_getpshared, pthread_mutexattr_setpshared — get and set the process-shared attribute

SYNOPSIS

```
#include <pthread.h>

int pthread_mutexattr_getpshared(const pthread_mutexattr_t *restrict attr, int *restrict pshared);
int pthread_mutexattr_setpshared(pthread_mutexattr_t *attr, int pshared);
```

DESCRIPTION

The `pthread_mutexattr_getpshared()` function shall obtain the value of the `process-shared` attribute from the attributes object referenced by `attr`. The `pthread_mutexattr_setpshared()` function shall set the `process-shared` attribute in an initialized attributes object referenced by `attr`.

The `process-shared` attribute is set to PTHREAD_PROCESS_SHARED to permit a mutex to be operated upon by any thread that has access to the memory where the mutex is allocated, even if the mutex is allocated in memory that is shared by multiple processes. If the `process-shared` attribute is PTHREAD_PROCESS_PRIVATE, the mutex shall only be operated upon by threads created within the same process as the thread that initialized the mutex; if threads of differing processes attempt to operate on such a mutex, the behavior is undefined. The default value of the attribute shall be PTHREAD_PROCESS_PRIVATE.

RETURN VALUE

Upon successful completion, `pthread_mutexattr_setpshared()` shall return zero; otherwise, an error number shall be returned to indicate the error.

Upon successful completion, `pthread_mutexattr_getpshared()` shall return zero and store the value of the `process-shared` attribute of `attr` into the object referenced by the `pshared` parameter. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_mutexattr_getpshared()` and `pthread_mutexattr_setpshared()` functions may fail if:

- `EINVAL` The value specified by `attr` is invalid.
- `EINVAL` The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of `EINVAL`.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6

The pthread_mutexattr_getpshared() and pthread_mutexattr_setpshared() functions are marked as part of the Threads and Thread Process-Shared Synchronization options.

The restrict keyword is added to the pthread_mutexattr_getpshared() prototype for alignment with the ISO/IEC 9899: 1999 standard.
NAME

pthread_mutexattr_gettype, pthread_mutexattr_settype — get and set the mutex type attribute

SYNOPSIS

```c
#include <pthread.h>

int pthread_mutexattr_gettype(const pthread_mutexattr_t *restrict attr,
   int *restrict type);

int pthread_mutexattr_settype(pthread_mutexattr_t *attr, int type);
```

DESCRIPTION

The `pthread_mutexattr_gettype()` and `pthread_mutexattr_settype()` functions, respectively, shall get and set the mutex `type` attribute. This attribute is set in the `type` parameter to these functions. The default value of the `type` attribute is PTHREAD_MUTEX_DEFAULT.

The type of mutex is contained in the `type` attribute of the mutex attributes. Valid mutex types include:

- **PTHREAD_MUTEX_NORMAL**
  This type of mutex does not detect deadlock. A thread attempting to relock this mutex without first unlocking it shall deadlock. Attempting to unlock a mutex locked by a different thread results in undefined behavior. Attempting to unlock an unlocked mutex results in undefined behavior.

- **PTHREAD_MUTEX_ERRORCHECK**
  This type of mutex provides error checking. A thread attempting to relock this mutex without first unlocking it shall return with an error. A thread attempting to unlock a mutex which another thread has locked shall return with an error. A thread attempting to unlock an unlocked mutex shall return with an error.

- **PTHREAD_MUTEX_RECURSIVE**
  A thread attempting to relock this mutex without first unlocking it shall succeed in locking the mutex. The relocking deadlock which can occur with mutexes of type PTHREAD_MUTEX_NORMAL cannot occur with this type of mutex. Multiple locks of this mutex shall require the same number of unlocks to release the mutex before another thread can acquire the mutex. A thread attempting to unlock a mutex which another thread has locked shall return with an error. A thread attempting to unlock an unlocked mutex shall return with an error.

- **PTHREAD_MUTEX_DEFAULT**
  Attempting to recursively lock a mutex of this type results in undefined behavior. Attempting to unlock a mutex of this type which was not locked by the calling thread results in undefined behavior. Attempting to unlock a mutex of this type which is not locked results in undefined behavior. An implementation may map this mutex to one of the other mutex types.

RETURN VALUE

Upon successful completion, the `pthread_mutexattr_gettype()` function shall return zero and store the value of the `type` attribute of `attr` into the object referenced by the `type` parameter. Otherwise, an error shall be returned to indicate the error.

If successful, the `pthread_mutexattr_settype()` function shall return zero; otherwise, an error number shall be returned to indicate the error.
\textbf{ERRORS}

The `pthread_mutexattr_gettype()` function shall fail if:

\begin{itemize}
  \item \[\text{EINVAL}\] The value \textit{type} is invalid.
\end{itemize}

The `pthread_mutexattr_gettype()` and `pthread_mutexattr_settype()` functions may fail if:

\begin{itemize}
  \item \[\text{EINVAL}\] The value specified by \textit{attr} is invalid.
\end{itemize}

These functions shall not return an error code of \[\text{EINTR}\].

\textbf{EXAMPLES}

None.

\textbf{APPLICATION USAGE}

It is advised that an application should not use a PTHREAD_MUTEX_RECURSIVE mutex with condition variables because the implicit unlock performed for a `pthread_cond_timedwait()` or `pthread_cond_wait()` may not actually release the mutex (if it had been locked multiple times). If this happens, no other thread can satisfy the condition of the predicate.

\textbf{RATIONALE}

None.

\textbf{FUTURE DIRECTIONS}

None.

\textbf{SEE ALSO}

`pthread_cond_timedwait()`, the Base Definitions volume of IEEE Std 1003.1-2001, \texttt{<pthread.h>}

\textbf{CHANGE HISTORY}

First released in Issue 5.

\textbf{Issue 6}

The Open Group Corrigendum U033/3 is applied. The SYNOPSIS for `pthread_mutexattr_gettype()` is updated so that the first argument is of type \texttt{const pthread_mutexattr_t *}.

The \texttt{restrict} keyword is added to the `pthread_mutexattr_gettype()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME

NAME
pthread_once — dynamic package initialization

SYNOPSIS
THR
#include <pthread.h>

int pthread_once(pthread_once_t *once_control,
    void (*init_routine)(void));

pthread_once_t once_control = PTHREAD_ONCE_INIT;

DESCRIPTION
The first call to pthread_once() by any thread in a process, with a given once_control, shall call the
init_routine with no arguments. Subsequent calls of pthread_once() with the same once_control
shall not call the init_routine. On return from pthread_once(), init_routine shall have completed.
The once_control parameter shall determine whether the associated initialization routine has
been called.

The pthread_once() function is not a cancellation point. However, if init_routine is a cancellation
point and is canceled, the effect on once_control shall be as if pthread_once() was never called.
The constant PTHREAD_ONCE_INIT is defined in the <pthread.h> header.
The behavior of pthread_once() is undefined if once_control has automatic storage duration or is
not initialized by PTHREAD_ONCE_INIT.

RETURN VALUE
Upon successful completion, pthread_once() shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
The pthread_once() function may fail if:

[EINVAL] If either once_control or init_routine is invalid.

The pthread_once() function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Some C libraries are designed for dynamic initialization. That is, the global initialization for the
library is performed when the first procedure in the library is called. In a single-threaded
program, this is normally implemented using a static variable whose value is checked on entry
to a routine, as follows:

static int random_is_initialized = 0;
extern int initialize_random();

int random_function()
{
    if (random_is_initialized == 0) {
        initialize_random();
        random_is_initialized = 1;
    }
    ... /* Operations performed after initialization. */
}
To keep the same structure in a multi-threaded program, a new primitive is needed. Otherwise, library initialization has to be accomplished by an explicit call to a library-exported initialization function prior to any use of the library.

For dynamic library initialization in a multi-threaded process, a simple initialization flag is not sufficient; the flag needs to be protected against modification by multiple threads simultaneously calling into the library. Protecting the flag requires the use of a mutex; however, mutexes have to be initialized before they are used. Ensuring that the mutex is only initialized once requires a recursive solution to this problem.

The use of `pthread_once()` not only supplies an implementation-guaranteed means of dynamic initialization, it provides an aid to the reliable construction of multi-threaded and realtime systems. The preceding example then becomes:

```c
#include <pthread.h>

static pthread_once_t random_is_initialized = PTHREAD_ONCE_INIT;
extern int initialize_random();

int random_function()
{
    (void) pthread_once(&random_is_initialized, initialize_random);
    ... /* Operations performed after initialization. */
}
```

Note that a `pthread_once_t` cannot be an array because some compilers do not accept the construct `&<array_name>`. 

### CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Threads Extension.

The `pthread_once()` function is marked as part of the Threads option.

The [EINVAL] error is added as a may fail case for if either argument is invalid.

### SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-2001, `<pthread.h>`
NAME

pthread_rwlock_destroy, pthread_rwlock_init — destroy and initialize a read-write lock object

SYNOPSIS

```c
#include <pthread.h>

int pthread_rwlock_destroy(pthread_rwlock_t *rwlock);
int pthread_rwlock_init(pthread_rwlock_t *restrict rwlock,
                        const pthread_rwlockattr_t *restrict attr);
```

DESCRIPTION

The `pthread_rwlock_destroy()` function shall destroy the read-write lock object referenced by `rwlock` and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to `pthread_rwlock_init()`. An implementation may cause `pthread_rwlock_destroy()` to set the object referenced by `rwlock` to an invalid value. Results are undefined if `pthread_rwlock_destroy()` is called when any thread holds `rwlock`. Attempting to destroy an uninitialized read-write lock results in undefined behavior.

The `pthread_rwlock_init()` function shall allocate any resources required to use the read-write lock referenced by `rwlock` and initializes the lock to an unlocked state with attributes referenced by `attr`. If `attr` is NULL, the default read-write lock attributes shall be used; the effect is the same as passing the address of a default read-write lock attributes object. Once initialized, the lock can be used any number of times without being reinitialized. Results are undefined if `pthread_rwlock_init()` is called specifying an already initialized read-write lock. Results are undefined if a read-write lock is used without first being initialized.

If the `pthread_rwlock_init()` function fails, `rwlock` shall not be initialized and the contents of `rwlock` are undefined.

Only the object referenced by `rwlock` may be used for performing synchronization. The result of referring to copies of that object in calls to `pthread_rwlock_destroy()`, `pthread_rwlock_rdlock()`, `pthread_rwlock_timedrdlock()`, `pthread_rwlock_timedwrlock()`, `pthread_rwlock_tryrdlock()`, `pthread_rwlock_trywrlock()`, `pthread_rwlock_unlock()`, or `pthread_rwlock_wrlock()` is undefined.

RETURN VALUE

If successful, the `pthread_rwlock_destroy()` and `pthread_rwlock_init()` functions shall return zero; otherwise, an error number shall be returned to indicate the error.

The [EBUSY] and [EINVAL] error checks, if implemented, act as if they were performed immediately at the beginning of processing for the function and caused an error return prior to modifying the state of the read-write lock specified by `rwlock`.

ERRORS

The `pthread_rwlock_destroy()` function may fail if:

- **[EBUSY]** The implementation has detected an attempt to destroy the object referenced by `rwlock` while it is locked.
- **[EINVAL]** The value specified by `rwlock` is invalid.

The `pthread_rwlock_init()` function shall fail if:

- **[EAGAIN]** The system lacked the necessary resources (other than memory) to initialize another read-write lock.
- **[ENOMEM]** Insufficient memory exists to initialize the read-write lock.
- **[EPERM]** The caller does not have the privilege to perform the operation.
The \texttt{pthread_rwlock_init()} function may fail if:

- [EBUSY] The implementation has detected an attempt to reinitialize the object referenced by \texttt{rwlock}, a previously initialized but not yet destroyed read-write lock.
- [EINVAL] The value specified by \texttt{attr} is invalid.

These functions shall not return an error code of [EINVAL].

**EXAMPLES**

None.

**APPLICATION USAGE**

Applications using these and related read-write lock functions may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 5.

**Issue 6**

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension). The initializer macro is also deleted from the SYNOPSIS.
- The DESCRIPTION is updated as follows:
  - It explicitly notes allocation of resources upon initialization of a read-write lock object.
  - A paragraph is added specifying that copies of read-write lock objects may not be used.
- An [EINVAL] error is added to the ERRORS section for \texttt{pthread_rwlock_init()}, indicating that the \texttt{rwlock} value is invalid.
- The SEE ALSO section is updated.

The \texttt{restrict} keyword is added to the \texttt{pthread_rwlock_init()} prototype for alignment with the ISO/IEC 9899: 1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/45 is applied, adding \texttt{APPLICATION USAGE} relating to priority inversion.
NAME

pthread_rwlock_rdlock, pthread_rwlock_tryrdlock — lock a read-write lock object for reading

SYNOPSIS

THR

#include <pthread.h>

int pthread_rwlock_rdlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);

DESCRIPTION

The pthread_rwlock_rdlock() function shall apply a read lock to the read-write lock referenced by
rwlock. The calling thread acquires the read lock if a writer does not hold the lock and there are
no writers blocked on the lock.

If the Thread Execution Scheduling option is supported, and the threads involved in the lock are
executing with the scheduling policies SCHED_FIFO or SCHED_RR, the calling thread shall not
acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on
the lock; otherwise, the calling thread shall acquire the lock.

If the Threads Execution Scheduling option is supported, and the threads involved in the lock
are executing with the SCHED_SPORADIC scheduling policy, the calling thread shall not
acquire the lock if a writer holds the lock or if writers of higher or equal priority are blocked on
the lock; otherwise, the calling thread shall acquire the lock.

If the Thread Execution Scheduling option is not supported, it is implementation-defined
whether the calling thread acquires the lock when a writer does not hold the lock and there are
writers blocked on the lock. If a writer holds the lock, the calling thread shall not acquire the
read lock. If the read lock is not acquired, the calling thread shall block until it can acquire the
lock. The calling thread may deadlock if at the time the call is made it holds a write lock.

A thread may hold multiple concurrent read locks on rwlock (that is, successfully call the
pthread_rwlock_rdlock() function n times). If so, the application shall ensure that the thread
performs matching unlocks (that is, it calls the pthread_rwlock_unlock() function n times).

The maximum number of simultaneous read locks that an implementation guarantees can be
applied to a read-write lock shall be implementation-defined. The pthread_rwlock_rdlock()
function may fail if this maximum would be exceeded.

The pthread_rwlock_tryrdlock() function shall apply a read lock as in the pthread_rwlock_rdlock()
function, with the exception that the function shall fail if the equivalent pthread_rwlock_rdlock()
call would have blocked the calling thread. In no case shall the pthread_rwlock_tryrdlock()
function ever block; it always either acquires the lock or fails and returns immediately.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for reading, upon return from the
signal handler the thread resumes waiting for the read-write lock for reading as if it was not
interrupted.

RETURN VALUE

If successful, the pthread_rwlock_rdlock() function shall return zero; otherwise, an error number
shall be returned to indicate the error.

The pthread_rwlock_tryrdlock() function shall return zero if the lock for reading on the read-write
lock object referenced by rwlock is acquired. Otherwise, an error number shall be returned to
indicate the error.
The `pthread_rwlock_tryrdlock()` function shall fail if:

- [EBUSY] The read-write lock could not be acquired for reading because a writer holds the lock or a writer with the appropriate priority was blocked on it.

The `pthread_rwlock_rdlock()` and `pthread_rwlock_tryrdlock()` functions may fail if:

- [EINVAL] The value specified by `rwlock` does not refer to an initialized read-write lock object.
- [EAGAIN] The read lock could not be acquired because the maximum number of read locks for `rwlock` has been exceeded.
- [EDEADLK] The current thread already owns the read-write lock for writing.

These functions shall not return an error code of [EINTR].

### EXAMPLES
None.

### APPLICATION USAGE
Applications using these functions may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

### RATIONALE

### CHANGE HISTORY
First released in Issue 5.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The DESCRIPTION is updated as follows:
  - Conditions under which writers have precedence over readers are specified.
  - Failure of `pthread_rwlock_tryrdlock()` is clarified.
  - A paragraph on the maximum number of read locks is added.
- In the ERRORS sections, [EBUSY] is modified to take into account write priority, and [EDEADLK] is deleted as a `pthread_rwlock_tryrdlock()` error.
- The SEE ALSO section is updated.
NAME
pthread_rwlock_timedrdlock — lock a read-write lock for reading

SYNOPSIS
#include <pthread.h>
#include <time.h>
#include <pthread_rwlock.h>

int pthread_rwlock_timedrdlock(pthread_rwlock_t *rwlock,
    const struct timespec *abs_timeout);

DESCRIPTION
The pthread_rwlock_timedrdlock() function shall apply a read lock to the read-write lock
referenced by rwlock as in the pthread_rwlock_rdlock() function. However, if the lock cannot be
acquired without waiting for other threads to unlock the lock, this wait shall be terminated
when the specified timeout expires. The timeout shall expire when the absolute time specified
by abs_timeout passes, as measured by the clock on which timeouts are based (that is, when the
value of that clock equals or exceeds abs_timeout), or if the absolute time specified by abs_timeout
has already been passed at the time of the call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock. If
the Timers option is not supported, the timeout shall be based on the system clock as returned
by the time() function. The resolution of the timeout shall be the resolution of the clock on which
it is based. The timespec data type is defined in the <time.h> header. Under no circumstances
shall the function fail with a timeout if the lock can be acquired immediately. The validity of the
abs_timeout parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
write lock via a call to pthread_rwlock_timedrdlock(), upon return from the signal handler the
thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds a write lock on rwlock.
The results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE
The pthread_rwlock_timedrdlock() function shall return zero if the lock for reading on the read-
write lock object referenced by rwlock is acquired. Otherwise, an error number shall be returned
to indicate the error.

ERRORS
The pthread_rwlock_timedrdlock() function shall fail if:

[ETIMEDOUT] The lock could not be acquired before the specified timeout expired.

The pthread_rwlock_timedrdlock() function may fail if:

[EAGAIN] The read lock could not be acquired because the maximum number of read
locks for lock would be exceeded.

[EDEADLK] The calling thread already holds a write lock on rwlock.

[EINVAL] The value specified by rwlock does not refer to an initialized read-write lock
object, or the abs_timeout nanosecond value is less than zero or greater than or
equal to 1 000 million.

This function shall not return an error code of [EINVAL].
EXAMPLES
None.

APPLICATION USAGE
Applications using this function may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

The `pthread_rwlock_timedrdlock()` function is part of the Threads and Timeouts options and need not be provided on all implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME

pthread_rwlock_timedwrlock — lock a read-write lock for writing

SYNOPSIS

#include <pthread.h>
#include <time.h>

int pthread_rwlock_timedwrlock(pthread_rwlock_t *restrict rwlock,
    const struct timespec *restrict abs_timeout);

DESCRIPTION

The `pthread_rwlock_timedwrlock()` function shall apply a write lock to the read-write lock
referenced by `rwlock` as in the `pthread_rwlock_wrlock()` function. However, if the lock cannot be
acquired without waiting for other threads to unlock the lock, this wait shall be terminated
when the specified timeout expires. The timeout shall expire when the absolute time specified
by `abs_timeout` passes, as measured by the clock on which timeouts are based (that is, when the
value of that clock equals or exceeds `abs_timeout`), or if the absolute time specified by `abs_timeout`
has already been passed at the time of the call.

If the Timers option is supported, the timeout shall be based on the `CLOCK_REALTIME` clock. If
the Timers option is not supported, the timeout shall be based on the system clock as returned
by the `time()` function. The resolution of the timeout shall be the resolution of the clock on which
it is based. The `timespec` data type is defined in the `<time.h>` header. Under no circumstances
shall the function fail with a timeout if the lock can be acquired immediately. The validity of the
`abs_timeout` parameter need not be checked if the lock can be immediately acquired.

If a signal that causes a signal handler to be executed is delivered to a thread blocked on a read-
write lock via a call to `pthread_rwlock_timedwrlock()`, upon return from the signal handler the
thread shall resume waiting for the lock as if it was not interrupted.

The calling thread may deadlock if at the time the call is made it holds the read-write lock. The
results are undefined if this function is called with an uninitialized read-write lock.

RETURN VALUE

The `pthread_rwlock_timedwrlock()` function shall return zero if the lock for writing on the read-
write lock object referenced by `rwlock` is acquired. Otherwise, an error number shall be returned
to indicate the error.

ERRORS

The `pthread_rwlock_timedwrlock()` function shall fail if:

- [ETIMEDOUT] The lock could not be acquired before the specified timeout expired.
- [EDEADLK] The calling thread already holds the `rwlock`.
- [EINVAL] The value specified by `rwlock` does not refer to an initialized read-write lock
  object, or the `abs_timeout` nanosecond value is less than zero or greater than or
  equal to 1 000 million.

This function shall not return an error code of [EINTR].
EXAMPLES
None.

APPLICATION USAGE
Applications using this function may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

The `pthread_rwlock_timedwrlock()` function is part of the Threads and Timeouts options and need not be provided on all implementations.

CHANGE HISTORY
NAME
pthread_rwlock_tryrdlock — lock a read-write lock object for reading

SYNOPSIS
THR
#include <pthread.h>

int pthread_rwlock_tryrdlock(pthread_rwlock_t *rwlock);

DESCRIPTION
Refer to pthread_rwlock_rdlock().
NAME
pthread_rwlock_trywrlock, pthread_rwlock_wrlock — lock a read-write lock object for writing

SYNOPSIS
THR
#include <pthread.h>

int pthread_rwlock_trywrlock(pthread_rwlock_t *rwlock);
int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);

DESCRIPTION
The pthread_rwlock_trywrlock() function shall apply a write lock like the pthread_rwlock_wrlock() function, with the exception that the function shall fail if any thread currently holds rwlock (for reading or writing).

The pthread_rwlock_wrlock() function shall apply a write lock to the read-write lock referenced by rwlock. The calling thread acquires the write lock if no other thread (reader or writer) holds the read-write lock rwlock. Otherwise, the thread shall block until it can acquire the lock. The calling thread may deadlock if at the time the call is made it holds the read-write lock (whether a read or write lock).

Implementations may favor writers over readers to avoid writer starvation.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

If a signal is delivered to a thread waiting for a read-write lock for writing, upon return from the signal handler the thread resumes waiting for the read-write lock for writing as if it was not interrupted.

RETURN VALUE
The pthread_rwlock_trywrlock() function shall return zero if the lock for writing on the read-write lock object referenced by rwlock is acquired. Otherwise, an error number shall be returned to indicate the error.

If successful, the pthread_rwlock_wrlock() function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS
The pthread_rwlock_trywrlock() function shall fail if:

[EBUSY] The read-write lock could not be acquired for writing because it was already locked for reading or writing.

The pthread_rwlock_trywrlock() and pthread_rwlock_wrlock() functions may fail if:

[EINVAL] The value specified by rwlock does not refer to an initialized read-write lock object.

The pthread_rwlock_wrlock() function may fail if:

[EDEADLK] The current thread already owns the read-write lock for writing or reading.

These functions shall not return an error code of [EINTR].
EXCEPTIONS
None.

APPLICATION USAGE
Applications using these functions may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion.

RATIONALE

CHANGE HISTORY
First released in Issue 5.

Issue 6
The following changes are made for alignment with IEEE Std 1003.1j-2000:
• The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
• The [EDEADLK] error is deleted as a pthread_rwlock_trywrlock() error.
• The SEE ALSO section is updated.
**NAME**

pthread_rwlock_unlock — unlock a read-write lock object

**SYNOPSIS**

```c
#include <pthread.h>

int pthread_rwlock_unlock(pthread_rwlock_t *rwlock);
```

**DESCRIPTION**

The `pthread_rwlock_unlock()` function shall release a lock held on the read-write lock object referenced by `rwlock`. Results are undefined if the read-write lock `rwlock` is not held by the calling thread.

If this function is called to release a read lock from the read-write lock object and there are other read locks currently held on this read-write lock object, the read-write lock object remains in the read locked state. If this function releases the last read lock for this read-write lock object, the read-write lock object shall be put in the unlocked state with no owners.

If this function is called to release a write lock for this read-write lock object, the read-write lock object shall be put in the unlocked state.

If there are threads blocked on the lock when it becomes available, the scheduling policy shall determine which thread(s) shall acquire the lock. If the Thread Execution Scheduling option is supported, when threads executing with the scheduling policies SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC are waiting on the lock, they shall acquire the lock in priority order when the lock becomes available. For equal priority threads, write locks shall take precedence over read locks. If the Thread Execution Scheduling option is not supported, it is implementation-defined whether write locks take precedence over read locks.

Results are undefined if any of these functions are called with an uninitialized read-write lock.

**RETURN VALUE**

If successful, the `pthread_rwlock_unlock()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

**ERRORS**

The `pthread_rwlock_unlock()` function may fail if:

- `EINVAL` The value specified by `rwlock` does not refer to an initialized read-write lock object.
- `EPERM` The current thread does not hold a lock on the read-write lock.

The `pthread_rwlock_unlock()` function shall not return an error code of `[EINTR]`.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

CHANGE HISTORY

First released in Issue 5.

Issue 6

The following changes are made for alignment with IEEE Std 1003.1j-2000:

• The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is
  now part of the Threads option (previously it was part of the Read-Write Locks option in
  IEEE Std 1003.1j-2000 and also part of the XSI extension).

• The DESCRIPTION is updated as follows:
  — The conditions under which writers have precedence over readers are specified.
  — The concept of read-write lock owner is deleted.

• The SEE ALSO section is updated.
NAME

pthread_rwlock_wrlock — lock a read-write lock object for writing

SYNOPSIS

THR

```c
#include <pthread.h>

int pthread_rwlock_wrlock(pthread_rwlock_t *rwlock);
```

DESCRIPTION

Refer to `pthread_rwlock_trywrlock()`.
NAME

pthread_rwlockattr_destroy, pthread_rwlockattr_init — destroy and initialize the read-write lock attributes object

SYNOPSIS

THR
#include <pthread.h>

int pthread_rwlockattr_destroy(pthread_rwlockattr_t *attr);
int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

DESCRIPTION

The pthread_rwlockattr_destroy() function shall destroy a read-write lock attributes object. A destroyed attr attributes object can be reinitialized using pthread_rwlockattr_init(); the results of otherwise referencing the object after it has been destroyed are undefined. An implementation may cause pthread_rwlockattr_destroy() to set the object referenced by attr to an invalid value.

The pthread_rwlockattr_init() function shall initialize a read-write lock attributes object attr with the default value for all of the attributes defined by the implementation.

Results are undefined if pthread_rwlockattr_init() is called specifying an already initialized attr attributes object.

After a read-write lock attributes object has been used to initialize one or more read-write locks, any function affecting the attributes object (including destruction) shall not affect any previously initialized read-write locks.

RETURN VALUE

If successful, the pthread_rwlockattr_destroy() and pthread_rwlockattr_init() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_rwlockattr_destroy() function may fail if:

[EINVAL] The value specified by attr is invalid.

The pthread_rwlockattr_init() function shall fail if:

[ENOMEM] Insufficient memory exists to initialize the read-write lock attributes object.

These functions shall not return an error code of [EINTR].

EXAMPLES

pthread_rwlock_destroy(), pthread_rwlockattr_getpshared(), pthread_rwlockattr_setpshared(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>
CHANGE HISTORY

First released in Issue 5.

The following changes are made for alignment with IEEE Std 1003.1j-2000:

- The margin code in the SYNOPSIS is changed to THR to indicate that the functionality is now part of the Threads option (previously it was part of the Read-Write Locks option in IEEE Std 1003.1j-2000 and also part of the XSI extension).
- The SEE ALSO section is updated.
NAME

pthread_rwlockattr_getpshared, pthread_rwlockattr_setpshared — get and set the process-shared attribute of the read-write lock attributes object

SYNOPSIS

```c
#include <pthread.h>

int pthread_rwlockattr_getpshared(const pthread_rwlockattr_t * restrict attr, int *restrict pshared);
int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr, int pshared);
```

DESCRIPTION

The `pthread_rwlockattr_getpshared()` function shall obtain the value of the process-shared attribute from the initialized attributes object referenced by `attr`. The `pthread_rwlockattr_setpshared()` function shall set the process-shared attribute in an initialized attributes object referenced by `attr`.

The process-shared attribute shall be set to PTHREAD_PROCESS_SHARED to permit a read-write lock to be operated upon by any thread that has access to the memory where the read-write lock is allocated, even if the read-write lock is allocated in memory that is shared by multiple processes. If the process-shared attribute is PTHREAD_PROCESS_PRIVATE, the read-write lock shall only be operated upon by threads created within the same process as the thread that initialized the read-write lock; if threads of differing processes attempt to operate on such a read-write lock, the behavior is undefined. The default value of the process-shared attribute shall be PTHREAD_PROCESS_PRIVATE.

Additional attributes, their default values, and the names of the associated functions to get and set those attribute values are implementation-defined.

RETURN VALUE

Upon successful completion, the `pthread_rwlockattr_getpshared()` function shall return zero and store the value of the process-shared attribute of `attr` into the object referenced by the `pshared` parameter. Otherwise, an error number shall be returned to indicate the error.

If successful, the `pthread_rwlockattr_setpshared()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_rwlockattr_getpshared()` and `pthread_rwlockattr_setpshared()` functions may fail if:

- `EINVAL` The value specified by `attr` is invalid.
- The `pthread_rwlockattr_setpshared()` function may fail if:
  - `EINVAL` The new value specified for the attribute is outside the range of legal values for that attribute.

These functions shall not return an error code of `[EINTR]`. 
EXAMPLES
None.

APPLICATION USAGE
None.

NAME
pthread_rwlockattr_init — initialize the read-write lock attributes object

SYNOPSIS
#include <pthread.h>

int pthread_rwlockattr_init(pthread_rwlockattr_t *attr);

DESCRIPTION
Refer to pthread_rwlockattr_destroy().
NAME

pthread_rwlockattr_setpshared — set the process-shared attribute of the read-write lock attributes object

SYNOPSIS

#include <pthread.h>

int pthread_rwlockattr_setpshared(pthread_rwlockattr_t *attr,
                                  int pshared);

DESCRIPTION

Refer to pthread_rwlockattr_getpshared().
NAME
pthread_self — get the calling thread ID

SYNOPSIS
THR
#include <pthread.h>

pthread_t pthread_self(void);

DESCRIPTION
The pthread_self() function shall return the thread ID of the calling thread.

RETURN VALUE
Refer to the DESCRIPTION.

ERRORS
No errors are defined.

The pthread_self() function shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The pthread_self() function provides a capability similar to the getpid() function for processes and the rationale is the same: the creation call does not provide the thread ID to the created thread.

FUTURE DIRECTIONS
None.

SEE ALSO
pthread_create(), pthread_equal(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The pthread_self() function is marked as part of the Threads option.
NAME

pthread_setcancelstate, pthread_setcanceltype, pthread_testcancel — set cancelability state

SYNOPSIS

THR

#include <pthread.h>

int pthread_setcancelstate(int state, int *oldstate);
int pthread_setcanceltype(int type, int *oldtype);
void pthread_testcancel(void);

DESCRIPTION

The pthread_setcancelstate() function shall atomically both set the calling thread’s cancelability state to the indicated state and return the previous cancelability state at the location referenced by oldstate. Legal values for state are PTHREAD_CANCEL_ENABLE and PTHREAD_CANCEL_DISABLE.

The pthread_setcanceltype() function shall atomically both set the calling thread’s cancelability type to the indicated type and return the previous cancelability type at the location referenced by oldtype. Legal values for type are PTHREAD_CANCEL_DEFERRED and PTHREAD_CANCEL_ASYNCHRONOUS.

The cancelability state and type of any newly created threads, including the thread in which main() was first invoked, shall be PTHREAD_CANCEL_ENABLE and PTHREAD_CANCEL_DEFERRED respectively.

The pthread_testcancel() function shall create a cancellation point in the calling thread. The pthread_testcancel() function shall have no effect if cancelability is disabled.

RETURN VALUE

If successful, the pthread_setcancelstate() and pthread_setcanceltype() functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The pthread_setcancelstate() function may fail if:

[EINVAL] The specified state is not PTHREAD_CANCEL_ENABLE or PTHREAD_CANCEL_DISABLE.

The pthread_setcanceltype() function may fail if:

[EINVAL] The specified type is not PTHREAD_CANCEL_DEFERRED or PTHREAD_CANCEL_ASYNCHRONOUS.

These functions shall not return an error code of [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The pthread_setcancelstate() and pthread_setcanceltype() functions control the points at which a thread may be asynchronously canceled. For cancellation control to be usable in modular fashion, some rules need to be followed.

An object can be considered to be a generalization of a procedure. It is a set of procedures and global variables written as a unit and called by clients not known by the object. Objects may depend on other objects.
First, cancelability should only be disabled on entry to an object, never explicitly enabled. On exit from an object, the cancelability state should always be restored to its value on entry to the object.

This follows from a modularity argument: if the client of an object (or the client of an object that uses that object) has disabled cancelability, it is because the client does not want to be concerned about cleaning up if the thread is canceled while executing some sequence of actions. If an object is called in such a state and it enables cancelability and a cancellation request is pending for that thread, then the thread is canceled, contrary to the wish of the client that disabled.

Second, the cancelability type may be explicitly set to either deferred or asynchronous upon entry to an object. But as with the cancelability state, on exit from an object the cancelability type should always be restored to its value on entry to the object.

Finally, only functions that are cancel-safe may be called from a thread that is asynchronously cancelable.

FUTURE DIRECTIONS
None.

SEE ALSO
pthread_cancel(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Threads Extension.

Issue 6
The pthread_setcancelstate(), pthread_setcanceltype(), and pthread_testcancel() functions are marked as part of the Threads option.
NAME

pthread_setconcurrency — set the level of concurrency

SYNOPSIS

XSI

```c
#include <pthread.h>

int pthread_setconcurrency(int new_level);
```

DESCRIPTION

Refer to `pthread_getconcurrency()`.
NAME
pthread_setschedparam — dynamic thread scheduling parameters access (REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_setschedparam(pthread_t thread, int policy,
const struct sched_param *param);
```

DESCRIPTION

Refer to `pthread_getschedparam()`.
NAME

pthread_setschedprio — dynamic thread scheduling parameters access (REALTIME THREADS)

SYNOPSIS

```c
#include <pthread.h>

int pthread_setschedprio(pthread_t thread, int prio);
```

DESCRIPTION

The `pthread_setschedprio()` function shall set the scheduling priority for the thread whose thread ID is given by `thread` to the value given by `prio`. See Scheduling Policies (on page 44) for a description on how this function call affects the ordering of the thread in the thread list for its new priority.

If the `pthread_setschedprio()` function fails, the scheduling priority of the target thread shall not be changed.

RETURN VALUE

If successful, the `pthread_setschedprio()` function shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

The `pthread_setschedprio()` function may fail if:

- [EINVAL] The value of `prio` is invalid for the scheduling policy of the specified thread.
- [ENOTSUP] An attempt was made to set the priority to an unsupported value.
- [EPERM] The caller does not have the appropriate permission to set the scheduling policy of the specified thread.
- [EPERM] The implementation does not allow the application to modify the priority to the value specified.
- [ESRCH] The value specified by `thread` does not refer to an existing thread.

The `pthread_setschedprio()` function shall not return an error code of [EINTR].

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The `pthread_setschedprio()` function provides a way for an application to temporarily raise its priority and then lower it again, without having the undesired side effect of yielding to other threads of the same priority. This is necessary if the application is to implement its own strategies for bounding priority inversion, such as priority inheritance or priority ceilings. This capability is especially important if the implementation does not support the Thread Priority Protection or Thread Priority Inheritance options, but even if those options are supported it is needed if the application is to bound priority inheritance for other resources, such as semaphores.

The standard developers considered that while it might be preferable conceptually to solve this problem by modifying the specification of `pthread_setschedparam()`, it was too late to make such a change, as there may be implementations that would need to be changed. Therefore, this new function was introduced.
**FUTURE DIRECTIONS**

None.

Scheduling Policies (on page 44), `pthread_getschedparam()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<pthread.h>`

**CHANGE HISTORY**

First released in Issue 6. Included as a response to IEEE PASC Interpretation 1003.1 #96.
NAME
pthread_setspecific — thread-specific data management

SYNOPSIS
THR
#include <pthread.h>

int pthread_setspecific(pthread_key_t key, const void *value);

DESCRIPTION
Refer to pthread_getspecific().
NAME
pthread_sigmask, sigprocmask — examine and change blocked signals

SYNOPSIS
#include <signal.h>

int pthread_sigmask(int how, const sigset_t *restrict set, 
                    sigset_t *restrict oset);

int sigprocmask(int how, const sigset_t *restrict set, 
                 sigset_t *restrict oset);

DESCRIPTION
The pthread_sigmask() function shall examine or change (or both) the calling thread’s
signal mask, regardless of the number of threads in the process. The function shall be equivalent to
sigprocmask(), without the restriction that the call be made in a single-threaded process.
In a single-threaded process, the sigprocmask() function shall examine or change (or both) the
signal mask of the calling thread.
If the argument set is not a null pointer, it points to a set of signals to be used to change the
currently blocked set.
The argument how indicates the way in which the set is changed, and the application shall
ensure it consists of one of the following values:
SIG_BLOCK The resulting set shall be the union of the current set and the signal set
pointed to by set.
SIG_SETMASK The resulting set shall be the signal set pointed to by set.
SIG_UNBLOCK The resulting set shall be the intersection of the current set and the
complement of the signal set pointed to by set.
If the argument oset is not a null pointer, the previous mask shall be stored in the location
pointed to by oset. If set is a null pointer, the value of the argument how is not significant and the
process’ signal mask shall be unchanged; thus the call can be used to enquire about currently
blocked signals.
If there are any pending unblocked signals after the call to sigprocmask(), at least one of those
signals shall be delivered before the call to sigprocmask() returns.
It is not possible to block those signals which cannot be ignored. This shall be enforced by the
system without causing an error to be indicated.
If any of the SIGFPE, SIGILL, SIGSEGV, or SIGBUS signals are generated while they are blocked,
the result is undefined, unless the signal was generated by the kill() function, the sigqueue() function, or the raise() function.
If sigprocmask() fails, the thread’s signal mask shall not be changed.
The use of the sigprocmask() function is unspecified in a multi-threaded process.

RETURN VALUE
Upon successful completion pthread_sigmask() shall return 0; otherwise, it shall return the
corresponding error number.
Upon successful completion, sigprocmask() shall return 0; otherwise, −1 shall be returned, errno
shall be set to indicate the error, and the process’ signal mask shall be unchanged.
The `pthread_sigmask()` and `sigprocmask()` functions shall fail if:

- [EINVAL] The value of the `how` argument is not equal to one of the defined values.

The `pthread_sigmask()` function shall not return an error code of [EINTR].

**Examples**
None.

**Application Usage**
None.

**Rationale**
When a process’ signal mask is changed in a signal-catching function that is installed by `sigaction()`, the restoration of the signal mask on return from the signal-catching function overrides that change (see `sigaction()`). If the signal-catching function was installed with `signal()`, it is unspecified whether this occurs.

See `kill()` for a discussion of the requirement on delivery of signals.

**Future Directions**
None.

**See Also**
`sigaction()`, `sigaddset()`, `sigdelset()`, `sigemptyset()`, `sigfillset()`, `sigismember()`, `sigpending()`, `sigqueue()`, `sigsuspend()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<signal.h>`

**Change History**
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**Issue 6**
The `pthread_sigmask()` function is added for alignment with the POSIX Threads Extension.

The `pthread_sigmask()` function is marked as part of the Threads option.

The SYNOPSIS for `sigprocmask()` is marked as a CX extension to note that the presence of this function in the `<signal.h>` header is an extension to the ISO C standard.

The following changes are made for alignment with the ISO POSIX-1:1996 standard:

- The DESCRIPTION is updated to explicitly state the functions which may generate the signal.

The DESCRIPTION is updated to avoid use of the term ‘‘must’’ for application requirements.

The `restrict` keyword is added to the `pthread_sigmask()` and `sigprocmask()` prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME

pthread_spin_destroy, pthread_spin_init — destroy or initialize a spin lock object (ADVANCED REALTIME THREADS)

SYNOPSIS

THR SPI
#include <pthread.h>

int pthread_spin_destroy(pthread_spinlock_t *lock);
int pthread_spin_init(pthread_spinlock_t *lock, int pshared);

DESCRIPTION

The pthread_spin_destroy() function shall destroy the spin lock referenced by lock and release any resources used by the lock. The effect of subsequent use of the lock is undefined until the lock is reinitialized by another call to pthread_spin_init(). The results are undefined if pthread_spin_destroy() is called when a thread holds the lock, or if this function is called with an uninitialized thread spin lock.

The pthread_spin_init() function shall allocate any resources required to use the spin lock referenced by lock and initialize the lock to an unlocked state.

TSH
If the Thread Process-Shared Synchronization option is supported and the value of pshared is PTHREAD_PROCESS_SHARED, the implementation shall permit the spin lock to be operated upon by any thread that has access to the memory where the spin lock is allocated, even if it is allocated in memory that is shared by multiple processes.

If the Thread Process-Shared Synchronization option is supported and the value of pshared is PTHREAD_PROCESS_PRIVATE, or if the option is not supported, the spin lock shall only be operated upon by threads created within the same process as the thread that initialized the spin lock. If threads of differing processes attempt to operate on such a spin lock, the behavior is undefined.

The results are undefined if pthread_spin_init() is called specifying an already initialized spin lock. The results are undefined if a spin lock is used without first being initialized.

If the pthread_spin_init() function fails, the lock is not initialized and the contents of lock are undefined.

Only the object referenced by lock may be used for performing synchronization.

The result of referring to copies of that object in calls to pthread_spin_destroy(), pthread_spin_lock(), pthread_spin_trylock(), or pthread_spin_unlock() is undefined.

RETURN VALUE

Upon successful completion, these functions shall return zero; otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EBUSY] The implementation has detected an attempt to initialize or destroy a spin lock while it is in use (for example, while being used in a pthread_spin_lock() call) by another thread.

[EINVAL] The value specified by lock is invalid.

The pthread_spin_init() function shall fail if:

[EAGAIN] The system lacks the necessary resources to initialize another spin lock.
pthreads

[ENOMEM] Insufficient memory exists to initialize the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
The pthread_spin_destroy() and pthread_spin_init() functions are part of the Spin Locks option and need not be provided on all implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
pthread_spin_lock(), pthread_spin_unlock(), the Base Definitions volume of IEEE Std 1003.1-2001, <pthread.h>

CHANGE HISTORY

NAME
pthread_spin_lock, pthread_spin_trylock — lock a spin lock object (ADVANCED REALTIME
THREADS)

SYNOPSIS
#include <pthread.h>

int pthread_spin_lock(pthread_spinlock_t *lock);
int pthread_spin_trylock(pthread_spinlock_t *lock);

DESCRIPTION
The `pthread_spin_lock()` function shall lock the spin lock referenced by `lock`. The calling thread
shall acquire the lock if it is not held by another thread. Otherwise, the thread shall spin (that is,
shall not return from the `pthread_spin_lock()` call) until the lock becomes available. The results
are undefined if the calling thread holds the lock at the time the call is made. The
`pthread_spin_trylock()` function shall lock the spin lock referenced by `lock` if it is not held by any
thread. Otherwise, the function shall fail.

The results are undefined if any of these functions is called with an uninitialized spin lock.

RETURN VALUE
Upon successful completion, these functions shall return zero; otherwise, an error number shall
be returned to indicate the error.

ERRORS
These functions may fail if:

[EINVAl] The value specified by `lock` does not refer to an initialized spin lock object.

The `pthread_spin_lock()` function may fail if:

[EDEADLK] The calling thread already holds the lock.

The `pthread_spin_trylock()` function shall fail if:

[EBUSY] A thread currently holds the lock.

These functions shall not return an error code of [EINTR].

EXAMPLES
None.

APPLICATION USAGE
Applications using this function may be subject to priority inversion, as discussed in the Base

The `pthread_spin_lock()` and `pthread_spin_trylock()` functions are part of the Spin Locks option
and need not be provided on all implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME

pthread_spin_unlock — unlock a spin lock object (ADVANCED REALTIME THREADS)

SYNOPSIS

#include <pthread.h>

int pthread_spin_unlock(pthread_spinlock_t *lock);

DESCRIPTION

The pthread_spin_unlock() function shall release the spin lock referenced by lock which was
locked via the pthread_spin_lock() or pthread_spin_trylock() functions. The results are undefined if
the lock is not held by the calling thread. If there are threads spinning on the lock when
pthread_spin_unlock() is called, the lock becomes available and an unspecified spinning thread
shall acquire the lock.

The results are undefined if this function is called with an uninitialized thread spin lock.

RETURN VALUE

Upon successful completion, the pthread_spin_unlock() function shall return zero; otherwise, an
error number shall be returned to indicate the error.

ERRORS

The pthread_spin_unlock() function may fail if:

EINVAL An invalid argument was specified.

EPERM The calling thread does not hold the lock.

This function shall not return an error code of [EINVAL].

EXAMPLES

None.

APPLICATION USAGE

The pthread_spin_unlock() function is part of the Spin Locks option and need not be provided on
all implementations.

NAME

pthread_testcancel — set cancelability state

SYNOPSIS

THR

#include <pthread.h>

void pthread_testcancel(void);

DESCRIPTION

Refer to pthread_setcancelstate().
NAME
ptsname — get name of the slave pseudo-terminal device

SYNOPSIS
XSI
#include <stdlib.h>

char *ptsname(int fildes);

DESCRIPTION
The ptsname() function shall return the name of the slave pseudo-terminal device associated
with a master pseudo-terminal device. The fildes argument is a file descriptor that refers to the
master device. The ptsname() function shall return a pointer to a string containing the pathname
of the corresponding slave device.

The ptsname() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

RETURN VALUE
Upon successful completion, ptsname() shall return a pointer to a string which is the name of the
pseudo-terminal slave device. Upon failure, ptsname() shall return a null pointer. This could
occur if fildes is an invalid file descriptor or if the slave device name does not exist in the file
system.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The value returned may point to a static data area that is overwritten by each call to ptsname().

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.
A note indicating that this function need not be reentrant is added to the DESCRIPTION.
NAME
putc — put a byte on a stream

SYNOPSIS
#include <stdio.h>

int putc(int c, FILE *stream);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The putc() function shall be equivalent to fputc(), except that if it is implemented as a macro it may evaluate stream more than once, so the argument should never be an expression with side effects.

RETURN VALUE
Refer to fputc().

ERRORS
Refer to fputc().

EXAMPLES
None.

APPLICATION USAGE
Since it may be implemented as a macro, putc() may treat a stream argument with side effects incorrectly. In particular, putc(c,*f++) does not necessarily work correctly. Therefore, use of this function is not recommended in such situations; fputc() should be used instead.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

NAME         putchar_unlocked — stdio with explicit client locking

SYNOPSIS   #include <stdio.h>

int putchar_unlocked(int c);

DESCRIPTION Refer to getc_unlocked().
NAME
putenv — change or add a value to an environment

SYNOPSIS
XSI
#include <stdlib.h>
int putenv(char *string);

DESCRIPTION
The putenv() function shall use the string argument to set environment variable values. The
string argument should point to a string of the form "name=value". The putenv() function shall
make the value of the environment variable name equal to value by altering an existing variable
or creating a new one. In either case, the string pointed to by string shall become part of the
environment, so altering the string shall change the environment. The space used by string is no
longer used once a new string which defines name is passed to putenv().

The putenv() function need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

RETURN VALUE
Upon successful completion, putenv() shall return 0; otherwise, it shall return a non-zero value
and set errno to indicate the error.

ERRORS
The putenv() function may fail if:
[ENOMEM] Insufficient memory was available.

EXAMPLES
Changing the Value of an Environment Variable
The following example changes the value of the HOME environment variable to the value
/usr/home.
#include <stdlib.h>
...
static char *var = "HOME=/usr/home";
int ret;
ret = putenv(var);

APPLICATION USAGE
The putenv() function manipulates the environment pointed to by environ, and can be used in
conjunction with getenv().
See exec, for restrictions on changing the environment in multi-threaded applications.
This routine may use malloc() to enlarge the environment.
A potential error is to call putenv() with an automatic variable as the argument, then return from
the calling function while string is still part of the environment.
The setenv() function is preferred over this function.

RATIONALE
The standard developers noted that putenv() is the only function available to add to the
environment without permitting memory leaks.
FUTURE DIRECTIONS
None.

SEE ALSO
exec, getenv(), malloc(), setenv(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The type of the argument to this function is changed from const char * to char *. This was indicated as a FUTURE DIRECTION in previous issues.
A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/48 is applied, clarifying wording in the DESCRIPTION and adding a new paragraph into APPLICATION USAGE referring readers to exec.
NAME
putmsg, putpmsg — send a message on a STREAM (STREAMS)

SYNOPSIS
XSR
#include <stropts.h>

int putmsg(int fildes, const struct strbuf *ctlptr,
const struct strbuf *dataptr, int flags);
int putpmsg(int fildes, const struct strbuf *ctlptr,
const struct strbuf *dataptr, int band, int flags);

DESCRIPTION
The putmsg() function shall create a message from a process buffer(s) and send the message to a
STREAMS file. The message may contain either a data part, a control part, or both. The data and
control parts are distinguished by placement in separate buffers, as described below. The
semantics of each part are defined by the STREAMS module that receives the message.

The putpmsg() function is equivalent to putmsg(), except that the process can send messages in
different priority bands. Except where noted, all requirements on putmsg() also pertain to
putpmsg().

The fildes argument specifies a file descriptor referencing an open STREAM. The ctlptr and
dataptr arguments each point to a strbuf structure.

The ctlptr argument points to the structure describing the control part, if any, to be included in
the message. The buf member in the strbuf structure points to the buffer where the control
information resides, and the len member indicates the number of bytes to be sent. The maxlen
member is not used by putmsg(). In a similar manner, the argument dataptr specifies the data, if
any, to be included in the message. The flags argument indicates what type of message should be
sent and is described further below.

To send the data part of a message, the application shall ensure that dataptr is not a null pointer
and the len member of dataptr is 0 or greater. To send the control part of a message, the
application shall ensure that the corresponding values are set for ctlptr. No data (control) part
shall be sent if either dataptr(ctlptr) is a null pointer or the len member of dataptr(ctlptr) is set to
−1.

For putmsg(), if a control part is specified and flags is set to RS_HIPRI, a high priority message
shall be sent. If no control part is specified, and flags is set to RS_HIPRI, putmsg() shall fail and
set errno to [EINVAL]. If flags is set to 0, a normal message (priority band equal to 0) shall be
sent. If a control part and data part are not specified and flags is set to 0, no message shall be
sent and 0 shall be returned.

For putpmsg(), the flags are different. The flags argument is a bitmask with the following
mutually-exclusive flags defined: MSG_HIPRI and MSG_BAND. If flags is set to 0, putpmsg() shall fail and set errno to [EINVAL]. If a control part is specified and flags is set to MSG_HIPRI
and band is set to 0, a high-priority message shall be sent. If flags is set to MSG_HIPRI and either
no control part is specified or band is set to a non-zero value, putpmsg() shall fail and set errno to
[EINVAL]. If flags is set to MSG_BAND, then a message shall be sent in the priority band
specified by band. If a control part and data part are not specified and flags is set to MSG_BAND,
no message shall be sent and 0 shall be returned.

The putmsg() function shall block if the STREAM write queue is full due to internal flow control
conditions, with the following exceptions:

• For high-priority messages, putmsg() shall not block on this condition and continues
  processing the message.
• For other messages, `putmsg()` shall not block but shall fail when the write queue is full and O_NONBLOCK is set.

The `putmsg()` function shall also block, unless prevented by lack of internal resources, while waiting for the availability of message blocks in the STREAM, regardless of priority or whether O_NONBLOCK has been specified. No partial message shall be sent.

**RETURN VALUE**

Upon successful completion, `putmsg()` and `putpmsg()` shall return 0; otherwise, they shall return −1 and set `errno` to indicate the error.

**ERRORS**

The `putmsg()` and `putpmsg()` functions shall fail if:

- [EAGAIN] A non-priority message was specified, the O_NONBLOCK flag is set, and the STREAM write queue is full due to internal flow control conditions; or buffers could not be allocated for the message that was to be created.
- [EBADF] `fildes` is not a valid file descriptor open for writing.
- [EINTR] A signal was caught during `putmsg()`.
- [EINVAL] An undefined value is specified in `flags`, or `flags` is set to RS_HIPRI or MSG_HIPRI and no control part is supplied, or the STREAM or multiplexer referenced by `fildes` is linked (directly or indirectly) downstream from a multiplexer, or `flags` is set to MSG_HIPRI and `band` is non-zero (for `putpmsg()` only).
- [ENOSR] Buffers could not be allocated for the message that was to be created due to insufficient STREAMS memory resources.
- [ENOOSTR] A STREAM is not associated with `fildes`.
- [ENXIO] A hangup condition was generated downstream for the specified STREAM.
- [EPIPE] or [EIO] The `fildes` argument refers to a STREAMS-based pipe and the other end of the pipe is closed. A SIGPIPE signal is generated for the calling thread.
- [ERANGE] The size of the data part of the message does not fall within the range specified by the maximum and minimum packet sizes of the topmost STREAM module. This value is also returned if the control part of the message is larger than the maximum configured size of the control part of a message, or if the data part of a message is larger than the maximum configured size of the data part of a message.

In addition, `putmsg()` and `putpmsg()` shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of `errno` does not reflect the result of `putmsg()` or `putpmsg()`, but reflects the prior error.
putmsg()  

EXAMPLES

Sending a High-Priority Message

The value of \textit{fd} is assumed to refer to an open STREAMS file. This call to \textit{putmsg()} does the following:

1. Creates a high-priority message with a control part and a data part, using the buffers pointed to by \textit{ctrlbuf} and \textit{databuf}, respectively.

2. Sends the message to the STREAMS file identified by \textit{fd}.

```c
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;
ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);
data.buf = databuf;
data.len = strlen(databuf);
ret = putmsg(fd, &ctrl, &data, MSG_HIPRI);
```

Using putpmsg()

This example has the same effect as the previous example. In this example, however, the \textit{putpmsg()} function creates and sends the message to the STREAMS file.

```c
#include <stropts.h>
#include <string.h>
...
int fd;
char *ctrlbuf = "This is the control part";
char *databuf = "This is the data part";
struct strbuf ctrl;
struct strbuf data;
int ret;
ctrl.buf = ctrlbuf;
ctrl.len = strlen(ctrlbuf);
data.buf = databuf;
data.len = strlen(databuf);
ret = putpmsg(fd, &ctrl, &data, 0, MSG_HIPRI);
```

APPLICATION USAGE

None.
putmsg()

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked as part of the XSI STREAMS Option Group.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
puts — put a string on standard output

SYNOPSIS
#include <stdio.h>
int puts(const char *s);  

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The puts() function shall write the string pointed to by s, followed by a <newline>, to the standard output stream stdout. The terminating null byte shall not be written.

CX The st_ctime and st_mtime fields of the file shall be marked for update between the successful execution of puts() and the next successful completion of a call to fflush() or fclose() on the same stream or a call to exit() or abort().

RETURN VALUE
Upon successful completion, puts() shall return a non-negative number. Otherwise, it shall return EOF, shall set an error indicator for the stream, and errno shall be set to indicate the error.

ERRORS
Refer to fputc().

EXAMPLES

Printing to Standard Output

The following example gets the current time, converts it to a string using localtime() and asctime(), and prints it to standard output using puts(). It then prints the number of minutes to an event for which it is waiting.

#include <time.h>
#include <stdio.h>
...
time_t now;  
int minutes_to_event;  
...
time(&now);
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n",minutes_to_event);
...

APPLICATION USAGE
The puts() function appends a <newline>, while fputs() does not.

RATIONALE
None.

FUTURE DIRECTIONS
None.

pwrite( )

NAME
pwrite — write on a file

SYNOPSIS
#include <unistd.h>

XSI
ssize_t pwrite(int fildes, const void *buf, size_t nbyte,
off_t offset);

DESCRIPTION
Refer to write().
qsort()

NAME
qsort — sort a table of data

SYNOPSIS
#include <stdlib.h>

void qsort(void *base, size_t nel, size_t width,
        int (*compar)(const void *, const void *));

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The qsort() function shall sort an array of nel objects, the initial element of which is pointed to by base. The size of each object, in bytes, is specified by the width argument. If the nel argument has the value zero, the comparison function pointed to by compar shall not be called and no rearrangement shall take place.

The application shall ensure that the comparison function pointed to by compar does not alter the contents of the array. The implementation may reorder elements of the array between calls to the comparison function, but shall not alter the contents of any individual element.

When the same objects (consisting of width bytes, irrespective of their current positions in the array) are passed more than once to the comparison function, the results shall be consistent with one another. That is, they shall define a total ordering on the array.

The contents of the array shall be sorted in ascending order according to a comparison function. The compar argument is a pointer to the comparison function, which is called with two arguments that point to the elements being compared. The application shall ensure that the function returns an integer less than, equal to, or greater than 0, if the first argument is considered respectively less than, equal to, or greater than the second. If two members compare as equal, their order in the sorted array is unspecified.

RETURN VALUE
The qsort() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

RATIONALE
The requirement that each argument (hereafter referred to as p) to the comparison function is a pointer to elements of the array implies that for every call, for each argument separately, all of the following expressions are nonzero:

((char *)p - (char *)base) % width == 0
(char *)p >= (char *)base
(char *)p < (char *)base + nel * width
FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/49 is applied, adding the last sentence to the first non-shaded paragraph in the DESCRIPTION, and the following two paragraphs. The RATIONALE is also updated. These changes are for alignment with the ISO C standard.
raise()  

NAME  
raise — send a signal to the executing process  

SYNOPSIS  
#include <signal.h>  
int raise(int sig);  

DESCRIPTION  
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.  
The raise() function shall send the signal sig to the executing thread or process. If a signal handler is called, the raise() function shall not return until after the signal handler does.  
If the implementation supports the Threads option, the effect of the raise() function shall be equivalent to calling:  

raise(CX) pthread_kill(pthread_self(), sig);  

Otherwise, the effect of the raise() function shall be equivalent to calling:  

raise(CX) kill(getpid(), sig);  

RETURN VALUE  
Upon successful completion, 0 shall be returned. Otherwise, a non-zero value shall be returned and errno shall be set to indicate the error.  

ERRORS  
The raise() function shall fail if:  

raise(CX) [EINVAL] The value of the sig argument is an invalid signal number.  

EXAMPLES  
None.  

APPLICATION USAGE  
None.  

RATIONALE  
The term “thread” is an extension to the ISO C standard.  

FUTURE DIRECTIONS  
None.  

SEE ALSO  
kill(), sigaction(), the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>, <sys/types.h>  

CHANGE HISTORY  
First released in Issue 4. Derived from the ANSI C standard.  

Issue 5  
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the requirement to set `errno` on error is added.
- The `[EINVAL]` error condition is added.
NAME
rand, rand_r, srand — pseudo-random number generator

SYNOPSIS
#include <stdlib.h>

int rand(void);

int rand_r(unsigned *seed);

void srand(unsigned seed);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The rand() function shall compute a sequence of pseudo-random integers in the range
\[0, \text{RAND_MAX}\] with a period of at least \(2^{32}\).
The rand() function need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.
The rand_r() function shall compute a sequence of pseudo-random integers in the range
\[0, \text{RAND_MAX}\]. (The value of the \text{RAND_MAX} macro shall be at least 32,767.)
If rand_r() is called with the same initial value for the object pointed to by seed and that object is
not modified between successive returns and calls to rand_r(), the same sequence shall be
generated.
The srand() function uses the argument as a seed for a new sequence of pseudo-random
numbers to be returned by subsequent calls to rand(). If srand() is then called with the same
seed value, the sequence of pseudo-random numbers shall be repeated. If rand() is called before
any calls to srand() are made, the same sequence shall be generated as when srand() is first
called with a seed value of 1.
The implementation shall behave as if no function defined in this volume of
IEEE Std 1003.1-2001 calls rand() or srand().

RETURN VALUE
The rand() function shall return the next pseudo-random number in the sequence.
The rand_r() function shall return a pseudo-random integer.
The srand() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
Generating a Pseudo-Random Number Sequence
The following example demonstrates how to generate a sequence of pseudo-random numbers.
#include <stdio.h>
#include <stdlib.h>
...
long count, i;
char *keystr;
int elementlen, len;
char c;
... Initial random number generator. */
srand(1);

/* Create keys using only lowercase characters */
len = 0;
for (i=0; i<count; i++) {
    while (len < elementlen) { 
        c = (char) (rand() % 128);
        if (islower(c))
            keyst[ln++] = c;
    }
    keyst[len] = '\0';
    printf("%s Element%ld
", keyst, elementlen, i);
    len = 0;
}

Generating the Same Sequence on Different Machines
The following code defines a pair of functions that could be incorporated into applications
wishing to ensure that the same sequence of numbers is generated across different machines.

static unsigned long next = 1;
int myrand(void) /* RAND_MAX assumed to be 32767. */
{
    next = next * 1103515245 + 12345;
    return((unsigned)(next/65536) % 32768);
}

void mysrand(unsigned seed)
{
    next = seed;
}

APPLICATION USAGE
The drand48() function provides a much more elaborate random number generator.

The limitations on the amount of state that can be carried between one function call and another
mean the rand_r() function can never be implemented in a way which satisfies all of the
requirements on a pseudo-random number generator. Therefore this function should be avoided
whenever non-trivial requirements (including safety) have to be fulfilled.

RATIONALE
The ISO C standard rand() and srand() functions allow per-process pseudo-random streams
shared by all threads. Those two functions need not change, but there has to be mutual-
exclusion that prevents interference between two threads concurrently accessing the random
number generator.

With regard to rand(), there are two different behaviors that may be wanted in a multi-threaded
program:
1. A single per-process sequence of pseudo-random numbers that is shared by all threads
   that call rand()
2. A different sequence of pseudo-random numbers for each thread that calls rand()
This is provided by the modified thread-safe function based on whether the seed value is global to the entire process or local to each thread.

This does not address the known deficiencies of the `rand()` function implementations, which have been approached by maintaining more state. In effect, this specifies new thread-safe forms of a deficient function.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
`drand48()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
The `rand_r()` function is included for alignment with the POSIX Threads Extension.
A note indicating that the `rand()` function need not be reentrant is added to the DESCRIPTION.

**Issue 6**
Extensions beyond the ISO C standard are marked.
The `rand_r()` function is marked as part of the Thread-Safe Functions option.
NAME
random — generate pseudo-random number

SYNOPSIS
#include <stdlib.h>
long random(void);

DESCRIPTION
Refer to initstate().
NAME
pread, read — read from a file

SYNOPSIS
#include <unistd.h>

ssize_t pread(int fildes, void *buf, size_t nbyte, off_t offset);
ssize_t read(int fildes, void *buf, size_t nbyte);

DESCRIPTION
The read() function shall attempt to read nbyte bytes from the file associated with the open file
descriptor, fildes, into the buffer pointed to by buf. The behavior of multiple concurrent reads on
the same pipe, FIFO, or terminal device is unspecified.

Before any action described below is taken, and if nbyte is zero, the read() function may detect
and return errors as described below. In the absence of errors, or if error detection is not
performed, the read() function shall return zero and have no other results.

On files that support seeking (for example, a regular file), the read() shall start at a position in
the file given by the file offset associated with fildes. The file offset shall be incremented by the
number of bytes actually read.

Files that do not support seeking—for example, terminals—always read from the current
position. The value of a file offset associated with such a file is undefined.

No data transfer shall occur past the current end-of-file. If the starting position is at or after the
end-of-file, 0 shall be returned. If the file refers to a device special file, the result of subsequent
read() requests is implementation-defined.

If the value of nbyte is greater than {SSIZE_MAX}, the result is implementation-defined.

When attempting to read from an empty pipe or FIFO:

- If no process has the pipe open for writing, read() shall return 0 to indicate end-of-file.
- If some process has the pipe open for writing and O_NONBLOCK is set, read() shall return
  -1 and set errno to [EAGAIN].
- If some process has the pipe open for writing and O_NONBLOCK is clear, read() shall block
  the calling thread until some data is written or the pipe is closed by all processes that had the
  pipe open for writing.

When attempting to read a file (other than a pipe or FIFO) that supports non-blocking reads and
has no data currently available:

- If O_NONBLOCK is set, read() shall return -1 and set errno to [EAGAIN].
- If O_NONBLOCK is clear, read() shall block the calling thread until some data becomes
  available.
- The use of the O_NONBLOCK flag has no effect if there is some data available.

The read() function reads data previously written to a file. If any portion of a regular file prior to
the end-of-file has not been written, read() shall return bytes with value 0. For example, lseek()
allows the file offset to be set beyond the end of existing data in the file. If data is later written at
this point, subsequent reads in the gap between the previous end of data and the newly written
data shall return bytes with value 0 until data is written into the gap.

Upon successful completion, where nbyte is greater than 0, read() shall mark for update the
st_atime field of the file, and shall return the number of bytes read. This number shall never be
greater than nbyte. The value returned may be less than nbyte if the number of bytes left in the
read()

If a `read()` request was interrupted by a signal, if the `read()` request was interrupted by a signal, or if the file is a pipe or FIFO or special file and has fewer than `nbyte` bytes immediately available for reading. For example, a `read()` from a file associated with a terminal may return one typed line of data.

If a `read()` is interrupted by a signal before it reads any data, it shall return −1 with `errno` set to [EINTR].

If a `read()` is interrupted by a signal after it has successfully read some data, it shall return the number of bytes read.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with `fildes`.

If `fildes` refers to a socket, `read()` shall be equivalent to `recv()` with no flags set.

If the O_DSYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion. If the O_SYNC and O_RSYNC bits have been set, read I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

If `fildes` refers to a shared memory object, the result of the `read()` function is unspecified.

If `fildes` refers to a typed memory object, the result of the `read()` function is unspecified.

A `read()` from a STREAMS file can read data in three different modes: byte-stream mode, message-nondiscard mode, and message-discard mode. The default shall be byte-stream mode. This can be changed using the I_SRDOPT ioctl() request, and can be tested with I_GRDOPT ioctl().

In byte-stream mode, `read()` shall retrieve data from the STREAM until as many bytes as were requested are transferred, or until there is no more data to be retrieved. Byte-stream mode ignores message boundaries.

In STREAMS message-nondiscard mode, `read()` shall retrieve data until as many bytes as were requested are transferred, or until a message boundary is reached. If `read()` does not retrieve all the data in a message, the remaining data shall be left on the STREAM, and can be retrieved by the next `read()` call. Message-discard mode also retrieves data until as many bytes as were requested are transferred, or a message boundary is reached. However, unread data remaining in a message after the `read()` returns shall be discarded, and shall not be available for a subsequent `read()`, `getmsg()`, or `getpmsg()` call.

How `read()` handles zero-byte STREAMS messages is determined by the current read mode setting. In byte-stream mode, `read()` shall accept data until it has read `nbyte` bytes, or until there is no more data to read, or until a zero-byte message block is encountered. The `read()` function shall then return the number of bytes read, and place the zero-byte message back on the STREAM to be retrieved by the next `read()`, `getmsg()`, or `getpmsg()`.

In message-nondiscard mode or message-discard mode, a zero-byte message shall return 0 and the message shall be removed from the STREAM. When a zero-byte message is read as the first message on a STREAM, the message shall be removed from the STREAM and 0 shall be returned, regardless of the read mode.

A `read()` from a STREAMS file shall return the data in the message at the front of the STREAM head read queue, regardless of the priority band of the message.

By default, STREAMS are in control-normal mode, in which a `read()` from a STREAMS file can only process messages that contain a data part but do not contain a control part. The `read()` shall fail if a message containing a control part is encountered at the STREAM head. This default action can be changed by placing the STREAM in either control-data mode or control-discard mode with the I_SRDOPT ioctl() command. In control-data mode, `read()` shall convert any control part to data and pass it to the application before passing any data part originally present in the message.
in the same message. In control-discard mode, \textit{read}() shall discard message control parts but return to the process any data part in the message.

In addition, \textit{read}() shall fail if the STREAM head had processed an asynchronous error before the call. In this case, the value of \texttt{errno} shall not reflect the result of \textit{read}(), but reflect the prior error. If a hangup occurs on the STREAM being read, \textit{read}() shall continue to operate normally until the STREAM head read queue is empty. Thereafter, it shall return 0.

The \textit{pread}() function shall be equivalent to \textit{read}(), except that it shall read from a given position in the file without changing the file pointer. The first three arguments to \textit{pread}() are the same as \textit{read}() with the addition of a fourth argument \texttt{offset} for the desired position inside the file. An attempt to perform a \textit{pread}() on a file that is incapable of seeking shall result in an error.

\textbf{RETURN VALUE}

Upon successful completion, \textit{read}() and \textit{pread}() shall return a non-negative integer indicating the number of bytes actually read. Otherwise, the functions shall return -1 and set \textit{errno} to indicate the error.

\textbf{ERRORS}

The \textit{read}() and \textit{pread}() functions shall fail if:

- \textbf{[EAGAIN]} The O\_NONBLOCK flag is set for the file descriptor and the process would be delayed.
- \textbf{[EBADF]} The \texttt{fildes} argument is not a valid file descriptor open for reading.
- \textbf{[EBADMSG]} The file is a STREAM file that is set to control-normal mode and the message waiting to be read includes a control part.
- \textbf{[EINTR]} The read operation was terminated due to the receipt of a signal, and no data was transferred.
- \textbf{[EINVAL]} The STREAM or multiplexer referenced by \texttt{fildes} is linked (directly or indirectly) downstream from a multiplexer.
- \textbf{[EIO]} The process is a member of a background process attempting to read from its controlling terminal, the process is ignoring or blocking the SIGTTIN signal, or the process group is orphaned. This error may also be generated for implementation-defined reasons.
- \textbf{[EISDIR]} The \texttt{fildes} argument refers to a directory and the implementation does not allow the directory to be read using \textit{read}() or \textit{pread}(). The \textit{readdir}() function should be used instead.
- \textbf{[EOVERFLOW]} The file is a regular file, \texttt{nbyte} is greater than 0, the starting position is before the end-of-file, and the starting position is greater than or equal to the offset maximum established in the open file description associated with \texttt{fildes}.

The \textit{read}() function shall fail if:

- \textbf{[EAGAIN]} or \textbf{[EWOULDBLOCK]} The file descriptor is for a socket, is marked O\_NONBLOCK, and no data is waiting to be received.
- \textbf{[ECONNRESET]} A read was attempted on a socket and the connection was forcibly closed by its peer.
- \textbf{[ENOTCONN]} A read was attempted on a socket that is not connected.
- \textbf{[ETIMEDOUT]} A read was attempted on a socket and a transmission timeout occurred.
The `read()` and `pread()` functions may fail if:

- `[EIO]` A physical I/O error has occurred.
- `[ENOBUFFERS]` Insufficient resources were available in the system to perform the operation.
- `[ENOMEM]` Insufficient memory was available to fulfill the request.
- `[ENXIO]` A request was made of a nonexistent device, or the request was outside the capabilities of the device.

The `pread()` function shall fail, and the file pointer shall remain unchanged, if:

- `[EINVAL]` The `offset` argument is invalid. The value is negative.
- `[EOVERFLOW]` The file is a regular file and an attempt was made to read at or beyond the offset maximum associated with the file.
- `[ENXIO]` A request was outside the capabilities of the device.
- `[ESPIPE]` `fildes` is associated with a pipe or FIFO.

### EXAMPLES

#### Reading Data into a Buffer

The following example reads data from the file associated with the file descriptor `fd` into the buffer pointed to by `buf`.

```c
#include <sys/types.h>
#include <unistd.h>
...
char buf[20];
size_t nbytes;
ssize_t bytes_read;
int fd;
...
nbytes = sizeof(buf);
bytes_read = read(fd, buf, nbytes);
...
```

### APPLICATION USAGE

None.

### RATIONALE

This volume of IEEE Std 1003.1-2001 does not specify the value of the file `offset` after an error is returned; there are too many cases. For programming errors, such as `[EBADF]`, the concept is meaningless since no file is involved. For errors that are detected immediately, such as `[EAGAIN]`, clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

Note that a `read()` of zero bytes does not modify `st_atime`. A `read()` that requests more than zero bytes, but returns zero, shall modify `st_atime`.

Implementations are allowed, but not required, to perform error checking for `read()` requests of zero bytes.
Input and Output

The use of I/O with large byte counts has always presented problems. Ideas such as `lread()` and `lwrite()` (using and returning longs) were considered at one time. The current solution is to use abstract types on the ISO C standard function to `read()` and `write()`. The abstract types can be declared so that existing functions work, but can also be declared so that larger types can be represented in future implementations. It is presumed that whatever constraints limit the maximum range of `size_t` also limit portable I/O requests to the same range. This volume of IEEE Std 1003.1-2001 also limits the range further by requiring that the byte count be limited so that a signed return value remains meaningful. Since the return type is also a (signed) abstract type, the byte count can be defined by the implementation to be larger than an int can hold.

The standard developers considered adding atomicity requirements to a pipe or FIFO, but recognized that due to the nature of pipes and FIFOs there could be no guarantee of atomicity of reads of [PIPE_BUF] or any other size that would be an aid to applications portability.

This volume of IEEE Std 1003.1-2001 requires that no action be taken for `read()` or `write()` when `nbyte` is zero. This is not intended to take precedence over detection of errors (such as invalid buffer pointers or file descriptors). This is consistent with the rest of this volume of IEEE Std 1003.1-2001, but the phrasing here could be misread to require detection of the zero case before any other errors. A value of zero is to be considered a correct value, for which the semantics are a no-op.

I/O is intended to be atomic to ordinary files and pipes and FIFOs. Atomic means that all the bytes from a single operation that started out together end up together, without interleaving from other I/O operations. It is a known attribute of terminals that this is not honored, and terminals are explicitly (and implicitly permanently) excepted, making the behavior unspecified. The behavior for other device types is also left unspecified, but the wording is intended to imply that future standards might choose to specify atomicity (or not).

There were recommendations to add format parameters to `read()` and `write()` in order to handle networked transfers among heterogeneous file system and base hardware types. Such a facility may be required for support by the OSI presentation of layer services. However, it was determined that this should correspond with similar C-language facilities, and that is beyond the scope of this volume of IEEE Std 1003.1-2001. The concept was suggested to the developers of the ISO C standard for their consideration as a possible area for future work.

In 4.3 BSD, a `read()` or `write()` that is interrupted by a signal before transferring any data does not by default return an [EINTR] error, but is restarted. In 4.2 BSD, 4.3 BSD, and the Eighth Edition, there is an additional function, `select()`, whose purpose is to pause until specified activity (data to read, space to write, and so on) is detected on specified file descriptors. It is common in applications written for those systems for `select()` to be used before `read()` in situations (such as keyboard input) where interruption of I/O due to a signal is desired.

The issue of which files or file types are interruptible is considered an implementation design issue. This is often affected primarily by hardware and reliability issues.

There are no references to actions taken following an “unrecoverable error”. It is considered beyond the scope of this volume of IEEE Std 1003.1-2001 to describe what happens in the case of hardware errors.

Previous versions of IEEE Std 1003.1-2001 allowed two very different behaviors with regard to the handling of interrupts. In order to minimize the resulting confusion, it was decided that IEEE Std 1003.1-2001 should support only one of these behaviors. Historical practice on AT&T-derived systems was to have `read()` and `write()` return −1 and set `errno` to [EINTR] when interrupted after some, but not all, of the data requested had been transferred. However, the U.S. Department of Commerce FIPS 151-1 and FIPS 151-2 require the historical BSD behavior, in
which \textit{read()} and \textit{write()} return the number of bytes actually transferred before the interrupt. If
−1 is returned when any data is transferred, it is difficult to recover from the error on a seekable
device and impossible on a non-seekable device. Most new implementations support this
behavior. The behavior required by IEEE Std 1003.1-2001 is to return the number of bytes
transferred.

IEEE Std 1003.1-2001 does not specify when an implementation that buffers \textit{read}()s actually
moves the data into the user-supplied buffer, so an implementation may chose to do this at the
latest possible moment. Therefore, an interrupt arriving earlier may not cause \textit{read()} to return a
partial byte count, but rather to return −1 and set \textit{errno} to [EINTR].

Consideration was also given to combining the two previous options, and setting \textit{errno} to
[EINTR] while returning a short count. However, not only is there no existing practice that
implements this, it is also contradictory to the idea that when \textit{errno} is set, the function
responsible shall return −1.

\textbf{FUTURE DIRECTIONS}
None.

\textit{<unistd.h>}

\textbf{CHANGE HISTORY}
First released in Issue 1. Derived from Issue 1 of the SVID.

\textbf{Issue 5}
The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX
Threads Extension.
Large File Summit extensions are added.
The \textit{pread()} function is added.

\textbf{Issue 6}
The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are
marked as part of the XSI STREAMS Option Group.
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:
The DESCRIPTION now states that if \textit{read()} is interrupted by a signal after it has successfully
read some data, it returns the number of bytes read. In Issue 3, it was optional whether \textit{read()} returned the number of bytes read, or whether it returned −1 with \textit{errno} set to [EINTR]. This
is a FIPS requirement.
In the DESCRIPTION, text is added to indicate that for regular files, no data transfer occurs
past the offset maximum established in the open file description associated with \textit{fildes}. This
change is to support large files.
The [EOVERFLOW] mandatory error condition is added.
The [ENXIO] optional error condition is added.
Text referring to sockets is added to the DESCRIPTION.
The following changes were made to align with the IEEE P1003.1a draft standard:
The effect of reading zero bytes is clarified.
The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that `read()` results are unspecified for typed memory objects.

New RATIONALE is added to explain the atomicity requirements for input and output operations.

The following error conditions are added for operations on sockets: [EAGAIN], [ECONNRESET], [ENOTCONN], and [ETIMEDOUT].

The [EIO] error is changed to “may fail”.

The following error conditions are added for operations on sockets: [ENOBUFS] and [ENOMEM].

The `readv()` function is split out into a separate reference page.
NAME
readdir, readdir_r — read a directory

SYNOPSIS
#include <dirent.h>
struct dirent *readdir(DIR *dirp);

TSF
int readdir_r(DIR *restrict dirp, struct dirent *restrict entry,
struct dirent **restrict result);

DESCRIPTION
The type DIR, which is defined in the <dirent.h> header, represents a directory stream, which is
an ordered sequence of all the directory entries in a particular directory. Directory entries
represent files; files may be removed from a directory or added to a directory asynchronously to
the operation of readdir().

The readdir() function shall return a pointer to a structure representing the directory entry at the
current position in the directory stream specified by the argument dirp, and position the
directory stream at the next entry. It shall return a null pointer upon reaching the end of the
directory stream. The structure dirent defined in the <dirent.h> header describes a directory
entry.

The readdir() function shall not return directory entries containing empty names. If entries for
dot or dot-dot exist, one entry shall be returned for dot and one entry shall be returned for dot-
dot; otherwise, they shall not be returned.

The pointer returned by readdir() points to data which may be overwritten by another call to
readdir() on the same directory stream. This data is not overwritten by another call to readdir()
on a different directory stream.

If a file is removed from or added to the directory after the most recent call to opendir() or
rewinddir(), whether a subsequent call to readdir() returns an entry for that file is unspecified.

The readdir() function may buffer several directory entries per actual read operation; readdir() shall mark for update the st_atime field of the directory each time the directory is actually read.

After a call to fork(), either the parent or child (but not both) may continue processing the
directory stream using readdir(), rewinddir(), or seekdir(). If both the parent and child processes
use these functions, the result is undefined.

If the entry names a symbolic link, the value of the d_ino member is unspecified.

The readdir() function need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

TSF The readdir_r() function shall initialize the dirent structure referenced by entry to represent the
directory entry at the current position in the directory stream referred to by dirp, store a pointer
to this structure at the location referenced by result, and position the directory stream at the next
entry.

The storage pointed to by entry shall be large enough for a dirent with an array of char d_name
members containing at least {NAME_MAX}+1 elements.

Upon successful return, the pointer returned at *result shall have the same value as the argument
entry. Upon reaching the end of the directory stream, this pointer shall have the value NULL.

The readdir_r() function shall not return directory entries containing empty names.
readdir( )

System Interfaces

36743
36744

If a file is removed from or added to the directory after the most recent call to opendir( ) or
rewinddir( ), whether a subsequent call to readdir_r( ) returns an entry for that file is unspecified.

36745
36746
36747

The readdir_r( ) function may buffer several directory entries per actual read operation; the
readdir_r( ) function shall mark for update the st_atime field of the directory each time the
directory is actually read.

36748
36749

Applications wishing to check for error situations should set errno to 0 before calling readdir( ). If
errno is set to non-zero on return, an error occurred.

36750
36751
36752
36753
36754

RETURN VALUE
Upon successful completion, readdir( ) shall return a pointer to an object of type struct dirent.
When an error is encountered, a null pointer shall be returned and errno shall be set to indicate
the error. When the end of the directory is encountered, a null pointer shall be returned and errno
is not changed.

36755 TSF
36756
36757
36758

If successful, the readdir_r( ) function shall return zero; otherwise, an error number shall be
returned to indicate the error.

ERRORS
The readdir( ) function shall fail if:

36759
36760

[EOVERFLOW]

36761

The readdir( ) function may fail if:

36762

[EBADF]

The dirp argument does not refer to an open directory stream.

36763

[ENOENT]

The current position of the directory stream is invalid.

36764

The readdir_r( ) function may fail if:

36765

[EBADF]

36766
36767
36768

One of the values in the structure to be returned cannot be represented
correctly.

The dirp argument does not refer to an open directory stream.

EXAMPLES
The following sample program searches the current directory for each of the arguments supplied |
on the command line.

return;
}
} while (dp != NULL);
if (errno != 0)
perror("error reading directory");
else
(void) printf("failed to find %s\n", arg);
(void) closedir(dirp);
return;
}

int main(int argc, char *argv[])
{
  int i;
  for (i = 1; i < argc; i++)
    lookup(argv[i]);
  return (0);
}

APPLICATION USAGE
The `readdir()` function should be used in conjunction with `opendir()`, `closedir()`, and `rewinddir()` to examine the contents of the directory.

The `readdir_r()` function is thread-safe and shall return values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call.

RATIONALE
The returned value of `readdir()` merely represents a directory entry. No equivalence should be inferred.

Historical implementations of `readdir()` obtain multiple directory entries on a single read operation, which permits subsequent `readdir()` operations to operate from the buffered information. Any wording that required each successful `readdir()` operation to mark the directory `st_atime` field for update would disallow such historical performance-oriented implementations.

Since `readdir()` returns NULL when it detects an error and when the end of the directory is encountered, an application that needs to tell the difference must set `errno` to zero before the call and check it if NULL is returned. Since the function must not change `errno` in the second case and must set it to a non-zero value in the first case, a zero `errno` after a call returning NULL indicates end-of-directory; otherwise, an error.

Routines to deal with this problem more directly were proposed:

```c
int derror (dirp)
DIR *dirp;
void clearderr (dirp)
DIR *dirp;
```

The first would indicate whether an error had occurred, and the second would clear the error indication. The simpler method involving `errno` was adopted instead by requiring that `readdir()` not change `errno` when end-of-directory is encountered.
An error or signal indicating that a directory has changed while open was considered but rejected.

The thread-safe version of the directory reading function returns values in a user-supplied buffer instead of possibly using a static data area that may be overwritten by each call. Either the \{NAME_MAX\} compile-time constant or the corresponding \pathconf() option can be used to determine the maximum sizes of returned pathnames.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

\closedir(), \lstat(), \opendir(), \rewinddir(), \symlink(), the Base Definitions volume of IEEE Std 1003.1-2001, \file{dirent.h}, \file{sys/types.h}

**CHANGE HISTORY**

First released in Issue 2.

**Issue 5**

Large File Summit extensions are added.

The \readdir_r() function is included for alignment with the POSIX Threads Extension.

A note indicating that the \readdir() function need not be reentrant is added to the DESCRIPTION.

**Issue 6**

The \readdir_r() function is marked as part of the Thread-Safe Functions option.

The Open Group Corrigendum U026/7 is applied, correcting the prototype for \readdir_r().

The Open Group Corrigendum U026/8 is applied, clarifying the wording of the successful return for the \readdir_r() function.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include \file{sys/types.h} has been removed. Although \file{sys/types.h} was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- A statement is added to the DESCRIPTION indicating the disposition of certain fields in \struct dirent when an entry refers to a symbolic link.

- The [EOVERFLOW] mandatory error condition is added. This change is to support large files.

- The [ENOENT] optional error condition is added.

The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.

The \restrict keyword is added to the \readdir_r() prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/50 is applied, replacing the EXAMPLES section with a new example.
NAME
readlink — read the contents of a symbolic link

SYNOPSIS
#include <unistd.h>
ssize_t readlink(const char *restrict path, char *restrict buf, size_t bufsize);

DESCRIPTION
The readlink() function shall place the contents of the symbolic link referred to by path in the
buffer buf which has size bufsize. If the number of bytes in the symbolic link is less than bufsize,
the contents of the remainder of buf are unspecified. If the buf argument is not large enough to
contain the link content, the first bufsize bytes shall be placed in buf.
If the value of bufsize is greater than {SSIZE_MAX}, the result is implementation-defined.

RETURN VALUE
Upon successful completion, readlink() shall return the count of bytes placed in the buffer.
Otherwise, it shall return a value of −1, leave the buffer unchanged, and set errno to indicate the
error.

ERRORS
The readlink() function shall fail if:
[EACCES] Search permission is denied for a component of the path prefix of path.
EINVAL The path argument names a file that is not a symbolic link.
[EIO] An I/O error occurred while reading from the file system.
[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.
[ENAMETOOLONG]
The length of the path argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.
[ENOENT] A component of path does not name an existing file or path is an empty string.
[ENOTDIR] A component of the path prefix is not a directory.

The readlink() function may fail if:
[EACCES] Read permission is denied for the directory.
[ELOOP] More than {SYMLOOP_MAX} symbolic links were encountered during resolution of the path argument.
[ENAMETOOLONG]
As a result of encountering a symbolic link in resolution of the path argument,
the length of the substituted pathname string exceeded {PATH_MAX}.
Examples

Reading the Name of a Symbolic Link

The following example shows how to read the name of a symbolic link named `/modules/pass1`

```c
#include <unistd.h>
char buf[1024];
ssize_t len;
...
if ((len = readlink("/modules/pass1", buf, sizeof(buf)-1)) != -1)
  buf[len] = '\0';
```

Application Usage

Conforming applications should not assume that the returned contents of the symbolic link are null-terminated.

Rationale

Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links, there is no requirement that file times be updated by `readlink()`. The type associated with `bufsiz` is a `size_t` in order to be consistent with both the ISO C standard and the definition of `read()`.

The behavior specified for `readlink()` when `bufsiz` is zero represents historical practice. For this case, the standard developers considered a change whereby `readlink()` would return the number of non-null bytes contained in the symbolic link with the buffer `buf` remaining unchanged; however, since the `stat` structure member `st_size` value can be used to determine the size of buffer necessary to contain the contents of the symbolic link as returned by `readlink()`, this proposal was rejected, and the historical practice retained.

Future Directions

None.

See Also

`lstat()`, `stat()`, `symlink()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

Change History

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The return type is changed to `ssize_t`, to align with the IEEE P1003.1a draft standard.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- This function is made mandatory.
- In this function it is possible for the return value to exceed the range of the type `ssize_t` (since `size_t` has a larger range of positive values than `ssize_t`). A sentence restricting the size of the `size_t` object is added to the description to resolve this conflict.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The FUTURE DIRECTIONS section is changed to None.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.
The `restrict` keyword is added to the `readlink()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
readv — read a vector

SYNOPSIS
#include <sys/uio.h>
ssize_t readv(int fildes, const struct iovec *iov, int iovcnt);

DESCRIPTION
The readv() function shall be equivalent to read(), except as described below. The readv()
function shall place the input data into the iovcnt buffers specified by the members of the iov
array: iov[0], iov[1], ..., iov[iovcnt-1]. The iovcnt argument is valid if greater than 0 and less than
or equal to [IOV_MAX].
Each iovec entry specifies the base address and length of an area in memory where data should
be placed. The readv() function shall always fill an area completely before proceeding to the
next.
Upon successful completion, readv() shall mark for update the st_atime field of the file.

RETURN VALUE
Refer to read().

ERRORS
Refer to read().
In addition, the readv() function shall fail if:
[EINVAL] The sum of the iov_len values in the iov array overflowed an ssize_t.
The readv() function may fail if:
[EINVAL] The iovcnt argument was less than or equal to 0, or greater than [IOV_MAX].

EXAMPLES
Reading Data into an Array
The following example reads data from the file associated with the file descriptor fd into the
buffers specified by members of the iov array.
#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_read;
int fd;
char buf0[20];
char buf1[30];
char buf2[40];
int iovcnt;
struct iovec iov[3];
iov[0].iov_base = buf0;
iov[0].iov_len = sizeof(buf0);
iov[1].iov_base = buf1;
iov[1].iov_len = sizeof(buf1);
iov[2].iov_base = buf2;
iov[2].iov_len = sizeof(buf2);
iovcnt = sizeof(iov) / sizeof(struct iovec);

bytes_read = readv(fd, iov, iovcnt);

APPLICATION USAGE
None.

RATIONALE
Refer to read().

FUTURE DIRECTIONS
None.

Issue 6
Split out from the read() reference page.
realloc()

NAME
realloc — memory reallocator

SYNOPSIS
#include <stdlib.h>
void *realloc(void *ptr, size_t size);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The realloc() function shall change the size of the memory object pointed to by ptr to the size
specified by size. The contents of the object shall remain unchanged up to the lesser of the new
and old sizes. If the new size of the memory object would require movement of the object, the
space for the previous instantiation of the object is freed. If the new size is larger, the contents of
the newly allocated portion of the object are unspecified. If size is 0 and ptr is not a null pointer,
the object pointed to is freed. If the space cannot be allocated, the object shall remain unchanged.

If ptr is a null pointer, realloc() shall be equivalent to malloc() for the specified size.

If ptr does not match a pointer returned earlier by calloc(), malloc(), or realloc() or if the space has
previously been deallocated by a call to free() or realloc(), the behavior is undefined.

The order and contiguity of storage allocated by successive calls to realloc() is unspecified. The
pointer returned if the allocation succeeds shall be suitably aligned so that it may be assigned to
a pointer to any type of object and then used to access such an object in the space allocated (until
the space is explicitly freed or reallocated). Each such allocation shall yield a pointer to an object
disjoint from any other object. The pointer returned shall point to the start (lowest byte address)
of the allocated space. If the space cannot be allocated, a null pointer shall be returned.

RETURN VALUE
Upon successful completion with a size not equal to 0, realloc() shall return a pointer to the
(possibly moved) allocated space. If size is 0, either a null pointer or a unique pointer that can be
successfully passed to free() shall be returned. If there is not enough available memory, realloc()
shall return a null pointer and set errno to [ENOMEM].

ERRORS
The realloc() function shall fail if:
[ENOMEM] Insufficient memory is available.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

calloc(), free(), malloc(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>
CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• In the RETURN VALUE section, if there is not enough available memory, the setting of \texttt{errno} to [ENOMEM] is added.

• The [ENOMEM] error condition is added.
NAME
realpath — resolve a pathname

SYNOPSIS
#include <stdlib.h>

char *realpath(const char *restrict file_name,
char *restrict resolved_name);

DESCRIPTION
The realpath() function shall derive, from the pathname pointed to by file_name, an absolute
pathname that names the same file, whose resolution does not involve ’.’, ’.’, ’..’, or symbolic
links. The generated pathname shall be stored as a null-terminated string, up to a maximum of
(PATH_MAX) bytes, in the buffer pointed to by resolved_name.

If resolved_name is a null pointer, the behavior of realpath() is implementation-defined.

RETURN VALUE
Upon successful completion, realpath() shall return a pointer to the resolved name. Otherwise,
realpath() shall return a null pointer and set errno to indicate the error, and the contents of the
buffer pointed to by resolved_name are undefined.

ERRORS
The realpath() function shall fail if:

[EACCES] Read or search permission was denied for a component of file_name.

EINVAL] The file_name argument is a null pointer.

EIO] An error occurred while reading from the file system.

ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

ENAMETOOLONG] The length of the file_name argument exceeds (PATH_MAX) or a pathname
component is longer than (NAME_MAX).

ENOENT] A component of file_name does not name an existing file or file_name points to
an empty string.

ENOTDIR] A component of the path prefix is not a directory.

The realpath() function may fail if:

ELOOP] More than (SYMLOOP_MAX) symbolic links were encountered during
resolution of the path argument.

ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result
whose length exceeds (PATH_MAX).

ENOMEM] Insufficient storage space is available.
EXAMPLES

Generating an Absolute Pathname

The following example generates an absolute pathname for the file identified by the symlinkpath argument. The generated pathname is stored in the actualpath array.

```c
#include <stdlib.h>
... char *symlinkpath = "/tmp/symlink/file";
char actualpath [PATH_MAX+1];
char *ptr;
ptr = realpath(symlinkpath, actualpath);
```

APPLICATION USAGE

None.

RATIONALE

Since the maximum pathname length is arbitrary unless [PATH_MAX] is defined, an application generally cannot supply a resolved_name buffer with size {{PATH_MAX}+1}.

FUTURE DIRECTIONS

In the future, passing a null pointer to realpath() for the resolved_name argument may be defined to have realpath() allocate space for the generated pathname.

SEE ALSO

cwd(), sysconf(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

Issue 6

The restrict keyword is added to the realpath() prototype for alignment with the ISO/IEC 9899:1999 standard.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/51 is applied, adding new text to the DESCRIPTION for the case when resolved_name is a null pointer, changing the [EINVAL] error text, adding text to the RATIONALE, and adding text to FUTURE DIRECTIONS.
NAME
recv — receive a message from a connected socket

SYNOPSIS
#include <sys/socket.h>
ssize_t recv(int socket, void *buffer, size_t length, int flags);

DESCRIPTION
The recv() function shall receive a message from a connection-mode or connectionless-mode
socket. It is normally used with connected sockets because it does not permit the application to
retrieve the source address of received data.

The recv() function takes the following arguments:
socket Specifies the socket file descriptor.
buffer Points to a buffer where the message should be stored.
length Specifies the length in bytes of the buffer pointed to by the buffer argument.
flags Specifies the type of message reception. Values of this argument are formed by
logically OR'ing zero or more of the following values:
MSG_PEEK Peeks at an incoming message. The data is treated as unread and
the next recv() or similar function shall still return this data.
MSG_OOB Requests out-of-band data. The significance and semantics of
out-of-band data are protocol-specific.
MSG_WAITALL On SOCK_STREAM sockets this requests that the function block
until the full amount of data can be returned. The function may
return the smaller amount of data if the socket is a message-
based socket, if a signal is caught, if the connection is
terminated, if MSG_PEEK was specified, or if an error is pending
for the socket.

The recv() function shall return the length of the message written to the buffer pointed to by the
buffer argument. For message-based sockets, such as SOCK_DGRAM and SOCK_SEQPACKET,
the entire message shall be read in a single operation. If a message is too long to fit in the
supplied buffer, and MSG_PEEK is not set in the flags argument, the excess bytes shall be
discarded. For stream-based sockets, such as SOCK_STREAM, message boundaries shall be
ignored. In this case, data shall be returned to the user as soon as it becomes available, and no
data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
message.

If no messages are available at the socket and O_NONBLOCK is not set on the socket’s file
descriptor, recv() shall block until a message arrives. If no messages are available at the socket
and O_NONBLOCK is set on the socket’s file descriptor, recv() shall fail and set errno to
[EAGAIN] or [EWOULDBLOCK].

RETURN VALUE
Upon successful completion, recv() shall return the length of the message in bytes. If no
messages are available to be received and the peer has performed an orderly shutdown, recv()
shall return 0. Otherwise, −1 shall be returned and errno set to indicate the error.
The `recv()` function shall fail if:

- [EAGAIN] or [EWOULDBLOCK] The socket’s file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket’s file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.
- [EBADF] The `socket` argument is not a valid file descriptor.
- [ECONNRESET] A connection was forcibly closed by a peer.
- [EINTR] The `recv()` function was interrupted by a signal that was caught, before any data was available.
- [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.
- [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.
- [ENOTSOCK] The `socket` argument does not refer to a socket.
- [EOPNOTSUPP] The specified flags are not supported for this socket type or protocol.
- [ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The `recv()` function may fail if:

- [EIO] An I/O error occurred while reading from or writing to the file system.
- [ENOBUFS] Insufficient resources were available in the system to perform the operation.
- [ENOMEM] Insufficient memory was available to fulfill the request.

**EXAMPLES**
None.

**APPLICATION USAGE**
The `recv()` function is equivalent to `recvfrom()` with a zero `address_len` argument, and to `read()` if no flags are used.
The `select()` and `poll()` functions can be used to determine when data is available to be received.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

recvfrom()

NAME
recvfrom — receive a message from a socket

SYNOPSIS
#include <sys/socket.h>
ssize_t recvfrom(int socket, void *restrict buffer, size_t length,
        int flags, struct sockaddr *restrict address,
        socklen_t *restrict address_len);

DESCRIPTION
The recvfrom() function shall receive a message from a connection-mode or connectionless-mode
socket. It is normally used with connectionless-mode sockets because it permits the application
to retrieve the source address of received data.

The recvfrom() function takes the following arguments:

socket Specifies the socket file descriptor.
buffer Points to the buffer where the message should be stored.
length Specifies the length in bytes of the buffer pointed to by the buffer argument.
flags Specifies the type of message reception. Values of this argument are formed
by logically OR'ing zero or more of the following values:
    MSG_PEEK Peeks at an incoming message. The data is treated as unread
        and the next recvfrom() or similar function shall still return
        this data.
    MSG_OOB Requests out-of-band data. The significance and semantics
        of out-of-band data are protocol-specific.
    MSG_WAITALL On SOCK_STREAM sockets this requests that the function
        block until the full amount of data can be returned. The
        function may return the smaller amount of data if the socket
        is a message-based socket, if a signal is caught, if the
        connection is terminated, if MSG_PEEK was specified, or if
        an error is pending for the socket.

address A null pointer, or points to a sockaddr structure in which the sending address
        is to be stored. The length and format of the address depend on the address
        family of the socket.

address_len Specifies the length of the sockaddr structure pointed to by the address
        argument.

The recvfrom() function shall return the length of the message written to the buffer pointed to by
the buffer argument. For message-based sockets, such as SOCK_RAW, SOCK_DGRAM, and
SOCK_SEQPACKET, the entire message shall be read in a single operation. If a message is too
long to fit in the supplied buffer, and MSG_PEEK is not set in the flags argument, the excess
bytes shall be discarded. For stream-based sockets, such as SOCK_STREAM, message
boundaries shall be ignored. In this case, data shall be returned to the user as soon as it becomes
available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
message.

Not all protocols provide the source address for messages. If the address argument is not a null
pointer and the protocol provides the source address of messages, the source address of the
received message shall be stored in the `sockaddr` structure pointed to by the `address` argument, and the length of this address shall be stored in the object pointed to by the `address_len` argument.

If the actual length of the address is greater than the length of the supplied `sockaddr` structure, the stored address shall be truncated.

If the `address` argument is not a null pointer and the protocol does not provide the source address of messages, the value stored in the object pointed to by `address` is unspecified.

If no messages are available at the socket and O_NONBLOCK is not set on the socket’s file descriptor, `recvfrom()` shall block until a message arrives. If no messages are available at the socket and O_NONBLOCK is set on the socket’s file descriptor, `recvfrom()` shall fail and set `errno` to [EAGAIN] or [EWOULDBLOCK].

**RETURN VALUE**

Upon successful completion, `recvfrom()` shall return the length of the message in bytes. If no messages are available to be received and the peer has performed an orderly shutdown, `recvfrom()` shall return 0. Otherwise, the function shall return −1 and set `errno` to indicate the error.

**ERRORS**

The `recvfrom()` function shall fail if:

- [EAGAIN] or [EWOULDBLOCK] The socket’s file descriptor is marked O_NONBLOCK and no data is waiting to be received; or MSG_OOB is set and no out-of-band data is available and either the socket’s file descriptor is marked O_NONBLOCK or the socket does not support blocking to await out-of-band data.

- [EBADF] The `socket` argument is not a valid file descriptor.

- [ECONNRESET] A connection was forcibly closed by a peer.

- [EINVAL] The MSG_OOB flag is set and no out-of-band data is available.

- [ENOTCONN] A receive is attempted on a connection-mode socket that is not connected.

- [ENOTSOCK] The `socket` argument does not refer to a socket.

- [EOPNOTSUPP] The specified flags are not supported for this socket type.

- [ETIMEDOUT] The connection timed out during connection establishment, or due to a transmission timeout on active connection.

The `recvfrom()` function may fail if:

- [EIO] An I/O error occurred while reading from or writing to the file system.

- [ENOBUFS] Insufficient resources were available in the system to perform the operation.

- [ENOMEM] Insufficient memory was available to fulfill the request.

NAME
recvmsg — receive a message from a socket

SYNOPSIS
#include <sys/socket.h>
ssize_t recvmsg(int socket, struct msghdr *message, int flags);

DESCRIPTION
The recvmsg() function shall receive a message from a connection-mode or connectionless-mode
socket. It is normally used with connectionless-mode sockets because it permits the application
to retrieve the source address of received data.

The recvmsg() function takes the following arguments:

socket Specifies the socket file descriptor.

message Points to a msghdr structure, containing both the buffer to store the source
address and the buffers for the incoming message. The length and format of
the address depend on the address family of the socket. The msg_flags member
is ignored on input, but may contain meaningful values on output.

flags Specifies the type of message reception. Values of this argument are formed
by logically OR’ing zero or more of the following values:

MSG_OOB Requests out-of-band data. The significance and semantics
of out-of-band data are protocol-specific.

MSG_PEEK Peeks at the incoming message.

MSG_WAITALL On SOCK_STREAM sockets this requests that the function
block until the full amount of data can be returned. The
function may return the smaller amount of data if the socket
is a message-based socket, if a signal is caught, if the
connection is terminated, if MSG_PEEK was specified, or if
an error is pending for the socket.

The recvmsg() function shall receive messages from unconnected or connected sockets and shall
return the length of the message.

The recvmsg() function shall return the total length of the message. For message-based sockets,
such as SOCK_DGRAM and SOCK_SEQPACKET, the entire message shall be read in a single
operation. If a message is too long to fit in the supplied buffers, and MSG_PEEK is not set in the
flags argument, the excess bytes shall be discarded, and MSG_TRUNC shall be set in the
msg_flags member of the msghdr structure. For stream-based sockets, such as SOCK_STREAM,
message boundaries shall be ignored. In this case, data shall be returned to the user as soon as it
becomes available, and no data shall be discarded.

If the MSG_WAITALL flag is not set, data shall be returned only up to the end of the first
message.

If no messages are available at the socket and O_NONBLOCK is not set on the socket’s file
descriptor, recvmsg() shall block until a message arrives. If no messages are available at the
socket and O_NONBLOCK is set on the socket’s file descriptor, the recvmsg() function shall fail
and set errno to [EAGAIN] or [EWOULDBLOCK].

In the msghdr structure, the msg_name and msg_name len members specify the source address if
the socket is unconnected. If the socket is connected, the msg_name and msg_name len members
shall be ignored. The msg_name member may be a null pointer if no names are desired or
required. The msg_iov and msg_iovlen fields are used to specify where the received data shall be
recvmsg()

 stored. msg_iov points to an array of iovec structures; msg_iovlen shall be set to the dimension of
this array. In each iovec structure, the iov_base field specifies a storage area and the iov_len field
gives its size in bytes. Each storage area indicated by msg_iov is filled with received data in turn
until all of the received data is stored or all of the areas have been filled.

Upon successful completion, the msg_flags member of the message header shall be the bitwise-
inclusive OR of all of the following flags that indicate conditions detected for the received
message:

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MSG_EOR</td>
<td>End-of-record was received (if supported by the protocol).</td>
</tr>
<tr>
<td>MSG_OOB</td>
<td>Out-of-band data was received.</td>
</tr>
<tr>
<td>MSG_TRUNC</td>
<td>Normal data was truncated.</td>
</tr>
<tr>
<td>MSG_CTRUNC</td>
<td>Control data was truncated.</td>
</tr>
</tbody>
</table>

RETURN VALUE

Upon successful completion, recvmsg() shall return the length of the message in bytes. If no
messages are available to be received and the peer has performed an orderly shutdown,
recvmsg() shall return 0. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS

The recvmsg() function shall fail if:

- [EAGAIN] or [EWOULDBLOCK]  
  The socket’s file descriptor is marked O_NONBLOCK and no data is waiting
to be received; or MSG_OOB is set and no out-of-band data is available and
either the socket’s file descriptor is marked O_NONBLOCK or the socket does
not support blocking to await out-of-band data.

- [EBADF]  
  The socket argument is not a valid open file descriptor.

- [ECONNRESET]  
  A connection was forcibly closed by a peer.

- [EINTR]  
  This function was interrupted by a signal before any data was available.

- [EINVAL]  
  The sum of the iov_len values overflows a ssize_t, or the MSG_OOB flag is set
and no out-of-band data is available.

- [EMSGSIZE]  
  The msg_iovlen member of the msghdr structure pointed to by message is less
than or equal to 0, or is greater than [IOV_MAX].

- [ENOTCONN]  
  A receive is attempted on a connection-mode socket that is not connected.

- [ENOTSOCK]  
  The socket argument does not refer to a socket.

- [EOPNOTSUPP]  
  The specified flags are not supported for this socket type.

- [ETIMEDOUT]  
  The connection timed out during connection establishment, or due to a
transmission timeout on active connection.

The recvmsg() function may fail if:

- [EIO]  
  An I/O error occurred while reading from or writing to the file system.

- [ENOBUFFS]  
  Insufficient resources were available in the system to perform the operation.

- [ENOMEM]  
  Insufficient memory was available to fulfill the request.
EXAMPLES
None.

APPLICATION USAGE
The select() and poll() functions can be used to determine when data is available to be received.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY
First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
NAME
regcomp, regerror, regexec, regfree — regular expression matching

SYNOPSIS
#include <regex.h>

int regcomp(regex_t *restrict preg, const char *restrict pattern,
           int cflags);
size_t regerror(int errcode, const regex_t *restrict preg,
                char *restrict errbuf, size_t errbuf_size);
int regexec(const regex_t *restrict preg, const char *restrict string,
           size_t nmatch, regmatch_t pmatch[restrict], int eflags);
void regfree(regex_t *preg);

DESCRIPTION
These functions interpret basic and extended regular expressions as described in the Base
The regex_t structure is defined in <regex.h> and contains at least the following member:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size_t</td>
<td>re_nsub</td>
<td>Number of parenthesized subexpressions.</td>
</tr>
</tbody>
</table>

The regmatch_t structure is defined in <regex.h> and contains at least the following members:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regoff_t</td>
<td>rm_so</td>
<td>Byte offset from start of string to start of substring.</td>
</tr>
<tr>
<td>regoff_t</td>
<td>rm_eo</td>
<td>Byte offset from start of string of the first character after the end of substring.</td>
</tr>
</tbody>
</table>

The regcomp() function shall compile the regular expression contained in the string pointed to by
the pattern argument and place the results in the structure pointed to by preg. The cflags
argument is the bitwise-inclusive OR of zero or more of the following flags, which are defined in
the <regex.h> header:
REG_EXTENDED Use Extended Regular Expressions.
REG_ICASE Ignore case in match. (See the Base Definitions volume of
IEEE Std 1003.1-2001, Chapter 9, Regular Expressions.)
REG_NOSUB Report only success/fail in regexec().
REG_NEWLINE Change the handling of <newline>s, as described in the text.

The default regular expression type for pattern is a Basic Regular Expression. The application can
specify Extended Regular Expressions using the REG_EXTENDED cflags flag.

If the REG_NOSUB flag was not set in cflags, then regcomp() shall set re_nsub to the number of
parenthesized subexpressions (delimited by "\(\)" in basic regular expressions or " ( ) " in
extended regular expressions) found in pattern.

The regexec() function compares the null-terminated string specified by string with the compiled
regular expression preg initialized by a previous call to regcomp(). If it finds a match, regexec()
shall return 0; otherwise, it shall return non-zero indicating either no match or an error. The
eflags argument is the bitwise-inclusive OR of zero or more of the following flags, which are
defined in the <regex.h> header:
REG_NOTBOL The first character of the string pointed to by string is not the beginning of the line. Therefore, the circumflex character (‘ˆ’), when taken as a special character, shall not match the beginning of string.

REG_NOTEOL The last character of the string pointed to by string is not the end of the line. Therefore, the dollar sign (‘$’), when taken as a special character, shall not match the end of string.

If nmatch is 0 or REG_NOSUB was set in the cflags argument to regcomp(), then regexec() shall ignore the pmatch argument. Otherwise, the application shall ensure that the pmatch argument points to an array with at least nmatch elements, and regexec() shall fill in the elements of that array with offsets of the substrings of string that correspond to the parenthesized subexpressions of pattern: pmatch[i].rm_so shall be the byte offset of the beginning and pmatch[i].rm_eo shall be one greater than the byte offset of the end of substring i. (Subexpression i begins at the ith matched open parenthesis, counting from 1.) Offsets in pmatch[0] identify the substring that corresponds to the entire regular expression. Unused elements of pmatch up to pmatch[nmatch−1] shall be filled with −1. If there are more than nmatch subexpressions in pattern (pattern itself counts as a subexpression), then regexec() shall still do the match, but shall record only the first nmatch substrings.

When matching a basic or extended regular expression, any given parenthesized subexpression of pattern might participate in the match of several different substrings of string, or it might not match any substring even though the pattern as a whole did match. The following rules shall be used to determine which substrings to report in pmatch when matching regular expressions:

1. If subexpression i in a regular expression is not contained within another subexpression, and it participated in the match several times, then the byte offsets in pmatch[i] shall delimit the last such match.

2. If subexpression i is not contained within another subexpression, and it did not participate in an otherwise successful match, the byte offsets in pmatch[i] shall be −1. A subexpression does not participate in the match when: ‘*’ or "\{\}\" appears immediately after the subexpression in a basic regular expression, or ‘*’, ‘?’, or "\{\}\" appears immediately after the subexpression in an extended regular expression, and the subexpression did not match (matched 0 times)

or:

‘|’ is used in an extended regular expression to select this subexpression or another, and the other subexpression matched.

3. If subexpression i is contained within another subexpression j, and i is not contained within any other subexpression that is contained within j, and a match of subexpression j is reported in pmatch[j], then the match or non-match of subexpression i reported in pmatch[i] shall be as described in 1. and 2. above, but within the substring reported in pmatch[j] rather than the whole string. The offsets in pmatch[i] are still relative to the start of string.

4. If subexpression i is contained in subexpression j, and the byte offsets in pmatch[j] are −1, then the pointers in pmatch[i] shall also be −1.

5. If subexpression i matched a zero-length string, then both byte offsets in pmatch[i] shall be the byte offset of the character or null terminator immediately following the zero-length string.

If, when regexec() is called, the locale is different from when the regular expression was compiled, the result is undefined.
If REG_NEWLINE is not set in cflags, then a <newline> in pattern or string shall be treated as an ordinary character. If REG_NEWLINE is set, then <newline> shall be treated as an ordinary character except as follows:

1. A <newline> in string shall not be matched by a period outside a bracket expression or by any form of a non-matching list (see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular Expressions).

2. A circumflex (‘ˆ’) in pattern, when used to specify expression anchoring (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 9.3.8, BRE Expression Anchoring), shall match the zero-length string immediately after a <newline> in string, regardless of the setting of REG_NOTBOL.

3. A dollar sign (‘$’) in pattern, when used to specify expression anchoring, shall match the zero-length string immediately before a <newline> in string, regardless of the setting of REG_NOTEOL.

The regfree() function frees any memory allocated by regcomp() associated with preg.

The following constants are defined as error return values:

- REG_NOMATCH regexec() failed to match.
- REG_BADPAT Invalid regular expression.
- REG_ECOLLATE Invalid collating element referenced.
- REG_ECTYPE Invalid character class type referenced.
- REG_EESCAPE Trailing ‘\’ in pattern.
- REG_ESUBREG Number in "\digit" invalid or in error.
- REG_EBRACK "[]" imbalance.
- REG_EPAREN "\(\)" or "()" imbalance.
- REG_EBRACE "\{\}" imbalance.
- REG_BADBR Content of "\{\}" invalid: not a number, number too large, more than two numbers, first larger than second.
- REG_ERANGE Invalid endpoint in range expression.
- REG_ESPACE Out of memory.
- REG_BADRPT ‘?’, ‘*’, or ‘+’ not preceded by valid regular expression.

The regerror() function provides a mapping from error codes returned by regcomp() and regexec() to unspecified printable strings. It generates a string corresponding to the value of the errcode argument, which the application shall ensure is the last non-zero value returned by regcomp() or regexec() with the given value of preg. If errcode is not such a value, the content of the generated string is unspecified.

If preg is a null pointer, but errcode is a value returned by a previous call to regexec() or regcomp(), the regerror() still generates an error string corresponding to the value of errcode, but it might not be as detailed under some implementations.

If the errbuf_size argument is not 0, regerror() shall place the generated string into the buffer of size errbuf_size bytes pointed to by errbuf. If the string (including the terminating null) cannot fit in the buffer, regerror() shall truncate the string and null-terminate the result.
If `errbuf_size` is 0, `regerror()` shall ignore the `errbuf` argument, and return the size of the buffer needed to hold the generated string.

If the `preg` argument to `regexec()` or `regfree()` is not a compiled regular expression returned by `regcomp()`, the result is undefined. A `preg` is no longer treated as a compiled regular expression after it is given to `regfree()`.

**RETURN VALUE**

Upon successful completion, the `regcomp()` function shall return 0. Otherwise, it shall return an integer value indicating an error as described in `<regex.h>`, and the content of `preg` is undefined.

If a code is returned, the interpretation shall be as given in `<regex.h>`.

If `regcomp()` detects an invalid RE, it may return REG_BADPAT, or it may return one of the error codes that more precisely describes the error.

Upon successful completion, the `regexec()` function shall return 0. Otherwise, it shall return `REG_NOMATCH` to indicate no match.

Upon successful completion, the `regerror()` function shall return the number of bytes needed to hold the entire generated string, including the null termination. If the return value is greater than `errbuf_size`, the string returned in the buffer pointed to by `errbuf` has been truncated.

The `regfree()` function shall not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES**

```c
#include <regex.h>

/*
 * Match string against the extended regular expression in
 * pattern, treating errors as no match.
 *
 * Return 1 for match, 0 for no match.
 */

int match(const char *string, char *pattern)
{
    int status;
    regex_t re;
    if (regcomp(&re, pattern, REG_EXTENDED|REG_NOSUB) != 0) {
        return(0);      /* Report error. */
    }
    status = regexec(&re, string, (size_t) 0, NULL, 0);
    regfree(&re);
    if (status != 0) {
        return(0);      /* Report error. */
    }
    return(1);
}
```

The following demonstrates how the REG_NOTBOL flag could be used with `regexec()` to find all substrings in a line that match a pattern supplied by a user. (For simplicity of the example, very little error checking is done.)
(void) regcomp (&re, pattern, 0);
/* This call to regexec() finds the first match on the line. */
error = regexec (&re, &buffer[0], 1, &pm, 0);
while (error == 0) { /* While matches found. */
    /* Substring found between pm.rm_so and pm.rm_eo. */
    /* This call to regexec() finds the next match. */
    error = regexec (&re, buffer + pm.rm_eo, 1, &pm, REG_NOTBOL);
}

APPLICATION USAGE
An application could use:
regerror(code, preg, (char *)NULL, (size_t)0)
to find out how big a buffer is needed for the generated string, malloc() a buffer to hold the
string, and then call regerror() again to get the string. Alternatively, it could allocate a fixed,
static buffer that is big enough to hold most strings, and then use malloc() to allocate a larger
buffer if it finds that this is too small.

To match a pattern as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section
2.13, Pattern Matching Notation, use the fnmatch() function.

RATIONALE
The regexec() function must fill in all nmatch elements of pmatch, where nmatch and pmatch are
supplied by the application, even if some elements of pmatch do not correspond to
subexpressions in pattern. The application writer should note that there is probably no reason
for using a value of nmatch that is larger than preg->re_nsub+1.

The REG_NEWLINE flag supports a use of RE matching that is needed in some applications like
text editors. In such applications, the user supplies an RE asking the application to find a line
that matches the given expression. An anchor in such an RE anchors at the beginning or end of
any line. Such an application can pass a sequence of <newline>-separated lines to regexec() as a
single long string and specify REG_NEWLINE to regcomp() to get the desired behavior. The
application must ensure that there are no explicit <newline>s in pattern if it wants to ensure that
any match occurs entirely within a single line.

The REG_NEWLINE flag affects the behavior of regexec(), but it is in the cflags parameter to
regcomp() to allow flexibility of implementation. Some implementations will want to generate
the same compiled RE in regcomp() regardless of the setting of REG_NEWLINE and have
regexec() handle anchors differently based on the setting of the flag. Other implementations will
generate different compiled REs based on the REG_NEWLINE.

The REG_ICASE flag supports the operations taken by the grep -i option and the historical
implementations of ex and vi. Including this flag will make it easier for application code to be
written that does the same thing as these utilities.

The substrings reported in pmatch[] are defined using offsets from the start of the string rather
than pointers. Since this is a new interface, there should be no impact on historical
implementations or applications, and offsets should be just as easy to use as pointers. The
change to offsets was made to facilitate future extensions in which the string to be searched is
presented to regexec() in blocks, allowing a string to be searched that is not all in memory at
once.

The type regoff_t is used for the elements of pmatch[] to ensure that the application can
represent either the largest possible array in memory (important for an application conforming
to the Shell and Utilities volume of IEEE Std 1003.1-2001) or the largest possible file (important
for an application using the extension where a file is searched in chunks).
The standard developers rejected the inclusion of a \texttt{regsub()} function that would be used to do substitutions for a matched RE. While such a routine would be useful to some applications, its utility would be much more limited than the matching function described here. Both RE parsing and substitution are possible to implement without support other than that required by the ISO C standard, but matching is much more complex than substituting. The only difficult part of substitution, given the information supplied by \texttt{regexec()}, is finding the next character in a string when there can be multi-byte characters. That is a much larger issue, and one that needs a more general solution.

The \texttt{errno} variable has not been used for error returns to avoid filling the \texttt{errno} name space for this feature.

The interface is defined so that the matched substrings \texttt{rm_sp} and \texttt{rm_ep} are in a separate \texttt{regmatch_t} structure instead of in \texttt{regex_t}. This allows a single compiled RE to be used simultaneously in several contexts; in \texttt{main()} and a signal handler, perhaps, or in multiple threads of lightweight processes. (The \texttt{preg} argument to \texttt{regexec()} is declared with type \texttt{const}, so the implementation is not permitted to use the structure to store intermediate results.) It also allows an application to request an arbitrary number of substrings from an RE. The number of subexpressions in the RE is reported in \texttt{re_nsub} in \texttt{preg}. With this change to \texttt{regexec()}, consideration was given to dropping the \texttt{REG_NOSUB} flag since the user can now specify this with a zero \texttt{nmatch} argument to \texttt{regexec()}. However, keeping \texttt{REG_NOSUB} allows an implementation to use a different (perhaps more efficient) algorithm if it knows in \texttt{regcomp()} that no subexpressions need be reported. The implementation is only required to fill in \texttt{pmatch} if \texttt{nmatch} is not zero and if \texttt{REG_NOSUB} is not specified. Note that the \texttt{size_t} type, as defined in the ISO C standard, is unsigned, so the description of \texttt{regexec()} does not need to address negative values of \texttt{nmatch}.

\texttt{REG_NOTBOL} was added to allow an application to do repeated searches for the same pattern in a line. If the pattern contains a circumflex character that should match the beginning of a line, then the pattern should only match when matched against the beginning of the line. Without the \texttt{REG_NOTBOL} flag, the application could rewrite the expression for subsequent matches, but in the general case this would require parsing the expression. The need for \texttt{REG_NOTEOL} is not as clear; it was added for symmetry.

The addition of the \texttt{regerror()} function addresses the historical need for conforming application programs to have access to error information more than “Function failed to compile/match your RE for unknown reasons”.

This interface provides for two different methods of dealing with error conditions. The specific error codes (\texttt{REG_EBRACE}, for example), defined in \texttt{<regex.h>}, allow an application to recover from an error if it is so able. Many applications, especially those that use patterns supplied by a user, will not try to deal with specific error cases, but will just use \texttt{regerror()} to obtain a human-readable error message to present to the user.

The \texttt{regerror()} function uses a scheme similar to \texttt{confstr()} to deal with the problem of allocating memory to hold the generated string. The scheme used by \texttt{sterror()} in the ISO C standard was considered unacceptable since it creates difficulties for multi-threaded applications.

The \texttt{preg} argument is provided to \texttt{regerror()} to allow an implementation to generate a more descriptive message than would be possible with \texttt{errcode} alone. An implementation might, for example, save the character offset of the offending character of the pattern in a field of \texttt{preg}, and then include that in the generated message string. The implementation may also ignore \texttt{preg}.

A \texttt{REG_FILENAME} flag was considered, but omitted. This flag caused \texttt{regexec()} to match patterns as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern Matching Notation instead of REs. This service is now provided by the \texttt{fnmatch()}
Notice that there is a difference in philosophy between the ISO POSIX-2:1993 standard and IEEE Std 1003.1-2001 in how to handle a “bad” regular expression. The ISO POSIX-2:1993 standard says that many bad constructs “produce undefined results”, or that “the interpretation is undefined”. IEEE Std 1003.1-2001, however, says that the interpretation of such REs is unspecified. The term “undefined” means that the action by the application is an error, of similar severity to passing a bad pointer to a function.

The regcomp() and regexec() functions are required to accept any null-terminated string as the pattern argument. If the meaning of the string is “undefined”, the behavior of the function is “unspecified”. IEEE Std 1003.1-2001 does not specify how the functions will interpret the pattern; they might return error codes, or they might do pattern matching in some completely unexpected way, but they should not do something like abort the process.

FUTURE DIRECTIONS
None.

SEE ALSO
fnmatch(), glob(), Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.13, Pattern Matching Notation, Base Definitions volume of IEEE Std 1003.1-2001, Chapter 9, Regular Expressions, <regex.h>, <sys/types.h>

CHANGE HISTORY

Issue 5
Moved from POSIX2 C-language Binding to BASE.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The REG_ENOSYS constant is removed.

The restrict keyword is added to the regcomp(), regerror(), and regexec() prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME
remainder, remainderf, remainderl — remainder function

SYNOPSIS
#include <math.h>

double remainder(double x, double y);
float remainderf(float x, float y);
long double remainderl(long double x, long double y);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall return the floating-point remainder \( r = x - ny \) when \( y \) is non-zero. The value \( n \) is the integral value nearest the exact value \( x/y \). When \( \left| n - x/y \right| = \frac{1}{2} \), the value \( n \) is chosen to be even.

The behavior of \( \text{remainder()} \) shall be independent of the rounding mode.

RETURN VALUE
Upon successful completion, these functions shall return the floating-point remainder \( r = x - ny \) when \( y \) is non-zero.

If \( x \) or \( y \) is NaN, a NaN shall be returned.

If \( x \) is infinite or \( y \) is 0 and the other is non-NaN, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS
These functions shall fail if:

- **Domain Error**
  - The \( x \) argument is ±\( \text{Inf} \), or the \( y \) argument is ±0 and the other argument is non-\( \text{NaN} \).
  - If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then \( errno \) shall be set to \[EDOM\]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

remainder()  

**CHANGE HISTORY**

37741 First released in Issue 4, Version 2.

37742 **Issue 5**

37743 Moved from X/OPEN UNIX extension to BASE.

37744 **Issue 6**

37745 The `remainder()` function is no longer marked as an extension.

37746 The `remainderf()` and `remainderl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

37748 The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

NAME
remove — remove a file

SYNOPSIS
#include <stdio.h>
int remove(const char *path);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The remove() function shall cause the file named by the pathname pointed to by path to be no longer accessible by that name. A subsequent attempt to open that file using that name shall fail, unless it is created anew.
If path does not name a directory, remove(path) shall be equivalent to unlink(path).
If path names a directory, remove(path) shall be equivalent to rmdir(path).

RETURN VALUE
CX Refer to rmdir() or unlink().

ERRORS
CX Refer to rmdir() or unlink().

EXAMPLES
Removing Access to a File
The following example shows how to remove access to a file named /home/cnd/old.mods.
#include <stdio.h>
int status;
...
status = remove("/home/cnd/old.mods");

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
rmdir(), unlink(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

CHANGE HISTORY

Issue 6
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• The DESCRIPTION, RETURN VALUE, and ERRORS sections are updated so that if `path` is not a directory, `remove()` is equivalent to `unlink()`, and if it is a directory, it is equivalent to `rmdir()`.
NAME
remque — remove an element from a queue

SYNOPSIS
XSI
#include <search.h>

void remque(void *element);

DESCRIPTION
Refer to insque().
NAME
remquo, remquof, remquol — remainder functions

SYNOPSIS
#include <math.h>

double remquo(double x, double y, int *quo);
float remquof(float x, float y, int *quo);
long double remquol(long double x, long double y, int *quo);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The remquo(), remquof(), and remquol() functions shall compute the same remainder as the
remainder(), remainderf(), and remainderl() functions, respectively. In the object pointed to by
quo, they store a value whose sign is the sign of x/y and whose magnitude is congruent modulo
$2^n$ to the magnitude of the integral quotient of $x/y$, where $n$ is an implementation-defined
integer greater than or equal to 3.
An application wishing to check for error situations should set errno to zero and call
feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
zero, an error has occurred.

RETURN VALUE
These functions shall return $x \text{ REM } y$.

If $x$ or $y$ is NaN, a NaN shall be returned.
If $x$ is $\pm \text{Inf}$ or $y$ is zero and the other argument is non-NaN, a domain error shall occur, and either
a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS
These functions shall fail if:

Domain Error The $x$ argument is $\pm \text{Inf}$, or the $y$ argument is $\pm 0$ and the other argument is
non-NaN.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling
& MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception
shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
These functions are intended for implementing argument reductions which can exploit a few
low-order bits of the quotient. Note that $x$ may be so large in magnitude relative to $y$ that an
exact representation of the quotient is not practical.
System Interfaces

remquo()

FUTURE DIRECTIONS
None.

CHANGE HISTORY
rename( )

NAME
rename — rename a file

SYNOPSIS
#include <stdio.h>

int rename(const char *old, const char *new);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The rename() function shall change the name of a file. The old argument points to the pathname of the file to be renamed. The new argument points to the new pathname of the file.

If either the old or new argument names a symbolic link, rename() shall operate on the symbolic link itself, and shall not resolve the last component of the argument. If the old argument and the new argument resolve to the same existing file, rename() shall return successfully and perform no other action.

If the old argument points to the pathname of a file that is not a directory, the new argument shall not point to the pathname of a directory. If the link named by the new argument exists, it shall be removed and old renamed to new. In this case, a link named new shall remain visible to other processes throughout the renaming operation and refer either to the file referred to by new or old before the operation began. Write access permission is required for both the directory containing old and the directory containing new.

If the old argument points to the pathname of a directory, the new argument shall not point to the pathname of a file that is not a directory. If the directory named by the new argument exists, it shall be removed and old renamed to new. In this case, a link named new shall exist throughout the renaming operation and shall refer either to the directory referred to by new or old before the operation began. If new names an existing directory, it shall be required to be an empty directory.

If the old argument points to a pathname of a symbolic link, the symbolic link shall be renamed. If the new argument points to a pathname of a symbolic link, the symbolic link shall be removed.

The new pathname shall not contain a path prefix that names old. Write access permission is required for the directory containing old and the directory containing new. If the old argument points to the pathname of a directory, write access permission may be required for the directory named by old, and, if it exists, the directory named by new.

If the link named by the new argument exists and the file's link count becomes 0 when it is removed and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before rename() returns, but the removal of the file contents shall be postponed until all references to the file are closed.

Upon successful completion, rename() shall mark for update the st_ctime and st_mtime fields of the parent directory of each file.

If the rename() function fails for any reason other than [EIO], any file named by new shall be unaffected.

RETURN VALUE
Upon successful completion, rename() shall return 0; otherwise, −1 shall be returned, errno shall be set to indicate the error, and neither the file named by old nor the file named by new shall be changed or created.
The `rename()` function shall fail if:

- **[EACCES]** A component of either path prefix denies search permission; or one of the directories containing `old` or `new` denies write permissions; or, write permission is required and is denied for a directory pointed to by the `old` or `new` arguments.
- **[EBUSY]** The directory named by `old` or `new` is currently in use by the system or another process, and the implementation considers this an error.
- **[EEXIST]** or **[ENOTEMPTY]** The link named by `new` is a directory that is not an empty directory.
- **[EINVAL]** The `new` directory pathname contains a path prefix that names the `old` directory.
- **[EIO]** A physical I/O error has occurred.
- **[EISDIR]** The `new` argument points to a directory and the `old` argument points to a file that is not a directory.
- **[ELOOP]** A loop exists in symbolic links encountered during resolution of the `path` argument.
- **[EMLINK]** The file named by `old` is a directory, and the link count of the parent directory of `new` would exceed `{LINK_MAX}`.
- **[ENAMETOOLONG]** The length of the `old` or `new` argument exceeds `{PATH_MAX}` or a pathname component is longer than `{NAME_MAX}`.
- **[ENOENT]** The link named by `old` does not name an existing file, or either `old` or `new` points to an empty string.
- **[ENOSPC]** The directory that would contain `new` cannot be extended.
- **[ENOTDIR]** A component of either path prefix is not a directory; or the `old` argument names a directory and `new` argument names a non-directory file.
- **[EPERM]** or **[EACCES]** The S_ISVTX flag is set on the directory containing the file referred to by `old` and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges; or `new` refers to an existing file, the S_ISVTX flag is set on the directory containing this file, and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges.
- **[EROFS]** The requested operation requires writing in a directory on a read-only file system.
- **[EXDEV]** The links named by `new` and `old` are on different file systems and the implementation does not support links between file systems.
- **[EPERM]** or **[EACCES]** The S_ISVTX flag is set on the directory containing the file referred to by `old` and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges; or `new` refers to an existing file, the S_ISVTX flag is set on the directory containing this file, and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges.

The `rename()` function may fail if:

- **[EBUSY]** The file named by the `old` or `new` arguments is a named STREAM.
- **[ELOOP]** More than `{SYMLOOP_MAX}` symbolic links were encountered during resolution of the `path` argument.
As a result of encountering a symbolic link in resolution of the path argument, the length of the substituted pathname string exceeded \{PATH_MAX\}.

The file to be renamed is a pure procedure (shared text) file that is being executed.

**EXAMPLES**

Renaming a File

The following example shows how to rename a file named /home/cnd/mod1 to /home/cnd/mod2.

```c
#include <stdio.h>
int status;
...
status = rename("/home/cnd/mod1", "/home/cnd/mod2");
```

**APPLICATION USAGE**

Some implementations mark for update the st_ctime field of renamed files and some do not. Applications which make use of the st_ctime field may behave differently with respect to renamed files unless they are designed to allow for either behavior.

**RATIONALE**

This rename() function is equivalent for regular files to that defined by the ISO C standard. Its inclusion here expands that definition to include actions on directories and specifies behavior when the new parameter names a file that already exists. That specification requires that the action of the function be atomic.

One of the reasons for introducing this function was to have a means of renaming directories while permitting implementations to prohibit the use of link() and unlink() with directories, thus constraining links to directories to those made by mkdir().

The specification that if old and new refer to the same file is intended to guarantee that:

```c
rename ("x", "x");
```

does not remove the file.

Renaming dot or dot-dot is prohibited in order to prevent cyclical file system paths.

See also the descriptions of [ENOTEMPTY] and [ENAMETOOLONG] in rmdir() and [EBUSY] in unlink(). For a discussion of [EXDEV], see link().

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

link(), rmdir(), symlink(), unlink(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

The [EBUSY] error is added to the “may fail” part of the ERRORS section.
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EIO] mandatory error condition is added.
- The [ELOOP] mandatory error condition is added.
- A second [ENAMETOOLONG] is added as an optional error condition.
- The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Details are added regarding the treatment of symbolic links.
- The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
rewind — reset the file position indicator in a stream

SYNOPSIS
#include <stdio.h>
void rewind(FILE *stream);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The call:
rewind(stream)
shall be equivalent to:
(void) fseek(stream, 0L, SEEK_SET)
except that rewind() shall also clear the error indicator.

Since rewind() does not return a value, an application wishing to detect errors should clear errno,
then call rewind(), and if errno is non-zero, assume an error has occurred.

RETURN VALUE
The rewind() function shall not return a value.

ERRORS
Refer to fseek() with the exception of [EINVAL] which does not apply.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
Extensions beyond the ISO C standard are marked.
rewinddir()  

NAME  
rewinddir — reset the position of a directory stream to the beginning of a directory  

SYNOPSIS  
#include <dirent.h>  
void rewinddir(DIR *dirp);  

DESCRIPTION  
The rewinddir() function shall reset the position of the directory stream to which dirp refers to  
the beginning of the directory. It shall also cause the directory stream to refer to the current state  
of the corresponding directory, as a call to opendir() would have done. If dirp does not refer to a  
directory stream, the effect is undefined.  
After a call to the fork() function, either the parent or child (but not both) may continue  
processing the directory stream using readdir(), rewinddir(), or seekdir(). If both the parent and  
child processes use these functions, the result is undefined.  

RETURN VALUE  
The rewinddir() function shall not return a value.  

ERRORS  
No errors are defined.  

APPLICATION USAGE  
The rewinddir() function should be used in conjunction with opendir(), readdir(), and closedir() to  
examine the contents of the directory. This method is recommended for portability.  

RATIONALE  
None.  

FUTURE DIRECTIONS  
None.  

SEE ALSO  
closedir(), opendir(), readdir(), the Base Definitions volume of IEEE Std 1003.1-2001, <dirent.h>  
<sys/types.h>  

CHANGE HISTORY  
First released in Issue 2.  

Issue 6  
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.  
The following new requirements on POSIX implementations derive from alignment with the  
Single UNIX Specification:  
• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was  
required for conforming implementations of previous POSIX specifications, it was not  
required for UNIX applications.
NAME
rindex — character string operations (LEGACY)

SYNOPSIS
#include <strings.h>

char *rindex(const char *s, int c);

DESCRIPTION
The rindex() function shall be equivalent to strchr().

RETURN VALUE
Refer to strchr().

ERRORS
Refer to strchr().

EXAMPLES
None.

APPLICATION USAGE
The strchr() function is preferred over this function.

APPLICATION USAGE
For maximum portability, it is recommended to replace the function call to rindex() as follows:

#define rindex(a, b) strchr((a), (b))

RATIONALE
None.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

SEE ALSO
strchr(), the Base Definitions volume of IEEE Std 1003.1-2001, <strings.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked LEGACY.
NAME
rint, rintf, rintl — round-to-nearest integral value

SYNOPSIS
#include <math.h>

double rint(double x);
float rintf(float x);
long double rintl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

These functions shall return the integral value (represented as a double) nearest x in the
direction of the current rounding mode. The current rounding mode is implementation-defined.

If the current rounding mode rounds toward negative infinity, then rint() shall be equivalent to
floor(). If the current rounding mode rounds toward positive infinity, then rint() shall be
equivalent to ceil().

These functions differ from the nearbyint(), nearbyintf(), and nearbyintl() functions only in that
they may raise the inexact floating-point exception if the result differs in value from the
argument.

An application wishing to check for error situations should set errno to zero and call
feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or
fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-
zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the integer (represented as a double
precision number) nearest x in the direction of the current rounding mode.

If x is NaN, a NaN shall be returned.
If x is ±0 or ±Inf, x shall be returned.
If the correct value would cause overflow, a range error shall occur and rint(), rintf(), and rintl()
shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the
same sign as x), respectively.

ERRORS
These functions shall fail if:

Range Error The result would cause an overflow.
If the integer expression (math_errhandling & MATH_ERRNO) is non-zero,
then errno shall be set to [ERANGE]. If the integer expression
(math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow
floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
abs(), ceil(), feclearexcept(), fetestexcept(), floor(), isnan(), nearbyint(), the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
The following changes are made for alignment with the ISO/IEC 9899:1999 standard:
- The rintf() and rintl() functions are added.
- The rint() function is no longer marked as an extension.
- The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899: 1999 standard.
NAME
rmdir — remove a directory

SYNOPSIS
#include <unistd.h>
int rmdir(const char *path);

DESCRIPTION
The rmdir() function shall remove a directory whose name is given by path. The directory shall be removed only if it is an empty directory.

If the directory is the root directory or the current working directory of any process, it is unspecified whether the function succeeds, or whether it shall fail and set errno to [EBUSY].

If path names a symbolic link, then rmdir() shall fail and set errno to [ENOTDIR].

If the path argument refers to a path whose final component is either dot or dot-dot, rmdir() shall fail.

If the directory’s link count becomes 0 and no process has the directory open, the space occupied by the directory shall be freed and the directory shall no longer be accessible. If one or more processes have the directory open when the last link is removed, the dot and dot-dot entries, if present, shall be removed before rmdir() returns and no new entries may be created in the directory, but the directory shall not be removed until all references to the directory are closed.

If the directory is not an empty directory, rmdir() shall fail and set errno to [EEXIST] or [ENOTEMPTY].

Upon successful completion, the rmdir() function shall mark for update the st_ctime and st_mtime fields of the parent directory.

RETURN VALUE
Upon successful completion, the function rmdir() shall return 0. Otherwise, −1 shall be returned, and errno set to indicate the error. If −1 is returned, the named directory shall not be changed.

ERRORS
The rmdir() function shall fail if:

[EACCES] Search permission is denied on a component of the path prefix, or write permission is denied on the parent directory of the directory to be removed.

[EBUSY] The directory to be removed is currently in use by the system or some process and the implementation considers this to be an error.

[EEXIST] or [ENOTEMPTY]
The path argument names a directory that is not an empty directory, or there are hard links to the directory other than dot or a single entry in dot-dot.

[EINVAL] The path argument contains a last component that is dot.

[EIO] A physical I/O error has occurred.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOENT] A component of path does not name an existing file, or the path argument names a nonexistent directory or points to an empty string.
The `rmdir()` function may fail if:

- [ENOTDIR] A component of `path` is not a directory.
- [EPERM] or [EACCES] The `S_ISVTX` flag is set on the parent directory of the directory to be removed and the caller is not the owner of the directory to be removed, nor is the caller the owner of the parent directory, nor does the caller have the appropriate privileges.
- [EROF S] The directory entry to be removed resides on a read-only file system.
- [ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the `path` argument.
- [ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the `path` argument, the length of the substituted pathname string exceeded [PATH_MAX].

### EXAMPLES

#### Removing a Directory

The following example shows how to remove a directory named `/home/cnd/mod1`.

```c
#include <unistd.h>
int status;
... status = rmdir("/home/cnd/mod1");
```

### APPLICATION USAGE

None.

### RATIONALE

The `rmdir()` and `rename()` functions originated in 4.2 BSD, and they used [ENOTEMPTY] for the condition when the directory to be removed does not exist or `new` already exists. When the 1984 `/usr/group` standard was published, it contained [EEXIST] instead. When these functions were adopted into System V, the 1984 `/usr/group` standard was used as a reference. Therefore, several existing applications and implementations support/use both forms, and no agreement could be reached on either value. All implementations are required to supply both [EEXIST] and [ENOTEMPTY] in `<errno.h>` with distinct values, so that applications can use both values in C-language case statements.

The meaning of deleting `pathname/dot` is unclear, because the name of the file (directory) in the parent directory to be removed is not clear, particularly in the presence of multiple links to a directory.

The POSIX.1-1990 standard was silent with regard to the behavior of `rmdir()` when there are multiple hard links to the directory being removed. The requirement to set `errno` to [EEXIST] or [ENOTEMPTY] clarifies the behavior in this case.

If the process' current working directory is being removed, that should be an allowed error.

Virtually all existing implementations detect [ENOTEMPTY] or the case of dot-dot. The text in Section 2.3 (on page 21) about returning any one of the possible errors permits that behavior to continue. The [ELOOP] error may be returned if more than [SYMLOOP_MAX] symbolic links are encountered during resolution of the path argument.
FUTURE DIRECTIONS
None.

SEE ALSO
Section 2.3 (on page 21), mkdir(), remove(), unlink(), the Base Definitions volume of
IEEE Std 1003.1-2001, <unistd.h>

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

• The DESCRIPTION is updated to indicate the results of naming a symbolic link in path.
• The [EIO] mandatory error condition is added.
• The [ELOOP] mandatory error condition is added.
• A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

• The [ELOOP] optional error condition is added.
NAME
round, roundf, roundl — round to the nearest integer value in a floating-point format

SYNOPSIS
#include <math.h>

double round(double x);
float roundf(float x);
long double roundl(long double x);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to the nearest integer value in floating-point format, rounding halfway cases away from zero, regardless of the current rounding direction.

An application wishing to check for error situations should set errno to zero and call fclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the rounded integer value.

If x is NaN, a NaN shall be returned.

If x is ±0 or ±Inf, x shall be returned.

If the correct value would cause overflow, a range error shall occur and round(), roundf(), and roundl() shall return the value of the macro ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as x), respectively.

ERRORS

These functions may fail if:

Range Error The result overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.
SEE ALSO

feclearexcept(), fetestexcept(), the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18,
Treatment of Error Conditions for Mathematical Functions, <math.h>

CHANGE HISTORY

NAME
scalb — load exponent of a radix-independent floating-point number

SYNOPSIS
#include <math.h>

double scalb(double x, double n);

DESCRIPTION
The scalb() function shall compute \( x \times r^n \), where \( r \) is the radix of the machine's floating-point arithmetic. When \( r \) is 2, scalb() shall be equivalent to ldexp(). The value of \( r \) is FLT_RADIX which is defined in <float.h>.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, the scalb() function shall return \( x \times r^n \).

If \( x \) or \( n \) is NaN, a NaN shall be returned.

If \( n \) is zero, \( x \) shall be returned.

If \( x \) is ±Inf and \( n \) is not −Inf, \( x \) shall be returned.

If \( x \) is ±0 and \( n \) is not +Inf, \( x \) shall be returned.

If \( x \) is ±0 and \( n \) is +Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If \( x \) is ±Inf and \( n \) is −Inf, a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

If the result would cause an overflow, a range error shall occur and ±HUGE_VAL (according to the sign of \( x \)) shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

If the correct value would cause underflow, and is not representable, a range error may occur, and 0.0 shall be returned.

ERRORS
The scalb() function shall fail if:

Domain Error If \( x \) is zero and \( n \) is +Inf, or \( x \) is Inf and \( n \) is −Inf.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Range Error The result would overflow.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.
The `scalb()` function may fail if:

- **Range Error** The result underflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

**EXAMPLES**
None.

**APPLICATION USAGE**
Applications should use either `scalbln()`, `scalblnf()`, or `scalblnl()` in preference to this function.

IEEE Std 1003.1-2001 only defines the behavior for the `scalb()` function when the `n` argument is an integer, a NaN, or Inf. The behavior of other values for the `n` argument is unspecified.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**

- `<float.h>`, `<math.h>`

**CHANGE HISTORY**
First released in Issue 4, Version 2.

**Issue 5**
Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

**Issue 6**
This function is marked obsolescent.

Although this function is not part of the ISO/IEC 9899:1999 standard, the RETURN VALUE and ERRORS sections are updated to align with the error handling in the ISO/IEC 9899:1999 standard.
NAME
scalbln, scalblnf, scalblnl, scalbn, scalbnf, scalbnl — compute exponent using FLT_RADIX

SYNOPSIS
#include <math.h>

double scalbln(double x, long n);
float scalblnf(float x, long n);
long double scalblnl(long double x, long n);
double scalbn(double x, int n);
float scalbnf(float x, int n);
long double scalbnl(long double x, int n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute \( x \times \text{FLT\_RADIX}^n \) efficiently, not normally by computing \( \text{FLT\_RADIX}^n \) explicitly.

An application wishing to check for error situations should set \text{errno} to zero and call \text{feclearexcept}(\text{FE\_ALL\_EXCEPT}) before calling these functions. On return, if \text{errno} is non-zero or \text{fetestexcept}(\text{FE\_INVALID} | \text{FE\_DIVBYZERO} | \text{FE\_OVERFLOW} | \text{FE\_UNDERFLOW}) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return \( x \times \text{FLT\_RADIX}^n \).

If the result would cause overflow, a range error shall occur and these functions shall return \( \pm\text{HUGE\_VAL} \), \( \pm\text{HUGE\_VALF} \), and \( \pm\text{HUGE\_VALL} \) (according to the sign of \( x \)) as appropriate for the return type of the function.

If the correct value would cause underflow, and is not representable, a range error may occur, and either 0.0 (if supported), or an implementation-defined value shall be returned.

If \( x \) is NaN, a NaN shall be returned.

If \( x \) is \( \pm0 \) or \( \pm\text{Inf} \), \( x \) shall be returned.

If \( n \) is 0, \( x \) shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

ERRORS
These functions shall fail if:

Range Error The result overflows.

If the integer expression (\text{math\_errhandling} & \text{MATH\_ERRNO}) is non-zero, then \text{errno} shall be set to [ERANGE]. If the integer expression (\text{math\_errhandling} & \text{MATH\_ERREXCEPT}) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The result underflows.

If the integer expression (\text{math\_errhandling} & \text{MATH\_ERRNO}) is non-zero, then \text{errno} shall be set to [ERANGE]. If the integer expression
(math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

These functions are named so as to avoid conflicting with the historical definition of the `scalb()` function from the Single UNIX Specification. The difference is that the `scalb()` function has a second argument of `double` instead of `int`. The `scalb()` function is not part of the ISO C standard. The three functions whose second type is `long` are provided because the factor required to scale from the smallest positive floating-point value to the largest finite one, on many implementations, is too large to represent in the minimum-width `int` format.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`feclearexcept()`, `fetestexcept()`, `scalb()`, the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions, `<math.h>`

NAME
scanf — convert formatted input

SYNOPSIS
#include <stdio.h>

int scanf(const char *restrict format, ...);

DESCRIPTION
Refer to fscanf().
sched_get_priority_max( )

NAME
sched_get_priority_max, sched_get_priority_min — get priority limits (REALTIME)

SYNOPSIS
#include <sched.h>

int sched_get_priority_max(int policy);
int sched_get_priority_min(int policy);

DESCRIPTION
The sched_get_priority_max() and sched_get_priority_min() functions shall return the appropriate maximum or minimum, respectively, for the scheduling policy specified by policy.

The value of policy shall be one of the scheduling policy values defined in <sched.h>.

RETURN VALUE
If successful, the sched_get_priority_max() and sched_get_priority_min() functions shall return the appropriate maximum or minimum values, respectively. If unsuccessful, they shall return a value of -1 and set errno to indicate the error.

ERRORS
The sched_get_priority_max() and sched_get_priority_min() functions shall fail if:

[EINVVAL] The value of the policy parameter does not represent a defined scheduling policy.

Issue 6
These functions are marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The [ESRCH] error condition has been removed since these functions do not take a pid argument.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/52 is applied, changing the PS margin code in the SYNOPSIS to PS|TPS.
NAME
sched_getparam — get scheduling parameters (REALTIME)

SYNOPSIS
#include <sched.h>

int sched_getparam(pid_t pid, struct sched_param *param);

DESCRIPTION
The sched_getparam() function shall return the scheduling parameters of a process specified by
pid in the sched_param structure pointed to by param.

If a process specified by pid exists, and if the calling process has permission, the scheduling
parameters for the process whose process ID is equal to pid shall be returned.

If pid is zero, the scheduling parameters for the calling process shall be returned. The behavior of
the sched_getparam() function is unspecified if the value of pid is negative.

RETURN VALUE
Upon successful completion, the sched_getparam() function shall return zero. If the call to
sched_getparam() is unsuccessful, the function shall return a value of −1 and set errno to indicate
the error.

ERRORS
The sched_getparam() function shall fail if:

[EPERM] The requesting process does not have permission to obtain the scheduling
parameters of the specified process.

[ESRCH] No process can be found corresponding to that specified by pid.

EXAMPLES

NAME
sched_getscheduler ( ) — get scheduling policy (REALTIME)

SYNOPSIS
```
#include <sched.h>

int sched_getscheduler(pid_t pid);
```

DESCRIPTION
The sched_getscheduler ( ) function shall return the scheduling policy of the process specified by pid. If the value of pid is negative, the behavior of the sched_getscheduler ( ) function is unspecified.

The values that can be returned by sched_getscheduler ( ) are defined in the <sched.h> header.

If a process specified by pid exists, and if the calling process has permission, the scheduling policy shall be returned for the process whose process ID is equal to pid.

If pid is zero, the scheduling policy shall be returned for the calling process.

RETURN VALUE
Upon successful completion, the sched_getscheduler ( ) function shall return the scheduling policy of the specified process. If unsuccessful, the function shall return −1 and set errno to indicate the error.

ERRORS
The sched_getscheduler ( ) function shall fail if:

- [EPERM] The requesting process does not have permission to determine the scheduling policy of the specified process.
- [ESRCH] No process can be found corresponding to that specified by pid.

NAME
sched_rr_get_interval — get execution time limits (REALTIME)

SYNOPSIS
PS|TPS
#include <sched.h>

int sched_rr_get_interval(pid_t pid, struct timespec *interval);

DESCRIPTION
The sched_rr_get_interval() function shall update the timespec structure referenced by the
interval argument to contain the current execution time limit (that is, time quantum) for the
process specified by pid. If pid is zero, the current execution time limit for the calling process
shall be returned.

RETURN VALUE
If successful, the sched_rr_get_interval() function shall return zero. Otherwise, it shall return a
value of −1 and set errno to indicate the error.

ERRORS
The sched_rr_get_interval() function shall fail if:
[ESRCH] No process can be found corresponding to that specified by pid.

SEE ALSO
sched_getparam(), sched_get_priority_max(), sched_setscheduler(), sched_setparam(),
sched_setscheduler(), the Base Definitions volume of IEEE Std 1003.1-2001, <sched.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
The sched_rr_get_interval() function is marked as part of the Process Scheduling option.
The [ENOSYS] error condition has been removed as stubs need not be provided if an
implementation does not support the Process Scheduling option.
IEEE Std 1003.1-2001/Cor 1-2002, XSH/TC1/D6/53 is applied, changing the PS margin code in
the SYNOPSIS to PS|TPS.
The `sched_setparam()` function shall set the scheduling parameters of the process specified by `pid` to the values specified by the `struct sched_param` structure pointed to by `param`. The value of the `sched_priority` member in the `struct sched_param` structure shall be any integer within the inclusive priority range for the current scheduling policy of the process specified by `pid`. Higher numerical values for the priority represent higher priorities. If the value of `pid` is negative, the behavior of the `sched_setparam()` function is unspecified.

If a process specified by `pid` exists, and if the calling process has permission, the scheduling parameters shall be set for the process whose process ID is equal to `pid`. If `pid` is zero, the scheduling parameters shall be set for the calling process.

The conditions under which one process has permission to change the scheduling parameters of another process are implementation-defined.

Implementations may require the requesting process to have the appropriate privilege to set its own scheduling parameters or those of another process.

The target process, whether it is running or not running, shall be moved to the tail of the thread list for its priority.

If the priority of the process specified by the `pid` argument is set higher than that of the lowest priority running process and if the specified process is ready to run, the process specified by the `pid` argument shall preempt a lowest priority running process. Similarly, if the process calling `sched_setparam()` sets its own priority lower than that of one or more other non-empty process lists, then the process that is the head of the highest priority list shall also preempt the calling process. Thus, in either case, the originating process might not receive notification of the completion of the requested priority change until the higher priority process has executed.

If the scheduling policy of the target process is SCHED_SPORADIC, the value specified by the `sched_ss_low_priority` member of the `param` argument shall be any integer within the inclusive priority range for the sporadic server policy. The `sched_ss_repl_period` and `sched_ss_init_budget` members of the `param` argument shall represent the time parameters to be used by the sporadic server scheduling policy for the target process. The `sched_ss_max_repl` member of the `param` argument shall represent the maximum number of replenishments that are allowed to be pending simultaneously for the process scheduled under this scheduling policy.

The specified `sched_ss_repl_period` shall be greater than or equal to the specified `sched_ss_init_budget` for the function to succeed; if it is not, then the function shall fail.

The value of `sched_ss_max_repl` shall be within the inclusive range `[1, SS_REPL_MAX]` for the function to succeed; if not, the function shall fail.

If the scheduling policy of the target process is either SCHED_FIFO or SCHED_RR, the `sched_ss_low_priority`, `sched_ss_repl_period`, and `sched_ss_init_budget` members of the `param` argument shall have no effect on the scheduling behavior. If the scheduling policy of this process is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the effects of these members are implementation-defined; this case includes the SCHED_OTHER policy.
If the current scheduling policy for the process specified by `pid` is not SCHED_FIFO, SCHED_RR, or SCHED_SPORADIC, the result is implementation-defined; this case includes the SCHED_OTHER policy.

The effect of this function on individual threads is dependent on the scheduling contention scope of the threads:

- For threads with system scheduling contention scope, these functions shall have no effect on their scheduling.
- For threads with process scheduling contention scope, the threads' scheduling parameters shall not be affected. However, the scheduling of these threads with respect to threads in other processes may be dependent on the scheduling parameters of their process, which are governed using these functions.

If an implementation supports a two-level scheduling model in which library threads are multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled entities for the system contention scope threads shall not be affected by these functions.

The underlying kernel-scheduled entities for the process contention scope threads shall have their scheduling parameters changed to the value specified in `param`. Kernel-scheduled entities for use by process contention scope threads that are created after this call completes shall inherit their scheduling policy and associated scheduling parameters from the process.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy for the underlying kernel-scheduled entities used by the process contention scope threads.

**RETURN VALUE**

If successful, the `sched_setparam()` function shall return zero.

If the call to `sched_setparam()` is unsuccessful, the priority shall remain unchanged, and the function shall return a value of −1 and set `errno` to indicate the error.

**ERRORS**

The `sched_setparam()` function shall fail if:

- [EINVAL] One or more of the requested scheduling parameters is outside the range defined for the scheduling policy of the specified `pid`.
- [EPERM] The requesting process does not have permission to set the scheduling parameters for the specified process, or does not have the appropriate privilege to invoke `sched_setparam()`.
- [ESRCH] No process can be found corresponding to that specified by `pid`.

**EXAMPLES**

None.

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The `sched_setparam()` function is marked as part of the Process Scheduling option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Process Scheduling option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the effect of this function on a thread’s scheduling parameters is added.
- Sections describing two-level scheduling and atomicity of the function are added.
- The SCHED_SPORADIC scheduling policy is added for alignment with IEEE Std 1003.1d-1999.
- IEEE PASC Interpretation 1003.1 #100 is applied.
sched_setscheduler() 

NAME

sched_setscheduler — set scheduling policy and parameters (REALTIME)

SYNOPSIS

#include <sched.h>

int sched_setscheduler(pid_t pid, int policy, const struct sched_param *param);

DESCRIPTION

The sched_setscheduler() function shall set the scheduling policy and scheduling parameters of the process specified by pid to policy and the parameters specified in the sched_param structure pointed to by param, respectively. The value of the sched_priority member in the sched_param structure shall be any integer within the inclusive priority range for the scheduling policy specified by policy. If the value of pid is negative, the behavior of the sched_setscheduler() function is unspecified.

The possible values for the policy parameter are defined in the <sched.h> header.

If a process specified by pid exists, and if the calling process has permission, the scheduling policy and scheduling parameters shall be set for the process whose process ID is equal to pid.

If pid is zero, the scheduling policy and scheduling parameters shall be set for the calling process.

The conditions under which one process has the appropriate privilege to change the scheduling parameters of another process are implementation-defined.

Implementations may require that the requesting process have permission to set its own scheduling parameters or those of another process. Additionally, implementation-defined restrictions may apply as to the appropriate privileges required to set a process’ own scheduling policy, or another process’ scheduling policy, to a particular value.

The sched_setscheduler() function shall be considered successful if it succeeds in setting the scheduling policy and scheduling parameters of the process specified by pid to the values specified by policy and the structure pointed to by param, respectively.

If the scheduling policy specified by policy is SCHED_Sporadic, the value specified by the sched_ss_low_priority member of the param argument shall be any integer within the inclusive priority range for the sporadic server policy. The sched_ss_repl_period and sched_ss_init_budget members of the param argument shall represent the time parameters used by the sporadic server scheduling policy for the target process. The sched_ss_max_repl member of the param argument shall represent the maximum number of replenishments that are allowed to be pending simultaneously for the process scheduled under this scheduling policy.

The specified sched_ss_repl_period shall be greater than or equal to the specified sched_ss_init_budget for the function to succeed; if it is not, then the function shall fail.

The value of sched_ss_max_repl shall be within the inclusive range [1,SS_REPL_MAX] for the function to succeed; if not, the function shall fail.

If the scheduling policy specified by policy is either SCHED_FIFO or SCHED_RR, the sched_ss_low_priority, sched_ss_repl_period, and sched_ss_init_budget members of the param argument shall have no effect on the scheduling behavior.

The effect of this function on individual threads is dependent on the scheduling contention scope of the threads:
For threads with system scheduling contention scope, these functions shall have no effect on their scheduling.

For threads with process scheduling contention scope, the threads’ scheduling policy and associated parameters shall not be affected. However, the scheduling of these threads with respect to threads in other processes may be dependent on the scheduling parameters of their process, which are governed using these functions.

If an implementation supports a two-level scheduling model in which library threads are multiplexed on top of several kernel-scheduled entities, then the underlying kernel-scheduled entities for the system contention scope threads shall not be affected by these functions.

The underlying kernel-scheduled entities for the process contention scope threads shall have their scheduling policy and associated scheduling parameters changed to the values specified in policy and param, respectively. Kernel-scheduled entities for use by process contention scope threads that are created after this call completes shall inherit their scheduling policy and associated scheduling parameters from the process.

This function is not atomic with respect to other threads in the process. Threads may continue to execute while this function call is in the process of changing the scheduling policy and associated scheduling parameters for the underlying kernel-scheduled entities used by the process contention scope threads.

Upon successful completion, the function shall return the former scheduling policy of the specified process. If the sched_setscheduler() function fails to complete successfully, the policy and scheduling parameters shall remain unchanged, and the function shall return a value of -1 and set errno to indicate the error.

The sched_setscheduler() function shall fail if:

- [EINVAL] The value of the policy parameter is invalid, or one or more of the parameters contained in param is outside the valid range for the specified scheduling policy.
- [EPERM] The requesting process does not have permission to set either or both of the scheduling parameters or the scheduling policy of the specified process.
- [ESRCH] No process can be found corresponding to that specified by pid.

NAME
sched_yield — yield the processor

SYNOPSIS

```c
#include <sched.h>

int sched_yield(void);
```

DESCRIPTION

The `sched_yield()` function shall force the running thread to relinquish the processor until it again becomes the head of its thread list. It takes no arguments.

RETURN VALUE

The `sched_yield()` function shall return 0 if it completes successfully; otherwise, it shall return a value of −1 and set `errno` to indicate the error.

ERRORS

No errors are defined.

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6

The `sched_yield()` function is now marked as part of the Process Scheduling and Threads options.
seede48 — seed a uniformly distributed pseudo-random non-negative long integer generator

**SYNOPSIS**

```c
#include <stdlib.h>

unsigned short *seed48(unsigned short seed16v[3]);
```

**DESCRIPTION**

Refer to `drand48()`.
NAME
seekdir — set the position of a directory stream

SYNOPSIS
#include <dirent.h>

void seekdir(DIR *dirp, long loc);

DESCRIPTION
The seekdir() function shall set the position of the next readdir() operation on the directory stream specified by dirp to the position specified by loc. The value of loc should have been returned from an earlier call to telldir(). The new position reverts to the one associated with the directory stream when telldir() was performed.

If the value of loc was not obtained from an earlier call to telldir(), or if a call to rewinddir() occurred between the call to telldir() and the call to seekdir(), the results of subsequent calls to readdir() are unspecified.

RETURN VALUE
The seekdir() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The original standard developers perceived that there were restrictions on the use of the seekdir() and telldir() functions related to implementation details, and for that reason these functions need not be supported on all POSIX-conforming systems. They are required on implementations supporting the XSI extension.

One of the perceived problems of implementation is that returning to a given point in a directory is quite difficult to describe formally, in spite of its intuitive appeal, when systems that use B-trees, hashing functions, or other similar mechanisms to order their directories are considered. The definition of seekdir() and telldir() does not specify whether, when using these interfaces, a given directory entry will be seen at all, or more than once.

On systems not supporting these functions, their capability can sometimes be accomplished by saving a filename found by readdir() and later using rewinddir() and a loop on readdir() to relocate the position from which the filename was saved.

FUTURE DIRECTIONS
None.

SEE ALSO
opendir(), readdir(), telldir(), the Base Definitions volume of IEEE Std 1003.1-2001, <dirent.h>, <stdio.h>, <sys/types.h>

CHANGE HISTORY
First released in Issue 2.

NAME
select — synchronous I/O multiplexing

SYNOPSIS
#include <sys/time.h>

int select(int nfds, fd_set *restrict readfds,
        fd_set *restrict writefds, fd_set *restrict errorfds,
        struct timeval *restrict timeout);

DESCRIPTION
Refer to pselect().
NAME
sem_close — close a named semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

int sem_close(sem_t *sem);

DESCRIPTION
The sem_close() function shall indicate that the calling process is finished using the named
semaphore indicated by sem. The effects of calling sem_close() for an unnamed semaphore (one
created by sem_init()) are undefined. The sem_close() function shall deallocate (that is, make
available for reuse by a subsequent sem_open() by this process) any system resources allocated
by the system for use by this process for this semaphore. The effect of subsequent use of the
semaphore indicated by sem by this process is undefined. If the semaphore has not been
removed with a successful call to sem_unlink(), then sem_close() has no effect on the state of the
semaphore. If the sem_unlink() function has been successfully invoked for name after the most
recent call to sem_open() with O_CREAT for this semaphore, then when all processes that have
opened the semaphore close it, the semaphore is no longer accessible.

RETURN VALUE
Upon successful completion, a value of zero shall be returned. Otherwise, a value of −1 shall be
returned and errno set to indicate the error.

ERRORS
The sem_close() function shall fail if:

[EINVAL] The sem argument is not a valid semaphore descriptor.

EXAMPLES
None.

APPLICATION USAGE
The sem_close() function is part of the Semaphores option and need not be available on all
implementations.

RATIONALE
None.

FUTURE DIRECTIONS

Issue 6
The sem_close() function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an
implementation does not support the Semaphores option.
NAME
sem_destroy — destroy an unnamed semaphore (REALTIME)

SYNOPSIS
SEM
#include <semaphore.h>

int sem_destroy(sem_t *sem);

DESCRIPTION
The sem_destroy() function shall destroy the unnamed semaphore indicated by sem. Only a
semaphore that was created using sem_init() may be destroyed using sem_destroy(); the effect of
calling sem_destroy() with a named semaphore is undefined. The effect of subsequent use of the
semaphore sem is undefined until sem is reinitialized by another call to sem_init().

It is safe to destroy an initialized semaphore upon which no threads are currently blocked. The
effect of destroying a semaphore upon which other threads are currently blocked is undefined.

RETURN VALUE
Upon successful completion, a value of zero shall be returned. Otherwise, a value of −1 shall be
returned and errno set to indicate the error.

ERRORS
The sem_destroy() function shall fail if:

[EINVAL] The sem argument is not a valid semaphore.
[EBUSY] There are currently processes blocked on the semaphore.

EXAMPLES
None.

APPLICATION USAGE
The sem_destroy() function is part of the Semaphores option and need not be available on all
implementations.

The sem_destroy() function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an
implementation does not support the Semaphores option.
NAME
sem_getvalue — get the value of a semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

int sem_getvalue(sem_t *restrict sem, int *restrict sval);

DESCRIPTION
The sem_getvalue() function shall update the location referenced by the sval argument to have
the value of the semaphore referenced by sem without affecting the state of the semaphore. The
updated value represents an actual semaphore value that occurred at some unspecified time
during the call, but it need not be the actual value of the semaphore when it is returned to the
calling process.

If sem is locked, then the object to which sval points shall either be set to zero or to a negative
number whose absolute value represents the number of processes waiting for the semaphore at
some unspecified time during the call.

RETURN VALUE
Upon successful completion, the sem_getvalue() function shall return a value of zero. Otherwise,
it shall return a value of −1 and set errno to indicate the error.

ERRORS
The sem_getvalue() function shall fail if:

[EINVAl] The sem argument does not refer to a valid semaphore.

EXAMPLES
None.

APPLICATION USAGE
The sem_getvalue() function is part of the Semaphores option and need not be available on all
implementations.

RATIONALE
None.

FUTURE DIRECTIONS

NAME  
sem_init — initialize an unnamed semaphore (REALTIME)

SYNOPSIS  

```c
#include <semaphore.h>

int sem_init(sem_t *sem, int pshared, unsigned value);
```

DESCRIPTION  
The `sem_init()` function shall initialize the unnamed semaphore referred to by `sem`. The value of the initialized semaphore shall be `value`. Following a successful call to `sem_init()`, the semaphore may be used in subsequent calls to `sem_wait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()`. This semaphore shall remain usable until the semaphore is destroyed.

If the `pshared` argument has a non-zero value, then the semaphore is shared between processes; in this case, any process that can access the semaphore `sem` can use `sem` for performing `sem_wait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()` operations.

Only `sem` itself may be used for performing synchronization. The result of referring to copies of `sem` in calls to `sem_wait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()` is undefined.

If the `pshared` argument is zero, then the semaphore is shared between threads of the process; any thread in this process can use `sem` for performing `sem_wait()`, `sem_trywait()`, `sem_post()`, and `sem_destroy()` operations. The use of the semaphore by threads other than those created in the same process is undefined.

Attempting to initialize an already initialized semaphore results in undefined behavior.

RETURN VALUE  
Upon successful completion, the `sem_init()` function shall initialize the semaphore in `sem`. Otherwise, it shall return `−1` and set `errno` to indicate the error.

ERRORS  
The `sem_init()` function shall fail if:

- `EINVAL` The `value` argument exceeds `{SEM_VALUE_MAX}`.
- `ENOSPC` A resource required to initialize the semaphore has been exhausted, or the limit on semaphores ({SEM_NSEMS_MAX}) has been reached.
- `EPERM` The process lacks the appropriate privileges to initialize the semaphore.

EXAMPLES  
None.

APPLICATION USAGE  
The `sem_init()` function is part of the Semaphores option and need not be available on all implementations.

RATIONALE  
Although this volume of IEEE Std 1003.1-2001 fails to specify a successful return value, it is likely that a later version may require the implementation to return a value of zero if the call to `sem_init()` is successful.

FUTURE DIRECTIONS  
None.
SEE ALSO

sem_destroy(), sem_post(), sem_timedwait(), sem_trywait(), sem_wait(), the Base Definitions volume of IEEE Std 1003.1-2001, <semaphore.h>

CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The sem_init() function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The sem_timedwait() function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
NAME
sem_open — initialize and open a named semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

sem_t *sem_open(const char *name, int oflag, ...);

DESCRIPTION
The sem_open() function shall establish a connection between a named semaphore and a process.
Following a call to sem_open() with semaphore name name, the process may reference the
semaphore associated with name using the address returned from the call. This semaphore may
be used in subsequent calls to sem_wait(), sem_trywait(), sem_post(), and sem_close(). The
semaphore remains usable by this process until the semaphore is closed by a successful call to
sem_close(), _exit(), or one of the exec functions.

The oflag argument controls whether the semaphore is created or merely accessed by the call to
sem_open(). The following flag bits may be set in oflag:

O_CREAT This flag is used to create a semaphore if it does not already exist. If O_CREAT is
set and the semaphore already exists, then O_CREAT has no effect, except as noted
under O_EXCL. Otherwise, sem_open() creates a named semaphore. The O_CREAT
flag requires a third and a fourth argument: mode, which is of type mode_t, and
value, which is of type unsigned. The semaphore is created with an initial value of
value. Valid initial values for semaphores are less than or equal to
{SEM_VALUE_MAX}.

The user ID of the semaphore is set to the effective user ID of the process; the
group ID of the semaphore is set to a system default group ID or to the effective
group ID of the process. The permission bits of the semaphore are set to the value
of the mode argument except those set in the file mode creation mask of the
process. When bits in mode other than the file permission bits are specified, the
effect is unspecified.

After the semaphore named name has been created by sem_open() with the
O_CREAT flag, other processes can connect to the semaphore by calling
sem_open() with the same value of name.

O_EXCL If O_EXCL and O_CREAT are set, sem_open() fails if the semaphore name exists.
The check for the existence of the semaphore and the creation of the semaphore if
it does not exist are atomic with respect to other processes executing sem_open()
with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the
effect is undefined.

If flags other than O_CREAT and O_EXCL are specified in the oflag parameter, the
effect is unspecified.

The name argument points to a string naming a semaphore object. It is unspecified whether the
name appears in the file system and is visible to functions that take pathnames as arguments.
The name argument conforms to the construction rules for a pathname. If name begins with the
slash character, then processes calling sem_open() with the same value of name shall refer to the
same semaphore object, as long as that name has not been removed. If name does not begin with
the slash character, the effect is implementation-defined. The interpretation of slash characters
other than the leading slash character in name is implementation-defined.

If a process makes multiple successful calls to sem_open() with the same value for name, the
same semaphore address shall be returned for each such successful call, provided that there
have been no calls to \textit{sem.unlink()} for this semaphore.

References to copies of the semaphore produce undefined results.

\textbf{RETURN VALUE}

Upon successful completion, the \textit{sem.open()} function shall return the address of the semaphore. Otherwise, it shall return a value of SEM\_FAILED and set \textit{errno} to indicate the error. The symbol SEM\_FAILED is defined in the \texttt{<semaphore.h>} header. No successful return from \textit{sem.open()} shall return the value SEM\_FAILED.

\textbf{ERRORS}

If any of the following conditions occur, the \textit{sem.open()} function shall return SEM\_FAILED and set \textit{errno} to the corresponding value:

- [EACCES] The named semaphore exists and the permissions specified by \textit{oflag} are denied, or the named semaphore does not exist and permission to create the named semaphore is denied.
- [EEXIST] O\_CREAT and O\_EXCL are set and the named semaphore already exists.
- [EINTR] The \textit{sem.open()} operation was interrupted by a signal.
- [EINVAL] The \textit{sem.open()} operation is not supported for the given name, or O\_CREATE was specified in \textit{oflag} and \textit{value} was greater than \{SEM\_VALUE\_MAX\}.
- [EMFILE] Too many semaphore descriptors or file descriptors are currently in use by this process.
- [ENAMETOOLONG] The length of the \textit{name} argument exceeds \{PATH\_MAX\} or a pathname component is longer than \{NAME\_MAX\}.
- [ENFILE] Too many semaphores are currently open in the system.
- [ENOENT] O\_CREAT is not set and the named semaphore does not exist.
- [ENOSPC] There is insufficient space for the creation of the new named semaphore.

\textbf{EXAMPLES}

None.

\textbf{APPLICATION USAGE}

The \textit{sem.open()} function is part of the Semaphores option and need not be available on all implementations.

\textbf{RATIONALE}

Early drafts required an error return value of \texttt{−1} with the type \texttt{sem_t *} for the \textit{sem.open()} function, which is not guaranteed to be portable across implementations. The revised text provides the symbolic error code SEM\_FAILED to eliminate the type conflict.

\textbf{FUTURE DIRECTIONS}

None.

\textbf{SEE ALSO}

\textbf{CHANGE HISTORY}

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.
The `sem_open()` function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
NAME
sem_post — unlock a semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

int sem_post(sem_t *sem);

DESCRIPTION
The sem_post() function shall unlock the semaphore referenced by sem by performing a
semaphore unlock operation on that semaphore.

If the semaphore value resulting from this operation is positive, then no threads were blocked
waiting for the semaphore to become unlocked; the semaphore value is simply incremented.

If the value of the semaphore resulting from this operation is zero, then one of the threads
blocked waiting for the semaphore shall be allowed to return successfully from its call to
sem_wait(). If the Process Scheduling option is supported, the thread to be unblocked shall be
chosen in a manner appropriate to the scheduling policies and parameters in effect for the
blocked threads. In the case of the schedulers SCHED_FIFO and SCHED_RR, the highest
priority waiting thread shall be unblocked, and if there is more than one highest priority thread
blocked waiting for the semaphore, then the highest priority thread that has been waiting the
longest shall be unblocked. If the Process Scheduling option is not defined, the choice of a thread
to unblock is unspecified.

If the Process Sporadic Server option is supported, and the scheduling policy is
SCHED_SPORADIC, the semantics are as per SCHED_FIFO above.

RETURN VALUE
If successful, the sem_post() function shall return zero; otherwise, the function shall return −1
and set errno to indicate the error.

ERRORS
The sem_post() function shall fail if:

[EINVAL] The sem argument does not refer to a valid semaphore.

EXAMPLES
None.

APPLICATION USAGE
The sem_post() function is part of the Semaphores option and need not be available on all
implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

volume of IEEE Std 1003.1-2001, <semaphore.h>
CHANGE HISTORY

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6

The `sem_post()` function is marked as part of the Semaphores option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.

The `sem_timedwait()` function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.

SCHED_SPORADIC is added to the list of scheduling policies for which the thread that is to be unblocked is specified for alignment with IEEE Std 1003.1d-1999.
NAME
sem_timedwait() — lock a semaphore (ADVANCED REALTIME)

SYNOPSIS

```c
#include <semaphore.h>
#include <time.h>

int sem_timedwait(sem_t *restrict sem, 
const struct timespec *restrict abs_timeout);
```

DESCRIPTION

The sem_timedwait() function shall lock the semaphore referenced by sem as in the sem_wait() function. However, if the semaphore cannot be locked without waiting for another process or thread to unlock the semaphore by performing a sem_post() function, this wait shall be terminated when the specified timeout expires.

The timeout shall expire when the absolute time specified by abs_timeout passes, as measured by the clock on which timeouts are based (that is, when the value of that clock equals or exceeds abs_timeout), or if the absolute time specified by abs_timeout has already been passed at the time of the call.

If the Timers option is supported, the timeout shall be based on the CLOCK_REALTIME clock. If the Timers option is not supported, the timeout shall be based on the system clock as returned by the time() function. The resolution of the timeout shall be the resolution of the clock on which it is based. The timespec data type is defined as a structure in the <time.h> header.

Under no circumstance shall the function fail with a timeout if the semaphore can be locked immediately. The validity of the abs_timeout need not be checked if the semaphore can be locked immediately.

RETURN VALUE

The sem_timedwait() function shall return zero if the calling process successfully performed the semaphore lock operation on the semaphore designated by sem. If the call was unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a value of -1 and set errno to indicate the error.

ERRORS

The sem_timedwait() function shall fail if:

- [EINVAL] The sem argument does not refer to a valid semaphore.
- [EINVAL] The process or thread would have blocked, and the abs_timeout parameter specified a nanoseconds field value less than zero or greater than or equal to 1 000 million.
- [ETIMEDOUT] The semaphore could not be locked before the specified timeout expired.
- [EDEADLK] A deadlock condition was detected.
- [EINTR] A signal interrupted this function.
sem_timedwait()

EXAMPLES
None.

APPLICATION USAGE
Applications using these functions may be subject to priority inversion, as discussed in the Base Definitions volume of IEEE Std 1003.1-2001, Section 3.285, Priority Inversion. The sem_timedwait() function is part of the Semaphores and Timeouts options and need not be provided on all implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
NAME
sem_trywait, sem_wait — lock a semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

int sem_trywait(sem_t *sem);
int sem_wait(sem_t *sem);

DESCRIPTION
The sem_trywait() function shall lock the semaphore referenced by sem only if the semaphore is
currently not locked; that is, if the semaphore value is currently positive. Otherwise, it shall not
lock the semaphore.

The sem_wait() function shall lock the semaphore referenced by sem by performing a semaphore
lock operation on that semaphore. If the semaphore value is currently zero, then the calling
thread shall not return from the call to sem_wait() until it either locks the semaphore or the call is
interrupted by a signal.

Upon successful return, the state of the semaphore shall be locked and shall remain locked until
the sem_post() function is executed and returns successfully.

The sem_wait() function is interruptible by the delivery of a signal.

RETURN VALUE
The sem_trywait() and sem_wait() functions shall return zero if the calling process successfully
performed the semaphore lock operation on the semaphore designated by sem. If the call was
unsuccessful, the state of the semaphore shall be unchanged, and the function shall return a
value of −1 and set errno to indicate the error.

ERRORS
The sem_trywait() and sem_wait() functions shall fail if:

[EAGAIN] The semaphore was already locked, so it cannot be immediately locked by the
          sem_trywait() operation (sem_trywait() only).

[EINVAL] The sem argument does not refer to a valid semaphore.

The sem_trywait() and sem_wait() functions may fail if:

[EDEADLK] A deadlock condition was detected.

EINTR] A signal interrupted this function.

EXAMPLES
None.

APPLICATION USAGE
Applications using these functions may be subject to priority inversion, as discussed in the Base

The sem_trywait() and sem_wait() functions are part of the Semaphores option and need not be
provided on all implementations.

sem_trywait()

FUTURE DIRECTIONS
None.

SEE ALSO
semctl(), semget(), semop(), sem_post(), sem_timedwait(), the Base Definitions volume of IEEE Std 1003.1-2001, <semaphore.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
The sem_trywait() and sem_wait() functions are marked as part of the Semaphores option.
The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.
The sem_timedwait() function is added to the SEE ALSO section for alignment with IEEE Std 1003.1d-1999.
NAME
sem_unlink — remove a named semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>

int sem_unlink(const char *name);

DESCRIPTION
The sem_unlink() function shall remove the semaphore named by the string name. If the
semaphore named by name is currently referenced by other processes, then sem_unlink() shall
have no effect on the state of the semaphore. If one or more processes have the semaphore open
when sem_unlink() is called, destruction of the semaphore is postponed until all references to the
semaphore have been destroyed by calls to sem_close(), _exit(), or exec. Calls to sem_open() to
recreate or reconnect to the semaphore refer to a new semaphore after sem_unlink() is called. The
sem_unlink() call shall not block until all references have been destroyed; it shall return
immediately.

RETURN VALUE
Upon successful completion, the sem_unlink() function shall return a value of 0. Otherwise, the
semaphore shall not be changed and the function shall return a value of −1 and set errno to
indicate the error.

ERRORS
The sem_unlink() function shall fail if:

[EACCES] Permission is denied to unlink the named semaphore.

[ENAMETOOLONG] The length of the name argument exceeds {PATH_MAX} or a pathname
component is longer than {NAME_MAX}.

[ENOENT] The named semaphore does not exist.

EXCEPTIONS
None.

APPLICATION USAGE
The sem_unlink() function is part of the Semaphores option and need not be available on all
implementations.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Issue 6
The sem_unlink() function is marked as part of the Semaphores option.
The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Semaphores option.
NAME
sem_wait — lock a semaphore (REALTIME)

SYNOPSIS
#include <semaphore.h>
int sem_wait(sem_t *sem);

DESCRIPTION
Refer to sem_trywait().
NAME

semctl — XSI semaphore control operations

SYNOPSIS

XSI

#include <sys/sem.h>

int semctl(int semid, int semnum, int cmd, ...);

DESCRIPTION

The semctl() function operates on XSI semaphores (see the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on page 41).

The semctl() function provides a variety of semaphore control operations as specified by cmd. The fourth argument is optional and depends upon the operation requested. If required, it is of type union semun, which the application shall explicitly declare:

union semun {
   int val;
   struct semid_ds *buf;
   unsigned short *array;
} arg;

The following semaphore control operations as specified by cmd are executed with respect to the semaphore specified by semid and semnum. The level of permission required for each operation is shown with each command; see Section 2.7 (on page 39). The symbolic names for the values of cmd are defined in the <sys/sem.h> header:

GETVAL Return the value of semval; see <sys/sem.h>. Requires read permission.

SETVAL Set the value of semval to arg.val, where arg is the value of the fourth argument to semctl(). When this command is successfully executed, the semadj value corresponding to the specified semaphore in all processes is cleared. Requires alter permission; see Section 2.7 (on page 39).

GETPID Return the value of sempid. Requires read permission.

GETNCNT Return the value of semncnt. Requires read permission.

GETZCNT Return the value of semzcnt. Requires read permission.

The following values of cmd operate on each semval in the set of semaphores:

GETALL Return the value of semval for each semaphore in the semaphore set and place into the array pointed to by arg.array, where arg is the fourth argument to semctl(). Requires read permission.

SETALL Set the value of semval for each semaphore in the semaphore set according to the array pointed to by arg.array, where arg is the fourth argument to semctl(). When this command is successfully executed, the semadj values corresponding to each specified semaphore in all processes are cleared. Requires alter permission.

The following values of cmd are also available:

IPC_STAT Place the current value of each member of the semid_ds data structure associated with semid into the structure pointed to by arg.buf, where arg is the fourth argument to semctl(). The contents of this structure are defined in
semctl()

IPC_SET

Set the value of the following members of the semid_ds data structure associated with semid to the corresponding value found in the structure pointed to by arg.buf, where arg is the fourth argument to semctl():

- sem_perm.uid
- sem_perm.gid
- sem_perm.mode

The mode bits specified in Section 2.7.1 (on page 40) are copied into the corresponding bits of the sem_perm.mode associated with semid. The stored values of any other bits are unspecified.

This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of sem_perm.cuid or sem_perm.uid in the semid_ds data structure associated with semid.

IPC_RMID

Remove the semaphore identifier specified by semid from the system and destroy the set of semaphores and semid_ds data structure associated with it. This command can only be executed by a process that has an effective user ID equal to either that of a process with appropriate privileges or to the value of sem_perm.cuid or sem_perm.uid in the semid_ds data structure associated with semid.

RETURN VALUE

If successful, the value returned by semctl() depends on cmd as follows:

- GETVAL  The value of semval.
- GETPID  The value of sempid.
- GETNCNT The value of semncnt.
- GETZCNT The value of semzcnt.
- All others 0.

Otherwise, semctl() shall return -1 and set errno to indicate the error.

ERRORS

The semctl() function shall fail if:

- [EACCES]  Operation permission is denied to the calling process; see Section 2.7 (on page 39).
- [EINVAL]  The value of semid is not a valid semaphore identifier, or the value of semnum is less than 0 or greater than or equal to sem_nsems, or the value of cmd is not a valid command.
- [EPERM]  The argument cmd is equal to IPC_RMID or IPC_SET and the effective user ID of the calling process is not equal to that of a process with appropriate privileges and it is not equal to the value of sem_perm.cuid or sem_perm.uid in the data structure associated with semid.
- [ERANGE] The argument cmd is equal to SETVAL or SETALL and the value to which semval is to be set is greater than the system-imposed maximum.
EXAMPLES
None.

APPLICATION USAGE
The fourth parameter in the SYNOPSIS section is now specified as "..." in order to avoid a clash with the ISO C standard when referring to the union `semun` (as defined in Issue 3) and for backwards-compatibility.

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME
semget — get set of XSI semaphores

SYNOPSIS
#include <sys/sem.h>
int semget(key_t key, int nsems, int semflg);

DESCRIPTION
The semget() function operates on XSI semaphores (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function
interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
page 41).

The semget() function shall return the semaphore identifier associated with key.

A semaphore identifier with its associated semid_ds data structure and its associated set of
nsems semaphores (see <sys/sem.h>) is created for key if one of the following is true:

• The argument key is equal to IPC_PRIVATE.
• The argument key does not already have a semaphore identifier associated with it and (semflg
 &IPC_CREAT) is non-zero.

Upon creation, the semid_ds data structure associated with the new semaphore identifier is
initialized as follows:

• In the operation permissions structure sem_perm.cuid, sem_perm.uid, sem_perm.cgid, and
sem_perm.gid shall be set equal to the effective user ID and effective group ID, respectively, of
the calling process.
• The low-order 9 bits of sem_perm.mode shall be set equal to the low-order 9 bits of semflg.
• The variable sem_nsems shall be set equal to the value of nsems.
• The variable sem_otime shall be set equal to 0 and sem_ctime shall be set equal to the current
time.
• The data structure associated with each semaphore in the set shall not be initialized. The
semctl() function with the command SETVAL or SETALL can be used to initialize each
semaphore.

RETURN VALUE
Upon successful completion, semget() shall return a non-negative integer, namely a semaphore
identifier; otherwise, it shall return -1 and set errno to indicate the error.

ERRORS
The semget() function shall fail if:

[EACCES] A semaphore identifier exists for key, but operation permission as specified by
the low-order 9 bits of semflg would not be granted; see Section 2.7 (on page
39).

[EINVAL] The value of nsems is either less than or equal to 0 or greater than the system-
 imposed limit, or a semaphore identifier exists for the argument key, but the
number of semaphores in the set associated with it is less than nsems and
nsems is not equal to 0.
semget()

A semaphore identifier does not exist for the argument key and (semflg &IPC_CREAT) is equal to 0.

A semaphore identifier is to be created but the system-imposed limit on the maximum number of allowed semaphores system-wide would be exceeded.

EXAMPLES

Creating a Semaphore Identifier

The following example gets a unique semaphore key using the ftok() function, then gets a semaphore ID associated with that key using the semget() function (the first call also tests to make sure the semaphore exists). If the semaphore does not exist, the program creates it, as shown by the second call to semget(). In creating the semaphore for the queuing process, the program attempts to create one semaphore with read/write permission for all. It also uses the IPC_EXCL flag, which forces semget() to fail if the semaphore already exists.

After creating the semaphore, the program uses a call to semop() to initialize it to the values in the sbuf array. The number of processes that can execute concurrently without queuing is initially set to 2. The final call to semget() creates a semaphore identifier that can be used later in the program.

```c
#include <sys/types.h>
#include <stdio.h>
#include <sys/ipc.h>
#include <sys/sem.h>
#include <sys/stat.h>
#include <errno.h>
#include <unistd.h>
#include <stdlib.h>
#include <pwd.h>
#include <fcntl.h>
#include <limits.h>

... 

key_t semkey;
int semid, pfd, fv;
struct sembuf sbuf;
char *lgn;
char filename[PATH_MAX+1];
struct stat outstat;
struct passwd *pw;
...
/* Get unique key for semaphore. */
if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}
/* Get semaphore ID associated with this key. */
if ((semid = semget(semkey, 0, 0)) == -1) {
    * Semaphore does not exist - Create. */
    if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
        S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1) {
        /* Initialize the semaphore. */
        sbuf.sem_num = 0;
    }
}```
APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

First released in Issue 2. Derived from Issue 2 of the SVID.

Issue 5

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.
NAME
semop — XSI semaphore operations

SYNOPSIS
XSI
#include <sys/sem.h>

int semop(int semid, struct sembuf *sops, size_t nsops);

DESCRIPTION
The semop() function operates on XSI semaphores (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 4.15, Semaphore). It is unspecified whether this function
interoperates with the realtime interprocess communication facilities defined in Section 2.8 (on
page 41).

The semop() function shall perform atomically a user-defined array of semaphore operations on
the set of semaphores associated with the semaphore identifier specified by the argument semid.

The argument sops is a pointer to a user-defined array of semaphore operation structures. The
implementation shall not modify elements of this array unless the application uses
implementation-defined extensions.

The argument nsops is the number of such structures in the array.

Each structure, sembuf, includes the following members:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>sem_num</td>
<td>Semaphore number.</td>
</tr>
<tr>
<td>short</td>
<td>sem_op</td>
<td>Semaphore operation.</td>
</tr>
<tr>
<td>short</td>
<td>sem_flg</td>
<td>Operation flags.</td>
</tr>
</tbody>
</table>

Each semaphore operation specified by sem_op is performed on the corresponding semaphore
specified by semid and sem_num.

The variable sem_op specifies one of three semaphore operations:

1. If sem_op is a negative integer and the calling process has alter permission, one of the
   following shall occur:
   - If semval (see <sys/sem.h>) is greater than or equal to the absolute value of sem_op, the
     absolute value of sem_op is subtracted from semval. Also, if (sem_flg & SEM_UNDO) is
     non-zero, the absolute value of sem_op shall be added to the calling process’ semadj
     value for the specified semaphore.
     - If semval is less than the absolute value of sem_op and (sem_flg & IPC_NOWAIT) is non-zero,
       semop() shall return immediately.
     - If semval is less than the absolute value of sem_op and (sem_flg & IPC_NOWAIT) is 0,
       semop() shall increment the semncnt associated with the specified semaphore and
       suspend execution of the calling thread until one of the following conditions occurs:
       - The value of semval becomes greater than or equal to the absolute value of sem_op. When
         this occurs, the value of semncnt associated with the specified semaphore shall be decremented,
         the absolute value of sem_op shall be subtracted from semval and, if (sem_flg & SEM_UNDO) is
         non-zero, the absolute value of sem_op shall be added to the calling process’ semadj value for the specified semaphore.
       - The semid for which the calling thread is awaiting action is removed from the
         system. When this occurs, errno shall be set equal to [EIDRM] and −1 shall be
The calling thread receives a signal that is to be caught. When this occurs, the value of \texttt{semncnt} associated with the specified semaphore shall be decremented, and the calling thread shall resume execution in the manner prescribed in \texttt{sigaction()}.  

2. If \texttt{sem_op} is a positive integer and the calling process has alter permission, the value of \texttt{sem_op} shall be added to \texttt{semval} and, if \((\texttt{sem_flg} \& \texttt{SEM_UNDO})\) is non-zero, the value of \texttt{sem_op} shall be subtracted from the calling process' \texttt{semadj} value for the specified semaphore.  

3. If \texttt{sem_op} is 0 and the calling process has read permission, one of the following shall occur:  
   \begin{itemize}
   \item If \texttt{semval} is 0, \texttt{semop()} shall return immediately.
   \item If \texttt{semval} is non-zero and \((\texttt{sem_flg} \& \texttt{IPC_NOWAIT})\) is non-zero, \texttt{semop()} shall return immediately.
   \item If \texttt{semval} is non-zero and \((\texttt{sem_flg} \& \texttt{IPC_NOWAIT})\) is 0, \texttt{semop()} shall increment the \texttt{semzcnt} associated with the specified semaphore and suspend execution of the calling thread until one of the following occurs:
      \begin{itemize}
      \item The value of \texttt{semval} becomes 0, at which time the value of \texttt{semzcnt} associated with the specified semaphore shall be decremented.
      \item The \texttt{semid} for which the calling thread is awaiting action is removed from the system. When this occurs, \texttt{errno} shall be set equal to [EIDRM] and -1 shall be returned.
      \item The calling thread receives a signal that is to be caught. When this occurs, the value of \texttt{semzcnt} associated with the specified semaphore shall be decremented, and the calling thread shall resume execution in the manner prescribed in \texttt{sigaction()}.  
    \end{itemize}
   \end{itemize}

Upon successful completion, the value of \texttt{sempid} for each semaphore specified in the array pointed to by \texttt{sops} shall be set equal to the process ID of the calling process.  

\textbf{RETURN VALUE}

Upon successful completion, \texttt{semop()} shall return 0; otherwise, it shall return -1 and set \texttt{errno} to indicate the error.  

\textbf{ERRORS}

The \texttt{semop()} function shall fail if:

\begin{itemize}
\item [E2BIG] The value of \texttt{nsops} is greater than the system-imposed maximum.
\item [EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page 39).
\item [EAGAIN] The operation would result in suspension of the calling process but \((\texttt{sem_flg} \& \texttt{IPC_NOWAIT})\) is non-zero.
\item [EBUG] The value of \texttt{sem_num} is less than 0 or greater than or equal to the number of semaphores in the set associated with \texttt{semid}.
\item [EIDRM] The semaphore identifier \texttt{semid} is removed from the system.
\item [EINTR] The \texttt{semop()} function was interrupted by a signal.
\item [EINVAL] The value of \texttt{semid} is not a valid semaphore identifier, or the number of individual semaphores for which the calling process requests a SEM_UNDO would exceed the system-imposed limit.
\end{itemize}
The limit on the number of individual processes requesting a SEM_UNDO
would be exceeded.

An operation would cause a semval to overflow the system-imposed limit, or
an operation would cause a semadj value to overflow the system-imposed
limit.

### EXAMPLES

#### Setting Values in Semaphores

The following example sets the values of the two semaphores associated with the semid
identifier to the values contained in the sb array.

```c
#include <sys/sem.h>
...
int semid;
struct sembuf sb[2];
int nsops = 2;
int result;

/* Adjust value of semaphore in the semaphore array semid. */
sb[0].sem_num = 0;
sb[0].sem_op = -1;
sb[0].sem_flg = SEM_UNDO | IPC_NOWAIT;
sb[1].sem_num = 1;
sb[1].sem_op = 1;
sb[1].sem_flg = 0;
result = semop(semid, sb, nsops);
```

#### Creating a Semaphore Identifier

The following example gets a unique semaphore key using the ftok() function, then gets a
semaphore ID associated with that key using the semget() function (the first call also tests to
make sure the semaphore exists). If the semaphore does not exist, the program creates it, as
shown by the second call to semget(). In creating the semaphore for the queuing process, the
program attempts to create one semaphore with read/write permission for all. It also uses the
IPC_EXCL flag, which forces semget() to fail if the semaphore already exists.

After creating the semaphore, the program uses a call to semop() to initialize it to the values in
the sbuf array. The number of processes that can execute concurrently without queuing is
initially set to 2. The final call to semget() creates a semaphore identifier that can be used later in
the program.

The final call to semop() acquires the semaphore and waits until it is free; the SEM_UNDO
option releases the semaphore when the process exits, waiting until there are less than two
processes running concurrently.

```c
#include <sys/types.h>
#include <stdio.h>
#include <sys/ipc.h>
#include <sys/sem.h>
#include <sys/stat.h>
#include <errno.h>
#include <unistd.h>
#include <stdlib.h>
```
#include <pwd.h>
#include <fcntl.h>
#include <limits.h>

... 
key_t semkey;
int semid, pfd, fv;
struct sembuf sbuf;
char *lgn;
char filename[PATH_MAX+1];
struct stat outstat;
struct passwd *pw;

/* Get unique key for semaphore. */
if ((semkey = ftok("/tmp", 'a')) == (key_t) -1) {
    perror("IPC error: ftok"); exit(1);
}

/* Get semaphore ID associated with this key. */
if ((semid = semget(semkey, 0, 0)) == -1) {
    /* Semaphore does not exist - Create. */
    if ((semid = semget(semkey, 1, IPC_CREAT | IPC_EXCL | S_IRUSR |
         S_IWUSR | S_IRGRP | S_IWGRP | S_IROTH | S_IWOTH)) != -1) {
        /* Initialize the semaphore. */
        sbuf.sem_num = 0;
        sbuf.sem_op = 2; /* This is the number of runs without queuing. */
        sbuf.sem_flg = 0;
        if (semop(semid, &sbuf, 1) == -1) {
            perror("IPC error: semop"); exit(1);
        }
    }
    else if (errno == EEXIST) {
        if ((semid = semget(semkey, 0, 0)) == -1) {
            perror("IPC error 1: semget"); exit(1);
        }
    }
    else {
        perror("IPC error 2: semget"); exit(1);
    }
}

sbuf.sem_num = 0;
sbuf.sem_op = -1;
sbuf.sem_flg = SEM_UNDO;
if (semop(semid, &sbuf, 1) == -1) {
    perror("IPC Error: semop"); exit(1);
}

APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

NAME
send — send a message on a socket

SYNOPSIS
#include <sys/socket.h>

ssize_t send(int socket, const void *buffer, size_t length, int flags);

DESCRIPTION
The send() function shall initiate transmission of a message from the specified socket to its peer. The send() function shall send a message only when the socket is connected (including when the peer of a connectionless socket has been set via connect()).

The send() function takes the following arguments:

socket Specifies the socket file descriptor.

buffer Points to the buffer containing the message to send.

length Specifies the length of the message in bytes.

flags Specifies the type of message transmission. Values of this argument are formed by logically OR’ing zero or more of the following flags:

MSG_EOR Terminates a record (if supported by the protocol).

MSG_OOB Sends out-of-band data on sockets that support out-of-band communications. The significance and semantics of out-of-band data are protocol-specific.

The length of the message to be sent is specified by the length argument. If the message is too long to pass through the underlying protocol, send() shall fail and no data shall be transmitted.

Successful completion of a call to send() does not guarantee delivery of the message. A return value of −1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does not have O_NONBLOCK set, send() shall block until space is available. If space is not available at the sending socket to hold the message to be transmitted, and the socket file descriptor does have O_NONBLOCK set, send() shall fail. The select() and poll() functions can be used to determine when it is possible to send more data.

The socket in use may require the process to have appropriate privileges to use the send() function.

RETURN VALUE
Upon successful completion, send() shall return the number of bytes sent. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The send() function shall fail if:

[EAGAIN] or [EWOULDBLOCK] The socket’s file descriptor is marked O_NONBLOCK and the requested operation would block.

[EBADF] The socket argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EDESTADDRREQ] The socket is not connection-mode and no peer address is set.
send()

A signal interrupted send() before any data was transmitted.

The message is too large to be sent all at once, as the socket requires.

The socket is not connected or otherwise has not had the peer pre-specified.

The socket argument does not refer to a socket.

The socket argument is associated with a socket that does not support one or
more of the values set in flags.

The socket is shut down for writing, or the socket is connection-mode and is
no longer connected. In the latter case, and if the socket is of type
SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.

The send() function may fail if:

The calling process does not have the appropriate privileges.

An I/O error occurred while reading from or writing to the file system.

The local network interface used to reach the destination is down.

No route to the network is present.

Insufficient resources were available in the system to perform the operation.

None.

The send() function is equivalent to sendto() with a null pointer dest_len argument, and to write() if no flags are used.

None.

None.

sendmsg( )

NAME
sendmsg — send a message on a socket using a message structure

SYNOPSIS
#include <sys/socket.h>
ssize_t sendmsg(int socket, const struct msghdr *message, int flags);

DESCRIPTION
The sendmsg( ) function shall send a message through a connection-mode or connectionless-
mode socket. If the socket is connectionless-mode, the message shall be sent to the address
specified by msghdr. If the socket is connection-mode, the destination address in msghdr shall
be ignored.

The sendmsg( ) function takes the following arguments:

socket Specifies the socket file descriptor.
message Points to a msghdr structure, containing both the destination address and the
buffers for the outgoing message. The length and format of the address
depend on the address family of the socket. The msg_flags member is ignored.
flags Specifies the type of message transmission. The application may specify 0 or
the following flag:
MSG_EOR Terminates a record (if supported by the protocol).
MSG_OOB Sends out-of-band data on sockets that support out-of-
bound data. The significance and semantics of out-of-band
data are protocol-specific.

The msg_iov and msg_iovlen fields of message specify zero or more buffers containing the data to
be sent. msg_iov points to an array of iovec structures; msg_iovlen shall be set to the dimension of
this array. In each iovec structure, the iov_base field specifies a storage area and the iov_len field
gives its size in bytes. Some of these sizes can be zero. The data from each storage area indicated
by msg_iov is sent in turn.

Successful completion of a call to sendmsg( ) does not guarantee delivery of the message. A
return value of −1 indicates only locally-detected errors.

If there is not enough space available at the sending socket to hold the message to be transmitted and the
socket file descriptor does not have O_NONBLOCK set, the sendmsg( ) function shall block until
space is available. If there is not enough space available at the sending socket to hold the message to be
transmitted and the socket file descriptor does have O_NONBLOCK set, the sendmsg( ) function
shall fail.

If the socket protocol supports broadcast and the specified address is a broadcast address for the
socket protocol, sendmsg( ) shall fail if the SO_BROADCAST option is not set for the socket.

The socket in use may require the process to have appropriate privileges to use the sendmsg( )
function.

RETURN VALUE
Upon successful completion, sendmsg( ) shall return the number of bytes sent. Otherwise, −1
shall be returned and errno set to indicate the error.

ERRORS
The sendmsg() function shall fail if:

[EAGAIN] or [EWOULDBLOCK]

The socket's file descriptor is marked O_NONBLOCK and the requested
sendmsg()

operation would block.

[EAFNOSUPPORT]
Addresses in the specified address family cannot be used with this socket.

[EBADF] The socket argument is not a valid file descriptor.

[ECONNRESET] A connection was forcibly closed by a peer.

[EINTR] A signal interrupted sendmsg() before any data was transmitted.

[EINVAL] The sum of the iov_len values overflows an ssize_t.

[EMSGSIZE] The message is too large to be sent all at once (as the socket requires), or the msg_iovlen member of the msghdr structure pointed to by message is less than or equal to 0 or is greater than IOV_MAX.

[ENOTCONN] The socket is connection-mode but is not connected.

[ENOTSOCK] The socket argument does not refer to a socket.

[EOPNOTSUPP] The socket argument is associated with a socket that does not support one or more of the values set in flags.

[EPIPE] The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.

If the address family of the socket is AF_UNIX, then sendmsg() shall fail if:

[EIO] An I/O error occurred while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the pathname in the socket address.

[ENOENT] A component of the pathname does not name an existing file or the path name is an empty string.

[ENOTDIR] A component of the path prefix of the pathname in the socket address is not a directory.

The sendmsg() function may fail if:

[EACCES] Search permission is denied for a component of the path prefix; or write access to the named socket is denied.

[EDESTADDRREQ] The socket is not connection-mode and does not have its peer address set, and no destination address was specified.

[EHOSTUNREACH] The destination host cannot be reached (probably because the host is down or a remote router cannot reach it).

[EIO] An I/O error occurred while reading from or writing to the file system.

[EISCONN] A destination address was specified and the socket is already connected.

[ENETDOWN] The local network interface used to reach the destination is down.

sendto()  

NAME  
sendto — send a message on a socket

SYNOPSIS  
#include <sys/socket.h>

ssize_t sendto(int socket, const void *message, size_t length,  
    int flags, const struct sockaddr *dest_addr,  
    socklen_t dest_len);

DESCRIPTION  
The sendto() function shall send a message through a connection-mode or connectionless-mode  
socket. If the socket is connectionless-mode, the message shall be sent to the address specified by  
dest_addr. If the socket is connection-mode, dest_addr shall be ignored.

The sendto() function takes the following arguments:

socket Specifies the socket file descriptor.
message Points to a buffer containing the message to be sent.
length Specifies the size of the message in bytes.
flags Specifies the type of message transmission. Values of this argument are  
formed by logically OR’ing zero or more of the following flags:
   MSG_EOR Terminates a record (if supported by the protocol).
   MSG_OOB Sends out-of-band data on sockets that support out-of-band  
data. The significance and semantics of out-of-band data are  
protocol-specific.

dest_addr Points to a sockaddr structure containing the destination address. The length  
and format of the address depend on the address family of the socket.

dest_len Specifies the length of the sockaddr structure pointed to by the dest_addr  
argument.

If the socket protocol supports broadcast and the specified address is a broadcast address for the  
socket protocol, sendto() shall fail if the SO_BROADCAST option is not set for the socket.

The dest_addr argument specifies the address of the target. The length argument specifies the  
length of the message.

Successful completion of a call to sendto() does not guarantee delivery of the message. A return  
value of −1 indicates only locally-detected errors.

If space is not available at the sending socket to hold the message to be transmitted and the  
socket file descriptor does not have O_NONBLOCK set, sendto() shall block until space is  
available. If space is not available at the sending socket to hold the message to be transmitted  
and the socket file descriptor does have O_NONBLOCK set, sendto() shall fail.

The socket in use may require the process to have appropriate privileges to use the sendto()  
function.

RETURN VALUE  
Upon successful completion, sendto() shall return the number of bytes sent. Otherwise, −1 shall  
be returned and errno set to indicate the error.
The `sendto()` function shall fail if:

- **[EAFNOSUPPORT]** Addresses in the specified address family cannot be used with this socket.
- **[EAGAIN]** or **[EWOULDBLOCK]** The socket's file descriptor is marked O_NONBLOCK and the requested operation would block.
- **[EBADF]** The `socket` argument is not a valid file descriptor.
- **[ECONNRESET]** A connection was forcibly closed by a peer.
- **[EINTR]** A signal interrupted `sendto()` before any data was transmitted.
- **[EMSGSIZE]** The message is too large to be sent all at once, as the socket requires.
- **[ENOTCONN]** The socket is connection-mode but is not connected.
- **[ENOTSOCK]** The `socket` argument does not refer to a socket.
- **[EOPNOTSUPP]** The `socket` argument is associated with a socket that does not support one or more of the values set in `flags`.
- **[EPIPE]** The socket is shut down for writing, or the socket is connection-mode and is no longer connected. In the latter case, and if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling thread.

If the address family of the socket is AF_UNIX, then `sendto()` shall fail if:

- **[EIO]** An I/O error occurred while reading from or writing to the file system.
- **[ELOOP]** A loop exists in symbolic links encountered during resolution of the pathname in the socket address.
- **[ENAMETOOLONG]** A component of a pathname exceeded {NAME_MAX} characters, or an entire pathname exceeded {PATH_MAX} characters.
- **[ENOENT]** A component of the pathname does not name an existing file or the pathname is an empty string.
- **[ENOTDIR]** A component of the path prefix of the pathname in the socket address is not a directory.

The `sendto()` function may fail if:

- **[EACCES]** Search permission is denied for a component of the path prefix; or write access to the named socket is denied.
- **[EDESTADDRREQ]** The socket is not connection-mode and does not have its peer address set, and no destination address was specified.
- **[EINVAL]** The `dest_len` argument is not a valid length for the address family.
- **[EIO]** An I/O error occurred while reading from or writing to the file system.
sendto()

System Interfaces

[EINVAL] A destination address was specified and the socket is already connected. This error may or may not be returned for connection mode sockets.

[ENETDOWN] The local network interface used to reach the destination is down.

[ENETUNREACH]

No route to the network is present.

[ENOBUFS] Insufficient resources were available in the system to perform the operation.

[ENOMEM] Insufficient memory was available to fulfill the request.

If the address family of the socket is AF_UNIX, then sendto() may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the pathname in the socket address.

[ENAMETOOLONG]

Pathname resolution of a symbolic link produced an intermediate result whose length exceeds [PATH_MAX].

EXAMPLES

None.

APPLICATION USAGE

The select() and poll() functions can be used to determine when it is possible to send more data.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.
NAME
setbuf — assign buffering to a stream

SYNOPSIS
#include <stdio.h>
void setbuf(FILE *restrict stream, char *restrict buf);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
Except that it returns no value, the function call:
setbuf(stream, buf)
shall be equivalent to:
setvbuf(stream, buf, _IOFBF, BUFSIZ)
if buf is not a null pointer, or to:
setvbuf(stream, buf, _IONBF, BUFSIZ)
if buf is a null pointer.

RETURN VALUE
The setbuf() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
A common source of error is allocating buffer space as an “automatic” variable in a code block,
and then failing to close the stream in the same block.
With setbuf(), allocating a buffer of BUFSIZ bytes does not necessarily imply that all of BUFSIZ
bytes are used for the buffer area.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
fopen(), setvbuf(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
The prototype for setbuf() is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
setcontext — set current user context

SYNOPSIS

XSI
#include <ucontext.h>

int setcontext(const ucontext_t *ucp);

DESCRIPTION
Refer to getcontext().
**NAME**
setegid — set the effective group ID

**SYNOPSIS**
```c
#include <unistd.h>

int setegid(gid_t gid);
```

**DESCRIPTION**
If `gid` is equal to the real group ID or the saved set-group-ID, or if the process has appropriate privileges, `setegid()` shall set the effective group ID of the calling process to `gid`; the real group ID, saved set-group-ID, and any supplementary group IDs shall remain unchanged. The `setegid()` function shall not affect the supplementary group list in any way.

**RETURN VALUE**
Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and `errno` set to indicate the error.

**ERRORS**
The `setegid()` function shall fail if:

- **EINVAL** The value of the `gid` argument is invalid and is not supported by the implementation.
- **EPERM** The process does not have appropriate privileges and `gid` does not match the real group ID or the saved set-group-ID.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
Refer to the RATIONALE section in `setuid()`.

**FUTURE DIRECTIONS**
None.

**CHANGE HISTORY**
First released in Issue 6. Derived from the IEEE P1003.1a draft standard.
**setenv()**

**NAME**
setenv — add or change environment variable

**SYNOPSIS**
```c
#include <stdlib.h>

int setenv(const char *envname, const char *envval, int overwrite);
```

**DESCRIPTION**
The `setenv()` function shall update or add a variable in the environment of the calling process. The `envname` argument points to a string containing the name of an environment variable to be added or altered. The environment variable shall be set to the value to which `envval` points. The function shall fail if `envname` points to a string which contains an '=' character. If the environment variable named by `envname` already exists and the value of `overwrite` is non-zero, the function shall return success and the environment shall be updated. If the environment variable named by `envname` already exists and the value of `overwrite` is zero, the function shall return success and the environment shall remain unchanged.

If the application modifies `environ` or the pointers to which it points, the behavior of `setenv()` is undefined. The `setenv()` function shall update the list of pointers to which `environ` points.

The strings described by `envname` and `envval` are copied by this function.

The `setenv()` function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

**RETURN VALUE**
Upon successful completion, zero shall be returned. Otherwise, -1 shall be returned, `errno` set to indicate the error, and the environment shall be unchanged.

**ERRORS**
The `setenv()` function shall fail if:

- [EINVAL] The `name` argument is a null pointer, points to an empty string, or points to a string containing an '=' character.
- [ENOMEM] Insufficient memory was available to add a variable or its value to the environment.

**EXAMPLES**
None.

**APPLICATION USAGE**
See `exec`, for restrictions on changing the environment in multi-threaded applications.

**RATIONALE**
Unanticipated results may occur if `setenv()` changes the external variable `environ`. In particular, if the optional `envp` argument to `main()` is present, it is not changed, and thus may point to an obsolete copy of the environment (as may any other copy of `environ`). However, other than the aforementioned restriction, the developers of IEEE Std 1003.1-2001 intended that the traditional method of walking through the environment by way of the `environ` pointer must be supported.

It was decided that `setenv()` should be required by this revision because it addresses a piece of missing functionality, and does not impose a significant burden on the implementor.

There was considerable debate as to whether the System V `putenv()` function or the BSD `setenv()` function should be required as a mandatory function. The `setenv()` function was chosen because it permitted the implementation of the `unsetenv()` function to delete environmental variables, without specifying an additional interface. The `putenv()` function is available as an XSI.
extension.

The standard developers considered requiring that `setenv()` indicate an error when a call to it would result in exceeding `{ARG_MAX}`. The requirement was rejected since the condition might be temporary, with the application eventually reducing the environment size. The ultimate success or failure depends on the size at the time of a call to `exec`, which returns an indication of this error condition.

**FUTURE DIRECTIONS**

None.

NAME
seteuid — set effective user ID

SYNOPSIS
#include <unistd.h>
int seteuid(uid_t uid);

DESCRIPTION
If uid is equal to the real user ID or the saved set-user-ID, or if the process has appropriate
privileges, seteuid() shall set the effective user ID of the calling process to uid; the real user ID
and saved set-user-ID shall remain unchanged.
The seteuid() function shall not affect the supplementary group list in any way.

RETURN VALUE
Upon successful completion, 0 shall be returned; otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The seteuid() function shall fail if:
[EINVAL] The value of the uid argument is invalid and is not supported by the
implementation.
[EPERM] The process does not have appropriate privileges and uid does not match the
real group ID or the saved set-group-ID.

EXAMPLES
None.

APPLICATION USAGE
None.

CHANGE HISTORY
First released in Issue 6. Derived from the IEEE P1003.1a draft standard.
NAME
setgid — set-group-ID

SYNOPSIS
#include <unistd.h>
int setgid(gid_t gid);

DESCRIPTION
If the process has appropriate privileges, setgid() shall set the real group ID, effective group ID,
and the saved set-group-ID of the calling process to gid.
If the process does not have appropriate privileges, but gid is equal to the real group ID or the
saved set-group-ID, setgid() shall set the effective group ID to gid; the real group ID and saved
set-group-ID shall remain unchanged.
The setgid() function shall not affect the supplementary group list in any way.
Any supplementary group IDs of the calling process shall remain unchanged.

RETURN VALUE
Upon successful completion, 0 is returned. Otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The setgid() function shall fail if:
[EINVAL] The value of the gid argument is invalid and is not supported by the implementation.
[EPERM] The process does not have appropriate privileges and gid does not match the
real group ID or the saved set-group-ID.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:
• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
required for conforming implementations of previous POSIX specifications, it was not
required for UNIX applications.
• Functionality associated with _POSIX_SAVED_IDS is now mandated. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

• The effects of `setgid()` in processes without appropriate privileges are changed.

• A requirement that the supplementary group list is not affected is added.
setgrent — reset the group database to the first entry

SYNOPSIS

```c
#include <grp.h>

void setgrent(void);
```

DESCRIPTION

Refer to `endgrent()`.
NAME
sethostent — network host database functions

SYNOPSIS
#include <netdb.h>

void sethostent(int stayopen);

DESCRIPTION
Refer to endhostent().
NAME
setitimer — set the value of an interval timer

SYNOPSIS
XSI
#include <sys/time.h>

int setitimer(int which, const struct itimerval *restrict value,
struct itimerval *restrict ovalue);

DESCRIPTION
Refer to getitimer().
NAME
setjmp — set jump point for a non-local goto

SYNOPSIS
#include <setjmp.h>
int setjmp(jmp_buf env);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

A call to setjmp() shall save the calling environment in its env argument for later use by longjmp().

It is unspecified whether setjmp() is a macro or a function. If a macro definition is suppressed in order to access an actual function, or a program defines an external identifier with the name setjmp, the behavior is undefined.

An application shall ensure that an invocation of setjmp() appears in one of the following contexts only:

- The entire controlling expression of a selection or iteration statement
- One operand of a relational or equality operator with the other operand an integral constant expression, with the resulting expression being the entire controlling expression of a selection or iteration statement
- The operand of a unary ‘!‘ operator with the resulting expression being the entire controlling expression of a selection or iteration
- The entire expression of an expression statement (possibly cast to void)

If the invocation appears in any other context, the behavior is undefined.

RETURN VALUE
If the return is from a direct invocation, setjmp() shall return 0. If the return is from a call to longjmp(), setjmp() shall return a non-zero value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
In general, sigsetjmp() is more useful in dealing with errors and interrupts encountered in a low-level subroutine of a program.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
longjmp(), sigsetjmp(), the Base Definitions volume of IEEE Std 1003.1-2001, <setjmp.h>
**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
setkey()

NAME
setkey — set encoding key (CRYPT)

SYNOPSIS
#include <stdlib.h>

void setkey(const char *key);

DESCRIPTION
The setkey() function provides access to an implementation-defined encoding algorithm. The
argument of setkey() is an array of length 64 bytes containing only the bytes with numerical
value of 0 and 1. If this string is divided into groups of 8, the low-order bit in each group is
ignored; this gives a 56-bit key which is used by the algorithm. This is the key that shall be used
with the algorithm to encode a string block passed to encrypt().

The setkey() function shall not change the setting of errno if successful. An application wishing to
check for error situations should set errno to 0 before calling setkey(). If errno is non-zero on
return, an error has occurred.

The setkey() function need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

RETURN VALUE
No values are returned.

ERRORS
The setkey() function shall fail if:

[ENOSYS] The functionality is not supported on this implementation.

EXAMPLES
None.

APPLICATION USAGE
Decoding need not be implemented in all environments. This is related to government
restrictions in some countries on encryption and decryption routines. Historical practice has
been to ship a different version of the encryption library without the decryption feature in the
routines supplied. Thus the exported version of encrypt() does encoding but not decoding.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
crypt(), encrypt(), the Base Definitions volume of IEEE Std 1003.1-2001, <stdlib.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.
NAME
setlocale — set program locale

SYNOPSIS
#include <locale.h>
char *setlocale(int category, const char *locale);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The setlocale() function selects the appropriate piece of the program's locale, as specified by the category and locale arguments, and may be used to change or query the program's entire locale or portions thereof. The value LC_ALL for category names the program's entire locale; other values for category name only a part of the program's locale:

LC_COLLATE Affects the behavior of regular expressions and the collation functions.
LC_CTYPE Affects the behavior of regular expressions, character classification, character conversion functions, and wide-character functions.
LC_MESSAGES Affects what strings are expected by commands and utilities as affirmative or negative responses.
LC_MONETARY Affects the behavior of functions that handle monetary values.
LC_NUMERIC Affects the behavior of functions that handle numeric values.
LC_TIME Affects the behavior of the time conversion functions.

The locale argument is a pointer to a character string containing the required setting of category. The contents of this string are implementation-defined. In addition, the following preset values of locale are defined for all settings of category:

"POSIX" Specifies the minimal environment for C-language translation called the POSIX locale. If setlocale() is not invoked, the POSIX locale is the default at entry to main().
"C" Equivalent to "POSIX".
" " Specifies an implementation-defined native environment. This corresponds to the value of the associated environment variables, LC_* and LANG; see the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale and the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.
A null pointer Used to direct setlocale() to query the current internationalized environment and return the name of the locale.

The locale state is common to all threads within a process.

RETURN VALUE
Upon successful completion, setlocale() shall return the string associated with the specified category for the new locale. Otherwise, setlocale() shall return a null pointer and the program's locale is not changed.
A null pointer for locale causes setlocale() to return a pointer to the string associated with the category for the program’s current locale. The program’s locale shall not be changed.

The string returned by setlocale() is such that a subsequent call with that string and its associated category shall restore that part of the program’s locale. The application shall not modify the string returned which may be overwritten by a subsequent call to setlocale().

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

The following code illustrates how a program can initialize the international environment for one language, while selectively modifying the program’s locale such that regular expressions and string operations can be applied to text recorded in a different language:

```c
setlocale(LC_ALL, "De");
setlocale(LC_COLLATE, "Fr@dict");
```

Internationalized programs must call setlocale() to initiate a specific language operation. This can be done by calling setlocale() as follows:

```c
setlocale(LC_ALL, "");
```

Changing the setting of LC_MESSAGES has no effect on catalogs that have already been opened by calls to catopen().

RATIONALE

The ISO C standard defines a collection of functions to support internationalization. One of the most significant aspects of these functions is a facility to set and query the international environment. The international environment is a repository of information that affects the behavior of certain functionality, namely:

1. Character handling
2. Collating
3. Date/time formatting
4. Numeric editing
5. Monetary formatting
6. Messaging

The setlocale() function provides the application developer with the ability to set all or portions, called categories, of the international environment. These categories correspond to the areas of functionality mentioned above. The syntax for setlocale() is as follows:

```c
char *setlocale(int category, const char *locale);
```

where category is the name of one of following categories, namely:

- LC_COLLATE
- LC_CTYPE
- LC_MESSAGES
- LC_MONETARY
- LC_NUMERIC
- LC_TIME
In addition, a special value called \texttt{LC\_ALL} directs \texttt{setlocale()} to set all categories.

There are two primary uses of \texttt{setlocale()}:  
\begin{enumerate}
\item Querying the international environment to find out what it is set to
\item Setting the international environment, or \texttt{locale}, to a specific value
\end{enumerate}

The behavior of \texttt{setlocale()} in these two areas is described below. Since it is difficult to describe the behavior in words, examples are used to illustrate the behavior of specific uses.

To query the international environment, \texttt{setlocale()} is invoked with a specific category and the NULL pointer as the locale. The NULL pointer is a special directive to \texttt{setlocale()} that tells it to query rather than set the international environment. The following syntax is used to query the name of the international environment:

\begin{verbatim}
setlocale({LC\_ALL, LC\_COLLATE, LC\_CTYPE, LC\_MESSAGES, LC\_MONETARY, \ 
         LC\_NUMERIC, LC\_TIME},(char *) NULL);
\end{verbatim}

The \texttt{setlocale()} function shall return the string corresponding to the current international environment. This value may be used by a subsequent call to \texttt{setlocale()} to reset the international environment to this value. However, it should be noted that the return value from \texttt{setlocale()} may be a pointer to a static area within the function and is not guaranteed to remain unchanged (that is, it may be modified by a subsequent call to \texttt{setlocale()}). Therefore, if the purpose of calling \texttt{setlocale()} is to save the value of the current international environment so it can be changed and reset later, the return value should be copied to an array of \texttt{char} in the calling program.

There are three ways to set the international environment with \texttt{setlocale()}:

\begin{verbatim}
setlocale(category, string)
\end{verbatim}

This usage sets a specific \texttt{category} in the international environment to a specific value corresponding to the value of the \texttt{string}. A specific example is provided below:

\begin{verbatim}
setlocale(LC\_ALL, "fr\_FR\_ISO\_8859\_1");
\end{verbatim}

In this example, all categories of the international environment are set to the locale corresponding to the string "fr\_FR\_ISO\_8859\_1", or to the French language as spoken in France using the ISO/IEC 8859-1:1998 standard codeset.

If the string does not correspond to a valid locale, \texttt{setlocale()} shall return a NULL pointer and the international environment is not changed. Otherwise, \texttt{setlocale()} shall return the name of the locale just set.

\begin{verbatim}
setlocale(category, "C")
\end{verbatim}

The ISO C standard states that one locale must exist on all conforming implementations. The name of the locale is C and corresponds to a minimal international environment needed to support the C programming language.

\begin{verbatim}
setlocale(category, "")
\end{verbatim}

This sets a specific category to an implementation-defined default. This corresponds to the value of the environment variables.

CHANGE HISTORY

First released in Issue 3.

Issue 5  
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6  
Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
setlogmask — set the log priority mask

SYNOPSIS
XSI
#include <syslog.h>

int setlogmask(int maskpri);

DESCRIPTION
Refer to closelog().
NAME
setnetent — network database function

SYNOPSIS
#include <netdb.h>

void setnetent(int stayopen);

DESCRIPTION
Refer to endnetent().
NAME
setpgid — set process group ID for job control

SYNOPSIS
#include <unistd.h>

int setpgid(pid_t pid, pid_t pgid);

DESCRIPTION
The setpgid() function shall either join an existing process group or create a new process group
within the session of the calling process. The process group ID of a session leader shall not
change. Upon successful completion, the process group ID of the process with a process ID that
matches pid shall be set to pgid. As a special case, if pid is 0, the process ID of the calling process
shall be used. Also, if pgid is 0, the process ID of the indicated process shall be used.

RETURN VALUE
Upon successful completion, setpgid() shall return 0; otherwise, −1 shall be returned and errno
shall be set to indicate the error.

ERRORS
The setpgid() function shall fail if:

[EACCES] The value of the pid argument matches the process ID of a child process of the
calling process and the child process has successfully executed one of the exec
functions.

[EINVAL] The value of the pgid argument is less than 0, or is not a value supported by
the implementation.

[EPERM] The process indicated by the pid argument is a session leader.

[EPERM] The value of the pid argument matches the process ID of a child process of the
calling process and the child process is not in the same session as the calling
process.

[EPERM] The value of the pgid argument is valid but does not match the process ID of
the process indicated by the pid argument and there is no process with a
process group ID that matches the value of the pgid argument in the same
session as the calling process.

[ESRCH] The value of the pid argument does not match the process ID of the calling
process or of a child process of the calling process.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The setpgid() function shall group processes together for the purpose of signaling, placement in
foreground or background, and other job control actions.

The setpgid() function is similar to the setpgrp() function of 4.2 BSD, except that 4.2 BSD allowed
the specified new process group to assume any value. This presents certain security problems
and is more flexible than necessary to support job control.

To provide tighter security, setpgid() only allows the calling process to join a process group
already in use inside its session or create a new process group whose process group ID was
equal to its process ID.
When a job control shell spawns a new job, the processes in the job must be placed into a new process group via `setpgid()`. There are two timing constraints involved in this action:

1. The new process must be placed in the new process group before the appropriate program is launched via one of the `exec` functions.
2. The new process must be placed in the new process group before the shell can correctly send signals to the new process group.

To address these constraints, the following actions are performed. The new processes call `setpgid()` to alter their own process groups after `fork()` but before `exec`. This satisfies the first constraint. Under 4.3 BSD, the second constraint is satisfied by the synchronization property of `vfork()`; that is, the shell is suspended until the child has completed the `exec`, thus ensuring that the child has completed the `setpgid()`. A new version of `fork()` with this same synchronization property was considered, but it was decided instead to merely allow the parent shell process to adjust the process group of its child processes via `setpgid()`. Both timing constraints are now satisfied by having both the parent shell and the child attempt to adjust the process group of the child process; it does not matter which succeeds first.

Since it would be confusing to an application to have its process group change after it began executing (that is, after `exec`), and because the child process would already have adjusted its process group before this, the `[EACCES]` error was added to disallow this.

One non-obvious use of `setpgid()` is to allow a job control shell to return itself to its original process group (the one in effect when the job control shell was executed). A job control shell does this before returning control back to its parent when it is terminating or suspending itself as a way of restoring its job control “state” back to what its parent would expect. (Note that the original process group of the job control shell typically matches the process group of its parent, but this is not necessarily always the case.)

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`exec`, `getpgid()`, `setsid()`, `tcsetpgrp()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<sys/types.h>`, `<unistd.h>

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
- The `setpgid()` function is mandatory since `_POSIX_JOB_CONTROL` is required to be defined in this issue. This is a FIPS requirement.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/56 is applied, changing the wording in the DESCRIPTION from “the process group ID of the indicated process shall be used” to “the process ID of the indicated process shall be used”. This change reverts the wording to as in the ISO POSIX-1:1996 standard; it appeared to be an unintentional change.
NAME
setpgrp — set the process group ID

SYNOPSIS
XSI
#include <unistd.h>

pid_t setpgrp(void);

DESCRIPTION
If the calling process is not already a session leader, setpgrp() sets the process group ID of the calling process to the process ID of the calling process. If setpgrp() creates a new session, then the new session has no controlling terminal.

The setpgrp() function has no effect when the calling process is a session leader.

RETURN VALUE
Upon completion, setpgrp() shall return the process group ID.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Moved from X/OPEN UNIX extension to BASE.
setpriority()

NAME
setpriority — set the nice value

SYNOPSIS
XSI
#include <sys/resource.h>

int setpriority(int which, id_t who, int nice);

DESCRIPTION
Refer to getpriority().
NAME
setprotoent — network protocol database functions

SYNOPSIS
#include <netdb.h>

void setprotoent(int stayopen);

DESCRIPTION
Refer to endprotoent().
setpwent()

NAME
setpwent — user database function

SYNOPSIS

XSI
#include <pwd.h>

void setpwent(void);

DESCRIPTION
Refer to endpwent().
NAME
setregid — set real and effective group IDs

SYNOPSIS
XSI
#include <unistd.h>

int setregid(gid_t rgid, gid_t egid);

DESCRIPTION
The setregid() function shall set the real and effective group IDs of the calling process.

If rgid is −1, the real group ID shall not be changed; if egid is −1, the effective group ID shall not be changed.

The real and effective group IDs may be set to different values in the same call.

Only a process with appropriate privileges can set the real group ID and the effective group ID to any valid value.

A non-privileged process can set either the real group ID to the saved set-group-ID from one of the exec family of functions, or the effective group ID to the saved set-group-ID or the real group ID.

Any supplementary group IDs of the calling process remain unchanged.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error, and neither of the group IDs are changed.

ERRORS
The setregid() function shall fail if:

[EINVAL] The value of the rgid or egid argument is invalid or out-of-range.

[EPERM] The process does not have appropriate privileges and a change other than changing the real group ID to the saved set-group-ID, or changing the effective group ID to the real group ID or the saved set-group-ID, was requested.

EXAMPLES
None.

APPLICATION USAGE
If a set-group-ID process sets its effective group ID to its real group ID, it can still set its effective group ID back to the saved set-group-ID.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4, Version 2.
setregid()

**Issue 5**

Moved from X/Open UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the saved set-group-ID can be set by any of the `exec` family of functions, not just `execve()`.
NAME
setreuid — set real and effective user IDs

SYNOPSIS
#include <unistd.h>

int setreuid(uid_t ruid, uid_t euid);

DESCRIPTION
The setreuid() function shall set the real and effective user IDs of the current process to the values specified by the ruid and euid arguments. If ruid or euid is −1, the corresponding effective or real user ID of the current process shall be left unchanged.

A process with appropriate privileges can set either ID to any value. An unprivileged process can only set the effective user ID if the euid argument is equal to either the real, effective, or saved user ID of the process.

It is unspecified whether a process without appropriate privileges is permitted to change the real user ID to match the current real, effective, or saved set-user-ID of the process.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The setreuid() function shall fail if:

-EINVAL The value of the ruid or euid argument is invalid or out-of-range.
-EPERM The current process does not have appropriate privileges, and either an attempt was made to change the effective user ID to a value other than the real user ID or the saved set-user-ID or an attempt was made to change the real user ID to a value not permitted by the implementation.

EXAMPLES
Setting the Effective User ID to the Real User ID
The following example sets the effective user ID of the calling process to the real user ID, so that files created later will be owned by the current user.

#include <unistd.h>
#include <sys/types.h>
...
setreuid(getuid(), getuid());
...

APPLICATION USAGE
None.

RATIONALE

NAME
setrlimit — control maximum resource consumption

SYNOPSIS

#include <sys/resource.h>

int setrlimit(int resource, const struct rlimit *rlp);

DESCRIPTION
Refer to getrlimit().
NAME
setservent — network services database functions

SYNOPSIS
#include <netdb.h>
void setservent(int stayopen);

DESCRIPTION
Refer to endservent().
NAME
setsid — create session and set process group ID

SYNOPSIS
#include <unistd.h>

pid_t setsid(void);

DESCRIPTION
The setsid() function shall create a new session, if the calling process is not a process group leader. Upon return the calling process shall be the session leader of this new session, shall be the process group leader of a new process group, and shall have no controlling terminal. The process group ID of the calling process shall be set equal to the process ID of the calling process. The calling process shall be the only process in the new process group and the only process in the new session.

RETURN VALUE
Upon successful completion, setsid() shall return the value of the new process group ID of the calling process. Otherwise, it shall return (pid_t)−1 and set errno to indicate the error.

ERRORS
The setsid() function shall fail if:

[EPERM] The calling process is already a process group leader, or the process group ID of a process other than the calling process matches the process ID of the calling process.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The setsid() function is similar to the setpgrp() function of System V. System V, without job control, groups processes into process groups and creates new process groups via setpgrp(); only one process group may be part of a login session.

Job control allows multiple process groups within a login session. In order to limit job control actions so that they can only affect processes in the same login session, this volume of IEEE Std 1003.1-2001 adds the concept of a session that is created via setsid(). The setsid() function also creates the initial process group contained in the session. Additional process groups can be created via the setpgid() function. A System V process group would correspond to a POSIX System Interfaces session containing a single POSIX process group. Note that this function requires that the calling process not be a process group leader. The usual way to ensure this is true is to create a new process with fork() and have it call setsid(). The fork() function guarantees that the process ID of the new process does not match any existing process group ID.

FUTURE DIRECTIONS
None.

SEE ALSO
getsid(), setpgid(), setpgrp(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/types.h>, <unistd.h>
setsid()

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

In the SYNOPSIS, the optional include of the `<sys/types.h>` header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
NAME
setsockopt — set the socket options

SYNOPSIS
#include <sys/socket.h>

int setsockopt(int socket, int level, int option_name,
    const void *option_value, socklen_t option_len);

DESCRIPTION
The setsockopt() function shall set the option specified by the option_name argument, at the
protocol level specified by the level argument, to the value pointed to by the option_value
argument for the socket associated with the file descriptor specified by the socket argument.

The level argument specifies the protocol level at which the option resides. To set options at the
socket level, specify the level argument as SOL_SOCKET. To set options at other levels, supply
the appropriate level identifier for the protocol controlling the option. For example, to indicate
that an option is interpreted by the TCP (Transport Control Protocol), set level to IPPROTO_TCP
as defined in the <netinet/in.h> header.

The option_name argument specifies a single option to set. The option_name argument and any
specified options are passed uninterpreted to the appropriate protocol module for interpretations. The <sys/socket.h> header defines the socket-level options. The options are as
follows:

SO_DEBUG Turns on recording of debugging information. This option enables or
disables debugging in the underlying protocol modules. This option takes
an int value. This is a Boolean option.

SO_BROADCAST Permits sending of broadcast messages, if this is supported by the
protocol. This option takes an int value. This is a Boolean option.

SO_REUSEADDR Specifies that the rules used in validating addresses supplied to bind()
should allow reuse of local addresses, if this is supported by the protocol.
This option takes an int value. This is a Boolean option.

SO_KEEPALIVE Keeps connections active by enabling the periodic transmission of
messages, if this is supported by the protocol. This option takes an int
value.

If the connected socket fails to respond to these messages, the connection
is broken and threads writing to that socket are notified with a SIGPIPE
signal. This is a Boolean option.

SO_LINGER Lingers on a close() if data is present. This option controls the action
taken when unsent messages queue on a socket and close() is performed.
If SO_LINGER is set, the system shall block the process during close()
until it can transmit the data or until the time expires. If SO_LINGER is
not specified, and close() is issued, the system handles the call in a way
that allows the process to continue as quickly as possible. This option
takes a linger structure, as defined in the <sys/socket.h> header, to
specify the state of the option and linger interval.

SO_OOBINLINE Leaves received out-of-band data (data marked urgent) inline. This
option takes an int value. This is a Boolean option.

SO_SNDBUF Sets send buffer size. This option takes an int value.
SO_RCVBUF  Sets receive buffer size. This option takes an int value.

SO_DONTROUTE  Requests that outgoing messages bypass the standard routing facilities. The destination shall be on a directly-connected network, and messages are directed to the appropriate network interface according to the destination address. The effect, if any, of this option depends on what protocol is in use. This option takes an int value. This is a Boolean option.

SO_RCVLOWAT  Sets the minimum number of bytes to process for socket input operations. The default value for SO_RCVLOWAT is 1. If SO_RCVLOWAT is set to a larger value, blocking receive calls normally wait until they have received the smaller of the low water mark value or the requested amount. (They may return less than the low water mark if an error occurs, a signal is caught, or the type of data next in the receive queue is different from that returned; for example, out-of-band data.) This option takes an int value. Note that not all implementations allow this option to be set.

SO_RCVTIMEO  Sets the timeout value that specifies the maximum amount of time an input function waits until it completes. It accepts a timeval structure with the number of seconds and microseconds specifying the limit on how long to wait for an input operation to complete. If a receive operation has blocked for this much time without receiving additional data, it shall return with a partial count or errno set to [EAGAIN] or [EWOULDBLOCK] if no data is received. The default for this option is zero, which indicates that a receive operation shall not time out. This option takes a timeval structure. Note that not all implementations allow this option to be set.

SO_SNDLOWAT  Sets the minimum number of bytes to process for socket output operations. Non-blocking output operations shall process no data if flow control does not allow the smaller of the send low water mark value or the entire request to be processed. This option takes an int value. Note that not all implementations allow this option to be set.

SO_SNDTIMEO  Sets the timeout value specifying the amount of time that an output function blocks because flow control prevents data from being sent. If a send operation has blocked for this time, it shall return with a partial count or with errno set to [EAGAIN] or [EWOULDBLOCK] if no data is sent. The default for this option is zero, which indicates that a send operation shall not time out. This option stores a timeval structure. Note that not all implementations allow this option to be set.

For Boolean options, 0 indicates that the option is disabled and 1 indicates that the option is enabled.

Options at other protocol levels vary in format and name.

RETURN VALUE

Upon successful completion, setsockopt () shall return 0. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS

The setsockopt () function shall fail if:

- [EBADF] The socket argument is not a valid file descriptor.
- [EDOM] The send and receive timeout values are too big to fit into the timeout fields in the socket structure.
The setsockopt() function may fail if:

- **EINVAL** The specified option is invalid at the specified socket level or the socket has been shut down.
- **EISCONN** The socket is already connected, and a specified option cannot be set while the socket is connected.
- **ENOPROTOOPT** The option is not supported by the protocol.
- **ENOTSOCK** The socket argument does not refer to a socket.
- **ENOMEM** There was insufficient memory available for the operation to complete.
- **ENOBUFS** Insufficient resources are available in the system to complete the call.

**EXAMPLES**

None.

**APPLICATION USAGE**

The setsockopt() function provides an application program with the means to control socket behavior. An application program can use setsockopt() to allocate buffer space, control timeouts, or permit socket data broadcasts. The <sys/socket.h> header defines the socket-level options available to setsockopt(). Options may exist at multiple protocol levels. The SO_ options are always present at the uppermost socket level.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

Section 2.10 (on page 58), bind(), endprotoent(), getsockopt(), socket(), the Base Definitions volume of IEEE Std 1003.1-2001, <netinet/in.h>, <sys/socket.h>

**CHANGE HISTORY**

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
setstate()

NAME
setstate — switch pseudo-random number generator state arrays

SYNOPSIS
XSI
#include <stdlib.h>

char *setstate(const char *state);

DESCRIPTION
Refer to initstate().
NAME

setuid — set user ID

SYNOPSIS

#include <unistd.h>

int setuid(uid_t uid);

DESCRIPTION

If the process has appropriate privileges, setuid() shall set the real user ID, effective user ID, and
the saved set-user-ID of the calling process to uid.

If the process does not have appropriate privileges, but uid is equal to the real user ID or the
saved set-user-ID, setuid() shall set the effective user ID to uid; the real user ID and saved set-
user-ID shall remain unchanged.

The setuid() function shall not affect the supplementary group list in any way.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS

The setuid() function shall fail, return −1, and set errno to the corresponding value if one or more
of the following are true:

EINVAL The value of the uid argument is invalid and not supported by the
implementation.

EPERM The process does not have appropriate privileges and uid does not match the
real user ID or the saved set-user-ID.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The various behaviors of the setuid() and setgid() functions when called by non-privileged
processes reflect the behavior of different historical implementations. For portability, it is
recommended that new non-privileged applications use the seteuid() and setegid() functions
instead.

The saved set-user-ID capability allows a program to regain the effective user ID established at
the last exec call. Similarly, the saved set-group-ID capability allows a program to regain the
effective group ID established at the last exec call. These capabilities are derived from System V.
Without them, a program might have to run as superuser in order to perform the same
functions, because superuser can write on the user's files. This is a problem because such a
program can write on any user's files, and so must be carefully written to emulate the
permissions of the calling process properly. In System V, these capabilities have traditionally
been implemented only via the setuid() and setgid() functions for non-privileged processes. The
fact that the behavior of those functions was different for privileged processes made them
difficult to use. The POSIX.1-1990 standard defined the setuid() function to behave differently
for privileged and unprivileged users. When the caller had the appropriate privilege, the
function set the calling process' real user ID, effective user ID, and saved set-user ID on
implementations that supported it. When the caller did not have the appropriate privilege, the
function set only the effective user ID, subject to permission checks. The former use is generally
needed for utilities like login and su, which are not conforming applications and thus outside the
scope of IEEE Std 1003.1-2001. These utilities wish to change the user ID irrevocably to a new value, generally that of an unprivileged user. The latter use is needed for conforming applications that are installed with the set-user-ID bit and need to perform operations using the real user ID.

IEEE Std 1003.1-2001 augments the latter functionality with a mandatory feature named _POSIX_SAVED_IDS. This feature permits a set-user-ID application to switch its effective user ID back and forth between the values of its exec-time real user ID and effective user ID. Unfortunately, the POSIX.1-1990 standard did not permit a conforming application using this feature to work properly when it happened to be executed with the (implementation-defined) appropriate privilege. Furthermore, the application did not even have a means to tell whether it had this privilege. Since the saved set-user-ID feature is quite desirable for applications, as evidenced by the fact that NIST required it in FIPS 151-2, it has been mandated by IEEE Std 1003.1-2001. However, there are implementors who have been reluctant to support it given the limitation described above.

The 4.3BSD system handles the problem by supporting separate functions: setuid() (which always sets both the real and effective user IDs, like setuid() in IEEE Std 1003.1-2001 for privileged users), and seteuid() (which always sets just the effective user ID, like setuid() in IEEE Std 1003.1-2001 for non-privileged users). This separation of functionality into distinct functions seems desirable. 4.3BSD does not support the saved set-user-ID feature. It supports similar functionality of switching the effective user ID back and forth via setreuid(), which permits reversing the real and effective user IDs. This model seems less desirable than the saved set-user-ID because the real user ID changes as a side effect. The current 4.4BSD includes saved effective IDs and uses them for seteuid() and setegid() as described above. The setreuid() and setregid() functions will be deprecated or removed.

The solution here is:

- Require that all implementations support the functionality of the saved set-user-ID, which is set by the exec functions and by privileged calls to setuid().
- Add the seteuid() and setegid() functions as portable alternatives to setuid() and setgid() for non-privileged and privileged processes.

Historical systems have provided two mechanisms for a set-user-ID process to change its effective user ID to be the same as its real user ID in such a way that it could return to the original effective user ID: the use of the setuid() function in the presence of a saved set-user-ID, or the use of the BSD setreuid() function, which was able to swap the real and effective user IDs. The changes included in IEEE Std 1003.1-2001 provide a new mechanism using seteuid() in conjunction with a saved set-user-ID. Thus, all implementations with the new seteuid() mechanism will have a saved set-user-ID for each process, and most of the behavior controlled by _POSIX_SAVED_IDS has been changed to agree with the case where the option was defined. The kill() function is an exception. Implementors of the new seteuid() mechanism will generally be required to maintain compatibility with the older mechanisms previously supported by their systems. However, compatibility with this use of setreuid() and with the _POSIX_SAVED_IDS behavior of kill() is unfortunately complicated. If an implementation with a saved set-user-ID allows a process to use setreuid() to swap its real and effective user IDs, but were to leave the saved set-user-ID unmodified, the process would then have an effective user ID equal to the original real user ID, and both real and saved set-user-ID would be equal to the original effective user ID. In that state, the real user would be unable to kill the process, even though the effective user ID of the process matches that of the real user, if the kill() behavior of _POSIX_SAVED_IDS was used. This is obviously not acceptable. The alternative choice, which is used in at least one implementation, is to change the saved set-user-ID to the effective user ID during most calls to setreuid(). The standard developers considered that alternative to be less correct than the
retention of the old behavior of \texttt{kill()} in such systems. Current conforming applications shall accommodate either behavior from \texttt{kill()}, and there appears to be no strong reason for \texttt{kill()} to check the saved set-user-ID rather than the effective user ID.

**FUTURE DIRECTIONS**

None.

exec, getegid(), geteuid(), getgid(), getuid(), setegid(), seteuid(), setgid(), setregid(), setreuid(), the Base Definitions volume of IEEE Std 1003.1-2001, \texttt{<sys/types.h>}, \texttt{<unistd.h>}

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

In the SYNOPSIS, the optional include of the \texttt{<sys/types.h>} header is removed.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include \texttt{<sys/types.h>} has been removed. Although \texttt{<sys/types.h>} was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- The functionality associated with _POSIX_SAVED_IDS is now mandatory. This is a FIPS requirement.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The effects of \texttt{setuid()} in processes without appropriate privileges are changed.

- A requirement that the supplementary group list is not affected is added.
NAME
setutxent — reset the user accounting database to the first entry

SYNOPSIS
```
#include <utmpx.h>

void setutxent(void);
```

DESCRIPTION
Refer to endutxent().
NAME
setvbuf — assign buffering to a stream

SYNOPSIS
#include <stdio.h>

int setvbuf(FILE *restrict stream, char *restrict buf, int type,
size_t size);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The setvbuf() function may be used after the stream pointed to by stream is associated with an open file but before any other operation (other than an unsuccessful call to setvbuf()) is performed on the stream. The argument type determines how stream shall be buffered, as follows:

- __IOFBF shall cause input/output to be fully buffered.
- __IOLBF shall cause input/output to be line buffered.
- __IONBF shall cause input/output to be unbuffered.

If buf is not a null pointer, the array it points to may be used instead of a buffer allocated by setvbuf() and the argument size specifies the size of the array; otherwise, size may determine the size of a buffer allocated by the setvbuf() function. The contents of the array at any time are unspecified.

For information about streams, see Section 2.5 (on page 34).

RETURN VALUE
Upon successful completion, setvbuf() shall return 0. Otherwise, it shall return a non-zero value if an invalid value is given for type or if the request cannot be honored, and may set errno to indicate the error.

ERRORS
The setvbuf() function may fail if:

- [EBADF] The file descriptor underlying stream is not valid.

EXAMPLES
None.

APPLICATION USAGE
A common source of error is allocating buffer space as an “automatic” variable in a code block, and then failing to close the stream in the same block.

With setvbuf(), allocating a buffer of size bytes does not necessarily imply that all of size bytes are used for the buffer area.

Applications should note that many implementations only provide line buffering on input from terminal devices.

RATIONALE
None.
FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
Extensions beyond the ISO C standard are marked.
The setvbuf() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME

tim_open — open a shared memory object (REALTIME)

SYNOPSIS

#include <sys/mman.h>

int tim_open(const char *name, int oflag, mode_t mode);

DESCRIPTION

The tim_open() function shall establish a connection between a shared memory object and a file descriptor. It shall create an open file description that refers to the shared memory object and a file descriptor that refers to that open file description. The file descriptor is used by other functions to refer to that shared memory object. The name argument points to a string naming a shared memory object. It is unspecified whether the name appears in the file system and is visible to other functions that take pathnames as arguments. The name argument conforms to the construction rules for a pathname. If name begins with the slash character, then processes calling tim_open() with the same value of name refer to the same shared memory object, as long as that name has not been removed. If name does not begin with the slash character, the effect is implementation-defined. The interpretation of slash characters other than the leading slash character in name is implementation-defined.

If successful, tim_open() shall return a file descriptor for the shared memory object that is the lowest numbered file descriptor not currently open for that process. The open file description is new, and therefore the file descriptor does not share it with any other processes. It is unspecified whether the file offset is set. The FD_CLOEXEC file descriptor flag associated with the new file descriptor is set.

The file status flags and file access modes of the open file description are according to the value of oflag. The oflag argument is the bitwise-inclusive OR of the following flags defined in the <fcntl.h> header. Applications specify exactly one of the first two values (access modes) below in the value of oflag:

- O_RDONLY  Open for read access only.
- O_RDWR    Open for read or write access.

Any combination of the remaining flags may be specified in the value of oflag:

- O_CREAT If the shared memory object exists, this flag has no effect, except as noted under O_EXCL below. Otherwise, the shared memory object is created; the user ID of the shared memory object shall be set to the effective user ID of the process; the group ID of the shared memory object is set to a system default group ID or to the effective group ID of the process. The permission bits of the shared memory object shall be set to the value of the mode argument except those set in the file mode creation mask of the process. When bits in mode other than the file permission bits are set, the effect is unspecified. The mode argument does not affect whether the shared memory object is opened for reading, for writing, or for both. The shared memory object has a size of zero.

- O_EXCL    If O_EXCL and O_CREAT are set, tim_open() fails if the shared memory object exists. The check for the existence of the shared memory object and the creation of the object if it does not exist is atomic with respect to other processes executing tim_open() naming the same shared memory object with O_EXCL and O_CREAT set. If O_EXCL is set and O_CREAT is not set, the result is undefined.
shm_open()

If the shared memory object exists, and it is successfully opened O_RDWR,
the object shall be truncated to zero length and the mode and owner shall be
unchanged by this function call. The result of using O_TRUNC with
O_RDWR is undefined.

When a shared memory object is created, the state of the shared memory object, including all
data associated with the shared memory object, persists until the shared memory object is
unlinked and all other references are gone. It is unspecified whether the name and shared
memory object state remain valid after a system reboot.

RETURN VALUE

Upon successful completion, the shm_open() function shall return a non-negative integer
representing the lowest numbered unused file descriptor. Otherwise, it shall return −1 and set
errno to indicate the error.

ERRORS

The shm_open() function shall fail if:

EACCES The shared memory object exists and the permissions specified by oflag are
denied, or the shared memory object does not exist and permission to create
the shared memory object is denied, or O_TRUNC is specified and write
permission is denied.

EEXIST O_CREAT and O_EXCL are set and the named shared memory object already
exists.

EINVAL The shm_open() operation is not supported for the given name.

EMFILE Too many file descriptors are currently in use by this process.

ENAMETOOLONG The length of the name argument exceeds {PATH_MAX} or a pathname
component is longer than {NAME_MAX}.

ENFILE Too many shared memory objects are currently open in the system.

ENOENT O_CREAT is not set and the named shared memory object does not exist.

ENOSPC There is insufficient space for the creation of the new shared memory object.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

When the Memory Mapped Files option is supported, the normal open() call is used to obtain a
descriptor to a file to be mapped according to existing practice with mmap(). When the Shared
Memory Objects option is supported, the shm_open() function shall obtain a descriptor to the
shared memory object to be mapped.

There is ample precedent for having a file descriptor represent several types of objects. In the
POSIX.1-1990 standard, a file descriptor can represent a file, a pipe, a FIFO, a tty, or a directory.
Many implementations simply have an operations vector, which is indexed by the file descriptor
type and does very different operations. Note that in some cases the file descriptor passed to
generic operations on file descriptors is returned by open() or creat() and in some cases returned
by alternate functions, such as pipe(). The latter technique is used by shm_open().
Note that such shared memory objects can actually be implemented as mapped files. In both cases, the size can be set after the open using \textit{ftruncate}. The \textit{shm_open} function itself does not create a shared object of a specified size because this would duplicate an extant function that sets the size of an object referenced by a file descriptor.

On implementations where memory objects are implemented using the existing file system, the \textit{shm_open} function may be implemented using a macro that invokes \textit{open}, and the \textit{shm_unlink} function may be implemented using a macro that invokes \textit{unlink}.

For implementations without a permanent file system, the definition of the name of the memory objects is allowed not to survive a system reboot. Note that this allows systems with a permanent file system to implement memory objects as data structures internal to the implementation as well.

On implementations that choose to implement memory objects using memory directly, a \textit{shm_open} followed by an \textit{ftruncate} and \textit{close} can be used to preallocate a shared memory area and to set the size of that preallocation. This may be necessary for systems without virtual memory hardware support in order to ensure that the memory is contiguous.

The set of valid open flags to \textit{shm_open} was restricted to O_RDONLY, O_RDWR, O_CREAT, and O_TRUNC because these could be easily implemented on most memory mapping systems. This volume of IEEE Std 1003.1-2001 is silent on the results if the implementation cannot supply the requested file access because of implementation-defined reasons, including hardware ones.

The error conditions [EACCES] and [ENOTSUP] are provided to inform the application that the implementation cannot complete a request.

[EACCES] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode because it conflicts with another requested mode. An example might be that an application desires to open a memory object two times, mapping different areas with different access modes. If the implementation cannot map a single area into a process space in two places, which would be required if different access modes were required for the two areas, then the implementation may inform the application at the time of the second open.

[ENOTSUP] indicates for implementation-defined reasons, probably hardware-related, that the implementation cannot comply with a requested mode at all. An example would be that the hardware of the implementation cannot support write-only shared memory areas.

On all implementations, it may be desirable to restrict the location of the memory objects to specific file systems for performance (such as a RAM disk) or implementation-defined reasons (shared memory supported directly only on certain file systems). The \textit{shm_open} function may be used to enforce these restrictions. There are a number of methods available to the application to determine an appropriate name of the file or the location of an appropriate directory. One way is from the environment via \textit{getenv}. Another would be from a configuration file.

This volume of IEEE Std 1003.1-2001 specifies that memory objects have initial contents of zero when created. This is consistent with current behavior for both files and newly allocated memory. For those implementations that use physical memory, it would be possible that such implementations could simply use available memory and give it to the process uninitialized. This, however, is not consistent with standard behavior for the uninitialized data area, the stack, and of course, files. Finally, it is highly desirable to set the allocated memory to zero for security reasons. Thus, initializing memory objects to zero is required.
shm_open()

**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**
The `shm_open()` function is marked as part of the Shared Memory Objects option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Shared Memory Objects option.
NAME
shm_unlink — remove a shared memory object (REALTIME)

SYNOPSIS
#include <sys/mman.h>

int shm_unlink(const char *name);

DESCRIPTION
The shm_unlink() function shall remove the name of the shared memory object named by the
string pointed to by name.

If one or more references to the shared memory object exist when the object is unlinked, the
name shall be removed before shm_unlink() returns, but the removal of the memory object
contents shall be postponed until all open and map references to the shared memory object have
been removed.

Even if the object continues to exist after the last shm_unlink(), reuse of the name shall
subsequently cause shm_open() to behave as if no shared memory object of this name exists (that
is, shm_open() will fail if O_CREAT is not set, or will create a new shared memory object if
O_CREAT is set).

RETURN VALUE
Upon successful completion, a value of zero shall be returned. Otherwise, a value of −1 shall be
returned and errno set to indicate the error. If −1 is returned, the named shared memory object
shall not be changed by this function call.

ERRORS
The shm_unlink() function shall fail if:

[EACCES] Permission is denied to unlink the named shared memory object.
[ENAMETOOLONG] The length of the name argument exceeds [PATH_MAX] or a pathname
component is longer than [NAME_MAX].
[ENOENT] The named shared memory object does not exist.

EXAMPLES
None.

APPLICATION USAGE
Names of memory objects that were allocated with open() are deleted with unlink() in the usual
fashion. Names of memory objects that were allocated with shm_open() are deleted with
shm_unlink(). Note that the actual memory object is not destroyed until the last close and
unmap on it have occurred if it was already in use.

RATIONALE
None.

FUTURE DIRECTIONS
None.

of IEEE Std 1003.1-2001, <sys/mman.h>
**CHANGE HISTORY**

First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

**Issue 6**

The `shm_unlink()` function is marked as part of the Shared Memory Objects option.

In the DESCRIPTION, text is added to clarify that reusing the same name after a `shm_unlink()` will not attach to the old shared memory object.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Shared Memory Objects option.
NAME
shmat — XSI shared memory attach operation

SYNOPSIS
#include <sys/shm.h>

void *shmat(int shmid, const void *shmaddr, int shmflg);

DESCRIPTION
The shmat() function operates on XSI shared memory (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
function interoperates with the realtime interprocess communication facilities defined in Section
2.8 (on page 41).

The shmat() function attaches the shared memory segment associated with the shared memory
identifier specified by shmid to the address space of the calling process. The segment is attached
at the address specified by one of the following criteria:

• If shmaddr is a null pointer, the segment is attached at the first available address as selected
  by the system.

• If shmaddr is not a null pointer and (shmflg &SHM_RND) is non-zero, the segment is attached
  at the address given by (shmaddr −((uintptr_t)shmaddr %SHMLBA)). The character ‘%’ is the
  C-language remainder operator.

• If shmaddr is not a null pointer and (shmflg &SHM_RND) is 0, the segment is attached at the
  address given by shmaddr.

• The segment is attached for reading if (shmflg &SHM_RDONLY) is non-zero and the calling
  process has read permission; otherwise, if it is 0 and the calling process has read and write
  permission, the segment is attached for reading and writing.

RETURN VALUE
Upon successful completion, shmat() shall increment the value of shm_nattach in the data
structure associated with the shared memory ID of the attached shared memory segment and
return the segment’s start address.

Otherwise, the shared memory segment shall not be attached, shmat() shall return −1, and errno
shall be set to indicate the error.

ERRORS
The shmat() function shall fail if:

[EACCES] Operation permission is denied to the calling process; see Section 2.7 (on page
39).

EINVAL The value of shmid is not a valid shared memory identifier, the shmaddr is not a
null pointer, and the value of (shmaddr −((uintptr_t)shmaddr %SHMLBA)) is an
illegal address for attaching shared memory; or the shmaddr is not a null
pointer, (shmflg &SHM_RDWR) is 0, and the value of shmaddr is an illegal
address for attaching shared memory.

[EMFILE] The number of shared memory segments attached to the calling process
would exceed the system-imposed limit.

[ENOMEM] The available data space is not large enough to accommodate the shared
memory segment.
The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.

The Open Group Corrigendum U021/13 is applied.
NAME
shmctl — XSI shared memory control operations

SYNOPSIS
XSI
#include <sys/shm.h>

int shmctl(int shmid, int cmd, struct shmid_ds *buf);

DESCRIPTION
The shmctl() function operates on XSI shared memory (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
function interoperates with the realtime interprocess communication facilities defined in Section
2.8 (on page 41).

The shmctl() function provides a variety of shared memory control operations as specified by
cmd. The following values for cmd are available:

IPC_STAT Place the current value of each member of the shmid_ds data structure
associated with shmid into the structure pointed to by buf. The contents of the
structure are defined in <sys/shm.h>.

IPC_SET Set the value of the following members of the shmid_ds data structure
associated with shmid to the corresponding value found in the structure
pointed to by buf:

shm_perm.uid
shm_perm.gid
shm_perm.mode Low-order nine bits.

IPC_SET can only be executed by a process that has an effective user ID equal
to either that of a process with appropriate privileges or to the value of
shm_perm.cuid or shm_perm.uid in the shmid_ds data structure associated with
shmid.

IPC_RMID Remove the shared memory identifier specified by shmid from the system and
destroy the shared memory segment and shmid_ds data structure associated
with it. IPC_RMID can only be executed by a process that has an effective user
ID equal to either that of a process with appropriate privileges or to the value
of shm_perm.cuid or shm_perm.uid in the shmid_ds data structure associated
with shmid.

RETURN VALUE
Upon successful completion, shmctl() shall return 0; otherwise, it shall return −1 and set errno to
indicate the error.

ERRORS
The shmctl() function shall fail if:

EACCES The argument cmd is equal to IPC_STAT and the calling process does not have
read permission; see Section 2.7 (on page 39).

EINVAL The value of shmid is not a valid shared memory identifier, or the value of cmd
is not a valid command.

EPERM The argument cmd is equal to IPC_RMID or IPC_SET and the effective user ID
of the calling process is not equal to that of a process with appropriate
privileges and it is not equal to the value of shm_perm.cuid or shm_perm.uid in
the data structure associated with shmid.
The `shmctl()` function may fail if:

- [EOVERFLOW] The `cmd` argument is IPC_STAT and the `gid` or `uid` value is too large to be stored in the structure pointed to by the `buf` argument.

### EXAMPLES

None.

### APPLICATION USAGE

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

NAME
shmdt — XSI shared memory detach operation

SYNOPSIS
XSI
#include <sys/shm.h>

int shmdt(const void *shmmaddr);

DESCRIPTION
The shmdt() function operates on XSI shared memory (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
function interoperates with the realtime interprocess communication facilities defined in Section
2.8 (on page 41).

The shmdt() function detaches the shared memory segment located at the address specified by
shmmaddr from the address space of the calling process.

RETURN VALUE
Upon successful completion, shmdt() shall decrement the value of shm_nattch in the data
structure associated with the shared memory ID of the attached shared memory segment and
return 0.

Otherwise, the shared memory segment shall not be detached, shmdt() shall return −1, and errno
shall be set to indicate the error.

ERRORS
The shmdt() function shall fail if:

[EINVAL] The value of shmmaddr is not the data segment start address of a shared
memory segment.

EXAMPLES
None.

APPLICATION USAGE
The POSIX Realtime Extension defines alternative interfaces for interprocess communication.
Application developers who need to use IPC should design their applications so that modules
using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the
alternative interfaces.

DIRECTIONS to a new APPLICATION USAGE section.
NAME
shmget — get an XSI shared memory segment

SYNOPSIS
XSI
#include <sys/shm.h>

int shmget(key_t key, size_t size, int shmflg);

DESCRIPTION
The shmget() function operates on XSI shared memory (see the Base Definitions volume of
IEEE Std 1003.1-2001, Section 3.340, Shared Memory Object). It is unspecified whether this
function interoperates with the realtime interprocess communication facilities defined in Section
2.8 (on page 41).

The shmget() function shall return the shared memory identifier associated with key.

A shared memory identifier, associated data structure, and shared memory segment of at least
size bytes (see <sys/shm.h>) are created for key if one of the following is true:

• The argument key is equal to IPC_PRIVATE.
• The argument key does not already have a shared memory identifier associated with it and
  (shmflg & IPC_CREAT) is non-zero.

Upon creation, the data structure associated with the new shared memory identifier shall be
initialized as follows:

• The values of shm_perm.cuid, shm_perm.uid, shm_perm.cgid, and shm_perm.gid are set equal to
  the effective user ID and effective group ID, respectively, of the calling process.
• The low-order nine bits of shm_perm.mode are set equal to the low-order nine bits of shmflg.
• The value of shm_segsz is set equal to the value of size.
• The values of shm_lpid, shm_nattch, shm_atime, and shm_dtime are set equal to 0.
• The value of shm_ctime is set equal to the current time.

When the shared memory segment is created, it shall be initialized with all zero values.

RETURN VALUE
Upon successful completion, shmget() shall return a non-negative integer, namely a shared
memory identifier; otherwise, it shall return −1 and set errno to indicate the error.

ERRORS
The shmget() function shall fail if:

[EACCES] A shared memory identifier exists for key but operation permission as
specified by the low-order nine bits of shmflg would not be granted; see
Section 2.7 (on page 39).

[EEXIST] A shared memory identifier exists for the argument key but (shmflg
& IPC_CREAT) && (shmflg & IPC_EXCL) is non-zero.

[EINVAL] A shared memory segment is to be created and the value of size is less than
the system-imposed minimum or greater than the system-imposed maximum.

[EINVAL] No shared memory segment is to be created and a shared memory segment
exists for key but the size of the segment associated with it is less than size and
size is not 0.
A shared memory identifier does not exist for the argument \textit{key} and \((\text{shmflg} &\text{IPC_CREAT})\) is 0.

A shared memory identifier and associated shared memory segment shall be created, but the amount of available physical memory is not sufficient to fill the request.

A shared memory identifier is to be created, but the system-imposed limit on the maximum number of allowed shared memory identifiers system-wide would be exceeded.

\textbf{EXAMPLES}

None.

\textbf{APPLICATION USAGE}

The POSIX Realtime Extension defines alternative interfaces for interprocess communication. Application developers who need to use IPC should design their applications so that modules using the IPC routines described in Section 2.7 (on page 39) can be easily modified to use the alternative interfaces.

\textbf{RATIONALE}

None.

\textbf{FUTURE DIRECTIONS}

None.

\textbf{CHANGE HISTORY}

First released in Issue 2. Derived from Issue 2 of the SVID.

\textbf{Issue 5}

Moved from SHARED MEMORY to BASE.

The note about use of POSIX Realtime Extension IPC routines has been moved from FUTURE DIRECTIONS to a new APPLICATION USAGE section.
shutdown()

NAME
shutdown — shut down socket send and receive operations

SYNOPSIS
#include <sys/socket.h>
int shutdown(int socket, int how);

DESCRIPTION
The shutdown() function shall cause all or part of a full-duplex connection on the socket
associated with the file descriptor socket to be shut down.

The shutdown() function takes the following arguments:
socket Specifies the file descriptor of the socket.
how Specifies the type of shutdown. The values are as follows:
SHUT_RD Disables further receive operations.
SHUT_WR Disables further send operations.
SHUT_RDWR Disables further send and receive operations.

The shutdown() function disables subsequent send and/or receive operations on a socket,
depending on the value of the how argument.

RETURN VALUE
Upon successful completion, shutdown() shall return 0; otherwise, −1 shall be returned and errno
set to indicate the error.

ERRORS
The shutdown() function shall fail if:
[EBADF] The socket argument is not a valid file descriptor.
[EINVAL] The how argument is invalid.
[ENOTCONN] The socket is not connected.
[ENOTSOCK] The socket argument does not refer to a socket.

The shutdown() function may fail if:
[ENOBUFS] Insufficient resources were available in the system to perform the operation.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
NAME

sigaction — examine and change a signal action

SYNOPSIS

```
#include <signal.h>

int sigaction(int sig, const struct sigaction *restrict act,  
               struct sigaction *restrict oact);
```

DESCRIPTION

The `sigaction()` function allows the calling process to examine and/or specify the action to be associated with a specific signal. The argument `sig` specifies the signal; acceptable values are defined in `<signal.h>`.

The structure `sigaction`, used to describe an action to be taken, is defined in the `<signal.h>` header to include at least the following members:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>void(*) (int)</td>
<td><code>sa_handler</code></td>
<td>Pointer to a signal-catch function or one of the macros SIG_IGN or SIG_DFL.</td>
</tr>
<tr>
<td><code>sigset_t</code></td>
<td><code>sa_mask</code></td>
<td>Additional set of signals to be blocked during execution of signal-catching function.</td>
</tr>
<tr>
<td><code>int</code></td>
<td><code>sa_flags</code></td>
<td>Special flags to affect behavior of signal.</td>
</tr>
</tbody>
</table>
| void(*)(int,  
           siginfo_t*, void *) | `sa_sigaction` | Pointer to a signal-catch function. |

The storage occupied by `sa_handler` and `sa_sigaction` may overlap, and a conforming application shall not use both simultaneously.

If the argument `act` is not a null pointer, it points to a structure specifying the action to be associated with the specified signal. If the argument `oact` is not a null pointer, the action previously associated with the signal is stored in the location pointed to by the argument `oact`. If the argument `act` is a null pointer, signal handling is unchanged; thus, the call can be used to enquire about the current handling of a given signal. The SIGHUP, SIGINT, SIGQUIT, and SIGILL signals shall not be added to the signal mask using this mechanism; this restriction shall be enforced by the system without causing an error to be indicated.

If the SA_SIGINFO flag (see below) is cleared in the `sa_flags` field of the `sigaction` structure, the `sa_handler` field identifies the action to be associated with the specified signal. If the SA_SIGINFO flag is set in the `sa_flags` field, and the implementation supports the Realtime Signals Extension option or the XSI Extension option, the `sa_sigaction` field specifies a signal-catching function. If the SA_SIGINFO bit is cleared and the `sa_handler` field specifies a signal-catching function, or if the SA_SIGINFO bit is set, the `sa_mask` field identifies a set of signals that shall be added to the signal mask of the thread before the signal-catching function is invoked. If the `sa_handler` field specifies a signal-catching function, the `sa_mask` field identifies a set of signals that shall be added to the process' signal mask before the signal-catching function is invoked.

The `sa_flags` field can be used to modify the behavior of the specified signal.

The following flags, defined in the `<signal.h>` header, can be set in `sa_flags`:

---

1344 System Interfaces, Issue 6 — Copyright © 2001-2003, IEEE and The Open Group. All rights reserved.
SA_NOCLDSTOP  Do not generate SIGCHLD when children stop or stopped children continue.

If \textit{sig} is SIGCHLD and the SA_NOCLDSTOP flag is not set in \textit{sa_flags}, and the implementation supports the SIGCHLD signal, then a SIGCHLD signal shall be generated for the calling process whenever any of its child processes stop and a SIGCHLD signal may be generated for the calling process whenever any of its stopped child processes are continued. If \textit{sig} is SIGCHLD and the SA_NOCLDSTOP flag is set in \textit{sa_flags}, then the implementation shall not generate a SIGCHLD signal in this way.

SA_ONSTACK  If set and an alternate signal stack has been declared with \textit{sigaltstack()}, the signal shall be delivered to the calling process on that stack. Otherwise, the signal shall be delivered on the current stack.

SA_RESETHAND  If set, the disposition of the signal shall be reset to SIG_DFL and the SA_SIGINFO flag shall be cleared on entry to the signal handler.

Note: SIGILL and SIGTRAP cannot be automatically reset when delivered; the system silently enforces this restriction.

Otherwise, the disposition of the signal shall not be modified on entry to the signal handler.

In addition, if this flag is set, \textit{sigaction}() behaves as if the SA_NODEFER flag were also set.

SA_RESTART  This flag affects the behavior of interruptible functions; that is, those specified to fail with \textit{errno} set to [EINTR]. If set, and a function specified as interruptible is interrupted by this signal, the function shall restart and shall not fail with [EINTR] unless otherwise specified. If the flag is not set, interruptible functions interrupted by this signal shall fail with \textit{errno} set to [EINTR].

SA_SIGINFO  If cleared and the signal is caught, the signal-catching function shall be entered as:

\begin{verbatim}
void func(int signo);
\end{verbatim}

where \textit{signo} is the only argument to the signal-catching function. In this case, the application shall use the \textit{sa_handler} member to describe the signal-catching function and the application shall not modify the \textit{sa_sigaction} member.

If \textit{SA_SIGINFO} is set and the signal is caught, the signal-catching function shall be entered as:

\begin{verbatim}
void func(int signo, siginfo_t *info, void *context);
\end{verbatim}

where two additional arguments are passed to the signal-catching function. The second argument shall point to an object of type \textit{siginfo_t} explaining the reason why the signal was generated; the third argument can be cast to a pointer to an object of type \textit{ucontext_t} to refer to the receiving process’ context that was interrupted when the signal was delivered. In this case, the application shall use the \textit{sa_sigaction} member to describe the signal-catching function and the application shall not modify the \textit{sa_handler} member.

The \textit{si_signo} member contains the system-generated signal number.
The `si_errno` member may contain implementation-defined additional error information; if non-zero, it contains an error number identifying the condition that caused the signal to be generated.

The `si_code` member contains a code identifying the cause of the signal.

If the value of `si_code` is less than or equal to 0, then the signal was generated by a process and `si_pid` and `si_uid`, respectively, indicate the process ID and the real user ID of the sender. The `<signal.h>` header description contains information about the signal-specific contents of the `siginfo_t` type.

---

SA_NOCLDWAIT

If set, and `sig` equals SIGCHLD, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and `wait()`, `waitid()`, and `waitpid()` shall fail and set `errno` to [ECHILD]. Otherwise, terminating child processes shall be transformed into zombie processes, unless SIGCHLD is set to SIG_IGN.

SA_NODEFER

If set and `sig` is caught, `sig` shall not be added to the process’ signal mask on entry to the signal handler unless it is included in `sa_mask`. Otherwise, `sig` shall always be added to the process’ signal mask on entry to the signal handler.

When a signal is caught by a signal-catching function installed by `sigaction()`, a new signal mask is calculated and installed for the duration of the signal-catching function (or until a call to either `sigprocmask()` or `sigsuspend()` is made). This mask is formed by taking the union of the current signal mask and the value of the `sa_mask` for the signal being delivered unless SA_NODEFER or SA_RESETHAND is set, and then including the signal being delivered. If and when the user’s signal handler returns normally, the original signal mask is restored.

Once an action is installed for a specific signal, it shall remain installed until another action is explicitly requested (by another call to `sigaction()`), until the SA_RESETHAND flag causes resetting of the handler, or until one of the `exec` functions is called.

If the previous action for `sig` had been established by `signal()`, the values of the fields returned in the structure pointed to by `oact` are unspecified, and in particular `oact->sa_handler` is not necessarily the same value passed to `signal()`. However, if a pointer to the same structure or a copy thereof is passed to a subsequent call to `sigaction()` via the `act` argument, handling of the signal shall be as if the original call to `signal()` were repeated.

If `sigaction()` fails, no new signal handler is installed.

It is unspecified whether an attempt to set the action for a signal that cannot be caught or ignored to SIG_DFL is ignored or causes an error to be returned with `errno` set to [EINVAL].

If `SA_SIGINFO` is not set in `sa_flags`, then the disposition of subsequent occurrences of `sig` when it is already pending is implementation-defined; the signal-catching function shall be invoked with a single argument. If the implementation supports the Realtime Signals Extension option, and if `SA_SIGINFO` is set in `sa_flags`, then subsequent occurrences of `sig` generated by `sigqueue()` or as a result of any signal-generating function that supports the specification of an application-defined value (when `sig` is already pending) shall be queued in FIFO order until delivered or accepted; the signal-catching function shall be invoked with three arguments. The application specified value is passed to the signal-catching function as the `si_value` member of the `siginfo_t` structure.
The result of the use of `sigaction()` and a `sigwait()` function concurrently within a process on the same signal is unspecified.

**RETURN VALUE**

Upon successful completion, `sigaction()` shall return 0; otherwise, −1 shall be returned, `errno` shall be set to indicate the error, and no new signal-catching function shall be installed.

**ERRORS**

The `sigaction()` function shall fail if:

- **[EINVAL]** The `sig` argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

- **[ENOTSUP]** The SA_SIGINFO bit flag is set in the `sa_flags` field of the `sigaction` structure, and the implementation does not support either the Realtime Signals Extension option, or the XSI Extension option.

The `sigaction()` function may fail if:

- **[EINVAL]** An attempt was made to set the action to `SIG_DFL` for a signal that cannot be caught or ignored (or both).

**EXAMPLES**

None.

**APPLICATION USAGE**

The `sigaction()` function supersedes the `signal()` function, and should be used in preference. In particular, `sigaction()` and `signal()` should not be used in the same process to control the same signal. The behavior of reentrant functions, as defined in the DESCRIPTION, is as specified by this volume of IEEE Std 1003.1-2001, regardless of invocation from a signal-catching function. This is the only intended meaning of the statement that reentrant functions may be used in signal-catching functions without restrictions. Applications must still consider all effects of such functions on such things as data structures, files, and process state. In particular, application writers need to consider the restrictions on interactions when interrupting `sleep()` and interactions among multiple handles for a file description. The fact that any specific function is listed as reentrant does not necessarily mean that invocation of that function from a signal-catching function is recommended.

In order to prevent errors arising from interrupting non-reentrant function calls, applications should protect calls to these functions either by blocking the appropriate signals or through the use of some programmatic semaphore (see `semget()`, `sem_init()`, `sem_open()`, and so on). Note in particular that even the "safe" functions may modify `errno`; the signal-catching function, if not executing as an independent thread, may want to save and restore its value. Naturally, the same principles apply to the reentrancy of application routines and asynchronous data access. Note that `longjmp()` and `siglongjmp()` are not in the list of reentrant functions. This is because the code executing after `longjmp()` and `siglongjmp()` can call any unsafe functions with the same danger as calling those unsafe functions directly from the signal handler. Applications that use `longjmp()` and `siglongjmp()` from within signal handlers require rigorous protection in order to be portable.

Many of the other functions that are excluded from the list are traditionally implemented using either `malloc()` or `free()` functions or the standard I/O library, both of which traditionally use data structures in a non-reentrant manner. Since any combination of different functions using a common data structure can cause reentrancy problems, this volume of IEEE Std 1003.1-2001 does not define the behavior when any unsafe function is called in a signal handler that interrupts an unsafe function.

If the signal occurs other than as the result of calling `abort()`, `kill()`, or `raise()`, the behavior is undefined if the signal handler calls any function in the standard library other than one of the
functions listed in the table above or refers to any object with static storage duration other than by assigning a value to a static storage duration variable of type `volatile sig_atomic_t`. Furthermore, if such a call fails, the value of `errno` is unspecified.

Usually, the signal is executed on the stack that was in effect before the signal was delivered. An alternate stack may be specified to receive a subset of the signals being caught.

When the signal handler returns, the receiving process resumes execution at the point it was interrupted unless the signal handler makes other arrangements. If `longjmp()` or `_longjmp()` is used to leave the signal handler, then the signal mask must be explicitly restored by the process.

This volume of IEEE Std 1003.1-2001 defines the third argument of a signal handling function when SA_SIGINFO is set as a `void *` instead of a `ucontext_t *`, but without requiring type checking. New applications should explicitly cast the third argument of the signal handling function to `ucontext_t *`.

The BSD optional four argument signal handling function is not supported by this volume of IEEE Std 1003.1-2001. The BSD declaration would be:

```c
void handler(int sig, int code, struct sigcontext *scp, char *addr);
```

where `sig` is the signal number, `code` is additional information on certain signals, `scp` is a pointer to the `sigcontext` structure, and `addr` is additional address information. Much the same information is available in the objects pointed to by the second argument of the signal handler specified when SA_SIGINFO is set.

**RATIONALE**

Although this volume of IEEE Std 1003.1-2001 requires that signals that cannot be ignored shall not be added to the signal mask when a signal-catch function is entered, there is no explicit requirement that subsequent calls to `sigaction()` reflect this in the information returned in the `oact` argument. In other words, if SIGKILL is included in the `sa_mask` field of `act`, it is unspecified whether or not a subsequent call to `sigaction()` returns with SIGKILL included in the `sa_mask` field of `oact`.

The SA_NOCLDSTOP flag, when supplied in the `act->sa_flags` parameter, allows overloading SIGCHLD with the System V semantics that each SIGCLD signal indicates a single terminated child. Most conforming applications that catch SIGCHLD are expected to install signal-catch functions that repeatedly call the `waitpid()` function with the WNOHANG flag set, acting on each child for which status is returned, until `waitpid()` returns zero. If stopped children are not of interest, the use of the SA_NOCLDSTOP flag can prevent the overhead from invoking the signal-catch routine when they stop.

Some historical implementations also define other mechanisms for stopping processes, such as the `ptrace()` function. These implementations usually do not generate a SIGCHLD signal when processes stop due to this mechanism; however, that is beyond the scope of this volume of IEEE Std 1003.1-2001.

This volume of IEEE Std 1003.1-2001 requires that calls to `sigaction()` that supply a NULL `act` argument succeed, even in the case of signals that cannot be caught or ignored (that is, SIGKILL or SIGSTOP). The System V `signal()` and BSD `sigvec()` functions return [EINVAL] in these cases and, in this respect, their behavior varies from `sigaction()`.

This volume of IEEE Std 1003.1-2001 requires that `sigaction()` properly save and restore a signal action set up by the ISO C standard `signal()` function. However, there is no guarantee that the reverse is true, nor could there be given the greater amount of information conveyed by the `sigaction` structure. Because of this, applications should avoid using both functions for the same signal in the same process. Since this cannot always be avoided in case of general-purpose
library routines, they should always be implemented with `sigaction()`.

It was intended that the `signal()` function should be implementable as a library routine using `sigaction()`.

The POSIX Realtime Extension extends the `sigaction()` function as specified by the POSIX.1-1990 standard to allow the application to request on a per-signal basis via an additional signal action flag that the extra parameters, including the application-defined signal value, if any, be passed to the signal-catching function.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and POSIX Threads Extension.

In the DESCRIPTION, the second argument to `func` when `SA_SIGINFO` is set is no longer permitted to be NULL, and the description of permitted `siginfo_t` contents is expanded by reference to `<signal.h>`.

Since the X/OPEN UNIX Extension functionality is now folded into the BASE, the [ENOTSUP] error is deleted.

**Issue 6**

The Open Group Corrigendum U028/7 is applied. In the paragraph entitled “Signal Effects on Other Functions”, a reference to `sigpending()` is added.

In the DESCRIPTION, the text “Signal Generation and Delivery”, “Signal Actions”, and “Signal Effects on Other Functions” are moved to a separate section of this volume of IEEE Std 1003.1-2001.

Text describing functionality from the Realtime Signals option is marked.

The following changes are made for alignment with the ISO POSIX-1: 1996 standard:

- The [ENOTSUP] error condition is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The `restrict` keyword is added to the `sigaction()` prototype for alignment with the ISO/IEC 9899: 1999 standard.

References to the `wait3()` function are removed.

The SYNOPSIS is marked CX since the presence of this function in the `<signal.h>` header is an extension over the ISO C standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/57 is applied, changing text in the table describing the `sigaction` structure.
NAME
sigaddset — add a signal to a signal set

SYNOPSIS
CX
#include <signal.h>

int sigaddset(sigset_t *set, int signo);

DESCRIPTION
The sigaddset() function adds the individual signal specified by the signo to the signal set pointed
to by set.

Applications shall call either sigemptyset() or sigfillset() at least once for each object of type sigset_t prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of pthread_sigmask(), sigaction(), sigaddset(), sigdelset(), sigismember(), sigpending(), sigprocmask(), sigsuspend(), sigtimedwait(), sigwait(), or sigwaitinfo(), the results are undefined.

RETURN VALUE
Upon successful completion, sigaddset() shall return 0; otherwise, it shall return −1 and set errno
to indicate the error.

ERRORS
The sigaddset() function may fail if:

[EINVAL] The value of the signo argument is an invalid or unsupported signal number.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5
The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in
previous issues.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an
extension over the ISO C standard.
NAME
sigaltstack — set and get signal alternate stack context

SYNOPSIS
XSI
#include <signal.h>

int sigaltstack(const stack_t *restrict ss, stack_t *restrict oss);

DESCRIPTION
The sigaltstack() function allows a process to define and examine the state of an alternate stack
for signal handlers for the current thread. Signals that have been explicitly declared to execute
on the alternate stack shall be delivered on the alternate stack.

If ss is not a null pointer, it points to a stack_t structure that specifies the alternate signal stack
that shall take effect upon return from sigaltstack(). The ss_flags member specifies the new stack
state. If it is set to SS_DISABLE, the stack is disabled and ss_sp and ss_size are ignored.
Otherwise, the stack shall be enabled, and the ss_sp and ss_size members specify the new address
and size of the stack.

The range of addresses starting at ss_sp up to but not including ss_sp+ss_size is available to the
implementation for use as the stack. This function makes no assumptions regarding which end
is the stack base and in which direction the stack grows as items are pushed.

If oss is not a null pointer, on successful completion it shall point to a stack_t structure that
specifies the alternate signal stack that was in effect prior to the call to sigaltstack(). The ss_sp
and ss_size members specify the address and size of that stack. The ss_flags member specifies the
stack's state, and may contain one of the following values:

SS_ONSTACK The process is currently executing on the alternate signal stack. Attempts to
modify the alternate signal stack while the process is executing on it fail. This
flag shall not be modified by processes.

SS_DISABLE The alternate signal stack is currently disabled.

The value SIGSTKSZ is a system default specifying the number of bytes that would be used to
cover the usual case when manually allocating an alternate stack area. The value MINSIGSTKSZ
is defined to be the minimum stack size for a signal handler. In computing an alternate stack
size, a program should add that amount to its stack requirements to allow for the system
implementation overhead. The constants SS_ONSTACK, SS_DISABLE, SIGSTKSZ, and
MINSIGSTKSZ are defined in <signal.h>.

After a successful call to one of the exec functions, there are no alternate signal stacks in the new
process image.

In some implementations, a signal (whether or not indicated to execute on the alternate stack)
shall always execute on the alternate stack if it is delivered while another signal is being caught
using the alternate stack.

Use of this function by library threads that are not bound to kernel-scheduled entities results in
undefined behavior.

RETURN VALUE
Upon successful completion, sigaltstack() shall return 0; otherwise, it shall return −1 and set errno
to indicate the error.
The `sigaltstack()` function shall fail if:

- **[EINVAL]** The `ss` argument is not a null pointer, and the `ss_flags` member pointed to by `ss` contains flags other than `SS_DISABLE`.
- **[ENOMEM]** The size of the alternate stack area is less than `MINSIGSTKSZ`.
- **[EPERM]** An attempt was made to modify an active stack.

### Examples

**Allocating Memory for an Alternate Stack**

The following example illustrates a method for allocating memory for an alternate stack.

```c
#include <signal.h>
...
if ((sigstk.ss_sp = malloc(SIGSTKSZ)) == NULL)
    /* Error return. */
sigstk.ss_size = SIGSTKSZ;
sigstk.ss_flags = 0;
if (sigaltstack(&sigstk,(stack_t *)0) < 0)
    perror("sigaltstack");
```

### Application Usage

On some implementations, stack space is automatically extended as needed. On those implementations, automatic extension is typically not available for an alternate stack. If the stack overflows, the behavior is undefined.

### Rationale

None.

### Future Directions

None.

### See Also

Section 2.4 (on page 28), `sigaction()`, `sigsetjmp()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<signal.h>`

### Change History

First released in Issue 4, Version 2.

**Issue 5**

Moved from X/OPEN UNIX extension to BASE.

The last sentence of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

**Issue 6**

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The `restrict` keyword is added to the `sigaltstack()` prototype for alignment with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/58 is applied, updating the first sentence to include “for the current thread”.

NAME
sigemptyset — initialize and empty a signal set

SYNOPSIS
**CX**
```c
#include <signal.h>

int sigemptyset(sigset_t *set);
```

DESCRIPTION
The `sigemptyset()` function initializes the signal set pointed to by `set`, such that all signals defined in IEEE Std 1003.1-2001 are excluded.

RETURN VALUE
Upon successful completion, `sigemptyset()` shall return 0; otherwise, it shall return −1 and set `errno` to indicate the error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The implementation of the `sigemptyset()` (or `sigfillset()`) function could quite trivially clear (or set) all the bits in the signal set. Alternatively, it would be reasonable to initialize part of the structure, such as a version field, to permit binary-compatibility between releases where the size of the set varies. For such reasons, either `sigemptyset()` or `sigfillset()` must be called prior to any other use of the signal set, even if such use is read-only (for example, as an argument to `sigpending()`). This function is not intended for dynamic allocation.

The `sigfillset()` and `sigemptyset()` functions require that the resulting signal set include (or exclude) all the signals defined in this volume of IEEE Std 1003.1-2001. Although it is outside the scope of this volume of IEEE Std 1003.1-2001 to place this requirement on signals that are implemented as extensions, it is recommended that implementation-defined signals also be affected by these functions. However, there may be a good reason for a particular signal not to be affected. For example, blocking or ignoring an implementation-defined signal may have undesirable side effects, whereas the default action for that signal is harmless. In such a case, it would be preferable for such a signal to be excluded from the signal set returned by `sigfillset()`.

In early proposals there was no distinction between invalid and unsupported signals (the names of optional signals that were not supported by an implementation were not defined by that implementation). The [EINVAL] error was thus specified as a required error for invalid signals. With that distinction, it is not necessary to require implementations of these functions to determine whether an optional signal is actually supported, as that could have a significant performance impact for little value. The error could have been required for invalid signals and optional for unsupported signals, but this seemed unnecessarily complex. Thus, the error is optional in both cases.

FUTURE DIRECTIONS
None.

**NAME**
sigfillset — initialize and fill a signal set

**SYNOPSIS**
CX

```c
#include <signal.h>

int sigfillset(sigset_t *set);
```

**DESCRIPTION**
The `sigfillset()` function shall initialize the signal set pointed to by `set`, such that all signals defined in this volume of IEEE Std 1003.1-2001 are included.

**RETURN VALUE**
Upon successful completion, `sigfillset()` shall return 0; otherwise, it shall return −1 and set `errno` to indicate the error.

**ERRORS**
No errors are defined.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**

**Issue 6**
The SYNOPSIS is marked CX since the presence of this function in the `<signal.h>` header is an extension over the ISO C standard.
NAME

sighold, sigignore, sigpause, sigrelse, sigset — signal management

SYNOPSIS

#include <signal.h>

int sighold(int sig);
int sigignore(int sig);
int sigpause(int sig);
int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);

DESCRIPTION

Use of any of these functions is unspecified in a multi-threaded process.

The sighold(), sigignore(), sigpause(), sigrelse(), and sigset() functions provide simplified signal management.

The sigset() function shall modify signal dispositions. The sig argument specifies the signal, which may be any signal except SIGKILL and SIGSTOP. The disp argument specifies the signal’s disposition, which may be SIG_DFL, SIG_IGN, or the address of a signal handler. If sigset() is used, and disp is the address of a signal handler, the system shall add sig to the calling process’ signal mask before executing the signal handler; when the signal handler returns, the system shall restore the calling process’ signal mask to its state prior to the delivery of the signal. In addition, if sigset() is used, and disp is equal to SIG_HOLD, sig shall be added to the calling process’ signal mask and sig’s disposition shall remain unchanged. If sigset() is used, and disp is not equal to SIG_HOLD, sig shall be removed from the calling process’ signal mask.

The sighold() function shall add sig to the calling process’ signal mask.

The sigrelse() function shall remove sig from the calling process’ signal mask.

The sigignore() function shall set the disposition of sig to SIG_IGN.

The sigpause() function shall remove sig from the calling process’ signal mask and suspend the calling process until a signal is received. The sigpause() function shall restore the process’ signal mask to its original state before returning.

If the action for the SIGCHLD signal is set to SIG_IGN, child processes of the calling processes shall not be transformed into zombie processes when they terminate. If the calling process subsequently waits for its children, and the process has no unwaited-for children that were transformed into zombie processes, it shall block until all of its children terminate, and wait(), waitid(), and waitpid() shall fail and set errno to [ECHILD].

RETURN VALUE

Upon successful completion, sigset() shall return SIG_HOLD if the signal had been blocked and the signal’s previous disposition if it had not been blocked. Otherwise, SIG_ERR shall be returned and errno set to indicate the error.

The sigpause() function shall suspend execution of the thread until a signal is received, whereupon it shall return −1 and set errno to [EINTR].

For all other functions, upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.
ERRORS

These functions shall fail if:

- [EINVAL] The sig argument is an illegal signal number.

The sigset() and sigignore() functions shall fail if:

- [EINVAL] An attempt is made to catch a signal that cannot be caught, or to ignore a signal that cannot be ignored.

EXAMPLES

None.

APPLICATION USAGE

The sigaction() function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use sigaction() rather than sigset().

The sighold() function, in conjunction with sigrelse() or sigpause(), may be used to establish critical regions of code that require the delivery of a signal to be temporarily deferred.

The sigsuspend() function should be used in preference to sigpause() for broader portability.

RATIONALE

None.

FUTURE DIRECTIONS

None.

SEE ALSO

Section 2.4 (on page 28), exec, pause(), sigaction(), signal(), sigsuspend(), waitid(), the Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>

CHANGE HISTORY

First released in Issue 4, Version 2.

Issue 5

Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the sigpause() function restores the process’ signal mask to its original state before returning.

The RETURN VALUE section is updated to indicate that the sigpause() function suspends execution of the process until a signal is received, whereupon it returns −1 and sets errno to [EINTR].

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

References to the wait3() function are removed.

The XSI functions are split out into their own reference page.
NAME
siginterrupt — allow signals to interrupt functions

SYNOPSIS
XSI
#include <signal.h>

int siginterrupt(int sig, int flag);

DESCRIPTION
The siginterrupt() function shall change the restart behavior when a function is interrupted by the specified signal. The function siginterrupt(sig, flag) has an effect as if implemented as:

```c
int siginterrupt(int sig, int flag) {
    int ret;
    struct sigaction act;
    (void) sigaction(sig, NULL, &act);
    if (flag)
        act.sa_flags &= ~SA_RESTART;
    else
        act.sa_flags |= SA_RESTART;
    ret = sigaction(sig, &act, NULL);
    return ret;
}
```

RETURN VALUE
Upon successful completion, siginterrupt() shall return 0; otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The siginterrupt() function shall fail if:

- [EINVAL] The sig argument is not a valid signal number.

EXAMPLES
None.

APPLICATION USAGE
The siginterrupt() function supports programs written to historical system interfaces. A conforming application, when being written or rewritten, should use sigaction() with the SA_RESTART flag instead of siginterrupt().

RATIONALE
None.

FUTURE DIRECTIONS
None.

Moved from X/OPEN UNIX extension to BASE.

Issue 6
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/59 is applied, correcting the declaration in the sample implementation given in the DESCRIPTION.
NAME
sigismember — test for a signal in a signal set

SYNOPSIS

cx
#include <signal.h>

int sigismember(const sigset_t *set, int signo);

DESCRIPTION

The sigismember() function shall test whether the signal specified by signo is a member of the set pointed to by set.

Applications should call either sigemptyset() or sigfillset() at least once for each object of type sigset_t prior to any other use of that object. If such an object is not initialized in this way, but is nonetheless supplied as an argument to any of pthread_sigmask(), sigaction(), sigaddset(), sigdelset(), sigismember(), sigpending(), sigprocmask(), sigsuspend(), sigtimedwait(), sigwait(), or sigwaitinfo(), the results are undefined.

RETURN VALUE

Upon successful completion, sigismember() shall return 1 if the specified signal is a member of the specified set, or 0 if it is not. Otherwise, it shall return −1 and set errno to indicate the error.

ERRORS

The sigismember() function may fail if:

[EINVVAL] The signo argument is not a valid signal number, or is an unsupported signal number.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5

The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

Issue 6

The SYNOPSIS is marked CX since the presence of this function in the <signal.h> header is an extension over the ISO C standard.
**NAME**

siglongjmp — non-local goto with signal handling

**SYNOPSIS**

```c
#include <setjmp.h>

void siglongjmp(sigjmp_buf env, int val);
```

**DESCRIPTION**

The `siglongjmp()` function shall be equivalent to the `longjmp()` function, except as follows:

- References to `setjmp()` shall be equivalent to `sigsetjmp()`.
- The `siglongjmp()` function shall restore the saved signal mask if and only if the `env` argument was initialized by a call to `sigsetjmp()` with a non-zero `savemask` argument.

**RETURN VALUE**

After `siglongjmp()` is completed, program execution shall continue as if the corresponding invocation of `sigsetjmp()` had just returned the value specified by `val`. The `siglongjmp()` function shall not cause `sigsetjmp()` to return 0; if `val` is 0, `sigsetjmp()` shall return the value 1.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

The distinction between `setjmp()` or `longjmp()` and `sigsetjmp()` or `siglongjmp()` is only significant for programs which use `sigaction()`, `sigprocmask()`, or `sigsuspend()`.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the ISO POSIX-1 standard.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

**Issue 6**

The DESCRIPTION is rewritten in terms of `longjmp()`.

The SYNOPSIS is marked CX since the presence of this function in the `<setjmp.h>` header is an extension over the ISO C standard.
NAME
signal — signal management

SYNOPSIS
#include <signal.h>
void (*signal(int sig, void (*func)(int)))(int);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

Use of this function is unspecified in a multi-threaded process.

The signal() function chooses one of three ways in which receipt of the signal number sig is to be subsequently handled. If the value of func is SIG_DFL, default handling for that signal shall occur. If the value of func is SIG_IGN, the signal shall be ignored. Otherwise, the application shall ensure that func points to a function to be called when that signal occurs. An invocation of such a function because of a signal, or (recursively) of any further functions called by that invocation (other than functions in the standard library), is called a “signal handler”.

When a signal occurs, and func points to a function, it is implementation-defined whether the equivalent of:

signal(sig, SIG_DFL);

is executed or the implementation prevents some implementation-defined set of signals (at least including sig) from occurring until the current signal handling has completed. (If the value of sig is SIGIILL, the implementation may alternatively define that no action is taken.) Next the equivalent of:

(*func)(sig);

is executed. If and when the function returns, if the value of sig was SIGFPE, SIGILL, or SIGSEGV or any other implementation-defined value corresponding to a computational exception, the behavior is undefined. Otherwise, the program shall resume execution at the point it was interrupted. If the signal occurs as the result of calling the abort(), raise(), kill(), pthread_kill(), or sigqueue() function, the signal handler shall not call the raise() function.

If the signal occurs other than as the result of calling abort(), raise(), kill(), pthread_kill(), or sigqueue(), the behavior is undefined if the signal handler refers to any object with static storage duration other than by assigning a value to an object declared as volatile sig_atomic_t, or if the signal handler calls any function in the standard library other than one of the functions listed in Section 2.4 (on page 28). Furthermore, if such a call fails, the value of errno is unspecified.

At program start-up, the equivalent of:

signal(sig, SIG_IGN);

is executed for some signals, and the equivalent of:

signal(sig, SIG_DFL);

is executed for all other signals (see exec).

RETURN VALUE
If the request can be honored, signal() shall return the value of func for the most recent call to signal() for the specified signal sig. Otherwise, SIG_ERR shall be returned and a positive value shall be stored in errno.
The `signal()` function shall fail if:

- `[EINVAL]` The `sig` argument is not a valid signal number or an attempt is made to catch a signal that cannot be caught or ignore a signal that cannot be ignored.

The `signal()` function may fail if:

- `[EINVAL]` An attempt was made to set the action to SIG_DFL for a signal that cannot be caught or ignored (or both).

### Examples
None.

### Application Usage
The `sigaction()` function provides a more comprehensive and reliable mechanism for controlling signals; new applications should use `sigaction()` rather than `signal()`.

### Rationale
None.

### Future Directions
None.

### Change History
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
Moved from X/OPEN UNIX extension to BASE.

The DESCRIPTION is updated to indicate that the `sigpause()` function restores the process’ signal mask to its original state before returning.

The RETURN VALUE section is updated to indicate that the `sigpause()` function suspends execution of the process until a signal is received, whereupon it returns −1 and sets `errno` to `[EINTR]`.

**Issue 6**
Extensions beyond the ISO C standard are marked.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.

References to the `wait3()` function are removed.

The `sighold()`, `sigignore()`, `sigrelse()`, and `sigset()` functions are split out onto their own reference page.
NAME
signbit — test sign

SYNOPSIS
#include <math.h>
int signbit(real-floating x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The signbit() macro shall determine whether the sign of its argument value is negative. NaNs, zeros, and infinities have a sign bit.

RETURN VALUE
The signbit() macro shall return a non-zero value if and only if the sign of its argument value is negative.

ERRORS
No errors are defined.

sigprocmask() — examine and change blocked signals

#include <signal.h>

int sigprocmask(int how, const sigset_t *restrict set,
                 sigset_t *restrict oset);

Refer to pthread_sigmask().
**sys call**

**NAME**

sigqueue — queue a signal to a process (REALTIME)

**SYNOPSIS**

```c
#include <signal.h>

int sigqueue(pid_t pid, int signo, const union sigval value);
```

**DESCRIPTION**

The `sigqueue()` function shall cause the signal specified by `signo` to be sent with the value specified by `value` to the process specified by `pid`. If `signo` is zero (the null signal), error checking is performed but no signal is actually sent. The null signal can be used to check the validity of `pid`.

The conditions required for a process to have permission to queue a signal to another process are the same as for the `kill()` function.

The `sigqueue()` function shall return immediately. If SA_SIGINFO is set for `signo` and if the resources were available to queue the signal, the signal shall be queued and sent to the receiving process. If SA_SIGINFO is not set for `signo`, then `signo` shall be sent at least once to the receiving process; it is unspecified whether `value` shall be sent to the receiving process as a result of this call.

If the value of `pid` causes `signo` to be generated for the sending process, and if `signo` is not blocked for the calling thread and if no other thread has `signo` unblocked or is waiting in a `sigwait()` function for `signo`, either `signo` or at least the pending, unblocked signal shall be delivered to the calling thread before the `sigqueue()` function returns. Should any multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected for delivery, it shall be the lowest numbered one.

The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified.

**RETURN VALUE**

Upon successful completion, the specified signal shall have been queued, and the `sigqueue()` function shall return a value of zero. Otherwise, the function shall return a value of −1 and set `errno` to indicate the error.

**ERRORS**

The `sigqueue()` function shall fail if:

- **[EAGAIN]** No resources are available to queue the signal. The process has already queued [SIGQUEUE_MAX] signals that are still pending at the receiver(s), or a system-wide resource limit has been exceeded.
- **[EINVAL]** The value of the `signo` argument is an invalid or unsupported signal number.
- **[EPERM]** The process does not have the appropriate privilege to send the signal to the receiving process.
- **[ESRCH]** The process `pid` does not exist.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
The `sigqueue()` function allows an application to queue a realtime signal to itself or to another process, specifying the application-defined value. This is common practice in realtime applications on existing realtime systems. It was felt that specifying another function in the `sig...` name space already carved out for signals was preferable to extending the interface to `kill()`.

Such a function became necessary when the put/get event function of the message queues was removed. It should be noted that the `sigqueue()` function implies reduced performance in a security-conscious implementation as the access permissions between the sender and receiver have to be checked on each send when the `pid` is resolved into a target process. Such access checks were necessary only at message queue open in the previous interface.

The standard developers required that `sigqueue()` have the same semantics with respect to the null signal as `kill()`, and that the same permission checking be used. But because of the difficulty of implementing the “broadcast” semantic of `kill()` (for example, to process groups) and the interaction with resource allocation, this semantic was not adopted. The `sigqueue()` function queues a signal to a single process specified by the `pid` argument.

The `sigqueue()` function can fail if the system has insufficient resources to queue the signal. An explicit limit on the number of queued signals that a process could send was introduced. While the limit is “per-sender”, this volume of IEEE Std 1003.1-2001 does not specify that the resources be part of the state of the sender. This would require either that the sender be maintained after exit until all signals that it had sent to other processes were handled or that all such signals that had not yet been acted upon be removed from the queue(s) of the receivers. This volume of IEEE Std 1003.1-2001 does not preclude this behavior, but an implementation that allocated queuing resources from a system-wide pool (with per-sender limits) and that leaves queued signals pending after the sender exits is also permitted.

FUTURE DIRECTIONS
None.

SEE ALSO
Section 2.8.1 (on page 41), the Base Definitions volume of IEEE Std 1003.1-2001, `<signal.h>`

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Issue 6
The `sigqueue()` function is marked as part of the Realtime Signals Extension option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.
NAME
sigrelse, sigset — signal management

SYNOPSIS
XSI

#include <signal.h>

int sigrelse(int sig);
void (*sigset(int sig, void (*disp)(int)))(int);

DESCRIPTION
Refer to sighold().
NAME
sigsetjmp — set jump point for a non-local goto

SYNOPSIS
#include <setjmp.h>
int sigsetjmp(sigjmp_buf env, int savemask);

DESCRIPTION
The sigsetjmp() function shall be equivalent to the setjmp() function, except as follows:

• References to setjmp() are equivalent to sigsetjmp().
• References to longjmp() are equivalent to siglongjmp().
• If the value of the savemask argument is not 0, sigsetjmp() shall also save the current signal
mask of the calling thread as part of the calling environment.

RETURN VALUE
If the return is from a successful direct invocation, sigsetjmp() shall return 0. If the return is from
a call to siglongjmp(), sigsetjmp() shall return a non-zero value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The distinction between setjmp()/longjmp() and sigsetjmp()/siglongjmp() is only significant for
programs which use sigaction(), sigprocmask(), or sigsuspend().

Note that since this function is defined in terms of setjmp(), if savemask is zero, it is unspecified
whether the signal mask is saved.

RATIONALE
The ISO C standard specifies various restrictions on the usage of the setjmp() macro in order to
permit implementors to recognize the name in the compiler and not implement an actual
function. These same restrictions apply to the sigsetjmp() macro.

There are processors that cannot easily support these calls, but this was not considered a
sufficient reason to exclude them.

4.2 BSD, 4.3 BSD, and XSI-conformant systems provide functions named _setjmp() and
_longjmp() that, together with setjmp() and longjmp(), provide the same functionality as
sigsetjmp() and siglongjmp(). On those systems, setjmp() and longjmp() save and restore signal
masks, while _setjmp() and _longjmp() do not. On System V Release 3 and in corresponding
issues of the SVID, setjmp() and longjmp() are explicitly defined not to save and restore signal
masks. In order to permit existing practice in both cases, the relation of setjmp() and longjmp() to
signal masks is not specified, and a new set of functions is defined instead.

The longjmp() and siglongjmp() functions operate as in the previous issue provided the matching
setjmp() or sigsetjmp() has been performed in the same thread. Non-local jumps into contexts
saved by other threads would be at best a questionable practice and were not considered worthy
of standardization.
FUTURE DIRECTIONS
None.

IEEE Std 1003.1-2001, <setjmp.h>

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 5
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6
The DESCRIPTION is reworded in terms of setjmp().
The SYNOPSIS is marked CX since the presence of this function in the <setjmp.h> header is an
extension over the ISO C standard.
sigsuspend()

NAME
sigsuspend — wait for a signal

SYNOPSIS
#include <signal.h>

int sigsuspend(const sigset_t *sigmask);

DESCRIPTION
The sigsuspend() function shall replace the current signal mask of the calling thread with the set
of signals pointed to by sigmask and then suspend the thread until delivery of a signal whose
action is either to execute a signal-catching function or to terminate the process. This shall not
cause any other signals that may have been pending on the process to become pending on the
thread.

If the action is to terminate the process then sigsuspend() shall never return. If the action is to
execute a signal-catching function, then sigsuspend() shall return after the signal-catching
function returns, with the signal mask restored to the set that existed prior to the sigsuspend() call.

It is not possible to block signals that cannot be ignored. This is enforced by the system without
causing an error to be indicated.

RETURN VALUE
Since sigsuspend() suspends thread execution indefinitely, there is no successful completion
return value. If a return occurs, −1 shall be returned and errno set to indicate the error.

ERRORS
The sigsuspend() function shall fail if:

[EINTR] A signal is caught by the calling process and control is returned from the
signal-catching function.

EXAMPLES
None.

APPLICATION USAGE
Normally, at the beginning of a critical code section, a specified set of signals is blocked using
the sigprocmask() function. When the thread has completed the critical section and needs to wait
for the previously blocked signal(s), it pauses by calling sigsuspend() with the mask that was
return by the sigprocmask() call.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Base Definitions volume of IEEE Std 1003.1-2001, <signal.h>

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.
Issue 5
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6
The text in the RETURN VALUE section has been changed from “suspends process execution” to “suspends thread execution”. This reflects IEEE PASC Interpretation 1003.1c #40.

Text in the APPLICATION USAGE section has been replaced.

The SYNOPSIS is marked CX since the presence of this function in the `<signal.h>` header is an extension over the ISO C standard.
NAME
sigtimedwait, sigwaitinfo — wait for queued signals (REALTIME)

SYNOPSIS
#include <signal.h>

int sigtimedwait(const sigset_t *restrict set,
                 siginfo_t *restrict info,
                 const struct timespec *restrict timeout);

int sigwaitinfo(const sigset_t *restrict set,
                 siginfo_t *restrict info);

DESCRIPTION
The sigtimedwait() function shall be equivalent to sigwaitinfo() except that if none of the signals
specified by set are pending, sigtimedwait() shall wait for the time interval specified in the
timespec structure referenced by timeout. If the timespec structure pointed to by timeout is
zero-valued and if none of the signals specified by set are pending, then sigtimedwait() shall return immediately with an error. If timeout is the NULL pointer, the behavior is unspecified. If
the Monotonic Clock option is supported, the CLOCK_MONOTONIC clock shall be used to
measure the time interval specified by the timeout argument.

The sigwaitinfo() function selects the pending signal from the set specified by set. Should any of
multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the
lowest numbered one. The selection order between realtime and non-realtime signals, or
between multiple pending non-realtime signals, is unspecified. If no signal in set is pending at
the time of the call, the calling thread shall be suspended until one or more signals in set become
pending or until it is interrupted by an unblocked, caught signal.

The sigwaitinfo() function shall be equivalent to the sigwait() function if the info argument is
NULL. If the info argument is non-NULL, the sigwaitinfo() function shall be equivalent to
sigwait(), except that the selected signal number shall be stored in the si_signo member, and the
cause of the signal shall be stored in the si_code member. If any value is queued to the selected
signal, the first such queued value shall be dequeued and, if the info argument is non-NULL, the
value shall be stored in the si_value member of info. The system resource used to queue the
signal shall be released and returned to the system for other use. If no value is queued, the
content of the si_value member is undefined. If no further signals are queued for the selected
signal, the pending indication for that signal shall be reset.

RETURN VALUE
Upon successful completion (that is, one of the signals specified by set is pending or is
generated) sigwaitinfo() and sigtimedwait() shall return the selected signal number. Otherwise,
the function shall return a value of −1 and set errno to indicate the error.

ERRORS
The sigtimedwait() function shall fail if:

[EAGAIN] No signal specified by set was generated within the specified timeout period.

The sigtimedwait() and sigwaitinfo() functions may fail if:

[EINTR] The wait was interrupted by an unblocked, caught signal. It shall be
documented in system documentation whether this error causes these
functions to fail.
The `sigtimedwait()` function may also fail if:

- **[EINVAL]** The `timeout` argument specified a `tv_nsec` value less than zero or greater than or equal to 1 000 million.

An implementation only checks for this error if no signal is pending in `set` and it is necessary to wait.

**EXAMPLES**

None.

**APPLICATION USAGE**

The `sigtimedwait()` function times out and returns an `[EAGAIN]` error. Application writers should note that this is inconsistent with other functions such as `pthread_cond_timedwait()` that return `[ETIMEDOUT]`.

**RATIONALE**

Existing programming practice on realtime systems uses the ability to pause waiting for a selected set of events and handle the first event that occurs in-line instead of in a signal-handling function. This allows applications to be written in an event-directed style similar to a state machine. This style of programming is useful for largescale transaction processing in which the overall throughput of an application and the ability to clearly track states are more important than the ability to minimize the response time of individual event handling.

It is possible to construct a signal-waiting macro function out of the realtime signal function mechanism defined in this volume of IEEE Std 1003.1-2001. However, such a macro has to include the definition of a generalized handler for all signals to be waited on. A significant portion of the overhead of handler processing can be avoided if the signal-waiting function is provided by the kernel. This volume of IEEE Std 1003.1-2001 therefore provides two signal-waiting functions—one that waits indefinitely and one with a timeout—as part of the overall realtime signal function specification.

The specification of a function with a timeout allows an application to be written that can be broken out of a wait after a set period of time if no event has occurred. It was argued that setting a timer event before the wait and recognizing the timer event in the wait would also implement the same functionality, but at a lower performance level. Because of the performance degradation associated with the user-level specification of a timer event and the subsequent cancellation of that timer event after the wait completes for a valid event, and the complexity associated with handling potential race conditions associated with the user-level method, the separate function has been included.

Note that the semantics of the `sigwaitinfo()` function are nearly identical to that of the `sigwait()` function defined by this volume of IEEE Std 1003.1-2001. The only difference is that `sigwaitinfo()` returns the queued signal value in the `value` argument. The return of the queued value is required so that applications can differentiate between multiple events queued to the same signal number.

The two distinct functions are being maintained because some implementations may choose to implement the POSIX Threads Extension functions and not implement the queued signals extensions. Note, though, that `sigwaitinfo()` does not return the queued value if the `value` argument is NULL, so the POSIX Threads Extension `sigwait()` function can be implemented as a macro on `sigwaitinfo()`.

The `sigtimedwait()` function was separated from the `sigwaitinfo()` function to address concerns regarding the overloading of the `timeout` pointer to indicate indefinite wait (no timeout), timed wait, and immediate return, and concerns regarding consistency with other functions where the conditional and timed waits were separate functions from the pure blocking function. The
semantics of `sigtimedwait()` are specified such that `sigwaitinfo()` could be implemented as a macro with a NULL pointer for `timeout`.

The `sigwait` functions provide a synchronous mechanism for threads to wait for asynchronously-generated signals. One important question was how many threads that are suspended in a call to a `sigwait()` function for a signal should return from the call when the signal is sent. Four choices were considered:

1. Return an error for multiple simultaneous calls to `sigwait` functions for the same signal.
2. One or more threads return.
3. All waiting threads return.
4. Exactly one thread returns.

Prohibiting multiple calls to `sigwait()` for the same signal was felt to be overly restrictive. The “one or more” behavior made implementation of conforming packages easy at the expense of forcing POSIX threads clients to protect against multiple simultaneous calls to `sigwait()` in application code in order to achieve predictable behavior. There was concern that the “all waiting threads” behavior would result in “signal broadcast storms”, consuming excessive CPU resources by replicating the signals in the general case. Furthermore, no convincing examples could be presented that delivery to all was either simpler or more powerful than delivery to one.

Thus, the consensus was that exactly one thread that was suspended in a call to a `sigwait` function for a signal should return when that signal occurs. This is not an onerous restriction as:

- A multi-way signal wait can be built from the single-way wait.
- Signals should only be handled by application-level code, as library routines cannot guess what the application wants to do with signals generated for the entire process.
- Applications can thus arrange for a single thread to wait for any given signal and call any needed routines upon its arrival.

In an application that is using signals for interprocess communication, signal processing is typically done in one place. Alternatively, if the signal is being caught so that process cleanup can be done, the signal handler thread can call separate process cleanup routines for each portion of the application. Since the application main line started each portion of the application, it is at the right abstraction level to tell each portion of the application to clean up.

Certainly, there exist programming styles where it is logical to consider waiting for a single signal in multiple threads. A simple `sigwait_multiple()` routine can be constructed to achieve this goal. A possible implementation would be to have each `sigwait_multiple()` caller registered as having expressed interest in a set of signals. The caller then waits on a thread-specific condition variable. A single server thread calls a `sigwait()` function on the union of all registered signals. When the `sigwait()` function returns, the appropriate state is set and condition variables are broadcast. New `sigwait_multiple()` callers may cause the pending `sigwait()` call to be canceled and reissued in order to update the set of signals being waited for.

First released in Issue 5. Included for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

These functions are marked as part of the Realtime Signals Extension option.

The Open Group Corrigendum U035/3 is applied. The SYNOPSIS of the `sigwaitinfo()` function has been corrected so that the second argument is of type `siginfo_t*`.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Realtime Signals Extension option.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that the CLOCK_MONOTONIC clock, if supported, is used to measure timeout intervals.

The `restrict` keyword is added to the `sigtimedwait()` and `sigwaitinfo()` prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME
sigwait — wait for queued signals

SYNOPSIS
CX
#include <signal.h>

int sigwait(const sigset_t *restrict set, int *restrict sig);

DESCRIPTION
The sigwait() function shall select a pending signal from set, atomically clear it from the system's set of pending signals, and return that signal number in the location referenced by sig. If prior to the call to sigwait() there are multiple pending instances of a single signal number, it is implementation-defined whether upon successful return there are any remaining pending signals for that signal number. If the implementation supports queued signals and there are multiple signals queued for the signal number selected, the first such queued signal shall cause a return from sigwait() and the remainder shall remain queued. If no signal in set is pending at the time of the call, the thread shall be suspended until one or more becomes pending. The signals defined by set shall have been blocked at the time of the call to sigwait(); otherwise, the behavior is undefined. The effect of sigwait() on the signal actions for the signals in set is unspecified.

If more than one thread is using sigwait() to wait for the same signal, no more than one of these threads shall return from sigwait() with the signal number. Which thread returns from sigwait() if more than a single thread is waiting is unspecified.

Should any of the multiple pending signals in the range SIGRTMIN to SIGRTMAX be selected, it shall be the lowest numbered one. The selection order between realtime and non-realtime signals, or between multiple pending non-realtime signals, is unspecified.

RETURN VALUE
Upon successful completion, sigwait() shall store the signal number of the received signal at the location referenced by sig and return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS
The sigwait() function may fail if:

[EINVAL] The set argument contains an invalid or unsupported signal number.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
To provide a convenient way for a thread to wait for a signal, this volume of IEEE Std 1003.1-2001 provides the sigwait() function. For most cases where a thread has to wait for a signal, the sigwait() function should be quite convenient, efficient, and adequate.

However, requests were made for a lower-level primitive than sigwait() and for semaphores that could be used by threads. After some consideration, threads were allowed to use semaphores and sem_post() was defined to be async-signal and async-cancel-safe.

In summary, when it is necessary for code run in response to an asynchronous signal to notify a thread, sigwait() should be used to handle the signal. Alternatively, if the implementation provides semaphores, they also can be used, either following sigwait() or from within a signal handling routine previously registered with sigaction().
**FUTURE DIRECTIONS**
None.

NAME
sigwaitinfo — wait for queued signals (REALTIME)

SYNOPSIS

```c
#include <signal.h>

int sigwaitinfo(const sigset_t *restrict set, siginfo_t *restrict info);
```

DESCRIPTION
Refer to sigtimedwait().
NAME
sin, sinf, sinl — sine function

SYNOPSIS
#include <math.h>

double sin(double x);
float sinf(float x);
long double sinl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the sine of their argument \( x \), measured in radians.

An application wishing to check for error situations should set \( \text{errno} \) to zero and call \( \text{fekclearexcept}(\text{FE_ALL_EXCEPT}) \) before calling these functions. On return, if \( \text{errno} \) is non-zero or \( \text{fetestexcept}(\text{FE_INVALID} \mid \text{FE_DIVBYZERO} \mid \text{FE_OVERFLOW} \mid \text{FE_UNDERFLOW}) \) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the sine of \( x \).

If \( x \) is NaN, a NaN shall be returned.
If \( x \) is \( ±0 \), \( x \) shall be returned.
If \( x \) is subnormal, a range error may occur and \( x \) should be returned.
If \( x \) is \( ±\infty \), a domain error shall occur, and either a NaN (if supported), or an implementation-defined value shall be returned.

ERRORS
These functions shall fail if:

Domain Error The \( x \) argument is \( ±\infty \).

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then \( \text{errno} \) shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

These functions may fail if:

Range Error The value of \( x \) is subnormal.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then \( \text{errno} \) shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.
EXAMPLES

Taking the Sine of a 45-Degree Angle

```c
#include <math.h>
...
double radians = 45.0 * M_PI / 180;
double result;
...
result = sin(radians);
```

APPLICATION USAGE

These functions may lose accuracy when their argument is near a multiple of π or is far from 0.0.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

NAME

sinh, sinhf, sinhl — hyperbolic sine functions

SYNOPSIS

#include <math.h>

double sinh(double x);
float sinhf(float x);
long double sinhl(long double x);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the hyperbolic sine of their argument x.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE

Upon successful completion, these functions shall return the hyperbolic sine of x.

If the result would cause an overflow, a range error shall occur and ±HUGE_VAL, ±HUGE_VALF, and ±HUGE_VALL (with the same sign as x) shall be returned as appropriate for the type of the function.

If x is NaN, a NaN shall be returned.

If x is ±0 or ±Inf, x shall be returned.

If x is subnormal, a range error may occur and x should be returned.

ERRORS

These functions shall fail if:

Range Error The result would cause an overflow.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

These functions may fail if:

Range Error The value x is subnormal.

If the integer expression (math_errno & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errno & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.
EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

NAME
sinl — sine function

SYNOPSIS
#include <math.h>
long double sinl(long double x);

DESCRIPTION
Refer to sin().
NAME
sleep — suspend execution for an interval of time

SYNOPSIS
#include <unistd.h>
unsigned sleep(unsigned seconds);

DESCRIPTION
The sleep() function shall cause the calling thread to be suspended from execution until either
the number of realtime seconds specified by the argument seconds has elapsed or a signal is
delivered to the calling thread and its action is to invoke a signal-catching function or to
terminate the process. The suspension time may be longer than requested due to the scheduling
of other activity by the system.

If a SIGALRM signal is generated for the calling process during execution of sleep() and if the
SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether sleep()
returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
unspecified whether it remains pending after sleep() returns or it is discarded.

If a SIGALRM signal is generated for the calling process during execution of sleep(), except as a
result of a prior call to alarm(), and if the SIGALRM signal is not being ignored or blocked from
delivery, it is unspecified whether that signal has any effect other than causing sleep() to return.

If a signal-catching function interrupts sleep() and examines or changes either the time a
SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
whether the SIGALRM signal is blocked from delivery, the results are unspecified.

If a signal-catching function interrupts sleep() and calls siglongjmp() or longjmp() to restore an
environment saved prior to the sleep() call, the action associated with the SIGALRM signal and
the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
unspecified whether the SIGALRM signal is blocked, unless the process' signal mask is restored
as part of the environment.

XSI Interactions between sleep() and any of setitimer(), ualarm(), or usleep() are unspecified.

RETURN VALUE
If sleep() returns because the requested time has elapsed, the value returned shall be 0. If sleep()
returns due to delivery of a signal, the return value shall be the "unslept" amount (the requested
time minus the time actually slept) in seconds.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
There are two general approaches to the implementation of the sleep() function. One is to use the
alarm() function to schedule a SIGALRM signal and then suspend the process waiting for that
signal. The other is to implement an independent facility. This volume of IEEE Std 1003.1-2001
permits either approach.

In order to comply with the requirement that no primitive shall change a process attribute unless
explicitly described by this volume of IEEE Std 1003.1-2001, an implementation using SIGALRM
must carefully take into account any SIGALRM signal scheduled by previous alarm() calls, the
action previously established for SIGALRM, and whether SIGALRM was blocked. If a SIGALRM has been scheduled before the `sleep()` would ordinarily complete, the `sleep()` must be shortened to that time and a SIGALRM generated (possibly simulated by direct invocation of the signal-catching function) before `sleep()` returns. If a SIGALRM has been scheduled after the `sleep()` would ordinarily complete, it must be rescheduled for the same time before `sleep()` returns. The action and blocking for SIGALRM must be saved and restored.

Historical implementations often implement the SIGALRM-based version using `alarm()` and `pause()`. One such implementation is prone to infinite hangups, as described in `pause()`. Another such implementation uses the C-language `setjmp()` and `longjmp()` functions to avoid that window. That implementation introduces a different problem: when the SIGALRM signal interrupts a signal-catching function installed by the user to catch a different signal, the `longjmp()` aborts that signal-catching function. An implementation based on `sigprocmask()`, `alarm()`, and `sigsuspend()` can avoid these problems.

Despite all reasonable care, there are several very subtle, but detectable and unavoidable, differences between the two types of implementations. These are the cases mentioned in this volume of IEEE Std 1003.1-2001 where some other activity relating to SIGALRM takes place, and the results are stated to be unspecified. All of these cases are sufficiently unusual as not to be of concern to most applications.

See also the discussion of the term `realtime` in `alarm()`.

Since `sleep()` can be implemented using `alarm()`, the discussion about alarms occurring early under `alarm()` applies to `sleep()` as well.

Application writers should note that the type of the argument `seconds` and the return value of `sleep()` is `unsigned`. That means that a Strictly Conforming POSIX System Interfaces Application cannot pass a value greater than the minimum guaranteed value for `{UINT_MAX}`, which the ISO C standard sets as 65 535, and any application passing a larger value is restricting its portability. A different type was considered, but historical implementations, including those with a 16-bit `int` type, consistently use either `unsigned` or `int`.

Scheduling delays may cause the process to return from the `sleep()` function significantly after the requested time. In such cases, the return value should be set to zero, since the formula (requested time minus the time actually spent) yields a negative number and `sleep()` returns an `unsigned`.

**FUTURE DIRECTIONS**

None.

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Threads Extension.
NAME
snprintf — print formatted output

SYNOPSIS
#include <stdio.h>

int snprintf(char *restrict s, size_t n,
const char *restrict format, ...);

DESCRIPTION
Refer to fprintf().
NAME
sockatmark — determine whether a socket is at the out-of-band mark

SYNOPSIS
#include <sys/socket.h>
int sockatmark(int s);

DESCRIPTION
The sockatmark() function shall determine whether the socket specified by the descriptor s is at the out-of-band data mark (see the System Interfaces volume of IEEE Std 1003.1-2001, Section 2.10.12, Socket Out-of-Band Data State). If the protocol for the socket supports out-of-band data by marking the stream with an out-of-band data mark, the sockatmark() function shall return 1 when all data preceding the mark has been read and the out-of-band data mark is the first element in the receive queue. The sockatmark() function shall not remove the mark from the stream.

RETURN VALUE
Upon successful completion, the sockatmark() function shall return a value indicating whether the socket is at an out-of-band data mark. If the protocol has marked the data stream and all data preceding the mark has been read, the return value shall be 1; if there is no mark, or if data precedes the mark in the receive queue, the sockatmark() function shall return 0. Otherwise, it shall return a value of −1 and set errno to indicate the error.

ERRORS
The sockatmark() function shall fail if:

[EBADF] The s argument is not a valid file descriptor.
[ENOTTY] The s argument does not specify a descriptor for a socket.

EXAMPLES
None.

APPLICATION USAGE
The use of this function between receive operations allows an application to determine which received data precedes the out-of-band data and which follows the out-of-band data.

There is an inherent race condition in the use of this function. On an empty receive queue, the current read of the location might well be at the “mark”, but the system has no way of knowing that the next data segment that will arrive from the network will carry the mark, and sockatmark() will return false, and the next read operation will silently consume the mark.

Hence, this function can only be used reliably when the application already knows that the out-of-band data has been seen by the system or that it is known that there is data waiting to be read at the socket (via SIGURG or select()). See Section 2.10.11 (on page 61), Section 2.10.12 (on page 61), Section 2.10.14 (on page 62), and pselect() for details.

RATIONALE
The sockatmark() function replaces the historical SIOCATMARK command to ioctl() which implemented the same functionality on many implementations. Using a wrapper function follows the adopted conventions to avoid specifying commands to the ioctl() function, other than those now included to support XSI STREAMS. The sockatmark() function could be implemented as follows:

#include <sys/ioctl.h>
int sockatmark(int s)
The use of [ENOTTY] to indicate an incorrect descriptor type matches the historical behavior of SIOCATMARK.

**FUTURE DIRECTIONS**

None.

CHANGE HISTORY

First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
NAME
socketpair — create a pair of connected sockets

SYNOPSIS
#include <sys/socket.h>

int socketpair(int domain, int type, int protocol,
               int socket_vector[2]);

DESCRIPTION
The socketpair() function shall create an unbound pair of connected sockets in a specified domain, of a specified type, under the protocol optionally specified by the protocol argument. The two sockets shall be identical. The file descriptors used in referencing the created sockets shall be returned in socket_vector[0] and socket_vector[1].

The socketpair() function takes the following arguments:

domain Specifies the communications domain in which the sockets are to be created.
type Specifies the type of sockets to be created.
protocol Specifies a particular protocol to be used with the sockets. Specifying a protocol of 0 causes socketpair() to use an unspecified default protocol appropriate for the requested socket type.
socket_vector Specifies a 2-integer array to hold the file descriptors of the created socket pair.

The type argument specifies the socket type, which determines the semantics of communications over the socket. The following socket types are defined; implementations may specify additional socket types:

SOCK_STREAM Provides sequenced, reliable, bidirectional, connection-mode byte streams, and may provide a transmission mechanism for out-of-band data.

SOCK_DGRAM Provides datagrams, which are connectionless-mode, unreliable messages of fixed maximum length.

SOCK_SEQPACKET Provides sequenced, reliable, bidirectional, connection-mode transmission paths for records. A record can be sent using one or more output operations and received using one or more input operations, but a single operation never transfers part of more than one record. Record boundaries are visible to the receiver via the MSG_EOR flag.

If the protocol argument is non-zero, it shall specify a protocol that is supported by the address family. If the protocol argument is zero, the default protocol for this address family and type shall be used. The protocols supported by the system are implementation-defined.

The process may need to have appropriate privileges to use the socketpair() function or to create some sockets.

RETURN VALUE
Upon successful completion, this function shall return 0; otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The socketpair() function shall fail if:

[EAFNOSUPPORT]
The implementation does not support the specified address family.
socketpair() No more file descriptors are available for this process.

No more file descriptors are available for the system.

The specified protocol does not permit creation of socket pairs.

The protocol is not supported by the address family, or the protocol is not supported by the implementation.

The socket type is not supported by the protocol.

The socketpair() function may fail if:

The process does not have appropriate privileges.

Insufficient resources were available in the system to perform the operation.

Insufficient memory was available to fulfill the request.

EXAMPLES None.

APPLICATION USAGE The documentation for specific address families specifies which protocols each address family supports. The documentation for specific protocols specifies which socket types each protocol supports.

The socketpair() function is used primarily with UNIX domain sockets and need not be supported for other domains.

RATIONALE None.

FUTURE DIRECTIONS None.

SEE ALSO socket(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/socket.h>

CHANGE HISTORY First released in Issue 6. Derived from the XNS, Issue 5.2 specification.
NAME
sprintf — print formatted output

SYNOPSIS
#include <stdio.h>

int sprintf(char *restrict s, const char *restrict format, ...);

DESCRIPTION
Refer to fprintf().
NAME
sqrt, sqrtf, sqrtl — square root function

SYNOPSIS
#include <math.h>

double sqrt(double x);
float sqrtf(float x);
long double sqrtl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the square root of their argument \( x, \sqrt{x} \).

An application wishing to check for error situations should set \( \text{errno} \) to zero and call \( \text{feclearexcept}(\text{FE_ALL_EXCEPT}) \) before calling these functions. On return, if \( \text{errno} \) is non-zero or \( \text{fetestexcept}(\text{FE_INVALID} | \text{FE_DIVBYZERO} | \text{FE_OVERFLOW} | \text{FE_UNDERFLOW}) \) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the square root of \( x \).

For finite values of \( x < -0 \), a domain error shall occur, and either a \( \text{NaN} \) (if supported), or an implementation-defined value shall be returned.

If \( x \) is \( \text{NaN} \), a \( \text{NaN} \) shall be returned.

If \( x \) is \( \pm 0 \) or \( +\text{Inf} \), \( x \) shall be returned.

If \( x \) is \( -\text{Inf} \), a domain error shall occur, and either a \( \text{NaN} \) (if supported), or an implementation-defined value shall be returned.

ERRORS
These functions shall fail if:

Domain Error The finite value of \( x \) is \( < -0 \), or \( x \) is \( -\text{Inf} \).

If the integer expression (\( \text{math_errhandling} \& \text{MATH_ERRNO} \)) is non-zero, then \( \text{errno} \) shall be set to [EDOM]. If the integer expression (\( \text{math_errhandling} \& \text{MATH_ERREXCEPT} \)) is non-zero, then the invalid floating-point exception shall be raised.

EXAMPLES

Taking the Square Root of 9.0

#include <math.h>
...
double x = 9.0;
double result;
...
result = sqrt(x);
APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling &
MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

Section 4.18, Treatment of Error Conditions for Mathematical Functions, <math.h>, <stdio.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This
text was previously published in the APPLICATION USAGE section.

Issue 6

The sqrtf() and sqrtl() functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are
revised to align with the ISO/IEC 9899:1999 standard.

IEC 60559:1989 standard floating-point extensions over the ISO/IEC 9899:1999 standard are
marked.

DESCRIPTION
Refer to scanf().
NAME
stat — get file status

SYNOPSIS
#include <sys/stat.h>
int stat(const char *restrict path, struct stat *restrict buf);

DESCRIPTION
The stat() function shall obtain information about the named file and write it to the area pointed to by the buf argument. The path argument points to a pathname naming a file. Read, write, or execute permission of the named file is not required. An implementation that provides additional or alternate file access control mechanisms may, under implementation-defined conditions, cause stat() to fail. In particular, the system may deny the existence of the file specified by path.

If the named file is a symbolic link, the stat() function shall continue pathname resolution using the contents of the symbolic link, and shall return information pertaining to the resulting file if the file exists.

The buf argument is a pointer to a stat structure, as defined in the <sys/stat.h> header, into which information is placed concerning the file.

The stat() function shall update any time-related fields (as described in the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.7, File Times Update), before writing into the stat structure.

Unless otherwise specified, the structure members st_mode, st_ino, st_dev, st_uid, st_gid, st_atime, st_ctime, and st_mtime shall have meaningful values for all file types defined in this volume of IEEE Std 1003.1-2001. The value of the member st_nlink shall be set to the number of links to the file.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The stat() function shall fail if:

[EACCES] Search permission is denied for a component of the path prefix.

[EIO] An error occurred while reading from the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOENT] A component of path does not name an existing file or path is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EOVERFLOW] The file size in bytes or the number of blocks allocated to the file or the file serial number cannot be represented correctly in the structure pointed to by buf.
The `stat()` function may fail if:

- `[ELOOP]` More than `{SYMLOOP_MAX}` symbolic links were encountered during resolution of the `path` argument.
- `[ENAMETOOLONG]` As a result of encountering a symbolic link in resolution of the `path` argument, the length of the substituted pathname string exceeded `{PATH_MAX}`.
- `[EOVERFLOW]` A value to be stored would overflow one of the members of the `stat` structure.

**EXAMPLES**

**Obtaining File Status Information**

The following example shows how to obtain file status information for a file named `/home/cnd/mod1`. The structure variable `buffer` is defined for the `stat` structure.

```c
#include <sys/types.h>
#include <sys/stat.h>
#include <fcntl.h>

struct stat buffer;
int status;
...
status = stat("/home/cnd/mod1", &buffer);
```

**Getting Directory Information**

The following example fragment gets status information for each entry in a directory. The call to the `stat()` function stores file information in the `stat` structure pointed to by `statbuf`. The lines that follow the `stat()` call format the fields in the `stat` structure for presentation to the user of the program.

```c
#include <sys/types.h>
#include <sys/stat.h>
#include <dirent.h>
#include <pwd.h>
#include <grp.h>
#include <time.h>
#include <locale.h>
#include <langinfo.h>
#include <stdio.h>
#include <stdint.h>

struct dirent *dp;
struct stat statbuf;
struct passwd *pwd;
struct group *grp;
struct tm *tm;
char datestring[256];
...
/* Loop through directory entries. */
while ((dp = readdir(dir)) != NULL) {
    /* Get entry’s information. */
    if (stat(dp->d_name, &statbuf) == -1)
```
continue;

/* Print out type, permissions, and number of links. */
printf("%10.10s", sperm(statbuf.st_mode));
printf("%4d", statbuf.st_nlink);

/* Print out owner’s name if it is found using getpwuid(). */
if ((pwd = getpwuid(statbuf.st_uid)) != NULL)
    printf(" %-8s", pwd->pw_name);
else
    printf(" %-8d", statbuf.st_uid);

/* Print out group name if it is found using getgrgid(). */
if ((grp = getgrgid(statbuf.st_gid)) != NULL)
    printf(" %-8s", grp->gr_name);
else
    printf(" %-8d", statbuf.st_gid);

/* Print size of file. */
printf(" %9jd", (intmax_t)statbuf.st_size);
tm = localtime(&statbuf.st_mtime);
/* Get localized date string. */
strftime(datestring, sizeof(datestring), nl_langinfo(D_T_FMT), tm);
printf(" %s %s\n", datestring, dp->d_name);
}

APPLICATION USAGE
None.

RATIONALE
The intent of the paragraph describing “additional or alternate file access control mechanisms”
is to allow a secure implementation where a process with a label that does not dominate the
file’s label cannot perform a stat() function. This is not related to read permission; a process with
a label that dominates the file’s label does not need read permission. An implementation that
supports write-up operations could fail fstat() function calls even though it has a valid file
descriptor open for writing.

FUTURE DIRECTIONS
None.

SEE ALSO
fstat(), lstat(), readlink(), symlink(), the Base Definitions volume of IEEE Std 1003.1-2001,
<sys/stat.h>, <sys/types.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
Large File Summit extensions are added.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:
• The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

• The [EIO] mandatory error condition is added.

• The [ELOOP] mandatory error condition is added.

• The [EOVERFLOW] mandatory error condition is added. This change is to support large files.

• The [ENAMETOOLONG] and the second [EOVERFLOW] optional error conditions are added.

The following changes were made to align with the IEEE P1003.1a draft standard:

• Details are added regarding the treatment of symbolic links.

• The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The `restrict` keyword is added to the `stat()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
statvfs — get file system information

SYNOPSIS
XSI
#include <sys/statvfs.h>

int statvfs(const char * restrict path, struct statvfs * restrict buf);

DESCRIPTION
Refer to fstatvfs().
NAME
stderr, stdin, stdout — standard I/O streams

SYNOPSIS
#include <stdio.h>
extern FILE *stderr, *stdin, *stdout;

DESCRIPTION
CX The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

A file with associated buffering is called a stream and is declared to be a pointer to a defined type FILE. The fopen() function shall create certain descriptive data for a stream and return a pointer to designate the stream in all further transactions. Normally, there are three open streams with constant pointers declared in the <stdio.h> header and associated with the standard open files.

At program start-up, three streams shall be predefined and need not be opened explicitly: standard input (for reading conventional input), standard output (for writing conventional output), and standard error (for writing diagnostic output). When opened, the standard error stream is not fully buffered; the standard input and standard output streams are fully buffered if and only if the stream can be determined not to refer to an interactive device.

CX The following symbolic values in <unistd.h> define the file descriptors that shall be associated with the C-language stdin, stdout, and stderr when the application is started:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STDIN_FILENO</td>
<td>Standard input value, stdin. Its value is 0.</td>
</tr>
<tr>
<td>STDOUT_FILENO</td>
<td>Standard output value, stdout. Its value is 1.</td>
</tr>
<tr>
<td>STDERR_FILENO</td>
<td>Standard error value, stderr. Its value is 2.</td>
</tr>
</tbody>
</table>

The stderr stream is expected to be open for reading and writing.

RETURN VALUE
None.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE

CHANGE HISTORY

First released in Issue 1.

Issue 6

Extensions beyond the ISO C standard are marked.

A note that stderr is expected to be open for reading and writing is added to the DESCRIPTION.
NAME
strcasecmp, strncasecmp — case-insensitive string comparisons

SYNOPSIS
#include <strings.h>

int strcasecmp(const char *s1, const char *s2);
int strncasecmp(const char *s1, const char *s2, size_t n);

DESCRIPTION
The strcasecmp() function shall compare, while ignoring differences in case, the string pointed to by s1 to the string pointed to by s2. The strncasecmp() function shall compare, while ignoring differences in case, not more than n bytes from the string pointed to by s1 to the string pointed to by s2.

In the POSIX locale, strcasecmp() and strncasecmp() shall behave as if the strings had been converted to lowercase and then a byte comparison performed. The results are unspecified in other locales.

RETURN VALUE
Upon completion, strcasecmp() shall return an integer greater than, equal to, or less than 0, if the string pointed to by s1 is, ignoring case, greater than, equal to, or less than the string pointed to by s2, respectively.

Upon successful completion, strncasecmp() shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by s1 is, ignoring case, greater than, equal to, or less than the possibly null-terminated array pointed to by s2, respectively.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

NAME
strcat — concatenate two strings

SYNOPSIS
#include <string.h>
char *strcat(char *restrict s1, const char *restrict s2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strcat() function shall append a copy of the string pointed to by s2 (including the terminating null byte) to the end of the string pointed to by s1. The initial byte of s2 overwrites the null byte at the end of s1. If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE
The strcat() function shall return s1; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3 applications. Reliable error detection by this function was never guaranteed.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Issue 6
The strcat() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
strchr — string scanning operation

SYNOPSIS
#include <string.h>
char *strchr(const char *s, int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflicting between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strchr() function shall locate the first occurrence of c (converted to a char) in the string pointed to by s. The terminating null byte is considered to be part of the string.

RETURN VALUE
Upon completion, strchr() shall return a pointer to the byte, or a null pointer if the byte was not found.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

Issue 6
Extensions beyond the ISO C standard are marked.
NAME
strcmp — compare two strings

SYNOPSIS
#include <string.h>
int strcmp(const char *s1, const char *s2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The *strcmp*() function shall compare the string pointed to by *s1* to the string pointed to by *s2*.
The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type unsigned char) that differ in the strings being compared.

RETURN VALUE
Upon completion, *strcmp*() shall return an integer greater than, equal to, or less than 0, if the string pointed to by *s1* is greater than, equal to, or less than the string pointed to by *s2*, respectively.

ERRORS
No errors are defined.

EXAMPLES
Checking a Password Entry
The following example compares the information read from standard input to the value of the name of the user entry. If the *strcmp*() function returns 0 (indicating a match), a further check will be made to see if the user entered the proper old password. The *crypt*() function shall encrypt the old password entered by the user, using the value of the encrypted password in the passwd structure as the salt. If this value matches the value of the encrypted passwd in the structure, the entered password oldpasswd is the correct user’s password. Finally, the program encrypts the new password so that it can store the information in the passwd structure.

```c
#include <string.h>
#include <unistd.h>
#include <stdio.h>
...
int valid_change;
struct passwd *p;
char user[100];
char oldpasswd[100];
char newpasswd[100];
char savepasswd[100];
...
if (strcmp(p->pw_name, user) == 0) {
    if (strcmp(p->pw_passwd, crypt(oldpasswd, p->pw_passwd)) == 0) {
        strcpy(savepasswd, crypt(newpasswd, user));
        p->pw_passwd = savepasswd;
        valid_change = 1;
    }
    else {
        ...
    }
    else {
        ...
    }
   ...
```
fprintf(stderr, "Old password is not valid\n");

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
Extensions beyond the ISO C standard are marked.
NAME
strcoll — string comparison using collating information

SYNOPSIS
#include <string.h>

int strcoll(const char *s1, const char *s2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strcoll() function shall compare the string pointed to by s1 to the string pointed to by s2, both interpreted as appropriate to the LC_COLLATE category of the current locale.

The strcoll() function shall not change the setting of errno if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set errno to 0, then call strcoll(), then check errno.

RETURN VALUE
Upon successful completion, strcoll() shall return an integer greater than, equal to, or less than 0, according to whether the string pointed to by s1 is greater than, equal to, or less than the string pointed to by s2 when both are interpreted as appropriate to the current locale. On error, strcoll() may set errno, but no return value is reserved to indicate an error.

ERRORS
The strcoll() function may fail if:

[EINVAL] The s1 or s2 arguments contain characters outside the domain of the collating sequence.

EXAMPLES
Comparing Nodes
The following example uses an application-defined function, node_compare(), to compare two nodes based on an alphabetical ordering of the string field.

#include <string.h>
...
struct node { /* These are stored in the table. */
    char *string;
    int length;
};
...
int node_compare(const void *node1, const void *node2)
{
    return strcoll(((const struct node *)node1)->string,
                   ((const struct node *)node2)->string);
}
...

APPLICATION USAGE
The strxfrm() and strcmp() functions should be used for sorting large lists.
RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
strcoll(), strcmp(), strxfrm(), the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

CHANGE HISTORY
First released in Issue 3.

Issue 5
The DESCRIPTION is updated to indicate that errno does not change if the function is successful.

Issue 6
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• The [EINVAL] optional error condition is added.
An example is added.
**NAME**
strcpy — copy a string

**SYNOPSIS**
```c
#include <string.h>
char *strcpy(char *restrict s1, const char *restrict s2);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `strcpy()` function shall copy the string pointed to by `s2` (including the terminating null byte) into the array pointed to by `s1`. If copying takes place between objects that overlap, the behavior is undefined.

**RETURN VALUE**
The `strcpy()` function shall return `s1`; no return value is reserved to indicate an error.

**ERRORS**
No errors are defined.

**EXAMPLES**

**Initializing a String**
The following example copies the string "----------" into the `permstring` variable.
```c
#include <string.h>
...
static char permstring[11];
...
strcpy(permstring, "----------");
```

**Storing a Key and Data**
The following example allocates space for a key using `malloc()` then uses `strcpy()` to place the key there. Then it allocates space for data using `malloc()`, and uses `strcpy()` to place data there. (The user-defined function `dbfree()` frees memory previously allocated to an array of type `struct element`.*
```c
#include <string.h>
#include <stdlib.h>
#include <stdio.h>
...
/* Structure used to read data and store it. */
struct element {
    char *key;
    char *data;
};
struct element *tbl, *curtbl;
char *key, *data;
int count;
...
void dbfree(struct element *, int);
```
...  
43915  if ((curtbl->key = malloc(strlen(key) + 1)) == NULL) {
43916      perror("malloc"); dbfree(tbl, count); return NULL;
43917  }
43918  strcpy(curtbl->key, key);
43919  
43920  if ((curtbl->data = malloc(strlen(data) + 1)) == NULL) {
43921      perror("malloc"); free(curtbl->key); dbfree(tbl, count); return NULL;
43922  }
43923  strcpy(curtbl->data, data);
43924  ...

APPLICATION USAGE
43925  Character movement is performed differently in different implementations. Thus, overlapping
43926  moves may yield surprises.
43927  This issue is aligned with the ISO C standard; this does not affect compatibility with XPG3
43928  applications. Reliable error detection by this function was never guaranteed.

RATIONALE
43929  None.

FUTURE DIRECTIONS
43930  None.

SEE ALSO
43931  strlen(), the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

CHANGE HISTORY
43935  First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
43938  The strcpy() prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.
**NAME**

strcspn — get the length of a complementary substring

**SYNOPSIS**

```c
#include <string.h>

size_t strcspn(const char *s1, const char *s2);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `strcspn` function shall compute the length (in bytes) of the maximum initial segment of the string pointed to by `s1` which consists entirely of bytes *not* from the string pointed to by `s2`.

**RETURN VALUE**

The `strcspn` function shall return the length of the computed segment of the string pointed to by `s1`; no return value is reserved to indicate an error.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`strspn()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<string.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

- **Issue 5**
  - The RETURN VALUE section is updated to indicate that `strcspn()` returns the length of `s1`, and not `s1` itself as was previously stated.

- **Issue 6**
  - The Open Group Corrigendum U030/1 is applied. The text of the RETURN VALUE section is updated to indicate that the computed segment length is returned, not the `s1` length.
NAME
strdup — duplicate a string

SYNOPSIS
#include <string.h>
char *strdup(const char *s1);

DESCRIPTION
The strdup() function shall return a pointer to a new string, which is a duplicate of the string pointed to by s1. The returned pointer can be passed to free(). A null pointer is returned if the new string cannot be created.

RETURN VALUE
The strdup() function shall return a pointer to a new string on success. Otherwise, it shall return a null pointer and set errno to indicate the error.

ERRORS
The strdup() function may fail if:
[ENOMEM] Storage space available is insufficient.

EXAMPLES
None.

APPLICATION USAGE
None.

NAME
strerror, strerror_r — get error message string

SYNOPSIS
#include <string.h>

char *strerror(int errnum);

int strerror_r(int errnum, char *strerrbuf, size_t buflen);

DESCRIPTION
For strerror(): The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strerror() function shall map the error number in errnum to a locale-dependent error message string and shall return a pointer to it. Typically, the values for errnum come from errno, but strerror() shall map any value of type int to a message.

The string pointed to shall not be modified by the application, but may be overwritten by a subsequent call to strerror() or perror().

The contents of the error message strings returned by strerror() should be determined by the setting of the LC_MESSAGES category in the current locale.

The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls strerror().

The strerror() function shall not change the setting of errno if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set errno to 0, then call strerror(), then check errno.

The strerror() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The strerror_r() function shall map the error number in errnum to a locale-dependent error message string and shall return the string in the buffer pointed to by strerrbuf, with length buflen.

RETURN VALUE

Upon successful completion, strerror() shall return a pointer to the generated message string. On error errno may be set, but no return value is reserved to indicate an error.

Upon successful completion, strerror_r() shall return 0. Otherwise, an error number shall be returned to indicate the error.

ERRORS

These functions may fail if:

[EINVAL] The value of errnum is not a valid error number.

The strerror_r() function may fail if:

[ERANGE] Insufficient storage was supplied via strerrbuf and buflen to contain the generated message string.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
perror(), the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

CHANGE HISTORY
First released in Issue 3.

Issue 5
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.
A note indicating that this function need not be reentrant is added to the DESCRIPTION.

Issue 6
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE section, the fact that errno may be set is added.
- The [EINVAL] optional error condition is added.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The strerror_r() function is added in response to IEEE PASC Interpretation 1003.1c #39.
The strerror_r() function is marked as part of the Thread-Safe Functions option.
NAME
strfmon — convert monetary value to a string

SYNOPSIS
XSI
#include <monetary.h>

ssize_t strfmon(char *restrict s, size_t maxsize,
const char *restrict format, ...);

DESCRIPTION
The strfmon() function shall place characters into the array pointed to by s as controlled by the
string pointed to by format. No more than maxsize bytes are placed into the array.

The format is a character string, beginning and ending in its initial state, if any, that contains two
types of objects: plain characters, which are simply copied to the output stream, and conversion
specifications, each of which shall result in the fetching of zero or more arguments which are
converted and formatted. The results are undefined if there are insufficient arguments for the
format. If the format is exhausted while arguments remain, the excess arguments are simply
ignored.

The application shall ensure that a conversion specification consists of the following sequence:

- A ‘%’ character
- Optional flags
- Optional field width
- Optional left precision
- Optional right precision
- A required conversion specifier character that determines the conversion to be performed

Flags
One or more of the following optional flags can be specified to control the conversion:

- An ‘=’ followed by a single character f which is used as the numeric fill character. In
  order to work with precision or width counts, the fill character shall be a single byte
  character; if not, the behavior is undefined. The default numeric fill character is the
  <space>. This flag does not affect field width filling which always uses the <space>.
  This flag is ignored unless a left precision (see below) is specified.
- Do not format the currency amount with grouping characters. The default is to insert
  the grouping characters if defined for the current locale.

Specify the style of representing positive and negative currency amounts. Only one of
‘+’ or ‘(‘ may be specified. If ‘+’ is specified, the locale’s equivalent of ‘+’ and ‘−’
are used (for example, in the U.S., the empty string if positive and ‘−’ if negative). If
‘(‘ is specified, negative amounts are enclosed within parentheses. If neither flag is
specified, the ‘+’ style is used.

Suppress the currency symbol from the output conversion.

Specify the alignment. If this flag is present the result of the conversion is left-justified
(padded to the right) rather than right-justified. This flag shall be ignored unless a field
width (see below) is specified.
Field Width

\( w \)  A decimal digit string \( w \) specifying a minimum field width in bytes in which the result of the conversion is right-justified (or left-justified if the flag \( '-' \) is specified). The default is 0.

Left Precision

\#n  A \( '#' \) followed by a decimal digit string \( n \) specifying a maximum number of digits expected to be formatted to the left of the radix character. This option can be used to keep the formatted output from multiple calls to the \( \text{strfmon()} \) function aligned in the same columns. It can also be used to fill unused positions with a special character as in "$***123.45". This option causes an amount to be formatted as if it has the number of digits specified by \( n \). If more than \( n \) digit positions are required, this conversion specification is ignored. Digit positions in excess of those actually required are filled with the numeric fill character (see the \( =f \) flag above).

If grouping has not been suppressed with the \( '^' \) flag, and it is defined for the current locale, grouping separators are inserted before the fill characters (if any) are added. Grouping separators are not applied to fill characters even if the fill character is a digit.

To ensure alignment, any characters appearing before or after the number in the formatted output such as currency or sign symbols are padded as necessary with \( <\text{space}>s \) to make their positive and negative formats an equal length.

Right Precision

\.p  A period followed by a decimal digit string \( p \) specifying the number of digits after the radix character. If the value of the right precision \( p \) is 0, no radix character appears. If a right precision is not included, a default specified by the current locale is used. The amount being formatted is rounded to the specified number of digits prior to formatting.

Conversion Specifier Characters

The conversion specifier characters and their meanings are:

\( i \)  The double argument is formatted according to the locale's international currency format (for example, in the U.S.: USD 1,234.56). If the argument is \( \pm \text{Inf} \) or NaN, the result of the conversion is unspecified.

\( n \)  The double argument is formatted according to the locale's national currency format (for example, in the U.S.: $1,234.56). If the argument is \( \pm \text{Inf} \) or NaN, the result of the conversion is unspecified.

\%  Convert to a \( '\'%'\); no argument is converted. The entire conversion specification shall be \%.

Locale Information

The \( \text{LC_MONETARY} \) category of the program's locale affects the behavior of this function including the monetary radix character (which may be different from the numeric radix character affected by the \( \text{LC_NUMERIC} \) category), the grouping separator, the currency symbols, and formats. The international currency symbol should be conformant with the ISO 4217:2001 standard.

If the value of \( \text{maxsize} \) is greater than \( \text{SSIZE_MAX} \), the result is implementation-defined.
**RETURN VALUE**

If the total number of resulting bytes including the terminating null byte is not more than `maxsize`, `strfmon()` shall return the number of bytes placed into the array pointed to by `s`, not including the terminating null byte. Otherwise, −1 shall be returned, the contents of the array are unspecified, and `errno` shall be set to indicate the error.

**ERRORS**

The `strfmon()` function shall fail if:

- [E2BIG] Conversion stopped due to lack of space in the buffer.

**EXAMPLES**

Given a locale for the U.S. and the values 123.45, −123.45, and 3456.781, the following output might be produced. Square brackets (" [ ] ") are used in this example to delimit the output.

- `%n [%123.45]`  
  Default formatting

- `%11n [ $123.45]`  
  Right align within an 11-character field

- ` %#5n [ $ 123.45]`  
  Aligned columns for values up to 99 999

- `%=*#5n [ $***123.45]`  
  Specify a fill character

- `%=0#5n [ $000123.45]`  
  Fill characters do not use grouping even if the fill character is a digit

- `%^[#5n [ $ 123]`  
  Disable the grouping separator

- `%^[5.0n [ $ 123]`  
  Round off to whole units

- `%^[5.4n [ $ 123.450]`  
  Increase the precision

- `%(#5n [($ 123.45)]`  
  Use an alternative pos/neg style

- `%!(#5n [ 123.45]`  
  Disable the currency symbol

- `%%14#5.4n [ $ 123.4500 ]`  
  Left-justify the output
System Interfaces

strfmon()

%14#5.4n [ $ 123.4500] Corresponding right-justified output
[ -$ 123.4500]
[ $ 3,456.7810]

See also the EXAMPLES section in fprintf().

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
Lowercase conversion characters are reserved for future standards use and uppercase for implementation-defined use.

SEE ALSO
fprintf(), localeconv(), the Base Definitions volume of IEEE Std 1003.1-2001, <monetary.h>

CHANGE HISTORY
First released in Issue 4.

Issue 5
Moved from ENHANCED I18N to BASE.
The [ENOSYS] error is removed.
A sentence is added to the DESCRIPTION warning about values of maxsize that are greater than [SSIZE_MAX].

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The restrict keyword is added to the strfmon() prototype for alignment with the ISO/IEC 9899:1999 standard.
The EXAMPLES section is reworked, clarifying the output format.
NAME
strftime — convert date and time to a string

SYNOPSIS
#include <time.h>

size_t strftime(char *restrict s, size_t maxsize,
  const char *restrict format, const struct tm *restrict timeptr);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This
The strftime() function shall place bytes into the array pointed to by s as controlled by the string
pointed to by format. The format is a character string, beginning and ending in its initial shift
state, if any. The format string consists of zero or more conversion specifications and ordinary
characters. A conversion specification consists of a ‘%’ character, possibly followed by an E or O
modifier, and a terminating conversion specifier character that determines the conversion
specification’s behavior. All ordinary characters (including the terminating null byte) are copied
unchanged into the array. If copying takes place between objects that overlap, the behavior is
undefined. No more than maxsize bytes are placed into the array. Each conversion specifier is
replaced by appropriate characters as described in the following list. The appropriate characters
are determined using the LC_TIME category of the current locale and by the values of zero or
more members of the broken-down time structure pointed to by timeptr, as specified in brackets
in the description. If any of the specified values are outside the normal range, the characters
stored are unspecified.

Local timezone information is used as though strftime() called tzset().
The following conversion specifications are supported:
%a Replaced by the locale’s abbreviated weekday name. [tm_wday]
%A Replaced by the locale’s full weekday name. [tm_wday]
%b Replaced by the locale’s abbreviated month name. [tm_mon]
%B Replaced by the locale’s full month name. [tm_mon]
%c Replaced by the locale’s appropriate date and time representation. (See the Base
Definitions volume of IEEE Std 1003.1-2001, <time.h>.)
%c Replaced by the year divided by 100 and truncated to an integer, as a decimal number
[00,99]. [tm_year]
%d Replaced by the day of the month as a decimal number [01,31]. [tm_mday]
%d Equivalent to %m/%d/%y. [tm_mon, tm_mday, tm_year]
%e Replaced by the day of the month as a decimal number [1,31]; a single digit is preceded
by a space. [tm_mday]
%F Equivalent to %Y-%m-%d (the ISO 8601:2000 standard date format). [tm_year, tm_mon,
 tm_mday]
%g Replaced by the last 2 digits of the week-based year (see below) as a decimal number
[00,99]. [tm_year, tm_wday, tm_yday]
%G Replaced by the week-based year (see below) as a decimal number (for example, 1977).
[tm_year, tm_wday, tm_yday]
System Interfaces

strftime()

%h  Equivalent to %b.  [tm_mon]

%H  Replaced by the hour (24-hour clock) as a decimal number [00,23].  [tm_hour]

%i  Replaced by the hour (12-hour clock) as a decimal number [01,12].  [tm_hour]

%j  Replaced by the day of the year as a decimal number [001,366].  [tm_yday]

%m  Replaced by the month as a decimal number [01,12].  [tm_mon]

%M  Replaced by the minute as a decimal number [00,59].  [tm_min]

%n  Replaced by a <newline>.

%p  Replaced by the locale's equivalent of either a.m. or p.m.  [tm_hour]

%r  Replaced by the time in a.m. and p.m. notation; in the POSIX locale this shall be equivalent to %I:%M:%S %p.  [tm_hour, tm_min, tm_sec]

%R  Replaced by the time in 24-hour notation (%H:%M).  [tm_hour, tm_min]

%S  Replaced by the second as a decimal number [00,60].  [tm_sec]

%t  Replaced by a <tab>.

%T  Replaced by the time (%H:%M:%S).  [tm_hour, tm_min, tm_sec]

%u  Replaced by the weekday as a decimal number [1,7], with 1 representing Monday.  [tm_wday]

%U  Replaced by the week number of the year as a decimal number [00,53]. The first Sunday of January is the first day of week 1; days in the new year before this are in week 0.  [tm_year, tm_wday, tm_yday]

%V  Replaced by the week number of the year (Monday as the first day of the week) as a decimal number [01,53]. If the week containing 1 January has four or more days in the new year, then it is considered week 1. Otherwise, it is the last week of the previous year, and the next week is week 1. Both January 4th and the first Thursday of January are always in week 1.  [tm_year, tm_wday, tm_yday]

%w  Replaced by the weekday as a decimal number [0,6], with 0 representing Sunday.  [tm_wday]

%W  Replaced by the week number of the year as a decimal number [00,53]. The first Monday of January is the first day of week 1; days in the new year before this are in week 0.  [tm_year, tm_wday, tm_yday]

%x  Replaced by the locale's appropriate date representation. (See the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>.)

%X  Replaced by the locale's appropriate time representation. (See the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>.)

%y  Replaced by the last two digits of the year as a decimal number [00,99].  [tm_year]

%Y  Replaced by the year as a decimal number (for example, 1997).  [tm_year]

%z  Replaced by the offset from UTC in the ISO 8601:2000 standard format (+hhmm or −hhmm), or by no characters if no timezone is determinable. For example, "−0430" means 4 hours 30 minutes behind UTC (west of Greenwich). If tm_isdst is zero, the standard time offset is used. If tm_isdst is greater than zero, the daylight savings time offset is used. If tm_isdst is negative, no characters are returned.  [tm_isdst]
%Z  Replaced by the timezone name or abbreviation, or by no bytes if no timezone information exists. [tm_isdst]
%z  Replaced by \%.

If a conversion specification does not correspond to any of the above, the behavior is undefined.

 CX

If a struct tm broken-down time structure is created by localtime() or localtime_r(), or modified
by mktime(), and the value of TZ is subsequently modified, the results of the %Z and %z strftime()
conversion specifiers are undefined, when strftime() is called with such a broken-down time
structure.

If a struct tm broken-down time structure is created or modified by gmtime() or gmtime_r(), it is
unspecified whether the result of the %Z and %z conversion specifiers shall refer to UTC or the
current local timezone, when strftime() is called with such a broken-down time structure.

Modified Conversion Specifiers
Some conversion specifiers can be modified by the E or O modifier characters to indicate that an
alternative format or specification should be used rather than the one normally used by the
unmodified conversion specifier. If the alternative format or specification does not exist for the
current locale (see ERA in the Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5,
LC_TIME), the behavior shall be as if the unmodified conversion specification were used.

%Ec  Replaced by the locale's alternative appropriate date and time representation.
%Ec  Replaced by the name of the base year (period) in the locale's alternative representation.
%Ex  Replaced by the locale's alternative date representation.
%Ex  Replaced by the locale's alternative time representation.
%Ey  Replaced by the offset from %Ec (year only) in the locale's alternative representation.
%Ey  Replaced by the full alternative year representation.
%Od  Replaced by the day of the month, using the locale's alternative numeric symbols, filled
as needed with leading zeros if there is any alternative symbol for zero; otherwise, with
leading spaces.
%Oe  Replaced by the day of the month, using the locale's alternative numeric symbols, filled
as needed with leading spaces.
%Oh  Replaced by the hour (24-hour clock) using the locale's alternative numeric symbols.
%O1  Replaced by the hour (12-hour clock) using the locale's alternative numeric symbols.
%Om  Replaced by the month using the locale's alternative numeric symbols.
%Oo  Replaced by the minutes using the locale's alternative numeric symbols.
%Os  Replaced by the seconds using the locale's alternative numeric symbols.
%OU  Replaced by the week number of the year (Monday as the first day of the week, rules
corresponding to %U) using the locale's alternative numeric symbols.
%OV  Replaced by the week number of the year (Monday as the first day of the week, rules
corresponding to %V) using the locale's alternative numeric symbols.
System Interfaces

strftime()

%ow  Replaced by the number of the weekday (Sunday=0) using the locale’s alternative numeric symbols.
%OW  Replaced by the week number of the year (Monday as the first day of the week) using the locale’s alternative numeric symbols.
%oy  Replaced by the year (offset from %C) using the locale’s alternative numeric symbols.

%g, %G, and %V give values according to the ISO 8601:2000 standard week-based year. In this system, weeks begin on a Monday and week 1 of the year is the week that includes January 4th, which is also the week that includes the first Thursday of the year, and is also the first week that contains at least four days in the year. If the first Monday of January is the 2nd, 3rd, or 4th, the preceding days are part of the last week of the preceding year; thus, for Saturday 2nd January 1999, %G is replaced by 1998 and %V is replaced by 53. If December 29th, 30th, or 31st is a Monday, it and any following days are part of week 1 of the following year. Thus, for Tuesday 30th December 1997, %G is replaced by 1998 and %V is replaced by 01.

If a conversion specifier is not one of the above, the behavior is undefined.

RETURN VALUE
If the total number of resulting bytes including the terminating null byte is not more than maxsize, strftime() shall return the number of bytes placed into the array pointed to by s, not including the terminating null byte. Otherwise, 0 shall be returned and the contents of the array are unspecified.

ERRORS
No errors are defined.

EXAMPLES
Getting a Localized Date String
The following example first sets the locale to the user’s default. The locale information will be used in the nl_langinfo() and strftime() functions. The nl_langinfo() function returns the localized date string which specifies how the date is laid out. The strftime() function takes this information and, using the tm structure for values, places the date and time information into datestring.

```c
#include <time.h>
#include <locale.h>
#include <langinfo.h>
 ...
struct tm *tm;
char datestring[256];
 ...
setlocale (LC_ALL, "");
 ...
strftime (datestring, sizeof(datestring), nl_langinfo (D_T_FMT), tm);
 ...
```

APPLICATION USAGE
The range of values for %S is [00,60] rather than [00,59] to allow for the occasional leap second.
Some of the conversion specifications are duplicates of others. They are included for compatibility with nl_cxtime() and nl_ascxtime(), which were published in Issue 2.
Applications should use %Y (4-digit years) in preference to %y (2-digit years).
In the C locale, the E and O modifiers are ignored and the replacement strings for the following specifiers are:
%a  The first three characters of %A.
%A  One of Sunday, Monday, . . ., Saturday.
%b  The first three characters of %B.
%B  One of January, February, . . ., December.
%c  Equivalent to %a %b %e %T %Y.
%p  One of AM or PM.
%r  Equivalent to %I:%M:%S%p.
%x  Equivalent to %m/%d/%y.
%X  Equivalent to %T.
%Z  Implementation-defined.

RATIONALE
None.

FUTURE DIRECTIONS
None.

asctime(), clock(), ctime(), difftime(), getdate(), gmtime(), localtime(), mktime(), strftime(), time(), tzone(), utime(), Base Definitions volume of IEEE Std 1003.1-2001, Section 7.3.5, LC_TIME, <time.h>

CHANGE HISTORY
First released in Issue 3.

Issue 5
The description of %OV is changed to be consistent with %V and defines Monday as the first day of the week.
The description of %OV is clarified.

Issue 6
Extensions beyond the ISO C standard are marked.
The Open Group Corrigendum U033/8 is applied. The %V conversion specifier is changed from “Otherwise, it is week 53 of the previous year, and the next week is week 1” to “Otherwise, it is the last week of the previous year, and the next week is week 1”.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
- The %C, %D, %E, %H, %h, %r, %R, %T, and %t conversion specifiers are added.
- The modified conversion specifiers are added for consistency with the ISO POSIX-2 standard date utility.
The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:
- The strftime() prototype is updated.
- The DESCRIPTION is extensively revised.
- The %Z conversion specifier is added.
A new example is added.
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/60 is applied.
NAME
strlen — get string length

SYNOPSIS
#include <string.h>
size_t strlen(const char *s);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strlen() function shall compute the number of bytes in the string to which s points, not including the terminating null byte.

RETURN VALUE
The strlen() function shall return the length of s; no return value shall be reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES

Getting String Lengths
The following example sets the maximum length of key and data by using strlen() to get the lengths of those strings.

#include <string.h>
...
struct element {
    char *key;
    char *data;
};
...
char *key, *data;
int len;
*keylength = *datalength = 0;
...
if ((len = strlen(key)) > *keylength)
    *keylength = len;
if ((len = strlen(data)) > *datalength)
    *datalength = len;
...

APPLICATION USAGE

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The RETURN VALUE section is updated to indicate that strlen() returns the length of s, and not s itself as was previously stated.
NAME
strncasecmp — case-insensitive string comparison

SYNOPSIS

XSI
#include <strings.h>

int strncasecmp(const char *s1, const char *s2, size_t n);

DESCRIPTION
Refer to strcasecmp().
NAME
strncat — concatenate a string with part of another

SYNOPSIS
#include <string.h>
char *strncat(char *restrict s1, const char *restrict s2, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This

The strncat() function shall append not more than \( n \) bytes (a null byte and bytes that follow it
are not appended) from the array pointed to by \( s2 \) to the end of the string pointed to by \( s1 \). The
initial byte of \( s2 \) overwrites the null byte at the end of \( s1 \). A terminating null byte is always
appended to the result. If copying takes place between objects that overlap, the behavior is
undefined.

RETURN VALUE
The strncat() function shall return \( s1 \); no return value shall be reserved to indicate an error.

ERRORS
No errors are defined.

**NAME**

strncmp — compare part of two strings

**SYNOPSIS**

```c
#include <string.h>

int strncmp(const char *s1, const char *s2, size_t n);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `strncmp()` function shall compare not more than `n` bytes (bytes that follow a null byte are not compared) from the array pointed to by `s1` to the array pointed to by `s2`.

The sign of a non-zero return value is determined by the sign of the difference between the values of the first pair of bytes (both interpreted as type `unsigned char`) that differ in the strings being compared.

**RETURN VALUE**

Upon successful completion, `strncmp()` shall return an integer greater than, equal to, or less than 0, if the possibly null-terminated array pointed to by `s1` is greater than, equal to, or less than the possibly null-terminated array pointed to by `s2` respectively.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`strcmp()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<string.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

Extensions beyond the ISO C standard are marked.
**NAME**

`strncpy` — copy part of a string

**SYNOPSIS**

```c
#include <string.h>

char *strncpy(char *restrict s1, const char *restrict s2, size_t n);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `strncpy()` function shall copy not more than \( n \) bytes (bytes that follow a null byte are not copied) from the array pointed to by \( s2 \) to the array pointed to by \( s1 \). If copying takes place between objects that overlap, the behavior is undefined.

If the array pointed to by \( s2 \) is a string that is shorter than \( n \) bytes, null bytes shall be appended to the copy in the array pointed to by \( s1 \), until \( n \) bytes in all are written.

**RETURN VALUE**

The `strncpy()` function shall return \( s1 \); no return value is reserved to indicate an error.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

Character movement is performed differently in different implementations. Thus, overlapping moves may yield surprises.

If there is no null byte in the first \( n \) bytes of the array pointed to by \( s2 \), the result is not null-terminated.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

`strcpy()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<string.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**

The `strncpy()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
strpbrk() — scan a string for a byte

#include <string.h>

char *strpbrk(const char *s1, const char *s2);

The strpbrk() function shall locate the first occurrence in the string pointed to by s1 of any byte from s2.

Upon successful completion, strpbrk() shall return a pointer to the byte or a null pointer if no byte from s2 occurs in s1.

No errors are defined.

strchr(), strrchr(), the Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

First released in Issue 1. Derived from Issue 1 of the SVID.
NAME
strptime — date and time conversion

SYNOPSIS
XSI
#include <time.h>

char *strptime(const char *restrict buf, const char *restrict format,
    struct tm *restrict tm);

DESCRIPTION
The strptime() function shall convert the character string pointed to by buf to values which are stored in the tm structure pointed to by tm, using the format specified by format.

The format is composed of zero or more directives. Each directive is composed of one of the following: one or more white-space characters (as specified by isspace( )); an ordinary character (neither ‘%’ nor a white-space character); or a conversion specification. Each conversion specification is composed of a ‘%’ character followed by a conversion character which specifies the replacement required. The application shall ensure that there is white-space or other non-alphanumeric characters between any two conversion specifications. The following conversion specifications are supported:

%a The day of the week, using the locale's weekday names; either the abbreviated or full name may be specified.
%A Equivalent to %a.
%b The month, using the locale's month names; either the abbreviated or full name may be specified.
%B Equivalent to %b.
%c Replaced by the locale's appropriate date and time representation.
%c The century number [00,99]; leading zeros are permitted but not required.
%j The day number of the year [001,366]; leading zeros are permitted but not required.
%m The month number [01,12]; leading zeros are permitted but not required.
%e Equivalent to %d.
%h Equivalent to %b.
%H The hour (24-hour clock) [00,23]; leading zeros are permitted but not required.
%H The hour (12-hour clock) [01,12]; leading zeros are permitted but not required.
%j The day number of the year [001,366]; leading zeros are permitted but not required.
%m The month number [01,12]; leading zeros are permitted but not required.
%M The minute [00,59]; leading zeros are permitted but not required.
%n Any white space.
%p The locale's equivalent of a.m or p.m.
%r 12-hour clock time using the AM/PM notation if t_fmt_ampm is not an empty string in the LC_TIME portion of the current locale; in the POSIX locale, this shall be equivalent to %I:%M:%S %p.
%R The time as %H:%M.
strptime()  System Interfaces

%S  The seconds [00,60]; leading zeros are permitted but not required.
%T  The time as %H:%M:%S.
%U  The week number of the year (Sunday as the first day of the week) as a decimal number [00,53]; leading zeros are permitted but not required.
%W  The week number of the year (Monday as the first day of the week) as a decimal number [00,53]; leading zeros are permitted but not required.
%x  The date, using the locale’s date format.
%X  The time, using the locale’s time format.
%y  The year within century. When a century is not otherwise specified, values in the range [69,99] shall refer to years 1969 to 1999 inclusive, and values in the range [00,68] shall refer to years 2000 to 2068 inclusive; leading zeros shall be permitted but shall not be required.
%Y  The year, including the century (for example, 1988).
%%  Replaced by %.

Modified Conversion Specifiers

Some conversion specifiers can be modified by the $E$ and $O$ modifier characters to indicate that an alternative format or specification should be used rather than the one normally used by the unmodified conversion specifier. If the alternative format or specification does not exist in the current locale, the behavior shall be as if the unmodified conversion specification were used.

%Ec  The locale’s alternative appropriate date and time representation.
%EC  The name of the base year (period) in the locale’s alternative representation.
%Ex  The locale’s alternative date representation.
%EX  The locale’s alternative time representation.
%Ey  The offset from %EC (year only) in the locale’s alternative representation.
%EY  The full alternative year representation.
%Od  The day of the month using the locale’s alternative numeric symbols; leading zeros are permitted but not required.
%Oe  Equivalent to %Od.
%OH  The hour (24-hour clock) using the locale’s alternative numeric symbols.
%OI  The hour (12-hour clock) using the locale’s alternative numeric symbols.
%Om  The month using the locale’s alternative numeric symbols.
%OM  The minutes using the locale’s alternative numeric symbols.
%OS  The seconds using the locale’s alternative numeric symbols.

%OU  The week number of the year (Sunday as the first day of the week) using the locale’s alternative numeric symbols.

%OW  The number of the weekday (Sunday=0) using the locale’s alternative numeric symbols.

%OW  The week number of the year (Monday as the first day of the week) using the locale’s alternative numeric symbols.

%Oy  The year (offset from %C) using the locale’s alternative numeric symbols.

A conversion specification composed of white-space characters is executed by scanning input up to the first character that is not white-space (which remains unscanned), or until no more characters can be scanned.

A conversion specification that is an ordinary character is executed by scanning the next character from the buffer. If the character scanned from the buffer differs from the one comprising the directive, the directive fails, and the differing and subsequent characters remain unscanned.

A series of conversion specifications composed of %n, %t, white-space characters, or any combination is executed by scanning up to the first character that is not white space (which remains unscanned), or until no more characters can be scanned.

Any other conversion specification is executed by scanning characters until a character matching the next directive is scanned, or until no more characters can be scanned. These characters, except the one matching the next directive, are then compared to the locale values associated with the conversion specifier. If a match is found, values for the appropriate tm structure members are set to values corresponding to the locale information. Case is ignored when matching items in buf such as month or weekday names. If no match is found, strftime() fails and no more characters are scanned.

RETURN VALUE

Upon successful completion, strftime() shall return a pointer to the character following the last character parsed. Otherwise, a null pointer shall be returned.

ERRORS

No errors are defined.

EXAMPLES

None.

APPLICATION USAGE

Several “equivalent to’’ formats and the special processing of white-space characters are provided in order to ease the use of identical format strings for strftime() and strptime().

Applications should use %Y (4-digit years) in preference to %y (2-digit years).

It is unspecified whether multiple calls to strftime() using the same tm structure will update the current contents of the structure or overwrite all contents of the structure. Conforming applications should make a single call to strftime() with a format and all data needed to completely specify the date and time being converted.

RATIONALE

None.
**FUTURE DIRECTIONS**

The `strptime()` function is expected to be mandatory in the next version of this volume of IEEE Std 1003.1-2001.

**SEE ALSO**

`scanf()`, `strftime()`, `time()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<time.h>`

**CHANGE HISTORY**

First released in Issue 4.

**Issue 5**

Moved from ENHANCED I18N to BASE.

The [ENOSYS] error is removed.

The exact meaning of the `%y` and `%Oy` specifiers is clarified in the DESCRIPTION.

**Issue 6**

The Open Group Corrigendum U033/5 is applied. The `%r` specifier description is reworded.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The `restrict` keyword is added to the `strptime()` prototype for alignment with the ISO/IEC 9899:1999 standard.

The Open Group Corrigendum U047/2 is applied.

The DESCRIPTION is updated to use the terms “conversion specifier” and “conversion specification” for consistency with `strftime()`.
NAME
strrchr — string scanning operation

SYNOPSIS
#include <string.h>
char *strrchr(const char *s, int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The *strrchr*() function shall locate the last occurrence of *c* (converted to a char) in the string pointed to by *s*. The terminating null byte is considered to be part of the string.

RETURN VALUE
Upon successful completion, *strrchr*() shall return a pointer to the byte or a null pointer if *c* does not occur in the string.

ERRORS
No errors are defined.

EXAMPLES
Finding the Base Name of a File
The following example uses *strrchr*() to get a pointer to the base name of a file. The *strrchr*() function searches backwards through the name of the file to find the last ‘/’ character in *name*. This pointer (plus one) will point to the base name of the file.

#include <string.h>
...
const char *name;
char *basename;
...
basename = strrchr(name, '/') + 1;
...

NAME
strspn — get length of a substring

SYNOPSIS
#include <string.h>

size_t strspn(const char *s1, const char *s2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This

The strspn() function shall compute the length (in bytes) of the maximum initial segment of the
string pointed to by s1 which consists entirely of bytes from the string pointed to by s2.

RETURN VALUE
The strspn() function shall return the length of s1; no return value is reserved to indicate an
error.

ERRORS
No errors are defined.

Issue 5
The RETURN VALUE section is updated to indicate that strspn() returns the length of s, and not
s itself as was previously stated.
NAME
strstr — find a substring

SYNOPSIS
#include <string.h>
char *strstr(const char *s1, const char *s2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The strstr() function shall locate the first occurrence in the string pointed to by s1 of the sequence of bytes (excluding the terminating null byte) in the string pointed to by s2.

RETURN VALUE
Upon successful completion, strstr() shall return a pointer to the located string or a null pointer if the string is not found.
If s2 points to a string with zero length, the function shall return s1.

ERRORS
No errors are defined.

EXAMPLES

NAME
strtod, strtof, strtold — convert a string to a double-precision number

SYNOPSIS
#include <stdlib.h>

double strtod(const char *restrict nptr, char **restrict endptr);
float strtof(const char *restrict nptr, char **restrict endptr);
long double strtold(const char *restrict nptr, char **restrict endptr);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall convert the initial portion of the string pointed to by nptr to double, float, and long double representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by isspace())
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final string of one or more unrecognized characters, including the terminating null byte of the input string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character, then an optional exponent part
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character, then an optional binary exponent part
- One of INF or INFINITY, ignoring case
- One of NAN or NAN(n-char-sequence_opt), ignoring case in the NAN part, where:

  n-char-sequence:
  digit
  nondigit
  n-char-sequence digit
  n-char-sequence nondigit

The subject sequence is defined as the longest initial subsequence of the input string, starting with the first non-white-space character, that is of the expected form. The subject sequence contains no characters if the input string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of characters starting with the first digit or the decimal-point character (whichever occurs first) shall be interpreted as a floating constant of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not appear in a hexadecimal floating-point number, an exponent part of the appropriate type with value zero is assumed to follow the last digit in the string. If the subject sequence begins with a minus sign, the sequence shall be interpreted as negated. A character sequence INF or INFINITY shall be interpreted as an
infinity, if representable in the return type, else as if it were a floating constant that is too large
for the range of the return type. A character sequence NAN or NAN(\text{\text{n-char-sequence}}_{opt}) shall be
interpreted as a quiet NaN, if supported in the return type, else as if it were a subject sequence
part that does not have the expected form; the meaning of the \text{n-char sequences} is
implementation-defined. A pointer to the final string is stored in the object pointed to by \text{endptr},
provided that \text{endptr} is not a null pointer.

If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the value
resulting from the conversion is correctly rounded.

The radix character is defined in the program’s locale (category \text{LC\_NUMERIC}). In the POSIX
locale, or in a locale where the radix character is not defined, the radix character shall default to a
period (‘.’).

In other than the C or POSIX locales, other implementation-defined subject sequences may be
accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be
performed; the value of \text{str} is stored in the object pointed to by \text{endptr}, provided that \text{endptr} is not
a null pointer.

The \text{strtod}() function shall not change the setting of \text{errno} if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check
for error situations should set \text{errno} to 0, then call \text{strtod()}, \text{strtof()}, or \text{strtold()}, then check \text{errno}.

Upon successful completion, these functions shall return the converted value. If no conversion
could be performed, 0 shall be returned, and \text{errno} may be set to [EINVAL].

If the correct value is outside the range of representable values, ±HUGE\_VAL, ±HUGE\_VALF, or
±HUGE\_VALL shall be returned (according to the sign of the value), and \text{errno} shall be set to
[ERANGE].

If the correct value would cause an underflow, a value whose magnitude is no greater than the
smallest normalized positive number in the return type shall be returned and \text{errno} set to
[ERANGE].

These functions shall fail if:

\text{[ERANGE]} The value to be returned would cause overflow or underflow.

These functions may fail if:

\text{[EINVAL]} No conversion could be performed.

None.

If the subject sequence has the hexadecimal form and FLT\_RADIX is not a power of 2, and the
result is not exactly representable, the result should be one of the two numbers in the
appropriate internal format that are adjacent to the hexadecimal floating source value, with the
extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL\_DIG (defined in <float.h>)
significant digits, the result should be correctly rounded. If the subject sequence \text{D} has the
decimal form and more than DECIMAL\_DIG significant digits, consider the two bounding,
adjacent decimal strings \text{L} and \text{U}, both having DECIMAL\_DIG significant digits, such that the
values of $L$, $D$, and $U$ satisfy $L \leq D \leq U$. The result should be one of the (equal or adjacent) values that would be obtained by correctly rounding $L$ and $U$ according to the current rounding direction, with the extra stipulation that the error with respect to $D$ should have a correct sign for the current rounding direction.

The changes to `strtod()` introduced by the ISO/IEC 9899:1999 standard can alter the behavior of well-formed applications complying with the ISO/IEC 9899:1990 standard and thus earlier versions of the base documents. One such example would be:

```c
int what_kind_of_number (char *s)
{
    char *endp;
    double d;
    long l;
    d = strtod(s, &endp);
    if (s != endp && *endp == '\0')
        printf("It's a float with value %g\n", d);
    else
    {
        l = strtol(s, &endp, 0);
        if (s != endp && *endp == '\0')
            printf("It's an integer with value %ld\n", l);
        else
            return 1;
    }
    return 0;
}
```

If the function is called with:

```
what_kind_of_number ("0x10")
```

an ISO/IEC 9899:1990 standard-compliant library will result in the function printing:

```
It's an integer with value 16
```

With the ISO/IEC 9899:1999 standard, the result is:

```
It's a float with value 16
```

The change in behavior is due to the inclusion of floating-point numbers in hexadecimal notation without requiring that either a decimal point or the binary exponent be present.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

`isspace()`, `localeconv()`, `scanf()`, `setlocale()`, `strtol()`, the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, `<float.h>`, `<stdlib.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.
**Issue 5**
The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

**Issue 6**
Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The `strtod()` function is updated.
- The `strtof()` and `strtold()` functions are added.
- The DESCRIPTION is extensively revised.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/61 is applied, correcting the second paragraph in the RETURN VALUE section. This change clarifies the sign of the return value.
NAME
strtoimax, strtoumax — convert string to integer type

SYNOPSIS
#include <inttypes.h>

intmax_t strtoimax(const char *restrict nptr, char **restrict endptr, int base);

uintmax_t strtoumax(const char *restrict nptr, char **restrict endptr, int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall be equivalent to the strtol(), strtoll(), strtoul(), and strtoull() functions, except that the initial portion of the string shall be converted to intmax_t and uintmax_t representation, respectively.

RETURN VALUE
These functions shall return the converted value, if any.

If no conversion could be performed, zero shall be returned.

If the correct value is outside the range of representable values, INTMAX_MAX, INTMAX_MIN, or UINTMAX_MAX shall be returned (according to the return type and sign of the value, if any), and errno shall be set to [ERANGE].

ERRORS
These functions shall fail if:

[ERANGE] The value to be returned is not representable.

These functions may fail if:

[EINVAL] The value of base is not supported.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME
strtok, strtok_r — split string into tokens

SYNOPSIS
#include <string.h>

char *strtok(char *restrict s1, const char *restrict s2);

TSF
char *strtok_r(char *restrict s, const char *restrict sep,
   char **restrict lasts);

DESCRIPTION

For strtok(): The functionality described on this reference page is aligned with the ISO C
standard. Any conflict between the requirements described here and the ISO C standard is
unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

A sequence of calls to strtok() breaks the string pointed to by s1 into a sequence of tokens, each
of which is delimited by a byte from the string pointed to by s2. The first call in the sequence has
s1 as its first argument, and is followed by calls with a null pointer as their first argument. The
separator string pointed to by s2 may be different from call to call.

The first call in the sequence searches the string pointed to by s1 for the first byte that is not
contained in the current separator string pointed to by s2. If no such byte is found, then there
are no tokens in the string pointed to by s1 and strtok() shall return a null pointer. If such a byte
is found, it is the start of the first token.

The strtok() function then searches from there for a byte that is contained in the current
separator string. If no such byte is found, the current token extends to the end of the string
pointed to by s1, and subsequent searches for a token shall return a null pointer. If such a byte is
found, it is overwritten by a null byte, which terminates the current token. The strtok() function
saves a pointer to the following byte, from which the next search for a token shall start.

Each subsequent call, with a null pointer as the value of the first argument, starts searching from
the saved pointer and behaves as described above.

The implementation shall behave as if no function defined in this volume of
IEEE Std 1003.1-2001 calls strtok().

The strtok() function need not be reentrant. A function that is not required to be reentrant is not
required to be thread-safe.

The strtok_r() function considers the null-terminated string s as a sequence of zero or more text
tokens separated by spans of one or more characters from the separator string sep. The
argument lasts points to a user-provided pointer which points to stored information necessary
for strtok_r() to continue scanning the same string.

In the first call to strtok_r(), s points to a null-terminated string, sep to a null-terminated string of
separator characters, and the value pointed to by lasts is ignored. The strtok_r() function shall
return a pointer to the first character of the first token, write a null character into s immediately
following the returned token, and update the pointer to which lasts points.

In subsequent calls, s is a NULL pointer and lasts shall be unchanged from the previous call so
that subsequent calls shall move through the string s, returning successive tokens until no
tokens remain. The separator string sep may be different from call to call. When no token
remains in s, a NULL pointer shall be returned.
RETURN VALUE
Upon successful completion, `strtok()` shall return a pointer to the first byte of a token. Otherwise, if there is no token, `strtok()` shall return a null pointer.

The `strtok_r()` function shall return a pointer to the token found, or a NULL pointer when no token is found.

ERRORS
No errors are defined.

EXAMPLES

Searching for Word Separators
The following example searches for tokens separated by <space>s.

```c
#include <string.h>
...
char *token;
char *line = "LINE TO BE SEPARATED";
char *search = " ";
/* Token will point to "LINE". */
token = strtok(line, search);
/* Token will point to "TO". */
token = strtok(NULL, search);
```

Breaking a Line
The following example uses `strtok()` to break a line into two character strings separated by any combination of <space>s, <tab>s, or <newline>s.

```c
#include <string.h>
...
struct element {
    char *key;
    char *data;
};
...
char line[LINEMAX];
char *key, *data;
...
key = strtok(line, " \n");
data = strtok(NULL, " \n");
```

APPLICATION USAGE
The `strtok_r()` function is thread-safe and stores its state in a user-supplied buffer instead of possibly using a static data area that may be overwritten by an unrelated call from another thread.

RATIONALE
The `strtok()` function searches for a separator string within a larger string. It returns a pointer to the last substring between separator strings. This function uses static storage to keep track of the current string position between calls. The new function, `strtok_r()`, takes an additional argument, `lasts`, to keep track of the current position in the string.
FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-2001, <string.h>

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The strtok_r() function is included for alignment with the POSIX Threads Extension.
A note indicating that the strtok() function need not be reentrant is added to the DESCRIPTION.

Issue 6
Extensions beyond the ISO C standard are marked.
The strtok_r() function is marked as part of the Thread-Safe Functions option.
In the DESCRIPTION, the note about reentrancy is expanded to cover thread-safety.
The APPLICATION USAGE section is updated to include a note on the thread-safe function and its avoidance of possibly using a static data area.
The restrict keyword is added to the strtok() and strtok_r() prototypes for alignment with the ISO/IEC 9899:1999 standard.
NAME
strtol, strtoll — convert a string to a long integer

SYNOPSIS
#include <stdlib.h>

long strtol(const char *restrict str, char **restrict endptr, int base);
long long strtoll(const char *restrict str, char **restrict endptr,
        int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

These functions shall convert the initial portion of the string pointed to by str to a type long and
long long representation, respectively. First, they decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by isspace( ))
2. A subject sequence interpreted as an integer represented in some radix determined by the
   value of base
3. A final string of one or more unrecognized characters, including the terminating null byte
   of the input string.

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If the value of base is 0, the expected form of the subject sequence is that of a decimal constant,
octal constant, or hexadecimal constant, any of which may be preceded by a ' + ' or ' − ' sign. A
decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
octal constant consists of the prefix ' 0 ' optionally followed by a sequence of the digits ' 0 ' to
' 7 ' only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
decimal digits and letters ' a ' (or ' A ' ) to ' f ' (or ' F ' ) with values 10 to 15 respectively.

If the value of base is between 2 and 36, the expected form of the subject sequence is a sequence
of letters and digits representing an integer with the radix specified by base, optionally preceded
by a ' + ' or ' − ' sign. The letters from ' a ' (or ' A ' ) to ' z ' (or ' Z ' ) inclusive are ascribed the
values 10 to 35; only letters whose ascribed values are less than that of base are permitted. If the
value of base is 16, the characters 0x or 0X may optionally precede the sequence of letters and
digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting
with the first non-white-space character that is of the expected form. The subject sequence shall
contain no characters if the input string is empty or consists entirely of white-space characters,
or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of base is 0, the sequence of
characters starting with the first digit shall be interpreted as an integer constant. If the subject
sequence has the expected form and the value of base is between 2 and 36, it shall be used as the
base for conversion, ascribing to each letter its value as given above. If the subject sequence
begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
the final string shall be stored in the object pointed to by endptr, provided that endptr is not a null
pointer.

In other than the C or POSIX locales, other implementation-defined subject sequences may be
accepted.
If the subject sequence is empty or does not have the expected form, no conversion is performed; the value of str is stored in the object pointed to by endptr, provided that endptr is not a null pointer.

The `strtol()` function shall not change the setting of errno if successful.

Since 0, [LONG_MIN] or [LLONG_MIN], and [LONG_MAX] or [LLONG_MAX] are returned on error and are also valid returns on success, an application wishing to check for error situations should set errno to 0, then call `strtol()` or `strtoll()`, then check errno.

**RETURN VALUE**
Upon successful completion, these functions shall return the converted value, if any. If no conversion could be performed, 0 shall be returned and errno may be set to [EINVAL].

If the correct value is outside the range of representable values, [LONG_MIN], [LONG_MAX], [LLONG_MIN], or [LLONG_MAX] shall be returned (according to the sign of the value), and errno set to [ERANGE].

**ERRORS**
These functions shall fail if:

[ERANGE] The value to be returned is not representable.

These functions may fail if:

[EINVAL] The value of base is not supported.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.

**Issue 6**
Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899:1999 standard:

- The `strtol()` prototype is updated.
- The `strtoll()` function is added.
NAME
strtol — convert a string to a double-precision number

SYNOPSIS
#include <stdlib.h>

long double strtol(const char *restrict nptr, char **restrict endptr);

DESCRIPTION
Refer to `strtol()`.
NAME
strtol — convert a string to a long integer

SYNOPSIS
#include <stdlib.h>

long long strtol(const char *restrict str, char **restrict endptr,
int base);

DESCRIPTION
Refer to strtol().
NAME
strtol, strtoull — convert a string to an unsigned long

SYNOPSIS
#include <stdlib.h>
unsigned long strtol(const char *restrict str,
        char **restrict endptr, int base);
unsigned long long strtoull(const char *restrict str,
        char **restrict endptr, int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
collision between the requirements described here and the ISO C standard is unintentional. This

These functions shall convert the initial portion of the string pointed to by str to a type unsigned
long and unsigned long long representation, respectively. First, they decompose the input
string into three parts:

1. An initial, possibly empty, sequence of white-space characters (as specified by isspace())
2. A subject sequence interpreted as an integer represented in some radix determined by the
   value of base
3. A final string of one or more unrecognized characters, including the terminating null byte
   of the input string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
result.

If the value of base is 0, the expected form of the subject sequence is that of a decimal constant,
octal constant, or hexadecimal constant, any of which may be preceded by a ‘+’ or ‘−’ sign. A
decimal constant begins with a non-zero digit, and consists of a sequence of decimal digits. An
octal constant consists of the prefix ‘0’ optionally followed by a sequence of the digits ‘0’ to
‘7’ only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
decimal digits and letters ‘a’ (or ‘A’) to ‘f’ (or ‘F’) with values 10 to 15 respectively.

If the value of base is between 2 and 36, the expected form of the subject sequence is a sequence
of letters and digits representing an integer with the radix specified by base, optionally preceded
by a ‘+’ or ‘−’ sign. The letters from ‘a’ (or ‘A’) to ‘z’ (or ‘Z’) inclusive are ascribed the
values 10 to 35; only letters whose ascribed values are less than that of base are permitted. If the
value of base is 16, the characters 0x or 0X may optionally precede the sequence of letters and
digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input string, starting
with the first non-white-space character that is of the expected form. The subject sequence shall
contain no characters if the input string is empty or consists entirely of white-space characters,
or if the first non-white-space character is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and the value of base is 0, the sequence of
characters starting with the first digit shall be interpreted as an integer constant. If the subject
sequence has the expected form and the value of base is between 2 and 36, it shall be used as the
base for conversion, ascribing to each letter its value as given above. If the subject sequence
begins with a minus sign, the value resulting from the conversion shall be negated. A pointer to
the final string shall be stored in the object pointed to by endptr, provided that endptr is not a null
pointer.
In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of str shall be stored in the object pointed to by endptr, provided that endptr is not a null pointer.

The `strtoul()` function shall not change the setting of `errno` if successful.

Since 0, `{ULONG_MAX}`, and `{ULLONG_MAX}` are returned on error and are also valid returns on success, an application wishing to check for error situations should set `errno` to 0, then call `strtoul()` or `strtoull()`, then check `errno`.

Upon successful completion, these functions shall return the converted value, if any. If no conversion could be performed, 0 shall be returned and `errno` may be set to `[EINVAL]`. If the correct value is outside the range of representable values, `{ULONG_MAX}` or `{ULLONG_MAX}` shall be returned and `errno` set to `[ERANGE]`.

These functions shall fail if:

- `[EINVAL]` The value of `base` is not supported.
- `[ERANGE]` The value to be returned is not representable.

These functions may fail if:

- `[EINVAL]` No conversion could be performed.

`isalpha()`, `scanf()`, `strtod()`, `strtol()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<stdlib.h>`

First released in Issue 4. Derived from the ANSI C standard.

The DESCRIPTION is updated to indicate that `errno` is not changed if the function is successful.

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The `[EINVAL]` error condition is added for when the value of `base` is not supported.

In the RETURN VALUE and ERRORS sections, the `[EINVAL]` optional error condition is added if no conversion could be performed.
The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The `strtoul` () prototype is updated.
- The `strtoull` () function is added.
NAME
strtoimax — convert a string to an integer type

SYNOPSIS
#include <inttypes.h>

uintmax_t strtoimax(const char *restrict nptr, char **restrict endptr,
                      int base);

DESCRIPTION
Refer to strtoimax().
NAME
strxfrm — string transformation

SYNOPSIS
#include <string.h>

size_t strxfrm(char *restrict s1, const char *restrict s2, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The strxfrm() function shall transform the string pointed to by s2 and place the resulting string into the array pointed to by s1. The transformation is such that if strcmp() is applied to two transformed strings, it shall return a value greater than, equal to, or less than 0, corresponding to the result of strcoll() applied to the same two original strings. No more than n bytes are placed into the resulting array pointed to by s1, including the terminating null byte. If n is 0, s1 is permitted to be a null pointer. If copying takes place between objects that overlap, the behavior is undefined.

The strxfrm() function shall not change the setting of errno if successful.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set errno to 0, then call strxfrm(), then check errno.

RETURN VALUE
Upon successful completion, strxfrm() shall return the length of the transformed string (not including the terminating null byte). If the value returned is n or more, the contents of the array pointed to by s1 are unspecified.

On error, strxfrm() may set errno but no return value is reserved to indicate an error.

ERRORS
The strxfrm() function may fail if:

[EINVAL] The string pointed to by the s2 argument contains characters outside the domain of the collating sequence.

APPLICATION USAGE
The transformation function is such that two transformed strings can be ordered by strcmp() as appropriate to collating sequence information in the program’s locale (category LC_COLLATE).

The fact that when n is 0 s1 is permitted to be a null pointer is useful to determine the size of the s1 array prior to making the transformation.

RATIONALE
None.

FUTURE DIRECTIONS
None.

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the ISO C standard.

**Issue 5**

The DESCRIPTION is updated to indicate that *errno* does not change if the function is successful.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The *strxfrm()* prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
swab()

NAME
swab — swap bytes

SYNOPSIS
XSI
#include <unistd.h>

void swab(const void *restrict src, void *restrict dest,
ssize_t nbytes);

DESCRIPTION
The swab() function shall copy nbytes bytes, which are pointed to by src, to the object pointed to
by dest, exchanging adjacent bytes. The nbytes argument should be even. If nbytes is odd, swab()
copies and exchanges nbytes−1 bytes and the disposition of the last byte is unspecified. If
copying takes place between objects that overlap, the behavior is undefined. If nbytes is
negative, swab() does nothing.

RETURN VALUE
None.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

NAME

swapcontext — swap user context

SYNOPSIS

XSI

```c
#include <ucontext.h>

int swapcontext(ucontext_t *restrict oucp,
    const ucontext_t *restrict ucp);
```

DESCRIPTION

Refer to `makecontext()`.
NAME
swprintf — print formatted wide-character output

SYNOPSIS
#include <stdio.h>
#include <wchar.h>

int swprintf(wchar_t *restrict ws, size_t n,
        const wchar_t *restrict format, ...);

DESCRIPTION
Refer to fprintf().
NAME
swscanf — convert formatted wide-character input

SYNOPSIS
#include <stdio.h>
#include <wchar.h>

int swscanf(const wchar_t *restrict ws,
             const wchar_t *restrict format, ... );

DESCRIPTION
Refer to fscanf().
NAME

symlink — make a symbolic link to a file

SYNOPSIS

#include <unistd.h>

int symlink(const char *path1, const char *path2);

DESCRIPTION

The symlink() function shall create a symbolic link called path2 that contains the string pointed to by path1 (path2 is the name of the symbolic link created, path1 is the string contained in the symbolic link).

The string pointed to by path1 shall be treated only as a character string and shall not be validated as a pathname.

If the symlink() function fails for any reason other than [EIO], any file named by path2 shall be unaffected.

RETURN VALUE

Upon successful completion, symlink() shall return 0; otherwise, it shall return −1 and set errno to indicate the error.

ERRORS

The symlink() function shall fail if:

[EACCES] Write permission is denied in the directory where the symbolic link is being created, or search permission is denied for a component of the path prefix of path2.

[EEXIST] The path2 argument names an existing file or symbolic link.

[EIO] An I/O error occurs while reading from or writing to the file system.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path2 argument.

[ENAMETOOLONG] The length of the path2 argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX] or the length of the path1 argument is longer than [SYMLINK_MAX].

[ENOENT] A component of path2 does not name an existing file or path2 is an empty string.

[ENOSPC] The directory in which the entry for the new symbolic link is being placed cannot be extended because no space is left on the file system containing the directory, or the new symbolic link cannot be created because no space is left on the file system which shall contain the link, or the file system is out of file-allocation resources.

[ENOTDIR] A component of the path prefix of path2 is not a directory.

[EROFS] The new symbolic link would reside on a read-only file system.

The symlink() function may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the path2 argument.

[ENAMETOOLONG] As a result of encountering a symbolic link in resolution of the path2
argument, the length of the substituted pathname string exceeded
(PATH_MAX) bytes (including the terminating null byte), or the length of the
string pointed to by path1 exceeded [SYMLINK_MAX].

EXAMPLES
None.

APPLICATION USAGE
Like a hard link, a symbolic link allows a file to have multiple logical names. The presence of a
hard link guarantees the existence of a file, even after the original name has been removed. A
symbolic link provides no such assurance; in fact, the file named by the path1 argument need not
exist when the link is created. A symbolic link can cross file system boundaries.
Normal permission checks are made on each component of the symbolic link pathname during
its resolution.

RATIONALE
Since IEEE Std 1003.1-2001 does not require any association of file times with symbolic links,
there is no requirement that file times be updated by symlink().

FUTURE DIRECTIONS
None.

IEEE Std 1003.1-2001, <unistd.h>

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
The following changes were made to align with the IEEE P1003.1a draft standard:

• The DESCRIPTION text is updated.
• The [ELOOP] optional error condition is added.
NAME
sync — schedule file system updates

SYNOPSIS
#include <unistd.h>

void sync(void);

DESCRIPTION
The sync() function shall cause all information in memory that updates file systems to be
scheduled for writing out to all file systems.

The writing, although scheduled, is not necessarily complete upon return from sync().

RETURN VALUE
The sync() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

Moved from X/OPEN UNIX extension to BASE.
NAME
sysconf — get configurable system variables

SYNOPSIS
#include <unistd.h>
long sysconf(int name);

DESCRIPTION
The sysconf() function provides a method for the application to determine the current value of a configurable system limit or option (variable). The implementation shall support all of the variables listed in the following table and may support others.

The name argument represents the system variable to be queried. The following table lists the minimal set of system variables from <limits.h> or <unistd.h> that can be returned by sysconf(), and the symbolic constants defined in <unistd.h> that are the corresponding values used for name.

System Interfaces

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value of Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>_XOPEN_XCU_VERSION</td>
<td>_SC_XOPEN_XCU_VERSION</td>
</tr>
</tbody>
</table>

**RETURN VALUE**

If `name` is an invalid value, `sysconf()` shall return −1 and set `errno` to indicate the error. If the variable corresponding to `name` has no limit, `sysconf()` shall return −1 without changing the value of `errno`. Note that indefinite limits do not imply infinite limits; see `<limits.h>`.

Otherwise, `sysconf()` shall return the current variable value on the system. The value returned shall not be more restrictive than the corresponding value described to the application when it was compiled with the implementation's `<limits.h>` or `<unistd.h>`. The value shall not change during the lifetime of the calling process, except that `sysconf(_SC_OPEN_MAX)` may return different values before and after a call to `setrlimit()` which changes the RLIMIT_NOFILE soft limit.

**ERRORS**

The `sysconf()` function shall fail if:

```c
[EINVAL] The value of the name argument is invalid.
```

**EXAMPLES**

None.

**APPLICATION USAGE**

As −1 is a permissible return value in a successful situation, an application wishing to check for error situations should set `errno` to 0, then call `sysconf()`, and, if it returns −1, check to see if `errno` is non-zero.

If the value of `sysconf(_SC_2_VERSION)` is not equal to the value of the `_POSIX2_VERSION` symbolic constant, the utilities available via `system()` or `popen()` might not behave as described in the Shell and Utilities volume of IEEE Std 1003.1-2001. This would mean that the application is not running in an environment that conforms to the Shell and Utilities volume of IEEE Std 1003.1-2001. Some applications might be able to deal with this, others might not. However, the functions defined in this volume of IEEE Std 1003.1-2001 continue to operate as specified, even if `sysconf(_SC_2_VERSION)` reports that the utilities no longer perform as specified.

**RATIONALE**

This functionality was added in response to requirements of application developers and of system vendors who deal with many international system configurations. It is closely related to `pathconf()` and `fpathconf()`.

Although a conforming application can run on all systems by never demanding more resources than the minimum values published in this volume of IEEE Std 1003.1-2001, it is useful for that application to be able to use the actual value for the quantity of a resource available on any given system. To do this, the application makes use of the value of a symbolic constant in `<limits.h>` or `<unistd.h>`.

However, once compiled, the application must still be able to cope if the amount of resource available is increased. To that end, an application may need a means of determining the quantity of a resource, or the presence of an option, at execution time.

Two examples are offered:

1. Applications may wish to act differently on systems with or without job control. Applications vendors who wish to distribute only a single binary package to all instances of a computer architecture would be forced to assume job control is never available if it...
were to rely solely on the `<unistd.h>` value published in this volume of IEEE Std 1003.1-2001.

2. International applications vendors occasionally require knowledge of the number of clock ticks per second. Without these facilities, they would be required to either distribute their applications partially in source form or to have 50 Hz and 60 Hz versions for the various countries in which they operate.

It is the knowledge that many applications are actually distributed widely in executable form that leads to this facility. If limited to the most restrictive values in the headers, such applications would have to be prepared to accept the most limited environments offered by the smallest microcomputers. Although this is entirely portable, there was a consensus that they should be able to take advantage of the facilities offered by large systems, without the restrictions associated with source and object distributions.

During the discussions of this feature, it was pointed out that it is almost always possible for an application to discern what a value might be at runtime by suitably testing the various functions themselves. And, in any event, it could always be written to adequately deal with error returns from the various functions. In the end, it was felt that this imposed an unreasonable level of complication and sophistication on the application writer.

This runtime facility is not meant to provide ever-changing values that applications have to check multiple times. The values are seen as changing no more frequently than once per system initialization, such as by a system administrator or operator with an automatic configuration program. This volume of IEEE Std 1003.1-2001 specifies that they shall not change within the lifetime of the process.

Some values apply to the system overall and others vary at the file system or directory level. The latter are described in `pathconf()`.

Note that all values returned must be expressible as integers. String values were considered, but the additional flexibility of this approach was rejected due to its added complexity of implementation and use.

Some values, such as `{PATH_MAX}`, are sometimes so large that they must not be used to, say, allocate arrays. The `sysconf()` function returns a negative value to show that this symbolic constant is not even defined in this case.

Similar to `pathconf()`, this permits the implementation not to have a limit. When one resource is infinite, returning an error indicating that some other resource limit has been reached is conforming behavior.

**FUTURE DIRECTIONS**

None.

`confstr()`, `pathconf()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<limits.h>`, `<unistd.h>`, the Shell and Utilities volume of IEEE Std 1003.1-2001, `getconf`

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

The _XBS_ variables and name values are added to the table of system variables in the DESCRIPTION. These are all marked EX.
The symbol CLK_TCK is obsolescent and removed. It is replaced with the phrase “clock ticks per second”.

The symbol [PASS_MAX] is removed.

The following changes were made to align with the IEEE P1003.1a draft standard:

- Table entries are added for the following variables: _SC_REGEXP, _SC_SHELL, _SC_REGEX_VERSION, _SC_SYMLOOP_MAX.

The following `sysconf()` variables and their associated names are added for alignment with IEEE Std 1003.1d-1999:

- `_POSIX_ADVISORY_INFO`
- `_POSIX_CPUTIME`
- `_POSIX_SPAWN`
- `_POSIX_SPORADIC_SERVER`
- `_POSIX_THREAD_CPUTIME`
- `_POSIX_THREAD_SPORADIC_SERVER`
- `_POSIX_TIMEOUTS`

The following changes are made to the DESCRIPTION for alignment with IEEE Std 1003.1j-2000:

- A statement expressing the dependency of support for some system variables on implementation options is added.

- The following system variables are added:
  - `_POSIX_BARRIERS`
  - `_POSIX_CLOCK_SELECTION`
  - `_POSIX_MONOTONIC_CLOCK`
  - `_POSIX_READER_WRITER_LOCKS`
  - `_POSIX_SPIN_LOCKS`
  - `_POSIX_TYPED_MEMORY_OBJECTS`

The following system variables are added for alignment with IEEE Std 1003.2d-1994:

- `_POSIX2_PBS`
- `_POSIX2_PBS_ACCOUNTING`
- `_POSIX2_PBS_LOCATE`
- `_POSIX2_PBS_MESSAGE`
- `_POSIX2_PBS_TRACK`

The following `sysconf()` variables and their associated names are added for alignment with IEEE Std 1003.1q-2000:

- `_POSIX_TRACE`
- `_POSIX_TRACE_EVENT_FILTER`
- `_POSIX_TRACE_INHERIT`
- `_POSIX_TRACE_LOG`

The macros associated with the c89 programming models are marked LEGACY, and new equivalent macros associated with c99 are introduced.
IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/63 is applied, making it clear in the
RETURN VALUE section that the value returned for `sysconf(_SC_OPEN_MAX)` may change if a
call to `setrlimit()` adjusts the RLIMIT_NOFILE soft limit.
NAME
syslog — log a message

SYNOPSIS
#include <syslog.h>

void syslog(int priority, const char *message, ... /* argument */);

DESCRIPTION
Refer to closelog().
NAME
system — issue a command

SYNOPSIS
#include <stdlib.h>

int system(const char *command);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

If command is a null pointer, the system() function shall determine whether the host environment has a command processor. If command is not a null pointer, the system() function shall pass the string pointed to by command to that command processor to be executed in an implementation-defined manner; this might then cause the program calling system() to behave in a non-conforming manner or to terminate.

The environment of the executed command shall be as if a child process were created using fork(), and the child process invoked the sh utility using execl() as follows:

execl(<shell path>, "sh", "-c", command, (char *)0);

where <shell path> is an unspecified pathname for the sh utility.

The system() function shall ignore the SIGINT and SIGQUIT signals, and shall block the SIGCHLD signal, while waiting for the command to terminate. If this might cause the application to miss a signal that would have killed it, then the application should examine the return value from system() and take whatever action is appropriate to the application if the command terminated due to receipt of a signal.

The system() function shall not affect the termination status of any child of the calling processes other than the process or processes it itself creates.

The system() function shall not return until the child process has terminated.

RETURN VALUE
If command is a null pointer, system() shall return non-zero to indicate that a command processor is available, or zero if none is available. The system() function shall always return non-zero when command is NULL.

If command is not a null pointer, system() shall return the termination status of the command language interpreter in the format specified by waitpid(). The termination status shall be as defined for the sh utility; otherwise, the termination status is unspecified. If some error prevents the command language interpreter from executing after the child process is created, the return value from system() shall be as if the command language interpreter had terminated using exit(127) or _exit(127). If a child process cannot be created, or if the termination status for the command language interpreter cannot be obtained, system() shall return −1 and set errno to indicate the error.

ERRORS
The system() function may set errno values as described by fork().

In addition, system() may fail if:

ECHILD] The status of the child process created by system() is no longer available.
EXAMPLES

None.

APPLICATION USAGE

If the return value of \texttt{system()} is not \texttt{-1}, its value can be decoded through the use of the macros described in \texttt{<sys/wait.h>}. For convenience, these macros are also provided in \texttt{<stdlib.h>}. Note that, while \texttt{system()} must ignore SIGINT and SIGQUIT and block SIGCHLD while waiting for the child to terminate, the handling of signals in the executed command is as specified by \texttt{fork()} and \texttt{exec}. For example, if SIGINT is being caught or is set to SIG_DFL when \texttt{system()} is called, then the child is started with SIGINT handling set to SIG_DFL.

Ignoring SIGINT and SIGQUIT in the parent process prevents coordination problems (two processes reading from the same terminal, for example) when the executed command ignores or catches one of the signals. It is also usually the correct action when the user has given a command to the application to be executed synchronously (as in the \texttt{!} command in many interactive applications). In either case, the signal should be delivered only to the child process, not to the application itself. There is one situation where ignoring the signals might have less than the desired effect. This is when the application uses \texttt{system()} to perform some task invisible to the user. If the user typed the interrupt character ("\texttt{^C}", for example) while \texttt{system()} is being used in this way, one would expect the application to be killed, but only the executed command is killed. Applications that use \texttt{system()} in this way should carefully check the return status from \texttt{system()} to see if the executed command was successful, and should take appropriate action when the command fails.

Blocking SIGCHLD while waiting for the child to terminate prevents the application from catching the signal and obtaining status from \texttt{system()}’s child process before \texttt{system()} can get the status itself.

The context in which the utility is ultimately executed may differ from that in which \texttt{system()} was called. For example, file descriptors that have the \texttt{FD_CLOEXEC} flag set are closed, and the process ID and parent process ID are different. Also, if the executed utility changes its environment variables or its current working directory, that change is not reflected in the caller’s context.

There is no defined way for an application to find the specific path for the shell. However, \texttt{confstr()} can provide a value for \texttt{PATH} that is guaranteed to find the \texttt{sh} utility.

RATIONALE

The \texttt{system()} function should not be used by programs that have set user (or group) ID privileges. The \texttt{fork()} and \texttt{exec} family of functions (except \texttt{execlp()} and \texttt{execvp()}), should be used instead. This prevents any unforeseen manipulation of the environment of the user that could cause execution of commands not anticipated by the calling program.

There are three levels of specification for the \texttt{system()} function. The ISO C standard gives the most basic. It requires that the function exists, and defines a way for an application to query whether a command language interpreter exists. It says nothing about the command language or the environment in which the command is interpreted.

IEEE Std 1003.1-2001 places additional restrictions on \texttt{system()}. It requires that if there is a command language interpreter, the environment must be as specified by \texttt{fork()} and \texttt{exec}. This ensures, for example, that close-on-exec works, that file locks are not inherited, and that the process ID is different. It also specifies the return value from \texttt{system()} when the command line can be run, thus giving the application some information about the command’s completion status.
Finally, IEEE Std 1003.1-2001 requires the command to be interpreted as in the shell command language defined in the Shell and Utilities volume of IEEE Std 1003.1-2001.

Note that, system(NULL) is required to return non-zero, indicating that there is a command language interpreter. At first glance, this would seem to conflict with the ISO C standard which allows system(NULL) to return zero. There is no conflict, however. A system must have a command language interpreter, and is non-conforming if none is present. It is therefore permissible for the system() function on such a system to implement the behavior specified by the ISO C standard as long as it is understood that the implementation does not conform to IEEE Std 1003.1-2001 if system(NULL) returns zero.

It was explicitly decided that when command is NULL, system() should not be required to check to make sure that the command language interpreter actually exists with the correct mode, that there are enough processes to execute it, and so on. The call system(NULL) could, theoretically, check for such problems as too many existing child processes, and return zero. However, it would be inappropriate to return zero due to such a (presumably) transient condition. If some condition exists that is not under the control of this application and that would cause any system() call to fail, that system has been rendered non-conforming.

Early drafts required, or allowed, system() to return with errno set to [EINTR] if it was interrupted with a signal. This error return was removed, and a requirement that system() not return until the child has terminated was added. This means that if a waitpid() call in system() exits with errno set to [EINTR], system() must reissue the waitpid(). This change was made for two reasons:

1. There is no way for an application to clean up if system() returns [EINTR], short of calling wait(), and that could have the undesirable effect of returning the status of children other than the one started by system().

2. While it might require a change in some historical implementations, those implementations already have to be changed because they use wait() instead of waitpid().

Note that if the application is catching SIGCHLD signals, it will receive such a signal before a successful system() call returns.

To conform to IEEE Std 1003.1-2001, system() must use waitpid(), or some similar function, instead of wait().

The following code sample illustrates how system() might be implemented on an implementation conforming to IEEE Std 1003.1-2001.

```c
#include <signal.h>
int system(const char *cmd)
{
    int stat;
    pid_t pid;
    struct sigaction sa, savintr, savequit;
    sigset_t saveblock;
    if (cmd == NULL)
        return(1);
    sa.sa_handler = SIG_IGN;
    sigemptyset(&sa.sa_mask);
    sa.sa_flags = 0;
    sigemptyset(&savintr.sa_mask);
    sigemptyset(&savequit.sa_mask);
    sigaction(SIGINT, &sa, &savintr);
    sigaction(SIGQUIT, &sa, &savequit);
```
System Interfaces

```c
45972    sigaddset(&sa.sa_mask, SIGCHLD);
45973    sigprocmask(SIG_BLOCK, &sa.sa_mask, &saveblock);
45974    if ((pid = fork()) == 0) {
45975        sigaction(SIGINT, &savintr, (struct sigaction *)0);
45976        sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45977        sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45978        execl("/bin/sh", "sh", "-c", cmd, (char *)0);
45979        _exit(127);
45980    }
45981    if (pid == -1) {
45982        stat = -1; /* errno comes from fork() */
45983    } else {
45984        while (waitpid(pid, &stat, 0) == -1) {
45985            if (errno != EINTR){
45986                stat = -1;
45987                break;
45988            }
45989        }
45990    }
45991    sigaction(SIGINT, &savintr, (struct sigaction *)0);
45992    sigaction(SIGQUIT, &savequit, (struct sigaction *)0);
45993    sigprocmask(SIG_SETMASK, &saveblock, (sigset_t *)0);
45994    return(stat);
45995 }

Note that, while a particular implementation of `system()` (such as the one above) can assume a particular path for the shell, such a path is not necessarily valid on another system. The above example is not portable, and is not intended to be.

One reviewer suggested that an implementation of `system()` might want to use an environment variable such as `SHELL` to determine which command interpreter to use. The supposed implementation would use the default command interpreter if the one specified by the environment variable was not available. This would allow a user, when using an application that prompts for command lines to be processed using `system()`, to specify a different command interpreter. Such an implementation is discouraged. If the alternate command interpreter did not follow the command line syntax specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, then changing `SHELL` would render `system()` non-conforming. This would affect applications that expected the specified behavior from `system()`, and since the Shell and Utilities volume of IEEE Std 1003.1-2001 does not mention that `SHELL` affects `system()`, the application would not know that it needed to unset `SHELL`.

FUTURE DIRECTIONS

None.

**NAME**

`tan`, `tanf`, `tanl` — tangent function

**SYNOPSIS**

```c
#include <math.h>

double tan(double x);
float tanf(float x);
long double tanl(long double x);
```

**DESCRIPTION**

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the tangent of their argument `x`, measured in radians.

An application wishing to check for error situations should set `errno` to zero and call `feclearexcept(FE_ALL_EXCEPT)` before calling these functions. On return, if `errno` is non-zero or `fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW)` is non-zero, an error has occurred.

**RETURN VALUE**

Upon successful completion, these functions shall return the tangent of `x`.

If the correct value would cause underflow, and is not representable, a range error may occur, and either 0.0 (if supported), or an implementation-defined value shall be returned.

If `x` is `NaN`, a `NaN` shall be returned.

If `x` is ±0, `x` shall be returned.

If `x` is subnormal, a range error may occur and `x` should be returned.

If `x` is ±Inf, a domain error shall occur, and either a `NaN` (if supported), or an implementation-defined value shall be returned.

If the correct value would cause underflow, and is representable, a range error may occur and the correct value shall be returned.

If the correct value would cause overflow, a range error shall occur and `tan()`, `tanf()`, and `tanl()` shall return `±HUGE_VAL`, `±HUGE_VALF`, and `±HUGE_VALL`, respectively, with the same sign as the correct value of the function.

**ERRORS**

These functions shall fail if:

- **Domain Error** The value of `x` is ±Inf.
- If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, then `errno` shall be set to `[EDOM].` If the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the invalid floating-point exception shall be raised.

- **Range Error** The result overflows
- If the integer expression `(math_errhandling & MATH_ERRNO)` is non-zero, then `errno` shall be set to `[ERANGE].` If the integer expression `(math_errhandling & MATH_ERREXCEPT)` is non-zero, then the overflow floating-point exception shall be raised.
These functions may fail if:

- **MX Range Error** The result underflows, or the value of \( x \) is subnormal.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then \( errno \) shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

**EXAMPLES**

**Taking the Tangent of a 45-Degree Angle**

```c
#include <math.h>
...
double radians = 45.0 * M_PI / 180;
double result;
...
result = tan(radians);
```

**APPLICATION USAGE**

There are no known floating-point representations such that for a normal argument, \( \tan(x) \) is either overflow or underflow.

These functions may lose accuracy when their argument is near a multiple of \( \pi/2 \) or is far from 0.0.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

None.

**FUTURE DIRECTIONS**

None.

**SEE ALSO**

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

The `tanf()` and `tanl()` functions are added for alignment with the ISO/IEC 9899:1999 standard.

The DESCRIPTION, RETURN VALUE, ERRORS, and APPLICATION USAGE sections are revised to align with the ISO/IEC 9899:1999 standard.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/64 is applied, correcting the last paragraph in the RETURN VALUE section.
NAME
tanh, tanhf, tanhl — hyperbolic tangent functions

SYNOPSIS
#include <math.h>

double tanh(double x);
float tanhf(float x);
long double tanhl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall compute the hyperbolic tangent of their argument x.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the hyperbolic tangent of x.

MX
If x is Nan, a Nan shall be returned.

If x is ±0, x shall be returned.

If x is ±Inf, ±1 shall be returned.

If x is subnormal, a range error may occur and x should be returned.

ERRORS
These functions may fail if:

MX
Range Error The value of x is subnormal.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.

EXAMPLES
None.

APPLICATION USAGE
On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE
None.

FUTURE DIRECTIONS

Issue 5
The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6
NAME
tanl — tangent function

SYNOPSIS
#include <math.h>
long double tanl(long double x);

DESCRIPTION
Refer to tan().
NAME
tcdrain — wait for transmission of output

SYNOPSIS
#include <termios.h>
int tcdrain(int fildes);

DESCRIPTION
The tcdrain() function shall block until all output written to the object referred to by fildes is transmitted. The fildes argument is an open file descriptor associated with a terminal.

Any attempts to use tcdrain() from a process which is a member of a background process group on a fildes associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The tcdrain() function shall fail if:

[EBADF] The fildes argument is not a valid file descriptor.

[EINTR] A signal interrupted tcdrain().

[ENOTTY] The file associated with fildes is not a terminal.

The tcdrain() function may fail if:

[EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

EXAMPLES
None.

APPLICATION USAGE
None.

tcflush(), the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, <termios.h>, <unistd.h>

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on \_POSIX\_JOB\_CONTROL. This is a FIPS requirement.
- The [EIO] error is added.
NAME

tcflow — suspend or restart the transmission or reception of data

SYNOPSIS

```c
#include <termios.h>

int tcflow(int fildes, int action);
```

DESCRIPTION

The `tcflow()` function shall suspend or restart transmission or reception of data on the object referred to by `fildes`, depending on the value of `action`. The `fildes` argument is an open file descriptor associated with a terminal.

- If `action` is TCOOFF, output shall be suspended.
- If `action` is TCOON, suspended output shall be restarted.
- If `action` is TCIOFF, the system shall transmit a STOP character, which is intended to cause the terminal device to stop transmitting data to the system.
- If `action` is TCION, the system shall transmit a START character, which is intended to cause the terminal device to start transmitting data to the system.

The default on the opening of a terminal file is that neither its input nor its output are suspended.

Attempts to use `tcflow()` from a process which is a member of a background process group on a `fildes` associated with its controlling terminal, shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and `errno` set to indicate the error.

ERRORS

The `tcflow()` function shall fail if:

- [EBADF] The `fildes` argument is not a valid file descriptor.
- [EINVAL] The `action` argument is not a supported value.
- [ENOTTY] The file associated with `fildes` is not a terminal.

The `tcflow()` function may fail if:

- [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• The [EIO] error is added.
NAME
tcflush — flush non-transmitted output data, non-read input data, or both

SYNOPSIS
#include <termios.h>

int tcflush(int fildes, int queue_selector);

DESCRIPTION
Upon successful completion, \texttt{tcflush()} shall discard data written to the object referred to by \texttt{fildes} (an open file descriptor associated with a terminal) but not transmitted, or data received but not read, depending on the value of \texttt{queue_selector}:

- If \texttt{queue_selector} is TCIFLUSH, it shall flush data received but not read.
- If \texttt{queue_selector} is TCOFLUSH, it shall flush data written but not transmitted.
- If \texttt{queue_selector} is TCIOFLUSH, it shall flush both data received but not read and data written but not transmitted.

Attempts to use \texttt{tcflush()} from a process which is a member of a background process group on a \texttt{fildes} associated with its controlling terminal shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, \texttt{-1} shall be returned and \texttt{errno} set to indicate the error.

ERRORS
The \texttt{tcflush()} function shall fail if:

- [EBADF] The \texttt{fildes} argument is not a valid file descriptor.
- [EINVAL] The \texttt{queue_selector} argument is not a supported value.
- [ENOTTY] The file associated with \texttt{fildes} is not a terminal.

The \texttt{tcflush()} function may fail if:

- [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6

The Open Group Corrigendum U035/1 is applied. In the ERRORS and APPLICATION USAGE sections, references to `tcflow()` are replaced with `tcflush()`.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, the final paragraph is no longer conditional on `_POSIX_JOB_CONTROL`. This is a FIPS requirement.
- The [EIO] error is added.
NAME
tcgetattr — get the parameters associated with the terminal

SYNOPSIS
#include <termios.h>
int tcgetattr(int fildes, struct termios *termios_p);

DESCRIPTION
The tcgetattr() function shall get the parameters associated with the terminal referred to by fildes
and store them in the termios structure referenced by termios_p. The fildes argument is an open
file descriptor associated with a terminal.

The termios_p argument is a pointer to a termios structure.

The tcgetattr() operation is allowed from any process.

If the terminal device supports different input and output baud rates, the baud rates stored in
the termios structure returned by tcgetattr() shall reflect the actual baud rates, even if they are
equal. If differing baud rates are not supported, the rate returned as the output baud rate shall be
the actual baud rate. If the terminal device does not support split baud rates, the input baud rate
stored in the termios structure shall be the output rate (as one of the symbolic values).

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The tcgetattr() function shall fail if:

[EBADF] The fildes argument is not a valid file descriptor.

[ENOTTY] The file associated with fildes is not a terminal.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Care must be taken when changing the terminal attributes. Applications should always do a
tcgetattr(), save the termios structure values returned, and then do a tcsetattr(), changing only
the necessary fields. The application should use the values saved from the tcgetattr() to reset the
terminal state whenever it is done with the terminal. This is necessary because terminal
attributes apply to the underlying port and not to each individual open instance; that is, all
processes that have used the terminal see the latest attribute changes.

A program that uses these functions should be written to catch all signals and take other
appropriate actions to ensure that when the program terminates, whether planned or not, the
terminal device's state is restored to its original state.

Existing practice dealing with error returns when only part of a request can be honored is based
on calls to the ioctl() function. In historical BSD and System V implementations, the
 corresponding ioctl() returns zero if the requested actions were semantically correct, even if
some of the requested changes could not be made. Many existing applications assume this
behavior and would no longer work correctly if the return value were changed from zero to −1
in this case.
Note that either specification has a problem. When zero is returned, it implies everything succeeded even if some of the changes were not made. When −1 is returned, it implies everything failed even though some of the changes were made.

Applications that need all of the requested changes made to work properly should follow \texttt{tcsetattr}() with a call to \texttt{tcgetattr}() and compare the appropriate field values.

\textbf{FUTURE DIRECTIONS}

None.

\textbf{SEE ALSO}

\texttt{tcsetattr}(), the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, \texttt{<termios.h>}

\textbf{CHANGE HISTORY}

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

In the DESCRIPTION, the rate returned as the input baud rate shall be the output rate. Previously, the number zero was also allowed but was obsolescent.
NAME
tcgetpgrp — get the foreground process group ID

SYNOPSIS
#include <unistd.h>

pid_t tcgetpgrp(int fildes);

DESCRIPTION
The tcgetpgrp() function shall return the value of the process group ID of the foreground process
group associated with the terminal.

If there is no foreground process group, tcgetpgrp() shall return a value greater than 1 that does
not match the process group ID of any existing process group.

The tcgetpgrp() function is allowed from a process that is a member of a background process
group; however, the information may be subsequently changed by a process that is a member of
a foreground process group.

RETURN VALUE
Upon successful completion, tcgetpgrp() shall return the value of the process group ID of the
foreground process associated with the terminal. Otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The tcgetpgrp() function shall fail if:

[EBADF] The fildes argument is not a valid file descriptor.

[ENOTTY] The calling process does not have a controlling terminal, or the file is not the
controlling terminal.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

/sys/types.h>, <unistd.h>

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6
In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:
• The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was
required for conforming implementations of previous POSIX specifications, it was not
required for UNIX applications.
In the DESCRIPTION, text previously conditional on support for _POSIX_JOB_CONTROL is now mandatory. This is a FIPS requirement.
NAME
tcgetsid — get the process group ID for the session leader for the controlling terminal

SYNOPSIS
#include <termios.h>

pid_t tcgetsid(int fildes);

DESCRIPTION
The tcgetsid() function shall obtain the process group ID of the session for which the terminal specified by fildes is the controlling terminal.

RETURN VALUE
Upon successful completion, tcgetsid() shall return the process group ID associated with the terminal. Otherwise, a value of (pid_t)-1 shall be returned and errno set to indicate the error.

ERRORS
The tcgetsid() function shall fail if:
    [EBADF] The fildes argument is not a valid file descriptor.
    [ENOTTY] The calling process does not have a controlling terminal, or the file is not the controlling terminal.

EXAMPLES

Issue 5
Moved from X/OPEN UNIX extension to BASE.

The [EACCES] error has been removed from the list of mandatory errors, and the description of [ENOTTY] has been reworded.
NAME
tcsendbreak — send a break for a specific duration

SYNOPSIS
#include <termios.h>

int tcsendbreak(int fildes, int duration);

DESCRIPTION
If the terminal is using asynchronous serial data transmission, tcsendbreak() shall cause
transmission of a continuous stream of zero-valued bits for a specific duration. If duration is 0, it
shall cause transmission of zero-valued bits for at least 0.25 seconds, and not more than 0.5
seconds. If duration is not 0, it shall send zero-valued bits for an implementation-defined period
of time.

The fildes argument is an open file descriptor associated with a terminal.

If the terminal is not using asynchronous serial data transmission, it is implementation-defined
whether tcsendbreak() sends data to generate a break condition or returns without taking any
action.

Attempts to use tcsendbreak() from a process which is a member of a background process group
on a fildes associated with its controlling terminal shall cause the process group to be sent a
SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process
shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to
indicate the error.

ERRORS
The tcsendbreak() function shall fail if:

[EBADF] The fildes argument is not a valid file descriptor.

[ENOTTY] The file associated with fildes is not a terminal.

The tcsendbreak() function may fail if:

[EIO] The process group of the writing process is orphaned, and the writing process
is not ignoring or blocking SIGTTOU.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

tcsendbreak()

CHANGE HISTORY
First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.
- The [EIO] error is added.
NAME
tcsetattr — set the parameters associated with the terminal

SYNOPSIS
#include <termios.h>

int tcsetattr(int fildes, int optional_actions,
               const struct termios *termios_p);

DESCRIPTION
The tcsetattr() function shall set the parameters associated with the terminal referred to by the
open file descriptor fildes (an open file descriptor associated with a terminal) from the termios
structure referenced by termios_p as follows:

• If optional_actions is TCSANOW, the change shall occur immediately.

• If optional_actions is TCSADRAIN, the change shall occur after all output written to fildes is
  transmitted. This function should be used when changing parameters that affect output.

• If optional_actions is TCSAFLUSH, the change shall occur after all output written to fildes is
  transmitted, and all input so far received but not read shall be discarded before the change is
  made.

If the output baud rate stored in the termios structure pointed to by termios_p is the zero baud
rate, B0, the modem control lines shall no longer be asserted. Normally, this shall disconnect the
line.

If the input baud rate stored in the termios structure pointed to by termios_p is 0, the input baud
rate given to the hardware is the same as the output baud rate stored in the termios structure.

The tcsetattr() function shall return successfully if it was able to perform any of the requested
actions, even if some of the requested actions could not be performed. It shall set all the
attributes that the implementation supports as requested and leave all the attributes not
supported by the implementation unchanged. If no part of the request can be honored, it shall
return −1 and set errno to [EINVAL]. If the input and output baud rates differ and are a
combination that is not supported, neither baud rate shall be changed. A subsequent call to
tcgetattr() shall return the actual state of the terminal device (reflecting both the changes made
and not made in the previous tcsetattr() call). The tcsetattr() function shall not change the values
found in the termios structure under any circumstances.

The effect of tcsetattr() is undefined if the value of the termios structure pointed to by termios_p
was not derived from the result of a call to tcgetattr() on fildes; an application should modify
only fields and flags defined by this volume of IEEE Std 1003.1-2001 between the call to
tcgetattr() and tcsetattr(), leaving all other fields and flags unmodified.

No actions defined by this volume of IEEE Std 1003.1-2001, other than a call to tcsetattr() or a
close of the last file descriptor in the system associated with this terminal device, shall cause any
of the terminal attributes defined by this volume of IEEE Std 1003.1-2001 to change.

If tcsetattr() is called from a process which is a member of a background process group on a
fildes associated with its controlling terminal:

• If the calling process is blocking or ignoring SIGTTOU signals, the operation completes
  normally and no signal is sent.

• Otherwise, a SIGTTOU signal shall be sent to the process group.
### tcsetattr()

**RETURN VALUE**

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and *errno* set to indicate the error.

**ERRORS**

The *tcsetattr()* function shall fail if:

- [EBADF] The *fildes* argument is not a valid file descriptor.
- [EINVAL] The *optional_actions* argument is not a supported value, or an attempt was made to change an attribute represented in the *termios* structure to an unsupported value.
- [ENOTTY] The file associated with *fildes* is not a terminal.

The *tcsetattr()* function may fail if:

- [EIO] The process group of the writing process is orphaned, and the writing process is not ignoring or blocking SIGTTOU.

**EXAMPLES**

None.

**APPLICATION USAGE**

If trying to change baud rates, applications should call *tcsetattr()* then call *tcgetattr()* in order to determine what baud rates were actually selected.

**RATIONALE**

The *tcsetattr()* function can be interrupted in the following situations:

- It is interrupted while waiting for output to drain.
- It is called from a process in a background process group and SIGTTOU is caught.

See also the RATIONALE section in *tcgetattr()*.

**FUTURE DIRECTIONS**

Using an input baud rate of 0 to set the input rate equal to the output rate may not necessarily be supported in a future version of this volume of IEEE Std 1003.1-2001.

**SEE ALSO**

cfgetispeed(), tcgetattr(), the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 11, General Terminal Interface, `<termios.h>`, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the DESCRIPTION, text previously conditional on _POSIX_JOB_CONTROL is now mandated. This is a FIPS requirement.
- The [EIO] error is added.
In the DESCRIPTION, the text describing use of `tcsetattr()` from a process which is a member of a background process group is clarified.
tcsetpgrp()  

NAME

tcsetpgrp — set the foreground process group ID

SYNOPSIS

#include <unistd.h>

int tcsetpgrp(int fildes, pid_t pgid_id);

DESCRIPTION

If the process has a controlling terminal, tcsetpgrp() shall set the foreground process group ID associated with the terminal to pgid_id. The application shall ensure that the file associated with fildes is the controlling terminal of the calling process and the controlling terminal is currently associated with the session of the calling process. The application shall ensure that the value of pgid_id matches a process group ID of a process in the same session as the calling process.

Attempts to use tcsetpgrp() from a process which is a member of a background process group on a fildes associated with its controlling terminal shall cause the process group to be sent a SIGTTOU signal. If the calling process is blocking or ignoring SIGTTOU signals, the process shall be allowed to perform the operation, and no signal is sent.

RETURN VALUE

Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS

The tcsetpgrp() function shall fail if:

- [EBADF] The fildes argument is not a valid file descriptor.
- [EINVAL] This implementation does not support the value in the pgid_id argument.
- [ENOTTY] The calling process does not have a controlling terminal, or the file is not the controlling terminal, or the controlling terminal is no longer associated with the session of the calling process.
- [EPERM] The value of pgid_id is a value supported by the implementation, but does not match the process group ID of a process in the same session as the calling process.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 3. Included for alignment with the POSIX.1-1988 standard.
In the SYNOPSIS, the inclusion of `<sys/types.h>` is no longer required.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- In the DESCRIPTION and ERRORS sections, text previously conditional on `_POSIX_JOB_CONTROL` is now mandated. This is a FIPS requirement.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The Open Group Corrigendum U047/4 is applied.
tdelete()

NAME
tdelete, tfind, tsearch, twalk — manage a binary search tree

SYNOPSIS
#include <search.h>

void *tdelete(const void *restrict key, void **restrict rootp,
               int (*compar)(const void *, const void *));
void *tfind(const void *key, void *const *rootp,
            int (*compar)(const void *, const void *));
void *tsearch(const void *key, void **rootp,
              int (*compar)(const void *, const void *));
void twalk(const void *root,
           void (*action)(const void *, VISIT, int));

DESCRIPTION
The tdelete(), tfind(), tsearch(), and twalk() functions manipulate binary search trees. Comparisons are made with a user-supplied routine, the address of which is passed as the compar argument. This routine is called with two arguments, which are the pointers to the elements being compared. The application shall ensure that the user-supplied routine returns an integer less than, equal to, or greater than 0, according to whether the first argument is to be considered less than, equal to, or greater than the second argument. The comparison function need not compare every byte, so arbitrary data may be contained in the elements in addition to the values being compared.

The tsearch() function shall build and access the tree. The key argument is a pointer to an element to be accessed or stored. If there is a node in the tree whose element is equal to the value pointed to by key, a pointer to this found node shall be returned. Otherwise, the value pointed to by key shall be inserted (that is, a new node is created and the value of key is copied to this node), and a pointer to this node returned. Only pointers are copied, so the application shall ensure that the calling routine stores the data. The rootp argument points to a variable that points to the root node of the tree. A null pointer value for the variable pointed to by rootp denotes an empty tree; in this case, the variable shall be set to point to the node which shall be at the root of the new tree.

Like tsearch(), tfind() shall search for a node in the tree, returning a pointer to it if found. However, if it is not found, tfind() shall return a null pointer. The arguments for tfind() are the same as for tsearch().

The tdelete() function shall delete a node from a binary search tree. The arguments are the same as for tsearch(). The variable pointed to by rootp shall be changed if the deleted node was the root of the tree. The tdelete() function shall return a pointer to the parent of the deleted node, or a null pointer if the node is not found.

The twalk() function shall traverse a binary search tree. The root argument is a pointer to the root node of the tree to be traversed. (Any node in a tree may be used as the root for a walk below that node.) The argument action is the name of a routine to be invoked at each node. This routine is, in turn, called with three arguments. The first argument shall be the address of the node being visited. The structure pointed to by this argument is unspecified and shall not be modified by the application, but it shall be possible to cast a pointer-to-node into a pointer-to-pointer-to-element to access the element stored in the node. The second argument shall be a value from an enumeration data type:

typedef enum { preorder, postorder, endorder, leaf } VISIT;
tdelete()

(defined in `<search.h>`), depending on whether this is the first, second, or third time that the
node is visited (during a depth-first, left-to-right traversal of the tree), or whether the node is a
leaf. The third argument shall be the level of the node in the tree, with the root being level 0.

If the calling function alters the pointer to the root, the result is undefined.

**RETURN VALUE**

If the node is found, both `tsearch()` and `tfind()` shall return a pointer to it. If not, `tfind()` shall
return a null pointer, and `tsearch()` shall return a pointer to the inserted item.

A null pointer shall be returned by `tsearch()` if there is not enough space available to create a new
node.

A null pointer shall be returned by `tdelete()`, `tfind()`, and `tsearch()` if `rootp` is a null pointer on
entry.

The `tdelete()` function shall return a pointer to the parent of the deleted node, or a null pointer if
the node is not found.

The `twalk()` function shall not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES**

The following code reads in strings and stores structures containing a pointer to each string and
a count of its length. It then walks the tree, printing out the stored strings and their lengths in
alphabetical order.

```c
#include <search.h>
#include <string.h>
#include <stdio.h>

#define STRSZ 10000
#define NODSZ 500

struct node { /* Pointers to these are stored in the tree. */
    char *string;
    int length;
};

char string_space[STRSZ]; /* Space to store strings. */
struct node nodes[NODSZ]; /* Nodes to store. */
void *root = NULL; /* This points to the root. */

int main(int argc, char *argv[])
{
    char *strptr = string_space;
    struct node *nodeptr = nodes;
    void print_node(const void *, VISIT, int);
    int i = 0, node_compare(const void *, const void *, const void *);

    while (fgets(strptr) != NULL && i++ < NODSZ) {
    /* Set node. */
        nodeptr->string = strptr;
        nodeptr->length = strlen(strptr);
    /* Put node into the tree. */
        (void) tsearch((void *)nodeptr, (void **)&root,
                        node_compare);
```
/* Adjust pointers, so we do not overwrite tree. */
strptr += nodeptr->length + 1;
nodeptr++;

twalk(root, print_node);
return 0;

/* This routine compares two nodes, based on an
alphabetical ordering of the string field. */
int
node_compare(const void *node1, const void *node2)
{
    return strcmp(((const struct node *) node1)->string,
                  ((const struct node *) node2)->string);
}

/* This routine prints out a node, the second time
twalk encounters it or if it is a leaf. */
void
print_node(const void *ptr, VISIT order, int level)
{
    const struct node *p = *(const struct node **) ptr;
    if (order == postorder || order == leaf) {
        (void) printf("string = %s, length = %d\n", p->string, p->length);
    }
}

APPLICATION USAGE
The root argument to twalk() is one level of indirection less than the rootp arguments to tdelete() and tsearch().

There are two nomenclatures used to refer to the order in which tree nodes are visited. The tsearch() function uses preorder, postorder, and endorder to refer respectively to visiting a node before any of its children, after its left child and before its right, and after both its children. The alternative nomenclature uses preorder, inorder, and postorder to refer to the same visits, which could result in some confusion over the meaning of postorder.

Issue 5
The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The restrict keyword is added to the tdelete() prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
telldir — current location of a named directory stream

SYNOPSIS
XSI
#include <dirent.h>

long telldir(DIR *dirp);

DESCRIPTION
The telldir() function shall obtain the current location associated with the directory stream
specified by dirp.

If the most recent operation on the directory stream was a seekdir(), the directory position
returned from the telldir() shall be the same as that supplied as a loc argument for seekdir().

RETURN VALUE
Upon successful completion, telldir() shall return the current location of the specified directory
stream.

ERRORS
No errors are defined.

NAME

tempnam — create a name for a temporary file

SYNOPSIS

XSI
#include <stdio.h>

char *tempnam(const char *dir, const char *pfx);

DESCRIPTION

The tempnam() function shall generate a pathname that may be used for a temporary file.

The tempnam() function allows the user to control the choice of a directory. The dir argument points to the name of the directory in which the file is to be created. If dir is a null pointer or points to a string which is not a name for an appropriate directory, the path prefix defined as P_tmpdir in the <stdio.h> header shall be used. If that directory is not accessible, an implementation-defined directory may be used.

Many applications prefer their temporary files to have certain initial letter sequences in their names. The pfx argument should be used for this. This argument may be a null pointer or point to a string of up to five bytes to be used as the beginning of the filename.

Some implementations of tempnam() may use tmpnam() internally. On such implementations, if called more than {TMP_MAX} times in a single process, the behavior is implementation-defined.

RETURN VALUE

Upon successful completion, tempnam() shall allocate space for a string, put the generated pathname in that space, and return a pointer to it. The pointer shall be suitable for use in a subsequent call to free(). Otherwise, it shall return a null pointer and set errno to indicate the error.

ERRORS

The tempnam() function shall fail if:

[ENOMEM] Insufficient storage space is available.

EXAMPLES

Generating a Pathname

The following example generates a pathname for a temporary file in directory /tmp, with the prefix file. After the filename has been created, the call to free() deallocates the space used to store the filename.

```c
#include <stdio.h>
#include <stdlib.h>
...
char *directory = "\tmp";
char *fileprefix = "file";
char *file;
file = tempnam(directory, fileprefix);
free(file);
```

APPLICATION USAGE

This function only creates pathnames. It is the application’s responsibility to create and remove the files. Between the time a pathname is created and the file is opened, it is possible for some other process to create a file with the same name. Applications may find tmpfile() more useful.
tempnam()  

System Interfaces

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The last paragraph of the DESCRIPTION was included as an APPLICATION USAGE note in previous issues.
NAME
tfind — search binary search tree

SYNOPSIS
#include <search.h>

void *tfind(const void *key, void *const *rootp,
           int (*compar)(const void *, const void *));

DESCRIPTION
Refer to tdelete().
NAME
tgamma, tgammaf, tgammal — compute gamma() function

SYNOPSIS
#include <math.h>

double tgamma(double x);
float tgammaf(float x);
long double tgammal(long double x);

DESCRIPTION
CX The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

These functions shall compute the gamma() function of \( x \).

An application wishing to check for error situations should set \( \text{errno} \) to zero and call
\( \text{fcontext}(\text{FE_ALL_EXCEPT}) \) before calling these functions. On return, if \( \text{errno} \) is non-zero or
\( \text{fetestexcept}(\text{FE_INVALID} | \text{FE_DIVBYZERO} | \text{FE_OVERFLOW} | \text{FE_UNDERFLOW}) \) is non-
zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return \( \text{Gamma}(x) \).

If \( x \) is a negative integer, a domain error shall occur, and either a NaN (if supported), or an
implementation-defined value shall be returned.

If the correct value would cause overflow, a range error shall occur and \( \text{tgamma}(), \text{tgammaf}(), \) and
\( \text{tgammal}() \) shall return \( \pm \text{HUGE}_\text{VAL}, \pm \text{HUGE}_\text{VALF}, \) or \( \pm \text{HUGE}_\text{VALL}, \) respectively, with
the same sign as the correct value of the function.

MX If \( x \) is NaN, a NaN shall be returned.

If \( x \) is \( +\text{Inf}, x \) shall be returned.

If \( x \) is \( +0, \) a pole error shall occur, and \( \text{tgamma}(), \text{tgammaf}(), \) and
\( \text{tgammal}() \) shall return \( \pm \text{HUGE}_\text{VAL}, \pm \text{HUGE}_\text{VALF}, \) and \( \pm \text{HUGE}_\text{VALL}, \) respectively.

If \( x \) is \( -\text{Inf}, \) a domain error shall occur, and either a NaN (if supported), or an implementation-
defined value shall be returned.

ERRORS
These functions shall fail if:

Domain Error The value of \( x \) is a negative integer, or \( x \) is \( -\text{Inf}. \)

If the integer expression (\text{math_errno} & \text{MATH_ERRNO}) is non-zero,
then \( \text{errno} \) shall be set to [EDOM]. If the integer expression (\text{math_errno} & \text{MATH_EPERRXCEPT}) is non-zero, then the invalid floating-point exception
shall be raised.

Pole Error The value of \( x \) is zero.

If the integer expression (\text{math_errno} & \text{MATH_ERRNO}) is non-zero,
then \( \text{errno} \) shall be set to [ERANGE]. If the integer expression
(\text{math_errno} & \text{MATH_EPERRXCEPT}) is non-zero, then the divide-by-
zero floating-point exception shall be raised.
Range Error The value overflows.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then *errno* shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

**EXAMPLES**

None.

**APPLICATION USAGE**

For IEEE Std 754-1985 *double*, overflow happens when 0 < *x* < 1/DBL_MAX, and 171.7 < *x*.

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

**RATIONALE**

This function is named *tgamma()* in order to avoid conflicts with the historical *gamma()* and *lgamma()* functions.

**FUTURE DIRECTIONS**

It is possible that the error response for a negative integer argument may be changed to a pole error and a return value of ±Inf.

**SEE ALSO**

feclearexcept(), fetestexcept(), lgamma(), the Base Definitions volume of IEEE Std 1003.1-2001, Section 4.18, Treatment of Error Conditions for Mathematical Functions, `<math.h>`

**CHANGE HISTORY**

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/65 is applied, correcting the third paragraph in the RETURN VALUE section.
time()

NAME
time — get time

SYNOPSIS
#include <time.h>
time_t time(time_t *tloc);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The time() function shall return the value of time in seconds since the Epoch.
The tloc argument points to an area where the return value is also stored. If tloc is a null pointer,
no value is stored.

RETURN VALUE
Upon successful completion, time() shall return the value of time. Otherwise, (time_t)−1 shall be
returned.

ERRORS
No errors are defined.

EXAMPLES

Getting the Current Time
The following example uses the time() function to calculate the time elapsed, in seconds, since
the Epoch, localtime() to convert that value to a broken-down time, and asctime() to convert the
broken-down time values into a printable string.

#include <stdio.h>
#include <time.h>

int main(void)
{
    time_t result;
    result = time(NULL);
    printf("%s%ju secs since the Epoch\n", 
           asctime(localtime(&result)),
           (uintmax_t)result);
    return(0);
}

This example writes the current time to stdout in a form like this:

835810335 secs since the Epoch
Timing an Event

The following example gets the current time, prints it out in the user's format, and prints the number of minutes to an event being timed.

```c
#include <time.h>
#include <stdio.h>
...

time_t now;
int minutes_to_event;
...

time(&now);
minutes_to_event = ...;
printf("The time is ");
puts(asctime(localtime(&now)));
printf("There are %d minutes to the event.\n", minutes_to_event);
...
```

APPLICATION USAGE

None.

RATIONALE

The `time()` function returns a value in seconds (type `time_t`) while `times()` returns a set of values in clock ticks (type `clock_t`). Some historical implementations, such as 4.3 BSD, have mechanisms capable of returning more precise times (see below). A generalized timing scheme to unify these various timing mechanisms has been proposed but not adopted.

Implementations in which `time_t` is a 32-bit signed integer (many historical implementations) fail in the year 2038. IEEE Std 1003.1-2001 does not address this problem. However, the use of the `time_t` type is mandated in order to ease the eventual fix.

The use of the `<time.h>` header instead of `<sys/types.h>` allows compatibility with the ISO C standard.

Many historical implementations (including Version 7) and the 1984 `/usr/group` standard use `long` instead of `time_t`. This volume of IEEE Std 1003.1-2001 uses the latter type in order to agree with the ISO C standard.

4.3 BSD includes `time()` only as an alternate function to the more flexible `gettimeofday()` function.

FUTURE DIRECTIONS

In a future version of this volume of IEEE Std 1003.1-2001, `time_t` is likely to be required to be capable of representing times far in the future. Whether this will be mandated as a 64-bit type or a requirement that a specific date in the future be representable (for example, 10000 AD) is not yet determined. Systems purchased after the approval of this volume of IEEE Std 1003.1-2001 should be evaluated to determine whether their lifetime will extend past 2038.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.
Extensions beyond the ISO C standard are marked.

The EXAMPLES, RATIONALE, and FUTURE DIRECTIONS sections are added.
NAME

timer_create — create a per-process timer (REALTIME)

SYNOPSIS

```
#include <signal.h>
#include <time.h>

int timer_create(clockid_t clockid, struct sigevent *restrict evp,
                 timer_t *restrict timerid);
```

DESCRIPTION

The `timer_create()` function shall create a per-process timer using the specified clock, `clock_id`, as
the timing base. The `timer_create()` function shall return, in the location referenced by `timerid`, a
timer ID of type `timer_t` used to identify the timer in timer requests. This timer ID shall be
unique within the calling process until the timer is deleted. The particular clock, `clock_id`, is
defined in `<time.h>`. The timer whose ID is returned shall be in a disarmed state upon return
from `timer_create()`.

The `evp` argument, if non-NULL, points to a `sigevent` structure. This structure, allocated by the
application, defines the asynchronous notification to occur as specified in Section 2.4.1 (on page
28) when the timer expires. If the `evp` argument is NULL, the effect is as if the `evp` argument
pointed to a `sigevent` structure with the `sigev_notify` member having the value `SIGEV_SIGNAL`,
the `sigev_signo` having a default signal number, and the `sigev_value` member having the value of
the timer ID.

Each implementation shall define a set of clocks that can be used as timing bases for per-process
timers. All implementations shall support a `clock_id` of `CLOCK_REALTIME`. If the Monotonic
Clock option is supported, implementations shall support a `clock_id` of `CLOCK_MONOTONIC`.
Per-process timers shall not be inherited by a child process across a `fork()` and shall be disarmed
and deleted by an `exec`.

If `_POSIX_CPUTIME` is defined, implementations shall support `clock_id` values representing the
CPU-time clock of the calling process.

If `_POSIX_THREAD_CPUTIME` is defined, implementations shall support `clock_id` values
representing the CPU-time clock of the calling thread.

It is implementation-defined whether a `timer_create()` function will succeed if the value defined
by `clock_id` corresponds to the CPU-time clock of a process or thread different from the process
or thread invoking the function.

RETURN VALUE

If the call succeeds, `timer_create()` shall return zero and update the location referenced by `timerid
to a `timer_t`, which can be passed to the per-process timer calls. If an error occurs, the function
shall return a value of −1 and set `errno` to indicate the error. The value of `timerid` is undefined if
an error occurs.

ERRORS

The `timer_create()` function shall fail if:

[EAGAIN] The system lacks sufficient signal queuing resources to honor the request.

[EAGAIN] The calling process has already created all of the timers it is allowed by this
implementation.

[EINVAL] The specified clock ID is not defined.
The implementation does not support the creation of a timer attached to the CPU-time clock that is specified by `clock_id` and associated with a process or thread different from the process or thread invoking `timer_create()`.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

**Periodic Timer Overrun and Resource Allocation**

The specified timer facilities may deliver realtime signals (that is, queued signals) on implementations that support this option. Since realtime applications cannot afford to lose notifications of asynchronous events, like timer expirations or asynchronous I/O completions, it must be possible to ensure that sufficient resources exist to deliver the signal when the event occurs. In general, this is not a difficulty because there is a one-to-one correspondence between a request and a subsequent signal generation. If the request cannot allocate the signal delivery resources, it can fail the call with an [EAGAIN] error.

Periodic timers are a special case. A single request can generate an unspecified number of signals. This is not a problem if the requesting process can service the signals as fast as they are generated, thus making the signal delivery resources available for delivery of subsequent periodic timer expiration signals. But, in general, this cannot be assured—processing of periodic timer signals may "overrun"; that is, subsequent periodic timer expirations may occur before the currently pending signal has been delivered.

Also, for signals, according to the POSIX.1-1990 standard, if subsequent occurrences of a pending signal are generated, it is implementation-defined whether a signal is delivered for each occurrence. This is not adequate for some realtime applications. So a mechanism is required to allow applications to detect how many timer expirations were delayed without requiring an indefinite amount of system resources to store the delayed expirations.

The specified facilities provide for an overrun count. The overrun count is defined as the number of extra timer expirations that occurred between the time a timer expiration signal is generated and the time the signal is delivered. The signal-catching function, if it is concerned with overruns, can retrieve this count on entry. With this method, a periodic timer only needs one "signal queuing resource" that can be allocated at the time of the `timer_create()` function call.

A function is defined to retrieve the overrun count so that an application need not allocate static storage to contain the count, and an implementation need not update this storage asynchronously on timer expirations. But, for some high-frequency periodic applications, the overhead of an additional system call on each timer expiration may be prohibitive. The functions, as defined, permit an implementation to maintain the overrun count in user space, associated with the `timerid`. The `timer_getoverrun()` function can then be implemented as a macro that uses the `timerid` argument (which may just be a pointer to a user space structure containing the counter) to locate the overrun count with no system call overhead. Other implementations, less concerned with this class of applications, can avoid the asynchronous update of user space by maintaining the count in a system structure at the cost of the extra system call to obtain it.
Timer Expiration Signal Parameters

The Realtime Signals Extension option supports an application-specific datum that is delivered to the extended signal handler. This value is explicitly specified by the application, along with the signal number to be delivered, in a `sigevent` structure. The type of the application-defined value can be either an integer constant or a pointer. This explicit specification of the value, as opposed to always sending the timer ID, was selected based on existing practice.

It is common practice for realtime applications (on non-POSIX systems or realtime extended POSIX systems) to use the parameters of event handlers as the case label of a switch statement or as a pointer to an application-defined data structure. Since `timer_ids` are dynamically allocated by the `timer_create()` function, they can be used for neither of these functions without additional application overhead in the signal handler; for example, to search an array of saved timer IDs to associate the ID with a constant or application data structure.

FUTURE DIRECTIONS
None.

SEE ALSO
`clock_getres()`, `timer_delete()`, `timer_getoverrun()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<time.h>`

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
The `timer_create()` function is marked as part of the Timers option.

The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

CPU-time clocks are added for alignment with IEEE Std 1003.1d-1999.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by adding the requirement for the CLOCK_MONOTONIC clock under the Monotonic Clock option.

The `restrict` keyword is added to the `timer_create()` prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
  timer_delete — delete a per-process timer (REALTIME)

SYNOPSIS
  #include <time.h>

  int timer_delete(timer_t timerid);

DESCRIPTION
  The timer_delete() function deletes the specified timer, timerid, previously created by the
timer_create() function. If the timer is armed when timer_delete() is called, the behavior shall be
as if the timer is automatically disarmed before removal. The disposition of pending signals for
the deleted timer is unspecified.

RETURN VALUE
  If successful, the timer_delete() function shall return a value of zero. Otherwise, the function shall
return a value of −1 and set errno to indicate the error.

ERRORS
  The timer_delete() function shall fail if:
  [EINVAL] The timer ID specified by timerid is not a valid timer ID.

EXAMPLES
  None.

APPLICATION USAGE
  None.

RATIONALE
  None.

FUTURE DIRECTIONS
  None.

  timer_create(), the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>

CHANGE HISTORY
  First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
  The timer_delete() function is marked as part of the Timers option.

  The [ENOSYS] error condition has been removed as stubs need not be provided if an
implementation does not support the Timers option.
NAME
timer_getoverrun, timer_gettime, timer_settime — per-process timers (REALTIME)

SYNOPSIS
#include <time.h>

int timer_getoverrun(timer_t timerid);
int timer_gettime(timer_t timerid, struct itimerspec *value);
int timer_settime(timer_t timerid, int flags,
                     const struct itimerspec *restrict value,
                     struct itimerspec *restrict ovalue);

DESCRIPTION
The timer_gettime( ) function shall store the amount of time until the specified timer, timerid, expires and the reload value of the timer into the space pointed to by the value argument. The it_value member of this structure shall contain the amount of time before the timer expires, or zero if the timer is disarmed. This value is returned as the interval until timer expiration, even if the timer was armed with absolute time. The it_interval member of value shall contain the reload value last set by timer_settime().

The timer_settime( ) function shall set the time until the next expiration of the timer specified by timerid from the it_value member of the value argument and arm the timer if the it_value member of value is non-zero. If the specified timer was already armed when timer_settime( ) is called, this call shall reset the time until next expiration to the value specified. If the it_value member of value is zero, the timer shall be disarmed. The effect of disarming or resetting a timer with pending expiration notifications is unspecified.

If the flag TIMER_ABSTIME is not set in the argument flags, timer_settime( ) shall behave as if the time until next expiration is set to be equal to the interval specified by the it_value member of value. That is, the timer shall expire in it_value nanoseconds from when the call is made. If the flag TIMER_ABSTIME is set in the argument flags, timer_settime( ) shall behave as if the time until next expiration is set to be equal to the difference between the absolute time specified by the it_value member of value and the current value of the clock associated with timerid. That is, the timer shall expire when the clock reaches the value specified by the it_value member of value.

If the specified time has already passed, the function shall succeed and the expiration notification shall be made.

The reload value of the timer shall be set to the value specified by the it_interval member of value. When a timer is armed with a non-zero it_interval, a periodic (or repetitive) timer is specified.

Time values that are between two consecutive non-negative integer multiples of the resolution of the specified timer shall be rounded up to the larger multiple of the resolution. Quantization error shall not cause the timer to expire earlier than the rounded time value.

If the argument ovalue is not NULL, the timer_settime( ) function shall store, in the location referenced by ovalue, a value representing the previous amount of time before the timer would have expired, or zero if the timer was disarmed, together with the previous timer reload value. Timers shall not expire before their scheduled time.

Only a single signal shall be queued to the process for a given timer at any point in time. When a timer for which a signal is still pending expires, no signal shall be queued, and a timer overrun shall occur. When a timer expiration signal is delivered to or accepted by a process, if the implementation supports the Realtime Signals Extension, the timer_getoverrun( ) function shall return the timer expiration overrun count for the specified timer. The overrun count returned contains the number of extra timer expirations that occurred between the time the signal was...
generated (queued) and when it was delivered or accepted, up to but not including an
implementation-defined maximum of \{DELAYTIMER_MAX\}. If the number of such extra
expirations is greater than or equal to \{DELAYTIMER_MAX\}, then the overrun count shall be set
to \{DELAYTIMER_MAX\}. The value returned by \texttt{timer_getoverrun()} shall apply to the most
recent expiration signal delivery or acceptance for the timer. If no expiration signal has been
delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of
\texttt{timer_getoverrun()} is unspecified.

**RETURN VALUE**

If the \texttt{timer_getoverrun()} function succeeds, it shall return the timer expiration overrun count as
explained above.

If the \texttt{timer_gettime()} or \texttt{timer_settime()} functions succeed, a value of 0 shall be returned.

If an error occurs for any of these functions, the value \(-1\) shall be returned, and \texttt{errno} set to
indicate the error.

**ERRORS**

The \texttt{timer_getoverrun()}, \texttt{timer_gettime()}, and \texttt{timer_settime()} functions shall fail if:

- **[EINVAL]** The \texttt{timerid} argument does not correspond to an ID returned by \texttt{timer_create()}
  but not yet deleted by \texttt{timer_delete()}.

The \texttt{timer_settime()} function shall fail if:

- **[EINVAL]** A \texttt{value} structure specified a nanosecond value less than zero or greater than
  or equal to 1 000 million, and the \texttt{it_value} member of that structure did not
  specify zero seconds and nanoseconds.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

Practical clocks tick at a finite rate, with rates of 100 hertz and 1 000 hertz being common. The
inverse of this tick rate is the clock resolution, also called the clock granularity, which in either
case is expressed as a time duration, being 10 milliseconds and 1 millisecond respectively for
these common rates. The granularity of practical clocks implies that if one reads a given clock
twice in rapid succession, one may get the same time value twice; and that timers must wait for
the next clock tick after the theoretical expiration time, to ensure that a timer never returns too
soon. Note also that the granularity of the clock may be significantly coarser than the resolution
of the data format used to set and get time and interval values. Also note that some
implementations may choose to adjust time and/or interval values to exactly match the ticks of
the underlying clock.

This volume of IEEE Std 1003.1-2001 defines functions that allow an application to determine the
implementation-supported resolution for the clocks and requires an implementation to
document the resolution supported for timers and \texttt{nanosleep()} if they differ from the supported
clock resolution. This is more of a procurement issue than a runtime application issue.

**FUTURE DIRECTIONS**

None.
System Interfaces

timer_getoverrun()

SEE ALSO
clock_getres(), timer_create(), the Base Definitions volume of IEEE Std 1003.1-2001, <time.h>

CHANGE HISTORY
First released in Issue 5. Included for alignment with the POSIX Realtime Extension.

Issue 6
The timer_getoverrun(), timer_gettime(), and timer_settime() functions are marked as part of the Timers option.

Issued 6
The [ENOSYS] error condition has been removed as stubs need not be provided if an implementation does not support the Timers option.

Issue 6
The [EINVAL] error condition is updated to include the following: “and the it_value member of that structure did not specify zero seconds and nanoseconds.” This change is for IEEE PASC Interpretation 1003.1 #89.

Issue 6
The DESCRIPTION for timer_getoverrun() is updated to clarify that “If no expiration signal has been delivered for the timer, or if the Realtime Signals Extension is not supported, the return value of timer_getoverrun() is unspecified”.

Issue 6
The restrict keyword is added to the timer_settime() prototype for alignment with the ISO/IEC 9899:1999 standard.
NAME
times — get process and waited-for child process times

SYNOPSIS
#include <sys/times.h>
clock_t times(struct tms *buffer);

DESCRIPTION
The times() function shall fill the tms structure pointed to by buffer with time-accounting information. The tms structure is defined in <sys/times.h>.

All times are measured in terms of the number of clock ticks used.

The times of a terminated child process shall be included in the tms_cutime and tms_cstime elements of the parent when wait() or waitpid() returns the process ID of this terminated child. If a child process has not waited for its children, their times shall not be included in its times.

- The tms_utime structure member is the CPU time charged for the execution of user instructions of the calling process.
- The tms_stime structure member is the CPU time charged for execution by the system on behalf of the calling process.
- The tms_cutime structure member is the sum of the tms_utime and tms_cutime times of the child processes.
- The tms_cstime structure member is the sum of the tms_stime and tms_cstime times of the child processes.

RETURN VALUE
Upon successful completion, times() shall return the elapsed real time, in clock ticks, since an arbitrary point in the past (for example, system start-up time). This point does not change from one invocation of times() within the process to another. The return value may overflow the possible range of type clock_t. If times() fails, (clock_t)-1 shall be returned and errno set to indicate the error.

ERRORS
No errors are defined.

EXAMPLES
Timing a Database Lookup
The following example defines two functions, start_clock() and end_clock(), that are used to time a lookup. It also defines variables of type clock_t and tms to measure the duration of transactions. The start_clock() function saves the beginning times given by the times() function. The end_clock() function gets the ending times and prints the difference between the two times.

#include <sys/times.h>
#include <stdio.h>
...
void start_clock(void);
void end_clock(char *msg);
...
static clock_t st_time;
static clock_t en_time;
static struct tms st_cpu;
static struct tms en_cpu;
void start_clock()
{
    st_time = times(&st_cpu);
}

/* This example assumes that the result of each subtraction
   is within the range of values that can be represented in
   an integer type. */
void end_clock(char *msg)
{
    en_time = times(&en_cpu);
    puts(msg, stdout);
    printf("Real Time: %jd, User Time %jd, System Time %jd\n",
           (intmax_t)(en_time - st_time),
           (intmax_t)(en_cpu.tms_utime - st_cpu.tms_utime),
           (intmax_t)(en_cpu.tms_stime - st_cpu.tms_stime));
}

APPLICATION USAGE
Applications should use sysconf(_SC_CLK_TCK) to determine the number of clock ticks per
second as it may vary from system to system.

RATIONALE
The accuracy of the times reported is intentionally left unspecified to allow implementations
flexibility in design, from uniprocessor to multi-processor networks.

The inclusion of times of child processes is recursive, so that a parent process may collect the
total times of all of its descendants. But the times of a child are only added to those of its parent
when its parent successfully waits on the child. Thus, it is not guaranteed that a parent process
can always see the total times of all its descendants; see also the discussion of the term
"realtime" in alarm().

If the type clock_t is defined to be a signed 32-bit integer, it overflows in somewhat more than a
year if there are 60 clock ticks per second, or less than a year if there are 100. There are individual
systems that run continuously for longer than that. This volume of IEEE Std 1003.1-2001 permits
an implementation to make the reference point for the returned value be the start-up time of the
process, rather than system start-up time.

The term "charge" in this context has nothing to do with billing for services. The operating
system accounts for time used in this way. That information must be correct, regardless of how
that information is used.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.
NAME
timezone — difference from UTC and local standard time

SYNOPSIS

XSI
#include <time.h>

extern long timezone;

DESCRIPTION
Refer to tzset().
tmpfile( )

NAME
tmpfile — create a temporary file

SYNOPSIS
#include <stdio.h>
FILE *tmpfile(void);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The tmpfile() function shall create a temporary file and open a corresponding stream. The file shall be automatically deleted when all references to the file are closed. The file is opened as in fopen() for update (w+).

In some implementations, a permanent file may be left behind if the process calling tmpfile() is killed while it is processing a call to tmpfile().

An error message may be written to standard error if the stream cannot be opened.

RETURN VALUE
Upon successful completion, tmpfile() shall return a pointer to the stream of the file that is created. Otherwise, it shall return a null pointer and set errno to indicate the error.

ERRORS
The tmpfile() function shall fail if:

EINTR  A signal was caught during tmpfile().
EMFILE  [OPEN_MAX] file descriptors are currently open in the calling process.
ENFILE  The maximum allowable number of files is currently open in the system.
ENOSPC  The directory or file system which would contain the new file cannot be expanded.
EOVERFLOW  The file is a regular file and the size of the file cannot be represented correctly in an object of type off_t.

The tmpfile() function may fail if:

EMFILE  [FOPEN_MAX] streams are currently open in the calling process.
ENOMEM  Insufficient storage space is available.

EXAMPLES
Creating a Temporary File
The following example creates a temporary file for update, and returns a pointer to a stream for the created file in the fp variable.

#include <stdio.h>
... FILE *fp;
fp = tmpfile();
APPLICATION USAGE
It should be possible to open at least \( \text{TMP\_MAX} \) temporary files during the lifetime of the program (this limit may be shared with \text{tmpnam()}\) and there should be no limit on the number simultaneously open other than this limit and any limit on the number of open files \( \text{([FOPEN\_MAX])} \).

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
\text{fopen()}, \text{tmpnam()}, \text{unlink()}, \text{the Base Definitions volume of IEEE Std 1003.1-2001, <stdio.h>}

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
Large File Summit extensions are added.
The last two paragraphs of the DESCRIPTION were included as APPLICATION USAGE notes in previous issues.

Issue 6
Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
- In the ERRORS section, the \[ \text{EOVERFLOW} \] condition is added. This change is to support large files.
- The \[ \text{EMFILE} \] optional error condition is added.
The APPLICATION USAGE section is added for alignment with the ISO/IEC 9899:1999 standard.
NAME
tmpnam — create a name for a temporary file

SYNOPSIS
#include <stdio.h>
char *tmpnam(char *s);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The tmpnam() function shall generate a string that is a valid filename and that is not the same as the name of an existing file. The function is potentially capable of generating {TMP_MAX} different strings, but any or all of them may already be in use by existing files and thus not be suitable return values.

The tmpnam() function generates a different string each time it is called from the same process, up to {TMP_MAX} times. If it is called more than {TMP_MAX} times, the behavior is implementation-defined.

The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls tmpnam().

CX If the application uses any of the functions guaranteed to be available if either _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS is defined, the application shall ensure that the tmpnam() function is called with a non-NULL parameter.

RETURN VALUE
Upon successful completion, tmpnam() shall return a pointer to a string. If no suitable string can be generated, the tmpnam() function shall return a null pointer.

If the argument s is a null pointer, tmpnam() shall leave its result in an internal static object and return a pointer to that object. Subsequent calls to tmpnam() may modify the same object. If the argument s is not a null pointer, it is presumed to point to an array of at least L_tmpnam chars; tmpnam() shall write its result in that array and shall return the argument as its value.

ERRORS
No errors are defined.

EXAMPLES
Generating a Filename
The following example generates a unique filename and stores it in the array pointed to by ptr.
#include <stdio.h>
...
char filename[L_tmpnam+1];
char *ptr;
ptr = tmpnam(filename);

APPLICATION USAGE
This function only creates filenames. It is the application’s responsibility to create and remove the files.

Between the time a pathname is created and the file is opened, it is possible for some other process to create a file with the same name. Applications may find tmpfile() more useful.
tmpnam()

NAME
tolower — transliterate uppercase characters to lowercase

SYNOPSIS
#include <ctype.h>
int tolower(int c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The tolower() function has as a domain a type int, the value of which is representable as an unsigned char or the value of EOF. If the argument has any other value, the behavior is undefined. If the argument of tolower() represents an uppercase letter, and there exists a corresponding lowercase letter (as defined by character type information in the program locale category LC_CTYPE), the result shall be the corresponding lowercase letter. All other arguments in the domain are returned unchanged.

RETURN VALUE
Upon successful completion, tolower() shall return the lowercase letter corresponding to the argument passed; otherwise, it shall return the argument unchanged.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 6
Extensions beyond the ISO C standard are marked.
towctrans() — wide-character transliteration

#include <wctype.h>

wint_t towctrans(wint_t wc, wctrans_t desc);

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The towctrans() function shall transliterate the wide-character code wc using the mapping described by desc. The current setting of the LC_CTYPE category should be the same as during the call to wctrans() that returned the value desc. If the value of desc is invalid (that is, not obtained by a call to wctrans() or desc is invalidated by a subsequent call to setlocale() that has affected category LC_CTYPE), the result is unspecified.

An application wishing to check for error situations should set errno to 0 before calling towctrans(). If errno is non-zero on return, an error has occurred.

If successful, the towctrans() function shall return the mapped value of wc using the mapping described by desc. Otherwise, it shall return wc unchanged.

The towctrans() function may fail if:

- EINVAL: desc contains an invalid transliteration descriptor.

The strings "tolower" and "toupper" are reserved for the standard mapping names. In the table below, the functions in the left column are equivalent to the functions in the right column.

| towlower(wc) | towctrans(wc, wctrans("tolower")) |
| towupper(wc) | towctrans(wc, wctrans("toupper")) |

None.

The strings "tolower" and "toupper" are reserved for the standard mapping names. In the table below, the functions in the left column are equivalent to the functions in the right column.

| towlower(wc) | towctrans(wc, wctrans("tolower")) |
| towupper(wc) | towctrans(wc, wctrans("toupper")) |

None.

None.

Extensions beyond the ISO C standard are marked.
towlower() — transliterate uppercase wide-character code to lowercase

#include <wctype.h>

wint_t towlower(wint_t wc);

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The towlower() function has as a domain a type wint_t, the value of which the application shall ensure is a character representable as a wchar_t, and a wide-character code corresponding to a valid character in the current locale or the value of WEOF. If the argument has any other value, the behavior is undefined. If the argument of towlower() represents an uppercase wide-character code, and there exists a corresponding lowercase wide-character code (as defined by character type information in the program locale category LC_CTYPE), the result shall be the corresponding lowercase wide-character code. All other arguments in the domain are returned unchanged.

Upon successful completion, towlower() shall return the lowercase letter corresponding to the argument passed; otherwise, it shall return the argument unchanged.

No errors are defined.

setlocale(), the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 7, Locale, <wctype.h>, <wchar.h>

First released in Issue 4.

The following change has been made in this issue for alignment with ISO/IEC 9899: 1990/Amendment 1: 1995 (E):

• The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the <wctype.h> header rather than <wchar.h>.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
towupper()

NAME
towupper — transliterate lowercase wide-character code to uppercase

SYNOPSIS
#include <wctype.h>

wint_t towupper(wint_t wc);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The towupper() function has as a domain a type wint_t, the value of which the application shall
ensure is a character representable as a wchar_t, and a wide-character code corresponding to a
valid character in the current locale or the value of WEOF. If the argument has any other value,
the behavior is undefined. If the argument of towupper() represents a lowercase wide-character
code, and there exists a corresponding uppercase wide-character code (as defined by character
type information in the program locale category LC_CTYPE), the result shall be the
corresponding uppercase wide-character code. All other arguments in the domain are returned
unchanged.

RETURN VALUE

Upon successful completion, towupper() shall return the uppercase letter corresponding to the
argument passed. Otherwise, it shall return the argument unchanged.

ERRORS

No errors are defined.

Issue 6

The DESCRIPTION is updated to avoid use of the term "must" for application requirements.
System Interfaces

NAME
trunc, truncf, truncl — round to truncated integer value

SYNOPSIS
#include <math.h>

double trunc(double x);
float truncf(float x);
long double truncl(long double x);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall round their argument to the integer value, in floating format, nearest to but no larger in magnitude than the argument.

RETURN VALUE
Upon successful completion, these functions shall return the truncated integer value.

If x is NaN, a NaN shall be returned.
If x is ±0 or ±Inf, x shall be returned.

ERRORS
No errors are defined.

CHANGE HISTORY
truncatem() — truncate a file to a specified length

SYNOPSIS

```
#include <unistd.h>

int truncatem(const char *path, off_t length);
```

DESCRIPTION

The `truncatem()` function shall cause the regular file named by `path` to have a size which shall be equal to `length` bytes.

If the file previously was larger than `length`, the extra data is discarded. If the file was previously shorter than `length`, its size is increased, and the extended area appears as if it were zero-filled.

The application shall ensure that the process has write permission for the file.

If the request would cause the file size to exceed the soft file size limit for the process, the request shall fail and the implementation shall generate the SIGXFSZ signal for the process.

This function shall not modify the file offset for any open file descriptions associated with the file. Upon successful completion, if the file size is changed, this function shall mark for update the `st_cltime` and `st_mtime` fields of the file, and the `S_ISUID` and `S_ISGID` bits of the file mode may be cleared.

RETURN VALUE

Upon successful completion, `truncatem()` shall return 0. Otherwise, −1 shall be returned, and `errno` set to indicate the error.

ERRORS

The `truncatem()` function shall fail if:

- **[EINVAL]** The `length` argument was less than 0.
- **[EFBIG]** or **[EINVAL]** The `length` argument was greater than the maximum file size.
- **[EIO]** An I/O error occurred while reading from or writing to a file system.
- **[ENOENT]** A component of `path` does not name an existing file or `path` is an empty string.
- **[ENOTDIR]** A component of the path prefix of `path` is not a directory.
- **[ERofs]** The named file resides on a read-only file system.
The `truncate()` function may fail if:

- [ELOOP] More than `SYMLOOP_MAX` symbolic links were encountered during resolution of the `path` argument.
- [ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds `PATH_MAX`.

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
None.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
`open()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 4, Version 2.

- **Issue 5**
  - Moved from X/OPEN UNIX extension to BASE.
  - Large File Summit extensions are added.

- **Issue 6**
  - This reference page is split out from the `ftruncate()` reference page.
  - The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
  - The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.
truncf()

NAME
truncf, truncl — round to truncated integer value

SYNOPSIS
#include <math.h>
float truncf(float x);
long double truncl(long double x);

DESCRIPTION
Refer to trunc().
NAME
tsearch — search a binary search tree

SYNOPSIS
#include <search.h>

void *tsearch(const void *key, void **rootp, int (*compar)(const void *, const void *));

DESCRIPTION
Refer to tdelete().
NAME

ttname, ttname_r — find the pathname of a terminal

SYNOPSIS

#include <unistd.h>

char *ttname(int fildes);

int ttname_r(int fildes, char *name, size_t namesize);

DESCRIPTION

The ttname() function shall return a pointer to a string containing a null-terminated pathname of the terminal associated with file descriptor fildes. The return value may point to static data whose content is overwritten by each call.

The ttname() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The ttname_r() function shall store the null-terminated pathname of the terminal associated with the file descriptor fildes in the character array referenced by name. The array is namesize characters long and should have space for the name and the terminating null character. The maximum length of the terminal name shall be [TTY_NAME_MAX].

RETURN VALUE

Upon successful completion, ttname() shall return a pointer to a string. Otherwise, a null pointer shall be returned and errno set to indicate the error.

If successful, the ttname_r() function shall return zero. Otherwise, an error number shall be returned to indicate the error.

ERRORS

The ttname() function may fail if:

[EBADF] The fildes argument is not a valid file descriptor.
[ENOTTY] The fildes argument does not refer to a terminal.

The ttname_r() function may fail if:

[EBADF] The fildes argument is not a valid file descriptor.
[ENOTTY] The fildes argument does not refer to a terminal.

[ERANGE] The value of namesize is smaller than the length of the string to be returned including the terminating null character.

EXAMPLES

None.

APPLICATION USAGE

None.

RATIONALE

The term “terminal” is used instead of the historical term “terminal device” in order to avoid a reference to an undefined term.

The thread-safe version places the terminal name in a user-supplied buffer and returns a non-zero value if it fails. The non-thread-safe version may return the name in a static data area that may be overwritten by each call.
FUTURE DIRECTIONS

None.

SEE ALSO

The Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The `ttyname_r()` function is included for alignment with the POSIX Threads Extension.

A note indicating that the `ttyname()` function need not be reentrant is added to the DESCRIPTION.

Issue 6

The `ttyname_r()` function is marked as part of the Thread-Safe Functions option.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The statement that `errno` is set on error is added.
- The `[EBADF]` and `[ENOTTY]` optional error conditions are added.
NAME
twalk — traverse a binary search tree

SYNOPSIS
XSI
#include <search.h>

void twalk(const void *root,
void (*action)(const void *, VISIT, int ));

DESCRIPTION
Refer to tdelete().
NAME
daylight, timezone, tzname, tzset — set timezone conversion information

SYNOPSIS
#include <time.h>

extern int daylight;
extern long timezone;
extern char *tzname[2];
void tzset(void);

DESCRIPTION
The tzset() function shall use the value of the environment variable TZ to set time conversion information used by ctime(), localtime(), mktime(), and strftime(). If TZ is absent from the environment, implementation-defined default timezone information shall be used.

The tzset() function shall set the external variable tzname as follows:
tzname[0] = "std";
tzname[1] = "dst";
where std and dst are as described in the Base Definitions volume of IEEE Std 1003.1-2001, Chapter 8, Environment Variables.

The tzset() function also shall set the external variable daylight to 0 if Daylight Savings Time conversions should never be applied for the timezone in use; otherwise, non-zero. The external variable timezone shall be set to the difference, in seconds, between Coordinated Universal Time (UTC) and local standard time.

RETURN VALUE
The tzset() function shall not return a value.

ERRORS
No errors are defined.

EXAMPLES
Example TZ variables and their timezone differences are given in the table below:

<table>
<thead>
<tr>
<th>TZ</th>
<th>timezone</th>
</tr>
</thead>
<tbody>
<tr>
<td>EST5EDT</td>
<td>5<em>60</em>60</td>
</tr>
<tr>
<td>GMT0</td>
<td>0<em>60</em>60</td>
</tr>
<tr>
<td>JST-9</td>
<td>-9<em>60</em>60</td>
</tr>
<tr>
<td>MET-1MEST</td>
<td>-1<em>60</em>60</td>
</tr>
<tr>
<td>MST7MDT</td>
<td>7<em>60</em>60</td>
</tr>
<tr>
<td>PST8PDT</td>
<td>8<em>60</em>60</td>
</tr>
</tbody>
</table>

Issue 6
The example is corrected.
NAME
ualarm — set the interval timer

SYNOPSIS
#include <unistd.h>

useconds_t ualarm(useconds_t useconds, useconds_t interval);

DESCRIPTION
The ualarm() function shall cause the SIGALRM signal to be generated for the calling process after the number of realtime microseconds specified by the useconds argument has elapsed. When the interval argument is non-zero, repeated timeout notification occurs with a period in microseconds specified by the interval argument. If the notification signal, SIGALRM, is not caught or ignored, the calling process is terminated.

Implementations may place limitations on the granularity of timer values. For each interval timer, if the requested timer value requires a finer granularity than the implementation supports, the actual timer value shall be rounded up to the next supported value.

Interactions between ualarm() and any of the following are unspecified:

alarm()
nanosleep()
setitimer()
timer_create()
timer_delete()
timer_getovrun()
timer_settime()
sleep()

RETURN VALUE
The ualarm() function shall return the number of microseconds remaining from the previous ualarm() call. If no timeouts are pending or if ualarm() has not previously been called, ualarm() shall return 0.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
Applications are recommended to use nanosleep() if the Timers option is supported, or setitimer(), timer_create(), timer_delete(), timer_getovrun(), timer_settime(), or timer_settime() instead of this function.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

**CHANGE HISTORY**

First released in Issue 4, Version 2.

Moved from X/OPEN UNIX extension to BASE.

This function is marked obsolescent.
NAME
ulimit — get and set process limits

SYNOPSIS

XSI
#include <ulimit.h>

long ulimit(int cmd, ...);

DESCRIPTION
The ulimit() function shall control process limits. The process limits that can be controlled by this function include the maximum size of a single file that can be written (this is equivalent to using setrlimit() with RLIMIT_FSIZE). The cmd values, defined in <ulimit.h>, include:

UL_GETFSIZE Return the file size limit (RLIMIT_FSIZE) of the process. The limit shall be in units of 512-byte blocks and shall be inherited by child processes. Files of any size can be read. The return value shall be the integer part of the soft file size limit divided by 512. If the result cannot be represented as a long, the result is unspecified.

UL_SETFSIZE Set the file size limit for output operations of the process to the value of the second argument, taken as a long, multiplied by 512. If the result would overflow an rlim_t, the actual value set is unspecified. Any process may decrease its own limit, but only a process with appropriate privileges may increase the limit. The return value shall be the integer part of the new file size limit divided by 512.

The ulimit() function shall not change the setting of errno if successful.

As all return values are permissible in a successful situation, an application wishing to check for error situations should set errno to 0, then call ulimit(), and, if it returns −1, check to see if errno is non-zero.

RETURN VALUE
Upon successful completion, ulimit() shall return the value of the requested limit. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
The ulimit() function shall fail and the limit shall be unchanged if:

EINVAL The cmd argument is not valid.
EPERM A process not having appropriate privileges attempts to increase its file size limit.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.
SEE ALSO
getrlimit(), setrlimit(), write(), the Base Definitions volume of IEEE Std 1003.1-2001, <ulimit.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
In the description of UL_SETFSIZE, the text is corrected to refer to rlim_t rather than the spurious rlimit_t.
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.
umask() — set and get the file mode creation mask

#include <sys/stat.h>

mode_t umask(mode_t cmask);

The umask() function shall set the process’ file mode creation mask to cmask and return the previous value of the mask. Only the file permission bits of cmask (see <sys/stat.h>) are used; the meaning of the other bits is implementation-defined.

The process’ file mode creation mask is used during open(), creat(), mkdir(), and mkfifo() to turn off permission bits in the mode argument supplied. Bit positions that are set in cmask are cleared in the mode of the created file.

The file permission bits in the value returned by umask() shall be the previous value of the file mode creation mask. The state of any other bits in that value is unspecified, except that a subsequent call to umask() with the returned value as cmask shall leave the state of the mask the same as its state before the first call, including any unspecified use of those bits.

No errors are defined.

None.

None.

Unsigned argument and return types for umask() were proposed. The return type and the argument were both changed to mode_t.

Historical implementations have made use of additional bits in cmask for their implementation-defined purposes. The addition of the text that the meaning of other bits of the field is implementation-defined permits these implementations to conform to this volume of IEEE Std 1003.1-2001.

None.

creat(), mkdir(), mkfifo(), open(), the Base Definitions volume of IEEE Std 1003.1-2001, <sys/stat.h>, <sys/types.h>

First released in Issue 1. Derived from Issue 1 of the SVID.

In the SYNOPSIS, the optional include of the <sys/types.h> header is removed.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include `<sys/types.h>` has been removed. Although `<sys/types.h>` was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.
NAME
uname — get the name of the current system

SYNOPSIS
#include <sys/utsname.h>
int uname(struct utsname *name);

DESCRIPTION
The uname() function shall store information identifying the current system in the structure pointed to by name.

The uname() function uses the utsname structure defined in <sys/utsname.h>.

The uname() function shall return a string naming the current system in the character array sysname. Similarly, nodename shall contain the name of this node within an implementation-defined communications network. The arrays release and version shall further identify the operating system. The array machine shall contain a name that identifies the hardware that the system is running on.

The format of each member is implementation-defined.

RETURN VALUE
Upon successful completion, a non-negative value shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
The inclusion of the nodename member in this structure does not imply that it is sufficient information for interfacing to communications networks.

RATIONALE
The values of the structure members are not constrained to have any relation to the version of this volume of IEEE Std 1003.1-2001 implemented in the operating system. An application should instead depend on _POSIX_VERSION and related constants defined in <unistd.h>.

This volume of IEEE Std 1003.1-2001 does not define the sizes of the members of the structure and permits them to be of different sizes, although most implementations define them all to be the same size: eight bytes plus one byte for the string terminator. That size for nodename is not enough for use with many networks.

The uname() function originated in System III, System V, and related implementations, and it does not exist in Version 7 or 4.3 BSD. The values it returns are set at system compile time in those historical implementations.

4.3 BSD has gethostname() and gethostid(), which return a symbolic name and a numeric value, respectively. There are related sethostname() and sethostid() functions that are used to set the values the other two functions return. The former functions are included in this specification, the latter are not.

FUTURE DIRECTIONS
None.
unaln()
NAME
ungetc — push byte back into input stream

SYNOPSIS
#include <stdio.h>

int ungetc(int c, FILE *stream);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The ungetc() function shall push the byte specified by c (converted to an unsigned char) back
onto the input stream pointed to by stream. The pushed-back bytes shall be returned by
subsequent reads on that stream in the reverse order of their pushing. A successful intervening
call (with the stream pointed to by stream) to a file-positioning function (fseek(), fsetpos(), or
rewind()) shall discard any pushed-back bytes for the stream. The external storage
corresponding to the stream shall be unchanged.

One byte of push-back shall be provided. If ungetc() is called too many times on the same stream
without an intervening read or file-positioning operation on that stream, the operation may fail.

If the value of c equals that of the macro EOF, the operation shall fail and the input stream shall
be left unchanged.

A successful call to ungetc() shall clear the end-of-file indicator for the stream. The value of the
file-position indicator for the stream after reading or discarding all pushed-back bytes shall be
the same as it was before the bytes were pushed back. The file-position indicator is decremented
by each successful call to ungetc(); if its value was 0 before a call, its value is unspecified after
the call.

RETURN VALUE
Upon successful completion, ungetc() shall return the byte pushed back after conversion.
Otherwise, it shall return EOF.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

ungetwc()

NAME
ungetwc — push wide-character code back into the input stream

SYNOPSIS
#include <stdio.h>
#include <wchar.h>
wint_t ungetwc(wint_t wc, FILE *stream);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The ungetwc() function shall push the character corresponding to the wide-character code
specified by wc back onto the input stream pointed to by stream. The pushed-back characters
shall be returned by subsequent reads on that stream in the reverse order of their pushing. A
successful intervening call (with the stream pointed to by stream) to a file-positioning function
(fseek(), fsetpos(), or rewind()) discards any pushed-back characters for the stream. The external
storage corresponding to the stream is unchanged.

At least one character of push-back shall be provided. If ungetwc() is called too many times on
the same stream without an intervening read or file-positioning operation on that stream, the
operation may fail.

If the value of wc equals that of the macro WEOF, the operation shall fail and the input stream
shall be left unchanged.

A successful call to ungetwc() shall clear the end-of-file indicator for the stream. The value of the
file-position indicator for the stream after reading or discarding all pushed-back characters shall
be the same as it was before the characters were pushed back. The file-position indicator is
decremented (by one or more) by each successful call to ungetwc(); if its value was 0 before a
call, its value is unspecified after the call.

RETURN VALUE
Upon successful completion, ungetwc() shall return the wide-character code corresponding to
the pushed-back character. Otherwise, it shall return WEOF.

ERRORS
The ungetwc() function may fail if:

[EILSEQ] An invalid character sequence is detected, or a wide-character code does not
correspond to a valid character.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY

First released in Issue 4. Derived from the MSE working draft.

Issue 5
The Optional Header (OH) marking is removed from <stdio.h>.

Issue 6
The [EILSEQ] optional error condition is marked CX.
NAME
unlink — remove a directory entry

SYNOPSIS
#include <unistd.h>

int unlink(const char *path);

DESCRIPTION
The unlink() function shall remove a link to a file. If path names a symbolic link, unlink() shall remove the symbolic link named by path and shall not affect any file or directory named by the contents of the symbolic link. Otherwise, unlink() shall remove the link named by the pathname pointed to by path and shall decrement the link count of the file referenced by the link.

When the file's link count becomes 0 and no process has the file open, the space occupied by the file shall be freed and the file shall no longer be accessible. If one or more processes have the file open when the last link is removed, the link shall be removed before unlink() returns, but the removal of the file contents shall be postponed until all references to the file are closed.

The path argument shall not name a directory unless the process has appropriate privileges and the implementation supports using unlink() on directories.

Upon successful completion, unlink() shall mark for update the st_ctime and st_mtime fields of the parent directory. Also, if the file's link count is not 0, the st_ctime field of the file shall be marked for update.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno set to indicate the error. If −1 is returned, the named file shall not be changed.

ERRORS
The unlink() function shall fail and shall not unlink the file if:

[EACCES] Search permission is denied for a component of the path prefix, or write permission is denied on the directory containing the directory entry to be removed.

[EBUSY] The file named by the path argument cannot be unlinked because it is being used by the system or another process and the implementation considers this an error.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds {PATH_MAX} or a pathname component is longer than {NAME_MAX}.

[ENOENT] A component of path does not name an existing file or path is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The file named by path is a directory, and either the calling process does not have appropriate privileges, or the implementation prohibits using unlink() on directories.

[XSI] [EPERM] or [EACCES] The S_ISVTX flag is set on the directory containing the file referred to by the path argument and the caller is not the file owner, nor is the caller the directory owner, nor does the caller have appropriate privileges.
The directory entry to be unlinked is part of a read-only file system.

The `unlink()` function may fail and not unlink the file if:

- `EBUSY` The file named by `path` is a named STREAM.
- `ELOOP` More than `[SYMLOOP_MAX]` symbolic links were encountered during resolution of the `path` argument.
- `[ENAMETOOLONG]` As a result of encountering a symbolic link in resolution of the `path` argument, the length of the substituted pathname string exceeded `[PATH_MAX]`.
- `ETXTBSY` The entry to be unlinked is the last directory entry to a pure procedure (shared text) file that is being executed.

**EXAMPLES**

**Removing a Link to a File**

The following example shows how to remove a link to a file named `/home/cnd/mod1` by removing the entry named `/modules/pass1`.

```c
#include <unistd.h>

char *path = "/modules/pass1";
int status;
...
status = unlink(path);
```

**Checking for an Error**

The following example fragment creates a temporary password lock file named `LOCKFILE`, which is defined as `/etc/ptmp`, and gets a file descriptor for it. If the file cannot be opened for writing, `unlink()` is used to remove the link between the file descriptor and `LOCKFILE`.

```c
#include <sys/types.h>
#include <stdio.h>
#include <fcntl.h>
#include <errno.h>
#include <unistd.h>
#include <sys/stat.h>

#define LOCKFILE "/etc/ptmp"

int pfd; /* Integer for file descriptor returned by open call. */
FILE *fpfd; /* File pointer for use in putpwent(). */
...
/* Open password Lock file. If it exists, this is an error. */
if ((pfd = open(LOCKFILE, O_WRONLY| O_CREAT | O_EXCL, S_IRUSR | S_IWUSR | S_IRGRP | S_IROTH)) == -1) {
    fprintf(stderr, "Cannot open /etc/ptmp. Try again later.\n");
    exit(1);
}
/* Lock file created; proceed with fdopen of lock file so that putpwent() can be used. */
if ((fpfd = fdopen(pfd, "w")) == NULL) {
```
Replacing Files

The following example fragment uses `unlink()` to discard links to files, so that they can be replaced with new versions of the files. The first call removes the link to `LOCKFILE` if an error occurs. Successive calls remove the links to `SAVEFILE` and `PASSWDFILE` so that new links can be created, then removes the link to `LOCKFILE` when it is no longer needed.

```c
#include <sys/types.h>
#include <stdio.h>
#include <fcntl.h>
#include <errno.h>
#include <unistd.h>
#include <sys/stat.h>
#define LOCKFILE "/etc/ptmp"
#define PASSWDFILE "/etc/passwd"
#define SAVEFILE "/etc/opasswd"
...
/* If no change was made, assume error and leave passwd unchanged. */
if (!valid_change) {
    fprintf(stderr, "Could not change password for user %s\n", user);
    unlink(LOCKFILE);
    exit(1);
}
/* Change permissions on new password file. */
chmod(LOCKFILE, S_IRUSR | S_IRGRP | S_IROTH);
/* Remove saved password file. */
unlink(SAVEFILE);
/* Save current password file. */
link(PASSWDFILE, SAVEFILE);
/* Remove current password file. */
unlink(PASSWDFILE);
/* Save new password file as current password file. */
link(LOCKFILE, PASSWDFILE);
/* Remove lock file. */
unlink(LOCKFILE);
exit(0);
```

APPLICATION USAGE

Applications should use `rmdir()` to remove a directory.

RATIONALE

Unlinking a directory is restricted to the superuser in many historical implementations for reasons given in `link()` (see also `rename()`).
The meaning of [EBUSY] in historical implementations is “mount point busy”. Since this volume of IEEE Std 1003.1-2001 does not cover the system administration concepts of mounting and unmounting, the description of the error was changed to “resource busy”. (This meaning is used by some device drivers when a second process tries to open an exclusive use device.) The wording is also intended to allow implementations to refuse to remove a directory if it is the root or current working directory of any process.

FUTURE DIRECTIONS
None.

close(), link(), remove(), rmdir(), the Base Definitions volume of IEEE Std 1003.1-2001, <unistd.h>

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The [EBUSY] error is added to the “may fail” part of the ERRORS section.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

• In the DESCRIPTION, the effect is specified if path specifies a symbolic link.
• The [ELOOP] mandatory error condition is added.
• A second [ENAMETOOLONG] is added as an optional error condition.
• The [ETXTBSY] optional error condition is added.

The following changes were made to align with the IEEE P1003.1a draft standard:

• The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
unlockpt()

NAME
unlockpt — unlock a pseudo-terminal master/slave pair

SYNOPSIS
#include <stdlib.h>

int unlockpt(int fildes);

DESCRIPTION
The unlockpt() function shall unlock the slave pseudo-terminal device associated with the master to which fildes refers.

Conforming applications shall ensure that they call unlockpt() before opening the slave side of a pseudo-terminal device.

RETURN VALUE
Upon successful completion, unlockpt() shall return 0. Otherwise, it shall return −1 and set errno to indicate the error.

ERRORS
The unlockpt() function may fail if:

[EBADF] The fildes argument is not a file descriptor open for writing.

EINVAL] The fildes argument is not associated with a master pseudo-terminal device.

EXAMPLES
None.

APPLICATION USAGE
None.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
unsetenv — remove an environment variable

SYNOPSIS
#include <stdlib.h>
int unsetenv(const char *name);

DESCRIPTION
The unsetenv() function shall remove an environment variable from the environment of the
calling process. The name argument points to a string, which is the name of the variable to be
removed. The named argument shall not contain an '=' character. If the named variable does
not exist in the current environment, the environment shall be unchanged and the function is
considered to have completed successfully.

If the application modifies environ or the pointers to which it points, the behavior of unsetenv() is
undefined. The unsetenv() function shall update the list of pointers to which environ points.

The unsetenv() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

RETURN VALUE
Upon successful completion, zero shall be returned. Otherwise, −1 shall be returned, errno set to
indicate the error, and the environment shall be unchanged.

ERRORS
The unsetenv() function shall fail if:

[EINV] The name argument is a null pointer, points to an empty string, or points to a
string containing an '=' character.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
Refer to the RATIONALE section in setenv().

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 6. Derived from the IEEE P1003.1a draft standard.
usleep()  

NAME

usleep — suspend execution for an interval

SYNOPSIS

```c
#include <unistd.h>

int usleep(useconds_t useconds);
```

DESCRIPTION

The `usleep()` function shall cause the calling thread to be suspended from execution until either
the number of realtime microseconds specified by the argument `useconds` has elapsed or a signal
is delivered to the calling thread and its action is to invoke a signal-catching function or to
terminate the process. The suspension time may be longer than requested due to the scheduling
of other activity by the system.

The `useconds` argument shall be less than one million. If the value of `useconds` is 0, then the call
has no effect.

If a SIGALRM signal is generated for the calling process during execution of `usleep()` and if the
SIGALRM signal is being ignored or blocked from delivery, it is unspecified whether `usleep()`
returns when the SIGALRM signal is scheduled. If the signal is being blocked, it is also
unspecified whether it remains pending after `usleep()` returns or it is discarded.

If a SIGALRM signal is generated for the calling process during execution of `usleep()`, except as a
result of a prior call to `alarm()`, and if the SIGALRM signal is not being ignored or blocked from
delivery, it is unspecified whether that signal has any effect other than causing `usleep()` to return.

If a signal-catching function interrupts `usleep()` and examines or changes either the time a
SIGALRM is scheduled to be generated, the action associated with the SIGALRM signal, or
whether the SIGALRM signal is blocked from delivery, the results are unspecified.

If a signal-catching function interrupts `usleep()` and calls `siglongjmp()` or `longjmp()` to restore an
environment saved prior to the `usleep()` call, the action associated with the SIGALRM signal and
the time at which a SIGALRM signal is scheduled to be generated are unspecified. It is also
unspecified whether the SIGALRM signal is blocked, unless the process’ signal mask is restored
as part of the environment.

Implementations may place limitations on the granularity of timer values. For each interval
timer, if the requested timer value requires a finer granularity than the implementation supports,
the actual timer value shall be rounded up to the next supported value.

Interactions between `usleep()` and any of the following are unspecified:

- `nanosleep()`
- `setitimer()`
- `timer_create()`
- `timer_delete()`
- `timer_getoverrun()`
- `timer_gettime()`
- `timer_settime()`
- `ualarm()`
- `sleep()`
RETURN VALUE
Upon successful completion, `usleep()` shall return 0; otherwise, it shall return –1 and set `errno` to indicate the error.

ERRORS
The `usleep()` function may fail if:

- [EINVAL] The time interval specified one million or more microseconds.

EXAMPLES
None.

APPLICATION USAGE
Applications are recommended to use `nanosleep()` if the Timers option is supported, or `setitimer()`, `timer_create()`, `timer_delete()`, `timer_getoverrun()`, `timer_gettime()`, or `timer_settime()` instead of this function.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
`alarm()`, `getitimer()`, `nanosleep()`, `sigaction()`, `sleep()`, `timer_create()`, `timer_delete()`, `timer_getoverrun()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<unistd.h>`

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
The DESCRIPTION is changed to indicate that timers are now thread-based rather than process-based.

This function is marked obsolescent.
NAME
utime — set file access and modification times

SYNOPSIS
#include <utime.h>

int utime(const char *path, const struct utimbuf *times);

DESCRIPTION
The utime() function shall set the access and modification times of the file named by the path argument.

If times is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or the process has write permission to the file or has appropriate privileges, to use utime() in this manner.

If times is not a null pointer, times shall be interpreted as a pointer to a utimbuf structure and the access and modification times shall be set to the values contained in the designated structure. Only a process with the effective user ID equal to the user ID of the file or a process with appropriate privileges may use utime() this way.

The utimbuf structure is defined in the <utime.h> header. The times in the structure utimbuf are measured in seconds since the Epoch.

Upon successful completion, utime() shall mark the time of the last file status change, st_ctime, to be updated; see <sys/stat.h>.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno shall be set to indicate the error, and the file times shall not be affected.

ERRORS
The utime() function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the times argument is a null pointer and the effective user ID of the process does not match the owner of the file, the process does not have write permission for the file, and the process does not have appropriate privileges.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds [PATH_MAX] or a pathname component is longer than [NAME_MAX].

[ENOENT] A component of path does not name an existing file or path is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The times argument is not a null pointer and the calling process’ effective user ID does not match the owner of the file and the calling process does not have the appropriate privileges.

[EROFS] The file system containing the file is read-only.

The utime() function may fail if:

[ELOOP] More than [SYMLOOP_MAX] symbolic links were encountered during resolution of the path argument.
As a result of encountering a symbolic link in resolution of the path argument, the length of the substituted pathname string exceeded [PATH_MAX].

**EXAMPLES**
None.

**APPLICATION USAGE**
None.

**RATIONALE**
The actime structure member must be present so that an application may set it, even though an implementation may ignore it and not change the access time on the file. If an application intends to leave one of the times of a file unchanged while changing the other, it should use stat() to retrieve the file's st_atime and st_mtime parameters, set actime and modtime in the buffer, and change one of them before making the utime() call.

**FUTURE DIRECTIONS**
None.

**SEE ALSO**
The Base Definitions volume of IEEE Std 1003.1-2001, <sys/stat.h>, <utime.h>

**CHANGE HISTORY**
First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 6**
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The requirement to include <sys/types.h> has been removed. Although <sys/types.h> was required for conforming implementations of previous POSIX specifications, it was not required for UNIX applications.

- The [ELOOP] mandatory error condition is added.

- A second [ENAMETOOLONG] is added as an optional error condition.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The [ELOOP] optional error condition is added.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
utimes — set file access and modification times (LEGACY)

SYNOPSIS
XSI
#include <sys/time.h>

int utimes(const char *path, const struct timeval times[2]);

DESCRIPTION
The utimes() function shall set the access and modification times of the file pointed to by the path argument to the value of the times argument. The utimes() function allows time specifications accurate to the microsecond.

For utimes(), the times argument is an array of timeval structures. The first array member represents the date and time of last access, and the second member represents the date and time of last modification. The times in the timeval structure are measured in seconds and microseconds since the Epoch, although rounding toward the nearest second may occur.

If the times argument is a null pointer, the access and modification times of the file shall be set to the current time. The effective user ID of the process shall match the owner of the file, or has write access to the file or appropriate privileges to use this call in this manner. Upon completion, utimes() shall mark the time of the last file status change, st_ctime, for update.

RETURN VALUE
Upon successful completion, 0 shall be returned. Otherwise, −1 shall be returned and errno shall be set to indicate the error, and the file times shall not be affected.

ERRORS
The utimes() function shall fail if:

[EACCES] Search permission is denied by a component of the path prefix; or the times argument is a null pointer and the effective user ID of the process does not match the owner of the file and write access is denied.

[ELOOP] A loop exists in symbolic links encountered during resolution of the path argument.

[ENAMETOOLONG] The length of the path argument exceeds PATH_MAX or a pathname component is longer than NAME_MAX.

[ENOENT] A component of path does not name an existing file or path is an empty string.

[ENOTDIR] A component of the path prefix is not a directory.

[EPERM] The times argument is not a null pointer and the calling process’ effective user ID has write access to the file but does not match the owner of the file and the calling process does not have the appropriate privileges.

[EROFS] The file system containing the file is read-only.

The utimes() function may fail if:

[ELOOP] More than SYMLOOP_MAX symbolic links were encountered during resolution of the path argument.

[ENAMETOOLONG] Pathname resolution of a symbolic link produced an intermediate result whose length exceeds PATH_MAX.
EXAMPLES
None.

APPLICATION USAGE
For applications portability, the \textit{utime}() function should be used to set file access and modification times instead of \textit{utimes}().

RATIONALE
None.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

SEE ALSO
\textit{utime}(), the Base Definitions volume of IEEE Std 1003.1-2001, \texttt{<sys/time.h>}

CHANGE HISTORY
First released in Issue 4, Version 2.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked LEGACY.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The wording of the mandatory [ELOOP] error condition is updated, and a second optional [ELOOP] error condition is added.
va_arg()  

NAME
va_arg, va_copy, va_end, va_start — handle variable argument list

SYNOPSIS
#include <stdarg.h>

#define va_arg(va_list ap, type);
#define va_copy(va_list dest, va_list src);
#define va_end(va_list ap);
#define va_start(va_list ap, argN);

DESCRIPTION
Refer to the Base Definitions volume of IEEE Std 1003.1-2001, <stdarg.h>.
NAME
vfork — create a new process; share virtual memory

SYNOPSIS

```c
#include <unistd.h>

pid_t vfork(void);
```

DESCRIPTION

The `vfork()` function shall be equivalent to `fork()`, except that the behavior is undefined if the process created by `vfork()` either modifies any data other than a variable of type `pid_t` used to store the return value from `vfork()`, or returns from the function in which `vfork()` was called, or calls any other function before successfully calling `_exit()` or one of the `exec` family of functions.

RETURN VALUE

Upon successful completion, `vfork()` shall return 0 to the child process and return the process ID of the child process to the parent process. Otherwise, −1 shall be returned to the parent, no child process shall be created, and `errno` shall be set to indicate the error.

ERRORS

The `vfork()` function shall fail if:

- `[EAGAIN]` The system-wide limit on the total number of processes under execution would be exceeded, or the system-imposed limit on the total number of processes under execution by a single user would be exceeded.
- `[ENOMEM]` There is insufficient swap space for the new process.

EXAMPLES

None.

APPLICATION USAGE

Conforming applications are recommended not to depend on `vfork()`, but to use `fork()` instead.

The `vfork()` function may be withdrawn in a future version.

On some implementations, `vfork()` is equivalent to `fork()`.

The `vfork()` function differs from `fork()` only in that the child process can share code and data with the calling process (parent process). This speeds cloning activity significantly at a risk to the integrity of the parent process if `vfork()` is misused.

The use of `vfork()` for any purpose except as a prelude to an immediate call to a function from the `exec` family, or to `_exit()`, is not advised.

The `vfork()` function can be used to create new processes without fully copying the address space of the old process. If a forked process is simply going to call `exec`, the data space copied from the parent to the child by `fork()` is not used. This is particularly inefficient in a paged environment, making `vfork()` particularly useful. Depending upon the size of the parent’s data space, `vfork()` can give a significant performance improvement over `fork()`.

The `vfork()` function can normally be used just like `fork()`. It does not work, however, to return while running in the child’s context from the caller of `vfork()` since the eventual return from `vfork()` would then return to a no longer existent stack frame. Care should be taken, also, to call `_exit()` rather than `exit()` if `exec` cannot be used, since `exit()` flushes and closes standard I/O channels, thereby damaging the parent processes’ standard I/O data structures. (Even with `fork()`, it is wrong to call `exit()`, since buffered data would then be flushed twice.)

If signal handlers are invoked in the child process after `vfork()`, they must follow the same rules as other code in the child process.
RATIONALE
None.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

Issue 5
Moved from X/OPEN UNIX extension to BASE.

Issue 6
This function is marked obsolescent.
NAME
vfprintf, vprintf, vsnprintf, vsprintf — format output of a stdarg argument list

SYNOPSIS
#include <stdarg.h>
#include <stdio.h>

int vfprintf(FILE *restrict stream, const char *restrict format, va_list ap);
int vprintf(const char *restrict format, va_list ap);
int vsnprintf(char *restrict s, size_t n, const char *restrict format, va_list ap);
int vsprintf(char *restrict s, const char *restrict format, va_list ap);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The vprintf(), vfprintf(), vsnprintf(), and vsprintf() functions shall be equivalent to printf(), fprintf(), snprintf(), and sprintf() respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined by <stdarg.h>.

These functions shall not invoke the va_end macro. As these functions invoke the va_arg macro, the value of ap after the return is unspecified.

RETURN VALUE
Refer to fprintf().

ERRORS
Refer to fprintf().

EXAMPLES
None.

APPLICATION USAGE
Applications using these functions should call va_end(ap) afterwards to clean up.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The vsnprintf() function is added.

Issue 6
The vfprintf(), vprintf(), vsnprintf(), and vsprintf() functions are updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
vfscanf, vscanf, vsscanf — format input of a stdarg argument list

SYNOPSIS
#include <stdarg.h>
#include <stdio.h>

int vfscanf(FILE *restrict stream, const char *restrict format,
            va_list arg);
int vscanf(const char *restrict format, va_list arg);
int vsscanf(const char *restrict s, const char *restrict format,
            va_list arg);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The vscanf(), vfscanf(), and vsscanf() functions shall be equivalent to the scanf(), fscanf(), and sscanf() functions, respectively, except that instead of being called with a variable number of arguments, they are called with an argument list as defined in the <stdarg.h> header. These functions shall not invoke the va_end macro. As these functions invoke the va_arg macro, the value of ap after the return is unspecified.

RETURN VALUE
Refer to fscanf().

ERRORS
Refer to fscanf().

EXAMPLES
None.

APPLICATION USAGE
Applications using these functions should call va_end(ap) afterwards to clean up.

RATIONALE
None.

FUTURE DIRECTIONS

NAME
wait, waitpid — wait for a child process to stop or terminate

SYNOPSIS
#include <sys/wait.h>

pid_t wait(int *stat_loc);
pid_t waitpid(pid_t pid, int *stat_loc, int options);

DESCRIPTION
The wait() and waitpid() functions shall obtain status information pertaining to one of
the caller's child processes. Various options permit status information to be obtained for child
processes that have terminated or stopped. If status information is available for two or more
child processes, the order in which their status is reported is unspecified.

The wait() function shall suspend execution of the calling thread until status information for one
of the terminated child processes of the calling process is available, or until delivery of a signal
whose action is either to execute a signal-capturing function or to terminate the process. If more
than one thread is suspended in wait() or waitpid() awaiting termination of the same process,
every one thread shall return the process status at the time of the target process termination. If
status information is available prior to the call to wait(), return shall be immediate.

The waitpid() function shall be equivalent to wait() if the pid argument is (pid_t)-1 and the
options argument is 0. Otherwise, its behavior shall be modified by the values of the pid and
options arguments.

The pid argument specifies a set of child processes for which status is requested. The waitpid()
function shall only return the status of a child process from this set:

- If pid is equal to (pid_t)-1, status is requested for any child process. In this respect, waitpid()
is then equivalent to wait().
- If pid is greater than 0, it specifies the process ID of a single child process for which status is
  requested.
- If pid is 0, status is requested for any child process whose process group ID is equal to that of
  the calling process.
- If pid is less than (pid_t)-1, status is requested for any child process whose process group ID
  is equal to the absolute value of pid.

The options argument is constructed from the bitwise-inclusive OR of zero or more of the
following flags, defined in the <sys/wait.h> header:

- XSI: WCONTINUED The waitpid() function shall report the status of any continued child process
  specified by pid whose status has not been reported since it continued from a
  job control stop.
- WNOHANG The waitpid() function shall not suspend execution of the calling thread if
  status is not immediately available for one of the child processes specified by
  pid.
- WUNTRACED The status of any child processes specified by pid that are stopped, and whose
  status has not yet been reported since they stopped, shall also be reported to
  the requesting process.

If the calling process has SA_NOCLDWAIT set or has SIGCHLD set to SIG_IGN, and the
process has no unwaited-for children that were transformed into zombie processes, the calling
thread shall block until all of the children of the process containing the calling thread terminate,
and wait() and waitpid() shall fail and set errno to [ECHILD].
If `wait()` or `waitpid()` return because the status of a child process is available, these functions shall return a value equal to the process ID of the child process. In this case, if the value of the argument `stat_loc` is not a null pointer, information shall be stored in the location pointed to by `stat_loc`. The value stored at the location pointed to by `stat_loc` shall be 0 if and only if the status returned is from a terminated child process that terminated by one of the following means:

1. The process returned 0 from `main()`.
2. The process called `_exit()` or `exit()` with a `status` argument of 0.
3. The process was terminated because the last thread in the process terminated.

Regardless of its value, this information may be interpreted using the following macros, which are defined in `<sys/wait.h>` and evaluate to integral expressions; the `stat_val` argument is the integer value pointed to by `stat_loc`.

- `WIFEXITED(stat_val)`
  Evaluates to a non-zero value if `status` was returned for a child process that terminated normally.

- `WEXITSTATUS(stat_val)`
  If the value of `WIFEXITED(stat_val)` is non-zero, this macro evaluates to the low-order 8 bits of the `status` argument that the child process passed to `_exit()` or `exit()`, or the value the child process returned from `main()`.

- `WIFSIGNALED(stat_val)`
  Evaluates to a non-zero value if `status` was returned for a child process that terminated due to the receipt of a signal that was not caught (see `<signal.h>`).

- `WTERMSIG(stat_val)`
  If the value of `WIFSIGNALED(stat_val)` is non-zero, this macro evaluates to the number of the signal that caused the termination of the child process.

- `WIFSTOPPED(stat_val)`
  Evaluates to a non-zero value if `status` was returned for a child process that is currently stopped.

- `WSTOPSIG(stat_val)`
  If the value of `WIFSTOPPED(stat_val)` is non-zero, this macro evaluates to the number of the signal that caused the child process to stop.

- `XSI_WIFCONTINUED(stat_val)`
  Evaluates to a non-zero value if `status` was returned for a child process that has continued from a job control stop.

It is unspecified whether the `status` value returned by calls to `wait()` or `waitpid()` for processes created by `posix_spawn()` or `posix_spawnp()` can indicate a `WIFSTOPPED(stat_val)` before subsequent calls to `wait()` or `waitpid()` indicate `WIFEXITED(stat_val)` as the result of an error detected before the new process image starts executing.

It is unspecified whether the `status` value returned by calls to `wait()` or `waitpid()` for processes created by `posix_spawn()` or `posix_spawnp()` can indicate a `WIFSIGNALED(stat_val)` if a signal is sent to the parent’s process group after `posix_spawn()` or `posix_spawnp()` is called.

If the information pointed to by `stat_loc` was stored by a call to `waitpid()` that specified the WUNTRACED flag and did not specify the WCONTINUED flag, exactly one of the macros `WIFEXITED(*stat_loc), WIFSIGNALED(*stat_loc), and WIFSTOPPED(*stat_loc)` shall evaluate to a non-zero value.
If the information pointed to by stat_loc was stored by a call to waitpid() that specified the WUNTRACED and WCONTINUED flags, exactly one of the macros WIFEXITED(*stat_loc), WIFSIGNALED(*stat_loc), WIFSTOPPED(*stat_loc), and WIFCONTINUED(*stat_loc) shall evaluate to a non-zero value.

If the information pointed to by stat_loc was stored by a call to waitpid() that did not specify the WUNTRACED or WCONTINUED flags, or by a call to the wait() function, exactly one of the macros WIFEXITED(*stat_loc), WIFSIGNALED(*stat_loc), WIFSTOPPED(*stat_loc), and WIFCONTINUED(*stat_loc) shall evaluate to a non-zero value.

If _POSIX_REALTIME_SIGNALS is defined, and the implementation queues the SIGCHLD signal, then if wait() or waitpid() returns because the status of a child process is available, any pending SIGCHLD signal associated with the process ID of the child process shall be discarded. Any other pending SIGCHLD signals shall remain pending.

Otherwise, if SIGCHLD is blocked, if wait() or waitpid() return because the status of a child process is available, any pending SIGCHLD signal shall be cleared unless the status of another child process is available.

For all other conditions, it is unspecified whether child status will be available when a SIGCHLD signal is delivered.

There may be additional implementation-defined circumstances under which wait() or waitpid() report status. This shall not occur unless the calling process or one of its child processes explicitly makes use of a non-standard extension. In these cases the interpretation of the reported status is implementation-defined.

If a parent process terminates without waiting for all of its child processes to terminate, the remaining child processes shall be assigned a new parent process ID corresponding to an implementation-defined system process.

RETURN VALUE

If wait() or waitpid() returns because the status of a child process is available, these functions shall return a value equal to the process ID of the child process for which status is reported. If wait() or waitpid() returns due to the delivery of a signal to the calling process, −1 shall be returned and errno set to [EINTR]. If waitpid() was invoked with WNOHANG set in options, it has at least one child process specified by pid for which status is not available, and status is not available for any process specified by pid, 0 is returned. Otherwise, (pid_t)−1 shall be returned, and errno set to indicate the error.

ERRORS

The wait() function shall fail if:

- [ECHILD] The calling process has no existing unwaited-for child processes.
- [EINTR] The function was interrupted by a signal. The value of the location pointed to by stat_loc is undefined.

The waitpid() function shall fail if:

- [ECHILD] The process specified by pid does not exist or is not a child of the calling process, or the process group specified by pid does not exist or does not have any member process that is a child of the calling process.
The function was interrupted by a signal. The value of the location pointed to by \texttt{stat_loc} is undefined.

The \texttt{options} argument is not valid.

**EXAMPLES**

None.

**APPLICATION USAGE**

None.

**RATIONALE**

A call to the \texttt{wait()} or \texttt{waitpid()} function only returns \texttt{status} on an immediate child process of the calling process; that is, a child that was produced by a single \texttt{fork()} call (perhaps followed by an \texttt{exec} or other function calls) from the parent. If a child produces grandchildren by further use of \texttt{fork()}, none of those grandchildren nor any of their descendants affect the behavior of a \texttt{wait()} from the original parent process. Nothing in this volume of IEEE Std 1003.1-2001 prevents an implementation from providing extensions that permit a process to get \texttt{status} from a grandchild or any other process, but a process that does not use such extensions must be guaranteed to see \texttt{status} from only its direct children.

The \texttt{waitpid()} function is provided for three reasons:

1. To support job control
2. To permit a non-blocking version of the \texttt{wait()} function
3. To permit a library routine, such as \texttt{system()} or \texttt{pclose()}, to wait for its children without interfering with other terminated children for which the process has not waited

The first two of these facilities are based on the \texttt{wait3()} function provided by 4.3 BSD. The function uses the \texttt{options} argument, which is equivalent to an argument to \texttt{wait3()}. The WUNTRACED flag is used only in conjunction with job control on systems supporting job control. Its name comes from 4.3 BSD and refers to the fact that there are two types of stopped processes in that implementation: processes being traced via the \texttt{ptrace()} debugging facility and (untraced) processes stopped by job control signals. Since \texttt{ptrace()} is not part of this volume of IEEE Std 1003.1-2001, only the second type is relevant. The name WUNTRACED was retained because its usage is the same, even though the name is not intuitively meaningful in this context.

The third reason for the \texttt{waitpid()} function is to permit independent sections of a process to spawn and wait for children without interfering with each other. For example, the following problem occurs in developing a portable shell, or command interpreter:

```c
stream = popen("/bin/true");
(void) system("sleep 100");
(void) pclose(stream);
```

On all historical implementations, the final \texttt{pclose()} fails to reap the \texttt{wait()} \texttt{status} of the \texttt{popen()}.

The status values are retrieved by macros, rather than given as specific bit encodings as they are in most historical implementations (and thus expected by existing programs). This was necessary to eliminate a limitation on the number of signals an implementation can support that was inherent in the traditional encodings. This volume of IEEE Std 1003.1-2001 does require that a \texttt{status} value of zero corresponds to a process calling \texttt{_exit(0)}, as this is the most common encoding expected by existing programs. Some of the macro names were adopted from 4.3 BSD.

These macros syntactically operate on an arbitrary integer value. The behavior is undefined unless that value is one stored by a successful call to \texttt{wait()} or \texttt{waitpid()} in the location pointed to by the \texttt{stat_loc} argument. An early proposal attempted to make this clearer by specifying each
argument as *stat_loc rather than stat_val. However, that did not follow the conventions of other
specifications in this volume of IEEE Std 1003.1-2001 or traditional usage. It also could have
implied that the argument to the macro must literally be *stat_loc; in fact, that value can be
stored or passed as an argument to other functions before being interpreted by these macros.

The extension that affects wait() and waitpid() and is common in historical implementations is
the ptrace() function. It is called by a child process and causes that child to stop and return a
status that appears identical to the status indicated by WIFSTOPPED. The status of ptrace()
children is traditionally returned regardless of the WUNTRACED flag (or by the wait() function). Most applications do not need to concern themselves with such extensions because
they have control over what extensions they or their children use. However, applications, such
as command interpreters, that invoke arbitrary processes may see this behavior when those
arbitrary processes misuse such extensions.

Implementations that support core file creation or other implementation-defined actions on
termination of some processes traditionally provide a bit in the status returned by wait() to
indicate that such actions have occurred.

Allowing the wait() family of functions to discard a pending SIGCHLD signal that is associated
with a successfully waited-for child process puts them into the sigwait() and sigwaitinfo()
category with respect to SIGCHLD.

This definition allows implementations to treat a pending SIGCHLD signal as accepted by the
process in wait(), with the same meaning of ‘accepted’ as when that word is applied to the
sigwait() family of functions.

Allowing the wait() family of functions to behave this way permits an implementation to be able
to deal precisely with SIGCHLD signals.

In particular, an implementation that does accept (discard) the SIGCHLD signal can make the
following guarantees regardless of the queuing depth of signals in general (the list of waitable
children can hold the SIGCHLD queue):

1. If a SIGCHLD signal handler is established via sigaction() without the SA_RESETHAND
flag, SIGCHLD signals can be accurately counted; that is, exactly one SIGCHLD signal will
be delivered to or accepted by the process for every child process that terminates.

2. A single wait() issued from a SIGCHLD signal handler can be guaranteed to return
immediately with status information for a child process.

3. When SA_SIGINFO is requested, the SIGCHLD signal handler can be guaranteed to
receive a non-NULL pointer to a siginfo_t structure that describes a child process for
which a wait via waitpid() or waitid() will not block or fail.

4. The system() function will not cause a process’ SIGCHLD handler to be called as a result of
the fork()/exec executed within system() because system() will accept the SIGCHLD signal
when it performs a waitpid() for its child process. This is a desirable behavior of system() so
that it can be used in a library without causing side effects to the application linked with
the library.

An implementation that does not permit the wait() family of functions to accept (discard) a
pending SIGCHLD signal associated with a successfully waited-for child, cannot make the
guarantees described above for the following reasons:

Guarantee #1

Although it might be assumed that reliable queuing of all SIGCHLD signals generated by
the system can make this guarantee, the counter-example is the case of a process that blocks
SIGCHLD and performs an indefinite loop of fork()/wait() operations. If the
implementation supports queued signals, then eventually the system will run out of
memory for the queue. The guarantee cannot be made because there must be some limit to
the depth of queuing.

Guarantees #2 and #3
These cannot be guaranteed unless the \texttt{wait()} family of functions accepts the SIGCHLD
signal. Otherwise, a \texttt{fork()}/\texttt{wait()} executed while SIGCHLD is blocked (as in the \texttt{system()}
function) will result in an invocation of the handler when SIGCHLD is unblocked, after the
process has disappeared.

Guarantee #4
Although possible to make this guarantee, \texttt{system()} would have to set the SIGCHLD
handler to SIG_DFL so that the SIGCHLD signal generated by its \texttt{fork()} would be discarded
(the SIGCHLD default action is to be ignored), then restore it to its previous setting. This
would have the undesirable side effect of discarding all SIGCHLD signals pending to the
process.

FUTURE DIRECTIONS
None.

\texttt{<sys/wait.h>}

CHANGE HISTORY
First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5
The DESCRIPTION is updated for alignment with the POSIX Threads Extension.

Issue 6
The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

- The requirement to include \texttt{<sys/types.h>} has been removed. Although \texttt{<sys/types.h>} was
  required for conforming implementations of previous POSIX specifications, it was not
  required for UNIX applications.

The following changes were made to align with the IEEE P1003.1a draft standard:

- The processing of the SIGCHLD signal and the [ECHILD] error is clarified.

The semantics of WIFSTOPPED\texttt{(stat_val)}, WIFEXITED\texttt{(stat_val)}, and WIFSIGNALED\texttt{(stat_val)}
are defined with respect to \texttt{posix_spawn()} or \texttt{posix_spawnp()} for alignment with

The DESCRIPTION is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
waitid — wait for a child process to change state

SYNOPSIS

```
#include <sys/wait.h>

int waitid(idtype_t idtype, id_t id, siginfo_t *infop, int options);
```

DESCRIPTION
The waitid() function shall suspend the calling thread until one child of the process containing
the calling thread changes state. It records the current state of a child in the structure pointed to
by infop. If a child process changed state prior to the call to waitid(), waitid() shall return
immediately. If more than one thread is suspended in wait() or waitpid() waiting for termination
of the same process, exactly one thread shall return the process status at the time of the target
process termination.

The idtype and id arguments are used to specify which children waitid() waits for.
If idtype is P_PID, waitid() shall wait for the child with a process ID equal to (pid_t)id.
If idtype is P_PGID, waitid() shall wait for any child with a process group ID equal to (pid_t)id.
If idtype is P_ALL, waitid() shall wait for any children and id is ignored.

The options argument is used to specify which state changes waitid() shall wait for. It is formed
by OR'ing together one or more of the following flags:

- WEXITED: Wait for processes that have exited.
- WSTOPPED: Status shall be returned for any child that has stopped upon receipt of a signal.
- WCONTINUED: Status shall be returned for any child that was stopped and has been
  continued.
- WNOHANG: Return immediately if there are no children to wait for.
- WNOWAIT: Keep the process whose status is returned in infop in a waitable state. This
  shall not affect the state of the process; the process may be waited for again
  after this call completes.

The application shall ensure that the infop argument points to a siginfo_t structure. If waitid()
returns because a child process was found that satisfied the conditions indicated by the
arguments idtype and options, then the structure pointed to by infop shall be filled in by the
system with the status of the process. The si_signo member shall always be equal to SIGCHLD.

RETURN VALUE
If WNOHANG was specified and there are no children to wait for, 0 shall be returned. If waitid()
returns due to the change of state of one of its children, 0 shall be returned. Otherwise, −1 shall
be returned and errno set to indicate the error.

ERRORS
The waitid() function shall fail if:

- [ECHILD]: The calling process has no existing unwaited-for child processes.
- [EINVAL]: The waitid() function was interrupted by a signal.
- [EINVAL]: An invalid value was specified for options, or idtype and id specify an invalid
  set of processes.
waitid()

NAME
waitpid — wait for a child process to stop or terminate

SYNOPSIS
#include <sys/wait.h>

pid_t waitpid(pid_t pid, int *stat_loc, int options);

DESCRIPTION
Refer to wait().
NAME
wcrtomb — convert a wide-character code to a character (restartable)

SYNOPSIS
#include <stdio.h>

size_t wcrtomb(char *restrict s, wchar_t wc, mbstate_t *restrict ps);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

If s is a null pointer, the wcrtomb() function shall be equivalent to the call:
wcrtomb(buf, L'\0', ps)
where buf is an internal buffer.

If s is not a null pointer, the wcrtomb() function shall determine the number of bytes needed to represent the character that corresponds to the wide character given by wc (including any shift sequences), and store the resulting bytes in the array whose first element is pointed to by s. At most {MB_CUR_MAX} bytes are stored. If wc is a null wide character, a null byte shall be stored, preceded by any shift sequence needed to restore the initial shift state. The resulting state described shall be the initial conversion state.

If ps is a null pointer, the wcrtomb() function shall use its own internal mbstate_t object, which is initialized at program start-up to the initial conversion state. Otherwise, the mbstate_t object pointed to by ps shall be used to completely describe the current conversion state of the associated character sequence. The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls wcrtomb().

If the application uses any of the _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS functions, the application shall ensure that the wcrtomb() function is called with a non-NULL ps argument.

The behavior of this function shall be affected by the LC_CTYPE category of the current locale.

RETURN VALUE
The wcrtomb() function shall return the number of bytes stored in the array object (including any shift sequences). When wc is not a valid wide character, an encoding error shall occur. In this case, the function shall store the value of the macro [EILSEQ] in errno and shall return (size_t)-1; the conversion state shall be undefined.

ERRORS
The wcrtomb() function may fail if:

[EINVAL] ps points to an object that contains an invalid conversion state.

[EILSEQ] Invalid wide-character code is detected.

CHANGE HISTORY
In the DESCRIPTION, a note on using this function in a threaded application is added.
Extensions beyond the ISO C standard are marked.
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
The wcrtomb() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
wcscat — concatenate two wide-character strings

SYNOPSIS
#include <wchar.h>

wchar_t *wcscat(wchar_t *restrict ws1, const wchar_t *restrict ws2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wcscat() function shall append a copy of the wide-character string pointed to by ws2 (including the terminating null wide-character code) to the end of the wide-character string pointed to by ws1. The initial wide-character code of ws2 shall overwrite the null wide-character code at the end of ws1. If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE
The wcscat() function shall return ws1; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4. Derived from the MSE working draft.

Issue 6
The Open Group Corrigendum U040/2 is applied. In the RETURN VALUE section, s1 is changed to ws1.
The wcscat() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
wcschr — wide-character string scanning operation

SYNOPSIS
#include <wchar.h>

wchar_t *wcschr(const wchar_t *ws, wchar_t wc);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The wcschr() function shall locate the first occurrence of wc in the wide-character string pointed
to by ws. The application shall ensure that the value of wc is a character representable as a type
wchar_t and a wide-character code corresponding to a valid character in the current locale. The
terminating null wide-character code is considered to be part of the wide-character string.

RETURN VALUE
Upon completion, wcschr() shall return a pointer to the wide-character code, or a null pointer if
the wide-character code is not found.

ERRORS
No errors are defined.

EXAMPLES

NAME
wcscmp — compare two wide-character strings

SYNOPSIS
#include <wchar.h>

int wcscmp(const wchar_t *ws1, const wchar_t *ws2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wcscmp() function shall compare the wide-character string pointed to by ws1 to the wide-character string pointed to by ws2.

The sign of a non-zero return value shall be determined by the sign of the difference between the values of the first pair of wide-character codes that differ in the objects being compared.

RETURN VALUE
Upon completion, wcscmp() shall return an integer greater than, equal to, or less than 0, if the wide-character string pointed to by ws1 is greater than, equal to, or less than the wide-character string pointed to by ws2, respectively.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE

NAME
wcscoll — wide-character string comparison using collating information

SYNOPSIS
#include <wchar.h>

int wcscoll(const wchar_t *ws1, const wchar_t *ws2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The wcscoll() function shall compare the wide-character string pointed to by ws1 to the wide-
character string pointed to by ws2, both interpreted as appropriate to the LC_COLLATE category
of the current locale.
The wcscoll() function shall not change the setting of errno if successful.
An application wishing to check for error situations should set errno to 0 before calling wcscoll().
If errno is non-zero on return, an error has occurred.

RETURN VALUE
Upon successful completion, wcscoll() shall return an integer greater than, equal to, or less than
0, according to whether the wide-character string pointed to by ws1 is greater than, equal to, or
less than the wide-character string pointed to by ws2, when both are interpreted as appropriate
to the current locale. On error, wcscoll() shall set errno, but no return value is reserved to
indicate an error.

ERRORS
The wcscoll() function may fail if:

[EINVAL] The ws1 or ws2 arguments contain wide-character codes outside the domain of
the collating sequence.

EXAMPLES
None.

APPLICATION USAGE
The wcsxfrm() and wcscmp() functions should be used for sorting large lists.

RATIONALE
None.

FUTURE DIRECTIONS
None.

CHANGE HISTORY
First released in Issue 4. Derived from the MSE working draft.

Issue 5
Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.
NAME
wcscpy — copy a wide-character string

SYNOPSIS
#include <wchar.h>

wchar_t *wcscpy(wchar_t *restrict ws1, const wchar_t *restrict ws2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The wcscpy() function shall copy the wide-character string pointed to by ws2 (including the
terminating null wide-character code) into the array pointed to by ws1. If copying takes place
between objects that overlap, the behavior is undefined.

RETURN VALUE
The wcscpy() function shall return ws1; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

NAME
wcscspn — get the length of a complementary wide substring

SYNOPSIS
#include <wchar.h>

size_t wcscspn(const wchar_t *ws1, const wchar_t *ws2);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The wcscspn() function shall compute the length (in wide characters) of the maximum initial segment of the wide-character string pointed to by ws1 which consists entirely of wide-character codes not from the wide-character string pointed to by ws2.

RETURN VALUE
The wcscspn() function shall return the length of the initial substring of ws1; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

NAME
wcsftime — convert date and time to a wide-character string

SYNOPSIS
#include <wchar.h>

size_t wcsftime(wchar_t *restrict wcs, size_t maxsize,
               const wchar_t *restrict format, const struct tm *restrict timeptr);

DESCRIPTION
CX The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The wcsftime() function shall be equivalent to the strftime() function, except that:

• The argument wcs points to the initial element of an array of wide characters into which the
  generated output is to be placed.
• The argument maxsize indicates the maximum number of wide characters to be placed in the
  output array.
• The argument format is a wide-character string and the conversion specifications are replaced
  by corresponding sequences of wide characters.
• The return value indicates the number of wide characters placed in the output array.
If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE
If the total number of resulting wide-character codes including the terminating null wide-
character code is no more than maxsize, wcsftime() shall return the number of wide-character
codes placed into the array pointed to by wcs, not including the terminating null wide-character
code. Otherwise, zero is returned and the contents of the array are unspecified.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

Issue 5
Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.

Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, the type of the format
argument is changed from const char * to const wchar_t *.
The `wcsftime()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
wcslen — get wide-character string length

SYNOPSIS
#include <wchar.h>
size_t wcslen(const wchar_t *ws);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The wcslen() function shall compute the number of wide-character codes in the wide-character
string to which ws points, not including the terminating null wide-character code.

RETURN VALUE
The wcslen() function shall return the length of ws; no return value is reserved to indicate an
error.

ERRORS
No errors are defined.

NAME
wcsncat — concatenate a wide-character string with part of another

SYNOPSIS
#include <wchar.h>

wchar_t *wcsncat(wchar_t *restrict ws1, const wchar_t *restrict ws2,
               size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wcsncat() function shall append not more than \textit{n} wide-character codes (a null wide-character code and wide-character codes that follow it are not appended) from the array pointed to by \textit{ws2} to the end of the wide-character string pointed to by \textit{ws1}. The initial wide-character code of \textit{ws2} shall overwrite the null wide-character code at the end of \textit{ws1}. A terminating null wide-character code shall always be appended to the result. If copying takes place between objects that overlap, the behavior is undefined.

RETURN VALUE
The wcsncat() function shall return \textit{ws1}; no return value is reserved to indicate an error.

ERRORS
No errors are defined.

EXAMPLES
None.

NAME
wcsrtombs — convert a wide-character string to a character string (restartable)

SYNOPSIS
#include <wchar.h>

size_t wcsrtombs(char *restrict dst, const wchar_t **restrict src,
                  size_t len, mbstate_t *restrict ps);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The wcsrtombs() function shall convert a sequence of wide characters from the array indirectly
pointed to by src into a sequence of corresponding characters, beginning in the conversion state
described by the object pointed to by ps. If dst is not a null pointer, the converted characters
shall then be stored into the array pointed to by dst. Conversion continues up to and including a
terminating null wide character, which shall also be stored. Conversion shall stop earlier in the
following cases:
• When a code is reached that does not correspond to a valid character
• When the next character would exceed the limit of len total bytes to be stored in the array
  pointed to by dst (and dst is not a null pointer)
Each conversion shall take place as if by a call to the wcrtomb() function.

If dst is not a null pointer, the pointer object pointed to by src shall be assigned either a null
pointer (if conversion stopped due to reaching a terminating null wide character) or the address
just past the last wide character converted (if any). If conversion stopped due to reaching a
terminating null wide character, the resulting state described shall be the initial conversion state.

If ps is a null pointer, the wcsrtombs() function shall use its own internal mbstate_t object, which
is initialized at program start-up to the initial conversion state. Otherwise, the mbstate_t object
pointed to by ps shall be used to completely describe the current conversion state of the
associated character sequence. The implementation shall behave as if no function defined in this

If the application uses any of the _POSIX_THREAD_SAFE_FUNCTIONS or _POSIX_THREADS
functions, the application shall ensure that the wcsrtombs() function is called with a non-NULL
ps argument.
The behavior of this function shall be affected by the LC_CTYPE category of the current locale.

RETURN VALUE
If conversion stops because a code is reached that does not correspond to a valid character, an
encoding error occurs. In this case, the wcsrtombs() function shall store the value of the macro
[EILSEQ] in errno and return (size_t)-1; the conversion state is undefined. Otherwise, it shall
return the number of bytes in the resulting character sequence, not including the terminating
null (if any).

ERRORS
The wcsrtombs() function may fail if:

 CX [EINVAL] ps points to an object that contains an invalid conversion state.
 [EILSEQ] A wide-character code does not correspond to a valid character.
EXCEPTIONS
None.

APPLICATION USAGE
None.

NAME
wcstod, wcstof, wcstold — convert a wide-character string to a double-precision number

SYNOPSIS
#include <wchar.h>

double wcstod(const wchar_t *restrict nptr, wchar_t **restrict endptr);
float wcstof(const wchar_t *restrict nptr, wchar_t **restrict endptr);
long double wcstold(const wchar_t *restrict nptr, wchar_t **restrict endptr);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

These functions shall convert the initial portion of the wide-character string pointed to by nptr to double, float, and long double representation, respectively. First, they shall decompose the input wide-character string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by iswspace())
2. A subject sequence interpreted as a floating-point constant or representing infinity or NaN
3. A final wide-character string of one or more unrecognized wide-character codes, including the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to a floating-point number, and return the result.

The expected form of the subject sequence is an optional plus or minus sign, then one of the following:

- A non-empty sequence of decimal digits optionally containing a radix character, then an optional exponent part
- A 0x or 0X, then a non-empty sequence of hexadecimal digits optionally containing a radix character, then an optional binary exponent part
- One of INF or INFINITY, or any other wide string equivalent except for case
- One of NAN or NAN(n-wchar-sequence), or any other wide string ignoring case in the NAN part, where:

\[
\text{n-wchar-sequence:}
\]
\[
\text{digit}
\]
\[
\text{nondigit}
\]
\[
\text{n-wchar-sequence digit}
\]
\[
\text{n-wchar-sequence nondigit}
\]

The subject sequence is defined as the longest initial subsequence of the input wide string, starting with the first non-white-space wide character, that is of the expected form. The subject sequence contains no wide characters if the input wide string is not of the expected form.

If the subject sequence has the expected form for a floating-point number, the sequence of wide characters starting with the first digit or the radix character (whichever occurs first) shall be interpreted as a floating constant according to the rules of the C language, except that the radix character shall be used in place of a period, and that if neither an exponent part nor a radix character appears in a decimal floating-point number, or if a binary exponent part does not
appear in a hexadecimal floating-point number, an exponent part of the appropriate type with
value zero shall be assumed to follow the last digit in the string. If the subject sequence begins
with a minus sign, the sequence shall be interpreted as negated. A wide-character sequence INF
or INFINITY shall be interpreted as an infinity, if representable in the return type, else as if it
were a floating constant that is too large for the range of the return type. A wide-character
sequence NAN or NAN(n-wchar-sequence opt) shall be interpreted as a quiet NaN, if supported in
the return type, else as if it were a subject sequence part that does not have the expected form;
the meaning of the n-wchar sequences is implementation-defined. A pointer to the final wide
string shall be stored in the object pointed to by endptr, provided that endptr is not a null pointer.
If the subject sequence has the hexadecimal form and FLT_RADIX is a power of 2, the
conversion shall be rounded in an implementation-defined manner.

The radix character shall be as defined in the program’s locale (category LC_NUMERIC). In the
POSIX locale, or in a locale where the radix character is not defined, the radix character shall
default to a period (‘.’).

In other than the C or POSIX locales, other implementation-defined subject sequences may be
accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be
performed; the value of nptr shall be stored in the object pointed to by endptr, provided that
endptr is not a null pointer.

The wcstod() function shall not change the setting of errno if successful.

Since 0 is returned on error and is also a valid return on success, an application wishing to check
for error situations should set errno to 0, then call wcstod(), wcstof(), or wcstold(), then check
errno.

Upon successful completion, these functions shall return the converted value. If no conversion
could be performed, 0 shall be returned and errno may be set to [EINVAL].

If the correct value is outside the range of representable values, ±HUGE_VAL, ±HUGE_VALF, or
±HUGE_VALL shall be returned (according to the sign of the value), and errno shall be set to
[ERANGE].

If the correct value would cause underflow, a value whose magnitude is no greater than the
smallest normalized positive number in the return type shall be returned and errno set to
[ERANGE].

The wcstod() function shall fail if:

The value to be returned would cause overflow or underflow.

The wcstod() function may fail if:

No conversion could be performed.
EXEMPLARY
None.

APPLICATION USAGE
If the subject sequence has the hexadecimal form and FLT_RADIX is not a power of 2, and the
result is not exactly representable, the result should be one of the two numbers in the
appropriate internal format that are adjacent to the hexadecimal floating source value, with the
extra stipulation that the error should have a correct sign for the current rounding direction.

If the subject sequence has the decimal form and at most DECIMAL_DIG (defined in <float.h>)
significant digits, the result should be correctly rounded. If the subject sequence D has the
decimal form and more than DECIMAL_DIG significant digits, consider the two bounding,
adjacent decimal strings L and U, both having DECIMAL_DIG significant digits, such that the
values of L, D, and U satisfy "L <= D <= U". The result should be one of the (equal or
adjacent) values that would be obtained by correctly rounding L and U according to the current
rounding direction, with the extra stipulation that the error with respect to D should have a
correct sign for the current rounding direction.

RATIONALE
None.

FUTURE DIRECTIONS
None.

IEEE Std 1003.1-2001, Chapter 7, Locale, <float.h>, <wchar.h>

CHANGE HISTORY
First released in Issue 4. Derived from the MSE working draft.

Issue 5
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.

Issue 6
Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the
Single UNIX Specification:

In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is
added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

The wcstod() prototype is updated.

The wcstof() and wcstold() functions are added.

The correct value for wcstod() would cause underflow, the return value changed from 0 (as
specified in Issue 5) to the smallest normalized positive number.

The DESCRIPTION, RETURN VALUE, and APPLICATION USAGE sections are extensively
updated.

IEEE Std 1003.1-2001/Cor 1-2002, item XSH/TC1/D6/66 is applied, correcting the second
paragraph in the RETURN VALUE section.
NAME
wcstoimax, wcstoumax — convert a wide-character string to an integer type

SYNOPSIS
#include <stddef.h>
#include <inttypes.h>

intmax_t wcstoimax(const wchar_t *restrict nptr,
                   wchar_t **restrict endptr, int base);
uintmax_t wcstoumax(const wchar_t *restrict nptr,
                    wchar_t **restrict endptr, int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
These functions shall be equivalent to the wcstol(), wcstoll(), wcstoul(), and wcstoull() functions,
respectively, except that the initial portion of the wide string shall be converted to intmax_t and
uintmax_t representation, respectively.

RETURN VALUE
These functions shall return the converted value, if any.
If no conversion could be performed, zero shall be returned. If the correct value is outside the
range of representable values, INTMAX_MAX, INTMAX_MIN, or UINTMAX_MAX shall be returned (according to the return type and sign of the value, if any), and errno shall be set to
ERANGE.

ERRORS
These functions shall fail if:
[EINVAL] The value of base is not supported.
[ERANGE] The value to be returned is not representable.
These functions may fail if:
[EINVAL] No conversion could be performed.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY
NAME
wcstok — split a wide-character string into tokens

SYNOPSIS
#include <wchar.h>

wchar_t *wcstok(wchar_t *restrict ws1, const wchar_t *restrict ws2,
                wchar_t **restrict ptr);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

A sequence of calls to wcstok() shall break the wide-character string pointed to by ws1 into a sequence of tokens, each of which shall be delimited by a wide-character code from the wide-character string pointed to by ws2. The ptr argument points to a caller-provided wchar_t pointer into which the wcstok() function shall store information necessary for it to continue scanning the same wide-character string.

The first call in the sequence has ws1 as its first argument, and is followed by calls with a null pointer as their first argument. The separator string pointed to by ws2 may be different from call to call.

The first call in the sequence shall search the wide-character string pointed to by ws1 for the first wide-character code that is not contained in the current separator string pointed to by ws2. If no such wide-character code is found, then there are no tokens in the wide-character string pointed to by ws1 and wcstok() shall return a null pointer. If such a wide-character code is found, it shall be the start of the first token.

The wcstok() function shall then search from there for a wide-character code that is contained in the current separator string. If no such wide-character code is found, the current token extends to the end of the wide-character string pointed to by ws1, and subsequent searches for a token shall return a null pointer. If such a wide-character code is found, it shall be overwritten by a null wide character, which terminates the current token. The wcstok() function shall save a pointer to the following wide-character code, from which the next search for a token shall start.

Each subsequent call, with a null pointer as the value of the first argument, shall start searching from the saved pointer and behave as described above.

The implementation shall behave as if no function calls wcstok().

RETURN VALUE
Upon successful completion, the wcstok() function shall return a pointer to the first wide-character code of a token. Otherwise, if there is no token, wcstok() shall return a null pointer.

ERRORS
No errors are defined.
EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

CHANGE HISTORY
First released in Issue 4.

Issue 5
Aligned with ISO/IEC 9899:1990/Amendment 1:1995 (E). Specifically, a third argument is added to the definition of `wcstok()` in the SYNOPSIS.

Issue 6
The `wcstok()` prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
wcstol, wcstoll — convert a wide-character string to a long integer

SYNOPSIS
#include <wchar.h>

long wcstol(const wchar_t *restrict nptr, wchar_t **restrict endptr, int base);
long long wcstoll(const wchar_t *restrict nptr, wchar_t **restrict endptr, int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

These functions shall convert the initial portion of the wide-character string pointed to by nptr to
long, long long, and unsigned long long representation, respectively. First, they
shall decompose the input string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
   iswspace())
2. A subject sequence interpreted as an integer represented in some radix determined by the
   value of base
3. A final wide-character string of one or more unrecognized wide-character codes, including
   the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to an integer, and return the result.

If base is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
or hexadecimal constant, any of which may be preceded by a '+', or '-' sign. A decimal
constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
constant consists of the prefix '0' optionally followed by a sequence of the digits '0' to '7'
only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
decimal digits and letters 'a' (or 'A') to 'f' (or 'F') with values 10 to 15 respectively.

If the value of base is between 2 and 36, the expected form of the subject sequence is a sequence
of letters and digits representing an integer with the radix specified by base, optionally preceded
by a '+' or '-' sign, but not including an integer suffix. The letters from 'a' (or 'A') to 'z'
(or 'Z') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
than that of base shall be permitted. If the value of base is 16, the wide-character code
representations of 0x or 0X may optionally precede the sequence of letters and digits, following
the sign if present.

The subject sequence is defined as the longest initial subsequence of the input wide-character
string, starting with the first non-white-space wide-character code that is of the expected form.
The subject sequence contains no wide-character codes if the input wide-character string is
empty or consists entirely of white-space wide-character code, or if the first non-white-space
wide-character code is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and base is 0, the sequence of wide-character codes
starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
the expected form and the value of base is between 2 and 36, it shall be used as the base for
conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
minus sign, the value resulting from the conversion shall be negated. A pointer to the final
wide-character string shall be stored in the object pointed to by endptr, provided that endptr is
System Interfaces

wcstol(

not a null pointer.

In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of nptr shall be stored in the object pointed to by endptr, provided that endptr is not a null pointer.

These functions shall not change the setting of errno if successful.

Since 0, [LONG_MIN] or [LLONG_MIN] and [LONG_MAX] or [LLONG_MAX] are returned on error and are also valid returns on success, an application wishing to check for error situations should set errno to 0, then call wcstol() or wcstoll(), then check errno.

Upon successful completion, these functions shall return the converted value, if any. If no conversion could be performed, 0 shall be returned and errno may be set to indicate the error. If the correct value is outside the range of representable values, [LONG_MIN], [LONG_MAX], [LLONG_MIN], or [LLONG_MAX] shall be returned (according to the sign of the value), and errno set to [ERANGE].

These functions shall fail if:

- [EINVAL] The value of base is not supported.
- [ERANGE] The value to be returned is not representable.
- These functions may fail if:
  - [EINVAL] No conversion could be performed.

The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.
The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The `wcstol()` prototype is updated.
- The `wcstoll()` function is added.
NAME
wcstold — convert a wide-character string to a double-precision number

SYNOPSIS
#include <wchar.h>

long double wcstold(const wchar_t *restrict nptr,
                     wchar_t **restrict endptr);

DESCRIPTION
Refer to wcstod().
NAME
wcstoll — convert a wide-character string to a long integer

SYNOPSIS
#include <wchar.h>

long long wcstoll(const wchar_t *restrict nptr,
                   wchar_t **restrict endptr, int base);

DESCRIPTION
Refer to wcstol().
NAME
cwstombs — convert a wide-character string to a character string

SYNOPSIS
#include <stdlib.h>
size_t cwstombs(char *restrict s, const wchar_t *restrict pwcs,
size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This
The cwstombs() function shall convert the sequence of wide-character codes that are in the array
pointed to by pwcs into a sequence of characters that begins in the initial shift state and store
these characters into the array pointed to by s, stopping if a character would exceed the limit of n
total bytes or if a null byte is stored. Each wide-character code shall be converted as if by a call to
wctomb(), except that the shift state of wctomb() shall not be affected.
The behavior of this function shall be affected by the LC_CTYPE category of the current locale.
No more than n bytes shall be modified in the array pointed to by s. If copying takes place
between objects that overlap, the behavior is undefined. If s is a null pointer, cwstombs() shall
return the length required to convert the entire array regardless of the value of n, but no values
are stored.
The cwstombs() function need not be reentrant. A function that is not required to be reentrant is
not required to be thread-safe.

RETURN VALUE
If a wide-character code is encountered that does not correspond to a valid character (of one or
more bytes each), cwstombs() shall return (size_t)−1. Otherwise, cwstombs() shall return the
number of bytes stored in the character array, not including any terminating null byte. The array
shall not be null-terminated if the value returned is n.

ERRORS
The cwstombs() function may fail if:

[EINVAL] A wide-character code does not correspond to a valid character.

EXAMPLES
None.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS
None.

**CHANGE HISTORY**

First released in Issue 4. Derived from the ISO C standard.

**Issue 6**

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The DESCRIPTION states the effect of when `s` is a null pointer.
- The [EILSEQ] error condition is added.

The `wcstombs()` prototype is updated for alignment with the ISO/IEC 9899: 1999 standard.
NAME
wcstoul, wcstoull — convert a wide-character string to an unsigned long

SYNOPSIS
#include <wchar.h>

unsigned long wcstoul(const wchar_t *restrict nptr,
        wchar_t **restrict endptr, int base);

unsigned long long wcstoull(const wchar_t *restrict nptr,
        wchar_t **restrict endptr, int base);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The wcstoul() and wcstoull() functions shall convert the initial portion of the wide-character
string pointed to by nptr to unsigned long and unsigned long long representation, respectively.
First, they shall decompose the input wide-character string into three parts:

1. An initial, possibly empty, sequence of white-space wide-character codes (as specified by
   iswspace())

2. A subject sequence interpreted as an integer represented in some radix determined by the
   value of base

3. A final wide-character string of one or more unrecognized wide-character codes, including
   the terminating null wide-character code of the input wide-character string

Then they shall attempt to convert the subject sequence to an unsigned integer, and return the
result.

If base is 0, the expected form of the subject sequence is that of a decimal constant, octal constant,
or hexadecimal constant, any of which may be preceded by a ' + ' or ' - ' sign. A decimal
constant begins with a non-zero digit, and consists of a sequence of decimal digits. An octal
constant consists of the prefix ' 0 ' optionally followed by a sequence of the digits ' 0 ' to ' 7 '
only. A hexadecimal constant consists of the prefix 0x or 0X followed by a sequence of the
decimal digits and letters ' a ' (or ' A ') to ' f ' (or ' F ') with values 10 to 15 respectively.

If the value of base is between 2 and 36, the expected form of the subject sequence is a sequence of
letters and digits representing an integer with the radix specified by base, optionally preceded
by a ' + ' or ' - ' sign, but not including an integer suffix. The letters from ' a ' (or ' A ') to ' z '
(or ' Z ') inclusive are ascribed the values 10 to 35; only letters whose ascribed values are less
than that of base shall be permitted. If the value of base is 16, the wide-character codes 0x or 0X
may optionally precede the sequence of letters and digits, following the sign if present.

The subject sequence is defined as the longest initial subsequence of the input wide-character
string, starting with the first wide-character code that is not white space and is of the expected
form. The subject sequence contains no wide-character codes if the input wide-character string is
empty or consists entirely of white-space wide-character codes, or if the first wide-character
code that is not white space is other than a sign or a permissible letter or digit.

If the subject sequence has the expected form and base is 0, the sequence of wide-character codes
starting with the first digit shall be interpreted as an integer constant. If the subject sequence has
the expected form and the value of base is between 2 and 36, it shall be used as the base for
conversion, ascribing to each letter its value as given above. If the subject sequence begins with a
minus sign, the value resulting from the conversion shall be negated. A pointer to the final
wide-character string shall be stored in the object pointed to by endptr, provided that endptr is
not a null pointer.

In other than the C or POSIX locales, other implementation-defined subject sequences may be accepted.

If the subject sequence is empty or does not have the expected form, no conversion shall be performed; the value of *nptr* shall be stored in the object pointed to by *endptr*, provided that *endptr* is not a null pointer.

The `wcstoul()` function shall not change the setting of *errno* if successful.

Since 0, [ULONG_MAX], and [ULLONG_MAX] are returned on error and 0 is also a valid return on success, an application wishing to check for error situations should set *errno* to 0, then call `wcstoul()` or `wcstoull()`, then check *errno*.

Upon successful completion, the `wcstoul()` and `wcstoull()` functions shall return the converted value, if any. If no conversion could be performed, 0 shall be returned and *errno* may be set to indicate the error. If the correct value is outside the range of representable values, [ULONG_MAX] or [ULLONG_MAX] respectively shall be returned and *errno* set to [ERANGE].

These functions shall fail if:

- [EINVAL] The value of `base` is not supported.
- [ERANGE] The value to be returned is not representable.

These functions may fail if:

- [EINVAL] No conversion could be performed.

**EXAMPLES**

None.

**CHANGE HISTORY**

First released in Issue 4. Derived from the MSE working draft.

**Issue 5**

The DESCRIPTION is updated to indicate that *errno* is not changed if the function is successful.

**Issue 6**

Extensions beyond the ISO C standard are marked.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:

- The [EINVAL] error condition is added for when the value of `base` is not supported.
In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.

The following changes are made for alignment with the ISO/IEC 9899: 1999 standard:

- The `wcstoul()` prototype is updated.
- The `wcstoull()` function is added.
NAME

wcstoumax — convert a wide-character string to an integer type

SYNOPSIS

#include <stddef.h>
#include <inttypes.h>

uintmax_t wcstoumax(const wchar_t *restrict nptr,
                     wchar_t **restrict endptr, int base);

DESCRIPTION

Refer to wcstoimax().
NAME
wcswcs — find a wide substring (LEGACY)

SYNOPSIS
XSI
#include <wchar.h>

wchar_t *wcswcs(const wchar_t *ws1, const wchar_t *ws2);

DESCRIPTION
The wcswcs() function shall locate the first occurrence in the wide-character string pointed to by
ws1 of the sequence of wide-character codes (excluding the terminating null wide-character
code) in the wide-character string pointed to by ws2.

RETURN VALUE
Upon successful completion, wcswcs() shall return a pointer to the located wide-character string
or a null pointer if the wide-character string is not found.

If ws2 points to a wide-character string with zero length, the function shall return ws1.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
This function was not included in the final ISO/IEC 9899:1990/Amendment 1:1995 (E).
Application developers are strongly encouraged to use the wcsstr() function instead.

RATIONALE
None.

FUTURE DIRECTIONS
This function may be withdrawn in a future version.

Issue 6
This function is marked LEGACY.
NAME
wcswidth — number of column positions of a wide-character string

SYNOPSIS
#include <wchar.h>

int wcswidth(const wchar_t *pwcs, size_t n);

DESCRIPTION
The wcswidth() function shall determine the number of column positions required for n wide-
character codes (or fewer than n wide-character codes if a null wide-character code is
encountered before n wide-character codes are exhausted) in the string pointed to by pwcs.

RETURN VALUE
The wcswidth() function either shall return 0 (if pwcs points to a null wide-character code), or
return the number of column positions to be occupied by the wide-character string pointed to by
pwcs, or return −1 (if any of the first n wide-character codes in the wide-character string pointed
to by pwcs is not a printable wide-character code).

ERRORS
No errors are defined.

APPLICATION USAGE
None.

RATIONALE
None.

FUTURE DIRECTIONS

Issue 6
The Open Group Corrigendum U021/11 is applied. The function is marked as an extension.
NAME
wcsxfrm — wide-character string transformation

SYNOPSIS
#include <wchar.h>

size_t wcsxfrm(wchar_t *restrict ws1, const wchar_t *restrict ws2, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wcsxfrm() function shall transform the wide-character string pointed to by ws2 and place the resulting wide-character string into the array pointed to by ws1. The transformation shall be such that if wcscmp() is applied to two transformed wide strings, it shall return a value greater than, equal to, or less than 0, corresponding to the result of wcscoll() applied to the same two original wide-character strings. No more than n wide-character codes shall be placed into the resulting array pointed to by ws1, including the terminating null wide-character code. If n is 0, ws1 is permitted to be a null pointer. If copying takes place between objects that overlap, the behavior is undefined.

Since no return value is reserved to indicate an error, an application wishing to check for error situations should set errno to 0, then call wcsxfrm(), then check errno.

RETURN VALUE
The wcsxfrm() function shall return the length of the transformed wide-character string (not including the terminating null wide-character code). If the value returned is n or more, the contents of the array pointed to by ws1 are unspecified.

On error, the wcsxfrm() function may set errno, but no return value is reserved to indicate an error.

ERRORS
The wcsxfrm() function may fail if:

[EINVAL] The wide-character string pointed to by ws2 contains wide-character codes outside the domain of the collating sequence.

EXAMPLES
None.

APPLICATION USAGE
The transformation function is such that two transformed wide-character strings can be ordered by wcscmp() as appropriate to collating sequence information in the program’s locale (category LC_COLLATE).

The fact that when n is 0 ws1 is permitted to be a null pointer is useful to determine the size of the ws1 array prior to making the transformation.

RATIONALE
None.
FUTURE DIRECTIONS
None.

SEE ALSO
wcscmp(), wcscoll(), the Base Definitions volume of IEEE Std 1003.1-2001, <wchar.h>

CHANGE HISTORY
First released in Issue 4. Derived from the MSE working draft.

Issue 5
Moved from ENHANCED I18N to BASE and the [ENOSYS] error is removed.
The DESCRIPTION is updated to indicate that errno is not changed if the function is successful.

Issue 6
In previous versions, this function was required to return −1 on error.

Extensions beyond the ISO C standard are marked.
The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• In the RETURN VALUE and ERRORS sections, the [EINVAL] optional error condition is added if no conversion could be performed.
The wcsxfrm() prototype is updated for alignment with the ISO/IEC 9899:1999 standard.
NAME
wctob — wide-character to single-byte conversion

SYNOPSIS
#include <stdio.h>
#include <wchar.h>
int wctob(wint_t c);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wctob() function shall determine whether c corresponds to a member of the extended character set whose character representation is a single byte when in the initial shift state.

The behavior of this function shall be affected by the LC_CTYPE category of the current locale.

RETURN VALUE
The wctob() function shall return EOF if c does not correspond to a character with length one in the initial shift state. Otherwise, it shall return the single-byte representation of that character as an unsigned char converted to int.

ERRORS
No errors are defined.

EXAMPLES

CHANGE HISTORY
wctomb()

NAME
wctomb — convert a wide-character code to a character

SYNOPSIS
#include <stdlib.h>

int wctomb(char *s, wchar_t wchar);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The *wctomb*() function shall determine the number of bytes needed to represent the character corresponding to the wide-character code whose value is *wchar* (including any change in the shift state). It shall store the character representation (possibly multiple bytes and any special bytes to change shift state) in the array object pointed to by *s* (if *s* is not a null pointer). At most {MB_CUR_MAX} bytes shall be stored. If *wchar* is 0, a null byte shall be stored, preceded by any shift sequence needed to restore the initial shift state, and *wctomb*() shall be left in the initial shift state.

The behavior of this function is affected by the *LC_CTYPE* category of the current locale. For a state-dependent encoding, this function shall be placed into its initial state by a call for which its character pointer argument, *s*, is a null pointer. Subsequent calls with *s* as other than a null pointer shall cause the internal state of the function to be altered as necessary. A call with *s* as a null pointer shall cause this function to return a non-zero value if encodings have state dependency, and 0 otherwise. Changing the *LC_CTYPE* category causes the shift state of this function to be unspecified.

The *wctomb*() function need not be reentrant. A function that is not required to be reentrant is not required to be thread-safe.

The implementation shall behave as if no function defined in this volume of IEEE Std 1003.1-2001 calls *wctomb*().

RETURN VALUE
If *s* is a null pointer, *wctomb*() shall return a non-zero or 0 value, if character encodings, respectively, do or do not have state-dependent encodings. If *s* is not a null pointer, *wctomb*() shall return −1 if the value of *wchar* does not correspond to a valid character, or return the number of bytes that constitute the character corresponding to the value of *wchar*.

In no case shall the value returned be greater than the value of the {MB_CUR_MAX} macro.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

CHANGE HISTORY

First released in Issue 4. Derived from the ANSI C standard.

Issue 6

Extensions beyond the ISO C standard are marked.

In the DESCRIPTION, a note about reentrancy and thread-safety is added.
NAME
wctrans — define character mapping

SYNOPSIS
#include <wctype.h>

wctrans_t wctrans(const char *charclass);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.
The wctrans() function is defined for valid character mapping names identified in the current locale. The charclass is a string identifying a generic character mapping name for which codeset-specific information is required. The following character mapping names are defined in all locales: tolower and toupper.
The function shall return a value of type wctrans_t, which can be used as the second argument to subsequent calls of towctrans(). The wctrans() function shall determine values of wctrans_t according to the rules of the coded character set defined by character mapping information in the program's locale (category LC_CTYPE). The values returned by wctrans() shall be valid until a call to setlocale() that modifies the category LC_CTYPE.

RETURN VALUE
The wctrans() function shall return 0 and may set errno to indicate the error if the given character mapping name is not valid for the current locale (category LC_CTYPE); otherwise, it shall return a non-zero object of type wctrans_t that can be used in calls to towctrans().

ERRORS
The wctrans() function may fail if:

[EINVAL] The character mapping name pointed to by charclass is not valid in the current locale.

CHANGE HISTORY
wctype()  

NAME  
wctype — define character class  

SYNOPSIS  
#include <wctype.h>  
wctype_t wctype(const char *property);  

DESCRIPTION  
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.  
The wctype() function is defined for valid character class names as defined in the current locale. The property argument is a string identifying a generic character class for which codeset-specific type information is required. The following character class names shall be defined in all locales:  

- alnum  
- alpha  
- blank  
- cntrl  
- digit  
- graph  
- lower  
- print  
- punct  
- space  
- upper  
- xdigit  

Additional character class names defined in the locale definition file (category LC_CTYPE) can also be specified.  
The function shall return a value of type wctype_t, which can be used as the second argument to subsequent calls of iswctype(). The wctype() function shall determine values of wctype_t according to the rules of the coded character set defined by character type information in the program's locale (category LC_CTYPE). The values returned by wctype() shall be valid until a call to setlocale() that modifies the category LC_CTYPE.  

RETURN VALUE  
The wctype() function shall return 0 if the given character class name is not valid for the current locale (category LC_CTYPE); otherwise, it shall return an object of type wctype_t that can be used in calls to iswctype().  

ERRORS  
No errors are defined.

CHANGE HISTORY  
First released in Issue 4.
The following change has been made in this issue for alignment with ISO/IEC 9899:1990/Amendment 1:1995 (E):

- The SYNOPSIS has been changed to indicate that this function and associated data types are now made visible by inclusion of the `<wctype.h>` header rather than `<wchar.h>`.
NAME
wcwidth — number of column positions of a wide-character code

SYNOPSIS
XSI
#include <wchar.h>

int wcwidth(wchar_t wc);

DESCRIPTION
The wcwidth( ) function shall determine the number of column positions required for the wide character wc. The application shall ensure that the value of wc is a character representable as a wchar_t, and is a wide-character code corresponding to a valid character in the current locale.

RETURN VALUE
The wcwidth( ) function shall either return 0 (if wc is a null wide-character code), or return the number of column positions to be occupied by the wide-character code wc, or return −1 (if wc does not correspond to a printable wide-character code).

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
This function was removed from the final ISO/IEC 9899:1990/Amendment 1:1995 (E), and the return value for a non-printable wide character is not specified.

RATIONALE
None.

FUTURE DIRECTIONS
None.

SEE ALSO
wcswidth( ), the Base Definitions volume of IEEE Std 1003.1-2001, wchar.h

CHANGE HISTORY
First released as a World-wide Portability Interface in Issue 4. Derived from the MSE working draft.

Issue 6
The Open Group Corrigendum U021/12 is applied. This function is marked as an extension.

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
wmemchr — find a wide character in memory

SYNOPSIS
#include <wchar.h>

wchar_t *wmemchr(const wchar_t *ws, wchar_t wc, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any
conflict between the requirements described here and the ISO C standard is unintentional. This

The wmemchr() function shall locate the first occurrence of wc in the initial n wide characters of
the object pointed to by ws. This function shall not be affected by locale and all wchar_t values
shall be treated identically. The null wide character and wchar_t values not corresponding to
valid characters shall not be treated specially.

If n is zero, the application shall ensure that ws is a valid pointer and the function behaves as if
no valid occurrence of wc is found.

RETURN VALUE
The wmemchr() function shall return a pointer to the located wide character, or a null pointer if
the wide character does not occur in the object.

ERRORS
No errors are defined.

EXAMPLES
None.

APPLICATION USAGE
None.

NAME

wmemcmp — compare wide characters in memory

SYNOPSIS

#include <wchar.h>

int wmemcmp(const wchar_t *ws1, const wchar_t *ws2, size_t n);

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wmemcmp() function shall compare the first n wide characters of the object pointed to by ws1 to the first n wide characters of the object pointed to by ws2. This function shall not be affected by locale and all wchar_t values shall be treated identically. The null wide character and wchar_t values not corresponding to valid characters shall not be treated specially.

If n is zero, the application shall ensure that ws1 and ws2 are valid pointers, and the function shall behave as if the two objects compare equal.

RETURN VALUE

The wmemcmp() function shall return an integer greater than, equal to, or less than zero, respectively, as the object pointed to by ws1 is greater than, equal to, or less than the object pointed to by ws2.

ERRORS

No errors are defined.

NAME

wmemcpy — copy wide characters in memory

SYNOPSIS

```
#include <wchar.h>

wchar_t *wmemcpy(wchar_t *restrict ws1, const wchar_t *restrict ws2,
size_t n);
```

DESCRIPTION

The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The `wmemcpy()` function shall copy `n` wide characters from the object pointed to by `ws2` to the object pointed to by `ws1`. This function shall not be affected by locale and all `wchar_t` values shall be treated identically. The null wide character and `wchar_t` values not corresponding to valid characters shall not be treated specially.

If `n` is zero, the application shall ensure that `ws1` and `ws2` are valid pointers, and the function shall copy zero wide characters.

RETURN VALUE

The `wmemcpy()` function shall return the value of `ws1`.

ERRORS

No errors are defined.

NAME
wmemmove — copy wide characters in memory with overlapping areas

SYNOPSIS
#include <wchar.h>

wchar_t *wmemmove(wchar_t *ws1, const wchar_t *ws2, size_t n);

DESCRIPTION
The functionality described on this reference page is aligned with the ISO C standard. Any conflict between the requirements described here and the ISO C standard is unintentional. This volume of IEEE Std 1003.1-2001 defers to the ISO C standard.

The wmemmove() function shall copy \( n \) wide characters from the object pointed to by \( ws2 \) to the object pointed to by \( ws1 \). Copying shall take place as if the \( n \) wide characters from the object pointed to by \( ws2 \) are first copied into a temporary array of \( n \) wide characters that does not overlap the objects pointed to by \( ws1 \) or \( ws2 \), and then the \( n \) wide characters from the temporary array are copied into the object pointed to by \( ws1 \).

This function shall not be affected by locale and all wchar_t values shall be treated identically. The null wide character and wchar_t values not corresponding to valid characters shall not be treated specially.

If \( n \) is zero, the application shall ensure that \( ws1 \) and \( ws2 \) are valid pointers, and the function shall copy zero wide characters.

RETURN VALUE
The wmemmove() function shall return the value of \( ws1 \).

ERRORS
No errors are defined

Issue 6
The DESCRIPTION is updated to avoid use of the term “must” for application requirements.
NAME
wordexp, wordfree — perform word expansions

SYNOPSIS

```c
#include <wordexp.h>

int wordexp(const char *restrict words, wordexp_t *restrict pwordexp,
             int flags);
void wordfree(wordexp_t *pwordexp);
```

DESCRIPTION

The `wordexp()` function shall perform word expansions as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions, subject to quoting as in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.2, Quoting, and place the list of expanded words into the structure pointed to by `pwordexp`.

The `words` argument is a pointer to a string containing one or more words to be expanded. The expansions shall be the same as would be performed by the command line interpreter if `words` were the part of a command line representing the arguments to a utility. Therefore, the application shall ensure that `words` does not contain an unquoted `<newline>` or any of the unquoted shell special characters `|`, `&`, `;`, `<`, `>`, except in the context of command substitution as specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.3, Command Substitution. It also shall not contain unquoted parentheses or braces, except in the context of command or variable substitution. The application shall ensure that every member of `words` which it expects to have expanded by `wordexp()` does not contain an unquoted initial comment character. The application shall also ensure that any words which it intends to be ignored (because they begin or continue a comment) are deleted from `words`. If the argument `words` contains an unquoted comment character (number sign) that is the beginning of a token, `wordexp()` shall either treat the comment character as a regular character, or interpret it as a comment indicator and ignore the remainder of `words`.

The structure type `wordexp_t` is defined in the `<wordexp.h>` header and includes at least the following members:

<table>
<thead>
<tr>
<th>Member Type</th>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>size_t</code></td>
<td><code>we_wordc</code></td>
<td>Count of words matched by <code>words</code>.</td>
</tr>
<tr>
<td><code>char **</code></td>
<td><code>we_wordv</code></td>
<td>Pointer to list of expanded words.</td>
</tr>
<tr>
<td><code>size_t</code></td>
<td><code>we_offs</code></td>
<td>Slots to reserve at the beginning of <code>pwordexp-&gt;we_wordv</code>.</td>
</tr>
</tbody>
</table>

The `wordexp()` function shall store the number of generated words into `pwordexp->we_wordc` and a pointer to a list of pointers to words in `pwordexp->we_wordv`. Each individual field created during field splitting (see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.5, Field Splitting) or pathname expansion (see the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.6, Pathname Expansion) shall be a separate word in the `pwordexp->we_wordv` list. The words shall be in order as described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6, Word Expansions. The first pointer after the last word pointer shall be a null pointer. The expansion of special parameters described in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.5.2, Special Parameters is unspecified.

It is the caller's responsibility to allocate the storage pointed to by `pwordexp`. The `wordexp()` function shall allocate other space as needed, including memory pointed to by `pwordexp->we_wordv`. The `wordfree()` function frees any memory associated with `pwordexp` from a previous call to `wordexp()`.
The `flags` argument is used to control the behavior of `wordexp()`. The value of `flags` is the bitwise-inclusive OR of zero or more of the following constants, which are defined in `<wordexp.h>`:

- **WRDE_APPEND**: Append words generated to the ones from a previous call to `wordexp()`.
- **WRDE_DOOFFS**: Make use of `pwordexp->we_offs`. If this flag is set, `pwordexp->we_offs` is used to specify how many null pointers to add to the beginning of `pwordexp->we_wordv`. In other words, `pwordexp->we_wordv` shall point to `pwordexp->we_offs` null pointers, followed by `pwordexp->we_wordc` word pointers, followed by a null pointer.
- **WRDE_NOCMD**: If the implementation supports the utilities defined in the Shell and Utilities volume of IEEE Std 1003.1-2001, fail if command substitution, as specified in the Shell and Utilities volume of IEEE Std 1003.1-2001, Section 2.6.3, Command Substitution, is requested.
- **WRDE_REUSE**: The `pwordexp` argument was passed to a previous successful call to `wordexp()`, and has not been passed to `wordfree()`. The result shall be the same as if the application had called `wordfree()` and then called `wordexp()` without `WRDE_REUSE`.
- **WRDE_SHOWERR**: Do not redirect `stderr` to `/dev/null`.
- **WRDE_UNDEF**: Report error on an attempt to expand an undefined shell variable.
- **WRDE_APPEND** flag can be used to append a new set of words to those generated by a previous call to `wordexp()`. The following rules apply to applications when two or more calls to `wordexp()` are made with the same value of `pwordexp` and without intervening calls to `wordfree()`:
  1. The first such call shall not set WRDE_APPEND. All subsequent calls shall set it.
  2. All of the calls shall set WRDE_DOFFS, or all shall not set it.
  3. After the second and each subsequent call, `pwordexp->we_wordv` shall point to a list containing the following:
     a. Zero or more null pointers, as specified by WRDE_DOFFS and `pwordexp->we_offs`
     b. Pointers to the words that were in the `pwordexp->we_wordv` list before the call, in the same order as before
     c. Pointers to the new words generated by the latest call, in the specified order
  4. The count returned in `pwordexp->we_wordc` shall be the total number of words from all of the calls.
  5. The application can change any of the fields after a call to `wordexp()`, but if it does it shall reset them to the original value before a subsequent call, using the same `pwordexp` value, to `wordfree()` or `wordexp()` with the WRDE_APPEND or WRDE_REUSE flag.

If the implementation supports the utilities defined in the Shell and Utilities volume of IEEE Std 1003.1-2001, and `words` contains an unquoted character—`
`, `'`, `&`, `;`, `<`, `>`, `(`, `)`—in an inappropriate context, `wordexp()` shall fail, and the number of expanded words shall be 0.

Unless WRDE_SHOWERR is set in `flags`, `wordexp()` shall redirect `stderr` to `/dev/null` for any utilities executed as a result of command substitution while expanding `words`. If WRDE_SHOWERR is set, `wordexp()` may write messages to `stderr` if syntax errors are detected while expanding `words`. 

---

1652 System Interfaces, Issue 6 — Copyright © 2001-2003, IEEE and The Open Group. All rights reserved.
The application shall ensure that if WRDE_DOFFS is set, then *pwordexp->we_offs* has the same value for each *wordexp()* call and *wordfree()* call using a given *pwordexp*.

The following constants are defined as error return values:

- **WRDE_BADCHAR**: One of the unquoted characters—newline, ‘|’, ‘&’, ‘;’, ‘<’, ‘>’, ‘(‘, ‘)’, ‘{‘, ‘}’—appears in *words* in an inappropriate context.
- **WRDE_BADVAL**: Reference to undefined shell variable when WRDE_UNDEF is set in *flags*.
- **WRDE_CMDSUB**: Command substitution requested when WRDE_NOCMD was set in *flags*.
- **WRDE_NOSPACE**: Attempt to allocate memory failed.
- **WRDE_SYNTAX**: Shell syntax error, such as unbalanced parentheses or unterminated string.

**RETURN VALUE**

Upon successful completion, *wordexp()* shall return 0. Otherwise, a non-zero value, as described in *<wordexp.h>* shall be returned to indicate an error. If *wordexp()* returns the value ***WRDE_NOSPACE***, then *pwordexp->we_wordc* and *pwordexp->we_wordv* shall be updated to reflect any words that were successfully expanded. In other cases, they shall not be modified.

The *wordfree()* function shall not return a value.

**ERRORS**

No errors are defined.

**EXAMPLES**

None.

**APPLICATION USAGE**

The *wordexp()* function is intended to be used by an application that wants to do all of the shell’s expansions on a word or words obtained from a user. For example, if the application prompts for a filename (or list of filenames) and then uses *wordexp()* to process the input, the user could respond with anything that would be valid as input to the shell.

The WRDE_NOCMD flag is provided for applications that, for security or other reasons, want to prevent a user from executing shell commands. Disallowing unquoted shell special characters also prevents unwanted side effects, such as executing a command or writing a file.

**RATIONALE**

This function was included as an alternative to *glob()* function. There had been continuing controversy over exactly what features should be included in *glob()* function. It is hoped that by providing *wordexp()* (which provides all of the shell word expansions, but which may be slow to execute) and *glob()* (which is faster, but which only performs pathname expansion, without tilde or parameter expansion) this will satisfy the majority of applications.

While *wordexp()* could be implemented entirely as a library routine, it is expected that most implementations run a shell in a subprocess to do the expansion.

Two different approaches have been proposed for how the required information might be presented to the shell and the results returned. They are presented here as examples.

One proposal is to extend the *echo* utility by adding a −q option. This option would cause *echo* to add a backslash before each backslash and <blank> that occurs within an argument. The *wordexp()* function could then invoke the shell as follows:

```c
(void) strcpy(buffer, "echo -q");
(void) strcat(buffer, words);
if ((flags & WRDE_SHOWERR) == 0)
```

Copyright © 2001-2003, IEEE and The Open Group. All rights reserved.
The `wordexp()` function would read the resulting output, remove unquoted backslashes, and break into words at unquoted <blank>s. If the WRDE_NOCMD flag was set, `wordexp()` would have to scan `words` before starting the subshell to make sure that there would be no command substitution. In any case, it would have to scan `words` for unquoted special characters.

Another proposal is to add the following options to `sh`:

```
-w wordlist
```

This option provides a wordlist expansion service to applications. The words in `wordlist` shall be expanded and the following written to standard output:

1. The count of the number of words after expansion, in decimal, followed by a null byte
2. The number of bytes needed to represent the expanded words (not including null separators), in decimal, followed by a null byte
3. The expanded words, each terminated by a null byte

If an error is encountered during word expansion, `sh` exits with a non-zero status after writing the former to report any words successfully expanded.

```
-P
```

Run in “protected” mode. If specified with the `-w` option, no command substitution shall be performed.

With these options, `wordexp()` could be implemented fairly simply by creating a subprocess using `fork()` and executing `sh` using the line:

```
execl(<shell path>, "sh", "-P", "-w", words, (char *)0);
```

after directing standard error to `/dev/null`.

It seemed objectionable for a library routine to write messages to standard error, unless explicitly requested, so `wordexp()` is required to redirect standard error to `/dev/null` to ensure that no messages are generated, even for commands executed for command substitution. The WRDE_SHOWERR flag can be specified to request that error messages be written.

The WRDE_REUSE flag allows the implementation to avoid the expense of freeing and reallocating memory, if that is possible. A minimal implementation can call `wordfree()` when WRDE_REUSE is set.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

Issue 5

Moved from POSIX2 C-language Binding to BASE.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The `restrict` keyword is added to the `wordexp()` prototype for alignment with the ISO/IEC 9899:1999 standard.
wprintf()  

NAME
wprintf — print formatted wide-character output

SYNOPSIS
#include <stdio.h>
#include <wchar.h>

int wprintf(const wchar_t *restrict format, ...);

DESCRIPTION
Refer to fwprintf().
Write

System Interfaces

NAME
pwrite, write — write on a file

SYNOPSIS
#include <unistd.h>

XSI
ssize_t pwrite(int fildes, const void *buf, size_t nbyte, 
  off_t offset);

XSI
ssize_t write(int fildes, const void *buf, size_t nbyte);

DESCRIPTION
The write() function shall attempt to write nbyte bytes from the buffer pointed to by buf to the file associated with the open file descriptor, fildes.

Before any action described below is taken, and if nbyte is zero and the file is a regular file, the write() function may detect and return errors as described below. In the absence of errors, or if error detection is not performed, the write() function shall return zero and have no other results.

If nbyte is zero and the file is not a regular file, the results are unspecified.

On a regular file or other file capable of seeking, the actual writing of data shall proceed from the position in the file indicated by the file offset associated with fildes. Before successful return from write(), the file offset shall be incremented by the number of bytes actually written. On a regular file, if this incremented file offset is greater than the length of the file, the length of the file shall be set to this file offset.

On a file not capable of seeking, writing shall always take place starting at the current position. The value of a file offset associated with such a device is undefined.

If the O_APPEND flag of the file status flags is set, the file offset shall be set to the end of the file prior to each write and no intervening file modification operation shall occur between changing the file offset and the write operation.

If a write() requests that more bytes be written than there is room for (for example, the process’ file size limit or the physical end of a medium), only as many bytes as there is room for shall be written. For example, suppose there is space for 20 bytes more in a file before reaching a limit. A write of 512 bytes will return 20. The next write of a non-zero number of bytes would give a failure return (except as noted below).

XSI
If the request would cause the file size to exceed the soft file size limit for the process and there is no room for any bytes to be written, the request shall fail and the implementation shall generate the SIGXFSZ signal for the thread.

If write() is interrupted by a signal before it writes any data, it shall return −1 with errno set to [EINTR].

If write() is interrupted by a signal after it successfully writes some data, it shall return the number of bytes written.

If the value of nbyte is greater than {SSIZE_MAX}, the result is implementation-defined.

After a write() to a regular file has successfully returned:

• Any successful read() from each byte position in the file that was modified by that write shall return the data specified by the write() for that position until such byte positions are again modified.

• Any subsequent successful write() to the same byte position in the file shall overwrite that file data.
Write requests to a pipe or FIFO shall be handled in the same way as a regular file with the following exceptions:

- There is no file offset associated with a pipe, hence each write request shall append to the end of the pipe.
- Write requests of \(\text{PIPE_BUF}\) bytes or less shall not be interleaved with data from other processes doing writes on the same pipe. Writes of greater than \(\text{PIPE_BUF}\) bytes may have data interleaved, on arbitrary boundaries, with writes by other processes, whether or not the O_NONBLOCK flag of the file status flags is set.
- If the O_NONBLOCK flag is clear, a write request may cause the thread to block, but on normal completion it shall return \(nbyte\).
- If the O_NONBLOCK flag is set, write() requests shall be handled differently, in the following ways:
  - The write() function shall not block the thread.
  - A write request for \(\text{PIPE_BUF}\) or fewer bytes shall have the following effect: if there is sufficient space available in the pipe, write() shall transfer all the data and return the number of bytes requested. Otherwise, write() shall transfer no data and return –1 with errno set to [EAGAIN].
  - A write request for more than \(\text{PIPE_BUF}\) bytes shall cause one of the following:
    - When at least one byte can be written, transfer what it can and return the number of bytes written. When all data previously written to the pipe is read, it shall transfer at least \(\text{PIPE_BUF}\) bytes.
    - When no data can be written, transfer no data, and return –1 with errno set to [EAGAIN].

When attempting to write to a file descriptor (other than a pipe or FIFO) that supports non-blocking writes and cannot accept the data immediately:

- If the O_NONBLOCK flag is clear, write() shall block the calling thread until the data can be accepted.
- If the O_NONBLOCK flag is set, write() shall not block the thread. If some data can be written without blocking the thread, write() shall write what it can and return the number of bytes written. Otherwise, it shall return –1 and set errno to [EAGAIN].

Upon successful completion, where \(nbyte\) is greater than 0, write() shall mark for update the \(\text{st_ctime}\) and \(\text{st_mtime}\) fields of the file, and if the file is a regular file, the S_ISUID and S_ISGID bits of the file mode may be cleared.

For regular files, no data transfer shall occur past the offset maximum established in the open file description associated with \(\text{fildes}\).

If \(\text{fildes}\) refers to a socket, write() shall be equivalent to send() with no flags set.

- If the O_DSYNC bit has been set, write I/O operations on the file descriptor shall complete as defined by synchronized I/O data integrity completion.
- If the O_SYNC bit has been set, write I/O operations on the file descriptor shall complete as defined by synchronized I/O file integrity completion.

If \(\text{fildes}\) refers to a shared memory object, the result of the write() function is unspecified.

If \(\text{fildes}\) refers to a typed memory object, the result of the write() function is unspecified.
If `fildes` refers to a STREAM, the operation of `write()` shall be determined by the values of the minimum and maximum `nbyte` range (packet size) accepted by the STREAM. These values are determined by the topmost STREAM module. If `nbyte` falls within the packet size range, `nbyte` bytes shall be written. If `nbyte` does not fall within the range and the minimum packet size value is 0, `write()` shall break the buffer into maximum packet size segments prior to sending the data downstream (the last segment may contain less than the maximum packet size). If `nbyte` does not fall within the range and the minimum value is non-zero, `write()` shall fail with `errno` set to [ERANGE]. Writing a zero-length buffer (`nbyte` is 0) to a STREAMS device sends 0 bytes with 0 returned. However, writing a zero-length buffer to a STREAMS-based pipe or FIFO sends no message and 0 is returned. The process may issue `I_SWROPT ioctl()` to enable zero-length messages to be sent across the pipe or FIFO.

When writing to a STREAM, data messages are created with a priority band of 0. When writing to a STREAM that is not a pipe or FIFO:

- If `O_NONBLOCK` is clear, and the STREAM cannot accept data (the STREAM write queue is full due to internal flow control conditions), `write()` shall block until data can be accepted.
- If `O_NONBLOCK` is set and the STREAM cannot accept data, `write()` shall return −1 and set `errno` to [EAGAIN].
- If `O_NONBLOCK` is set and part of the buffer has been written while a condition in which the STREAM cannot accept additional data occurs, `write()` shall terminate and return the number of bytes written.

In addition, `write()` shall fail if the STREAM head has processed an asynchronous error before the call. In this case, the value of `errno` does not reflect the result of `write()`, but reflects the prior error.

The `pwrite()` function shall be equivalent to `write()`, except that it writes into a given position without changing the file pointer. The first three arguments to `pwrite()` are the same as `write()` with the addition of a fourth argument offset for the desired position inside the file.

Upon successful completion, `write()` and `pwrite()` shall return the number of bytes actually written to the file associated with `fildes`. This number shall never be greater than `nbyte`. Otherwise, −1 shall be returned and `errno` set to indicate the error.

The `write()` and `pwrite()` functions shall fail if:

- [EAGAIN] The `O_NONBLOCK` flag is set for the file descriptor and the thread would be delayed in the `write()` operation.
- [EBADF] The `fildes` argument is not a valid file descriptor open for writing.
- [EFBIG] An attempt was made to write a file that exceeds the implementation-defined maximum file size or the process’ file size limit, and there was no room for any bytes to be written.
- [EFBIG] The file is a regular file, `nbyte` is greater than 0, and the starting position is greater than or equal to the offset maximum established in the open file description associated with `fildes`.
- [EINVAL] The write operation was terminated due to the receipt of a signal, and no data was transferred.
- [EIO] The process is a member of a background process group attempting to write to its controlling terminal, TOSTOP is set, the process is neither ignoring nor
The `write()` function shall fail if:

- `[ENOSPC]` There was no free space remaining on the device containing the file.
- `[EPIPE]` An attempt is made to write to a pipe or FIFO that is not open for reading by any process, or that only has one end open. A SIGPIPE signal shall also be sent to the thread.
- `[ERANGE]` The transfer request size was outside the range supported by the STREAMS file associated with `fildes`.
- `[EAGAIN]` or `[EWOULDBLOCK]` The file descriptor is for a socket, is marked O_NONBLOCK, and write would block.
- `[ECONNRESET]` A write was attempted on a socket that is not connected.
- `[EPIPE]` A write was attempted on a socket that is shut down for writing, or is no longer connected. In the latter case, if the socket is of type SOCK_STREAM, the SIGPIPE signal is generated to the calling process.
- `[EINVAL]` The STREAM or multiplexer referenced by `fildes` is linked (directly or indirectly) downstream from a multiplexer.
- `[EIO]` A physical I/O error has occurred.
- `[ENOBUFFS]` Insufficient resources were available in the system to perform the operation.
- `[ENXIO]` A request was made of a nonexistent device, or the request was outside the capabilities of the device.
- `[ENXIO]` A hangup occurred on the STREAM being written to.
- `[EACCES]` A write was attempted on a socket and the calling process does not have appropriate privileges.
- `[ENETDOWN]` A write was attempted on a socket and the local network interface used to reach the destination is down.
- `[ENETUNREACH]` A write was attempted on a socket and no route to the network is present.

The `write()` function may fail if:

- `[EINVAL]` The `offset` argument is invalid. The value is negative.
- `[ESPIPE]` `fildes` is associated with a pipe or FIFO.
EXAMPLES

Writing from a Buffer

The following example writes data from the buffer pointed to by buf to the file associated with the file descriptor fd.

```c
#include <sys/types.h>
#include <string.h>
...
char buf[20];
size_t nbytes;
ssize_t bytes_written;
int fd;
...
strcpy(buf, "This is a test\n");
nbytes = strlen(buf);
bytes_written = write(fd, buf, nbytes);
...
```

APPLICATION USAGE

None.

RATIONALE

See also the RATIONALE section in read().

An attempt to write to a pipe or FIFO has several major characteristics:

- Atomic/non-atomic: A write is atomic if the whole amount written in one operation is not interleaved with data from any other process. This is useful when there are multiple writers sending data to a single reader. Applications need to know how large a write request can be expected to be performed atomically. This maximum is called |PIPE_BUF|. This volume of IEEE Std 1003.1-2001 does not say whether write requests for more than |PIPE_BUF| bytes are atomic, but requires that writes of |PIPE_BUF| or fewer bytes shall be atomic.

- Blocking/immediate: Blocking is only possible with O_NONBLOCK clear. If there is enough space for all the data requested to be written immediately, the implementation should do so. Otherwise, the process may block; that is, pause until enough space is available for writing. The effective size of a pipe or FIFO (the maximum amount that can be written in one operation without blocking) may vary dynamically, depending on the implementation, so it is not possible to specify a fixed value for it.

- Complete/partial/deferred: A write request:

  ```c
  int fildes;
  size_t nbyte;
  ssize_t ret;
  char *buf;
  ret = write(fildes, buf, nbyte);
  may return:
  Complete  ret=nbyte
  Partial  ret<nbyte
  ```

  This shall never happen if nbyte≤|PIPE_BUF|. If it does happen (with nbyte>|PIPE_BUF|), this volume of IEEE Std 1003.1-2001 does not guarantee
atomicity, even if \( ret \leq \{ \text{PIPE_BUF} \} \), because atomicity is guaranteed according to the amount requested, not the amount written.

Deferred: \( ret = -1, \text{errno} = \text{[EAGAIN]} \)

This error indicates that a later request may succeed. It does not indicate that it shall succeed, even if \( nbyte \leq \{ \text{PIPE_BUF} \} \), because if no process reads from the pipe or FIFO, the write never succeeds. An application could usefully count the number of times \text{[EAGAIN]} is caused by a particular value of \( nbyte > \{ \text{PIPE_BUF} \} \) and perhaps do later writes with a smaller value, on the assumption that the effective size of the pipe may have decreased.

Partial and deferred writes are only possible with O_NONBLOCK set.

The relations of these properties are shown in the following tables:

<table>
<thead>
<tr>
<th>Write to a Pipe or FIFO with O_NONBLOCK clear</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately Writable:</td>
</tr>
<tr>
<td>( nbyte \leq { \text{PIPE_BUF} } )</td>
</tr>
<tr>
<td>( nbyte &gt; { \text{PIPE_BUF} } )</td>
</tr>
</tbody>
</table>

If the O_NONBLOCK flag is clear, a write request shall block if the amount writable immediately is less than that requested. If the flag is set (by \text{fcntl}()), a write request shall never block.

<table>
<thead>
<tr>
<th>Write to a Pipe or FIFO with O_NONBLOCK set</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately Writable:</td>
</tr>
<tr>
<td>( nbyte \leq { \text{PIPE_BUF} } )</td>
</tr>
<tr>
<td>( nbyte &gt; { \text{PIPE_BUF} } )</td>
</tr>
</tbody>
</table>

There is no exception regarding partial writes when O_NONBLOCK is set. With the exception of writing to an empty pipe, this volume of IEEE Std 1003.1-2001 does not specify exactly when a partial write is performed since that would require specifying internal details of the implementation. Every application should be prepared to handle partial writes when O_NONBLOCK is set and the requested amount is greater than \{ PIPE_BUF \}, just as every application should be prepared to handle partial writes on other kinds of file descriptors.

The intent of forcing writing at least one byte if any can be written is to assure that each write makes progress if there is any room in the pipe. If the pipe is empty, \{ PIPE_BUF \} bytes must be written; if not, at least some progress must have been made.

Where this volume of IEEE Std 1003.1-2001 requires \(-1\) to be returned and \text{errno} set to \text{[EAGAIN]}, most historical implementations return zero (with the O_NDELAY flag set, which is the historical predecessor of O_NONBLOCK, but is not itself in this volume of IEEE Std 1003.1-2001). The error indications in this volume of IEEE Std 1003.1-2001 were chosen so that an application can distinguish these cases from end-of-file. While \text{write()} cannot receive an indication of end-of-file, \text{read()} can, and the two functions have similar return values. Also, some existing systems (for example, Eighth Edition) permit a write of zero bytes to mean that the reader should get an end-of-file indication; for those systems, a return value of zero from \text{write()} indicates a successful write of an end-of-file indication.
Implementations are allowed, but not required, to perform error checking for `write()` requests of zero bytes.

The concept of a `{PIPE_MAX}` limit (indicating the maximum number of bytes that can be written to a pipe in a single operation) was considered, but rejected, because this concept would unnecessarily limit application writing.

See also the discussion of `O_NONBLOCK` in `read()`.

Writes can be serialized with respect to other reads and writes. If a `read()` of file data can be proven (by any means) to occur after a `write()` of the data, it must reflect that `write()`, even if the calls are made by different processes. A similar requirement applies to multiple write operations to the same file position. This is needed to guarantee the propagation of data from `write()` calls to subsequent `read()` calls. This requirement is particularly significant for networked file systems, where some caching schemes violate these semantics.

Note that this is specified in terms of `read()` and `write()`. The XSI extensions `readv()` and `writev()` also obey these semantics. A new “high-performance” write analog that did not follow these serialization requirements would also be permitted by this wording. This volume of IEEE Std 1003.1-2001 is also silent about any effects of application-level caching (such as that done by `stdio`).

This volume of IEEE Std 1003.1-2001 does not specify the value of the file offset after an error is returned; there are too many cases. For programming errors, such as `[EBADF]`, the concept is meaningless since no file is involved. For errors that are detected immediately, such as `[EAGAIN]`, clearly the pointer should not change. After an interrupt or hardware error, however, an updated value would be very useful and is the behavior of many implementations.

This volume of IEEE Std 1003.1-2001 does not specify behavior of concurrent writes to a file from multiple processes. Applications should use some form of concurrency control.

**FUTURE DIRECTIONS**

None.

`chmod()`, `creat()`, `dup()`, `fcntl()`, `getrlimit()`, `lseek()`, `open()`, `pipe()`, `ulimit()`, `writev()`, the Base Definitions volume of IEEE Std 1003.1-2001, `<limits.h>`, `<stropts.h>`, `<sys/uio.h>`, `<unistd.h>`

**CHANGE HISTORY**

First released in Issue 1. Derived from Issue 1 of the SVID.

**Issue 5**

The DESCRIPTION is updated for alignment with the POSIX Realtime Extension and the POSIX Threads Extension.

Large File Summit extensions are added.

The `pwrite()` function is added.

**Issue 6**

The DESCRIPTION states that the `write()` function does not block the thread. Previously this said “process” rather than “thread”.

The DESCRIPTION and ERRORS sections are updated so that references to STREAMS are marked as part of the XSI STREAMS Option Group.

The following new requirements on POSIX implementations derive from alignment with the Single UNIX Specification:
• The DESCRIPTION now states that if \texttt{write()} is interrupted by a signal after it has successfully written some data, it returns the number of bytes written. In the POSIX.1-1988 standard, it was optional whether \texttt{write()} returned the number of bytes written, or whether it returned \texttt{-1} with 	exttt{errno} set to \texttt{[EINTR]}. This is a FIPS requirement.

• The following changes are made to support large files:
  — For regular files, no data transfer occurs past the offset maximum established in the open file description associated with the \texttt{fildes}.
  — A second \texttt{[EFBIG]} error condition is added.

• The \texttt{[EIO]} error condition is added.

• The \texttt{[EPIPE]} error condition is added for when a pipe has only one end open.

• The \texttt{[ENXIO]} optional error condition is added.

Text referring to sockets is added to the DESCRIPTION.

The following changes were made to align with the IEEE P1003.1a draft standard:

• The effect of reading zero bytes is clarified.

The DESCRIPTION is updated for alignment with IEEE Std 1003.1j-2000 by specifying that \texttt{write()} results are unspecified for typed memory objects.

The following error conditions are added for operations on sockets: \texttt{[EAGAIN]}, \texttt{[EWOULDBLOCK]}, \texttt{[ECONNRESET]}, \texttt{[ENOTCONN]}, and \texttt{[EPIPE]}.

The \texttt{[EIO]} error is changed to “\texttt{may fail}”.

The \texttt{[ENOBUFFS]} error is added for sockets.

The following error conditions are added for operations on sockets: \texttt{[EACCES]}, \texttt{[ENETDOWN]}, and \texttt{[ENETUNREACH]}.

The \texttt{writev()} function is split out into a separate reference page.
writev()

NAME
writev — write a vector

SYNOPSIS
XSI
#include <sys/uio.h>
ssize_t writev(int fildes, const struct iovec *iov, int iovcnt);

DESCRIPTION
The writev() function shall be equivalent to write(), except as described below. The writev()
function shall gather output data from the iovcnt buffers specified by the members of the iov
array: iov[0], iov[1], ..., iov[iovcnt-1]. The iovcnt argument is valid if greater than 0 and less than
or equal to {IOV_MAX}, as defined in <limits.h>.

Each iovec entry specifies the base address and length of an area in memory from which data
should be written. The writev() function shall always write a complete area before proceeding to
the next.

If fildes refers to a regular file and all of the iov_len members in the array pointed to by iov are 0,
writev() shall return 0 and have no other effect. For other file types, the behavior is unspecified.

If the sum of the iov_len values is greater than {SSIZE_MAX}, the operation shall fail and no data
shall be transferred.

RETURN VALUE
Upon successful completion, writev() shall return the number of bytes actually written.
Otherwise, it shall return a value of −1, the file-pointer shall remain unchanged, and errno shall
be set to indicate an error.

ERRORS
Refer to write().

In addition, the writev() function shall fail if:

[EINVAL] The sum of the iov_len values in the iov array would overflow an ssize_t.

The writev() function may fail and set errno to:

[EINVAL] The iovcnt argument was less than or equal to 0, or greater than [IOV_MAX].

EXAMPLES
Writing Data from an Array
The following example writes data from the buffers specified by members of the iov array to the
file associated with the file descriptor fd.

#include <sys/types.h>
#include <sys/uio.h>
#include <unistd.h>
...
ssize_t bytes_written;
int fd;
char *buf0 = "short string\n";
char *buf1 = "This is a longer string\n";
char *buf2 = "This is the longest string in this example\n";
int iovcnt;
struct iovec iov[3];
System Interfaces

writev()

51391    iov[0].iov_base = buf0;
51392    iov[0].iov_len = strlen(buf0);
51393    iov[1].iov_base = buf1;
51394    iov[1].iov_len = strlen(buf1);
51395    iov[2].iov_base = buf2;
51396    iov[2].iov_len = strlen(buf2);
51397    ...
51398    iovcnt = sizeof(iov) / sizeof(struct iovec);
51399    bytes_written = writev(fd, iov, iovcnt);
51400    ...

51401 APPLICATION USAGE
51402 None.

51409 CHANGE HISTORY
51410 First released in Issue 4, Version 2.
51411 Issue 6
51412 Split out from the write() reference page.
NAME
wscanf — convert formatted wide-character input

SYNOPSIS
#include <stdio.h>
#include <wchar.h>

int wscanf(const wchar_t *restrict format, ...);

DESCRIPTION
Refer to fwscanf().
NAME
y0, y1, yn — Bessel functions of the second kind

SYNOPSIS
#include <math.h>

double y0(double x);
double y1(double x);
double yn(int n, double x);

DESCRIPTION
The y0(), y1(), and yn() functions shall compute Bessel functions of x of the second kind of orders 0, 1, and n, respectively.

An application wishing to check for error situations should set errno to zero and call feclearexcept(FE_ALL_EXCEPT) before calling these functions. On return, if errno is non-zero or fetestexcept(FE_INVALID | FE_DIVBYZERO | FE_OVERFLOW | FE_UNDERFLOW) is non-zero, an error has occurred.

RETURN VALUE
Upon successful completion, these functions shall return the relevant Bessel value of x of the second kind.

If x is NaN, NaN shall be returned.

If the x argument to these functions is negative, −HUGE_VAL or NaN shall be returned, and a domain error may occur.

If x is 0.0, −HUGE_VAL shall be returned and a range error may occur.

If the correct result would cause underflow, 0.0 shall be returned and a range error may occur.

If the correct result would cause overflow, −HUGE_VAL or 0.0 shall be returned and a range error may occur.

ERRORS
These functions may fail if:

Domain Error The value of x is negative.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [EDOM]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the invalid floating-point exception shall be raised.

Range Error The value of x is 0.0, or the correct result would cause overflow.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the overflow floating-point exception shall be raised.

Range Error The value of x is too large in magnitude, or the correct result would cause underflow.

If the integer expression (math_errhandling & MATH_ERRNO) is non-zero, then errno shall be set to [ERANGE]. If the integer expression (math_errhandling & MATH_ERREXCEPT) is non-zero, then the underflow floating-point exception shall be raised.
EXAMPLES

None.

APPLICATION USAGE

On error, the expressions (math_errhandling & MATH_ERRNO) and (math_errhandling & MATH_ERREXCEPT) are independent of each other, but at least one of them must be non-zero.

RATIONALE

None.

FUTURE DIRECTIONS

None.

CHANGE HISTORY

First released in Issue 1. Derived from Issue 1 of the SVID.

Issue 5

The DESCRIPTION is updated to indicate how an application should check for an error. This text was previously published in the APPLICATION USAGE section.

Issue 6

The DESCRIPTION is updated to avoid use of the term “must” for application requirements.

The RETURN VALUE and ERRORS sections are reworked for alignment of the error handling with the ISO/IEC 9899: 1999 standard.

Information Technology —
Portable Operating System Interface (POSIX®)

Shell and Utilities

Sponsor

Portable Applications Standards Committee
of the
IEEE Computer Society

and

The Open Group
Abstract

This standard defines a standard operating system interface and environment, including a command interpreter (or “shell”), and common utility programs to support applications portability at the source code level. This standard is intended to be used by both applications developers and system implementors and comprises four major components (each in an associated volume):

• General terms, concepts, and interfaces common to all volumes of this standard, including utility conventions and C-language header definitions, are included in the Base Definitions volume.
• Definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery, are included in the System Interfaces volume.
• Definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs are included in the Shell and Utilities volume.
• Extended rationale that did not fit well into the rest of the document structure, which contains historical information concerning the contents of this standard and why features were included or discarded by the standard developers, is included in the Rationale (Informative) volume.

The following areas are outside the scope of this standard:

• Graphics interfaces
• Database management system interfaces
• Record I/O considerations
• Object or binary code portability
• System configuration and resource availability

This standard describes the external characteristics and facilities that are of importance to applications developers, rather than the internal construction techniques employed to achieve these capabilities. Special emphasis is placed on those functions and facilities that are needed in a wide variety of commercial applications.

Keywords

terminology, application program interface (API), argument, asynchronous, basic regular expression (BRE), batch job, batch system, built-in utility, byte, child, command language interpreter, CPU, extended regular expression (ERE), FIFO, file access control mechanism, input/output (I/O), job control, network, portable operating system interface (POSIX®), parent, shell, stream, string, synchronous, system, thread, X/Open System Interface (XSI)
IEEE Standards documents are developed within the IEEE Societies and the Standards Coordinating Committees of the IEEE Standards Association (IEEE-SA) Standards Board. The IEEE develops its standards through a consensus development process, approved by the American National Standards Institute, which brings together volunteers representing varied viewpoints and interests to achieve the final product. Volunteers are not necessarily members of the Institute and serve without compensation. While the IEEE administers the process and establishes rules to promote fairness in the consensus development process, the IEEE does not independently evaluate, test, or verify the accuracy of any of the information contained in its standards.

Use of an IEEE Standard is wholly voluntary. The IEEE disclaims liability for any personal injury, property, or other damage, of any nature whatsoever, whether special, indirect, consequential, or compensatory, directly or indirectly resulting from the publication, use of, or reliance upon this, or any other IEEE Standard document.

The IEEE does not warrant or represent the accuracy or content of the material contained herein, and expressly disclaims any express or implied warranty, including any implied warranty of merchantability or fitness for a specific purpose, or that the use of the material contained herein is free from patent infringement. IEEE Standards documents are supplied "AS IS".

The existence of an IEEE Standard does not imply that there are no other ways to produce, test, measure, purchase, market, or provide other goods and services related to the scope of the IEEE Standard. Furthermore, the viewpoint expressed at the time a standard is approved and issued is subject to change brought about through developments in the state of the art and comments received from users of the standard. Every IEEE Standard is subjected to review at least every five years for revision or reaffirmation. When a document is more than five years old and has not been reaffirmed, it is reasonable to conclude that its contents, although still of some value, do not wholly reflect the present state of the art. Users are cautioned to check to determine that they have the latest edition of any IEEE Standard.

In publishing and making this document available, the IEEE is not suggesting or rendering professional or other services for, or on behalf of, any person or entity. Nor is the IEEE undertaking to perform any duty owed by any other person or entity to another. Any person utilizing this, and any other IEEE Standards document, should rely upon the advice of a competent professional in determining the exercise of reasonable care in any given circumstances.

Interpretations: Occasionally questions may arise regarding the meaning of portions of standards as they relate to specific applications. When the need for interpretations is brought to the attention of the IEEE, the Institute will initiate action to prepare appropriate responses. Since IEEE Standards represent a consensus of concerned interests, it is important to ensure that any interpretation has also received the concurrence of a balance of interests. For this reason, IEEE and the members of its societies and Standards Coordinating Committees are not able to provide an instant response to interpretation requests except in those cases where the matter has previously received formal consideration.

Comments for revision of IEEE Standards are welcome from any interested party, regardless of membership affiliation with the IEEE. Suggestions for changes in documents should be in the form of a proposed change of text, together with appropriate supporting comments. Comments on standards and requests for interpretations should be addressed to:

Secretary, IEEE-SA Standards Board, 445 Hoes Lane, P.O. Box 1331, Piscataway, NJ 08855-1331, U.S.A.

Attention is called to the possibility that implementation of this standard may require use of subject matter covered by patent rights. By publication of this standard, no position is taken with respect to the existence or validity of any patent rights in connection therewith. The IEEE shall not be responsible for identifying patents for which a license may be required by an IEEE Standard or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

A patent holder has filed a statement of assurance that it will grant licenses under these rights without compensation or under reasonable rates and non-discriminatory, reasonable terms and conditions to all applicants desiring to obtain such licenses. The IEEE makes no representation as to the reasonableness of rates and/or terms and conditions of the license agreements offered by patent holders. Further information may be obtained from the IEEE Standards Department.

Authorization to photocopy portions of any individual standard for internal or personal use is granted in the U.S. by the Institute of Electrical and Electronics Engineers, Inc., provided that the appropriate fee is paid to the Copyright Clearance Center. Permission to photocopy portions of any individual standard for educational classroom use can also be obtained through the Copyright Clearance Center. To arrange for payment of the licensing fee, please contact:

Copyright Clearance Center, Customer Service, 222 Rosewood Drive, Danvers, MA 01923, U.S.A., Tel.: +1 978 750 8400

Amendments, corrigenda, and interpretations for this standard, or information about the IEEE standards development process, may be found at http://standards.ieee.org.

Full catalog and ordering information on all IEEE publications is available from the IEEE Online Catalog & Store at http://shop.ieee.org/store.

1. For this standard, please send comments via the Austin Group as requested on page iii.

2. Please refer to the special provisions for this standard on page iii concerning permissions from both copyright holders and arrangements to cover photocopying and reproduction across the world, as well as by commercial organizations wishing to license the material for use in product documentation.
The Open Group

The Open Group, a vendor and technology-neutral consortium, is committed to delivering greater business efficiency by bringing together buyers and suppliers of information technology to lower the time, cost, and risks associated with integrating new technology across the enterprise.

The Open Group’s mission is to offer all organizations concerned with open information infrastructures a forum to share knowledge, integrate open initiatives, and certify approved products and processes in a manner in which they continue to trust our impartiality.

In the global eCommerce world of today, no single economic entity can achieve independence while still ensuring interoperability. The assurance that products will interoperate with each other across differing systems and platforms is essential to the success of eCommerce and business workflow. The Open Group, with its proven testing and certification program, is the international guarantor of interoperability in the new century.

The Open Group provides opportunities to exchange information and shape the future of IT. The Open Group’s members include some of the largest and most influential organizations in the world. The flexible structure of The Open Groups membership allows for almost any organization, no matter what their size, to join and have a voice in shaping the future of the IT world.

More information is available on The Open Group web site at http://www.opengroup.org.

The Open Group has over 15 years’ experience in developing and operating certification programs and has extensive experience developing and facilitating industry adoption of test suites used to validate conformance to an open standard or specification. The Open Group portfolio of test suites includes the Westwood family of tests for this standard and the associated certification program for Version 3 of the Single UNIX Specification, as well tests for CDE, CORBA, Motif, Linux, LDAP, POSIX.1, POSIX.2, POSIX Realtime, Sockets, UNIX, XPG4, XNFS, XTI, and X11. The Open Group test tools are essential for proper development and maintenance of standards-based products, ensuring conformance of products to industry-standard APIs, applications portability, and interoperability. In-depth testing identifies defects at the earliest possible point in the development cycle, saving costs in development and quality assurance.

More information is available at http://www.opengroup.org/testing.

The Open Group publishes a wide range of technical documentation, the main part of which is focused on development of Technical and Product Standards and Guides, but which also includes white papers, technical studies, branding and testing documentation, and business titles. Full details and a catalog are available at http://www.opengroup.org/pubs.

As with all live documents, Technical Standards and Specifications require revision to align with new developments and associated international standards. To distinguish between revised specifications which are fully backwards compatible and those which are not:

- A new Version indicates there is no change to the definitive information contained in the previous publication of that title, but additions/extensions are included. As such, it replaces the previous publication.
- A new Issue indicates there is substantive change to the definitive information contained in the previous publication of that title, and there may also be additions/extensions. As such, both previous and new documents are maintained as current publications.

Readers should note that Corrigenda may apply to any publication. Corrigenda information is published at http://www.opengroup.org/corrigenda.

Full catalog and ordering information on all Open Group publications is available at http://www.opengroup.org/pubs.

Foreword

Structure of the Standard

This standard was originally developed by the Austin Group, a joint working group of members of the IEEE, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1, as one of the four volumes of IEEE Std 1003.1-2001. The standard was approved by ISO and IEC and published in four parts, correlating to the original volumes.

A mapping of the parts to the volumes is shown below:

<table>
<thead>
<tr>
<th>ISO/IEC 9945 Part</th>
<th>IEEE Std 1003.1 Volume</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9945-1</td>
<td>Base Definitions</td>
<td>Includes general terms, concepts, and interfaces common to all parts of ISO/IEC 9945, including utility conventions and C-language header definitions.</td>
</tr>
<tr>
<td>9945-2</td>
<td>System Interfaces</td>
<td>Includes definitions for system service functions and subroutines, language-specific system services for the C programming language, function issues, including portability, error handling, and error recovery.</td>
</tr>
<tr>
<td>9945-3</td>
<td>Shell and Utilities</td>
<td>Includes definitions for a standard source code-level interface to command interpretation services (a “shell”) and common utility programs for application programs.</td>
</tr>
<tr>
<td>9945-4</td>
<td>Rationale</td>
<td>Includes extended rationale that did not fit well into the rest of the document structure, containing historical information concerning the contents of ISO/IEC 9945 and why features were included or discarded by the standard developers.</td>
</tr>
</tbody>
</table>

All four parts comprise the entire standard, and are intended to be used together to accommodate significant internal referencing among them. POSIX-conforming systems are required to support all four parts.
Introduction

Note: This introduction is not part of IEEE Std 1003.1-2001, Standard for Information Technology — Portable Operating System Interface (POSIX).

This standard has been jointly developed by the IEEE and The Open Group. It is simultaneously an IEEE Standard, an ISO/IEC Standard, and an Open Group Technical Standard.

The Austin Group

This standard was developed, and is maintained, by a joint working group of members of the IEEE Portable Applications Standards Committee, members of The Open Group, and members of ISO/IEC Joint Technical Committee 1. This joint working group is known as the Austin Group. The Austin Group arose out of discussions amongst the parties which started in early 1998, leading to an initial meeting and formation of the group in September 1998. The purpose of the Austin Group has been to revise, combine, and update the following standards: ISO/IEC 9945-1, ISO/IEC 9945-2, IEEE Std 1003.1, IEEE Std 1003.2, and the Base Specifications of The Open Group Single UNIX Specification.

After two initial meetings, an agreement was signed in July 1999 between The Open Group and the Institute of Electrical and Electronics Engineers (IEEE), Inc., to formalize the project with the first draft of the revised specifications being made available at the same time. Under this agreement, The Open Group and IEEE agreed to share joint copyright of the resulting work. The Open Group has provided the chair and secretariat for the Austin Group.

The base document for the revision was The Open Group’s Base volumes of its Single UNIX Specification, Version 2. These were selected since they were a superset of the existing POSIX.1 and POSIX.2 specifications and had some organizational aspects that would benefit the audience for the new revision.

The approach to specification development has been one of “write once, adopt everywhere”, with the deliverables being a set of specifications that carry the IEEE POSIX designation, The Open Group’s Technical Standard designation, and an ISO/IEC designation. This set of specifications forms the core of the Single UNIX Specification, Version 3.

This unique development has combined both the industry-led efforts and the formal standardization activities into a single initiative, and included a wide spectrum of participants. The Austin Group continues as the maintenance body for this document.

Anyone wishing to participate in the Austin Group should contact the chair with their request. There are no fees for participation or membership. You may participate as an observer or as a contributor. You do not have to attend face-to-face meetings to participate; electronic participation is most welcome. For more information on the Austin Group and how to participate, see http://www.opengroup.org/austin.

3. The Austin Group is named after the location of the inaugural meeting held at the IBM facility in Austin, Texas in September 1998.
Background

The developers of this standard represent a cross section of hardware manufacturers, vendors of operating systems and other software development tools, software designers, consultants, academics, authors, applications programmers, and others.

Conceptually, this standard describes a set of fundamental services needed for the efficient construction of application programs. Access to these services has been provided by defining an interface, using the C programming language, a command interpreter, and common utility programs that establish standard semantics and syntax. Since this interface enables application writers to write portable applications—it was developed with that goal in mind—it has been designated POSIX, an acronym for Portable Operating System Interface.

Although originated to refer to the original IEEE Std 1003.1-1988, the name POSIX more correctly refers to a family of related standards: IEEE Std 1003.n and the parts of ISO/IEC 9945. In earlier editions of the IEEE standard, the term POSIX was used as a synonym for IEEE Std 1003.1-1988. A preferred term, POSIX.1, emerged. This maintained the advantages of readability of the symbol “POSIX” without being ambiguous with the POSIX family of standards.

Audience

The intended audience for this standard is all persons concerned with an industry-wide standard operating system based on the UNIX system. This includes at least four groups of people:

1. Persons buying hardware and software systems
2. Persons managing companies that are deciding on future corporate computing directions
3. Persons implementing operating systems, and especially
4. Persons developing applications where portability is an objective

Purpose

Several principles guided the development of this standard:

• Application-Oriented

The basic goal was to promote portability of application programs across UNIX system environments by developing a clear, consistent, and unambiguous standard for the interface specification of a portable operating system based on the UNIX system documentation. This standard codifies the common, existing definition of the UNIX system.

• Interface, Not Implementation

This standard defines an interface, not an implementation. No distinction is made between library functions and system calls; both are referred to as functions. No details of the implementation of any function are given (although historical practice is sometimes indicated in the RATIONALE section). Symbolic names are given for constants (such as signals and error numbers) rather than numbers.

4. The name POSIX was suggested by Richard Stallman. It is expected to be pronounced pahz-icks, as in positive, not poh-six, or other variations. The pronunciation has been published in an attempt to promulgate a standardized way of referring to a standard operating system interface.
• Source, Not Object, Portability

This standard has been written so that a program written and translated for execution on one conforming implementation may also be translated for execution on another conforming implementation. This standard does not guarantee that executable (object or binary) code will execute under a different conforming implementation than that for which it was translated, even if the underlying hardware is identical.

• The C Language

The system interfaces and header definitions are written in terms of the standard C language as specified in the ISO C standard.

• No Superuser, No System Administration

There was no intention to specify all aspects of an operating system. System administration facilities and functions are excluded from this standard, and functions usable only by the superuser have not been included. Still, an implementation of the standard interface may also implement features not in this standard. This standard is also not concerned with hardware constraints or system maintenance.

• Minimal Interface, Minimally Defined

In keeping with the historical design principles of the UNIX system, the mandatory core facilities of this standard have been kept as minimal as possible. Additional capabilities have been added as optional extensions.

• Broadly Implementable

The developers of this standard endeavored to make all specified functions implementable across a wide range of existing and potential systems, including:

1. All of the current major systems that are ultimately derived from the original UNIX system code (Version 7 or later)
2. Compatible systems that are not derived from the original UNIX system code
3. Emulations hosted on entirely different operating systems
4. Networked systems
5. Distributed systems
6. Systems running on a broad range of hardware

No direct references to this goal appear in this standard, but some results of it are mentioned in the Rationale (Informative) volume.

• Minimal Changes to Historical Implementations

When the original version of IEEE Std 1003.1 was published, there were no known historical implementations that did not have to change. However, there was a broad consensus on a set of functions, types, definitions, and concepts that formed an interface that was common to most historical implementations.

The adoption of the 1988 and 1990 IEEE system interface standards, the 1992 IEEE shell and utilities standard, the various Open Group (formerly X/Open) specifications, and the subsequent revisions and addenda to all of them have consolidated this consensus, and this revision reflects the significantly increased level of consensus arrived at since the original versions. The earlier standards and their modifications specified a number of areas where consensus had not been reached before, and these are now reflected in this revision. The authors of the original versions tried, as much as possible, to follow the principles below.
when creating new specifications:

1. By standardizing an interface like one in an historical implementation; for example, directories

2. By specifying an interface that is readily implementable in terms of, and backwards-compatible with, historical implementations, such as the extended tar format defined in the pax utility

3. By specifying an interface that, when added to an historical implementation, will not conflict with it; for example, the sigaction() function

This revision tries to minimize the number of changes required to implementations which conform to the earlier versions of the approved standards to bring them into conformance with the current standard. Specifically, the scope of this work excluded doing any “new” work, but rather collecting into a single document what had been spread across a number of documents, and presenting it in what had been proven in practice to be a more effective way. Some changes to prior conforming implementations were unavoidable, primarily as a consequence of resolving conflicts found in prior revisions, or which became apparent when bringing the various pieces together.

However, since it references the 1999 version of the ISO C standard, and no longer supports “Common Usage C”, there are a number of unavoidable changes. Applications portability is similarly affected.

This standard is specifically not a codification of a particular vendor’s product.

It should be noted that implementations will have different kinds of extensions. Some will reflect “historical usage” and will be preserved for execution of pre-existing applications. These functions should be considered “obsolete” and the standard functions used for new applications. Some extensions will represent functions beyond the scope of this standard. These need to be used with careful management to be able to adapt to future extensions of this standard and/or port to implementations that provide these services in a different manner.

• Minimal Changes to Existing Application Code

A goal of this standard was to minimize additional work for the developers of applications. However, because every known historical implementation will have to change at least slightly to conform, some applications will have to change.

This Standard

This standard defines the Portable Operating System Interface (POSIX) requirements and consists of the following volumes:

• Base Definitions
• Shell and Utilities (this volume)
• System Interfaces
• Rationale (Informative)
This Volume

The Shell and Utilities volume describes the commands and utilities offered to application programs on POSIX-conformant systems. Readers are expected to be familiar with the Base Definitions volume.

This volume is structured as follows:

- Chapter 1 explains the status of this volume and its relationship to other formal standards. It also describes the defaults used by the utility descriptions in Chapter 4.
- Chapter 2 describes the command language used in POSIX-conformant systems.
- Chapter 3 describes a set of services and utilities that are implemented on systems supporting the Batch Environment Services and Utilities option.
- Chapter 4 consists of reference pages for all utilities available on POSIX-conformant systems.

Comprehensive references are available in the index.

Typographical Conventions

The following typographical conventions are used throughout this standard. In the text, this standard is referred to as IEEE Std 1003.1-2001, which is technically identical to The Open Group Base Specifications, Issue 6.

The typographical conventions listed here are for ease of reading only. Editorial inconsistencies in the use of typography are unintentional and have no normative meaning in this standard.

Notes:

1. Conversion specifications, specifier characters, and modifier characters are used primarily in date-related functions and utilities and the `fprintf` and `scanf` formatting functions.

2. Unless otherwise noted, the quotes shall not be used as input or output. When used in a list item, the quotes are omitted. For literal characters, `'\'` (or any of the other sequences such as `'\'`) is the same as the C constant `'\'` (or `'\'`).

3. The style selected for some of the special characters, such as `<newline>`, matches the form of the input given to the `localedef` utility. Generally, the characters selected for this special treatment are those that are not visually distinct, such as the control characters `<tab>` or `<newline>`.

4. Names surrounded by braces represent symbolic limits or configuration values which may be declared in appropriate headers by means of the C `#define` construct.

5. Brackets shown in this font, `[ ]`, are part of the syntax and do not indicate optional items. In syntax the `'|'` symbol is used to separate alternatives, and ellipses (`"..."`) are used to show that additional arguments are optional.

Shading is used to identify extensions and options; see Section 1.8.1 (on page 9).

Footnotes and notes within the body of the normative text are for information only (informative).

Informative sections (such as Rationale, Change History, Application Usage, and so on) are denoted by continuous shading bars in the margins.

Ranges of values are indicated with parentheses or brackets as follows:

- 

  - `(a,b)` means the range of all values from `a` to `b`, including neither `a` nor `b`.
  - `[a,b]` means the range of all values from `a` to `b`, including `a` and `b`.
  - `[a,b)` means the range of all values from `a` to `b`, including `a`, but not `b`.
  - `(a,b]` means the range of all values from `a` to `b`, including `b`, but not `a`. 

Participants

IEEE Std 1003.1-2001 was prepared by the Austin Group, sponsored by the Portable Applications Standards Committee of the IEEE Computer Society, The Open Group, and ISO/SC22 WG15.

The Austin Group

At the time of approval, the membership of the Austin Group was as follows:

Andrew Josey, Chair
Donald W. Cragun, Organizational Representative, IEEE PASC
Nicholas Stoughton, Organizational Representative, ISO/SC22 WG15
Mark Brown, Organizational Representative, The Open Group
Cathy Hughes, Technical Editor

IEEE-SA Standards Board

When the IEEE-SA Standards Board approved IEEE Std 1003.1-2001/Cor 1-2002 on 11 December 2002, the membership was as follows:

James T. Carlo, Chair
James H. Gurney, Vice-Chair
Judith Gorman, Secretary

Sid Bennett
H. Stephen Berger
Clyde R. Camp
Richard DeBlasio
Harold E. Epstein
Julian Forster*
Howard M. Frazier
Toshio Fukuda

Arnold M. Greenspan
Raymond Hapeman
Donald M. Heirman
Richard H. Hulett
Lowell G. Johnson
Joseph L. Koepfinger*
Peter H. Lips
Nader Mehravari

Daleep C. Mohla
William J. Moylan
Malcolm V. Thaden
Geoffrey O. Thompson
Howard L. Wolfman
Don Wright

Also included are the following non-voting IEEE-SA Standards Board liaisons:

Alan Cookson, NIST Representative
Satish K. Aggarwal, NRC Representative
Savoula Amanatidis, IEEE Standards Managing Editor

* Member Emeritus
Trademarks

The following information is given for the convenience of users of this standard and does not constitute endorsement of these products by The Open Group or the IEEE. There may be other products mentioned in the text that might be covered by trademark protection and readers are advised to verify them independently.

1003.1™ is a trademark of the Institute of Electrical and Electronic Engineers, Inc.
